FISCAL YEAR 1999**

TUESDAY, FEBRUARY 10, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:07 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Gorton, Burns, Bumpers, Kohl, and Leahy.

DEPARTMENT OF AGRICULTURE

OFFICE OF THE SECRETARY

STATEMENT OF DAN GLICKMAN, SECRETARY

ACCOMPANIED BY:

**RICHARD ROMINGER, DEPUTY SECRETARY
KEITH COLLINS, CHIEF ECONOMIST
STEPHEN B. DEWHURST, BUDGET OFFICER**

OPENING REMARKS

Senator COCHRAN. The meeting of our subcommittee on agricultural appropriations will please come to order.

Today we are beginning our hearings to review the budget request submitted by the President for the fiscal year beginning October 1, 1998—the fiscal year 1999 budget—for agriculture, rural development, and related agencies.

We are very pleased to have as our leadoff witness at this hearing the Secretary of Agriculture, Dan Glickman. We appreciate very much your being here, Mr. Secretary, and we understand that you have accompanying you today Richard Rominger, Deputy Secretary of the Department of Agriculture; Keith Collins, the Department's Chief Economist; and Stephen Dewhurst, the Budget Officer for the Department.

This subcommittee has jurisdiction for all programs and activities of the Department of Agriculture, with the exception of the Forest Service which is funded by the Interior appropriations bill.

For this next fiscal year, the President has requested appropriations of \$56 billion for Department of Agriculture programs and activities under the jurisdiction of the subcommittee, which is a net increase of \$8 billion from the current fiscal year enacted level.

Three-fourths of that request is for mandatory appropriations required by law to be appropriated.

The President's total discretionary appropriations request is \$12.6 billion.

This presents us with a proposed decrease of approximately \$330 million from the enacted level for this current fiscal year. That's assuming that the President's legislative proposals and offsetting savings are enacted into law.

The Department's request relies very heavily on the adoption of new user fee legislation to generate \$624 million in collections for this next fiscal year. One of these proposals is to cover the costs of meat, poultry, and egg products inspections. This and other user fee proposals of this administration have been rejected by previous Congresses, and I suspect they will be rejected by this Congress.

Further, a \$205 million savings in appropriations for the crop insurance program results from the President's proposal to shift sales commissions for agents from discretionary to mandatory spending. That's not certain to be approved by Congress either.

Many other increases proposed for food safety, integrated pest management, and a host of other priorities are funded in the President's budget by redirecting funds from existing programs and activities.

I think it is fair to say that this subcommittee will not have the luxury of being able to count on the availability of user fee resources from legislation which has not been approved by Congress, and I also expect that Congress will disapprove many of the proposed shifts in funds from existing priorities of the Congress.

So, we have our work cut out for us, Mr. Secretary, to get these numbers to come out at the end of the line so that we fund our programs for research, for agriculture production, and for the food programs that are required to be funded by this subcommittee each year. So, we will work with you to try to identify the priorities and the needs for the Department's funding for this next fiscal year.

We appreciate very much your providing us with your statement in advance. It will be made a part of the record in full, and we would invite you to proceed to summarize your statement or make any other comments that you think are appropriate.

At this point, however, I am going to yield to the distinguished Senator from Arkansas, the ranking Democrat on the committee, Senator Bumpers.

STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Mr. Chairman, thank you very much. I will ask unanimous consent that my formal statement be inserted in the record and simply say that this is a sort of bittersweet occasion for me because this is the opening round of the hearings of my last year in the Congress and my last year on this subcommittee.

Having said that, Mr. Chairman, let me thank you personally for the cooperation and the kindnesses you have shown me. We have agreed on most things, but even when we have not agreed, they have been most amicable disagreements. I could not have asked for a better chairman to work with on this committee, and I want to publicly thank you for that and just summarize.

My statement would be basically the same things you said, but I would just like to emphasize again that when you consider the fact that the budget authority for 1999 is \$332 million less than 1998 and then you add \$600 million in user fees to that, we have a pretty tough year in front of us obviously because I agree with you, Mr. Chairman. User fees have been brought up here—I think this is maybe the sixth consecutive year that the Department has asked for user fees, and it will probably be the sixth consecutive year they will not be granted.

But I just want to point up the magnitude of our problem if user fees are not granted by this subcommittee or by the authorizing committee, for that matter, which technically we ought to have before we enter into such a thing as that.

But in any event, Mr. Secretary, I want to thank you for your services. You have always been very responsive to the members of this committee and we want to publicly thank you for that.

Thank you, Mr. Chairman.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Senator. I especially appreciate your kind remarks. I do not know of any person I have worked with in Congress that I have enjoyed the relationship with than this distinguished Senator from Arkansas. We have swapped this job back and forth over the last decade a number of times. It has always been a pleasure to work with him closely on the subjects under the jurisdiction of this committee. We will insert your statement in the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

I am proud to join Senator Cochran and my other colleagues on the subcommittee in welcoming Secretary Glickman, Secretary Rominger, Mr. Collins, and Mr. Dewhurst. Secretary Glickman was in my state a few short days ago and it is a real pleasure to have him and others from the Department of Agriculture with us here today.

This is a bittersweet occasion for me because it marks the first hearing for the last annual appropriations bill of which I will have the pleasure to serve as a member of this subcommittee. Over the years, I have not always agreed with my colleague and friend, Senator Cochran, on every single issue before us, but I am happy to say that those times of disagreement have been very few and without doubt, the two of us have agreed on far more topics than we have disagreed. I want to publicly thank him for his courtesy, his thoughtfulness, and the partnership we have shared these past several years in crafting the funding bills for the Department of Agriculture, the Food and Drug Administration, and the other agencies under the jurisdiction of this subcommittee.

The fiscal year 1999 budget now before us appears to offer many new initiatives and a few themes we have seen before. Last year, as we considered the fiscal year 1998 bill on the Senate floor, I made clear my view that investment in agricultural research must be one of our highest priorities. I was disappointed to note the overall decline below the fiscal year 1998 level in new budget authority requested for programs in the Research, Education, and Economics mission area. I realize that some of this reduction is simply a result of moving specific programs to other mission areas or, as in the case of the Census of Agriculture, a function of cyclical budgeting.

However, I have serious concerns about reductions in formula funds to our nation's system of land grant universities and extension network. The federal-state partnerships in agricultural research have been the backbone for developing our nation's productive capability which has made us the envy of the world. Similarly, the budget's elimination of congressionally directed research through the Agricultural Research Service presents a challenge to us and to the research communities in our states who had looked forward to a reliable partnership with the federal research

arm of USDA. Still, I am confident the commitment of the President and of Secretary Glickman toward agricultural research is strong and I look forward to working together to craft legislation for the coming year that will help prepare our nation and our nation's farmers for the coming century.

I also worry about the farmers themselves. I know that may sound a little disingenuous when you consider that net farm income, though slightly down in 1997, was at a record high of \$60 billion in 1996. It is an unfortunate lesson of history, but prosperity on the farm is usually fleeting. Cycles of high yields and high prices come, and those same cycles, in time, go. In 1996, when the tide was high, Congress with the stroke of a pen kicked away a tradition of cooperative support and assistance that the farmer had known for more than a generation. It may have been an imperfect partnership, but the American farmer knew USDA would be there when it was needed.

USDA is still there and the challenge now is for the Department of Agriculture to continue to be a Department for Agriculture in a very changing economic and political environment. The 1996 Farm Bill did not destroy the farm safety net, but it was badly mangled. Before declining budgets and different directions in farm programs and farm policies completely dismantle USDA's presence in rural America, we need to take a few steps back and reflect on where we have been, where we need to go, and how best to get there. I note that the budget for fiscal year 1999 contains several features designed to improve the farm safety net and I look forward to hearing from the Secretary on this subject.

The 1996 Farm Bill also included the creation of a Commission for Agriculture in the 21st Century. Being a new commission and a new appropriations account in a time when it has been difficult just to maintain the necessary ongoing programs, the Congress provided no direct funds for this activity in the fiscal year 1998 bill. I hope we will look more closely at the work and the potential of the Commission this year. I fear we may otherwise one day regret having turned our backs on the American farmer because times were good only to find that without him, times may become very, very bad for the rest of us.

Food Safety continues to demand our strict attention. Food recalls accounted for some of last year's largest news stories. Whether it is contaminated beef or tainted strawberries, the American people are more demanding than ever about the wholesomeness of the food they eat. Part of this goes back to my earlier comments about research. It is vital that we learn all we can about how to identify, detect, and prevent the occurrence of food borne illness. It is equally vital that we proceed with the very best science in order to avoid sensationalized scares regarding food safety that can, in an instant, destroy businesses that took generations to establish.

This subcommittee provided funds in fiscal year 1998 to implement the President's Food Safety Initiative, a collaboration of USDA, FDA, and CDC. The fiscal year 1999 submission carries this initiative forward. Food safety is an area where everyone should be in agreement. Food producers, processors, and consumers all have a vital interest in knowing that products are reliable and safe. Consumers demand such standards just as producers and processors hope consumers will demand their products. As more and more foods are imported from around the world, as emerging diseases and pests capture the headlines, it is more important than ever that we hold food safety to the highest attainable standard possible.

Again this year, the budget request is dotted with proposed user fees. Some are new creations, some are old acquaintances. The budget proposes to collect \$573 million in new FSIS user fees. This sizable amount, we are told, would equal only pennies per pound in additional costs to the consumer. After all I have just stated about food safety, one would assume that the American consumer would think nothing of spending a few pennies more to know that the meat or poultry products in the shopping cart are safe. Unfortunately, I am not convinced higher consumer prices is the proper analogy to the user fee proposal.

If authorized and collected, the cost of FSIS user fees would seldom, if ever, be absorbed by the meat and poultry processing companies. Anecdotally, we are told that those few additional pennies per pound would come, not out of our tax burden, but out of our pocketbooks at the grocery store. However, it is most unlikely that the companies would pass this cost on to the consumers in grocery stores where competition is the most fierce. Instead, the companies are more likely to pass on these costs to the one sector of the economy that is unable to pass them on to anyone else, the producer. It seems odd that while we worry about the small farmer, while we shake our heads at livestock prices, while we worry about the economy of foreign nations that might disrupt our livestock exports, we would in the next breath propose adding another \$573 million annual cost (nearly \$2.8 billion through the year 2003) to these very producers.

The Department of Agriculture touches on many more subjects than those I have just discussed. Providing adequate nutrition for our people, protecting our environment, promoting rural development, and remaining on the cutting edge of world trade are but a few of the other vitally important functions of USDA. As we proceed through this year's hearing schedule, I look forward to hearing from all agencies of USDA on their plans for the coming year.

The budget presented to us by President Clinton is a balanced budget. It took a lot of pain and suffering by all of us to reach this historic point. We will have a lot of pain yet to endure to make a balanced budget more than simply a point in time. As we hear from Secretary Glickman, and the other USDA officials that will follow him, we need to keep in mind that austerity will continue as our guide. We will also recognize our duty to the constituencies we serve today and in the years to come. The passage of the fiscal year 1999 appropriations bill will be a point in time, but one which we must assure will lead us in the right direction to a coming millennium.

STATEMENT OF SENATOR BURNS

Senator COCHRAN. Are there other Senators who would like to make an opening statement? If so, I will be happy to recognize you for that purpose. Senator Burns, you were here early.

Senator BURNS. Well, Mr. Chairman, let me just place my statement in the record.

The Secretary already understands that I have got—I do not know why we ought to be appropriating any money for the Department, to be honest with you. That is where I am at right now.

Senator BUMPERS. Would you repeat that?

Senator BURNS. Yes; I do not know why we are appropriating any money because I do not see an advocate down there for the producer and I would sure like to.

I want to say that I am very disappointed in the roadless areas so far as the Forest Service is concerned with EEP having the money and not spending it, not competing. Those areas that I think would best be left to really just a private sit-down, I would like to sit down with the Secretary one of these days and go over each one of these things because what is going on in my State of Montana has far-reaching ramifications. It is serious. It is serious beyond belief. I know there is a way to work through this and I do not think probably in the public domain is the place to do that.

I have a hard time telling my farmers if you think everything is good on the farm. I have a hard time saying that we cannot get as much for a 60-pound bushel of wheat as they are getting for a pound of wheat in the grocery store. Now, something is awry and I am not smart enough to figure it out. I wish I was. I wish there was a single bullet, but there is not.

PREPARED STATEMENT

So, Mr. Chairman, I would just submit my statement for the record and one of these days I would like to sit down with the Secretary because we have some very, very serious things to go over, if we possibly can.

I thank the Secretary for coming today and I thank the chairman for holding the hearing.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman. I would like to start by stating how well run I find this subcommittee to be, I believe the Chairman and the Ranking member do a very

good job of getting this process underway in this subcommittee. I would also like to commend the staff of this subcommittee for the professional manner in which they perform their jobs. Last year their work was a good example of how this process works and I do appreciate their fine work.

Now with that done, I am pleased to see the Secretary of Agriculture before us today. In my mind this is a very timely hearing considering much of the work that the Secretary and his department have been involved with in recent weeks. Between the difficult times that our farmers are facing in the field and the recent announcement on roadless areas in our National Forests. These issues have all had a definite impact on my state of Montana, and I honestly don't think a lot of consideration is being given to rural America by the Department at this time.

To start out with Mr. Secretary, we must all admit that the current farm program is in existence and is moving forward. The producers are getting their transition payments and all is well on the farms. That is the feeling I am getting from my constituents when they talk to the people in your department. But all is not well. When I go to the store to purchase breakfast cereal, and have to pay \$3.75 a pound for Wheaties, and yet my farmers in Montana can't get that for a bushel which weighs sixty pounds, well something is far from right on the ground.

It is my belief, and it is shared by many on the ground that this is due to inadequate trade policies and work both by the office of the United States Trade Representative and the Department of Agriculture. In recent weeks I have had numerous inquiries into my position on the trade credits that this country is providing to countries in Asia. They are wondering about their future in these markets.

It is my position that I will accept the first payment made by this government to Asian countries, but Mr. Secretary we had better see some realistic development in the trade of American agriculture products from this effort. Without that I see a rough and rocky future for any approval of additional efforts for bailing out these countries. When our trade representatives are working with these people it is their responsibility to make sure that American farmers and ranchers are being taken care of on the world market.

As far as I am concerned this is not the case today. Most if not all American farmers are proud of and will back their country to the bitter end on matters of national defense and security. But, when doing so they would like to think that their government is giving them a fair break on dealing on the world trade stage. This is not the case today. As we place trade sanctions on many countries in the world, thus losing any and all opportunities for trade of food products with these countries, our friends and trade partners move into those markets and have a hay day.

It is known that some of our trade partners are going into the countries we have trade sanctions with and selling above market price. They then take the extra earnings they have achieved and sell below market price in those markets in which we compete with them. Yet, for the past two years the Department which you have been in charge of has yet to spend one dollar of Export Enhancement Program, (EEP), funds to counteract this trade difference. As a matter of fact you gladly turned back about \$60 million last year for disaster assistance.

This year you propose capping EEP at a sum of \$320 million, when Congress has provided you authority for up to \$550 million for this program. I would personally like to see some of that money used, but in consideration of what you have done in the past couple of years, I honestly don't understand why you are even putting that amount in the account this year. I would be pleased today to hear you state that you really plan on using it, but I doubt you will say much more than if market conditions warrant the use of EEP funds your office will make those funds available.

In contrast to the EEP funds the Department of Agriculture has gone out and done a lot of good work with the Foreign Market Development funds. This seems to be the one account in the Department and in the Foreign Agriculture Service where the dollars are getting used. Then again we face another obstacle set forth by the Department, the lack of realistic funding for this program. If it is the one program that seems to be working and bringing dollars back to the American producer, why does the Department continue to under fund this vital program. It appears all the Department does is carry over funds for the Cooperator program.

This weekend I will be returning to Montana, as will many of my colleagues be returning to their states, for the President's week break. This Friday and Saturday in Shelby, Montana they will be hosting the annual Farm and Ranch Days in which I will be in attendance, answering questions and speaking to a number of farmers from Montana and surrounding Provinces and states about our Agriculture policy. I would like to invite you, and will assist your office to set up a time, for you to speak to my farmers about their future via the phone. Then you can explain to them why the rest of the world seems to be under selling our grain on the world market.

By the way, are you aware of the significance of this meeting being held in Shelby, it was the town that almost declared war on Canada several years ago due to the amount of wheat that was coming across the border in that area. They did it then, and don't be surprised if they do it again in the near future Mr. Secretary.

I can guarantee you, your staff and the Department that until I feel that the concerns of the American and Montana farmers are adequately addressed on the world market that you will continue to hear from me on this topic. I have not supported NAFTA or GATT and for the reasons listed above. This Department and this Administration continue to cut trade deals all across the world, but my farmers are not basking in the splendor that they were assured would come their way. Because the world looks upon us as easy traders, one of the first issues that drops off the table is agriculture.

Why is it that everybody is concerned about the food supply the American Farmer and Rancher provide. It is because without a doubt they produce the finest, most reliable and SAFEST food in the world. The rest of the world knows this, and in reality are afraid of our producers. Mr. Secretary, I am willing to put any producer in Montana up against, on a competitive market, any producer in any country in the world. Time and time again they will produce a SAFER, more reliable and less expensive product. But time and time again they, the producers, are faced with the fact that they must compete not against another farmer, but against a foreign government without much help from their own.

It is apparent that the current Administration wants you and your office to go down in history for providing a safer food supply for the people of this country. Well, Mr. Secretary, if this Department does not go out and assist our farmers with marketing on the world market, you won't have to worry too much about the food supply here in the United States. I wonder how safe you all will consider the food supply that we will be required to import from foreign countries in order to meet our daily needs.

Mr. Secretary, it is simple, Congress has provided you with the tools do go out and compete on the world market. Please use them and help our farmers make a decent living and have a chance. If not, the idea of the Big Open will occur again, and states like Montana will become the playgrounds that those with the big dollars would like to see anyway.

Well that is my sermon on agricultural trade for today. Here ends the lesson. Unfortunately now I must go onto the issue which I am sure you knew I would bring up today, Roadless Areas and the moratorium on any and all construction of roads in these areas.

I cannot believe the nature in which you and the Chief of the National Forest Service allowed this to occur. A couple of weeks prior to the announcement by the Forest Service, myself and several members of this committee and the Energy and Natural Resources Committee, joined in sending you a letter outlining our concerns and suggesting that we were as concerned as you about the roadless areas. We stated that we would be willing to work with you and the Administration in developing a policy to address these issues in our states where your announcement had the greatest impact. But obviously those people who have elected us have no understanding of the finer issues, since their voices and their concerns went selectively unanswered by your office.

This concerns me greatly, since we like the President are elected officials, and although both Congress and the Administration like to act like we have all the answers. By working together we may be able to at least address them in a fashion that will answer the concerns of all the people, not just special interest groups that fancy having one ear or the other.

Mr. Secretary, your decision to implement this moratorium and to notice proposed rule making has done more in the past few weeks to reignite the fire that was once called the "war on the west". No other Administration has done more to make people who live and work on the public, and for that matter private lands, in the west feel as though nobody cares about them like this Administration has. These are real people, Mr. Secretary, with real jobs and real dreams about the future, both for themselves and their children. Yet they are brokered as insignificant pawns in a motion to please the extreme elements within this Administration.

I have to honestly tell you how very disappointed I am in you and your office for this action. There were numerous ways in which to address the current situation, and you let them all slide in order to preserve some righteous thinking person in the White House. Just remember sir that which can be done by executive order can be undone by executive order, and god forbid the consequences at times can be worse than what we started out with in the first place.

Now I have preached a sermon, and given a lecture. I had hoped and always thought that this might be the one committee where I did not feel the need to do this, but current events have led me to this point today.

On to a point of interest in regards to a situation in Montana. You understand that I worked with the Chairman and Ranking Member of this Committee last year to provide funding for a quarantine facility in Montana for the bison that leave Yellowstone National Park. I also understood that with the timing of the Agriculture Appropriations, and the upcoming winter, that it would not be possible for the Department to do much work in relation to that facility. However I had assumed that in the past four months that there might be some dialogue with the state of Montana and the Department on the future of this facility.

Mr. Chairman, I admit to being rather long winded today, somewhat unlike me, but I had a great deal to get off my chest here today. I again appreciate the leadership that you and Mr. Bumpers provide to this committee and I am also aware of some of the differences that the Ranking member and I have on these issues. But it was important to me to get this out in the open and let the Secretary understand why I have such a lack of confidence in the Department of Agriculture at this time. Again thank you for this opportunity, and I look forward to listening to the Secretary explain the USDA budget for the coming year. I will have some questions later.

Thank you, Mr. Chairman.

STATEMENT OF SENATOR LEAHY

Senator COCHRAN. Senator Leahy.

Senator LEAHY. Thank you, Mr. Chairman.

I too am one who has enjoyed working with you. We have served for so many years. I think we both had dark hair when we started. Well, you still have hair. [Laughter.]

I also was privileged to come to the Senate with Senator Bumpers who has been, like you, one of the best friends I have had here. I would like to praise Senator Bumpers because of what he has done, both as chairman and as ranking member of this subcommittee. I know that in that capacity he has had, as you have, Senators from both sides of the aisle constantly coming, asking for help on far more things than it is possible to do. Like you, he has helped when it was possible to do it, and when he was unable to, like you, he has still left the Senators feeling that they had a fair hearing. No more could be asked of any chairman or ranking member.

Right now we are close to funding full participation for the WIC Program. Mr. Secretary, I would say that is a pretty significant accomplishment when you consider that not very long ago one-half of the pregnant women, infants, and children went unserved.

Another important nutrition investment is the WIC farmers market program which helps create farmers markets and assists families on WIC at the same time. This committee has greatly helped that program with continued funding, and it has turned out to be a win-win situation; both a win for the producers and a win for the consumers.

Secretary Glickman, I want to especially thank you and your staff. I am glad that there is a USDA because you have been up in the past several weeks to help Vermonters in the aftermath of one of the worst ice storms in this century. I toured that area, along with Senator Jeffords. I know how badly it was hit, and I saw the USDA, the Vermont National Guard, and the private sector come together to help us there.

The ice storm paralyzed communities from northern New York to the tip of Maine. Trees collapsed from the weight of several inches of ice that coated their branches. Power lines were literally just

ripped right out of the houses. We had miles of utility poles that were just flattened. They were standing one hour, and the next hour they were all down. Hundreds of thousands of people were left without power for days and even weeks, while temperatures dropped down well below zero. The temperatures warmed up and we got hit with ice melting and rivers flooding, overpowering their banks.

I was born in Vermont. I have lived there 57 years. This storm is the worst I have ever seen. In the Burlington area, 50 percent of the trees were toppled or severely damaged, and across the region 70 percent of the trees were damaged. You have visited that area before, Mr. Secretary. You know the beauty and the utility of those trees, and you can imagine what it was like with them down.

Along with farming, forest and forest products make up the majority of the economy of the region hit by the ice storm. These rural communities, and the men and women who work there, are going to be feeling the economic effect of this storm for years to come. In some cases, sugarmakers and woodlot owners and apple orchards are going to have to wait several years before regrowth allows them to go back into what has been their livelihood not only for them but their families for generations. We see over \$8 million in crop damages and \$3 million in trail damages in our national forests and untold millions beyond that.

The hardest hit, though, were the dairy farmers in many ways. They are already struggling to make ends meet. Farmers were left without power needed to milk their cows. Cows have to be milked twice every day whether you have power or not, and sometimes cows went for days without being milked. Farms lost cows. Milk handlers were unable to get through on the roads to make their pickups. Farmers had to dump thousands of pounds of milk, and losing one milk check for a lot of these farmers can make the difference of whether they stay viable or not.

Local and State assistance is going to help them, but Federal relief is needed. I hope the Department can help us all the way through. There are a number of programs that you have in your Department, Mr. Secretary, and we are going to need your help and we will continue to work with you.

But there is another storm on the horizon and that is manmade. The storm that I am concerned about in the future is the one that the Department of Agriculture is proposing in the milk marketing order system. If it is made final, it is going to put thousands of small dairy farmers out of business in very short order.

The Commissioner of Agriculture of Vermont has advised me that Vermont could lose one-half its farms under the USDA proposal. Economic analyses by Agrimark Cooperative shows the Northeast will lose \$117 million in annual income. Almost all regions of the country will be dramatically hurt.

So, you can imagine then, Mr. Secretary, you are going to hear a lot about this. You just had a proposal and a report which says we should increase efforts to keep smaller farms in farming. Yet, your proposal for milk pricing will force a lot of these same small farms out of business. We will address this in authorizing committee, but I just wanted you to know it is an area of concern.

Mr. Chairman, I thank you for your courtesy in allowing me to go on longer than usual.

Senator COCHRAN. Thank you, Senator.
Senator Gorton.

STATEMENT OF SENATOR GORTON

Senator GORTON. Mr. Chairman, I would like to start out also by saying how much we will miss Senator Bumpers when he leaves. I was reflecting on the fact that there is almost no one I have come across in my career with whom I can disagree more frequently or more cheerfully with more eloquence on his part and with less rancor from a personal point of view or, for that matter, someone who is so great a friend and an ally when we find ourselves in agreement. He has done a great deal on this subcommittee and the Senate as a whole.

I guess I wish I could be so kind to the Secretary and his budget, but Mr. Chairman, when you start by saying that in spite of the image that the American people have of the Department of Agriculture, overwhelmingly its money goes into entitlements that have to do with transferring money and assets from one group in our population to another and how little of it goes into agriculture itself, as both we and the American people think of agriculture, that is to say, our producers of food and fiber.

To see a budget that continues to move so radically in the direction of again cutting off farmers and being hostile to them and their interests in the way that this does is an intense regret. To see a complete cutoff, for all practical purposes, of cooperative research programs of work between the Department of Agriculture and our universities in order to fund basically more welfare programs.

The President's ideology that he is unwilling to submit to the Congress for its normal ratification just means in my view that we have a Department of Agriculture that has forgotten about agriculture, and I am convinced that you, Mr. Chairman, as has been the case in the past, are going to come up with a rather different budget in these research areas than the one that has been submitted to us here.

I also join Senator Burns in a statement, that is not directly relevant to this hearing because it is part of the Department of Agriculture that belongs in the jurisdiction of my subcommittee, over their forest initiatives, again hostile to traditional uses without having solicited the views of the people in communities who are greatly affected by those decisions, making decisions that really ought to be decisions made by the elected representatives of the people through their Congress rather than in individual Departments.

So, I have to say that an appropriation bill that I hoped we would have a wide degree of agreement on is one that is simply going to create controversy and has deeply disturbed people in agriculture in my State and I suspect across the country.

Senator COCHRAN. Thank you, Senator.
Senator Kohl.

STATEMENT OF SENATOR KOHL

Senator KOHL. Mr. Secretary, we appreciate your willingness to testify before this subcommittee today on the issues raised in USDA's fiscal year 1998 budget. We recognize the magnitude of the task before you. Managing the USDA with this administration's commitment to a balanced budget is no small task.

We do ask that as you review programs, you avoid picking winners and losers and focus on treating all programs and people fairly and equitably. Past decisions in one program, the milk pricing laws, have created winners and losers with family farms having the most at stake. What needs to happen to Federal milk marketing orders is equity and simplicity to eliminate the regional differences. Without reform, Wisconsin will lose almost one-half of our family dairy farmers over the next decade.

In addition, Mr. Secretary, the family farmers must be assured that other countries are not being given an unfair advantage or unfair access to our markets and we must expand our agricultural exports. To achieve these goals, USDA must actively monitor international agriculture trading agreements. While properly constructed trading agreements alone will not save the family farm, poorly monitored ones will harm their existence. Without detailed analysis and careful attention to the issues, I feel that family farms may in fact disappear forever. Mr. Secretary, USDA's actions on these issues will determine the future of the family dairy industry.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Mr. Secretary, with that warm welcome. [Laughter.]

Thank you. We appreciate your being here.

Secretary GLICKMAN. I am reminded of Senator Bumpers' joke which I have stolen from him and told about 4,000 times. I won't repeat it today.

But thank you very much, Senator Cochran.

Senator COCHRAN. It may be one of the few jokes of his you can retell. [Laughter.]

Senator GORTON. I did not know there was one.

Secretary GLICKMAN. If he has more, I would be glad if he called me this afternoon.

Senator COCHRAN. We better get back on the subject here. You may proceed.

STATEMENT OF SECRETARY GLICKMAN

Secretary GLICKMAN. Thank you. I want to thank you for your courtesy and hospitality.

I also would like to pay tribute to Senator Bumpers. I was in Lonoke, AR, Senator Bumpers, where we announced a water program that you had actually gotten started. The affection that people have for Senator Bumpers is higher than I have seen for about anybody in public life. So, I know that his contribution to his State is enormous.

In any event, I want to make a couple of comments.

DECREASES IN USDA OUTLAYS

One is if you look at the chart here, outlays in the Department of Agriculture for the last 6 years have clearly been coming down. There are a lot of reasons for that, but the prime reason is the reduction in entitlement spending: food stamps and farm programs. Food stamp reductions have largely taken place because of economic improvement and the resulting reduction in the numbers of people on the rolls and their length of time on the rolls, particularly for the last 3 years. Farm program spending also has come down largely because of congressional action related to AMTA payments.

So, the fact of the matter is that in the 1999 budget we have requested increases in EQIP, increases in conservation, and to fully fund crop insurance, but we have not asked for more money to fund the basic commodity programs because we are operating under the 7-year AMTA Freedom to Farm Act which has a ratcheting down of farm program expenditures every single year.

So, I do not want the impression to be left that there is a reduction on the farm side and an increase on the welfare side. Congress has made some decisions on the farm side to lock in reductions over the next 7 years, and I think by and large most farmers—not all, but most—think that that decision was an appropriate decision. And, we are implementing that the best way that we possibly can. The flexibility provisions of that farm bill have proven to be very positive.

Not every part of agriculture is doing well. Most farmers are doing better because interest rates are down. They are low because we have made progress on the budget. We also have made progress on inflation. I think that is a tribute to both the administration and Congress, but the fact is those lower interest rates have stabilized a lot of the slide on farm income that we saw in the 1980's.

SEVERE WEATHER PROBLEMS

But clearly, the Northern Plains regionally have the most serious problem in agriculture today. The Dakotas, Montana, the northern tier of States with the very severe weather problems, coupled with prices particularly in grains that have not been of an augmented level have caused serious problems there, and I understand that.

DAIRY PRICE ISSUE

In addition to that, dairy has not done as well as other segments of the American farm economy. Dairy prices today are better, but I cannot predict to you where they are going in the future. I think the basic formula price for last month was \$13.30, which indicates some strengthening, but dairy producers have suffered a great deal and I think that that is a problem for us and we need to work on it. We have proposed milk marketing order reform, which is highly controversial, but at least we will get a national debate.

WEAKENED LIVESTOCK PRICES

A third issue is livestock. Livestock prices, while they have been strong the last few years, have weakened recently. Part of that has

to do with the Asia financial crisis. Part of it has to do with other factors.

CONSERVATION RESERVE PROGRAM

But without trying to be overly defensive, I think it is important to recognize that whether we are working on a conservation reserve program for example in Washington State to make sure that Senator Gorton's farmers are treated fairly under that CRP program or we are dealing with exports or other kinds of initiatives, the heart of the Department of Agriculture is in our efforts to preserve stable income and the health of production agriculture. We do a lot of other things as well, such as seeing to the sustainability of land and making sure that hungry people are fed.

But I take very seriously, coming from Kansas, my role in preserving the strength of production agriculture. A lot of decisions were made in the 1996 farm bill which changed farm policy, and perhaps we need to talk about some legislative issues. I want to make it clear that the heart of what we do is to preserve a strong farm economy out there in all sectors, all regions, and all commodities.

PRESIDENT'S BALANCED BUDGET

Let me just make a comment that we had to make difficult decisions in light of the Balanced Budget Act of 1997 and the President's commitment to a balanced budget, the first one in 30 years submitted. We had to make difficult decisions on resources in terms of where we provide them and how they are redirected. We did propose some new user fees. We absorbed certain costs and looked at our own business practices. Those efforts, combined with program reductions and reforms taken in prior years, have made a significant contribution to the President's balanced budget.

USDA's outlays, as you can see on this chart, are down by about 14 percent over the last 6 years, from \$63 billion to a projected \$54 billion.

Over this same period, employment, on the other chart, is down about 20,000 through reorganization and streamlining efforts. Today USDA is the smallest it has been since the mid-1960's. We are doing our part to reduce the deficit.

But notwithstanding those facts, there are serious challenges facing farmers, rural Americans, and the Nation and we cannot abdicate our role in that area.

CIVIL RIGHTS

I also want to emphasize to you the importance that the President and I place on improving USDA's civil rights performance. The necessary funding for civil rights-related activities contained in this budget, the largest increase in two decades in that area reflects that commitment. We are asking for funds to carry out recommendations of our Civil Rights Action Team and the National Commission on Small Farms that support our civil rights agenda. In total, we are requesting \$250 million to invest in credit, outreach, and conservation programs relating to civil rights, plus funding to resolve discrimination cases that are currently pending.

Briefly, I want to go over the four major parts of the budget. The first one has to do with economic and trade opportunities.

CROP INSURANCE PROGRAM

The long-term viability of our farmers is now more dependent than ever on their ability to manage risks inherent in the market. This is what I call the post freedom to farm market, where the Government is not actively engaged in managing the supply and price of products. We believe that maintenance of a strong set of risk management tools is essential in this new situation, and that is why our budget provides for full funding of the crop insurance program. We will propose legislation to shift funding of certain crop insurance delivery expenses to mandatory funding to ensure maintenance of this vital program. There is no real safety net out there for most farmers except selling our products overseas and having an effective crop insurance program.

I admit to you that the crop insurance program is not perfect in all respects, but having it based on mandatory funding I think will give farmers some security that it will be there for a long time.

NATIONAL COMMISSION ON SMALL FARMS

Farmers and ranchers need credit to succeed. Our National Commission on Small Farms and our civil rights report emphasized that, driving home the point that improved access to credit creates opportunity for family farmers, in particular beginning and socially disadvantaged farmers.

For that reason, the 1999 budget provides more funding for farm loans. We have proposed doubling direct farm ownership loans to \$85 million and increasing guaranteed loans. Under our budget, almost 3,500 beginning and small family farmers will be able to acquire or save their farms. The budget keeps direct and guaranteed farm operating loans at \$2.4 billion to serve some 28,000 limited resource farmers.

GOVERNMENT DEBT FORGIVENESS

But I must tell you there is one other issue I urge you to deal with and that is that the 1996 farm bill contains an onerous provision which is a categorical ban on loans to farmers who have had Government debt forgiveness since the mid-1980's. Now, mind you, banks do not even do this. What the law says is that if you have had any kind of a write-down in the past, 10 years ago, you can no longer get a Government loan, a direct operating loan, a guaranteed loan, or the related farm loans that we have. So, that means, notwithstanding the redemption that we tend to believe that people should have, that once you have that impediment, you are forever barred from Government assistance. No bank has that kind of onerous requirement.

I admit to you that there were people back in the 1980's that took advantage of Government loans and abused the process, but since 1989 we have had between 75,000 and 80,000 people who have had write-downs and most of those people are doing OK now but they are forever barred from getting loans.

This is a very serious problem and one that has a monumental effect. It was raised by our Civil Rights Action Team, but it is a problem that affects every single State in this country. I am sure, Senator Kohl, you have had people who have had Government write-downs in the last 10 years. They are no longer eligible for Government farm credit assistance. We are denying a lot of small farmers access to credit.

We will ask Congress to replace this prohibitive standard with one that we think is based on common sense that will protect both taxpayers and hardworking, creditworthy farmers and ranchers. This is also one that we need to work on quickly because if we do not, we will lose more farmers because they will not be able to get credit assistance, guaranteed or direct credit.

AGRICULTURAL EXPORTS

Exports have never been more important to the health of the American agriculture. This is the other part of the safety net. We have to aggressively use our efforts to open new markets, maximize export opportunities, fight new obstacles to trade, particularly sanitary and phytosanitary restrictions being put on our products by other countries. We have been wrestling with the Asia financial situation. We have been extending export guarantees to key markets, keeping them open to our farmers and ranchers.

On that point but unrelated directly to our budget, I want to emphasize the critical importance to American agriculture of congressional support for IMF funding. The stability of these Asian countries to buy our products is in large degree due to stability of their currencies and their economic conditions, and it is unlikely that we will have much of a market there without that kind of stability.

For 1999 we have proposed spending nearly \$6.5 billion for trade related activities, including a projected \$4.6 billion for export credit guarantees to protect sales to Asia. Just this last week I announced that the Koreans were coming in for an additional \$100 million of credit for hides and skins, Senator Burns, which had the cattlemen very, very interested.

Senator BURNS. It will not be my hide.

Secretary GLICKMAN. No.

Senator BURNS. That is the only one I am interested in right now.

Secretary GLICKMAN. OK. Well, I will not comment.

But anyway, the fact is that the export credits are a key way to deal with this issue.

The budget also proposes a flexible multiyear authorization for the export enhancement program.

RURAL DEVELOPMENT

We also believe that the programs dealing with housing, running water, electricity, and telecommunications are critical. They mean job opportunities. Overall the 1999 rural development budget will support about \$9.8 billion in loans, loan guarantees, grants, and technical assistance, which is \$300 million more than 1998 and \$1.8 billion more than in 1997, largely due to reduced and stable interest rates. The budget supports the administration's Water 2000 initiative, homeowner initiative, and maintains rural rental

assistance to low-income families. I will not read all of the statement here, but the area of rural development is a very high priority to the administration.

AGRICULTURAL RESEARCH

Research is critical to the future economic growth of agriculture. Driven by publicly funded research, agricultural productivity has grown at an annual rate of 1.8 percent over the last 45 years. There have been all sorts of breakthroughs that I do not need to go into here. The budget increases the work we are supporting to identify and develop a better understanding of genes that are important to agricultural production and crop biodiversity. We also intend to increase our competitiveness in the global market, production efficiency, and ultimately our farmers' profitability through our research.

The budget emphasizes improving sustainable management systems to enhance the economic competitiveness of small farm producers and protecting the environment.

Marketing is more important to American agriculture than ever before, particularly protecting the health and well-being of American agriculture at home and protecting us from unfounded sanitary and phytosanitary barriers to trade. For example, we are making excellent progress in combating many plant and animal pest and disease programs such as brucellosis.

There are other budget increases that are useful in this area, in the area of pest detection, disease prevention, and border inspection. We have several proposals that will help farmers and ranchers stay competitive in an increasingly concentrated market, especially the meat and poultry markets. Our budget requests funds to carry out the organic certification program and broaden the pesticide data program.

NATIONAL FOOD SAFETY INITIATIVE

In connection with our goal for a healthy, safe, and affordable food supply, the USDA budget includes \$46 million, roughly one-half of a Governmentwide increase of \$101 million, for the President's national food safety initiative. This initiative will focus on enhancing the safety of imported and domestic fruits and vegetables, food safety education, modernizing our meat and poultry inspection systems, and developing information and tools to control a greater range of potential food safety hazards.

We are on our way to modernizing our 90-year-old meat and poultry inspection system. On January 26, 1998, or less than 2 weeks ago, 300 of the largest slaughter and poultry establishments, producing about 92 percent of all meat and poultry, implemented the HACCP system. These firms are using the latest science to identify and correct food safety hazards setting the framework for change.

For 1999 we proposed boosting food safety spending by \$34 million to a program level of \$710 million. The resources will allow us to maintain a frontline inspection work force providing rigorous science-based inspection while working to involve a greater range of food safety risks from farm to table. As you know, we have pro-

posed user fees in this area. I am well aware of the controversial nature of them. I dealt with them when I was in Congress.

My point is that, as I go around the country and talk to people, the food safety issue is perhaps the dominant issue that people talk to me about everywhere. So, in order to do what we need to do in the food safety area, we have proposed the user fees because without them we will have to either make major cuts in those areas or major cuts in a lot of other program areas. Funding for research and conservation needs to be maintained but we also have to keep our frontline meat inspectors on the ground.

Obviously, we are going to work with you to deal with this issue the best way we possibly can, but given the fact that the budget is going down, and we have a balanced budget, the old expression is something has got to give and I do not want the confidence that the public has in our food safety system threatened.

I will have to tell you this. We have the safest food supply in the world, bar none, but that is dependent on consumer confidence. People in the industry also understand that safe food sells. So, what we are doing with this is trying to ensure that we have the infrastructure in order to keep that public confidence as high as possible.

FOOD ASSISTANCE

In addition to that, not everybody has the advantages in this society. Low-income people still need food assistance. The budget requests full funding for the food stamps, child nutrition, and WIC programs to ensure that that takes place.

With respect to food stamps, we propose to restore food stamps to legal alien families, which include children, elderly, and disabled persons.

For WIC, we are requesting the funds to support 7.5 million recipients while we work to bring down the program's package costs. There are several other areas.

One area I would like to tell you about is our budget proposal for a new \$20 million food recovery and gleaning initiative to provide community-based grants to help neighborhoods recover edible food and use it to alleviate hunger. The research we have done documents that 25 percent of the food produced every day in America is thrown away. Twenty-five percent of food that is prepared in this country is uneaten and thrown away, and a lot of that food can go to feed hungry people and to supplement the Food Stamp Program and other Government programs. These initiatives I think will help.

CONSERVATION

In the area of conservation, obviously we need to continue to have a vital, sustainable natural resource base. One of my top priorities is implementing the farm bill's conservation programs together with our State and local partners. To do so, USDA needs \$825 million for the Natural Resources Conservation Service. That will help us to contribute to the administration's clean water initiative which will improve water quality in certain highly vulnerable watersheds that are impaired by agriculture.

I will have to tell you that those programs are much more farmer friendly than they have ever been in the past. Working cooperatively with State conservation districts, with RC&D's, and with other public and private bodies, most folks now believe that we have gone to a carrot approach rather than a stick approach when it comes to farmer-led conservation measures around the country.

We are making outstanding progress in our land conservation and cost share programs funded through the CCC.

On the CRP, we held our first signup last year under new environmentally focused rules. We have just completed another signup. The response has been impressive. There were mistakes made, but by and large we have tried to correct those mistakes as they have come to our attention. I mentioned that I was out in the Pacific Northwest correcting one of those mistakes in Senator Gorton's area. It had to deal with the environmental benefit index as it related to air quality.

I am pleased to report that in 1 year we have doubled the environmental benefits of CRP while at the same time saving taxpayers hundreds of millions of dollars, and we are doing similar things with the wetlands reserve program.

Another popular and vital conservation program, established by the last farm bill and funded through the CCC, is the Environmental Quality Incentives Program. The budget includes a \$300 million amount for EQIP, a one-third increase over 1998 funding, which is critical to support the clean water initiatives. We also intend to manage EQIP to respond to recommendations made by the Civil Rights Action Team to increase participation by minority and low-income farmers and other underserved clientele.

CUSTOMER SERVICE AND PROGRAM DELIVERY

In the area of customer service and program delivery, we place high priority in this area. We are streamlining. We intend to go down to approximately 2,550 service centers. Right now we are about 2,700. And, we are collocating the county-based agencies into one-stop USDA centers. We are also consolidating the administrative functions that support the county-based agencies. Many times you would have one office in a county with an NRCS xerox machine, an FSA xerox machine, and a rural development xerox machine. I use that colloquially to talk about the fact that we have operated our farmer-based decentralized systems as separate units for far too long from an administrative perspective. We are developing a common administrative and computing environment for these agencies to achieve further efficiencies, and we have contracted with an independent consultant to examine what further steps, if any, we can take to improve the efficiency of our farm and rural program delivery system. And, that study is to be completed this year.

OFFICE OF THE INSPECTOR GENERAL

Our budget also includes an additional \$22 million to support a Presidential initiative for our inspector general to crack down on abuse in our nutrition, rural development, and other programs. Our inspector general has had great success with a program called Operation Talon dealing with people who are fugitives who are get-

ting food stamps. That led the effort for prosecutions all over the United States. This is another very high priority for us. I might say that we have one of the most aggressive and energetic inspector general operations of any Federal agency.

So, I think to summarize in terms of our goal, to repeat it, because Senator Burns is here, our prime function is to protect the stability and security of America's food production capabilities. The budget is falling largely because there are fewer people on food stamps and the AMTA payment provisions of the Freedom to Farm bill have called for yearly reductions in farm program spending.

At the same time, we will fund whatever we need to fund to protect our markets overseas because we believe that is the ultimate safety net that American agriculture has, and in addition to that, we need a strong and aggressive crop insurance program to provide the safety net when disasters hit.

We also believe that funding for conservation programs and our food safety and security programs are necessary for the future of American agriculture as well.

So, I thank you very much, Mr. Chairman, for bearing with me during this conversation. I would be glad to answer any questions that you have.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Mr. Secretary. We have your complete statement and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF DAN GLICKMAN

Mr. Chairman, Members of the Committee, it is a privilege to appear before you to discuss the 1999 budget for the Department of Agriculture (USDA).

With the passage of the Balanced Budget Act of 1997 and the President's commitment to the first balanced budget in 30 years, we faced very tight funding constraints in developing the 1999 proposals for USDA. At the same time, our strategic plan contains goals and objectives we must achieve to meet the needs of the people we serve. These fundamental priorities include: increasing economic opportunities for family farms and for rural communities and expanding trade; providing more tools for the wise stewardship of our natural resources; feeding more needy children and families and raising consumer confidence in the safety of the Nation's food supply; and providing effective customer services and efficient program delivery and improving the Department's civil rights performance.

The discipline we imposed on the 1999 budget forced us to make difficult decisions to restrain, reduce, and redirect resources to focus on the priority goals we established. We have had to propose new user fees and contain and absorb certain costs. We thoroughly scrutinized our employment and business practices. As a part of the Department's continuing reorganization, we are implementing a field office streamlining plan which collocates the county-based agencies in one-stop USDA Service Centers and that will consolidate administrative support functions for the county-based agencies. We are developing a common computing environment for these agencies to optimize the use of data and equipment and improve our efficiencies across the agencies. The Department has also entered into a contract with an independent consultant to examine what further steps, if any, we can take to improve the efficiency of our farm and rural program delivery system. That study will be completed by September 1, 1998. These efforts, combined with program reductions and reforms taken in prior years, have made a significant contribution to the President's balanced budget submission to the Congress.

In addition to the improvements and strengthening in the economy, several factors account for the projected 14 percent reduction in our budget—from \$63 million in 1993 to a projected \$54 million for 1999. Farm programs are more market oriented today, significantly lowering outlays. The strong economy and welfare reform

lowered participation in our food assistance programs. Declining interest rates have led to large savings in rural credit programs and the shift to user fees in certain programs has contributed to deficit reductions. Over this period USDA employment will be reduced by over 22,000 staff years through our reorganization and streamlining efforts.

The President's balanced budget plan for 1999 contains a number of new governmentwide initiatives that include participation of USDA agencies, including:

- A Food Safety initiative for improving the Federal food inspection system from farm-to-table, through increased inspection, expanded research and consumer education, better food surveillance, and improved Federal, State, and local coordination.
- A Clean Water and Watershed Restoration initiative to achieve further progress in solving water quality problems and enhancing the environmental quality of agricultural and forest lands.
- A Land, Water and Facility Restoration initiative so that the Forest Service can better protect wildlife habitat, maintain recreation sites and preserve the national forests.
- A Climate Change Technology initiative to support research aimed at investigating mitigation tactics, including production practices which sequester greenhouse gases, to minimize the adverse effects of agricultural production practices on climate change.
- A Food Gleaning initiative to increase food recovery by one-third above current levels by the year 2000, providing a significant source of food to food banks and other non-profit institutions to help feed hungry people.
- A Law Enforcement initiative to provide funds and resources to crack down on fraud and abuse in the Food Stamp and other programs. This supports the President's commitment to assure that program benefits go only to those who are in need and eligible.

The President's budget proposes \$57.4 billion in budget authority for 1999 for USDA compared to a current estimate of \$55.9 billion for 1998. Budget authority for discretionary spending, which accounts for about 25 percent of USDA total budget authority, declines from \$15.6 billion in 1998 to \$15.2 billion in 1999. The request before this Committee for discretionary budget authority is \$12.6 billion.

The budget also proposes legislation that affects the discretionary request before the Committee, including user fees for the Food Safety and Inspection Service; the Animal and Plant Health Inspection Service; the Grain Inspection, Packers and Stockyards Administration; the Farm Service Agency; and the Natural Resources Conservation Service. The budget also proposes shifting sales commissions for the crop insurance program from discretionary to mandatory spending. We will send this proposed legislation to the authorizing committees. If the entire package is enacted, it would lower the discretionary request to this Committee by \$829 million.

The budget also proposes legislative changes in some mandatory programs, including restoring food stamp benefits to most legal aliens, reducing the Federal share of administrative funding provided to the States in the Food Stamp Program to prevent cost shifting, reducing the cost of the crop insurance program, capping cotton step-2 payments, providing a flexible multi-year cap for the Export Enhancement Program, and increasing the Environmental Quality Incentives Program, Rural Empowerment Zones, and a change in the formula for Forest Service payments to States.

Before addressing specifics of the budget, I want to emphasize the importance that the President has placed on our civil rights work at USDA; the priority is reflected in the budget. The President's budget calls for the largest increase in civil rights funding in two decades. For USDA, that means providing funding to carry out the recommendations of the Civil Rights Action Team (CRAT) as well as the recommendations of the National Commission on Small Farms which support our civil rights agenda. In total, we are requesting about \$250 million for civil rights-related activities that would increase farm ownership and operating loans; increase loans and grants to construct housing for the Nation's farmworkers; support an integrated research, extension, and education competitive grants program for new technology adoption and transfer to small farms; eliminate disparities in funding and enhance the Department's cooperative efforts with institutions of higher education that are primarily devoted to the needs of minority students; and improve outreach and technical assistance to assure that all customers have full access to USDA programs and services, and to provide assistance to socially disadvantaged farmers and ranchers through a substantial increase in the Section 2501 outreach program. Also, we are requesting increased funds for more timely processing and resolution of complaints, as well as efforts to prevent disputes and discrimination.

FARM AND FOREIGN AGRICULTURAL SERVICES

The mission of the Farm and Foreign Agricultural Services area is to secure the long-term vitality and global competitiveness of American agriculture. Implementation of planting flexibility and other provisions of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act), in conjunction with strong export programs and sound trade policy, are helping us reach these goals. However, we remain concerned about the adequacy of the safety net for our producers and have been working to expand and improve programs which help producers manage their risk. We are also working hard to assure improved assistance and expanded opportunities for minority and limited resource producers in our farm programs.

Maintenance of an effective economic safety net for our farmers and ranchers is a major priority for our plans in 1999, particularly in our proposals for risk management. Last year we proposed legislation to make some modest improvements in the safety net which were not acted upon by the Congress. The proposed improvements included, among other things, provisions to permit extension of the terms of marketing assistance loans during periods of extraordinary market disruption; and the expansion of revenue insurance. These proposals deserve further consideration by the Congress.

The challenge of providing improved customer service with improved efficiency as resource constraints are tightened also remains a major focus of our efforts, particularly in the Farm Service Agency (FSA) and the other county-based farm conservation and rural development agencies. The independent study being conducted by a private consulting firm during 1998 of our county-based agencies will help us better assess county office workload and identify options to gain efficiencies while meeting customer needs.

Farm Service Agency

The consolidation of staffs and county offices, establishment of a common computing environment, and the convergence of administrative services at all levels of the county-based agencies, continue to be the focus of FSA streamlining efforts. FSA staffing has changed dramatically as a result of these streamlining efforts and workload changes brought about by the 1996 Act. FSA Federal and county staffing is projected to be down by over 500 staff years, from 17,267 staff years at the end of 1997 to 16,744 staff years at the end of 1998 as a result of buyouts, Reductions-In-Force (RIF's), and attrition. The 1999 budget for FSA salaries and expenses proposes a program level of \$976 million, including \$30 million earmarked for the establishment of a common computing environment in the service centers of the county-based agencies. The budget also incorporates a proposed increase in user fees to help offset some of the costs of providing information and other services to FSA clients. It is estimated that the budget will support a staff year level about 7 percent below 1998 levels.

Farm Loan Programs

Access to credit is one of the most important elements of success in farming. That point has been made in fairly dramatic fashion by USDA's Civil Rights Action Team and by the Small Farms Commission. Improved access to credit means more opportunities for beginning and small farmers and, in particular, members of socially disadvantaged groups. For that reason, the 1999 budget provides more funding for farm loans. Farm ownership loans would be increased to \$85 million in direct loans and \$425 million in loan guarantees, compared to 1998 levels of \$45 million in direct and \$400 million in guarantees. In terms of people served, this means that 3,500 beginning and small farmers will be given an opportunity to either acquire their own farm or to save an existing one—600 more than during 1998. About 1,000 of these farmers will receive direct loans and the rest will receive guarantees. The budget also provides for \$2.4 billion in direct and guaranteed farm operating loans, which maintains the 1998 level of funding and would serve an estimated 28,000 beginning and small farmers about 12,000 of whom will receive direct loans.

The share of direct loans made at the reduced interest rate for limited resource borrowers would be continued at current levels about 61 percent for farm ownership loans and about 40 percent for farm operating loans. The budget also provides funding for emergency loans, credit sales, the boll weevil eradication program and credit for Native Americans.

The Administration will also be proposing emergency legislation to modify the 1996 Act prohibition on loans to borrowers who received debt forgiveness. It is unfair to deny these borrowers a second chance.

Commodity Credit Corporation

Changes over the last decade in commodity, disaster, and conservation programs have dramatically changed the level, mix, and variability of the Commodity Credit Corporation (CCC) outlays. CCC outlays are projected to total \$8.6 billion in 1998 and \$8.4 billion in 1999 and are projected to decline to a total of about \$7.0 billion in 2003. Since the late 1980's, commodity program spending has declined dramatically, spending for ad hoc crop disaster programs has been virtually eliminated, and spending for conservation programs has increased and has become a major portion of CCC's outlays. Commodity program outlays account for about two-thirds of total CCC outlays in 1999, and they largely reflect the pattern of production flexibility contract (PFC) payments set in the 1996 Act. Outlays for the commodity programs are projected to decline from \$6.0 billion in 1998 to \$5.7 billion in 1999 and to \$4.0 billion in 2003.

Conservation program outlays account for almost one-fourth of the CCC expenditures in 1999. The 1996 Act authorized direct CCC funding for the Conservation Reserve Program (CRP) administered by FSA and several new conservation programs administered by the Natural Resources Conservation Service (NRCS). CRP provides landowners annual payments and half the cost of establishing a conserving cover in exchange for retiring environmentally sensitive land from production for 10 to 15 years. The 1996 Act authorized the program through 2002 and set maximum enrollment in the program at 36.4 million acres. Current enrollment totaled about 28 million acres at the end of calendar year 1997. The budget assumes that the acreage goal will be achieved gradually. Other conservation programs funded by CCC but administered by NRCS include the Wetlands Reserve Program and the Environmental Quality Incentives Program (EQIP), which along with the Conservation Farm Option give producers incentives to create long-term comprehensive farm plans. The budget proposes to help meet critical water quality goals by increasing CCC spending for EQIP by \$100 million in 1999 and \$350 million between 1999 and 2003. Other new programs funded by CCC include the Wildlife Habitat Incentives Program which provides cost-share assistance to landowners to implement management practices improving wildlife habitat, and the Farmland Protection Program which provides for the purchase of easements limiting nonagricultural uses on prime and unique farmland.

Risk Management Agency

Implementation of the 1994 reform of the crop insurance program has been a major achievement for American agriculture. It has alleviated the need for ad hoc disaster assistance. About 63 percent of the insurable acreage nationwide is covered by the program, about 22 percent at the catastrophic (CAT) level of coverage, which is fully subsidized by the Government, and 41 percent at higher levels of coverage for which producers pay a portion of the premium. Producers may buy-up to 75 percent of normal production and 100 percent of expected market price or purchase a relatively new product, Crop Revenue Coverage (CRC), which provides protection against price declines even without a production loss. CRC already accounts for about 16 percent of the business.

While the reform legislation allowed for a dual delivery system with FSA providing CAT coverage and private insurance companies providing both CAT and buy-up coverage, the private insurance industry has demonstrated that it can handle the job alone and has been given that opportunity beginning in 1998.

There are 17 private insurance companies of various sizes participating in the program. Sales agents work for these companies, mostly on a commission basis, while loss adjusters are usually independent contractors. Companies sell policies that the Government reinsures. However, the companies are required to retain some risk of loss on the policies they sell, for which they may earn underwriting gains or incur underwriting losses.

Weather has played a big role in the program performance over the last few years. In 1997, the weather was particularly good and indications are that the program had a very favorable loss ratio of less than .80, which is well below the statutory requirement of 1.10. Consequently, the companies received underwriting gains based on the risk they retained. Under normal conditions, the amount of underwriting gains received by companies would have been far less.

The 1999 budget provides full funding of the crop insurance program, but proposes legislative changes to accommodate a shift in sales commissions for agents from discretionary to mandatory spending. This shift would consolidate all program spending into a single account and eliminate the possibility of the program being restricted by a limited appropriation of discretionary funds for sales commissions. In effect, the proposal is intended to fix a problem that dates back to the 1994 legislative reform of the program which divided the funding for company expense reim-

bursments between the mandatory and discretionary budgets for the sole purpose of meeting technical scoring requirements.

Because the shift to mandatory spending will require PAYGO offsets, the Administration will also propose various program changes, including a reduction in the loss ratio, a limit on CAT coverage to \$100,000, and other changes. These changes are expected to take effect in 2000 because other program offsets are available for 1999.

It should also be noted that the Risk Management Agency is charged with the responsibility for risk management education. About \$5 million is budgeted in the agency's mandatory account for this activity in 1999. The Cooperative State Research, Education and Extension Service and the Commodity Futures Trading Commission are assisting in the education program. This is expected to be an important part of helping producers adjust to the changes in price and income support programs that came about in the 1996 Act.

International Trade and Export Programs

The performance of U.S. agricultural exports was again robust in 1997, reaching the second highest level ever at \$57.3 billion. While this was somewhat below the all-time high achieved in 1996, many positive developments did occur. It was the third year running in which agricultural exports topped \$50 billion, and new export records were established for both intermediate and consumer-oriented products. And, for the 37th consecutive year; U.S. agriculture made a positive contribution to the Nation's trade balance, with exports exceeding imports by \$21.5 billion.

The value of agricultural exports to the Nation's economy is very significant, but for the agricultural sector, exports are critical. Today, U.S. agriculture's reliance on exports as measured by gross receipts is approaching 30 percent, a level which is twice as high as for the U.S. economy as a whole. With improving productivity and slow growth in domestic demand, the future prosperity of our farmers and ranchers is increasingly linked to strong export markets. Recent changes in domestic farm policy also have reinforced the importance of global markets and have made export performance a critical component of the farm safety net.

For these reasons, USDA's 5-year strategic plan has established the expansion of global market opportunities for U.S. agricultural producers as one of the Department's primary objectives. With this mandate, we are continuing our aggressive efforts of recent years to bolster export competitiveness, open new markets, and expand exports. The 1999 budget request supports these efforts by providing a total program level of nearly \$6.4 billion for the Department's trade and export promotion activities.

The CCC export credit guarantee programs are the largest of the Department's export promotion activities. These programs make an important contribution to meeting our export expansion objective by facilitating sales of U.S. agricultural products to buyers in markets where credit is necessary to maintain or increase sales. The value of these programs is being demonstrated this year. In recent months, we have made available to countries in southeast Asia and the Republic of Korea a total of \$2 billion of export credit guarantees. This action is helping these countries tackle their import financing problems and allows them to continue to purchase agricultural products from the United States. By doing so, continued access to these important Asian markets will be ensured.

The 1999 budget adopts a new approach for presenting the annual program levels and budget estimates for the guarantee programs. These estimates will now reflect the actual level of sales expected to be registered under the programs for which CCC guarantees will be issued. This change will result in more realistic estimates of the costs of these programs and will increase the accuracy of the CCC budget estimates. The actual level of guarantees to be issued during the course of the year will not be limited by the budget estimates but will instead be determined by market conditions and program demand.

Based on this new approach, the budget projects a total program level for CCC export credit guarantees of \$5 billion in 1998 and \$4.6 billion in 1999. These levels are substantially above sales registrations in 1997 and prior years, due primarily to the recent boost in programming to Asian countries.

The Export Enhancement Program (EEP) has seen very little activity during the past 2½ years because of world commodity supply and competitive conditions. Nevertheless, the program remains in place and can be reactivated whenever market conditions warrant. To ensure our ability to do so, the budget provides a program level of up to \$320 million for EEP in 1999, an increase of \$170 million above this year's level.

In conjunction with the budget, we will be submitting proposed legislation to provide a flexible, multi-year program level authorization for EEP, which will apply to

the 1999 to 2003 period. The proposal will authorize a total program level of \$1.2 billion for EEP over the 5-year period and will provide administrative discretion to the Department to determine the annual level of funding for EEP. Any funding that is not used in 1 year will remain available for use in subsequent years. However, the annual level of programming will continue to be subject to the Uruguay Round export subsidy reduction commitments. The proposal would generate approximately \$1.4 billion in savings during the 5-year period that will help to offset increased funding proposed in the budget for other mandatory programs.

The pace of programming under our other subsidy program, the Dairy Export Incentive Program (DEIP), has increased significantly during the past year. This has helped to move additional dairy products into export markets and modify price fluctuations here at home. The budget projects a somewhat reduced level of programming under DEIP in 1999 because of a projected tightening in the domestic supply situation; however, the actual level of programming will be determined by market conditions at that time.

The budget continues funding for the Market Access Program (MAP) at its maximum authorized funding level of \$90 million. In recent years, the Department has taken steps to make MAP more targeted and friendly to small businesses. These efforts continue and, in 1998, for the first time export promotion assistance will be provided to small companies or cooperatives only.

The Public Law 480 foreign food assistance programs remain a mainstay of efforts to assist developing countries meet their food import needs and develop long-term trading relationships. For 1999, the budget requests a total program level of \$979 million for Public Law 480 programs, which is expected to provide 2.8 million metric tons of commodity assistance to recipient countries.

For the Foreign Agricultural Service (FAS), the budget provides direct appropriated funding of \$146 million, an increase of \$6 million above the 1998 level. The budget includes a proposal to establish a buying power maintenance fund to assist FAS manage unanticipated changes in the costs of its overseas operations. These changes result from exchange rate losses or gains and overseas inflation which are difficult to predict when budget estimates are prepared. Under the proposal, a revolving fund would be established which can be drawn upon to meet higher costs resulting from exchange rate losses. Alternatively, exchange rate gains would be credited to the account and would be available for use to meet future cost increases. This proposal responds to a request of the Conference Committee on the 1998 Agriculture Appropriations Bill.

The budget also proposes that certain FAS Information Resources Management costs, including the operating costs of the CCC Computer Facility, will no longer be funded through a reimbursable agreement with CCC. Instead, these costs will now be funded through FAS appropriations. With this change, this funding will shift from mandatory to discretionary spending and will no longer be subject to the annual limitation on CCC reimbursable agreements established by the 1996 Act.

RURAL DEVELOPMENT

Rural development creates opportunities for people who live in rural America—the kind of housing they occupy; access to such amenities as running water, electricity, telecommunications; and the strengthening of local economic activity that affect their prospects for finding a job that will allow them to earn enough income to have a decent standard of living. The Department's rural development programs help rural residents achieve these benefits by providing financial assistance and by working with rural communities through partnerships, empowerment and technical assistance. Under this Administration, special attention has been given to serving those rural communities that have been underserved in the past—where poverty is persistent and unemployment remains high.

Overall, the 1999 budget reflects the Administration's strong support for ensuring that rural Americans have the ability to take advantage of the same opportunities for economic growth that exist in urban areas. It supports the Administration's Water 2000 initiative which targets resources to the estimated 2.5 million rural residents who have some of the Nation's most serious drinking water availability, dependability, and quality problems. It supports the Administration's National Home Ownership initiative to increase home ownership, and maintains rural rental assistance for low-income families and individuals, many of whom are elderly women. It continues programs that provide infrastructure for meeting electric, telecommunications and a variety of other community needs. Further, it encourages business and industry activity in rural areas through loan guarantees that create or save jobs.

About \$129 million of the rural development program funding would be targeted to Empowerment Zones and Enterprise Communities (EZ/EC). The EZ/EC initiative

reaches communities with the most persistent poverty and other economic adversity, which have developed strategic plans for development. In addition, the budget proposes to provide \$20 million annually in mandatory spending to fund additional grants for 5 new rural Empowerment Zones.

About \$715 million of the \$2.2 billion in budget authority included in the 1999 budget for USDA's rural development programs would be funded under the provisions of the Rural Community Advancement Program (RCAP). RCAP was enacted in the 1996 Act. It provides flexibility for transferring funds among programs in order to meet local priorities. It also provides for the development of strategic plans to help guide the development process. The Department's proposal assumes the full flexibility to transfer funds among accounts as authorized in the 1996 Act, which is an important tool in tailoring assistance to meet the unique needs of each rural community.

Rural Utilities Service

Without the Department's rural utilities programs, much of rural America would have been unable to obtain, at reasonable prices, basic infrastructure such as electricity, telephone, and water and waste disposal services. In earlier times, progress was measured in terms of the number of farms and rural households receiving any level of services. Today, the primary need is to assure quality infrastructure and service at a reasonable price so that rural America can keep pace with modern technology and clean water requirements.

The water and waste disposal programs are one of the Administration's highest priorities. The budget provides \$500 million in grants, essentially the same level as provided in 1998. In addition, the budget proposes a \$73 million increase in the direct loan program. This level of funding will allow the Department to continue making significant progress towards meeting the goals of the Administration's Water 2000 initiative. Water 2000 targets resources to the estimated 2.5 million rural residents who have some of the Nation's most serious drinking water availability, dependability, and quality problems—including the estimated 400,000 rural households lacking such basic amenities as complete plumbing.

The 1999 budget provides for \$1.65 billion in electric and telecommunications loans, about \$55 million above 1998; however, there will be a shift in how this assistance will be provided in order to meet growing demand. The budget proposes greater reliance on direct Treasury rate and Federal Financing Bank insured loans. Legislation will be proposed to authorize direct Treasury rate loans under the electric program. This authority is currently available under the telecommunications program.

The budget calls for \$175 million in loans to be made by the Rural Telephone Bank, the same as 1998. The Administration continues to work with the industry towards its goal of privatizing the bank. In 1999, the bank is proposed to become a "Performance Based Organization," in order to establish its commercial viability prior to being fully privatized in 10 years or less.

With regard to the distance learning and medical link program, the 1999 budget includes about \$15 million for grants and \$150 million in loans at the Treasury rate, requiring a total budget authority of \$15.2 million. In 1998, Congress provided a budget authority of \$12.5 million which the Department converted into a grant program of about \$12.5 million and a loan program of \$150 million at the Treasury rate. This program encompasses two of the most useful applications of modern telecommunications—education and medical services. Applications for this program are well in excess of current funding. The increase in grant funding will provide vitally needed assistance to some of rural America's most remote and poorest communities.

Rural Housing Service

USDA's rural housing programs have been important in improving the availability and quality of housing in rural America since the 1970's. The programs reach those who cannot otherwise afford decent, safe, and sanitary housing, and those who cannot obtain credit from other sources to achieve home ownership.

The 1999 budget supports \$4.4 billion in rural housing loans and loan guarantees, an increase of about \$200 million over 1998. This includes \$1 billion in direct loans and \$3.1 billion in guaranteed loans for single family housing. Direct loans are available only to low-income families, low-income meaning less than 80 percent of area median income. Guaranteed loans are available to families up to 115 percent of area median income. Further, the Administration will propose legislation to make guaranteed loans available for refinancing existing direct loans—\$100 million is included in the \$3.1 billion overall funding level for this purpose.

For rural rental housing, the budget includes \$100 million in direct loans and \$150 million in guaranteed loans. These levels represent a reduction of \$29 million

in direct loans from the amount available for 1998, but a significant increase in guaranteed loans, which were first introduced in 1997 and are limited to about \$20 million in 1998. The guaranteed loan program has operated on a pilot basis to date but has shown great potential, particularly where it can be used to leverage other Federal, State and local or private financing. It serves a higher income clientele than the direct loan program, yet reaches some lower income families and individuals, and operates at far less cost than the direct loan program.

USDA currently has a portfolio of about 18,000 rural rental housing projects which contain about 470,000 units. About one-half of these units receive rental assistance payments. Tenants in units receiving rental assistance pay 30 percent of their income for rent. Rental assistance, provided through 5-year contracts, makes up the difference between what the low-income tenant pays and the rent required for the project owner to meet debt servicing requirements. The average income of tenants receiving rental assistance payments is \$7,300. In 1999, contracts on an estimated 37,500 units are expected to expire. The budget provides for the renewal of these contracts and a limited number of contracts on additional units, and includes full funding of all new farm labor housing projects. No rental assistance is provided for projects financed with guaranteed loans.

The 1999 budget also provides for \$97.1 million in loans and \$72.9 million in grants for various specific purpose housing programs. This includes \$32 million in loans and \$13 million in grants for farm labor housing projects, an increase of \$17 million in loans and \$3 million in grants over last year's levels. This would allow the agency to finance 658 new units and rehabilitate 199 units of existing housing for farm workers. The increase is proposed as part of USDA's CRAT report.

Rural Business-Cooperative Service

Jobs are the cornerstone of all economic development—rural as well as urban. The Department's role in creating jobs and improving the infrastructure in rural areas is both financial and supportive. Despite budgetary pressures, it is important that the job creation and retention programs in rural areas remain adequately funded.

The business and industry (B&I) loan program is one of our best means to help foster the growth of rural businesses including cooperatives. The cooperative form of business is seeing a resurgence throughout rural America, agricultural producers are embracing cooperatives for a variety of purposes including: value-added processing, to return more of the value of farm products to producers; as a safety net, to protect against price fluctuations; and for the traditional use of purchasing farm supplies. Many "new-wave" cooperatives are being organized and operated in a manner which is quite different from the historic cooperative principles. The 1996 Act helped to improve the effectiveness of the B&I loan program in developing cooperative businesses by authorizing loan guarantees to assist farmers and ranchers to purchase start-up capital stock in processing cooperatives where the cooperative will process the commodity being produced by the farmer. The 1999 budget maintains the direct loan program at \$50 million, while the guaranteed loan program would be funded at \$1 billion, including \$200 million that will be directed to cooperative-owned businesses. Further, using the flexibility available under RCAP, the Department expects to fund a \$1 billion guaranteed loan program during the current fiscal year.

Our investments in cooperative businesses, however, will not provide the expected returns unless there also is an investment in understanding the "evolving" cooperative form of business. Therefore, the budget also proposes an increase of \$2 million in funding for research on cooperatives. These funds will be used to form cooperative agreements primarily with State departments of agriculture, universities, and colleges to conduct research on rural cooperatives. This funding will help provide vitally needed research and information at a time when available Federal resources in this area are dwindling.

Through the intermediary relending program the Department provides low interest (1 percent) loans to a variety of public and private organizations who, in turn, provide loans to finance business facilities and community development projects in their local areas. By providing assistance through local organizations the Department ensures that funding is used on the basis of local priorities. The budget maintains support for the intermediary relending program at \$35 million, the same level as 1998.

Rural business enterprise grants may be provided to public bodies, Indian tribes, and nonprofit corporations to finance and facilitate development of small and emerging businesses in rural areas. The budget provides \$40 million for rural business enterprise grants in 1999, a small increase from 1998.

The budget provides for an increase in the Alternative Agricultural Research and Commercialization (AARC) program from \$7 million in 1998 to \$10 million in 1999.

This program is particularly useful in meeting the needs for capital to commercialize innovative value-added products from agricultural and forestry materials and animal by-products.

Salaries and Expenses

The Department's rural development programs are delivered through about 800 field offices, located within USDA Service Centers. The delivery system has been noticeably improved by the introduction in 1997 of a centralized system for servicing single family housing loans, which will save taxpayers \$250 million through 2000 and allowed staff resources to be redirected to other urgent needs. Further, the rural development programs are included in our administrative convergence efforts for county-based agencies.

The 1999 budget includes \$529 million for the administration of USDA's rural development programs including AARC. This amount includes funding for an estimated 7,138 staff years, which is a decrease of about 150 below 1998.

FOOD, NUTRITION AND CONSUMER SERVICES

USDA's farm and food safety programs help ensure a safe and affordable food supply, while the nutrition assistance programs help to ensure that low-income families are adequately nourished. The Food Stamp, Child Nutrition and WIC (the Special Supplemental Nutrition Program for Women, Infants and Children) Programs are the primary programs for carrying out the Nation's food assistance policy. The 1999 budget request combines better management with increased funding to advance the Administration's war on hunger and demonstrate our commitment to improve the nutritional levels of low-income households.

The Food Stamp Program will be funded at a program level of \$23.9 billion in 1999. The Administration proposes to restore Food Stamp benefits for vulnerable groups of legal immigrants. Upon signing the 1996 welfare law, the President pledged to work toward reversing the harsh, unnecessary cuts in benefits to legal immigrants that had nothing to do with moving people from welfare to work. The President believes that legal immigrants should have the same opportunity, and bear the same responsibility, as other members of society. The 1999 budget would provide Food Stamp benefits to 730,000 legal immigrants at a cost of \$535 million in 1999 and \$2.5 billion over 5 years. The proposal expands access to Food Stamps for families with children, people with disabilities, the elderly, and refugees and asylees. Legislation will also be proposed to address the allocation of administrative costs between the Temporary Assistance for Needy Families program, Medicaid, and the Food Stamp Program which will result in a savings of \$180 million in 1999.

We are working to improve Food Stamp program integrity, and are requesting funds to improve accuracy in the food stamp certification process to achieve our annual performance plan of reducing error by at least 4 percent. The annual plan calls for an increase in food stamp overpayment collections of 5 percent a year. Achieving these goals will reduce program costs by over \$60 million. We will also continue our integrity efforts to reduce State over-billing of State administrative expenses and trafficking.

Child Nutrition will be funded at a program level of \$9.6 billion, an increase of \$0.4 billion from the 1998 estimate. This increase is needed for increased free meal claims in the School Lunch Program, increased school and child care enrollment and food cost increases. Child Nutrition Programs, both school and community based, help keep children nourished and ready to learn. The Child Nutrition Programs are particularly well positioned to provide nutrition assistance directly to children from low-income families, easing the transition from welfare to work for their parents and to support the President's initiative to assure reading skills by the end of the 3rd grade.

With portions of the Child Nutrition Programs expiring at the end of 1998, we will also be seeking reauthorization legislation. We want to work with Congress to improve program integrity, reduce paperwork burden, support the President's child care initiatives, and foster improved dietary practices. As stated in the annual performance plan, we will work to assist school food service management to implement better business systems and increase the proportion of correctly claimed free meals. And we believe we can better meet the Recommended Daily Allowance and Dietary Guideline requirements for meals served, as well as improve the nutritional intake of school children. School programs are demonstrated to be a very effective way to shape the nutritional choices not only of our children, but their families as well.

WIC will be funded at \$4.2 billion, 4 percent more than the 1998 appropriation and sufficient to support 7.5 million recipients. Improving Federal and State program management will be a major focus of our activities for 1999, including continued efforts to reduce the overall cost of WIC food packages by 10 percent by 2002.

WIC State agencies have been highly successful in keeping unit food costs down for the past decade primarily through rebates on infant formula, and now we will be working together to expand other promising cost control activities. We are also undertaking a series of management reforms to improve WIC program integrity.

The Commodity Assistance Programs will be funded at \$317 million, including \$96 million for the Commodity Supplemental Food Program, \$45 million for the Emergency Food Assistance Program (TEFAP), \$140 million for the Nutrition Program for the Elderly, and the budget also requests \$15 million for the farmers' market program, an increase from the \$12 million provided in 1998.

The budget includes \$20 million for a new gleaning initiative that would be used to support community-based grants and other incentives to help local neighborhoods recover edible food before it is lost and use it to help alleviate hunger and distress. With billions of pounds of food going to waste, we anticipate that the initiative will yield large returns in helping needy families through temporary hard times, supplementing food stamps for some; and for others providing necessary sustenance on an occasional basis.

The budget also requests funds for research on nutrition assistance programs. The Administration places high priority on receiving accurate, relevant, and timely information from research and evaluation on the food assistance programs. To ensure that the policy and research needs of the nutrition programs are most effectively met in the context of administering the food programs, the Administration strongly believes that the Food and Nutrition Service (FNS) is the appropriate agency to oversee and administer these research funds.

For Food Program Administration, the primary funding source for administrative management of the Nation's food assistance programs and the Center for Nutrition Policy and Promotion, we request \$111.8 million, an increase of \$4.2 million. The increase will fund existing responsibilities at current levels and provide for increased Civil Rights effectiveness. In addition, the requested increase will improve food assistance program management, particularly financial system integrity. Also, funds will be used for work on year 2000 Dietary Guidelines for Americans.

FOOD SAFETY

On July 25, 1996, a milestone was reached in our strategy for making significant gains in improving the safety of America's food supply. The final rule for Pathogen Reduction and Hazard Analysis and Critical Control Point (HACCP) Systems for meat and poultry products was published. This rule modernizes a 90-year old inspection system and lays out the Administration's commitment to improve food safety and reduce the incidence of foodborne illness by 25 percent by the year 2000 as stated in the Department's strategic plan.

On January 27, 1997, the first implementation date for the final rule was reached. All meat and poultry establishments now have in place standard operating procedures for sanitation to ensure they are meeting their responsibility for preventing direct product contamination and maintaining sanitary conditions. In addition, slaughter establishments have begun testing carcasses for generic *E. coli* to ensure their processes are under control with respect to prevention of fecal contamination. On January 26, 1998, the 300 largest establishments, which produce 92 percent of inspected meat and poultry products, were required to have HACCP systems in place. In addition to HACCP systems in place, those establishments that slaughter and those that produce ground product will have to meet *Salmonella* performance standards, thereby implementing a major portion of the science-based inspection system. By January 25, 2000, all the provisions of the rule will be implemented in all establishments.

The final rule sets an important framework for change, but is only part of our overall strategy to improve the safety of our meat and poultry supply. On January 25, 1997, the President announced the National Food Safety initiative. The initiative includes seven components for improving the Federal food inspection system from farm-to-table. Key components include expansion of the Federal food safety surveillance system, improved coordination between Federal, State, and local health authorities, improved risk assessment capabilities, increased inspection, expanded research, consumer education, and strategic planning. The initiative reflects a high level of coordination between agencies within USDA and the Department of Health and Human Services. For 1999, we plan to build on these investments which Congress supported in 1998. Continued investment in meat, poultry, and egg products inspection activities will enhance public health by minimizing foodborne illness from these products.

For 1999 the budget requests \$623 million, an increase of \$34 million over the 1998 current estimate. The additional resources will allow the Department to ad-

dress a greater range of food safety risks from farm-to-table. At the farm level, we will work with producers to develop voluntary measures that producers can utilize to reduce pathogenic contamination of animals prior to presentation at the slaughter plant. In addition, we will provide support to State educational efforts that will improve the ability of producers to respond to new demands that slaughter and processing establishments may make with the implementation of HACCP. In order to improve inspection we will provide additional technology and training to Federal inspectors and provide special assistance to State programs to facilitate their transformation to HACCP. Another key component of the Department's strategy in 1999 will be targeted food safety education. In a coordinated effort between the public and private sectors product specific and audience specific messages that address food safety risks relevant to such groups will be developed, evaluated, and disseminated.

The 1999 budget request proposes legislation to recover the full cost of providing Federal meat, poultry, and egg products inspection. We estimate that this proposal would generate approximately \$573 million in new revenues in 1999 and thereafter. The budget requests \$150 million in appropriated funding to convert the program to user fees and to maintain State inspection programs. States administering their own inspection programs would continue to be reimbursed by the Federal government for up to 50 percent of the cost of administering their programs and the special assistance proposed for 1999.

Requiring the payment of user fees for Federal inspection services would not only result in savings to the taxpayer, but would also ensure that sufficient resources are available to provide the mandatory inspection services needed to meet increasing industry demand. The overall impact on prices as a result of these fees has been estimated to be less than one cent per pound for meat, poultry, and egg products production. The implementation of the user fee authority would be designed to be fair and equitable, promote accountability and efficiency, and minimize the impact on the affected industries.

NATURAL RESOURCES AND ENVIRONMENT

The 1999 budget reflects the Department's continuing commitment to voluntary, cooperative and well-financed conservation programs that provide farmers with the financial and technical assistance they need to remain competitive while not putting our vital natural resources in jeopardy. The 1996 Act recognized the need for this balance and dramatically expanded USDA's conservation mission by creating new or refocused existing conservation programs. The effects of programs like the Conservation Reserve Program and the Environmental Quality Incentives Program (EQIP) are already being felt as we focus on protecting mainly environmentally sensitive lands that need our attention while returning fertile lands to production.

As farmers rely more on markets and utilize greater planting flexibility, it becomes even more critical that we maintain and strengthen our technical expertise in the field, where it is needed. The Department's field office streamlining initiative has been successfully implemented so far and has enabled NRCS to continue to provide high quality technical assistance to farmers with proportionately fewer management and support staff. In so doing, NRCS has reduced headquarters staff by over 50 percent, reduced State office staff by almost one-third, and consolidated a number of administrative functions, which will continue under the administrative convergence initiative for USDA's county-based agencies.

The request for appropriated funds for NRCS totals \$826 million which includes \$650 million for conservation technical assistance and water resources assistance. This will fund critical NRCS technical support needed to meet the ambitious goals set out in the agency's Annual Performance Plan. For example, in 1999, NRCS will protect more than 4 million acres of cropland against excessive erosion and complete conservation management systems on 6.4 million acres of grazing land. The budget will also provide the resources needed by NRCS to maintain and enhance the conservation partnership that has grown over the years not only with conservation districts but also with farmers, ranchers, and other private landowners. As we approach the 21st century, this partnership becomes more vital when we consider how much more we can accomplish for the environment when we work together.

The budget supports this continuing shift toward greater cooperation and includes an increase of \$20 million for incentive payments to those States that are successful in increasing the level of non-Federal support for the private-public partnership. To further leverage the Department's conservation dollar, we are also proposing to collect \$10 million in user fees for certain types of products or technical services that are available in the private sector or that provide mostly private benefits. Fee struc-

tures and applications will be developed by NRCS with direct input from State offices and other groups or individuals that are directly affected.

The technical assistance budget also includes the NRCS contribution to the goal of improving water quality in certain highly vulnerable watersheds where it is impaired by agriculture. Through the proposed interagency Clean Water and Watershed Restoration initiative, in order to strengthen local leadership capacity, NRCS will direct \$20 million to Competitive Partnership Grants. These funds will be awarded to locally-led institutions such as conservation districts or watershed councils, primarily for the hiring of non-Federal watershed coordinators who will take an active role in problem identification, goal setting and watershed restoration planning. An additional \$3 million is also provided for monitoring work to help target resources and document baseline conditions and performance. In addition to these appropriated funds, the budget includes an increase of \$100 million for EQIP as proposed legislation in 1999 to provide added support to the Clean Water initiative as well as to meet other Administration priorities in the Civil Rights area.

In the watershed planning and construction area, the Department will continue efforts that have begun in improving how these limited resources are allocated. Only the most cost-effective and environmentally beneficial projects will be funded with an emphasis on nonstructural management systems. We will also continue to examine approved watershed plans to eliminate those projects that are now infeasible in order to reduce the backlog of unfunded work. Beginning in 1999, technical support for NRCS' watershed planning and construction activities will come from the agency's conservation technical assistance program which will reduce the number of NRCS accounts that include payroll items. Also, we will try to help sponsors with implementation costs by allowing some of the funds to be used to subsidize rates of municipal loans administered by the Rural Utilities Service. Increases are provided for additional planning activities and for educational assistance to watershed sponsors to make them more aware of the need to examine and possibly repair older systems.

Finally, the Department's 1999 budget continues its support of the 290 authorized Resource Conservation and Development (RC&D) areas. It will also be sufficient to support the approximately 25 new area authorizations that I hope to announce later this year.

RESEARCH, EDUCATION, AND ECONOMICS

The budget recommendations for the programs administered by the four Research, Education, and Economics (REE) mission area agencies reflect the importance of scientific, technological, and economic knowledge on future performance of the agricultural sector in the U.S. economy, and its competitiveness abroad. Driven by publicly funded research in Federal laboratories, land-grant universities, and private sector investments, agricultural productivity has grown at an annual average rate of 1.8 percent over the past 45 years. Yet hunger and malnutrition remain a problem for too many people in the U.S., and throughout the world, and with the projected population growth rates, there are moral challenges and economic opportunities to make our agricultural system even more productive in the future. Federally-supported agricultural research and education is needed to promote key Departmental objectives related to expanding agricultural-based economic and trade opportunities for all producers; ensuring a safe and affordable food supply; and protecting natural resources for the benefit of current and future generations.

The ability of U.S. agriculture to help meet world food requirements relies on research and technology to enhance productivity growth, develop a safer food supply, and address critical human nutrition needs. Increased support for research and education will also lead to a better understanding of how agricultural production impacts the environment and how effective management practices can be applied to mitigate harmful effects. Federal support for research conducted at land-grant universities and private laboratories encourages these institutions to invest in science and technology needed to address critical issues at a level beyond what they could do on their own. Publicly supported research and extension programs provide the basis to complement much of the work carried out by the private sector.

The activities proposed under REE aim to achieve the five general goals for research and extension set forth in the mission area strategic plan and in the agencies' performance plans: (1) an agricultural production system that is highly competitive in the global economy; (2) a safe and secure food and fiber system; (3) a healthy, well-nourished population; (4) an agricultural system which protects the environment; and (5) enhanced economic opportunity and quality of life for American citizens. These goals are derived from the purpose statement for agricultural research in the 1996 Act and the advice we have received from users and stakeholders

represented on the National Agricultural Research, Education, and Extension, and Economics Advisory Board.

Total funding requested for REE agencies in 1999 is about \$1.8 billion. Within this total, research in ARS would be increased by \$32 million, funding for Federal facilities would be reduced by \$43 million, funding for university research and extension would be reduced by \$9 million, and support for economic research and agricultural statistics would be increased by \$3.1 million. ARS will be redirecting about \$35 million from a number of ongoing research projects to support programs and initiatives of high national priority.

An increase of \$6 million in the ARS budget is provided for research efforts to reduce the incidence of emerging diseases and exotic pests that threaten the safety of the U.S. food supply. Of the total, \$3.7 million will be used to enhance the development of diagnostic tests, vaccines, and other immune strategies that prevent the outbreaks and spread of exotic and zoonotic diseases, and pathogens. The remaining \$2.3 million will be used to prevent the introduction of emerging plant diseases and pests.

Enhanced genetic diversity supported under the Department's Food Genome initiative can reduce the likelihood of losses due to rapid environmental changes or epidemics of pests or pathogens. An increase of \$3.5 million in the ARS budget is provided to support the continued development and maintenance of living germplasm collections for crops, animals, and microbes. New funding for this initiative is also proposed in the Cooperative State Research, Education, and Extension Service (CSREES) budget. Under proposed legislation, competitive grants totaling \$10 million will fund selected projects that enhance the genetic knowledge base resulting in improved agricultural production and crop biodiversity. Also, within the total CSREES National Research Initiative (NRI) funds, \$16 million is proposed for this initiative.

The budget for ARS includes an increase of \$14 million for the President's Food Safety initiative. Of the total, about \$8 million is provided for pre-harvest food safety research to design effective control programs to prevent the spread of bacteria and parasites from animals to humans, and to improve post-harvest handling practices for fruits and vegetables. The remaining \$6 million is provided for post-harvest research in support of the HACCP model implemented by the Food Safety and Inspection Service. Efforts will be focused on developing methods to reduce the pathogens and toxins infecting our food supply, including fruits and vegetables, and meat and poultry products. The \$11 million increase proposed in the CSREES budget for food safety research and education programs will complement the ARS efforts. Of the total CSREES request, \$3 million is proposed to assess the impact of food handling and storage practices on selected population groups, and \$3 million of the NRI funds is proposed for research to improve the understanding of disease-causing pathogens. The remaining \$5 million targets education programs for consumers in support of HACCP implementation for meat and poultry products.

An increase of \$5.5 million in ARS will support the development of substitute pest management technologies to replace pesticides that are slated for elimination under the new Food Quality Protection Act (FQPA) regulatory standards. The research will also support the Department's commitment to encourage the adoption of Integrated Pest Management (IPM) practices on 75 percent of the Nation's crop land by the year 2000. The CSREES budget also includes funding to support the Departmental goal on adoption of IPM practices. Increased funding of \$15.5 million is proposed for research and extension programs on improved IPM systems to provide pest control solutions that are economically and environmentally sound. All IPM activities in the Department will be coordinated by the newly established Office of Pest Management Policy which will work closely with EPA to promote safer pest control practices and coordinate data and analysis to support informed decision-making on pesticide regulations.

The ARS budget also includes a \$10.5 million increase in support of the Presidential Initiative on Human Nutrition. The overall objective of the human nutrition program, conducted at the six ARS Human Nutrition Research Centers, is to enhance nutritional means to promote optimum human health and well-being for individuals through improved nutrition. The impact of nutrition on childhood growth and development will be given special emphasis. Of the total request, \$1.5 million is also proposed to expand the sample size of the ongoing dietary survey to provide more accurate and up-to-date information on food consumption patterns for pesticide tolerance review activities mandated under FQPA.

Additional emphasis is placed on addressing pressing environmental issues. An increase of \$7 million in the ARS budget is proposed in support of the President's Climate Change Technology Initiative. This will also complement the climate change research undertaken by the Forest Service. Efforts will be aimed at minimizing the

adverse effects of agricultural production practices on climate change, as well as using agricultural practices to mitigate global warming. An additional \$2 million is provided under the President's Clean Water and Watershed Restoration initiative to deal with the recent *Pfiesteria* outbreak in the Chesapeake Bay.

ARS also plays an important role in the Administration's initiative to restore the South Florida Everglades ecosystem. The budget includes an increase of about \$1 million to develop mechanisms to control the spread of invasive *Melaleuca* trees and \$4 million for construction of a quarantine facility to house the study of biological control agents. Construction of this facility was designated by the Administration's South Florida Ecosystem Task Force as a top priority to ensure prompt restoration of the Everglades National Park.

The budget includes about \$36 million for facility construction and modernization projects, a reduction of \$43 million from 1998. Of the total, \$2.5 million is provided for modernization of the Beltsville Agricultural Research Center at Beltsville, Maryland. The request includes \$17.7 million for modernization of facilities at three ARS Regional Research Centers. Remaining funds provide \$5.6 million for the renovation of facilities at the National Animal Disease Center at Ames, Iowa, \$3.5 million for ongoing renovation projects at the Plum Island Animal Disease Center at Greenport, New York, and \$1.4 million for the renovation of the Grain Marketing and Production Research Center at Manhattan, Kansas.

The budget request for CSREES is reduced by \$9 million from the 1998 appropriation. Within this total, however, there are proposals for enhanced programs to support a number of high priority research and education projects and Presidential initiatives. Offsetting reductions are proposed for selected research and extension formula programs. Current law gives States broad authority to determine research program priorities and provide funding for selected projects accordingly. In addition, the Administration recommends legislative changes to permit States to use up to 10 percent of the Hatch Act and Smith-Lever formula funds for research and extension interchangeably.

The CSREES budget includes an increase of \$33 million for the NRI, bringing funding for this competitive grants program to \$130 million. NRI grants support a wide range of environmental, health, food safety, and nutrition programs through a competitive, peer-reviewed grant process that is open to all of the Nation's scientists. NRI encourages breakthroughs and new approaches to problem-solving in biological sciences that equip scientists with powerful new tools to meet continuing and emerging challenges in agricultural and food sciences.

CSREES also proposes a \$2 million increase to develop and improve sustainable agriculture systems which require fewer off-farm inputs. The Sustainable Agriculture Research, and Education program, which has been funded at \$8 million annually since 1995, is proposed to be funded at \$10 million. Research and education grants under this program are awarded competitively at the regional level.

In response to the recommendations of the Civil Rights Action Team and the National Commission on Small Farms, the CSREES budget also contains proposals of \$27 million for selected activities to strengthen programs at minority-serving institutions and to enhance opportunities for small farm and minority producers. The request includes \$4 million to address problems that are unique to small farm producers. Proposed legislation which authorizes grants for integrated research, extension, or education activities, is requested to carry out this program. Other proposals include \$12 million for the renovation and construction of the 1890 facilities, \$5 million to support additional extension agents under the Extension Indian Reservation Program, \$3.5 million to expand the extension and teaching capacity at the 29 Native American Institutions, and \$2.5 million to enhance the education capacity at the Hispanic Serving Institutions.

The CSREES budget includes \$2 million for continued expansion of the REE Data Information System begun in 1996. An increase of \$1.2 million above the 1998 appropriated level is provided to continue development of an interactive information system with the capability to manage administrative, financial, and management-related data for any research, education, extension, and economics activities. This information will be used for GPRA reporting and evaluation requirements.

The Economic Research Service (ERS) is an important source of information on food and agricultural related issues, and the economic and social science research conducted by ERS helps both policymakers and producers make informed decisions. The budget request for ERS is \$56 million, a decrease of \$16 million below the 1998 appropriated level. The 1998 appropriation included \$18 million for food program studies previously funded within FNS. The 1999 budget reflects this funding within FNS, which we believe is the appropriate agency to conduct this research.

The ERS budget includes increases to support economic analysis on three high priority issues. Funding included as part of the President's Food Safety initiative

would support work with the Centers for Disease Control and Prevention to more accurately assess the costs of foodborne illness and the economic consequences of efforts to improve food safety. ERS would also collaborate on the development of risk assessment models to identify where pathogens enter the food chain and where control efforts would be most cost effective. A second increase would support an assessment of the Department's role in meeting the information needs of small farmers. More specifically, ERS will assess how information needs vary by the type of operation, how well USDA and private information services meet the needs of small farmers, and what reforms and modifications in the Department's current market information programs are needed in order to better serve small farmers. Finally, an increase is included to support research on electric utility deregulation in order to assess the potential impacts of deregulation on the Department's rural utility loan programs, the competitiveness of rural businesses and communities, and rural households.

The National Agricultural Statistics Service (NASS) is also an important source of information. NASS estimates and forecasts are relied upon by a wide range of participants in the agricultural economy, and NASS has earned and maintained an unmatched reputation for accurate, unbiased, and timely information. The implementation of the 1996 Freedom to Farm Act has made reliable and timely information about production, supply and prices even more critical to participants in agricultural markets.

This year for the first time, NASS is conducting the Census of Agriculture which has previously been conducted every 5 years by the Department of Commerce. The census serves as the main source of local level data about American agriculture, the only complete enumeration of farmers, and an important benchmark for USDA's program to produce national and State estimates. Overall, the budget for NASS reflects a net decrease of \$11 million, from \$118 million to \$107 million, due to the cyclical funding needs of the Census. With the proposed NASS budget, 98 percent of total national agricultural production will be included in NASS' annual estimates program, an increase of 5 percent above 1998.

The NASS budget includes increases for two follow-on surveys to the 1997 Census of Agriculture: (1) the Agriculture Economics Land Ownership Survey (AELOS) which has historically been conducted as a follow-on survey to the Census of Agriculture since the 1950's; and (2) a national survey of the fast growing aquaculture industry for which very little data is currently available. For NASS' Agricultural Estimates program, an increase of \$1.4 million is included to expand the current pesticide use surveys supporting implementation of FQPA to include the fast growing nursery and greenhouse industries. In addition to providing pesticide use data for an important sector of agriculture, this initiative also supports the CRAT recommendation to address concerns about farmworker exposure to pesticides and the Administration's IPM initiative.

MARKETING AND REGULATORY PROGRAMS

The Marketing and Regulatory Programs contribute to increased domestic and international marketing of U.S. agricultural products by: (1) reducing international trade barriers and assuring that all sanitary and phytosanitary requirements are based on sound science; (2) protecting domestic producers from animal and plant pests and diseases; (3) monitoring markets to assure fair trading practices; (4) promoting competition and efficient marketing; (5) reducing the effects of destructive wildlife; and (6) assuring the well-being of research, exhibition, and pet animals. Consumers, as well as the agricultural sector, benefit from these activities.

Beneficiaries of these services already pay a large percentage of the program costs through user fees. And, we are proposing legislation to recover over \$31 million in new user fees from those who directly benefit from USDA services. New license fees are requested to recover the cost of administering the Packers and Stockyards Act except for the one-time restructuring costs. Expanded user fees are requested for developing grain standards and developing methods for measuring grain quality, and for certain animal and plant inspection activities.

The budget includes an increase of \$11 million for the Agricultural Marketing Service (AMS). Modest increases are requested for expanding foreign market news reporting and expanded reporting of livestock and poultry markets in accordance with recommendations set forth by the Advisory Committee on Agricultural Concentration. The proposed rule to implement the Organic Foods Production Act was published on December 16, 1997. In order to implement this new program, we are requesting additional funds to accredit organic certifiers. Program costs will be recovered through user fees. Funding for the Pesticide Data Program (PDP) was provided within AMS in 1998 after being funded through the Environmental Protection

Agency (EPA) for 1997. For 1999, program increases are requested to initiate a rapid response capability necessary to support EPA's data requirements under FQPA. As part of the President's Food Safety initiative, an increase of \$6.3 million is requested to broaden the scope of PDP to include microbiological testing of fruits and vegetables.

For the Animal and Plant Health Inspection Service (APHIS), the budget contains \$10 million in new user fees and a redirection of \$12 million from APHIS appropriations for the cotton growers' share of boll weevil eradication to a USDA loan program. This redirection in boll weevil eradication allows an appropriations decrease without a decrease in program operations. Program successes in brucellosis eradication allow an \$8 million redirection to higher priority activities to help the agency comply with international trade agreements. APHIS anticipates that all 50 States will reach brucellosis Class "Free" Status by the end of 1999. The budget assumes increased cost sharing from beneficiaries of Wildlife Services activities. Also, this budget supports activities that would increase agricultural exports. It maintains funding for our important data gathering and risk analysis used in negotiations concerning sanitary and phytosanitary trade barriers and restrictions on genetically engineered products entering world markets. Funding increases are provided for Pest Detection activities such as Agricultural Quarantine Inspection at the borders. APHIS will likely inspect upwards of 85 million passengers potentially carrying banned agricultural products into the United States.

The budget requests an increase in available resources of \$4.8 million to strengthen the Packers and Stockyards (P&S) programs of the Grain Inspection, Packers and Stockyards Administration (GIPSA). The increased funding will enable GIPSA to address more of the recommendations of the Advisory Committee on Agricultural Concentration related to livestock and poultry marketing. Specifically the agency would: (1) hire additional staff to monitor and analyze packer competitive practices and the implications of structural changes in the meat packing industry; (2) expand poultry compliance activities; and (3) install electronic filing equipment to reduce financial reporting costs for stockyard owners and packing house operators. P&S programs will be able to conduct upwards of 1,950 compliance investigations in 1999. Legislation will again be proposed to authorize a dealer trust similar to that of the existing packer trust. The legislation would require dealers to maintain trust assets covering the value of livestock inventory and accounts receivable due from the sale of livestock until livestock is paid for. This proposed trust would be a valuable tool in assisting the recovery of payments for unpaid sellers. Finally, this budget proposes to fund the one-time costs of \$3.0 million associated with restructuring the P&S programs. The restructuring will strengthen P&S programs' ability to investigate anti-competitive practices and provide greater flexibility and efficiency in enforcing the trade practice and payment protection provisions of the Act.

Funding for grain inspection is maintained at the 1998 level and GIPSA expects to officially inspect 260 million metric tons in 1999. The budget proposes to recover the cost of standardization and methods development through increased inspection fees.

DEPARTMENTAL MANAGEMENT ACTIVITIES

Several offices are responsible for Departmental management activities. These offices provide leadership and administrative support to USDA agencies. The 1999 budget provides the resources necessary for these offices to enhance their leadership, coordination, and support the Department's Strategic Plan Management initiatives to: ensure that all customers and employees are treated fairly and equitably, with dignity and respect; improve customer service by streamlining and restructuring the county offices; create a unified system of information technology management; and improve financial management and reporting.

As indicated previously, this request reflects a number of priority funding increases to carry out the recommendations contained in the report of the Department's Civil Rights Action Team. In both 1997 and 1998, the Congress increased funding specifically for certain civil rights activities within Departmental Administration. These activities will continue. The 1999 budget includes an increase of \$6.3 million for civil rights and other activities. These resources are needed to meet the Department's strategic objective of ensuring that all employees and customers are treated fairly and equitably with dignity and respect. The funds will support additional staffing to improve personnel services and assistance to USDA agencies, including ethics compliance; to improve outreach to USDA customers including support for the new USDA Office of Outreach that will assure all customers, especially underserved populations, have full access to USDA programs and services; and to

enhance management-employee relations that support early resolution of employee grievances and conflicts within USDA.

The Office of the General Counsel (OGC) provides critical legal support and advice to the Department and its agencies. An increase is proposed in 1999 to facilitate the processing and adjudicating of civil rights complaints by expanding the Civil Rights Division in OGC.

The Office of the Chief Information Officer provides policy guidance, leadership, and coordination to USDA's information management and technology investment activities. The proposed increase for 1999 includes \$1.5 million for further development of the Department's information technology capital planning and investment control programs and the USDA information architecture. USDA is also taking a strong management approach to effectively respond to the challenges of year 2000 remediation and we fully expect that all mission critical systems will be compliant by no later than March 1999.

The Office of the Chief Financial Officer (OCFO) provides overall direction and leadership in the development of modern financial management structures and systems. In addition, the OCFO is responsible for implementation of the Government Performance and Results Act (GPRA). Additional funds are requested for 1999 to strengthen the Department's capability to provide cost accounting information for services provided, particularly with regard to implementing GPRA.

The request includes additional funds to continue the implementation of the USDA Strategic Space Plan for the Washington metropolitan area. This plan has been tailored to meet the needs of USDA based on the projected staff levels at the Washington headquarters and to provide a safe, efficient work place for our employees. The Beltsville facility will be ready for occupancy in early 1998. The design for the first phase of the South Building renovation was completed and a construction contract is expected to be awarded in February. The design for phase 2 of the modernization is now underway and scheduled to be completed during 1998. The 1999 request includes funds for the construction of phase 2.

The Office of the Chief Economist advises the Secretary on policies and programs related to U.S. agriculture and rural areas, provides objective analysis on the impacts of policy options on the agricultural and rural economy, and participates in planning and development programs to improve the Department's forecasts, projections, and policy analysis capabilities. The proposed increase would be used to continue USDA's initiative to provide enhanced weather and climate data for agricultural areas. This initiative includes modernization of USDA's weather and climate data acquisition equipment to allow USDA to continue to provide data to and receive data from the National Weather Service, and implementation of the second phase of the National Agricultural Weather Observing Network which will manage the collection, quality control, and dissemination of the weather and climate data in agricultural areas.

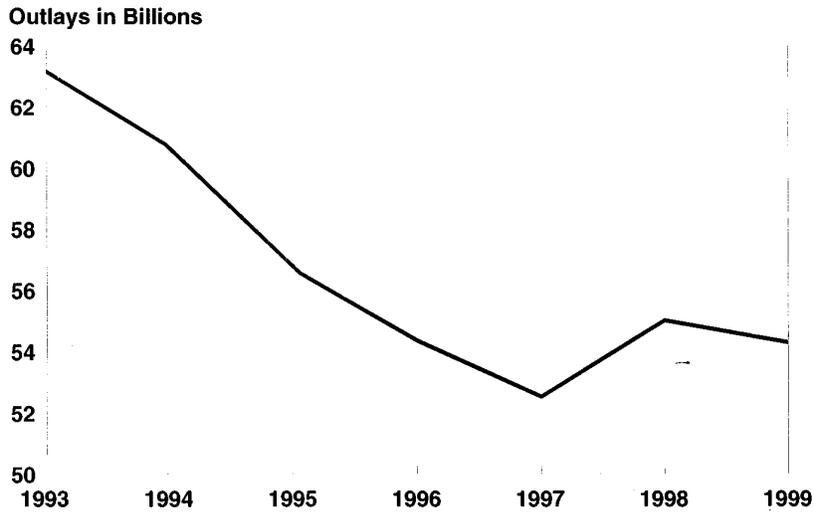

An increase is proposed for the Office of Risk Assessment and Cost Benefit Analysis in support of the President's Food Safety initiative. Additional funding is also included for the Commission on 21st Century Agriculture. The Commission is conducting a comprehensive review and assessment of the future of production agriculture in the U.S. and the appropriate role of the Federal Government in support of production agriculture.

An increase is proposed for the Office of Inspector General (OIG) including \$21.7 million to support a Presidential Law Enforcement initiative. Included in the initiative is funding for OIG to expand activities to crack down on fraud and abuse in the food stamp and other nutrition programs. In this area, estimates indicate that over \$50 million a year in food stamps goes illegally to convicted felons and prison inmates, and that a sizable number of retailers who accept food stamps make money from them illegally. OIG's recent pilot effort, Operation Talon, has been extremely successful. In the 24 metropolitan areas around the country included in the pilot, Operation Talon resulted in the arrest of over 2,200 fugitive felons and the savings of millions of dollars to the U.S. Treasury. This initiative will allow OIG to expand these efforts nationwide.

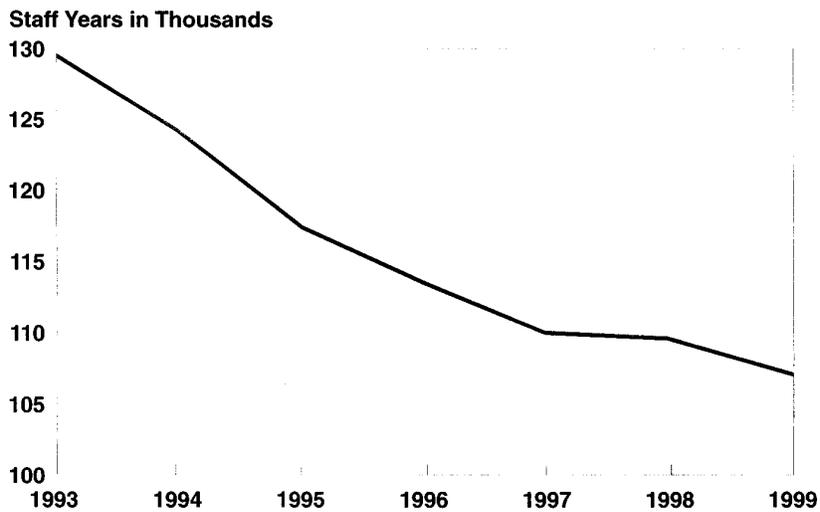

In addition to food stamp fraud, these funds will also enable OIG to dedicate more resources to rural rental housing programs, and disaster and health and safety programs. Health and safety of food from production to the consumer is of special concern because of such highly visible emergencies as contaminated strawberries in the School Lunch Program and the tainted meat in the food distribution chain resulting in the recall of 25 million pounds of ground beef from public consumption.

That concludes my statement, I am looking forward to working with the Committee on the 1999 budget so that together we can meet the needs of our clients and at the same time balance the Federal budget.

United States Department of Agriculture Outlays

United States Department of Agriculture Staff Years

OFFICE OF THE INSPECTOR GENERAL

Senator COCHRAN. Mr. Secretary, you mentioned the Office of Inspector General. I just wanted to bring up the fact that I had a

meeting with the inspector general in my office yesterday to talk about some of these initiatives.

One thing which we discussed was the authority that we had written into the agriculture appropriations bill I think in 1996 giving our OIG access to forfeited funds or funds that were forfeited to the Government by reason of actions taken by this office so that we would not have to appropriate as much money to operate that office in the future. But for some reason or another, the Department of Justice has blocked access to those forfeited funds. I wonder if you would take it up with the Attorney General and find out what is going on. For 2 straight years, we have had that authority in the law, but the Department has prevented its being implemented.

Do you know anything about that problem?

Secretary GLICKMAN. Not any more than you have just stated, although I have talked to Mr. Viadero, as my staff has, and I will follow it up with the Attorney General. The fact that it is in the law—and I think the law is pretty clear—we need to work this out.

Senator COCHRAN. Well, I would like to work with you if you feel that we can be of any specific help in getting cooperation from the Department of Justice on that subject.

ASIAN FINANCIAL CRISIS

On another topic, the Asian financial crisis is something that is being talked about because it concerns us in agriculture with respect to pressure on markets for U.S. agriculture commodities in that part of the world. Many of these countries are major markets for U.S. agriculture commodities such as soybeans, poultry, beef, cotton, and others.

What is the situation with respect to our access to those markets, whether we are going to sustain losses in sales in that part of the world? What about the use of our Federal programs such as GSM credit guarantees in helping to deal with that problem?

Secretary GLICKMAN. I dispatched a team to Asia: our Under Secretary, Gus Schumacher, and the head of our Foreign Agricultural Service, Lon Hatamiya. They were in virtually every country in Asia. Their assessment is basically that the crisis could reduce U.S. agricultural exports between 3 to 6 percent from levels where it would have been had there been no crisis. Much as this loss will be in Korea and Indonesia, which is expected to account for the lion's share. I do not think they expect very much impact at all with Japan or China, Hong Kong, or the other nations.

Now, we have just made available about 2 billion dollars' worth of CCC export credit guarantees to the Republic of Korea and five Southeast Asian countries. That action is helping to ease liquidity constraints. A lot of these people could not even get letters of credit because the banks would not issue them in some of the areas. So, this is the highest priority for us right now in terms of the farm sector, to make sure that those markets remain open to us.

It is my understanding that there is no statutory limit on the amount of GSM credits that we can provide. It is a budget question determining how much of a loss there will be, and we obviously have to work with OMB on this particular issue. But it is my goal

to use that provision of the law aggressively in order to ensure that goods keep flowing.

Now, some of the other countries in the world are extremely unhappy with our use of these export credits—Australia, for example, I think their term for us was—how did they characterize it? Avaricious looters. The Americans were avaricious looters moving into a market which they believe perhaps was traditionally their own. The fact of the matter is the use of our credits is perfectly consistent with our obligations under all international trade arrangements.

Again, these are not subsidies. These are Government guaranteed bank credits, a commercial credit. But this is at the heart of what we are doing in this particular area.

As I mentioned just briefly, the livestock industry, which used to only export 2 or 3 percent of their product—but which now exports up to about 10 percent—is very much affected by this, pork and beef particularly. But the poultry industry has been a little more on historical trend to both Hong Kong as well as Eastern Europe.

We are going to aggressively use our credit programs. Obviously we will have to look at the potential for taxpayers' losses in this particular area, but I would say that is the biggest line of defense right now for our exports. And it is not limited by the budget estimates.

By the way, we have thought that we would use about—let's see. What are we talking about? About \$5.7 billion this year?

Mr. DEWHURST. \$5 billion this year, \$4.6 billion next year.

Secretary GLICKMAN. But that is based on what we considered the demand to be. That is not a cap. The level could go up if their utilization—and our desire is to move as much product as we possibly can.

Senator COCHRAN. I think Mr. Dewhurst responded to you that the plan was to use up to \$5 billion this year and \$4.6 billion next year. Is that your understanding of the forecast?

Secretary GLICKMAN. I would just say that is an estimate, though. It is not a cap.

Mr. DEWHURST. That is right. That is an estimate of our use of that authority, but it is not a limit. We could go above that number if that is what the situation requires.

FEDERAL CROP INSURANCE FUNDING

Senator COCHRAN. Speaking of limits, one of the caps that is proposed in the President's budget request is on the cotton program, proposing to save \$110 million. This savings, as I understand it, would fund the Federal crop insurance sales commissions. And, there is another cap that is supposed to save an additional \$48 million.

These are troubling to those of us who come from cotton producing States. We worry about why the administration has singled out the cotton industry to impose these caps to help fund the crop insurance program. If enacted, the competitiveness of our cotton products may be harmed, particularly in light of this Asian financial crisis, making sales more difficult.

Have you undertaken to assess what the effect of these caps would have as a practical matter on the marketability of U.S. cotton in the overseas markets?

Secretary GLICKMAN. I would ask Mr. Collins.

Mr. COLLINS. Yes, Mr. Chairman; we have looked at that. You are right. It would hurt our competitiveness somewhat. Our estimate is that a total loss of sales might be a couple of hundred thousand bales as a result of these caps, \$140 million cap in fiscal year 1999. We would have essentially \$193 million total that we could spend in the year 2000 and beyond.

I might point out just one thing, though, that for every dollar that we spend in step 2 payments on the export side, we are spending \$2 to support domestic mills. There has been very little evidence that that \$2 spending on the domestic mills has really made that much of a difference in domestic mill use.

But overall, yes, there would be some effect on our export competitiveness.

CSREES RESEARCH PROGRAMS

Senator COCHRAN. One other proposal in the budget that troubles me considerably is zeroing out Cooperative State Research Education Service research programs and the reduction of formula funds for the Hatch Act, Smith-Lever, McIntyre-Stennis cooperative forestry research.

What is the rationale for proposing such significant reductions in formula research and extension programs? These enable the States to meet local priority needs, to set some goals for helping students, things like 4-H Club activities, others that are at the heart of rural communities and small schools around the country. I worry about the approval of that. I do not think we are going to approve that. Why do you propose it?

Secretary GLICKMAN. First of all, let me say with respect to both the cotton step 2 program, as well as this program, we obviously are going to work with you to try to devise the best dollars and language that we can get under the circumstances.

The step 2 program has been the subject again of a serious amount of OIG audits and investigations. So, we need to work together to make sure we enhance our competitiveness, but at the same time have a program that gives the taxpayer a good bang for the buck and is not prone to being misused. I think we hopefully can do that.

On the formula funding, obviously this is something else that relates to the total budget picture. We do not anticipate that the proposed reductions in the formula program will have a materially negative impact on activities carried out at the State level. States will have full discretion to fund their research and extension activities that they consider to be of high priority, and the reductions in Federal funding can be offset with modest increases in State and local funding, less than 1 percent I believe, the total amount.

So, there are a lot of pieces of this puzzle. There are some increases in the research budget in other areas as well. We will work with you on this.

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. Mr. Secretary, thank you very much for your statement, a big part of which I, of course, agree with. But Senator Cochran has touched on something that is becoming increasingly important to me because I have just been studying it a little bit.

But a couple of years ago, as best I could tell, we were putting about \$1.3 billion into research each year. Does that sound like about a right figure, Mr. Dewhurst?

Mr. DEWHURST. Yes.

Senator BUMPERS. When you consider we spend about \$40 to \$45 billion a year over at the Pentagon to make things explode and then we spend, which everybody would agree with, roughly \$15 billion at NIH for medical research, but when you consider the fact that we have roughly 435 million acres of arable land in the lower 48 and we are taking 2 million acres a year out for highways, urban sprawl, housing, shopping centers, and so on, and we are adding 2 million people to the population every year, and when you consider the addition of people to the population every year, 2 million, taking 2 million acres out of cultivation and we are spending \$1.3 billion on research, that seems frankly like a pitifully small amount.

Would you comment on that?

Secretary GLICKMAN. My personal reaction is I agree with you. We have to deal with the priorities in the total budget process, and working together, we do our best to try to make sure those priorities are an adequate amount.

There are some increases on the research side of the budget. We have put some additional money into human and food genome research as well as the Pfiesteria and other key problem areas, but the total dollars have not been going up.

I would say a couple of things here. If you had to ask me is every bit of agriculture research we are doing necessary or is there duplication of research being done at various universities around this country, I would say probably there is some duplication of research and not every bit of agriculture research that is being done is necessarily serving the good as much as it could.

We do have an outside advisory group that is looking at our facilities now and trying to see if there is a way that we can better do our research job less expensively. It is difficult to close down a research facility, as you know.

Senator BUMPERS. I want you to close all the others. I do not want you to close the ones in Arkansas.

Secretary GLICKMAN. That is right.

Overall, I do not think we spend enough in agriculture research.

Senator BUMPERS. We obviously do not.

Secretary GLICKMAN. That is a personal item, but we have to do the best we can and we have to make the best of the resources we have.

Senator BUMPERS. We have a gigantic train wreck that is going to happen probably long after I am dead, but you can see it developing and we are not really addressing it. That is the reason I raise that sort of macro, long-term problem.

Secretary GLICKMAN. Let us just take a few areas. How do we increase yields without using more pesticides, herbicides, fungicides, particularly in massive areas of both the arid area of the

United States but also in the developing areas of the world. That is obviously one key area. How do we produce more nutrition in the crops that are grown, how do we protect production agriculture and still not have land wash away and blow away.

As you look down the next 30 or 40 or 50 years in terms of crisis problems, how do we deal with global climate change, which I know is controversial, but I suspect that it is going on and we have to protect American agriculture in that process rather than just say it is not happening and we do not want anything to do with it. We have to make sure we do adequate planning, and that means research activities as well. So, we need to spend the money to do it.

Senator BUMPERS. Mr. Secretary, what kind of food safety inspection do we have on imported fruits and vegetables? I have never really known.

Secretary GLICKMAN. The FDA is essentially responsible for that. They do some spot inspections.

Senator BUMPERS. I will save that. They will be here, so I will save that question for them.

Secretary GLICKMAN. I would say they are rather limited in amounts, and that is one of the reasons the increase in the President's budget is to provide more resources for them.

Senator BUMPERS. I just will make one observation—two observations.

No. 1, in connection with the train wreck that I have described, we have a piece of that problem which is slightly different in my State. The Mississippi alluvial aquifer which covers a good portion of Mississippi, a lot of Arkansas, a little of Missouri, the southern part, northern Louisiana. I had been successful in getting money to study the depletion of that aquifer. Those studies have been completed.

RICE PRODUCTION

As you know, we produce roughly 43 percent of all the rice produced in this country. Rice is very water intensive, and we have been depleting that aquifer for rice growing for many, many years now. We have reached the point where if something is not done, rather dramatically done, by the year 2015, rice production, because of the loss of that aquifer, will be so much lower, and by the year 2020, there will be no rice grown in my State, virtually none.

I felt so strongly about it, I went over to talk to the President about it, and of course, coming from Arkansas, he was fully familiar with it and put some money in his budget request to start dealing with it.

All I want to say is it is a \$1 billion problem. In the budget, the President asked for \$13.5 million to initiate a program that the Corps of Engineers—now the Corps does not like agricultural products. They are not prohibited from doing them, but they do not like them. They are going to have to learn to like them because this is not just a problem in my State. This is a problem that is developing everywhere, for example, the Ogallala aquifer that covers the Plains States. That aquifer is going to disappear too.

So, what we are proposing to do is to divert surface water from the rivers to the rice fields. I tell you that simply because the Corps of Engineers is going to have to get actively involved, even though

they would rather not, and the Department of Agriculture is going to have to help in coordinating these efforts and helping us determine where the most critical areas are.

Now, finally, Mr. Secretary, let me laud you by saying I think you have done a superb job. You have been a very responsive Secretary. I have never called, I have never asked for anything that I did not get a fast response.

FOOD SAFETY INSPECTION SERVICE

But I must say when it comes to the Food Safety Inspection Service, the one big disagreement I have had with the Department is the way the *Hudson Foods* case was handled. I have been familiar with that company since I ran for Governor in 1970 when it was just doing a few million dollars a year, until it became last year a \$1.5 billion business. Let me just say what my concern is and ask you to respond to it.

What Hudson Foods had was one meat packing—they are big in the turkey and poultry business. That is all they are. They built a meat packing company just to accommodate Burger King. It was a state-of-the-art facility. There is no question but *E. coli* was found in the plant. There is not any question that the Secretary of Agriculture, the Food Inspection Service had to move. They had to do something to find out about it.

But what happened, I really felt that these were gratuitous, inflammatory, and unnecessary statements made that caused Hudson to have to sell a good company, built over a 30-year period, and they had no choice but to sell at what I have been told is \$300 million less than the fair market value of the company. The publicity was so pervasive and so volatile they could not survive it.

Yet, the *E. coli* that was found in that plant came from another USDA-inspected beef slaughtering plant. The question was why should Hudson have had to bear the brunt of it when the *E. coli* that came into that plant came from another FSIS-inspected facility, which so far as I know, till this day has never been named, and yet Hudson had to bear the whole brunt of it. It seems to me that USDA and FSIS should have taken the hit on the very fact that this beef came in from another inspected plant which Hudson had relied on. Hudson was relying on FSIS to make sure that the beef they got from these other packing plants—they bought from about 15, but they were all inspected. They had the right to rely on the safety and the efficacy of that beef.

Secretary GLICKMAN. Well, first of all, let me say that I am somewhat limited because there has been a U.S. Attorney investigation, and I do not know if there is a grand jury looking at this.

Senator BUMPERS. Well, I was not aware of that. I am not trying to prejudice the case.

Secretary GLICKMAN. I cannot talk about the specifics of that case.

E. COLI

The only thing I can tell you is this, that I think we have learned a lot from that episode. *E. coli* was either nonexistent or we had not identified it as recently as 15 years ago. It is new. It is virulent, it kills, and it is a troublesome problem, much more than a

lot of other food safety problems. The fact is that we are learning about this and how to deal with these kinds of problems. The companies are learning as well how to manage their systems in order to keep problems from happening. We have to regulate that process. So, I cannot tell you today that everything we did was perfect in that context.

But I would tell you this, that I have had some very successful meetings with the meat and poultry industry as a result of the new HACCP rules that went into effect. The new HACCP rules changed the way that they and we do business so that no longer do you wait until you find a problem in a piece of meat that has gone out in the countryside before you take action. You try to deal with the systems approach so that you test and the company itself focuses on those critical systems at every stage of the operation.

Right now the focus is primarily on the packers, slaughterers, and processors. Restaurants are beginning to use this system as well. We obviously need a farm-to-table system that involves production agriculture and involves the consumers because they are the last line of defense.

Hopefully with the new system there will be a process that will provide greater public safety so unsafe products will not be distributed. We will discover hazards inside the operations of the plant, and at the same time we will be involved with the companies in a way that still preserves our arm's length regulatory approach but in a cooperative way to try to find a problem when it occurs early on.

So, Senator, I cannot tell you that I would do it exactly every iota of the way we did it before, but I will tell you this, that this issue is one that is going to grow in magnitude and complexity, the concern about food safety. What we have to do as a country is to make sure that the industry and USDA are working together to try to understand that the public cares about food safety more than they care just about any other thing in the world. So, we are just going to continue to do the best that we can, and the new system I think will help a lot.

Senator COCHRAN. Mr. Secretary, we have a vote in progress. We are going to have to go over there and be recorded and we will be right back. We will stand in recess temporarily.

[A brief recess was taken.]

Senator COCHRAN. If the committee could return to order. We apologize for the interruption for the votes on the floor of the Senate.

We are prepared now to resume our questioning of the Secretary of Agriculture. Senator Bumpers was in the process of asking questions. He will be returning, and we will yield to him when he does return to continue his questioning, but until he returns, I am going to call on Senator Burns, if you are ready, or Senator Kohl.

Senator BURNS. Mr. Chairman, I will be very quick. The Secretary and I have talked over a couple of things. We are going to have a sit-down when we come back, and we have some very specific things we would like to go over and maybe we can find some answers. We are very concerned not only with the road moratorium and how that is being held, but also what the designs are on the Royal Teton Ranch and how that plays into the public land man-

agement there north of the Yellowstone Park. We just talked about the buffalo situation and APHIS and the things that we have to do to deal with that situation.

So, Mr. Chairman, rather than take up a lot of time, I have a whip meeting anyway. We have agreed to sit down and visit about it because these are isolated instances that probably have very little to do with the overall picture of funding the Department of Agriculture.

Senator COCHRAN. Thank you, Senator.

Senator BURNS. Thank you. I want to thank the Secretary for that, and I want to thank the chairman.

As far as Mr. Bumpers going through his final hearings on agriculture appropriations, I for one am very disappointed that he is leaving because he is one of the easiest guys to imitate. I can give his space station speech on the floor now if they give me a pointer. And I got them all up and we can do all those things. I will miss him because he is a great source of good humor. So, I will be sorry to see him go.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Senator Kohl.

NEW MILK MARKETING ORDER

Senator KOHL. Thank you very much, Mr. Chairman.

Secretary Glickman, when USDA announced the new milk marketing order, two options were proposed which you called 1-A and 1-B, 1-A being the status quo and 1-B recognizing the need to make some movement.

You have said on innumerable occasions that you do not support status quo, that you support movement. The nature of that movement is the contentiousness that exists in terms of what is finally going to be done, but there has never been any question about your position that the present system needs to be changed. I am troubled by the fact that 1-A, which represents the present system, is still out there.

Now, is that a misunderstanding in my interpretation of what you said, or do I have cause to wonder about what is this 1-A?

Secretary GLICKMAN. Senator, somehow I believed you would ask this question. So, let me just say this.

We have indicated that 1-B is our preferred option. So, we are clearly on record as saying 1-B, which reflects some changes in the order of price determination for class 1 milk, is our preferred option.

We had examined several options before, five or six, and 1-A and 1-B had clearly the most public interest as well as congressional and academic support. So, we chose to pool those two options into this final review process for comment. There is no question the Department prefers 1-B, but we also now have to go out to the public and get the input in the hearing process that is necessary. In a sense, what we have done is we have given people a clear choice, and now it is up to farmers, dairymen, consumers and others around the country to help us augment the record in order to make the decision that we have to make.

By the way, even if I had only gone with one option, under the law, I would have been required to accept testimony and, where relevant, make modifications in that anyway in accordance with the Administrative Procedure Act.

Senator KOHL. I appreciate that and I understand how—

Secretary GLICKMAN. If I just may make a couple of other points.

Senator KOHL. Go right ahead, yes.

Secretary GLICKMAN. In the 1-B option, we also provide a transition option, a suboption of 1-B. So, what we have in 1-B is differentials for class 1 milk in some regions of the country flattened out. Some class 1 milk price reductions do occur, although reductions would not be as great as some would expect for all milk prices because of the way it is computed. We have also proposed a transition option where there would be a bump-up on the price in certain areas. We proposed two or three different ways of doing that, and that is also out there for public comment as well.

Dairy did not get transition assistance in previous farm bills as we went to a more market oriented system. So, what we have tried to do is provide some transition assistance in this bill.

One final thing, if I might. We have also proposed flooring the basic formula price until such time as all of this milk marketing order reform is done, and there will be a hearing next week on the 17th on that issue as well. That is a separate issue but they kind of relate.

Senator KOHL. Yes; and I appreciate that answer, but I still must say that having heard you say so often that the present system cannot endure and will not endure, and recognizing that the Department has the authority to make the change—it does not have to come up for a congressional vote—

Secretary GLICKMAN. But we have to take public comment.

Senator KOHL. That is all right and I understand that, but it is not as though USDA is not aware or has been unaware of the problem and has gone into this whole process starting from ground zero. USDA is pretty expert at the order, and you as the leader of the USDA, having taken a position, which I respect and, as you know, agree with, that the present system must change, it still is troubling to have you put out the present system as though it were maybe not your alternative but an alternative. And I do not understand that.

I know how contentious this is and what kind of powerful forces are arrayed, and then I hear Senator Leahy representing his own district saying, hey, we cannot change the system, the system benefits us. Any change in the system will be a disaster for Vermont. And you hear that I am sure from other States.

And then I see, yes, the present system is still out there as an alternative, maybe not yours, but an alternative. You can understand how, as I learn more and more about the political system and how it operates, that the fact that you put that out as an alternative is troubling to those of us who want change, particularly in light of your stated position that change must occur. If change must occur, then why is 1-A, the status quo, out there?

Secretary GLICKMAN. Well, let me say a couple things. One is that we do provide preferred alternatives and options on environmental impact statements all the time. We do it on proposed rules.

We will provide options on proposed rules sometimes when there is a very strong public interest perspective, and we decide to put options in there. So, that is not unusual. This is not the only case we have ever done that before.

The second thing I would say is that it is incumbent upon us to get folks in your district and your constituents to actively engage in this rulemaking process. We are going to get inundated with comments on these rules. It is very important that your perspective on this be known. I am not sure if it conforms with the 1-B option—I think you had even further ideas on what to do, but it is very important that your perspective is reflected in that rule-making process.

The third thing I would say is that beyond 1-A and 1-B, which really just relates to differential prices on class 1 milk, there is a lot in this rule that affects the price of milk. For example, we changed the way the basic formula price is computed which will probably have the benefit of reducing the wide variations. It will be based on a longer time period and there will be some consolidations and are other things in there as well.

So, my hope is that we get the kind of comment that we are hearing now.

But again, I want to make it clear. We have set forth a preferred option. It is not as if I am bucking or ducking the issue, but we do have a preferred option.

Senator KOHL. All right. I do appreciate that.

STATE TRADING ENTERPRISES

Mr. Secretary, charges have been brought in state trading enterprises in England for illegal importing schemes, but problems do exist in prosecuting STE's in England. I am asking what is being done to ensure that state trading enterprises, which may well be engaging in unfair transfer pricing of dairy products, are compelled to compete fairly with United States farmers.

Secretary GLICKMAN. Well, generally, I am aware that the IRS and Treasury are looking at this issue to see if there are any violations of Federal revenue laws. So, I have asked our folks to provide them whatever assistance that they need. That is on the pricing issue. So, we need to make sure they comply with our laws.

I also would say that we are generally concerned about state trading enterprises, and we intend to highlight this issue in the next round of trade discussions. The Deputy was in Singapore last year where this was one of the dominant issues raised. The state trading enterprises in Canada, and there are others.

Senator KOHL. New Zealand particularly.

Secretary GLICKMAN. There are dairy boards.

Senator KOHL. You understand, which I am sure you do, what they do at the worst—and they do do that—is they price their products to the American affiliate so high that the American affiliate does not make any profit, and then there are no taxes to be paid. As a result of that, the American affiliate is able to undersell local domestic companies and take away business because of this unfair pricing procedure that they go through which brings their tax liability down to zero.

Now, that is something which I know you do not agree with and the IRS does not agree with, and we need to get to a resolution of that. I would like to hope that will be on a list of priorities that you have.

Secretary GLICKMAN. It will be.

EUROPEAN UNION

Senator KOHL. Last question. The European Union is aggressively targeting our traditional barley malt markets in Central and South America. Five years ago the malt industry exported 6 to 9 million bushels. This year only 50,000 bushels were exported from the United States. This business was essentially lost by three Wisconsin companies, so I am very concerned.

You have the Export Enhancement Program which helps companies compete against unfair competition. My question is, can we expect that you are going to give the companies in this industry, the barley malt industry, the help they need to compete with other companies in Europe who are subsidized by their governments and have thereby been able to take away this 6 to 9 million bushels market in Central and South America on barley malt?

Secretary GLICKMAN. Well, I need to look at the issue specifically. The EEP program, the Export Enhancement Program, is geared to the specific issue of dealing with unfair farm subsidies—it's not just a trade tool. It must be focused on, let us say, the EU or other places that are undercutting us in a way that we need to use this authority to keep markets. So, if what you are saying is an accurate reflection, it would seem to be something that would be suitable for EEP. But we will take a look at this. I presume our folks know about this particular issue, but we may need to contact your office to get more information.

Senator KOHL. I would appreciate that. I think we can provide you with enough information that would hopefully satisfy you that there is some assistance here that is deserved.

Secretary GLICKMAN. Have these constituents of yours filed any other trade complaints under various sections of our trade laws?

Senator KOHL. Well, maybe I can be in touch or you can be in touch and we can work out the facts and maybe some resolution.

Secretary GLICKMAN. Yes.

Senator KOHL. I would appreciate it.

Secretary GLICKMAN. OK.

Senator KOHL. Thank you, Mr. Secretary. Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Senator BUMPERS.

Senator BUMPERS. Thank you, Mr. Chairman. I just have one or two items.

STATUS OF AGRICULTURE

Mr. Secretary, first of all, does the Department have any studies as to what the status of agriculture in this country will be, good or bad or somewhere in between, once the farm subsidies expire?

Secretary GLICKMAN. I will ask our Chief Economist to determine what we are doing there.

But as you know, Congress authorized a Commission on 21st Century Agriculture. In fact, there is a representative. I believe Jim DuPree from Arkansas is on it. You do have somebody from Mississippi on there as well.

They have started to meet and their task is to look at this issue, but not as much from an economic perspective. It is more what comes next, and they are currently doing that. We are having trouble, frankly, providing them the resources they need because our advisory committee budget is so limited. We are trying to do our best to make sure they can at least do some of their work.

Perhaps Mr. Collins might talk about what we are doing in the post-1996 farm bill environment to look at what is going on.

Mr. COLLINS. That is in our plans to look at, Mr. Bumpers. We are going to be releasing on February 23 a 10-year assessment that looks out at agriculture over the next 10 years. But in that assessment, we used the conventional assumption that in years beyond the expiration of the farm bill, we use the level of CCC payments that were available in the last year of the farm bill which is roughly \$4 billion. So, we assume a \$4 billion annual continuation beyond 2003.

But certainly as we move closer to the year 2003, we are going to look at this question in more detail, and I think we will also do it in conjunction with the Commission on 21st Century Production Agriculture.

Secretary GLICKMAN. Yes.

The other thing I would say is that crop insurance is going to have to be the center piece for risk management. This program works pretty well for some, not very well for others. We really need to make it an effective operating tool for all producers. If you are in the Northern Plains and you suffer two, three, four disasters in a row, given the actuarial nature of it, it is a problem. If you are in a place that does not get disasters all that frequently, it can work out very effectively. That is one of the reasons why we have asked for moving it on the mandatory side in order to give it some long-term predictability so it can operate. So, we have looked at that as well.

We have provided some other safety net proposals like loan extensions, other kinds of things that we have asked in our budget before.

But the question is a good question. What happens post-2002? Actually the question may be more relevant, what happens next year and the year after? The first 2 years of Freedom to Farm were quite good for most producers with the payments and the market. They have come out ahead. I think the majority of producers have come out ahead, but I do not know what happens next.

COMMODITY YIELD COMPARISONS

Senator BUMPERS. Mr. Secretary, let me ask you—and if you could just give me a short answer to this—what is the comparison on a per-acre-yield basis of corn, wheat, soybeans? Just take those. Those are basic food crops. What is the comparison of yields now per acre as compared over the last 3 or 4 years? Are they not rather static? Are the yields in this country not rather static? Secretary Rominger or Mr. Collins?

Mr. COLLINS. Actually we are doing much better in soybeans over the last couple of years.

Senator BUMPERS. Is that because of irrigation?

Mr. COLLINS. It is because of a change in agricultural practices. Much higher plant populations per acre are being used in the Midwest, and we also have much better varieties in the South. So, the South is getting much better soybean yields.

We have actually gone up a little bit on wheat yields. If you just look at this past year, 1997, we had the largest wheat crop that we have had in the 1990's, and in the winter wheat areas, Kansas and other areas, we had record high yields.

For corn, we had a 127-bushel-per-acre yield this past year. I think it was the fourth highest in history, the record being in 1994 of about 139 bushels.

So, actually we still do continue to trend up. I know your concern earlier about research is whether we will be able to sustain that trend given the research investment that we have been making.

AGRICULTURAL TRADE BALANCE

Senator BUMPERS. Well, I am concerned about another matter, and that is we depend on farm exports to keep our balance of trade sort of halfway in balance. You stated I think maybe in your statement, Mr. Secretary, that the trade balance afforded by agriculture last year was a plus \$21 billion—

Secretary GLICKMAN. Correct.

Senator BUMPERS. Even though overall exports were \$3 or \$4 billion less than the preceding year.

I am sort of coming back to where I was a moment ago, and that is I do not see, unless we have some unbelievable breakthroughs in research, any way that we can continue to export unless we have much bigger yields than we have had in the past. I do not think we can feed an ever-increasing population in this country and continue to increase our exports abroad unless yields go up much faster than they have been going up.

This is just a country lawyer's sort of common sensical approach to it. It seems to me that where we are headed is for lower exports, not higher, because we are going to have to feed an ever-increasing population in our own country and we are taking a lot of land out of cultivation every year.

Secretary GLICKMAN. I think you have to segregate agriculture a little bit. Bulk commodities—well, there has been some growth and some decline. The big increases in exports have been in value-added, which is livestock, meat, poultry, and fresh fruits and vegetables, and those have been dramatic, profound increases. We talked a little bit about the poultry exports to Russia and related countries. Our export growth has doubled in the last decade, roughly. And much of that growth has occurred in the value-added fresh fruits and vegetables horticulture products.

In terms of the bulk commodities, I cannot give you a projection. A lot of that frankly depends on the income levels of these importing countries. Most of these countries want to be self-sufficient in those commodities, and they look to us kind of as a reservoir of last resort when things get bad.

So, I still think there is great positive potential out there, particularly in the value-added side of the picture.

Senator BUMPERS. I am not quite as sanguine about our future on this as you are.

ASIA'S COMMODITY EXPORT VALUE

The final question, Mr. Chairman. Of the \$56 or \$57 billion in exports in 1997, what percentage of that went to Asia or what dollar figure went to Asia?

Secretary GLICKMAN. I think 40 percent of our exports go to Asia.

Senator BUMPERS. Have you already seen a decline in demand for exports?

Secretary GLICKMAN. A small decrease.

Mr. COLLINS. Our most recent data is only through the month of November from Commerce, but it does look like that, plus anecdotal data do show that our sales have fallen off some.

Secretary GLICKMAN. But let me just tell you the real worry of the dropoff is Korea and Indonesia. We have not seen any material dropoff in China, Hong Kong, Japan, other major markets.

Senator BUMPERS. How did exports to China in 1997 compare with 1996? Can anybody answer that?

Mr. COLLINS. They were a little bit lower. China usually buys about 2 to 3 billion dollars' worth of our products. In 1997 they had a superb wheat crop. They had very large corn stocks, and so they actually became a net grain exporter. This is a country that in the early 1990's was importing 12 million, 13 million tons of wheat, in 1995-96 actually imported 3 million tons of coarse grain, and here in 1997 they became a net grain exporter. So, there has been quite a shift in China because they have been promoting a policy of self-sufficiency in grains.

Senator BUMPERS. They do not import cotton anymore either, do they?

Mr. COLLINS. They are importing our cotton this year. I think we expect somewhere in the neighborhood of 1 million bales of cotton to China this year.

Senator BUMPERS. Thank you, Mr. Chairman.

Senator COCHRAN. On that subject, I think India is another country that has had a turnaround in production in wheat. It used to be a big importer. Now it is self-sufficient and even exporting some as I understand it.

Mr. COLLINS. That's true. They're also increasing their exports of soybeans and they have become a competitor for us in oilseed products in Asia because of their own soybean production.

Secretary GLICKMAN. But notwithstanding that, there is population growth of the world. I hope that you are wrong and I am right. The population growth is significant enough to allow for radically increased demand over the next 10 years if we can capitalize on that.

CONSERVATION PROGRAMS

Senator COCHRAN. There is a substantial commitment in this budget request to conservation which I applaud. We have done a good job, I think, in helping to devise programs to protect more effectively soil and water resources. We have also added another di-

mention and that is incentives for development of wildlife habitat on privately owned land where land is idle. The conservation reserve program has been a big contributor to nurturing wildlife, endangered species, and the rest.

I noticed in the EQIP program, the Environmental Quality Incentives Program, there is a big increase in the request from \$100 million in mandatory funding to a total program level of \$300 million.

What is the justification? Given all these programs that we have seen working effectively, like CRP and the wildlife habitat incentives program, why is it necessary for that big jump proposed in that one EQIP program?

Secretary GLICKMAN. There is a tremendous demand for this program. A lot of it involves small and medium-size livestock operators who sense a lot of problems associated with environmental issues affecting livestock production and the need for water systems and sewer systems and control mechanisms to deal with effluent. That is one thing.

There has also been a big demand from farmers installing practices that improve water quality and the overall health of their watershed. A lot of this was a result of State conservationists and our farm folks around the country saying there is a tremendous amount we could be doing in land practices.

The Deputy might want to comment on this too.

Mr. ROMINGER. I think one reason, as the Secretary mentioned, is water quality and the fact that as a country we are beginning to focus now on the nonpoint source pollution, which means in this case agriculture being one of those. So, this is a program that will help farmers address those areas so that they can improve water quality in the watersheds where they are operating.

EQIP PROGRAM

Senator COCHRAN. Some are suspicious that this program just gives the Department of Agriculture more people to go out and beat up on farmers. But you are saying it provides technical assistance and helps them meet the challenges of meeting these goals and targets.

Mr. ROMINGER. Technical assistance and cost share money.

Secretary GLICKMAN. I think that in the NRCS—the old Soil Conservation Service—there was this belief that they had this club and they hit people over the head, but I think by and large, it is not true any longer. I mean, there may be some Government programs that still do that, but by and large, NRCS is cooperative with the farm groups, conservation districts, related folks.

Senator COCHRAN. So, in this program when the person comes to your farm gate and says, I am from the Government and I am here to help you, he is really on the level? Is that what you are saying?

Secretary GLICKMAN. Theoretically. He would not be coming unless he was asked to come.

Senator COCHRAN. Well, that would be a good attitude to try to develop in the Department in these conservation programs because a lot of farmers are still nervous that when you add money to this program, you are just creating more trouble for them rather than providing technical assistance, as it is called.

Secretary GLICKMAN. It also keeps land in production. Farmers like to farm and if we can provide them assistance to, let us say, prevent soil from washing away, they view this positively.

Senator COCHRAN. I would like for the record to reflect what our enrollment in the wildlife habitat incentives program is anticipated to be in 1998 and what level of CCC funds will be needed to support the enrollment number, what enrollment and level of funding is projected to be needed to support the program in 1999. Those can be submitted for the record. I do not expect you to have all those details in front of you.

LOWER MISSISSIPPI DELTA COMMISSION

There is a submission in the Interior appropriations budget I presume—at least I know there is a request for \$26 million for new economic development initiatives in the lower Mississippi River Delta. Some years ago, Senator Bumpers and I and others proposed a commission to study the lower Mississippi Delta to come up with some answers to the serious problems because of economic stagnation in that area and human resource problems of various kinds. The commission worked for a couple of years, made some recommendations. We implemented some of those. But now the President's budget is suggesting a \$26 million new program to be under the auspices of the Appalachian Regional Commission and its staff.

My question to you is, would this be just as well administered by the Department of Agriculture's Rural Development Agency or some other agency that is available for that job?

There are some of these States, for example, like Louisiana, Arkansas, Illinois, Missouri, which will be in this new program—beneficiaries of this new program—but they are not in the Appalachian Regional Commission area. Some of the Governors have—in particular, the Governor of my State is worried that this is going to weaken the Appalachian regional program and there is some controversy about that aspect of it.

It would be nice to have the benefit of your thoughts on that. I do not want to put you at cross purposes with the President right now in public.

Secretary GLICKMAN. Of course, I will take jurisdiction over anything you want to give us.

The only thing I can say is that I am not personally familiar with the specifics of this. I do know that we have our empowerment zone program. One is in the Mississippi Delta region, and we are working with the Southern EZ/EC Forum, which is an informal organization of communities in the region, including Arkansas, Louisiana, Mississippi, to form a partnership to implement many of the recommendations in the original Lower Delta Commission report. We are talking about expanding the number of zones.

As you know, the empowerment zone concept is basically to do a lot of what they have talked about, which is to bring various Federal agencies together but allow it to be locally driven.

So, all I can tell you is that we will—we are still working on the delta empowerment zone because it has done a lot of good.

But I cannot tell you what the conflicts are. We will raise the issue internally to see what else we might be doing on it.

COCHRAN FELLOWSHIP PROGRAM

Senator COCHRAN. There is a request, I understand, in the budget for \$3 million for funding a fellowship program which we started some years ago to bring students, midlevel managers and others in agriculture and agriculture-related activities, to the United States to learn more about our market economic system and political institutions, hoping that this would develop better relationships between our country and others.

Tell me how that program is working, and if you can for the record, give us a status of that fellowship program so we can see where the money has been spent last year and whether we should add money to that or \$3 million is all we need to fully fund that program.

Secretary GLICKMAN. I would have to tell you this is a very popular, successful program. The Vice President has a commission with South Africa, and it is fascinating to see the impact of the Cochran program with respect to people who have been trained, South Africans who come to this country and train in a variety of areas.

My records indicate in fiscal year 1997 about 700 participants from 45 countries received training through the program. For fiscal year 1998, the number of countries is expected to increase to 49 with the addition of Guatemala, Senegal, Tanzania, and Uganda, and about 760 participants are expected to participate.

So, we have asked for a basic \$3 million which is the same funding level, but I can tell you this program is extremely popular.

SUBMITTED QUESTIONS

Senator COCHRAN. Thank you for that, and we will continue to monitor it and try to be supportive in our committee of the program goals.

There are a number of other questions and areas that we want to explore with you, but my hope is that we can submit all those questions to you and have the answers printed in our record. Other Senators may very well want to submit questions too, and we hope you will be able to respond to them in a timely way.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD SAFETY AND INSPECTION SERVICE

Question. User fees to require industry to pay the cost of meat and poultry inspection have been consistently proposed by the Administration although they have never been authorized. The fiscal year 1999 budget for FSIS again assumes collections from these unauthorized user fees. In the past, the Administration has proposed user fees to cover the costs of pay for overtime of inspectors. The fiscal year 1999 budget user fees to recover the full costs of inspections. Why does the Administration believe this proposal will have any greater success this year?

Answer. User fees are essential to the successful long-term implementation of meat, poultry, and egg products inspection reform. The time for user fees is now before budget restrictions hamper our ability to ensure the safety of the food supply. Each year discretionary funds for USDA have been getting reduced, which has made it more difficult to ensure a stable budget for food safety inspection activities. By converting the program to user fees now, we can ensure that meat, poultry, and egg products inspection get the resources needed to protect the safety of the food supply without an adverse impact on other important USDA programs.

Question. Mr. Secretary, it is unlikely that Congress will legislate these proposed user fees. What impact will adoption of the FSIS's appropriations request have on the country's food safety if the legislative proposal is not accepted?

Answer. In the event that the proposed user fees are not enacted, we will have to seek additional funding for meat, poultry, and egg products inspection to the level needed under current law.

Question. The FSIS proposed budget also requests increases for other food safety program activities. What is the priority of these new increases if an appropriation for inspection activities are required and the full request cannot be provided for these additional activities?

Answer. Maintaining an adequate inspection work force that has the training and tools necessary for conducting effective inspection, facilitating the adoption of HACCP by State inspection programs, and ensuring food safety from farm-to-table are all essential to our mission of improving the safety of the food supply.

Question. The fiscal year 1999 request for the President's Food Safety Initiative includes an \$11 million increase for the Food Safety Inspection Service (FSIS). How will the agency use this money to fund the FSIS portion of this initiative? Please designate which activities are new and which ones are a continuation of current programs. Please prioritize these activities.

Answer. Under the President's Food Safety Initiative, the Food Safety and Inspection Service will facilitate the transformation of State programs to Hazard Analysis and Critical Control Point systems, work cooperatively with other Federal agencies to expand consumer education, and develop voluntary measures to reduce the risk of pathogenic contamination of animals on the farm. These new activities would build on the successes and fill the gaps identified in the President's 1998 Food Safety Initiative. The food safety activities identified as part of the initiative are all of high priority and we urge Congress to fund it as an integrated approach within available resources to reducing foodborne illness.

Question. Farmers are currently over-burdened with regulations. There is much speculation that FSIS will eventually implement regulations which will affect the farmer and his farming operation. In the fiscal year 1999 USDA explanatory notes, there is mention of voluntary activities to deal with food safety issues from the farm-to-table and the collection of data linking "food animal production to processing contamination." Would you please explain these voluntary activities and how the agency plans to implement them?

Answer. We do not have, nor are we seeking, authority to mandate on farm practices. The FSIS Animal Production Food Safety Program is actively working with producers to develop voluntary science-based animal management practices to improve food safety on the farm. To assist producers in dealing with marketing pressures and to improve the safety of the food supply, we are proposing risk assessment and education activities. Risk assessments will help producers identify food safety hazards and measures that can be taken on a voluntary basis to mitigate them on their own behalf. Education is necessary to ensure that producers understand the changes that are occurring within the industry due to HACCP implementation and to communicate the ways risk assessment can assist them in meeting these new challenges.

Question. Does the agency see the need in the future to make these activities mandatory?

Answer. We do not see the need to make any on farm food safety practices mandatory.

Question. How does the agency plan to collect this data and use it once it is collected?

Answer. Successful development of risk assessments and education strategies will require a collaborative effort between producers, academia, and State agriculture and public health agencies. Any data collected to support these activities will be used to assist producers in identifying food safety hazards and cost-effective intervention strategies they can voluntarily utilize on their own behalf.

Question. Mr. Secretary, the National Academy of Sciences is publishing a report this summer on the creation of a single food agency. Are there any joint initiatives that FSIS and the Food and Drug Administration (FDA) are undertaking currently?

Answer. FSIS, FDA, and several other Federal agencies have a close working relationship, which can be seen through the joint implementation of the President's Food Safety Initiative.

Question. What is the Administration's current position on the need to create one single food agency?

Answer. Like Congress, we are also interested in seeing the conclusions of the National Academy of Science and would not like to prejudge them at this time.

Question. The fiscal year 1999 budget request indicates an increase of \$130,000 to provide additional resources to the Under Secretary and the Secretary to support activities associated with the President's Food Safety Initiative. What sort of resources do you mean?

Answer. With the additional resources requested we will be able to support the level of staffing necessary for this office to fulfill its role of building greater public confidence in the safety of the food supply and maintaining the integrity of the Federal inspection system.

Question. The fiscal year 1999 budget request proposes a number of funding increases in support of the President's Food Safety Initiative. Please rank these increases in order of priority.

Answer. The Administration has proposed an integrated food safety initiative that encompasses several high priority activities and involves several Departments and agencies. We encourage Congress to fund this proposal within available resources as a part of the integrated initiative.

NATIONAL COMMISSION ON SMALL FARMS

The Secretary of Agriculture established the National Commission on Small Farms on July 9, 1997, and identified the Natural Resources Conservation Service (NRCS) to provide support to the Commission.

Question. What recommendations were made by the Commission and does the President's fiscal year 1999 budget incorporate these recommendations?

Answer. There were in excess of 140 recommendations made by the National Commission on Small Farms. All of the recommendations are outlined in the January 1998 Report entitled "A Time To Act—A report to the USDA National Commission on Small Farms." A copy of the report is being provided for the record. No additional funds have been requested in the President's fiscal year 1999 budget to implement recommendations of the commission's report. It is anticipated that recommendations can be accommodated through ongoing operations.

Question. Why was the NRCS chosen to support the Commission?

Answer. NRCS was selected because of its long standing history and success in working with outside groups and locally led initiatives.

Question. Is the Commission still in formation and meeting formally?

Answer. The Commission was chartered for a period of up to two (2) years. Although the commission is currently not meeting, it is scheduled to reconvene within nine (9) months of the receipt of their report to provide input on emerging concerns within the Commission's domain.

WILDLIFE HABITAT INCENTIVES PROGRAM

Question. What is the enrollment in WHIP anticipated to be in 1998?

Answer. Enrollment is anticipated to be approximately 170,000 acres under 3,400 agreements.

Question. What level of CCC funds will be needed to support this enrollment in fiscal year 1998?

Answer. This enrollment level will require up to \$30 million in CCC funding.

Question. What enrollment and level of funding is projected to be needed to support the program in fiscal year 1999?

Answer. The enrollment level is expected to be 114,000 acres under 2,300 agreements with a funding requirement of \$20 Million.

CLEAN WATER AND WATERSHED RESTORATION INITIATIVE

The Clean Water and Watershed Restoration Initiative is proposed to be funded under the new interagency Environmental Resources Fund for America. Funding of \$23 million is designated for NRCS participation in this initiative.

Question. Which activities are proposed to be funded through the "Clean Water and Watershed Restoration Initiative"?

Answer. NRCS funding for the Clean Water and Watershed Restoration Initiative in fiscal year 1999 is proposed at \$23 million. This includes a requested increase of \$20 million for partnership grants and \$3 million for natural resources inventory evaluation needs.

Question. Please describe each one and provide the cost of each activity.

Answer. The activities proposed to be funded include partnership grants designed to comprehensively improve water quality to be funded at a level of \$20 million. The partnership grants will enable State and local organizations to hire non-federal watershed coordinators. Also included in the increased funding is \$3 million for improved natural resource inventory evaluation needs. This will enable the develop-

ment of baseline assessments, integration of compatible inventories, and the evaluation of program impacts and will fund an additional 30 FTE's.

DEBT FORGIVENESS

Question. Mr. Secretary, you are proposing that the Congress pass "emergency legislation" to modify the 1996 Farm Bill prohibition on loans to allow farmers with past debt problems and restore creditworthiness to once again be eligible for USDA loans. What is the pressing need for this legislation?

Answer. There are several thousand family farmers who may need USDA farm loan assistance but are prohibited from obtaining it because they received a debt forgiveness on loans that were made to them in the past. This isn't fair. Even the bankruptcy code allows borrowers restore their credit worthiness. Moreover, much of the debt USDA has forgiven over the last several years traced back to the mid-1980's when an accumulation of too much debt coupled with a decline in farm income and land prices produced a credit crisis. These were circumstances beyond the control of borrowers. Further, USDA actually encouraged borrowers to restructure their loans in ways that lead to the debt forgiveness, and borrowers did so without knowing that it would mean they would not be eligible for new loans. In fact, these borrowers were eligible for new loans until the 1996 Farm Bill changed the ground-rules.

Question. Should this legislation be passed by the Congress, how many farmers in your estimation would then be eligible for farm loans?

Answer. Since 1989, USDA provided debt forgiveness to about 73,000 farm borrowers. About 11,000 of these borrowers still have active accounts. There is no information available on the status of the rest of these borrowers. A sizable number may no longer be farming; however, the Department has heard from many former borrowers who are still in business and could use new loans. The legislative proposal would also affect those borrowers who receive a debt forgiveness in the future.

Question. Does the fiscal year 1999 President's Budget assume that these farmers with past debt problems would be eligible for loans? If so, what number of farm loans are estimated?

Answer. The President's 1999 budget is based on current law, which includes limits on the authorized levels for both farm operating and farm ownership loans. With the enactment of the proposed legislation, the additional demand for these loans would be accommodated within the authorized levels. In general, this would mean that there would be increased competition for direct loans, which would most likely affect applicants who do not qualify for targeted assistance as beginning farmers or members of socially disadvantaged groups. Borrowers who do not receive direct loans may, however, be able to obtain a guaranteed one.

COUNTY OFFICE CLOSINGS

Question. Mr. Secretary you have committed not to close any county offices without Congressional input beyond those already named. At the same time, the Department is currently streamlining and collocating offices at the state level.

A. Is there an employee reduction number each State Director is required to meet as a result of the streamlining and collocation of offices.

B. Is staff being reduced on a state-by-state or county-by-county basis? Please explain the rationale used to decide where staffing reductions occur.

C. What are you doing to make reductions in staffing at the state level do not predetermine further county office closures.

Answer. USDA has been downsizing its county-based program delivery offices since 1994 when Congress passed major reorganization legislation. Pursuant to commitments made when that legislation was passed USDA developed a plan to close or consolidate USDA field offices into service centers. We have reduced the number of offices from 3,700 to approximately 2,700 and will be down to below 2,600 by the end of the year. Beyond these office closures we have no specific actions identified at this time.

No employee streamlining plans have been established in relation to the service center collocation effort. However, individual service center partner agencies are managing within their assigned resources and budgets which may impact staffing levels in the field and require further office closures. In addition, we are awaiting the outcome of the Departmental study on the structure and delivery systems of FSA, NRCS, Rural Development and the Risk Management Agency.

WORKLOAD STUDY

Question. USDA has an outside consulting firm conducting a workload study of the farm and rural program delivery system of county-based agencies (FSA, NRCS,

and RD) to be completed on September 18, 1998. What has the consulting firm been told to look at specifically?

Answer. We have contracted with Coopers and Lybrand to conduct a study of the farm and rural program delivery system of FSA, NRCS, and RD. The study will evaluate the county office workload and resources of these agencies in relation to their program responsibilities and customer needs. It will also review ongoing efforts to improve efficiency and identify, assess and, as appropriate, recommend alternative approaches for the organization and staffing of the county based agency delivery system. The results will be drawn upon in developing budget and operational plans for subsequent years.

Question. Are streamlining and collocating of offices postponed until the study is completed?

Answer. We have proceeded with the closure of FSA county offices according to the 1994 plan. The current target for the number of service centers is 2,554. The number of field office locations has been reduced from 3,726 in 1994 to 2,775 at the end of calendar year 1997. Under current plans, office moves and closures will reduce our locations by 221 service centers. However, staffing reductions proposed for 1999 may require a reexamination of our county office structure. Because there is a point at which an office can be too small to function effectively, it may become necessary to further consolidate offices where staffing reductions take place. Results of the study should be useful in any such reexamination of further restructuring and consolidation of field offices. I will consider any closure decisions in light of cost effectiveness and quality of service to the producer, and I will keep the Committee apprised of any prospective closures.

COUNTY COMMITTEE CONVERSION TO FEDERAL STATUS

Question. Much concern exists regarding the impact of converting county committee workers to federal status. Please explain this conversion process of federal employees and county employees. Is this process also postponed by the workload study?

Answer. As you know, I favor converting FSA non-Federal county committee employees to Federal civil service status. Conversion would eliminate the challenges we face in operating two different personnel systems for FSA employees in county offices. We are working with Congress to enact changes in authorization needed to implement the conversion, and the process has not been postponed by the study being carried out by Coopers and Lybrand.

Question. What criteria is being used in this conversion?

Answer. We have proposed that current employees with 3 years of permanent county committee service be given career civil service appointments. Employees with less than 3 years of permanent county committee service would be given career-conditional civil service appointments and the period of current permanent county committee service would be counted when determining the 3 years of service necessary for converting to career civil service status. Temporary county and area office employees with appointments of 1 year or less could be converted to temporary Federal civil service appointments. Former permanent county committee employees would retain reemployment rights resulting from a reduction-in-force. Other provisions would facilitate certification of agreements between labor organizations and USDA concerning bargaining units and their representation.

Question. How does this conversion process play a role in the streamlining and collocation of offices?

Answer. The conversion process is intended to enhance management capabilities and office productivity which should facilitate office streamlining and collocation initiatives. Equitable re-employment procedures are central in both conversion and streamlining activities.

Question. Please explain this Common Computing Environment (CCE) implementation. Why is CCE exempt from the Department's current moratorium on purchases of information technology?

Answer. The county-based field offices are being restructured into Service Centers to improve customer service. At the core of this initiative is a shared information system built on a Common Computing Environment (CCE) that will provide Service Center staffs access to customer, program, technical, and administrative information, regardless of the agency they represent. The CCE is based on identified business needs and will provide the enabling technology for implementing reengineered business processes to provide one-stop service to customers.

The CCE will enable USDA to: optimize the data, equipment, and staff sharing opportunities at the service centers; overcome the extreme limitations of the current legacy systems; and enhance customer service into the 21st Century.

In fiscal year 1998, a business integration center has been established to facilitate the development of reengineered business applications and pilot testing at nine USDA Service Centers, as well as, test and evaluate information technology alternatives. Depending on the availability of funding, the plan is to achieve complete migration from legacy systems to the identified CCE by 2002.

CCE is not exempt from the current moratorium on purchases of information technology. OCIO is working closely with the Service Center Implementation Team and will review any contract actions requiring waivers, as necessary.

LOWER MISSISSIPPI DELTA

Question. The fiscal year 1999 budget proposes a \$26 million increase in the Interior budget for a new economic development program for the lower Mississippi Delta.

Does the Rural Development Agency have the existing structure to implement a new economic development program in the lower Mississippi River Delta? If so, why is this proposal not under USDA's jurisdiction?

Answer. I cannot answer the question as to why the proposal for the new economic development initiative for the lower Mississippi Delta was in the budget as it was. The proposal was not discussed with the Department. However, USDA does have a structure in place that could administer the program and we have been working on an effort involving the lower Mississippi Delta Center and the Empowerment Zone and Enterprise Communities in the Delta to pool their resources and efforts to more comprehensively address the economic and community development problems in the Delta. A Memorandum of Agreement between these parties is scheduled to be signed in March of this year.

SALARIES AND EXPENSES

Question. The fiscal year 1999 budget includes \$529 million for the administration of USDA's rural development programs, including the Alternative Agricultural Research and Commercialization Corporation (AARC). This amount includes funding for 7,138 staff years, which is a decrease of about 150 staff years below the fiscal year 1998 level.

In what areas of Rural Development does the decrease of 150 staff years occur, and how will the reductions be accomplished?

Answer. The reductions occur throughout the Mission Area; 80 in the Rural Housing Service; 49 in the Rural Utilities Service; and 24 in the Rural Business-Cooperative Service. My policy is that the reductions will primarily come from administrative areas rather than program areas. I anticipate that administrative convergence will provide the reductions.

ENVIRONMENTAL RESOURCES FUND FOR AMERICA

Question. The fiscal year 1999 Budget proposes the Environmental Resources Fund for America which would include funding for the Rural Community Advancement Program (RCAP). Why did the Administration include the RCAP in its proposal for the Environmental Resources Fund? What areas of the RCAP are included in this fund?

Answer. The Environmental Resources Fund is an attempt to show all environmental expenditures in one area. Only the Water and Waste funding for Water 2000 is included in the Fund.

BOLL WEEVIL ERADICATION LOANS

Misinformation regarding the interest rate in calculating the boll weevil eradication loan program was given last year, resulting in a shortfall of \$250,000 in appropriated funds which would have supported approximately \$22 million in guaranteed loans.

Question. How many loans were made to farmers and what was the total of those loans in fiscal year 1997?

Answer. Three loans were made in fiscal year 1997 totalling \$39,999,500.

Question. What is the anticipated number of loans that will be made this year?

Answer. The 1998 budget assumes that five boll weevil loans will be made this year. However, there are no applications on hand at this time, so it is difficult to tell what will happen.

Question. How much is needed in additional funds to fully meet the demand for these loans in fiscal year 1998?

Answer. As I mentioned, we do not have any applications on hand at this time, and it is very difficult to predict the demand for this program because the amount

requested per application is relatively large. The \$30 million included in the 1999 budget should, however, be adequate to meet the demand.

1998 SUPPLEMENTAL APPROPRIATIONS

I understand the administration will be proposing supplemental funding for fiscal year 1998 to increase the Departmental Administration budget by \$4.8 million and the Office of the General Counsel budget by \$235,000 to enhance funding for the Department's Civil Rights. To offset these amounts, the Department has proposed to reduce the largest USDA salaries and expenses accounts across the board. In particular, the Farm Service Agency's salaries and expenses account has been targeted to be cut by \$1,080,000.

Question. Currently, the FSA has had to RIF 170 people this year. What additional reductions in force, if any, will be required if this proposed rescission to cut salaries and expenses in FSA funding is enacted?

Answer. The Farm Service Agency (FSA) is anticipating a reduction in force of 152 people in fiscal year 1998. The proposed rescission of \$1.080 million is not expected to result in any additional staff reductions beyond the expected 152. Instead, the impact of this cut will mainly affect the non-salary portion of FSA's budget which includes funds for equipment, travel, supplies and contracted services.

Question. In Rural Development, the budget reflects a 153 staff year reduction from fiscal year 1998 to fiscal year 1999. What additional reduction in staff will be required if this proposed rescission to cut salaries and expenses in RD funding is enacted?

Answer. There will be no further staff year reductions resulting from the proposed rescission. Rural Development will defer planned expenditures in information systems to compensate for the proposed rescission.

Question. What will be the impact of each of the other proposed rescissions in salaries and expenses funding, by account, on each agency activities?

Answer. The proposed rescissions are based upon total FTE's and the use of the Department's civil rights resources, and in total, represent about one-tenth of one percent of the total appropriations. The rescissions will not have a noticeable impact on the involved programs. The agencies affected by the rescissions will be making small across-the-board reductions.

Question. What is the urgency of providing the supplemental funding requested for the Department's civil rights efforts?

Answer. These resources are needed to meet the Department's strategic objective of ensuring that all customers are treated fairly and equitably with dignity and respect. The funds will support additional staffing to improve personnel services and assistance to USDA agencies, including ethics compliance; to improve outreach to USDA customers including support for the new USDA Office of Outreach that will ensure all customers, especially under served populations, have full access to USDA programs and services; and to enhance management employee relations that support early resolution of employee grievances and conflicts within USDA.

It is hoped that these supplementals will be enacted by the end of March.

An increase of \$4.8 million is requested for Departmental Administration consisting of:

- \$1,123,000 for Human Resources Management activities,
- \$1,004,000 for outreach to USDA customers, institutions, and businesses,
- \$273,000 for conflict resolution,
- \$1,900,000 for ongoing policy, oversight, and program activities conducted by Human Resources Management, Office of Operations, Procurement and Property Management, Office of Administrative Support, and Small and Disadvantaged Business Utilization,
- \$500,000 to establish a commission on civil rights.

An increase of \$235,000 is requested for the Office of the General Counsel which would staff the newly created Civil Rights Division and continue to reduce the backlog of complaints pending.

AGRICULTURAL RESEARCH SERVICE BUILDINGS AND FACILITIES

The President used his line-item veto authority to cancel funds appropriated for fiscal year 1998 for planning and design of two ARS replacement facilities: (1) the Biocontrol and Insect Rearing Facility in Stoneville, Mississippi (—\$900,000), and (2) the Poisonous Plant Laboratory in Logan, Utah (—\$600,000).

The rationale given for cancellation of funding for each project was: (1) the funds weren't requested by the President; (2) additional appropriations would be required in the future; and (3) the need for additional research facilities is under review by the Strategic Planning Task Force, due to report in April 1999.

Funding for the Biocontrol and Insect Rearing Facility in Stoneville, Mississippi, was initiated on the basis of a USDA report on insect rearing capabilities which the Committee requested in fiscal year 1997. While the President's cancellation message notes the fact that ARS conducts insect rearing at nearly 30 locations as a reason for removing the funding for the new insect rearing facility, the ARS report notes that "most of these operations are not of major concern * * * as they are location specific and produce only a small number of insects for limited use." The USDA report indicates that the only three major facilities that produce large numbers of insects in support of many important projects that are in Starkville and Stoneville, MS, and Honolulu, Hawaii—the Starkville facility being ARS' primary insect rearing laboratory.

A copy of the report is submitted for inclusion in the record.

INSECT REARING FACILITIES

INTRODUCTION

Senate Report No. 104-317, accompanying the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriation Act for fiscal year 1997, contained the following request by the Senate Committee on Appropriations:

The Committee is informed of the critical importance of the role of ARS in terms of insect rearing capabilities for purposes of the development of new technology in crop production. The Committee is interested in obtaining a summary of the capabilities of FIRS to meet present and future needs for insect rearing, and specifically requests that a proposal be submitted to the Committee outlining these needs prior to the submission of the fiscal year 1998 budget. The Committee further directs ARS to refrain from closing any existing facilities or programs aimed at insect rearing until the results of this study have been reviewed by the Congress.

In response to this directive, an internal Agricultural Research Service (ARS) assessment of insect rearing facilities was conducted with input acquired from external location review committees. Based on these assessments, this report outlines facility needs in support of two primary areas of crop production. The proposed facilities will support new insect and weed control technologies for the southern U.S., California, and Hawaii.

BACKGROUND

ARS conducts research on, and pilot scale production of, many different insects in support of Integrated Pest Management (IPM) programs in a variety of crops. Efficient production of high quality insects is essential for their successful use. Mass reared insects are used as test organisms when developing resistant host plants, biorational/chemical controls and in basic biological studies, or are used directly in biologically-based control strategies such as the release of sterile insects or biological control agents. Application of these technologies using mass reared insects has allowed the eradication of the screwworm fly from North America; aided in the elimination of the Mediterranean and/or other fruit flies from California, Florida, and Texas; and many similar successes with pests from various crops.

A number of new technologies now being developed by ARS are dependent on the release of large numbers of beneficial insects, however, the efficiency of insect rearing has been identified as a limiting factor that needs additional research. Examples of biologically-based technologies in this category include, but are not limited to, viruses that control *Heliothis*, parasites that control the boll weevil, beetles capable of killing leafy spurge, parasites that search out and attack fruit flies, and many of the pests themselves that can be used directly in sterile insect release programs for control. These organisms are typically grown under controlled environmental conditions, packaged and distributed by the insect producer, and then taken to the field where they are applied to control the target pests. Unfortunately, mass rearing technology and facilities within ARS are based on 1960's (or earlier) technology, and thus are severely outdated and no longer capable of fulfilling the current or anticipated research and development needs.

THE ROLE OF MAJOR INSECT REARING FACILITIES IN ARS

Mass rearing facilities fulfill two primary roles in ARS research programs. First, they produce large quantities of test organisms to supply researchers with adequate amounts of products to test new control strategies at realistic levels of operation. This is extremely important in the development and evaluation of new area-wide

IPM technologies prior to full implementation by action agencies or farmers. Second, they allow limited laboratory rearing methods to be scaled up for mass production using industrial-sized equipment and handling techniques. Making the step from the laboratory bench to production scale operations is a significant component of ARS research that involves designing new equipment, improving handling methods, and evaluating product quality.

CURRENT ARS INSECT REARING FACILITIES

ARS conducts insect rearing at nearly 30 locations in support of local research and action programs. Most of these operations are not of major concern for this report as they are location specific and produce only a small number of insects for limited use. ARS, however, operates three major facilities that produce large numbers of insects in support of many important projects. These facilities are located in Starkville and Stoneville, Mississippi, and Honolulu, Hawaii, and are the focus of this report.

Mississippi

The facility in Starkville (Robert T. Gast Insect Rearing Facility) is housed in a 24,000 sq. ft. State owned building adjacent to ARS laboratories on the campus of Mississippi State University. Although the Gast Facility is ARS' primary insect rearing laboratory, it is severely limited in its production capabilities as the building, supporting utilities, air handling capabilities, and existing equipment are inadequate to meet production requirements and also do not meet existing safety specifications. Future expansion of the University campus is expected to displace the existing Gast Facility building.

Insect rearing in Stoneville is temporarily and inadequately housed within the main laboratory building at the ARS Jamie Whitten Delta States Research Center. Several different species of insects important for corn and cotton production and an insect pathogenic virus being used in a 201,000 acre area-wide management program for *Heliothis* are produced in this temporary housing. The building in which insects are reared was built for biology research and is not properly designed to handle insect rearing or microbial production which needs to be conducted under highly sanitary conditions, with specialized air, water and waste handling systems.

ARS proposes to combine the two facilities from Stoneville and Starkville into a new 50,000 sq. ft. laboratory and pilot plant that will be located adjacent to the main laboratory at Stoneville.

Hawaii

The ARS fruit fly rearing facility is located on University of Hawaii property in a residential area of Honolulu and is housed in old World War II Quonset huts. Being surrounded by a densely populated residential area has caused ARS problems of compatibility with the local community due to odor and waste disposal. Several species of fruit flies and parasites are mass produced in this facility that is in severe need of replacement. The State has requested that ARS vacate this facility in the near future.

NEED FOR NEW FACILITIES

Despite hundreds of millions of dollars spent by agricultural producers on insect and weed control, and millions of pounds of pesticides being applied to vast areas of the U.S. each year, pests continue to cause severe losses to a large number of crops. In two recent reports, the National Academy of Sciences (1996) and the Congressional Office of Technology Assessment (1995) called for increased research and development of new biologically-based pest control technologies to improve control effectiveness and reduce the use of chemical pesticides. One of the primary factors limiting the development of new biologically-based technologies (biological control, sterile insect release, etc.) is our lack of ability to mass produce high quality and effective agents at economically acceptable costs. The proposed new facilities should eliminate this constraint.

Laboratory and Pilot Plant Facility at Stoneville, Mississippi

Although ARS has developed and successfully demonstrated augmentative biological control technology and products on a small scale, specific scale-up research and pilot plant production needs to be investigated and improved so that industry can further develop and commercialize these new technologies for U.S. producers. The proposed mass propagation facility will include both developmental laboratories and a pilot plant to address these needs. The pilot plant concept was created to allow co-development of commercial scale equipment, improve operational level processing systems, to develop and test other scientific advances in insect mass rearing, and

to accelerate technology transfer in cooperation with industry. The projected cost of construction for a new 50,000 sq. ft. facility is estimated to be \$10 million (\$200 per sq. ft.).

Laboratory and Quarantine Facilities in Hawaii

The fruit fly rearing laboratory in Hawaii is needed to provide adequate facilities and equipment in support of evaluating new fruit fly strains for use in action agency programs; to develop new rearing/handling methodologies to improve the quality, longevity, competitiveness and economics of mass reared fruit flies for use in sterile insect release programs; and to develop new cost-effective means of mass producing beneficial parasites of fruit flies that can be released into the environment to control these pests. Due to the quarantine status of many fruit flies in the U.S., this facility must maintain a limited number of quarantine laboratories and small scale rearing rooms. The projected costs of construction for a new 20,000 sq. ft. facility are estimated to be \$5 million (\$250/sq. ft. due to quarantine needs). The proposed ARS Fruit Fly Rearing Research Laboratory will be located adjacent to the U.S. Department of Agriculture, Animal and Plant Health Inspection Service (USDA-APHIS) and the California Department of Food and Agriculture facilities in Waimanalo, Hawaii. This facility will address research needs for fruit fly control in fruit and vegetable crops supporting implementation programs conducted by the States of California and Hawaii. This facility will complement the existing APHIS mass production facility in Hawaii which collectively will support fruit fly suppression and eradication in Hawaii to prevent mainland infestation and greatly enhance the agricultural production and export potential from Hawaii.

CONCLUSION

The need for new insect mass rearing facilities within ARS that support research and control efforts for major pests such as the boll weevil, cotton bollworm, European corn borer, Mediterranean fruit fly and other pests is clear. By combining two old and inadequate facilities in Mississippi into a single new facility at Stoneville, ARS will be better able to develop and support USDA and grower action programs in field crop pest control. This facility will be linked with private industry through pilot plant operations for scale-up production of organisms of commercial value. Operations at the proposed Stoneville facility will be housed in a new 50,000 sq. ft. building that is projected to cost \$10 million. The proposed ARS Fruit Fly Rearing Research Laboratory in Hawaii will address research needs for fruit fly control in fruit and vegetable crops supporting implementation programs conducted by the States of California and Hawaii, and USDA-APHIS, and is estimated to cost \$5 million. A small section of the Hawaii facility will be constructed to maintain pest and beneficial insects under quarantine conditions.

Question. Does the Department recommend new insect rearing facilities, as the USDA report to the Committee submitted by Dr. Woteki indicates?

Answer. The Department still believes that two new high production, modern insect rearing facilities will need to be constructed as described in the USDA/ARS Insect Rearing Facilities Report submitted to Congress in fiscal year 1997. This will require combining the two facilities at Stoneville and Starkville into a new 50,000 square feet laboratory and pilot plant in Stoneville to address corn and cotton pests. Also required is construction of a new fruitfly rearing facility in Hawaii to develop new rearing/handling methodologies to improve the quality, longevity, competitiveness and economics of mass-reared fruitflies for use in sterile insect release programs, as well as to develop new cost-effective means of mass producing beneficial parasites of fruit flies than can be released into the environment to control these pests in Hawaii and in the continental United States.

Question. When will each of these new facilities be needed?

Answer. Although the need is not immediate, ARS will eventually need to move forward with construction and completion of these projects to fulfill the Department's and the nation's long-range IPM goals, to furnish new biologically-based replacements for chemical pesticides that will be removed in the next several years as a result of FQPA, and to fulfill the needs of USDA and grower action programs in field crop pest control. Decisions on when to make these investments in new facilities will be reviewed annually as system-wide facility needs are considered and priorities established for the annual budget.

Question. The President's fiscal year 1999 budget again proposes to closed down the ARS Prosser, WA; Mandan, ND; Orono, ME; and Brawley, CA facilities and to transfer the Melaleuca, FL facility from the Corps of Engineers to USDA and initiate construction funding for this facility in fiscal year 1999. Why isn't the Administration proposing to wait for the Task Force conclusions before making these proposals?

Answer. The President's budget requires the reallocation of existing resources to finance new, high priority research needs. A number of projects carried out in ARS research stations at Prosser, Washington; Mandan, North Dakota; Orono, Maine and Brawley, California, were identified as less critical. Given these programmatic decisions, management considerations lead to recommendations to terminate and redirect resources to new research initiatives and close the mention research stations. We believe there is adequate information for Congress to act on these relatively straight forward recommendations at this time without formal input from the Strategic Planning Task Force.

Question. Please give the Department's assessment of the adequacy of the current ARS Poisonous Plants Laboratory office and laboratory space.

Answer. The structure that currently houses the 20 staff of the ARS Poisonous Plants Laboratory in Logan, Utah, is inadequate. The patch-work building is too small and outmoded to fill the needs of the current research program. The original metal building was constructed in 1962. Four additions were constructed, the latest in 1984, but the building is again too small to provide sufficient office and laboratory space. The design is inefficient and awkward to utilize, difficult to manage, and expensive to maintain. The building has 7,725 sq. ft. of floor space, including laboratories and offices. The heating, ventilation, and air conditioning (HVAC) system does not properly heat and cool the building, causing personal discomfort and analytical instruments to malfunction. The HVAC system is marginal in terms of meeting OSHA laboratory standards for air quality. Corrective measures have been taken, but expensive repairs and replacement of HVAC equipment on this old structure are not justified.

Question. Why didn't the reasons given by the President for cancellation of the Stoneville, MS, and Logan, Utah, ARS replacement facilities also apply to the unrequested funds provided for fiscal year 1998 for planning and initial construction of the Western Human Nutrition Research Center in Davis, CA, replacement facility, and the Jornada Range Research Center in Las Cruces, NM?

Answer. Funding provided for the construction projects in Utah and Mississippi was vetoed by the President under the line-item veto authority for the following reasons: (1) the projects were not requested in the fiscal year 1998 budget; (2) the funding was for planning only and would require future additional resources for construction costs; (3) the need for additional research facilities is currently under review by the Strategic Planning Task Force mandated by the 1996 Farm Bill to review potential consolidations of Federal agricultural research facilities. The Task Force report is due in late spring of 1999. In addition, ARS conducts insect rearing at nearly 30 other locations.

Because of other factors, funding for the Davis and Jornada projects was not vetoed. In the case of the Davis, CA project, relocation of the WHNRC from San Francisco, is necessary due to the likelihood of substantially increased leasing costs at the current site. This facility is one of six ARS Human Nutrition Research Centers and the only Center responsible for testing the biological efficacy of nutrition intervention programs. Research conducted at the Jornada Research Center in Las Cruces, NM is a key component of the ARS grazing lands program. ARS scientists, and collocated collaborators from NRCS, EPA, and NSF are currently housed in a temporary facility. Both relocations will foster continued cooperation between ARS and university scientists by co-locating the ARS lab with university facilities.

FOOD RECOVERY AND GLEANING

Question. Mr. Secretary, last year we spoke about the Department's food recovery and gleaning efforts. You commented at the time that this is an area "where government can be a facilitator, without costing any money."

The fiscal year 1999 budget proposes \$20 million for a new community-based food recovery and gleaning program. Would you please explain this proposal and why federal funding is now required for what you last year described to be a "no-cost" federal effort?

Answer. Senator Cochran, you are correct. Last year I noted that government can be a facilitator without costing any money. Government can also take a more active role. And in this case, an active role is warranted. We can multiply the value of the money we provide to local charities working on food rescue, and dramatically increase the amount of food that they can safely acquire distribute to the needy.

As you may know, the Department estimates that 96 billion pounds of foods was lost in 1995. Not all of this is wholesome and nutritious, or food that could be economically recovered by volunteer groups. However, with a little bit more effort, we can rescue a whole lot more than we are today—currently we rescue less than one half of one percent—and we can use that food to feed hungry people. A key impedi-

ment is one-time ramp up expenses that local organizations and charities must incur as they take on the challenge of safely acquiring and distributing perishable foods. Our proposal will help local communities pay for vans and trucks, specialized containers to pick up usable food, other supplies, and training for both staff and volunteers in how to safely handle the food.

FOOD AND NUTRITION PROGRAM RESEARCH

Question. Would you please explain how the Economic Research Service is executing the nutrition research and evaluation program for fiscal year 1998 and why the Administration believes the Food and Nutrition Service can better oversee and administer these research funds?

Answer. I understand that ERS has consulted with many government agencies, private and non-profit organizations, universities, and the Food and Nutrition Service to solicit input for program development. A recent conference under the auspices of the National Academy of Sciences was sponsored by ERS to help design and focus the program. ERS plans to operate a nationally diverse program which draws on the research capabilities of the public and private sectors, including the nation's academic institutions.

Despite the excellent work that ERS has done, the Administration believes this research and evaluation program should be overseen and administered by the Food and Nutrition Service. FNS has detailed knowledge of the country's food programs and, because they administer and have oversight responsibility for the programs, they better understand the research and evaluation needs of the food programs.

Question. Would you please describe this initiative, its importance, and long-term cost?

Answer. The National Food Genome Initiative (NFGI) is an essential component of USDA's Research Agenda. It will vastly expand our knowledge of the genetic make-up for species of importance to the food and agricultural sectors. This knowledge is the key that will permit the U.S. to develop and use new genetic technologies for improvement in yield, pest resistance, production, and quality of the domestic agricultural output. The Initiative will focus on mapping, identifying, and understanding the function and control of genes responsible for economically important traits in the major agriculturally important species of plants and animals and associated microbes. The Initiative expands the scope of the National Plant Genome Initiative (NPGI)—a long term project of the National Science Foundation, the National Institute of Health (NIH), the Department of Energy, USDA, and the international research community. NPGI is described in the recently published report from the National Science and Technology Council (NSTC). (A copy of the NSTC report is being provided to the committee.)

The research for NFGI will build upon the foundation established in the current USDA genetic research programs. In this way, USDA will continue to acquire a full understanding of the genetics of economically desirable plants, animals, and microbes, and will simultaneously enhance the employment of new and developing genomic technology needed to achieve a safe and secure food supply. It will build upon current genomic research, such as the Human Genome Initiative and the Arabidopsis Genome Research Project, to understand gene structure and function which is expected to have considerable payoff in crop species ranging from corn to soybean to cotton and animal species ranging from cattle to swine to poultry.

In fiscal year 1999, the Department proposes investing \$40 million in the NFGI. The funds would be used primarily for whole genome sequencing for rice and Arabidopsis; expressed sequence tag (EST) analysis for corn, soybean, cattle and pig; data base enhancement and interface for species data bases; and functional genomics. In fiscal year 2000 and 2001, it is envisioned that the Initiative will increase to \$70 million and \$100 million respectively, and then continue at \$100 million per year, adjusted as appropriate for advances in technologies and scientific knowledge, and as funds are available within overall spending limitations.

I understand that the Department's fiscal year 1999 request includes \$30 million increase in discretionary appropriations for this initiative and proposes legislation to provide for an additional \$10 million.

Question. What authorization is needed for this proposed research initiative and is the additional \$10 million proposed an authorization for appropriations or direct spending?

Answer. The fiscal year 1999 budget proposes new legislation to establish a Food Genome Competitive Research Grants Program to support the Federal investment in NFGI and to authorize annual appropriations to finance the program. The budget recommends \$10 million in discretionary spending for the Initiative under this new authority to support competitively awarded projects.

COMMISSION ON 21ST CENTURY PRODUCTION AGRICULTURE

The fiscal year 1999 budget request an increase of \$350,000 to fund the Commission on 21st Century Production Agriculture authorized by the Federal Agriculture Improvement and Reform Act. Last year, the budget request a separate appropriation of \$1 million for the Commission. The Committee did not approve that request but left it to the Department to make funding available for the Commission within the overall limitation on obligation for activities of advisory committees, panels commissions, and task forces.

Question. Why has the request for the Commission fallen from \$1 million last year to \$350,000 for fiscal year 1999?

Answer. Last year's request assumed the Commission would employ a staff of several persons, hold an ambitious schedule of meetings and hearings, award research contracts, and publish the reports. Since that request was submitted, the Commission members have been appointed and met. This year's request was developed in consultation with the Commission. Given the lack of appropriations last year, the Commission has scaled down their planned activities. Current plans for fiscal year 1999 call for the employment of only one staff person, no research contracts, less frequent meetings, and limited distribution of printed copies of the reports.

Question. Is funding being made available for the Commission for fiscal year 1998 within the overall \$1 million limitation on obligations for such activities? If so, how much is being provided and which agency is bearing the cost?

Answer. The Commission is being provided up to \$50,000 for fiscal year 1998. The \$50,000 will be made available within the overall \$1 million limitation on obligations for such activities. At this time, no funds have yet been made available to the Commission and the decision has not been made as to which agency is bearing the costs.

CHIEF ECONOMIST: AGRICULTURAL WEATHER SERVICES

Increased funding was provided to the Office of the Chief Economist for fiscal year 1998 to improve weather and climate data for agricultural areas.

Question. Would you please explain the agricultural weather initiative more fully. Also, how are the fiscal year 1998 funds being spent and what additional resources will be required in fiscal year 1999 and each future fiscal year to fully carry out this program and for what specific purposes will these funds be required?

Answer. Weather data is a key input to agricultural production forecasts, disaster assessments, fire and flood control, conservation and natural resource programs, global change analysis, environmental monitoring, and drought mitigation. Program and budget cuts underway in the National Weather Service (NWS) have significantly curtailed meteorological data and services formerly available to USDA. For example, as a cost cutting measure, NWS recently announced it will cease delivery of weather charts and satellite imagery used extensively by USDA.

The Office of the Chief Economist (OCE) is using a portion of the fiscal year 1998 funding to purchase computer hardware and software compatible with that being adopted by NWS. When fully implemented, this will be USDA's only source for obtaining NWS data products.

The remainder of fiscal year 1998 funds are being used to collect, quality control, and disseminate weather and climate data in agricultural regions no longer covered by the NWS. In fiscal year 1998, USDA is acting to mitigate NWS data losses in the southeastern United States, a prime agricultural area where weather and climate data gaps in agricultural areas have been well documented. A data collection center is being staffed at Stoneville, Mississippi which will concentrate on improving data collection in key agricultural states including, Mississippi, Florida, Alabama, Georgia, and South Carolina.

For fiscal year 1999, OCE is seeking additional modernization funds and staff to continue software development to improve access to and delivery of NWS data and forecasts to additional USDA field sites.

Also during fiscal year 1999, data collection efforts will expand beyond the southeastern United States. The staff at Stoneville will be increased, and additional cooperative agreements will be established to acquire agricultural weather and climate information in Texas, Louisiana, and parts of the southern and central Plains.

Beyond fiscal year 1999, initiatives will be directed at completing data acquisition activities across the remainder of the nation's agricultural areas, specifically, the Plains, Great Lakes, and Midwest. The exact funding requirements will vary depending on the extent of weather data collected and the agricultural areas covered.

CIVIL RIGHTS

Question. Mr. Secretary, at your request, additional funds were provided for fiscal year 1997 and again for the current year for the Office of Civil Rights to address the backlog of pending equal employment opportunity and program discrimination complaint cases. However, the backlog of cases seems to have grown, not diminished.

Is any progress being made in this area?

Answer. Significant progress has been made with both program complaints and employment complaints. Experience by others has shown that when an agency starts to address complaints after a period of time in which they were not acted upon there is a sudden flood of complaints filed by those who are hopeful that their case will be seriously considered. Once these complaints are filed, the filing rate diminishes.

Question. How many cases were closed at the end of fiscal year 1997, how many were pending in the courts; and how many had not been addressed?

Answer. When the Department focused on addressing complaints filed with USDA in late fiscal year 1997 and early fiscal year 1998, we discovered that the basic case load information was confused and incomplete. Some complaints that were submitted over the past few years had not been properly logged into the system, and others were inaccurately included in the case file with similar cases instead of being counted as new ones. The backlog of program complaints were not updated and verified until November 1, 1997, and employee complaints until January 1, 1997. As of these dates, 1,129 of the 3,179 complaints filed were closed, and 2,050 were active. Normally there would be no active program complaints pending in court. However, the latest amended list in the Pigford class litigation contains 351 names of which 143 have complaints filed with the Office of Civil Rights. Of these, 43 were filed before February 21, 1997.

Question. Please provide this same information for fiscal year 1998 to date.

Answer. Two hundred eighty new cases have been filed since the backlog was verified. Fifteen of these cases have been closed and two hundred sixty five are active cases.

Question. How many of the above cases are employee complaints and how many are complaints by farmers?

Answer. Out of the 3,459 complaints that we have on file, 1,118 are program complaints and 2,341 are employee complaints. Of the program complaints, 155 are from farmers. USDA has closed 229 of the program complaints and 915 of the employee complaints.

Question. What are the Department's plans to address the pending cases?

Answer. In addition to re-establishing the program complaints investigations unit this year, the program complaint process is being accelerated through contracts with 10 investigative firms, 14 temporary investigators, more than 20 part-time law students, 10 temporary support staff, and about 10 detailed employees to resolve the entire backlog in a methodical and organized manner. New cases that have been received are being addressed using a re-engineered process that should process and resolve each new complaint within 180 days under normal circumstances.

Backlogged employee complaints are being resolved to the extent possible through a mediation process that uses USDA employees and mediators outside the Department. For example, the Forest Service resolved 75 percent of its backlog cases through mediation during a special initiative this past fall and winter. New cases that are relatively clear cut are being quickly addressed by in house staff to reduce the time and cost to resolve them.

Question. Last year, you indicated to Senator Robb that the most pressing need for the Office of Civil Rights was to establish the civil rights investigative unit and that unit was critical to addressing the backlog of cases and ensuring timely resolution of future complaints. Why wasn't that unit funded from the funding increase the Department received for fiscal year 1997, and has that unit now been established?

Answer. We did not want to simply hire more employees until we had examined and understood the extent of the workload and how past procedures used by USDA to handle these cases had contributed to the backlog. Consequently, most of last year's funds were used for these purposes. We also concentrated on addressing those cases which had a potential to be quickly resolved.

Our intention is to improve both how we deal with the complaint process and how we can make institutional changes in USDA policy and employee attitudes and actions that will prevent future situations that lead to complaints. The program complaints investigations unit has been established and is responding to the program complaints that have been made against the Department. At the same time, other oversight, policy and program actions have been proposed to further ensure that fair

and equitable treatment is provided to USDA customers through services to the public.

Question. Of the increased funding requested for fiscal year 1999 for civil rights related, how much of this is for the processing and resolution of complaints?

Answer. The increased funding requested for civil rights activities will be used to strengthen the Office of Human Resources Management, the Office of Outreach and conflict resolution capabilities, so we can serve USDA customers and employees better and prevent future discrimination complaints.

About \$170,000 of the total proposed increase for fiscal year 1999 would be used to cover increased pay and operating costs for the Office of Civil Rights to process and resolve complaints.

Question. How does this compare with the current level of resources devoted to these activities?

Answer. About \$3.5 million will be spent to resolve program complaints in fiscal year 1998 and nearly \$3.7 million will be needed for fiscal year 1999.

The fiscal year 1999 budget proposes \$250 million for civil rights-related activities. This is an increase of \$150 million above the fiscal year '98 level.

Question. Please list the individual activities for which increased funding is requested in the fiscal year 1999 budget and indicate the fiscal year 1998 funding level and staffing levels for each activity compared with those requested for fiscal year 1999.

Answer. We will provide this information for the record.
[The information follows:]

USDA CIVIL RIGHTS INITIATIVE—BUDGET AUTHORITY

[Dollars in millions]

Program	1998 current estimate	1999 budget
Fund Civil Rights Activities in DA	\$12.8	\$17.8
Improve Outreach to USDA Customers and Socially Disadvantaged Farmers and Ranchers	3.0	10.0
Civil Rights Division Within OGC	0.2	0.9
Fund Small Farms Initiative		4.0
Address Disparities in Funding of Institutes of Higher Education:		
1890 Facilities	8.0	12.0
Extension Services—1994 Institutions	2.0	3.5
Hispanic Serving Institutions Education Grants	2.5	2.5
Extension Indian Reservation Program	1.7	5.0
Farm Ownership and Farm Operating Loans:		
Farm Ownership at \$85 million level in 1999	6.0	13.0
Farm Operating Loans at \$500 million level in 1999	32.0	34.0
Farm Labor Housing Program:		
Subsidy for \$32 million in loans in 1999	7.3	17.0
Farm Labor Housing Grant Level	10.0	13.0
Rural Rental Assistance Payments	5.0	10.0
Address the Needs of Farmworkers: Fund NASS Pesticide Use Survey	5.7	7.1
Provide Increased EQIP Funds to Low-Income Farmers and to Address Environmental Needs		100.0
Total, Civil Rights	96.2	249.8

In addition to the request for funding, the budget also reflects increased staffing levels for some of the previously listed activities. These include the following:

Administration.—An increase of 62 staff years. This will improve civil rights related personnel services and technical assistance to agencies, increase outreach and assistance efforts to under represented customers and groups, enhance management-employee relations and support early resolution of complaints. The increase includes staffing for the newly established Office of Outreach within DA to assure that all eligible customers have access to USDA programs and services and for the Socially Disadvantaged Farmers Outreach Program, which is authorized by Section 2501 of the Food, Agriculture, Conservation and Trade Act of 1990.

An increase of 8 staff years is proposed to facilitate the processing and adjudicating of civil rights complaints by expanding the civil rights division in OGC.

Research, Education, Extension and Statistics.—Funds are requested to support an integrated research, extension, and education competitive grants program through CSREES for new technology adoption and transfer to small farms. This initiative is intended to foster greater diversity in small farm enterprises as well as enhance current small farms production capabilities.

Additional funds are requested to address disparities in funding and enhance the Department's cooperative efforts with institutions of higher education that are primarily devoted to the needs of minority students. Funds will also be targeted to improve outreach to socially disadvantaged farmers and ranchers in cooperation with these institutions to help stem the reduction of minority small farmers. The Extension Indian Reservation program will be expanded to meet the need for greater outreach by Extension Agents. One additional staff year is included for the Small Farms initiative. The NASS proposal to support collection of data on pesticide usage in nursery and greenhouse crops, where the potential for farmworker exposure is high reflects an increase of 10 staff years.

Farm Credit.—Funds are proposed to support farm ownership and operating loans at the levels recommended by the CRAT report. Direct farm ownership loans would be increased from \$46 million in 1998 to \$85 million in 1999. This funding increase will allow over 1,000 family farmers to either acquire their own farm or to save an existing one—nearly 500 more than in 1998. Roughly 60 percent of these loans are provided to limited resource borrowers.

Farm Labor Housing.—Funds are provided to support a total of \$55 million in loans and grants to construct housing for some of the Nation's neediest families. This is over an 80 percent increase from the 1998 level.

Environmental Quality Incentives Program.—An increase of \$100 million is requested to address CRAT recommendations and Clean Water Initiative goals. While this will not be used to support an overall increase in staff for NRCS, we expect up to 50 staff years will be devoted to CRAT related activities.

FORECLOSURES

Question. In April 1997, USDA halted foreclosures on USDA farm loans, pending civil rights reviews. As a result, 116 foreclosures were postponed. In each state USDA office, a Civil Rights Independent Review Group has been created to review these foreclosures. Have these Civil Rights Independent Review Groups reported that discrimination contributed to any of these foreclosures? If so, how many and in which states?

Answer. The 116 cases mentioned were reviewed by the Independent Review Team in the National Office. The Review Team was established to review all cases in the foreclosure process only to determine whether a question of discrimination was raised, not whether it occurred. Upon the completion of their review, twenty-eight of the 116 cases were referred to the USDA Office of Civil Rights, Program Complaint Adjudication Division (PCAD). Of the twenty-eight cases referred to PCAD, only eighteen discrimination complaints were filed, while the other ten were determined to need additional loan servicing. Of the 18 discrimination complaints filed, one has been closed by settlement and not foreclosure. Seventeen discrimination complaints remain open until a decision is made whether discrimination occurred. Based on the twenty-eight cases reviewed none have been foreclosed. With respect to 88 cases remaining from the 116 reviewed, additional servicing needs are being carried out and none have been foreclosed. The Independent Review Team was disbanded on September 12, 1997.

Question. How were these conclusions about discrimination determined?

Answer. The Independent Review Group was given guidance through a National written directive that includes a detailed checklist to assist in the review. The checklist, when completed, provides a history of the servicing actions taken and any documentation submitted by the borrower that alleges discrimination. However, as indicated earlier, the Independent Review Team did not make any determination that discrimination occurred.

DEPARTMENTWIDE OBLIGATIONS

Question. Please provide a summary of obligations, Departmentwide, for each of fiscal years 1997–1999, for the following object classifications: salaries and benefits; travel; ADP hardware/software purchases; contracts, grants, and other extramural agreements; and equipment (other than ADP related).

Answer. The following table provides an estimate of the obligations for 1997, 1998, and the 1999 budget in millions of dollars, excluding Forest Service:

Object class	1997 estimate	1998 estimate	1999 estimate
Salaries and benefits	\$3,424	\$3,576	\$3,617
Travel	159	166	170
ADP hardware/software purchases	65	123	152
Contracts, grants and other extramural agreements	1,537	1,623	1,396
Equipment (other than ADP related)	107	93	98

Question. Please provide the Committee with a consolidated listing of obligations for fiscal years 1997–1999 for the following crosscutting program activities:

- civil rights activities;
- support for 1890 Institutions and Historically Black Colleges and Universities;
- pest management;
- food safety;
- nutrition (excluding benefits);
- USDA information activities;
- Congressional relations and legislative affairs offices; and
- natural resources and environmental programs.

Answer. The following table contains the information. Please note the amounts are dollars in millions.

Activities	1997 estimate	1998 estimate	1999 estimate
Civil rights activities	\$23	\$34	\$37
1890 Institutions and HBCU's	95	92	96
Pest management and related programs	231	260	266
Food safety	631	654	721
Nutrition	411	421	457
Information activities	46	47	48
Congressional relations and legislative affairs offices:			
USDA (w/o FS)	3	3	3
FS	1	1	1
Natural resources and environment programs	3,310	3,298	3,223

ADMINISTRATIVE STAFFING

Question. What is the total number of administrative staff for USDA broken out by headquarters, regional, State, and field office levels?

Answer. The following table contains the information.

USDA Administrative Staff

Location	1997 estimate
Headquarters	4,298
Regional	4,353
State	1,457
Field Offices	4,600
Total	14,708

EMPLOYEE DETAILS/ASSIGNMENTS

Question. The fiscal year 1998 appropriations Act specifies that "No employee of the Department of Agriculture may be detailed or assigned to an agency or office funded by this Act to any other agency or office of the Department for more than 30 days unless the individual's employing agency or office is fully reimbursed by the receiving agency or office for the salary or expenses of the employee for the period of assignment."

Please provide the Committee with a list, by agency, of each employee detail or assignment (by employing agency, title, and position) in each of fiscal years 1997 and 1998 for a period up to 30 days, and identify the agency to which that detail or assignment was made, its length, and the purpose of the detail assignment. Provide this same information for employee details/assignments made for a period of more than 30 days, and indicate the dollar amount of reimbursement made to the employing agency for such detail/assignment.

Answer. The following table contains the information.

DETAILED FOR LESS THAN 30 DAYS—FISCAL YEAR 1998

Position/agency	Detailed to	Date/length	Purpose	Reimbursed
William Digdo (GIPSA)	APHIS	15 days	APHIS Modify	\$3,837

SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

The Administration is seeking an increase of \$145.5 million for fiscal year 1999 to "meet the long-standing bi-partisan commitment to funding in the WIC Program at a full participation level of 7.5 million." Further, the budget indicates that this requested increase for fiscal year 1999 mainly offsets expected food and administrative cost increases.

Question. On what basis has the Administration determined that 7.5 million represents the "full participation" level for the WIC program?

Answer. Our estimate is based on Census data and medical evidence which suggests that 9 million women, infants and children were fully eligible for WIC in 1996, the most recent year for which we have figures. In a fully funded program we would not expect that all eligibles would participate. However, with funds available, participation reached 7.5 million last January, and has hovered just below that figure ever since. On that basis, the Administration has determined that 7.5 million represents the full participation level for WIC.

Question. The fiscal year 1998 appropriations Act granted the Secretary of Agriculture the authority requested in the President's budget to allocate WIC funds outside the regulatory funding formula. How are WIC funds made available for fiscal year 1998 being allocated to states and how does that allocation differ, by state, from the statutory/regulatory WIC funding distribution formula?

Answer. At this point, we have not used the flexibility granted to us by the Appropriations Act. We requested it as a contingency to ensure that WIC funds went where they were most needed. We estimate that the total available fiscal year 1998 funds will be adequate to bring States to stability funding with only a small amount left over for distribution to States that have received less than their fair share of funds. Therefore, we do not anticipate that it will be necessary to utilize the additional flexibility.

Question. Mr. Secretary, you indicate in your prepared testimony that efforts continue to reduce the overall cost of WIC food packages by 10 percent by 2002. When did this effort begin and what reductions have we achieved to date in the overall cost of WIC food packages?

Answer. We established this goal in the Government Performance and Results Act Strategic Goals development process. This goal was mentioned in those sent to the Congress last fall.

As far as specific reductions to date, WIC cost containment is one of the more remarkable success stories in government. In fact, food costs were lower in 1997 (at \$31.66 per person) than they were in 1987 (at \$32.68 per person). This is true despite 10 years of general inflation in the economy and immense growth in the program. This was achieved in large part because, in 1997 nearly \$1.3 billion was saved from infant formula rebates.

Our efforts to improve WIC management and to reduce food package costs are expected to help improve the overall quality of WIC. Many States have achieved notable successes in efficient and effective management, and as their practices are adopted and adapted by other States, program quality will improve along with cost efficiencies. WIC is a mature program and simply needs some fine tuning. If we can keep food costs low we can serve more participants with the same money. That is our strategic goal.

Question. You also indicate in your testimony that the Department is working with states to expand other promising cost control activities and is undertaking a series of management reforms to improve WIC program integrity. Would you summarize the cost control activities and management reforms which have been implemented?

Answer. We are committed to improving WIC management and have several initiatives underway to reduce errors and save money. For example, now that WIC is a mature program we are beginning to see evidence of errors in eligibility determinations similar to food stamps and school lunch. Therefore we are proposing to require that all States obtain income documentation before certifying individuals to participate. That is not currently a Federal requirement and not all States ask for income documentation at certification. We are also reviewing our income verification requirements to see if they need strengthened or brought in line with food stamps and school lunch. Another area that we are working on concerns nutrition risk. We are working with the States and the medical community to standardize enforcement of WIC nutritional risk criteria. WIC statute allows only individuals at nutritional risk to participate in the program. Finally, we know WIC has some problems with unscrupulous vendors, the same stores trying to cheat the Food Stamp Program. We will be issuing regulations to improve vendor management and reduce overcharging.

Our efforts to improve WIC management will be coordinated with the Administration's government wide error reduction initiative.

INTEGRATED PEST MANAGEMENT

The fiscal year 1999 budget requests increased funding in support of the Department's commitment to encourage the adoption of Integrated Pest Management (IPM) on 75 percent of the Nation's crop land by the year 2000.

Question. Where do we stand in meeting this goal? When did this initiative begin and what percent of the Nation's crop land was under IPM at that time? What percent was under IPM at the end of fiscal year 1997? What percent is projected to be under IPM practices at the end of fiscal years 1998 and 1999?

Answer. Consensus has emerged that IPM systems should be measured along a continuum, ranging from no to high levels of IPM adoption. The Department's 1994 report, *Adoption of Integrated Pest Management in the United States*, measured adoption along a continuum, and this approach was refined by Consumers Union in its 1996 report, *Pest Management at the Crossroads*. These analyses estimated that 70 percent of crop acreage is managed using IPM systems. However, according to the Consumers Union estimates, 38 percent of these systems were at the low end of the IPM continuum. Our goal is to develop and help growers implement IPM strategies that permit them to move from the low end of the continuum to the high end of the continuum, moving incrementally toward biologically based IPM systems.

The overall percentage of U.S. crop acres under IPM in 1997 remained at the 70 percent level, and will likely remain constant in 1998. However, we remain convinced that the increased investments proposed in the President's budget request for fiscal year 1999 will permit us to reach the 75 percent adoption goal by 1999 or 2000. More importantly, we believe that these investments will accelerate the adoption of IPM systems at the medium and high end of the continuum. We believe that increasing adoption of pest management systems at the high end of the IPM continuum will benefit all Americans by increasing profitability, protecting water quality and farm worker safety, and enhancing the wholesome quality of our Nation's food supply. We believe that an accelerated effort is warranted to develop and help growers implement pest management strategies that will help them reduce reliance on high-risk pesticides and enhance the sustainability of their operations.

Question. Please provide a summary of the total USDA appropriations, by agency and account, invested in the Integrated Pest Management Initiative in each of fiscal years 1993 through 1998 and included in the fiscal year 1999 budget request.

Answer. Three agencies provide direct support for the Integrated Pest Management Initiative (IPM): the Agricultural Research Service (ARS), the Cooperative State Research, Education, and Extension Service (CSREES), and the Economic Research Service (ERS). Funding amounts from fiscal year 1993 to fiscal year 1999 are as follows:

INTEGRATED PEST MANAGEMENT INITIATIVE

[Dollars in millions]

	1993	1994	1995	1996	1997	1998 estimate	1999 budget
ARS Area-wide IPM Research	\$3,100	\$3,800	\$3,801	\$3,772	\$5,915	\$5,944	\$6,444
CSREES:							
Research and Education Activities:							
IPM Research Grants	4,457	3,034	2,731	2,731	2,731	2,731	8,000
Pest Management Alternatives				1,623	1,623	1,623	4,200
Expert IPM Decision Support				0.177	0.177	0.177	0.260
Extension Activities: IPM Application	8,200	8,459	10,947	10,783	10,783	10,783	15,000
ERS IPM Research	0.200	0.200	0.500	0.500	0.500	0.500	0.500
Total, IPM Initiative	15,957	15,493	17,979	19,586	21,729	21,758	34,404

INTEGRATED PEST MANAGEMENT

Question. Please prioritize the fiscal year 1999 proposed funding increase for integrated pest management (IPM) and IPM-related activities.

Answer. The increases proposed for IPM and related activities reflect USDA's goal of helping U.S. agriculture implement IPM practices on 75 percent of the nation's crop acreage by the year 2000, and to help producers respond to the challenges they will face as the result of Food Quality Protection Act (FQPA) implementation. Each research and extension program that supports IPM activities is coordinated to support major IPM goals. To further the development of a coordinated and integrated effort, USDA has created a new Office of Pest Management and Policy (OPMP) to serve as the focal point within the Department for pest management and pesticide regulatory issues.

Proposed IPM and IPM-related activities in the fiscal year 1999 Budget focus on this integrated and coordinated approach are summarized below. All of these would be considered high priority within the Department's 1999 budget.

IPM Initiative.—Activities proposed under this multi-faceted initiative are built around producer-identified needs for applied research and education projects using pest control technologies that are ready for large-area trials and adoption. These regional or area-wide projects will be supported by proposed increases of approximately \$10 million for CSREES and ARS.

The initiative also include a proposed increase of \$2.7 million for research on alternatives to pesticides that may be lost to producers as EPA proceeds to implement FQPA and on a decision support system that will help identify crop-pest combinations where alternative controls are most critical.

Pesticide Use Data Collection and Analysis.—Net increases of \$2.7 million are proposed for pesticide use and food consumption data. USDA is the sole or primary source for this data. Information on actual use and consumption patterns is needed to conduct more accurate risk assessments. These programs include the Continuing Survey of Food Intakes by Individuals (CSFII) carried out by ARS, the Pesticide Data Program under AMS, and pesticide use survey and analysis conducted by ERS and NASS, respectively.

Pesticide Registration, Clearance, Assessment, and Training.—Net increases of \$4.8 million are proposed for programs to support the registration process with information and analyses on the costs and benefits of current and alternative pest management strategies at the local, regional, and national scales; programs to gather data on pesticide residues for new and safer minor-use products, and for applicator training to build confidence in the system that relies on well informed pesticide applicators. Accurate data and analysis are essential to help policy-makers understand the implications of pest-control decisions.

Question. For fiscal year 1998, the appropriations Act establishes a \$1 million limitation on activities of advisory committees, panels, commissions, and task forces, excluding panels to comply with negotiated rulemaking or to evaluate competitively-awarded grants. Please provide a listing of advisory committees, panels, commissions and task forces funded in each of fiscal years 1997 and 1998, by agency, and the amount of funds allocated for each.

Answer. I will provide for the record a listing of those advisory committees, panels, commissions and task forces that are subject to the \$1 million limitation. Final decisions have not been made with regard to funding for each advisory committee in fiscal year 1998. We will submit further cost estimates by committee when they become final.

[The information follows:]

National Commission on Small Farms	77,245
Total, NRE	117,952
Office of the Chief Economist: Commission on 21st Century Production Agriculture	
Total, Advisory Committee Limitation	808,822

Question. Why is the Department proposing to eliminate this limitation for fiscal year 1999?

Answer. The Department has proposed that this limitation be lifted in order to provide greater flexibility in managing advisory committees to support the efficient operation of USDA programs.

Question. Please provide a list of the advisory committee, panel, commissions, and task forces, by agency, included in the fiscal year 1999 budget request, and the amount assumed for each.

Answer. The advisory committees, panels, commissions and task forces proposed for fiscal year 1999 are similar to those already funded and includes at least one new committee, the Secretary's Small Business Advisory Committee. Final decisions have not been made regarding the proposed funding for each advisory committee. I will provide the cost estimates by committee when they become final.

OFFICE OF THE INSPECTOR GENERAL

Question. What amount has been deposited in the Department of Justice and/or Treasury Department Assets Forfeiture Fund in each of fiscal years 1996, 1997, and 1998 as a result of investigation in which the USDA Office of Inspector General (OIG) participates?

Answer. The Department of Justice and Treasury do not inform us of how much has been actually deposited in their funds as a result of our investigative actions. We do know that over \$11 million in assets has been seized for the funds as a result of our actions since receipt of our authority—over \$7 million for the Treasury Fund and approximately \$3.5 million for the Justice Fund.

Question. Why isn't a memorandum of understanding between the OIG and the U.S. Department of Justice and/or Treasury in place to allow USDA to receive an equitable share of these resources?

Answer. The memorandum of understanding between the Office of the Inspector General and the U.S. Department of Treasury has been finalized and is currently in the process of being signed.

Question. The fiscal year 1999 budget requests and increase of \$21.7 million for a law enforcement initiative to allow the Office of Inspector General to crack down on fraud and waste in Food Stamps and other USDA programs. Would receiving payments from forfeited assets reduce the need for increased appropriations for these activities? If so, by how much?

Answer. OIG is authorized to receive proceeds from asset forfeitures as an additional tool in carrying out our law enforcement mission. Payments received from forfeiture assets would not reduce the need for the increased appropriations as detailed in the initiative because the laws on the use of forfeiture funds limit their use and specifically prohibit them from being used for personnel compensation which is about 80 percent of our agency's costs.

Question. The fiscal year 1999 budget requests increased funding for the Office of Inspector General to crack down on fraud and abuse in USDA programs, particularly the Food Stamp and nutrition programs. Is a funding increase also proposed for the Food and Nutrition Service compliance activities? If not, why?

Answer. A funding increase of \$150,000 is being proposed for the Food and Nutrition Service to enable the compliance branch to conduct "sweeps" in 8 States.

BRUCELLOSIS

Question. The Department's fiscal year 1999 explanatory notes indicate that APHIS anticipated that all 50 States will reach brucellosis Class "Free" Status by the end of 1998. Will bison carrying brucellosis and wandering beyond the Yellowstone National Park boundaries affect the achievement of this class "free" status?

Answer. As long as the surrounding states comply with the conditions of the Interim Bison Management Plan (which requires States and the National Park Service to prevent the movement of bison from Yellowstone National Park and Brucellosis Management Areas) and maintain active brucellosis surveillance programs, the Yellowstone bison should not affect the achievement of Class "Free" status in all 50 states.

INFORMATION TECHNOLOGY SERVICES

Question. We understand USDA continues to have in place its moratorium on significant information technology investments that was established back in November 1996 with a waiver process to make acquisitions. Also restrictions under this moratorium have been tightened to allow for IT investments to be made only for Year 2000 projects and emergency needs.

With only about half of fiscal year 1998 remaining, what impact will the moratorium have on USDA's IRM expenditure plans this fiscal year?

Answer. According to the Chief Information officer the moratorium has caused agencies to redirect their fiscal year 1998 expenditures from non-mission-critical systems towards Year 2000 compliance. The moratorium may not affect the total IRM expenditures for USDA because of this redirection towards Year 2000 programs and the continued need for operations and services for existing systems.

Question. As of this hearing, how many waivers were requested under the moratorium for fiscal year 1997 and fiscal year 1998, and what was the total dollar amount of waivers approved each fiscal year?

Answer. Agencies can and do submit waiver requests which cover expenditures in more than one fiscal year because the waivers are submitted for multiple year projects. Since the moratorium began in November 1996, 127 waivers were requested in fiscal year 1997 for approximately \$283.7 million and approximately \$210.5 million was approved for fiscal years 1997, 1998 and 1999 expenditures. We have received 36 waivers during fiscal year 1998 for \$143.6 million and approved approximately \$133 million for fiscal years 1998 and 1999 expenditures.

Question. In light of the IT moratorium, what major investments have been pushed back to fiscal year 1999 and beyond?

Answer. Because of the moratorium, agencies have made the decision to come forward only with those investments which meet the emergency or Year 2000 criteria for approval. The Office of the Chief Information Officer cannot categorically state which investments have been deferred because of the moratorium.

Question. We are hearing that USDA may have spent more than \$200 million in fiscal year 1997 with plans to spend about \$250 million in fiscal year 1998. If the numbers are anywhere near this, the confidence we have in the moratorium may be eroded.

If USDA continues to spend hundreds of millions on IT investments even while under a strict moratorium on such investments, how effective in your opinion has the moratorium been? Please elaborate on your answer.

Answer. While USDA has continued to make some investments while under the IT moratorium, those investments have been scrutinized carefully by the Office of the Chief Information Officer to ensure that they met the requirements of the moratorium. Any investments made were to support mission-critical programs. Since the moratorium has become more stringent, IT investments are made only for emergency situations or to support USDA's Year 2000 program. The CIO assures me that the moratorium has been effective in ensuring that our expenditures for IT were limited to those that are absolutely necessary to carry out USDA programs.

USDA has had its moratorium on IT purchases in place since November 1996. Originally this moratorium applied to all IT acquisitions over \$250,000, with exceptions for renewals to existing contracts and support services contracts for existing systems to become Year 2000 compliant. However, waivers were being granted. We understand that more recently that the threshold was lowered to all IT acquisitions over \$25,000, and that starting at the end of fiscal year 1997, waivers were only being granted for emergencies and those directly related to ensuring Year 2000 compliance.

Question. What was the total number of moratorium waiver requests submitted in fiscal year 1997 and what was the total dollar amount of these?

Answer. During fiscal year 1997 there were 127 waivers requesting approximately \$283.7 million.

Question. What was the total amount dollars and number of waivers approved in fiscal year 1997?

Answer. During fiscal year 1997, 113 waivers requesting expenditures of approximately \$210.5 million were approved for fiscal years 1997, 1998 and 1999.

Question. With tighter restrictions put in place for fiscal year 1998, what has been the total number of waivers requested, in terms of numbers and dollars, in fiscal year 1998 to date?

Answer. Since October 1, 1997, we have received 36 waiver requests totaling \$143.6 million.

Question. Also, what has been the total number of waivers approved, in terms of numbers and dollars, in fiscal year 1998 broken out by those granted to meet emergencies, those directly related to ensuring Year 2000 compliance and others?

Answer. Ten waivers have been approved in fiscal year 1998 for emergencies, totalling \$6.7 million in fiscal year 1998 funding and \$1.4 million in fiscal year 1999 funding.

Eighteen waivers have been approved for Year 2000 compliance, totalling \$122.4 million for fiscal year 1998 funding and \$2.9 million in fiscal year 1999 funding. The waivers for year 2000 compliance include incremental costs for making systems compliant, as well as costs for upgrading systems, for which a portion of those costs can be attributable to year 2000 compliance.

Since no other grounds for approval of waivers exist, all waivers granted fall into the above categories.

Question. In light of the waivers granted for Year 2000 compliance, how do these waivers compare to what the agencies estimate they will need to spend to fix systems and make them year 2000 compliant?

Answer. USDA agencies estimate that the incremental cost for Year 2000 repairs for fiscal year 1998 will be \$58 million. This total is less than the amount of waivers approved for Year 2000-related work because the Forest Service Project 615 initiative has been granted a waiver for Year 2000 compliance in fiscal year 1998, but only a portion of those costs can be attributed solely to year 2000 compliance.

Question. What are the Department's overall planned expenditures for information technology in fiscal year 1997, fiscal year 1998, and fiscal year 1999? Please provide specific expenditures, by agency and account. What are the Department's actual expenditures in each of fiscal years 1997 and 1998 by agency and account? What planned expenditures were not made in each of fiscal year 1997 and 1998 as a result of the moratorium?

Answer. In February 1996, based on the 1997 proposed President's Budget, USDA estimated that it would spend \$1.253 billion in information technology during fiscal year 1997. The February 1998 report indicated that during fiscal year 1997, \$1.080 billion was actually spent on IT. We believe that this reduction is in large measure due to the impact of the moratorium.

In February 1997, USDA estimated that it would spend \$1.239 billion in information technology during fiscal year 1998. The February 1998 report indicates that USDA plans to spend \$1.211 billion during fiscal year 1998. Our experience indicates that this estimate will further decline after the fiscal year is complete and actual expenditures are reported. We believe that this reflects the effectiveness of the moratorium in reducing USDA expenditures for IT.

The Chief Information Officer has issued a call letter to the agencies, asking them to update last year's report "USDA Agency Information Technology Expenditures by Budget Account". I expect to be able to provide this information to the Committee in early April.

Question. Identify what each agency plans to spend in total during fiscal year 1998 and fiscal year 1999, and of that what it plans to spend under the following information technology spending categories; (1) equipment purchases and leases, (2) software purchases and leases, (3) supplies, (4) personnel costs, (5) commercial support services, (6) other services (i.e. primarily commercial telephone and data service), and (7) Intra-Governmental Services?

Answer. I will ask the Chief Information Officer to provide the information for the record.

[The information follows:]

The following information is from the Department's OMB Circular A-11 report. This report includes actual expenditures for fiscal year 1997, and estimated expenditures for fiscal year 1998 and fiscal year 1999. The estimated expenditures are subject to review and approval according to requirements of the moratorium.

Question. Provide a list of major technology initiatives underway or planned at the Department. In doing so, provide what has been spent to date on the initiative, what will be spent on the initiative in fiscal year 1998 and fiscal year 1999, and the total estimated life-cycle costs of the initiative.

Answer. The following table outlines our major technology initiatives. Specific spending and life-cycle costs will be provided to the Committee by early April.

Integrated Systems Acquisitions Project (ISAP).—ISAP will establish a strategic framework for implementing the next generation of information systems in the Animal and Plant Health Inspection Service (APHIS). In the fall of 1995, a contract for computer products and services was awarded. APHIS has begun a five-year phased transition to the new environment of software, hardware, telecommunications and support services. Before starting formal implementation, APHIS is sponsoring transition activities to prepare for the new architecture. Total obligations from fiscal year 1997 through fiscal year 1999 are estimated to be \$26 million.

Project 615.—Through hardware and software acquisition, Project 615 will refresh the Forest Service's (FS) office automation technology and provide that agency with geographical information systems (GIS) technology. This will give FS the infrastructure to change its management of forests and rangelands from a single timber focus to a multiple ecosystem focus. Through Project 615's series of contracts, FS will establish an open systems environment. The full application phase began in fiscal year 1997, and by the end of fiscal year 2000 all FS employees are expected to be on line with the new technologies. Total obligations from fiscal years 1997 through 1999 should reach an estimated \$400 million.

Food Stamp Program Integrated Information System (FSPIIS).—In the Food and Consumer Service (FCS), the FSPIIS is a comprehensive, integrated, on-line, menu-driven information system to support administration of the Food Stamp Program. Through GSA's Federal Information System Support Program and the Small Business Administration's 8(a) Program, the FCS is acquiring software development and maintenance for the system. FSPIIS extensions and interfaces are being implemented to support Electronic Benefits Transfer (EBT) and Electronic Data Interchange (EDI). Business Process Reengineering (BPR) methodologies were employed to determine requisite business functions during fiscal year 1994. These business functions are currently supported by EDI and EBT. From the BPR came also an initiative to consolidate food stamp forms, which should dramatically reduce State and project area reporting burdens, in terms of both the number of reporting points—sites—and events. Total obligations from fiscal year 1997 through fiscal year 1999 should equal about \$17 million.

Service Center Implementation.—Under the leadership of the Service Center Implementation Team, initiatives are underway to consolidate county offices into local USDA service centers equipped with communications and computer-related technology to save costs, improve program delivery, and provide one-stop service to customers. This is a joint effort by the Farm Service Agency, Natural Resources Conservation Service and Rural Development. The implementation will support integrated voice and data communications infrastructures, reengineered business processes, data sharing within current agency systems, and a common computing environment to serve all agencies operating in any given service center. The communications systems currently being installed will cost approximately \$100 million. The reengineering efforts are underway and will continue next year. The estimate of the cost for the first phase of the common computing environment at the field level to be approximately \$30 million in fiscal year 1998 and \$70 million in fiscal year 1999. Approximately \$10 million will be required for pilot and demonstration sites in fiscal years 1998 and 1999.

Field Automation and Information Management (FAIM).—The Food Safety and Inspection Service's FAIM initiative is a project to automate improved business processes for the agency and to provide an agency-wide information management and sharing network. Total obligations from fiscal year 1996 through fiscal year 1999 should equal about \$45 million.

Dedicated Loan Origination and Servicing System (DLOS).—In amending the Housing Act of 1949, Congress in 1988 mandated that the then Farmers Home Administration escrow taxes and insurance. To comply, the Rural Housing Service has purchased a commercial mortgage loan origination and servicing system known as the Dedicated Loan Origination and Servicing System. It has an estimated total obligation from fiscal years 1996 through 1999 of \$20 million.

The Foundation Financial Information System (FFIS) is a major initiative sponsored by the Office of the Chief Financial Officer to replace USDA's core accounting system. FFIS implementation is underway. FFIS is designed to help us meet a strategic departmental objective: implementing a single, integrated financial management information systems in USDA, in compliance with OMB guidance and USDA financial standards. We are looking at costs, planned schedules, performance and management to ensure that FFIS is successfully completed. We will provide the Committee cost information as we complete this review.

This Committee has been trying to get the Department to develop an information systems architecture for the last several years and do so prior to making major investments. We understand that early last year the Department developed the initial version of such an architecture, but one that needed much additional work.

CCC ADP

Question. Section 161 of the FAIR Act of 1996 amended the Commodity Credit Corporation (CCC) Charter Act to significantly limit the use of CCC funds. CCC spending for equipment or services relating to automated data processing (ADP), information technologies, or related items (including telecommunications equipment and computer hardware and software) was limited to \$170 million in fiscal year 1996, and \$275 million for the six-year period including fiscal years 1997 through 2002. What was the total amount of CCC funds used in fiscal year 1997 for ADP?

Answer. Fiscal year 1997 CCC ADP obligations were \$36,146,007, leaving a balance of \$238,853,993 from the authorized cap of \$275 million.

Question. What is the total amount of CCC funds USDA plans to spend in fiscal year 1998 and fiscal year 1999 for ADP?

Answer. Fiscal year 1998 and fiscal year 1999 CCC ADP budget obligations in the President's fiscal year 1999 budget are estimated to be \$106,549,000 and \$76,401,000, respectively.

Question. What ADP initiatives will be supported in fiscal year 1998 and fiscal year 1999 with the CCC funds?

Answer. During fiscal year 1998 one initiative partially funded by CCC is the USDA Service Center Initiative. fiscal year 1998 funds will be used to complete Phase I of the LAN/WAN/Voice project. Phase I, carried over from fiscal year 1997, will provide integrated phone and local and wide area data communications for the State and county offices. Phase II LAN/WAN/Voice activities funded in fiscal year 1998 include e-mail, satellite dishes for distance learning and circuit upgrade equipment for the Service Centers. CCC funds for the Common Computing Environment (CCE) pilot demonstration sites, hardware and software, digital orthophotography, and Business Processes Reengineering/Improvement projects, training, and studies are also included in the fiscal year 1998 budget. NRCS and RD will also be using their funds to support the CCE.

Several initiatives are funded in both fiscal year 1998 and fiscal year 1999. Contractor support is needed for application development and programming, including Year 2000 modifications, in support of continued FSA State and county office program delivery. Funds are also included for the continuing implementation of FSA's portion of the FFAS integrated financial management system, CORE, which will feed the Department's Foundation Financial Information System for preparation of consolidated financial statements and reports. Hardware and software maintenance, upgrades, replacement and operational support for FSA legacy systems remain a need.

Assuming successful pilot installations in fiscal year 1998, CCC funds are included with funds from other Service Center agencies, in late fiscal year 1998 and fiscal year 1999 to procure, deploy, and install the initial components of the nationwide implementation of CCE, including employee training to use the new equipment and software. Procurement priorities of actual CCE components will be consistent with business requirements resulting from reengineered business processes and supportive of administrative convergence.

Question. What has the Department done since last year to build its information systems architecture into a tool that USDA could use to plan Information Technology(IT) investments and ensure that any new systems meet the Department's business and information needs of the 21st century?

Answer. The USDA Information Systems Technology Architecture was reviewed by a contractor under the OCIO's Independent Verification and Validation (IV&V) Program. While the IV&V findings were generally positive regarding USDA's first effort, there were several recommendations that USDA will incorporate into the implementation and management of the architecture. OCIO developed a high-level project plan which currently is being expanded with detailed tasks and milestones.

Last Year, USDA received a grade of "D" from the House Government Reform and Oversight Subcommittee on Government Management, Information and Technology for its efforts to address the Year 2000 problem and bring systems into compliance.

Question. What steps has the Department taken to improve its grade and ensure that it will be ready with its information systems to move into the next millennium?

Answer. I have taken strong management action to effectively respond to the challenges of year 2000 remediation. During the past year, USDA has established a Year 2000 Program Office, under the Chief Information Officer, with Senior Executive Service leadership to manage the Year 2000 issues Department-wide. The Chief Information Officer (CIO), Under and Assistant Secretaries have been given the responsibility for ensuring that USDA's mission-critical systems nationwide are Year 2000 compliant by March 1999. I directed each Agency Administrator to appoint a Year 2000 Senior Executive Sponsor who reports directly to the Administrator and establish Year 2000 project teams. Year 2000 is a critical element in the performance standards of the Senior Executive Sponsor in order to establish accountability

Additionally, USDA has issued a procurement moratorium requiring CIO approval of any IT procurement over \$25,000; under this moratorium, purchases can only be approved on an emergency basis or when the acquisition is directly related to Year 2000 remediation. The CIO has sole signatory authority under the moratorium, which will remain in place throughout fiscal year 1998 and fiscal year 1999 to assure that the Year 2000 is the Department's information technology priority.

Question. What is the status of the Department's efforts in readying the systems to be Year 2000 compliant?

Answer. USDA continues to make steady progress in the remediation of mission critical systems. Currently, 41 percent of USDA's 1,319 mission critical systems are Year 2000 compliant and we anticipate that the remaining mission critical systems,

which will be required for use in the Year 2000, will be compliant by no later than March 1999. All agencies have reassessed their systems to ensure compliance with the new deadlines, and some agencies have redirected or reprogrammed resources to accelerate completion of the remediation effort.

Question. How much does USDA plan to spend, by component agency, this fiscal year and in fiscal year 1999 to fix the Year 2000 problems at USDA?

Answer. USDA plans to spend \$58 million this fiscal year and \$27 million in fiscal year 1999 to fix the Year 2000 problem.

I will provide the agency information for the record.

[The information follows:]

[Cost in thousands]

Agency	Fiscal year—	
	1998	1999
Foreign Agricultural Service	\$170	\$170
Farm Service Agency—KC	6,190	1,580

Question. Who is charged with the overall responsibility and accountability at USDA for ensuring that the Department's mission critical information systems are Year 2000 compliant and what are the Department's Year 2000 milestones.

Answer. The Chief Information Officer and the Year 2000 Program Executive have the overall responsibility for the planning, oversight, and evaluation of USDA's effort to achieve Year 2000 compliance. The Under and Assistant Secretaries and Agency Heads have been empowered with the programmatic, budgetary, managerial, and technical responsibility for ensuring that USDA's mission-critical systems nationwide are Year 2000 compliant by March 1999 in their respective areas.

Milestones for completion of the various phases of remediation have been established based on guidance from the General Accounting Office and the Office of Management and Budget. September 1998 is the milestone for completion of the renovation phase for repaired systems; January 1999 is the milestone for completion of validation for all mission critical systems; and, March 1999 is the milestone for completion of the implementation phase for all mission critical systems.

Question. What assurances can you give this Committee that the Department will fix its mission-critical information system Year 2000-related problems in sufficient time for adequate testing and validation to occur, and that the necessary steps can be taken in sufficient time so that USDA's operations and customers are not adversely affected?

Answer. As I mentioned previously, responsibilities for Year 2000 compliance have been firmly designated at multiple levels within USDA. Plans have been developed to achieve compliance by March 1999. In addition, the Office of the Chief Information Officer is establishing a verification and validation process to bring independent third party review of selected critical systems in terms of Year 2000 compliance.

A USDA-wide mainframe testing environment is being established at the National Information Technology Center in Kansas City. The test environment is expected to be fully operational in July 1998. An additional mainframe test environment has been established and is currently operational at the National Finance Center (NFC) in New Orleans. It will be used to test NFC based applications.

Question. Obviously, one of the Department's biggest efforts in the IT area is the Service Center Procurement effort.

A. How much has the Department obligated each fiscal year since fiscal year 1995 for this effort? Please show it by funding source for each fiscal year.

B. How much is the Department requesting in fiscal year 1999 for the Service Center IT procurement by funding source and how much in additional funding will it cost to fully fund this effort?

Answer. The Department's investment in achieving a shared information system for the USDA Service Center agencies includes: Business Process Reengineering (BPR), which defines the business requirements for enabling technology; telecommunication infrastructure, better known as the Local area network/Wide area network/Voice (LAN/WAN/Voice) Project; Base data acquisition, digital ortho photography and soils digitization; and a capital investment in hardware and software, the Common Computing Environment (CCE). The total investment in each of these areas for fiscal year 1996 through fiscal year 1999 is shown in the table that follows.

Most of the costs for these initiatives are being funded from base level agency resources. However, an increase of \$30 million is requested in fiscal year 1999 under the salaries and expense account of the Farm Service Agency. Based on the BPR Business Case, the Department's Executive Information Technology Investment Review Board (EITIRB) approved a \$350 million investment for the Service Center CCE to be added to the IT investment portfolio of the Department. The \$110 million investment in fiscal year 1998 and 1999 includes approximately \$100 million for the CCE "procurement". Approximately \$250 million will be needed between fiscal year

2000 and fiscal year 2001 to complete the acquisition of the CCE equipment and software for the Service Centers. The funding sources for future years have not been determined at this time.

[The information follows:]

USDA SERVICE CENTER SHARED INFORMATION SYSTEM

¹ The \$9 million in fiscal year 1999 include \$4 million to complete the installation phase by December 1998. The remaining \$5 million are to cover maintenance costs.

² Of these amounts, \$4.2 million in fiscal year 1997, \$9.3 million in fiscal year 1998, and \$1.25 million in fiscal year 1999 are for pre-acquisition studies, evaluations, and pilot testing.

Question. We understand that the Department has turned to contractors to perform oversight responsibilities for IT projects, the Independent Verification and Validation (IV&V) process. Given the change in philosophy to contract out for oversight of IT projects using the IV&V process:

A. What savings have been achieved for the Department in terms of reduced staff since contractors now have some of the workload?

B. What other quantifiable benefits have resulted from these IV&V's?

C. What has been spent to date and is obligated for conducting IV&V's, and what projects have been reviewed to date?

Answer. Please let me make an important clarification. Oversight responsibilities for IT projects remain in the Department, specifically in the Office of the Chief Information Officer, and are not contracted out. The purpose of our Independent Verification and Validation program is to conduct un-biased reviews and analyses of IT plans, management approaches, technical alternatives, requirements and cost-benefit studies. We feel very strongly that these independent reviews, conducted before we make multi-million dollar investments in IT, will assist us in identifying strengths and weaknesses, alternatives or requirements which we did not consider, or alternative courses of actions which may help us to maximize benefits and minimize risks.

The IV&V program is designed to help us acquire, on a short-term basis, expertise which is not readily available internally. Typical task length is 45-90 days. We look at the breadth of both the government and private sector experience when we select an IV&V contractor.

A table identifying costs and benefits of the IV&V Projects will be submitted for the record.

[The information follows:]

<i>IV&V project/benefits</i>	<i>Dollars obligated</i>
Service Center Implementation—LAN/WAN/Voice Initial Review (fiscal year 1997). Completed. Identified problem areas and suggested resolutions which, when applied, allowed USDA to lift the nation-wide suspension on installations	\$50,000
Service Center Implementation—LAN/WAN/Voice Follow-On Review (fiscal year 1997). Completed. Evaluated USDA's implementation of suggestions from initial review. Verified that new approaches are working	10,000
Service Center Implementation—Review of Year 2000 Plans (fiscal year 1997). Completed. Evaluation of service center agency Y2K plans, based on contractor-developed criteria, consistent with GAO guidance. Conducted in conjunction with USDA Y2K program office	45,000
Service Center Implementation (fiscal year 1998). Completed. Evaluation of Service Center implementation plans to identify and rank candidate components for future IV&V studies	27,000
Service Center Implementation—Common Computing Environment (fiscal year 1998). Completed. Verified and validated cost/benefit analysis and technical alternatives. Provided additional insights, based on experience, which will be useful in conducting laboratory and pilot tests	115,000
USDA IT Architecture (fiscal year 1998). Completed. Contractor validated USDA's current baseline against industry standards and found no major problems; provided recommended future actions, based on an OMB-approved methodology	220,000
USDA Foundation Financial Information System (fiscal year 1998). Currently underway to: evaluate project plans, schedules and projected costs; evaluate USDA requirements versus software capabilities; review strategies and plans for future implementations and upgrades	150,000

Three years ago this Committee noted the growth in geographical information systems (GIS) technologies and their application in the private sector. As a result, the Committee encouraged the Secretary to pursue the possibility of a multi-agency, multi-disciplinary approach to better involve federal, state, and local governments in developing uniform GIS applications. We understand that USDA has several agencies involved in developing geographical information systems (GIS) and associated projects such as digital orthophotography and data digitization.

Question. Please provide a list of USDA agencies engaged in GIS projects, a description of these projects, and total estimated life-cycle costs for each project.

Answer. The agencies involved in GIS development are: Forest Service, Natural Resources Conservation Service, Farm Service Agency and Rural Development.

Question. What have each of these agencies spent over the last 5 individual years on GIS technologies and related expenditures?

Answer. Spending for GIS-related hardware, software, and geospatial data is integrated into the A-11 reports submitted by each agency without specific breakout.

Question. What does USDA plan to spend in fiscal years 1998 and 1999 on GIS systems?

Answer. The Chief Information Officer will provide you with information on expenditures and life-cycle costs by early April.

Question. What progress has USDA made to establish a multi-agency, multi-disciplinary approach to develop uniform GIS applications?

Answer. USDA is working with the Open GIS Consortium (OGC), which represents most of the major information technology companies. We have representation on the Board of Directors as well as management and technical committees and help guide industry in making decisions which foster interoperability and enable the development of common GIS applications. Recently the OGC issued a standard for representing point and line geographic features and they have demonstrated the ability for competing vendors to access and use each others geospatial data, over the internet, without having to go through a time consuming and expensive download and conversion process. We are working with industry to develop other standards for geographic features and GIS technology that will foster interoperability.

As industry completes and adopts these standards, various agencies and disciplines will be able to develop more uniform applications which make use of each other's information without having to recreate or convert that information.

Question. What steps has USDA taken to ensure that activities related to developing GIS are not duplicated across government agencies and are systematically accomplished?

Answer. The Federal Geographic Data Committee (FGDC) continues to be the primary committee which ensures that GIS activities are coordinated among government agencies. USDA is an active participant at the Steering Committee level as well as the many subcommittee and working group level. USDA also has an Agriculture Geographic Data Committee which meets periodically to coordinate GIS activities within the Department.

The three Service Center Agencies—Farm Service Agency (FSA), Natural Resources Conservation Service (NRCS), and Rural Development—have formed a partnership to develop and implement a uniform GIS solution for Service Center offices. This involves a common set of shared geospatial data layers, common hardware and GIS software, and joint training.

The Forest Service and NRCS periodically meet to coordinate their efforts in GIS and geospatial data development and data sharing. A number of projects are underway to development geospatial data and GIS applications in a uniform manner to avoid duplication of efforts.

MANAGEMENT

Question. In several places within the budget, the term administrative convergence is mentioned and that the Department is coordinating the functions of the different field service agencies to provide a more seamless and efficient delivery system. We see that this is being done only for the Service Center agencies, i.e., the Farm Service Agency, Natural Resource Conservation Service and Rural Development, but nevertheless USDA reports that by 2002, the proposal would result in a 22 percent reduction in administrative staffing from 1997. Savings by 2002 would equal \$127 million/per year.

How many administrative staff did the USDA Service Center agencies have in 1997 broken out by headquarters, state, and field office level, and what did this staff cost?

Answer. I would be glad to provide that information for the record.
[The information follows:]

STAFF YEARS

Mission area	Head-quarters	Finance Office ¹	Regional Office	Technical Center/Institute ²	States	Total
NRCS	118	91	171	613	993
FSA	393	940	88	338	1,759

STAFF YEARS—Continued

Mission area	Head- quarters	Finance Office ¹	Regional Office	Technical Center/In- stitute ²	States	Total
RD	224	472	404	1,100
Total	735	1,412	91	171	1,347	3,852

¹The column headed Finance Office includes the St. Louis operations of Rural Development and the Kansas Operations of the Farm Service Agency.

²The column headed Technical Center/Institute includes the Aerial Photography unit of the Farm Service Agency in Salt Lake City.

The estimated savings of \$127 million annually represents only the savings resulting from the reduction of 2,314 staff years between 1993 and the year 2002, assuming an average staff year cost of \$55,000. It does not include the savings to be realized through the elimination of duplicate systems, business process re-engineering and better coordination of activities. Nor does it include the cost acquiring and installing the common computing environment, any relocation of personnel or other costs associated with consolidation. Assuming an average staff year cost of \$55,000, the fiscal year 1997 cost of the 3,852 administrative positions in the three mission areas is a little over \$200 million.

Question. What is the total number of administrative staff for USDA broken out by headquarters, state, and field office levels?

Answer. The following table contains the information.

USDA Administrative Staff

<i>Location</i>	<i>1997 estimate</i>
Headquarters	4,298
Regional	4,353
State	1,457
Field Offices	4,600
Total	14,708

Question. With the significant amount of savings estimated for the Service Center agencies alone, what would the amount of savings be if all USDA agencies were included in the administrative convergence initiative? Does the Department have any current plans for expanding the administrative convergence effort across the Department?

Answer. The administrative convergence initiative would be difficult to apply to other agencies that are not operating out of the USDA Service Centers. At this time we do not have plans to expand this effort across the Department. However, I would like to note that administrative units for each mission area were combined as part of the USDA reorganization a few years ago.

MODERNIZATION OF ADMINISTRATIVE PROCESSES PROGRAM

For years now, USDA has funded the Modernization of Administrative Processes (MAP) program, but now we see that USDA is no longer funding this program.

Question. What was spent in total on this program since its inception?

Answer. From fiscal year 1993 through fiscal year 1997, the MAP Program spent \$13 million. For fiscal year 1998, \$4.2 million have been planned which will bring the total MAP expenditures to \$17.2 million.

Question. What were the results of this program?

Answer. Prior to its termination, the program had seven active projects to improve USDA's administrative functions: (1) Purchase Card/Convenience Check, (2) Procurement System Modernization, (3) Human Resources Management (personnel system) Modernization study, (4) Time and Attendance, (5) Telecommunication Services, (6) Information Resources Management Analysis, and (7) Civil Rights Complaints Processes to include both Program and Equal Employment Opportunity processes.

The Purchase Card project (an automated system for tracking, reconciling, and paying government credit card purchases up to \$2,500) has begun implementation USDA-wide and is planned to be completed by March 1999. Both the Purchase Card/Convenience Check and the Procurement System Modernization projects have been combined. Cost avoidance is expected to exceed \$29 million annually when

fully implemented. Pilot testing of the Telecommunication Services project (to automate and consolidate USDA's telecommunications needs to allow central billing, reconciling, and equipment inventory management) began in February 1998. This project has been expanded to include a baseline telecommunications inventory in support of Year 2000. This project is expected to complete its evaluation by July 1998. The IRM Analysis project (to analyze USDA's IRM program regarding those IRM business processes that support the Department's technology program) was completed September 1998. It will serve as the basis for future modernization projects. The Human Resources Management Modernization study was completed September 30, 1997, and provided recommendations for 10 different modernization projects. The Time and Attendance project was identified as a top modernization project. Currently, commercial-off-the-shelf software packages are being pilot tested to determine their application to USDA's time and attendance requirements. A final report on the results will be issued May 1998. A potential cost avoidance of \$39 million is expected. The Civil Rights program and EEO complaint processes' redesign were completed September 1998 as part of the Civil Rights Implementation Team efforts. Currently, automated tracking systems are being developed to support these Civil Rights processes.

Question. Why did USDA terminate this program?

Answer. While it is true that USDA terminated the MAP program Office in Departmental Administration, the MAP projects were not terminated. All of the active modernization were transferred to the respective offices within Departmental Administration and to USDA's Office of the Chief Information Officer. These ongoing modernization projects are still funded by the Department's Working Capital Fund.

QUESTIONS SUBMITTED BY SENATOR GORTON

REGIONAL RESEARCH

Question. It is apparent from this budget that the President and USDA have not made regional research a priority. Using Washington state as an example, how can you explain the need to cut essential research for the nation's leading apple, hops, dry peas and lentils and second leading potato, grape and asparagus producers in the United States?

Answer. As a part of the Administration's efforts to balance the budget and direct spending to higher priority areas, projects earmarked for specific institutions were proposed for elimination. Research funding distributed by formula under the Hatch Act to Washington State University could be used to continue aspects of these projects if they are deemed to be of a high priority at State or local levels. Additionally, researchers could apply for funding under the National Research Initiative competitive research grants program or obtain funding from State and local governments and/or private sources, such as industry, to continue these projects.

Question. Last year USDA and the President cut regional research, much like we have witnessed in this budget. Why, after Congress reinstated all of the regional-based research our agriculture communities require, were these projects again eliminated?

Answer. The elimination of projects earmarked for specific institutions is consistent with the Administration's efforts to balance the budget and direct spending to higher priority areas and its policy of awarding research, education, and extension projects through a competitive, merit-review process. It is possible that funding distributed under the Hatch Act, or funding from the National Research Initiative competitive research grants program, State and local governments and/or private sources, such as industry, could be used to continue aspects of these projects if they are deemed to be of high priority at State or local levels.

ARS LOCATION CLOSURE

Question. Another specific question for the State of Washington—why was the Prosser Research Station zeroed out for the second year in a row?

Answer. The President's budget requires the reallocation of existing resources to finance new, high priority research needs. A number of projects carried out in ARS research stations at Prosser, Washington; Mandan, North Dakota; Orono, Maine and Brawley, California, were identified as less critical. As a result, a cost-effective decision was made to terminate and redirect resources to new research initiatives and recommend closure of these research stations.

QUESTIONS SUBMITTED BY SENATOR BURNS

U.S. AGRICULTURAL EXPORTS FOR 1998

Question. Now that I have launched into my sermon of what I consider to be the evils of this Administration's agricultural trade policy, I would appreciate it, Mr. Secretary, if you would provide the Committee with an outline of what you foresee in the export of American products for the coming year.

Answer. The current fiscal 1998 forecast for U.S. agricultural exports is \$58.5 billion, up \$1.2 billion from 1997 and second only to the 1996 record of \$59.8 billion. Compared with 1997, the only major products expected to show a year-over-year drop in export value are soybeans and meal. U.S. export volumes for soybeans and products should rise due to strong foreign demand; however, prices are down sharply reflecting a strong recovery in domestic and foreign oilseed stocks.

A large increase in sales to Latin America is forecast. Little change is expected for exports to Europe, Canada, the Middle East, and the Newly Independent States of the former Soviet Union. The forecast for Asia reflects slower export growth to Japan and reduced prospects for U.S. exports due to the financial crisis. The adverse impact of the Asian crisis on U.S. agricultural exports in 1998 was conservatively estimated at \$500 million in December. We will be releasing a revised export forecast for 1998 on February 23, which should include a more thorough assessment of the effects of the Asian financial crisis on this year's export performance.

EXPORT ENHANCEMENT PROGRAM

Question. Would you please outline what you see as the standards by which you would consider using Export Enhancement Program (EEP) funds for the coming year?

Answer. There is no single standard for deciding when to use EEP. Congress has given guidance that it should be used both for trade policy reasons, such as responding to EU subsidies, and for market development. We will use EEP when we believe it's the appropriate tool to meet those objectives. With the recent developments in Asia, credit guarantees under the GSM-102 program seem to be the most useful tool to protect U.S. export markets. We are aware of EU subsidy actions, and we are watching them closely. But, we don't think the situation warrants use of EEP at this time.

FOREIGN MARKET DEVELOPMENT PROGRAM

Question. Would you provide the Committee with the exact amount that has been allocated in this budget for the Foreign Market Development Fund? I would like it broken down in terms of the amount appropriated for this coming year and for any dollars considered to be carry over from previous fiscal years.

Answer. The budget includes \$22.0 million in new appropriated funds for the Foreign Market Development Cooperator Program in fiscal 1999. It is currently estimated that an additional \$6.7 million of carryover funds also will be available to support Cooperator marketing activities in 1999. Thus, the total USDA contribution to support the program is currently estimated at \$28.7 million. While the level of new appropriated funding requested in the budget is somewhat lower than in previous years, the budget assumes a higher level of cost-share contributions from Cooperator organizations which will help to offset the reduced Federal contribution.

ASIAN FINANCIAL REFORMS

Question. Taking into account the fact that many of the Asian countries which have recently experienced economic chaos will or have received funds from this country and your Department in particular. And considering that these same countries have a number of barriers in place against the importation of American agricultural products, could you give the Committee some idea of the talks that are proceeding between this Government and the governments of those countries which we have recently given funding to in order to stabilize their currencies and economies?

Answer. We are in frequent communication with many of the countries that have received IMF assistance in terms of assessing their credit needs and as part of ongoing bilateral discussions. We do not want to underestimate the fact that the Asian countries that have received the IMF assistance are also important U.S. agricultural export markets. To obtain IMF assistance, recipient countries agreed to improve market access and adopt more transparent trading regimes, steps which are also beneficial to U.S. agricultural exports.

For example, effective February 1, Indonesia reduced agricultural tariffs on over 500 agricultural items to five percent and on April 1, BULOG's monopoly on Indo-

nesian wheat imports ends. Regarding South Korea, the good news is that a condition of the IMF assistance package is that Korea adopt a more open and transparent trade policy. Korea notified the WTO of revision to its Food Additive Code which should bring Korea into more conformance with international codes. In addition, we understand that Thailand has also reduced tariffs on certain agricultural items.

WILDLIFE SERVICES

Question. Again this year Mr. Secretary, the budget proposes a redirection in funding for the Wildlife Services Agency, the former Animal Damage Control. For the past three years I have worked in the Interior Appropriations bill to get additional funds for the agency from the Fish and Wildlife Service. It is my feeling that if they are the reason the wolves have come into the area, then they need to pay additional dollars for control. Are you aware that in 1994 the Fish and Wildlife Service provided \$100,000 for predation reports related to the wolves in the Yellowstone National Park in Idaho? Four years later and 10 times as many wolves in the area, Fish and Wildlife Service is continuing to provide that same level of funding.

Answer. Yes, I am aware of the funding situation. Cooperation between the Department of Interior's Fish and Wildlife Service (FWS) and APHIS' program for Wildlife Services (WS) in dealing with gray wolf recovery has been good. An inter-agency agreement between WS and the FWS calls for each agency to contribute \$100,000 per year to support WS' Wolf Management Specialist and program efforts to deal with wolf predation on livestock.

Question. Could you explain the reasoning behind the reduction in the budget for Wildlife Services?

Answer. The 50/50 cost sharing proposal is made in an effort to encourage cooperators to contribute a fair share of funding toward cooperative Wildlife Services activities in each State. This proposal is made in consideration of States in which cooperator contributions are equal to or greater than Federal contributions, as this approach greatly enhances the value of Federal funds invested. By encouraging a minimum 50 percent cooperator contribution level, the Agency can accomplish a more equitable distribution of Federal funds, can accomplish the same level of program activity with less Federal funding, and can consider future needs and new cooperative agreement proposals on a more programmatic and equal basis.

Question. Do you see where the proposed change in the joint budgetary venture will have any affect on the important wildlife damage control program?

Answer. This proposal is made in anticipation of cooperators increasing their contributions to a minimum 50 percent cost sharing level. When this is accomplished, total cooperative funding levels and therefore cooperative program activities, would not be affected by this proposal. If, however, cooperative funding levels do not increase as needed to increase the 50 percent minimum, Federal contributions would be reduced to a 50 percent maximum contribution level. This action would affect a variety of cooperative program activities in 33 states, based on fiscal year 1996 Federal/cooperative contribution data.

Question. Are you aware Mr. Secretary, that the 1931 Act which provides you with the Authority for the Wildlife Services Agency, has set a ratio for these programs in the States? (If he is not aware of this, how can he proceed with this proposal for a 50/50 split?)

Answer. No, I am not aware of such restrictions. The 1931 Act authorizes control and related experiments and investigations regarding predatory and other wild animals, and provides that the Secretary of Agriculture may cooperate with States, individuals, public and private agencies, organizations, and institutions, but does not include specific details or ratios regarding this cooperation.

FOREST SERVICE ROADS

Question. Mr. Secretary earlier this year when you announced the moratorium on road construction in roadless areas in our National Forests, your web page announced that there would be a series of public hearings on this in the west. Yet just today I was informed that you have done away with these public meetings. Do you consider it sound public policy to propose a dramatic change of this nature, with only a thirty day comment period and with no public meetings involved in the public process?

Answer. As a result of early public and Congressional comment on the proposed interim rule establishing an 18 month moratorium on road construction in certain roadless areas and on the Department's advance notice of proposed rulemaking on road management, the Department has decided to extend the public comment period on the proposed road moratorium for an additional 30 days. There are also plans to hold at least 25 public forums across the country.

LAND ACQUISITION

Question. Your department, namely the Forest Service, has been discussing the possibility of purchasing a private property and a conservation easement north of Yellowstone National Park. In fact, 3 million has been included in the supplemental LWCF account for this property. (6.5 million within the Forest Service and 6.5 million within BLM) Last month, the White House Council on Environmental Quality hosted a meeting with livestock producers and animal health authorities from various states to discuss this issue and how it relates to the management of the brucellosis infected Yellowstone National Park Bison herd. At the meeting, federal authorities stated this land acquisition would be a major part of the solution to the bison situation. How does this land acquisition address eradication of the disease, something your department has advocated for decades?

Answer. Acquisition of portions of the Royal Teton Ranch is only one part of the solution of the bison management problem. Land acquisition does not specifically address eradication of brucellosis. Support for acquisition of the ranch goes far beyond benefits to bison management. The focus of this project is to protect key winter ranges and migration corridors for several species of wildlife that move across the Yellowstone National Park boundary. These lands provide habitat for bighorn sheep, mule deer, elk, antelope, grizzly bear, mountain lion and bison.

Question. Your agency's discussion about the land north of Yellowstone National Park do not simply deal with an acquisition of fee-title. The proposed package includes purchase of land, exchange of lands and an conservation easement for wildlife. The details of these are not clearly defined. I have two questions:

How is the Gallatin National Forest going to pay for the increased amount of responsibilities of the new land, especially in light of Region One's current budget constraints?

Answer. I understand that there will be additional costs associated with processing the land purchase and exchange cases. The Forest Service will pay for these costs through the current land acquisition management request. Future management costs are difficult to estimate. It is the agency's sense that the consolidated land ownership patterns will result in cost savings and the additional acreage will not have a major impact on the funding needs of the Gallatin National Forest.

Question. And: How do you plan on including the Montana Congressional Delegation and the Governor in these discussions?

Answer. The Department has been working with State agencies, other Federal agencies, the landowner and others to define the property to be acquired. It is my understanding that State officials clearly understand the proposal. We are certainly willing to meet with the Montana delegation to discuss details of the acquisition.

BRUCELLOSIS

Question. It is my understanding that APHIS agreed to move a trap for bison management in the West Yellowstone area (specially on Horse Butte). This would require a financial commitment for the relocation and operation of the trap. Please provide the Committee and update on this trap relocation efforts and the financial commitment management around this facility?

Answer. The State of Montana and the Forest Service (FS) have selected a site for relocating the trap to the West Yellowstone area. In December 1997, the State of Montana received a draft permit for setting up and operating the trap. To date, the draft permit has not been signed by the State. The State of Montana has several concerns with the permit. Conditions of the permit include the requirement of a 2 week-long survey on eagle nests in the area and restrictions on the trap's usage to certain days and hours of operation. The permit also requires the trap operations to cease in mid-April. Once the permit is signed, APHIS expects operations to commence within 3 weeks. Two weeks will be needed to conduct the survey on area eagle nests and 1 week will be needed to relocate the trap.

So far this winter, the demand for a trap in this area has not been great. The low level of demand is due to the mild winter and the absence of bison in the area. To date, only six bison have been located in this area and removed.

The cost of relocating the trap is estimated at about \$11,000. APHIS will most likely contract this work. APHIS also expects to contract for trap maintenance and snow removal. It is expected that the State of Montana will have operational control over the facility with Forest Service providing site security and APHIS providing personnel. APHIS may decide to contract personnel coverage with the State. The cost of operating the trap is difficult to predict and would depend on a number of factors including the weather conditions in a given winter, the number of bison in the area, and the number of staff-hours needed to operate the trap. In a mild winter, operating costs at the trap could be close to \$100,000 (assuming the work is

contracted to the State) and in a more severe winter, costs could total up to \$150,000.

Question. As you know, restrictions or threat of restrictions by other State animal health authorities is becoming increasingly more important in terms of brucellosis. The National Eradication Program created not only a Federal position of eradication and management of the disease, but also encouraged State animal health authorities involvement. In fact, Montana has very specific State statutes on herds which are exposed to brucellosis. What role is your department taking in educating States about activities which relate to disease exposed herds (bison and elk) within the Greater Yellowstone?

Answer. To educate the states, APHIS has contracted with the Livestock Conservation Institute to issue newsletters to the states regarding the status of the National Eradication Program and activities within the Greater Yellowstone Area (GYA). In addition, APHIS recently sent a letter to all state veterinarians to inform them of the status of activities in the GYA.

Question. I am aware of the actions being taken to manage brucellosis disease within the Greater Yellowstone Area. However, please provide to the Committee a specific list of actions the federal agencies are taking to eradicate brucellosis within Yellowstone National Park and Teton National Park.

Answer. APHIS continues to work with and assist the National Park Service and the State of Montana with the implementation of the Interim Bison Management Plan and the development of a long-term bison management plan. APHIS participates on the Greater Yellowstone Interagency Brucellosis Committee and assists with preparing the Environmental Impact Statement (EIS) on brucellosis in the Park. The EIS is expected to be finalized in the third or fourth quarter of fiscal year 1998.

In addition, APHIS provides personnel to assist with liaison activities, planning, bison capture, testing and sampling, and research activities. Several ongoing research projects are being funded in fiscal year 1998 including projects to evaluate the transmission of brucellosis in bison within Yellowstone National Park and study the safety and efficacy of the RB51 vaccine on bison.

Question. In 1997, Secretary of the Interior Bruce Babbitt commissioned a report by the National Academy of Science regarding brucellosis. What comments has the Department of Agriculture made about this document and did your department provide any comments during the public comment period by the National Academy of Science? Please provide those to the comment.

Answer. No comments have been provided by the Department of Agriculture on the National Academy of Science report regarding brucellosis in the GYA.

QUESTIONS SUBMITTED BY SENATOR STEVENS

WILDFIRE PROGRAMS

The Millers Reach Fire caused more private property damage than any previous rural fire on record in Alaska. 161 families were totally burned out of their primary homes. Over 260 families were forced to seek some form of temporary or permanent assistance to make it through the winter. When I visited fire fighters on the scene, I was told that at least one volunteer fire fighting unit close to the source of the fire was unable to roll out due to mechanical problems and concern voiced by the State over their level of training.

America's rural volunteer firefighters provide some \$36.8 billion annually in estimated benefit to taxpayers. However the Administration's budget for this worthwhile program is the same as last year's level of only \$2 million. Of that Alaska received only \$40,000 to cover roughly one-fifth of the nation's land mass.

Question. Will your agency want to ensure that the Volunteer Fire Assistance program is equipped and capable of training volunteer fire departments so that they are able to contain fires in rural areas before the fires get out of control?

Answer. In addition to the \$2 million Volunteer Fire Assistance Program, which provides technical and financial assistance directly to local organizations, the budget provides \$21.5 million to State forestry departments for their wildfire programs. This includes an annual average of \$115 million worth of Federal Excess Personal Property loaned to the States. Finally, the Forest Service and the Interior agencies devote substantial fire protection and suppression resources to the Federal lands in the State of Alaska.

BEAR CREEK FEES

Recently the Juneau Empire ran a story about your intention to raise fees associated with visiting Bear Creek, in Alaska, to \$50 per person.

Question. Is there a Record of Decision on either an Environmental Assessment of an Environmental Impact Statement to implement these fees at Bear Creek?

Answer. I presume that this is a site in the Recreation Fee Demonstration Program which was authorized by the 1996 Interior Appropriation. I support the program as a means of providing funding for the maintenance and reconstruction needs of the recreation program. As you know the backlog in this area is much greater than we, or the Congress, have been able to fund. User fees provide a welcome supplement to annual appropriations. I am not familiar with the specific situation at the location you are concerned about and have asked the Forest Service to provide additional information.

[The information follows:]

By Bear Creek, we presume that the question refers to the Pack Creek Bear Viewing Recreation Fee Demonstration Area. An Environmental Assessment of the Pack Creek Bear Viewing Area was completed in 1989 which, among other management changes, initiated a reservation fee of \$10 per permit. This fee was imposed to discourage people from obtaining permits and then not using them. Pack Creek has a very limited capacity of only 24 people per day. Thus, "no-shows" quickly limit the number of people who can actually visit this extremely popular area.

In 1996, with the advent of the Recreation Fee Demonstration Program, both the Forest Service and the Alaska Department of Fish and Game (which co-manages the area since they manage the adjacent lands) scoped the topic of a joint use fee with the public. Most State funds for managing the area had been withdrawn by the Legislature, and Forest Service funding was continuing to decrease. The scoping evaluated several different price structures and cost recovery possibilities through implementation of a use fee. Under the demonstration fee authority, we have adopted a fee of \$50 per person per day for the peak viewing season with a lower rate in the off prime, or "shoulder" seasons of April and May. The agencies elected to phase in fee increases to the \$50 level if initial visitor responses were favorable. The agencies signed a cost-share agreement in which the net receipts are split 50/50 after the cost of the reservation system is deducted. Visitors receive a permit that clearly identifies the two agencies and are told the funds go to both agencies for management of the site when they make their reservation.

In 1997, the first year in which the interagency fee was implemented at Pack Creek, the fee was \$20 per person per day in the shoulder season and \$36 per person per day in the peak season. Seniors and juniors receive a discount. The customer response cards showed very strong support for the fee and management of the area. Some customers expressed willingness to pay more due to their high satisfaction with their visit. Despite the new fee, site use went up 11 percent overall from 1996, with increases of 7 percent and 22 percent in the peak and shoulder seasons, respectively.

The current fee structure will remain in place in 1998 and is still below the target recovery rate of 70 percent. Current fees recover about 42 percent of the costs to manage the area. Positive customer service card responses indicated to both agencies that an increase to \$50 per person per day for only the peak season was reasonable. Fees for the shoulder season will remain at \$20 per person per day and senior and junior discounts will continue as before. The \$50 fee will not take place until 1999 and will have been phased in over three years. Advance notice has been given our outfitter/guide permittees so that they will have ample time to incorporate the revised fees into their business plans. It appears that the \$50 fee for the peak season is set at a level that provides reasonable returns to both agencies and it also appears to have solid support from the public.

Question. The fees are raised 500 percent—from \$10 to \$50—Have you raised fees a similar percentage in ALL National Forests?

Answer. Again, I am not familiar with the specific charges at each of the demonstration fee sites. I have asked the Forest Service to provide the information.

[The information follows:]

Nationally the Recreation Fee Demonstration Program is testing a wide variety of fees at a limited number of selected sites across the country. In fiscal year 1997, there were 40 projects charging fees. They ranged from single campgrounds to multi-State area trailhead parking fees. The Demonstration program is not an Agency-wide fee system at this time. It is testing an authority which expires on September 30, 1999 under current law. These fees are being tested on a very small fraction of the total National Forest System. In most cases, the fees being charged are new fees at locations or facilities which were previously free. Since these projects

increased from no fee at all to something, the percentage increase cannot be calculated. Fees are being determined at the project level using methods such as fair market value analysis, surveys of potential users, and cost recovery.

Fee demonstration prices vary widely from unique project to unique project. Most developed site projects and dispersed area parking fees include annual passes in the \$20 to \$30 range. Annual passes at a highly developed project in Arizona are \$90. If the public is willing to pay an outfitter and guide company \$1,700 for a one-week Heritage Expedition trip through Hells Canyon in Idaho, a modest Forest Service recreation fee would hardly be noticed.

Pack Creek is a unique experience with substantial costs associated with protecting both the people and the bears. The fees are a test and public comments are being gathered to provide Congress with the information necessary to evaluate the Recreation Fee Demonstration Program.

RURAL UTILITIES PROGRAMS

Question. Alaska's rural communities suffer from wide spread unemployment coupled with deplorable sanitation and water supply, and expensive diesel generated power issues. Recently key members of your staff visited Alaska to assess conditions first hand.

Please state for the record what is being done by your Department to help address Alaska's rural utilities and power generation problems?

Answer. I am aware of the sanitary conditions you spoke of and I understand that we are financing a significant number of projects in Alaska's rural communities and there are applications and plans underway for additional financing. I understand the recent visit of my staff was associated with oil spills related to fuel storage. I believe that we are going to be able to assist in correcting these problems through our community facilities program. I am told by my staff that discussions are underway to determine the most appropriate means of financing the effort in about 15 villages.

I understand that we are also currently reviewing applications totalling about \$30 million for electric cooperatives in Alaska.

QUESTIONS SUBMITTED BY SENATOR BENNETT

RURAL CREDIT

Question. In your personal opinion and based on your research, how critical is the need for enhanced credit for rural non-agricultural activities?

Answer. Access to credit is vital to growth and development, and opportunities to provide greater access to credit for rural areas need to be explored. Several studies, including the rural credit study which the Department completed last year in response to a requirement of the 1996 Farm Bill, have concluded that rural financial markets are working reasonably well. However, these studies also note that there are gaps in the market, particularly for isolated rural areas. There are, as well, problems that many rural borrowers have in qualifying for credit. This is why the Department needs to maintain a strong role in helping rural borrowers obtain credit. For example, the Department's Business and Industry loan guarantee program offers rural borrowers access to credit by allowing private lenders to make loans they would otherwise be unwilling or unable to make because of the amount of perceived risk or lending limitations. The Department also provides technical assistance and outreach. In addition, it provides credit at rates and terms that can be met by applicants who lack the repayment ability for commercial loans. Where there are opportunities to make more credit available to rural areas, either by improving the Department's programs or through other means, I believe we should give serious consideration to at least exploring those opportunities.

Question. Do you agree that adequate credit for non-agricultural projects in rural localities is critical for the economic health of these areas?

Answer. It is absolutely a critical component of the economic health of rural areas.

Question. Do you and the United States Department of Agriculture support the three-year pilot proposal being considered by Senator Bennett to expand the authority of the Farm Credit System and Farmer Mac by allowing them to buy business and industry type loans from banks in rural areas?

Answer. We have not developed a position on the proposal, but I think it is certainly something worth exploring.

QUESTIONS SUBMITTED BY SENATOR CRAIG

REDIRECTION OF ARS FUNDING

As you know from the years we served together in the House of Representatives, I have long been a supporter of agricultural research. To your credit, since you took the helm at USDA, ARS has expanded its mission and continues to produce the highest quality research in the field. Producers in my state, and their suppliers, have grown dependent upon the work being done by ARS scientists to develop new crop varieties and pest resistance. This work is conducted around the country, including four ARS stations in Idaho. I was pleased to learn that the President's budget request includes a \$32 million increase for ARS—pleased until I saw where the money was to be spent.

The President's budget request cuts important funding for ARS research in a wide range of crops, including: soybeans, potatoes, rice, cotton, small fruits, and sugar, among others. In place of these important research activities, ARS dollars are being siphoned off to fund environmental projects such as the Presidential Environmental Initiative for Global Change, the Presidential Initiative on South Florida Ecosystem Restoration, and programs in watershed health and environmental quality.

Question. How can this administration justify cutting important crop research—research directly responsible to the challenges facing America's farmers and producers—to fund "feel good" environmental programs? Are there not better sources of funding for these programs than ARS, such as EPA?

Answer. Environmental issues such as global change, watershed health, and environmental quality are directly relevant to crop production and are recognized by commodity groups as important concerns for the USDA research agenda. Because ARS does not have enough funds to address all the necessary required research, it became necessary to assign priority, and to redirect funds from projects which are less urgent. The projects proposed for closure are not limited to production agriculture, but also include certain environmental research projects that are less critical. ARS' strategic plan, gives a high priority to production agriculture. Part of the funds obtained through project closures would be redirected to environmental research that is directly relevant to crop production. ARS does not have direct influence on the budget and program of EPA. Although many EPA programs do concern agriculture indirectly and involve ARS research to varying degrees, much of the high priority environmental research ARS needs to undertake is not currently being pursued by EPA.

FOOD SAFETY INITIATIVE

The President's request for ARS also includes \$8 million in support of the Presidential Initiative for Food Safety.

Question. Will the money be spent on new ARS facilities dedicated to food safety?

Answer. The \$8 million for ARS in support of the Presidential Initiative for Food Safety will not be spent on new ARS facilities dedicated to food safety.

Question. How does USDA propose to incorporate this new work with the ongoing efforts being conducted at research universities across the nation?

Answer. ARS food safety research is coordinated with and complements that of ongoing efforts being conducted at research universities across the Nation.

ARS works closely with CSREES to explore how the two agencies can effectively coordinate the food safety research agenda, identify opportunities for collaborative research between Federal agency scientists and university scientists, and to identify unique research facilities and expertise of each set of performers.

The longer term nature of Federal funding complements that of the university research programs. The multi-year sustained programs of the Federal laboratories support research initiatives that establish the basis for the continued biological understanding of pathogens and the technological advances necessary to develop the means to assure food safety and meet the expectations of the American consumer. The combined efforts of both Federal Government and academia are necessary because food safety research must solve the problems resulting from a plethora of technological practices, an array of animal and plant species and varieties, a range of climatic and regional differences, and a vast array of food products and consumer practices.

Question. Has USDA considered the option of matching these ARS funds with CSREES monies to establish a series of national food safety research centers?

Answer. Because ARS already has facilities for conducting the necessary food safety research, and the critical mass of scientific expertise and structure to lead the necessary food safety research programs, ARS has not considered the option of

matching these ARS funds with CSREES monies to establish a series of national food safety research centers.

WILDLIFE SERVICES

Question. The President's request would decrease APHIS funding for wildlife services operations by more than \$3.4 million or 17 percent. The Department's budgetary justification explains that this cut would bring the Federal/State cost sharing into "equilibrium" with each contributing 50 percent. I am reminded that in 1992 the funding was divided between the Federal and State governments at 75 percent Federal and 25 percent State, and 65 percent Federal and 35 percent State in 1997. I am disturbed by this trend and would like to know if any specific target cost share ratio is mentioned in the program's organic legislation, the Animal Damage Control Act of 1931. If not, would the Secretary explain how the Department reached the 50 percent figure?

Answer. The 1931 Act authorizes control and related experiments and investigations regarding predatory and other wild animals, and provides that the Secretary of Agriculture may cooperate with States, individuals, public and private agencies, organizations, and institutions, but does not include specific details or ratios regarding this cooperation.

The 50/50 cost sharing proposal is made in an effort to encourage cooperators to contribute a fair share of funding toward cooperative Wildlife Services activities in each State. It is more in line with cost sharing programs like brucellosis, boll weevil, and fruit fly eradication. This proposal is also made in consideration of States in which cooperator contributions are equal to or greater than Federal contributions, as this approach greatly enhances the value of Federal funds invested. By encouraging a minimum 50 percent cooperator contribution level, the Agency can accomplish a more equitable distribution of Federal funds, can accomplish the same level of program activity with less Federal funding, and can consider future needs and new cooperative agreement proposals on a more programmatic and equal basis. The specific activities and the degree to which activities would be affected, is dependent upon changes in funding levels in each affected state.

Question. Has the Department conducted any study into the impact this change would have in existing Wildlife Services operations?

Answer. This action could affect a variety of cooperative program activities in 33 States based on fiscal year 1996 Federal/cooperative contribution data. The specific activities and the degree to which activities would be affected is dependent upon increased cost-share funding levels in each affected state.

NUTRIENT ANALYSIS IN CHILD NUTRITION PROGRAMS

Question. As you know, authority for the bulk of child nutrition programs expires this year and each will need to be reauthorized. In light of this, and the Department's and Congress' strong past commitment to these programs, do you not agree that we should take steps to eliminate the requirement for the use of weighted averages when conducting nutrient analysis?

Answer. The School Lunch Act requires that schools serve lunches and breakfasts that are consistent with the goals of the Dietary Guidelines. However, how schools achieve this goal, and how we measure their success, is a somewhat technical matter. I understand that Under Secretary Watkins has waived the requirement to use weighted averages when conducting nutrient analysis through July 2000 while she reviews this issue.

Question. Does the Department support this fundamental change and can you commit to removing the use of weighted averages from future Departmental policies?

Answer. I prefer not to make any commitments at the present time until after I have seen the results of the Department's review of this issue.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

FARM SAFETY NET

The 1996 Farm bill made substantial changes in farm programs and altered the government's role in the farm sector. Over the past couple of years, times have been good for farmers. Markets, for the most part have been strong. On top of that, taxpayers have been paying out billions of dollars in Freedom to Farm payments that farmers would not have earned under previous programs because assistance, then, was tied to the market.

Farm net income hit a record high of \$60 billion in 1996. Estimates for the year just ended have already fallen by \$5 billion from the year before. As the fixed Freedom to Farm payments glide to extinction and commodity prices regain their historical pattern of unreliability, I fear what may be on the horizon.

Question. The USDA Budget Summary and your remarks make several references to the need to improve the farm "safety net". Would you provide your thoughts on the short and long term stability of the farm economy?

Answer. Some perceive that the 1996 Farm Act will lead to increased volatility in grain markets. It is generally argued that increased planting flexibility, fixed payments, and the elimination of acreage reduction programs and the Farmer-Owned Reserve will contribute to more volatility in grain prices (and planted acreage). In the short term, absent a stocks policy, there is the potential for greater volatility. However, in the medium to longer term, increased planting flexibility afforded by the 1996 Farm Act provides the opportunity for producers to respond to market imbalances more quickly and in a more timely fashion than was possible under previous laws. Commodity loans, credit assistance, crop insurance and other elements of the farm safety net can help producers respond and adjust to these changes.

Question. What level of risk will farmers hold if the "safety net" items you propose are not enacted?

Answer. All of the proposals we have made involve some degree of risk reduction in several areas of the farming enterprise. Loan extensions would help reduce price risk in marketing, insurance proposals reduce yield and revenue risk, and loan proposals help in the area of asset acquisition during years of crop disaster and/or abnormally low market prices.

Question. Are some commodities, farm groups, or regions of the country at higher risk?

Answer. Areas of the country that have limited options for producing alternative crops when prices are low for a particular crop may face greater risks than regions in which alternatives are greater. Producers who can select among several crops have the opportunity to profit from favorable market conditions in several markets. A producer who has only one cropping alternative has less opportunity to avoid low-priced markets. For these producers, availability of risk reduction tools is essential.

Crops which are subject to higher risk may include those for which markets are very thin. For traditional producers of these crops, profitable market conditions may suddenly attract a significant temporary increase in acreage and a corresponding reduction in price, leaving those producers with lower than expected revenues during years in which the initial expected price is high. These producers are also in need of risk reduction tools, especially if cropping alternatives are limited.

Question. Of the "safety net" items you propose, which do you feel to be the most important and why?

Answer. Several proposals have been made to strengthen the safety net for farmers. Maintenance of an effective safety net to help our farmers and ranchers better manage risk has been a major priority for the past two years. Last year, we proposed some modest improvements in the safety net which were not acted upon by the Congress. These included provisions to permit extension of the terms of marketing assistance loans during periods of extraordinary market disruption, and the expansion of revenue insurance. These proposals deserve full consideration by the Congress.

Important proposals in this year's budget include full funding of crop insurance with a shift in sales commissions for agents from discretionary to mandatory spending. This would consolidate all program spending into a single account and eliminate the possibility of the program being restricted by a limited appropriation of discretionary funds. This change will make the program more reliable for those producers who depend on crop insurance as a tool to manage risk.

Another important proposal in the current budget is in the area of farm loan eligibility. Currently, once a farmer receives debt forgiveness, he/she is ineligible for future loans except annual operating loans in cases where the debt forgiveness was in the form of a write-down. This is a stricter standard than private lenders use. It's wrong, and I will send Congress emergency legislation as soon as possible to address the problem. This change would help some of the producers most in need of our assistance.

DIVERSITY IN PRODUCTION/INDUSTRY INFRASTRUCTURE

Question. Another feature of the 1996 Farm Bill was the planting flexibility it provided. It was recently reported that in your own state of Kansas, cotton production

has expanded by a fourfold increase. Do you see a radical change in crop planting patterns?

Answer. U.S. plantings of the principal crops in 1996 increased to the highest level since the mid-1980's—up about 16 million acres from 1995—and stayed at that level in 1997. The increase in plantings for 1996 primarily occurred for corn, wheat, sorghum and soybeans. Cotton, oats, and sunflower acreage declined. Plantings of principal crops in 1997 remained at 1996 levels. Producers adjusted the mix of crops on their farms, but, on average, did not expand acreage as they did in 1996.

The biggest acreage shifts in 1997 was the 6.7-million-acre increase in soybean planted acreage. Soybean producers never had any acreage controls associated with their crop, but to the extent that acreage limitations for other crops limited the expansion of soybean acreage, the 1996 farm law could have been partially responsible for the acreage increase. Very strong oilseed prices, modifications of farm rotations to include more soybeans, favorable planting conditions for soybeans, and problems getting other crops planted also led to this soybean acreage surge. Record acreage of soybeans in the Lake States, Corn Belt and Northern Plains displaced corn and wheat plantings in this region.

Plantings of sorghum declined in 1997 because the crop was not replanted after failed acres of other crops. Cotton acreage declined for the second consecutive year because a cool, wet spring limited plantings and more favorable net return prospects for several competing crops. Cotton acreage fell throughout the country, except for a small increase in the Southeast, as a recent buildup in the cotton infrastructure of the region has supported acreage there and some area planted to corn in 1996 returned to cotton.

Winter wheat acreage dropped to the lowest level since 1978. Most States that expanded their wheat acreage in 1996 in response to rising prices scaled back wheat plantings the following year. Also limiting winter wheat plantings were late soybean and sorghum harvesting in 1996, disease concerns in the eastern Corn Belt, and dry weather in other regions of the country. Farmers planted the second highest spring wheat crop in modern times following the 1996 60-year high.

These changes in cropping patterns over the last two years are probably the result of commodity prices, weather conditions, and new legislation. While the new legislation expanded flexibility from prior laws, changes in plantings such as those described here likely could have occurred under the more limited planting flexibility provisions of the 1990 law.

Question. Since, for example, cotton production requires cotton gins and other fixed facilities to further process the raw commodity, what are the economic implications in rural areas for increased diversification?

Answer. Increased economic diversification in rural areas is generally beneficial for rural economies. In a global economy, where rural communities are subject to the effects of large scale economic forces beyond local control, survival may depend on having a wider range of economic options. This is true within the agricultural sector as well as in the general economy. Using the example of cotton, if global events result in reduced cotton prices for an extended period, producers are in a better position to survive if they have cropping alternatives to provide income. The local economy is more stable if alternative income sources are available.

This does not mean all are better off in an increasingly diverse local economy. Excess processing capacity may develop in an area if crop production shifts occur in response to price changes. If these changes become permanent, investment in fixed facilities such as cotton gins would need to be re-evaluated. Investment risk may be higher for some processors, but on balance, rural communities are healthier if economic choices are available.

Question. Are changes in farmer planting decisions likely to have a lasting effect on supporting services and erosion of the existing agricultural industry infrastructure?

Answer. Farmers' planting decisions can affect supporting services if the services are tied to a specific crop. If decisions become permanent, this can cause an erosion of existing agricultural industry infrastructure along with expansion of new infrastructure to support alternative crops. However, acreage shifts tend to occur in response to price changes from year to year, and in agriculture it is unusual for prices to remain high or low for too long, so infrastructure often is not greatly affected. Two examples from the last two years are wheat and soybeans. Farm level wheat prices climbed to over \$5.75 per bushel in the spring of 1995, and acreage increased by around 6 million acres in 1996. The resulting lower prices helped to reduce plantings by 4.5 million acres in 1997, and winter wheat seedings this fall were the lowest since 1973.

High soybean prices persisted through most of 1996 and 1997 and led to the large increases in soybean acreage. Plantings in 1998 are expected to reach record

levels. However, prices are forecast to return to below \$5.50 for 1998/99, a price level that will likely have a significant effect on plantings in 1999.

The new farm law, while giving farmers much greater latitude to shift to alternative crops, also provides the means to allow producers to respond quickly when prices signal a market imbalance, so it is unlikely that the new law will lead to a permanent shifting from traditional cropping patterns.

DISMANTLING OF FARM PROGRAM DELIVERY

Question. In light of the changes inherent in the 1996 Farm Bill, there has been an ongoing debate about the future of USDA's county-based delivery system. Every year, we see the number of Farm Service Agency staff positions fall and with them, obviously, the level of service to our farmers. Fears have been expressed that the 1996 Farm Bill and the related decline in USDA's delivery system contain a hidden agenda to make certain that once the system is seriously impaired, future farm programs won't even be possible. How many staff positions at the county level will be eliminated in fiscal year 1998 and how many do you plan to reduce in fiscal year 1999?

Answer. In fiscal year 1998 there has been an estimated reduction in non-Federal county office staffing of 564 staff years through buyouts, RIF's, voluntary early outs and attrition. Proposed staffing reductions for fiscal year 1999 would reduce county office staffing by another 855 staff years.

Question. Will your projected reduction in fiscal year 1999 change if the assumed user fees for FSA and NRCS are not adopted, and if so to what level?

Answer. Yes, if proposed user fees are not enacted in fiscal year 1999, the estimated total FSA non-Federal county staffing reduction would be 1,078—an increase of 223 staff years from the 855 estimated staff year reduction in the proposed budget. If direct appropriations were substituted in lieu of user fees to fund the 223 non-Federal county office staff years, then the reduction would remain at 855 FTE's. For NRCS, the staff year reductions in the absence of the budgeted user fee revenues would be in the range of 175 to 200 staff years.

Question. How much difficulty are you experiencing in managing staff reductions because some county offices contain both federal and non-federal positions?

Answer. FSA currently has in operation two different personnel systems for employees in county offices. One system covers employees with Federal civil service status and the other system covers non-Federal positions. Due to the difference in systems, there are a few obstacles that the agency faces in managing reductions. Non-Federal FSA employees cannot compete for FSA Federal vacancies on an equal footing with Federal employees. Non-Federal employees who are in RIF status are not entitled to assistance and priority placement under the Career Transition Assistance Program. At this time, FSA is required by law to establish separate supervisory reporting procedures for non-Federal and Federal employees located in the same county office. These differences combined with the varying levels of staffing reductions needed between Federal and non-Federal FTE's have created new types of personnel problems. As you know, I favor converting non-Federal county employees, with their career tenure, to Federal civil service status.

Question. Do you think all county positions should be federalized and why?

Answer. Yes, I favor converting FSA non-Federal county committee employees, with their career tenure, to Federal civil service status. Conversion of FSA non-Federal employees to Federal civil service status would eliminate the difficulties FSA currently has in operating two different personnel systems for employees in county offices. These difficulties include the fact that non-Federal FSA employees cannot compete for FSA Federal vacancies on an equal footing with Federal employees, non-Federal employees who are RIF'ed are not entitled to assistance and priority placement under the Career Transition Assistance Program, and FSA is required by law to establish separate supervisory reporting lines for non-Federal and Federal employees located in the same county office. I also favor conversion of these employees because I believe the accountability of these employees in the areas of civil rights and access to credit is not as direct as if they were Federal employees. We are working on that legislation.

Question. You have stated that you will not close any county offices until you have consulted with Congress, but doesn't the ongoing decline in county-level personnel affect the continued viability of certain county offices and therefore determine the closing of offices on a de facto basis?

Answer. The substantial decline in county office employment does affect the capacity or ability of certain county offices to remain open. As these situations become more apparent, a normal option for FSA is to combine two or more headquarters' offices into a shared management operation where one office remains the head-

quarters office while the other county office or offices become full or part time sub-offices. FSA will continue to close and consolidate county offices only with consultation of local FSA county committees, the Secretary, and Congressional delegations. We will consider any closure decisions in light of cost effectiveness and quality of service to the producer.

Question. To what extent do you think we can continue the decline of USDA services at the county level until we have reached a point of no return?

Answer. The Department has entered into a contract with an outside consulting firm to conduct a study of the farm and rural program delivery system of the county based agencies, FSA, NRCS, and RD, to be completed by September 1, 1998. The study will clearly identify the purposes agency operations are intended to achieve, provide an independent assessment of agency workload estimates, consider the prospective impact of administrative convergence on county office operations, identify criteria for determining the highest value use of office staff, evaluate office operations efficiencies gained so far, and assemble a profile of the USDA customer base as defined by eligibility for program benefits. Finally, the study will identify alternative decision systems or organizational structures for matching USDA resources with customer needs and preferences. We will see what steps we can take, if any, to improve the efficiency of our program delivery system. That may involve further staffing reductions, but not beyond the point of providing producer service.

WATER RESOURCE CONSERVATION IN EAST ARKANSAS

For the past several years, this subcommittee has provided special funds for work on ground water resource issues in Eastern Arkansas. In the fiscal year 1999 budget proposal for the Corps of Engineers, \$11.5 million and \$2.5 million is provided for the Grand Prairie and Bayou Meto projects respectively. These two items are contained in the budget, I believe, in large part because of my personal appeal to the President and because of his knowledge of the dire crisis we are soon to face in the lower Mississippi River basin due to failing ground water supplies. These projects are sizable, which explains the need for the Corps of Engineers to participate. These is also a component for these projects which must rest with USDA. The funding we have provided to date moves us in that direction, but there is much more to do.

Question. Will you work with the Corps of Engineers to determine an adequate, shared level of participation regarding this project?

Answer. Yes, sir we will.

Question. Will you commit USDA resources to help insure that your Department will play a proper role in protecting these water resources?

Answer. USDA has been devoting considerable resources in this area over the past ten years. In addition, USDA recently established the South Central Water Management Center located in Little Rock, Arkansas as a National Water Management Center which demonstrates our commitment to protecting our water resources.

Question. Following consultation with the Corps, will you report back to this committee on appropriate levels of funding needed by USDA to work appropriately and timely with the Corps of Engineers?

Answer. Yes, when the information becomes available, we will report back to you. USDA has been working closely with the Corps on several studies over the past several years. We understand that the plans were recently completed for the Grand Prairie and Bayou Meto which will assist in identifying the work to be done and the resources needed to implement.

CIVIL RIGHTS

You and your staff appear to be receiving high marks in the area of civil rights. I notice that the budget request for fiscal year 1999 contains a number of items among various agencies designed to bolster your civil rights activities.

Question. What is the current backlog of civil rights cases and complaints?

Answer. There are currently 1,426 active employee complaints, and 889 active program complaints.

Question. How old are those pending cases?

Answer. Many of the backlog cases date back to the early 1990's because USDA disbanded the program complaints unit and there was no specific unit in existence with the responsibility to resolve these cases. We estimate that the median program complaint has been in the system for 710 days.

Question. What is the statute of limitations for civil rights cases regarding client and personnel complaints?

Answer. The statute of limitations is 2 years from the date of incident for cases under the Equal Credit Opportunity Act. Additional time can be allowed on a case by case basis if instructed by civil court action.

Question. Have any civil rights complaints been processed if the statute of limitations had expired, and if so, what standards are used to make the determination to proceed?

Answer. None have been processed since the Department of Justice made the decision.

Question. Are new complaints being filed at a more or less rapid rate than those of several years ago?

Answer. The annual number of cases varies from year to year. The average was about 350 cases from 1992 through 1994, and the 1995 and 1996 filings were 171 and 237 respectively. 447 cases were filed in 1997, which is the highest total in recent years.

Question. Is the rate of frivolous claims changing from previous levels, and if so, please explain?

Answer. USDA accepts and processes program complaints when it is determined that there is sufficient information and jurisdictional basis to process them. There is no evidence to suggest the new complaints to be any different from the older ones.

Question. Does the Office of Civil Rights have the authority to award program dollars related to a civil rights claim without the concurrence of the program agency or the Office of General Council?

Answer. Under the delegation of authority from the Secretary to the Assistant Secretary for Administration, the Office of Civil Rights has the authority to award any remedy a court could enter when discrimination has been found, including monetary damages. Agency concurrence is not required as the authority comes from the Secretary. However, OGC reviews all decisions of the Office of Civil Rights for legal sufficiency and must concur in legal authority and factual basis before an award of damages is given.

Question. Are the civil rights complaints that are filed with the national office being referred to the appropriate state or county offices for resolution in a timely manner?

Answer. When a program complaint is filed with and accepted by the Office of Civil Rights, a notification letter requesting an agency response is concurrently sent to the civil rights staff of the alleged agency, which is in turn responsible for referring the case to the appropriate state or county offices.

Question. Are there any pending civil rights claims in the national office of which the appropriate state agency head is not aware? If so, why?

Answer. To the best of my knowledge, no pending civil rights claims are in the national office that the appropriate state agency head is not aware of.

Question. How much coordination occurs between the Office of General Council and the Office of Civil Rights?

Answer. The Office of Civil Rights and OGC coordinate daily on matters regarding resolution of discrimination complaints. OGC reviews files and proposed decisions, participates in negotiation discussions, and gives feedback to the Office of Civil Rights. The Office of Civil Rights makes the determinations. OGC makes sure the determinations are in accordance with the law.

Question. Would you please provide an update of these activities at the end of June?

Answer. We will provide an update of these activities to you at the end of June.

ARS/RESEARCH/STATE PARTNERSHIPS

The budget request for fiscal year 1999 deletes all funding for ARS programs that was not included in the fiscal year 1998 budget request. I am concerned about the signal this might be sending research communities in our states who had anticipated a continuing partnership with USDA's research agency. For example, the University of Arkansas donated the land upon which the ARS Rice Germplasm laboratory was built and I know the University has plans of working with ARS on various research projects. In other cases, ARS scientists are commonly assigned to positions on the campuses of land-grant colleges.

Question. Do you think it is appropriate for ARS to continue its association with land grant research activities?

Answer. ARS values its long-standing collaboration with the land grant research system and believes that American agriculture is best served through this well-developed partnership. The two systems complement each other and, through various coordination and review mechanisms, minimize duplication. The missions of the two systems reinforce their distinctions i.e., ARS has a national mission, characterized by long-term, high risk research, while the land grant institutions generally focus on State and regional problems. This combined overall effort has demonstrated great effectiveness. Examples are the area-wide pest management programs and the

national water quality research initiatives. These ARS-led efforts have been highly successful because of ARS' ability to draw upon both Federal and State research resources and personnel.

Question. Do you agree that deleting funds that otherwise would have been added to the ARS base, which would have been the common practice, damage the expectations of the state research communities that ARS will continue to stand as a reliable partner?

Answer. Decisions to redirect ARS budget resources to higher priority areas can have negative effects on some ARS-State research cooperative arrangements. We try to minimize any disruptive effects on our university partners by providing advance notice of our plans and, when there are opportunities to do so, use the funds that will be redirected to higher priority work to enter into new ARS-university cooperative research projects.

Question. Since the fiscal year 1999 request includes an increase for plant germplasm research, why were the funds for the rice germplasm lab deleted?

Answer. All fiscal year 1998 fund increases that were not proposed in the President's budget are proposed for redirection in fiscal year 1999. If these reductions are approved, the funds will contribute to the increase proposed for ARS plant genome research, a program that will benefit crop production, including rice.

TRADE/ASIAN FINANCIAL CRISIS

Reports of the financial condition in Asia suggest trouble for U.S. exports to that region, including shipments of meat and poultry. Additionally, it is reported that some of our trade competitors claim that U.S. methods to hold onto Asian markets are unfair and use of the WTO has been threatened.

Question. What actions have you taken and expect to take to stabilize our position in Asian markets?

Answer. As serious as the Asian crisis' estimated trade impacts are, we must remember that they are projections, not a foregone conclusion. We are developing a comprehensive strategy for responding to the crisis to reduce its impacts on U.S. exporters and producers. USDA has already announced the first component of this strategy—a sharp increase in the availability of GSM-102 export credit guarantees to those countries most in need, namely South Korea and Southeast Asia. This will help ease the liquidity constraint that is at the heart of this crisis.

In addition, we are considering the possibility of offering concessional credits, under Title I of Public Law 480, to Indonesia to help them meet their food import needs. USDA has also been supportive of efforts by the IMF to promote structural reforms in these countries which we believe will ultimately strengthen their economies and make them better customers for U.S. agricultural products.

Question. What commodities are most at risk?

Answer. In fiscal 1998, two thirds of the export loss is projected to be in high-value products, led by horticultural products, red meats/poultry, and processed foods. These are the most price and income sensitive U.S. agricultural exports and will be affected first. In fiscal 1999, losses are expected to grow substantially in bulk commodities, such as grains and oilseeds, as Asian economies slow and competitors benefit from a stronger U.S. dollar.

Question. What is the U.S. response to threats that our practices in regard to Asia violate international trade laws?

Answer. We understand there has been some criticism of the CCC export credit guarantees made available for South Korea and Indonesia during the financial crunch. Frankly, we are surprised by this criticism as the urgent need for trade financing in Asia to support reform efforts and return the region to growth and stability is well understood. Our GSM-102 credit guarantee programs in the region are intended to provide adequate access to financing for imports of food and other critically important agricultural products—not to “grab” markets.

Further, there has been a long history of the use of GSM-102 program in the region. Our export credit guarantees support commercial bank financing at commercial interest rates. There are no subsidies involved. The credit guarantees available to South Korea represent about 25 percent of total U.S. agricultural exports to that market, while the guarantees extended to Indonesia represent about one-half of total U.S. agricultural exports.

TRADE/POULTRY/EU CHLORINE ISSUE

On October 28, 1997, Senator Cochran and I wrote you on the subject of poultry exports to the EU. In that letter we expressed concern that the EU was excluding our products due to the U.S. industry practice of using chlorine as an accepted antimicrobial treatment. We were further concerned by reports that some EU member

nations were accepting product from our competitors who did use chlorine and, even more blatantly, that some EU nations used it themselves. Your response of December 22 reported that no resolution on the chlorine issue had been reached, but that you were proceeding with a number of options, including establishment of a scientific study with the EU on the use of anti-microbial treatments.

Question. What is the status of the EU "Equivalency Agreement" on veterinary practices?

Answer. The EU Agriculture Council is scheduled to vote on the U.S.-EU Veterinary Equivalency Agreement on March 16. We are expecting a positive outcome.

Question. What is the status of working with the EU on the chlorine issue?

Answer. In the Veterinary Equivalency Agreement, the EU committed to undertake a scientific study on the use of anti-microbial treatments, including chlorine. The experts, which include a person from the United States, have begun their research, and we expect this study to be completed by mid-1998. If the results are positive, the Commission has agreed to submit legislation to Member States, reversing EU policy.

Question. When do you see U.S. poultry exports resuming normal access to the EU?

Answer. In the Veterinary Equivalency Agreement, we were successful in negotiating improved conditions for trade for poultry, although in the near future this will only benefit poultry producers who do not use anti-microbial treatments. Several U.S. establishments are in a position to meet the new conditions and could begin exporting poultry as soon as the Agreement is implemented. In addition, we are confident that the EU study will show that the use of anti-microbial treatments is an effective and safe method of lowering the bacteria counts for poultry.

Question. How is the poultry export problem with the EU comparing to other livestock product access?

Answer. The Agreement will open new opportunities for red meat exports and preserve most pre-existing trade in products such as petfood, dairy products, fishery products, and egg products. In addition, the United States may be able to recoup some of its lost trade in poultry despite the differences in the U.S. and EU positions on the use of anti-microbial treatments. The Agreement eliminates many of the onerous requirements that the poultry as well as other industries would have to meet to export to the EU. Without this Agreement, U.S. exports of certain products could be blocked from the EU market unless U.S. industries invested in costly adjustments to their facilities to comply with each EU internal market requirement.

TRADE/STEP 2 COTTON

Question. Language was contained in Section 728 of the conference report to accompany the fiscal year 1998 appropriations bill that allowed for adjustments to the Step 2 Cotton certificate program to help ease an unforeseen problem regarding import quotas for cotton. The Step 2 procedure was enacted in the 1996 Farm Bill and capped at \$701 million over the life of the Farm Bill. Now that the problem is resolved, we note in the budget submission a proposal to reduce the amount available for the Step 2 procedure by \$100 million in offsets for other administration priorities in the fiscal year 1999. Explain why this action would not be harmful to U.S. cotton producers given the volatility of foreign markets, especially in Asia?

Answer. It is quite possible that the proposed spending level of \$140 million will not be appreciably below the amount that would otherwise have been spent in fiscal year 1999 without this cap.

We simply do not know how much money would have been required for payments under the upland cotton marketing certificate program without the cap. Based on the pricing estimates assumed in the budget projected marketing certificate expenditures would be about \$250 million for fiscal year 1999.

However, history would be another guide in estimating the need for funding in this program. Over the life of the marketing certificate program, beginning in fiscal year 1992, the Commodity Credit Corporation has spent about \$750 million on these payments. That averages about \$125 million per year.

Thus, the proposed spending level of \$140 million may or may not prove to be enough. If it is enough, i.e., if U.S. prices turn out to be not as far out of line with the rest of the world's cotton prices as we had assumed, then there will be absolutely no harm to farmers from the proposed reduction in authorized spending. If the original estimate of \$250 million was closer to being right, then the program will be able to only partially address the non-competitive position in which we will find ourselves.

Should the latter prove to be the case, any harm to farmers will still be minimal. The effectiveness of these payments in stimulating export sales is quite low. A work-

ing assumption used by our USDA cotton estimates committee is that a 1-percent change in the cotton price will cause a change in cotton exports of about 1 percent. The certificate payments so far this year may have brought about a reduction in cotton export prices of between 0.7 and 1.5 percent. That would translate into an increase in exports of between 50,000 and 100,000 bales, out of the 6.9 million bales we are expecting to export. That impact is not very significant for farmers.

For 1999, the impact might be a reduction in exports of 100,000 to 150,000 bales if the proposed reduction is adopted, as compared to exports without the spending cap. Farmers are not held harmless, but the impact is small.

Question. Although the Step 2 payments are not, per se, part of the so-called "Freedom to Farm" payments, (after all, Step 2 payments are tied to market conditions, not a simple give-away) do you not believe that many cotton farmers will not see this action as a breach of what little "farm safety net" was left in the 1996 Farm Bill?

Answer. The spending cap on upland cotton marketing certificates could have a slight impact on exports of cotton. However, the impact is likely to be small. The savings from the spending cap are likely to be applied to other programs of the Department which can benefit cotton farmers, including crop insurance and conservation cost-share programs. It is not a certainty at all that the rearrangement of spending priorities will result in a net loss to cotton farmers.

TRADE/CUBA MARKETS

Following Pope John Paul's trip to Cuba, there has been discussion about liberalizing trade with that nation. Prior to the trade sanctions with Cuba, U.S. agriculture was a big winner. If trade were reopened, rice trade, especially, with Cuba would present U.S. producers with wonderful opportunities. This would especially be true for producers in the mid-South with ready transportation down the inland waterways and across the Gulf of Mexico.

Question. What is your outlook for opening trade with Cuba?

Answer. We encourage the leadership in Cuba to provide to its citizens the political, economic, and social freedoms they deserve. Once these rights are restored to the Cuban people, we will embrace the opportunity to renew trade.

Question. Because of the importance Cuban trade holds for agriculture, are you taking a personal role in any discussions regarding trade liberalization?

Answer. U.S. agricultural exports are of great importance to the U.S. agricultural economy and our farmers and ranchers. We want to increase our exports where ever possible but, in the case of Cuba, I have not entered into any negotiations regarding trade liberalization.

USER FEE PROPOSALS

The budget proposes \$624 million in new user fees. Clearly, this is problematic for many reasons. The authorization committee may not approve them, if we tried to enact them the House Ways and Means Committee might Blue Slip our bill, and without them, we start out \$624 million in the hole. User fee proposals are no stranger to this subcommittee, but their rate of acceptance is not high. User fees need to be carefully crafted to ensure that, if appropriate at all, they are borne by the groups best and most properly suited to absorb them.

Question. Do you believe the meat and poultry companies will absorb these costs?

Answer. We do not estimate that the industry will absorb all of the cost of the user fees for meat, poultry, and egg products inspection.

Question. Do you believe the fees will be passed on to the consumers when companies are more likely to try and keep retail prices down below their competition?

Answer. We estimate that most of the fees will be passed on to consumers in the form of higher retail prices. The overall impact on retail prices would be less than one cent per pound.

Question. How do you justify the FSIS fees (\$573 million) which will most likely be borne by livestock producers at this time of low prices, poor markets, and other problems facing small farmers?

Answer. We do not estimate that the impact of the user fees will be passed down to producers in the form of lower prices paid. We estimate that most of the fees will be passed on to consumers in the form of higher retail prices. The overall impact on retail prices would be less than one cent per pound.

Question. Has an analysis been performed regarding the other proposed user fees to determine the impact the fees will have on the groups most likely to bear the cost of the fees? If not, why? If so, what did it reveal?

Answer. When the Administration's user fee proposal is transmitted to Congress, we will provide you with our analysis of the proposal's economic impact.

FOOD ASSISTANCE SURVEYS AND EVALUATIONS

Question. The conference agreement for the fiscal year 1998 appropriations bill contained a House provision that transferred the survey and evaluation function of the Food and Consumer Service to the Economic Research Service. The fiscal year 1999 proposal moves them back.

Please explain the rationale for moving them back?

Answer. The Administration believes that the surveys and evaluation function for the Food Assistance Programs should remain with the Food and Nutrition Service (FNS), the agency that administers these programs. These surveys and evaluations are most effective when conducted in conjunction with food assistance program operations.

Question. What problem, if any, have you encountered with them at ERS?

Answer. I have the highest regard and respect for the Economic Research Service and its people. As I stated in my response to a written question from Senator Cochran, ERS has done an admirable job in administrating and conducting the fiscal year 1998 research and evaluation program for the food assistance programs.

Question. Why is it reasonable for ERS to conduct research for some USDA activities and not others?

Answer. ERS' mission is to conduct research to support USDA's programs, including the Nation's food assistance and nutrition programs. Historically, ERS has conducted an applied research program on food assistance and nutrition issues. The agency has published numerous research findings that have helped policy officials understand the impacts of these programs on participants and the economy. Despite ERS' long history of collaborating with universities on important research issues, it has not had the opportunity to administer a large scale extramural research program.

DELTA REGIONAL COMMISSION PROPOSAL

Question. The USDA budget submission contains a request for an additional \$20 million for Empowerment Zones and Enterprise Communities (EZ/EC) assistance. At the same time, the President's budget request for the Appalachian Regional Commission (ARC) includes \$26 million for expansion into the Lower Mississippi River Delta as a new arm of the ARC to be known as the Delta Regional Commission (DRC).

Has the proposal to create the DRC been shared with you? If not, will you review it? Upon review of this proposal, will you submit to this subcommittee your views if the proposal would duplicate USDA programs or if it simply would be better administered by USDA?

Answer. I have not had the opportunity to review the proposal, but I will do so.

ADVISORY COMMITTEE CAP

The fiscal year 1998 appropriations act contains a provision that limits all advisory and related committees of USDA to \$1 million.

Question. What functions have been provided using this sum?

Answer. I will provide for the record a listing of those advisory committees, panels, commissions and task forces that we plan to fund within the \$1 million limitation.

[The information follows:]

USDA ADVISORY COMMITTEES

Food, Nutrition and Consumer Services:

National Advisory Council on Maternal, Infant and Fetal Nutrition

Food Safety:

National Advisory Committee on Meat and Poultry Inspection

National Advisory Committee on Microbiological Criteria for Foods

Research, Education and Economics:

Forestry Research Advisory Council

National Agricultural Research, Extension, Education, and Economics Advisory Board

Strategic Planning Task Force on Research Facilities

USDA/Hispanic Association of Colleges and Universities

USDA/American Indian Higher Education Consortium

National Nutrition Monitoring Advisory Council

National Genetics Resources Advisory Council

Dietary Guidelines Advisory Committee
 Census Advisory Committee on Agriculture Statistics

Marketing and Regulatory Programs:

Advisory Committee on Foreign Animal and Poultry Diseases
 General Conference Committee of the National Poultry Improvement Plan
 National Animal Damage Control Advisory Committee
 USDA/1890 Task Force
 National Organic Standards Board
 Federal Grain Inspection Advisory Committee

Farm and Foreign Agricultural Services:

Agricultural Policy Advisory Committee for Trade

Ag. Tech. Adv. Comm. for Trade in:

Animals and Animal Products
 Fruits and Vegetables
 Grains, Feed and Oilseeds
 Sweeteners
 Tobacco, Cotton and Peanuts

Technical Advisory Committee for Edward R. Madigan Agricultural Export Excellence Award Board

Emerging Markets Advisory Committee

Advisory Committee on Beginning Farmers and Ranchers

Natural Resources and Environment:

Task Force on Agricultural Air Quality Research

National Commission on Small Farms

Office of the Chief Economist:

Commission on 21st Century Production Agriculture

Question. What problems has it posed for the Department?

Answer. Advisory committees and panels provide the Department with the means to involve the public in our decisionmaking processes by providing reports and recommendations. The cap limits the flexibility we have in USDA to establish and operate committees that assist in the effective and efficient operation of USDA programs. Because of the limitation, most of the committees have been forced to reduce activities, for example, hold fewer meetings or delay reports. In addition, the limitation makes it difficult to deal with new issues like the Secretary's National Commission on Small Farms and the Commission on 21st Century Production Agriculture while still providing adequate support for ongoing activities.

Question. What are some of the additional activities you would have performed without this limitation?

Answer. The cap has caused delay in the establishment of some committees such as the Commission on 21st Century Agriculture Production and the proposed Secretary's Small Business Advisory Committee. As I indicated previously, many committees have significantly reduced meetings and delayed reports in an effort to live within the cap. The flexibility to use additional resources as necessary would enable the committees to provide additional input to the Department's decisionmaking process.

ORGANIC STANDARDS

Question. For several years, I have heard much dissatisfaction with the delays in publishing proposed rules for National Organic Standards. Now, these rules have been published but public acceptance seems questionable due to inclusion of irradiation, human sludge, and other components of production and processing that may or may not be appropriate elements of an organic standard. I understand you have responded by providing an extension for comments?

Answer. Yes. The comment period for the National Organic Standard Program was extended 45 days from March 16, 1998, to April 30, 1998.

Question. Did this reaction surprise you?

Answer. No. Organic standards have been of great interest to a wide audience that feels strongly about the issues addressed in the proposed rule.

Question. When do you think it is feasible to expect publication of a final rule?

Answer. We are working diligently to analyze the comments, which are about 4,000 at this time, and will release a final rule by January, 1999.

HATCH/SMITH-LEVER FLEXIBILITY

Question. The budget request makes reference to a provision that would allow shifting of funds between the Hatch and Smith-Lever accounts. Was this approach shared with the land-grant colleges and extension system prior to announcement of the budget? If so, what was the reaction? In view of all the overall reduction in formula funds, do you think that this proposal will simply worsen the scramble for limited funds by these constituencies?

Answer. In the Administration's concept paper detailing recommendations related to reauthorization of the research title of the Farm Bill, and specifically in testimony presented July 22, 1997, before the Subcommittee on Forestry, Resource Conservation, and Research of the Committee on Agriculture of the U.S. House of Representatives, we addressed this issue. The Administration proposed to amend the Smith-Lever extension formula program and redirect up to 10 percent of total research and extension formula funds to any research or extension purpose, with an approved plan of work. The goal of this amendment is to provide Federal funding to states in a more flexible manner so states can meet high priority needs and to permit states to better leverage their resources. Our proposal would increase this flexibility of states (at their discretion, not direction of the Federal agency) to redirect funds between these formula programs to 25 percent by 2002.

Aspects of this concept have been discussed by individual universities for several years, and by the broader community in the context of studies such as that completed by the National Research Council in 1996 on "Colleges of Agriculture at the Land Grant Universities." Reactions to the Concept have been mixed both within and among institutions.

The Administration believes increased flexibility to the institutions would help in managing proposed reduction in the formula programs.

LOSS OF AG CHEMICALS/PESTICIDE DATA PROGRAM

A few years ago, I spoke in this hearing room about my concerns of a train wreck on the horizon when we lose use of many agricultural chemicals with no worthwhile replacements. Every year, I hear from producer groups asking for special emergency registrations of pesticides to protect their crops from some new or debilitating infestation. Now, the new Food Quality Protection Act places more substances under review.

Question. What is USDA doing to help overcome the potential crisis when production grinds to a halt for lack of useful pesticides or fertilizers?

Answer. To prevent the potential loss of important crop protection pesticides, we are working closely with EPA to ensure that they have the data necessary for developing accurate risk equations needed for the reregistration pesticides under the Food Quality Protection Act (FQPA). In addition, multi-Agency USDA programs, such as IR-4, Integrated Pest Management, Pest Management Alternatives Program, and the National Agricultural Pesticide Impact Assessment Program, provide vital registration information on existing active ingredients, new products including new and safer pest management technologies. By the use of these data, registrants and the EPA are providing safer pest management alternatives to producers and consumers through science-based decisions.

Question. To what extent does the Pesticide Data Program remain important in helping keep products on the market?

Answer. The Pesticide Data Program (PDP) is a critical component of the recently enacted Food Quality Protection Act (FQPA), which directed the Secretary of Agriculture to provide improved data collection of pesticide residues. The FQPA further expanded the use of risk assessments by eliminating the "Delaney" clause that required zero risk to consumers from carcinogens associated with pesticides. The elimination of this provision enables the registration of pesticides where the actual levels of residue would present "no reasonable harm" to consumers from carcinogens. Consequently, EPA will be able to use the PDP data, on actual residue levels, for a greater variety of pesticides important to American agriculture.

For 1999, the budget includes additional funding to maintain statistically valid sampling and to establish a rapid response capability to service EPA data needs. With the implementation of FQPA there is an increased demand for providing the EPA pesticide residue data for minor-use pesticides on rapid basis. EPA will need the data to conduct dietary risk assessment reviews for over 9,000 tolerances over the next 10 years as required by FQPA. Without the data, EPA will be required to make conservative assumptions about pesticide levels that could result in over-estimation of risk and loss of registrations for economically important pesticides. The increased funds will permit increased sampling of specific commodities at a faster rate.

GLOBAL WARMING/RICE PRODUCERS

Question. Rice producers in my state are being informed that the Global Warming Treaty may impair their operations due to the reported "contribution" of greenhouse gases released by decaying rice stubble in flooded rice fields. Are you aware of such claims?

Answer. We are aware of certain research documenting that rice fields are a source of the greenhouse gas methane generated by decomposition of plant materials in wet or flooded soils.

Question. If there is any validity to this "contribution" to Global Warming, will USDA enter into the discussion in support of American farmers?

Answer. Yes, in fact USDA has been involved in both the scientific study of agricultural sources of greenhouse gas emissions and the negotiations of the United Nations Framework Convention on Climate Change. Research conducted by the Agricultural Research Service suggests that methane emissions from rice fields is reduced by limiting the period of time when the fields are flooded, without affecting rice yields. USDA employees participate in an interagency team headed by the Department of State which determines the U.S. positions on climate change negotiations, and USDA was represented on the U.S. delegation to the Third Conference of Parties to the Framework Convention in Kyoto, Japan. USDA is currently intensifying its involvement in these issues by strengthening its Global Change Program Office, which will insure that American farmers and ranchers are represented in those discussions. The President's budget for fiscal year 1999 proposes a funding increase of \$10 million for climate change activities, and \$3 million of that total is targeted towards development of new technology for mitigation of climate change impacts on agriculture, including reduction of greenhouse gas emissions from agricultural lands.

CROP INSURANCE SALES COMMISSIONS

Question. During consideration of the fiscal year 1998 appropriations bill, there was discussion of the proper level to provide as reimbursement to insurance companies to pay for sales commissions. The authorized amount was in excess of \$200 million and you argued for a level closer to \$150 million. In the end, the conferees agreed on a level in the \$180 millions. You note that the past year has provided gains for the insurance industry.

If the sales commission funding is not transferred to mandatory accounts, what level will you think appropriate for fiscal year 1999?

Answer. If no change is made in current law which requires that sales commissions be funded as discretionary spending, \$208 million would need to be appropriated for that purpose for 1999. But, I strongly recommend that Congress enact the legislation which the Administration will submit in the very near future to change the law to shift this expense to the mandatory account and make certain other changes in the program.

UNDERWRITING GAINS

Question. Do you think the higher than normal insurance gains should affect the amount we make available?

Answer. I believe that insurance gains, which reflect the level of risk taken by private companies, should be treated separately from administrative and operating expenses which reflect costs incurred for delivering the program.

BOLL WEEVIL

Question. A couple of years ago, we developed a loan program to help farmers move more rapidly into the boll weevil eradication program. This program was necessary because of the delay in appropriating a level of APHIS grant funds that states low on the list were being kept at a marketing disadvantage under states with lower costs due to complete eradication. It was never our intention that the loan program would replace the grant program. Rather, the loan program was designed to accelerate the entire eradication process. How do you justify allowing some states the lower cost of eradication by use of a grants program when neighboring states will have to rely on loans?

Answer. We agree that the FSA loan program is critical to accelerating the entire boll weevil eradication process, because it allows growers to spread the significant start-up costs over several years, resulting in more affordable annual contributions to their programs. We have taken the opportunity to look for cost effective ways to manage program operations. For example, we have recently discontinued cost-sharing in virtually all areas in which the weevil has been eradicated to make available

so much funding as possible for active eradication zones. Grower organizations in all states with active eradication program had been receiving an equitable cost-share percentage. However, as the momentum for expansion has increased, the amount of acreage involved has also increased dramatically resulting in each area receiving a smaller percentage of Federal grant funds than in prior years. Grant funds simply are not available in the amounts needed to accelerate the program. In fact the loan program makes more total funds available for program expansion than have been under the traditional appropriations and grants approach. Because of the tremendous benefits cotton growers can gain from boll weevil eradication, we believe that they will choose to take advantage of the loan program.

LOAN SUBSIDY COSTS

Question. You state that savings will be achieved in loan programs due to declining interest rates. However, due to reforms that lock in program levels over a fixed number of years, it appears that loan subsidy cost is actually increasing. For example, the water and sewer loan program in fiscal year 1998 required a subsidy of only \$67 million to achieve a program level of \$691 million. For fiscal year 1999, a program level of \$764 million will require \$126 million in subsidy, nearly twice that of last year.

How do you explain your statement of lower costs for loan programs with the example of higher subsidy costs?

Answer. Perhaps I should clarify my statement. What I said was that due to decreasing interest rates resulting from the economic expansion, the budget authority required to administer these programs is 40 percent less costly than it was in 1993. Your observation regarding the higher subsidy costs for fiscal year 1999 is correct, but that stems from a provision enacted in the Balanced Budget Act of 1997. This provision attempted to fix the problem of widely fluctuating program levels caused by differences in interest rates assumed in the economic assumptions and the actual interest rates in effect at the beginning of the fiscal year. This fix also locked in the budget year interest rate in the out years which means that the out-year interest rates will not be decreasing as they have previously. Since most loan programs have low disbursements in the initial year and higher disbursements in the out-years, the effect is to increase the subsidy cost. Conversely, in an era of increasing interest rates, the subsidy cost will be lower.

ANIMAL WELFARE ACT

Question. What is the Administration's position on legislation (H.R. 594, the Pet Safety Protection Act) proposed by Rep. Canady (R-FL) and Rep. Brown (D-CA)?

Answer. The Administration is continuing to review this bill and has not finalized a position at this time.

Question. What effect would enactment of H.R. 594 have on agricultural, medical, and related research?

Answer. The bill would allow research dogs and cats to come only from licensed breeders, publicly owned and operated pounds and shelters, individual donors who have bred or raised the animals or who have owned them for at least 1 year prior to donation, or other research facilities. The bill would eliminate "random-source" dog and cat dealing—an activity in which only 32 dealers nationwide are involved at this time.

Question. To what extent would enactment of H.R. 594 curtail the occurrence of fraud, theft, and mistreatment of animals?

Answer. We are very pleased that over the last few years, we have succeeded in revoking the licenses of the most non-compliant Class B dealers, and we have dramatically improved compliance by the remaining 32 Class B dealers by inspecting their operations quarterly and tracing selected animals back to their original sources. In fact, in fiscal year 1997, Animal Care officials were able to complete 95.5 percent of their tracebacks of animals sold into research—up from approximately 40 percent in fiscal year 1993. We firmly believe that our efforts have significantly reduced the potential for USDA licensees to steal or otherwise fraudulently obtain animals. Presumably, disallowing random-source dealing altogether would reduce that potential even further.

Of course, we must note that the bill would not affect the wide variety of other situations not covered by the AWA in which fraud, theft, and mistreatment of animals can occur. Examples would include theft of privately owned hunting or security dogs or abuse or neglect of animals by individual pet owners.

Question. Would eliminating USDA regulation of Class B "random source" dealers under the Animal Welfare Act, the objective of H.R. 594, result in savings, and if so, by what amount?

Answer. Not necessarily. It is important to note that a number of Class B dealers have signalled intent to convert to Class A (breeder) operations or have already done so, so if Class B dealers were to be eliminated, some of these savings would be offset by costs to regulate these same individuals as Class A dealers. In addition, H.R. 594 would require pounds and shelters to be licensed and comply with record-keeping and certification requirements, which would further offset any savings achieved by eliminating Class B dealers.

QUESTIONS SUBMITTED BY SENATOR BYRD

WATER 2000

Question. Please provide me with a status report on the U.S. Department of Agriculture's (USDA) progress in achieving the goals of Water 2000 in West Virginia in 1997.

Answer. In fiscal year 1997, 13 water projects were financed by RUS in West Virginia. These 13 water systems served 11,600 people. Out of the 11,600 people served, 5,600 received clean water for the first time. The other 6,000 people had their water systems improved so they could continue to provide clean water.

Question. What progress does the agency expect to make on the goals of Water 2000 in 1998?

Answer. In fiscal year 1998, we estimate that 8,500 more rural people in West Virginia will receive clean water through RUS financed water systems.

Question. What progress does the agency expect to make toward the goals of Water 2000 with respect to the President's fiscal year 1999 budget request?

Answer. In fiscal year 1999, we estimate that an additional 9,319 rural people in West Virginia will receive clean water through RUS financed water systems.

NATIONAL CENTER FOR COOL AND COLD WATER AQUACULTURE

Question. Please provide me with a status report on progress on the National Center for Cool and Cold Water Aquaculture.

Answer. The following describes progress on the National Center for Cool and Cold Water Aquaculture (NCCCWA):

- The mission of the NCCCWA is to enhance aquaculture production of cool and coldwater finfish. The NCCCWA's priority research program areas will include genetics and breeding, fish health, nutrition, and production systems. Work will focus on trout and other salmonids. Other potential species include hybrid striped bass and other cool and cold water species.
- The NCCCWA will combine its scientific expertise with that of the Freshwater Institute and the Leetown Science Center (LSC) of the Biological Resources Division of the U.S. Geological Survey, and with the marketing, genetics, and other scientific expertise of West Virginia University (WVU), in a collaborative and comprehensive program that should contribute greatly to the economic potential of West Virginia and of the Nation.
- ARS and LSC enacted an Interagency Memorandum of Understanding (MOU) on September 30, 1996, to facilitate cooperation between NCCCWA and the LSC. LSC and ARS are presently developing accessory agreements for the MOU to provide more detail on cooperation in research and sharing of facilities and resources. LSC has agreed to provide space and facilities for ARS scientists to conduct aquaculture research the NCCCWA construction is underway.
- Extreme drought conditions in 1997 resulted in significantly reduced spring water supplies and stream flow in the vicinity of LSC. The drought condition called into question whether natural water resources would always be sufficient to provide for the future needs of both the Fish Health Laboratory (FHL) and NCCCWA without impacting local residents. Consequently, the present plan is for the NCCCWA design to include the capability to recirculate, with appropriate treatment, up to 50 percent of the water supplied to the building. This capability will also provide for greater control over water quality for research purposes and will obviate the need to develop Bell and Link Springs. Preliminary projections are that the capital costs of the recirculation capability will be essentially equivalent to the cost savings resulting from not developing the Bell and Link Springs. Operating cost projections are presently being formulated. LSC and ARS have also agreed to develop a comprehensive, joint water management plan.
- ARS received \$1.9 million in fiscal year 1995 for land purchase and laboratory planning and design. ARS received \$6 million in fiscal year 1997 and \$6 million

- in fiscal year 1998 for construction of the NCCCWA. Total estimated construction costs are \$12 million. Annual operating costs are estimated at \$4 million.
- The design for the NCCCWA is currently being developed. A site plan has been prepared. Conceptual designs have been prepared for the laboratory/office building and the tank/aquaria building. Aesthetics will be an important component of the design to ensure that the facility blends well with the surrounding environments. Final drafts of the Program of Requirements and the Investigative Report have been completed.
 - On October 20, 1997, ARS purchased a 217-acre farm adjacent to the Leetown site to provide for additional watershed protection. The purchase price was \$600,000.
 - The fiscal year 1998 Congressional appropriation of \$250,000 for the NCCCWA's first program funding will be used to recruit a highly-qualified scientist to serve as Research Leader; to begin carrying out a cooperative research program with FHL; and to oversee final design and construction of the facility.

APPALACHIAN SOIL AND WATER CONSERVATION LABORATORY

Question. With the completion of the five-year mission plan for the Appalachian Soil and Water Conservation Laboratory, please provide me with a list of research programs that will be undertaken in the future.

Answer. The proposed research programs to be undertaken in the next five years are:

- (1) Management of hilly grassland in Appalachia for sustainable production;
- (2) Renovation and improvement of underutilized, abandoned or disturbed hill lands with browsing livestock;
- (3) Agroforestry systems for the Appalachian region; and
- (4) Improving forage legumes for Appalachian grasslands.

Question. Please provide the funding level required for each program.

Answer. To fully develop these programs and operate the Laboratory at full capacity would require the addition of four to five scientists for an estimated total of \$1.2 to \$1.5 million.

APPALACHIAN FRUIT RESEARCH LABORATORY

Question. With the completion of the five-year mission plan for the Appalachian Fruit Research Laboratory, please provide me with a list of research programs that will be undertaken in the future.

Answer. The mission of the Appalachian Fruit Research Laboratory is to develop the science, technology and genetic base needed to enhance productivity and fruit quality, minimize adverse effects on the environment and solve critical problems of temperate fruit production, protection, harvesting and marketing in the Eastern U.S.

In response to this mission, the current program is focused on the development of (1) knowledge of the critical molecular processes in fruit development and ripening; (2) genetic materials with improved pest resistance, cold hardiness and fruit quality; (3) integrated cultural and pest management systems that reduce pesticide/herbicide use and increase production efficiency; (4) harvesting, handling and postharvest disease controls that increase shelf life and market value.

Question. Please provide the funding level required for each program.

Answer. To fully develop these programs and operate the Laboratory at full capacity would require an additional four to five scientists for an estimated total of \$1.2 to \$1.5 million.

POTOMAC HEADWATERS LAND TREATMENT PROJECT

Question. Please provide me with a report on the Potomac Headwaters Land Treatment Project. What is the status of the funding for this project?

Answer. In fiscal year 1997, \$2,416,300 funded 116 contracts. In fiscal year 1998, \$3,130,000 went to this project which will fund approximately 150 additional contracts.

Question. What is the participation rate of eligible farmers in the program?

Answer. The participation rate has been greater than anticipated when the project was originally planned. There are approximately 340 poultry producers in the watershed. Currently 255 have requested assistance.

STAFFING REDUCTIONS

Question. I understand that the proposed Farm Service Agency (FSA) fiscal year 1999 budget will result in an additional reduction of 1,000 FSA jobs. What effect will these reductions have on the FSA's mission?

Answer. The proposed fiscal year 1999 non-Federal county office staffing level of 9,980, a decrease of 855 staff years from fiscal year 1998, will challenge us to perform the ongoing operations and program activities for the 1996 Act with an adequate level of customer service. However, in proposing these reductions, difficult choices had to be made in balancing the budget for fiscal year 1999.

These staff reductions may hinder program delivery and service to producers in locations already minimally staffed as a result of previous agency downsizing. Assistance to sister agencies, conservation associations and others may also have to be reduced.

In order to effectively manage the resources remaining in the field offices, FSA may be required to achieve some office closures or consolidation beyond those previously planned. However, I've asked that actions to close and consolidate any additional county offices be made only with consultation of local FSA county committees, my office, and Congressional delegations. The Department has entered into a contract with an outside consulting firm to conduct a study of the county-based agencies, and we expect to be able to use the results of the contractor study in guiding our actions to achieve any required office closures through a solid independent workload analysis of the county-based agencies.

Question. What effect will these reductions have on the FSA's mission in West Virginia?

Answer. Historically, the methodology for allocating personnel reductions among States has been based primarily on current and projected workload by State. Until the proposed budget is agreed upon and specific reductions are determined for a State, it will be difficult to furnish specific impacts for a particular State. However, it is likely that an approximate 855 non-Federal county office employee reduction will result in new shared-management arrangements and/or closures of some offices. As I mentioned, the Department has entered into a contract with an outside consulting firm. The study is to be completed by September 1, 1998, and may provide insight on how any future staffing reductions might be distributed.

Question. What actions is the FSA taking to accommodate individuals wishing to remain in the FSA's employment, or to otherwise soften the individual disruptions caused by the reduction in force?

Answer. For Federal employees, FSA extends full career transition assistance under the Career Transition Assistance Program. This includes priority placement rights, provision of job information and counseling on resume preparation, administrative time for using career transition resource services and facilities, and official time for interviews.

For non-Federal employees, FSA extends re-employment priority rights to all RIF'ed employees for two years. This affords RIF'ed employees with re-employment priority for any comparable vacancy in the State in which they were employed.

FSA is aggressively pursuing ways to soften the impact of FTE cuts. FSA will continue to use buyouts and early outs wherever possible to minimize the number of involuntary separations. FSA is also retraining employees to learn new skills to assume any vacant positions in the Agency.

 QUESTIONS SUBMITTED BY SENATOR LEAHY

EMERGENCY CONSERVATION PROGRAM

Question. The Northeast is still trying to recover from the worst ice storm this century. Although the Farm Service Agency, Natural Resources Conservation Service and the Forest Service have been working with farmers, woodlot owners, maple producers and apple orchards, I am concerned that the Department's ability to help Vermonters rebuild from this atypical disaster is limited. Although there was over \$8 million in damage on Vermont farms, Farm Service Agency programs have only requested \$1.5 million from the Emergency Conservation Program because the majority of the damage does not fit within the constraints of ECP. Will the Department be flexible in using USDA programs to assist Vermonters and others recover from the storm?

Answer. Our disaster program authorities provide us with significant flexibility in providing assistance to producers with losses due to natural disasters. We are working with producers affected by severe weather conditions in the Northeast and else-

where and will propose any necessary changes in authorities and funding levels as expeditiously as possible.

Question. What programs, other than ECP, can be used to help the region rebuild and diversify their economy over the next 5 or 10 years?

Answer. FSA lending programs, particularly the emergency loan program, can play a critically important role in helping producers recover from losses resulting from natural disasters. Many other programs, including initiatives of the Fund for Rural Development and other rural development loan and grant programs, can help rural areas support and strengthen diversified economies.

UNOBLIGATED DISASTER FUNDS

Question. Does the Department have unobligated funds from previous disasters that may be reprogrammed to address ice storm damage?

Answer. We are unable to determine at this time the extent of additional funding we may need for emergency assistance in the Northeast and elsewhere. We are reviewing current funding obligations to determine whether any funds remain available. But it is clear that unobligated balances in our emergency programs are extremely limited.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

Question. The Department requested an additional \$100 million in fiscal year 1999 for the Environmental Quality Incentives Program. How does the Department intend to distribute this additional funding among cost share payments, incentive payments and technical assistance?

Answer. The additional funds will be used to provide increased assistance to meet the President's Clean Water Initiative and to increase assistance to limited resource and Native American farmers and ranchers as recommended by the USDA Civil Rights Action Team. A prescribed distribution to education and financial assistance has not yet been determined, but 10 percent is anticipated at this time for technical assistance.

Question. How will the Department prioritize this funding amongst states and watersheds?

Answer. While a process for prioritizing funding has not been finalized, we will consider the recommendations of NRCS State Conservationists, in consultation with their respective State Technical Committees, NRCS Regional Conservationists, and recommendations received from other governmental and non-governmental entities with interest and expertise in water quality and natural resource concerns.

Question. With this increase can we anticipate an increase in funding for states with long waiting lists of farmers who want to adopt conservation practices or for states that have devoted significant state resources to match the federal program?

Answer. It is likely that States with significant natural resource and environmental problems with a recognized demand for program assistance will receive increased funding. Leveraging of State or other funds has been a consideration when allocating funds and will continue to be so that we maximize environmental benefits per program dollar expended.

RESOURCE CONSERVATION AND DEVELOPMENT

Question. The fiscal year 1998 Agriculture appropriation bill included an \$18 million increase for the Resource Conservation and Development Program. How was this funding distributed across the RC&D councils and what criteria were used?

Answer. In fiscal year 1998, Congress appropriated \$34,377,000 to the Resource Conservation and Development Program, an increase of \$5 million. As outlined in the operating plan submitted to the Congress on December 18, 1997, \$2.5 million will fund up to 25 newly authorized RC&D areas, and \$1.45 million will provide additional funding for the existing 290 RC&D areas. The remaining \$1.05 million will establish a Challenge Grant Fund for one year for authorized areas.

CONSERVATION FARM OPTION

Question. It is my understanding that the Department is finalizing the proposed rule for the Conservation Farm Option (CFO) program. When will it be published?

Answer. The CFO proposed rule should be published by late March, 1998.

Question. Given the protracted development of the rulemaking, there is some concern that full use of the authorized funding levels for the program will not be made. Has the Department projected the demand for the program and how will the program be implemented once the rulemaking process is completed?

Answer. Yes, the Department has projected the demand for the program. Once the proposed rule is published, a call for proposed pilot project areas will be conducted. Selection of the actual pilot areas will follow. As soon as the final rule is published, eligible participants within the selected pilot areas may apply for program benefits.

Question. What are the six regions where the pilot program will be implemented and how will the states be selected for participation?

Answer. The six regions are the six NRCS regions which cover the entire United States. A call for proposed pilot project areas will be conducted nationwide. Generally, pilot project areas within states will be proposed for selection in the CFO. Selection of pilot project areas will be made by the Chief, NRCS.

FARMLAND PROTECTION PROGRAM

Question. The Farmland Protection Program (FPP) reached its authorized ceiling of \$35 million in fiscal year 1998. Since 1997, how many requests for FPP funding has NRCS received?

Answer. NRCS has not received any formal requests for FPP since fiscal year 1997, as requests for proposals to participate in the program will not be made until March 1998.

Question. How does this compare with the number of requests you have funded and what is the projected need for the program?

Answer. It is anticipated that new requests will far exceed the number of requests made in fiscal year 1997 as the funding available will be \$18 million for fiscal year 1998, as compared to \$2 million last year. The projected future funding need for the Farmland Protection Program far exceeds the program's current funding level. This is estimated at approximately \$100 million per year.

Question. Has the Department identified other programs that may be able to address this remaining need?

Answer. The FPP is unique in that NRCS works with Tribal, State and local entities to leverage program funding and thus maximize the Federal funds available. Therefore farmland protection programs in the different states will continue to do limited work with individuals in this area of conservation. The department has not identified any other additional federal funds from other programs to address the remaining FPP needs.

CLEAN WATER AND WATERSHED RESTORATION INITIATIVE

Question. The Clean Water and Watersheds Restoration Initiative includes assistance for 1,000 rural watersheds. How will these be selected for assistance?

Answer. Although the guidelines for selecting the 1000 rural watersheds hasn't been completed, the foundation for addressing our nations water quality issues is through a locally-led process. A key component in the selection process will naturally include the condition of water quality in the watershed. It is expected the \$20 million NRCS budget proposal will address 350 watersheds.

CONSERVATION OPERATIONS

Under the Conservation Operations budget, NRCS includes \$20 million for incentive payments to those States that are successful in increasing the level of non-Federal contributions to the conservation effort. In Vermont, the state agriculture department has funded a program to match federal funds in order to increase the cost-share payment to farmers and attract farm operations that otherwise would not be able to participate in the program. In fiscal year 1999, the Governor has requested \$750,000 for this program, almost three-quarters of the federal funding level in Vermont.

Question. Is this the type of success NRCS will be looking for distribution of the additional \$20 million?

Answer. The budget proposal of \$20 million will be internally allocated to NRCS state offices based on an as yet to be determined threshold of contributions from state and local entities for such activities as GIS and soil survey digitization. These funds are not intended to be used as grants to state and local entities.

Certainly, the Vermont program is an outstanding example of the initiative that states can take to leverage federal funds. The support that the Governor of Vermont and the State Legislature are providing to conservation is exemplary. State efforts such as this result in an increase in conservation on the land and improvement in the environment. Multiplying the Vermont experience across the country will have a significant impact on our environment. Definitely, states that have successful programs in place should be rewarded while at the same time other states should be provided an incentive to initiate suitable leveraging efforts. NRCS will include both of these factors in an equitable system to distribute the \$20 million.

Question. The Conservation Operations budget also gives special consideration to those States that expand their use of geographic information systems and purchase additional digital orthophotography. In 1995, the Vermont Center for Geographic Information was presented with an award to "maintain, support and integrate decision support systems for agricultural, rural development, and natural resources initiatives * * *" (USDA letter signed by Wardell Townsend, October 34, 1995) Although the Vermont Center worked with USDA over the next year to actually receive the award, no funding has ever been forwarded to Vermont. Although I find it very troubling that USDA would award a grant and then not follow through on the promise, I am pleased to see that the Department recognizes the importance of these projects in the fiscal year 1999 budget.

Will the Department consider funding the Vermont project under the Conservation Operations budget in fiscal year 1999? If not, how will the Department fulfill its obligation to the Vermont Center for Geographic Information?

Answer. I am aware of the Vermont concerns. We are exploring the opportunity of making the Vermont project a USDA Business process re-engineering project as part of the Service Center Implementation Team activities.

OPTION 1-B

Question. The Department's preferred option for milk marketing order reform is the so-called "Option 1-B." But your proposal notes that this option would put dairy farmers out of business. Therefore you have proposed some so-called transition payments to ease the pain as you phase in Option 1-B. Your proposal states that, with the exception of the upper mid-west, dairy farmers would face reduced income under Option 1-B. Even farmers in the upper mid-west would be better off under Option 1-A in terms of income. The economists for Agri-Mark dairy believe that Option 1-B will cost dairy farmers over \$360 million per year in net income. Vermont's Commissioner of Agriculture believes that Option 1-B will mean that half of Vermont's farmers go out of business. Without local, fresh supplies of milk consumer prices could skyrocket with each snow storm in the Midwest. Would you reexamine your preferred position to take into account the recommendations of the National Commission on Small Farms, which I will officially offer as a comment to this marketing order proposal?

Answer. One of the main purposes of issuing a proposed rule is to receive public input on the proposals contained in the rule. All comments submitted to the Department will be reviewed and considered. Based on this review, the Department will then issue a final rule. The National Commission on Small Farms report has been identified as a proposed rule comment and will be considered when developing the final rule.

Question. Would you look at Agri-Mark's analysis and provide me with a detailed explanation of how, if at all, USDA's analysis would differ. I recognize this request, and my next request, cannot be done overnight and I would simply request that this be done soon.

Answer. We have requested input from the public on the proposed rule. Once Agri-Mark's comments are submitted to the Department, they will be given full consideration. Because of ex parte restrictions, I will not be able to give you a detailed explanation of how Agri-Mark's analysis may differ from USDA's analysis. I can assure you though that when received, full consideration will be given to Agri-Mark's analysis.

Question. Would you reexamine your preferred marketing order position (1-B) to take into account the recommendations of the National Commission on Small Farms which I will officially offer as a comment to this marketing order proposal?

Answer. One of the main purposes of issuing a proposed rule is to receive public input on the proposals contained in the rule. All comments submitted to the Department will be reviewed and considered. Based on this review, the Department will then issue a final rule. The National Commission on Small Farms report has been identified as a proposed rule comment and will be considered when developing the final rule.

Question. I would like you to examine how many small farms might go out of business under Option 1-B, as compared to Option 1-A. I am aware some dairy farmers will go out of business regardless, but I would like to know how many more would go out of business under Option 1-B, as compared to 1-A, and what circumstances would affect that issue.

Answer. It is difficult to predict the impact on farm numbers under either Option 1-B or Option 1-A. However, the proposed rule does request input from the public regarding the impact of this proposal on small businesses. We will examine the full impact of any action addressed in the proposed rule.

Question. I recognize that there are limits to being able to predict such outcomes and that other factors, such as interest rate levels, can have a significant impact. Please identify other factors which you think would play a role in this matter.

I believe it is imperative that greater focus be placed on keeping small, local dairy farmers in business.

Answer. Other factors, such as interest rates, have an impact on our ability to predict outcomes from any proposed action. However, the proposed rule does request input from the public regarding the impact of this proposal on small businesses and regarding the price level and phase-in programs. Any additional information we receive will be fully considered in our evaluation of the impacts of the proposed rule.

FUND FOR RURAL AMERICA

Question. I was fortunate enough to have played a part in authorizing the 1996 Farm Bill—a bill that broke new ground in providing assistance to our rural communities. A case in point is the Fund for Rural America, which was established in the bill. The Fund directs \$300 million over three years to help solve the problems facing rural areas. Due to a technical error, the \$100 million that was intended for use in 1998 will not be available unless a correction to the law is made. Secretary Glickman, what steps are being taken to ensure there is no gap in the Fund for Rural America for 1998?

Answer. The Department shares your concern about the 1-year hiatus in Fund for Rural America funding. We asked for a language correction and the issue is embedded in discussions about the Farm Bill Research Title. However, should the correction not be made, we plan to minimize any break by spending 1999 monies early in the fiscal year. For example, we currently plan to make the final first round Center Grant awards in October, 1998, with additional project grants through the end of the calendar year.

Question. If funding is not provided in 1998, how will that affect projects that receive "Center" grants or other multi-year awards out of the 1997 funding cycle?

Answer. The projects receiving funding out of the 1997 funding cycle would not be affected by the hiatus in 1998. This is because the projects in question were fully funded for the life of the project at the time of award. Therefore, they have funds to continue the activities despite the delay in 1998 funding. However, the break will delay award of center grants from summer to fall. The scheduling adjustments we are making will limit the impact of no 1998 funding to a 4-6 month lag rather than a full year lag.

Question. When will the announcement on 1997 awards be made?

Answer. All 1997 awards were completed March 24, 1998. Congressional offices were notified immediately prior to award in case Members wanted to contact constituents directly. A complete list of the awardees will be released along with press information and individual project summaries in late March or early April.

SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS AND CHILDREN (WIC)

Question. Your budget indicates that WIC is "fully funded." However, WIC directors believe that not all eligible applicants in all states will be able to be served by WIC. Please explain the status of the WIC funding request in terms of being able to serve all eligible applicants within a reasonable degree of certainty. I recognize USDA has to make projections so that absolute certainty would be difficult to determine.

Answer. Our full funding projection model starts with Bureau of Census estimates of income-eligible infants and children and uses Department of Health and Human Services data useful in estimating those at nutritional risk. We estimate income eligible pregnant women, and then apply nutritional risk factors to each group, and finally make certain projections as to the proportion of those eligible who will actually seek WIC benefits. We are confident that our 1999 funding request is adequate to serve 7.5 million participants a month. As that has been our target for several years, during which time the economy has improved markedly, we are confident that it is a reasonable estimate of full participation.

QUESTIONS SUBMITTED BY SENATOR DORGAN

RURAL ECONOMIC AREA PARTNERSHIP (REAP) ZONE

In 1993 President Clinton made a commitment to establish a high-level inter-agency working group on Community Development and Economic Empowerment which would specifically address the need to send more Federal economic development resources to rural areas with serious out-migration problems.

Question. Please describe USDA's participation in the interagency working group development as part of this Presidential commitment.

Answer. The Department of Agriculture is one of 22 Departments and Agencies that are a part of the Community Empowerment Board which provides overall coordination for implementation the Empowerment Zone/Enterprise Commodity Initiative.

Question. What specific steps has USDA taken to fulfill the President's commitment to reinvigorate economics in rural areas affected by out-migration?

Answer. USDA and the Small Business Administration help pull together a One-Stop Capital Shop to serve the Rural Economic Area Partnership (REAP) Zones of North Dakota as well as all of North Dakota (one of only five nationwide). In addition, Rural Development assistance to participating North Dakota REAP counties has risen sharply. The 14 county area encompassed within the two REAP zones averaged \$1.68 million a year in Rural Development funding dollars (not including single family housing) during 1991-94. For 1996 and 1997 the annual average of Rural Development assistance to the REAP counties is approximately \$12.5 million annually.

Question. Please describe the activities USDA will engage in fiscal year 1998 to advance this policy priority.

Answer. USDA's Rural Development mission area is committed to helping improve the economy and quality of life in all of rural America, including areas where out-migration and job loss has torn asunder the fabric of the rural economy. Our financial programs in 1998 will continue to support essential public facilities and services as water and sewer systems, housing, health clinics, emergency service facilities and electric and telephone service. We will promote economic development by supporting loans to businesses through banks and community-managed lending pools. We will offer technical assistance and information to help agricultural and other cooperatives get started and improve the effectiveness of their member services. And we will provide technical assistance to help communities undertake community empowerment programs, such as the REAP demonstration areas in North Dakota.

Question. Due to the obvious application of USDA's rural development mission area programs relating to this initiative, please describe your willingness to take a lead role in helping the interagency working group develop practical, real proposals and actions that will transform the President's commitment into real opportunity in rural areas.

Answer. USDA has always been willing and enthusiastic to take a lead role in developing practical and real proposals to support rural development.

ARS FACILITY CLOSURES

Question. The Appropriations Committee made it clear in Public Law 105-83 that it did not concur with the Department's proposed closure of ARS facilities and, further, that the strategic planning process in the Federal Agriculture Improvement and Reform Act relating to all USDA research facilities be completed before any further closures are contemplated. Now the Department, in the fiscal year 1999 budget, has again proposed closures. What is the rationale for the closure in light of the direction already clearly delineated in the fiscal year 1998 funding bill?

Answer. The fiscal year 1999 Federal budget submitted by the President recommends a number of new initiatives to address changing priorities facing agriculture and the American consumer. Food safety, global climate, nutritional requirements, emerging infectious diseases in a global community, genome maps of critical agricultural products etc. represent critical challenges that must be addressed as we move into the next century. The constraints of Federal spending remain in place. The Administration and the Congress continue to target Federal spending and revenue savings in all budget deliberations.

The research budget proposed for ARS reflects an increase of \$32 million over the current year. However, the Department is focusing on many priority agricultural issues that must be addressed now by our research scientists. This requires that ARS terminate ongoing projects and reallocate these resources to the new or expanded initiatives as recommended by the President. In this effort a number of projects carried out at Prosser, Washington; Orono, Maine; Brawley, California and Mandan, North Dakota were identified as less critical. Given these programmatic decisions, management considerations lead to recommendations to terminate and redirect resources to new research initiatives and close the mention research stations. We believe there is adequate information for Congress to act on these relatively straight forward recommendations at this time without formal input from the Strategic Planning Task Force.

CENTRALIZED SERVICING CENTER

Many North Dakotans have registered serious complaints about service at the St. Louis Rural Development Centralized Servicing Center, including that financial records were muddled and files misplaced.

Question. In the case of the Rural Housing centralized service, can you articulate how centralization in this case has been beneficial to the customer?

Answer. The Centralized Servicing Center (CSC) is providing state-of-the-art servicing comparable with any other system available to homeowners across the nation. Our system is unique because of the Congressionally mandated "supervised credit" that must be available to our borrowers to preserve home ownership though economic or other hardships individuals and families may experience. For this reason, we have had to modify the private sector serving software we purchased to ensure these servicing options were handled in a consistent and efficient manner. These servicing features include: 7 day a week, 24 hours voice response for detailed information on loans; nationwide consistency for servicing, including payment assistance, moratorium, reamortization and other services; centralized cash management providing fiduciary control; a monthly statement sent to each borrower; escrow of taxes and insurance; and expanded (7:00 am-6:00 pm) customer service representatives to handle more complex issues for our borrowers.

Beginning in October of 1997, RHS centralized over 700,000 loans from 1,200 offices nationwide to one facility in St. Louis. We currently have approximately 800 field offices. This was a massive undertaking. We have experienced some difficulties with backlogs in our mailroom which has delayed payment assistance and other services. This problem has been rectified and our response time has improved dramatically. Additionally, we have and are continuing to modify our software and other support systems to handle additional concerns and provide the best customer service to our borrowers.

Question. How many staff have been added to the Center, and how does this number compare with the number of personnel that previously handled housing program inquiries in the field offices?

Answer. Prior to the Centralized Servicing Center (CSC), there were approximately 3,300 staff years performing single-family loan origination and servicing in the field. As a result of a move to centralize the loan servicing process, 900 staff years in the field were deployed for other critical Rural Development activities, 600 staff years were transferred to the CSC, 600 staff years were eliminated, 600 staff years still remain in the field to conduct loan origination and 600 staff years remain in the field to conduct post CSC acceleration and liquidation including management and disposal of inventory properties.

SUBCOMMITTEE RECESS

Senator COCHRAN. We do not have any more requests for recognition from other Senators, so this concludes today's hearing. We appreciate very much your cooperation with our subcommittee.

Our next hearing will be on Tuesday, February 24, at 10 a.m. in this room, room SD-138, of the Dirksen Senate Office Building. We will hear then from departmental witnesses with respect to the Department's research, education, and economics programs.

Until then, the subcommittee stands in recess.

[Whereupon, at 12:13 p.m., Tuesday, February 10, the subcommittee was recessed, to reconvene at 10:04 a.m., Tuesday, February 24.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

TUESDAY, FEBRUARY 24, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:04 a.m., in room SD-192, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Gorton, Burns, and Bumpers.

DEPARTMENT OF AGRICULTURE

**STATEMENT OF I. MILEY GONZALEZ, UNDER SECRETARY, RESEARCH,
EDUCATION, AND ECONOMICS**

ACCOMPANIED BY:

**EILEEN KENNEDY, ACTING DEPUTY UNDER SECRETARY, RE-
SEARCH, EDUCATION, AND ECONOMICS**
DENNIS KAPLAN, BUDGET OFFICE

NATIONAL AGRICULTURAL STATISTICS SERVICE

STATEMENT OF DONALD BAY, ADMINISTRATOR

AGRICULTURAL RESEARCH SERVICE

STATEMENT OF FLOYD P. HORN, ADMINISTRATOR

ECONOMIC RESEARCH SERVICE

STATEMENT OF SUSAN OFFUTT, ADMINISTRATOR

**COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION
SERVICE**

STATEMENT OF BOB ROBINSON, ADMINISTRATOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.
This morning our subcommittee continues its hearings to review the budget request submitted by the President to fund the Department of Agriculture and related agencies. This morning we are pleased to have an opportunity to review the budget request of the Agricultural Research Service; the Cooperative State Research, Education, and Extension Service; the Economic Research Service; and the National Agricultural Statistics Service.

Miley Gonzalez, who is Under Secretary of Research, Education, and Economics, is with us and is accompanied by Eileen Kennedy, Donald Bay, Floyd Horn, Susan Offutt, and Bob Robinson. Dennis Kaplan is here representing the Budget Office for the Department. We welcome you and we thank you for your cooperation with our subcommittee.

This is probably one of the most important areas for agriculture that the Department administers. If we do not maintain our capacity to improve productivity on our farms; if we do not maintain access to research, which is what extension provides through its programs for farmers and agriculture, landowners, then we are not going to be able to compete in the global marketplace. We are not going to be able to maintain the high quality of our foodstuffs for American consumers at reasonable prices.

So for all of these reasons, the funds that are provided for these programs are essential if we are to continue to enjoy the benefits of our agricultural economy. It provides a lot of jobs, of course. It means a lot in many other ways to us.

That is one reason why I am personally disturbed that the budget request this year is \$63 million below last year's funding level. I am disturbed by that, concerned by it, and, frankly, amazed that the President would submit a budget that underfunds these programs to that extent. I hope our hearing this morning will shed some light on why the budget is submitted in that way.

There are some very important programs for which funding is proposed to be cut. The sum of \$26 million is cut in Hatch Act and Smith-Lever formula funds. These go directly to our State universities and colleges that are involved in research. A reduction of \$41 million in special grants, and a number of other proposed funding decreases and terminations are included in this budget submission.

We are going to look very carefully at it, and I am sure that this subcommittee is going to make some changes in the President's budget request in this area. But you can help us understand where those changes should be considered and why the budget is submitted in this form.

Before going to our panel of witnesses, I recognize the distinguished ranking member of this subcommittee, my good friend from Arkansas, Senator Bumpers.

PREPARED STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Mr. Chairman, thank you very much. In the interest of time, I will waive the reading of my opening statement and insert it in the record.

My statement would very much echo what you have just said. I am mightily concerned about a number of issues in this budget. We will get into those during the question and answer session.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

I am pleased to welcome Secretary Gonzalez before this subcommittee. This is your first visit before this panel we look forward to your comments. I also want to welcome the other agency heads. And, it is always good to see Mr. Kaplan whose long-time assistance to this subcommittee has been invaluable.

In spite of these words of welcome, I must admit that my sentiments with the overall budget submission in the research mission area are a little less generous.

I have stated publicly, on many occasions, that I feel we are not committing enough resources to agricultural research. Compared to the money we spend on research on how to make things explode better and bigger, our dedication in meeting the demands of an ever growing, ever hungry world pale. Over the course of American history, the American farmer has done more to improve the quality of life through an improved quality and abundance of food than any other sector of the economy. But increased production is necessary to keep up with an ever growing population. In addition, our growing population is also responsible for urban sprawl converting more and more farm acreage into housing developments, greater demands on our water and wildlife resources, and higher expectations for food safety. In short, the American farmer is expected to do more with less and only agricultural research can make that happen.

The budget proposal for agencies included under the heading of Research, Education, and Economics reflects a request of \$1.826 billion. This is a net decrease of \$47 million, or 2.5 percent, below the fiscal year 1998 level. I recognize that the budget proposal implies an overall increase for research and development by about \$7 million with the reductions in other areas such as facilities. However, we must consider the budget proposal in total and remember that the mission of USDA's research, education, and economics agencies is tied to the basic premise I have just outlined that we must make American agriculture do more with less. Whether the funding is for agricultural competitive, formula, or facility programs, the programs are designed to work together with an overarching purpose of keeping the American farmer and, by extension, the American consumer at least one step ahead of the increasing demands and challenges ever snapping at our heels. Unfortunately, this budget submission asks us to continue providing the American farmer less, to the tune of about \$47 million.

I also feel compelled, again, to point out that our problems with this budget are not limited to what it does not include, but also because of what it does include. The budget request from USDA contains hundreds of millions of dollars in assumed user fees. I realize that those fees are not directly tied to the agencies before us today, but those assumptions will have an impact on our ability to meet the demands of our research efforts. The importance of what we do here is too great for playing budget parlor games. We have a responsibility to protect the U.S. agricultural research base. We are serious about it and we know that if we don't step forward, no one else will. There is simply too much at stake.

I also want to offer a few comments on the apparently continuing battle between the Congress and USDA on setting the research agenda. For as many years as I can remember, the budget request to this subcommittee would always zero out most, if not all, of the CSREES Special Grants. Now, the struggle seems to have been elevated and we find that the programs Congress elected to fund through the Agricultural Research Service, too, have been zeroed out. It appears that in addition to in-house research, USDA is willing only to fund research through competitive grants, which means USDA wants to fund research only to those institutions and researchers that USDA feels is important. It seems a little odd that if USDA funds priority research it is called being competitive and if Congress funds priority research, it is called pork barrel spending.

I realize that USDA makes use of peer review and other scientific community-based groups to set funding priorities and to determine which projects will get attention and which will not. However, it seems that USDA accepts the premise that only they have access to research stakeholders who have any sense of research priorities. With all due respect to my many friends in the research community, let me point out that scientists tend to spend much of their time looking through microscopes. Sometimes, it is important to have a more global view of research priorities which can be lost in the often discipline-specific world of science. I suspect that if you ask an agronomist where the research priorities are, he would likely suggest in the field of agronomy. If you ask the same question of a specialist in animal science, you would get a different answer.

Obviously, there are many specific areas of agricultural research that are very important to me. They may or may not be identical to priorities of Senator Cochran or other members of the subcommittee. However, the process we undertake here is to come together in an agreement that allows us all to form a consensus of research priorities. It would be welcome for USDA to join us in that process rather than suggest only they hold the keys to research.

As I mentioned, there are many specific areas of research in which I hold great interest. I will not go into all of them now. Instead, I look forward to the comments of our guests and the opportunity to ask them questions later during this hearing.

INTRODUCTION OF WITNESS

Senator COCHRAN. Mr. Gonzalez, we have copies of your statement and others' statements. We appreciate having those and they will be printed in the record in full. Please proceed with any remarks you consider helpful to the subcommittee.

FISCAL YEAR 1999 BUDGET REQUEST

Dr. GONZALEZ. Thank you, Mr. Chairman. It is a pleasure to be here with you this morning to talk about the fiscal year 1999 budget request that we have submitted for research, education, economics, our mission area at USDA, and to recognize the team of folks that work with me in this particular mission area. I just would like to begin by underscoring some of the important points that you made.

We are very much engaged in this conversation in terms of the importance that we consider this mission area to have at USDA because of the continuing changing environment out there in agriculture production and all the systems that support that. So we are pleased to be here to work with you, and look forward to continuing the discussion in terms of where we are going with our budget.

I would also say that, as you indicated, we think that this is one of the most important mission areas within USDA and within the Federal agencies, specifically because of the type of approach that we will take to supporting our agricultural production systems.

I have been here for just a short time and I wanted to take a few minutes to talk a little bit about my impressions with regard to the mission area and the USDA budget. We have begun the dialog in discussion with a number of our partners internally to again highlight the importance of what we believe is this particular mission area with regard to research, education, economics, and extension.

As you may know, I have a background in agriculture, both from the production standpoint as well as an educator in agricultural education and extension for a number of years. So this particular mission area, as I considered coming to serve in this capacity, was of particular importance to me, knowing that the things that we do at REE and within USDA really provide the basis and foundation for much of the things that will happen, not only in our current circumstances, but also as we look forward to identifying the kind of scientific knowledge and extension programs that will fortify agriculture in the future.

The combination of fundamental and applied research and statistics, coupled with the higher education and extension programs that we have, I believe yield a powerful partnership that serves agriculture well and will continue to do that. Our research must continue to be cutting edge that will benefit all of our citizens. We plan to communicate these objectives that we have as a part of our strategic plan to everyone, not only those that are already involved in the food and fiber system, but all of our clients.

We have an opportunity to draw on the distinct differences that we have within our four agencies and also on those similarities as we look forward to supporting the work of the other agencies with-

in USDA and certainly as we work across Federal Departments to support the work that is done in other areas.

REE-funded physical and biological research provides the scientific foundation for a vast array of advances that are being made in agriculture and related industries. We are committed to strengthening those linkages between the basic and applied research that also serve the broader Governmentwide research agenda.

REE brings to this larger agenda excellent cutting edge research that complements similar excellence found elsewhere, in Government, at colleges and universities, and in the private sector.

Mr. Chairman, we welcome the opportunity to work with you and with the administration to promote these linkages through funding of research directed at broader priorities and initiatives. Let me emphasize that the budget that we have for our agencies was created through an ongoing conversation with many of our stakeholders, both in and out of Government. We have made an effort, all of us at this table, to go out and visit with a number of our constituents in the research community, the producer and commodity groups, the members of associations that are focused on environmental, food safety, and nutrition concerns, to gain a better understanding of their needs.

We are committed to listening and to the extent possible being responsive to the concerns and recommendations voiced by our stakeholders. I believe that we have met our responsibility to formulate a budget that is responsive to those concerns and interests to the extent possible.

The REE mission area has had to deal with some important issues and concerns regarding the high priority areas that we have addressed in this budget request. The REE budget request for fiscal year 1999 is \$1.826 billion, a net decrease of \$47 million, or 2.5 percent from the fiscal year 1998 budget. Within this total, the allocation for research and development actually increases by \$7 million, or about 1 percent.

The REE agency budgets were developed in the context of the administration's commitment to achieving a balanced budget for fiscal year 1999 and within that context and taking into consideration the almost infinite number of worthy goals and problems REE could address, I believe the budget in total funding and specific initiatives represents a sound and balanced portfolio of public investment.

We have had to make difficult decisions to reduce and redirect resources or terminate valuable projects in order to fund others of higher priority within those established goals.

I think it is important to reiterate that the return on public investment in agriculture research and development is very high. The decline in the percentage of disposable personal income that we spend on food, sustained over many decades, is due in large part to the increases in agricultural productivity resulting from investments in research and development.

Between 1948 and 1994, productivity in U.S. agriculture grew at an annual rate of 1.9 percent, as compared to 1.1 percent for non-farm businesses and 1.3 percent for manufacturing.

HIGH-PRIORITY INITIATIVES FOR FISCAL YEAR 1999

Mr. Chairman and members, I would like to focus on four of the high-priority initiatives that we have identified in this budget proposal: food genome, food safety, pest management, and civil rights. These initiatives are all closely aligned with the general goals of our strategic plan and contribute to the achievement of several of those goals.

FOOD GENOME INITIATIVE

Among the major challenges the Nation will face in the 21st century are the need for increased high-quality food production, a cleaner environment, and renewable chemical and energy resources. The President's food genome initiative, a Governmentwide initiative in which USDA is playing a major role, will help achieve a safe and abundant food supply, meet the needs of a growing population worldwide, and ensure global competitiveness of the U.S. agricultural industries in a more environmentally sensitive manner.

The food genome strategy will vastly expand our knowledge of genomes of species of importance to the food and agricultural sector. REE is carrying out considerable genetic research, but it does not nearly meet the need. Therefore, as part of the President's initiative REE is requesting \$40 million for food genome research, an increase of \$19 million over the estimated \$21 million for fiscal year 1998.

FOOD SAFETY INITIATIVE

Food safety is another of the initiatives that is of importance to us in this particular budget. The administration has taken major strides to improve our current food safety systems. The recent implementation of HACCP is radically changing our meat and poultry inspection systems, which reside in another of our mission areas. The research proposed in the fiscal year 1999 budget will bring us farther in generating new knowledge to identify cost-effective technologies for prevention and detection of existing and newly emerging pathogens.

The fiscal year 1999 budget includes a total of \$26 million in increased funding across ARS, CSREES, and ERS. The majority of the funds will focus on developing improved pathogen prevention and detection methods and other bioscience research in both ARS and CSREES. ERS requests funds to better assess the costs of foodborne illness and to apply economic analysis in the development of more cost-effective control methods.

PEST MANAGEMENT INITIATIVE

The third initiative is pest management. Producers tell us that they need the research community to develop the science and technologies that will allow them to control pests in an environmentally responsible manner and to meet increasingly stringent food safety standards while remaining economically viable.

Last October, in response to these concerns, the Department established the Office of Pest Management Policy within ARS. The fiscal year 1999 pest management initiative encompasses USDA's

multiyear integrated pest management initiative that relates directly to the Department's national goal for the adoption of IPM practices on 75 percent of U.S. cropland by the year 2000. The initiative includes increases to support enhanced research in biocontrol alternatives to pesticides and new control technologies, as well as transfer of the new technologies to producers. This is a very important and critical element in this process.

CIVIL RIGHTS INITIATIVE

The last initiative that I would like to address this morning is civil rights. In December 1996, Secretary Glickman launched a major initiative to address the wide range of civil rights problems and concerns within the Department. The fiscal year 1999 REE budget for the agencies represents a serious response to these concerns that were raised by the Secretary, the USDA Civil Rights Action Team, as well as the National Commission on Small Farms.

The budget also reflects a recognition that the best future for agriculture is one that benefits from a diverse and talented scientific and technological work force. We have additional details about this particular initiative in our budget proposals.

These are the highlights of the four initiatives that span the agencies within REE. Fuller discussion of agency components of these initiatives can be found in the agencies' explanatory notes.

FISCAL YEAR 1999 PROPOSED FUNDING LEVELS

The Agricultural Research Service fiscal year 1999 budget request of \$813 million is slightly lower than the \$824 million for fiscal year 1998. Embedded in that decrease is a net increase of \$32 million in research. Funding for the national research initiative under CSREES' budget request has increased by \$33 million, to a total of \$130 million, an increase of 34 percent. We realize, of course, that within that budget we also have a decrease of \$9 million to a level of \$850 million for the total agency budget.

ERS BUDGET

The Economic Research Service budget decreases from \$72 million to \$56 million in fiscal year 1999. ERS conducts research and analysis on the efficiency, efficacy, and equity aspects of issues related to agriculture, food safety, nutrition, and the environment and rural development.

NASS BUDGET

NASS' budget declines by \$11 million due to the cyclical nature of the required census of agriculture funding.

In summary, I want to reiterate that, in the context of a balanced budget, the REE budgets reflect a continued strong commitment to investment in agricultural research, statistics, education, and extension. If U.S. agriculture is to continue to be dynamic and provide leadership in a very competitive global economy and if the American public is to continue to enjoy the high quality, safe, and nutritious products of agriculture that you spoke about a few minutes ago, then our national commitment to increasing the investment in research, education, extension, must continue.

We want to work closely with you and with the administration as we continue to increase our investment in that area, and we look for opportunities to share thoughts and discussion with you following today's hearings. We would, at this point, welcome any discussion and questions that you might have for the REE team. Thank you, Mr. Chairman.

PREPARED STATEMENTS

Senator COCHRAN. Thank you very much, Dr. Gonzalez.

Is it your wish that any of the other members of your panel make a statement at this point? My thought is we do have copies of statements.

Dr. GONZALEZ. We do have and they have been submitted for the record. I think what we would be ready to do is answer and discuss any of the questions that you might have.

[The statements follow:]

PREPARED STATEMENT OF DR. I. MILEY GONZALEZ

Mr. Chairman, Members of the Committee, I am pleased to appear before you to discuss the fiscal year 1999 budgets for the Research, Education, and Economics (REE) mission area agencies. I am accompanied by Acting Deputy Under Secretary, Dr. Eileen Kennedy, and the Administrators of the four mission area agencies: Dr. Floyd Horn, Administrator of the Agricultural Research Service (ARS); Dr. Bob Robinson, Administrator of the Cooperative State Research, Education, and Extension Service (CSREES); Dr. Susan Offutt, Administrator of the Economic Research Service (ERS); and Mr. Donald Bay, Administrator of the National Agricultural Statistics Service (NASS). Each Administrator has submitted written testimony for the record.

This is the first opportunity I have had to appear before this subcommittee since being confirmed as Under Secretary last July. Before we focus on the budget, I would like members of the Subcommittee to know that your advice is welcomed. We look forward to working with you to enhance and strengthen the already strong programs of the Research, Education, and Economics mission area of USDA. I would like to take just a moment to share with you my impressions of the mission area programs and where I think they lead us as we consider the REE budget for fiscal year 1999. I have a background rooted in Agriculture, as a producer and an educator. Since assuming the responsibilities as Under Secretary I have come to believe that Research, Education and Economics is the most critical Federal mission in agriculture because the continued success of agriculture in the world is dependent on knowledge. The combination of fundamental and applied research and statistics coupled with higher education and extension yields a powerful partnership that serves agriculture well.

The public demands that agriculture provide an affordable, nutritious, and safe food supply, and in doing so, conserve natural resources and assure social and economic progress in rural areas. I am committed to the REE mission area meeting these goals. Our research must continue to be the cutting edge for the benefit of all Americans. We plan to communicate these objectives to all Americans and not just those in the food and fiber sector.

The creation of the REE mission area in 1994 brought together the research, education, statistics, analysis and social sciences and captured the synergies across those functions and disciplines. We can see the fruits of the mission area structure in such diverse program areas as food safety and Integrated Pest Management (IPM).

Drawing on their distinct and complementary capacities, the REE agencies play critical roles in supporting the work of the agencies of other USDA mission areas. REE funded physical and biological research provides the scientific foundation for a vast array of advances being made in agriculture and related industries. For example, in 1997 ARS research resulted in 59 new varieties and 89 new germplasm lines of agricultural and horticultural crops released for use by farmers, ranchers, and home gardeners. REE's statistical and analytical programs enhance understanding of markets and market conditions. Working with USDA's Rural Development mission area, last year ERS prepared a report on rural credit which concluded that, in general, rural financial markets work reasonably well in serving the needs

of rural America. NASS recently assumed responsibility for conducting the Census of Agriculture that will provide valuable information about farm operations and the local economies of which they are a part. REE's education and extension programs work to strengthen the capacity of institutions serving minorities. CSREES awarded more than \$1.4 million in grants to 13 Hispanic-Serving Institutions in 1997 to carry out programs needed to educate students capable of enhancing the nation's food and agricultural scientific and professional work force.

REE is committed to strengthening the linkages between the basic and applied agriculture research REE conducts and supports and the broader government-wide and national research agenda. REE brings to this larger agenda excellent cutting-edge research that complements similar excellence found elsewhere in government, at colleges and universities, and in the private sector. We welcome the opportunity to work with Congress and the Administration to promote these linkages through funding of research directed at broader priorities and initiatives.

The President's Food Genome Initiative, for which we are providing leadership, proposes just such a collaborative effort involving multiple Federal agencies and researchers in the academic community and the private sector. Such collaborations I believe, must and will, become the model that the research community adopts to address pressing, complex issues. Such approaches are effective and efficient and create partnerships in which all participants contribute to a common goal.

Working together, the REE agencies are finding that implementation of the Government Performance and Results Act of 1993 is providing a valuable process for enhancing the effectiveness of our programs. Last fall you received our strategic plans. REE and agency plans were generally well received, getting particularly high marks for their outcome-orientation. Last spring when we began work on the budget under discussion, the mission area used the five general goals common to our strategic plans to structure our discussion of proposed adjustments and increases. The process facilitated our looking across the agencies to see how the parts fit together and how they could be more effectively coordinated, while maximizing the unique contributions of each agency.

More recently, developing performance plans helped us systematically consider and describe, in the context of the strategic plans, what we were committed to accomplishing in fiscal year 1999. Within a short time you will receive the departmental performance plan with the four agency performance plans. I believe you will find these plans valuable in reviewing our current program and assessing our proposed budget from the outcome-oriented perspective of the five goals of our strategic plans—an agricultural system that is highly competitive in the global economy; a safe and secure food and fiber system; a healthy, well-nourished population; greater harmony between agriculture and the environment; and enhanced economic opportunity and quality of life for Americans. We welcome your suggestions for making future plans more useful.

I want to emphasize that the agency budgets were created through on-going conversations with our many stakeholders in and out of government. Over the course of the year, all of us at this table and many others from REE have met with people from the research community, producer and commodity group representatives, and members of associations focused on environmental, food safety, and nutrition concerns, to gain an understanding of their needs and recommendations as they relate to national needs and our programs. The National Agricultural Research, Education, Extension, and Economics Advisory Board, with its very diverse membership, also has provided valuable recommendations on the REE strategic plan and a draft performance plan, both of which have implications for the shape and content of these budgets.

We are committed to listening and, to the extent possible, being responsive to the concerns and recommendations voiced by our stakeholders. Clearly, funding constraints do not allow us to be as responsive to individual stakeholders as they or we might like. In general, I believe that we have met our responsibility to formulate a budget that is responsive to the concerns and interests of our diverse stakeholders. As importantly, it is a clear expression of our judgment of where the needs for Federal budget resources are the greatest.

REE'S FISCAL YEAR 1999 BUDGET

I would like to turn now to the fiscal year 1999 budget for the agencies of the Research, Education, and Economics mission area. First, I will discuss overall budget issues and then focus on several important initiatives that address high priority issues and problems.

The REE budget request for fiscal year 1999 is \$1.826 billion, a net decrease of \$47 million or 2.5 percent from fiscal year 1998. Within this total, the allocation for

research and development actually increases by \$7 million or about 1 percent. The REE agency budgets were developed in the context of the Administration's commitment to achieving a balanced budget in fiscal year 1999. Within that context and taking into consideration the almost infinite number of worthy goals and problems REE could address, I believe the budget, in total funding and specific initiatives, represents a sound and balanced portfolio of public investments. In developing the budget, we have had to make difficult decisions to reduce and redirect resources or terminate valuable projects in order to fund others of higher priority within the established goals.

I believe it is important to reiterate that the return on public investment in agricultural research and development is very high. The decline in the percentage of disposable personal income we spend on food, sustained over many decades, is due in large part to increases in agricultural productivity, resulting from investments in research and development. Between 1948 and 1994 productivity in U. S. agriculture grew at an annual rate of 1.9 percent compared to 1.1 percent for non-farm businesses and 1.3 percent for manufacturing. Investments in research have also resulted in new understanding of the linkages between agriculture production and environmental conditions leading to new environmentally friendly production practices and technologies. Similarly, new discoveries about the ecology of human pathogens has led to an improved capacity to prevent and detect food-borne contaminants and to support the development of Hazard Analysis and Critical Control Point (HACCP) regulations. New understanding of both the nutrient content of foods and the nutritional needs of people has been central to our developing healthy dietary guidelines.

REE FISCAL YEAR 1999 INITIATIVES

I would like to focus on four high priority initiatives proposed in the REE agency budgets—the Food Genome, Food Safety, Pest Management and Civil Rights Initiatives. These initiatives are all closely aligned with the general goals of our strategic plans and contribute to the achievement of several goals.

Among the major challenges the nation will face in the 21st century are the need for increased high quality food production, a cleaner environment, and renewable chemical and energy resources. The President's Food Genome Initiative, a government-wide initiative in which USDA plays a major leadership role, will help achieve a safe and abundant food supply, meet the needs of a growing population worldwide and ensure the global competition of the U.S. agricultural industries in a more environmentally sensitive manner.

The Food Genome Strategy will vastly expand our knowledge of genomes of species of importance to the food and agricultural sector. The research will focus on efforts to understand gene structure and function which is expected to have considerable payoff in crop species ranging from rice to corn and animal species ranging from cattle to swine to poultry. Early efforts in the USDA food genomics work will concentrate on identification of economically important traits that increase yield, quality and disease resistance in plants, minimize the need for pesticides, and protect the environment.

The REE mission area has chaired the Interagency Working Group on Plant Genomics involving the Office of Science and Technology Policy, the Department of Health and Human Services, the Department of Energy and the National Science Foundation. In this role, REE brought together commodity group representatives and leading scientists to solicit their views. REE is in the final stage of developing a concept paper on USDA's role in Food Genomics that will provide a blueprint for future research. The paper will build on the genome research program already conducted under ARS and CSREES and will describe how the REE program will complement the food genome program within the National Science Foundation.

REE is carrying out considerable genetic research but it does not nearly meet the need. Therefore, as part of the President's initiative REE is requesting \$40 million for food genome research, an increase of \$19 million over an estimated \$21 million in the fiscal year 1998 budget. The request would increase ARS's research program by \$3.0 million to a total of \$14 million. CSREES's would increase \$16 million, with \$6 million added to the current \$10 million in the National Research Initiative and an additional \$10 million in a new competitive Food Genome Research Program under proposed legislation.

Food safety is the second initiative I would like to address. Even though the U. S. food supply is one of the safest in the world, millions of citizens become ill each year due to foodborne pathogens. In addition, there is growing concern associated with the consumption of foods containing known or potentially harmful levels of natural toxins, such as aflatoxins.

The Administration has taken major strides to improve our current food safety systems. The recent implementation of HACCP is radically changing our meat and poultry inspection system. Research proposed in the fiscal year 1999 budget will bring us further in generating new knowledge to identify cost-effective technologies for prevention and detection of existing and newly emerging pathogens.

As part of the President's Food Safety Initiative, REE is currently co-chairing a National Science and Technology Council working group to develop a comprehensive and coordinated government-wide food safety research agenda. This coordinated research agenda, to be completed in May, should prove valuable in facilitating greater coordination across the research agencies and guiding the formulation of the fiscal year 2000 budget.

The REE component of the Food Safety Initiative in the fiscal year 1999 budget includes a total of \$26 million in increased funding across ARS, CSREES, and ERS. The majority of the funds will focus on developing improved pathogen prevention and detection methods and other bioscience research in ARS and CSREES. ERS requests funds to better assess the cost of foodborne illness and to apply economic analysis in the development of more cost effective control methods. CSREES would also receive funding to expand education efforts for those involved in the food production system from farm to table.

The third initiative I would like to discuss is pest management. Effective pest management is an ever present and challenging facet of agriculture production. Increasing public value placed on environmental quality and growing public concern about food safety, only heighten the challenge of effective pest control. Producers tell us they need the research community to develop the science and technologies that will allow them to control pests in an environmentally responsible manner that also meets increasingly stringent food safety standards and is economically viable. That message is as clear this year as in the past. Enactment of the Food Quality Protection Act of 1996 (FQPA) adds to the need for research to develop biological controls and other technologies and production practices that effectively control pests while minimizing environmental stress and food contamination.

Last October, in response to this need, the Department established the Office of Pest Management Policy in ARS. This office will provide a coordinated Departmental approach to minor crops pesticide use, including coordinating USDA's response to EPA's data needs as it implements FQPA. Several of the programs with requested increases in the ARS and CSREES budgets would be coordinated by this office that is focusing principally on FQPA related issues.

Another component of the fiscal year 1999 pest management initiative is USDA's multi-year Integrated Pest Management initiative that relates directly to the Department's national goal for the adoption of IPM practices on 75 percent of U.S. cropland by the year 2000. The initiative includes increases to support enhanced research on biocontrol alternatives to pesticides and new control technologies, as well as to transfer the new technologies to producers. While considerable progress has been made in reaching the IPM goal, the gap between the discoveries made by the scientific community and the transfer of those discoveries and associated technologies to the producer is significant. Both the ARS and the CSREES budgets include funding requests to work with producers to test new technologies and practices and facilitate their adoption. These increases are critical to our harvesting the fruits of our investment in research to enhance environmental quality and food safety through producer adoption of IPM technologies and practices.

The last initiative I would like to address is civil rights. In December 1996 Secretary Glickman launched a major initiative to address a wide range of civil rights problems and concerns in the Department. The fiscal year 1999 REE agency budgets represent a serious response to these concerns raised by the Secretary, the USDA Civil Rights Action Team (CRAT), as well as the National Commission on Small Farms. The budget also reflects a recognition that the best future for agriculture is one that benefits from a diverse and talented scientific and technological work force. With this principle in mind, the CSREES budget includes increased funding for the 1890 and 1994 Land Grant colleges and universities that primarily serve minority populations. If agriculture is to attract those students, it must provide them the best opportunities to gain the knowledge and experience they need at the university or college they attend.

The ERS, NASS and CSREES budgets also include requests for increases that would support new activities that are responsive to the information and technology needs of historically underserved populations. The ERS's budget includes a request for funds to analyze the information needs, particularly market information needs, of small farms, many of which are disproportionately minority owned. Complementing this ERS increase, CSREES will initiate an integrated research, extension, and education competitive grants program for new technology development and transfer

to small farms. Proposed legislation is being submitted for this new integrated program. The NASS budget includes funds to collect data on pesticide use in nursery and greenhouse crops, where farmworker exposure is potentially high. These budget requests, most of which are part of the Department's Civil Rights Initiative, reflect a heightened awareness of our obligation to design and implement programs that are responsive to the needs of all our customers, including those historically underserved.

These are the highlights of four initiatives that span the agencies within REE. Fuller discussion of agency components of these initiatives can be found in the agencies' Explanatory Notes.

REE AGENCY FISCAL YEAR 1999 BUDGETS

I would like to turn briefly to the budgets of the four REE agencies. The Agricultural Research Service (ARS) fiscal year 1999 budget request of \$813 million is slightly lower than the \$824 million in fiscal year 1998. Embedded in that decrease is a net increase of \$32 million in research, facilitated by a decrease of \$43 million in buildings and facilities improvement funds. The budget also includes redirection of approximately \$35 million in current programs to fund new high priority program initiatives. As the principal intramural biological and physical science research agency in the Department, ARS continues to play a critical role for the Department and the larger agricultural community. Results from ARS's fundamental research provide the foundation of applied and developmental research carried out in many public and private institutions. Drawing on its own and other fundamental research, ARS also conducts research to solve specific problems of national and regional importance and to meet the research needs of other USDA agencies.

The ARS fiscal year 1999 budget includes increases as part of the President's Human Nutrition Research Initiative. With every passing day, we learn more about the critical role of nutrition in promoting health and the number of diet-related diseases that could be mitigated with good nutrition. It is hard to overestimate the potential payoff to individuals in improved well-being and to the nation in enhanced economic productivity if all Americans were to adopt healthy diets. Due in part to this understanding, questions of nutritional outcomes are increasingly being integrated in all the ARS research programs. The increases in fiscal year 1999 funding support both fundamental research on the relationship of nutrition to development and enhanced data on nutrient content of foods and dietary patterns. The ARS budget also includes increases for climate change and *Pfiesteria*, as part of the President's Climate Change Technology and Clean Water and Watershed Initiatives.

The fiscal year 1999 budget proposes \$36 million for the ARS building and facilities program, a decrease of \$43 million from the fiscal year 1998 level. As the Subcommittee knows, the Strategic Planning Task Force on Research Facilities mandated in the 1996 Farm Bill has been established and has met several times. The Task Force is progressing in its work, which will be completed by May 1999 when it issues a report of its findings. In the meantime, we believe we must provide support for several projects with critical and immediate needs.

The ARS budget includes a total of \$17.7 million in funding for three of its Regional Research Centers located at Peoria, Philadelphia, and New Orleans. All three centers are major research facilities built in the 1930's and need major infrastructure replacement and modernization. Another \$9.1 million is requested for animal disease centers located at Plum Island, New York, and Ames, Iowa. Current biosafety and biocontainment standards and regulatory issues relating to environmental quality and energy conservation, are among many concerns that indicate both facilities are in very serious need of modernization. All of these planned renovations, as well as those for the Beltsville Research Center, the National Agricultural Library, and Grain Marketing Research Laboratory in Manhattan Kansas, are the product of careful planning over several years. The increase of \$4 million for construction of the Melaleuca Research and Quarantine Facility at Ft. Lauderdale, Florida, reflects the Administration's continuing commitment to restoration of the Everglades ecosystem and was designated by the Administration's South Florida Ecosystem Task Force as a top priority.

The Cooperative State Research, Education, and Extension Service's (CSREES) budget decreases by \$9 million to \$850 million in fiscal year 1999. Funding for the National Research Initiative (NRI), the Department's hallmark competitive research grants program, is increased by \$33 million to \$130 million, an increase of 34 percent. The Administration continues to believe the competitive research grant programs, such as the NRI, provide the most effective mechanism for eliciting and supporting the most meritorious science focused on high priority research issues and conducted within the vast research community across the country. The increases in

the NRI will emphasize expanded research in food genomics as part of the Administration's Food Genome Initiative, food safety in support of the President's Interagency Food Safety Initiative, and environmental quality. Focusing the NRI increases on these three areas of investigation indicates the importance the Administration places on these research programs. In providing critical funding to the research, education, and extension programs of the Land Grant Universities and other universities and organizations across the country, CSREES continues to play a central role in helping generate new knowledge and technology and in facilitating the transfer of that knowledge and technology to those who ultimately use it.

Consistent with the President's commitment to improving our children's well-being, the fiscal year 1999 budget includes an increase in CSREES's Children, Youth and Families At Risk (CYFAR) program. Designed to empower youth, parents, and community leaders to take responsibility for their own lives and that of their communities, the additional funding will restore CYFAR to its fiscal year 1995 level.

The Economic Research Service's budget decreases from \$72 million to \$56 million in fiscal year 1999. As the Department's principal intramural economics and social science research agency, ERS conducts research and analysis on the efficiency, efficacy, and equity aspects of issues related to agriculture, food safety and nutrition, the environment, and rural development. The decreased funding level reflects the return of the food program studies to the Food and Nutrition Service. The fiscal year 1999 proposed budget supports new or enhanced research of \$1.5 million on the impact of electric utility deregulation on rural areas, market information needs of small farms (as part of the Civil Rights Initiative), and food safety (as a part of the President's Interagency Food Safety Initiative.)

The National Agricultural Statistics Service (NASS) budget declines by \$11 million due to the cyclical nature of required census of agriculture funding. With authorization to conduct the census passed into law, NASS is currently conducting the 1997 Census. Fiscal year 1998 is the peak funding year for this cycle of the census of agriculture, accounting for the decrease in the proposed fiscal year 1999 NASS budget. All data are collected in this fiscal year. As of late January, NASS had received approximately 1.2 million completed forms. The NASS budget includes proposals for three surveys, including a new aquaculture census that for the first time will provide national and state level data on aquaculture production.

The new, more market-oriented agriculture policy in the 1996 Farm Bill makes NASS's statistical data program more essential than ever. NASS's comprehensive, reliable, and timely data on U.S. agricultural commodities are critical for farmers, ranchers, and other agribusinesses to make informed production and marketing decisions in a highly competitive global market. Annually, NASS prepares 400 reports on more than 120 crops and 45 livestock items.

SUMMARY

In summary, I want to reiterate that, in the context of a balanced budget, the REE budgets reflect a continued strong commitment to investment in agricultural research, statistics, education, and extension. If U.S. agriculture is to continue to be dynamic and provide leadership in a very competitive global economy, and the American public is to continue to enjoy the high quality, safe and nutritious products of agriculture, then our national commitment to increasing the investment in research, education, and extension must continue. Thank you for this opportunity to share with you my thoughts about the mission area and its agencies' budgets. We welcome your questions.

PREPARED STATEMENT OF DONALD M. BAY

Mr. Chairman and members of the Committee, I appreciate the opportunity to submit a statement for this Committee's consideration of the fiscal year 1999 budget request for the National Agricultural Statistics Service (NASS). This agency was created in 1862 to provide factual information about the Nation's food and agricultural industry. Beginning in fiscal year 1997, NASS also has responsibility for the census of agriculture which was formerly conducted by the Bureau of the Census in the Department of Commerce.

Since the first crop reports were issued 135 years ago, tremendous change has taken place within the agricultural industry. However, each new season brings renewed interest in what will happen. What will farmers plant given the growing list of crops? How will weather affect crop yields? What changes are occurring in the livestock, poultry, and aquaculture industries? The need for relevant, accurate, timely, and impartial statistical information on United States agriculture has grown

during this information age as NASS is constantly faced with demands for more data. The transfer of the census of agriculture certainly enhances the quality and quantity of agricultural statistics available, as well as further strengthens NASS's State-Federal partnership.

This State-Federal cooperative program began 80 years ago and has successfully consolidated both staff and resources, thus eliminating duplication while meeting both State and Federal data needs through a single agency. This unique partnership also makes it possible to establish and maintain national standards to produce consistency in surveys conducted throughout the United States, while at the same time meeting the special needs of each individual State and county. Serving local agricultural data needs through NASS's 45 field offices which cover all 50 States further strengthens NASS's support of the five goals and outcomes stated in the Research, Education, and Economics (REE) mission area strategic plan.

The Nation's food and fiber industry employs one out of every six employees in the United States. The basic food and fiber statistical information provided by NASS supports all facets of the industry from producers through handlers, processors, wholesalers, retailers, and ultimately, food prices for consumers. Voids in relevant, timely, accurate data contribute to wasteful inefficiencies throughout the entire production and marketing system.

NASS estimates provide important information in support of the export of agricultural commodities. NASS estimates also contribute to providing fair markets where buyers and sellers alike have access to the same official statistics. This prevents markets from overly reacting to "inside" information which might unfairly influence market price for the gain of an individual market participant.

With the passage of the Federal Agriculture Improvement and Reform Act of 1996, a question might be asked as to how this legislation affects the NASS program. The first crop report was issued in 1842 in response to the need for producers and processors to know the expected supply of basic food commodities so that markets could properly reflect the true situation throughout the country. Today, with the end of most government price intervention mechanisms, commodity prices are even more heavily influenced by market information which NASS supplies. For that reason, the demand for agricultural statistics is increasing as producers make production decisions based solely on market information. Empirical evidence indicates that an increase in information improves the efficiency of commodity markets. Information on the competitiveness of our Nation's agricultural industry will become increasingly important as producers rely more on the world market for their income.

NASS's agricultural statistics are used throughout the agricultural sector to evaluate supplies and determine competitive prices for world marketing of U.S. commodities, which directly supports Goal 1 of the REE Strategic Plan: Through research and education, empower the agricultural system with knowledge that will improve domestic production, processing, and marketing to successfully compete in the global market.

Through new technology, the products produced in the United States are changing rapidly, which also means that the agricultural statistics program must be dynamic and able to respond to the demand for coverage of newly emerging products. For example, genetic engineering technology will be producing thousands of new varieties such as BT corn and cotton, and Roundup ready soybeans. Data users are already requesting information which would accurately measure the impact of these new varieties.

Not only are NASS statistical reports important to assess the current supply and demand of agricultural commodities, but they are also extremely valuable to farm organizations, commodity groups, and public officials who analyze agricultural policy, foreign trade, construction, and environmental programs, research, rural development, and many other activities. NASS numbers are scrutinized very closely by producers, agribusinesses, industry analysts, economists, investors, as well as government policy makers. As a result of this analysis, major decisions are made that affect the Nation's economy.

All reports issued by NASS's Agricultural Statistics Board are made available to the public at previously announced release times to ensure that everyone is given equal access to the information. NASS has been a leader among Federal agencies in providing electronic access to information. All of NASS's national statistical reports and data products, including graphics, are available as periodic printed reports, as well as on the Internet. They are also available annually in USDA's Agricultural Statistics, and major data series are available in the Statistical Abstract of the United States.

Beginning in fiscal year 1997, NASS received funding to conduct the census of agriculture every 5 years. On February 2, 1997, 68 of the 79 Bureau of the Census employees working on the census of agriculture program officially transferred to

NASS. This makes it possible to truly consolidate the existing NASS survey activities with the census of agriculture. The transfer of the responsibility for the census of agriculture to USDA streamlines Federal agricultural data collection activities and is expected to improve the efficiency, timeliness, and quality of data provided. The enactment of Public Law 105-113, the Census of Agriculture Act of 1997, has now officially transferred the authority for the census to USDA.

Statistical research is conducted to improve methods and techniques used in collecting and processing agricultural data. This research is directed toward providing higher quality census and survey data with less burden to respondents, producing more accurate and timely estimates to data users, and increasing the efficiency of the entire process. For example, NASS has been a leader in the research and development of satellite imagery to improve agricultural statistics. The NASS statistical research program strives to improve methods and techniques for obtaining agricultural statistics with an acceptable level of accuracy. The growing diversity and specialization of the Nation's farm operations have greatly complicated procedures for producing accurate agricultural statistics. Development of new sampling and survey methodology, along with intensive use of telephone and face-to-face contacts and computer technology enable NASS to keep pace with an increasingly complex agricultural industry. Considerable new research will be directed at improving the next census of agriculture to be conducted in 2003.

NASS performs a number of statistical services for other Federal, State, and producer organizations on a cost-reimbursable basis. In addition, NASS has an expanding international program to provide technical assistance to a number of countries on a cost-reimbursable basis.

MAJOR ACTIVITIES OF THE NATIONAL AGRICULTURAL STATISTICS SERVICE (NASS)

The primary activity of NASS is to conduct surveys which include the collection, summarization, analysis, and publication of reliable agricultural forecasts and estimates. Farmers, ranchers, and agribusinesses voluntarily respond to a series of nationwide surveys about crops, livestock, prices, and other agricultural activities each year. Periodic surveys are conducted during the growing season to measure the impact weather, pests, and other factors have on crop production. Frequent surveys are also needed for food products that are perishable. Many crop surveys are supplemented by actual field observations in which various plant counts and measurements are made. Administrative data from other State and USDA agencies, as well as data on imports and exports, are thoroughly analyzed and utilized as appropriate. NASS prepares estimates for over 120 crops and 45 livestock items which are published annually in almost 400 separate reports.

Agricultural reports issued by NASS include: number of farms and land in farms; acreage, yield, and production of grains, hay, oilseeds, cotton, tobacco, major fruits and vegetables, floriculture, and selected specialty crops; stocks of grains; inventories and production of hogs, cattle, sheep and wool, goats, catfish, trout, poultry, eggs, and dairy products; prices received by farmers for products; farm real estate values and land rental rates; prices paid by farmers for inputs and services; cold storage supplies; agricultural labor and wage rates; agricultural chemical usage; crop production cultural practices; and other data related to the agricultural economy.

The census of agriculture provides national, State, and county data for the United States on the agricultural economy every 5 years, including: number of farms, land use, production expenses, farm product values, value of land and buildings, farm size and characteristics of farm operators, market value of agricultural production sold, acreage of major crops, inventory of livestock and poultry, and farm irrigation practices. The census of agriculture is the only source for this information on a local level which is extremely important to the agricultural community. Detailed information at the county level helps agricultural organizations, suppliers, handlers, processors, and wholesalers and retailers better plan their operations. Important demographic information supplied by the census of agriculture also provides a very valuable data base for developing public policy for rural areas. The local detailed data provided by the census of agriculture which facilitates locality-based policy and business decisions supports Goal 5 of the REE mission area Strategic Plan: Empower people and communities, through research-based information and education, to address the economic and social problems facing our youth, families, and communities.

The NASS agricultural statistics program is conducted through 45 field offices servicing all 50 States. Nearly two-thirds of the agency's staff and resources are located in the field. All State offices operate under cooperative funding and 25 are collocated with State Departments of Agriculture or land-grant universities. This joint State-Federal program helps meet State and national data needs while minimizing

overall costs, eliminating duplication of effort, and reducing the reporting burden on farm and ranch operators. NASS's State Statistical Offices issue approximately 9,000 different reports each year.

NASS has developed a broad environmental statistics program under the Department's water quality and food safety programs. Until 1991, there was a complete void in the availability of reliable pesticide usage data. This became evident during the Alar situation with apples. In cooperation with other USDA agencies, the Environmental Protection Agency (EPA), and the Food and Drug Administration (FDA), NASS has implemented comprehensive chemical usage surveys that collect data on selected crops in selected States. Beginning in fiscal year 1997, NASS began survey programs to acquire more information on Integrated Pest Management (IPM), additional farm pesticide uses, and post-harvest application of pesticides and other chemicals applied to commodities after leaving the farm. These programs will result in significant new chemical use data, which will be important additions to the existing chemical use data base. These surveys also collect detailed economic and farming practice information for the purpose of determining the use of IPM practices as well as to analyze the productivity and the profitability of different levels of chemical use. Our farms and ranches manage half the land mass in the United States, underscoring the value of complete and accurate statistics on chemical use and farming practices to effectively address public concerns about the environmental effects of agricultural production. NASS's pesticide use survey program supports both Goals 2 and 4 of the REE Strategic Plan which relate to ensuring an adequate food and fiber supply and the promotion of food safety, and enhancing the quality of the environment.

NASS conducts a number of special surveys as well as provides consulting services for many USDA agencies and other Federal, State, and private agencies or organizations on a cost-reimbursable basis. Consulting services include assistance with survey methodology, questionnaire and sample design, information resource management, and statistical analysis. NASS has been very active in assisting USDA agencies in programs that monitor nutrition, food safety, environmental quality, and customer satisfaction. In cooperation with State Departments of Agriculture, land-grant universities, and industry groups, NASS conducted 135 special surveys in fiscal year 1997 covering a wide range of issues such as farm injury, nursery and horticulture, farm finance, fruits and nuts, vegetables, and cropping practices.

NASS provides technical assistance and training to improve agricultural survey programs in other countries in cooperation with other Government agencies on a cost-reimbursable basis. NASS's international programs focus on both developing countries, such as those in Asia, Africa, the Middle East, and Central and South America, as well as emerging democracies in Eastern Europe. Accurate information is essential in these countries for the orderly marketing of farm products. NASS works directly with countries undergoing the transition from centrally-planned to market economies by assisting them in applying modern statistical methodology, including sample survey techniques. This past year, NASS provided assistance to Argentina, Bulgaria, China, Colombia, Dominican Republic, Ethiopia, Kazakhstan, Mexico, Morocco, Nicaragua, Poland, Rumania, Russia, South Africa, and Ukraine.

NASS annually seeks input on improvements and priorities from the public through: displays at major commodity meetings, data user meetings with representatives from agribusinesses and commodity groups, special briefings for agricultural leaders during the release of major reports, and through numerous individual contacts. The Agency has made many adjustments to its agricultural statistics program, published reports, and electronic access capabilities as a result of these activities to better meet the statistical needs of customers and stakeholders.

FISCAL YEAR 1999 PLANS

The fiscal year 1999 budget request is for \$107,190,000. This is a net decrease of \$11,130,222 from the fiscal year 1998 current estimate.

The census of agriculture budget request for \$23,741,000 includes a net decrease of \$12,586,000. This amount reflects a reduction of \$13,328,000 due to the cyclical nature of the census. The \$23,741,000 includes the aquaculture census, the Agricultural Economics and Land Ownership Survey, census pay costs, and the census share of increased CSRS retirement costs. Fiscal year 1999 is the fifth and final year of the census of agriculture cycle. Activities in this year include final review of the census data, preparation of results for publication, and conduct of the horticultural specialties and irrigation special follow-on studies.

For fiscal year 1999, NASS has requested a 1-year increase of \$500,000 and 2 staff-years to conduct an aquaculture census. This would provide, for the first time, detailed State and national data about aquaculture production. Aquaculture is a

fast emerging domestic industry responding to the expanding demand for seafood. The aquaculture census would collect data on type of production systems, type of products sold, species being raised such as food fish, shell fish, bait fish, oysters, clams, salmon, catfish, trout, fish eggs, fingerlings, and ornamental fish.

An increase of \$100,000 and 1 staff-year is requested for 1999 to do the preparatory work needed to conduct the Agricultural Economics and Land Ownership Survey. This special survey was begun following the 1959 Census of Agriculture and has been repeated at about 10-year intervals. It provides the only State-level comprehensive data on agricultural land ownership, financing, and inputs by both farm operators and landlords. The fiscal year 1999 funding would provide for field testing an integrated program that eliminates duplication with the joint NASS/Economic Research Service's annual economic survey.

An increase of \$1,400,000 and 10 staff-years is requested to conduct a pesticide use survey of the horticulture and greenhouse industries. NASS has successfully implemented comprehensive pesticide-use surveys that cover the major field crops, fruits, and vegetables grown in the United States. However, such data are lacking for the fast growing nursery and greenhouse industry. This industry, like the fruit and vegetable industry, employs a large number of hired workers. Therefore, it is especially important that this growing industry be included in the comprehensive reports on pesticide use as required under Section 1491 of the 1990 Farm Bill. Collection of these pesticide use statistics also supports a recommendation included in USDA's Civil Rights Action Team Report that addresses the needs of farm workers.

An increase of \$1,435,000 for pay costs and \$390,300 for retirement costs is requested.

NASS is realizing a decrease of \$1,463,000 and 17 staff-years as a result of efficiencies in the agricultural estimates and research programs gained in assuming responsibility for the census of agriculture. This reduction reflects efficiencies which will be realized in the agricultural estimates program as a result of the census of agriculture. Efficiencies will be realized in the NASS annual estimates program in the areas of list frame development and maintenance, data collection, and data dissemination activities.

This concludes my statement, Mr. Chairman, and I will be happy to respond to any questions.

PREPARED STATEMENT OF DR. FLOYD P. HORN

Mr. Chairman and Members of the Subcommittee, I appreciate this opportunity to present the Agricultural Research Service's budget recommendations for fiscal year 1999. I would like to state at the outset that I am very pleased with the research proposals in this budget and the research initiatives recommended by the Administration. They are directed at some of this Nation's most serious problems involving food safety, human health, agricultural productivity, and the environment.

In fact, because of their importance to the Nation, the Administration has endorsed several of ARS' proposed research thrusts as "Presidential Initiatives," in food safety, human nutrition, and environmental health.

I would now like to turn to our budget recommendations for fiscal year 1999.

FISCAL YEAR 1999 BUDGET ESTIMATES

The ARS fiscal year 1999 budget recommends a research funding level of \$776,828,000. This represents an increase of \$32,037,000 over the fiscal year 1998 appropriations level. The fiscal year 1999 budget reflects funding increases for several new and expanded research initiatives as well as resources to finance critical operating costs. It also includes terminations of a number of selected research projects totaling \$35 million to provide resources to finance the new research which is necessary to address the Nation's changing agricultural needs.

NEW AND EXPANDED RESEARCH INITIATIVES

The budget proposes \$51,220,000 for new and expanded research initiatives to meet critical health and safety, nutrition, economic and environmental issues as follows:

Food Safety.—On January 25, 1997, the President announced a National Food Safety Initiative. As part of a multi-agency food safety program ARS is recommending an increase of \$13,970,000 for pre- and post-harvest food safety. Food safety is a major concern of American consumers and remains a top priority of ARS. The Department is committed to ensuring the safety of our food supply.

The proposed increases in pre-harvest food safety will be used to develop new disinfection methods for improved sanitation of animal production facilities and waste handling systems. The recommended increases will also be used to develop new technology which will reduce the growth of pathogens on livestock and poultry during transport.

Post-harvest operations of slaughtering and processing can be a source of pathogen contamination of meat and poultry products. Similarly, pathogen contamination can occur during the processing of fruits and vegetables. In the area of post-harvest food safety, ARS is recommending additional research to develop: new handling systems and pathogen decontamination technologies for use in conjunction with packaging, storing, and processing fresh fruits and vegetables; chemical and physical agents to control pathogens (such as Salmonella and E. coli O157:H7) in fresh produce; alternatives to heat-based preservation technologies that will preserve the fresh qualities of fruits and vegetables.

Human Nutrition.—For the second year increases are proposed for a Human Nutrition Initiative. What and how much people eat affects how they grow, develop, and age. Dietary intake is linked to risks for development of a variety of common, chronic diseases that are disabling and life threatening. For diseases linked strongly to diet, the cost of medical treatment and care exceeds \$200 billion per year.

ARS is recommending an increase of \$10,500,000 in human nutrition research. As part of the Initiative on Human Nutrition, the proposed increases will be used toward developing the means for promoting optimum health and well-being. Specifically, research will be conducted on the effects of diet on the immune system; the dietary patterns of human performance; and the role of nutrition throughout the life cycle (e.g., the relationship between diet and bone growth and cognitive and neurological development; the nutritional requirements that are needed to delay the onset of diseases associated with aging; and the factors that lead to obesity in children). The proposed increases will also be used to update the National Nutrient Databank, a database of the nutrient content of foods. Congress provided \$5 million in 1998 for the Continuing Survey of Food Intakes by Infants and Children (CSFII). The budget proposes to redirect \$3.5 million of this 1998 CSFII funding to other fundamental diet, nutrition, and nutrition-related disease research. In addition, \$1.5 million would be used to expand the CSFII to increase the sampling size necessary to include population groups requiring special attention as EPA implements the Food Quality Protection Act of 1996.

Environmental Quality and Natural Resources.—The preservation of the Nation's natural resources has become increasingly critical. Because of its importance, ARS is recommending a total increase of \$17,250,000 which supports several areas of research emphases.

Of the total recommended increase, \$7,000,000 is targeted toward the President's Climate Change Technology Initiative. ARS's role in the initiative is directed at agricultural greenhouse gas emissions and the use of biomass for energy. The proposed increases will be used to identify and mitigate sources of greenhouse gas emissions, and to further develop plant feedstocks for biofuels.

In addition, \$3,500,000 is proposed for research which will provide new information on pest biology, the impacts of pest control strategies on crop and animal production systems, and pest control technologies which provide additional safety and effectiveness while providing increased protection to the natural environment. The technologies which will be developed will provide the basic pest control components for implementing effective and sustainable Integrated Pest Management (IPM) programs. Part of this proposed increase will be used to establish the Office of Pest Management Policy which will serve as USDA's focal point for pesticide issues.

ARS is recommending \$2,000,000 of additional funding to augment existing resources to accelerate efforts to find alternative solutions to methyl bromide. Grower groups will work with ARS to develop the priorities for a competitively awarded program focused on crops or uses most threatened by the loss of methyl bromide.

ARS is also recommending an increase of \$2,000,000 for research on waste management problems associated with large animal production systems. The proposed increases will be used to address manure management, and animal well-being and behavior in confined animal production systems.

An increase of \$2,000,000 is proposed for research on Pfiesteria as part of the President's Clean Water and Watershed Restoration Initiative. The recent outbreaks of Pfiesteria in the Chesapeake Bay tributaries have focused public attention on the potential role of agriculture in the degradation of these waters. The proposed funding will be used to develop new management practices to reduce the movement of nutrients and pathogens to surface and ground waters, and new methods for handling, storage, and field application of manure. Technologies will also be developed to detect and identify Pfiesteria, and to determine whether fish or shellfish affected

with *Pfiesteria* are safe for human consumption, rendering, or other processing for use in livestock and poultry feed.

Finally, ARS is recommending an increase of \$750,000 for research in support of the South Florida Ecosystem Restoration. ARS is requesting funds to accelerate research to resolve the ecological, hydrological, and agricultural constraints on sustainable production in South Florida, and to develop biological control agents that control *Melaleuca* and other exotic or invasive plant species in the Everglades National Park.

Emerging Infectious Diseases.—During the past ten years, emerging and reemerging infectious diseases and exotic pests have become a major health concern. The globalization of trade, increased international travel, changing weather patterns, uncontrolled population growth of cities, highly intensive agriculture, and changes in farm practices are responsible. Once introduced, exotic (non-native) organisms can explode into epidemic proportions due to the absence of natural control agents and lack of resistance by host animals.

ARS is recommending an increase of \$6,000,000 for this important research. Of this proposed increase, \$3,700,000 will be used to develop diagnostic tests, novel genetic vaccines, and immune strategies to prevent outbreaks and the spread of exotic animal diseases (e.g., Johne's disease, Babesiosis, Vesicular Stomatitis, Bovine Spongiform Encephalopathy, Porcine Reproductive Respiratory Syndrome, Avian Influenza, and Anaplasmosis). Research will also be conducted on the development of technologies to protect livestock and humans against zoonotic diseases (e.g., tuberculosis, brucellosis, toxoplasmosis, trichinosis, and cryptosporidiosis).

The remaining \$2,300,000 will be directed at preventing the introduction of emerging plant diseases and pests. Invasive, noxious, and weedy plants are a serious problem in the U.S. that annually cause billions of dollars in damages to the agricultural, recreational, and tourist industries. Research will be conducted to develop new strategies to combat wheat scab, karnal bunt, salt cedar, and sorghum ergot. In addition, the means to rear large numbers of new insect biological control agents will be developed. Remote sensing technology will also be developed to identify new or expanding weed infestations.

Food Genome Research.—ARS is recommending an increase of \$3,500,000 in support of the Food Genome Initiative and the preservation of genetic resources which are necessary to ensure that an adequate supply of food and fiber will be available at a reasonable cost in the future. The investigations will focus on agriculturally important crops and livestock and their associated microbes. Specifically, the proposed increases will be used to map genomes of agriculturally important plants, animals, and microbes to advance breeding programs. Research in this area will contribute to food production efficiencies and ensure the continued availability of genetically diverse collections of plant and animal germplasm.

Essentially, all the crops and livestock raised and used for food, fiber, ornamentals, and industrial feed stocks originated outside the United States, so the system of renewable resource production is highly dependent on germplasm introduced from other countries, some of which is endangered. Once lost, the germplasm cannot be fully reconstructed, so that sources of productive capacity and efficiency, and resistance to pests, pathogens, and environmental stress may be lost forever. A major and growing problem is the loss or "narrowness" of the gene pools of crop and livestock species.

ARS is also requesting the restoration of \$913,000 for Evaluation Studies. These investigations provide a basis for policy and funding decisions in support of the mission area's research, education and economics programs.

ARS is also recommending \$14,498,000 to finance the anticipated Federal pay raises and Civil Service Retirement System costs. These funds are critical to the ongoing operations of the Agency.

PROJECT TERMINATIONS

The fiscal year 1999 Budget recommends \$34,594,000 of reductions in base programs, consisting of fiscal year 1998 proposed project terminations restored in the 1998 Act, as well as Congressionally-added projects. The ongoing projects that have been identified for termination have been deemed less critical to continue in light of higher priority research needs and limited resources. The savings achieved will be redirected to finance the agricultural research initiatives recommended in the President's budget.

BUILDING AND FACILITIES

The modernization and replacement of ARS' major research centers and laboratories remains one of the Agency's highest priorities. Continuing with the renovation

and replacement of the Agency's research facilities is critical if ARS is going to fulfill its mission and carry out its programs.

In fiscal year 1999, ARS recommends under its Building and Facilities account a total of \$35,900,000 for the following projects:

Beltsville Agricultural Research Center, Beltsville, Maryland.—Established in 1910, the Center is widely recognized as one of the largest agricultural research facilities in the world. The Center carries out programs in natural resources and environmental sciences, plant and animal productivity, post-harvest research, and human nutrition. ARS is requesting \$2,500,000 to continue the modernization of the Center's facilities which began in 1988. Specifically, the funds would be used for the design and construction of a new poultry production facility as well as finance a number of miscellaneous small projects.

National Agricultural Library, Beltsville, Maryland.—Built in 1968, NAL is the largest agricultural library in the world and one of four national libraries. NAL houses a collection of more than 2.2 million volumes in 50 different languages. In 1991, a comprehensive facility condition study of NAL was conducted. Numerous mechanical, electrical, and architectural deficiencies were identified. In fiscal year 1999, ARS is requesting \$1,200,000 to begin construction of the first phase of the air handling unit replacement.

National Animal Disease Center, Ames, Iowa.—The Center is the primary USDA facility for conducting research on animal diseases that are of economic importance to U.S. agriculture. Constructed in 1961, the facilities are antiquated and in need of modernization. ARS is requesting \$5,600,000 to initiate rehabilitation of the 80 buildings and supporting infrastructure of the Center. In fiscal year 1999, the funds would be used for design and construction plans for repair projects, including the repair of the contaminated waste collection piping system and treatment plant for infectious agents.

ARS Regional Research Centers, Peoria, Illinois; Philadelphia, Pennsylvania; and New Orleans, Louisiana.—The regional research centers were constructed in the late 1930's. All major building systems—heating, ventilation, air conditioning, electrical, roofs, and infrastructures (i.e., paving, steam and water lines, and waste treatment disposal systems)—have either reached or passed their useful life expectancy. ARS is requesting \$8,400,000 for its Center in Peoria. The funds will be used to continue the modernization program. Similarly, ARS is requesting \$3,300,000 and \$6,000,000 for modernization programs at the Philadelphia and New Orleans Regional Research Centers, respectively.

Grain Marketing and Production Research Center, Manhattan, Kansas.—The Center conducts research on a broad range of technical problems in domestic and international marketing, handling, and storage of grains. In 1990, a facility condition study identified numerous deficiencies in all of the Center's buildings. ARS is requesting in fiscal year 1999, \$1,400,000 to continue with the renovation program.

Plum Island Animal Disease Center, Greenport, New York.—Plum Island conducts state-of-the-art research on foreign animal diseases which are an ongoing threat to the U.S. It is the only facility in the Nation authorized by Congress to carry out such research. In 1989, ARS developed a long range plan for the repair and maintenance of the Center's 23 buildings and supporting infrastructure. In fiscal year 1999, ARS is requesting \$3,500,000 to continue with the phased plan to renovate and modernize the Center.

Melaleuca Research and Quarantine Facility, Ft. Lauderdale, Florida.—The exotic weed tree Melaleuca, introduced in the 1930's, now covers tens of thousands of acres of South Florida's fragile wetlands. Melaleuca can be controlled with the aid of biological control agents from Australia. ARS is proposing \$4,000,000 for the construction of a Melaleuca research and quarantine facility in support of this research. Construction of this facility has been designated by the Administration's South Florida Ecosystem Restoration Task Force as one of its highest priorities to ensure the restoration of the Everglades National Park.

CLOSING REMARKS

ARS' challenge is to bring the most advanced research and technologies to bear on some of this Nation's most recent and difficult problems, in food safety and health, human nutrition, agricultural productivity and the environment. In a larger sense, its challenge is to continue solving problems for agriculture, its producers and consumers, and meet the food and fiber requirements of a growing population in a way that is safer, more efficient, and more nutritious.

ARS has completed a 2½ year long process of developing a new Strategic Plan that embodies the spirit and letter of the Government Performance and Results Act of 1993. The new plan focuses on the outcomes of the Agency's research activities,

organized around the five broad goals identified in the Strategic Plan of the Research, Education, and Economics mission area. The new strategic plan went into effect on October 1, 1997, and the Agency developed its first Annual Performance Plan, as required by GPRA. The Annual Performance Plan describes what ARS will accomplish in fiscal year 1998 and fiscal year 1999 in measurable terms that will demonstrate progress towards reaching the Agency's goals.

Mr. Chairman, this concludes my prepared remarks. I will be happy to answer any questions you may have.

PREPARED STATEMENT OF SUSAN E. OFFUTT

Mr. Chairman and members of the Committee, I am pleased to have the opportunity to present the proposed fiscal year 1999 budget for the Economic Research Service.

MISSION

The Economic Research Service provides economic and other social science analysis on efficiency, efficacy, and equity issues related to agriculture, food, the environment, and rural development to improve public and private decision making.

BUDGET

ERS's appropriation for 1998 of \$71.6 million consists of the 1997 appropriation level (\$53.1 million) and an increase of \$18.5 million to evaluate food stamp, child nutrition, and WIC programs. ERS continues implementation of its streamlining strategy and plans to maintain staff in 1998 at its current level of 554 full-time equivalents. ERS continues to make full use of early-out and buy-out authorities. Since October 1993, the ERS staff has been reduced by 241 full-time equivalents, including reductions in 1998 through 19 buyouts. In the future, ERS must manage its staff levels to maintain its non-salary program of agricultural data purchases and cooperative university research necessary to support its analytical program.

The agency's request for 1999 is \$55.8 million, a net decrease of \$15.8 million over 1998. The decrease consists of five parts: a \$1.3 million increase for pay raises and contributions to the CSRS retirement fund; a \$0.9 million increase for estimating the benefits of food safety; a \$0.3 million increase to meet the analytical information needs of small farmers, niche marketers, other casualties of an industrializing agricultural sector; a \$0.2 million increase to assess the potential impacts of electric utility deregulation; and an \$18.5 million decrease for evaluations of food stamp, child nutrition, and WIC programs. When he signed the Agriculture Appropriations bill, the President stated that, "I am concerned about the provision of this bill that alters the administration and funding for research on nutrition programs serving the poor and disadvantaged. The research needs of these important programs should continue to be addressed in the context of the programs' administration." This budget follows through on these concerns and restores funding for WIC, Food Stamps, and Child Nutrition research to the Food and Nutrition Service.

Food Safety.—ERS proposes an interagency research effort to strengthen our understanding of the costs of foodborne illness and the benefits and costs of programs and policies to improve the safety of the Nation's food supply. This initiative is designed in accordance with the President's Food Safety Initiative, and is based on activities underway as part of this initiative.

National Estimates of Foodborne Illness and their Economic Costs from Sentinel Site Survey Data.—The initiative includes funding for eight regional data collection efforts. We will work with staff of the Centers for Disease Control and Prevention to develop new estimates of the national incidence of foodborne disease, the distribution of illness among subpopulations, and morbidity and mortality rates for specific illnesses. We will use these new data to refine our estimates of the costs of illness from specific foodborne diseases, to narrow the confidence intervals for specific cost-of-illness measures, and to evaluate the distribution of these costs among subpopulations.

Risk/Benefit Assessment of Pathogen Control Options.—The initiative also includes funding for expanded risk assessment. To perform benefit/cost analysis of control options for improving food safety, economists need data from other scientific disciplines. The best way to further this multidisciplinary exchange is to set up a formal collaboration among groups of scientists. Economists from ERS will work with scientists from other USDA agencies, FDA, CDC and academia to bring a systems view to their analyses of options for pathogen control from farm to table. The goal is to provide economic analysis of pathogen control options to determine which

controls are most cost-beneficial. Application of risk modeling to food safety is a new field. Risk assessment models (such as fault-tree analysis and probabilistic-scenario analysis) could be used to identify where pathogens gain entry into the food chain and where control efforts would be most cost-effective. By incorporating the results of risk assessment in our economic analysis of pathogen control options, we will further enhance our understanding of the economic consequences of specific food safety policies (such as HACCP, safe handling labels, and consumer education).

Completion of activities outlined in this initiative will yield improved economic assessment of policies and programs designed to improve the safety of the Nation's food supply. This will result in improved economic performance of the food sector, as the costs of achieving food safety goals and the attendant economic burden on farmers, processors, distributors, and retailers are minimized. This will also result in increased cost savings to consumers and the general economy as the research results are used to maximize the public health benefits of public and private efforts to improve food safety.

Information Needs of Small Farmers.—ERS proposes to organize and lead an interagency research activity to comprehensively assess the USDA's role in providing analytically based information on agricultural markets to small, limited-resource, and socially disadvantaged farmers, in the context of an interagency market information program. Specifically, the study will determine: (a) whether and how the agricultural market information needs of domestic producers and marketers vary by scale of operation, organizational structure, or demographics; (b) whether, given this new knowledge, it appears that USDA market information programs provide information that meets some subgroups' needs better or worse than others, and if any revealed differentiation in service is warranted; (c) the extent to which private sector analytical and information services do or can serve various subgroups' needs for market information; and (d) whether and, if so, in what manner ERS and other USDA agricultural market information programs require reform or modification to accommodate the new public sector role in a modern agricultural economy. Subsequently, plans would be designed and implemented to reform and/or modify these programs in the manner suggested by the assessment.

In 1996 and 1997, ERS conducted a general assessment of the market for agricultural market information. While this study examined the use and value of information across several broad categories of public and private sector clientele, resources have not been available to conduct sampling to assess how utility and value might vary within groups as a function of size, economic class, or other features. Additional resources are a necessary prerequisite for any assessment aimed at segmenting the information client population to assure public service to unique and potentially underserved subgroups (e.g., small or disadvantaged farms, direct marketing firms, independent firms in otherwise highly coordinated industries, etc.).

The proposed effort will be planned by ERS, with input from an advisory group representing CSREES, WAOB, OCE, AMS, FSA, and FAS. ERS will perform the market research needed to assess the performance of its own and USDA's agricultural market information programs, with focus on the nature of the information generated and its utility to clients of different sorts, sizes, economic classes, and demographic characteristics. Following market data collection, analysis, and interpretation, the full set of agencies producing agricultural market information will need to be involved directly in the implementation of resultant recommendations.

By providing a sound understanding of how commodity market information needs vary among different sizes and types of agricultural producers and marketers, the study will assure that USDA's commodity market information programs are non-discriminatory with respect to producers' and marketers' scales of operation, income brackets, races or ethnicities, and geographic locations (for locations characterized by small or disadvantaged enterprises). It will prevent small, niche, limited-resource and socially disadvantaged clients from "falling through the cracks" as commodity market information programs respond to the changing structure of American agriculture. It will thus allow these producers and marketers to be competitive by assuring them easy access to scale-appropriate, market-empowering information, regardless of their disassociation with large, integrated, or vertically coordinated markets where information is otherwise more readily available or affordable. This, in turn, assures a more robustly competitive sector overall. Without the study, attempts to accomplish these results would have to rely on anecdotes and supposition. With it, USDA will be armed with the knowledge required to ensure information-related competitiveness for small and disadvantaged, along with large and advantaged, market participants, as the American agricultural sector continues its divergent path towards a small number of large, highly commercial operations, and a large number of small and diverse operations.

Electric Utility Deregulation.—ERS proposes an interagency research activity with USDA's Rural Utilities Service (RUS) and the Department of Energy to expand REE's capacity to assess the potential impacts of electric utility deregulation on USDA's rural utility loan programs, the competitive position of rural businesses and communities, the viability of alternative power generation systems, and the well-being of rural customers.

ERS has considerable expertise and data available on rural industries, households, and communities, and has experience developing economic models and policy analysis on a wide range of issues. However, ERS currently lacks expertise and information on the electric utility industry sufficient to model deregulation's effects on rural utility customers in various regions of the country. With an expanded program, ERS and its cooperators will be able to assess the potential impacts of deregulation on USDA's rural utility loan programs, the competitiveness of rural businesses and communities, and rural households.

The products of this research will enable RUS to better evaluate the likely effects of electric utility deregulation on the financial health of rural electric cooperatives, and, as a result, the prospective quality of the RUS loan and loan guarantee portfolio. The products of this research also will provide USDA with important information about the prospective effects of electric utility deregulation on farmer electric costs, electric costs for consumers in rural America, and on rural economic development. This information will be available to support the work of RUS and USDA as they participate in developing Administration policy on electric deregulation.

CUSTOMERS, PARTNERS, AND STAKEHOLDERS

The ultimate beneficiaries of ERS's program are the American people whose well-being is improved by informed public and private decisionmaking leading to more effective resource allocation. ERS shapes its program and products principally to serve key decision makers who routinely make or influence public policy and program decisions. This clientele includes White House and USDA policy officials and program administrators/managers, the U.S. Congress, other Federal agencies and State and local government officials, and domestic and international environmental, consumer, and other public groups, including farm and industry groups interested in public policy issues.

ERS carries out its economic analysis and research in four divisions and an Office of Energy. ERS depends heavily on working relationships with other organizations and individuals to accomplish its mission. Key partners include: the National Agricultural Statistics Service (NASS) for primary data collection; universities for research collaboration; the media as disseminators of ERS analyses; and other government agencies and departments for data information and services.

ERS CONTRIBUTIONS TO MISSION AREA GOALS

ERS shares five general goals with its fellow agencies in the Research, Education, and Economics mission area: a highly competitive agricultural production system, a safe and secure food supply, a healthy and well nourished population, harmony between agriculture and the environment, and enhanced economic opportunity and quality of life for all Americans. These goals are fully consistent with the U.S. Department of Agriculture mission.

A Highly Competitive Agricultural Production System in the Global Economy.—ERS helps the U.S. food and agriculture sector effectively adapt to changing market structure and post-GATT and post-NAFTA trade conditions by providing analyses on the linkage between domestic and global food and commodity markets and the implications of alternative domestic policies and programs on competitiveness. ERS economists analyze factors that drive change in the structure and performance of domestic and global food and agriculture markets; provide economic assessments of competitiveness and efficiency in the food industry; analyze how global environmental change, international environmental treaties and agreements, and agriculture-related trade restrictions affect U.S. agricultural production, exports and imports; and provide economic analyses that help identify competitive and environmentally sound new crops and uses. ERS will continue to consider how the potential for increased commodity price and farm income variability affects market performance and interacts with Federal policies and programs. These analyses will include short- and long-term projections of U.S. and world agricultural production, consumption, and trade. In addition, ERS will continue preparation for the 1999 World Trade Organization mini-round (expected to focus on agriculture) by analyzing the economic effects of Uruguay Round policy disciplines; assessing the economic effects of state trading and tariff-rate quota allocations; and assessing regional trade initiatives. In this latter category, ERS experts will take a more in-depth look at China's

evolving role in world agricultural markets. ERS will conduct research on the changing structure (for example, vertical integration, concentration, and contracting) of the food marketing chain and will also analyze the effectiveness and use of alternative marketing strategies and risk management tools in mitigating farm income risk, including tools available from both private and public sector providers.

ERS analyses can help guide and evaluate resource allocation and management of public sector agricultural research, a key to maintaining increases in productivity that underlie a strong competitive position for U.S. farmers. ERS economists track and endeavor to understand the determinants of public and private spending on agricultural R&D; evaluate the returns from those expenditures; and consider the most effective roles for public and private sector research entities.

A Safe and Secure Food Production System.—ERS focuses on improving the efficiency and effectiveness of public policies and programs designed to protect consumers from unsafe food by analyzing benefits of safer food and the costs of food safety policies; efficient and cost-effective approaches to promote food safety; and how agricultural production and processing practices affect food safety, resource quality, and farm workers' safety. This research helps government officials design more efficient and cost-effective approaches to promote food safety. Specifically, the ERS research program provides detailed and up-to-date appraisals of the benefits of safer food, such as reducing medical costs and costs of productivity losses from foodborne illnesses caused by microbial pathogens. In addition, ERS has undertaken new research on the costs to industry and consumers of alternative food safety policies, including assessment of the distribution of costs across the food industry and across demographic groups.

Understanding how food prices are determined is increasingly important in responding to domestic and international market events and opportunities that promote the security of the U.S. food supply. As the farm share of the food dollar declines, accurate retail price forecasts depend more heavily on understanding the marketing system beyond the farmgate. ERS systematically examines the factors that help set retail prices, including an assessment of the roles of the transportation, processing, manufacturing, wholesaling and retailing sectors, the impact of imports and exports, and linkages to the total economy.

A Healthy and Well-Nourished Population.—ERS helps identify efficient and effective public policies that promote consumers' access to a wide variety of high-quality foods at affordable prices. ERS economists analyze factors affecting dietary changes; assess impacts of nutrition education and the implications for the individual, society and agriculture; and provide economic evaluations of food nutrition and assistance programs. The Agency studies the implications for producers and consumers of movement towards adoption of the dietary guidelines; the trends and determinants of American's eating habits; evolution of food product trade; and the determinants of food prices. Analysis of nutrition education efforts considers what kinds of information motivate changes in consumer behavior, the food cost of healthy diets, the influence of food assistance programs on nutrition, and the implications of healthy diets for the structure of the food system. And, because trade in high valued agricultural products, including processed food, now exceeds the value of bulk commodity flows, ERS will spend more time to break down the components of these trade flows, understand relationships to international investment and strategic behavior of U.S. food firms; and investigate the implications for U.S. consumers of a globalized food marketplace.

Harmony in Agriculture and the Environment.—In this area, ERS analysis helps support development of Federal farm, natural resource, and rural policies and programs that promote long-term sustainability goals, improved agricultural competitiveness, and economic growth. This effort requires analyses on the profitability and environmental effects of alternative production management systems and on the cost effectiveness and equity, of public sector conservation policies and programs. ERS analysts focus on evaluating the benefits and costs of agricultural and environmental policies and programs in order to assess the relationship between improvements in environmental quality and increases in agricultural competitiveness. In this vein, ERS provides economic analyses on the linkages between biodiversity and sustainability issues and agricultural performance, competitiveness, and structure. In the energy and environment area, the ERS Office of Energy provides departmental leadership, oversight, coordination, and evaluation for energy and energy-related policies and programs affecting agriculture and rural America.

Enhanced Economic Opportunity and Quality of Life for Americans.—The ERS contribution to improving opportunity and quality of life in the U.S. is based on analysis that identifies how investment, employment opportunities and job training, and demographics affect rural America's capacity to prosper in the global marketplace. ERS economists analyze rural financial markets and how the availability of

credit, particularly Federal credit, spending, taxes, and regulations influence rural economic development. ERS analyzes the changing size and characteristics of the rural and farm populations and the implications of these changes in human capital, including skill development, on the performance of rural economies. In addition, ERS studies the economic structure and performance of non-farm economic activities in rural areas, including the fairly widespread rebound in population growth in non-metropolitan counties. The relevant analyses will involve monitoring rural earnings and labor market trends with emphasis on regional and other disaggregations in order to provide insight into the determinants of variation in trends among non-metro counties. Such work should yield a better understanding of the factors that promote rural vitality and the opportunities for effective public sector intervention.

Because the effects of changes in welfare programs may vary between rural and urban residents due to differences in labor markets and other aspects of a regional economy's structure, ERS social scientists will track implementation of recent program changes to understand any differential impacts. In particular, ERS analysis can help anticipate changes in participation across assistance programs, including those for which USDA has primary responsibility, in rural housing and in food. Another opportunity for understanding whether rural America faces unique circumstances will come with analysis of a recently-completed survey of the rural manufacturing sector.

ERS continues to monitor the financial situation of the farm sector, establishing farm business organization and performance benchmarks. This task includes study of the financial position of farmers who employ technological advances and innovative risk management strategies in their businesses, compared with the financial position of farmers who use more traditional approaches. Previous work on the use of production and marketing contracts by farmers will be extended to identify contractors by class to better define the role of non-farm businesses in the industrialization of farms. Analyses of financial performance will also measure the comparability of returns between farm and non-farm small businesses and assess the financial viability of commercial and non-commercial size farm operations.

CLOSING REMARKS

I appreciate the support that his Committee has given ERS in the past and look forward to continue working with you and your staff to ensure that ERS makes the most effective and appropriate use of the public resources. Thank you.

PREPARED STATEMENT OF DR. B.H. ROBINSON

Mr. Chairman and Members of the Committee, I appreciate the opportunity to present the proposed fiscal year 1999 budget for the Cooperative State Research, Education, and Extension Service (CSREES), one of four agencies in the Research, Education, and Economics (REE) mission area of USDA.

CSREES provides leadership for and cultivates partnerships in research and education among USDA, the land-grant university system, and other research and education institutions.

CSREES advances and integrates agricultural research and education through our partnership with the land-grant universities. In this partnership, 75 universities work in close cooperation with CSREES, employing more than 9,500 scientists, 9,600 extension educators, and engaging nearly 3 million volunteers supporting activities in the 50 states (3,150 counties), the District of Columbia, and six territories (Puerto Rico, the Virgin Islands, Guam, American Samoa, the Northern Marianas, and Micronesia). The scientific and education resource base of the 1890 Historically Black and the 1862 land-grant universities is expanded through the participation of scientists and educators from the 29 Native American land-grant institutions, and from non-land-grant institutions and the private sector.

The programs supported by CSREES and carried out through our university partners play a central role in meeting what I believe to be two fundamental challenges facing agriculture today. The first challenge is to achieve long-term sustainability in agricultural production while simultaneously maintaining competitiveness and profitability, minimizing negative environmental effects, and developing and improving strong communities. The second challenge is to respond to broad public concerns for a safe, nutritious, and accessible food supply.

To meet these challenges, our programs reflect the five Strategic Goals to which the REE mission area is committed: (1) an agricultural production system that is highly competitive in the global economy; (2) a safe and secure food and fiber system; (3) a healthy, well-nourished population; (4) greater harmony between agriculture and the environment; and (5) enhanced economic opportunity and quality of

life for Americans. These goals are the framework for the CSREES Strategic Plan, the fiscal year 1999 GPRÁ performance plan and, of course, the fiscal year 1999 President's budget request for CSREES.

I would like to present several examples of outstanding research, education, and extension accomplishments resulting from support provided through our programs as they relate to the five REE/CSREES Strategic Goals. I believe that these "success stories" clearly show that the activities conducted by the land-grant university system and other partner institutions significantly contribute to the ability of U.S. agriculture to maintain its worldclass competitive edge. The Committee may be interested to know that CSREES and its university partners are collaborating on the development of a World Wide Web site that contains impact statements to showcase how programs supported by the USDA/land-grant university partnership benefit U.S. agricultural research and education; this site is available for public access at <http://www.reeusda.gov/success/impact.htm>. Although many activities conducted by our partners contribute to multiple goals, the following examples are aligned under the Strategic Goals to which they make the most significant contribution:

Goal 1: An Agricultural Production System that is Highly Competitive in the Global Economy

In cattle, 30–40 percent of pregnancies are lost during the first 40 days of gestation. Research supported by the National Research Initiative and conducted at the University of Missouri and Texas A&M University has identified a protein, interferon-tau, which is produced by the developing embryo prior to implantation and acts as a biochemical signal to the mother's uterus to establish pregnancy in cattle and sheep. This protein, when given to nonpregnant cattle or sheep, extended the length of their reproductive cycle. Current studies are focusing on the potential use of the protein as a fertility drug to minimize early embryonic losses associated with insufficient production of the protein.

Goal 2: A Safe and Secure Food and Fiber System

Funding provided under the Smith-Lever 3(d) Food Quality and Safety program was used to develop and sponsor two National HACCP (Hazard Analysis and Critical Control Point) Education Conferences on "Forming Partnerships from Farm to Table." The conferences were designed to build and enhance partnerships among government, academia, industry, and consumers, and brought together state core teams who received training and education enabling them to develop and implement state planning strategies for HACCP training. Conference planning and coordination was a cooperative effort between Texas A&M University, Virginia Polytechnic Institute and State University, and Kansas State University.

Goal 3: Healthy, Well-Nourished Population

The nutritional status of participants in a program supported by Smith-Lever 3(d) Expanded Food and Nutrition Education Program (EFNEP) has improved due to intensive nutrition education instruction from the University of Massachusetts Extension Nutrition Educators. A behavior survey of more than 2,500 EFNEP participants indicated that behavior changes included: a 57 percent increase in recommended fruit consumption, a 34 percent increase in vegetable consumption, and 47 percent increase in the consumption of foods to meet the Recommended Daily Allowance for vitamin C. Improved nutrition practices resulting from this Massachusetts program included preparing foods without salt, reading nutrition labels for fat and sodium content, and ensuring that children eat breakfast.

Goal 4: Greater Harmony Between Agriculture and the Environment

An early project awarded under the USDA Food and Agricultural Sciences National Needs Graduate Fellowships program to North Carolina State University resulted in five exceptional graduate students' completing Doctoral degrees. The accomplishments of this project have been realized as these students are now employed in positions significantly impacting the food and agricultural sciences. These students are President of a soil and water engineering consulting company in Kentucky; Associate Professor at Texas A&M University, an Extension Specialist in Agricultural Engineering; President of a consulting company in Washington that deals with the impact of forestry programs on water quality and soil erosion; Chief Engineer for a State district in Florida; and Soil/Water Engineer for a consulting firm in California.

Goal 5: Enhanced Economic Opportunity and Quality of Life Among Americans

The Blackfeet Reservation comprises 1.2 million acres of rangeland in northwestern Montana. The location of the reservation limits the feasibility of alternative agricultural enterprises. The reservation has the range resources to greatly expand the

number of individually-owned cattle heads, and human resources to expand the number of ranchers. In the first 5 years of the program, with funding from the Smith-Lever 3(d) Extension Indian Reservation Program, Montana Cooperative Extension Service agents have assisted 38 young producers in acquiring over \$220,000 in youth agriculture loans, in the purchase of 385 head of cattle, and in the formation of business plans, as well as livestock production. These livestock should increase aggregate tribal income by at least \$20,000 per year while herds are being expanded. Assuming eventual net incomes of \$30,000 per year, these ranchers represent an increase in the aggregate tribal income of over \$1 million per year. Such income will contribute to improved quality of life for the ranchers and for their immediate and extended families. Income stability and improved quality of life will provide an example for family members and others. A cadre of successful private operations will foster increases in such enterprises. Successful marketing strategies will develop cooperative efforts.

Continuing its implementation of GPRA, CSREES is working with our State partners to develop annual performance plans with stated goals and targets; implement programs and projects designed to achieve or work toward achievement of goals; collect and assemble data at the State, regional, and National level; and integrate this information to assess accomplishments and extend the planning process.

CSREES is entering its fourth year after the merger of two former agencies, the Cooperative State Research Service and the Extension Service, and we continue to be successful in enhancing critical linkages between research and extension. Our land-grant university and other partners conduct fundamental and applied research to gain the knowledge needed to address problems in the development and sustainability of agriculture and forestry and in the overall quality of life of our citizens. Programs conducted by the Cooperative Extension System use this research-based guidance as the basis for practical decisionmaking by producers, individuals, families, and communities.

The Administration is proposing that a new authority be established for an Integrated Research, Extension, and Education Competitive Grants Program. In fiscal year 1999, we are requesting \$4 million for a Small Farms Initiative under the Integrated Research, Extension, and Education Competitive Grants Program. The Small Farms Initiative will benefit socially disadvantaged groups through the integration of research and education by supporting: (1) targeted research, outreach, and technology transfer/adoption to meet the needs of this diverse clientele; (2) needs assessments; (3) improved access to information for and delivery of programs to small farms; and (4) development of a small farms information system.

The Administration has also proposed new legislation for a Food Genome Initiative, to be funded in fiscal year 1999 at a level of \$10 million. The Initiative will be coordinated with NRI grants and ARS research activities. This Initiative represents a targeted investment in the National Food Genome Strategy, which has two major components. In the first component, the Plant Genome Initiative, USDA would be the lead Federal agency, working with the National Science Foundation and the Department of Energy, to focus on crop species of major, agriculturally important plants. In the second component of the National Food Genome Strategy, the Animal Genome Initiative, scientists would be able to take advantage of ongoing work at the National Institutes of Health on the Human Genome Initiative to improve our understanding of animal genes, their genetic capabilities, and their genetic structures. These efforts will permit development of new genetic technologies for improvement in yield, composition, and quality of the domestic agricultural output.

FISCAL YEAR 1999 BUDGET REQUEST

The budget submitted to Congress by the President requests \$849,840,000 for the Cooperative State Research, Education, and Extension Service. This request is a decrease of \$9.1 million or approximately 1 percent, from the current appropriation, and comprises specific program increases and decreases. Highlights of the proposed increases in the fiscal year 1999 CSREES Budget are:

FOOD SAFETY

An increase of \$3 million is proposed in fiscal year 1999 for the second year of the Food Safety Special Research Grants Program which supports the President's National Food Safety Initiative. We thank the Congress for providing \$2 million to initiate the program in fiscal year 1998. In 1999, research supported under this program will target select populations, such as children, the elderly, immunocompromised, or those suffering from chronic disease, who may be more vulnerable to foodborne illness and will address both biological and behavioral science

issues, including food handling and safety practices, purchasing and storage patterns among populations, and factors increasing risk of food-borne illness. These efforts will underpin the education activities supported by the Food Safety Education Program under the Smith-Lever 3(d) funding mechanism for which we are proposing an increase of \$5 million. Funding provided for the Food Safety Education Program will enable CSREES, in cooperation with ARS and other Federal agencies, to increase producer, processor, and consumer awareness, understanding, and information regarding food safety.

PEST CONTROL

The CSREES fiscal year 1999 budget proposes an increase of \$15.5 million for our research and extension-related pest control programs in contribution to USDA's Integrated Pest Management (IPM) Initiative, a multiagency effort to develop strategies to bring 75 percent of the nation's cropland under integrated pest management practices by the year 2000. Increases are proposed for the following programs: Pest Management Alternatives; Expert IPM Decision Support System; research and extension Integrated Pest Management; IR-4 Minor Crop Pest Management; Pesticide Applicator Training; and extension Pesticide Impact Assessment. The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber depends on access to safe, profitable, and reliable pest management systems. Farmers and pest managers have fewer chemical control options available to them than they did at the beginning of the decade, and this trend is likely to continue at an accelerated rate. In addition, the Food Quality Protection Act will have significant impact on pest management systems in the United States over the next decade. "Minor use" crops (high value crops grown on relatively few acres) will be particularly hard hit. It is essential that farmers and pest managers be provided with new pest management tools and better information to remain competitive in today's global marketplace and assure consumers access to a wide range of safe, affordable food. To meet this challenge effectively and efficiently, the CSREES pest-related programs will be coordinated with the activities of the USDA Office of Pest Management Policy along with other IPM-related activities undertaken by the Department.

SUSTAINABLE AGRICULTURE

An increase of \$2 million is proposed for the research and education component of the Sustainable Agriculture Research and Education (SARE) Program. This increase will allow expansion of the knowledge base related to more sustainable practices. Many of the projects supported by SARE emphasize helping farmers and ranchers save money through grazing system improvements that also protect our natural resources. Fiscal year 1998 marks the ten-year anniversary of Federal funding for the SARE research, education, and extension program. In the past decade, SARE has funded approximately 1,200 projects, most of which were led by university researchers working in concert with farmers, ranchers, and extension educators. In honor of the ten-year anniversary of SARE, a conference entitled, "Building on a Decade of Sustainable Agriculture Research and Education," will be held March 5-7 in Austin, Texas. The conference will bring together researchers, farmers and ranchers, agricultural extension agents and other educators, sustainable agriculture advocates, and other partners for informative sessions on sustainable agriculture and tours of farm and community, projects that are helping to bring about a more sustainable food system in central Texas. I believe that this conference is a fitting tribute to the impact the SARE program has had on U.S. agriculture.

NATIONAL RESEARCH INITIATIVE

The budget proposes to fund the NRI at \$130 million, an increase of \$32.8 million. The NRI is the USDA's largest competitive grants program that provides a critical investment for the future of American agriculture. We appreciate the Congress providing additional funding for the NRI in 1998. Agricultural research is needed to assure a sustained and bountiful harvest of agricultural products. It is also needed to meet the ever-changing preferences and demands of consumers, domestic and global, and to keep up with increases in both the population and economic status of people.

The NRI invests in those areas of research with the greatest potential for expanding the knowledge base needed to address issues that will face the agricultural and forestry enterprise. The NRI supports a broad spectrum of mission-linked agricultural research that results in practical outcomes.

The increase in the NRI will therefore focus on these key areas: food genome research, food safety, and environmental quality. Increased food genome research is

needed to improve plant and animal species to increase yields, reduce inputs such as fertilizers, pesticides and antibiotics, decrease production costs, and improve quality and safety. Also of particular concern to the American public is the safety of the food supply. The NRI responds to this need by expanding the science base for the Hazard Analysis and Critical Control Point (HACCP) approach to meat and poultry inspection to reduce food-borne illness due to microbial pathogens. The health of the environment also is a major concern to Americans. Research supported by the NRI leads to improved production practices and contributes to improved water quality, better soil quality and fertility, and sustained ecosystem health.

RESEARCH, EDUCATION, AND ECONOMICS INFORMATION SYSTEM

An increase of \$1.2 million is proposed for REEIS to work on the system design and launch development of the REEIS prototype. This also will entail the enhancement of several current databases to make them more useful to REEIS users. An information needs assessment will be conducted in order to align REEIS products and services with information requirements of the agencies and their partners.

The Research, Education, and Economics Information System—REEIS—will be a valuable mechanism for helping the REE agencies meet the accountability standards mandated by GPRA and for enabling us to provide better delivery of comprehensive research, education, extension, and economics information to USDA, REE agencies, and our partners. The first REEIS National Steering Committee meeting was held in June 1997, and I am very pleased with the progress that resulted from that meeting. As a result of the Committee recommendations, an information audit of existing REE databases is being conducted. The first phase of the audit produced an on-line catalog of the major databases and provided specifications, through interviews with database managers, to conduct an assessment of additional databases or information which should be included. The second phase of the audit will build the data dictionary and provide specifications for a controlled vocabulary to facilitate coordinated user access to REEIS databases. Initial implementation activities are expected to be essentially completed by the end of the year 2000.

The second National Steering Committee meeting is scheduled for the week of February 23. Members of the National Steering Committee, the REE mission agencies and State partner institutions have been provided copies of the specifications for the needs assessment and controlled vocabulary. The Committee will review and approve progress to date and formulate the action plan and strategies for future tasks such as specifications for the REEIS system design and collection of accountability data.

USDA CIVIL RIGHTS INITIATIVE

A proposed increase of \$9.3 million is included to address recommendations made in the USDA Civil Rights Action Team (CRAT) report of February 1997 to strengthen USDA's research and educational assistance to the socially disadvantaged and to address the needs of farmworkers. Increases are proposed for: (1) the Extension Indian Reservation Program to expand the presence of extension agents on Indian Reservations; (2) the 1890 Facilities Program to improve the quality of research, extension, and teaching facilities on the campuses of 1890 Institutions so that they are more comparable to facilities generally found on the campuses of 1862 land-grant universities; and (3) the Extension Services at 1994 Institutions to bring needed educational programs normally addressed under the broad mandate of the Cooperative Extension System to people served by Native American institutions. The Administration also is proposing that: (1) funding levels for the Hispanic Serving Institutions higher education program and the 1890 institutions research and extension formula programs be maintained at the fiscal year 1998 levels; and (2) as discussed earlier, a Small Farms Initiative be implemented under new legislation to be established through the reauthorization of the research title of the Farm Bill for an Integrated Research, Education, and Extension Competitive Grants Program. The Small Farms Initiative will support multi-functional research and education activities to address the resource constraints of small farms.

CHILDREN, YOUTH, AND FAMILIES AT RISK

The budget proposes that funding for the Children, Youth, and Families at Risk (CYFAR) program under Smith-Lever 3(d) be increased by \$446,000 to restore it to the 1995 level. This program is one of several National Initiatives of the Cooperative Extension System which represent the System's commitment to respond to important problems of broad national concern. CYFAR funds are distributed to each State and awarded competitively. Every State has identified youth at risk as a priority, and most of the efforts focus on community collaborations, initiating school age child

care programs, and strengthening science and technology programs. Projects supported by CYFAR are empowering youth, parents, and community leaders to take responsibility for their own lives to reduce environmental risk factors.

WATER QUALITY

An increase of \$296,000 is proposed to restore funding under the Water Quality research program to the level provided in fiscal years 1995–1997. In 1996 new projects were initiated as Agricultural Systems for Environmental Quality to focus on watershed-scale agriculture production systems that reduce pollution of soil and water while maintaining productivity and profitability. This increase will address these and other water quality issues, such as hypoxia oxygen depleted waters—and *Pfiesteria*, a problem recently reported in some tributaries of the Chesapeake Bay, and specific water-borne diseases such as *Cryptosporidium*, which continue to be of a high priority at local, regional, and National levels.

BINATIONAL AGRICULTURAL RESEARCH AND DEVELOPMENT (BARD)

The United States-Israel Binational Agricultural Research and Development Fund was established in 1977, but low interest rates and an increase in the cost of research have impeded the ability of BARD to adequately meet the needs of each country's producers and consumers. The Administration is proposing a \$1.5 million increase for BARD to continue support of research of mutual interest between the U.S. and Israeli agricultural research communities. These funds will supplement the interest derived from existing BARD endowment funds and will be matched by funding from the Israeli government.

GLOBAL CHANGE/UV-B MONITORING

An increase of \$567,000 is proposed for the Global Change/UV-B Monitoring Program to restore funding to the fiscal year 1997 level. This program supports the USDA UV-B (ultraviolet-B) Monitoring Program, a component of the U.S. Interagency UV-B Monitoring Network Plan of the United States Global Change Research Program. This increase will be used to bring the network closer to complete operational status for obtaining ground level UV-B radiation applicable to locations of importance to agriculture, forestry, and natural resources.

Sustained Funding Support:

The Animal Health and Disease Research formula program is proposed for funding at the 1998 appropriation level, as are most of those Special Research Grants that concentrate on problems of national and broad regional interest beyond the scope and resources of the formula-based programs, including Critical Issues, Minor Use Animal Drugs, National Biological Impact Assessment, Rural Development Centers, and Pesticide Impact Assessment.

In continuation of the Department's commitment to helping limited resource farmers and other socially disadvantaged populations, funding is maintained at the 1998 levels for extension formula distribution to the 1890 Institutions, the Evans-Allen research formula program, the 1890 Capacity Building Grants Program, the Hispanic-Serving Institutions Education Grants Program, the Tribal Colleges Education Equity Grants Program, and the Tribal Colleges Endowment Fund.

Our fiscal year 1999 Higher Education Programs portfolio is also maintained at the 1998 funding level of \$26.1 million. The portfolio includes the aforementioned Capacity Building Grants, Hispanic-Serving Institutions Education Grants, and Tribal Colleges Education Equity Grants Programs and the Tribal Colleges Endowment Fund, along with the Institution Challenge Grants Program, the Graduate Fellowship Grants Program, and the Multicultural Scholars Program.

Funding is also maintained at the 1998 levels for Smith-Lever 3(d) programs for Water Quality, Rural Development, and Sustainable Agriculture, as is funding for the Renewable Resources Extension Act Program.

Decreases and Eliminations:

In support of the Administration's goals to reduce the Federal deficit and focus its resources on high priority national issues, the fiscal year 1999 CSREES Budget proposes decreased funding for several programs.

The Administration strongly supports a mixed portfolio of formula-based and competitive funding but we find that a different approach is needed, in this era of limited resources, for addressing high priority National issues while simultaneously balancing the budget. We have proposed decreases for several of the formula programs in the 1999 budget to generate resources needed to address issues of broad public concern that cut across State lines or other boundaries. Formula decreases

include \$15.062 million for the Hatch Act research funds; \$615,000 for the McIntire-Stennis cooperative forestry research funds; and \$10.740 million for the Smith-Lever 3(b) and (c) extension funds. States have maximum flexibility to fund specific programs through formula funds, thus the proposed decreases should have the least impact in those areas States identify as high priority. The flexibility of the States in the use of the Hatch Act and Smith-Lever 3(b) and (c) formula funds will be enhanced if the Administration's recommendation that the States be given authority to use a percentage of these funds for either research or extension activities is implemented in the reauthorization of the research title of the Farm Bill.

Decreased funding or the elimination of funding is proposed for several other programs. These programs could be supported by the States through the reallocation of formula funds, or by State, local government, and/or private sources if they are deemed to be high priority at the State or local level. Decreases totaling \$2.5 million are proposed for the Aquaculture Centers Program and the Expanded Food and Nutrition Education Program (EFNEP). The Supplemental and Alternative Crops; Critical Agricultural Materials; Rural Health and Safety; Farm Safety; and Agricultural Telecommunications programs are proposed for elimination, saving \$7.6 million.

CSREES has also proposed that State-specific or other earmarked Special Research Grants totaling \$43.867 million; earmarked research Federal Administration projects totaling \$8.866 million; and earmarked extension Special Projects under Direct Federal Administration totaling \$6.113 million be eliminated because they are not high priority and National in scope. Alternate funding from formula programs, State and local government, and private sources could be used to continue these efforts if they are considered high priorities at the State or local levels.

In conclusion, the President's fiscal year 1999 Budget Request for CSREES reflects the commitment of the Administration to further strengthen the problem-solving capacity of Federally-supported agricultural research, extension, and higher education programs. I appreciate the support of the Committee and look forward to working with you and your staff during the upcoming budget process.

BIOGRAPHICAL SKETCHES

I. MILEY GONZALEZ

I. Miley Gonzalez was nominated by President Clinton as the Under Secretary of Agriculture for Research, Education, and Economics on July 9, 1997. He was confirmed for that position by the U.S. Senate on July 31, and sworn in on August 5.

Gonzalez provides oversight of the research, education and economics programs at USDA. He manages the Agricultural Research Service, the Cooperative State Research, Education, and Extension Service, the Economic Research Service, and the National Agricultural Statistics Service.

Before his appointment as Under Secretary, Gonzalez served on the National Agricultural Research, Extension, Education, and Economics Advisory Board—a 30-member group authorized by the 1996 Federal Agricultural Improvement and Reform (FAIR) Act to advise the Secretary and land-grant colleges and universities on agricultural research, extension, education, and economics policy and priorities. As the Under Secretary, Gonzalez is an ex-officio member of the group which will provide consultation on other FAIR Act legislation, including the Fund for Rural America.

Before joining USDA, Gonzalez served as associate dean and director for academic programs in the College of Agriculture and Home Economics at New Mexico State University (NMSU). From 1994–96, he was assistant dean and deputy director of the Cooperative Extension Service. Prior to that he served as professor and head of the Department of Agricultural and Extension Education at NMSU for three years.

Gonzalez worked on the Hispanic Association of Colleges and Universities/USDA leadership team, representing NMSU.

Before joining the faculty at NMSU, Gonzalez was an assistant director of International Agriculture Programs in the College of Agriculture at Iowa State University from 1988–91. In the early 1980's, Gonzalez served as a state 4-H specialist at Pennsylvania State University and participated in extension program activities.

His administrative experience began in 1976 at the University of Arizona as assistant director in the Office of Resident Instruction in the College of Agriculture. He has private sector experience in marketing, management, and production agriculture in both the U.S. and Mexico and worked on a cattle ranch in Venezuela. Gonzalez started his professional career as a high school vocational agriculture

teacher in 1970 and taught at Parker High School on the Colorado River Indian Reservation in Parker, AZ.

He has taught numerous undergraduate and graduate courses including guest lectures in Spanish. His teaching has focused on problem-solving techniques, program planning and evaluation, curriculum development, and beginning teacher and extension agent training.

Gonzalez has served on numerous evaluation and task force teams at the local, national, and international levels. His research and scholarly activities have focused on the areas of international development, extension education, adult and non-formal education, technology transfer, and leadership development and training.

He has received numerous awards and honors from various professional groups, teachers, institutions and many other organizations such as 4-H and the FFA. He earned the American Farmer Degree in FFA and has received the Distinguished Service Award from the American Association of Agricultural Education for both domestic and international work in the western region.

He was born in Ysleta, TX, on July 30, 1946, grew up on a small farm and livestock operation in San Simon, AZ, and managed farming and marketing operations in northern Mexico. Gonzalez attended the University of Arizona where he received both a B.S. and M.S. in agricultural education from the University of Arizona and a Ph.D. in agricultural and extension education from Pennsylvania State University.

EILEEN KENNEDY

WASHINGTON, Nov. 7, 1997—Agriculture Secretary Dan Glickman today announced the appointment of Dr. Eileen Kennedy as Acting Deputy Under Secretary for Research, Education, and Economics, effective November 10.

"Eileen Kennedy has provided sound policy advice, analysis, and research on USDA's food assistance and nutrition programs," said Glickman. "Her ability to work with diverse groups to develop research driven dietary guidance will serve USDA well in her new role. Her keen insight and extensive background in research and education will prove invaluable as USDA sets research and education priorities that are responsive to the needs of the American people."

Kennedy will work with the Under Secretary for Research, Education, and Economics, I. Miley Gonzalez, to provide oversight of the research, education, and economics mission. She will help to manage the Agricultural Research Service, the Cooperative State Research, Education, and Extension Service, the Economic Research Service, and the National Agricultural Statistics Service.

Prior to her appointment, Kennedy served as the Executive Director of the USDA Center for Nutrition Policy and Promotion. She managed the Center and provided technical direction for policy research and applied nutrition for USDA's nutrition programs.

Before joining USDA in 1994, Kennedy was a visiting professor at Tufts University, School of Nutrition. From 1981 to 1994, Kennedy worked for the International Food Policy Research Institute here as a senior research fellow. She also worked as a visiting professorial lecturer at Johns Hopkins School of Advanced International Studies from 1987 to 1990.

Dr. Kennedy is currently a member of the United Nations Advisory Group on Nutrition as well as a member of the Institute of Medicine's Board on International Health.

She received her B.A. degree from Hunter College in New York, NY, and her two M.S. degrees, one in Foods and Nutrition from Pennsylvania State University and one in Nutrition from Harvard. Kennedy received her Doctor of Science degree from Harvard University.

IMPLEMENTATION OF ARS' FISCAL YEAR 1998 PROGRAM INCREASES

Senator COCHRAN. That is perfectly satisfactory with us.

Let me ask the first question and then I am going to yield to my colleagues for any questions that they have. Looking at the budget request specifically for ARS—Dr. Horn has submitted a statement discussing that aspect of the budget request—but it confuses us to this extent: that the funding levels for ARS activities are proposed to be increased from the fiscal year 1998 level, mostly for the purpose of adding staff, professional research scientists, at ARS facilities throughout the Nation, but you are proposing to execute in-

creased staffing levels and at the same time requesting that all of those increases provided for the current fiscal year, what the budget calls "congressional add-ons," be eliminated? Some of these reflect, for example, suggestions that this committee received as to staffing that was needed in order to fully undertake the work that was being done at some of these facilities.

I am specifically aware of the warm water aquaculture research that is being done in Mississippi and in Arkansas, and we added a couple of research scientist staff positions there. How are you recruiting and filling those positions at the same time you are proposing to take the money out of the program and, therefore, having to cut those same staff positions?

What is the reality of the situation with regard to that?

Dr. GONZALEZ. Mr. Chairman, if I may, and I will ask Dr. Horn to share also with some of the detail. Within the broader context of the budgeting process, we looked at those areas of funding of very important and high-priority areas and went through a discussion to take a look at the shifting of resources. As a result, as you look at that budget, you will find some places where there is a definite increase and other places where we have had a shifting of resources.

But specifically to your question, I think that as we look at the site specific parts of this agricultural research agenda that we certainly have some areas where we have continued to move funding to enhance the work that is being done there and taken a look at how those things fit within this sort of limited, if you will, research budget that we are having to work with.

I will turn to Dr. Horn and ask him to provide any of the detail for this particular question.

Dr. HORN. I have been very concerned about the decline in the number of ARS scientists for some time, and in fact as an agency we are trying to turn that decline around. There were 3,400 scientists when I came to ARS 27 years ago and now we are under 1,900.

We went through exactly this same process a year ago when we had some projects and some locations proposed for closure, and we held back in our recruiting process and the ultimate result, of course, was restoration of many of the projects and of all of the four locations that were proposed for closure. But in that process our number of FTE slots for scientists actually did decrease by about 100.

So we learned a lesson there and we are proceeding to a point this year in a different way. We have about 140 vacant scientist positions in the agency. Seventy of those are holdovers from prior funds or the result of attrition. Seventy of those are from the new money that came to us in fiscal year 1998. We are pursuing the recruiting process full bore on all positions, and we are doing so in the realization that it is going to be midsummer before many of these will be to the point where we can interview or commit, and by that time we expect to have some additional information on what really will become of this budget.

As you have mentioned, you may impose changes in this committee and the House may do the same. So our intention is to continue to recruit, look for the best and the brightest, but the day will come

actually when we have to either say to them, you have to understand that the funds may not be there for that position next year, but we will find you a job in ARS, or we have to stop recruiting. So our intention is to keep recruiting.

STATUS OF FISCAL YEAR 1998 IMPLEMENTATION PLANS

Senator COCHRAN. One thing we will do for the record, if you can help us with this, is submit a listing of all of those research facilities and the additional funding that was provided in the appropriations bill for this current fiscal year and ask for a status report on the execution of the funding increases provided for fiscal year 1998 for ARS for those purposes.

We have a list that includes, it looks like, about 30 different facilities across the Nation that are in this same shape, not just the ones in Mississippi and Arkansas. But you know, the reason I point these out is that last year the testimony was very clear that aquaculture is one of the fastest growing activities in agriculture today in our country, and we need to find out about diseases and other challenges that are presented to the aquaculture industry in not only the South, but other parts of the country as well.

We had a West Virginia aquaculture center, for example, that was funded. That is another area where we are wondering how you are filling those positions that were funded last year, when now you are asking that those funds be terminated and canceled in this year's budget.

It is an important area. I think you recognize that, Dr. Horn and Dr. Gonzalez, in your comments before the committee. I know in Dr. Horn's case, from testimony he presented last year. And I think this year's testimony also confirms that this is an important area for inquiry.

Can you confirm that?

AQUACULTURE RESEARCH

Dr. HORN. Yes; it is absolutely true. I believe we are still importing about 70 percent of our shrimp, for example, and a lot of our freshwater fish activities not only promote rural economic development, but it is a new industry and a burgeoning industry and a very rapidly growing industry. So it is extremely important to us.

Senator COCHRAN. Thank you.

Senator BUMPERS.

Senator BUMPERS. Thank you, Mr. Chairman.

Dr. Horn, this is something you are not required to know the answer to. Do you know what rice yields are in this country compared to, say, 3 years ago?

Dr. HORN. I am glad I am not required to know that. [Laughter.]

Senator BUMPERS. Does anybody on the panel know?

Dr. HORN. Given 3 years ago, I suspect they are more or less level and perhaps even a bit lower compared to 10 or 12 years ago, due to our research accomplishments.

Senator BUMPERS. I think you are absolutely right. I wanted to hear somebody who monitors those figures. I am not going to make the same speech here this morning I have made 100 times about the importance of research on agriculture in this country and how we are going to feed ourselves in the future.

But I get the impression, with some minor exceptions, a lot of our yields of food products are pretty static. I think in 1965 we had a static production of corn for the first time in 60 years. Those things ought to be alarming, not only to the research community, but to those of us who are funding research.

Now, this brings me to my next question, and that is following up on what the chairman has just asked you about agriculture. Mississippi and Arkansas both have state-of-the-art agriculture research labs and in last year, 1997, we directed in the 1998 budget that—we just put a direction in there that in 1999 you would increase, for example, the funding for the rice germplasm center, which is really vital to increasing rice yields. We put a provision in there that it would be increased, I believe \$700,000 in 1999, and \$400,000—I am not sure what we put in for the Mississippi aquaculture lab, but we put an increase of \$500,000 for the aquaculture lab in Stuttgart in my home State.

They are not in here. My next question is, was this submitted to OMB for inclusion in the President's budget, these increases that Congress directed last year? I want to be sure we are on the same wavelength. Do you know what I am talking about?

Dr. HORN. By the agency?

Senator BUMPERS. Yes.

Dr. HORN. Yes; we requested those.

Senator BUMPERS. You did request those increases?

Dr. HORN. Yes; we did.

Senator BUMPERS. And you got a negative response, I take it? I mean, they just did not put it in the President's budget request. Of course, you knew in advance what their reaction was to this, I assume.

RICE RESEARCH

My point, Mr. Chairman and members of the panel, is that here we have these state-of-the-art research facilities that cannot function at the proper level, simply because we lack scientists. And we needed that \$700,000 in the rice germplasm center. The rice germplasm center is the only facility I know in this country that really has the ability to increase rice yields.

When I was first elected Governor of my State, I think yields were averaging less than 100 bushels per acre. Today the average is probably like 150, but 200 to 220 bushels an acre is not uncommon. That is all due to research.

I do not know how far you can go, but all I am saying is—and I have said 1,000 times—of all the research money we spend in this country, the Pentagon obviously gets the most of it, the National Institutes of Health is second and that is entirely proper. I am not going to deliver my sermonette on the Pentagon. But when I think about it, we are putting I think \$1.8 billion—is that a fair statement—in agricultural research in this country, it's outstanding to be alarming.

Dr. Gonzalez, do you want to comment on that?

Dr. GONZALEZ. Yes; thank you. Mr. Chairman and Senator, I think that has been part of our discussion internally as well, the fact that when you compare the share of research moneys for agri-

culture, including the extension and education component that is critical to that continuum, that we are not in the same ballpark.

It is certainly a discussion that we have begun to talk about with our agencies and across the mission areas within USDA, and I think to engage other parts of the research community so they understand the relationship and the linkage that we have between agricultural research and some of the things that they do.

You pointed out NIH; on the NSF side as well. And again, it is not a matter of getting engaged in a match, if you will, of those dollars, but that we communicate to all folks that we do have that opportunity to highlight the success of agricultural research and how it fits within the broader research agenda.

When we talk about the food genome area, for example, you were talking about rice. I think there is a component in that initiative that will also allow us to address some of those questions that you were specifically addressing a moment ago.

FACILITIES TASK FORCE

Senator BUMPERS. Dr. Horn, let me ask you another question. The Department has been working on a report by the Strategic Planning Task Force on Research Facilities, and they were to determine—they were to prioritize, and I hate that word, but they were to prioritize Federal research directives. Now, this report is not finished. One of the principal things it was supposed to do was to determine which facilities should be closed, is that correct? Is that a fair statement?

Dr. HORN. Not exactly, Senator Bumpers.

Senator BUMPERS. What was the principal purpose of that task force?

Dr. HORN. It was to evaluate all of the Federal and State facilities and, in fact, some private laboratories to take a look at what we have and what we are going to need to have. So it was to deal with more than just closures. It was to deal with highlighting as well what is needed into the future.

Senator BUMPERS. But that study has not been completed, has it?

Dr. HORN. No; as a matter of fact, they met yesterday.

PROPOSED CLOSURE OF ARS FACILITIES

Senator BUMPERS. Why is the Department recommending closure of certain facilities before that study is completed?

Dr. GONZALEZ. If I may, and I do not know that I know the exact answer. But certainly the committee is meeting now. This is their fourth meeting, and they are looking at, as Dr. Horn described, the research capacity both from the standpoint of facilities and the programmatic side. We will have an interim report by about the middle of June in terms of what we have done at this point to take a look at both the Federal facilities, as well as those that are out there in the university system.

The idea is that we will not finish that report, we will not have all of those data, until 1999. But within those constraints in the budget discussion there were some things that were already on the board that we were looking at in terms of how to manage the sites and programs that had been identified for closure prior to this

budget session. Those considerations were part of this ongoing discussion. There may or may not be some other facilities that they are looking at that might also fit into a list like that.

But I think part of my discussion with the committee and with others has been that we are not only looking at the possibility of closure, but also that we are looking at the capacity that we have. We have an investment in a variety of places, depending on the agricultural research that is going on, that is site specific. So we really have to come back with some serious answers to these questions that are being raised.

Senator BUMPERS. This committee obviously is going to review your recommendations and look at it very closely, because my own personal opinion is it is premature for ARS to be making these decisions right now. I know that the budget constraints are terrible. Senator Cochran and I have had private conversations about what a monumental task this subcommittee has in trying to get this budget—this is the toughest year I have ever seen on budgeting.

ALTERNATIVE PEST CONTROLS

Mr. Chairman, I have one final question and I will submit my other questions for the record. And I would like to direct this question to you, Dr. Robinson. And that is, what kind of progress are you making on alternative pest controls and what kind of progress, if any, is the private sector or the public sector making in making pesticides and herbicides more benign?

We have an environmental disaster on our hands, and we are trying to produce more crops at the same time we are trying to use less pesticide and herbicide. It is a monumental chore, but I would just like an update on that.

Dr. ROBINSON. I wish I could give you quantitative information across the board. Perhaps I can do it in three ways. We have, as you know, as part of the overall budget request—and it is the same kind of request we have had in previous years—a request to increase fairly significantly our pesticide management, research, and education program. Those also go in sort of a hand-and-glove manner with many of our sustainable agriculture programs.

One of the points, a quantitative point, that has been addressed in a lot of positions before was to reach 75 percent of agriculture applying IPM practices, which often would involve the alternative pesticide applications that you speak of, by the year 2000. Current information suggests that we are probably somewhere in the neighborhood of 65 to 70 percent. So 75 percent by the year 2000 is not out of the question.

The problem with that, that kind of answer, though, is it does not go deep enough. There are a lot of definitional issues with regard to what is and is not the application of an IPM practice or an alternative pesticide or production practice. So we like to think of that both in terms of the depth of that change in agriculture as well as just a percentage count of who is adopting some kind of practice.

We think that the programs that we have in terms of the alternative pesticide research programs that are producing—and it is a slow process—alternatives and in working with EPA in providing them information in terms of what alternatives are available or if

there are no alternatives, is a useful kind of collaborative effort as they begin to make their decisions. And the educational program that we have in extension to move that research to the farm and the farmer as quick as possible is going to move in the direction of improving both the depth as well as the quantitative count of IPM practices on farms by the year 2000.

That is not going to resolve all the issues, as you well know. So it is a program that is going to continue to have to struggle with the issues between interfacing production agriculture and competitiveness with the environment.

Senator BUMPERS. Let me just say that, you know, in the Department—and not just Agriculture, but everybody—every time Senator Cochran or Senator Burns or I get a little project for our State it is considered pork.

Senator BURNS. In agriculture that ain't bad.

Senator BUMPERS. If ARS comes up with it, it is high-class research. But I think about a small project I got for the University of Arkansas back in the eighties to do alternative pest control research, and they were doing high-class research when I went there 3 years later. And we funded it every year for a while.

They have been on their own for some time, I do not know how many years. They have been on their own now for 2 years. We are funding it. There may be a little private money from some of the chemical companies or somebody going into it. But they are doing top-class research and they are on their own.

Now, I cannot think of a better success story than that. I make that point just to show that the people sitting on this side of the table oftentimes have pretty good ideas, too. I always voted against Senator Proxmire's amendment that everything had to be let on a competitive basis. That meant everything went to Harvard and MIT and you name it and the University of Arkansas got nothing.

If Senator Cochran and I were not here protecting our States, we would not get anything, I can tell you. But we do good research, and that is the reason we have that rice germplasm center down there, which is really critical to the future of the rice industry.

Well, that is enough.

Senator COCHRAN. Senator, those were excellent questions and we appreciate very much your asking them.

Senator Burns.

Senator BURNS. Thank you, Mr. Chairman, and thanks to the folks for coming up here this morning.

When I look over this budget and the request for funds down there, I was a little dismayed in some areas. And I am glad to hear that at least the Department on the individual places that we think is very important they were requested from OMB. I would assume Miles City and Sydney and those things were in there.

PRODUCTION AGRICULTURE

With all the demands that are being placed on our producers today from environmental, taxes, high cost of operation, it would seem to me that the thrust of this part of USDA should be pointed toward production agriculture. I cannot believe that we have only got 1,900 scientists working in the USDA and ARS doing research today.

Dr. Horn—or I will ask Dr. Gonzalez: How many of those 1,900 are actively involved in production agriculture?

Dr. GONZALEZ. Mr. Chairman and Senator, maybe I will ask Dr. Horn to respond to that because of the specificity of that number. But before he does that, if I may, kind of going back to the question that the Senator asked a minute ago, I think those are the exact kinds of questions that we've begun to ask.

I talked yesterday to the CARET delegates that are here.

Senator BURNS. To the who?

Dr. GONZALEZ. The Council for Agricultural Research, Extension, and Teaching [CARET], that are part of that university community. A great many producers and commodity group representatives are in that group.

One of the things I said to them is that we are, again, readdressing, if you will, the agenda in terms of the importance of that producer community and to look at—

Senator BURNS. It is the only community. As far as this room is concerned, it is the only part. Everything else lives off of it. Everything else lives off of it. You take it out of business and none of us is working.

We can use pretty words, but it just does not make a lot of sense.

Dr. Horn.

Dr. HORN. I do not think we have anyone that is not working on a problem at ARS. We really do try to tell all of our scientists to understand why they are doing what they are doing, and it is a relatively applied program.

But the answer to your question specifically, about 70 percent of the scientists are involved in production agriculture. Others are involved in more fundamental programs that should lead to application and should help producers. But it is about 70 percent.

Senator BURNS. If you line that up against any other segment of the American economy, you have 1,000 scientists out there trying to deal with something that every one of us in this town does three times a day, and that is eat, most of us. I eat more than that, obviously, but nonetheless.

I just think that our initial thrust—I am just wondering, when OMB sent it back down was there anybody that raised their eyebrow and said, what in the world are we doing and what are our priorities? And is there anybody going back down there that says, this is unacceptable, this is unacceptable to go at this, this thing? It is like the aquaculture that they are concerned about in Arkansas, and I am concerned about that, too. I am concerned about rice yields. Our wheat has been going down a long time.

But yet we do not see anything, anything to address that. I would say, we cannot do research on western ranges or Mississippi aquaculture or Arkansas rice in Maryland. We cannot do it, we just cannot do it. And these two Senators to my right here have just absolutely fought tooth and toenail to put the research on the ground where it is supposed to be.

And then you come back and you cut extension. You can have all the knowledge in the world, but we have no way to transfer that technology, none. So it all goes hand in hand.

Forget about rural development. It may be a feel-good methodology to take care of something in the neighborhood, but if you have

no production that is where your great development is, folks. That is what pays the bills. And if you do not think we do not have a problem, you just go around and explain to producers in this country why Wheaties is \$3.75 a pound in the grocery store and we cannot get \$3 for a 60-pound bushel of wheat. And then you wonder why we got hurt and why we get awful sensitive about our producers that are on the land.

And by the way, if you took your researchers out there and tried to run a farm, ranch, or an aquaculture, I will tell you what: They would go broke in 15 minutes, and then we are all out of jobs.

A little ASCS guy is sitting in the ASCS office one time, he was crying. The guy says: What's the matter? And he said: My farmer died. Well, they are dying.

It just seems like that our thrust, that somebody in this Department, the Department of Agriculture, has got to go down to OMB and say: This is outrageous and completely unacceptable to a community that is supposed to be advocating something for production agriculture, because the demands—everybody wants to pass laws on agriculture, you got to do this, that, and the other.

You cannot spray, you cannot even take care of your weeds. You know how hard it is to find weed money? And noxious weeds runs, spotted nap runs all the way from the highest mountain in Arkansas to the flats of Arkansas. And by gosh, we cannot get a little old measly pile of money to develop something for noxious weeds.

But you go to one of these Grey Poupon parties around here and white wine, you know, them little finger parties, and you start talking about weeds and you are standing there talking to yourself pretty quick.

So we need some advocates down there, folks. We need somebody that is willing to fight, and I do not see that happening right now and I am concerned about it.

So I do not have any questions. We are going to look at this. I am going to work with the chairman. He is concerned about it. I am concerned about it, and I am going to work very, very hard in putting those dollars where they will do the most good, and that is research and production agriculture and the extension work it takes to get that technology on the farm. That is where I come from.

I do not have any of them fancy letters behind my name. It says "NDBA" behind mine: No degree, but boss anyway.

I am going to work very, very hard at that. Thank you for coming today.

TRADE FLOWS

Senator COCHRAN. Thank you, Senator.

Before I ask another question about the research budget, I was noticing in the Economic Research Service statement there is a comment about how the Economic Research Service intends to spend more time to break down the components of trade flows, understanding the relationships to international investment and the strategic behavior of U.S. firms, and investigate the implications for U.S. consumers of a globalized food marketplace.

After reading that, it occurs to me that one of the most challenging aspects of agriculture today is trying to understand the implica-

tions of international economic conditions. For example in Asia, the Far East, the Pacific Rim, we are seeing a lot of turbulence in markets there and currency values are plummeting in places like Indonesia and elsewhere. Korea is undergoing massive change and dramatic change in its economic structure there and the banking system.

We sell a tremendous amount, not only of raw agricultural commodities, but value-added products, in those parts of the world, and it is a growth area for us. We have seen China suspend imports of cotton.

Is the Economic Research Service actively engaged in trying to analyze what is going on there and interpret that for the benefit of American agriculture? If so, tell us what your findings are?

Dr. GONZALEZ. Go ahead, Susan, Dr. Offutt.

Dr. OFFUTT. Yes; we are. As you noted, the nature of change in economies around the world is as important to U.S. agriculture as anything that happens domestically because of our dependence on exports. Specifically, we recognize the importance of the Asian region to further growth in U.S. exports. With respect to China, ERS has in place a bilateral technical assistance agreement that will allow us to better understand Chinese agricultural markets as they themselves better understand them—in collaboration with the National Agricultural Statistics Service as well. We have also begun work on trying to understand the implications of accession to the World Trade Organization of China, which under some conditions would actually improve the functioning of the world marketplace. China might be less likely to be disruptive, for example, stopping imports without warning. So we certainly are concerned about the capacity of China because it is clearly the largest country on Earth, and as it enters the world trading system it will change the way our exports are dealt with in markets.

More specifically and more recently on the Asian crisis, most of the testimony that the Secretary and Under Secretary Gus Schumacher have given before the Congress is based on the analysis that ERS has done reflecting our understanding of changes in demand in the Asian markets, both with respect to reductions in income that come about when those economies falter as well as changes in currency values that affect our competitiveness in a market vis-a-vis, for example, the Australians, which is a particularly important relationship in Asia.

We feel it is certainly an important component of our program to look beyond what happens next week or the week after, because the forces that shape the prosperity of United States agriculture are being determined in China and Indonesia and Malaysia today.

Senator COCHRAN. Thank you very much.

REDUCTIONS IN CSREES RESEARCH PROGRAMS

I notice in the Cooperative State Research, Education, and Extension Service accounts, what we see in this budget is a proposal to terminate most special research grants that are funded for the current fiscal year and, for the first time that I can remember, to reduce formula funds—the Hatch Act Smith-Lever, McIntire-Stennis cooperative forestry research, and others.

What I would like to know is, have you assessed the implications of what the practical results of all of this would be in terms of benefits for production agriculture, for forestry, or for the research that is now supported by these special research grants? What are the practical consequences?

What if we just approved that and shocked the heck out of you, the President, and the people who are responsible for submitting this ridiculous proposal to the Congress? What if we just shocked you and said, OK. Would you bear the responsibility for it? Would you go out and explain to people what this means in practical terms?

What does it mean? Tell us if you can?

Dr. GONZALEZ. Mr. Chairman, we have begun that discussion. In the recent 2 or 3 weeks we have been discussing this with the university community. We have tried to put this in terms of the fact that we are looking at making sure, as we continue this discussion with regard to formula funding and competitive grants processes, that we balance the portfolio without harming that base structure that we established over a long period of time—the investment that we made in the university community to be able to be competitive.

I think that is part of this discussion. And I appreciate your question, because it is important that we talk about what those implications will be and what the impact will be out there at the local level, which, getting back to the Senator's question a minute ago, is just fundamental to the total process.

POSTAWARD MANAGEMENT

Senator COCHRAN. One thing that disturbs me, for example, is I do not think you have any analysis on which to base decisions to stop funding special research grants. I do not think you conduct, for example, a study, a post-grant study to evaluate the results of that research; do you? I do not think there is a process in place in CSREES to do that. Is that right, Dr. Robinson?

Dr. GONZALEZ. Dr. Robinson.

Dr. ROBINSON. Thank you, Mr. Chairman. We do have a process, but it is a bit ad hoc and it is not as developed as it needs to be. And that is true of special research grants and some of the other grants.

We have spoken within the mission area about the need to strengthen what we would call postaward management, the ability to evaluate projects once awarded, whether it involves special research grants or improving our postaward management process with the NRI grants or other activities, to ensure that those projects are addressing and, in fact, are producing the results that Congress and the administration had in mind.

Senator COCHRAN. You know, I would not have any argument if there was a proposal in here to set aside some amount of the funding in this budget to do just that, because we all know there are special grants in here that have been funded year in and year out for 20 years—I am just picking out a number—and we probably do not know what the practical results have been from that research. The grant gets funded every year because it is requested by somebody who is vouching for the program.

But as far as the Department is concerned, they do not really have any of the facts. They do not really have any of the detailed facts to make a judgment about whether this is valuable research, addressing a need and producing results and should be continued or not.

So why do we not try to maybe, in this appropriations bill, spell out that this is going to be an initiative that we think ought to be undertaken so we can make a determination, but not just right now, this year, in this bill, say all of these special grants are presumptively ineffective or not producing the results for which they were earlier intended or expected and should not be funded?

That to me would be a much more logical and thoughtful way to proceed, rather than to take the administration's request and just do away with all of these projects. I do not think that is wise or thoughtful. I think it is irresponsible to do that.

What is your reaction to that, Dr. Robinson?

Dr. ROBINSON. Well, I certainly cannot object to the statement you laid on the table. Postaward management is an area the agency needs to develop to the same standard as our preaward processes.

My sense is the special research grants that are included in the administration's budget versus those that are eliminated, are supported because there is fairly firm evidence that they are addressing national problems or issues and they are doing it in a way that we are seeing progress.

A few have emerged by virtue of the strength of the projects and definitely address either national or broad regional issues. Even then, we do not have the kind of postaward management assessment that you laid out that would be most beneficial as we look, not just to next year, but what is happening to this series of projects.

MC INTIRE-STENNIS PROGRAM

Senator COCHRAN. I appreciate that very much. As we proceed to markup after our hearings, I hope that we can establish a dialog as to how best we address that in this bill, so that we do not make the mistake of eliminating special grants that we think are providing real benefits to American agriculture and American citizens and are justified.

Let me ask you this. I do not know who wants to answer it, but what specific research is carried out, just for the benefit of the record, under the McIntire-Stennis research program?

Dr. GONZALEZ. Dr. Robinson.

Dr. ROBINSON. The program carried out under McIntire-Stennis is through colleges of forestry or forestry and natural resources in each of the States. It is a formula-based fund allocation to support in a cooperative way the partnership between the State and the Federal Government on forestry research at certified State institutions. This research complements the research done by the Forest Service through its many regional labs.

It addresses the needs of forestry, be they farm lot forestry production or broader scale forestry production, within the States or regions of this country.

Senator COCHRAN. Let me ask you one other question for the record, so we will have this information. I do not suggest that you have this right now to submit, but please provide the committee a description of each project funded through the McIntire-Stennis program, what forestry research is being supported by ARS and the CSREES, and the level of funding for each project, and who is conducting the research? That would be good for us to understand.

Dr. ROBINSON. We will get that information to you, sir.

[The information follows:]

MCINTIRE-STENNIS COOPERATIVE FORESTRY RESEARCH PROGRAM

In fiscal years 1997 and 1998, \$27,735,000 was appropriated each year to support the McIntire-Stennis Cooperative Forestry Program. Funds assist the States in carrying out a program of forestry research at State forestry schools, and in developing a trained pool of forest scientists capable of conducting needed forestry research. Forestry research funded through the McIntire-Stennis Program focuses on the following nine categories: (1) Reforestation and management of land for the production of crops of timber and other related products of the forest; (2) management of forest and related watershed lands to improve conditions of water flow and to protect resources against flood and erosion; (3) management of forest and related rangeland for production of forage and domestic livestock and game and improvement of food and habitat for wildlife; (4) management of forest lands for outdoor recreation; (5) protection of forest lands for outdoor recreation; (6) protection of forest resources against fire, insects, diseases, or other destructive agents; (7) utilization of wood and other forest products; (8) development of sound policies for the management of forest lands and the harvesting and marketing of forest products; and (9) such other studies as may be necessary to obtain the fullest and most effective use of forest resources.

A report detailing the projects supported by McIntire-Stennis funds has been provided to the Committee.

AQUACULTURE CENSUS

Senator COCHRAN. In the National Agricultural Statistics Service proposal, there is a request for an increase of \$500,000 and two staff-years to conduct an aquaculture census that would provide for the first time detailed State and national data about aquaculture production. It would be helpful to us if you could explain—I do not know who is going to answer. Mr. Bay?

Dr. GONZALEZ. Mr. Chairman, I will ask Mr. Bay to respond.

Senator COCHRAN. Mr. Bay, explain the importance of this census and who would use the data? What is this for? Is this a one-time cost or is this going to be an annual census of sorts?

Mr. BAY. Senator, this would be a one-time cost or it would be a cost every 5 or 10 years depending on what the industry felt like they needed. It would follow the census of agriculture, where we pick up very limited information on the aquaculture industry, and it would make it possible for us to provide a lot more detail and cover a lot more species that are not covered by the census of agriculture or the current agricultural statistics program that we have for catfish and trout.

AGRICULTURAL RESEARCH

Senator COCHRAN. The President in his State of the Union talked about emphasis on agriculture, making investments in—I am talking about research generally—proposing increases in National Institutes of Health research, a lot of emphasis on that in the speech, talking about the National Science Foundation and its programs.

We see in the budget request a lot of increases for National Science Foundation programs.

I do not have any objections to any of those. Those are very important areas of concern. But there is almost short shrift and no emphasis on the importance of agriculture research, which is one of our basic needs in our society and one of the most important economic activities in our society, providing surplus in trade. The record is unquestionably impressive in terms of the benefits that flow from agriculture research.

So it is my hope that we will not lose sight of the importance of it, that it does not get lost in the shuffle, which is what my impression is. Here we see a budget request cutting substantially the funding for research programs done by the Department of Agriculture, and I do not think this committee is going to just sit back and say, OK, if that is the way you want it, Mr. President, we will go along with that. I think we are going to say: No, not so fast; we need to look at this very carefully.

That is my attitude. I think there are ways that we can continue to reap benefits from agriculture research and we ought to put the emphasis there and not let it get lost in the shuffle.

SUBMITTED QUESTIONS

Additional questions will be submitted in writing, and we hope you will be able to respond to them in a timely fashion.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

RESEARCH, EDUCATION, AND ECONOMICS

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD SAFETY INITIATIVE

Question. An increase of \$26 million is requested for fiscal year 1999 across ARS, CSREES, and ERS for the Food Safety Initiative. How much has each of the research, education, and economics mission agencies invested in food safety research and related activities in each of fiscal years 1997 and 1998?

Answer.

REE FOOD SAFETY INITIATIVE

[Dollars in thousands]

	Fiscal year—			Increase
	1997	1998	1999	
Agricultural Research Service	\$49,647	\$54,849	\$68,819	\$13,970
Economic Research Service	485	485	1,391	906
Cooperative State Research, Education, and Extension Service ¹	6,234	8,765	19,765	11,000
Total REE	56,366	64,099	89,975	25,876

¹ Funds include the National Research Initiative, the Food Safety Special Research Grant Program, and Extension Smith-Lever 3(d) Food Safety. In addition approximately \$6 million is provided annually through formula programs and other special research grants for related food safety research.

Question. How is this research being coordinated among the agencies?

Answer. An interagency working group (IWG) under the National Science and Technology Council was formed in December 1997 to develop a food safety research

agenda. The group is co-chaired by the Deputy Under Secretary for Research, Education and Economics within USDA and the Science Advisor to the Secretary of HHS. Agencies within the Federal Government involved with food safety research participate in this IWG; this includes, ARS, CSREES, ERS, FSIS, FNS, and Office of the Chief Economist in USDA; FDA, CDC, NIH in HHS; and EPA. The IWG has developed a framework for assessing food safety research which looks at all the links from farm to table. Currently an inventory of food safety research across all the agencies is being conducted. This inventory will lead to an identification of any gaps in the research agenda and will also serve to ensure that there is no duplication of effort in research that is currently being conducted on food safety. The IWG expects to complete the research agenda this summer.

Question. How has duplication of effort been avoided?

Answer. This is the second year of the Food Safety Initiative. The REE agencies have worked closely with the other agencies, including FSIS, FDA, and CDC, in the development and implementation of the initiative. The current activity to develop an integrated food safety research agenda is one aspect of this overall effort to coordinate agency activities. This coordination effort has led to a government-wide program in which the food safety agencies each make distinct and complementary contributions to the overall initiative objectives.

Question. What have been the results of these investments to date?

Answer. USDA has a long history of serving the research needs of FSIS, APHIS, FDA, and other agencies responsible for food safety, as well as more broadly producers, food processors and the public. The recent release of new techniques that use benign microbes to control or eliminate Salmonella in poultry promises to help limit the risk of this serious food poisoning in humans, is just one recent example of how USDA investment in research is contributing to the safety of the U.S. food supply. Some other examples from fiscal year 1996 and 1997 include:

- a monoclonal antibody was developed by ARS to identify unacceptably high levels of glycoalkaloids in potatoes (and tomatoes and eggplants if needed) which can be toxic to humans. This technology can and will be commercialize in a test kit form;
- development by ARS of a specific avian immune cytokines which protects chickens against salmonella serotypes;
- research on *E. coli* 0157:H7 in production settings has shown that incidence of shedding of this organism is lower in feedlot beef animals than in adult cattle in cow-calf heads. Sources of contamination included often contaminated surface water supplies. Providing clean uncontaminated water to the animals would reduce the incidence of *E. coli* shedding. Related research on Intimin, an outer membrane protein of *E. coli* 0157:H7, demonstrated the important role that membrane plays in infecting newborn calves. This knowledge may lead to ways to prevent *E. coli* colonization;
- a Salmonella Risk Assessment Model for Poultry has been released and is currently being evaluated by processors. The software program assesses changes in microbiological safety through processing, storage, distribution, and final meal preparation;
- through cooperative HACCP research with FSIS, APHIS, and the National Pork Producer's Council, technologies have been developed that will allow for the production of pigs that are free of *Trichinella spiralis*. Periodic monitoring with an ARS developed blood test will certify that the pigs are *Trichinae* free;
- ongoing CSREES supported research with steam pasteurization of carcasses has proved that this process can consistently meet the pathogen reduction requirements for *E. coli* control, which is to be used as an index for process control. Results on Salmonella control also demonstrate that steam pasteurization can achieve the pathogen control standards required by USDA;
- several Pathogen Modeling Programs developed by ARS are widely used by microbiologists in industry, regulatory agencies, and educational institutions to estimate the growth or survival of pathogens during specified processes without expensive laboratory testing;
- researchers supported by CSREES found that trisodium phosphate is an effective antimicrobial rinse of catfish filets. They also found that atmosphere steam treatment of whole catfish reduced surface microbial numbers and resulted in the possibility of extending refrigerated shelf life without adversely affecting acceptance;
- discovery that certain strains of *Aspergillus flavus* (that do not produce aflatoxins) out compete aflatoxin producing strains thus limiting contamination. Tests using biological control techniques reduced aflatoxin levels in corn and peanut products by 90 percent; and

—a number of rapid immunoassay tests have been developed by ARS to measure drug and chemical residues in red meat and poultry.
 These examples are just a few of the discoveries resulting from USDA's research investments that are contributing directly to making U.S. agricultural products safe.

FOOD GENOME INITIATIVE

Question. The fiscal year 1999 budget requests a total of \$40 million in USDA funding for fiscal year 1999 for a food genome research initiative. Dr. Gonzalez, you indicated that the President's Food Genome Initiative is a collaborative effort involving multiple Federal agencies and researchers in the academic and private sector, and that you are in the final stage of developing a concept paper on the USDA's role in Food Genomics. Which other federal agencies are involved in this effort? Can you briefly distinguish the role of USDA and each of the other federal agencies involved in this effort? What is the total level of fiscal year 1999 funding proposed for this initiative, by federal agency?

Answer. The Interagency Working Group on Plant Genomics (IWG) included representatives from USDA, HHS, NSF, Department of Energy, OSTP, and OMB. The chair of the IWG was the Chief Scientist, CSREES/USDA. The IWG issued its report in January, 1998. A copy of the report is provided for the record.

[CLERK'S NOTE.—The IWG report does not appear in the hearing record but has been submitted to the committee.]

REE now has a draft Blueprint for Action for the USDA Food Genome Research which lays out the essential core activities for food genome research. The USDA Food Genome Initiative will focus on mapping, sequencing, identifying, and understanding the function and control of genes responsible for economically important traits in agricultural plants, animals and associated microbes. In addition to coordinated efforts in genomic research within USDA's National Research Initiative in the Cooperative State Research, Education, and Extension Service, Agricultural Research Service, and the Economic Research Service, the Initiative will be coordinated fully with other Federal agencies that are pursuing genome activities, principally through the Interagency Working Group of the National Science and Technology Council. Thus, the Initiative will build upon and be coordinated with ongoing genomic research in model organisms such as the Human Genome Program at the National Institutes of Health and the Department of Energy (DOE); the Arabidopsis Genome Research Program at the USDA, the National Science Foundation (NSF) and Department of Energy; the NSF Plant Genome Initiative; the DOE Microbial Genome Program; and the Advanced Technology Program of the U. S. National Institute of Standards and Technology. Coordinated efforts will reduce potential duplication and provide for efficiency in moving towards long-term goals.

FOOD GENOME INITIATIVE FUNDING

[Dollars in millions]

Agency	Fiscal year—		
	1998 estimated	1999 President's budget	1999 proposed increase
Department of Agriculture	25	40	15
Agriculture Research Service	11	14	3
Cooperative State Research, Education, and Extension	14	26	12
National Science Foundation	60	60
Department of Energy	0.15	0.15
Total	85	100	15

Question. Would you please describe the importance of the Food Genome Initiative, including fiscal year 1999 and future years objectives and costs.

Answer. The foundation of future gains in agricultural research will be driven in large part by research conducted under our food genome initiative. The knowledge gained from this research in genomics will permit the United States to develop new technologies for improvements in the yields of major crops, pest and disease resistance, enhanced quality of agricultural products, and new agricultural products. The overall thrust of the USDA research is better understanding of the structure of the entire DNA composition of the genome of economically important crops and livestock

and identification of how this structure relates to functional properties of these animals and crops.

The draft concept paper describes the following objectives under the Food Genome Objective:

- Understand the structural features of the entire DNA make-up of a genome;
- isolate and discover the biological function of expressed genes;
- identify the role of identified genes in the outward appearance and performance of economically important plants and animals;
- construct bioinformation systems that integrate data across species; and
- create new products important to U.S. agriculture using genome technologies.

The concept paper proposes funding for the Food Genome Program at \$40 million in fiscal year 1999, increasing to \$70 million in fiscal year 2000, and \$100 million in fiscal year 2001 and subsequent years.

Question. Is food genome research the initial phase of a longer-term federal genome research program? What is the blueprint for future research in the area of genomics and what level of federal investment will be required?

Answer. The blueprint for research on food genomics is envisioned as a long term effort. The draft concept paper identifies priorities and budget requirements for the first three years. The longer term strategy will be modified based on accomplishments.

The draft concept paper, now out for review and comment, provides a blueprint for a coordinated REE food genome program involving ARS, CSREES, and ERS. Specifically the paper describes the current intra- and extramural programs and their achievements, the overall objectives of the initiative, and planned activities directed at achieving those objectives. The proposed level of federal investment is \$40 million in fiscal year 1999, \$70 million in fiscal year 2000, and \$100 million in fiscal year 2001 and subsequent years.

Question. The Department's fiscal year 1999 request includes a \$30 million increase in the discretionary appropriations for this initiative and proposes legislation which involves an additional \$10 million. What legislative authority is required?

Answer. The Administration proposes a new authority for a competitive research grants program specifically focused on supporting research conducted under the Food Genome Initiative.

Question. Please describe the genome research program already conducted under ARS and CSREES. Please specify the level of funds now being committed to this research, where this research is being conducted, and what is being accomplished.

Answer. USDA conducts plant and animal genomics research through well-developed intramural and extramural programs. These programs are designed to complement each other in partnership with State agricultural experiment stations, colleges, universities, other research institutions or organizations, Federal agencies and laboratories, private organizations, corporations, or individuals.

The USDA's intramural plant and animal genomic research program has been conducted by the Agricultural Research Service (ARS) through their network of laboratories and strategic cooperative agreements with selected universities and private sector researchers. Substantial resources have been devoted to molecular genetic map development. Numerous genetic markers on the maps of cattle, swine, sheep, and poultry have been developed in ARS laboratories. The same is true for the genetic maps of a number of important crop species. The ARS has research projects aimed at the use of molecular genetic markers for the characterization of germplasm and for the selection of crop varieties with enhanced pest resistance and product quality. Other ARS programs are aimed at the isolation and manipulation of genes controlling disease resistance and stress tolerance in plant and animal species. An important result of USDA's genomic funding has been the development of extensive crop and animal genome databases now available on the World Wide Web hosted by the USDA National Agricultural Library.

In fiscal year 1998, ARS' food genome research is funded at \$11.5 million as follows:

Plant Genome Research

<i>Location</i>	<i>Funding</i>
Albany, California	\$217,100
Ames, Iowa	218,100
Beltsville, Maryland	161,800
Columbia, Missouri	\$217,200
Headquarters	2,544,300
Ithaca, New York	328,500
Total	3,687,000

Animal Genome Research

<i>Location</i>	<i>Funding</i>
Athens, Georgia	\$170,800
Ames, Iowa	559,000
Beltsville, Maryland	2,777,400
East Lansing, Michigan	926,100
Clay Center, Nebraska	3,377,800
Total	7,811,100

The USDA's extramural program is managed by the Cooperative State Research, Education and Extension Service (CSREES) in partnership with the Land Grant university system and other organizations. Whenever possible, CSREES provides national leadership by coordinating and facilitating genome research activities across federal agencies and regional projects. Under the auspices of CSREES National Research Initiative (NRI), NRI grants are awarded to genomic projects on agriculturally important crops, forest trees, and animals.

The NRI Plant Genome program places priority emphasis on cloning agriculturally important genes; developing new technologies for genome mapping, gene manipulation, gene isolation or gene transfer in plants; creation of new germplasm lines or varieties to solve problems of U.S. agriculture; and software development for databases and bioinformatics. CSREES, in a joint effort with NSF and DOE, is engaged in an international cooperative effort in mapping and sequencing the genome of the model plant, *Arabidopsis thaliana*. This program, which began in 1996, was the first effort to provide a complete DNA sequence of a plant, similar to the effort being done by NIH to completely sequence the human genome and by DOE to sequence microbial genomes. CSREES has also taken the lead, along with other Federal Agencies, to begin coordinating U.S. activities with the international rice genome sequencing programs. Sequencing *Arabidopsis* and rice as model systems in plants provides broad coverage of the plant kingdom. Compared to other higher plants, the genome of *Arabidopsis* and rice are small, making whole genome sequencing of these two plants a readily achievable goal. *Arabidopsis* and rice can become reference or model genomes for two major classifications of plants, dicots and monocots, respectively. It is anticipated that the genomes of *Arabidopsis* and rice could be completed in the years 2000 and 2004, respectively, provided that sufficient funding is available through a USDA Food Genome Initiative. This research will be vital to facilitate international collaboration to ensure that data, materials, and technologies are readily available to U.S. scientists and the larger agricultural community including growers and producers.

Priority emphasis of the NRI Animal Genetics and Genome Mapping has been placed upon genomic mapping and organization; gene identification and interactions; technology development, and economic or quantitative trait loci and marker assisted selection. CSREES provides leadership and coordination for a national, coordinated research program to map the genome of agriculturally important animal species through Regional Projects of the National Animal Genome Research Program. The program involves CSREES, ARS, State Agricultural Experiment Stations, and other universities. CSREES also provides leadership for several other Regional Projects, all with a national focus, that make major contributions to animal genomic research such as, Advanced Technologies for the Genetic Improvement of Poultry; Genetic Improvement of Cattle Using Molecular Markers; Positional and Functional Identification Economically Important Genes in the Pig; Integration of Quantitative Molecular Technologies for Genetic Improvement of Pigs; Genetic Basis for Resistance to Avian Disease; and Genetic Maps of Aquaculture Species.

In fiscal year 1998, CSREES funding devoted to food genome research under the NRI is estimated to be \$11.5 million for plant genome research and \$2.9 million for animal genome research for a total of \$14.4 million.

There are many accomplishments in plant and animal genomics to date. They include: development of genomic maps in corn, soybean, cotton, wheat, barley, rice, sorghum, loblolly pine, conifers, poplar, cattle, swine, wheat, poultry, horses, catfish and many other plant and animal organisms for genetic improvement; Quantitative Trait Loci have been mapped that target genes of paramount importance to producers and growers to include tolerance to environmental stress, pest and disease resistance, milk production and fat deposition, and quality. The USDA is the world leader in developing technologies used in gene transformation systems, agricultural bioinformatics, and germplasm resources for improved genetic enhancement of both plants and animals.

OFFICE OF PEST MANAGEMENT POLICY

Question. How is this Office being funded for fiscal year 1998? What are the current funding and staffing levels for this Office?

Answer. Funding for the Office of Pest Management Policy (OPMP) for fiscal year 1998 will come primarily from existing National Agriculture Pesticide Impact Assessment Program (NAPIAP) funding, including transfers of existing positions and staff. The funding level for NAPIAP in fiscal year 1998 is about \$1 million. Of the \$1 million, about \$400,000 in NAPIAP funds will be used for salaries and other expenses of the OPMP for the five remaining months of the fiscal year. The staff of the office currently includes a director, a staff entomologist transferred from Environmental Protection Agency (EPA), and a staff plant pathologist transferred from Beltsville NAPIAP. Current plans call for a total of 10 staff positions, representing all agricultural sciences. The positions will be filled through recruiting and transfers.

Question. Why did you determine there was need for a separate office to focus principally on Food Quality Protection Act-related issues? Please describe the role of this new office and list individual programs, by agency, that will be coordinated by this office.

Answer. Although the Food Quality Protection Act of 1996 (FQPA) requires that the Department establish a "minor use" program, the role of the new office extends beyond minor use issues and is charged with integrating and coordinating existing USDA pesticide and pest management programs. The office is also responsible for improving communications with and strengthening the existing network of grower organizations and crop specialists at land grant institutions. FQPA has the potential to dramatically alter pest management systems for many crops. It is important that the Department provide EPA with high quality data on current pest management tools and practices to make better informed regulatory decisions. Furthermore, the Department must be responsive to the needs of the agricultural community in developing alternative pest management practices to meet critical needs that may develop as a result of EPA's regulatory process. In addition to its new responsibilities, OPMP will assume the headquarters functions of the NAPIAP program. The state Land Grant component of NAPIAP will remain in place and continue to serve as the primary pest management data gathering and analyses arm of the office.

Existing programs include:

Food Consumption Surveys—ARS
 NAPIAP—ARS; CSREES; ERS; and Forest Service
 Pest Management Alternatives Program (PMAP)—CSREES
 Areawide Integrated Pest Management—ARS
 Biological Control—ARS; CSREES; APHIS
 Pesticide Use Surveys and Analysis—NASS and ERS
 Pesticide Data Program—AMS
 Integrated Pest Management Research—ARS, ERS, and CSREES
 IR-4 Minor Crop Pest Management Program—CSREES and ARS
 Pesticide Applicator Training—CSREES

USDA RESPONSIBILITIES UNDER THE FOOD QUALITY PROTECTION ACT (FQPA)

Question. You indicate that the Food Quality Protection Act of 1996 adds to the need for effective pest management research. Please cite for the record the requirements of this Act which will require additional investments by the USDA research, education, and economics mission agencies and the additional funds proposed for fiscal year 1999 and each future fiscal year to fulfill these requirements.

Answer. The Secretary of Agriculture has been given many new and enhanced responsibilities as a result of the passage of the Food Quality Protection Act (FQPA). The Secretary's FQPA-related functions can be grouped into the following categories:

- (1) Explicit USDA functions under the provisions of FQPA.
- (2) Explicit USDA functions provided for in FQPA amendments to FIFRA.
- (3) Explicit USDA functions provided for in FQPA amendments to FFDCA.
- (4) Other current law USDA responsibilities that will be enhanced by FQPA.

EXPLICIT USDA FUNCTIONS UNDER FQPA

Data Collection—Infants and Children

(1) Consumption Patterns—The Secretary is directed to coordinate the development and implementation of survey procedures with respect to food consumption patterns of infants and children. Secretary must consult with EPA and HHS. (Section 301 (a) of FQPA)

(2) Residue Data—The Secretary is directed to improve data collection of pesticide residues, to provide guidelines for the use of comparable analytical and standardized reporting methods, and to increase the sampling of foods most likely consumed by infants and children. (Section 301(c) of FQPA)

Data Collection—Pesticide Use

(1) Collection—The Secretary is directed to collect data on the use of pesticides on major crops and other dietarily significant crops through surveys of farmers or other sources. The Secretary must make the data available to EPA. (Section 302 of FQPA)

(2) Coordination—The Secretary is directed to coordinate with EPA in the design of the surveys. (Section 302(c) of FQPA)

(3) Study & Report—Within 1 year of enactment, the Secretary must carry out a study, in consultation with EPA, and report to Congress on the current status and potential for improvement of Federal agency collection of pesticide use information. The study must include an analysis of options available to increase the effectiveness of the collection, the costs and burdens placed on agricultural producers and other pesticide users, and the effectiveness in tracking risk reduction by those options. (Section 305 of FQPA)

Integrated Pest Management

The Secretary is directed to implement research, demonstration, and education programs to support adoption of IPM and to make information on IPM widely available to pesticide users. Federal agencies must use IPM techniques and promote IPM through procurement and regulatory policies, and other activities. (Section 303 of FQPA)

II. EXPLICIT FUNCTIONS UNDER FQPA AMENDMENTS TO FIFRA

Minor Use Crop Protection Incentives

(1) Definition—FQPA creates several incentives for the registration of minor pesticide uses. The Secretary is responsible for determining whether a pesticide use will qualify as a minor use based upon the total acreage on which the pesticide is used. Alternatively, the Secretary will consult with EPA in determining whether a pesticide use will qualify as a minor use due to the lack of sufficient economic incentive to support its registration. (Section 2(l)(1) & (2) of FIFRA as added by section 210(a) of FQPA)

(2) Exclusive Use Period—The Secretary is required to consult with EPA in determining whether particular minor uses will qualify a pesticide for extension of the registration data exclusive use period. (Section 3(C)(1)(F)(ii) of FIFRA as amended by section 210(b) of FQPA)

USDA Minor Use Program

(1) USDA responsibilities related to minor uses:

The Secretary is directed to assure the coordination of the responsibilities of USDA related to minor uses of pesticides including:

(a) IR-4 Project (established to develop registration data for minor uses).

(b) National Pesticide Resistance Monitoring Program (Established by section 1651 of the FACT Act.)

(c) Support for IPM research.

(d) Consultation with growers to develop minor use data.

(e) Assistance for minor use registrations, tolerances, and reregistrations with EPA. (Section 32(a) of FIFRA as added by section 210(i) of FQPA)

(2) Minor Use Data Grants and Revolving Fund—The Secretary is directed to establish and operate a grant program to provide matching funds for the development of data to support minor use pesticides. Any data that is developed as a result will be jointly owned by USDA. (Section 32(b) of FIFRA as added by section 210(i) of FQPA)

Identification of Public Health Pests

The Secretary is directed to coordinate with the Administrator of EPA to identify pests of significant public health importance. (Section 28(d) of FIFRA as added by section 236 of FQPA)

III. EXPLICIT FUNCTIONS UNDER FQPA AMENDMENTS TO FFDCA

Dietary Surveys

The Secretary is directed to conduct surveys to document dietary exposure to pesticides among infants and children in order to provide information for use by the

Administrator in the establishment of pesticide residue tolerances. (Section 408(b)(2)(C) of FFDCA as amended by section 405 of FQPA)

Actual Use Data

The Secretary may collect and provide aggregate pesticide use data for consideration by the Administrator when assessing chronic dietary risk in establishing a pesticide residue tolerances. (Section 408(b)(2)(F) of FFDCA as amended by section 405 of FQPA)

Consumer Right to Know

The Secretary is required to consult with EPA and HHS in the annual publication of information for public display by retail grocers relating to the risks and benefits of pesticide residues and recommendations to consumers for reducing dietary exposure. (Section 408(o) of FFDCA as amended by section 405 of FQPA)

IV. CURRENT LAW USDA RESPONSIBILITIES THAT WILL BE ENHANCED BY FQPA

Various provisions of current law, although not directly amended by FQPA, will continue to require the involvement of the Secretary of Agriculture. In several cases, the role of the Secretary may even be enhanced as a result:

Establishment of Tolerances (Maximum Residue Levels)

FQPA requires the consideration of various risk factors and data as part of the decision making process involved in issuing a tolerance under the new law. Much of the information and data on which these decisions will be based is to be collected by the Secretary. The data collected and provided by the Secretary will be extremely important to registrants and pesticide users seeking the establishment of tolerances for various pesticides. (Section 408 of FFDCA as amended by section 405 of FQPA)

Emergency Exemptions

Section 18 of FIFRA authorizes EPA to exempt the use of certain pesticides from registration requirements in order to handle local emergency situations. The FQPA adds a new requirement that each such exempt pesticide use must have a tolerance in place under the FFDCA when the exemption is granted. As stated, the Secretary will provide an increasingly important function with respect to the approval of all tolerances, which will be most critical in the case of tolerances associated with Section 18 emergency exemptions to meet local needs that must be issued within a short period of time in order to be useful. (Section 18 of FIFRA; Section 408 of FFDCA as amended by section 405 of FQPA)

Research Coordination

Section 20 of FIFRA requires EPA to coordinate with the Secretary in conducting IPM research, which is to receive increased emphasis under FQPA.

Regulations—Comments by USDA Sections 21 and 25 of FIFRA require EPA:

- (1) to notify and seek comments from the Secretary in advance of any rulemaking under FIFRA,
- (2) to share with the Secretary any proposed or final regulations in advance of their publication, and
- (3) to take into consideration and respond to any comments made by Secretary with respect to the regulations.

These current requirements will apply to any regulations issued by EPA to implement the amendments made by FQPA to FIFRA.

Identification of Pests

Section 28 of FIFRA directs the Secretary to cooperate and coordinate with EPA in the identification of:

- (1) Pests that must be brought under control.
- (2) Available methods of pest control.
- (3) Minor pest control problems, including minor or localized problems in major crops.
- (4) Factors limiting the availability of specific pest control methods.

The Secretary is also required to prepare an annual report to EPA containing the above information, indicating crucial pest control needs based on any shortage of control methods identified above, and describing research and extension efforts designed to address those needs. This function will be increasingly important as pest control products are lost due to the tougher standards established under FQPA.

Conditional Amendments

Section 3(c)(7) of FIFRA requires concurrence by the Secretary with any determination by EPA of the availability of effective alternative pesticides for the pur-

poses of making a risk-benefit determination for a conditional registration of a pesticide use on a minor food or feed crop.

Recordkeeping

Section 1491 of the 1990 Farm Bill directed the Secretary to require certified applicators of restricted use pesticides to keep records of pesticide use, make the information available when necessary, compile a data base, and publish annual comprehensive reports in conjunction with EPA. The new data collection requirements in FQPA (see above) seem to build on this current law requirement by requiring the Secretary to collect data from farmers and other sources on the use of all pesticides. One difference, however, is that the new requirements do not contain the same safeguards and penalties to avoid misuse of the data collected.

The fiscal year 1999 budget includes the following increases related to FQPA needs:

<i>Program</i>	<i>Increase</i>
IPM Research Grant Program	\$5,300,000
Pest Management Alternatives	2,600,000
Extension IPM Application	4,200,000
Food Consumption Surveys	1,500,000
Pesticide Use Surveys	1,400,000
Pesticide Residue Data	4,200,000
IR-4 Minor Use Program	1,700,000
NAPIAP Programs	1,600,000
Applicator Training Programs	1,500,000

Budget needs beyond fiscal year 1999 will depend on EPA's schedule and regulatory policy decisions and will be addressed in future budget requests.

INTEGRATED PEST MANAGEMENT (IPM)

Question. The fiscal year 1999 budget again requests increased funding for the Integrated Pest Management (IPM), which is the Administration's initiative to bring 75 percent of the nation's farmland under IPM practices by the year 2000. Can you give us a status report on what has been accomplished in that regard to date, what percent of the nation's crop acreage was under IPM practices when this initiative began and where we are now, and what the additional funds you are requesting for 1999 for this project will achieve?

Answer. A consensus has emerged that IPM systems should be measured along a continuum, ranging from none to high levels of IPM adoption. The Department's 1994 report, Adoption of Integrated Pest Management in the United States, measured adoption along a continuum, and this approach was refined by Consumers Union in its 1996 report, Pest Management at the Crossroads. These analyses estimated that 70 percent of crop acreage is managed using IPM systems, however, 38 percent of these systems are at the low end of the IPM continuum. Our goal is to develop and help growers implement IPM strategies that permit them to move from the low end of the continuum to the high end of the continuum, moving incrementally toward biologically based IPM systems.

The overall percentage of U.S. crop acres under IPM in 1997 remained at the 70 percent level, and will likely remain constant in 1998. However, we remain convinced that the increased investments proposed in the President's budget request for fiscal year 1998, and again proposed in fiscal year 1999, will permit us to reach the 75 percent adoption goal by 1999 or 2000. More importantly, we believe that these investments will accelerate the adoption of IPM systems at the medium and high end of the continuum. We believe that increasing adoption of pest management systems at the high end of the IPM continuum will benefit all Americans by increasing profitability, protecting water quality and farm worker safety, and enhancing the wholesome quality of our Nation's food supply. We believe that an accelerated effort is warranted to develop and help growers implement pest management strategies that will help them reduce reliance on high risk pesticides and enhance the sustainability of their operations.

Question. Please provide a list of the fiscal year 1999 IPM funding increases for the research, education, extension and economics agencies in order of priority.

Answer. The increases proposed for IPM and related activities reflect USDA's goal of helping U.S. agriculture implement IPM practices on 75 percent of the nation's crop acreage by the year 2000, and to help producers respond to the challenges they will face as the result of Food Quality Protection Act (FQPA) implementation. Each research and extension program that supports IPM activities is coordinated to support major IPM goals. To further the development of a coordinated and integrated effort, USDA has created a new Office of Pest Management and Policy (OPMP) to

serve as the focal point within the Department for pest management and pesticide regulatory issues.

Proposed IPM and IPM-related activities in the fiscal year 1999 budget focusing on this integrated and coordinated approach are summarized below. All of these would be considered high priority within the Department's 1999 budget.

IPM Initiative.—Activities proposed under this multi-faceted initiative are built around producer-identified needs for applied research and education projects using pest control technologies that are ready for large area trials and adoption. These regional or area-wide projects will be supported by proposed increases of approximately \$10 million for CSREES and ARS.

The initiative also includes a proposed increase of \$2.7 million for research on alternatives to pesticides that may be lost to producers as EPA proceeds to implement FQPA and on a decision support system that will help identify crop-pest combinations where alternative controls are most critical.

Pesticide Use Data Collection and Analysis.—Net increases of \$2.1 million are proposed for pesticide use and food consumption data. USDA is the sole or primary source for this data. Information on actual use and consumption patterns is needed to conduct more accurate risk assessments. These programs include the Continuing Survey of Food Intake by Individuals (CSFII) carried out by ARS, the Pesticide Data Program under AMS, and pesticide use survey and analysis conducted by NASS and ERS, respectively.

Pesticide Registration, Clearance, Assessment and Training.—Net increases of \$4.8 million are proposed for programs to support the registration process with information and analyses on the costs and benefits of current and alternative pest management strategies at the local, regional, and national scales; programs to gather data on pesticide residues for new and safer minor-use products; to fund the new Office of Pest Management Policy; and for applicator training to build confidence in the system that relies on well informed pesticide applicators. Accurate data and analysis are essential to help policy-makers understand the implications of pest-control decisions.

AGRICULTURAL RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

BUILDINGS AND FACILITIES

The President's fiscal year 1999 budget again proposes to close down the ARS Prosser, WA; Mandan, ND; Orono, ME; and Brawley, CA facilities. These are the same facilities proposed to be closed in the President's fiscal year 1998 budget and the Congress continued to fund.

The Administration has indicated that research facilities are under review by the Strategic Planning Task Force on Research Facilities mandated by the 1996 farm bill and that the Task Force is scheduled to report in April of 1999.

Question. Why prejudice the recommendations of that Task Force by proposing to close four ARS facilities in fiscal year 1999?

Answer. The fiscal year 1999 Federal budget submitted by the President recommends a number of new initiatives to address changing priorities facing agriculture and the American consumer. The research budget proposed for ARS reflects an increase of \$32 million over the current year. However, the Department is focusing on many priority agricultural issues that must be addressed now by our research scientists. This requires that ARS terminate ongoing projects and reallocate these resources to the new or expanded initiatives as recommended by the President. As a result, a cost-effective decision was made to terminate and redirect resources to new research initiatives and recommend closure of these research stations. These actions are essential to the President's recommendations and cannot be delayed for future decisions to be made by the Task Force.

Question. How many people and scientists would be impacted by the closure of Prosser, WA; Mandan, ND; Orono, ME; and Brawley, CA facilities? What is the annual operating cost of each of these facilities?

Answer. All permanent employees impacted by the proposed closures will be offered a position within the Agency. The number of impacted employees and the annual operating costs for these facilities will be provided for the record.

[The information follows:]

Facility	Scientists	Other employees	Operating cost
Prosser, WA	9	24	\$2,435,000
Mandan, ND	9	25	2,582,600
Orono, ME	3	7	808,500
Brawley, CA	4	287,200

The fiscal year 1999 budget again requests \$4 million in initial construction funding through ARS for a new Melaleuca Research and Quarantine Facility in Florida. Design and engineering work on this facility was funded and completed by the Corps of Engineers.

Question. Why request funds for a new facility when the Strategic Planning Task Force is now reviewing the need for additional facilities?

Answer. This facility is being built in support of biological control of the harmful introduced pest weeds, especially the Australian paperbark tree Melaleuca, which is devastating the Florida Everglades and causing major economic and environmental damage.

The need for the facility is immediate, based on the large number of biological control agents for Melaleuca and other high-priority introduced weeds that ARS and our State cooperators are now processing through an old, small and technologically inadequate quarantine facility in North Florida. Should the construction of this facility be delayed, the goal of safely managing introduced weeds would be set back, and Melaleuca and the other introduced pests would continue to spread unchecked, resulting in increased economic and environmental damage to Florida.

The new quarantine facility that ARS has proposed in south Florida is to be built in cooperation with the U.S. Army Corps of Engineers and the state of Florida. Although the primary and immediate use of the facility is to safety test and process exotic natural enemies of the paperbark tree Melaleuca, it will also be used for a number of other purposes. In fact, the portion of the facility that the Army Corps is interested in will address a number of aquatic and semi-aquatic weed issues that are important for several of the states in the southeastern U.S. (Alabama, Mississippi, Louisiana and Texas) and also the western states of California and Oregon. In addition, the state of Florida (specifically, the University of Florida Experiment Station at Ft. Pierce) is interested in the use of this facility to evaluate and process exotic beneficial agents and to study some pests under highly contained laboratory conditions. Thus, this facility is expected not only to help solve critical pest problems associated with Florida wetlands, but it is also expected to serve agricultural needs throughout the southeastern U.S. Examples of pest species that may be the focus of control studies at the new facility would include the brown citrus aphid, the silverleaf whitefly, thrips palmi, and the pink hibiscus mealybug. More specifically, the facility is expected to test and clear beneficial natural enemies of these pests for release into field sites throughout the U.S. Since many of these pests affect both field and greenhouse crops, the new technology developed at this new facility could be utilized in almost every state in the country.

The ARS biological control of weeds program is a partner in the Everglades Initiative, the National Strategy for Invasive Plant Management, and the White House initiative on management of Non-native Invasive Species. The facility is a key part of the nation's long-term biological control program for introduced pests.

Question. Why does the Administration propose that this project be transferred from the Corps of Engineers to the Agricultural Research Service?

Answer. Although the original design funds were appropriated through the Corps of Engineers, it had always been the intent that ARS would staff and operate the facility.

Question. Would ARS face any problems or difficulties constructing a facility based on the design and engineering work of the Corps of Engineers?

Answer. For project continuity purposes, ARS would likely pursue an arrangement with the Corps of Engineers for assistance during the construction phase to facilitate the completion of the project. Since ARS would be responsible for operating the facility, it is important that ARS be involved in management and oversight of construction so that the lab will meet the agency's research needs.

Question. What is the total cost of the project?

Answer. The latest cost estimate from the Corps of Engineers was \$3,143,000 in 1996 dollars. Applying escalation, construction contingency, and administration costs, the total cost for construction is estimated at \$4 million.

Question. Funding of \$2.5 million is requested for fiscal year 1999 to continue the modernization of the Beltsville Agricultural Research Center. These funds are to be

used for the design and construction of a new poultry production facility as well as a number of other miscellaneous projects. Please provide a list of each project for which funds are requested.

Answer. In fiscal year 1999, BARC will use \$2.5 million to design and construct a replacement Poultry Facility for \$2.2 million, demolish facilities for \$100,000, and utilize \$200,000 for unplanned small projects and unforeseen cost increases on other modernization projects.

Question. With respect to modernization of the Beltsville Agricultural Research Center, please provide the Committee with an update of the costs and projects completed and planned for the modernization of the Beltsville Agricultural Research Center. Please give projects and funding required by fiscal year.

Answer. Through fiscal year 1998, a total of \$106,616,792 has been expended on the modernization of BARC. The attached is a listing of projects that have been completed, initiated, or are proposed through fiscal year 1999. The funding source for these projects is the Building and Facility Modernization funding.

Beltsville Agricultural Research Center (BARC) Modernization

Fiscal year 1988:

Renovate Building 007	\$2,000,000
Design Building 003	660,859
Renovate Abattoir, Building 204	57,446
Renovate Building 303	506,877
Modify HVAC, Building 306	372,270
Water Lines	1,402,195
Miscellaneous Projects, BARC (under \$100,000)	374,234
Repair Building 307	88,064
Repair Building 467	10,835
Repair Building 264	5,480
Small Animal Facility Contingency	271,740
Total	5,750,000

Fiscal year 1989:

U.S. National Arboretum (USNA) Roof Repairs	300,852
U.S. National Arboretum Greenhouse Electrical Repairs	273,200
Steam Lines, Phase IV	1,100,000
Oil to Gas Conversion	328,237
Renovate Building 203 (Boar Facility)	529,026
U.S. National Arboretum, Relocate Service Road	87,643
Hazardous Waste Marshaling Facilities	79,662
Waste Water Treatment Study	194,864
Renovate Building 204	354,335
Beltsville Area Security	91,806
Pesticide Handling Facilities	441,793
Swing Space	274,100
Miscellaneous Projects	44,482
USNA Brickyard Restoration	2,000,000
Total	6,100,000

Fiscal year 1990:

Steam Lines, Building 169-179	568,752
Steam Lines, Buildings 001-011A	1,407,084
Range 2 Modernization	690,574
Waste Water Treatment Facility	1,100,056
Electrical Distribution System	574,157
BARC Roads Maintenance	361,027
Animal Parasitology Unit Planning	30,282
HVAC System, Building 050	44,598
Repair Embankment Failure	211,135
Powder Mill Road	1,547,588
Swing Space	103,685
Brooder House	230,000
Renovate Building 043, 046, 047	148,591
Annual Painting	200,098
Annual Roofing	247,582
U.S. National Arboretum Storage Building	90,402

U.S. National Arboretum Plastic Greenhouses (3)	235,687
Demolition of Obsolete Facilities	27,985
Replace Chiller, Building 006	103,965
Renovate Building 209	71,693
Renovate Headhouse 16	35,124
Repairs Building 177B	12,465
Repairs Building 211	7,965
Renovate Building 1120	18,391
Elevator, Building 449/Gas Cyl	50,954
Renovate Building 449	4,865
Key Card Security Gate	37,002
Small Miscellaneous Projects	625,031
Repairs, Building	15,000
Contingency Steam Lines	297,170
Contingency	197,604
Replace Roof, Building 012	139,000
Contingency	424,488
Total	9,860,000
<hr/>	
Fiscal year 1991:	
Addition, Building 426	65,000
Conference Room, Building 005	435,000
Electrical	1,500,000
Building 001	735,000
Plant Sciences Building	1,100,000
Dairy Research Facility	2,186,330
Central Hay Storage	803,670
Repair Building 201	50,000
BARC—East Waste Water Treatment	6,534,000
Building 200 Modernization	60,000
Renovate Building 007	1,290,000
Demolition	198,904
Swing Space	991,888
Contingency	50,000
Total	15,999,792
<hr/>	
Fiscal year 1992:	
Renovate Range 2 Greenhouse Complex	3,100,000
Repair/Replace Waste Water Treatment Facility	300,000
Construct Plant Sciences Building	12,600,000
Total	16,000,000
<hr/>	
Fiscal year 1993:	
Range 2 Greenhouse Complex	7,400,000
BARC—West Waste Water Treatment Plant	4,000,000
BARC—East Water System	600,000
Controlled Environmental Chamber Facility	586,000
Office/Laboratory Economic Analysis	200,000
Animal Space Economic Analysis	230,000
Contingencies	531,000
Total	13,547,000
<hr/>	
Fiscal year 1994:	
Modernize Building 001	9,700,000
Modernize East Potable Water System	7,400,000
Design New Animal Building	530,000
Upgrade West Electrical System	1,500,000
Design to Modernize Building 004	450,000

Contingencies	120,000
Total	19,700,000
Fiscal year 1995: Modernize Building	3,960,000
Fiscal year 1996:	
Construct Controlled Environment Facility	4,700,000
Design/Construct Infrastructure in 300 Area	2,000,000
Contingencies	60,000
New Animal Building Design	615,000
Cooling Tower for Building 004	375,000
Renovate Building 001	250,000
Total	8,000,000
Fiscal year 1997:	
Design New BHNRC Building	1,700,000
Infrastructure BARC—East	1,400,000
Fiber Optic Backbone Cabling	700,000
Contingencies	700,000
Total	4,500,000
Fiscal year 1998:	
Construct New Feed Center	1,970,000
Fiber Optic Backbone Cable	850,000
Contingencies	380,000
Total	3,200,000
Proposed fiscal year 1999:	
Design/Construct New Poultry Barn	2,200,000
Demolish Facilities	100,000
Contingencies/Miscellaneous Small Projects	200,000
Total	2,500,000

The balance of funds needed beyond fiscal year 1999 is in excess of \$96 million. Due to the uncertainty regarding funding levels in 1999 and beyond, and potential changes to priority projects, the Agency has not developed a firm phasing plan beyond fiscal year 1999.

Question. The budget requests \$1.2 million to begin the first phase of the air handling unit replacement at the National Agricultural Library. What additional funding will be required in each future fiscal year to complete this replacement project?

Answer. Replacement of the air handling units is planned in two phases. The second phase is planned for fiscal year 2000 and is estimated at \$1.2 million as well.

Question. What additional buildings and facilities work is required at the National Agricultural Library? Please give projects and funding required for each, by fiscal year.

Answer. NAL completed a facility study in 1991 that identified numerous code, mechanical, electrical, and architectural deficiencies estimated at \$18 million in 1998 dollars. In addition, NAL also commissioned a space utilization study in 1990 and 1991 to investigate how best to meet competing space needs. As a result of this study, it became clear that NAL needed more space for collections. The Total cost for the facilities work will increase based on how much is appropriated each year and the corresponding rate of inflation.

In general, the deficiencies and costs can be categorized into three major areas of work: architectural, mechanical/plumbing, and electrical. The types of deficiencies and associated estimated costs are as follows:

Architectural deficiencies include items such as deteriorating brick, exterior glazing leaks, egress requirements; fire code deficiencies; accessibility issues; and other items of this type. The estimated cost to correct these deficiencies is \$4.7 million.

Mechanical/plumbing deficiencies include items such as lack of a sprinkler system; insufficient cooling capacity; lack of temperature and humidity control; poor air circulation; lack of vacuum breakers; worn out water control valves; and other miscellaneous items. The estimated cost to correct these deficiencies is \$10.2 million.

Electrical deficiencies include items such as improper lighting levels; insufficient emergency power system; branch circuit wiring devices in disrepair; insufficient lightning protection system; and other miscellaneous items. The estimated cost to correct these deficiencies is \$3.1 million.

Due to uncertainty regarding future funding levels, the Agency has not developed a firm phasing plan beyond Phase 1. Phase 1 was to address the replacement of boilers, renovations to the first, third, fourth, and fifth floors, and installation of sprinklers. Of the \$6 million requested in fiscal year 1998 only \$2.5 million was appropriated. These funds will be used to renovate the first floor which will include correcting a variety of architectural, mechanical/plumbing, and electrical deficiencies. The renovation will also include a variety of improvements for library users. In fiscal year 2000, the Agency will request the balance of funds to complete Phase 1. This cost is estimated at \$3.7 million.

Question. The budget requests \$5.6 million to initiate rehabilitation of the 80 buildings and supporting infrastructure of the National Animal Disease Center. What additional funding will be required in each future fiscal year to rehabilitate the Center?

Answer. In fiscal year 1992, a Facility Condition Study indicated that an estimated \$140 million (escalated based on fiscal year 1998 implementation) would be required to upgrade the NADC facilities. In fiscal year 1998, the Agency will take action to update the existing Facility Condition Study to prioritize remaining needs at NADC. In fiscal year 1999, ARS will use \$5.6 million for the following modernization projects.

- \$1.7 million for design and construction plans for maintenance and repair projects common to all research activities (electrical, water and sanitary systems, central heating and cooling plants and distribution systems, and waste treatment facilities).

- \$3.9 million will be for design and construction costs associated with maintenance and repair of the contaminated waste collection piping system and treatment plant for infectious agents.

Because of the different types of diseases today, research at NADC has changed from Biosafety Level (BSL) 2 to BSL 3. Therefore, it is necessary to provide adequate BSL-3 facilities at NADC. ISU has received \$3.0 million for the initial phase of the new BSL-3 AG Large Animal Isolation Facility to complement the Necropsy/Incinerator Facility. ISU has started preliminary planning for this new facility. ARS will have to provide ISU with an easement authorizing ISU to have access to NADC for various tasks related to the design and construction of this project. This initial phase (approximately 5,000 gsf) will not satisfy ARS needs, however, it will address APHIS immediate needs. Ultimately, an additional 15,000 gsf will be necessary to satisfy ARS needs beginning with, \$2 million for planning and design of an addition to the BSL 3 Large Animal Isolation Facility. Also, \$3 million will be needed for planning, design and construction to perform minimum safety upgrades to plumbing and mechanical systems to an existing BSL-3 wing of an Animal Isolation Facility.

Due to uncertainty regarding future funding levels and the update to the Facility Condition Study currently underway, the Agency has not developed a firm phasing plan beyond the above. In fiscal year 1998, the Agency will develop a Master Plan for NADC that will provide the Agency with a phasing plan and better cost information.

Question. The fiscal year 1999 budget requests \$8.4 million to continue its modernization project at its Center in Peoria, Illinois. Which projects will be funded with the \$8.4 million requested and what additional funds will be required in each future fiscal year to complete this modernization effort?

Answer. The \$8.4 million in fiscal year 1999, will be used to fund Phase 3 of the North Wing Renovation project. This includes design and construction. This will complete the modernization effort of the North Wing. Additional funds will be needed in future fiscal years to cover planning, design, construction, and construction management of the Chemical, Biological, and Administrative Wings as follows:

<i>Fiscal year</i>		
2000:	Chemical Wing Design	\$2,500,000
2001:		
	Chemical Wing Construction	20,400,000
	Biological Wing Design	2,000,000
2002:		
	Biological Wing Construction	16,400,000
	Administrative Wing Design	2,000,000
2003:	Administrative Wing Construction	18,900,000

Question. Funding of \$1.4 million is requested to continue the renovation program at the Grain Marketing and Production Research Center, Manhattan, Kansas. What work will be funded with the \$1.4 million requested and what funds will be required in each future fiscal year to complete this renovation program?

Answer. The \$1.4 million requested will complete the funding necessary for:

1. The estimated construction cost of the Phase 1 and 2 combination—Phase 1 (Mechanical Room, Cooling Tower, Penthouse additions); Phase 2 (renovate the Central Systems and Equipment), and

2. The construction phase services/construction contingency for this construction phase.

The funds required in each future fiscal year to complete this renovation program are:

Fiscal year 2000—\$6.4 million for construction, construction management services and contingency for Phase 3. The scope of work for Phase 3 consists of: Renovate the laboratory (Sections C, D, B, A, E, F); Center Core (Sections C and D); North Wing (Sections A and B); and West Wing (Sections E and F).

Fiscal year 2001—\$1.25 million for construction, construction management services and contingency of Phase 4. The scope of work for Phase 4 consists of a new roof and lighting protection systems.

Question. Funding of \$3.5 million is requested for fiscal year 1999 to continue the phased plan to renovate and modernize the Plum Island Animal Disease Center, Greenport, New York. Will this complete a phase of this plan? Please provide the costs and projects completed and planned, by fiscal year, for the modernization of the Plum Island Animal Disease Center.

Answer. The \$3.5 million in fiscal year 1999 will be used to construct Phase 1 of the Power Plant; design renovations to laboratory space and animal rooms; and provide location and Architect-Engineer support services for modernization projects and other small miscellaneous projects. Modernization projects completed, or in design and construction at PIADC are as follows:

<i>Fiscal year 1993</i>	
Consolidation (c)	\$18,400,000

<i>Fiscal year 1993</i>	
Underground Storage Tank Removal/Replacement (c)	443,000
Old Wastewater Treatment Plant Repairs (c)	185,000
Boiler Rental (c)	304,000
Incinerator Repair (c)	74,000
Environmental Assessment (S)	33,000
Chiller Plant (c)	1,400,000
Sludge Removal (c)	500,000
Miscellaneous Projects	784,000
Total	¹ 3,723,000

¹ Includes APHIS contribution of \$1,183,000.

<i>Fiscal year 1994</i>	
New Wastewater Treatment Plant (c)	1,250,000
Miscellaneous Projects	741,250
Total	¹ 1,991,250

¹ Includes APHIS contribution of \$516,250.

<i>Fiscal year 1995</i>	
Above-Ground Fuel Tanks (Phase I)(C)	1,168,000
Miscellaneous Projects	747,000
Total	¹ 1,915,000

¹ Includes APHIS contribution of \$747,000.

<i>Fiscal year 1996</i>	
Upgrade Fire Alarm System B-101 (D/C)	1,150,000
Above-Ground Fuel Tanks (Phase 2) (c)	730,000
Wastewater Treatment Plant Closure/Wetlands Creation (c)	1,200,000
Boiler Plant Design	500,000
PCB Transformer Replacement (D/C)	51,000

Miscellaneous Projects	933,000
Emergency Repairs Building 102 (c)	250,000
DOE—Energy Savings Technical Support	273,000
Plum Island Harbor Repairs (D/C)	1,647,000
Install Chiller (D/C)	1,267,000
Electric/Telephone Distribution System (D)	199,000
Total	¹ 8,200,000

¹ Includes APHIS contribution of \$3.2 million.

Fiscal year 1997

Above-Ground Fuel Tanks (Phase 3) (c)	1,228,000
Underwater Electric Telecommunications Cable (c)	2,754,000
Sewage Decontamination Plant (D)	500,000
Miscellaneous Projects	668,000
Upgrade Pathological Incinerators (D)	450,000
Underwater Electric/Telecommunication Cable (c)	2,370,000
Wastewater Treatment Plant Improvements (D)	230,000
Total	¹ 8,200,000

¹ Includes APHIS contribution of \$3.2 million.

Fiscal year 1998

Renovate East Service Wing (D)	350,000
Wastewater Treatment Plant Improvements (c)	1,000,000
Upgrade Pathological Incinerators Phase 1 (c)	3,200,000
Animal Room Utilization Study (S)	150,000
Miscellaneous Projects	500,000
Total	¹ 5,200,000

¹ Includes APHIS contribution of \$3.2 million.

Proposed fiscal year 1999

Power Plant Phase 19c	2,700,000
Renovate Animal Wing (D)	300,000
Miscellaneous Projects	500,000
Sewage Decontamination Plant Phase 1 (c)	3,200,000
Total	¹ 6,700,000

¹ Assumes APHIS Contribution of \$3.2 million.

Proposed fiscal year 2000 and beyond

Sewage Decontamination Plant Phase 2 (c)	3,000,000
Power Plant Phase (c)	23,200,000
Miscellaneous Projects	500,000
Environmental Remediation	1,500,000
Total	8,200,000

In fiscal year 1995 future modernization planning was estimated at \$81.0 million. Since that projection, \$8.2 million was funded in fiscal years 1996 and 1997 and an additional \$5.2 million in fiscal year 1998. A reassessment of current infrastructure, environmental and physical plant repair and maintenance need reflect a future funding need of \$61.0 million as a result of shifts and or changes in project scopes/costs and the inclusion of appropriate escalation to the midpoint of construction.

Question. Please provide the Committee with an update of the costs and projects completed and planned for the modernization of each of the ARS Regional Research Centers, giving the funds required in each future fiscal year by project.

Answer. The status of modernization efforts at the four Regional Research Centers is as follows:

Southern Regional Research Center (SRRC).—The SRRC Modernization initially involved a complete renovation of the surrounding site and Chemical Wing, and included such items as asbestos abatement, new and upgraded drainage, landscaping, equipment pads, pavement repairs, retaining walls, and handicapped ramps. Work to the interior of the building will include replacement of HVAC systems, reconfiguring each laboratory module, new stairwell to comply with safety codes, replacement

of floor finishes, new windows and complete patched, primed, and painted walls and ceilings as necessary. Total cost was estimated at \$17.8 million, phased over 9 years.

Construction for Phase I of the Chemical Wing was awarded in fiscal year 1991 for \$1.4 million. Phase II was awarded in fiscal year 1992 for \$2.4 million using Agency funds. Phases III, IV, and V were awarded in fiscal year 1992 for \$5 million. In fiscal year 1994, \$2.667 million was appropriated for Phase VI of the Chemical Wing and in fiscal year 1995, \$2.934 million was appropriated for construction of Phase VII. These phases were awarded in fiscal year 1996.

With regard to the renovation of the surrounding site, design and construction of Phase I site repair work was funded using \$1,651,000 in fiscal year 1993 appropriations. The fiscal year 1996 appropriation of \$900,000 was used for Phase 2 of the site repair work. In fiscal year 1998, \$1.1 million was appropriated for the design of the renovation to the Industrial Wing. It is expected that construction will occur in four phases. Phase I in fiscal year 1999 at \$6 million, Phase 2 in fiscal year 2001 at \$5.5 million; Phase 3 in fiscal year 2003 at \$4.5 million; and Phase 4 in fiscal year 2005 at \$4 million.

The remaining sections of SRRC that need to be modernized are the Administration and Textile Wings.

Eastern Regional Research Center (ERRC).—ARS completed the Facility Modernization Study for ERRC in fiscal year 1993. The findings indicate that the utilities and building infrastructures have reached the end of their useful lives, and the facility itself has been overtaken by the evolution of codes, Agency criteria, and research needs over the past 50 years. The proposed modernization program will occur in 9 phases with a Total planning, design, and construction budget of \$39 million over nine years.

In fiscal year 1994, ARS funded design of Phase 1 (Service Building) and Phase 2 (Engineering Research Laboratory in Pilot Plant) with \$595,000 in Repair and Maintenance funds. In fiscal year 1995, ARS funded construction of Phase 1, and design of Phases 3 through 7, using \$4,175,000 in Repair and Maintenance funds. In fiscal year 1996, ARS funded construction of Phase 2 using \$4,100,000 in Repair and Maintenance funds. In fiscal year 1997, \$4,700,000 was needed to fund construction of Phase 3, and \$4 million was appropriated. In fiscal year 1998, \$5,200,000 was needed to complete funding of Phase 3 and fund construction of Phase 4, and \$5 million was appropriated. The Agency intends to award construction of Phases 3 and 4 with the \$9 million available.

Future modernization phases are planned in fiscal year 1999 (\$3.3 million), fiscal year 2000 (\$4.4 million), fiscal year 2001 (\$3.2 million). These phases will cover the remainder of the Chemical Wing. An additional phase in fiscal year 2001 for the Service Wing (\$1.1 million) and another phase in fiscal year 2002 for the Pilot Plant (\$7.8 million) will complete the current plan.

Western Regional Research Center (WRRC).—WRRC modernization includes the upgrade of outside utilities and complete renovation of the North Wing. The renovation includes asbestos and lead abatement, upgrade of existing HVAC system, laboratory reconfiguration to comply with safety and accessibility codes, replacement of all laboratory counters and tops, replacement of floor and windows, and completely patch, prime, and paint walls and ceilings as necessary. Total cost was \$29.6 million phased over a 7-year period.

Phases 1 and 2 were awarded in fiscal year 1990 for \$5.9 million. Phase 3 was awarded in fiscal year 1991 in the amount of \$3.4 million. Phase 4 was awarded in fiscal year 1993 in the amount of \$3.0 million. Phases 5 and 6 were awarded in fiscal year 1993 in the amount of \$4.4 million and \$3.2 million. Construction for Phase 6 was completed in the third quarter of fiscal year 1997.

In fiscal years 1994, 1995, and 1997, \$1.161 million, \$919 thousand, and \$4.0 million, respectively, were appropriated for construction, construction management, and contingency for Phase 7. The Area funded all necessary fine tuning costs. Construction for Phase 7 is expected to be completed by the first quarter of fiscal year 1999.

In addition, renovation of the Small Animal Facility (West Annex Building) was completed at a cost of \$5.0 million from the Agency's Repair and Maintenance funds.

Also, a construction contract was awarded in September 1995 using Agency funds in the amount of \$800,000 to upgrade the building envelope of the Research and Development Facility (Pilot Plant) which includes Food Processing Laboratory and Industrial Processing Laboratory. A program of requirements was concurrently developed using Agency funds, \$180,000, for the modernization of the Pilot Plant and was completed in fiscal year 1997. This facility occupies the south wing of WRRC encompassing approximately 21,000 square feet of space. The estimated design and construction cost for this project is \$17.6 million.

National Center for Agricultural Utilization Research (NCAUR).—The National Center for Agricultural Utilization Research is currently proceeding with a facilities upgrade design and construction program as follows:

Phase IA—Utility Tunnel, Steam Lines, and Boiler: Construction contract was awarded in the fourth quarter of fiscal year 1991. Construction was completed in the second quarter of fiscal year 1995. Total project cost of \$2.5 million is for construction.

Phase IB—Electrical and Drain System Upgrade: Construction contract was awarded in the third quarter of fiscal year 1992. Total cost of \$.9 million is for construction. Construction was completed in the first quarter of fiscal year 1994.

Phase IID—Pilot Plant and Semi-Works Building Upgrades: Total cost for design is \$1,825,000 which was appropriated in fiscal year 1992. The design for Phase II was awarded in fiscal year 1992 and is complete.

Appropriations to date include the following: Fiscal year 1992—\$1,825,000, planning and design for Phase II Pilot Plant. Fiscal year 1993—\$1,545,000 was redirected for Phase IID Modernization. In fiscal years 1996, 1997, and 1998, \$3.9 million, \$1.5 million, and \$8.0 million were appropriated. In fiscal year 1996, a revised plan was developed which recommended a three-phased renovation for the North Wing. The initial phase (Segment I of Phase IID) will renovate four modules of the Pilot Plant, add mechanical rooms and an exterior stairway. Estimated planning, design, and construction cost is \$6.9 million for this segment. Construction was awarded in the fourth quarter of fiscal year 1997 and will be completed in the third quarter of fiscal year 1999.

The remaining two segments are: Segment 2 of Phase IID will renovate adjoining areas in the North Wing. General laboratory, support space, and testing facilities will be provided to support the Pilot Plant modules. The Semi-Works Building will be renovated to support infrastructure of the Center. Estimated planning, design, and construction cost of \$8.0 million. Design will be completed in the third quarter of fiscal year 1998 with construction awarded in the fourth quarter of fiscal year 1998. Segment 3 of Phase IID will renovate additional laboratory, support space, and testing facilities will be provided to support the Pilot Plant modules. Estimated planning, design, and construction cost of \$8.4 million is requested in the fiscal year 1999 Budget.

Additional funding needed which has been escalated to the planned year of implementation is \$62.2 million. This will complete planned modernization efforts at the Center.

Question. How did the ARS use funds appropriated to it for repairs and maintenance of facilities in fiscal year 1997?

Answer. The fiscal year 1997 repair and maintenance budget was \$18.262 million. This amount includes \$14.246 million in Agency funds, \$900,000 for the National Agricultural Library, \$740,000 for the USNA, and \$2.376 million in BARC Renaissance 1993 funds. Some of the types of repair and maintenance projects funded in fiscal year 1997 include: roof repair, HVAC repair, plumbing repairs, upgrade to sewage lines, electrical repairs, fencing replacement, painting, pavement repair, asbestos and lead abatement, accessibility projects, and replacement of fire alarm systems.

Question. What are the planned use of Repair and Maintenance funds for fiscal year 1998? Please give project and funding.

Answer. The planned use of Repair and Maintenance funds for fiscal year 1998, by project and funding, will be provided for the record.

[The information follows:]

<i>State/location/project</i>	<i>Amount</i>
Nationwide—National Seismic Studies	\$253,000
Arkansas, Booneville—Upgrade Sewage Lagoon	90,000
Arizona, Phoenix—Renovate Three Labs	171,000
California:	
Albany:	
Upgrade Mechanical Rooms	350,000
Exterior Manlift/Accessibility Issue	65,000
Riverside—Upgrade Electrical Service	58,000
Salinas—New Replacement Well	106,000
Delaware, Newark—Remove/Replace Greenhouse Benches and Sidings ...	30,000
District of Columbia, U.S. National Arboretum:	
Exterior Lighting	250,000
Paths, Irrigation, Drainage and Lighting	300,000
Bonsai Courtyard	35,000
Auditorium/Lobby Renovation	20,000

<i>State/location/project</i>	<i>Amount</i>
Trim and Remove Trees	25,000
Street Signs	22,000
Miscellaneous	87,633
Florida:	
Canal Point—Repair/Modify Various Buildings	250,000
Gainesville:	
Replace Fire Alarm System	300,000
Phase 2 Modernization/Renovation	5,900,000
Georgia, Athens:	
Elevator/Stair Construction	75,000
300 KV Energy Generator	127,000
Idaho:	
Dubois:	
Repair 1.5 Mi. of Entrance Road	225,000
Repair Gravel Road	35,000
Kimberly—Repair Roof Bldg. 2, 3, 4, and 5	165,800
Illinois, Peoria:	
Replace Cooling Water Tower	125,000
Install Additional Fire Hydrants	75,000
Replace Steam Traps	25,000
Upgrade Ventilation Basement/Center Wing/Other Areas	65,000
Indiana, West Lafayette:	
Fume Hood	10,000
Install Insulation in Grinding Room	15,000
Iowa, Ames:	
Construct Bldg. 5 Improvements	120,000
High Priority Research List 400 NADC Master Plan	617,000
Maryland:	
Beltsville Agricultural Research Center (BARC):	
Annual Demolition	300,000
Mod Office Salaries	197,327
Inspection	51,052
Replace CFC Refrigerants	20,000
Telecommunications East and West	150,000
Road Repairs	100,000
Roof Repairs	100,000
Install Deaeratro Bldg. 014	70,000
Replace Storm/Sanitary Lines 3rd St	100,000
Convert 10 Boilers to Gas	160,000
Replace Steamlines, Bldgs. 307 and 306	150,000
Remove Pipe Chase Asbestos, Bldg. 200	150,000
Correct Water Leak, Bldg. 008, Rms. 10 and 12	20,000
Install Backflow Prevention on BARC	175,000
Install Fall Protection at Sites	70,000
Install Fence at Manure Pit	10,000
Install Smoke Indicator, Bldg 309	10,000
Repair/Repace Granary Docking/Turnheads	15,000
Replace Roof, Bldg. 161	150,000
Replace Roof, Bldg. 301	40,000
Replace Variable Frequency Drives, Bldg. 007	30,000
Correct Drainage, Bldg. 50, GH 2/Section 2	10,000
Install O/H Garage Doors, Bldgs. 029, 1124, and 1125	70,000
Replace HVAC System, Bldg. 046	45,000
Contingencies	182,683
Frederick—Upgrade HVAC/Lab Infrastructure Bldg. 1301	400,000
National Agricultural Library:	
Sprinkler System, Phase II	250,000
Replace Cooling Tower	375,000
Miscellaneous/Emergency Repairs	100,000
Facility Seismic Study	30,000
Clean Air Ducts	145,000
Michigan, East Lansing:	
Sewage Disposal Improvements	18,000
Replace Roofs	143,000
Minnesota:	
Morris:	
Install Fire Alarm System	50,000

<i>State/location/project</i>	<i>Amount</i>
Upgrade Micro-Biology Laboratory	45,000
St. Paul:	
Glazing on Greenhouse #2	15,000
Repair Structure of Building	132,000
Mississippi:	
Mississippi State—Replace Telephone System	220,000
Oxford—Renovate Chemistry Labs	150,000
Poplarville—Replace HVAC Systems and Lights in Bldgs. 1 and 2	50,000
Stoneville:	
Repair Pond Levees	88,000
Renovation of Laboratory/Quarantine Facility	100,000
Replace Underground Water Supply	100,000

Master Plan/Deficiency Study/Energy Conservation	35,000
Alter Soils Prep Bldg	85,000
Kearneysville—Maintain and Repair HVAC	30,000
Wisconsin, Madison—Upgrade Building Access	60,000
Agency Unassigned Funds	412,900
Total	18,262,395

Question. The fiscal year 1998 Appropriations Act provides \$700,000 in unrequested funding for planning and design of the Jornada Range Research Center, Las Cruces, NM. Please describe the need for this Center, the projected schedule for design and construction of the project, and what additional funds will be required, by fiscal year, to complete the project.

Answer. The Jornada Experimental Range Program investigates ecosystem processes, then uses that knowledge to develop best forage-livestock management practices and strategies for remediation and protection of desert rangelands. The Jornada programs have outgrown their temporary quarters on New Mexico State University's main campus. The scientists are currently housed in mobile trailer facilities. The laboratory and computer capabilities are inadequate for the research and information-sharing needs of Jornada's investigators and the cooperative approach necessary for the success of their program.

The projected schedule for design and construction are as follows: Start Design, July 1998; Complete Design, December 1999 (18 months); Start Construction, May 1999; Complete Construction, November 2000 (18 months).

In fiscal year 1999, \$6.7 million will be needed for construction, construction management services, and contingency.

Question. The fiscal year 1998 Appropriations Act provides \$5,200,000 in unrequested funding for planning and design work and initial construction costs for the Western Human Nutrition Research Center, Davis, California. Please describe the need for this project, the schedule for design and construction of the project, and the remaining funds required to complete the project, indicating the fiscal year for which the funds will be required.

Answer. The mission of the Western Human Nutrition Research Center (WHNRC) is to conduct research on human nutritional needs with emphasis on developing ways to measure these needs and assess nutritional status in large populations. The research directly supports the National Health and Nutrition Examination Surveys conducted jointly by USDA, FDA, and the Centers for Disease Control. WHNRC, created by Congress in 1980, is located in the former Letterman Army Institute of Research (LAIR) building at the Presidio in San Francisco now called The Letterman Complex. In October 1994, the Presidio was transferred to the National Park Service and became part of the Golden Gate National Recreation Area.

ARS has negotiated an agreement with the National Park Service to remain in the LAIR facility with about 37,000 gsf. It currently is the only tenant in the 300,000 gsf building. Beginning in fiscal year 1999, it is anticipated that the rental cost charged by the National Park Service will increase substantially from the current rate due to the Park Service's insistence on recouping facility operating costs.

ARS is currently undertaking a Master Plan Analysis of the proposed project site at Davis, California, where it plans to construct a replacement facility on the campus of the University of California. This analysis is scheduled to be complete by July 1998, with the remainder of the project schedule contingent upon appropriations received, as follows: Complete Predesign, December 1998; Complete Design, January 2000; Award Construction Contract, April 2000; Complete Construction, April 2002.

The Total project cost (planning, design, and construction) is estimated to be \$17.5 million.

In fiscal year 1998, \$5.2 million was appropriated for design and construction, resulting in a remaining need of \$12.3 million in future years.

Question. The President canceled the \$600,000 provided in the fiscal year 1998 Appropriations Act for the ARS Poisonous Plant Laboratory (PPRL) in Logan, Utah. Are the current ARS office and laboratory space and related facilities at this location adequate?

Answer. A new laboratory/office building (approximately 17,000 gsf) is needed and recommended for the ARS Poisonous Plant Laboratory by the Agency. The existing lab/office (early 1960's pre-engineered metal building) has exceeded its expected life and its occupants are crowded in its 7,500 square feet. The existing building is functionally inefficient due to the 5 different additions done over its 30-year life.

Question. Are replacement facilities recommended by ARS?

Answer. Funds for replacement facilities are not included in the fiscal year 1999 budget. As explained, the existing facilities have reached their useful life expectancy, and are inadequate for state-of-the-art research. Long term plans include a recommendation for replacement of these facilities.

Question. If so, when will these facilities be needed?

Answer. The fiscal year 1999 budget does not propose funding for this facility.

Question. On March 17, 1997, the Department of Agriculture submitted a report to the Committee on ARS' insect rearing capabilities. A copy of that report is submitted for the record. When will each of the two new facilities which the report indi-

cates are needed to mass produce high quality and effective agents at economically acceptable costs be required?

Answer. USDA/ARS recognizes the need to move forward with construction and completion of the Waimanalo, Hawaii, and Stoneville, Mississippi, rearing facilities. However, the funding for other facilities' construction and modernization is more urgent in the fiscal year 1999 budget request.

Question. What is ARS' recommended schedule for construction of each of these project?

Answer. Once funds are appropriated, planning and design will be complete in 18 months. Construction will take approximately 24 months.

Question. Please provide a status report on each of the ARS buildings and facilities for which funds were provided for fiscal year 1997 and 1998, indicating a current status of the work funded and what additional funds will be required, if any, to complete the project, by fiscal year.

Answer. The status of the fiscal year 1997 and fiscal year 1998 Building and Facilities funds, and additional funding required, will be provided for the record.

[The information follows:]

[Dollars in thousands]

Location/project status	Appropriation—		Additional funding needs
	1997	1998	
Albany, CA, Chemical Wing: Construction of Phase 7 is scheduled for completion in the 1st quarter of fiscal year 1999. This will conclude modernization of Chemical Wing	\$4,000
Davis, CA: Design is scheduled for award in the 2nd quarter of fiscal year 1998 for completion by January, 2000. Construction, which is projected at \$15.8 million, is partially funded with the \$3.5 million (within the \$5.2 million) appropriated in fiscal year 1998	\$5,200	\$12,300
Parlier, CA: Design is complete. Construction is scheduled for award in April, 1998	23,400
Montpellier, France: Construction is fully funded and contract was awarded March 23, 1998	3,400
Ft. Pierce, FL: Construction is fully funded and is scheduled for completion in the 3rd quarter of fiscal year 1999	27,000
Edwardsville, IL, Ethanol Pilot Plant: Fiscal year 1997 appropriation was provided as grant award to Southern Illinois Univ. for design of facility. Construction of facility is projected at \$19.7 million	1,500	19,700
Peoria, IL, Pilot Plant: \$8.4 million is requested in the fiscal year 1999 Budget to complete construction of pilot plant	1,500	8,000	8,400
Manhattan, KS: \$1.4 million requested in fiscal year 1999 Budget to complete total funding required for construction of Phases 1 and 2	500	9,300
New Orleans, LA, SRRC Industrial Wing: Design is scheduled for completion in December, 1998. \$6 million of the total \$20 million required for construction is requested in the fiscal year 1999 Budget	1,100	20,000
Beltsville, MD, BARC: \$2.5 million is requested in the fiscal year 1999 Budget for construction of a new Poultry Production facility and for other miscellaneous projects	4,500	3,200	98,000
Beltsville, MD, NAL: \$1.2 million is requested in the fiscal year 1999 Budget for replacement of air handler units	2,500	17,500
East Lansing, MI: Design is fully funded and contract is scheduled for award in the 4th quarter of fiscal year 1998. Construction of the facility is projected at \$17.2 million	1,800	17,200
Oxford, MS: Fiscal year 1998 appropriation was transferred to CSREES for award to Univ. of Mississippi for construction of Animal Facilities	7,000
Sidney, MT: Design of 27,780 GSF lab office and biocontainment facility is scheduled for award in the 3rd quarter of fiscal year 1998. Construction of the facility is projected at \$7.3 million	606	7,300
Las Cruces, NM: Design of 29,000 GSF lab office building is scheduled for award in the 3rd quarter of fiscal year 1998. Construction of the facility is projected at \$6.7 million	700	6,700
Greenport, NY, PIADC: \$3.5 million is requested in the fiscal year 1999 Budget for construction of Building 101 Incinerator and for accomplishing CERCLA remediation activities	5,000	2,000	61,000
Grand Forks, ND: Full restoration of Nutrition Center is scheduled for completion in the 2nd quarter of fiscal year 1999	4,400

[Dollars in thousands]

Location/project status	Appropriation—		Additional funding needs
	1997	1998	
Wyndmoor, PA: \$3.3 million is requested in the fiscal year 1999 Budget for construction of Phase 5. Appropriation provided in Fiscal years 1997 and 1998 is being used for construction of Phases 3 and 4	4,000	5,000	20,722
Charleston, SC: Construction of Phase 1 is fully funded and is scheduled for award in the 4th quarter of fiscal year 1998 for completion by the 4th quarter of fiscal year 2000. Design and construction of Phase 2 is projected at \$7.3 million	3,000	4,824	7,324
Lubbock, TX: Construction is fully funded and is scheduled for completion in the 1st quarter of fiscal year 1999	8,100
Weslaco, TX: Construction of laboratory, office and greenhouse is scheduled for completion in the 1st quarter of fiscal year 1999. Future modernization costs are projected at \$14.1 million	4,000	14,108
Leetown, WV: Design is scheduled for completion in January, 1999. Construction, which is projected at \$12 million, is fully funded	6,000	6,000
Total	69,100	79,130	319,554

APPROPRIATIONS LAW

Question. The fiscal year 1999 budget requests statutory language to facilitate land exchanges by providing the Agricultural Research Service authority to pay more than \$100 up to 25 percent of the value of land or interest transferred out of Federal ownership in order to equalize the value of exchange. Please explain why this language is needed.

Answer. In the past, ARS has received requests from non-federal entities, (state, county, and local governments including the Commonwealth of Puerto Rico) to use Federally-owned land in the custody of ARS for the construction of new schools, roads, flood control projects, etc., in exchange for land of equal value. Under ARS' current authority, the value of the land received in exchange must be within \$100 of the value of the Federally-owned land. This creates an undue burden on the non-federal entity to find a parcel of land acceptable to ARS that is equal in value within \$100. The proposed change provides more flexibility for ARS to accommodate land exchange requests from local jurisdictions.

Question. The fiscal year 1999 budget requests statutory language to grant easements at the Beltsville Agricultural Research Center, including for the construction of the Transgenic Animal Facility. Please explain in more detail why this language is required.

Answer. The Transgenic Animal Facility (TAF) will be constructed by the University of Maryland (UM) using grant funds received from the Cooperative State Research, Education and Extension Service. Section 523 of Pub.L. No. 100-202, a joint resolution making continuing appropriations for the fiscal year 1988, and other purposes, prohibits the use of appropriations "for the purpose of the sale, lease, rental, excessing, surplus, or disposal of any portion of land on which [BARC] is located at Beltsville, Maryland, without the specific approval of Congress." Easements are considered disposals, thus this law prohibits BARC from issuing easements.

Question. Does the Transgenic Animal Facility the University of Maryland will construct and this language allow the Secretary to accept replacement of an existing USDA facility?

Answer. The proposed fiscal year 1999 appropriation language provides the necessary provision for the Secretary to accept the gifted TAF building as a replacement building for an existing USDA temporary facility.

Question. Why is the University constructing this facility and not the USDA?

Answer. The University of Maryland is constructing the facility because the funds for constructing this facility are University of Maryland funds, not ARS appropriated funds. This will be a cooperative venture with USDA.

Question. What will be the annual operating costs of this facility to the ARS?

Answer. The new facility is currently under design. Therefore, we are unable to determine the actual operating costs. The current facility costs approximately \$110,000 per year for operation and maintenance. This is a temporary structure that has outlived its usefulness. With the construction of a modern facility that is energy efficient, the operating costs should be reduced.

The fiscal year 1999 budget requests statutory language for the purpose of appropriately responding to requests to make Federally-owned land and facilities available for special use and to allow fees to be charged as authorized by law.

Question. What law authorizes these fees? Please give citation.

Answer. Current laws authorizing ARS to collect fees are as follows:

—Easement law 40 USC 319, allows us to collect monetary or other consideration.

—31 USC 9701, provides the Government generally with the authority to charge fees for Government services and things of value.

—20 USC 196, subsection a, (4), authorizes the Secretary of Agriculture to charge fees for use of grounds and facilities of the U.S. National Arboretum.

—GSA Bulletin FPMR D-242, dated June 11, 1997, issued in accordance with President Clinton's memorandum of August 10, 1995, entitled "Facilitating Access to Federal Property for the Siting of Mobile Services Antennas", and section 704(c) of the Telecommunications Act of 1996, PL 104-104, (47 USC 332 note), provides authorization for agencies to charge and collect site fees and access fees.

Question. If these fees are authorized by law, why does the requested appropriations bill language "authorize" the agency to charge fees "commensurate with the fair market value, for any permit, easement, lease, or other special use authorization for the occupancy or use of land and facilities...as authorized by law"? Why doesn't the language simply permit fees authorized by law to be credited to the account and available until expended for authorized purposes?

Answer. Since existing authorities to collect fees are distinct and scattered in law, the language simply authorizes the collection and use of these fees to assure that there is no question that Congress intended ARS to collect fees for these purposes, and credit those fees to its appropriations.

Question. Please give some examples of special use permits which would be issued by the agency and what fees would be charged.

Answer. ARS is requesting the authority to issue specific use authorization, such as land use agreements or memorandum of understanding, for instances where the Federal or non-Federal entity does not use a standard lease, permit, or easement document. Special Use Permits is a general term used by some local jurisdictions or non-federal entities in place of Permits, Revocable Permits, Leases or Easements. For example, the University of California at Davis issues Land Use Agreements and CSX Railroad issues Special Use Agreements. Having authority to issue Special Use Permits would give ARS the authority to use the documents and terminology preferred by the local jurisdiction or non-federal entity. Fees, when applicable, would be based on the fair market value of the land under Special Uses Permit and would be similar to those currently charged by ARS for Easements.

FISCAL YEAR 1999 ARS SALARIES AND EXPENSES REQUEST

Question. The President's fiscal year 1999 budget recommends a number of project terminations and elimination of "Congressional add-ons" to fund "high priority" research. Why do you consider each of these projects to be of lower priority?

Answer. The fiscal year 1999 Federal budget submitted by the President recommends a number of new initiatives to address changing priorities facing agriculture and the American consumer. The research budget proposed for ARS reflects an increase of \$32 million over the current year. However, the Department is focusing on many priority agricultural issues that must be addressed now by our research scientists. This requires that ARS terminate ongoing projects and reallocate these resources to the new or expanded initiatives as recommended by the President. In this effort a number of projects were identified as less critical. As a result, a cost-effective decision was made to recommend project terminations and elimination of projects to fund higher priority research.

Question. What criteria did you impose to determine the projects and increases proposed for termination?

Answer. In order to provide financing for new and expanded high priority research in a fiscally constrained budget, it was determined that the restored projects proposed for termination in the fiscal year 1998 budget as well as all the Congressionally added projects included in the 1998 Appropriations Act be proposed for reduction in fiscal year 1999.

Question. Please explain what the Department is doing to make sure that the additional ARS positions and research program increases funded for fiscal year 1998 but not included in the President's fiscal year 1999 budget are executed?

Answer. ARS is moving forward with implementing the initiatives funded in the 1998 Appropriations Act. All new positions have been established. Recruitment ac-

tions are underway with vacancy announcements to open April 6. Research plans for these funded projects have been established and are underway.

Question. Please provide a status report on the execution of each of the following funding increases provided to ARS in fiscal year 1998:

- Vomitoxin in Wheat, \$500,000;
- Fusarium Head Blight, MN, \$500,000;
- Karnal Bunt, KS, \$500,000;
- Citrus Tristeza, \$750,000;
- Ergot Disease in Sorghum, \$300,000;
- Asian Long Horn Beetle, \$500,000;
- Apple E.Coli research, PA, \$250,000;
- Food Safety Agency Study (National Academy of Sciences), \$420,000;
- Hydrology, Canal Point, FL, \$500,000;
- Hydrologist, Dade County, FL, \$250,000;
- Melaleuca research, \$500,000;
- Appalachian Soil and Water Conservation Lab, WV, \$250,000;
- Arctic Germplasm Repository, \$650,000;
- Coastal Wetlands and Erosion Control, LA, \$1,000,000;
- Cotton Genetics, MS, \$250,000;
- Cotton Ginning, TX, \$500,000;
- Fish Disease, AL, \$250,000;
- Food Fermentation, NC, \$250,000;
- Formosan Termite, Southern Regional Research Center LA, \$5,000,000;
- Grain Legume, WA, \$250,000;
- Honeybee, TX, \$500,000;
- Hops research, OR, \$100,000;
- Lyme Disease, \$200,000;
- National Aquaculture Research Center, AR, \$500,000;
- National Center for Cool and Cold Water Aquaculture, WV, \$250,000;
- National Warmwater Aquaculture Center, MS, \$500,000;
- Natural Products, MS, \$700,000;
- Northwest Nursery Crops, OR, \$500,000;
- Organics Management Research, \$500,000;
- Plant Genetics Equipment/Greenhouse, MO, \$200,000;
- Poisonous Plant, UT, \$100,000;
- Poult Enteritis Mortality Syndrome, GA, \$250,000;
- Reproductive Efficiency of Beef Cattle, MT, \$250,000;
- Rice Research, Beaumont, TX, \$250,000;
- Rice Research, Stuttgart, AR, \$700,000;
- Small Fruits, MS, \$250,000;
- Small Grains, Raleigh, NC/Aberdeen, ID, \$450,000;
- Sugarcane Biotechnology Research, LA, \$200,000;

Answer. ARS is in the process of releasing each of these program increases added by Congress in fiscal year 1998 in the amounts and for the purposes authorized in accordance with the fiscal year 1998 Appropriations Act. A detailed listing of the distribution of these increases will be provided for the record.

[The information follows:]

AGRICULTURAL RESEARCH SERVICE—IMPLEMENTATION OF FISCAL YEAR 1998 PROGRAM INCREASES

Funding increase	Amount	Research location	Status/purpose	Status of new scientist(s) position(s)
Vomitoxin in wheat (\$500,000)	\$500,000	St. Paul, MN	Negotiations are underway with the 12 State Consortium to enter into Specific Cooperative Agreements.	Not applicable.
Fusarium Head Blight (\$500,000)	500,000	St. Paul, MN	Funds have been released for research on Fusarium head blight in wheat and other grain crops.	A Plant Pathologist and Pathologist/Microbiologist will be hired. Recruitment actions are underway with vacancy announcements opening April 6, 1998.
Karnal Bunt (\$500,000)	500,000	Manhattan, KS	Funds have been released for research to improve resistance of wheat varieties to Karnal bunt.	An Agronomist/Geneticist/or Molecular Biologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Citrus Tristeza (\$750,000)	540,000	Headquarters	Funds temporarily held at HQ. Funds will be used to fund cooperative agreements on citrus Tristeza virus research. Proposals have been submitted and are under review.	Not Applicable.
	150,000	Beltsville, MD	Funds have been released for collection of isolates of citrus Tristeza virus.	
	60,000	Orlando, FL	Funds have been released for establishment of full-time program on Citrus Tristeza Virus.	Not Applicable.
Ergot Disease in Sorghum (\$300,000)	300,000	Headquarters	Funds temporarily held at HQ. Negotiations are underway with Texas A&M and Puerto Rico University to fund cooperative research on ergot disease. In-house research is underway in Lincoln, NE, Frederick, MD, and Mayaguez, PR.	Not Applicable.
Asian Long Horn Beetle (\$500,000)	400,000	Newark, DE	Funds have been released to develop integrated pest management and biological control technology for Long Horn Beetle. Negotiations are underway for a Specific Cooperative Agreement with Cornell University to provide entomology and integrated pest management support.	An ARS Research Entomologist has been reassigned to Newark, DE to work on this research.

AGRICULTURAL RESEARCH SERVICE—IMPLEMENTATION OF FISCAL YEAR 1998 PROGRAM INCREASES—Continued

Funding increase	Amount	Research location	Status/purpose	Status of new scientist(s) position(s)
100,000	Headquarters	Funds temporarily held at HQ. Negotiations are underway to enter into a Specific Cooperative Agreement with Cornell University as outlined in a proposal from the University of Vermont to support taxonomic activities.	Not Applicable.	
Apple E. coli (\$250,000)	250,000	Wyndmoor, PA	Funds have been released and research is underway to determine the source of zoonotic pathogens in apples (<i>E. coli</i>) and to identify methods of effectively killing these pathogens.	A Food Technologist/Microbiologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Food Safety Agency Study (NAS) (\$420,000)	420,000	Headquarters	Funds have been released to fund a grant with the National Academy of Sciences to conduct the Food Safety Agency Study.	Not Applicable.
Hydrology, Canal Point, FL (\$500,000)	500,000	Canal Point, FL	Funds have been released and research is underway to develop high water table management practices for sugarcane breeding and microbiology programs.	An Agronomist and Geneticist or Soil Microbiologist will be hired. Recruitment actions are underway with vacancy announcements opening April 6, 1998.
Hydrologist, Dade County, FL (\$250,000)	250,000	Miami, FL	Funds have been released and research is underway to develop a hydrologic model to define the risk of flooding to the agricultural community in Dade County.	This position has been filled by an ARS Hydrologist selected to work on this research project.
Melaleuca Res. (\$500,000)	250,000	Ft. Lauderdale, FL	Funds have been released and research is underway to expand current research on biological control technology for Melaleuca in the Everglades.	A Research Entomologist will be hired. A position description has been developed and is currently being reviewed. Recruitment action will follow upon approval.
	250,000	Headquarters	Funds have been released and research is underway to develop Melaleuca control at the Australian Biological Control Laboratory, Brisbane, Australia.	A Research Entomologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Appalachian Soil and Water Conservation Lab, WV (\$250,000)	250,000	Beckley, WV	Funds have been released. Research is underway on the effects of timber management and accelerated harvesting on forest bio-systems.	A Plant or Soil Scientist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.

Arctic Germplasm Repository (\$650,000)	650,000	Pullman, WA	Funds have been released and research is underway on the preservation, evaluation, regeneration and storage of disease free germplasm adapted to northern soils. A Specific Cooperative Agreement with the State of Alaska Plant Materials Center to support a germplasm repository at Palmer, AK, has been completed.	A Horticulturist/Plant Pathologist or Geneticist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Coastal Wetlands and Erosion Control, LA (\$1,000,000)	1,000,000	Baton Rouge, LA	Funds have been released and research is underway on coastal wetlands and erosion control. Proposals have been submitted by Louisiana State University Agricultural Center and the Natural Resources Conservation Service for cooperative research with ARS.	An Ecologist/Water Management scientist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Cotton Genetics, MS (\$250,000)	250,000	Stoneville, MS	Funds have been released. Research is underway to develop new germplasm that will increase the genetic yield potential of upland cotton.	A Geneticist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Cotton Ginning, TX (\$500,000)	500,000	Lubbock, TX	Funds have been released. Research is underway to improve cotton quality through improved harvesting and ginning.	Two Agricultural Engineers will be hired. Recruitment actions are underway with vacancy announcements opening April 6, 1998.
Fish Disease, AL (\$250,000)	250,000	Auburn, AL	Funds have been released and research is underway to develop and implement methods to detect and prevent losses due to infectious diseases of cultivated fish.	A Fish Health Management Scientist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Food Fermentation, NC (\$250,000)	250,000	Raleigh, NC	Funds have been released. Research is underway to improve product quality and safety of brined and fermented vegetables while reducing the amount of waste generated.	A Microbial Ecologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Formosa Termite SRRC, LA (\$5,000,000)	5,000,000	New Orleans, LA	Funds have been released and research is underway. Proposals have been received from the University of Florida for cooperative research on testing existing termite control technologies.	Nine Research Scientists will be hired. Recruitment actions are underway with vacancy announcements opening April 6, 1998.
Grain Legume, WA (\$250,000)	250,000	Pullman, WA	Funds have been released and research is underway to expand the pea, lentil and legume program in basic genetics and varietal improvement.	A Geneticist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.

AGRICULTURAL RESEARCH SERVICE—IMPLEMENTATION OF FISCAL YEAR 1998 PROGRAM INCREASES—Continued

Funding increase	Amount	Research location	Status/purpose	Status of new scientist(s) position(s)
Honeybee, TX (\$500,000)	500,000	Westlaco, TX	Funds have been released and research is underway on the control of parasitic bee mites and management of Africanized bees.	An Insect Toxicologist and Research Entomologist will be hired. Recruitment actions are underway with vacancy announcements opening April 6, 1998.
Hops Research, OR (\$100,000)	100,000	Corvallis, OR	Funds have been released and research is underway for hops breeding and collection. Proposals have been received for cooperative research with Washington State University.	Not Applicable.
Lyme Disease (\$200,000)	200,000	Beltsville, MD	Funds have been released and collaborative research is underway with Yale University and the states of CT, RI, MD, NY and NJ to support the Northeast Regional Lyme Tick Control Project.	Not Applicable.
National Aquaculture Research Center, AR (\$500,000)	500,000	Stuttgart, AR	Funds have been released. Research is underway to conduct a comprehensive program to advance the cultivation of emerging warmwater aquaculture species with economic potential.	Two Aquaculture Research Scientists will be hired. Position descriptions are currently being reviewed. Recruitment action will follow upon approval.
National Center for Cool and Cold Water Aquaculture, WV (\$250,000) ...	250,000	Leetown, WV	Funds have been released and research is underway to address high priority research needs of the nation's cool and cold water aquaculture. The research program will be a cooperative and collaborative arrangement between the Leetown Science Center, West Virginia University and the ARS Appalachian Fruit Research Lab, Kearneysville, WV.	A new scientist will be hired to serve as Research Leader. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
National Warmwater Aquaculture Center, MS (\$500,000)	500,000	Stoneville, MS	Funds have been released and research is underway on the catfish genetics and breeding program. Action is also underway to modify the existing Cooperative Agreement with the MS Agr. and Forestry Experiment Station to increase funding.	An Aquaculture Production Systems scientist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.

Natural Products, MS (\$700,000)	700,000	Oxford, MS	Funds have been released and research is underway to develop natural products beneficial to agriculture. The existing Cooperative Agreement with the University of Mississippi has been modified to add additional funding.	A Research Microbiologist was selected and reported for duty in December 1997.
Northwest Nursery Crops, OR (\$500,000)	500,000	Corvallis, Or	Funds have been released and research is underway to develop physiological studies on improving transplant survival to stress and to develop cultural procedures that lead to improved root development. Proposals have been submitted for competitive cooperative agreements.	A Plant Physiologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Organics Management Research (\$500,000)	500,000	Beltsville, MD	Funds have been released and will be used to increase cooperative funding to Rodale Institute, N-Viro International and the Composting Council Research and Education Foundation.	Not Applicable.
Plant Genetics Equipment/Greenhouse, MO (\$200,000)	200,000	Columbia, MO	Funds have been released. Negotiations are underway to purchase equipment to support Seed Storage and Greenhouse Facility.	Not Applicable.
Poisonous Plants, UT (\$100,000)	100,000	Logan, UT	Funds have been released and research is underway to support poisonous plants containing pyrrolizidine alkaloids which cause excessive economic losses for the U.S. livestock industry.	Not Applicable.
Poultry Enteritis Mortality Syndrome, GA (\$250,000)	250,000	Athens, GA	Funds have been released and research is underway to address the identification and molecular characterization of agents causing Poultry Enteritis-Mortality Syndrome.	Not Applicable.
Reproduction Efficiency of Beef Cattle, MT (\$250,000)	250,000	Miles City, MT	Funds have been released and research is underway to identify the factors that affect reproduction efficiency of beef under range conditions.	An Animal Physiologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Rice Research Beaumont, TX (\$250,000)	250,000	Beaumont, TX	Funds have been released and research is underway to develop new technologies for evaluating and improving rice milling, cooking and processing quality.	A Research Chemist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.

AGRICULTURAL RESEARCH SERVICE—IMPLEMENTATION OF FISCAL YEAR 1998 PROGRAM INCREASES—Continued

Funding increase	Amount	Research location	Status/purpose	Status of new scientist(s) position(s)
Rice Research Stuttgart, AR (\$700,000)	700,000	Stuttgart, AR	Funds have been released and research is underway to improve domestic rice quality needs and breeding methods so the United States can remain competitive in the world market.	A Research Chemist and Geneticist will be hired. Recruitment actions are underway with vacancy announcements opening April 6, 1998.
Small Fruits, MS (\$250,000)	250,000	Poplarville, MS	Funds have been released and research is underway to study insect biology and develop improved methods of control in small fruit crops in the southeastern states.	A Research Entomologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
Small Grains, Raleigh, NC/Aberdeen, ID (\$450,000)	250,000	Raleigh, NC	Funds have been released and research is underway to control fungal pathogens of small grains.	A Plant Pathologist will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.
	200,000	Aberdeen, ID	Funds have been released and research is underway for improving both barley and oat genetic stocks.	Not Applicable.
Sugarcane Biotechnology Research, LA (\$200,000)	200,000	Houma, LA (New Orleans)	Funds have been released and research is underway to expand sugarcane biotechnology and to develop new varieties of sugarcane with improved quality and field performance.	A Geneticist/Plant Breeder will be hired. Recruitment action is underway with a vacancy announcement opening April 6, 1998.

Question. Provide for each of the increases requested for fiscal year 1999, how and where the new funding will be allotted.

Answer. An Implementation Plan for the requested fiscal year 1999 increases will be provided for the record.

[The information is provided:]

AGRICULTURAL RESEARCH SERVICE FISCAL YEAR 1999 BUDGET ESTIMATE
IMPLEMENTATION PLANS

OBJECTIVE I: SOIL, WATER, AND AIR SCIENCES—\$4,750,000

Watershed Health/Pfiesteria Research—\$1,000,000 (\$1,000,000 under Objective III)
—Water Quality, Nutrient Management, and Watershed Health (\$1,000,000)

Beltsville, MD, \$300,000.—Develop and evaluate management practices to prevent movement of nutrients and pathogens in manure to surface and ground water. Data will be used to enhance natural resource inventory and monitoring programs.

Beltsville, MD, \$300,000.—Evaluate and predict where best management practices to protect surface and ground water quality can be most effectively used. Data will enhance natural resource inventory and monitoring programs.

Florence, SC, \$300,000.—Develop improved methods for handling, storage, and application of manure to protect water quality. Data will be used to support natural resource inventory and monitoring programs.

Beltsville, MD, \$100,000.—Develop aquatic plant based systems to remove excess nutrients from waste and runoff water.

Global Change/Agricultural Practices and Mitigation of Climate Change Impacts—\$3,000,000

Phoenix, AZ, \$600,000.—Determine how the availability of water and plant nutrients will interact with rising temperatures and atmospheric carbon dioxide levels to affect rates of deposition of atmospheric carbon in soils of irrigated croplands. Data will enhance natural resource inventory and monitoring programs.

Ft. Collins, CO, \$400,000.—Develop a balance sheet approach to the modeling of agricultural emissions and sequestrations of greenhouse gases at the national scale as a basis for evaluating management practices and policies for reducing greenhouse gas levels and mitigating climate change impacts.

Athens, GA, \$300,000.—Develop and apply technology for monitoring methane emissions from cattle, livestock waste lagoons, and other agricultural sources, and accurately document total methane emissions attributable to agricultural activities. Data will support natural resource inventory and monitoring programs.

Auburn, AL, \$400,000.—Determine the extent of emissions or sequestration of greenhouse gases associated with various tillage systems, with and without cover crops, and develop soil management systems which mitigate against adverse effects of climate change on soil "health".

Temple, TX, \$300,000.—Determine how a changing climate and rising concentrations of atmospheric greenhouse carbon dioxide alter the carbon cycle on rangelands with emphasis on rates of accumulation of carbon in vegetation and soils.

Beltsville, MD, \$300,000.—Determine the effects of elevated atmospheric carbon dioxide levels, rising temperatures, and their interaction on physiological and other factors which influence the ability of weeds to reduce crop yields under multiple weed management systems.

Gainesville, FL, \$400,000.—Determine how water table management and other management options can be manipulated to reduce methane emissions and avoid yield losses due to elevated temperatures in rice and sugar cane.

Tucson, AZ, \$300,000.—Develop basin-scale simulation models of soil-vegetation-atmospheric fluxes of water and energy suitable for testing of proposed approaches to mitigation of climate change effects on the function and productivity of grazed, semi-arid watersheds.

South Florida Ecosystem Restoration—\$750,000

Miami, FL, \$250,000.—Develop farm-scale model to assess water quantity and quality for the Everglades restoration plan and assist action agencies and farmers in selection of Best Management Practices.

Ft. Lauderdale, FL, \$500,000.—Evaluation of natural enemies and assessment of approved natural enemies for Melaleuca control including economic and environmental impact assessment of control measures.

OBJECTIVE II: PLANT SCIENCES—\$11,300,000

Emerging Infectious Diseases—\$2,300,000

—Emerging Plant Diseases (\$1,100,000)

Beltsville, MD, \$300,000.—Identify, characterize, and develop the systematics and taxonomy of bunt and smut fungal pathogens.

St. Paul, MN, \$300,000.—Characterize the ecology and epidemiology of wheat scab and improve the genetic resistance of wheat to scab through conventional breeding and introduction of alien germplasm.

Ithaca, NY, \$250,000.—Characterize potato late blight development and develop integrated control strategies.

College Station, TX, \$250,000.—Characterize the biology, ecology, and epidemiology of sorghum ergot and develop disease management strategies.

—Biological Control of Existing Weed Infestations (\$600,000)

Albany, CA, \$300,000.—Evaluate insect biological control agents to enable effective suppression of Western invasive weeds.

Montpellier, France, \$300,000.—Collect, characterize, and process exotic microbial biological control agents in Eurasia.

—Combating New and Emerging Noxious Weed Pests (\$300,000)

Weslaco, TX, \$300,000.—Develop remote sensing technology to identify new or expanding weed infestations at early stages.

—Integrated Management and Maintenance of Lands (\$300,000)

Reno, NV, \$300,000.—Develop knowledge of natural stand renewal processes to maximize the reestablishment of desirable native grass and forage species following control of introduced weeds on rangelands and riparian areas.

Environmental Quality and Natural Resources—\$5,500,000

—Development of Biologically-Active Compounds to Replace Hazardous Agricultural Chemicals (\$2,600,000)

Gainesville, FL, \$300,000.—Identify plant emitted volatiles that naturally attract beneficial insects to control crop pests.

Oxford, MS, \$300,000.—Develop safe natural product-based algacides to selectively remove blue green algae from catfish ponds and eliminate the problem of off flavor.

Headquarters, \$2,000,000.—Competitively awarded grants to develop alternatives to Methyl Bromide.

—IPM and Area-wide IPM (\$1,400,000)

Beltsville, MD, \$250,000.—Develop a molecular systematic entomology program to support pest and natural enemy taxonomic identification and characterization for ARS and APHIS implementation programs.

College Station, TX, \$250,000.—Develop new/improved area-wide IPM technology in support of the boll weevil eradication program now being conducted by APHIS and grower run foundations.

Stoneville, MS, \$250,000.—Develop mass propagation technologies of beneficial insects for control of arthropods and weed pests, such as lygus bugs and leafy spurge.

Beltsville, MD, \$250,000.—Develop technologies for management of *Entomopharga maimaiga* a fungal pathogen of the gypsy moth in support of the Forest Service's "slow-the-spread" initiative.

Columbia, MO, \$400,000.—Develop pesticide resistant natural enemies in support of new augmentative biological control programs targeting significant insect and weed pests.

—USDA Office of Pest Management (\$1,500,000)

Headquarters, \$1,500,000.—Provide coordinated approach to minor use pesticides; interact with grower groups, and EPA; and provide more rapid response of FQPA data analysis needs.

Genetic Resources—\$3,500,000

—Food Genome Initiative (\$2,500,000)

Pullman, WA, \$275,000.—Identify genetic Loci in scrapie and other TSE.

Geneva/Ithaca, \$600,000.—Curate genome data bases for NY tomato-potato, and apple-prime fruits. Sequence rice expressed sequence tags and curate them and other information in rice genome data base. Coordinate effort with Japanese rice mapping and sequencing programs. Reconcile rice map with those for maize-sorghum, and wheat-barley-oats.

Albany, CA, \$600,000.—Sequence wheat, barley, and oat expressed sequence tags, and manage them and other information in genome data bases. Reconcile maps with those for maize-sorghum and rice.

Columbia, MO, \$500,000.—Maintain and manage genome data base for maize and sorghum. Sequence a select number of maize expressed sequence tags (probably 200,000 or fewer). Reconcile maize-sorghum maps with those for rice and wheat-barley-oats.

E. Lansing, MI, \$275,000.—Identify quarantine trail loci for disease and production traits in poultry.

Ames, IA, \$250,000.—Sequence soybean, expressed sequence tags, and manage them and other information in soybean genome data bases. Reconcile soybean maps with those for other legumes, e.g. peanuts, dry beans, alfalfa.

—Expansion of the Animal Germplasm Repository Program (\$500,000)

Headquarters, \$500,000.—Develop GRIN (Genetic Resources Information Network) data base for animals.

—Expansion of Microbial/Insect Genetic Resources Management Programs (\$250,000)

Peoria, IL, \$250,000.—Evaluate collections of yeast and fungi for improved agricultural and industrial applications for food and medicine utilizing new technologies of genetic analysis.

—Preservation of Plant Genetic Resources (\$250,000)

Urbana, IL, \$250,000.—Acquire collections of genetic stocks of maize endangered because of the death or retirement of researchers, and improve genetic stocks by introgressing mutants into superior, adapted inbred lines.

OBJECTIVE III: ANIMAL SCIENCES—\$14,700,000

Emerging Infectious Diseases—\$3,700,000

—Emerging Exotic Infectious Diseases of Livestock (\$1,300,000)

Ames, IA, \$300,000.—Johnes disease.

Pullman, WA, \$300,000.—Develop molecular markers and improved diagnostic tests to prevent importation of exotic tick-borne diseases of livestock.

Athens, GA, \$500,000.—Develop molecular vaccines and immune modulatory strategies to prevent outbreaks and spread of exotic poultry diseases, such as avian influenza.

Headquarters, \$200,000.—Build U.S. expertise in emerging diseases through joint international collaboration to develop new diagnostic tests and control strategies for exotic pathogens of livestock.

—Emerging Domestic Infectious/Zoonotic Diseases of Livestock (\$2,400,000)

Laramie, WY, \$600,000.—Develop control strategies for arbo-viral diseases of livestock, such as vesicular stomatitis, bluetongue and related viruses which prevent U.S. livestock exports.

Ames, IA, \$300,000.—Develop improved vaccine control strategies to prevent porcine reproductive and respiratory syndrome (PRRS), and gain an understanding of the epidemiology of the disease.

Ames, IA, \$300,000.—Identify causes and develop interventions for emerging swine enteric diseases, such as transmissible gastroenteritis.

Beltsville, MD, \$600,000.—Develop integrated control strategies to enhance immunity in livestock to drug resistant parasites.

Ames, IA, \$300,000.—Develop improved diagnostic tests for tuberculosis in wild-life and develop novel vaccines.

Pullman, WA, \$300,000.—Investigate the role tick-borne rickettsial bacteria as the cause of abortion in cattle.

Preharvest Food Safety—\$3,500,000

—Preharvest Food Safety (\$3,500,000)

Beltsville, MD, \$900,000.—Develop new disinfection methods and farming systems for improved sanitation of animal production facilities, and effective animal waste handling systems that will prevent the transmission of bacterial and parasitic pathogens to food producing animals and food crops.

Peoria, IL, \$300,000.—Determine how plants and *Fusarium* fungi interact during the infection and toxin production processes and how the fungi maintain resistance to their own toxins in order to develop tools to interfere with the infection process and production of the mycotoxins, such as deoxynivalenol (DON).

College Station, TX, \$500,000.—Develop techniques for manipulating the microbial ecology of the intestinal tract of agricultural and aquaculture animals to prevent the development of antibiotic resistance, particularly competitive exclusion techniques (probiotics).

Clay Center, NE, \$300,000.—Develop information on the dynamics and ecology of foodborne zoonotic pathogen transmission in cattle and their environment in order to prevent initial colonization of plants and animals.

Ames, IA, \$300,000.—Develop information on the dynamics and ecology of foodborne zoonotic pathogen transmission in swine and their environment in order to prevent initial colonization of plants and animals.

Athens, GA, \$300,000.—Develop information on the dynamics and ecology of foodborne zoonotic pathogen transmission in poultry and their environment in order to prevent initial colonization of plants and animals.

Clay Center, NE, \$300,000.—Correlate production practices and transportation systems used for cattle with post processing contamination of food products.

Ames, IA, \$300,000.—Correlate production practices and transportation systems used for swine with post processing contamination of food products.

Athens, GA, \$300,000.—Correlate production practices and transportation systems used for poultry with post processing contamination of food products.

Preharvest Food Safety (Presidential Initiative)—\$4,500,000

Athens, GA, \$500,000.—Develop methods to identify pathogens as they are found in animal waste, define their survival characteristics, and develop methods to handle and treat poultry manure during production in order to preclude transmission of pathogens to land and/or crops for human food.

Athens, GA, \$500,000.—Develop methods to handle manure on crop lands that will prevent transmission of pathogens to run off and irrigation waters, crops and to food producing animals.

Albany, CA, \$500,000.—Develop methods to identify pathogens as they are found in animal waste, and to define their survival characteristics, so that systems for sanitation to kill these pathogens can be developed for production facilities, particularly those of cattle and swine, to prevent their transmission to human foods.

Riverside, CA, \$500,000.—Define the survival and transport of pathogens from animal manures on crop lands in order to develop methods that will prevent their transmission to irrigation and drinking waters, crops and food producing animals.

Beltsville, MD, \$700,000.—Develop livestock and crop production systems to reduce nutrients and minerals that affect algal blooms.

New Orleans, LA, \$650,000.—Identify the life history states of major species of toxic algae, determine what factors control transitions between stages, and establish the role of stages in bloom dynamics in order to form the basis for effective control measures.

West Lafayette, IN, \$650,000.—Develop knowledge of animal behavior and combine with that of other sciences (animal physiology, immunology, and microbiology) to develop methods for producers to use to help assure that animals, including poultry, will arrive for slaughter following transport with fewer pathogens.

Ames, IA, \$500,000.—Develop knowledge of animal physiology, immunology, and microbiology and combine with that of animal behavior to develop methods for producers to use to help assure that food producing species will arrive for slaughter following transport with fewer pathogens.

Environmental Quality and Natural Resources—\$2,000,000

—Livestock Management Systems (\$2,000,000)

Ames, IA, \$600,000.—Identify components of swine diets that influence odor, and identify alternatives that can reduce odor from production environments.

Ames, IA, \$600,000.—Identify microbial populations responsible for the generation of major components of volatile odor compounds in fresh and stored manure.

Ames, IA, \$500,000.—Determine dietary fracture and feed management practices affecting entire microbial populations contributing to volatile organic odors.

Ames, IA, \$300,000.—Develop and evaluate environmental computer models to predict movement of volatile organic compounds from production facilities and manure store areas.

Watershed Health/Pfiesteria Research—\$1,000,000 (\$1,000,000 under Objective I)

—Aquatic Ecology and Aquaculture (\$1,000,000)

Auburn, AL, \$250,000.—Develop immunological reagents and rapid presumptive tests to detect and monitor anti-Pfiesteria antibodies and antigens in menhaden and other species of cultivated and wild fish to determine exposure to Pfiesteria.

Auburn, AL, \$250,000.—Develop and apply specific mono-clonal antibodies to identify and detect different species, strains, and life history stages of Pfiesteria and Pfiesteria-like organisms.

New Orleans, LA, \$250,000.—Determine the effects of agricultural nutrients, including interactions between specific nutrients and other water quality parameters, on outbreaks and toxicity of Pfiesteria and Pfiesteria-like organisms.

Auburn, AL, \$250,000.—Develop and apply immunodetection methods for epidemiological studies of coastal areas affected by Pfiesteria and Pfiesteria-like organisms.

OBJECTIVE IV: COMMODITY CONVERSION AND DELIVERY—\$9,970,000

Postharvest Food Safety—\$3,470,000

—Postharvest Food Safety (\$2,220,000)

Athens, GA, \$300,000.—Develop an understanding of the etiology of multidrug antibiotic resistance, including site specific integration into multidrug resistant plasmids using DNA integrons and elucidate factors in animal and plant production systems that influence the development of resistance.

Wyndmoor, PA, \$300,000.—Determine how microorganisms associated with foodborne disease become tolerant to various types of antimicrobials and to traditional food safety safeguards, such as heat or cold, low pH, high salt, and disinfectants, and elucidate factors in processing environments that influence the development of resistance.

Wyndmoor, PA, \$400,000.—Develop alternatives to traditional heat-based preservation technologies that will achieve adequate pathogen control while preserving the freshness qualities of fruits and vegetables.

Beltsville, MD, \$300,000.—Develop accurate user friendly detection methods for Cryptosporidia, Toxoplasma, and Cyclospora in animal- and plant-based foods.

Athens, GA, \$300,000.—Develop microbial sampling technologies to more accurately estimate true pathogen burden of food products for HACCP.

Wyndmoor, PA, \$320,000.—Develop computerized expert systems based on food pathogen inactivation and survival in order to evaluate both food processing systems and process controls.

Wyndmoor, PA, \$300,000.—Develop sensors to place on food products that will alert processors and consumers of products not stored safely.

New Technology to Maintain Safety/Quality of Fresh Fruits/Vegetables (\$1,250,000)

Albany, CA, \$600,000.—Develop knowledge of the attachment and detachment properties of pathogens on various fruits and vegetables.

Beltsville, MD, \$300,000.—Develop new handling systems and pathogen decontamination technology, including disinfectants and terminal pasteurization procedures for use in conjunction with packing, storing and/or processing of fresh fruits and vegetables to maintain their beneficial attributes.

Wyndmoor, PA, \$350,000.—Develop new handling systems and pathogen decontamination technology, including disinfectants and terminal pasteurization procedures for use in conjunction with packing, storing, and processing of fresh fruits and vegetables to maintain their beneficial attributes.

Postharvest Food Safety (Presidential Initiative)—\$2,500,000

Beltsville, MD, \$500,000.—For whole and minimally processed produce define the dose and conditions of treatment for both chemical and physical agents and technologies which will assure both microbiological safety and product quality in a cost effective process, and provide the necessary support for regulatory approvals.

Albany, CA, \$500,000.—For whole and minimally processed produce define the dose and conditions of treatment for both chemical and physical agents and technologies which will assure both microbiological safety and product quality in a cost effective process, and provide the necessary support for regulatory approvals.

Fargo, ND, \$500,000.—Identify and quantify toxins for algae, and develop methods for their detection and quantification in both human and animal food sources in order to help producers prevent their occurrence.

Ames, IA, \$500,000.—Develop reproducible, sensitive, and accurate laboratory tests to detect viruses of food safety concern by combining the necessary basic biological information about the viruses with the newer biotechnology being used for detection and differentiation of bacterial and animal genetic material.

Athens, GA, \$500,000.—Develop reproducible, sensitive, and accurate laboratory tests to detect viruses of food safety concern by combining the necessary basic biological information about the viruses with the newer biotechnology being used for detection and differentiation of bacterial and animal genetic material.

Global Change/Biomass for Energy—\$4,000,000

—Improve and Expand Feedstocks (\$3,000,000)

Lincoln, NE, \$600,000.—Develop improved varieties and management practices for producing switchgrass and other promising grass species for conversion to ethanol or for combusting to produce electricity.

Madison, WI, \$600,000.—Develop processes and machinery for harvesting, transporting, and storage of crop residues and dedicated energy crops, and to develop processes for biomass separation into efficient energy and coproduct streams.

St. Paul, MN, \$600,000.—Develop improved varieties and management practices for producing alfalfa and other promising legume species for conversion to ethanol or for combusting to produce electricity.

Tifton, GA, \$600,000.—Develop more productive varieties and improved management practices for switchgrass and other grasses with potential for conversion to ethanol or combustion to produce electricity.

Mississippi State, MS, \$600,000.—Develop persistent and productive legume/grass mixtures for biofuel production, which minimize nutrient inputs and energy requirements for nitrogen fertilizer production and application.

—Increase Biofuel and Biochemical Conversion Efficiency (\$1,000,000)

Peoria, IL, \$1,000,000.—To accelerate work to develop efficient processes for converting crop cellulose and hemicelluloses to ethanol, and to develop high-valued co-products that will substitute for petrochemical derived industrial products.

OBJECTIVE V: HUMAN NUTRITION—\$10,500,000

Presidential Initiative—\$10,500,000

—Nutrient—Gene Interactions (\$2,400,000)

Boston, MA, \$300,000.—Determine the regulation of the synthesis of fatty acids in response to oxidative stress and how the regulation is responsive to diet.

Little Rock, AR, \$900,000.—Determine the precise relationship between nutrients in the diet and the development of cognition in children at the molecular level.

Grand Forks, ND, \$650,000.—Identify the regulatory genes that are responsive to trace minerals in the diet with the aim of determining the regulatory genes of importance.

Houston, TX, \$550,000.—Genetic evaluation of fat metabolism in children.

—Diet and Immune Function (\$1,400,000)

San Francisco, CA, \$500,000.—Define the relationship between nutrition and the induction of the synthesis of immunoglobulins.

Boston, MA, \$250,000.—Determine changes in the immune response that occur throughout the aging process and determine if dietary antioxidants can delay or prevent such changes.

Beltsville, MD, \$250,000.—Define the role of phytonutrients to increase the immune response by looking at the induction of T-cell lymphocytes in response to foods of plant origin.

Little Rock, AR, \$400,000.—Determine foods in the diets of young children that have a positive effect on growth and development.

—Role of Nutrition throughout the Life Cycle (\$1,550,000)

Houston, TX, \$1,000,000.—Define the relationship of nutritional status at various stages of childhood to the long term needs for nutrients and the risk of nutritionally related diseases.

Boston, MA, \$550,000.—Develop an understanding of the relationship between diet and the development of vascular dementia in the elderly.

—Update the National Nutrient Databank (\$650,000)

Beltsville, MD, \$650,000.—Utilize key foods approach to update the National Nutrient Databank by analyzing the nutrient content of those foods that supply the bulk of the important nutrients in the American diet.

Diet and Human Performance—\$2,400,000

Beltsville, MD, \$500,000.—Adapt or develop methods for measuring the emerging class of putative phytonutrients which considers regional, seasonal, and maturity at harvest and can be used in field-evaluation of dietary patterns of health.

San Francisco, CA, \$750,000.—Define specific effects of energy intake on the impact of protective factors in foods on human performance.

Little Rock, AR, \$400,000.—Define material on child dietary components that affect cognitive development in children.

Houston, TX, \$250,000.—Study ethnic differences in the effect of diet on body composition in children.

Grand Forks, ND, \$500,000.—Establish influence of mineral-containing or mineral-influenced phytonutrients on marker for human performance.

Increasing the Scope of Food Nutrition Survey Efforts—\$850,000

Beltsville, MD, \$550,000.—Expand the scope of the Continuing Survey of Food Intakes by Individuals to include the NHANES measures of biological/functional indicators of nutritional status within individuals.

San Francisco, CA, \$300,000.—Assess the biological impact of the food assistance program to improve the cost-effectiveness of proper dieting.

Development of Food Consumption Methods—\$1,250,000

Beltsville, MD, \$500,000; Boston, MA, \$250,000; Little Rock, AR, \$500,000.—Develop analytical methods that will be used to determine the concentration of phytonutrients in food. Efforts will concentrate on those components suspected of having health promoting properties, particularly in carotenoids, flavonoids, glucosinylates and phenolic compounds.

NOTE.—In fiscal year 1998, an appropriation of \$5 million was provided to conduct a supplemental children's survey to the current 1994–96 Continuing Survey of Food Intakes by Individuals (CSFII). In fiscal year 1999, ARS recommends the use of these resources as follows:

Beltsville, MD, \$1,500,000.—Increase the CSFII sample size to include population groups that will require special attention as pesticide registration decisions are made under the Food Quality Protection Act.

Little Rock, AR, \$450,000.—Identify markers of nutritional well-being for use in epidemiological evaluations of disease risk.

Little Rock, AR, \$250,000.—Elucidate roles of phyto- and micronutrients in improving cognitive development.

Boston, MA \$450,000.—Examine the roles of anti-oxidants in maintaining cognitive function in the elderly.

Boston, MA, \$250,000.—Conduct epidemiological studies focused on the nutritional factors needed to prevent or delay diseases associated with aging, such as Alzheimer's disease, cardiovascular disease, and cancer.

Grand Forks, ND, \$700,000.—Determine biological functions of ultra trace elements, such as boron, aluminum, and manganese.

San Francisco, CA, \$700,000.—Improve the understanding of relationships between diet and chronic disease by evaluating commonly consumed phytonutrients' roles in minimizing oxidative damage and reducing cancer risk.

Houston, TX, \$700,000.—Determine how nutrients and other dietary constituents, including phytonutrients, act to turn on the synthesis of proteins that are required for metabolism as an essential step in developing meaningful dietary advice.

EMERGING DISEASES AND EXOTIC PESTS

Question. The fiscal year 1999 budget proposes a \$6 million increase for emerging diseases and exotic pests. What is now being spent for research on emerging diseases and exotic pests?

Answer. Emerging diseases and exotic pests are an increasing problem in the United States. USDA believes that this problem is linked to expanding intercontinental transport of goods and people, and that we should anticipate further increases in the rate of emerging diseases and exotic pests in the future. In fiscal year 1998, ARS is spending \$5,244,800 on emerging diseases and exotic pests of plants in addition to what is being spent on these pest problems through research reported under Area-wide Integrated Pest Management (IPM) and IPM component research.

Question. Please provide for each of fiscal years 1997 and 1998 a summary of the funding provided and a brief description of the research funded and where it is being conducted.

Answer. A summary of the funding, research and research locations for fiscal years 1997 and 1998 will be provided for the record.

[The information follows:]

Research area	Fiscal year—	
	1997	1998
Vomitoxin/Fusarium Head Blight	\$275,100	\$1,273,500
Karnal Bunt	218,100	714,200
Citrus Tristeza	¹ 1,513,700	¹ 2,457,100
Ergot Disease in Sorghum		² 300,000
Asian Longhorn Beetle		500,000
Total	2,006,900	5,244,800

¹ In fiscal year 1997, Total includes a Specific Cooperative Agreement with the University of Florida (\$386,000). In fiscal year 1998, approximately \$1.1 million will be used to fund competitive research proposals.

² Total includes Specific Cooperative Agreements with Texas A&M University (\$80,000) and Kansas State University (\$30,000).

Vomitoxin/Fusarium Head Blight

Peoria, IL.—1997 and 1998, Scientists in Peoria are characterizing the genetics and biosynthesis of vomitoxin, and studying the biological control of vomitoxin production.

St. Paul, MN.—1997, Scientists in St. Paul are characterizing the genetic resistance and identification of genes involved in head blight.

St. Paul, MN.—1998, Scientists in St. Paul are continuing the research begun in 1997 and are initiating a \$500,000 extramural program to support a national consortium to enhance plant germplasm to limit disease and toxin production. This research is being conducted to describe disease development and spread, and to develop new control strategies. With an additional \$500,000 appropriation, scientists at St. Paul will initiate research to evaluate the epidemiology of this disease, and describe pathogen ecology and pathotype variability.

Karnal Bunt

Frederick, MD.—1997 and 1998, Scientists in Frederick are conducting research on pathogen characterization, detection, and identification, and on disease epidemiology under field conditions.

Manhattan, KS.—1998, Scientists in Manhattan are evaluating the genetics of host plant resistance, and are conducting studies on the enhancement of host plant germplasm.

Citrus Tristeza

Fresno, CA.—1997 and 1998, Scientists in Fresno are conducting studies on disease epidemiology and identification of management strategies for tristeza under California production conditions.

Orlando, FL.—1997 and 1998, Scientists in Orlando are conducting studies on virus characterization, germplasm enhancement, disease control strategies, pathogen detection/identification methods, and virus-vector relationships.

Beltsville, MD.—1997 and 1998, Funds are used to maintain a worldwide collection of citrus tristeza virus strains. In 1998, the operation of the collection activities were increased and Headquarters held funds (\$500,000) are being used to support intramural and extramural competitive grants program that is addressing priority research objectives of the citrus tristeza problem.

Ergot Disease in Sorghum

Beltsville, MD.—1998, Headquarters held funds (\$300,000) are temporarily being allocated to: Mayaguez, PR, for research on chemical control, disease epidemiology, and germplasm evaluation and enhancement of Ergot resistant varieties; to Lincoln, NE, for pathogen detection and monitoring, evaluation of disease spread, and to determine alternate host plants; and to Frederick, MD, for research on pathogen variability.

Asian Longhorn Beetle

Newark, DE.—1998, Research is being conducted under both field and quarantine laboratory conditions on basic beetle biology, detection sampling, and control methodologies, including cultural and biological control. A Specific Cooperative Agreement was developed with the Department of Entomology at Cornell University to assist in this research effort.

Beltsville, MD.—1998, The ARS Insect Chemical Ecology Laboratory is conducting research on pheromone isolation and characterization to enhance field detection and sampling. The Systematics Entomology Laboratory is working cooperatively with the Department of Entomology at Cornell University to conduct research on beetle systematics, basic biology and pest identification methods.

Question. Of the \$6 million increase proposed for fiscal year 1999, \$3.7 million is proposed to be used to enhance the development of diagnostic tests, vaccines, and other immune strategies that prevent outbreaks and spread of exotic and zoonotic diseases, and pathogens. Please indicate for each of fiscal years 1997 and 1998 the research being funded in each of these areas and describe the progress we have made to date and why additional funds are required.

Answer. ARS has funded exotic and domestic animal disease research at a level of \$40,590,800 for fiscal year 1997 and \$39,943,900 for fiscal year 1998, respectfully. New funding is urgently needed because a number of new disease issues have emerged that are negatively impacting livestock production in the U.S. or have the potential to be introduced into the U.S. as exotic animal diseases. Recent outbreaks in 1995 and 1997 of the vector-borne disease vesicular stomatitis has cost approximately \$100 million. Tick-borne parasitic diseases and arbo-viral vector-borne diseases restrict U.S. export markets. Porcine reproductive respiratory syndrome (PRRS) emerged in the U.S. during the 1990's and is now considered the most im-

portant disease constraint for swine production. New variants of the PRRS virus caused major disease losses in 1997 in the Midwest. The emergence of several zoonotic diseases in wildlife such as tuberculosis and brucellosis pose new barriers to disease eradication in several states. The 1997 emergence of diseases such as foot and mouth disease (FMD) in Taiwan, hog cholera in Europe, and avian influenza in poultry in Hong Kong have each cost billions of dollars to animal agriculture in the respective countries where these diseases emerged. Bovine spongiform encephalopathy (BSE) in Great Britain and Europe continues to be a trade barrier issue. In summary, because of the emergence of new diseases within the borders of the U.S. and new disease outbreaks abroad, there is an urgent need for the U.S. to invest in animal disease research in order to protect our animal industries. Improved methods of disease prevention will enable U.S. livestock industries to provide the safest and most disease free livestock and livestock products in the world. This will lower production costs and allow the U.S. to continue to gain competitive advantages in international trade markets.

Highlights of progress made to date in animal infectious disease research are listed below:

Scrapie is now an endemic disease in sheep in the U.S. ARS scientists developed a non-invasive preclinical diagnostic test that will help the United States Sheep Industry significantly reduce the risk of infection from scrapie in their herds. A voluntary "scrapie free" flock certification has been established.

ARS scientists developed and evaluated a new vaccine strain of *Brucella* (RB51) that protects cattle from brucellosis and does not produce false-positive results in brucellosis screening tests, and preliminary efficacy studies show the vaccine to be effective in bison calves. However, the vaccine proved to be unsafe in pregnant bison, causing abortions after it was administered. Adaptation of the cattle vaccine for use in pregnant bison would significantly enhance efforts to control and eradicate brucellosis in bison.

ARS researchers used polymerase chain reaction (PCR) technology to identify the mycobacterium that causes TB in tissues submitted for pathologic examination. The PCR technique will benefit not only the TB eradication program but also will provide a significant contribution to agencies that must assess potential public health risks posed by the presence of mycobacterial infections in animals.

ARS scientists at the Plum Island Animal Disease Center, Greenport, Long Island, New York, have cloned the genes responsible for FMD viral proteins and expressed them in a non-infectious vector thus providing a safe source of reagents for a new diagnostic test. The availability of this type of test will reduce the risk of international trade of animals from countries free from FMD that still practice vaccination, as well as in the effective use of FMD vaccines for control strategies in the event of an outbreak in the U.S.

ARS scientists have tested two vaccine technologies using genetic material from the hemagglutinin gene of the H5 influenza virus. Both vaccines provided protection against illness and death from deadly strains of H5 avian influenza virus. The vaccines will provide a tool for use by the poultry industry and APHIS to be used in an overall eradication strategy emphasizing quarantine, biosecurity and controlled-slaughter.

ARS scientists developed a polymerase chain reaction (PCR) test that detects one form of Avian Leukosis virus-subgroup J in blood and other tissues of affected chickens. Using the PCR test, broiler breeder companies will be able to determine the incidence of this new virus infection in their breeder flocks. Additional PCR tests are needed to detect other strains of the virus.

ARS scientists have shown that *Culicoides variipennis*, a small biting midge, transmitted vesicular stomatitis virus to a vertebrate host. The understanding of the role of insects in disease transmission is essential to the U.S. ability to protect animals, humans, and U.S. agriculture against emerging pathogens.

ARS found a protein in bluetongue virus that binds to a protein in the insect vector species. This virus protein provided a first demonstration that the insect and animal host interact with this virus by different mechanisms. Blocking the attachment of the protein with this vector provides a new strategy that may prove useful in interrupting transmission.

ARS developed an electrostatic space charge supplier that removes about 95 percent of dust and airborne bacteria, such as *Salmonella*. Hatching cabinets are known to be one of the primary sources for *Salmonella* contamination of poultry. This system greatly reduces the need for chemical disinfectants, could greatly reduce cleanup and disinfection time, and is effective for dust control in other types of poultry environments.

ARS scientists developed a customized live vaccine to protect birds from losses due to coccidiosis and have shown that bird performance is comparable to birds

which are drug treated. So far, over 60 million birds have been treated with this ARS technology. This breakthrough is a major contribution in eliminating the need for chemicals in production of poultry. In addition, coccidiosis in chickens develop resistance to chemicals used for control.

Preempt, a new product created by ARS scientists, significantly reduces the potential of Salmonella contamination in broiler chickens. This new product preempts the growth of Salmonella in chicken intestines by introducing a blend of 29 live, non-harmful bacteria naturally present in healthy adult chickens. The newly developed mixture can be sprayed in a mist over newly hatched chicks to give them the protection necessary to significantly reduce potentially dangerous Salmonella in the chicken Americans eat. Preempt is the successful result of the public-private partnership where USDA patented the mixture and granted a private company a licensing agreement to market the product.

FOOD GENOME INITIATIVE

Question. A \$3.5 million increase in the ARS budget is proposed for fiscal year 1999 as part of the Food Genome Initiative. Please summarize why this funding is important and what you hope to accomplish. Is ARS doing any work in this area now or is this a completely new undertaking?

Answer. Among the major challenges facing humankind in the next century is the need for substantial increases in the production of high quality food. The Food Genome Initiative is an essential part of the USDA's and ARS' research strategy to meet that demand. The Initiative includes the mapping, identification, and understanding of the function and control of genes responsible for economically important traits in crops and livestock. ARS now devotes more than \$3 million annually to support plant genome databases and additional funds for genetically mapping of plant and animal species. This has contributed to the development of databases for nine crop species. However, there is a need to fill in gaps and expand databases on other crops and animal species. With the information gained from the genome initiative, scientists will be able to develop plants and animals with increased production traits such as growth efficiency, disease resistance, tolerance to adverse soil and climate conditions and improved nutritional quality.

FOOD SAFETY

Question. A \$14 million increase in the ARS budget is proposed for fiscal year 1999 for the President's Food Safety initiative. Please describe the Total amount of ARS funding now being committed to food safety research, where this research is being conducted, what is being accomplished, and why additional funds are required.

Answer. The Total amount of funding for ARS food safety research in fiscal year 1998 is \$54,949,400.

This research is being conducted in the following locations: Fayetteville, AR; Albany, CA; Athens, GA; Dawson, GA; Tifton, GA; Ames, IA; Peoria, IL; New Orleans, LA; Beltsville, MD; Mississippi State, MS; Fargo, ND, Clay Center, NE; Ithaca, NY; Wyndmoor, PA; College Station, TX; and Logan, UT and Headquarters.

Accomplishments of the ARS food safety research program are listed as follows by subject area:

Pathogen reduction research program.—To improve detection methods, ARS has developed:

(1) Methods for *Campylobacter* culture and identification for the Food Safety Inspection Service (FSIS).

(2) A rapid test for detecting *E. coli* 0157:H7 for use by producers and industry.

(3) Serologic tests to detect animals which have been infected but may not be actively shedding *E. coli* or Salmonella. (4) A single procedure Multiplex PCR assay for detection of *E. coli* 0157:H7 and Salmonella.

(4) PCR and immunohistochemical methods to detect Cryptosporidia.

Pathogen reduction research program.—To develop prevention techniques for pathogen avoidance, reduction, and elimination, ARS has demonstrated or developed:

(1) how infection of *E. coli* 0157:H7 can occur in neonatal and weaned calves, and that it requires 2 factors, intimin and Shiga toxin.

(2) that viable Cryptosporidia can be transmitted into oysters, clams and other aquaculture animals.

(3) bacterial cultures (preempt) to competitively inhibit Salmonella in broiler chicks, and natural substances to enhance the immune response in chicks and neonatal swine.

(4) irradiation procedures to kill *Cyclospora* on certain fruits and vegetables.

- (5) steam pasteurization for poultry to kill pathogens on poultry skin.
- (6) information identifying specific equipment materials in poultry processing facilities that are conducive to the formation of biofilms (bacterial films difficult to remove from surfaces).
- (7) spray scalding procedures to reduce cross contamination in poultry processing plants.
- (8) new methods to prevent spillage of fecal matter during initial processing and evisceration of poultry.
- (9) a hot water and quick chill (thermoflux) procedure that significantly reduces Salmonella incidence in specific, highly contaminated pork cuts.
- (10) that Salmonella and Campylobacter are increased during transportation of broilers to slaughter and that consumption of litter during fasting is a contributing factor.
- (11) that fecal shedding of *E. coli* 0157:H7 increases in cattle that are alternatively fasted and fed.
- (12) that swine carry Salmonella into the slaughter plant, because the Salmonella serotypes in trailers used for hauling swine are similar to those found in preslaughter holding pens.

Pathogen reduction research program.—In the area of risk assessment, ARS has:
 (1) Helped simplify the use of predictive microbiology in microbial risk assessment by updating the USDA Pathogen Modeling Program to the Fifth Edition. The models are now available to the public via Internet.

(2) Targeted the interactions of organic acids and temperature in relation to *E. coli* 0157:H7 for modeling studies, particularly to determine the rapidity at which this pathogen can adapt to change.

(3) Developed a technique, together with an international committee, for estimating dose-response curves based on microbiological survey and epidemiological data for foodborne pathogens for which direct human data is unlikely to be available.

Drug residues and chemical contaminants research program.—ARS research confirmed that levels of regulatory concern of dioxins in chickens resulted from ball clay that was added to soybean meal as an anticaking agent. Identification of these dioxin sources provides producers with the knowledge needed to produce dioxin-free food products. Studies of the disposition of the animal drug clenbuterol identified metabolites of clenbuterol and determined that they can be converted back to the parent drug in the GI tract; this will help to evaluate the risk of toxicity to humans. A monoclonal antibody capable of binding animal drug hygromycin B was formulated into a rapid ELISA assay, a patent issued, and the antibodies licensed to a private test kit manufacturing company.

Research program to prevent mycotoxins.—Specific genetic markers were identified in corn which contribute to resistance to both *Aspergillus* colonization and aflatoxin formation. Reporter strains of aflatoxin-producing fungi were developed and tested which allowed quantification of the amount of fungal invasion in kernels, a critical measurement in the assessment of resistance during corn varietal development by plant breeders. The reporter strains are also being used to detect compounds in corn kernels that modulate aflatoxin production. In cotton, genetic engineering has been able to transform embryos with antifungal genes to induce resistance to aflatoxin producing fungi. With walnut and peanut, ARS has significantly contributed to the germplasm transformation with antifungal genes that will enhance resistance to *A. flavus* in these crops. Biological control with competitive non-aflatoxin producing strains of the fungus now shows great promise with cotton, corn and peanut. In cotton, continued large-scale testing under the EPA Experimental Use Permit in Arizona resulted in reduced infection of cottonseed by toxigenic strains and, thus, in reduced aflatoxin levels. Experiments in GA with corn showed for the first time that biological control with a toxigenic strains of *A. flavus* and *A. parasiticus* could reduce aflatoxin contamination. Additionally, field-grown peanuts from the 1997 drought-stressed crop treated with the biocompetitive strains had aflatoxin levels reduced by 90 percent compared with untreated peanuts. To control the effects of *Fusarium graminearum* and its toxin, deoxynivalenol (DON), in wheat and barley, ARS has introduced partial resistance into wheat from lines that are more resistant under optimal conditions to the pathogen. The toxin, DON, was demonstrated to be a virulence factor for the pathogenesis of *F. graminearum* on wheat, a finding which suggests that wheat or barley germplasm with increased resistance to trichothecenes might have improved resistance to *Fusarium* diseases as well. Fungal genes that confer resistance to or detoxify DON have been identified and will be incorporated into wheat and barley to determine if they improve resistance to *Fusarium* caused head scab diseases.

Research to control the effects of toxic plants.—A study was conducted to quantify swainsonine in tissues of locoweed-poisoned sheep and determine the rate of

swainsonine clearance from animal tissues. Poisoned animals have significant tissue swainsonine concentrations and animals exposed to locoweed should be withheld from slaughter for at least 28 days to assure that the locoweed toxin has been cleared from all animal tissues. Lupine alkaloids have been detected in the blood plasma of cattle, sheep and goats after consumption of the lupines. Serum elimination times were found to vary for different individual alkaloids and measurements will be continued in order to determine definitive clearance times. Larkspur is the most important poisonous plant problem in cattle in the mountainous regions of the western United States.

Additional funds are being requested to support research initiatives to both establish a better biological understanding of pathogens and to make possible the technological advances to assure food safety and meet the expectations of the American consumer. Food safety research must meet the challenge of solving the problems resulting from emerging pathogens, changing production practices, increased pathogen resistance, increased numbers of food products, and poor food storage and preparation practices.

Question. Of the \$14 million increase requested, \$8 million is for pre-harvest food safety research to design effective control programs to prevent the spread of bacteria and parasites from animals to humans and to improve post-harvest handling practices for fruits and vegetables. Where will this research be carried out?

Answer. The requested increases for preharvest food safety research to design effective control programs to prevent the spread of bacteria and parasites between animals and humans will be carried out at the following locations: Albany, CA; Riverside, CA; Athens, GA; Ames, IA; Peoria, IL; West Lafayette, IN; New Orleans, LA; Beltsville, MD; Clay Center, NE; and College Station, TX.

Question. Are we doing any research in these areas currently? If so, what research is being conducted, where is it being carried out, and what is its cost?

Answer. ARS currently carries out food safety research in areas for which increases have been requested. Preharvest food safety research is currently being conducted at Fayetteville, AR (\$297,400); Albany, CA (\$2,153,200); Athens, GA (\$4,937,400); Dawson, GA (\$754,800); Tifton, GA (\$571,400); Ames, IA (\$3,367,100); Peoria, IL (\$3,384,100); New Orleans, LA (\$2,972,000); Beltsville, MD (\$1,971,700); Mississippi State, MS (\$677,300); Fargo, ND (\$2,024,400); Clay Center, NE (\$1,588,200); Ithaca, NY (\$320,100); College Station, TX (\$3,010,600); Logan, UT (\$1,973,700); and Headquarters (\$1,445,000).

Question. Of the \$14 million increase requested, \$6 million is for post-harvest research in support of the Hazard Analysis and Critical Control Point (HACCP) model implemented by the Food Safety and Inspection Service. Please describe this research proposal more fully.

Answer. This proposal provides for research to determine how microorganisms associated with foodborne disease become tolerant to antibiotics and to traditional food safety safeguards, to develop accurate user-friendly detection methods for pathogenic parasites and viruses in foods, to develop microbial sampling technologies to support HACCP, to develop computerized expert systems to evaluate both food processing systems and controls, to develop sensors to alert processors and consumers of food products not stored safely, and to develop new handling systems and pathogen decontamination technologies to control pathogens while preserving the freshness qualities of fruits and vegetables.

Question. Are any research monies being committed to this area currently? If so, where is that research being conducted and what is its cost?

Answer. ARS currently carries out food safety research in areas for which increases have been requested. Post-harvest research is currently being conducted at Albany, CA (\$3,876,400); Athens, GA (\$3,211,600); Peoria, IL (\$1,275,700); New Orleans, LA (\$104,400); Beltsville, MD (\$1,886,500); Clay Center, NE (\$1,738,500); Wyndmoor, PA (\$10,391,100); College Station, TX (\$806,800); and Headquarters (\$210,000).

Question. Funds were provided to the ARS for fiscal year 1998 for a study by the National Academy of Sciences on the scientific and organizational needs for an effective food safety system. Please give us a status report on this effort. When did the National Academy of Sciences receive the funds for the study? Please describe what involvement USDA is having in the study, if any.

Answer. A research agreement between the ARS and the National Academy of Sciences was completed on January 13, 1998, which provided for the agreement period of performance from January 1, 1998 through September 30, 1998. This grant from ARS will provide \$420,000 to be transferred to the Academy.

USDA has primarily a consultative and facilitative role in the study. USDA participated in the first open meeting of the committee (March 23–25, 1998) and will

assist in contacting other Federal agencies with responsibilities in food safety, and provide information as requested by the committee.

INTEGRATED PEST MANAGEMENT

Question. How will the \$5.5 million increase requested in the budget be utilized by the ARS to reach the Administration's goal of encouraging the adoption of IPM practices on 75 percent of the Nation's crop land by the year 2000?

Answer. The funding increase will be utilized by the ARS to support the Agency's efforts to develop biologically-based components needed in IPM and areawide systems that can be readily adopted by the nation's farming community. The agency is committed to reducing the use of higher risk pesticides and to promoting IPM, including biological and cultural control and other sustainable agricultural practices. The funding increase will be specifically targeted at developing biologically-active natural compounds (\$0.6 million) to attract natural enemies for control of crop pests and to control blue-green algae in catfish ponds; accelerating development of alternatives to methyl bromide by a Competitive Grants Program (\$2.0 million); developing augmentative biological control and other IPM programs for boll weevil, gypsy moth, and weed control (\$1.4 million); and to support the new USDA Office of Pest Management Policy (\$1.5 million) by providing a coordinated approach to minor use pesticides and a more rapid response to the Food Quality Protection Act data analysis needs.

The ARS areawide pest management IPM programs are coordinated across the USDA agencies, Directors of research and extension in the Land Grant system, EPA, and State and private IPM practitioners through a Departmental IPM National Coordinating Committee, Regional Coordinator Committees and Project Component Coordinating Committees with memberships from the Federal and State levels. Additionally, a number of research and extension task forces function as coordination and communication bodies, not only for the areawide IPM programs, but also for other major pest management programs administered by ARS. These task forces include representatives from Federal, State and private sectors.

HUMAN NUTRITION RESEARCH

Question. What amount of funding is currently being utilized for Human Nutrition Research?

Answer. The current funding for human nutrition research will be provided for the record.

[The information follows:]

Human Nutrition

<i>Location</i>	<i>Fiscal year 1998</i>
Arkansas Children's Hospital Research Institute, Little Rock, AR ...	\$2,769,500
Western Human Nutrition Research Center, San Francisco, CA	5,537,500
Jean Mayer USDA Human Nutrition Research Center on Aging, Boston, MA	14,909,000
Beltsville Human Nutrition Research Center, Beltsville, MD	18,645,200
Grand Forks Human Nutrition Research Center, Grand Forks, ND	8,204,400
Children's Nutrition Research Center, Houston, TX	11,191,700
National Agricultural Library	675,000
Lower Mississippi Delta Intervention Research Initiative (LA, AR, MS)	3,147,700
Other Locations	1,265,000
Headquarters (Survey of Children's Food Intake)	5,000,000
Totals	71,345,000

Question. Please describe the human nutrition research being carried out by each of the ARS Human Nutrition Research Centers and the overall objectives of this research.

Answer. The research carried out by each of the ARS Human Nutrition Research Centers and the overall objectives of this research will be provided for the record.

[The information follows:]

Beltsville Human Nutrition Research Center, Beltsville, Maryland.—Defines the role of food and its components in optimizing health and reducing the risk of nutritionally related disorders in the diverse American population. To accomplish this mission, the Center develops new methods of food analysis; determines the role of nutrients and their interactions in maintaining health; monitors nutritional intakes and maintains the database of the nutrient content of foods; studies the expenditure

of energy by using direct and indirect calorimetry; and investigates the consequences of altered nutrient intakes in free-living humans.

Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts.—Defines safe and adequate nutrient intakes and identifies factors that may contribute to degenerative processes associated with aging. To accomplish this mission, the Center determines factors related to prevention of age-related loss of bone density leading to osteoporosis and fracture, and the preservation of muscle strength; identifies dietary factors critical in slowing or preventing cataract development; determines the relation of antioxidant food components to heart disease and immune function; and explores relationships between vitamins and brain function, stroke, and dementia.

Grand Forks Human Nutrition Research Center, Grand Forks, North Dakota.—Determines nutrient needs for humans with an emphasis on mineral element requirements that prevent disease and promote health and optimal function throughout life. To accomplish this mission, the Center determines the importance of mineral elements at the molecular level with an emphasis on chronic disease; identifies detrimental functional changes, especially in bone, brain, cardiovascular and reproductive systems, that occur in the U.S. population because of improper mineral element nutrition; identifies and validates biochemical and physiological status assessment indicators for use in the study of populations at risk from inadequate mineral element nutrition; and defines the impact of environmental, dietary, physiological and psychological stressors on specific mineral requirements.

Children's Nutrition Research Center at Baylor College of Medicine, Houston, Texas.—Defines the nutritional needs of pregnant and lactating women and of their infants and children from conception through adolescence. To accomplish this mission, the Center establishes nutrient requirements to prevent low birth weight babies, particularly in pregnant adolescents; elucidates nutrient-gene interactions that regulate metabolism and disposition of nutrients; determines nutrient requirements for growth and development of school-aged and adolescent children; and establishes nutritional relationships to acute and chronic childhood diseases. *Western Human Nutrition Research Center, San Francisco, California*—determines the impacts of dietary, environmental, behavioral, and genetic factors on nutrient requirements and functions. To accomplish this mission, the Center establishes markers of nutritional status in relation to maintenance of healthy body weight, nutrition, infection and immune disorders; and protective factors in foods.

Arkansas Children's Nutrition Research Center, Little Rock, Arkansas.—Determines the role of nutrition in cognitive and behavioral function, and the health consequences of infant consumption of dietary factors (phytochemicals) such as phytoestrogens on endocrine and metabolic development and prevention of chronic diseases.

Question. What is an additional \$10.5 million required for Human Nutrition Research for fiscal year 1999 following the \$7.5 million increase provided for this research program for fiscal year 1998?

Answer. The Human Nutrition Initiative is a comprehensive multi-year plan for nutrition research, fiscal year 1998-fiscal year 2003 for which we request \$10.5 million this year. The research of the Human Nutrition Initiative will serve all Americans throughout the entire lifecycle, from maternal nutrition prior to conception through nutrition and the elderly, and includes diverse research strategies including molecular, biochemical, metabolic, behavioral, and agricultural research techniques. The Nutrition Research Initiative can help us reap benefits in terms of reduced health care costs, less morbidity and early mortality associated with chronic diseases, and improved quality of life. The Initiative harnesses the strengths of modern nutrition science and combines them with the fundamental mission of the ARS to conduct research that will define relationships between diet, genetics, and lifestyle and the risk for chronic disease in order to reduce health care costs and enhance health and life quality for Americans, improve the scientific basis for more effective Federal assistance programs, and generate a more nutritious food supply by conducting research that defines the basis for modifying the health promoting properties of plant and animal foods.

Question. How will the \$10.5 million requested be allocated, by Center, and what research will this additional funding support at each of the Centers? Please list the research projects for which increased funding is requested in order of priority.

Answer. The \$10.5 million would be allocated to the respective Centers to undertake research within the following human nutrition initiatives:

I. Nutrient—Gene Interactions (\$2,400,000)

Boston, MA, \$300,000.—Determine the regulation of the synthesis of fatty acids in response to oxidative stress and how the regulation is responsive to diet.

Little Rock, AR, \$900,000.—Determine the precise relationship between nutrients in the diet and the development of cognition in children at the molecular level.

Grand Forks, ND, \$650,000.—Identify the regulatory genes that are responsive to trace minerals in the diet with the aim of determining the regulatory genes of importance.

Houston, TX, \$550,000.—Determine which genes and nutrients interact and how they interact to mediate growth and weight gain in children.

II. Diet and Human Performance (\$2,400,000)

Beltsville, MD, \$500,000.—Adapt or develop methods for measuring the emerging class of putative phytonutrients which considers regional, seasonal, and maturity at harvest and can be used in field-evaluation of dietary patterns of health.

San Francisco, CA, \$750,000.—Define material on child dietary components that affect cognitive development in children.

Little Rock, AR, \$400,000.—Define material on child dietary components that affect cognitive development in children.

Houston, TX, \$250,000.—Study ethnic differences in the effect of diet on body composition in children.

Grand Forks, ND, \$500,000.—Establish influence of mineral-containing or mineral-influenced phytonutrients on markers for human performance.

III. Role of Nutrition throughout the Life Cycle (\$1,550,000)

Houston, TX, \$1,000,000.—Define the relationship of nutritional status at various stages of childhood to the long term needs for nutrients and the risk of nutritionally related diseases.

Boston, MA, \$550,000.—Develop an understanding of the relationship between diet and the development of vascular dementia in the elderly.

IV. Update the National Nutrient Databank (\$650,000)

Beltsville, MD, \$650,000.—Utilize key foods approach to update the National Nutrient Databank by analyzing the nutrient content of those foods that supply the bulk of the important nutrients in the American diet.

V. Diet and Immune Function (\$1,400,000)

San Francisco, CA, \$500,000.—Define the relationship between nutrition and the induction of the synthesis of immunoglobins.

Boston, MA, \$250,000.—Determine changes in the immune response that occur throughout the aging process and determine if dietary antioxidants can delay or prevent such changes.

Beltsville, MD, \$250,000.—Define the role of phytonutrients to increase the immune response by looking at the induction of T-cell lymphocytes in response to foods of plant origin.

Little Rock, AR, \$400,000.—Determine foods in the diets of young children that have a positive effect on growth and development.

VI. Increasing the Scope of Food Nutrition Survey Efforts (\$850,000)

Beltsville, MD, \$550,000.—Expand the scope of the Continuing Survey of Food Intakes by Individuals to include the NHANES measures of biological/functional indicators of nutritional status within individuals.

San Francisco, CA, \$300,000.—Assess the biological impact of the food assistance program to improve the cost-effectiveness of proper dieting.

VII. Development of Food Composition Methods (\$1,250,000)

Beltsville, MD, \$500,000; Boston, MA, \$250,000; Little Rock, AR, \$500,000.—Develop analytical methods that will be used to determine the concentration of phytochemicals in food. Efforts will concentrate on those components suspected of having health promoting properties, particularly in carotenoids, flavonoids, glucosinylates and phenolic compounds.

Question. What additional funding will be required in each future fiscal year, by Center, to meet the objectives of the Administration's Initiative on Human Nutrition?

Answer. The plan for the Administration's Human Nutrition Initiative published in the President's fiscal year 1998 Budget, called for increases in the research programs at the six human nutrition laboratories over the 1998–2002 period. This plan, updated to reflect actual 1998 appropriations, is provided for the record. However, as you know, budgets are developed on a year-by-year basis and funding estimates change based on current budget targets. The fiscal year 1999 President's Budget, submitted to Congress in February, included an additional \$10.5 million (for a Total of \$18 million) in fiscal year 1999.

[The information follows:]

AGRICULTURAL RESEARCH SERVICE HUMAN NUTRITION INITIATIVE AS PROPOSED IN THE 1998
PRESIDENT'S BUDGET—5-YEAR FUNDING

	Fiscal year—				
	1998 (actual)	1999 (estimate)	2000 (estimate)	2001 (estimate)	2002 (estimate)
Beltsville Human Nutrition Research Center (BHNRC)	\$250	\$4,200	\$7,300	\$10,500	\$14,000
Jean Mayer USDA Human Nutrition Research Center on Aging (HNRCA)	250	2,300	3,700	5,100	6,000
Children's Nutrition Research Center (CNRC) ..	500	3,000	5,100	7,100	9,000
Grand Forks Human Nutrition Research Center (GFHNRC)	250	2,100	3,200	4,300	4,900
Western Human Research Center (WHNRC)	250	2,500	4,000	5,400	6,500
Arkansas Children's Hospital Research Institute	1,000	3,900	6,700	9,600	12,600
Headquarters (Survey of Children's Food Intake)	5,000
Total	7,500	18,000	30,000	42,000	53,000

Question. Will the Administration's Initiative on Human Nutrition continue to be funded at the expense of ARS' existing research programs?

Answer. The Human Nutrition Initiative is important. Its implementation will be consistent with priorities set by the Administration. The Initiative on Human Nutrition complements ARS' existing research program. Knowledge about health-promoting foods and components of foods can be used by animal, plant, soil, and post-harvest scientists for development of methods that modify food composition both during production and processing, expand food choices, and provide more options for healthful diets. The National Nutrient Databank and the Continuing Survey of Food Intake in Individuals will both be strengthened by the Initiative. Both provide information which is foundational to agriculture production and food industries.

Question. For fiscal year 1998, one-time funding of \$5 million was provided for ARS to conduct a survey on food consumption by infants and children. Where is this reduction in funding for the one-year cost of this study reflected in the fiscal year 1999 budget?

Answer. The \$5 million allocated to ARS to conduct a survey on food consumption by infants and children in fiscal year 1998 was held at Headquarters for a one-time allocation to the survey. In fiscal year 1999, the \$5 million will be combined with a proposed increase of \$10.5 million for a Total of \$15.5 million to be allocated to the Human Nutrition Centers at Boston, MA (\$2.05 million), Little Rock, AR (\$2.9 million), Grand Forks, ND (\$1.85 million), Houston, TX (\$2.5 million), San Francisco, CA (\$2.25 million), and Beltsville, MD (\$3.95 million).

Question. Please provide the Committee with an update on the Dietary Intakes Survey.

Answer. The final year of data collection was released for the 1994-96 Continuous Survey of Food Intakes by Individuals (CSFII) and a CD-ROM of data for the entire survey was just released. The CSFII has been widely praised for its timely release of data, high response rate, ease of use of the data, and the quality of the survey. Current efforts are underway with a feasibility study directed at developing a new, computer assisted telephone interview technology to reduce the costs of conducting future surveys by providing an effective alternative to the costly on-site interview process. At the same time, data collection has begun on the year-long Supplemental Childrens Survey that will be combined with the just completed CSFII to provide the sample size needed by EPA to comply with the Food Quality Protection Act of 1996. ARS plans are to combine the Supplemental Children's Survey with the National Health and Nutrition Examination Survey (NHANES) conducted by the Department of Health and Human Services whereby food intake data can be linked to health status. This combined survey will be consistent with the National Nutrition Monitoring and Related Research Act of 1990.

Question. Why does the fiscal year 1999 request propose an increase of \$1.5 million to expand the sample size on the ongoing dietary surveys?

Answer. ARS proposes to reallocate \$1.5 million to enhance the surveys. The proposed Continuing Survey of Food Intakes by Individuals (CSFII) will increase sample size by 2,000 to assess dietary intakes by low income populations and populations at risk for disease such as the elderly and children. The data will be used by governmental policy makers to monitor effectiveness of food assistance programs.

Question. Why wasn't this expansion of the survey proposed last year?

Answer. Continued support for the survey is an integral part of the Human Nutrition Initiative to maintain baseline data on the food consumption patterns and to understand their likely impact on health and well-being. The proposal to reallocate \$1.5 million from the \$5 million 1998 increase for surveys to a specific survey in fiscal year 1999 is to meet research needs not met by the survey in fiscal year 1998. Specifically, the survey size will be increased for low income populations and populations at risk of disease.

ENVIRONMENTAL RESEARCH

Question. An increase of \$7 million is requested to support the President's Climate Change Technology Initiative. Please explain what research ARS will carry out and how this research will complement that undertaken by the Forest Service.

Answer. The \$7 million in the request would be utilized in two areas: (1) \$3 million of the proposed increase would be used to accelerate "Agricultural Practices and Mitigation of Climate Change Impacts" research which focuses on agriculture's opportunities for removing carbon dioxide from the atmosphere and storing it in soils as organic carbon (carbon sequestration). The Kyoto protocol provides credit for sequestering carbon in sinks as a portion of reductions in greenhouse gas emissions. Previous research by ARS has demonstrated that conservation practices such as the shift from conventional to minimum- or no-till systems are very effective in enhancing the uptake of soil carbon by the soil and storage in the soil. However, much remains to be done to document the various agricultural sinks, and to determine the sequestration potential of alternative management practices. (2) The remaining \$4 million will be used to initiate new research under the title "Biomass for Energy." The program's objectives are twofold: (1) the development of more productive plant materials as sources of fuel (biomass); thus, reducing the use of fossil fuels and the associated carbon-producing combustion; and (2) the development of more efficient processes for converting plant materials like switchgrass to ethanol and high-value chemicals which can substitute for petrochemicals in the manufacture of a variety of products like coatings, fuel additives, and livestock feed additives. This would provide farmers and rural communities with a more diversified commodity portfolio by adding energy-producing crops to traditional food and fiber production. The research complements that of the Forest Service by focusing on the production and utilization of highly productive grasses, as opposed to trees, and by developing methods for using stalks and other crop residues as a biomass source. ARS and the Forest Service cooperated in drafting the initiative, and ARS program leaders have begun meetings with their Forest Service counterparts to explore coordinated implementation of the research program. The research will also be coordinated with the Department of Energy.

Question. Increased funding of \$2 million is requested for ARS research on the Pfiesteria outbreak in the Chesapeake Bay. Please explain ARS' role in this research.

Answer. The increased funding will be used to develop detection methods for Pfiesteria, to determine the effect of Pfiesteria toxins on aquaculture and fish production, and to develop specific management practices and treatment technologies at the farm and watershed scale to protect water quality in order to prevent outbreaks of Pfiesteria and other harmful algal blooms. ARS research locations identified for the program increase are Beltsville, Maryland; Florence, South Carolina; Auburn, Alabama; and New Orleans, Louisiana. The ARS research program was developed in coordination with other Federal agencies as part of a national research strategy on Pfiesteria and harmful algal blooms. This multi-agency strategy was developed in the fall of 1997 through the Committee on Environment and Natural Resources of the National Science and Technology Council.

Question. Why is an additional \$500,000 requested for Melaleuca research for fiscal year 1999?

Answer. Melaleuca, the Australian paperbark tree, was introduced into Florida from Australia at the turn of the century. Well adapted to wetland areas, it escaped cultivation and now occupies about 1.5 million acres, and expands at a rate of about 50 acres per day. In the wild, Melaleuca displaces native wetland vegetation in the Everglades and other areas/waterways of south Florida, where damage from this tree is estimated at \$168 million per year. Herbicidal and mechanical control of

Melaleuca have proven ineffective in many situations, particularly for long-term control. ARS believes that biological control may provide the best option for sustainable management of Melaleuca. Although ARS has identified several potential biological control agents of this pest, safety testing, release and evaluation of these agents requires significant additional scientific research. The first biological control agent for Melaleuca, the weevil, *Oxyops vitosa*, was released in April 1997 following detailed quarantine tests that documented both the safety and effectiveness of this agent. Although the weevil is established and is beginning to cause damage to Melaleuca, ARS believes that a complex of several natural enemies will be required to effectively control this weed. In support of this program, ARS has identified many other natural enemies that are in various stages of assessment for biological control of Melaleuca. The proposed \$500,000 increase will be used to hire two new scientists at the ARS Ft. Lauderdale Laboratory to accelerate biological and safety assessments for these agents and to field release those where regulatory permits have been granted.

Question. What amount of funding is currently available for Melaleuca research, and how has ARS utilized the \$500,000 increase provided for this purpose for fiscal year 1998?

Answer. In fiscal year 1998, ARS allocated \$663,400 to research on Melaleuca control. These resources have been used in conjunction with temporary resources (\$225,000) provided by cooperators such as the Army Corps of Engineers, the South Florida Water Management District, the Florida Department of Natural Resources, the Florida Department of Environmental Regulations, and Dade County to initiate an international biological control program for management of this invasive tree. To accomplish this, ARS has stationed scientists in Australia and Florida to accelerate the biological control program for Melaleuca. Of the \$500,000 allocated to ARS in fiscal year 1998, \$250,000 was allocated to the ARS International Research Programs to hire a new scientist to locate, identify, collect and test new Melaleuca biological control agents in the weeds home range of Australia. The remaining \$250,000 is allocated to the ARS Laboratory at Ft. Lauderdale, Florida to hire a new scientist to safety test and release biological control agents onto Melaleuca in south Florida.

ALTERNATIVE SOLUTIONS TO METHYL BROMIDE

Question. What is the status of your research work to find alternative solutions to methyl bromide?

Answer. ARS is conducting research at 20 locations to find alternatives to current soil fumigation and postharvest methods requiring methyl bromide. ARS is seeking alternatives through several approaches: (1) new cultural practices; (2) improved host-plant resistance to pests and diseases; (3) biological control systems using beneficial microorganisms; (4) safer fumigants; and (5) combinations of the above. For postharvest treatment, research is directed at (1) creation of pest-free agricultural zones; (2) finding new physical methods such as heat or cold treatment or storage in modified atmospheres; (3) alternative fumigants; (4) methyl bromide trapping and recycling technologies; (5) biological control; and (6) combinations of the above.

ARS is supporting, through cooperative agreements, methyl bromide alternatives research by university scientists in Florida and California for crops that will be especially impacted by the methyl bromide ban in 2001. ARS has regular and frequent meetings with affected industry representatives to make sure that ARS research efforts as well as ARS-supported university research are properly focused on the most pressing industry problems. ARS is also working with the USDA Animal and Health Plant Inspection Service (APHIS) to develop quarantine treatment technology to interdict and eradicate exotic pests arriving at U.S. ports of entry on imported commodities, packing and crating materials, returning military equipment, etc.

Methyl bromide was only recently identified as an ozone depleting material. However, because ARS has for many years been developing non-chemical procedures to replace chemical soil and postharvest fumigations, ARS has several accomplishments in this area.

In relation to postharvest treatments ARS developed or assisted in developing include cold treatment for citrus and carambola from Florida to Japan, pest-free certification for walnuts to New Zealand, heat treatments for papaya and cold treatment for carambola from Hawaii to Japan and mainland U.S., phosphine fumigation of hay to Japan, gamma irradiation treatment of litchi, rambutan, papaya and carambola exported to the mainland U.S. and blueberry production in Florida, and forced hot air protocol for control of medfly in citrus. In addition, ARS scientists have worked with USDA Animal and Plant Health Inspection Service (APHIS) per-

sonnel to devise a risk-based quarantine standard which will be more amenable to non-methyl bromide treatments for some low-risk quarantine situations.

Accomplishments pertinent to replacing methyl bromide as a soil treatment include improved strawberry and vegetable varieties with increased resistance to some soilborne diseases and pests; microbiological agents for the biological control of some soilborne diseases of vegetables and ornamental crops; improved cultural practices, such as improved soil preparation, crop rotation systems, and altered planting dates, to mitigate the effects of some soilborne pests of strawberries, vegetable, and ornamental crops; and improved pesticide formulation and application technology for available chemicals other than methyl bromide to control plant parasitic nematodes.

Non-pathogenic variants of a tomato-infecting fungus were shown to be effective in controlling pathogenic strains. Grapevine, peach and prune rootstocks with improved nematode resistance have been developed. Methods were devised for mass-producing and stabilizing mycoherbicidal fungi for control of several weed species. Solarization of soil was shown to be effective for controlling weeds in vegetable production. Root-knot nematode resistance has been incorporated into commercial bell peppers. Impermeable films were shown to dramatically reduce the emissions of methyl bromide to the atmosphere. Fumigation with alternative chemicals was shown to be effective under some conditions for strawberries and tomatoes.

Question. What is the current level of funding for this research and how are those funds being allocated?

Answer. The current level of funding and where these funds are allocated will be provided for the record.

[The information follows:]

Location	Fiscal year—		
	1997 funds	1998 funds	1999 funds
Davis, CA	\$230,100	\$228,800	\$228,800
Fresno, CA	3,531,600	3,542,400	3,542,400

Totals	14,579,700	14,571,200	16,571,200

¹ Proposed fiscal year 1999 program increase of \$2 million (Environmental Quality/Bio-Active Compounds).

The fiscal year 1999 budget requests an increase of \$2 million for research on alternatives to methyl bromide. Dr. Horn, you indicate in your prepared statement that grower groups will work with ARS to develop the priorities for a competitively awarded program focusing on crops or uses most threatened by the loss of methyl bromide.

Question. Would you please explain how this will work and why ARS rather than CSREES will be responsible for a competitive grants program?

Answer. ARS has primary responsibility in USDA for methyl bromide alternatives research. As such, ARS has developed a broad network of State, university, and industry personnel who are interested in finding methyl bromide replacements for a

wide range of uses. ARS will use these contacts to assure that only high priority issues are addressed by any research projects funded by competitive grants funds ARS may receive. The ARS National Program Staff will ensure that funded projects will be coordinated and complementary to existing methyl bromide alternatives research. We think this program serves as an excellent model to ensuring coordination of in-house and extramural research directed toward a given problem.

EVALUATION STUDIES

Question. The fiscal year 1999 request proposes the restoration of \$913,000 for Evaluation Studies. Please provide a list of studies for the record which will be conducted with the funding proposed, including the purpose and cost of each study.

Answer. The funds appropriated for the Evaluation Studies Program are essential to provide valuable analyses and assessments from outside experts on high priority research and related issues relating to the broad Research, Education, and Economics (REE) program. These resources support studies examining the current status, results and promising future directions of research on specific issues within the scope of the REE mission. They have also allowed us to gain important assessments of the effectiveness of programs and potential ways to enhance that effectiveness to promote the highest return on investments in REE agencies. As such, these studies have provided invaluable input for planning and implementing the REE programs, resulting in stronger programs with promising outcomes.

A partial listing of projects for funding if monies are again made available are listed below. Additional study proposals are anticipated on other high-priority concerns such as food safety, transmissible spongiform encephalopathies, water quality, and other emerging issues.

1. The National Academy of Sciences Committee on Animal Nutrition—compiles nutrient requirement tables used for preparing balanced feed rations for all animals	\$100,000
2. Calcium and Related Nutrients: American Needs—reviews current information on nutrient intake to determine data gaps and to recommend adjustment of food consumption	100,000
3. Assessing the Overall Impacts of the USDA IPM Initiative—examination of IPM programs having the most significant impact on farm productivity	60,000
4. Evaluation of the National Research Initiative—review of the impact of competitive grants on agricultural technology	100,000
5. The Benefits of USDA's Investment in the 1890's—evaluation of USDA program contribution to the viability of 1890 universities	75,000
6. The Industrialization of Agriculture and Publicly-Funded Agricultural Research—evaluation of the impact of modern industrial farming enterprise on the structure of agriculture	100,000
Total	535,000

GERMPLASM

Question. Please identify the current ARS and State resources committed to maintaining plant germplasm repositories. Provide a listing of the repositories, showing federal and state resources committed to each.

Answer. The estimated funding for maintaining the ARS plant germplasm system repositories for fiscal year 1998 is \$21,405,000.

Location	Fiscal year—		
	1997 funds	1998 funds	1999 funds
Davis, CA	\$572,300	\$619,000	\$619,000
Fresno, CA	217,000	325,800	325,800
Riverside, CA	383,900	431,700	431,700
Ft. Collins, CO	2,960,200	3,193,400	3,193,400
Washington, DC	368,100	366,000	366,000
Miami, FL	670,300	666,500	666,500
Griffin, GA	1,502,800	1,494,300	1,494,300
Hilo, HI	447,400	494,900	494,900
Ames, IA	1,445,600	1,437,400	1,437,400
Aberdeen, ID	843,900	839,100	839,100

Location	Fiscal year—		
	1997 funds	1998 funds	1999 funds
Urban, IL	636,800	543,100	543,100
Beltsville, MD	3,688,600	3,539,300	3,539,300
Stoneville, MS	314,200	312,400	312,400
Fargo, ND	220,600	219,400	219,400
Geneva, NY	1,145,000		
Ithaca, NY		1,249,000	1,249,000
Corvallis, OR	767,600	813,200	813,200
Mayaguez, PR	943,900	1,159,900	1,159,900
College Station, TX	522,500	109,100	109,100
Logan, UT	145,000	144,200	144,200
Pullman, WA	1,120,600	2,312,100	1,662,100
Madison, WI	294,200	292,500	292,500
Headquarters	847,400	842,700	842,700
Total	20,057,900	21,405,000	20,755,000

State resources committed to certain repositories include both direct commitments and in-kind support to Regional Plant Introduction Stations (RPIS) and the Inter-regional Potato Station. In Total, these commitments are \$2,591,000. The direct commitments of the States can be identified and reported more accurately as off-the-top formula funding through the Regional Directors' Associations and local funds as direct contributions from the host State Agricultural Experiment Stations. These resources are identified for fiscal year 1998:

Location/site	Formula funds	Local funds
Griffin, GA, Southern RPIS	\$250,000	\$350,000
Ames, IA, North Central RPIS	497,000	324,000
Geneva, NY, Northeastern RPIS	144,000	155,000
Pullman, WA, Western RPIS	346,000	250,000
Sturgeon Bay, WI, IR Potato Station	151,000	124,000
Totals	1,388,000	1,203,000

Question. What are our unmet germplasm requirements? Please identify by repository.

Answer. The U.S. General Accounting Office's study of the U.S. National Plant Germplasm System (report GAO/RCED-98-20, October, 1997) identified some unmet germplasm requirements that fall into three principal areas. These include: the need to increase the genetic diversity in the national collections, the inadequate information on the germplasm in the collections, and the failure of the system's preservation activities to keep pace with the collections' needs. The needs encompass all activities of the germplasm system, but specific needs vary by location and crops. We have identified a number of specific activities that are of the highest priority to prevent the loss of genetic materials and to replenish long term storage and distribution centers with fresh stocks. Other activities are identified that make the collections more useful to researchers in publicly supported institutions and private industry who continue to place increased importance on having access to a broad range of genetic diversity that is critical to the improvement of plants for human and animal food, industrial, and ornamental use. All collections established must be rationalized, duplicates eliminated and core collections established which contain maximum diversity in the smallest number of samples.

LOCATION AND PRIORITY NEEDS FOR LOCATION

Palmer, AK (Pullman, WA worksite)

Acquire high latitude germplasm for the Arctic germplasm collection (barley, wheat, potato, forages, small fruits).

Develop an adequate infrastructure to preserve an Arctic germplasm collection.

Maintain virus-free potato germplasm.

(Activities of primary interest to 6 Crop Germplasm Committees (CGC's))

Davis, CA

Develop cultural practices to optimize use of the available space and long term maintenance of stone fruit, grape, and walnut germplasm collections.
 Document (passport, inventory, evaluation, and distribution data) collections in Germplasm Resources Information Network (GRIN) database.
 Conduct therapy on and maintain virus-free stone fruit collections.
 Characterize useful traits of stone fruit, grape and walnut collections.
 Conduct research to develop backup preservation technologies.
 Institute major regeneration effort for stone fruit, grape and walnut collections.
 (Activities of primary interest to 3 CGC's)

Fresno, CA

Conduct field regeneration of annual, biennial, and perennial seed-propagated crops requiring a long season, arid environment.
 Characterize germplasm during regeneration and document in GRIN database.
 (Activities of primary interest to 24 CGC's)

Riverside, CA

Acquire additional genetic diversity to fill gaps in the citrus collection.
 Conduct therapy on and maintain virus free citrus plants.
 Acquire adequate greenhouse space to accommodate the virus-free citrus collection.
 Conduct research to develop backup preservation technologies.
 Institute major regeneration effort for citrus collection.
 (Activities of primary interest to 2 CGC's)

Ft. Collins, CO

Develop reliable techniques for cryopreservation of a wide range of clonally-propagated species. Perform seed germination tests on accessions maintained in base and active collections.
 Provide backup to active collections by preserving seed, vegetative buds, in vitro plants and pollen.
 Develop methodologies for the long-term preservation of non-orthodox seeds.
 (Activities of primary interest to all CGC's)

Washington, DC

Acquire and maintain field plantings of woody and herbaceous ornamental germplasm.
 Characterize horticultural value of assembled woody and herbaceous ornamental collections.
 Document (passport, inventory, evaluation, and distribution data) collections in GRIN database. Cooperate with botanic gardens and arboreta to document woody plant collections in the U.S. Conduct research to develop backup preservation technologies.
 (Activities of primary interest to 5 CGC's)

Miami, FL

Conduct therapy on and maintain virus free sugarcane and fruit collections.
 Maintain collections of tropical and sub tropical fruit germplasm of important and potentially important species.
 (Activities of primary interest to 3 CGC's)

Griffin, GA

Regenerate, backup to base collection, and make available for distribution, 1481 diverse species.
 Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.
 Maintain in vitro the sweet potato germplasm collection in alternate location (Ft. Collins). Rationalize major collections (sorghum, cowpea, peanut) for redundancy.
 Complete the elimination of seedborne viruses from all peanut and cowpea accessions.
 Conduct research to develop backup preservation technologies.
 (Activities of primary interest to 7 CGC's)

Hilo, HI

Conduct therapy on and maintain virus-free fruit and nut collections.
 Conduct research to develop backup preservation technologies.
 (Activities of primary interest to 1 CGC)

Ames, IA

Regenerate, backup to base collection, and make available for distribution, 1770 diverse species.

Expand regeneration and characterization of the maize collection; expand germplasm enhancement of maize (GEM) project.

Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.

Conduct research to develop backup preservation technologies.

Institute major regeneration effort for maize, sunflower, melon, and cucumber collections.

(Activities of primary interest to 9 CGC's)

Aberdeen, ID

Regenerate wheat, barley, oat, and rice accessions on a regular basis to insure availability.

Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.

Regenerate and maintain the integrity of the barley genetic stock collection.

Acquire additional accessions of wheat wild relatives to increase the collections genetic diversity.

Acquire adequate quarantine greenhouse space for increasing weedy relatives of small grains.

Upgrade seed storage facility.

Institute major regeneration effort for small grain wild relatives.

(Activities of primary interest to 4 CGC's)

Urbana, IL

Acquire additional genetic diversity to fill gaps in the soybean collection.

Upgrade seed storage facility.

Regenerate maize genetic stocks and fill requests for seed.

Acquire necessary greenhouse space for maintaining soybean wild relatives and maize genetic stocks.

Institute major regeneration effort for maize genetic stocks.

(Activities of primary interest to 2 CGC's)

Beltsville, MD

Maintain and improve the GRIN database support for all sites.

Develop acquisition priorities across all crop species.

Provide taxonomic support for GRIN and all active collection sites.

Maintain prohibited species in quarantine and conduct required tests to determine pathogen status.

Conduct research to develop improved quarantine testing methods.

(Activities of primary interest to all CGC's)

Stoneville, MS

Institute major regeneration effort for soybean accessions adapted to Southern latitudes.

(Activities of primary interest to 1 CGC)

Ithaca, NY

Backup apple germplasm collection as cryopreserved, vegetative buds.

Conduct research to develop backup preservation technologies for grape and sour cherry germplasm.

Document (passport, inventory, evaluation, and distribution data) collections in GRIN database. Institute major regeneration effort for apple, onion, brassica, and winter squash collections.

(Activities of primary interest to 5 CGC's)

Fargo, ND

Maintain flax collection.

Document (passport, inventory, evaluation, and distribution data) collection in GRIN database.

Corvallis, OR

Maintain field greenhouse and screenhouse plantings of small fruit germplasm.

Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.

Develop cultural practices to optimize use of the available space and long term maintenance of pear and temperate nut germplasm collections.

Conduct therapy and maintain virus-free small fruit collections.
 Institute major regeneration effort for small fruit pear, temperate nut, mint, and hops collections.
 (Activities of primary interest to 2 CGC's)

Mayaguez, PR

Conduct quarantine growout of sorghum and maize accessions introduced into the U.S.

Maintain accessions of tropical fruit and nut species.
 Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.

Maintain sorghum genetic stocks.
 Institute major regeneration effort for sorghum (see Griffin, GA).
 (Activities of primary interest to 2 CGC's)

College Station, TX

Upgrade seed storage facility.
 Regenerate cotton collection on a timely basis. Document (passport, inventory, evaluation, and distribution data) cotton and pecan collections in GRIN database.
 Maintain and distribute cotton genetic stocks.
 Acquire additional genetic diversity to fill gaps in the pecan collection.
 Conduct research to develop backup preservation technologies.
 Institute major regeneration effort for cotton and pecan collections.
 (Activities of primary interest to 2 CGC's)

Logan, UT

Maintain in-field rangeland grass collection. Document (passport, inventory, evaluation, and distribution data) collection in GRIN database.
 (Activities of primary interest to 1 CGC)

Pullman, WA

Regenerate backup to base collection, and make available for distribution 2427 diverse species.
 Regenerate difficult to grow alfalfa, clover, and sugarbeet accessions to make them available.
 Complete the elimination of seedbourne viruses from all bean and pea accessions.
 Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.
 Institute major regeneration effort for alfalfa, sugarbeet, chickpea, lentil, clover, pea, and bean collections.
 (Activities of primary interest to 10 CGC's)

Madison, WI

Acquire additional potato wild relatives to fill gaps in the genetic diversity of the collection.
 Study the effect of the genebank's procedures on the genetic diversity of the potato collection.
 Complete taxonomic identification of potato wild relatives in the collection.
 Document (passport, inventory, evaluation, and distribution data) collections in GRIN database.
 Institute major regeneration effort for potato collection.
 (Activities of primary interest to 1 CGC)

FUNDS AND RESEARCH MANAGEMENT

Question. How much money budgeted for positions was due to lapse at the end of each of fiscal years 1996 and 1997?

Answer. Money budgeted for positions in fiscal years 1996 and 1997 was due to lapse in the amount of \$12.4 million and \$12.9 million, respectively.

Question. What was done with this savings in each of these years? Please be specific as to the purposes for which these funds were used and the extent to which funds were obligated at the location at which they were saved.

Answer. A portion of these projected lapsed funds accrued to Headquarters and were reallocated as follows:

Use of funds	Fiscal year—	
	1996 funds	1997 funds
Area-Wide Priorities (Research Equipment and Other High Cost Needs)	\$2,343,900	\$5,325,500

Use of funds	Fiscal year—	
	1996 funds	1997 funds
Location Closures, Conversions, and Transfers	2,299,500	602,700
Food Nutrition Study (Beltsville, MD)		500,000
Remedial Investigation and Feasibility Study (Beltsville, MD)		1,400,200
Removal Actions (Hazardous Waste Material)	436,900	
RCRA Closure Sites (Orient Point, NY)	360,000	
Senior Executive Service and Other Relocations	309,500	194,000
Oil Spill (Orient Point, NY)	164,500	
M. Shahan Repairs(Orient Point, NY)		113,000
Docks and Harbors Repairs (Orient Point, NY)		1,027,300
Environmental Site Assessment Phase II Sampling (El Reno, OK)	70,000	
Agency-Wide Hazardous Waste Cleanup	68,400	
Subtotal	7,452,900	7,762,500

The balance of accrued lapsed salaries was retained at ARS field locations for locally-based spending decision. Approximately, 40 percent of the savings were obligated at the locations where they were lapsed. The primary uses of these funds were for research equipment, employee relocations, facilities repair and maintenance, safety and health improvements, and unanticipated operating needs. The remaining 60 percent, as reflected in the funding table above, was used for Agency priorities not necessarily at the location where the funds were lapsed. An example of this would be the funding provided for location closures; no lapse occurred at these locations, however, funds were obligated at these sites for closure costs.

Question. How many active research projects does ARS currently engage? How many of these are to support production agriculture?

Answer. There are currently 1,078 active research projects. Seventy percent of these projects support production agriculture.

Question. How does the ARS assess the needs of producers in determining its research priorities?

Answer. As an Agency committed to finding solutions to "agricultural problems of high national priority," ARS actively maintains close interaction with its customers. The enactment of GPRA has encouraged ARS to make these lines of communication more formal and more explicit. At the headquarters level, ARS senior managers, including the members of the National Program Staff, are in regular contact with a wide range of organizations representing all aspects of agricultural production, processing, distribution, and consumption. Area Directors are continually interacting with producers within their jurisdiction. At the Laboratory level, our scientists are in almost daily contact with farmers, ranchers, and other users that have an interest in their research. We sometimes enter into agreements with local producers to test new practices or technologies under actual conditions. ARS conducts a large number of workshops annually to review its research programs and results. Customers of the research are usually included in order to get their input into the research. The accumulated effect of all these interactions is a research program that is relevant and able to meet the most critical needs of American agriculture. In addition, ARS is currently reorganizing its research activities into 25 National Programs. On February 23, 1998, we placed 25 descriptive statements on the ARS Home Page at the Internet address <http://www.ars.usda.gov>, and invited our customers, stakeholders, partners, and the general public to review and comment on them. The input we receive from our customers will play a major role in shaping our new national programs. We will continue to receive comments until the end of April 1998.

Question. How many scientists are currently on board? How many were on board at the beginning of each of fiscal years 1996 and 1997?

Answer. Currently the Agricultural Research Service employs 1,804 full time, permanent research scientists. At the beginning of fiscal year 1996, there were 1,849. There were 1,824 research scientists at the start of fiscal year 1997.

EXTRAMURAL FUNDING

Question. Please list the funding ARS commits to land grant universities. Please identify the amounts by recipient.

Answer. A list of funding committed to land grant universities will be provided for the record.

[The information follows:]

<i>School</i>	<i>Fiscal year 1997</i>
Alabama Agri and Mech College	\$10,000
Alcorn State (MS)	450,200
Auburn University	81,600
Central Oregon Experiment Station	18,500
Clemson University	43,900
Colorado State University	810,000
Cornell University	1,157,900
Florida Agri and Mech University	25,200
Georgia Coastal Plain Expt. Station	54,600
Illinois Ag. Expt. Station	42,000
Iowa State University	529,700
Kansas State University	483,600
Langston University	3,500
Louisiana State University	145,900
Michigan State University	248,700
Mississippi Ag. and Forestry Expt. Sta	1,501,300
Mississippi State University	918,600
Montana State University	262,400
New Mexico State University	831,100
New York Ag. Expt. Station	25,000
North Carolina State University	676,200
North Central Ag. Expt. Station	134,300
North Dakota State University	453,500
Ohio State University	64,000
Oklahoma State University	322,500
Oregon State University	526,000
Pennsylvania State University	220,700
Prairie View A&M College	10,000
Purdue University	1,157,500
Rutgers University	54,500
South Dakota State University	80,500
Southern University	289,700
Texas A&M University	682,600
Texas Ag. Expt. Station	8,000
Tuskegee Institute	61,900
University of Arizona	203,100
University of Arkansas	489,800
University of California	2,853,200
University of Connecticut	50,000
University of Delaware	12,500
University of Florida	1,143,300
University of Georgia	253,200
University of Hawaii	1,573,600
University of Idaho	276,600
University of Illinois	325,500
University of Kentucky	15,000
University of Maine	32,800
University of Maryland	755,000
University of Massachusetts	14,800
University of Minnesota	209,900
University of Missouri	765,400
University of Nebraska	695,500
University of Puerto Rico	25,000
University of Tennessee	40,000
University of Vermont	45,000
University of Wisconsin	861,700
University of Wyoming	155,000
Utah State University	193,900
Virginia Polytechnic Institute and State University	70,800
Washington State University	727,400
Total	24,173,600

Question. Please identify other extramural recipients of ARS research contracts. Answer. In fiscal year 1997 ARS committed \$11.64 million to Tufts University and \$.646 million to The Consortium for International Earth Science Information Network (CIESIN) for research contracts. In addition, Westat Inc. received \$3.4 million

from ARS of which \$5 million was provided by Food, Nutrition, and Consumer Services.

Question. In fiscal year 1998, the Committee directed that general reductions be taken across each program, project and activity. What was the magnitude of the fiscal year 1998 general reduction and explain how this was implemented?

Answer. As directed by the Congress, the agency applied general reductions totaling \$3.8 million in fiscal year 1998. This was implemented through an across-the-board reduction of all research projects.

Question. Provide for the record fiscal year 1997 obligations incurred and your current fiscal year 1998 funding estimates for the following areas of research: canola, hops, kenaf, guayule, lesquerella, and sunflowers. Similarly, provide the Committee with information on the following pests: bollworm, boll weevil, whitefly, karnal bunt, fire ant, and gypsy moth.

Answer. Obligations incurred for fiscal year 1997 and fiscal year 1998 estimated funding for crops and pest research are provided as follows:

CROPS AND PESTS RESEARCH

CROPS AND PESTS RESEARCH	Fiscal year	
	1997 obligations	1998 funding
Crops:		
Canola	\$349,110	\$350,000
Hops	382,751	491,000
Kenaf	1,318,353	737,100
Guayule	598,601	564,500
Lesquerella	482,591	329,200
Sunflower	2,514,329	2,252,300
Pests:		
Boll Worm/Corn Earworm	4,206,110	4,182,500
Boll Weevil	1,768,202	2,586,100
Whitefly	5,527,905	5,883,400
Karnal Bunt	423,542	714,200
Fire Ant	1,028,646	1,152,800
Gypsy Moth	1,675,631	1,832,100

CENTERS OF EXCELLENCE

Question. For fiscal year 1999, please identify the proposed funding for ARS Centers of Excellence, where they are located, how they were selected, and their proposed funding and staffing levels as compared with fiscal year 1997 and fiscal year 1998.

Answer. The ARS Centers of Excellence are selected by matching the critical and/or priority needs of ARS and the collaborating 1890 Universities which possess the expertise and excellence required to address the program mission and goals. These matches are often based on expansion of existing cooperative research programs and the institution's strength.

The location, funding and staffing levels of the ARS Centers of Excellence for fiscal years 1997, 1998 and 1999 are as follows:

Location	Fiscal year—					
	1997		1998		1999	
	Funds	Scientists	Funds	Scientists	Funds	Scientists
University of Arkansas Pine Bluff, AR	\$373,300	1.0	\$537,900	2.0	\$537,900	2.0
Delaware State University Dover, DE	250,000	1.0	248,500	1.0	248,500	1.0
University of Maryland Princess Anne, MD	245,600	1.0	244,400	1.0	244,400	1.0
Alcorn State University Lorman, MS	165,700	1.0	164,700	1.0	164,700	1.0
Langston University Langston, OK			199,000		199,000	
Tennessee State University McMinnville, TN	491,200	2.0	488,400	2.0	488,400	2.0

Location	Fiscal year—					
	1997		1998		1999	
	Funds	Scientists	Funds	Scientists	Funds	Scientists
Total	1,525,800	6.0	1,882,900	7.0	1,882,900	7.0

Question. Describe the programs at each of the Centers.

Answer. The research programs at each of the Centers will be provided for the record.

[The information follows:]

Swine Production at Alcorn State University.—The objective of the program is to develop an efficient system for the production of meat type hogs in the Southern United States. The research includes the evaluation of breeds of swine suitable for production in Southern climates, the use of local feeds, and development of feeding systems to obtain efficient production of pork.

Aquaculture Products at Delaware State University.—This program will develop rapid detection and monitoring methods for pathogens and spoilage microorganisms in aquaculture processes and products and improving the efficiency of purging contaminants in order to prevent human illnesses.

Grazing Lands at Langston University, Oklahoma.—The objective of this program is to determine impact of pasture design and grazing animals on quality of water emerging from watersheds, and develop pasture management systems that will optimize water quality and productivity in the semi-arid U.S.

Horticulture at Tennessee State University, McMinnville.—The objective of the program is to develop new and improved ornamental trees and shrubs for the U.S. nursery industry. The research includes development of basic genetic and physiological information related to nursery crop species; reduce pesticide use and fertilizer runoff during nursery crop production; develop improved nursery crop propagation methods; and evaluate existing germplasm or ornamental trees and shrubs for pest resistance, tolerance of environmental stress, and superior ornamental value.

Aquaculture at University of Arkansas at Pine Bluff.—The ARS Aquaculture Systems Research Unit develops and evaluates new or alternative aquaculture production systems, particularly small scale systems, and develops new components of these systems to improve the efficiency of fresh water fish farming. Research also addresses improvement of cultivation and processing methods to enhance the quality of farm-raised fish and their products.

Critical Control Points in Model Systems at University of Maryland Eastern Shore (UMES).—The program seeks to determine the natural prevalence of bacterial pathogens in poultry grow-out houses, processing plants, and in distribution channels; to conduct challenge studies on critical control points in model systems to provide data for predictive model development; and to develop risk assessment models for use in hazard management systems. In particular, the laboratory is developing risk assessment and predictive models to provide the scientific basis for Hazard Analysis Critical Control Point (HACCP) systems in poultry production, processing, and distribution. ARS research is conducted in close collaboration with the USDA Food Safety & Inspection Service (FSIS), providing critical research to support their regulatory mission.

Question. What working relationship and accomplishments have resulted from these collaborations?

Answer. The working relationship and accomplishments that have resulted from these collaborations will be provided for the record.

[The information follows:]

Alcorn State University.—Through meetings and visits of Alcorn personnel to ARS laboratories, ARS scientists have developed a good working relationship with the Center. As a result, new breeds of swine have been purchased for evaluation and an artificial insemination program utilizing semen from superior boars, has been initiated.

Delaware State University at Dover.—The ARS aquaculture program is housed in the Delaware State University (DSU), Department of Agriculture and Natural Resources. Close working relationships have been established with DSU's two aquaculture faculty members who have also participated in the recruitment for an ARS aquaculture research scientist to be based at DSU. The ARS research program will complement DSU's aquaculture research program. The ARS National Program Leader for Aquaculture is a cooperator in a Capacity Building Grant application for aquaculture research submitted to the USDA Cooperative State Research, Education, and Extension Service.

Langston University, Oklahoma.—ARS will assist Langston University in establishing a Grazing Lands Center of Excellence in fiscal year 1998. It is a worksite of the ARS grazing land research laboratory at El Reno, Oklahoma. The details of the program have not yet been developed, but it is expected to focus on pasture management by small farmers. ARS will soon station a plant physiologist at the Grazing Land Center of Excellence.

Tennessee State University at McMinnville.—A Director of the new research facility has been appointed by Tennessee State University (TSU). An excellent collaboration has been established between TSU, ARS and the Tennessee Nursery industry. This partnership has resulted in jointly establishing research objectives including breeding for resistance to dogwood anthracnose and the development and use of natural products for pest and disease control on nursery crops. Evaluation of several new shrubs and trees has been initiated in the genetics program of plant improvement for the Tennessee industry.

University of Arkansas at Pine Bluff.—The ARS Aquaculture Systems Research Unit (ASRU) and University of Arkansas at Pine Bluff (UAPB) have entered into a cooperative partnership to promote and facilitate the expansion of aquaculture in Arkansas and the surrounding areas of the Mississippi Delta. The location of the ASRU at UAPB has enabled ARS to hire UAPB students as aquaculture technicians and has enhanced ARS' ability to recruit from a broadened pool of highly-trained and competent minority candidates from the UAPB Aquaculture Center of Excellence program. As part of an effort to enhance production related research capabilities at UAPB, ARS funded a grant to UAPB for the construction of a research pond complex of 21 ponds (0.25 acre each) and a support building at the UAPB Aquaculture Research Station.

University of Maryland Eastern Shore (UMES).—The working relationships of ARS with the UMES are very close. ARS established a work site at the UMES, Princess Anne, MD, in fiscal year 1994 as a satellite laboratory of its Eastern Regional Research Center (ERRC). The ARS laboratory uses UMES laboratory space and UMES scientists and students to provide support for the research program. UMES students are employed by the ARS staff to conduct modeling studies. A UMES faculty member is employed during the summer months. The ARS laboratory at UMES has developed The Salmonella Risk Assessment Modeling Program for Poultry, version 1.0 as a guide for processors and regulatory personnel to evaluate the public health consequences of changes in the poultry grow-out to consumption continuum. It is now being evaluated by two of the largest U.S. poultry processors.

AIR QUALITY (PM-10) RESEARCH

Question. Where does ARS perform Air Quality (PM-10) research. Please describe the program, funding, and staffing by location.

Answer. At Pullman, Washington, 1.3 scientist years (SY's) and \$477,800 are allocated to PM-10 and PM-2.5 research which refers, respectively, to atmospheric particulates equal to less than the 10 and 2.5 micrometers in size that are said to reach and endanger human lungs. The research is directed to a) understanding how particulates are emitted from agricultural fields during field operations and wind storms, b) determining the origination of particulates, c) developing methods for reducing particulate emissions, and d) developing a PM-10 prediction technology for use in assessing alternative methods of controlling particle emissions.

At Manhattan, Kansas, 1.0 SY and \$166,800 are allocated to research on PM-10 and PM-2.5 particulates and on developing a PM-10 and PM-2.5 module for inclusion in a wind erosion model (Wind Erosion Prediction System—WEPS). The erosion prediction model will be used to select, from among alternative land treatments, the most appropriate treatments for controlling wind erosion and particulate emissions.

At Lubbock, Texas, 1.5 SY and \$317,600 are allocated to field measurement and documentation of particulate fractions during wind erosion events.

Question. What funding is included in the fiscal year 1999 budget for PM-10 research. Please give program, funding, and staffing by location.

Answer. The fiscal year 1999 budget and staffing is the same as that for fiscal year 1998; as described above.

Question. What major accomplishments have come from your research in this area?

Answer. (a) Considerable progress has been made in identifying how PM-10 emissions occur during weathering, tillage, traffic, and abrasion by wind-blown soil clods. (b) Progress has been made in establishing typical emission rates under field conditions for various tillage practices. (c) The PM-10 module for inclusion in the wind erosion model has been developed, but still needs validation. (d) The prediction model being developed for Washington is an interim model pending completion of

the wind erosion model. (e) A scientist in Pullman, WA, has developed a biologically-based method for determining the sources of particulates (e.g. agricultural fields, roads, parking lots).

Question. How is the ARS research effort connected at all to the San Joaquin Valley PM-10 study funded in part through CSREES?

Answer. The ARS program and the CSREES-administered PM-10 program in the San Joaquin Valley of California are funded separately. However, there is coordination, communication, and cooperation between the programs. California personnel participate in the review and planning meetings of the Washington study (which is a jointly funded study between ARS, CSREES-administered Washington State University projects, EPA and State of Washington agencies), and ARS and other co-operators in the State of Washington participate in similar California meetings.

PRECISION AGRICULTURE

Question. Dr. Horn, I understand that ARS scientists at Stoneville and Mississippi State have been working with scientists at the National Aeronautics and Space Administration (NASA) and Mississippi State University on precision agriculture. Please bring the Committee up to date on your current activities and future plans, including possible matching funds from NASA.

Answer. The ARS Application and Production Technology Research Unit (APTRU) at Stoneville has been informally collaborating with NASA's Space Remote Sensing Center (SRS) at the John C. Stennis Space Center. Negotiations are proceeding regarding a more formal collaborative arrangement. The Crop Simulation Research Unit (CSRU) at Mississippi State is currently a participant, with Mississippi State University (MSU), in the 5-year National Site Verification Index Program that is funded by NASA. Under the terms of this participation, CSRU has access to \$25,000 of the \$50,000 annual Total provided to MSU under the grant. CSRU is also a member of the Mississippi Coalition for Applications in Remote Sensing (MCARS), of which MSU and SRS are also members. MCARS is currently developing a proposal for funding under the Mississippi Challenge program, which is a matching funds program between NASA and the State of Mississippi. At both Stoneville and Mississippi State, the purpose of the research is to improve the tools and technologies of precision agriculture (i.e., remote sensing, geographical information systems, yield monitors) to assist producers in treating crop fields on a site-specific basis. The role of the APTRU is to conduct research on the application of various crop inputs (e.g., fertilizers, pesticides) to counteract crop stresses. The role of CSRU is, through simulation of crop growth, to provide decision support and even control of settings on equipment that apply various crop inputs. A major goal of each location is to produce precision agriculture tools that are economical, effective, and easy to use and understand.

INTEGRATED WATERSHED RESEARCH

Question. The Joint Explanatory Statement of the Conferees accompanying the conference report on the fiscal year 1998 appropriations Act directed that the USDA-ARS National Sedimentation Laboratory initiate an integrated watershed research program in the Yalobusha River Basin, stream estuaries, and Grenada Lake. What is ARS doing to carry out this directive?

Answer. The National Sedimentation Laboratory (NSL) has initiated several research activities in the Yalobusha River Basin (YRB) to meet the Congressional mandate. These research activities were primarily designed to establish a reference database against which the effect of evolutionary and proposed channel adjustment measures by the Army Corps of Engineers (COE) for flood control, as well as their environmental impact on Grenada Lake, can be assessed and to provide the COE with needed information for selecting locations for channel stabilization measures.

A geomorphic study was conducted which summarizes the historical background of channel changes, hydrologic conditions, stages of channel evolution, dominant watershed processes, bed material, and streambank stability conditions for the preconstruction phase. As part of this partially COE-funded study, geographic information (GIS) based maps were prepared showing stages of channel evolution, location of migrating scour holes, bed material type, and sampling locations. This information has been provided to the COE to assist them in selecting the most suitable locations for the placement of grade control structures and other channel improvement and stabilization measures, while at the same time providing the NSL with essential background information for river evolution studies.

Intensive studies were conducted to characterize water depth, velocity, habitat, fish and wildlife communities in the lower Yalobusha River above and below an existing debris jam. Contour maps of the channel bottom in limited reaches upstream

and downstream of the Yalobusha debris/sediment jam have been developed to obtain background information on quantity and quality of in channel aquatic habitats and to assess the impact of changes in channel geometry on flow regime and habitat following channel adjustments for flood control. Exploratory studies in cooperation with the U.S. Corps of Engineers Waterways Experiment Station are underway to obtain continuous records of water stage above and below the debris jam.

Water quality measurements have been made at several sites in the Yalobusha River main stream, tributaries, and at inflow and outflow points of Grenada Lake for determining concentrations of sediment, agricultural chemicals, and naturally occurring contaminants. The data will assist in selecting erosion control/conservation practice research on upland areas and will serve as documentation for determining the impact and effectiveness of channel stabilization and watershed restoration measures on water quality. A preliminary monitoring program, incorporating the biological and habitat components of the channel system prior to adjustments, has been initiated at 33 sites in the Yalobusha River and its tributaries. This program will facilitate the assessment of environmental and ecological changes during construction phases and the selection of low-cost remedial measures.

Discussions are underway to explore the use of funding from the Environmental Quality Improvement Program (EQIP) managed by the Natural Resources Conservation Service (NRCS), for stabilizing small tributaries and erosion control of adjacent land with edge-of-field bufferstrips and other soil erosion control measures, in order to reduce sediment and non-point source pollutants entering into streams and to rehabilitate in-stream habitat conditions.

AQUACULTURE

Question. Since we continue to hear that aquaculture is the fastest-growing sector of U.S. agriculture and you have provided to the Committee your research requirements to support this new industry, would you please tell us why the President's budget proposes to eliminate funding increases provided for fiscal year 1998 for ARS research in this area?

Answer. The President's fiscal year 1999 budget proposal calls for \$51.2 million in program spending for new and expanded research, plus \$14.5 million in pay increases and \$.9 million for evaluation studies, for a Total of \$66.6 million, however, proposed increased funding is only \$32 million. To cover the difference, the budget proposal calls for \$34.6 million in program reallocations. Specifically, fiscal year 1998 program increases added by the Congress are proposed for termination and redirected to support the Administration's priority programs in fiscal year 1999.

Question. Please list those locations involved in aquaculture research, their specific programs and mission, and current funding and staffing levels. Please list future funding and staffing requirements, by location.

Answer. The current and future funding and staffing levels for locations involved in aquaculture research will be provided for the record. The projections are based on the staffing and funding levels that will be required for fully functional programs at each location.

[The information follows:]

Location/program and mission	Fiscal year 1998—		Total funds re-quired	Total sci-entists re-quired
	Funds	Scientists		
Auburn, AL: Diagnosis and control of diseases and parasites of cultured fish	\$1,087,000	4.0	\$1,800,000	6.0
Pine Bluff, AR: Aquaculture production and processing technology	537,900	2.0	537,900	2.0
Stuttgart, AR: Research on therapeutics evaluation, health mgmt. and culture systems for farm-raised fish	1,728,600	5.0	3,590,00	11.0
Albany, CA (Hilo, HI) Oceanic Institute: Tropical aquaculture feeds and culture technology development	1,603,300
New Orleans, LA: Improve flavor quality of farm-raised catfish ...	755,100	2.4	1,005,10	3.4
Beltsville, MD (NAL): Aquaculture Information Program provides the public with information on all aspects of aquaculture.	34,000	34,000
Stoneville, MS: Improve production efficiency, including breeding, genetics, nutrition, health, harvesting, and product quality of catfish	3,639,200	5.0	5,298,60	8.0
Wyndmoor, PA (Dover, DE, Worksite): Food safety of farm-raised fish	248,500	1.0	248,500	1.0
College Station, TX: Food safety of catfish	363,200	363,200

Location/program and mission	Fiscal year 1998—		Total funds re- quired	Total sci- entists re- quired
	Funds	Scientists		
Kearneysville, WV: Water Quality control and intensive culture of fish	1,439,600	1,439,600
Leetown, WV: Cool and cold water aquaculture research	250,000	4,000,000	12.0
Total	11,686,40	19.4	18,316,900	43.4

Question. In its report to this Committee on Aquaculture, USDA indicated that it was planning a thorough review of the Stuttgart National Aquaculture Research Center to determine the specific directions of future research programs. Is that review, which was to be undertaken during fiscal year 1997, now complete? Please submit the results of this review for the record.

Answer. The review is now complete. The review consisted of three components: (1) a strategic planning session for all ARS aquaculture research locations held in New Orleans, Louisiana, on June 5-6, 1997; (2) an ARS Warmwater Aquaculture Research Meeting held in Memphis, Tennessee, on July 7, 1997; and (3) a review and Program Planning Session for the Stuttgart National Aquaculture Research Center (SNARC) conducted on February 2-3, 1998. As a result of the review, ARS aquaculture scientists and administrators and external stakeholders identified the mission, major program components, future species and research priorities, and funding and personnel needs for the SNARC. These results were shared with review participants and stakeholders in a report dated February 3, 1998, and will be the basis for future implementation of the SNARC research program and staffing.

Key points from the review are: (1) The primary focus of SNARC will be on warmwater species other than catfish. (2) Major research programs at SNARC will be Therapeutic Evaluations and Chemical Registration in support of cold, cool and warm species including catfish; and Aquaculture Production Systems. (3) Priority species identified are: baitfish, striped bass and its hybrids, and polyculture (simultaneous culture of multiple species). (4) Additional research areas identified for emphasis include bird depredation of aquaculture species.

DELTA NUTRITION INTERVENTION RESEARCH INITIATIVE

Question. Please provide the Committee with an update on the Lower Mississippi Delta Nutrition Intervention Project.

Answer. The Lower Mississippi Delta Nutrition Intervention Research Initiative (NIRI) is conducted by a consortium of seven partners: Alcorn State University, Arkansas Children's Hospital Research Institute, Pennington Biomedical Research Center, Southern University and A&M College, University of Arkansas at Pine Bluff, University of Southern Mississippi, and ARS. Each partner participates in attaining the project objectives. The consortium is governed by a steering committee which has representatives from each partner. The research committee develops objectives and protocols and has representation from each partner.

Question. What progress has been made to date?

Answer. The partners reviewed the current state of knowledge of the socio-economic, nutritional and health status of the Lower Mississippi Delta and published a monograph in 1997 entitled: "Nutritional and Health Status in the Lower Mississippi Delta of Arkansas, Louisiana and Mississippi: A Review of Existing Data," Edited by Gail Harrison.

The partners completed a data collection for validation and pilot study of assessment methodologies to be used for repeated cross sectional surveys. The partners also completed a Key Informant survey to determine the understanding that community leaders have of nutritional status in three Delta counties.

Question. What work on this project is scheduled for each of fiscal years 1998, 1999, and each future fiscal year?

Answer. In fiscal year 1998, the partners will prepare a draft research proposal for an expanded community assessment research program. The partners are analyzing the data of the Key Informant survey and determining community characteristics that will impact possible nutrition intervention strategies. The partners are each developing strategic plans to determine their contribution to obtaining and analyzing data necessary to develop nutrition interventions.

In fiscal year 1999, the partners propose extensive field surveys based on the results of preliminary assessments in 1998. The partnership will focus on data collection and analysis. Extensive collaborative field work will be required. Post fiscal year 1999, research will depend on prior outcomes but will include initial planning, implementation, and validation of targeted nutritional interventions.

Question. Please list objectives and funding by participant.

Answer. The objectives are shared by all members acting as a consortium and the funding of \$3,147,700 is shared equally. The members of the consortium are: Alcorn State University, Arkansas Children's Hospital Research Institute, Pennington Biomedical Research Center, Southern University and A&M College, University of Arkansas at Pine Bluff, University of Southern Mississippi, and ARS. The project objectives are listed:

1. To review the existing data describing the socioeconomic, nutritional, and health status of lower Mississippi delta residents.

2. To review the existing nutrition and community assessment research methodologies in order to identify potential assessment methods for the Lower Delta Research Initiative.

3. (a) To conduct an assessment to determine the nutritional status of a population of lower Delta residents (including dietary intake, food consumption behaviors, biochemical and physiologic, and anthropometric measurements) and to conduct similar assessments so that the nutritional status of the population can be measured over time. (b) To assess community factors impacting nutritional status.

4. To identify nutritionally responsive health problems and their determinants or causes in the Lower Mississippi Delta populations so that interventions may be designed for testing.

5. To review intervention research methodologies in order to identify potential interventions aimed at solving the nutritional problems identified in the Lower Delta.

6. To evaluate, in a research setting, potential solutions for the targeted nutritional problems so that successful interventions can be implemented on a larger scale.

Question. What level of funding is included in the fiscal year 1999 budget request for this project?

Answer. A Total of \$3,147,700 is budgeted for fiscal year 1999 for the Lower Mississippi Delta Nutrition Intervention Project.

I understand that increased funding for this project is required in fiscal year 1999 to fund a study to determine dietary intake, prevalence of food insecurity, and diet and health knowledge and attitudes as well as to fund a pilot study for nutrition assessment (biological measures and behavioral measures of nutrition status). This information, I am told can not be obtained from other nutritional studies funded by USDA.

Question. Do you agree that these studies are needed? If not, why? If so, when are these studies planned?

Answer. The partners in the Lower Mississippi Delta Nutrition Intervention Research Initiative are currently evaluating two trial studies, a phone survey and a key informant survey, that should dictate methodologies of future surveys. Recommendation for increased funding will be based on the results of these pilot studies. A thorough analysis was not available to make a recommendation for the fiscal year 1999 budget.

Question. Is funding included in the fiscal year 1999 budget request for these studies? If so, how much is included? If not, what funding is needed for fiscal year 1999?

Answer. The funding requests for fiscal year 1999 for the Lower Mississippi Delta Initiative is \$3,147,700. This will be satisfactory to analyze the pilot studies and to design large scale studies if warranted.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The ARS Annual Performance Plan parallels the structure of the new ARS Strategic Plan, which was developed to meet the requirements of the Government Performance and Results Act of 1993. In the Annual Performance Plan, the Goals, Objectives, Strategies, and Performance Goals are linked to specific anticipated outcomes that the Agency expects to achieve in fiscal year 1999 with the funds requested. All the activities identified in the Strategic and Performance Plans link directly to the Mission Statement which, in turn, directly reflects the statutory authorities that underpin the Agency's work. A crosswalk is shown at each of the five Goals and at Initiative 2 linking program activities to the budget request.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. ARS carries out its research through 1100 CRIS research projects which are aligned with the 6 Budget Program Activities, 25 National Programs and the

5 Goals of the GPRA driven Strategic and Performance Plan structure. The CRIS research projects are the primary level of funding and accountability and provide the linkage essential to crosswalk this information.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. There are many challenges in making a transition such as this. GPRA requires us to anticipate the longer-term outcomes and impacts of our work, which is more difficult in a research environment than it is in many other areas. Since the spring of 1994 ARS has employed a series of workgroups and teams to help clarify and resolve some of these issues. In addition, ARS helped found the Research Roundtable, an ad hoc group of Federal research agencies, that meets regularly to share information on how best to comply with GPRA. We have tried to adopt and adapt all this information to make GPRA work for ARS. In the Performance Plan submitted last year we relied heavily on numerical measures of outputs. We have since revised our approach and moved to using more tangible intermediate outcomes as the indicators of progress towards our long-term goals.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes, the funding resources are identified at the level of the 5 Agency Goals and Initiative 2, which relates to the work of the National Agricultural Library.

Question. Does each account have performance measures?

Answer. The Performance Goals relate to the new Strategic Plan structure and are linked to the traditional budget accounts by a crosswalk.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. There are substantial differences between the ARS Strategic and Performance planning structure, our National Programs and the Program Activity structure contained in the Budget. The budget activity structure is presented on the following areas: Soil, Water, and Air Sciences; Plant Sciences; Animal Sciences; Commodity Conversion and Delivery; Human Nutrition; the Integration of Agricultural Systems, and Agricultural Information and Library Services. The Strategic Plan is outcome oriented and includes the following 5 broad societal Outcomes: An agricultural production system that is highly competitive in the global economy; A safe and secure food and fiber system; A healthy, well nourished population; An agricultural system which protects Natural Resources and the environment; Enhanced economic opportunity and quality of life for Americans. In addition, three management initiatives, which includes the National Agricultural Library, are identified in the annual Performance Plan.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. No, the Agency will continue to effectively present its budget through the approved Program Activity Structure which is linked to the core, CRIS research project system. This system is utilized in the allocation of resources as budgeted by the President and as directed by Congress. Our accounting system tracks each project to ensure compliance with the Appropriations Act and Congressional reports. These projects also provide the basis for systematic review by the National Program Staff and Area Directors. As stated earlier, the CRIS project system provides the essential linkage to the major Planning and Financial systems utilized by the Agency.

Question. How were performance measures chosen?

Answer. The new ARS Strategic Plan was drafted by an Agency-wide team that was always mindful of the need to measure progress towards achieving the plan's Strategies, Objectives, and Goals. The ARS Annual Performance Plan, that accompanies the fiscal year 1999 budget, was developed by the National Program Staff. Input was obtained from each of the National Program Leaders who, in consultation with the key Research Leaders and Lead Scientists, identified the performance indicators that were incorporated into the Annual Performance Plan.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. ARS has various mechanisms in place to retrieve financial and programmatic data on all aspects of its research program. At the present time, a committee of ARS employees is looking at what data we are currently collecting and what data we should be collecting to support the new Strategic and Performance Plans and the new National Program structure. We do not anticipate that the cost of data collection needed to validate future performance will be much greater than current costs.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Across the five programmatic goals we have identified scores of performance indicators, that can be tracked and reported on by the National Program Staff. Accomplishing these performance measures will clearly demonstrate progress towards achieving the Goals and Objectives identified in the ARS Strategic Plan. We are still developing some of the baseline data, tracking and reporting requirements for several of the performance measures under Initiative 3, Creative Leadership, but we expect to have these mechanisms in place to meet the timetables identified in the Performance Plan.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. Measuring performance in research provides some unique challenges that may not exist in operating programs. The approach used in the fiscal year 1999 ARS Annual Performance Plan is to identify intermediate outcomes that are tangible and measurable. If ARS achieves all or most of these intermediate outcomes it will be a clear indication of progress towards meeting the longer-term Strategies, Objectives, and Goals in the new Strategic Plan. We would recommend that the subcommittee track the performance goals under the 5 programmatic Goals: Goal I: Through Research and Education, Empower the Agricultural System with Knowledge that Will Improve Competitiveness in Domestic Production, Processing, and Marketing. Goal II: To Ensure an Adequate Food Supply and Improved Detection, Surveillance, Prevention, and Educational Programs for the American Public's Health, Safety and Well-Being. Goal III: A Healthy and Well-Nourished Population Who Have Knowledge, Desire, and Means to Make Health Promoting Choices. Goal IV: To Enhance the Quality of the Environment through Better Understanding of and Building on Agriculture's and Forestry's Complex Links with Soil, Water, Air, and Biotic Resources. Goal V: Empower People and Communities, Through Research-based Information and Education, to Address the Economic and Social Challenges of Our Youth, Families, and Communities.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Because of the diversity of the ARS research program we have identified 84 performance indicators in fiscal year 1998 and 86 in fiscal year 1999 in the Annual Performance Plan. As we gain experience in implementing the GPRA performance and reporting processes, we believe we will become better able to identify performance goals and indicators that are meaningful in a research environment.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, the Agency's senior managers are fully aware of the difference in output and outcome.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. ARS has a long history of positive interaction with its customers and stakeholders but a formal process of more systematically measuring customer satisfaction is still evolving. Some components, such as the National Agricultural Library and the National Arboretum, periodically survey their users and visitors to measure and improve the quality of their services and general satisfaction. Many of the Administrative and Financial Management units regularly measure customer satisfaction from the internal agencies and components they support. A National Programs Staff committee is currently working to develop practical ways to measure customer satisfaction in our research programs. In developing our Strategic Plan ARS identified the following Customers, Beneficiaries, Stakeholders, and Partners:

Customers.—Individuals or organizations that directly use ARS products or services.

- Producers (farmers, growers, and ranchers) and processors
- National and international organizations
- Advocacy groups
- Commodity and futures markets
- International trade organizations
- International science and research organizations
- Legislative Branch
- Executive Branch
- U.S. Department of Agriculture

Secretary of Agriculture
 Other mission areas
 Action and regulatory agencies
 Office of Budget and Program Analysis
 Inspector General
 Chief Financial Officer
 Chief Information Officer
 Other Federal agencies
 Scientific community
 Medical community
 Health and dietary community
 Environmental community
 State and local governments
 News media

Beneficiaries.—Individuals whose well-being is enhanced by the agency's activities.

Domestic consumers

Foreign consumers of U.S. agricultural exports and technologies

Stakeholders.—Organizations or individuals that have an interest in the work of ARS but do not directly use the agency's products.

Legislative branch

Executive branch

ARS employees

National and international organizations

Producer and processor organizations

Food and commodity organizations

Foreign countries/governments

Trade organizations

Environmental organizations

Retail organizations

Consumer organizations

Partners.—Organizations that ARS works with collaboratively.

Institutions of higher education

Federal research agencies

Private industry

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The fiscal year 1999 Annual Performance Plan and the fiscal year 1999 budget were developed on parallel tracks with crosswalks showing the linkages.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes. The version of the Annual Performance Plan currently before the subcommittee reflects the President's budget proposal for fiscal year 1999. Once the appropriations process is completed, ARS will revise the Annual Performance Plan to show the level of program performance that can be expected with the actual resources that are appropriated.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Within reason, yes. ARS is currently revising the type and amount of data which it requests from each research unit. This enhanced data collection will help the National Program Staff and the Area Offices to better monitor and manage the research program. To avoid an undue burden on the research leaders, we plan to collect most of the data on an annual basis.

The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Question. Have you faced such difficulty?

Answer. This Agency will not have any difficulty linking dollars to results. As stated, ARS CRIS research projects underpin budget and program activities and the goals/outcomes as established under GPRA. The 1100 research projects are the foundation for allocating, accounting and review of the Agency's research. This is "the" level of accountability in this Agency and this information can be cross-walked or translated into the major systems operated by ARS.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No. The existing budget account structure consisting of 6 Program Activities does not need to be modified.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. The Agency's CRIS projects are the accountability unit and aggregate and crosswalk to the major program, budget, management and review systems.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. There is no need to modify the existing accountability systems for program performance or budget activities.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The Annual Performance Plan does not refer to external factors but the unabridged version of the ARS Strategic Plan 1997–2002, which will be printed later this spring, contains the following discussion of the external factors that impact on ARS:

Consumer, Socio-Economic, and Policy Trends.—The abundance and affordability of the American food supply is greatly due to U.S. agricultural research. The Nation's ability to sustain this plentiful and inexpensive food supply continues to be paramount. But in recent years, consumer and producer attention has expanded somewhat to other areas of concern such as food safety and quality, the relationship of agriculture and the environment, the profitability of the agricultural enterprise, and the impact of government regulations, land use restrictions, and economic options that diminish the supply of farm and grazing land. The long-term sustainability of the Nation's food and fiber production systems will be determined not only by the continued profitability of farming and ranching, but also by how these production systems affect the environment. The capacity of U.S. agriculture to adapt to environmental changes is also a concern as are the availability and quality of natural resources. Another key environmental issue is how human activities affect weather patterns, atmospheric composition, and soil and water quality and productivity. Global population increases, demographic changes, and economic growth will substantially increase the demand for agricultural products and lead to the development of new markets. At the same time, increased agricultural efficiency in other countries will force U.S. agriculture to be more competitive.

Funding.—The ability of ARS to respond to the many and diverse needs of producers and consumers is determined by annual appropriations.

1996 Farm Bill and the Pending Revision of the Research Title.—The 1996 Farm Bill, the Federal Agriculture Improvement and Reform Act, set a new direction for American agriculture by beginning the process of phasing out farm subsidy payments based on production levels and introducing free market disciplines. The effect of this legislation will be to heighten the importance of agricultural research as one form of a safety net beneath producers. Research to maintain and improve productivity; to detect, control, and eradicate diseases and pests (insects, weeds, etc.); and to promptly address nontariff trade barriers, especially sanitary and phytosanitary conditions will take on even greater importance in a market environment. The 1996 Farm Bill also updated and expanded the "Purposes of Agricultural Research" which were first enacted in 1990. As described elsewhere, ARS incorporated the Purposes into this strategic plan adopting them as the agency's objectives. Congressional reauthorization of the Research Title will have an impact on ARS, but we are still too early in the legislative process to anticipate what that impact will be.

Competition.—The Department of Labor projects an increase of 19 percent in the size of the general workforce in the next decade, which is slightly lower than the rate of growth for the preceding decade. The labor market during this period is also expected to be highly competitive for many occupations that require an advanced education, including scientists, engineers, economists, and computer specialists. The high earning potential of professions, such as law and medicine, will continue to make a career in science less attractive to many young men and women who have the creative intelligence needed for professional success in agricultural research. Consequently, a major emphasis on recruitment, student employment, upward mobility, and training programs will be needed to attract and retain a quality workforce. The trend toward increasing workforce diversity is also expected to continue, and opportunities for encouraging women and minorities into careers in science, engineering, and economics will need to be given a high priority.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. As indicated above, the issue of external factors was not addressed in the fiscal year 1999 ARS Annual Performance Plan. Having said that, we would like to stress that an in-depth examination of the major external factors affecting American agriculture was part of the strategic planning process and the process for developing the new National Programs. The five Vision Conferences are a specific example of how ARS identified and considered external factors in its strategic and programmatic planning processes. The visioning process consisted of a pilot conference in January 1995, followed by five regional conferences held in June and July of 1995. The conferences brought together over 400 participants, representing a broad cross section of the Agency's customers, stakeholders, and partners, who worked in more than 30 breakout groups to provide input regarding: (1) the key forces that will influence American agriculture during the next 20 to 25 years, (2) how these changes will affect agricultural research, and (3) more specifically, how ARS should respond to these changes. Using the input and information gathered from this process, ARS identified the following 10 major issue areas that will affect agriculture and agricultural research over the next 25 years: international/global issues, population/demographics issues, environmental issues, sustainability of production systems issues, economic issues, government and political issues, consumer/societal issues, food and health issues, technological advancement issues, and education and information issues. Likewise, ARS has been and is continuing to be actively engaged with a wide-range of customers, stakeholders, and partners in developing its new National Program structure.

Question. What impact might external factors have on your resource estimates?

Answer. The most important and direct external factor identified in the ARS Strategic Plan is the level of Administration and Congressional support, both in terms of the reauthorization of the Farm Bill—especially the Research Title, and the level of funds appropriated to support the Agency's research activities. Other external factors such as the heightened concern about the relationship of agriculture and the environment, concerns about food safety, and the impact of government regulations gradually change the focus of ARS research. Global population growth and economic changes also affects American agriculture and the research priorities needed to sustain it. Changes in the American workforce may also impact on ARS' ability to attract and retain the wide range of skills needed to meet the agricultural research needs of the next century.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No. In managing the ARS research program, the National Program Staff seeks to avoid unnecessary duplication while ensuring complementarity and coordination between research units and locations. Agricultural research must be conducted at different locations to account for climatic, regional, and geographic variations as well as different combinations of pests, diseases, and agricultural products, each with unique problems calling for unique research approaches and solutions.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. In developing the Annual Performance Plan we did not find any areas of program duplication.

Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

Question. To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. In our unabridged Strategic Plan which will be printed later this spring, we discuss the difficulty of predicting the ultimate outcome of research and the near impossibility of applying numerical measures to research, especially basic research. Having said that, we are confident that the use of a large number of tangible intermediate outcomes will enable the subcommittee to determine whether ARS is making reasonable progress towards reaching the goals and objectives identified in the Strategic and Performance Plans. Two examples of ARS Performance Goals and the tangible intermediate outcomes we have identified to indicate progress are as follows: Under Performance Goal 2.1.4.1—"During fiscal year 1999, ARS will conduct research leading to registration of a second therapeutic compound useful in treating diseases of farm raised fish." At the end of fiscal year 1999, the subcommittee will be able to determine if ARS completed the research and assembled the data on this compound and provided it to the Food and Drug Administration to support their decision making process on the use of this new drug. In Performance Goal 1.1.3.2—"During fiscal year 1999, ARS will release technology for calibrating HVI strength measurements on cotton fiber which is expected to be adopted worldwide as the official calibration procedure. This adoption will ensure that cottons are all subjected

to the same standards worldwide, allowing those cotton growers who produce a superior high-quality product to receive compensation for it." At the end of fiscal year 1999, the subcommittee will be able to determine if ARS produced a reference measuring technology that is adopted internationally enabling cotton marketers and buyers to compare cotton quality regardless of where it is produced. We have learned many lessons as we developed our new Strategic Plan and the first Annual Performance Plan and we will know a great deal more after we have moved through the entire GPRA planning and reporting cycle.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Certainly there are. Anticipating the longer range outcomes or results of research, especially basic research, runs counter to our long experience with predicting scientific research. The great unpredictability of research, particularly its unanticipated benefits, makes it extremely difficult for scientists to formally offer predictions for fear they will engender unrealistic expectations. Predicting what problems will need to be address, what type of metrics should be used to reasonably measure on-going research, how best to express "future" research accomplishments, and how to align the resources available to out year research results are all areas where we lack experience. As we work our way through one or two planning and reporting cycles, we will gain the experience we need to more meaningfully adapt GPRA to the ARS research environment.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. Not at this time. ARS devoted 2½ years to developing its new GPRA driven Strategic Plan and the first Annual Performance Plan. We used workgroups, a agency-wide Strategic Planning Team, as well as the input we received from outside sources such as the Research Roundtable, an ad hoc group of Federal research agencies formed to address how best to apply GPRA in a research environment. We held visioning conferences, published our draft strategic plan in the Federal Register, and placed several drafts on the ARS Home Page to expedite customer, stakeholder, and partner review and comments. As we move through the early stages of implementing GPRA we are discovering things that might have been done differently. Rather than devoting resources to the revision of the Strategic Plan, we believe that it would be more productive to move forward aggressively with full implementation of GPRA. At the end of the "shake-down" period (a testing under operating conditions of something new for possible faults and defects and for familiarizing the operators with it) we will be in a much better position to meaningfully revise the ARS Strategic Plan.

QUESTION SUBMITTED BY SENATOR GORTON

For two years in a row now, USDA and the Administration have eliminated funding for the operation of the Prosser Research Station in Washington state. I understand that the Agriculture Research Service did not recommend the closure of Prosser in this year's budget. I am told that this was a decision made by the Office of Management and Budget.

Question. Why did USDA and the research arm of USDA (REE) not express to OMB the importance of the Prosser Research Station, and for that matter, the other facilities which are to be eliminated in ARS' budget? Are these research sites not considered to be priorities for production agriculture research?

Answer. The President's budget requires the reallocation of existing resources to finance new, high priority research needs. A number of projects carried out in ARS research stations at Prosser, Washington; Mandan, North Dakota; Orono, Maine and Brawley, California, were identified as less critical. As a result, a cost-effective decision was made to terminate and redirect resources to new research initiatives and recommend closure of these research stations.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

HUMAN NUTRITION INITIATIVE

Question. Please provide an update on the Human Nutrition Initiative and, in particular, the role of Arkansas Children's Hospital.

Answer. The Human Nutrition Initiative is a multi-year plan to enhance the scientific basis for understanding the role of nutrition in well-being. The research areas of the Human Nutrition Initiative are: (1) nutrient-gene interactions, (2) diet and immune function, (3) role of nutrition throughout the life cycle, and (4) diet and

human performance. The Initiative began in fiscal year 1998 with a Congressional appropriation of \$7.5 million. Research in the Human Nutrition Initiative is carried out at six human nutrition centers: Arkansas Children's Hospital Research Institute, in Little Rock, AR; Western Human Nutrition Research Center, San Francisco, CA; Jean Mayer USDA Human Nutrition Research Center on Aging, Boston, MA; Beltsville Human Nutrition Research Center, Beltsville, MD; Grand Forks Human Nutrition Research Center, Grand Forks, ND; and Children's Nutrition Research Center, Houston, TX.

The Arkansas Children's Nutrition Center (ACNC) is the newest of the ARS Human Nutrition Research Centers. It provides a research program that focuses on unique issues. Its major efforts focus on the effects of early nutrition on growth, cognitive development in children, and the effect of early nutrition on the subsequent risk of diseases in adulthood. It currently has funding for two major projects. One, is to determine the role of nutrition in brain function, especially cognitive and behavioral function of infants and children. Data from these long-term studies will provide the understanding of how children can improve their learning abilities in the early years and later in the classroom. In addition, it is now thought that these results will have a far reaching impact on child behavior.

The second project involves dietary factors other than the traditionally studied nutrients. There are many factors in diets that affect development and normal metabolic, physiologic and endocrine systems. These factors may have beneficial or adverse effects. ACNC is studying factors in children's diet, such as the soybean products found in infant formula, that are thought to prevent breast cancer later in life based on their animal research model. There are factors that have been isolated in several foods that are likely to have similar effects on such diseases as prostate cancer, colon cancer, osteoporosis, obesity, etc. Thus, the role of the ACNC is to develop new and as yet unexplored areas of child nutrition.

Question. How is this Initiative more than just a simple restatement of the fact that we should all eat more fruits and vegetables?

Answer. The translation of sound nutritional science findings into consumer advice such as 'eat more fruits and vegetables' is certainly one important outcome of the research. Four important trends which affect nutrient intake and nutritional health: (1) Framework condition. This refers to the increasing importance of processed foods, and the declining presence of farming and gardening in most people's daily lives; (2) Acceleration of scientific knowledge about the positive biological effects of compounds within foods, particularly in preventing degenerative processes formerly thought to be obligate consequences of aging; (3) Biotechnology which can drastically alter the composition of many foods now under production; (4) Accelerations in information exchange which result in more rapid communication about nutrition. The Human Nutrition Initiative will strengthen production agriculture by defining the nutritional basis for enhancing the health promoting properties of foods, the scientific basis of dietary recommendations, the effectiveness of food assistance programs, and ultimately human health.

Question. If this Initiative results in a more healthy diet, are there projections on health care savings that might result from this research?

Answer. There are many areas where health care costs will be reduced. Diet is thought to be a major factor in 60–75 percent of all cancers. The delay or prevention of the type of breast cancer being studied at ACNC is thought to involve as much as 60 percent of the Total breast cancers in the United States. Any progress on prevention would result in multi-millions of dollars saved each year. Even if this disease onset could just be delayed for 5 years, there would be enormous savings in medical care costs. This is also true of other potentially diet-related cancers such as prostate cancers and colon cancers that if prevented or delayed would significantly reduce health care cost. In the central nervous system projects, improvement in cognitive function will improve the ability of children to learn and help reduce problems with behavior. Improved learning will enable individuals to more closely attain their full potential to contribute to society through private and public pursuits. It is postulated that diet plays a significant role in behavioral problems now treated with drugs and therapy. Prevention of these problems would also result in substantial cost savings. The success of nutrition research in the last 30 years in reducing the incidence and severity of cardiovascular and digestive disease, is a clear indication that alterations in diet and life-style have beneficial effects both through reduced morbidity and mortality and a concomitant reduction in the cost of health care.

FOOD GENOME RESEARCH INITIATIVE

Question. The proposed budget includes an increase for food genome research. What role might the ARS Rice Germplasm Laboratory play in this initiative?

Answer. The food genome research will vastly expand our knowledge of the genome for species of importance to the food and agricultural sectors. ARS will focus on a government-wide effort to map the genomes of agriculturally important crops and livestock to determine the DNA sequence of the functioning genes in those genomes, and to define and understand the function and control of economically important genes. ARS will build on current genomic research, such as the Human Genome Project and the Arabidopsis Genome Research Project, to understand gene structure and function. This is expected to have considerable payoff in crop species such as rice. The National Rice Germplasm Evaluation and Enhancement Center at Stuttgart, Arkansas, is a national center for genetic improvement of rice. The program to be developed at this new facility will include the genetic improvement of a broad range of traits critical to optimizing rice production and utilization. Thus, scientists at this location will be close collaborators with the food genome research, particularly in the functional genomics component.

Question. What role might the Poultry Center of Excellence in Fayetteville, Arkansas play?

Answer. There is potential for the poultry industry to benefit greatly from the use of molecular markers to select for superior animals. The ARS Avian Disease and Oncology Laboratory, East Lansing, Michigan, has developed a genomic map and a national database system for chickens. The Poultry Center of Excellence in Fayetteville, Arkansas, could work with the East Lansing laboratory to use genetic information, as other universities and ARS locations are doing, to identify genes or groups of genes that may be responsible for desired economic traits such as growth rate, feed efficiency, and resistance to disease. At present, we do not have scientists trained in the appropriate field of science at the Fayetteville, Arkansas laboratory, a necessity in order to initiate a genomics program.

Question. What role might the ARS National Aquaculture Research Center in Stuttgart, Arkansas play?

Answer. The recent review and planning session for future aquaculture research at the SNARC did not identify genome research as an area of emphasis for the Center, and there are no immediate plans to hire geneticists at the SNARC. However, there will be opportunities for genetic improvement of emerging warmwater aquaculture species, including hybrid striped bass, a species which will receive research emphasis at the SNARC.

Question. The proposed budget includes an increase for food genome research. How does the USDA food Genome research Initiative fit with ongoing genome research in other areas of government?

Answer. The USDA Food Genome Initiative expands the scope of a National Plant Genome Initiative to include animals and microbes. USDA will lead the Food Genome Initiative and ensure that there is coordination with other relevant Government agencies and the international research community.

ARS PEST BIOLOGY—FIRE ANTS

The budget proposes \$3.5 million for pest biology.

Question. Please provide an update on ARS research related to the control and eradication of the Imported Fire Ant.

Answer. Imported fire ants, *Solenopsis richteri*, and *S. invicta*, currently infest over 300,000,000 acres in the South. Continued expansion is expected northward along both continental coasts.

As a result of ARS research, four bait toxicants have been commercialized and two are coming to the marketplace through cooperative programs with industry. In addition, ARS scientists are working closely with Animal and Plant Health Inspection Service-Plant Protection and Quarantine (APHIS-PPQ) and other national and international customers, including seven universities to develop biologically-based IPM strategies for fire ant control.

The ongoing research on the imported fire ant at the ARS Unit in Gainesville, Florida, includes: development and introduction of three biocontrol agents into the United States for non-insecticidal management of fire ant in large-scale areas; pheromone enhancement of bait attractions; basic biology and ecology of fire ant populations; non-toxic, behavioral modification interventions using repellents and semiochemicals; and support of the APHIS program.

Recently, ARS has initiated an effort to introduce some natural enemies of fire ants in South America into the U.S. If successful, imported fire ant populations in the U.S. could be reduced to levels similar to those found in South America.

For example, parasitic flies in the genus *Pseudacteon* have been shown to stop fire ant foraging and shift the competitive balance to other local ant species. The microsporidian parasite, *Thelohania solenopsae*, causes reductions in mound density. The parasitic ant *Solenopsis (Labauchena) daguerrei* has been reported to kill host colonies over a period of several years.

The phorid fly, was released in Gainesville at 3 locations from July through early October. Fly populations successfully cycled to successive generations and were observed continuing to attack fire ants in January. Brood from laboratory colonies of fire ants infected with *Thelohania solenopsae* has been used to infect previously healthy field colonies in Florida. Preliminary data suggests that limited secondary spread has occurred.

A software and field-deployable hardware system currently is under development by the Gainesville unit that may aid in database management, the evaluation of candidate biocontrol agents, and in developing and implementing pesticide-reduced strategies incorporating existing technologies.

The long-term goals of ARS fire ant research are:

(1) Collect and determine relevant remotely sensed data for selected sites in cooperation with NASA. Merge ground-based biological data with remote sensed data to predict likelihood of success for various biocontrol agents.

(2) Develop computer-based decision support systems to aid fire ant control practitioners in day-to-day operations requiring integration of management technologies.

(3) Develop mass propagation of candidate biocontrol agents found successful in limited field research/demonstration tests.

(4) Develop large area-wide integrated management strategies.

(5) Develop quarantine management that will allow the use of less pesticides.

(6) Develop new technologies with emphasis on biologically-based strategies. These may include classical biocontrol agents, biopesticides, social disruption using semiochemicals (pheromones), genetic manipulation, resource manipulation, manipulation of pathogen virulence.

Question. Is ARS coordinating in any way with the fire ant research underway at the University of Arkansas at Monticello?

Answer. ARS has been cooperating with University of Arkansas at Monticello under a specific cooperative agreement for the development of an integrated fire ant management strategy. The principal objectives of the cooperative research include:

(1) Production of a hazard-rating model of fire ant range expansion into Northern Arkansas.

(2) Studies of fire ant natural enemies in South America to provide the science based knowledge that is needed to manage successfully imported biocontrol agents.

(3) Development of strategies for using existing contact pesticides for prolonged fire ant control.

QUESTIONS SUBMITTED BY SENATOR KOHL

INTEGRATED FARMING SYSTEM PROGRAM

I remain very interested in the Integrate Farming System program of the Agricultural Research Service. It is very important for USDA to be investing in long-term research on sustainable agriculture systems for the 21st century and ARS is well positioned to undertake this mission. The need for new diversified, integrated crop and animal production systems in particularly urgent for your family farmers and for the health of our environment.

Question. Does the budget request include funding for the Wisconsin Integrated Cropping System Trials?

Answer. The fiscal year 1999 budget request includes \$497,100 for the Wisconsin Integrated Cropping Systems Trials, the same as for fiscal year 1998. In fiscal year 1997, funding was appropriated for \$500,000. This funding is split between the U.S. Dairy Forage Research Center, the University of Wisconsin and the Michael Fields Agricultural Institute in East Troy, Wisconsin. The Agricultural Research Service (ARS), through the U.S. Dairy Forage Research Center, has established a long-term cooperative agreement with the University of Wisconsin in cooperation with the Michael Fields Agricultural Institute to carry out the Wisconsin Integrated Cropping Systems Trials at Arlington and at the Lakeland Agricultural Complex at Elkhorn, Wisconsin. A sum of \$810,000 is to be provided to the University for this cooperative project which spans a 5-year period from fiscal year 1997 through 2001. Funding of \$270,000 was provided in fiscal year 1997 and \$180,000 has been provided so far in fiscal year 1998. Additional in-house research on Integrated Farming Systems by an ARS scientist will be an integral part of the overall cooperative effort.

Question. Last year, this Committee instructed the agency to implement interdisciplinary partnerships, including farmers and nongovernmental organizations, in carrying out all its IFS projects. Can you give me a progress report on this?

Answer. Currently, 13 ARS locations doing IFS work have farmer and/or nongovernmental partners. During the past year, ARS organized its 1100 projects into 25 national programs. One of the national programs is titled 'Integrated Farming Systems' (IFS). An executive summary for this national program may be found on the Internet at <http://www.ars.usda.gov/nps/programs/207s2.htm>. An important aspect of program and project development will be obtaining inputs from farmers, nongovernmental organizations, and others as to the priority issues that need to be addressed and the manner in which partnerships may be developed.

Question. How many IFS projects are there currently?

Answer. The IFS national program is in the process of being formed. Forty-seven locations have tentatively been identified as participants. IFS covers traditional farming, sustainable agriculture, and precision agriculture.

Question. How many are implemented as partnerships?

Answer. Twelve multi-disciplinary research projects, which include partners representing the private sector and other governmental agencies, have been implemented.

Question. How many farmers participate in IFS projects?

Answer. Twelve of the above projects, including the Wisconsin Integrated Cropping Systems project, have direct participation of farmers. Ten of them are carried out as on-farm research projects in which farmers participate.

Question. What is your plan to transition more IFS projects to partnership arrangements?

Answer. ARS is encouraging all locations to identify and involve customer and stakeholder groups. The goals are to have these groups and interested individuals provide input during the periodic review and evaluations that all ARS units undergo, and to maintain continuous relationships that will lead to increased on-farm research, CRADAs, and other partnerships. For example, some ARS program managers and researchers recently met with farmers and ranchers associated with the Campaign for Sustainable Agriculture, which includes the Michael Fields Institute. As a result of that meeting, farmers will be matched with appropriate ARS scientists throughout the country to initiate partnerships.

QUESTIONS SUBMITTED BY SENATOR BYRD

Question. Please provide me with a status report on the construction of the National Center for Cool and Cold Water Aquaculture (NCCCWA), detailing pertinent dates and milestones.

Answer. ARS received \$1,921,000 in fiscal year 1995 for land purchase and laboratory planning and design. Total construction costs are estimated at \$12 million. ARS received \$6 million in fiscal year 1997 and an additional \$6 million in fiscal year 1998 for construction of the NCCCWA.

The architect-engineer has developed the site plan for the NCCCWA. Conceptual designs have also been prepared for the laboratory/office building and the tank/aquaria building. Final drafts of the Program of Requirements and the Investigative Report have been completed. However, there has been a delay in design progress as a result of the extreme drought conditions experienced in 1997 that resulted in an unprecedented reduction in spring water supplies and stream flow in the vicinity of the U.S. Department of Interior's Leetown Science Center (LSC), including very low flows in two nearby springs (Bell and Link). The NCCCWA will be co-located with the LSC. Original plans were to pipe the water from these springs to the NCCCWA and provide a return supply of water from the facility to prevent drawing down the natural water resource. The drought condition called into question whether natural water resources would always be sufficient to provide for the future needs of both the FHL and the NCCCWA without impacting local residents. After extensive investigation, the current plan is for the NCCCWA design to include the capability for water recirculation, with appropriate treatment, for up to 50 percent of the water supplied to the tank/aquaria building. This capability will also provide for greater control over water quality for research purposes and will obviate the need to develop Bell and Link Springs, as originally planned. Preliminary projections are that the capital costs of the recirculation capability will be essentially equivalent to the cost savings resulting from not developing the Bell and Link Springs.

The design is expected to be completed by January 1999; and a construction contract is scheduled for a May 1999 award. Construction is expected to take 18 months and be completed by November 2000.

Question. Is the current construction schedule the same as the Agricultural Research Service's (ARS) original projection?

Answer. The current schedule has fallen behind the original ARS projection by four months.

Question. If not, why?

Answer. The drought experienced in 1997 required extensive investigation of the adequacy of water resources which delayed the schedule beyond that originally envisioned.

In fiscal year 1998, \$250,000 was provided to ARS to initiate the program of the National Center for Cool and Cold Water Aquaculture.

Question. What progress has been made on the Center's program?

Answer. The program increase for the Center is being used to hire a highly qualified scientist to serve as Research Leader for the Center, to begin carrying out a cooperative research program with the U.S. Geological Survey's Leetown Science Center (LSC), and to oversee final design and construction of the facility. The ARS National Program Staff is working closely with the LSC to identify areas of mutual research interest where collaboration in research could occur.

Question. What is the status of collaborative efforts between ARS and West Virginia University on cool and cold water aquaculture activities in Appalachia?

Answer. The ARS, National Program Staff (NPS) has been discussing with scientists and administrators at West Virginia University (WVU) opportunities for collaboration in research between the National Center for Cool and Cold Water Aquaculture and WVU. There is particular interest in a collaborative research program on genetics of rainbow trout. ARS has indicated that, if WVU is successful in developing and obtaining funding for a proposal on the genetics of rainbow trout, ARS could provide additional support for graduate students and/or a post-doctoral researcher to work with WVU on the research program.

Question. What is the status of collaborative efforts between ARS and the West Virginia Department of Agriculture on cool and cold water aquaculture activities in Appalachia?

Answer. At the invitation of the Commissioner of the West Virginia Department of Agriculture, the ARS National Program Leader for Aquaculture is participating in the West Virginia Aquaculture Task Force, a partnership formed to support the development of aquaculture in West Virginia. The primary mission of the Task Force is to establish a State Aquaculture Plan that will set realistic goals and a system to achieve them and promote effective cooperation and government coordination for aquaculture in the State. The first meeting of the Task Force took place on February 25, 1998.

In fiscal year 1998, \$250,000 was provided for an agroforestry systems program at the Appalachian Soil and Water Conservation Research Laboratory.

Question. What progress has been made on this new research initiative?

Answer. A plant physiologist with root/soil interactions expertise was added to the agroforestry program. This addition filled a critical gap in the program. A research plan was developed to address conversion of farm woodlots to agroforestry production systems.

Question. What is the projected timetable to carry out the objectives of the research?

Answer. The envisioned system involves clearing selected areas in a woodlot, followed by establishment of a multi-species planting that includes high-value hardwood timber species and shade-tolerant horticultural (crop producing) tree, shrub, and herbaceous species. The resulting system would begin providing income to a landowner within 3-5 years.

Implementation of the research plan, experimental site selection and preparation has been initiated. This site represents a first-generation system for which no temperate-climate prototype exists. Within two years the research site will be fully developed, and will include establishment of short-term, immediate-return plant species; extensive data on the microclimate and rhizosphere characteristics of the research site will also be collected. Within 3-5 years, based on knowledge gained from the microclimate and rhizosphere characterizations, there should be: (1) complete establishment of long-lived woody species; (2) a procedure available to farmers on the methods needed to establish mid- and long-lived crop species; (3) results from the short-term production systems experiments; and (4) information on ecological/inter-species interactions in agroforestry woodlot systems.

Within 5-10 years the full production data from short and mid-term species will be available for reliable economic analyses of land use alternatives and the design of second-generation agroforestry woodlot production systems.

Question. What is the estimated cost of conducting this research?

Answer. The fiscal year 1999 funding for agroforestry research of \$438,400 will support the new scientist's research for the next 2 years. However, resources to purchase and install equipment for the research project are severely constrained. An additional \$300,000–\$500,000 (plus the reinstatement of the \$250,000 add on to the fiscal year 1998 budget, proposed for termination in fiscal year 1999), would allow full development of collaborations with university cooperators (e.g., West Virginia University), and would also support the addition of a new scientist, a soil mycologist, and the technical support to manage the research site and collect data. The collaboration of and support for University experts are needed to fully analyze and interpret the data.

Question. With the completion of the five-year mission plan for the Appalachian Soil and Water Conservation Research Laboratory, please provide me with a list of research programs that will be undertaken in the future.

Answer. Four major research programs areas have been identified: (1) Management of hilly grasslands in Appalachia for sustainable production; (2) Renovation and improvement of underutilized, abandoned or disturbed hill lands with browsing livestock; (3) Agroforestry systems for the Appalachian regions; and (4) Improving soil quality and forage legumes for Appalachia. Each program will have multiple objectives directed towards solving problems of the Appalachian small farmer.

Question. Please provide the funding level required for each program.

Answer. The current funding level at the Appalachian Soil and Water Conservation Research Laboratory is \$4,423,400. Because the programs are under development, final decisions have not been made on redistribution to the four programs, but approximately an equal split is anticipated. A \$1.2 to 1.5 million increase (4 to 5 scientists) is required for the location, distributed equally to the four programs.

Question. List any projects that have been terminated or are planned for termination at the Appalachian Soil and Water Conservation Research Laboratory in fiscal year 1998 or in fiscal year 1999.

Answer. The current projects to be redirected to the new programs are: Livestock grazing systems and water quality in Appalachia; management and ecology of pastures in the Appalachian region; forage legume breeding for the Appalachian region; alleviation of acid soil constraints to plant growth; and selection and improvement of plants for infertile acid soils. Agroforestry systems for the Appalachian region, will be continued. These projects will be implemented even though the fiscal year 1999 budget proposal does not include the fiscal year 1998 congressional add on. Many current project activities, especially related to the development of useful products for customers, will be incorporated into the new programs.

Question. What are the research results related to those programs?

Answer. The research results related to those programs are:

(1) *Potentials for Agroforestry.*—The research found that the use of black locust, honey locust and black walnut within forage pastures appears to be beneficial. The trees provide shade for the livestock and their seed pods are a good source of nutrients for the livestock. The growth of shade tolerant forage species among the trees also may allow the pastures to be grazed for a longer time during the summer.

(2) *Alleviation of Acid Soil Constraints to Plant Growth.*—The application of a coal combustion power plant residue, a flue gas desulfurization (FGD) by-product, to an Appalachian acid soil resulted in increased crop yields. This gypsum quality by-product was effective in raising calcium levels and reducing phytotoxic soil aluminum concentrations. When this by-product was combined with phosphate rock and dolomitic lime, improved soil phosphorus and magnesium levels and higher soil pH also resulted. The development of this combined product is being pursued through a Cooperative Agreement and Development Act (CRADA) activity. The FGD by-product combined with polyacrylamide was also shown to reduce soil erosion from tilled hillsides.

(3) *Selection and Improvement of Plants for Infertile Acid Soils.*—Poor plant growth in acid soils is most often caused by excessive aluminum adsorption by plant roots. This toxic effect of aluminum on plants is dependent upon the form or species of aluminum in soil, which in turn is dependent upon the other minerals present in a soil. The form or species of aluminum in acid soils toxic to plants has been reevaluated based on new information. These data were used to develop a mathematical model that describes the interaction between aluminum and other soil minerals that can relieve the aluminum toxicity. This model also describes the adsorption of aluminum and other minerals by plant root membranes. It can be used to predict the likely toxicity of various acid soils to plants. Not only do soils differ in their toxicity, but plants and varieties of plants differ in their tolerance to acid soil toxicity. The Alfagraze alfalfa variety was shown to be more tolerant and thus produce higher yields than the Vernal variety at a soil pH of 4.6.

(4) *Livestock Grazing Systems and Water Quality in Appalachia*.—Grazing studies in the Beckley area show that a balance of fiber, energy, and protein improves nitrogen (N) use efficiency in grazing livestock. If fiber energy and protein are in proper balance, less N will be excreted and the reduction in manure nitrogen will improve the quality of water leaving the watershed. A predictive energy model for grasses has been developed that will help managers decide how to stock or utilize a pasture to meet the energy demands of livestock. Water resource management practices, grazing techniques, and pasture management strategies were tested and shown to improve and preserve water quality in highly agriculturalized karst landscapes.

(5) *Management and Ecology of Pastures in the Appalachian Region*.—Different types of plants are being evaluated for use in Appalachia which will lead to increased commodity diversification. The composition of new and nontraditional plants is being examined as is the potential for production of bioactive compounds that may serve as herbivore deterrents. Some grasses infected with a beneficial mycorrhizal fungal symbiont were shown to have improved nutrient uptake ability and enhanced competitive ability, important features for low-input pasture systems in Appalachia.

(6) *Forage Legume Breeding for the Appalachian Region*.—The capability of legumes, such as clover and alfalfa, to fix atmospheric nitrogen in combination with a bacterial rhizobia symbiont and, thus, help the plant meet its requirement for this major nutrient as well as their digestibility makes legumes highly desirable forage plants. Unfortunately, most legumes are sensitive to acid soils. White clover cultivars currently used in Appalachia were found to be less acid soil resistant than those available from New Zealand and elsewhere. These more resistant cultivars are now being used to develop white clover varieties more suitable to Appalachian soils and conditions.

Question. Please provide the number of people on staff and full-time employees at the Appalachian Soil and Water Conservation Research Laboratory for fiscal year 1997 and budgeted for fiscal year 1998.

Answer. In fiscal year 1997 there are 58 full-time employees of which 15.0 were classified as research scientists. These numbers will remain the same for fiscal year 1998.

Question. With the completion of the five-year mission plan for the Appalachian Fruit Research Station, please provide me with a list of research programs that will be undertaken in the future.

Answer. The programs that will be undertaken in the future include the development of (1) knowledge of the critical molecular processes in fruit development and ripening; (2) genetic materials with improved pest resistance, cold hardiness and fruit quality; (3) integrated cultural and pest management systems that reduce pesticide/herbicide use, increase production cost efficiency and minimize environmental impact; (4) harvesting, handling and postharvest quality control technologies that increase shelf life and market value.

Question. Please provide the funding level required for each program.

Answer. To fully develop these programs and operate the laboratory at full capacity would require an additional four to five scientists for an estimated total of \$1.2 to \$1.5 million.

Question. List any projects that have been terminated or are planned for termination at the Appalachian Fruit Research Station in fiscal year 1998 or in fiscal year 1999.

Answer. No projects are planned for termination in fiscal year 1998 or in fiscal year 1999.

Question. What are the research results related to those programs?

Answer. Some of the research results from the current programs are provided below.

The peach gene for the chlorophyll a/b binding protein and the region controlling gene expression have been fully sequenced. This protein is essential for the light reaction of photosynthesis in peach and other plants.

A transgenic line of plum carrying a gene for resistance to plum pox virus was developed and shown to have good resistance in greenhouse and European field trials. This virus has caused severe economic loss in Europe and was recently detected in South America. The transgenic plums may provide the only basis for protecting U.S. orchards.

Transgenic Bartlett and Buerre Bosc pears carrying genes that affect growth habit and confer resistance to fire blight were developed and are being evaluated.

A unique, non-chemical approach to pest control in fruit crops using hydrophobic particles to coat tree leaves was developed, patents filed and successfully demonstrated in field trials in Chile and the U.S. Through a cooperative research and development agreement with a U.S. company, the technology has received EPA

clearance with a zero reentry time. This is a major step forward in meeting the regulatory limitations of the Food Security Act.

A mechanical harvester for citrus was developed and successfully tested in Florida. A cooperative research and development agreement has been signed with the Florida Department of citrus. A similar design for a blueberry and raspberry mechanical harvester that meets fresh fruit quality requirements was licensed. This could be important to small farm operations.

A 15-year study of herbicides used in orchard systems demonstrated no accumulation of herbicide residues in the soil or changes in soil microbial populations while effectively controlling perennial weeds.

Question. Please provide the number of people on staff and full-time employees at the Appalachian Fruit Research Station for fiscal year 1997 and budgeted for fiscal year 1998.

Answer. In fiscal year 1997, there were 17 scientists and 55 other full-time equivalents. For fiscal year 1998, there are 17 scientists and 50 other full-time equivalents budgeted.

QUESTIONS SUBMITTED BY SENATOR CRAIG

Producers in my state, and their suppliers, have grown dependant upon the work being done by ARS scientists to develop new crop varieties and pest resistance. This work is conducted around the country, including four ARS stations in Idaho. I was pleased to learn that the President's budget request includes a \$32 million increase for ARS—pleased until I saw where the money was to be spent.

The President's budget request cuts important funding for ARS research in a wide range of crops, including: soybeans, potatoes, rice, cotton, small fruits, and sugar, among others. In place of these important research activities, ARS dollars are being syphoned off to fund environmental projects such as the Presidential Environmental Initiative for Global Change, the Presidential Initiative on South Florida Ecosystem Restoration, and programs in watershed health and environmental quality.

Question. How does this effect the ability of ARS to fulfill its underlying mission of providing reliable research to American producers?

Answer. Environmental issues such as global change, watershed health, and environmental quality are directly relevant to crop production and are recognized by commodity groups as important concerns. Because ARS does not have enough funds to address all the necessary required research, the Administration has proposed for fiscal year 1999 that funds be redirected from projects which are less urgent. The projects proposed for closure are not limited to production agriculture, but also include certain environmental research projects that are less critical. ARS' strategic plan, gives a high priority to production agriculture. Part of the funds obtained through project closures would be redirected to environmental research that is directly relevant to crop production. Although many EPA programs do concern agriculture and involve ARS research to varying degrees, much of the high priority environmental research ARS needs to undertake is not now being pursued by other government research agencies, such as the EPA.

The President's request for ARS also includes \$13.97 million in support of the Presidential Initiative for Food Safety.

Question. Will the money be spent on new ARS facilities dedicated to food safety?

Answer. The \$13.97 million for ARS in support of the Presidential Initiative for Food Safety will not be spent on new ARS facilities dedicated to food safety.

Question. How does USDA propose to incorporate this new work with the ongoing efforts being conducted at research universities across the nation?

Answer. ARS food safety research is coordinated with and complements that of ongoing efforts being conducted at research universities across the Nation.

ARS works closely with CSREES to explore how the two agencies can effectively coordinate their research to plan food safety research, identify opportunities for collaborative Federal and State research to break down the barriers to communication between Federal agency scientists and university scientists, and to identify the unique research facilities and expertise of each party. The longer term nature of Federal funding complements that of the university research programs. The multi-year sustained programs of the Federal laboratories support research initiatives that establish the basis for the continued biological understanding of pathogens and the technological advances necessary to develop the means to assure food safety and meet the expectations of the American consumer. The combined efforts of both Federal Government and academia are necessary because food safety research must solve the problems resulting not only from the complexity of the food production and distribution system, e.g., the plethora of technological practices, an array of animal

and plant species and varieties, a range of climatic and regional differences, and a vast array of food products and consumer practices, but also recent changes in the system, e.g., changes in animal husbandry practices and processing technologies and the emergence of new pathogens.

Question. Has USDA considered the option of matching these ARS funds with CSREES monies to establish a series of national food safety research centers?

Answer. Because ARS already has facilities for conducting the necessary food safety research, and the critical mass of scientific expertise and structure to lead the necessary food safety research programs, ARS has not considered the option of matching these ARS funds with CSREES monies to establish a series of national food safety research centers.

Question. What impact would the proposed cuts at the ARS research station in Aberdeen, Idaho, have on the work being done in small grains? How does ARS plan to compensate for these cuts?

Answer. While the research conducted at Aberdeen is unique in its capacity for the molecular enhancement of oat and barley germplasm for feed and food efficiency and utility, ARS maintains a large, fully coordinated multi-disciplinary program for solving small grain production and postharvest issues. Although the work conducted at Aberdeen is important, ARS is required to make difficult decisions to support and finance other new research priorities. Some components of Aberdeen's molecular enhancement of oat and barley research would not be expanded and some components would be conducted elsewhere within the framework of the overall small grains program. The proposed cuts at Aberdeen would reduce the small grains research program by \$359,800 and impact 1 scientist.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD SAFETY

Question. The fiscal year 1999 budget proposes an increase of \$3 million for the second year of funding for the Food Safety Special Research Grants Program, from \$2 million for fiscal year 1998 to \$5 million for fiscal year 1999. What is the current status of this new program? For what types of research will funds be awarded?

Answer. We have developed the Request for Proposals for the fiscal year 1998 program after substantive internal discussion by our CSREES Food Safety Team and consultation with other Federal agencies, including FSIS, FDA, ARS, and EPA. It is currently awaiting final approval by USDA legal staff. The Request for Proposals will focus on issues in the fresh fruit and vegetable industry. Specifically, we are seeking proposals that will provide new information about contamination of these products with food-borne pathogens during the harvesting and transport segments, development of sampling and testing procedures to enable more accurate monitoring of the microbial status of fresh produce and, finally, development of new techniques or methods for preserving the quality and safety of these fresh products from harvesting to the consumer. While the explanatory notes implied a broader approach to food safety research, the CSREES Food Safety team strongly recommended, and the other agencies listed above agreed, that it was important to give more focus to the program in this first year. Given the high priority on improving the safety of fruits and vegetables by the President which occurred after the Explanatory Notes were written, and the increasingly obvious gaps in our knowledge for preventing contamination of these food products, this seemed to be the most effective use of these funds in fiscal year 1998.

Question. Why is such a significant increase in funding for this new program being requested when the results of the first fiscal year of the program are not yet known?

Answer. In preparing the Request for Proposals for this current fiscal year, it was clear that there were more high priority issues than could be addressed with funds made available in fiscal year 1998. In addition, as we are developing the educational materials to assist growers in complying with the new proposed guidance document for producers of fresh fruits and vegetables which is being issued soon by the Food and Drug Administration, it is already evident that there are several critical gaps in our knowledge base which will severely hamper our ability to provide the growers with the information they need to meet these new guidelines and improve the safety of our domestic produce. Similarly, the newly implemented regulations for Hazard Analysis Critical Control Points programs in slaughter plants has already begun to create a further impact on food animal producers to implement a series of good pro-

duction practices in order to meet the criteria being set by the packing industry. In several instances, our knowledge of the ecology of food borne pathogens in the animal production setting is too limited to be of greatest help to the producers. Thus, we will need to accelerate some of our research efforts on these topics if we are to be of greatest help to the production agriculture community. The production segment of our food product chain has received lesser attention within the food safety research agenda and is now in need of significant resources if we are to meet the needs of the producers as they attempt to meet the guidance and regulatory demands that they now face. It is our intention to broaden the Request for Proposals for fiscal year 1999 and include work related to safety of meat and poultry products in a more balanced portfolio of research. The exact split of funding between fruits and vegetables vs meat and poultry will be determined each year based on input from a number of sources including other federal agencies (ARS, FSIS, FDA, CDC, EPA), commodity groups, consumer groups, and industry.

Question. The fiscal year budget proposes a \$5 million increase in funding for Food Safety Education under the Smith-Lever 3(d) program (from \$2,365,000 to \$7,365,000). What is the justification for this increase?

Answer. In recent years, USDA has announced adoption of a new Hazard Analysis and Critical Control Points or HACCP-based method for inspecting meat and poultry products. But some industry representatives fear that HACCP places the onus for food safety on producers and processors. They believe that consumers also must share in the responsibility for food safety. The responsibility for ensuring the safety and wholesomeness of our nation's food supply is a shared one, and both industry and consumers have a critical role to play in food safety. But in order for consumers to understand and adopt recommended safe food handling practices, a massive public education and outreach effort is required. A funding increase for the Food Safety and Quality Smith-Lever 3(d) Program will be used to develop a broad, comprehensive public education program focusing on the entire spectrum of the food chain from farm to table, including the role of the consumer, as we work to ensure and improve the safety of the nation's food supply. We are having regular discussions with other agencies, including FSIS, FDA-CFSAN, and FDA-CVM, and are coordinating our programs with their efforts. The educational programs for growers of fruits and vegetables, which are designed to assist in reaching compliance with the new Guidance Document being promulgated by FDA-CFSAN, are being developed by a joint working group which includes USDA, FDA, and industry representatives.

As part of the President's Food Safety Initiative, both domestic and imported fruits and vegetables have been identified as an area of growing concern. In order to ensure that fruits and vegetables meet the highest health and safety standards, it is critical that an education and outreach effort be targeted toward producers of domestic and imported produce. A funding increase for the Food Safety and Quality Smith-Lever 3(d) Program will be used to significantly expand an education and outreach program focusing on preventing microbial contamination during growing, harvesting, processing, and transportation of produce. Expanded education efforts targeting consumers will also be required to prevent contamination of fruits and vegetables during food preparation, storage and service in homes, restaurants, schools, congregate meal sites, food banks, and other settings where food is prepared and served.

Question. How are the current program funds being allocated and what have been the achievements of this program to date to increase consumer awareness, understanding, and information regarding food safety?

Answer. Current funds are awarded either by formula or competitively to faculty at Land-grant colleges and universities throughout the U.S. and its territories. The formula funds are allocated as \$25,000 per institution with a total of \$1.4 million assigned to this part of the program. Each institution is required to submit a plan of work for these funds describing how they will be used. The remaining funds in the amount of \$775,800 are available for competitive awards. The focus of the program for the competitive funds is determined each year in consultation with stakeholders. The submitted proposals are reviewed by a committee of peer reviewers and the ranked proposals are then considered for funding. In fiscal year 1998, \$195,000 of the \$775,800 total has been allocated for support of the Food Animal Residue Avoidance Data Base (FARAD) program.

Funds have been used to support the development of educational programs and resources that improve peoples' ability to make informed, responsible decisions about food safety and quality issues. Educational programs developed with these food safety education funds have targeted farmers, producers, processors, distributors, educators, researchers, and consumers. Programs are developed primarily to help food handlers all across the food chain translate research-based food safety information into sound, practical behaviors that reduce the risk of food-borne illness.

Federal food safety education funds, and state matching funds have enabled Land-grant partners and stakeholders to develop programs and resources in food safety that can be sustained beyond the funding year. Since the inception of the program in 1991, 49 states and 5 territories have established on-going food safety education programs. More than half of those states have developed programs targeting youth; more than half have developed programs targeting industry; and about one quarter of those states have developed programs targeting under-served populations or those at increased risk for food-borne illness such as pregnant or nursing mothers, young children, the chronically ill, the immuno-compromised, and older Americans. Last year 42 percent of education program participants reported adoption of recommended food handling practices, while 70 percent of program participants reported increased adoption of practices that protect the food supply.

PEST MANAGEMENT

Question. Increased funding is requested for Minor Crop Pest Management to allow for expansion of the registration process for minor use pesticides and the initial registration of safer and more environmentally compatible pesticides. Please give us a report on the status of these efforts to date and what will be achieved with the additional \$1,721,000 proposed. Will this speed up the process so that farmers can have these pesticides available?

Answer. In response to the minor crop re-registrations needs created by FIFRA 88, the IR-4 Project conducted an average of 215 studies per year between 1988-97 and obtained an average of 94 clearances per year over the same time period. The increase of \$1,721,000 will allow an additional 20 percent more pesticide clearance—about 20—than in 1997. More recently, in response to the Food Quality Protection Act, IR-4 adopted a strategy to replace all “at risk” pesticide registrations on minor crops with “safer” pest control products, which include reduced risk pesticides, bio-pesticides, and IPM-compatible products.

This initiative began in 1997 with the addition of 45 reduced risk pesticide studies and 8 bio-pesticide studies to the on-going minor crop research program. In 1998, 165 registration studies involving safer pest control products are being conducted by IR-4 and its cooperators. This research will lead to the submission to EPA of 218 registrations, involving 96 minor crops over a two-year time period.

With an increased level of funding, goals for the IR-4 reduced risk strategy are: 195 registration petitions on minor crops in fiscal year 1999, 215 in fiscal year 2000, 235 in fiscal year 2001, and 250 in fiscal year 2002. This research will result in over 1,100 new registrations for safer pest control products over the next six years. These uses will serve as replacements for pesticide uses that may be canceled as a result of FQPA.

IR-4 also has adopted a policy of close cooperation with commodity interests and registrants. The purpose of this policy is to initiate early discovery research on pest control products for minor crops where expedited registration of these products will benefit producers of minor food and ornamental commodities. This policy will provide a much earlier start to the registration process than before and will assure that minor crop producers have rapid access to products that represent lower risk to the user, the consumer, and the environment.

Question. The budget indicates that the additional funding for the Pest Management Alternatives and Expert IPM Decision Support System program will permit the continued identification of a list of crop/pest/control combinations where only one or a limited number of control options are available. How many combinations have been identified under these programs to date and why are additional funds required to carry out this effort?

Answer. The Pest Management Alternatives Program provides funding to the Land-Grant System to develop alternative pest management tactics to replace those lost through EPA regulatory action or voluntary withdrawal as a result of FQPA implementation. The funding for this program supports two different activities. The first provides annual funding for a competitive grants program which solicits proposals from agricultural scientists to identify new environmentally sustainable pest management alternatives for pesticides which have been lost, or are in danger of being lost, due to FQPA regulatory action. The second supports the development of an on-line Pest Management Information and Decision Support System which accesses numerous specific databases and allows decision-makers to identify specific crop/pest pairs for which alternative pest management tactics are not available. The Decision Support System links informational databases together and provides decision-makers with ready access to pest management information needed to identify and prioritize the critical needs of American agriculture. Together, these two program activities provide a comprehensive response in addressing the needs resulting

from FQPA implementation by identifying pest management systems that are vulnerable to FQPA implementation, and conducting programs to develop solutions to pest management problems and assist growers in implementing them.

In the fiscal year 1998 Request for Proposals (RFP) for the Pest Management Alternatives Program the Information Decision Support System identified 58 crops which have no alternative pest management options available for one or more pest of the major pests with the implementation of FQPA. These crop/pest sites have been listed in the fiscal year 1998 RFP and research to identify pest management alternatives on these critical sites will be funded by this program in fiscal year 1998. Funding is needed to expand and refine the development of the expert decision support system by incorporating other existing or new databases into the Pest Management Information Decision Support System, and to make the decision support system accessible via the world wide web. Web access and data entry at the state and local level will identify additional critical pest management needs and additional options/alternatives for management. These critical needs will be incorporated into future RFP's allowing research to address key priority pest management needs of farmers and furthermore ensure that we have adequate pest management tools for production of both major and minor crops important to US agriculture.

PESTICIDE APPLICATOR TRAINING

Question. The fiscal year 1999 budget requests \$1.5 million for Pesticide Applicator Training through the Extension Service. What is the demand from growers, commercial applicators, and homeowners for this training?

Answer. The Pesticide Applicator Training Program offers growers and commercial applicators a forum, through meetings held at the county level and with state agricultural associations and commodity groups, for dialogue on important pesticide issues. Each year, extension pesticide coordinators and county agents train over 500,000 growers and commercial applicators in the proper use of pesticides and keep them up to date on issues such as the Food Quality Protection Act, ground water concerns, food safety and basic instruction in Integrated Pest Management. Total numbers of growers and commercial applicators continue to increase each year in these training sessions.

Homeowner training in the proper selection and use of pesticides is critically needed. Recent mis-use practices, such as occurred in Mississippi with a highly toxic agricultural pesticide used in homes, point up the need for an intensive, coordinated training and educational effort. Homeowners will benefit, by being able to make intelligent decisions on proper and safe pest control. These educational programs will also serve to safeguard agricultural pesticides, which if mis-used, may be canceled or further restricted in their use.

Question. Last year, the budget indicated that the Pesticide Applicator Training Program was being redesigned. Has this been done?

Answer. USDA's fiscal year 1998 budget included \$1.5 million to redesign the Pesticide Applicator Training Program to provide "seed money" for states to develop partnerships with other USDA supported programs such as EFNEP, 4-H, Master Gardener and with selected private organizations. The objective of the partnerships was to leverage funding to develop educational programs for the general public, especially homeowners and small or part-time farmers, that will reduce user and environmental exposure to toxic pesticides. The mis-use of pesticides in the home environment threatens human health, especially infants and children, and the continued availability of products essential to agriculture production, structural pest management, and public health.

In the last two years states and federal agencies spent nearly \$90 million investigating and remediating homes deliberately contaminated with agricultural pesticides. Unfortunately, the \$1.5 million requested for the Pesticide Applicator Training Program was not included in the fiscal year 1998 appropriation, thus precluding its redesign.

PEST MANAGEMENT

Question. How are extension activities supported with Integrated Pest Management (IPM) funds accelerating the transfer of proven pest management technologies from the researchers to farmers, ranchers, and other users? How fast are new research findings being transferred to the users?

Answer. Farmers have identified the lack of effective alternative pest management tactics as a primary reason for not implementing IPM on their farms. Where effective alternative tactics have been developed, they are widely and rapidly implemented through extension programs and adopted by farmers. These extension ef-

forts are a key element of USDA's goal of helping to implement IPM practices on 75 percent of U.S. crop acreage, and will help the Nation's farmers adjust to changes in pesticide availability resulting from implementation of the Food Quality Protection Act of 1996.

Additional funds requested in fiscal year 1999 will support regional and national projects that bring together the expertise of multiple organizations and disciplines. Funded projects will address research and extension education priorities identified by IPM planning teams consisting of farmers, crop consultants, agribusiness, land-grant university research and extension faculty, state and Federal agency personnel, public policy interest groups and other stakeholders. Examples of such projects are "Cotton IPM in Transition: Opportunities for Biologically-Intensive IPM" scheduled for Mississippi, North Carolina, Oklahoma, and Texas, "Area-wide Mating Disruption of Codling Moth on Tree Fruits" in the Pacific Northwest, and "Using an Adult Attracticide Against Corn Rootworm in the Midwestern United States". With extension faculty being part of the planning teams and participating as full members of funded projects, transfer of technology and information will occur as soon as it is available.

PROGRAM TERMINATIONS

Question. The fiscal year 1999 budget proposes to terminate Supplemental and Alternative Crops, Farm Safety, Agricultural Telecommunications, and Rural Health and Safety. Please provide a description of each of the programs proposed for termination, who will be impacted by the proposed reductions, and why you believe the cost of these programs can be borne by local governments when you are proposing to cut funding for the base Hatch Act and Smith-Lever formula programs.

Answer. The Supplemental and Alternative Crops program promotes the research and development of new crops and conventional crops grown for new uses. Traditional and new agricultural materials provide renewable raw materials for processing and manufacturing of a broad range of chemical, energy, construction, environmental, and fiber products, as well as food products. The authority under which this program is administered incorporates all phases of research and development including agronomics, harvesting and pilot processing operations for converting the raw materials into final product. This comprehensive approach results in new and expanded markets, reduced dependency on imports, and diversification of agriculture in areas affected by declining demand for crops grown locally. The proposed termination of Supplemental and Alternative Crops funding would affect the two research programs that are currently conducted under this authority. The first is the National Canola Research Program. Funding is provided to six land-grant universities, each representing a region with numerous institutions engaged in canola research and extension activities to provide a domestic source of the oil and to meet increasing market demands. The second program is conducted at the University of Arizona for research and development of hesperaloe, a plant with the potential to provide a domestic source of hard fibers that must currently be imported for use in specialty paper-making. Hesperaloe, as a new crop for the semi-arid Southwest, offers a potentially viable alternative to conventional crops grown in the region that have high water and chemical requirements.

The Farm Safety program provides seed money to all 50 states and Puerto Rico to support a National farm safety extension program developed by the State Extension Service Specialists to meet the State's most critical needs. These funds support development and implementation of extension education programs and methods targeted at reducing the injury, illness and mortality rates of farmers/ranchers, seasonal and migrant agricultural workers, timber harvesters, and their families. Competitive grants are also awarded under this program to support the AgrAbility Program that provides education and assistance on accommodating the agricultural workplace for the estimated 500,000 farmers, ranchers, and agricultural workers who have disabilities. The proposed reduction in the Farm Safety and AgrAbility programs will impact the land-grant universities that provide leadership and expertise in collaboration with State and non-governmental entities, such as Farm Safety Just 4 Kids, that have an interest in farm safety education and the development and implementation of programs that encourage citizens to adopt practices that will reduce agricultural injuries, illnesses and fatalities. This program can potentially be supported with Smith-Lever formula funds and other State and private funding sources.

The Agricultural Telecommunications Program was established to improve the competitive position of U.S. agriculture in international markets; to train students for careers in agriculture and food industries; to facilitate interaction among leading agricultural scientists; to enhance the ability of U.S. agriculture to respond to envi-

ronmental and food safety concerns and to identify new uses for farm commodities and increase domestic and foreign demand for U.S. agricultural products. The legislation provided funding for program production, program delivery and technical assistance to eligible institutions. The program enables land-grant and other universities to develop their capacity to design and deliver education at a distance using telecommunications. It also creates access to the information and education resources of the universities for citizens nationwide. Those impacted by the proposed reduction would include land-grant universities, such as 1994 Tribal Colleges, who are new to using distance learning and telecommunications to reach learners. Customers in rural areas who depend on telecommunications and distance learning to help them overcome distance and time barriers to education would ultimately be affected. The costs of these programs would be borne by universities who would shift existing resources to continue to fund these types of programs.

In support of the REE/CSREES Strategic Goal 3: Healthy, Well-Nourished Population, through the Mississippi Rural Health Corps project, the Rural Health and Safety Program is conducted by the Cooperative Extension Service and 15 community and junior colleges represented by the Mississippi Community College Foundation and the Mississippi State Board for Community and Junior Colleges. The purpose of this endeavor is to improve rural health service through education of Mississippians and to train health care professionals in rural practice. The Mississippi Rural Health Corps is attacking the rural health problem by building capacity to annually train and employ a minimum of 400 additional RNs, LPNs, and other allied health care professionals who contract to practice in a rural setting following their training. A pilot rural medical scholar program for high school students and an updated state health service industry needs assessment are also planned. Also supported under the Rural Health and Safety Program, the rural health and safety project in Louisiana, a joint effort of the Southern University Cooperative Extension and School of Nursing, has established a mobile clinic-based nurse education curriculum that gives students a client-based, culturally-sensitive understanding of health care needs and obstacles to accessing health care services for inner-city and rural medically underserved populations, while providing needed screening and referral services for these populations. Rural residents in Mississippi, and both rural and inner-city low income residents in selected Louisiana Parishes, would be impacted by these proposed reductions.

The State of Mississippi has been providing matching funds for the Mississippi Rural Health Corps program. We expect that the program will be maintained at a reduced funding level with the discontinuation of funding under the Rural Health and Safety Program. We also expect that State level funding in Louisiana can be provided to maintain the nurse-managed mobile health care clinic. States have the flexibility to support these programs with formula funds, State or local funding, or private funding.

Question. Please provide an update on achievements of the projects being carried out through the Rural Health and Safety Program.

Answer. After five years of operation, the Mississippi Rural Health Corps has led to major intermediate outcomes via educational and community-based changes in the rural health systems in the state. The project has stimulated the development of a network of collaborative rural health interests including economic, volunteer, community, health consumer, and health service organizations. The broad scope of this network positively impacts the Mississippi rural health system through: 247 Rural Health Association members; 165 Coalition members; 762 nursing graduates; 325 allied health graduates; 76,245 Cooperative Extension health education program participants; and 286 trained lay health advisors. To make the resources of the University of Mississippi Medical Center and other centralized health facilities available to the nursing and allied health departments of the community and junior colleges, to registered nurses, RNs, needing graduate level courses, and for state-wide informal health education, the interactive video Community College Network has been established, with some 2,000 undergraduate rural health program participants and 37 RNs receiving graduate level courses. In addition, Mississippi Rural Health Corps lay health advisors in self-care, blood pressure, and breast cancer early detection reached 2,500 consumers with screening, skills training, and awareness education. Although difficult to measure specifically, it is clear that the many accomplishments will result in final outcomes that include improved delivery of rural health care services, enhanced health status for tens of thousands of rural residents, and enhanced education and employment opportunities for thousands of rural Mississippi youth.

The Louisiana nurse-managed mobile health care clinic, called the "Jag Mobile," has reached needy low-income rural and inner-city populations through sixteen community based "health partners," including senior citizen community centers, public

housing authorities, church-operated day care and pre-school centers, community feeding centers, drop-in environmental shelters, and a battered women's program. Project outputs have included over 600 persons fully screened for health conditions and over 300 more receiving blood pressure and blood sugar screening only. For those persons fully screened, self-reported health conditions have included diabetes, high blood pressure, heart problems, asthma, kidney disease, cancer, hepatitis, and substance abuse. All persons found to have medical problems are referred to local physicians for further treatment. Two major intermediate outcomes have been realized from this project: first, several dozen nursing students have been prepared to provide culturally sensitive health care services to needy populations; and secondly, the Jag Mobile has become a welcome addition in communities and has made many individuals aware of their health needs and what they can do to prevent escalation of minor health conditions into more costly major medical problems.

Question. Who is receiving the agricultural telecommunications funds in fiscal year 1998 and for what purpose?

Answer. The request for proposals for the 1998 Agricultural Telecommunications Program will be released in June, 1998. As stated in the legislation, the competition will be open to accredited institutions of higher education. Grants will be awarded for projects which use telecommunications and distance education to create access to the information and education resources of the universities, and for projects that seek to improve the capacity of Land-Grant and other universities to design and deliver education at a distance using telecommunications.

EXPANDED FOOD AND NUTRITION EDUCATION PROGRAM (EFNEP)

Question. Please provide a description of the projects being funded through the Expanded Food and Nutrition Education Program (EFNEP) for fiscal year 1998.

Answer. EFNEP does not fund "projects" per se, but rather the funds are distributed to states based on a formula that takes into consideration the proportion of their population that is at or below 125 percent of poverty. EFNEP operates in all 50 states and the territories of American Samoa, Guam, Micronesia, Northern Marianas, Puerto Rico and the Virgin Islands. It is designed to assist limited resource audiences in acquiring the knowledge, skills, attitudes and changed behavior necessary for nutritionally sound diets and to contribute to their personal development and the improvement of the total family diet and nutritional well-being.

Within the constraints of the funds available, states select the communities with the greatest need, and conduct nutrition education programs for low-income youth and families with young children. Today EFNEP operates in less than 25 percent of all counties, and reaches only a fraction of the eligible population. The number of poor children under six years old grew from 3.4 million in 1972 when EFNEP was just beginning, to 6.0 million in 1992. This represents 26 percent of all U.S. children less than six years old. However, while the population that EFNEP focuses on nearly doubled, the funding only increased by 25 percent over this time period.

The delivery of EFNEP youth programs takes on various forms. EFNEP provides education at schools as an enrichment of the curriculum, in after school care programs, through 4-H EFNEP clubs, day camps, residential camps, community centers, neighborhood groups, and home and community gardening workshops. Youth are taught lessons on nutrition, food preparation and food safety, and physical fitness.

Through an experiential learning process, adult program participants learn how to make good choices to improve the nutritional quality of the meals they serve their families. They increase their ability to select and buy food that meets the nutritional needs of their family. They gain new skills in food production, preparation, storage, safety and sanitation, and they learn to better manage their food budgets and related resources such as Food Stamps. EFNEP is delivered as a series of 10-12 or more lessons, often over several months, by para-professionals and volunteers, many of whom are indigenous to the target population. The hands-on, learn-by-doing approach allows the participants to gain the practical skills necessary to make positive behavior changes. Through EFNEP, participants learn self-worth—that they have something to offer their families and society.

EFNEP is a program that works; in 1996, 84 percent of adult participants showed improvement in one or more food resource management practices, 91 percent showed improvement in one or more nutrition practices and 66 percent showed improvement in one or more food safety practices. Additionally, intakes levels for 6 key nutrients increased, and 2½ times as many participants consumed a minimally acceptable diet after completing EFNEP than at entry into the program.

Question. Why is a reduction in funding being proposed for fiscal year 1999? Who will be impacted by this proposed reduction?

Answer. Funding levels for many of the CSREES formula-funded line items, including EFNEP, were reduced to provide the funding necessary to support Departmental and Presidential initiatives, such as food safety, children, youth and families at risk and other initiatives. The 4 percent reduction in funding will result in approximately 8,600 fewer families and 16,000 fewer youth reached by this educational program.

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION (SARE)

Question. Please provide a list of the SARE research projects funded for each of fiscal years 1997 and 1998, including a description of the project, who conducted the research, and the amount of the award.

Answer. Proposals submitted for SARE funding in fiscal year 1998 are currently undergoing review and final decisions on projects to be funded will be made later this year. Projects funded in fiscal year 1997 are as follows, excluding producer grants, which are discussed in response to the next question.

Projects funded in fiscal year 1997—		Conducted by—	
Description	Contact	Organization/State	Amount
No-till Forage Establishment to Improve Soil and Water Conservation and Reduce Associated Production Risks.	Panciera	University of Alaska, AK	\$100,000
Blueprinting Traditional Sustainable Food Production Systems of Samoa in Development of a Research/Extension Model.	Frank	American Samoa Community College, AS.	91,850
Sustainable Culture of the Edible Red Seaweed <i>Gracilaria parvispora</i> Abbott in Traditional Hawaiian Fishponds.	Glenn	Environmental Research Laboratory, AZ.	95,201
Development and Implementation of Trap Cropping Strategies for Control of Hemipteran Pests in Pistachio Orchards.	Daane	University of California, CA	79,858
Decomposition and nutrient release dynamics of cover crop materials.	Mitchell	University of California, CA	41,604
Reducing Insecticide Use on Celery Through Low Input Pest Management Strategies.	Trumble	University of California, CA	100,000
Nitrogen Management for Pumpkins and Squash	Ashley	University of Connecticut, CT	40,000
Biological and Cultural Methods of Insect Management in Vegetables: Survey and Case Studies of Organic Farms and Evaluation of the Scientific Literature.	Stoner	Connecticut Agricultural Experiment Station, CT.	20,000
An Integrated Vegetable Production, Postharvest and Marketing System for Limited Resource Farmers in South Georgia.	Payton	The Pine Center—Bainbridge College, GA.	134,800
Producers assessment of sustainable land management practices to protect water quality.	Steiner	USDA-ARS, GA	228,864
Management of Soilborne Plant Parasitic Nematodes for Sustainable Production of Field Grown Tomatoes and Cucumbers by Cover Cropping.	McHugh	Waialele Farms, HI	21,900
Combining Landscape and Augmentative Biological Control to Suppress European Corn Borer Populations in Sustainable Low-Input Systems.	Lewis	Iowa State University, IA	92,740
Management, Impact and Economics of Beef Cattle Grazing in Mountain Riparian Ecosystems.	Momont	University of Idaho, ID	105,400
Development of Market Infrastructure to Support Local and Regional Food Systems.	Bonney	Sustainable Earth, Inc., IN	86,200
Cluster Use of Whole-Farm Planning with Decision Cases and Evaluation.	Janke	Kansas State University, KS	106,400
Yesterday's Research for Tomorrow's Needs	Kok	Kansas State University, KS	63,500
Integration of Freshwater Prawn Nursery and Growout Systems Into Diversified Systems.	Tidwell	University of Kentucky, KY	155,197
Impacts on Agricultural System Sustainability from Structural Change in Peanut, Poultry, Swine, and Tobacco Production Systems.	Hamilton	Center for Sustainable Systems, KY.	174,858
Chinese Medicinal Herbs as Crops for the Northeast	Craker	Univ. Massachusetts, MA	60,718
Integrating High-Density Orchards and Biointensive Integrated Pest Management Methods in Northeastern Apple Production.	Cooley	Univ. Massachusetts, MA	121,535

Projects funded in fiscal year 1997—		Conducted by—	
Description	Contact	Organization/State	Amount
Design and Implementation of a Searchable Database on Compost Production and Use for Internet Users.	Millner	USDA-ARS, MD	20,000
Enhancing Adoption of Sustainable Agriculture Practices via Farmer-Driven Research.	Mutch	Michigan State University, MI	100,405
Farm Beginnings: An Educational Training and Support Program to Establish Young Dairy Farmers in Southeast Minnesota.	Schwartau	Minnesota Extension Service, MN ...	90,000
A Sustainable Approach to Controlling Mite Pests of Honey Bees.	Spivak	University of Minnesota, MN	78,750
Use of a Vegetative Filter as an Alternative Waste Management System for a Sustainable, Seasonal Management-Intensive Grazing Dairy..	Crawford, Jr	University of Missouri, MO	55,755
Comparison of Pest Management Interactions in Spring Wheat-Cover Crop and Spring Wheat-Fallow Cropping Systems.	Lenssen	Montana State University, MT	150,964
Equal Access to Agriculture Programs and Opportunities: Advocacy to End USDA Racial Discrimination and Reestablish Viable and Sustainable Minority Farm Agriculture.	Harris	Land Loss Project, NC	151,290
Maximizing Forage and Minimizing Grain Intake in Bison Fed for Meat.	Anderson	North Dakota State University, ND.	78,360
Improving Sustainability of Cow-Calf Operations with Natural Forage Systems.	Adams	Univ. Nebraska West Central Res & Ext Ctr, NE.	81,000
Farmer-Designed Research on the use of Legumes in Sustainable Dryland Cropping Systems.	Baltensperger	University of Nebraska, NE	91,000
Potential of Earthworms as Biocontrol Agents of Scab and Leafminers in New England Apple Orchards.	MacHardy	University of New Hampshire, NH ..	99,069
Sustainable Phosphorous Fertilizer Recommendations for Corn Production in the Northeast USA.	Heckman	Rutgers University, NJ	92,780
Flowering Plants to Enhance Biological Control in Landscapes.	Shrewsbury	Rutgers University, NJ	80,344
Integration of Behavioral, Biological, and Reduced-Risk Chemical Approaches into a Sustainable Insect Management Program for Cranberries.	Polavarapu	Rutgers University, NJ	133,179
CORE VALUES Northeast: A Northeast IPM—Apple Consumer Education and Market Development Project.	Gordon	Mothers & Others, NY	20,000
Farmer-Centered, Value-Added Processing and Marketing Opportunities for Northeast Dairy Farmers: A Participatory Research.	Frisch	Regional Farm/Food Project of Citizens, NY.	53,000
Demonstration of Narrow Row Corn Production in New York.	Cox	Cornell University, NY	70,346
Ethnic Markets and Sustainable Agriculture	Lawrence	Just Food, NY	99,961
Eastern Gamagrass Determining its Feasibility as a Forage Crop for the Northeast.	Salon	USDA-NRCS, NY	108,252
A Strawberry IPM Systems Comparison Demonstration.	Kovach	Cornell University, NY	116,586
Use of Cover Crop Practices to Control Weeds in Integrated Lower-Chemical Input Systems of Vegetable Production.	Dickinson	Stratford Ecological Center, OH	87,823
Advancing Sustainable Potato Production in the Northwest.	Murphy	The NW Coalition for Altern. to Pesticides, OR.	35,000
Sustainable Crop/Livestock Systems in the Texas High Plains.	Allen	Texas Tech University, TX	222,125
The Hometown Creamery Revival	Dunaway	Dairy Farm Cooperators, VA	145,474
Regionally Centered Sustainable Agriculture System	Flaccavent	CPSDI, VA	173,240
Managed Riparian Buffer Zones and Cover Crops to Minimize Phosphorus and Nitrogen Runoff Losses from Corn Fields.	Jokela	University of Vermont, VT	142,448

Projects funded in fiscal year 1997—		Conducted by—	
Description	Contact	Organization/State	Amount
Efficacy Evaluation of Homeopathic Nosodes for Mastitis and Calf Scours, and Documentation of Homeopathic Practices in Organic and Conventional Dairy Production.	McCrory	Northeast Organic Farming Association, VT.	161,026
Documentation of Organic and Transitional Dairy Production Practices.	Wonnacott	NOFA-Vermont, VT	43,986
Building Community Support for Agriculture on the Urban Edge.	Butler	Washington State University, WA ...	113,000
Enhancing No-Till and Conservation Farming Success Through The Use of Case Studies, Conferences, and Workshops to Facilitate Farmer to Farmer Learning in The Pacific Northwest.	Fiez	Washington State University, WA ...	125,842

Question. What portion of SARE funds have been awarded to producers in each of the past two fiscal years, please include a description of the project and the amount of the award.

Answer. In fiscal year 1997, 113 producer grants were awarded for a total of \$513,423. These projects represent 68 percent of the total number of projects funded, and six percent of fiscal year 1997 funds. In fiscal year 1996, 114 producer grants were awarded for a total of \$512,618, representing 67 percent of the total number of projects funded, and six percent of fiscal year 1996 funds.

Fiscal year 1997 Producer Grants

<i>Description/producer/State</i>	<i>Amount</i>
Growing American and Korean Ginseng in Alaska, Smith, AK	\$5,000
Crop Production Systems for Nonchemical Control of Reniform Nematodes, Edgar, AL	8,892
Sustainable Pumpkin Production in the Southeast, James, AL	4,655
Evaluation of a Low-Cost Innovative Ensiling System for Small- to Medium-Sized Dairy Operations, Wright, AL	10,000
Continuation of a Sustainable Agroforestry System, Paleso'o, AS	2,315
Feasibility of Soil Solarization for Strawberry Production on the Central Coast of California, Galper, CA	5,000
Vermicomposting Demonstration Project, Renner, CA	5,000
Pheromone Foggers for Pesticide Replacement, Thompson, CA	5,000
Individual Confinement Rearing vs. Pasture-Based Group Rearing of Dairy Calves, Wackerman, CA	3,248
Pasture Fryer Chickens, Mattics, CO	2,500
Converting Pasture Land to Specialty Crop Production as an Alternative Farm Enterprise, Taylor, CO	2,500
Perennial Grass Establishment in Existing Alfalfa, Wiley, CO	1,825
Biological Insect Control of Herbaceous Perennials, Berecz, CT	600
Composting Tobacco Stalks Using PAW (Passive Aerated Windrow) System, Collins, CT	2,042
Effect of Limited Environmental Controls on Shiitake Mushroom Production in the Southern Coastal Plain, McRae, FL	9,990
Evaluation of an Alternative Low-Input Production System for Fresh Market Tomato, Murray, GA	5,109
Algae-Based Winter Feed for Small-Scale Goat Farm Operations, Szostak, GA	7,907

<i>Description/producer/State</i>	<i>Amount</i>
Use of Sunnhemp in Cucumber Production, Quan, GU	4,300
Sustainable Alternatives To Herbicide for Weed Control: Using Cover Crops To Combat Panicum repens and Panicum maximum In Lowland, Eastern Hawaii, Acciavatti, HI	3,500
Growing Ring-Spot Virus-Free Papayas Using Anti-transpirants and Other Sustainable Techniques, Biloon, HI	4,000
Trees for Food, Carter, IA	5,000
Converting Unproductive Woodlands Into a Profitable Shade-Plant Nursery, DeWitt, IA	2,925
Feasibility of Corn Stalk Ash as a Fertilizer Source, Reinig, IA	4,974
Systems Thinking in a Range Environment, Black, ID	5,000
Non-irrigated Alfalfa Performance Trial, Benewah County, Idaho, Crawford, ID	3,500
Paradise Time Controlled Grazing, Pratt, ID	5,000
Long-Term Benefits of Cover Crops and Crop Rotations, Upton Jr., IL	4,818
Ornamental Bittersweet Production for Small Woodland Farms, Klueh, IN	2,915
Great Circle Farm CSA/Permaculture Demonstration Site, Neff, IN	5,000
Biological Control of Small Soapweed (Yucca glauca Nutt.), Baldwin, KS	4,515
Comparing Controlled Microbial Systems (CMS) Composting to Conventional Composting to Piled Feedlot Manure, Boller, KS	5,000
Creating the Link: Cooperative Marketing of Organic (All-Natural) beef, Endicott, KS	9,854
Machinery Link Co., Govert, KS	5,000
Tree Filter & Wetland Livestock Waste Management Plan, Sextro, KS	4,808
Sustainability Starts at Home-Building Regional Self Reliance through Agritourism, Armstrong-Cummings, KY	9,580

Tall Stature Grasses for Winter Grazing and Spring Calving, Weber, WY	2,800

Question. Please summarize the achievements of the SARE program to date.

Answer. In its ten-year history, SARE has funded 1,122 projects. Five hundred of those projects are Research and Education projects—including projects in the USDA/EPA co-funded Agriculture in Concert with the Environment program—which are usually multi-disciplinary and often multi-institutional; 497 are producer grants to individual farmers or ranchers or small groups of producers to do on-farm research, demonstration, or education; and 125 are projects in the Professional Development Program funded with Smith-Lever 3(d) funds.

These 1,122 projects span a wide range of topics, farming systems, and geography, all related to improving the scientific base and practical knowledge about food and farming systems that are profitable, protect the environment, and contribute to quality of life for people and communities. Many if not most projects address multiple topics, however a breakdown of project numbers by primary topic is as follows: Approximately one-fourth of the projects address production of field or horticultural crops, for example soil-enhancing cover crops, crop rotation, ridge tillage, or crop diversification. Nearly one-fifth address animal production systems on topics such as management-intensive grazing, forage improvement, manure management, or less capital-intensive poultry and hog production for small farmers. Nearly one-fifth concern biologically-based IPM or other pest management topics. Ten percent of the projects are primarily educational, in addition to the requirement that each SARE research project include an education/outreach component; another 11 percent provide educational opportunities to field professionals—the 125 PDP projects. Eight percent address marketing, economics or community development, such as economic comparisons of different production systems, direct marketing, or on-farm processing and other value-added opportunities that provide jobs in local communities as well as improved profits for producers. Five percent of SARE projects are primarily concerned with protection of wildlife, riparian areas, and other natural resources. Another five percent explore the integration of crops and livestock in farms or ranches.

Many concrete impacts have resulted from these diverse projects. For example, a survey of participants in a Nebraska project that worked with more than 130 people on about 80,000 acres of farm and ranch land found that sixty percent of participants increased the diversity of commodities grown, thirty percent reported improved profitability, forty percent reported decreased soil erosion, and fifty percent reported improved wildlife habitat. A project re-introducing agriculture and value-added marketing to small producers in northern New Mexico is projected to bring them \$100,000 per year in agricultural income. A Michigan producer participating in a SARE project looking at the ability of grass and legume filter strips to provide habitat for beneficial insects while controlling nutrient runoff, saved \$6–10 per acre by reducing insecticide sprays. A New York grape producer saved \$31–36 per acre in reduced fungicide applications after learning to monitor conditions with a weather station and computer model. These are but a few of the ways that SARE project findings are contributing to producer profits, resource stewardship, and vital communities.

Question. The fiscal year 1999 budget proposes that with the additional funding proposed for SARE, emphasis will be given to helping farmers and ranchers save money through grazing system improvements that also protect natural resources. Why?

Answer. Grazing systems are one of several opportunities for SARE in the coming years. Management-intensive grazing has been shown, through dozens of research

and demonstration projects funded by SARE and others, to be an excellent strategy for producers to improve profits, protect natural resources, and improve quality of life for ranching families and communities. Traditional grazing systems turn livestock loose on large pastures, where the animals often remain for weeks at a time. In management-intensive grazing systems, graziers place livestock in smaller paddocks and move the animals frequently with the help of affordable, portable fencing. These grazing systems reduce feed costs because farmers and ranchers do not have to grow or purchase forage or grain year-round. Pastures require few or no inputs of pesticides and allow natural recycling of manure. They also provide a continuous soil cover while protecting wildlife habitat and important ecosystems. Graziers can work fewer hours and spend more time with their animals instead of worrying about field equipment and hauling manure. Thus grazing systems offer a fine example of a win-win approach where producers profit along with the environment and communities. Other areas of great opportunity for SARE include soil health, livestock waste management, crop and enterprise diversification, and other marketing alternatives for family farms both small and large. In each case, SARE funds will be used to study and extend these types of win-win solutions.

BINATIONAL AGRICULTURAL RESEARCH AND DEVELOPMENT PROGRAM (BARD)

Question. The fiscal year 1999 budget proposes to increase funding for the Binational Agricultural Research and Development Program (BARD) from the fiscal year 1998 funding level of \$500,000 to \$1,500,000. Given the fact that the budget proposes reductions in base programs such as the Hatch Act, McIntire-Stennis Cooperative Forestry, the Smith-Lever Act, EFNEP and Aquaculture Centers, the termination of existing programs, and the elimination of special research and federal administration grants in support of domestic needs, why is increased funding for BARD a priority?

Answer. The \$2 million requested for BARD would restore funding to the fiscal year 1997 level. Restoration of the \$2 million funding level is requested because the Administration supports increasing the proportion of agricultural research funding that is awarded by merit review with peer evaluation, as the case with the BARD program. The Administration also believes that the dollar-for-dollar matching support provided by the Israeli government under BARD results in a high quality return on the U.S. investment in the program. Further, each project funded under the BARD program is a joint effort between U.S. and Israeli scientists, which exemplifies the integrated approach to problem solving preferred by the Administration in meeting the challenges facing U.S. and global agriculture. The challenges of today and the future are more complex than those we have solved in the past and require the multi-functional, multi-disciplinary, multi-institutional approaches found under the BARD program.

Question. What agricultural research is currently being supported with funding through BARD? Please give a description of the research being funded, the amount of funds provided for each project, and who is conducting the research.

Answer. The information follows.

Fiscal year 1997 projects

Regulation of Arabidopsis Glutamate Decarboxylase in Response to Heat Stress: Modulation of Enzyme Activity and Gene Expression. Auburn University. Locy, R.D., Cherry, J.H., Singh, N.K. \$130,400

Farmer's Time Allocation Decisions in Different Institutional Environments: A Household Perspective. University of California at Davis. Chalfant, J.A., Sumner, D.A. \$76,182

Control of Fertilization-Independent Development by the *fi2* Gene. University of California at Berkeley. Fischer, R.L. \$120,900

Etiology of the Rugose Wood Disease of Grapevine and Molecular Study of the Associated Trichoviruses. University of California at Riverside. Rao, A.L.N. \$124,900

Interactions of Cloud Proteins, Pectins and Pectinesterases in Flocculation of Citrus Cloud. University of Georgia. Wicker, L., Kerr, W.L. \$124,900

Streptococcus iniae Infections in Trout and Tilapia: Host-Pathogen Interactions, the Immune Response Towards the Pathogen and Vaccine Formulation. University of Georgia. Evans, D.L. \$133,200

Lek Behavior of Mediterranean Fruit Flies: an Experimental Analysis. University of Hawaii. Shelly, T.E. \$122,400

Molecular-Based Analysis of Cellulose Binding Proteins Involved with Adherence to Cellulose by Ruminococcus albus. University of Nebraska. Morrison, M. \$142,660

Improving Methionine Content in Transgenic Forage Legumes. New Mexico State University. Sengupta-Gopalan, C. \$142,600

On-line Fault Detection and Diagnosis for Greenhouse Environment Control. Cornell University. Albright, Louis D. \$112,400

Use of Anti-Fungal Gene Synergisms for Improved Foliar and Fruit Disease Tolerance in Transgenic Grapes. Cornell University. Reisch, B.I., Kikkert, J.R. \$133,820

Controlling Ethylene Responses in Horticultural Crops at the Receptor Level. North Carolina State University. Sisler, E.C. \$124,320

Prediction of Nitrogen Stress Using Reflectance Techniques. Texas A&M University. Searcy, S.W. \$127,400

Control of Bovine Anaplasmosis: Cytokine Enhancement of Vaccine Efficacy. Washington State University. Palmer, G.H., Brown, W.C. \$143,230

Regulation of Avocado Resistance to Postharvest Pathogens by Modulation of the Biosynthesis of Antifungal Compounds. Washington State University. Browse, J. \$109,900

Fiscal year 1996 projects

Functional Biogenesis of V-ATPase in the Vacuolar System of Plants and Fungi. University of California at Berkeley. Schekman, R.W. \$81,000

Enhancement of Baculoviruses' Insecticidal Potency by Expression of Synergistic Anti-Insect Scorpion Toxins. University of California at Davis. Hammock, B.D. \$125,000

Genetic Diversity of Resistance Gene Clusters in Wild Populations of Lactuca. University of California at Davis. Micheltore, R.W. \$125,000

Resistance to Tomato Yellow Leaf Curl Virus by Combining Expression of a Natural Tolerance Gene and a Dysfunctional Movement Protein in a Single Cultivar. University of California at Davis. Gilbertson, R.L., Lucas, W.J. \$121,250

Mapping and Tagging by DNA Markers of Wild Emmer Alleles that Improve Quantitative Traits in Common Wheat. University of California at Davis. Qualset, C.O., McGuire, P.E. \$137,000

Biosensors for On-line Measurement of Reproductive Hormones and Milk Proteins to Improve Dairy Herd Management. University of California at Davis. Delwiche, M.J., BonDurant, R. \$145,870

Creating and Characterizing Genetic Variation in Tilapia Through the Creation of an Artificial Center of Origin. University of California at Davis. Gall, G.A.F., May, B. \$145,500

Molecular Genetic Analysis of Citric Acid Accumulation in Citrus Fruit. University of California at Riverside. Roose, M. \$125,000

Rhizosphere Ecology of Plant-Beneficial Microorganisms. University of California at Riverside. Crowley, D.E. \$130,430

Osmotin and Osmotin-Like Proteins as a Novel Source for Phytopathogenic Fungal Resistance in Transgenic Carnation and Tomato Plants. Purdue University. Hasegawa, P.M., Bressan, R.A. \$125,000

Study of the Basis for Toxicity and Specificity of Bacillus thuringiensis Delta-endotoxins. Purdue University. Aronson, A. \$113,630

Elicitor-Induced Response in Lycopersicon esculentum. Purdue University. Martin, G.B. \$125,000

Regulated Expression of Yeast FLP Recombinase in Plant Cells. Purdue University. Lyznik, L.A., Hodges, T.K. \$135,610

Ozone Altered Stomatal/Guard Cell Function: Whole Plant and Single Cell Analysis. Pennsylvania State University. Pell, E.J., Assmann, S. \$135,400

Developing Nutritional-Management Protocols which Prevent Tibial Dyschondroplasia. Pennsylvania State University. Leach, Jr. R.M., Gay, C.A. \$125,000

Identification of Staphylococcus aureus Virulence Factors Associated with Bovine Mastitis. Pennsylvania State University. Sordillo, L.M., Wojchowski, D.M., Perdeu, G.H. \$142,000

Virus Synergy in Transgenic Plants. Cornell University. Palukaitis, P., Zaitlin, M. \$124,480

Role of Placental Lactogen in Sheep. Texas A&M University. Bazer, F.W. \$116,130

Creating and Characterizing Genetic Variation in Tilapia Through the Creation of an Artificial Center of Origin. Virginia Polytechnic and State University. Hallerman, E.M. \$65,700

Question. What research will be supported with the \$1.5 million in fiscal year 1999 funding proposed for this program? Where will the research be carried out?

Answer. There are eleven discipline areas within which awards will be made using fiscal year 1999 funding. The discipline categories are: (1) Agricultural Engineering; (2) Animal Production; (3) Animal Protection; (4) Aquaculture; (5) Fruit Tree Crops; (6) Field & Garden Crops; (7) Post Harvest; (8) Soil & Water; (9) Agri-

cultural Economics; (10) Cellular & Molecular Biology; and (11) Plant Protection. Research supported by funding administered through CSREES for BARD is carried out at land-grant institutions.

Question. How are BARD funds awarded?

Answer. Each BARD grant funded by CSREES is for the U.S. portion of a joint U.S./Israel project. The Israeli portion of the joint project is supported from either the BARD endowment fund or from supplemental funds provided by Israel. Israel matches the supplemental funds provided by CSREES. Therefore, a significant portion of each project is supported with non-federal funds. BARD is an ongoing program designed to support fundamental science of importance to agriculture. Each year new projects are supported through the competitive process, and new objectives are set forth each year through the support of new and innovative proposals. Each proposal is funded for two to three years. Each proposal submitted to the BARD program receives a peer review evaluation. Only those proposals which review favorably are recommended for funding. A binational Technical Advisory Committee (TAC) reviews the recommendations of the peer review panels and policy recommendations which the Executive Director, BARD Executive Staff, presents to the binational BARD Board of Directors. All final decisions regarding support of proposals are made by the Board of Directors.

Question. The prepared testimony indicates that low interest rates and an increase in the cost of research have impeded the ability of BARD to adequately meet the needs of each country's producers and consumers. Please explain what increases in the cost of research have been incurred and what needs are not being met.

Answer. Increases in the cost of research are due to various factors, including the cost of complying with regulations, the use of more sophisticated equipment, and the complexity of problems being addressed. The goal of the BARD program is to support fundamental research in plant and animal sciences, economics, and engineering that are important to both U.S. and Israeli agriculture. The generation of new knowledge is an ongoing process, and the original goal of the BARD program to produce new knowledge continues today. Much of the research supported concentrates on issues of animal and plant health (including studies of the pests and pathogens of both plants and animals), and responses of plants to environmental conditions (particularly crops grown in warm, dry climates). Fundamental research supported by BARD provides the knowledge base needed to develop solutions to pressing agricultural problems in the U.S. and in Israel.

Question. What level of interest was available off the BARD endowment to support joint research efforts in each of the past three fiscal years? Has this interest off the BARD endowment been used to support research projects? If not, why? If yes, which research projects were funded with the interest off the existing BARD endowment in each of these years?

Answer. The level of interest has been approximately 7 percent on the initial BARD endowment of \$80 million and 6.9 percent on the subsequent \$30 million increase to the endowment to support joint research efforts in the past three fiscal years. The cumulative funding provided by BARD for projects awarded in fiscal years 1995 through 1997 is approximately \$32.9 million. This amount is derived from approximately \$6.1 million from CSREES and \$6.1 million in matching funding from the Israeli government for a total of \$12.2 million, and approximately \$20.7 million from the interest earned on the endowment. Copies of the BARD Annual Scientific Reports for 1995, 1996, and 1997 are being provided to the Committee. The Reports include scientific abstracts and other information about the BARD projects supported with combined CSREES, Israeli, and endowment interest funds in those three fiscal years.

NATIONAL RESEARCH INITIATIVE (NRI) COMPETITIVE GRANTS PROGRAM

Question. The prepared testimony indicates that NRI has expanded the science base for the Hazard and Critical Control Point (HACCP) approach to meat and poultry inspection. What HACCP requirements are based on NRI-funded research?

Answer. Incidence of disease-causing microorganisms in eggs, poultry, swine, cattle and shellfish, as well as the economic impact on food exports, lead to NRI-funded research on development of strategies to control, eliminate or prevent foodborne pathogens from entering the food supply. Research is ongoing to develop improved means for pathogen control and elimination, as well as determination through risk assessment, what critical control points from "farm to fork" are vulnerable. NRI has supported research to develop reduction strategies for Salmonella on commercial poultry and swine farms, as well as production systems; to understand the specific critical control points from harvest to consumption, in *Vibrio vulnificus* from shellfish; strategies are being developed to identify, then prevent or eliminate *E. coli* con-

tamination on the farm. Additionally, the NRI supported research on HACCP-based quality assurance programs on table eggs and the incidence of salmonellosis, and the potential impacts upon overall food quality and international trade.

Question. The fiscal year 1999 budget proposes to fund NRI at \$130 million, an increase of \$32.8 million from the fiscal year 1998 funding level. Please prioritize the specific increases requested for each component of NRI-funded research.

Answer. Priority will be given in each of the specific components to research topics that reflect national needs identified by stakeholders and reflected in the Administration's proposed initiatives. Further, a general priority of the NRI that applies to all of the components is that of making research grants that are both larger in awarded dollars and longer in duration while maintaining a reasonable funding success rate. By so doing, the use of Federal dollars is made more effective and the competitive process, for both the NRI and the recipient institutions, is made more efficient. The NRI also acknowledges an increase in sophistication of technological tools and instrumentation available to scientists conducting research relevant to agriculture. Such advances may allow for a broader scope to some types of proposals, while also requiring substantially higher levels of funding. In fiscal year 1999, NRI will be an important component of the National Food Genome Initiative and the President's Food Safety Initiative.

The requested increase in the Natural Resources and Environment component would ensure that the research programs contained therein were offered on a regular, annual basis, and that each program would be able to attain a better success rate, which has ranged from as low as 6 to 15 percent for some programs. The research areas currently supported are critical for sustainability of agriculture and forestry. They will contribute both fundamental and mission-linked information for improving understanding of: (1) plants as they respond to their environment, both normal and stressed by nature and man-made pollutants; (2) soils, the basic medium upon which all terrestrial organisms depend and where physical structure, chemistry, biology, and hydrology interact in ways that ultimately determine whether natural and managed soil and environmental quality are maintained and improved; (3) ecosystems, where an understanding of the flow of energy and the cycling of nutrients is requisite to the development of management strategies to ensure the sustainability and health of both natural and managed ecosystems; and (4) water quality and availability, as all agricultural and forestry practices ultimately influence the nation's water resource. A final priority is that of developing a new research area to enhance understanding weather and climate interactions with agricultural systems. Such a program would be complementary to the above areas, address current agricultural problems such as particulate pollution, and lead to improved management.

The increase requested for the Plant Division would be used for high priority research areas in Food Genomics; Energy Conversion by Plants; Synthesis of Plant Products; Plant/Microbe Interactions; Insect Community/Plant Habitat Interactions and; Assessment of Risks of Biological Control Agents. The increase will provide additional resources for plant genome research that will focus on mapping, identifying, and understanding the function and control of genes in agriculturally important plants, with emphasis on functional genomics, identification of expressed sequence tags and quantitative trait loci, development of comparative and physical genomic maps, technology, and bioinformatics. This knowledge is the key that will permit the United States to develop new genetic technologies for improvements in yield, pest resistance, composition, and quality of the domestic agricultural output. Increased funding will support research metabolic pathways in plants that will enable the genetic engineering for designing and altering agriculturally important plants for enhanced and new functions. Increased funding will answer questions about (1) how the composition and ecology of microbial communities surrounding a plant and the microbial flora inside a plant affect plant processes, such as disease resistance; beneficial plant/microbe interactions; response to environmental factors; water and nutrient uptake by the plant and; (2) the genetic and metabolic pathways and controls in both plants and microbes that govern these processes. Increased funding will focus on understanding ecological interactions between insect and plant communities to enhance development of new pest control strategies for US agriculture. For example, insects developing in non-crop plants (e.g., weeds, ornamentals, and native vegetation) can significantly impact their importance in many agroecosystems. In addition, funding will be used to assess the possible effects of classical biological control on non-target species.

In the area of Nutrition, Food Safety and Health, priority will be given to research to develop strategies to prevent or eliminate disease-causing micro-organisms, naturally occurring toxicants, or drug residues from entering our food supply; to develop or improve current sampling procedures for detection of disease-causing microorga-

nisms, naturally occurring toxicants or drug residues, expected to lead to rapid, reliable and practical quantification methods for microbial agents, naturally occurring toxicants or drug residues; to develop approaches to and models for risk assessment in support of food safety; examine the role of livestock/poultry manures and their applications in the transmission of foodborne diseases; examine the mechanisms responsible for antibiotic resistance in livestock and poultry that could lead to foodborne illness; identify obstacles to adopting appropriate food safety habits, and develop recommendations for interventions to improve safe food consumption among consumers. All these research areas are complementary to the President's Food Safety Initiative.

In the Animals component, the proposed increase will provide additional resources for high priority animal genome research such as functional genomics, comparative and physical mapping, identification of expressed sequence tags and economic trait loci and bioinformatics. The research would also include whole genome sequencing of animal pathogens, previously unsupported in the NRI due to insufficient funds. These research areas would be complementary to that of the National Food Genome strategy. Additional high priority animal health research will also be supported that responds to disease challenges posed by new and re-emerging diseases that threaten US animal agriculture.

In the Markets, Trade and Rural Development component, the Markets and Trade program provides priority consideration for agricultural competitiveness, and technology and sustainability. To these, a fourth priority would be added dealing with natural resource economics. The program has purposely limited the priority areas initiatives because of the relatively small size of the program. Expanding the program in this way would invite proposals that examine many of the critical environmental issues that are resulting from changes in the structure of various agricultural sectors, one example being increased concentration in the food animal production sector. The Rural Development Program currently places priority on research goals that deal with understanding the forces affecting rural areas and on the design and evaluation of new approaches to rural development. Because of resource constraints, a lower priority has been placed on understanding the quality of life aspects that are important to and result from living and working in rural areas. Increased funding would permit an expansion to capture research goals that address in a more direct manner, quality of life characteristics of rural areas, and how those characteristics might be improved.

The proposed increase for the Processing for Adding Value or Developing New Product components would allow additional resources to be directed toward: metabolic engineering of plants and microorganisms to produce value-added products from agriculture; new crop development, focusing on genetic and agronomic issues in addition to the current emphasis of value-added product development; greater emphasis on research of foods and food systems with health promoting properties; and additional resources directed toward development of novel food manufacturing processes, including greater process automation and control, to strengthen competitiveness of the US food industry.

An increase in the NRI will also allow additional high priority Agricultural Systems research to be supported. With the current level of funding, the NRI's Agricultural Systems Program can only support ten percent of the proposal submissions.

Question. What are the returns on NRI-funded research? What is the documentation for these findings?

Answer. The cost-effectiveness of the NRI or individual research projects has not been specifically estimated. However, the benefits of public investment in agricultural research, through programs such as the NRI, have consistently been shown to outweigh the costs.

For example, work by the Economic Research Service (ERS) indicates a return on investment for agricultural research of 20–60 percent. The ERS further concludes that agricultural basic research tends to have twice the benefits to society, with returns on investment of 60–90 percent as compared to more applied agricultural research. Publicly funded research was found to have twice the return as compared to privately funded research. A report by the Council of Economic Advisors further supports the link between research and positive economic and social returns, citing consistent positive returns from research.

Agriculture productivity has increased at an average annual rate of 1.94 percent for the period of 1948–1994, one of the highest rates of productivity growth of all U.S. industries. For the period of 1990–1994, this rate of productivity increase was 2.77 percent. Publicly funded research has been a major contributor to this increase in productivity, not only by providing higher yielding crop varieties, better livestock breeding practices, more effective fertilizers and pesticides, and better farm management practices, but also through research that keeps productivity from falling, such

as by overcoming pesticide resistance. Agriculture research not only benefits the farmer through decreased costs and higher profits, but also the nation, and low-income people in particular, through lower food prices. In addition, publicly funded agricultural research has been broadened to impact environmental protection and food safety.

The sources for these findings are Economic Research Service, "Agricultural Productivity in the United States," Agriculture Information Bulletin Number 9510, January 1998, USDA, Economic Research Service, "The Value and Role of Public Investment in Agricultural Research," Staff Paper Number 9510, May 1995, and the Council of Economic Advisors "Supporting Research and Development to Promote Economic Growth: The Federal Government's Role," October 1995.

EXTENSION INDIAN RESERVATION PROGRAM

Question. An increase in funding is requested for fiscal year 1999 to expand the presence of extension agents on Indian Reservations. How many extension agents are currently funded and which reservations are being served? How many additional extension agents will be funded with the increased funding requested and where will they be located?

Answer. Currently we have 25 agents in 16 states. They serve the following reservations:

- Alaska: Tanana Chiefs Council
- Arizona: Colorado River; Hopi; San Carlos Apache
- Arizona/New Mexico/Utah: Navajo (Window Rock); Navajo (Ship Rock)
- Florida: Seminole
- Idaho: Fort Hall
- Mississippi: Choctaw
- Montana: Flathead; No. Cheyenne; Blackfeet; Ft. Belknap
- North Carolina: Cherokee
- North Dakota: Ft. Berthold
- New Mexico: Jicarilla Apache; Zuni
- Nevada: Pyramid Lake & Walker River (one agent)
- Oklahoma: Muscogee
- Oregon: Warm Springs
- South Dakota: Rosebud; Pine Ridge
- Washington: Chehalis; Colville
- Wyoming: Wind River

The requested increase will be used to provide 31 additional agents for some of the unmet needs, as follows:

<i>State</i>	<i>Agents Needed</i>
Alaska	3
Arizona	14
California	2
Colorado	2
Idaho	2
Maine	1
Minnesota	2
Montana	4
Nevada	3
New Mexico	9
Oklahoma	2
South Dakota	8
Utah	4
Washington	4
Wisconsin	2
Wyoming	1

We have a backlog of about 20 unfunded projects from Arizona, Colorado, Idaho, Minnesota, Montana, Oklahoma, South Dakota, Wisconsin, and Wyoming as a result of previous competitive applications. These will be accorded some priority in any subsequent competition. We will issue a request for (competitive) proposals when an increase in funding is received. The requested increase for EIRP in fiscal year 1999 supports the CRAT team recommendations to expand agricultural opportunities to small-scale and disadvantaged farmers.

1890 FACILITIES PROGRAM

Question. Additional funds are requested for fiscal year 1999 for the 1890 Facilities Program to allow facilities at these institutions to be more comparable to the facilities found on campuses of the 1862 land-grant universities. Have you done an inventory of the facilities' improvements required at each of the 1890 Institutions to achieve this goal? If so, please provide the committee with a list of facilities' needs by institution and the funding required to meet these needs.

Answer. The agency has not yet conducted an inventory of the facilities' needs required for the use of the proposed fiscal year 1999 funds. The agency has instructed the 1890 Universities to update its inventory of needs for the use of the proposed funds. The agency will issue, in April 1998, a request for a Five-Year Plan for the development of facilities. The Five-Year Plan details the proposed use of the funds over a five year period. Each construction or renovation project must have a statement of need which describes the factors or circumstances which led to the institution's need for the planning, construction, renovation or acquisition project proposed. Also, the plan must show the procedures to be used to accomplish the goals of the individual project. Tentative timetables are developed for—accomplishing each goal. A proposed construction budget is submitted, indicating the sources of funding—federal and/or non-federal—for the completion of the project. A review panel must approve each Five-Year Plan, before a grant is awarded to the institution. The increase is consistent with the CRAT team recommendations.

Question. Please provide how the 1890 facilities funds were allocated, by institution, in each of fiscal years 1997 and 1998, and how much each institution would receive if the program is funded at the fiscal year 1999 request level.

Answer. The 1890 facilities funds were allocated in fiscal year 1997 and fiscal year 1998 as shown on the following table. The allocation for fiscal year 1999 has not yet been determined. This will be determined when the fiscal year 1999 budget is approved.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE 1890 EXTENSION AND RESEARCH FACILITIES PROGRAM

Institutions	Allocated fiscal year—	
	1997	1998
Alabama:		
Alabama A&M University	\$403,755	\$403,755
Tuskegee University	403,755	403,755
Arkansas: University of Arkansas at Pine Bluff	387,818	387,818
Delaware: Delaware State University	310,482	310,482
Florida: Florida A&M University	408,640	408,640
Georgia: Fort Valley State University	448,874	448,874
Kentucky: Kentucky State University	497,465	497,465
Louisiana: Southern University	379,624	379,624
Maryland: University of Maryland Eastern Shore	356,775	356,775
Mississippi: Alcorn State University	392,395	392,395
Missouri: Lincoln University	495,381	495,381
North Carolina: North Carolina A&T State University	511,065	511,065
Oklahoma: Langston University	399,604	399,604
South Carolina: South Carolina State University	394,830	394,830
Tennessee: Tennessee State University	455,003	455,003
Texas: Prairie View A&M University	588,339	588,339
Virginia: Virginia State University	430,885	430,885
Subtotal	7,247,040	7,247,040
Federal Administration	301,960	301,960
Total	7,549,000	7,549,000

Question. Please provide a list of the facility improvements funded through the 1890 Facilities Program for each of the past two fiscal years and for fiscal year 1998 to date, indicating the amount of funds provided by institution and the facilities funded.

Answer. The U.S. Department of Agriculture 1890 Facilities Program is authorized to provide Federal support in the design and construction of research and education facilities that assist in the discovery of new knowledge and the delivery of relevant and timely information to solve production problems and other problems of importance to diverse audiences served by the eligible universities. In addition to traditional programs, these institutions provide an emphasis on small farmers and other limited resource families, an important focus for the Department in the implementation of the Civil Rights Implementation Team recommendations.

Research and education programs are focused on the five outcomes adopted by the Research, Education, and Economics (REE) Mission Area and goals of the Cooperative State Research, Education, and Extension Service (CSREES) Agency strategic plans (An agricultural system that is highly competitive in the global economy; A safe and secure food and fiber system; A healthy well-nourished population; An agricultural system which protects natural resources and the environment; and Enhanced economic opportunity and quality of life for Americans). This ensures that the 1890 facilities programs focus on issues of national importance.

Completed and planned facilities will focus research and education efforts on issues, such as: water quality; food safety; nutrition; community development, particularly the rural/urban interface; plant and animal biotechnology, including forestry; small ruminant management; the use of distance and mobile education technologies; youth programming; plant and animal genome research; aquatic entomology; etc. Finally, the facilities will also provide training opportunities for minority undergraduate and graduate students who will become future scientists and agricultural leaders, with the potential to take advantage of employment opportunities with the U.S. Department of Agriculture. The broad scope of these activities is documented in the Five year plans of work developed by each university for approval by CSREES before facility funds are allocated. Program/project monitoring is possible through review of annual facility plans and the program plans and reports submitted for agency review as part of the Government Performance and Results Act accountability process initiated by the agency and land-grant partners.

Facilities Improvements as follows.

1890 FACILITIES PROGRAM

Institutions	Fiscal years—				1998 proposed projects ²	Status of approved 5-yr. plan ³
	Total cost of approved 5-yr. plan ¹ (1993-97)	1996 appropriated funds	1997 appropriated funds	1998 proposed projects ²		
Alabama: Alabama A&M University	\$2,093,113	\$416,242 1. Animal Science Research and Demonstration Facility. 2. Food Science & Nutrition Demonstration Laboratories. 3. Downlinking & networking development. 4. Construct Agricultural Mechanical Research Laboratory. 5. Plant, food & animal laboratory equipment.	\$403,755 1. Animal Science Research and Demonstration Facility. 2. Food Science & Nutrition Demonstration Laboratories. 3. Downlinking & networking development. 4. Construct Agricultural Mechanical Research Laboratory. 5. Plant, food & animal laboratory equipment.	\$403,755 1. Asbestos Removal Replacement of Campbell Hall roof.	—Major purchases have been made for water quality equipment, computer hardware/fiber optics lines and wiring for networking improvements. —The Alternative Crops facility was completed. —Renovations in the Family and Consumer Sciences Management Laboratory, Animal Physiology Laboratory, and Research and demonstration facilities. —Caprine research facility completed. —Replacement of the Campbell Hall Research Building's roof completed. —Renovation of the food processing laboratories & the construction of the Extension Activities Center in progress.
Tuskegee University	\$2,093,113	\$416,242 1. Construction/renovation Woodruff Lab.	\$416,242 1. Construction/renovation Woodruff Lab.	\$403,755 1. Asbestos Removal Replacement of Campbell Hall roof.	—Laboratory equipment purchased for aquaculture and small ruminant research programs. —Aquaculture facilities renovated. —Extension complex completed. —Furnishings and equipment for new Extension complex purchased.
Arkansas: University of Arkansas Pine Bluff.	\$2,010,493	\$399,812 1. Construct facility for horticulture, aquaculture, human nutrition, child development, and small ruminant (sheep) research and improve infrastructure. 2. Construct mixing pad for agricultural chemicals. 3. Contract engineering design for fish processing/marketing building.	\$387,818 1. Construct slaughter house for swine demonstration program. 2. Support construction of an aquaculture demonstration processing and marketing facility. 3. Repair station infrastructure including roads and ponds. 4. Purchase and install growth chamber for agronomy and horticulture research. 5. Purchase irrigation accessories for agronomy area and farm.	\$387,818 1. Construct slaughter house for swine demonstration program. 2. Support construction of an aquaculture demonstration processing and marketing facility. 3. Repair station infrastructure including roads and ponds. 4. Purchase and install growth chamber for agronomy and horticulture research. 5. Purchase irrigation accessories for agronomy area and farm.	—Laboratory equipment purchased for aquaculture and small ruminant research programs. —Aquaculture facilities renovated. —Extension complex completed. —Furnishings and equipment for new Extension complex purchased.

Delaware: Delaware State University	\$1,607,900	\$319,672 Expansion of Herbarium	\$310,482 Expansion of Herbarium and Small Animal Laboratory	—Accumulating funds. —Installed equipment in new extension building. —Installed feed storage handling system. —Mobile teaching unit operational. —Pond construction complete.
Florida: Florida A&M University	\$2,118,441	\$421,279 1. Research & Extension Complex. 2. Plant and soils research equipment.	\$408,640 1. Research and Extension Complex. 2. Teleconference Center. 3. Pavilion. 4. Environmental Center installation. 5. Animal science research equipment.	—Accumulating funds. —Completed research and extension complex. —Renovated entomology laboratory. —Installed irrigation system. —Renovated ponds.
Georgia: Fort Valley State University	\$2,327,016	\$462,757 1. Small Ruminant Research and Extension Center. 2. Research/Extension Education Support Center. 3. Research/Extension Human Development and Family Life Center.	\$448,874 1. Small Ruminant Research and Extension Center. 2. Research/Extension Education Support Center. 3. Research/Extension Human Development and Family Life Center. 4. Communication Production Center. 5. Technology Development Transfer Center. 6. Multipurpose Agricultural Demonstration Pavilion.	—Accumulating funds. —Under construction—Small Ruminant Research & Extension Center. —Completed the Communication Production Center.
Kentucky: Kentucky State University	\$2,578,915	\$512,850 1. Equipment for the Atwood Research Facility. 2. Renovate Water Quality lab. 3. Equipment for Extension building.	\$497,465 1. Pond Site (new construction). 2. Research farm (multi-purpose building).	—Horticulture and Entomology Laboratories in the Atwood Research Facility completed. —Telecommunications equipment was purchased and installed in four rooms in the Cooperative Extension Building.
Louisiana: Southern University	\$1,968,017	\$391,365 1. Renovation of livestock pavilion. 2. Multi-purpose Research & Demonstration Center 3. Extension Telecommunication Center. 4. Equipment purchases.	\$379,624 1. Renovation of livestock pavilion. 2. Multipurpose Research & Demonstration Center 3. Extension Telecommunication Center.	—Accumulating funds. —Contract awarded for renovation of livestock pavilion.

1890 FACILITIES PROGRAM—Continued

Institutions	Fiscal years—				1998 proposed projects ²	Status of approved 5-yr. plan ³
	Total cost of approved 5-yr. plan ¹ (1993-97)	1996 appropriated funds	1997 appropriated funds	1998 proposed projects ²		
Maryland: University of Maryland Eastern Shore.	\$1,849,563	\$367,809 1. Food Science Technology, Research & Extension Center. 2. The Lifespan Human Development Center. 3. Major equipment installation.	\$356,775 1. Food Science Technology, Research & Extension Center. 2. The Lifespan Human Development Center.	—Accumulating funds. —Major equipment purchased.	
Mississippi: Alcorn State University	\$2,034,222	\$404,531 1. Planning the construction of Research and Extension building.	\$392,395 1. Construction of Research & Extension building.	—Accumulating funds. —Construction underway on Research & Extension building.	
Missouri: Lincoln University	\$2,568,115	\$510,702 1. Construction of Phase II of Allen and Foster Halls.	\$495,381 1. Construction of Phase II of Allen and Foster Halls.	—Construction of Phase II of Allen and Foster Halls was completed.	
North Carolina: North Carolina A&T State University.	\$2,649,257	\$526,830 1. Renovation of Coltrane Hall. 2. Construction of Extension/Research office building at the University Farm Complex. 3. Renovation of Ward Hall. 4. Renovation of Analytical and Food & Nutrition Labs. 5. Scientific equipment purchases. 6. Construct building for research into adaption of small machinery to small scale farming. 7. Telecommunications studio.	\$511,065 1. Renovation of Coltrane Hall. 2. Construction of Extension/Research office building at the University Farm Complex. 3. Renovation of Ward Hall. 4. Renovation of Layer and Broiler Facilities. 5. Biotechnology purchase (growth chamber and accessories for plant stress studies) 6. Telecommunications studio.	—Accumulating funds. —Constructed off-campus farm storage building. —Constructed second floor to Coltrane Hall for Extension office complex. —Established an Extension/Research Telecommunications studio.	
Oklahoma: Langston University	\$2,071,598	\$411,963 Construction of Research and Extension building.	\$399,604 1. Construction of Research & Extension building.	—Accumulating funds.	

South Carolina: South Carolina State University	\$2,046,844	\$407,041 Renovate extension facility	\$394,830 Renovate extension facility.	—Construction underway on extension facility. —Purchase and installation of distance education equipment underway.
Tennessee: Tennessee State University	\$2,358,790	\$469,075 1. Construct Research & Extension Facility. 2. Purchase land for research farm.	\$455,003 1. Construct Research & Extension Facility. 2. Purchase land for research farm.	—Accumulating funds.
Texas: Prairie View A&M University	\$2,958,522	\$588,339 1. Install irrigation system in research plots. 2. Install security fencing around research plots. 3. Install animal waste disposal system. 4. Install environmental plant growth chambers. 5. Construction of multi-purpose pavilion. 6. Renovate facility and equipment in the Abattoir. 7. Renovate facility and equipment in creamery.	\$570,689 1. Purchase research laboratory equipment. 2. Purchase equipment for Abattoir. 3. Purchase communications equipment. 4. Run satellite (teleconferencing) cabling. 5. Renovate and upgrade bio-safety/surgery and environmental chamber labs at International Dairy Goat Research Center (IDGRC) and other general repairs and replacements in the IDGRC.	—Constructed office and training complex. —Purchased equipment for training complex.
Virginia: Virginia State University	\$2,233,761	\$444,211 1. Construct Extension building (office complex). 2. Renovate buildings on university farms. 3. Water quality and aquaculture equipment. 4. Further develop the multi-purpose pavilion at the university farm.	\$430,885 1. Renovate buildings on university farm. 2. Purchase major equipment for distance education. 3. Purchase major research equipment. 4. Renovate research storage building.	—Accumulate funds. —Major equipment purchased and installed. —Satellite downlinking equipment installed and in use. —Renovated research meat goat building. —Construction of Extension Office Complex has been completed. Building occupied. —Aquaculture equipment installed. —Multi-purpose pavilion completed.

¹ CSREES funding of the approved five-year plan is contingent upon the appropriation of funds for the 1890 Facilities Program.
² Fiscal year 1998 funds have not been allocated to the Universities to date. Waiting review of rules and guidelines by Office of General Counsel.
³ In many cases, 1890 Institutions are required by State law to have all funding in-hand before construction may begin; for that reason, construction accomplishments do not correspond to funds provided through fiscal year 1998; i.e., In-situations must "accumulate" funds before starting projects.

Question. How are 1890 Facilities Program funds allocated?

Answer. The distribution is as follows for the 1890 Facilities Program: 4 percent for Federal administration; of the remainder 60 percent will be distributed equally and 40 percent will be distributed based on the Section 1444 formula of the 1977 Farm Bill, as amended. Sec. 1447 states the following:

A sum equal to 4 percent of the total amount appropriated each fiscal year under this section shall be allotted to the Cooperative State Research, Education, and Extension Service of the Department of Agriculture for administrative, technical, and other services, and for coordinating the extension work of the Department of Agriculture and the several States.

Of the remainder, 20 percent shall be allotted among the eligible institutions in equal proportions; 40 per centum shall be allotted among the eligible institutions in the proportion that the rural population of the State in which each eligible institution is located bears to the total rural population of all the States in which eligible institutions are located, as determined by the last preceding decennial census; and the balance shall be allotted among the eligible institutions in the proportion that the farm population of the State in which each eligible institution is located bears to the total farm population of all the States in which the eligible institutions are located, as determined by the last preceding decennial census.

HIGHER EDUCATION PROGRAMS

Question. Please provide the Committee with a report on each of the CSREES higher education programs, indicating the institution receiving grants under each program and an assessment of how each program is meeting its objectives.

Answer. The information follows.

Higher Education Challenge Grants Program

Institutions funded in fiscal year 1997:

University of Arizona
 University of California—Davis (2)¹
 University of Connecticut
 University of Georgia
 University of Hawaii at Manoa (2)
 University of Idaho (2)
 Purdue University, Indiana (2)
 Iowa State University (2)
 Kansas State University (3)
 University of Kentucky
 Louisiana State University
 University of Missouri—Columbia (3)
 University of Nebraska
 Rutgers—The State University of New Jersey
 New Mexico State University
 Cornell University, New York (2)
 North Carolina State University
 Ohio State University (2)
 Cameron University, Oklahoma
 Oklahoma State University
 Oregon State University
 Pennsylvania State University
 Southwest Texas State University
 Texas Tech University
 University of Vermont
 Virginia Polytechnic Institute & State University (3)
 Washington State University (3)
 University of Wisconsin—River Falls (2)

The Challenge Grants Program's objective is to enable colleges and universities to provide high quality education in the food and agricultural sciences required to strengthen the Nation's food and agricultural scientific and professional work force. The program is accomplishing this by funding model projects that address regional and national higher education issues, use creative approaches to teaching, and foster partnerships among universities and between universities and the private sector. The program doubles the Federal investment since it requires dollar-for-dollar matching. The program serves the entire four-year academic community, making it the centerpiece of all USDA teaching grants programs. However, in spite of exciting

¹ Number indicates grants awarded.

projects that demonstrate its worth, only approximately 45 projects can be funded each year at the current level of funding. During the eight years of the program only 23.8 percent of proposals could be funded, in spite of many more worthy and needed projects.

Hispanic-Serving Institutions Education Grants Program

Institutions funded in fiscal year 1997:

Central Arizona College
 California State University, Los Angeles
 California State University, Bakersfield
 Porterville College, California
 Rancho Santiago College, California
 Trinidad State Junior College, Colorado
 Miami-Dade Community College, Florida
 Albuquerque Technical Vocational Institute, New Mexico
 University of New Mexico
 Eugenio Maria De Hostos Community College, New York
 Interamerican University of Puerto Rico
 Southwest Texas Junior College
 Texas A&M University—Kingsville

The Hispanic-Serving Institutions Education Grants Program was initiated in fiscal year 1997. The program's objectives are to promote and strengthen the ability of Hispanic-Serving Institutions to carry out higher education teaching programs in the food and agricultural sciences. The program will accomplish these by awarding grants to Hispanic-Serving Institutions for projects that will address one or more targeted need areas: curricula design and materials development; faculty preparation and enhancement for teaching; instruction delivery systems and scientific instrumentation for teaching; student experiential learning; and, student recruitment and retention. The program is competitive among Hispanic-Serving Institutions.

1890 Institution Capacity Building Grants Program

Institutions funded for teaching projects in fiscal year 1997:

Alabama A&M University (2)
 University of Arkansas-Pine Bluff (3)
 Florida A&M University (4)
 Southern University, Louisiana
 University of Maryland-Eastern Shore (2)
 Alcorn State University, Mississippi (2)
 Lincoln University, Missouri
 North Carolina A&T State University (2)
 South Carolina State University (2)
 Prairie View A&M University, Texas
 Virginia State University (3)

Institutions funded for research projects in fiscal year 1997:

Alabama A&M University (2)
 Tuskegee University, Alabama (2)
 Delaware State University
 Fort Valley State University, Georgia (3)
 Kentucky State University
 Lincoln University, Missouri
 North Carolina A&T State University
 Langston University, Oklahoma (3)
 Prairie View A&M University, Texas (2)

The competitive 1890 Institution Capacity Building Grants Program serves as the crux of the Department's high-priority initiatives to advance the teaching and research capacity of the 1890 Land-Grant Institutions and Tuskegee University. It reflects USDA's commitment to encourage more minorities to prepare for careers as food and agricultural scientists and professionals. The program meets these objectives by providing support for teaching and research projects in high-priority areas targeted by the institutions and USDA. Matching support from non-Federal dollars is strongly encouraged. Another component of the program that assists the 1890 Institution to build teaching and research capacity is the required cooperation of the institutions with one or more USDA agencies in developing the proposal and carrying out the project.

Multicultural Scholars Program

Grants are awarded every two years. Thus, institutions funded in fiscal year 1997, with both 1996 and 1997 funds, are:

Alabama A&M University
 University of Arkansas, Fayetteville
 California Polytechnic State University—San Luis Obispo
 California State University, Fresno
 University of Florida
 University of Hawaii at Manoa
 University of Idaho
 University of Illinois, Urbana
 Purdue University, Indiana
 Michigan State University
 Rutgers University, New Jersey
 New Mexico State University
 Cornell University, New York
 University of North Dakota
 North Dakota State University
 Oklahoma State University
 Pennsylvania State University
 Seton Hill College, Pennsylvania
 South Dakota State University
 Tennessee State University
 University of Vermont
 Virginia Polytechnic Institute & State University
 University of Wisconsin-River Falls
 University of Wisconsin-Stout

The Multicultural Scholars Program ultimately aims to increase the utilization of America's diverse talent in the food and agricultural work force and to advance the educational achievement of all Americans. The program strives to attract and educate more students from groups currently under-represented in the food and agricultural sciences for careers in agriscience and agribusiness. The program accomplishes these goals by providing grants to universities for undergraduate scholarships for outstanding students from such underrepresented groups. The program is open to all colleges and universities. Since the program began in 1994, participating colleges and universities have provided 206 scholarships.

USDA National Needs Graduate Fellowships Program

Grants are awarded every two years. Thus, institutions funded in fiscal year 1998, with both 1997 and 1998 funds, are:

University of Arkansas, Fayetteville
 University of Arizona
 University of California, Davis
 University of Florida
 University of Georgia
 Indiana University
 Iowa State University (4)
 University of Illinois, Urbana (3)
 Purdue University (5)
 Kansas State University
 University of Kentucky
 Worcester Polytechnic Institute, Massachusetts
 Michigan State University (3)
 University of Minnesota, St. Paul (6)
 University of Missouri—Columbia (3)
 North Carolina State University (3)
 North Dakota State University
 University of Nebraska—Lincoln (2)
 Cornell University, New York (5)
 Ohio State University
 Pennsylvania State University (2)
 Texas A&M University
 Virginia Polytechnic Institute & State University (3)
 University of Wisconsin, Madison (3)

Begun in 1984, the USDA National Needs Graduate Fellowships Grants Program seeks to stimulate the development of food and agricultural scientific expertise in targeted national need areas. This program represents a key investment strategy,

as it is the only Federal program targeted specifically to the recruitment and training of pre-doctoral students for critical food and agricultural scientific positions. The program achieves its goal by providing funds competitively to universities for attracting and supporting outstanding graduate students to pursue advanced degrees in areas of the food and agricultural sciences experiencing shortages of expertise. Approximately 1,028 Fellows have been trained within these areas of expertise under the Fellowships Program.

The program also provides competitive, special international study or thesis/dissertation research travel allowances for a limited number of current USDA Graduate Fellows. In 1997, seven Fellows from the following institutions were awarded funds for such international study: Indiana University; Iowa State University; Michigan State University; Purdue University; Cornell University; Oregon State University; and, Pennsylvania State University.

Tribal Colleges Endowment Fund and Tribal Colleges Education Equity Grants Program

All 29 tribally controlled Land-Grant Institutions were funded in the Tribal Colleges Endowment Fund and the Tribal Colleges Education Equity Grants Program in fiscal year 1997. They are:

Bay Mills Community College, Michigan
 Blackfeet Community College, Montana
 Cankdeska Cikana Community College, North Dakota
 Cheyenne River Community College, South Dakota
 College of the Menominee Nation, Wisconsin
 Crownpoint Institute of Technology, New Mexico
 D-Q University, California
 Dine Community College, Arizona
 Dull Knife Memorial College, Montana
 Fond du Lac Tribal and Community College, Minnesota
 Fort Belknap College, Montana
 Fort Berthold Community College, North Dakota
 Fort Peck Community College, Montana
 Haskell Indian Nations University, Kansas
 Institute of American Indian Arts, New Mexico
 Lac Courte Oreilles Ojibwa Community College, Wisconsin
 Leech Lake Tribal College, Minnesota
 Little Big Horn College, Montana
 Nebraska Indian Community College, Nebraska
 Northwest Indian College, Washington
 Oglala Lakota College, South Dakota
 Salish Kootenai College, Montana
 Sinte Gleska University, South Dakota
 Sisseton Wahpeton Community College, South Dakota
 Southwest Indian Polytechnic Institute, New Mexico
 Standing Rock College, North Dakota
 Stone Child Community College, Montana
 Turtle Mountain Community College, North Dakota
 United Tribes Technical College, North Dakota

The Tribal College Endowment Fund distributes interest earned by an endowment established for the 1994 Land-Grant Institutions (29 Tribally controlled colleges) as authorized in the Equity in Education Land-Grant Status Act of 1994. The Endowment Fund enhances education in agricultural sciences and related areas for Native Americans by building educational capacity at these institutions in the areas of curricula design and materials development, faculty development and preparation for teaching, instruction delivery systems, experiential learning, equipment and instrumentation for teaching, and student recruitment and retention. Interest earned in fiscal year 1997 was \$451,397. After a 4 percent set-aside for administration, the remaining funds are distributed by formula: 40 percent in equal shares and 60 percent based on student count.

The Tribal Colleges Education Equity Grants Program is designed to strengthen higher education instruction in the food and agricultural sciences at 1994 Land-Grant Institutions. Projects focus on undergraduate and/or graduate studies in the food and agricultural sciences in the same areas as the Endowment Fund. Each institution receives \$50,000.

SMALL FARM INITIATIVE

Question. Describe in more detail the Small Farms Initiative proposed to be funded at a level of \$4 million for fiscal year 1999.

Answer. The Initiative will support multi-functional, mutually reinforcing research and extension activities that address high priority needs of small farmers as identified by the National Small Farm Commission, USDA's National Plan for Small Farms, and participants in the 1996 National Small Farm Conference. These high priority needs include:

- Research that focuses on solutions to production, environmental protection, and processing problems that demand low capital inputs, but build on small farmers' management, labor, and entrepreneurial skills;
- Research and extension programs that help small farmers build alternative markets for their products and develop value added products;
- Education and extension programs that small farmers can use to enhance their entrepreneurial skills and business acumen;
- Extension programs that focus on developing farmer networks to enhance the flow of information and knowledge both to and from USDA and the Land Grant system and among farmers; and
- Educational and extension programs directed at the specific needs of new or beginning farmers.

CSREES will apply the lessons learned in previous research, education and extension programs to build a grass-roots-driven, participatory program that involves farmers, non-governmental organizations, USDA, other federal and state agencies, and all of the Land Grant partners in program development and delivery. These programs will:

- Involve farmers in every aspect of program development, delivery and evaluation, including serving on review teams, conducting on-farm research, and taking leadership of farmer networks;
- Include non-governmental organizations that represent or work closely with small farmers in program development to build a sustainable public-private sector partnership;
- Bring women farmers, minority farmers, farm youth, socially disadvantaged farmers, and physically challenged farmers into the mainstream of program activities; and
- Build on the research, education and extension strengths of the 1994, 1890 and 1962 Land Grant partners to ensure the program meets local needs.

The structure of the CSREES program will be frugal with taxpayers' money while ensuring representation from a broad sector of the government and non-government community and targeting local needs. CSREES will develop a structure for program delivery that:

- Keeps operating costs down by using existing structures where possible and relying to the maximum degree possible on new cost-saving technologies to administer the program;
- Encourages regional flexibility in organization and program content to meet local needs;
- Uses one or more virtual centers or consortia, including both Land Grant and non-governmental organizations, to administer program activities; and
- Relies heavily on competitive grants with 100 percent nonfederal match encouraged for commodity-or location-specific activities.

Question. Why is this new initiative needed?

Answer. Small farms are an important part of the total agricultural sector. About 1.4 million of the nation's 1.9 million farms are small farms. Small farmers hold about one-third of the nation's farm land.

Small farms complement and contribute to the productivity of mid- and large-sized farms and agribusinesses. For example, a medium-sized feedlot averages 10,000 head of cattle. The feedlot operator depends on thousands of cow/calf operations, each with an average of 49 head of cattle, to provide the feeder calves for his feedlot.

Small farms often lead the way in new product development. For example, the fastest growing sectors of the agricultural market in the United States today are the organic and natural food markets. Small farms led the way in both areas and contribute most of the production.

Small farms enhance the quality of life for millions more Americans and protect natural resources for the entire nation. Small farms play a dynamic and important role in maintaining and stabilizing rural communities. Small farmers are often major clients of the entire business community in rural areas. Their tax dollars are critical to the entire community.

Small farms also enhance the quality of life for urban communities. Small farms are often the only productive land use that can serve as a buffer between high density population centers and rural areas. They contribute significantly to the quality of the urban diet by providing fresh, high-quality, diverse produce through direct markets to urban residents.

Small farms protect resources that serve all Americans. They provide open space for wildlife habitat, water recharge and the human need for contact with nature.

Small farms have special and varied needs and new research, education and extension programs are required to address these needs. Small farms are not failed large farms. Small farmers are resourceful entrepreneurs who produce valuable agricultural products using more limited fiscal, human and land resources than their larger scale neighbors. Because they have fewer resources available to them, they have special research, education and extension needs.

Small farms differ widely from state to state and even within the same state. Small farmers include many different cultural and social groups. For example, language can be a barrier for some and these groups need information available to them in their own languages. Some small farmers have limited educational backgrounds. They also have special information needs. Education and extension programs must address these multiple groups of clients.

Small farms produce an enormous range of products and many of them are products for which the existing research base is not well developed. Organic production provides one example. Relatively little research-based information is available for organic producers.

This Initiative will help address the issues raised by the National Small Farm Commission and the USDA Civil Rights Action Team. All of the priority needs that this Initiative will address are prominent in the Report of the National Small Farm Commission. Many of the programs and activities that this Initiative will fund will address the USDA Civil Rights Action Team's "Recommendations for Strengthening USDA's Research and Educational Assistance to the Socially Disadvantaged."

This Initiative contributes significantly to achieving USDA's overall goals and objectives. It specifically addresses four of the CSREES goals outlined under the REE mission area.

Goal 1, to achieve an agricultural production system that is highly competitive in the global economy;

Goal 2, to provide a safe, secure food and fiber system;

Goal 4, to achieve greater harmony between agriculture and the environment; and

Goal 5, to enhance economic opportunities and quality of life for families and communities

Question. What legislative authority is required for this new initiative?

Answer. The Administration has proposed that a new authority for an Integrated Research, Extension, and Education Competitive Grants Program be included in the re-authorization of the research title of the 1996 Farm Bill.

FORESTRY RESEARCH

Question. Why is a reduction in the McIntire-Stennis research program being proposed for fiscal year 1999? What will be the impacts of this proposed funding reduction?

Answer. This change will reduce the amount of funding available for formula distribution. McIntire-Stennis funding provides the base for development of faculty and graduate students to respond to current issues through State, private, and other sources of funding at eligible State institutions. States have maximum flexibility to fund specific programs through formula funds, thus the proposed decrease would have the least impact in those areas States identify as high priority.

Question. What specific research is being carried out under the McIntire-Stennis research program?

Answer. Research under McIntire-Stennis includes investigations relating to: (1) Reforestation and management of land for the production of crops, timber, and other related commodities; (2) management of forested watershed lands to improve conditions of water flow and to protect resources against floods and erosion; (3) management of forest and rangeland for production of forage for domestic livestock and game and improvement of food and habitat for wildlife; (4) management of forest lands for outdoor recreation; (5) protection of forest land against fire, insects, diseases, or other destructive agents; (6) utilization of wood and other forest products; (7) development of sound policies for the management of lands and the harvesting and marketing of forest products; and (8) such other studies as may be necessary to obtain the fullest and most effective use of forest resources.

Question. Other than through the McIntire-Stennis program, what forestry research is being supported by the ARS and CSREES? Please provide a description of each project funded, the level of funding for each project and who is conducting the research.

Answer. ARS scientists conduct considerable research related to forestry problems and interests. Some ARS laboratories and Forest Service Research Laboratories are co-located to facilitate cooperative research. Additional cooperation is with scientists at Land Grant Universities and other research institutions. Brief descriptions of ARS research projects most applicable to forestry issues, including the level of funding for forestry related research in the fiscal year 1998 budget, and the ARS Facility doing the research, are as follows:

- Systematics of Flies of Importance in Biological Control, Agricultural Crops, and Forests—Systematics Entomology Laboratory, Beltsville, MD. This project is directed toward developing identification tools and a classification system for flies of agricultural importance. About \$72,000 of the total project funding of \$602,600 directly supports forestry related research.
- Discovery of Pest Behavior-Modifying Chemicals with Enhanced Biological Potency—Insect Chemical Biology Laboratory, Beltsville, MD. The objectives of this project are to discover and develop new and efficacious behavior-modifying compounds that will assist in the control of a wide range of insect pests. About \$34,000 of the total project funding of \$339,400 directly supports research on forest insect pests.
- Development of Sustainable Urban Agro-Systems and Biocontrol Strategies for Gypsy Moth—Insect Biocontrol Laboratory, Beltsville, MD. The principal objective of this project is to develop integrated insect pest management programs for urban-forest areas, such as home sites and parks. While not directly focused on forest ecosystems, much of the total project funding of \$548,000 supports research that could prove beneficial to insect control in forests.
- Development of Biological Control Technology for Exotic Insect Pests with Emphasis on the Asian Longhorn Beetle—Beneficial Insects Introduction Research, Newark, DE. This project is directed toward promoting cooperation with other state and federal scientists in identifying, importing, releasing, and evaluating biological control agents for major exotic insect pests, such as the Asian Longhorn beetle. About \$240,000 of the total funding of \$400,000 for this project, which was initiated in fiscal year 1998, supports forestry related research.
- Biological Control of Gypsy Moth & Quarantine Services for Introduced Beneficial Insects—Beneficial Insects Introduction Research, Newark, DE. This project is directed toward: the exploration for natural enemies of gypsy moth in Asia; the importation, quarantine handling, and rearing of promising species; assessment of the danger these introduced insects pose to non-target organisms; and evaluation of the effectiveness of released species on the target pest. About \$280,000 of the total project funding of \$403,700 supports research on forest insect control.
- Agroforestry Systems for the Small Farmer—Dale Bumpers Small Farms Research Center, Booneville, AR. The major goals of this project are to provide a scientific basis for managing small farm ecosystems and to develop technologies that enhance their sustainability and productivity. Agroforestry systems, that combine livestock, tree, forage, and crop production, provide opportunities for small farms to enhance their economic competitiveness and visibility. About \$375,000 of the total project funding of \$1,259,500 directly supports forestry related research.
- Agroforestry Systems for the Appalachian Region—Appalachian Soil and Water Conservation Laboratory, Beckley, WV. The major objective of this project is to evaluate the simultaneous production of trees and understory species to optimize the economic and environmental integrity of Appalachian farms. Specifically, the research will target the development of tree/forage/specialty crop systems that can fill high value niche markets and provide raw materials for associated value added enterprises. The competitive and synergistic mechanisms by which agroforestry systems partition sunlight, water and nutrients will be determined for use in developing improved land management strategies. About \$70,000 of the total funding for the project of \$688,400 directly supports forestry related research.
- The Development of Pest-Resistant Landscape Trees to Enhance the Environment and Reduce the Use of Pesticides—Arboretum, Washington, D.C. The objectives of this project are: to breed and select pest resistant individuals and progenies of important landscape trees with an emphasis on fungal, bacterial and insect pests, and tolerance to environmental stresses; to assess the range of variability in resistance among host plants; and to propagate, evaluate, and

release improved cultivars. None of the total funding for the project of \$743,300 supports research that is focused on forest ecosystems, but should benefit forest management.

—Genetics and Germplasm Evaluation of Landscape Woody Plants—Arboretum, Washington, DC. The objectives of this project are to select, evaluate and develop new cultivars of important nursery crops with pest and disease resistance, improved flowering and fruiting characteristics, better climatic adaptability, and greater tolerance to environmental stresses. None of the total funding for the project of \$745,300 directly supports research on forest ecosystems, but should benefit forest management.

Other forestry research funded by CSREES includes an array of forestry research in the same general areas as McIntire-Stennis—the range of physical sciences, biology, and the social sciences, in forest ecosystems, forest management and forest products. These areas of research are being conducted under the Special Grants, the National Research Initiative, Hatch, Small Business Innovation Research, and Evans-Allen programs, and multi-disciplinary projects through the Fund for Rural America.

The information on CSREES forestry research follows.

Question. Please distinguish the role of the Forest Service and that of ARS/CSREES in forestry research.

Answer. ARS conducts limited research related to forestry. Even though this research has relevance, and potential benefits for forest management, it is not directed toward the management of forest ecosystems. One of the principal targets for this ARS research is the urban environment. ARS research on agroforestry is primarily directed toward optimizing the economic and environmental benefits to both crop and livestock operations from interactions created when trees or shrubs are deliberately combined with farm crops and animals. Other ARS activities related to forestry research include research projects on the use of trees as windbreaks, in arboretums, and for horticultural applications. CSREES has a very different mission than the in-house research at USDA. The McIntire-Stennis funds are part of the land grant system, which has a tripartite mission of research, extension, and education. The Forest Service has no dedicated programs for the extension of their research results, nor for education.

The McIntire Stennis Act, states "it is further recognized that forestry schools are especially vital in the training of research workers in forestry." Thus, the capacity building aspect of this program was laid out in the original legislation. The forestry schools are also unique, in comparison to the Forest Service in that they have more forest scientists available, from a wider range of disciplines, and have a graduate student workforce available and therefore provide an organization capable of responding quickly to new trends and issues. Given their mandate, the Forest Service spends a higher proportion of its effort on research relating to public land management.

Finally, research direction and priorities are set nationally and regionally in Forest Service research, and state by state in CSREES cooperative research. The Dean or Department Head is usually in direct contact with stakeholders at the state level, so that in general, statewide and short-term research is the niche of the universities, and regional/national and long-term research is the niche of the Forest Service. The Forestry Research Advisory Council (FRAC) provides advice and reports on regional and national planning and coordination of forestry research within the Federal and State agencies concerned with developing and utilizing the Nation's forest resources, forestry schools, and the forest industries, as well as advising on the apportionment of funds for the McIntire-Stennis Program. Finally, some Forest Service research stations do not have all the relevant disciplines represented, and so for some areas in some disciplines, only universities are available to conduct research. This is particularly the case in social science research. The Forest Service, CSREES and the universities participate in ongoing coordination of research efforts.

SPECIAL AND ADMINISTRATIVE GRANTS

Question. For each of the special research and administrative (research and extension) grants funded for fiscal year 1998, please indicate the following: a detailed description of the project funded; who is carrying out the research; federal and non-federal funding made available for the project to date, by fiscal year; and the anticipated completion date for the original objectives of the project and whether those objectives have been met; and the anticipated completion date of additional or related objectives. For each project, please indicate when the last agency evaluation of the project was conducted. Provide a summary of the last evaluation conducted.

Answer. The information follows:

AFLATOXIN RESEARCH, ILLINOIS

The main focus of work on this problem has been identification of corn germplasm resistant to aflatoxin. Of continuing importance are the identification of *Aspergillus flavus*-inhibiting compounds and fungus-inhibiting enzymes, including developing effective transformation methods and plant regeneration techniques. There has been increased national concern over aflatoxins as carcinogens, possessing other toxic properties, as well as the potential for health risks wherever toxin-contaminated corn is found. Aflatoxin contamination continues to occur with some regularity in the southeastern United States, and more recently in the southwestern United States. Outbreaks also have occasionally occurred in the upper midwest region. The original goal of this research was the reduction of aflatoxin production in corn. During the past year, corn plants have been produced with the antifungal genes chitinase and β -glucanase. These antifungal genes have the potential of conferring resistance to many ear rots including that caused by *Aspergillus flavus*. Additional useful data have been collected on inheritance of resistance from the inbred line Tex6.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$87,000; fiscal year 1991, \$131,000; and fiscal years 1992-1993, \$134,000 per year; fiscal year 1994, \$126,000; and fiscal years 1995, 1996, 1997, and 1998, \$113,000 per year. A total of \$1,064,000 has been appropriated. The non-federal funds and sources for this grant are \$22,349, derived from project investigator salaries and fringe benefits.

This research is being conducted at the University of Illinois. The anticipated completion date for the original objectives was 1995, but last year, the scientists updated the estimate to 2000-2002, because there is concern that they do not have one mechanism of resistance that will completely solve the problem. It now appears necessary to pyramid genes for resistance, including naturally-occurring genes and possibly those that can be placed into the plant using biotechnology. The scientists continue to anticipate solving these related problems by the above estimated dates. The last agency evaluation was December, 1996. That evaluation stated that the research techniques are consistent with a high likelihood that specific objectives will be satisfied. There is good balance between fundamental and applied research.

AGRICULTURAL DIVERSIFICATION AND SPECIALTY CROPS, HAWAII

With the resurgence of interest in Hawaiian culture and corresponding increased prevalence of Hawaiian dances, there is increased pressure on plant materials found in State and Federal forests in Hawaii. To this end, the University of Hawaii College of Tropical Agriculture and Human Resources have been working on the "lei project", involving about 20 members from the College and different organizations in the state working together to develop a handbook for the production and business of materials for Hawaiian lei (body adornment made of plant materials). The group

identified 85 candidate plants and assembled a source book of 90 nurseries in Hawaii that have these plants for sale as starter material. Efforts continue to find entrepreneurs to grow and process taro on a large scale for hypoallergenic products. The new taro production manual will help prospective entrepreneurs understand the requirements of this opportunity.

Work is continuing with Maui onion growers who are potentially interested in obtaining a Federal Marketing Order for their unique onions. Most of the effort in this area has been on researching information about market potential and giving informational talks. Work is continuing on kava, a root crop that might be used as a non-addictive natural relaxant, in the area of collecting production stock and researching and assembling production information. Some work on market potential has also been done. Work is continuing on Stevia, to explore its use as a natural food sweetener and an ornamental plant.

Although this special research grant is awarded noncompetitively, the proposal is reviewed for merit by the university before submission to CSREES and reviewed by CSREES for technical merit and allowable costs and procedures. The principal investigator believes this research to be of local and Pacific regional need, and, in some cases, national need. The small projects that are being undertaken under the umbrella of the Diversified Agriculture project are one attempt to provide to some current and would-be entrepreneurs the tools they need to make business decisions about agricultural opportunities.

Grants have been awarded from funds appropriated as follows: fiscal year 1988–1989, \$156,000 per year; fiscal years 1990–1993, \$154,000 per year; fiscal year 1994, \$145,000; and fiscal years 1995–1998, \$131,000 per year. A total of \$1,597,000 has been appropriated. The University of Hawaii provides in-kind support in the form of laboratory and office facilities, equipment and equipment maintenance and administrative support services: \$68,503 in fiscal year 1992; \$75,165 in fiscal year 1993; and \$74,663 in each fiscal year 1994–1998. In addition, nearly \$50,000 of in-kind support has come from private sector and state partners, \$8,000 from the Office of Hawaiian Affairs, and \$30,000 from the private sector on the high pressure minimal processing project.

Research is being conducted at the University of Hawaii's College of Tropical Agriculture and Human Resources on the island of Oahu, and on the islands of Maui and Hawaii. The lei materials and Maui onion work will conclude by September 30, 1998. All taro related work is complete. Work on the marketing book is complete. Work continues on kava, high pressure processing, and other projects consistent with the original goal.

The CSREES's agency representative to this project has met with the University of Hawaii investigators to review progress and plan subsequent activities. This close interaction has led the project through a progression of steps from research discovery to near-term commercialization of various products, and, in the case of high pressure processing, back to testing and development of a new technology for possible commercial use.

AGRICULTURAL DIVERSITY/RED RIVER, MN AND ND

This multi-year, multi-phase project will have six specific components. They are: (1) vegetable growing research—especially field and glasshouse related research, (2) vegetable collection and storage research and/or related storage or distribution business development, (3) development of processing industries for the fresh market or research related to the fresh products for market, (4) development of marketing and/or supply associations among vegetable producers, (5) development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products, and (6) development of processing industries for the frozen vegetable products market or research related to frozen products. This first phase of this multi-phase project will concentrate its industry development and research activities in three areas: vegetable growing research—especially field and glasshouse related research, development of marketing and/or supply associations among vegetable producers, and development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products.

Initially the growing of vegetables in the region was driven by an opportunity to meet increasing consumer demand for fresh vegetables and concerns over both the cost of water and the environmental impacts of the use of chemicals in the traditional vegetable producing regions of the southern United States. This industry currently raises three crops of vegetables a year. This requires extensive irrigation in the hot summer months. Population growth and increased domestic and industrial demands for water have created significant pressures to shift water usage away from agriculture and toward other domestic and industrial needs. The shift in crop-

ping patterns can have a positive effect on farm income and lessen the need for outside or federal financial assistance. The project objectives include: (1) Conduct three replicated field trials on growing of carrots; (2) Continue study of vegetable growing techniques in Europe and continue negotiations with vegetable growing research facilities/laboratories in Europe to transfer growing knowledge to the region; (3) Review current and future market opportunities for further development of the industry and identify strategies and partners for pursuing these opportunities and take appropriate organizing steps; (4) Develop and maintain a WWW Webpage for this vegetable industry project; (5) Conduct market research for establishment of a ready-to-eat delicatessen salad processing facility in the region; (6) Conduct market research for establishment of a ready-to-eat fresh-bagged salad processing facility in the region; (7) Continue business development planning for establishment of a ready-to-eat delicatessen salad processing facility in the region; and, (8) Continue business development planning for establishment of a ready-to-eat fresh-bagged salad processing facility in the region.

This work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$250,000. Non-federal support will come from private growers, state agri-development project funds, the Ford Foundation and other local foundations. The work is being carried out in Minnesota, North Dakota and South Dakota. Since this is a new project and has not started yet, original objectives have not been met. It is expected that this will be a multi-year, multi-phase project.

AG-BASED INDUSTRIAL LUBRICANTS RESEARCH PROGRAM, IOWA

This project is a continuation of seven years of activity conducted to target specific applications, establish baseline performance data, develop formulations of additives and chemical modifications, administer laboratory and field tests, characterize, and build relationships for commercialization of industrial lubricants derived from U.S. grown vegetable base oils. Baseline performance data will be compiled to establish fatty acid compositions, guide genetic modifications, additive development, establish standards relative to toxicity and biodegradability, and characterize compatibility with specific metallic and non-metallic components. The grant has been peer reviewed internally at the University of Northern Iowa.

Primary local and regional need is related to expanding value-added applications of agricultural commodities in order to stimulate increased demand and raise crop prices paid to farmers. On a national level, the need is to provide renewable, safer, more environmentally sound alternatives to petroleum based industrial lubricants. The principal investigator believes this research to be of local, regional and national importance.

The original goal of the program was sponsored by non-federal funding to develop a soybean based hydraulic oil which was introduced to market in July of 1997, marketed by AGRI Industries of West Des Moines, Iowa as BioSOY hydraulic fluid. The original goal of the project sponsored by federal appropriation which has not yet officially started, is to replicate the success of the BioSOY introduction among several other currently targeted lubricant applications. Federal funding for this project began with an appropriation of \$200,000 in fiscal year 1998. No prior federal funding has been appropriated to this research.

Since 1992 this research program has received cash grants from the Iowa Soybean Promotion Board, Carver Scientific Research Initiatives, in addition to several in-kind donations from industry to develop and coordinate commercialization of what has since become BioSOY hydraulic oil. Beginning in 1995, the state of Iowa began to support the program through its Wallace Technology Transfer Foundation. Beginning in 1996, state funding was provided by legislative appropriation through the Iowa Department of Economic Development. Additional funding has been provided by the Iowa Department of Agriculture and Land Stewardship.

Laboratory and literature studies are being carried out primarily at the Ag-based Industrial Lubricants Research Program facility in Waverly, Iowa, with minor portions of activity being conducted on the campus of the University of Northern Iowa in Cedar Falls, Iowa and the laboratories of various industrial affiliates located throughout the state and country. Field tests are being conducted at Sandia National Laboratories, U.S. Department of Army test sites, some municipalities, and in industrial equipment located throughout the nation.

The original objectives of the project sponsored by federal appropriation have not yet begun, however these objectives are anticipated to be complete within the first year of the project. Additional lubricant applications are anticipated to be targeted during the first year for development in subsequent periods. Agency evaluation of this project has not been completed to date.

ALLIANCE FOR FOOD PROTECTION, NE, GA

The fiscal year 1998 appropriation supports the continuation of a collaborative alliance between the University of Georgia Center for Food Safety and Quality Enhancement and the University of Nebraska Department of Food Science and Technology. Fiscal year 1997 funds supported research at the University of Nebraska on the detection, identification and characterization of food allergens, the effects of processing on peanut allergens, and investigation of the efficacy of using various types of thermal processes to reduce or destroy the toxicity and mutagenicity of certain *Fusarium* metabolites in corn and corn products. Research at the University of Georgia was directed toward determining the foodborne significance of *Helicobacter pylori*, determining the fate of *Arcobacter* in foods and the effect of environmental factors on survival and growth, determining the efficacy and environmental factors on controlling *Bacillus cereus*, and developing a device to rapidly detect foodborne pathogens using immuno-magnetic separation technology. CSREES has requested, but has not yet received, proposals from the University of Georgia and the University of Nebraska in support of the fiscal year 1998 appropriation.

The principal researcher believes the proposed research addresses emerging issues in food safety which have national, regional and local significance. Specifically, research will address bacterial pathogens that can cause ulcers, cancer and diarrheal illness, toxic fungal metabolites in corn products, and allergens in foods that cause serious reactions, including death, in sensitive people. These emerging issues affect consumers, the food industry, and food producers at all levels, national, state, and local.

The original goal of this research was to: 1) facilitate the development and modification of food processing and preservation technologies to enhance the microbiological and chemical safety of products as they reach the consumer and 2) develop new rapid and sensitive techniques for detecting pathogens and their toxins as well as toxic chemicals and allergens in foods. The University of Nebraska developed assays for detection of almond and hazelnut residues in processed foods, produced high-quality antibodies for these assays, identified a soybean allergen, discovered that certain types of *Fusarium* fungi do not produce mutagenic substances, and developed a simple liquid chromatographic procedure for determination of moniliformin toxin. The University of Georgia developed a method to culture *Helicobacter pylori*, identified a treatment to prevent *Bacillus cereus* from producing toxin in refrigerated foods, determined survival and growth characteristics of *Arcobacter* and *Helicobacter pylori*, and determined the appropriate homogenization conditions to prepare food samples for rapid detection of pathogens by immunoseparation.

The work supported by this grant began in fiscal year 1996, and \$300,000 was appropriated in fiscal years 1996, 1997, and 1998, for a total appropriation of \$900,000. The non-federal funds and sources provided for this grant were \$117,000 state funds and \$250,000 industry and miscellaneous in fiscal year 1996 and were estimated to be a minimum of \$75,000 state funds and \$35,000 industry in fiscal year 1997.

Research is being conducted at the University of Georgia Center for Food Safety and Quality Enhancement in Griffin, Georgia and at the University of Nebraska Department of Food Science and Technology in Lincoln, Nebraska and the original objectives have not yet been met. The researchers anticipate that work will be completed on the original objectives in 1999.

An agency science specialist conducts a merit review of the proposals submitted in support of the appropriation on an annual basis. A review of the proposal from the University of Nebraska in support of the fiscal year 1997 appropriation was conducted on December 20, 1996, and good progress was demonstrated on the objectives undertaken in 1996. A progress report from the University of Georgia was evaluated by the agency on January 16, 1997, and demonstrated good progress on its 1996 objectives.

ALTERNATIVE CROPS, NORTH DAKOTA

The alternative crops project has two main thrusts, development and utilization of alternative or novel crops and utilization of traditional crops. The goals of the project are to diversify income at the farm gate, reduce reliance on monoculture to help alleviate pest problems, while providing new agricultural and industrial products to society. Some of the new areas under investigation include, production and use of dry field peas for the northern plains, production of levan from sugar beets, and development of a fresh-pack carrot industry in the northern plains. Previous work continues with oilseed crops such as crambe, rapeseed and safflower as a renewable supply of industrial oil, products from food crops for novel new uses in

paints, coatings, food ingredients, and the development of new biochemical and enzymatic processes to refine oils for industrial uses. The projects funded in this appropriation are evaluated by a peer-panel chosen by the Director of the North Dakota Agricultural Experiment Station.

The principal researcher believes that nationally, developing new crops and new markets for agricultural products is critical for both environmental and economic reasons. Enhanced biodiversity that comes from the successful commercialization of new crops aids farmers in dealing with pests and reducing the dependency upon pesticides. New markets are needed to provide more economic stability for agricultural products, especially as Federal price supports are gradually withdrawn. Regionally, the temperate areas of the Midwest have the potential to grow a number of different crops but are in need of publicly-sponsored research efforts to reveal the most practical, efficient, and economical crops and products to pursue. This effort has spawned several crops and products into profitable private sector businesses.

The original goal of this research was and still is to introduce, evaluate and test new crops which will broaden the economic diversity of crops grown in North Dakota. The primary emphasis is to find new crops with non-food uses and create value added products. It has helped sponsor research on crambe, lupin, canola, safflower, cool-season grain legumes, buckwheat, amaranth, field pea production and utilization, transgenic sugar beets to produce levan, utilization and processing lupin flower, confectionery sunflower production, and growing and marketing of carrots in North Dakota. It has helped develop a crop-derived red food dye and high quality pectin as food ingredients. It has sponsored research on innovative new biochemical means of splitting crop oils, and other new uses of oilseed crops. It has also helped develop markets for new crops as livestock and fish feeds.

Appropriations by fiscal year are as follows: 1990, \$494,000; 1991, \$497,000; 1992 and 1993, \$700,000 per year; 1994, \$658,000; 1995, \$592,000; and in 1996, 1997 and 1998, \$550,000 per year. A total of \$5,291,000 has been appropriated. In fiscal year 1991, \$10,170 was provided by state appropriations. In fiscal year 1992, \$29,158, was also provided by state appropriations and self-generated funds. In fiscal year 1993, \$30,084, was provided by state appropriations. In fiscal year 1994, \$161,628 was provided by state funds, \$3,189 provided by industry and \$9,020 provided by other sources, totaling \$173,837. In fiscal year 1995, \$370,618 was provided by state appropriations, \$1,496 provided by self-generated funds, \$1,581 provided by industry and \$5,970 was provided in other non-federal funds, totaling \$379,665 for fiscal year 1995. In fiscal year 1996 \$285,042 was provided by state appropriation, \$4,742 provided by industry, \$14,247 provided from other non-federal funds totaling \$304,031 for 1996.

The work is conducted on the campus of North Dakota State University and at the Carrington Research and Extension Center, Carrington, North Dakota, and the Williston Research Center, which are both in North Dakota. Work is also done in eastern Montana. The principal researcher believes that the development of new crops and products should be an on-going effort in North Dakota and other states.

Fiscal year 1998 is the ninth year of activity under this grant. The primary emphasis has been to find new crops with non-food uses and create value added products. The original objectives have been met, and continue to expand. As U.S. agriculture enters a new policy era with less emphasis on commodity subsidies, great opportunity may exist to better establish more biodiversity in agriculture. Such a change, however will remain dependent upon research and development programs specifically targeted at such a goal. This project has been evaluated based on the annual progress report. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of this agency. An evaluation of this project will be conducted in 1998.

ALTERNATIVE MARINE AND FRESHWATER SPECIES, MISSISSIPPI

The research has focused on the culture of hybrid striped bass, prawns, and crawfish. Nutritional requirements and alternative management strategies for these species have been evaluated and field tested. Utilization of improved technologies will enhance production efficiency and accelerate the use of these alternative species and alternative management strategies in commercial aquaculture. The project undergoes merit review by the university and by the CSREES Program Leader on an annual basis.

The principal researcher indicates that as the aquaculture industry continues to grow, it is extremely important to consider alternative species and production strategies for culture in order to help the industry diversify. Diversification is of benefit to both the producer and consumer of aquaculture products. Research generated

from this grant should lead to alternative production systems that can have national, regional and local impact.

The original goal of this research was to develop and evaluate aquaculture production technologies that would lead to the use of alternative species and management strategies in commercial aquaculture production. Research evaluating stocking rates, nutritional requirements, and methods to reduce stress in hybrid striped bass production systems has led to the development of improved production efficiency in these systems. Recent research has led to improved feed formulation and feeding strategies for hybrid striped bass. Researchers have also developed management strategies to improve production efficiency and cost effectiveness in non-forage based crawfish production systems.

The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 has been \$275,000 per year, \$258,000 in 1994, and \$308,000 in fiscal years 1995–1998 each year. A total of \$2,315,000 has been appropriated. The university reports a total of \$332,091 of non-federal funding to support research carried out under this program for fiscal years 1991–1994, \$70,636 in fiscal year 1995, \$79,935 in fiscal year 1996, and \$124,893 in fiscal year 1997. The primary source of the non-federal funding was from state sources.

Research is being conducted at Mississippi State University. The original specific research objectives were to be completed in 1994. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 2000. The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new grant proposal is submitted to CSREES for funding. The 1997 review indicated that the research addresses an important opportunity in the aquaculture industry, research objectives were met, that progress on previous research was well documented, and that the proposed research builds on the previous work funded through this program. The research on hybrid striped bass funding through this program complements research conducted through other USDA programs.

ALTERNATIVE SALMON PRODUCTS, AK

This is a new grant in fiscal year 1998. Research will be aimed at developing a commercial pin-bone removal machine to reduce production costs of salmon fillets and thus open markets for salmon fillet shatter packs. CSREES has requested, but has not yet received a proposal in support of the fiscal year 1998 appropriation.

The Alaska salmon industry has lost considerable market share worldwide to farmed salmon production. In 1994, the farmed salmon market share surpassed Alaska's market share of the world's salmon supply and has continued to climb every year since. In 1997, Norwegian farmed salmon production exceeded Alaska wild stock harvests. Also in 1997, Chilean coho salmon exports to Japan exceeded North American sockeye salmon exports to Japan. Japan has traditionally been Alaska's strongest and most lucrative export market. The current situation is an example of foreign competition undermining a traditional American industry.

The Alaska salmon industry is a multi-state industry. Though the product is harvested in Alaska, the benefits are shared with fishermen residents in Washington state, Oregon, California and throughout the nation. The appropriation will be used to support development of market-desired salmon products using wild-caught salmon. Because this is a new grant, no progress has been reported. The work supported by this grant will begin in fiscal year 1998, with an appropriation of \$400,000. Industry will contribute approximately \$200,000, based on an estimated cost of \$50,000 per plant, times four plants, for commercial testing of the beta prototypes during the summer 1998 salmon season in Alaska.

The work will be conducted at the University of Alaska Fairbanks: Fishery Industrial Technology Center in Kodiak Alaska and at the Geophysical Institute of the University in Fairbanks, Alaska. The anticipated completion of the full objectives of this research area, including original and related objectives, will require about five years. It is anticipated that the proposal received in support of the fiscal year 1998 appropriation will be reviewed for merit by a CSREES specialist shortly after it is received by the agency.

ANIMAL SCIENCE FOOD SAFETY CONSORTIUM

The research goal of the consortium has been to enhance the safety of red meat and poultry products for human consumption. Research has focused on accomplishing six objectives: (1) develop rapid detection techniques for pathogenic bacteria and toxic chemicals for use by the red meat and poultry production-marketing system; (2) devise a statistical framework from which to develop tolerance levels for these

hazardous substances; (3) identify effective interdiction points and develop methods to prevent or reduce substance presence; (4) develop monitoring techniques and methodologies to detect and estimate the human health risk of these contaminants; (5) develop technologies to reduce hazards and enhance quality of animal food products to complement the development of Hazard Analysis and Critical Control Point programs by USDA; and (6) estimate benefits and costs and risks associated with interdiction alternatives. The consortium's researchers have focused their efforts primarily on the first, third, fifth, and sixth objectives. CSREES has requested and received proposals from the consortium members in support of the fiscal year 1998 appropriation. Projects included for funding in the proposal submitted to CSREES have been reviewed for scientific merit by scientists at a non-recipient institution.

The principal researchers believe a safer national meat product food supply could reduce large economic losses—\$5 to \$6 billion a year—as a result of lost productivity and wages and medical treatment of victims, in addition to reducing the human suffering and loss of life that occur every year as a result of foodborne illnesses. The consortium's efforts for technology transfer with groups such as hospitality associations, health departments, and trade associations are helping educate the consumer and food service worker on safe handling procedures across the nation. Scientific based testing for safe food products will also find greater acceptance in international markets, which will continue to contribute to increased exports and sustainable rural economies at home. The goal is to develop detection, prevention, and monitoring techniques that will reduce or eliminate the presence of food borne pathogens and toxic substances from the Nation's red meat and poultry supplies.

The consortium is organized and operated along institutional lines with a coordinator and directors managing the research program. Advisory and technical committees consist of outside representation and provide advice on research planning and expertise on technical matters.

Major accomplishments this past year by the University of Arkansas included findings that for about 30 percent of households with children experiencing salmonellosis symptoms, *Salmonella* cells were recovered from multiple sources other than food. Researchers also found that some commercial "natural" antimicrobial compounds with claims of being able to control pathogens on poultry were either ineffective or not cost effective. A model poultry carcass spray unit using different chemical mixtures produced significant reductions in counts of total bacteria and of *Salmonella*. For raw deboned poultry items, an X-ray imaging system was coupled with laser system to aid in detection of small residual bone fragments in such products. Researchers have developed a rapid, non-destructive measurement model using near-infrared reflectance and transmittance spectroscopy to correlate heating patterns with destruction of pathogenic *Salmonella* and *Listeria* bacterial cells as poultry is thermally processed. The target pathogen *Listeria monocytogenes* was found to change its surface makeup with different selective growth media and thereby elude detection by monoclonal antibodies that can detect these pathogens when cells are grown in non-selective media. A 24-hour tissue culture procedure was developed that was able to detect the harmful cytotoxins of the pathogen *E. coli* O157:H7 in raw and cooked foods. Two new natural biopeptide bacteriocins active against *Listeria* were isolated and characterized and shown to be unlike previously reported bacteriocins. A novel simple adsorption method using rice hull ash was developed to harvest and concentrate bacteriocins from the production broth. A nested PCR assay was developed that is able to detect small numbers of *Campylobacter* in 14 different raw foods including selected raw fruits and vegetables. A DNA fingerprinting method recently reported to be very useful for separating strains and pinpointing sources of *E. coli* O157:H7 was shown to not be as helpful for separating ten different serotypes of *Salmonella* linked to human illnesses in Arkansas and Michigan, apparently because serotypes of this latter pathogen have a more highly similar DNA makeup.

At Iowa State University research was expanded in production animal food safety on farms. A triplex PCR technique for detection of *Escherichia coli* O157:H7 in ground meat was found to be more rapid and more sensitive than culture techniques. In another study, a test developed for rapid enumeration of coliforms and generic *E. coli* in water was adapted to monitoring these organisms on pork carcasses. *E. coli* and *Salmonella* spp. were found most frequently in ground pork samples collected from packers and purveyors and least frequently at supermarkets. *Listeria monocytogenes* was found in up to a third of samples taken at food services and supermarkets but was not identified in samples collected at packing plants. Hot water rinses of hog carcasses contaminated with hog feces were effective in reducing the bacterial load on the carcasses; an additional organic acid rinse achieved further reductions. Some acceleration of lipid oxidation and production of more volatiles

were found in irradiated ground pork, but levels were low and oxygen availability either before or after cooking caused more changes than did irradiation.

Research at Kansas State University showed that low dose irradiation resulted in minimal or no changes in beef and pork color, flavor and texture. Studies demonstrated that standard commercial processes for Lebanon-style bologna achieved a 5-log reduction in *E. coli* O157:H7. The ongoing work with steam pasteurization of carcasses has proved that this process can consistently meet the pathogen reduction requirements for *E. coli* control which is to be used as an index for process control. Results with *Salmonella* control demonstrated that steam pasteurization can achieve the pathogen control standards also required by USDA. Researchers have carried these findings to the industry, consumer groups, and classrooms. For example, the research demonstrating that ground beef can "brown" prematurely and before it reaches the temperature to control *E. coli* O157:H7 has helped USDA and others to recommend measuring the temperature to assure safety.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,400,000; fiscal year 1990, \$1,678,000; fiscal year 1991, \$1,845,000; fiscal years 1992-1993, \$1,942,000 per year; fiscal year 1994, \$1,825,000; fiscal years 1995-1996, \$1,743,000 each year; fiscal year 1997, \$1,690,000; and fiscal year 1998, \$1,521,000. A total of \$17,329,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$1,313,653 State appropriations, \$2,959 product sales, \$35,600 industry, and \$259,735 miscellaneous for a total of \$1,611,947 in 1991; \$1,270,835 State appropriations, \$10,129 product sales, \$90,505 industry, and \$267,590 miscellaneous for a total of \$1,639,059 in 1992; \$1,334,680 State appropriations, \$1,365 product sales, \$33,800 industry, and \$356,308 miscellaneous for a total of \$1,726,153 in 1993; \$1,911,389 State appropriations, \$192,834 industry, and \$200,000 miscellaneous for a total of \$2,304,223 in 1994; \$1,761,290 State appropriations, \$221,970 industry, and \$91,885 miscellaneous for a total of \$2,075,145 in 1995; \$2,643,666 State appropriations and \$152,431 industry, for a total of \$2,796,097 in 1996; and \$1,776,167 State appropriations and \$824,378 industry, for a total of \$2,600,545 in 1997. Thus, from 1991 through 1997 a total of \$14,753,169 in non-federal funds was provided.

Research is being conducted at the University of Arkansas at Fayetteville, the University of Arkansas for Medical Sciences at Little Rock, Arkansas Children's Hospital, Iowa State University, and Kansas State University. The current program of research outlined under the Consortium's revised strategic research plan should be completed in 1999. Continuing and evolving issues related to the safety of beef, pork and poultry products will necessitate that research be ongoing to ensure the safety of these products.

An agency science specialist conducts a merit review of the proposals submitted in support of the appropriation on an annual basis. A review of the proposals was conducted during January 1998. In addition, the CSREES scientist conducting the merit reviews of the proposals participated in the Consortium's annual meeting in October 1997 where results of Consortium research projects were presented. Good progress continues to be demonstrated by Consortium researchers in meeting research objectives. Consortium researchers have helped develop and validate procedures that have been adopted by USDA's Food Safety and Inspection Service to detect and reduce or destroy foodborne pathogens on beef carcasses.

APPLE FIRE BLIGHT, MICHIGAN AND NEW YORK

This project studies fire blight in apple trees, which is a bacterial disease that can kill spurs, branches, and whole trees. The management of this disease is difficult because only one antibiotic treatment is available. The objectives of this research are to develop fire blight resistance varieties, evaluate biological and chemical control methodologies for disease management, and develop an education and extension component for disease management. Fire blight is a destructive disease of apple trees that can kill the trees. This disease is caused by bacteria and effects apple trees in all apple growing areas of the nation. In the northeast, the disease is more prevalent because of humid weather conditions.

The goals of this research are to develop transgenic apple trees through various molecular technologies, to develop new approaches to antibiotic treatments of disease, to develop an early screening technique for tree sensitivity to the disease, to evaluate biological and cultural controls and to develop and improve education and extension components of disease management. The last objective involves using disease prediction models.

Fiscal year 1977 was the first year funds were appropriated for this grant at \$325,000. For fiscal year 1998, \$500,000 was appropriated. A total of \$825,000 has been appropriated. The non-federal funds for 1997 were \$40,127 for Michigan and

\$104,166 for New York State. The funds for 1998 are state appropriated \$25,071 and \$15,000 in funds from the Michigan Apple Research Committee for a total of \$40,071 from Michigan whereas New York is estimating state appropriated funds at \$104,166 for 1998.

Research is being conducted at Michigan State University and Cornell University, New York Experiment Station and the anticipated date of completion for the original objectives was 1998. The objectives have not been met. It is estimated by the researchers that three to five years are needed to complete this project.

The last merit review of this project was in January, 1997. In summary, the evaluation indicated that progress was demonstrated in all the objectives. In New York, rootstock transformation was successful in two commercially important apple varieties and another transgenic line performed well in field trials. New biological and chemical control agents were evaluated for their use in integrated pest management of fire blight. Commercial orchards were mapped for tree loss due to fire blight rootstock infection and were used in an economic analysis to determine a potential economic loss. In Michigan, a fire blight control activity of a mixture of phage was conducted on apple trees under field conditions. There was significantly less fire blight in inoculated blossom clusters that had been treated. The use of antibiotics on the bacteria were also effective under field conditions. A new technique for detection of fire blight was developed that allows for the rapid detection of low levels of bacteria from large samples.

AQUACULTURE, ILLINOIS

Researchers are developing and evaluating closed system technology for application to commercial aquaculture. System design and cost of production analysis for these systems have been conducted in commercial trials and pilot studies. The project undergoes merit review by the university and by the CSREES Program Leader on an annual basis. The principal researcher believes the development of alternative aquaculture production systems, such as closed recirculating systems, would reduce demands for water and would provide for greater control over production in aquacultural systems. Closed systems could be established independent of climatic condition in any region of the country. These systems also offer greater opportunity to manage aquacultural waste and reduce environmental impact.

The goal of this program is to develop closed recirculating aquacultural systems in order to lower production cost, improve product quality, and reduce the potential environmental impact of aquacultural production systems. An analysis of production costs and risk factors has been conducted on a new system design and on commercial systems in cooperation with the private sector. Best management practices have been developed for these systems. Solid waste management techniques have also been evaluated. The research has led to improved production efficiency and cost effectiveness in closed recirculating systems.

The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992-1993 was \$200,000 per year; fiscal year 1994, \$188,000; and fiscal years 1995-1997, \$169,000 each year, and in fiscal year 1998, \$158,000. A total of \$1,253,000 has been appropriated. The university estimates that non-federal funding for this program is as follows: in fiscal year 1992, \$370,000; in fiscal year 1993, \$126,389; in fiscal year 1994, \$191,789; in fiscal year 1995, \$152,682; in fiscal year 1996, \$171,970; and in fiscal year 1997 \$209,781. The primary source of funding is from the state with grants and industry funding accounting for the remainder. This estimate does not include substantial in-kind contributions from industry as this program conducts cooperative research with commercial producers.

Research is being conducted at Illinois State University at Normal, Illinois, through a subcontract with the University of Illinois and the original objectives were to be completed in fiscal year 1995. The original specific objectives have been met. The specific research outlined in the current proposal will be completed in fiscal year 2000.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report each year when the new grant proposal is submitted to CSREES for funding. The 1997 review of the project indicated that the project has met stated objectives to develop best management practices, evaluate solid waste management techniques, and improve production efficiency and cost effectiveness in closed recirculating systems. The researchers have indicated that the proposal is consistent with the NSTC's Strategic Plans for Aquaculture Research and Development.

AQUACULTURE, LOUISIANA

Research has focused on catfish, crawfish, redbfish, and hybrid striped bass in commercial aquaculture. Research has included basic and applied research in the areas of production systems, genetics, aquatic animal health, nutrition, and product quality. Grants are awarded to scientists within the university on a competitive peer review basis. The entire proposal is also reviewed by the CSREES Program Manager on an annual basis. The principal researcher indicates that there is a need to improve production efficiency for a number of important aquaculture species in order to enhance the profitability and sustainability of the aquaculture industry in the region. The research also addresses the issue of food safety and the quality of farm-raised products. The research funded through this program focuses on the production of a number of important aquaculture species such as catfish, crawfish, hybrid striped bass, and redbfish.

The original goal of this research was to expand the technology base to enhance the development of aquaculture through a broad research program that addresses the needs of the industry. The university has completed studies in the area of fish nutrition, fish health, production management strategies, alternative species, seafood processing and broodstock development. Research has led to improved feed formulations, improved production strategies for crawfish, and improved processing technologies for aquaculture products. Research continues to be directed at important opportunities to enhance production efficiency and the commercial viability of sustainable aquaculture systems in the region.

Research to be conducted under this program will continue research initiated under the Aquaculture General program in fiscal years 1988 through 1991. The work supported by this new grant category began in fiscal year 1992 and the appropriation for fiscal years 1992-1993 was \$390,000 per year, \$367,000 in fiscal year 1994, and \$330,000 in fiscal years 1995-1998 each year, for a total of \$2,467,000. The university estimates that non-federal funding for this program is as follows: in fiscal year 1991, \$310,051; in fiscal year 1992, \$266,857; in fiscal year 1993, \$249,320; in fiscal year 1994, \$188,816; in fiscal year 1995, \$159,810; in fiscal year 1996, \$150,104; and in fiscal year 1997 \$158,808. The primary source of this funding is from state sources with minor contributions from industry and other non-federal sources.

Research is being conducted at Louisiana State University and the original specific objectives were to be completed in 1990. These specific research objectives have been met, however, the broader objectives of the research program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 2000.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report each year when the new grant proposal is submitted to CSREES for funding. In addition, the CSREES program manager conducted site visits in 1996 and 1997 to meet with the scientists involved in the project and review the progress of the research. The 1997 review of the project indicated that the research is addressing the aquaculture industry, that the facilities are excellent, the principal investigators are well qualified, the experimental design is sound, the proposed research represented a logical progression of research previously funded through this program, and that the progress on previous research funded under this program is well documented. The researchers are asked to develop a research proposal consistent with the NSTC's Strategic Plans for Aquaculture Research and Development.

AQUACULTURE FOOD AND MARKETING DEVELOPMENT, WEST VIRGINIA

CSREES has requested the university to submit a grant proposal that has not yet been received. The proposal will be put through the university's peer review process and is reviewed by the CSREES Program Manager. Since this is the first year of this project, CSREES will send the proposal out for external peer review. The researchers indicate that there is a regional and national need to evaluate marketing and product development for small scale aquaculture systems in rural communities. In addition there is a need to improve the efficiency and sustainability of these systems. The researchers also indicate that the proposed research is consistent with the NSTC's Strategic Plan for Aquaculture Research and Development. This research could also potentially be funded through the Fund for Rural America.

The goal of this research program is to develop sustainable aquaculture production systems for small scale aquaculture producers in rural communities. Research is likely to focus on refining culture technologies, economics, marketing, value added processing and product quality. Researchers will utilize an integrated systems ap-

proach in addressing opportunities for these systems that may include biological and system design components.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$600,000. The university estimates that significant non-federal funding will be provided in fiscal year 1998 primarily from state sources to cover the salaries of the principal investigators. As the program develops, additional non-federal funding is expected.

The research would be conducted at the University of West Virginia in Morgantown and at off campus sites with a variety of potential cooperators and the anticipated completion date for the original objectives is fiscal year 2000.

The agency will evaluate the progress of this project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to CSREES for funding. Since this is the first year of the program, CSREES will conduct an external peer review of the proposal.

AQUACULTURE RESEARCH, STONEVILLE, MISSISSIPPI

The primary objectives of this research have been to improve practical feeds and feeding strategies, and improve water quality in channel catfish ponds. Additionally, scientists are evaluating the application of acoustical instrumentation in commercial aquaculture. In fiscal year 1996 the water quality component of the program was not included in the proposal. The project undergoes merit review by the university and by the CSREES Program Leader on an annual basis. The principal researcher indicates that the research findings from this project have a direct impact on the profitability and sustainability of a significant segment of the domestic aquaculture industry. The farmed-raised catfish industry accounts for over 55 percent of the total U.S. aquaculture industry. Research funded in this program is directed towards improved feeds and feeding strategies. In addition, research is directed towards acoustical monitoring and inventory of catfish in pond production systems.

The original goal of this research was to address the research needs of the catfish industry in the areas of water quality and nutrition. The research has led to improved water quality management practices in commercial catfish ponds. Research in the area of catfish nutrition has led to improved diet formulation and feeding strategies that have been widely adopted by the industry. Scientists are currently evaluating ratios of protein to energy in catfish feed formulations using conditions that closely reflect commercial production ponds. Vitamin supplements are also being evaluated. Research findings from this program have had a direct impact on feed formulations utilized by the commercial feed mills resulting in reduced cost of commercial feeds without reducing performance and productivity. Studies evaluating acoustical instrumentation have demonstrated possible applications in commercial aquaculture. Researchers are determining the accuracy and effectiveness of up-graded and calibrated acoustical monitoring equipment.

Grants have been awarded from funds appropriated as follows: fiscal years 1980–81, \$150,000 per year; fiscal year 1982, \$240,000; fiscal year 1983–84, \$270,000 per year; fiscal year 1985, \$420,000; fiscal years 1986–87, \$400,000 per year; fiscal year 1988, \$500,000; fiscal year 1989, \$588,000; fiscal year 1990, \$581,000; fiscal year 1991, \$600,000; and fiscal years 1992–1993, \$700,000 per year; fiscal year 1994, \$658,000; and fiscal years 1995–1997, \$592,000 each year, and \$642,000 in fiscal year 1998. A total of \$9,045,000 has been appropriated. The university estimates a total of \$2,101,508 in non-federal funding to support this research for fiscal years 1991–1994; \$1,128,451 in fiscal year 1995; \$601,473 in fiscal year 1996; and \$463,990 in fiscal year 1997. The primary source of non-federal funding is from the state. Additional funding is provided from product sales, industry contributions, and other miscellaneous sources.

The grants have been awarded to the Mississippi Agricultural Experiment Station. All research is conducted at the Delta Branch Experiment Station, Stoneville, Mississippi. The acoustical research in aquaculture is conducted in cooperation with the National Center for Physical Acoustics at the University of Mississippi.

The anticipated completion date for the specific original research objectives was 1984. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in 2000.

The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new proposal is submitted to CSREES for funding. The 1997 review indicated that the research addresses important opportunities in the farm-raised catfish industry, significant progress has been reported on specific research objectives, experimental design and scientific design are sound, there are excellent linkages between the researchers and

the catfish industry leading to accelerated adoption of research findings, and the scientists involved in the project are leading authorities in this area of research. This program has had a tremendous impact on improving production efficiency in commercial catfish ponds through improved feeds and feeding strategies.

The 1998 CSREES review will be completed within three weeks of submission of the proposal. The researchers are asked to develop a research proposal consistent with the NSTC's Strategic Plans for Aquaculture Research and Development.

BABCOCK INSTITUTE FOR INTERNATIONAL DAIRY RESEARCH AND DEVELOPMENT

The Babcock Institute for International Dairy Research and Development was established with participation of the University of Wisconsin-Madison College of Agriculture and Life Sciences, School of Veterinary Medicine and the Cooperative Extension Division. The objective of the Babcock Institute is to link the U.S. dairy industry with the rest of the world through degree training, continuing education, technology transfer, adaptive research, scientific collaboration and market analysis.

The principal researcher believes the need is to strengthen dairy industries around the world, to enhance international commercial and scientific collaborative opportunities for the U.S. dairy industry, and to draw upon global perspectives to build insight into the strategic planning of the U.S. dairy industry. Initial efforts were focused on planning and staffing. An initial activity was, and continues to be, the development of multi-language extension materials about basic management techniques essential to optimize performance of U.S. dairy cattle overseas. This activity has grown to include manuals on Breeding and Genetics, Lactation and Milking, and Basic Dairy Farm Financial Management published in English, Spanish, French, Russian, and Chinese. Research on potential implications of NAFTA and GATT on the U.S. dairy industry was completed. A technical workshop on dairy grazing in New Zealand and the mid-west was organized and held in Madison during the fall of 1993. A technical workshop on Nutrient Management, Manure and the Dairy Industry: European Perspectives and Wisconsin's Challenges was held in Madison, Wisconsin during September, 1994. A round table was held in January, 1995 addressing "World Dairy Markets in the Post-GATT Era". The Great Lakes Dairy Sheep Symposium was sponsored in 1995 and 1996. A World Wide Web site was created in 1996 for distribution of Babcock Institute technical dairy fact sheets in four languages. The first International Dairy Short Course for a group of producers and technicians from Argentina has been organized on the University of Wisconsin Campus. Scientists are being supported in collaborative research with New Zealand primarily to gain a better understanding of grazing systems as related to dairy management. An analysis of the impact of changes in European dairy policies has been completed. The Institute sponsored a Minnesota-Wisconsin Dairy Policy Conference to provide insights into current agricultural programs and policy issues in the dairy sector of the U.S. economy.

Grants have been awarded from funds appropriated as follows: fiscal years 1992 and 1993, \$75,000 per year; fiscal year 1994, \$250,000; and fiscal years 1995-1998, \$312,000 per year. A total of \$1,648,000 has been appropriated. During fiscal year 1992, \$13,145 of State funds were used to support this program and \$19,745 of State funds in fiscal year 1993 for a total of \$32,890 during the first two years of this research. Information is not available for fiscal year 1994-1997.

Research is being conducted at the University of Wisconsin-Madison College of Agriculture and Life Sciences. The Babcock Institute's overarching mission has been to link the US dairy industry and its trade potential with overseas dairy industries and markets. The original objectives of this project have remained consistent over the years. However, each year specific objectives were proposed to further the mission of the Institute and to build on previous accomplishments. The Institute has accomplished specific objectives each year in a timely manner. The Babcock Institute has remained true to its original objective of linking Wisconsin and the US to dairy industries around the world. This objective remains of increasing importance with continued development of international markets for dairy products and technologies. The University researchers anticipate that work currently in progress will be completed by September, 1999.

The Babcock Institute undergoes two independent review processes each year. The first is done by a committee of university and industry representatives who review the annual research proposal and amend it prior to submission to the agency. The annual proposal is reviewed by agency technical staff prior to approval for fund release. In addition, the institute was included in a comprehensive review of the programs of the Department of Dairy Science at the University of Wisconsin in May, 1995. The agency project officer has conducted two on site reviews of the institute since its formation in 1992. The most recent review has found that the approach

proposed by the researchers is appropriate and that the researchers are well qualified to perform the objectives as stated. The objectives of the proposal are within the mission of the United States Department of Agriculture and the Cooperative State Research, Education, and Extension Service.

BARLEY FEED FOR RANGELAND CATTLE, MONTANA

This project will support research on the nutritional value of barley cultivars as feed for beef cattle. This effort will assist with the breeding and selection of superior types that can be more competitive with other feed grains and improve farmer income from barley crops grown in rotational systems in the Northern Great Plains. The project was subjected to a merit review.

Barley as a feed grain is grown extensively in the United States. Based on chemical analyses and the experience of some cattle feeders the principal researcher believes it should have a feed value on par with corn and wheat. However, it is listed as inferior to both in feeds hand books and is therefore discounted in the market. Comprehensive feeding studies of various barley types will be conducted to document the value as a feed grain for beef cattle. The original goal of this research was to determine the true feed value of barley for feeder cattle, and thereby improve the economic return to barley production.

The work supported by this grant began fiscal year 1996 and the appropriation for fiscal year 1996 was \$250,000, for fiscal year 1997, \$500,000, and in fiscal year 1998, \$600,000. The total appropriation is \$1,350,000. Nonfederal funds for this project were \$160,000 in 1996 and \$174,500 in 1997.

Research is conducted at Montana State University and the project is proposed for completion following fiscal year 2001. Progress toward the objectives have been reported by the principal researcher. The project was peer reviewed annually through the project approval process. Progress has been made toward the goal of identifying feed quality parameters for barley and quantifying it's value as cattle feed. Additional work will address the development of cultivars with improved feed quality.

BINATIONAL AGRICULTURAL RESEARCH AND DEVELOPMENT PROGRAM (BARD)

The Binational Agricultural Research and Development Program, or BARD, is a competitive grants program that supports agricultural research of importance to both the United States and Israel. The areas of research supported by the BARD program include plant and animal sciences, water and soil science, aquaculture, economics and engineering. Research projects submitted for funding must involve collaboration between U.S. scientists and Israeli scientists. Proposals competing for the fiscal year 1998 funding were due by September 1, 1997. Those proposals are currently under review and funding decisions are expected by May of 1998. The funds available through the BARD Special Research Grants Program are used to support the U.S. portion of projects receiving BARD awards.

All proposals receiving awards through the BARD Program have national, regional and/or local significance to agriculture in both the United States and Israel. Thus, applicants must convince the review panel of the global significance of the proposed work in order to receive funding. The fundamental research supported by the BARD program provides the knowledge base needed to solve important agricultural problems in the U.S. and Israel as they arise.

The goal of the BARD program is to support fundamental research that is important to agriculture in both the U.S. and Israel. Many fundamental discoveries and accomplishments have been made in the research areas supported by BARD. These discoveries and accomplishments will lead to reduction of livestock diseases, increased livestock production, improved production of plants under harsh environmental conditions, and improved resistance of plants to disease. In the period between 1979-1997, a total of 796 grants were awarded, over 1,000 scientific articles were published, and 8 patents awarded. As an example, work supported by the BARD program at the University of Florida resulted in the DNA sequencing of the citrus tristeza virus. This virus has caused major economic losses to the citrus industry in both the U.S. and Israel. The sequencing information can now be used to develop effective methods to protect citrus trees by creating safe strains of the virus that protect the trees from disease-causing strains.

In 1977, an agreement was signed between the U.S. and Israeli governments which established BARD. An initial endowment fund of \$80 million was established through equal contributions from each country. Subsequently, that endowment was increased by \$30 million for a total of \$110 million. Funds for BARD are available from the interest earned on that endowment. In the early part of this decade, a reduction in interest rates, combined with increased research costs, impeded the abil-

ity of the BARD program to adequately meet the agricultural research needs of each country's producers and consumers. In fiscal year 1994, the Department directed that \$2.5 million of funding, which had been appropriated for CSREES's National Research Initiative Competitive Grants Program, be used for the BARD Program to supplement the interest earned from the endowment. The supplementary funds were matched by Israel. In fiscal year 1995, Congressional language directed that CSREES again use \$2.5 million of the National Research Initiative's appropriation for BARD, and in fiscal year 1996, the Department directed that a third \$2.5 million increment of the National Research Initiative's appropriation be used for BARD. CSREES received a direct appropriation in the amount of \$2 million for BARD in fiscal year 1997, and \$500,000 in fiscal year 1998.

The supplemental funds provided by CSREES are matched each year by the Israeli government. Each BARD grant funded by CSREES is for the U.S. portion of a collaborative project between U.S. and Israeli scientists. The Israeli portion of the project is supported by supplemental funds from Israel or from interest on the endowment. Therefore, a significant portion of each project is supported by non-federal funds.

The objective of BARD is to support fundamental science of importance to agriculture in the U.S. and Israel. The generation of knowledge is an ongoing process. Every year new research projects are awarded funding through the competitive review process. The trust fund was established to provide a long-term source of funding to conduct priority research for both the U.S. and Israel. The creators of the BARD Program determined that a ten-year review should be conducted to ensure its relevance and impact. The ten-year external review panel y endorsed the success of BARD and recommended its continuance and enhancement. Due to the ongoing nature of scientific research, the annual funding of grant awards is focused n development and application of state-of-the-art science. Each grant project is funded for two or three years and the results feed into the greater scientific body of knowledge generated by these and other scientists.

The USDA and the Israeli Ministry of Agriculture conducted a ten-year External Review of the BARD program and published the report in September of 1988. The objective of that external review was to evaluate the effectiveness of BARD and the suitability of its concept for bi-national collaborative research. The report concluded that the BARD program had achieved its objectives. The Report of the Review Committee concluded that "BARD" is working well, with efficiency. "The project evaluation and management infra-structure has been paramount in allowing BARD's programs to evolve. The Report made recommendations relative to operational procedures for managing the grant proposals and emphasized the need for increasing the corpus of the endowment. BARD is now commissioning a twenty-year external review of its operation to evaluate its efficiency and economic impact.

BIODIESEL RESEARCH, MISSOURI

Research on biodiesel involves examining the feasibility of producing biodiesel and other higher value products from oilseed crops including soybeans, canola, sunflower and industrial rapeseed. It also involves identifying and evaluating potential markets for the fuel and other products. An important part of the market thrust is to identify how biodiesel and other environmentally-friendly products can help meet state and federal environmental mandates of reduced air and water pollution. The project is also evaluating local processing plants whereby farmers could produce crops, process the crops locally and use the fuel and high protein feed coproducts on their farms or locally. This project undergoes merit review at the University of Missouri College of Agriculture. The initial work is being conducted in Missouri. The results may provide the agricultural community with alternative crops and more diverse markets, additional marketable products and a locally grown source of fuel. This will result in increased investment in local communities, additional jobs, and increased value added in the farm and rural community sectors.

The goals were to examine the feasibility of producing biodiesel and other higher value products from oilseed crops, plus to increase the value of coproducts. Results indicate that biodiesel can be produced most economically from soybeans, primarily because of the high value of soybean meal. Research indicates that with a community based biodiesel processing plant, costs of production could be as low as \$0.59 per gallon, although farmers might increase revenues by selling the soybean oil rather than using it to produce biodiesel. Since small quantities of biodiesel regularly sell for at least \$4.00 per gallon, the structure of the production, marketing and transportation is currently under evaluation to identify more efficient and less costly ways to produce and market biodiesel. Also, a study of which markets might provide the best opportunity to use increased levels of biodiesel is underway. Such

markets might include underground mining and the marine industry in addition to urban mass transit systems and cities having problems meeting more stringent air quality mandates. Research results indicate that for each one million gallons of biodiesel used in a B20 blend (20 percent biodiesel and 80 percent petroleum-based diesel) by the Kansas City, Missouri transit fleet would have the following estimated impacts: almost 100 additional jobs; increased investment of \$500,000; net increase in personal income of \$3.2 million; and an increase of \$9.6 million in total economic activity in the region. Research has also identified that rapeseed meal compares favorably to soybean meal and blood meal as an animal feed. It has a higher escape protein value than soybean meal. This research is carried out in close cooperation and coordination with other state and federal agencies, plus trade associations such as the National Biodiesel Board, the United Soybean Board, American Soybean Association, and others.

The work for this program began in fiscal 1993, and the appropriation for that year was \$50,000. The appropriation for 1994 was \$141,000; and for fiscal years 1995, 1996, 1997, and 1998 \$152,000 annually. A total of \$799,000 has been appropriated. The source of non-federal funds is state appropriated funds. The level in 1994 was \$7,310. The funding level 1995 was \$74,854. Cost sharing by the University of Missouri each year for fiscal year 1996 and fiscal year 1997 was \$80,000 and \$86,000 respectively. Total cost sharing for the project by the University of Missouri has been \$242,224. Additionally, some work funded by this grant has been conducted in cooperation with the National Biodiesel Board, plus the Missouri Soybean Merchandising Council. The level of those matching funds for these two sources are not available.

The work is being carried out at the University of Missouri-Columbia and the principals estimate that the work with biodiesel will require an additional two years to complete. Additionally, the work on higher value products, such as solvents from biodiesel, is expected to be on-going. Successes with the higher value products will result in more value added opportunities for farmers and rural communities. Also, much of the work in commercializing biodiesel has been with the B20, twenty percent blend, with petroleum-based diesel. This biodiesel research is evaluating the use of biodiesel in much smaller blends, such as one percent or one-half percent. At this use level, biodiesel would be considered an additive rather than as a fuel extender. With this scenario, the primary benefit would be a cost competitive lubricant with superior performance characteristics, thereby making the product more valuable as a lubricant than as a fuel.

The evaluation of using biodiesel as a complete fuel and in a blend has been met. Also, the cost of biodiesel, when produced by a new generation cooperative and used by members, has been evaluated. However, the most promising commercial uses appear to be when it is used for non-fuel uses and in very low blend levels. This project is evaluated on an annual basis based on the annual progress report, discussions with the principal investigator as appropriate, and agency participation in collaborative activities related to this project. The review is conducted by the cognizant staff scientist and it has been determined that the research is performed in accordance with the mission of this agency.

BROOM SNAKEWEED

Current research addresses several areas for broom snakeweed control, including efforts to understand more fully the onset of invasion and persistence of broom snakeweed, evaluate the toxicology and physiological effects of broom snakeweed on livestock, and develop an integrated weed management approach for broom snakeweed. Grants are awarded competitively based on a peer review panel administered by an executive committee to researchers at the New Mexico State University. The project holds an annual update meeting whereby investigators present findings to outside scientists.

Broom snakeweed is a serious weed in the southwestern United States and adjacent Western States. About 22 percent of rangeland in Texas, and 60 percent in New Mexico is infested to some degree by the weed. Current cost for control of broom snakeweed in the southwestern United States is estimated at over \$41 million. Dense broom snakeweed stands cause significant economic losses in the plains, prairie and desert areas of the central and southwestern United States. Snakeweed is a poisonous plant causing death and abortion in livestock and reduced productivity of associated vegetation.

Research is addressing three general areas which are ecology and management, biological control, and toxicology and animal health. One specific accomplishment is the biological control arena; several plant pathogens and insects are proving to be effective in broom snakeweed's control. Grazing management techniques and feeding

studies to minimize toxicological effects on livestock have shown that a 10 percent diet of broom snakeweed did not impair fertility or semen characteristics in test animals which were male rats.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$100,000; fiscal year 1990, \$148,000; fiscal year 1991, \$150,000; fiscal years 1992 and 1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995 and 1996, \$169,000 each year; fiscal year 1997, \$175,000; and fiscal year 1998, \$185,000. A total of \$1,684,00 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$249,251 state appropriations in 1991; \$200,110 state appropriations in 1992; \$334,779 state appropriations in 1993; \$302,793 state appropriations in 1994; \$294,451 state appropriation in 1995, and an estimated \$300,000 in state appropriation in each fiscal year of 1996 and 1997.

Research is being conducted at New Mexico State University on the project since it was initiated in 1989. Currently additional and related objectives have evolved and anticipated completion date for these is 1999. Considerable progress has been made on many of the objectives. Anticipated completion date of the additional and related objectives that have resulted based on the current work, would indicate another five years.

Each year the grant is peer reviewed with oversight by an administrative executive committee within the College of Agriculture and Home Economics at New Mexico State University. Additionally CSREES's senior scientific staff review the progress of the grant. Those reviews indicated progress in achieving the objectives.

CENTER FOR ANIMAL HEALTH AND PRODUCTIVITY, PENNSYLVANIA

This research is designed to reduce nutrient transfer to the environment surrounding dairy farms in the Chesapeake Bay watershed. Progress to date includes the development of a individual dairy cow model which will predict absorbed amino acids and the loss of nitrogen in manure. This model has been developed into user friendly software so that trained farm advisors can evaluate herd nutrient management status while on a farm site. A whole farm model has been developed which integrates feeding and agronomic practices to predict utilization of nitrogen and farm surpluses. Using these tools, a survey of dairy farms in the region has been done to assess nitrogen status on dairy farms and potential management practices to reduce nitrogen excesses on dairy farms. Refinement of the model tools and research to refine estimates of the environmental fate of excess nitrogen from dairy farms is in progress. Two on-site reviews of the program have been conducted by the CSREES Project Officer and a third is planned during 1998. The animal and farm models have been published in peer reviewed scientific journals.

The principal researcher believes that reducing non-point pollution of ground and surface water by nitrogen from intensive livestock production units is of concern nationally, and especially in sensitive ecosystems like the Chesapeake Bay. This research is designed to find alternative feeding and cropping systems which will reduce net nutrient flux on Pennsylvania dairy farms to near zero.

The original goal of this research remains the development of whole farm management systems which will reduce nutrient losses to the external environment to near zero. To date the researchers have developed their own models to more accurately formulate rations for individual dairy cows which permit the comparison of alternative feeding programs based upon both maximal animal performance and minimal nutrient losses in animal waste. This model is being tested on select commercial dairy farms to evaluate the extent to which total nitrogen losses in manure can be reduced without impacting economic performance of the farm. At the same time, whole farm nutrient models have been developed to evaluate alternative cropping systems which will make maximum use of nutrients from animal waste and minimize nutrient flux from the total farm system. These tools are currently being used to survey the current status of nutrient balance on farms in the area and efforts to fine tune the tools are in progress.

Grants have been awarded from funds appropriated in fiscal year 1993 for \$134,000 and in fiscal year 1994 for \$126,000. In fiscal years 1995-1998, \$113,000 was appropriated each year. A total of \$712,000 has been appropriated.

Research is being conducted at the University of Pennsylvania, College of Veterinary Medicine and the University researchers anticipate that work currently underway will be completed by September, 1999. This will complete the original objectives of the research. The principal researcher indicates that consideration has been given to the broadening of objectives to include additional nutrients in the model system, but this has been dropped because technical expertise required is currently not readily available.

The Center for Animal Health and Productivity project was last reviewed in June, 1997. An on-site review by agency technical staff was conducted in June, 1995. It was concluded that project objectives are within the goals of the program, are within the mission of both the USDA and CSREES, and the institution is well equipped and qualified to carry out the research project. The institution has made excellent progress towards the completion of the original goals of the project, but still must evaluate the effectiveness of the use of the new tools developed in reducing nutrient runoff from commercial dairy farms in the watershed of the Chesapeake Bay.

CENTER FOR INNOVATIVE FOOD TECHNOLOGY, OHIO

Funds from the fiscal year 1997 grant are supporting research projects on using neural network/fuzzy logic tools to develop a model of a growing and processing cycle for canning tomatoes, using membrane filtration to remove organic material from fluid dairy wastewater, combining several non-thermal processing techniques to sterilize liquid foods, developing a system to eliminate the contamination of turkey carcasses during slaughter, developing a non-contact, real time system for evaluating grain hardness, and developing a dry process to apply calcium carbonate, a hardening agent, to diced vegetables. Fiscal year 1997 funds support research from February 1, 1997 through February 28, 1998. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1998 appropriation. Projects included for funding in the proposal submitted to CSREES have been reviewed by industry representatives for relevance and by industry and university scientists for scientific merit.

The principal researcher believes the value-added food processing industry is the largest industry in Midwestern states, including Ohio where the industry contributes over \$17 billion to the annual economy. From an economic development point of view, processing and adding value to crops grown within a region is the largest possible stimulus to that region's total economic product. This program aims to partner with and encourage small and medium sized companies to undertake innovative research that might otherwise not be undertaken due to risk aversion and limited financial resources for research and development in these companies. The principal researcher believes that, although the initial impact of this research will be regional, the recipient organization of this grant is part of a technology transfer network and proactively seeks opportunities to deploy technologies developed through this research to the food industry on a national basis.

The original goal of the research was to develop innovative processing techniques to increase food safety and quality or reduce processing costs. The neural network project has developed a model for predicting the harvesting time that will optimize product quality and economic return to the grower, processor, and consumer. The fecal contamination control project has led to the development of a system in current operation that allows a turkey processor to operate within the zero fecal material tolerance guidelines established by the Food Safety and Inspection Service. The filtration project will allow fluid milk processors to lower their costs and increase water quality at municipal treatment systems. The sterilization project will lower processing costs by increasing the shelf life of liquid products.

The work supported by this grant began in fiscal year 1995. The project received appropriations of \$181,000 in fiscal years 1995 through 1997 and \$281,000 in fiscal year 1998. A total of \$824,000 has been appropriated. In fiscal year 1995, non-federal funds included \$26,000 from state funds and \$70,000 from industry memberships. In fiscal year 1996, non-federal funds included \$26,000 in state funds and \$80,000 in industry funds. In fiscal year 1997, non-federal funds included \$35,000 in state funds and \$95,000 in industry memberships.

Research is being conducted in the laboratories of the Ohio State University and at various participating companies in Ohio, Illinois, and Pennsylvania. The principal investigator anticipates that some projects supported by the fiscal year 1996 grant will have been completed by February 28, 1997, while other projects will not be completed until February 28, 1998. At the current funding level, it is anticipated that funding will be required through fiscal year 2000 to achieve the goal of self-sufficiency.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. Since the agency has not yet received the proposal in support of the fiscal year 1998 proposal, the last review of the proposal was conducted on March 4, 1997. At that time, the agency science specialist believed that the projects addressed issues relevant to food manufacturing, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

CENTER FOR RURAL STUDIES, VERMONT

The Center for Rural Studies Project involves applied research focused on developing and refining social and economic indicators used to evaluate the impact of economic development programming and activities. They are perfecting a delivery format for technical assistance for community and small business development. A major component of current research relates to utilization of the World Wide Web as a delivery vehicle. Project proposal undergoes a merit review within the agency.

The original goal was to create a database and analytical capability for rural development programming in Vermont. Examples of past accomplishments include maps presented to target child hunger programs, targeted areas for other types of rural development program intervention, analytical reports to guide the development of retail shopping areas, an "Economic Handbook for Vermont Counties", and strategies for using the World Wide Web to disseminate information.

The grant was initiated in fiscal year 1992. Appropriated amounts are: fiscal year 1992-93, \$37,000; fiscal year 1994, \$35,000; fiscal year 1995-98, \$32,000 for total appropriations of \$237,000. Fiscal year 1991 included \$91,130 in state matching funds. Fiscal years 1993, \$143,124; 1994-96, \$3,547 state matching funds. Fiscal years 1997 state dollars were \$2,931 plus researcher's salary. Fiscal year 1998 dollars are not known at this time.

Applied research and outreach is being carried out through the University of Vermont, and the original completion date was September 30, 1993. The original objectives of this research have been met, and additional objectives will be completed by August 31, 1998. A proposal for fiscal year 1998 has not been received to date.

The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

CHESAPEAKE BAY AQUACULTURE, MARYLAND

The objective of this research is to improve the culture of striped bass through genetics, reproductive biology, nutrition, health management, waste management and product quality. The research provides a good balance between basic and applied research. The university awards grants based on an internal competitive peer review and the CSREES Program Manager reviews the proposal each year. The principal researcher believes the Mid-Atlantic region of the country has significant opportunities to contribute to the overall development of the domestic aquaculture industry. Research supported through this program can have broad application and enhance production efficiency and the sustainability of aquaculture as a form of production agriculture.

The original research goal was to generate new knowledge that can be utilized by the aquaculture industry to address serious problems limiting the expansion of the industry in Maryland and the Mid-Atlantic region. The program focuses on closing the life cycle of the striped bass and its hybrids, enhancing production efficiency, and improving product quality under aquaculture conditions. Research is conducted in the areas of growth, reproduction and development, aquacultural systems, product quality, and aquatic animal health. Progress has been made in developing controlled artificial spawning techniques and refining the nutritional requirements of striped bass. Scientists continue studies to optimize water quality in closed systems. Researchers indicate that intermediate salinity levels may improve the feed conversion efficiency in juvenile striped bass.

The work supported under this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$370,000. The fiscal years 1991-1993 was \$437,000 per year; fiscal year 1994, \$411,000; and fiscal years 1995-1998 \$370,000, each year. A total of \$3,572,000 has been appropriated. The university reports the amount of non-federal funding for this program is as follows: in fiscal years 1991 and 1992, \$200,000; in fiscal years 1993 and 1994, \$175,000; in fiscal year 1995, \$400,000; in fiscal year 1996, \$536,000; and in fiscal year 1997 approximately \$400,000. The university reports that these funds are from direct state appropriations and other non-federal funding sources.

Research is being conducted at the University of Maryland and the original specific research objectives were to completed in 1993. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 2000.

The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new proposal is sub-

mitted to CSREES for funding. The 1997 review indicated the proposal was well written with objectives clearly stated; excellent progress is reported on previous work; scientific and technical expertise is excellent; and the proposal addresses high priority research needs. The researchers are asked to develop a research proposal consistent with the NSTC's Strategic Plans for Aquaculture Research and Development.

CITRUS DECAY FUNGUS, ARIZONA

The research being funded under this proposal is crucial to the development of effective management strategies for *Coniophora eremophila*, brown wood rot of citrus. Basic studies will include research on the life cycle of the fungus and its secondary hosts. Chemical control methodologies will be conducted to determine if any commonly available fungicides are effective and tree management for maintaining tree vigor will be determined. The decline appears in certain scion/rootstock combinations and therefore the incompatibilities of graft unions will be investigated. This project was not awarded competitively but will undergo peer review at the university level and merit review at CSREES. The principal researcher believes this research is of local need as of now but could potentially be a problem on lemon trees in other desert citrus production areas of the United States.

The objectives of this research to be conducted are to determine the extent of brown heartwood rot in mature lemon trees in Arizona; determine the relative susceptibility of various types of citrus to the fungus; evaluate the possible effects of different rootstocks on brown heart rot development; determine the fungus origin and secondary desert hosts; and explore the potential chemical control of the disease.

Fiscal year 1998 was the first year funds were appropriated for this grant. A total of \$250,000 was appropriated. The non-federal funds and sources provided for this grant is \$110,155 in state appropriations for 1998.

The research will be conducted at the University of Arizona, Tucson, and the field studies will be carried out by the extension facility at the Yuma Agricultural Center, Yuma, Arizona and the anticipated completion date for the original objectives is 1999. This is a new project and will be evaluated when received by the agency.

COASTAL CULTIVARS

This project will be undertaken to identify new ornamental, fruit, and vegetable crops for the lower coastal plain of Georgia and develop management systems for profitable production. This effort is designed to improve the rural economy and to help supply an expanding market for the products in that region and possibly beyond. Funds are awarded competitively among scientists working at this location. The proposed research under this project has regional significance for coastal zone land in the South Eastern US on potential new plants for the growing market for ornamentals and speciality fruits and vegetables for the area. The original goal of this research was to identify new plant cultivars to provide alternative crops with economic potential to the coastal area.

The work supported by this grant began in fiscal year 1997 and funds appropriated as follows: fiscal year 1997, \$200,000 and fiscal year 1998, \$250,000. A total of \$450,000 has been appropriated. The non-federal supporting this project in 1997 was \$50,150.

Research will be conducted at the University of Georgia coastal garden and this project was initiated in 1997 with the anticipation of meeting the major objectives in four years. A peer panel has been established to set priorities and review sub-proposals from eligible scientists at the Georgia Agricultural Experiment Stations. Subprojects are selected competitively based on scientific merit from among proposals that address high priority issues associated with production of new cultivars for the region. The combined proposal is then reviewed by CSREES for scientific merit. This review process has been used for both fiscal years 1997 and 1998.

COMPETITIVENESS OF AGRICULTURE PRODUCTS, WASHINGTON

Competitiveness of forest products research is conducted at the University of Washington. Competitiveness of food products is conducted at Washington State University. Export opportunities for forest products continue to increase although they have been substantially impacted by environmental restrictions on harvest and the Asian economic crisis. Research has been focused on the more complete transfer of U.S. light frame construction building technology primarily to Japan in direct support of the efforts to deregulate the Japanese housing sector, thereby opening their markets. Research has also been focused on the causes of declining wood resource availability and forest management alternatives that can better satisfy envi-

ronmental goals with less negative impacts in serving global consumer needs for products. Research project priorities are first prioritized by an outside Executive Board. Faculty then review the technical merits of each project proposal.

Export of food improves the global competitiveness of the Pacific Northwest region's value-added agricultural products. Research results are disseminated through various activities such as trade shows, international conferences, and a variety of media. Research focuses on foreign market assessments, product development, and policy and trade barriers. Particular attention has been paid to technology that can add value to U.S. agricultural products and to meet the changes brought by international trade agreements. This grant is awarded competitively at the state level. The agency's last formal review was in 1992.

While there is a very large opportunity to increase the export of materials and building systems to Asian markets, the companies are generally small and are not able to provide their own research. International markets have a long history and cultural appreciation for different construction technologies that are both higher cost and lower in construction quality than U.S. technology. Research on these market opportunities has been critical to the deregulation of foreign markets, development of acceptable product and building standards, understanding the quality and service needs, and the understanding and training in the customization of U.S. construction technology to foreign consumer values.

Research on forest management alternatives for the Pacific Northwest has also demonstrated that more wood, higher quality wood, and substantial increases in critical forest habitats can be produced using more advanced technologies, thereby reducing the substantial economic and market share losses that have been caused by harvest constraints to protect certain species.

The goal of the research in both wood products and food is to provide the information on markets and product technologies that can open higher valued international markets to U.S. exporters. Critical information is needed to support the deregulation of foreign markets, the education of foreign purchasers on the advantages of U.S. products, the education of potential U.S. exporters on the substantially different quality and service requirements for serving foreign markets. The food production research has given Pacific Northwest producers high-value options never before available, such as Wagyu beef, which retails at twice the price of traditional U.S. beef; azuki beans, which sell for 50 percent above other dry beans; and wasabi radish, which sells for up to \$60 per pound and is especially suited to small holdings. Burdock is arousing a lot of interest among Japanese buyers. In food processing, the Center has found beneficial uses of new technologies, such as hurdle techniques for shelf-stable foods, pulsed electric systems for pasteurization, microwave for drying, and high hydrostatic pressure for cheese and egg processing.

The work began in fiscal year 1992. The appropriation for fiscal years 1992-1993 was \$800,000 each year; fiscal year 1994, \$752,000; and fiscal years 1995-1998, \$677,000 each year. A total of \$5,060,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$716,986 State appropriations, \$209,622 product sales, \$114,000 industry, and \$661,119 miscellaneous, for a total of \$1,701,727 in 1991; \$727,345 State appropriations, \$114,581 product sales, \$299,000 industry, and \$347,425 miscellaneous for a total of \$1,488,351 in 1992; \$1,259,437 State appropriations, \$55,089 product sales, \$131,000 industry, and \$3,000 miscellaneous, for a total of \$1,448,526 in 1993; \$801,000 State appropriations, \$1,055,000 product sales, \$1,040,000 industry, and \$244,000 miscellaneous, for a total of \$3,140,000 in 1994; \$810,000 State appropriations, \$42,970 product sales, \$785,000 industry, and \$2,000,000 gift of a ranch due to the International Marketing Program for Agricultural Commodities and Trade Center's research on Wagyu cattle, for a total of \$3,637,970 in 1995; \$844,000 State appropriations, \$45,000 product sales, \$900,000 industry, and \$45,000 miscellaneous, for a total of \$1,834,000 in 1996; and \$876,000 State appropriations, \$1,606,000 industry, for a total of \$2,482,000 in 1997.

The research program is being carried out by the International Marketing Program for Agricultural Commodities and Trade at Washington State University, Pullman, and the Center for International Trade in Forest Products at the University of Washington, Seattle. The project is projected for 3 years duration and, therefore, should be completed following fiscal year 2000. New opportunities arise continuously as international markets undergo change.

Two evaluations of the Washington State University component of the project were conducted in 1992 by the U.S. Department of Agriculture. The State of Washington Legislative Budget Committee gave the Washington State Center exemplary marks for meeting its objectives. We anticipate a follow-up evaluation in 1999. On-site reviews are conducted annually of the University of Washington component of the project through annual meetings of the project's executive board, attended by

the agency's staff. Both components are reviewed annually by the agency. The project is meeting the key objective of trade expansion through innovative research. The University of Washington project was formally reviewed by the agency in 1991. State reviews were completed in 1992 and 1994. A formal review by the University was completed in 1997. A broad survey of constituents impacted by the research was completed, resulting in a very favorable review of the Center's activities and a recommendation to continue this research. Another state review is currently scheduled to start this coming year.

COOL SEASON LEGUME RESEARCH

The Cool Season Legume Research Program involves projects to improve efficiency and sustainability of pea, lentil, chickpea and fava bean cropping systems collaborative research. Scientists from seven states where these crops are grown have developed cooperative research projects directed toward crop improvement, crop protection, crop management and human nutrition/product development. This project is subjected to a merit review by peer scientists. The principal researcher indicates that the original goal of this project was to improve efficiency and sustainability of cool season food legumes through an integrated collaborative research program and genetic resistance to important virus diseases in peas and lentils. Evaluation studies of biocontrol agents for root disease organisms on peas are underway. Other studies are evaluating integration of genetic resistance and chemical control. Considerable progress has been made using biotechnology to facilitate gene identification and transfer. Management system studies have addressed tillage and weed control issues.

The work supported by this grant began in fiscal year 1991 with appropriations for fiscal year 1991 of \$375,000; fiscal year 1992 and 1993 \$387,000 per year; fiscal year 1994, \$364,000; fiscal year 1995, \$103,000; and fiscal years 1996 through 1998, \$329,000 per year. A total of \$2,603,000 has been appropriated. The nonfederal funds provided for this grant were as follows: 1991, \$304,761 state appropriations, \$14,000 industry, and \$18,071 other nonfederal; 1992, \$364,851 state appropriations, \$15,000 industry, and \$14,000 other nonfederal; 1993, \$400,191 state appropriations, \$19,725 industry, and \$10,063, other nonfederal; and 1994, \$147,607 nonfederal support. Nonfederal support for 1995 was \$150,607, for 1996 it was \$386,887, and for 1997 it was \$384,628.

Research has been conducted at agricultural experiment stations in Idaho, Oregon, Washington, Wisconsin, Minnesota, New York and New Hampshire. The funds have been awarded competitively among participating states and not all states receive funds each year. The projected duration of the initial project was five years. This research has provided vital information which is already being used to improve production management. However, a number of critical issues related to insect and disease control as well as crop quality remain to be addressed. Breeding for insect and disease resistance is given the highest priority, while crop management alternatives to help reduce disease and insect pest problems will continue to be studied.

COTTON RESEARCH, TEXAS

CSREES has requested the university to submit a grant proposal that has not yet been received. The proposed project is expected to help support a broad based program to address priority research needs of cotton grown on the Texas high plain. The goal of this project is to improve cotton production in West Texas.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$200,000. Nonfederal funding for the project is not yet known.

The work will be conducted at the Texas A&M University Research and Extension Center, Lubbock and Texas Technical University Campus. The initial phase of this work is projected to require 3 years, this project is just starting this year, and results are not yet available. The proposal will be evaluated by the institution project approval process.

CRANBERRY-BLUEBERRY DISEASE AND BREEDING, NEW JERSEY

The work has focused on identification and monitoring of insect pests on blueberries and cranberries, the identification, breeding, and incorporation of superior germplasm into horticulturally-desirable genotypes, identification and determination of several fungal fruit-rotting species, and identification of root-rot resistant cranberry genotypes. Overall, research has focused on the attainment of cultural management methods that are environmentally compatible, while reducing blueberry and cranberry crop losses. This project involves diseases having major impacts on New Jersey's cranberry and blueberry industries, but the finding here are being shared with experts in Wisconsin, Michigan, and New England.

The original goal was the development of cranberry and blueberry cultivars compatible with new disease and production management strategies. Last year, over 75 blueberry selections with wild blueberry accessions resistant to secondary mummy berry infections were moved into advanced testing. The biology and seasonal life history of spotted fireworm on cranberries was determined. A pheromone trap-based monitoring system for cranberry fruitworm was developed and further refined for commercialization in 1997. Blueberry fruit volatiles attractive to blueberry maggots were identified and tested in the field. Seven major fungal fruit-rotting species were identified, and their incidence in 10 major cultivars of blueberry and cranberry were determined. It is likely that resistance to fruit rot is specific to fungal species. Researchers identified about 20 root rot-resistant cranberry genotypes in an artificially inoculated field trial.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986–1987, \$95,000 per year; fiscal year 1988–1989, \$260,000 per year; fiscal year 1990, \$275,000; fiscal years 1991–1993, \$260,000 per year; fiscal year 1994, \$244,000; and fiscal years 1995–1998, \$220,000 each year. A total of \$2,989,000 has been appropriated. State and non-federal sources are providing funds in the amount of \$95,000 for this grant in fiscal year 1998.

This research is being conducted at the New Jersey Agricultural Experiment Station. The completion date for the original objectives was 1995. Those objectives have not been met. To complete the breeding, disease and insect management and provision of new management guidelines for extension and crop consultants, it estimated that an additional five to nine years will be required.

The last agency evaluation of this project occurred in December, 1996. In summary, the evaluation stated that the effort has continued to be highly productive, with various improved management strategies, plant materials and environmentally-balanced pesticides being areas of major impact. Some specific accomplishments included differentiating isolates of a fungus classified into different fungicide sensitivity groups using DNA-based probes, testing blueberry varieties with DNA for leafhopper resistance, and development of an infection assay for evaluating cranberry germplasm for *Phytophthora* root rot.

CRITICAL ISSUES

These funds support research on critical issues related to new or emerging pests and diseases of animals and plants. The program is expected to initiate research in a short time period until other resources can be secured to address the issue. The program began in fiscal year 1996 when potato late blight and vesicular stomatitis in animals were the two targeted emerging problems chosen for funding. Funding for vesicular stomatitis research was continued through fiscal year 1997 in an effort to identify either insect carriers of the virus that could transmit the disease among animals or the wildlife reservoirs of the virus which could contribute to initiation of future outbreaks. In fiscal year 1997, the critical issues funding continued to support research on potato late blight so that growers will be able to manage disease outbreaks more effectively with integrated pest management programs. Research is being conducted to identify molecular markers for specific strains of the fungus, develop epidemiological and prediction models, and educate growers about improved management approaches. Proposals for this research program are reviewed by scientific peer panels utilizing both USDA and non-USDA staff members. When appropriate, investigators may be asked to revise or improve certain components of the project to ensure that it meets the highest priority issues.

Vesicular stomatitis is of national impact due to its similarity to foot and mouth disease and the negative effect on movement of horses, cattle and swine during an outbreak. The last outbreak in 1995 had a very large impact on the economics of horse and cattle owners in the far western US. Since 1992 new, highly virulent strains of the potato late blight fungus *Phytophthora infestans* caused severe losses in potato and tomato production throughout the United States, resulting in what some experts term a national crisis. From 1993 to 1995, a series of meetings involving growers, consultants, industry, academia and government assessed the growing problem and participants concluded that extraordinary steps were needed to mobilize research efforts that would help address the problem in the near term.

In animals the goal was to discover natural reservoirs of the virus and insects which are capable of transmitting the disease among animals. At this time, we have been unable to find significant wildlife hosts which could serve as a reservoir for the virus during periods between outbreaks nor have the researchers been able to isolate the virus from insects in areas affected during the most recent outbreak. Research was initiated to provide growers with the knowledge and technologies they need to reduce economic losses resulting from potato late blight with less reliance

on pesticides. Research initiated with fiscal year 1996 funds is making progress in developing modeling tools and management approaches that are an important step towards reducing the devastating effects of late blight. The National Late Blight Fungicide Trial provided important information on the efficacy of an array of fungicide programs. A World Wide Web site was established to provide growers, researchers and industry with the latest information on management of potato late blight. Funds appropriated for fiscal years 1996–1998 were \$200,000 for each year, for a total appropriation of \$600,000 to date.

The vesicular stomatitis work is being conducted at the University of Arizona and Colorado State University. The potato late blight work has been conducted at Washington State University, Oregon State University, University of Idaho, University of Wisconsin, and Pennsylvania State University, and North Carolina State University.

The Critical Issues funds are intended to support the initiation of research on issues requiring immediate attention until other, longer-term resources are available. The objectives of the projects are short-term and are expected to be completed within a 1–2 year period. This has been true for the vesicular stomatitis and potato late blight work. These projects have been reviewed to ensure compliance with the original goals during fiscal year 1997. All projects were reviewed for scientific merit before funding decisions were made. Also, scientists being supported with these funds are in close contact with CSREES' National Program Leaders in these areas so that the agency is kept abreast of developments as they occur. In addition, site visits are arranged when convenient to include as part of other official travel to that state. Project locations have been visited and progress reports submitted to document expected progress. Results are also shared with APHIS scientists to ensure implementation of findings and verify that we are meeting their needs.

DAIRY AND MEAT GOAT RESEARCH, PRAIRIE VIEW A&M, TEXAS

The program has addressed a range of issues associated with goat production. Research by scientists at the International Dairy Goat Center, Prairie View A&M University focuses on problems affecting goat production in the United States. Issues included are the study of nutritional requirements of goats, disease problems, methods to improve reproductive efficiency in the doe, the use of gene transfer to improve caprine genetics and the evaluation of breeding schemes to improve meat and milk production. Currently, research is in progress to assess the economics of alternative breeding and rearing systems for goats in the southeastern region of the U.S., to study the incidence and impact of intestinal parasites, and to develop least-cost health management strategies for parasite control. The principal researcher believes that nationally, most of the farm enterprises that include goats are diverse and maintain a relatively small number of animals. Responding to disease, nutrition, breeding and management problems will improve efficiency of production and economic returns to the enterprise.

The original goal of this research was to conduct research that will lead to improvement in goat production among the many small producers in the United States. Research has been conducted to develop and improve nutritional standards, improve genetic lines for meat and milk production and to define mechanisms that impede reproductive efficiency in goats. Current efforts focus on the development of enterprise budget management tools for goat producers in the Texas gulf coast region.

Grants have been awarded through appropriated funds as follows: \$100,000 per year for fiscal years 1983–85; \$95,000 per year for fiscal years 1986–88; no funds were appropriated in fiscal year 1989; \$74,000 for fiscal year 1990; \$75,000 per year for fiscal years 1991–1993; \$70,000 for fiscal year 1994; and \$63,000 per year for fiscal years 1995–1998. A total of \$1,206,000 has been appropriated. The University reports no non-federal funds expended on this program.

Research is being conducted at Prairie View A&M University in Texas. The overall objective of this research is to support the needs of small farms engaged in the production of meat and milk from goats along the Texas Gulf Coast. The university researchers continue to address those needs on an annual basis and anticipate that work currently in progress will be completed by the end of fiscal year 1999. The Dairy/Meat Goat Research grant was reviewed in June, 1997 and it was determined that the institution is well equipped and qualified to carry out the research project.

DELTA RURAL REVITALIZATION, MISSISSIPPI

The Delta Rural Revitalization, Mississippi Project involves applied research and outreach focused on creating new and expanded economic development opportunities for the Mississippi Delta region. The project has gone through several phases in the

delineation of a strategy for long range development within the region. Phase I was completed with the delivery of a baseline assessment of the economic, social, and political factors that enhance or impede the advancement of the region. Phase II of the project evaluated the potential for entrepreneurship and small business creation as mechanisms to improve economic conditions. Phase III is now focusing on technical assistance to Delta region manufacturing firms to strengthen their ability to provide employment and incomes and includes to development and refinement of data bases and development statistics. The proposals are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas and provide greater impact on targeted region.

This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to job and business development as a development strategy. The principal researcher believes that the databases, technical assistance, and analytical capability will increase the effectiveness of economic development and entrepreneurial activity in the region. The applied research and outreach project was designed to increase ability to strategically guide economic development through target industry attraction. They developed an analytical baseline for the Delta region to benchmark economic development progress and to profile potential arenas of opportunity. An entrepreneurial forum was established to help new business ventures with start-up advice and assistance. A venture capital association was formed to help both inventors and businessmen find capital resources to carry out development initiatives. The emphasis of the project is now shifted to technical assistance for existing industries.

Grants have been awarded from appropriated funds in the following amounts per year: fiscal year 1989, \$175,000; fiscal year 1990, \$173,000; fiscal year 1991-93, \$175,000; fiscal year 1994, \$164,000; and fiscal year 1995 to 1998, \$148,000 per year. A total of \$1,629,000 has been appropriated and awarded. Total non-federal funds directed to this project, as reported by Mississippi State University, are: fiscal year 1991, \$117,866; fiscal year 1992, \$84,402; fiscal year 1993, \$68,961; fiscal year 1998, \$57,404. Reports for other years are incomplete at this time.

Applied research and outreach is being carried out through Mississippi State University and sub-contractors. The original completion date was September 30, 1990. The original objectives of this research have been met. The additional objectives being presented for the current year should be completed by September 30, 1999.

The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit periodic reports to the agency to document impact of the project. Significant suggestions have been offered to improve the relevance and impact of this project. Time lines tend to lag on targeted accomplishments. An assessment of the project was conducted by the Social Science Research Center at Mississippi State University and a report compiled in November, 1996.

DROUGHT MITIGATION, NEBRASKA

This grant supports the National Drought Mitigation Center program in the School of Natural Resource Sciences at the University of Nebraska. The Center is developing a comprehensive program aimed at lessening societal vulnerability to drought by promoting and conducting research on drought mitigation and preparedness technologies, improving coordination of drought-related activities and actions within and between levels of government, and assisting in the development, dissemination, and implementation of appropriate mitigation and preparedness technologies in the public and private sectors. Emphasis is directed toward research and outreach projects and mitigation/management strategies and programs that stress risk minimization measures rather than reactive actions. This grant has not been awarded competitively, largely because of the national and international reputation of the University of Nebraska for research in the field of drought mitigation and management. The grant proposal is reviewed annually by the University of Nebraska for its scientific merit.

Studies conducted by the principal researcher show that drought is a normal feature of the climate of virtually all regions of the United States. The Federal Emergency Management Agency has recently estimated that annual losses attributable to drought in the United States are between \$6-8 billion. Losses resulting from drought have increased from an estimated annual loss of \$7 million to \$1.2 billion in the mid-1970's. Drought impacts are escalating in response to increasing demands for water and other natural resources, increasing and shifting population, new technologies, and social behavior. These impacts are diverse and affect the economic, environmental, and social sectors of society. This fact was reinforced dra-

matically in 1996 in the Southwestern United States. Impacts in Texas alone were estimated to be more than \$5 billion.

Almost without exception, the occurrence of widespread severe drought in the past decade has illustrated the inadequacy of existing assessment, mitigation, response, and planning efforts at the federal, state, local, and tribal level. Rather than the "crisis management" approach of the past, a "risk management" approach is needed where the emphasis is on preventive measures, such as contingency planning, mitigation strategies, and public education. Until the creation of the Center in 1995, little attention has been focused on drought among the long list of natural hazards that affect the Nation. The Center is receiving non-federal funds in support of this research from the University of Nebraska. In addition, the Center is attracting support for specific projects that are an integral part of its mission from federal and state sources.

The original goal of this research was to create a National Drought Mitigation Center and develop a comprehensive program aimed at lessening societal vulnerability to drought. The Center has created an information clearinghouse and is delivering information to a diverse audience of users through its home page. Over 50,000 users now access the Center's home page each month. The Center's award winning home page was used extensively by state and federal agencies during the 1996 drought to assist in the evaluation and response process. This home page networks users of drought-related information in the United States and elsewhere with information that would otherwise be unavailable or inaccessible to users.

The National Drought Mitigation Center played an important role in the response of Federal and state government to the 1996 severe drought in the Southwest and southern Great Plains states. In addition to providing timely and relevant information on drought severity and alternative response, mitigation, and planning measures, the Center participated in the Multi-state Drought Task Force workshop organized at the request of President Clinton and helped formulate long-term recommendations to improve the way this Nation prepares for and responds to drought. The Center was also a member of the Western Governors' Association Drought Task Force. This task force also made recommendations to reduce the risks associated with drought in the western United States.

There have been several notable outcomes of the Western Governors' Association actions and the Center has been closely associated with each of these outcomes:

1. A Memorandum of Understanding was signed between Western Governors' Association and key federal agencies to develop a partnership to improve drought management and preparedness in the West.

2. A Western Drought Coordination Council was formed in 1997 to implement these actions. The National Drought Mitigation Center is serving as headquarters for the Council and the Director of the Center, is serving as the administrative director of the Council.

3. The Center has worked closely with both the Senate and the House in the formulation of the National Drought Policy Act. This bill was passed by the Senate in November 1997 and will be considered by the House in early 1998. This bill would create a Commission to review federal, state, and local drought programs and make recommendations to the President and Congress on the needs for a national drought policy. The Commission's work will be done in consultation with the National Drought Mitigation Center.

4. The Center has been organizing and conducting a series of training workshops on drought contingency planning. The purpose of these workshops is to train representatives of local, tribal, state, and federal governments on how to develop a drought contingency plan. Two workshops were held in 1997; three workshops are planned for 1998.

5. The Center continues to work with specific states and tribal governments on drought contingency planning efforts. The number of states with drought plans has increased dramatically since 1982—from 3 to 27 states; and the Director of the Center has been instrumental in this increased attention to drought planning at the state level. His research is the basis for recent drought planning efforts in Texas and Oklahoma. In addition, the Center will begin working with New Mexico in 1998 in the development of a long-term drought mitigation plan.

The work supported by this grant received an appropriation of \$200,000 in fiscal years 1995 through 1998, for a total appropriation of \$800,000. The University of Nebraska contributed \$75,737 of non-federal funds in support of this research in fiscal year 1995 and \$58,977 in fiscal year 1996, and \$61,545 in fiscal year 1997. The University of Nebraska will contribute \$67,819 in fiscal year 1998.

The research will be conducted at the University of Nebraska-Lincoln. The research conducted under this project is being undertaken under a series of nine tasks. Significant progress on each of these tasks has been made, but these activi-

ties are ongoing. The information clearinghouse has been created, but new information and documents are continuously added to the home page in response to users' needs and requests. In addition, the drought watch section is updated monthly to assist users in evaluating current climate and water supply conditions. Research on new climatic indices to monitor drought and water supply conditions are being tested and mitigation technologies and existing state drought plans are continuously evaluated. New activities are also being initiated in response to the growing interest and awareness in drought mitigation in the United States and elsewhere. For example, the activities of the Western Drought Coordination Council provides the Center with a broadening range of activities on an annual basis.

ECOSYSTEMS, ALABAMA

This is a collaboration between Auburn University, Faulkner State Community College, and the Alabama Southern Community College. The Faulkner State Community College's research will focus on marine and estuarine environmental issues, including water quality, habitat loss, non-point source pollution and watershed management in the Gulf of Mexico region. The Alabama Southern Community College's research will focus on issues facing the forestry industry in the southeastern United States, including the reduction of chemical discharge from wood and pulp processing. Goals for this project are still being refined, and no work on this project has been initiated. However, we anticipate that work will begin during the Spring 1998, and the appropriation for fiscal year 1998 is \$500,000.

Research will be conducted at the Faulkner State Community College Aquaculture Center and the Alabama Southern Community College Center for Forestry, Paper, and Chemical Technology. Objectives for the project and a timetable for completion should be included as part of the proposal, which has not been received by the agency. This project has not yet been evaluated, as it is still in the early stages. The first evaluation of the project will be a review of the research proposal, and will be conducted when the proposal has been received by the Agency.

ENVIRONMENTAL RESEARCH, NEW YORK

The environmental research in New York has several major goals. These are: (1) to better understand the impacts of nutrient flows, principally nitrogen, from agriculture on non-agricultural ecosystems, forests, wetlands, and water resources in mixed ecosystem landscapes; (2) to improve knowledge of agricultural contributions to greenhouse gas emissions and effects of projected climate change on crop production; and (3) to develop innovative approaches and technologies for improving the efficiency of agricultural production and/or reducing environmental impacts of agriculture. New goals for the coming year include: (1) to improve understanding of the impacts of land application of biosolids on the sustainability of New York agriculture and on water quality, and to develop management practices and guidelines for sustainable use of biosolids in New York agriculture; and (2) to evaluate spatial and temporal variability of crop yields within fields and to develop management practices that increase productivity, increase the efficiency of use of inputs, and reduce environmental impacts of agriculture.

Interactions between agriculture and the environment are many and complex and require multi-disciplinary efforts to both understand the interactions and to develop effective management strategies. Traditionally, research and research funding, has been discipline-based and, hence, uni-dimensional. Programs supported by the special grant are multi-disciplinary in nature, involving technical scientists from a range of disciplines, together with social scientists and economists. Additionally, translation of knowledge from plot or field studies to larger scales, such as landscape to regional and global, is needed to provide information that is useful to policymakers.

One goal of the program is to identify impacts of nitrogen flows from agricultural lands on adjacent natural ecosystems, forests and wetlands, and water resources and to devise management strategies to minimize these impacts. Nitrogen leaching from maize-based cropping systems has been shown to be higher when organic sources of nitrogen, manures, and plow-down alfalfa are used as nitrogen sources for crop growth compared to use of inorganic fertilizers. Attempts to use an interseeded cover crop to capture and recycle excess nitrogen left over after the cropping season were only marginally successful due to limited growth of the cover crop following maize harvest in New York's climate. Studies demonstrated that protection of groundwater resources in New York from contamination by nitrate in areas of intensive dairy farming must rely on dilution by water from non-intensively used areas within the watershed and on ammonia volatilization from manure. A com-

puter based nitrogen decision support system to improve recommendations for on-farm nitrogen management was developed and implemented in New York.

A second goal of the program is to investigate several interactions between agriculture and climate change. Studies have included:

- Impacts of agricultural use of land on methane fluxes to/from soils;
- Effects of interactions between elevated carbon dioxide and environmental variables on yields of vegetable crops;
- Effects of climate variability on crop production;
- Agronomic and economic effects of gradual climate change on grain yields, cropping patterns and food prices; and
- Carbon sequestration in agricultural soils.

Studies of methane fluxes to/from soils showed that northern hardwood forests are both a source and a sink for this powerful greenhouse gas and overall may be a net source of methane. In contrast, upland agricultural systems were consistently found to be a sink for methane; thus the surface land smoothing and improved drainage of upland agricultural lands has had a mitigating effect on atmospheric methane levels. Flooding land for rice production is known to create a substantial source of methane. Use of legume green manures to supply nitrogen in an organic production system increased methane emissions two-fold, creating a conflict between a sustainable agriculture practice and the environment.

Climate, crop production, and economic models were linked to provide an integrated framework for assessment of the impact of climatic change at the farm level. The model projected that a grain farm in a cool climate, Minnesota, could effectively adapt to climate change; whereas a similar farm in a warmer climate, Nebraska, would have reduced crop production and income.

No-tillage agriculture was shown to increase preservation of existing soil organic carbon but accumulation of carbon derived from crop inputs was higher with conventional tillage. Inputs of carbon to soils from root exudates and residues were found to be more important to carbon sequestration in soils than were residues from the tops of plants. The effects of soil texture and soil aggregation, coupled with tillage management, on carbon sequestration in soil organic matter are being investigated.

A third goal of developing innovative approaches to management, systems, and technologies has had the following components:

- Whole farm analysis and planning;
- Use of weather forecasts to predict weed management impacts on corn production;
- Soil quality changes in the Chesapeake farms sustainable agriculture project; and
- Use of constructed wetlands to mitigate phosphorus run-off from barnyards.

Assessments of nutrient use and management on farms have been carried out in Cayuga County, New York, and in Pennsylvania, in conjunction with Rodale Institute. In New York, mass nutrient balance data on dairy farms has shown that, because of nutrient imports in feed and inadequate cropland area, nutrients excreted in manure exceed crop requirements. Coupling of models for nutrient management and animal diets was used to develop improved management practices. On one farm, production of nitrogen in manure was reduced 25 percent by more accurate balancing of animal diets and on a second farm modification of the cropping pattern reduced the imported nitrogen in feed by 13 percent. In Pennsylvania, it was demonstrated that management of a mixed grain and livestock farm without external chemical inputs was economically feasible. Appropriate crop rotation was found to be the key element.

Soil quality assessments at the Chesapeake farms sustainable agriculture project on Maryland's Eastern shore, where various cropping systems are being compared with the conventional corn-soybean rotation, have shown that soil quality improves as the cropping system becomes more complex, involves less tillage, and has more organic inputs.

Mitigation of phosphorus in runoff from barnlots by a constructed wetland system is being evaluated on a 500-head dairy farm in New York. Different substrates in the wetland beds are being evaluated, including soil, limestone, norlite, and wollastonite. To date, the soil and norlite materials are proving to be the most effective at phosphorus removal.

The work supported by this grant began in fiscal year 1991 with an appropriation of \$297,000. The fiscal years 1992-1993 appropriation was \$575,000 per year; \$540,000 in fiscal year 1994; and fiscal years 1995 through 1998, \$486,000 each year. A total of \$3,931,000 has been appropriated.

In fiscal year 1991, Cornell University provided \$27,893 and the State of New York provided \$118,014. In fiscal year 1992, Cornell University provided \$37,476

and the State of New York \$188,915. In fiscal year 1993, Cornell University provided \$13,650 and the State of New York \$243,251. In fiscal year 1994, the State of New York provided \$214,989. In fiscal year 1995, the State of New York provided \$233,085. In fiscal year 1996, the State of New York provided \$388,301.

This research is being conducted at Cornell University. The original estimate was for a 5-year program, and many of the initial objectives in the nitrogen and climate change areas have been met. New objectives evolved from the original work; and the program was also oriented to consider broader dimensions of environmental management, particularly strategies for community-based watershed management, involving linkage of technical knowledge with social and local government mental perspectives and needs. Estimated completion dates for current program elements are:

1998-1999 program year

Nutrient processing in wetlands
Use of weather forecasts in weed management
Use of constructed wetlands to remediate barnyard run-off
Effect of climate variability on crop production
Carbon storage in soils

Completion beyond 1999

Watershed science and management
Effects of elevated CO₂ on crop yield potential
Remington farms sustainable agriculture project (a 10-year project)

The project was peer reviewed in 1997 and 1998. Overall, the project was rated very high. Specific ratings included the following:

1. Outstanding scientific merit.
2. Appropriate methodology
3. Excellent previous accomplishments.
4. The project has potential for significant impact concerning the relationship of agriculture to global change.
5. The proposal is well conceived and well written.

ENVIRONMENTAL RISK FACTORS/CANCER, NEW YORK

The American Cancer Society estimated that over 184,000 women in the United States were diagnosed with breast cancer in 1996. The role of environmental risk factors, such as pesticides, is of concern to women, the agricultural community, and policymakers. This project, emphasizing risk reduction prevention information, will work at filling that void.

The original goals of this research are:

1. To establish a database of critical evaluations on the current scientific evidence of breast carcinogenicity and effects on breast cancer risk for selected pesticides.
2. To effectively communicate database information to the scientific community, federal agencies, public health professionals, the agricultural community, and the general public using innovative electronic methods of communication, in-service training sessions, and printed materials.
3. To further develop the Breast Cancer Environmental Risk Factors World Wide Web to improve ease of use, add informational materials and hyperlinks, and determine the feasibility of developing an online, searchable bibliography on pesticides and breast cancer risk accessible through this Web site.

The work supported by this grant began in fiscal year 1997, and appropriations were as follow: fiscal years 1997-1998, \$100,000 for a total of \$200,000. The non-federal funds and sources provided for this grant were as follows: \$150,000 state appropriations for fiscal year 1996; \$250,000 in state funds (New York) were requested for fiscal year 1997.

Research is conducted at the Cornell University, Ithaca, New York and the anticipated completion date is March 31, 1999. As a relatively new project, an evaluation has not been conducted, although the proposal is currently under review. Periodic progress reports have been made throughout the year and the project is moving towards achieving its desired goals. A final evaluation will be made after March 31, 1999.

EXPANDED WHEAT PASTURE, OKLAHOMA

This project was designed to develop improved supplementation programs and new systems for technology delivery to reduce production risk of raising cattle on wheat pasture. The work involves evaluation of grazing termination date on grain and beef production, assess the impact of wheat cultural practices and develop an economic model to evaluate alternative decisions on grain/beef production. Addi-

tional effort is directed toward development of cool season perennial forage grasses to complement wheat pasture. The principal researcher believes that this work addresses the needs of wheat/cattle producers of Oklahoma as a primary focus. However, it would appear to have some application regionally in adjacent states.

The original goal of this research was to develop economically viable management systems for use of wheat for supplemental pasture for beef cattle before the crop starts making grain. This work has already shown how the use of feed supplements can increase net profit from cattle grazing on wheat pasture. The study has identified management practices, e.g. date of planting, cultivar selection, grazing intensity and date of cattle removal that produce the optimum grain yield and cattle gain. A Wheat/Stocker Management Model has been developed as a decision aid to help producers assess income risk in the operation. Work is underway on a Wheat Grazing Systems simulation model.

The work supported by this grant began in fiscal year 1989 and appropriations were as follows: fiscal year 1989, \$400,000; fiscal year 1990, \$148,000; fiscal year 1991, \$275,000; fiscal years 1992–1993, \$337,000 per year; fiscal year 1994, \$317,000, and fiscal years 1995–1998, \$285,000 each year. A total of \$2,954,000 has been appropriated.

The nonfederal funds and sources provided for this grant were as follows: \$175,796 state appropriations in 1991; \$174,074 state appropriations in 1992; and \$236,584 state appropriations in 1993. The non-federal support for 1994 was \$238,058 for state appropriations. Funds for fiscal year 1995 were \$275,426, for 1996 were \$120,000, and for 1997 were \$190,510.

The research is being done at Oklahoma State University and this project started in 1989 with a projection of 10 years to complete the research objectives. Some objectives are nearing completion while others will probably require further study. A number of wheat cultivars have been identified which will tolerate grazing and still produce economic grain yields. The grazing cut off date for grain production has been established. However year to year variation need additional study in order to develop a reliable decision support system.

This program has not been subjected to a comprehensive review. However, each year's funding cycle is reviewed internally by CSREES scientists for scientific merit and relevance. Results from this project are currently being used by ranchers to help with management decisions concerning stocker cattle grazed on wheat that will be harvested for grain. Current work is designed to refine the current information and identify wheat cultivars and grazing management for optimum economic return.

EXPERT IPM DECISION SUPPORT SYSTEM

A prototype information and decision support system was developed in collaboration with Purdue University and the Department of Energy's Argonne National Laboratory that integrates and manages information from multiple data sources. Information on the US Environmental Protection Agency (EPA) review status of pesticides, crop losses caused by pests, status of minor use registrations (IR-4), current research in progress, and priorities of IPM implementation teams are components of the Pest Management Information Decision Support System (PMIDSS). With the information in the current data bases, commodity/pest problems are prioritized using a science-based logic. The need for decision support and information is greater than in the past with the passage of the Food Quality Protection Act (FQPA) of 1996. The Act recognizes IPM as helping to provide workable solutions to pest problems. The decision support system is incorporating increased information to address these needs. The PMIDSS serves national, regional, and local needs for research and extension activities. At the national level, the system supports the USDA/USEPA Memorandum of Understanding (MOU) to identify crop protection gaps and to find alternatives to pesticides under regulatory review or those being lost due to pest resistance. The system has identified priorities for the Pest Management Alternatives Program request for proposals for the past two years. It also is interacting with the identification of priorities for research and extension activities in the regional IPM Special Grant and Special Projects. It provides a mechanism for growers and grower organizations to interact with the priority-setting process and the ultimate result is to help insure that farmers have adequate alternatives for managing pests at the specific local level.

The goal of the PMIDSS is to refine the process to identify IPM needs of USDA, EPA, and states by addressing critical needs, reinforce state and federal partnerships to disseminate important pest management information for improved decision making, profitability, and environmental quality, and to address future applications and needs. In 1996 and 1997, the program addressed priority commodity pest management needs due to voluntary pesticide cancellations and regulatory cancellations

responding to the MOU and supplemental MOU between EPA and USDA. The supplemental MOU was signed in April, 1996, at which time there were 58 pesticides and 374 uses identified and prioritized. The process included information on cancellations furnished by EPA, selected uses were sent to the states' NAPIAP and IPM network; and impacts of cancellations effecting individual state agriculture were reported for inclusion in the decision support system. Twenty-five minor commodities on which 40 specific pests were identified in the 1997 request for proposals. Results were also used by the regional IPM request for proposals. The Pest Management Alternatives Program WorkBench (a major component of PMIDSS) has been refined and placed on the CSREES local area network and is available to all pest management national program leaders.

In fiscal year 1994, we expended \$40,000 of CSREES administrative funds and \$90,000 from Science and Education Evaluation Funds to initiate collaborative work with the Argonne National Laboratory. In fiscal year 1995, we expended \$172,000 as a Cooperative Agreement with Purdue University and Argonne National Laboratory from the Pest Management Alternative Special Grant Funds and \$5,000 from NAPIAP funds. In fiscal year 1996, we expended \$177,000 in a cooperative agreement with Purdue University and Argonne National Laboratory from Pest Management Alternative Special Grant Funds, \$21,000 from Research, Extension, and Education Evaluation Funds, and \$40,000 from NAPIAP funds (for development of NAPIAP data fields). In fiscal years 1997-1998, we are expending \$177,000 per year to Purdue University and Argonne National Laboratory. The total resources to date are \$887,425. Purdue University and Cornell University have contributed non federal resources to the oversight of the information, decision support system as well as a number of states that have provided information that is part of the information base. Many program areas are contributing data bases that are part of the Pest Management Information Decision Support System.

The work is carried out by the Argonne National Laboratory which has a Washington, D.C. office where information, decision support personnel are housed and there are frequent interactions between CSREES and other USDA staff. Interactions and information is provided by every state in our system.

Our original estimate was two-to-three years with adequate resources to complete the developmental work. However, the design considerations become more complex as program needs dictate expansion of the information base such as the developments under FQPA. In addition, the technology is moving so swiftly that we must continue to do updating. We feel we are reasonably meeting our objectives with resources that are available. As indicated, we are institutionalizing this activity and it will become an ongoing activity of the agency of increasing importance.

PMIDSS underwent a formal review in June, 1997 and a major piece of the system, the Pest Management Alternatives Program WorkBench was reviewed by regionally selected land grant scientists in November, 1997. The June review recommendations included: focus of the system on the needs of the Pest Management Alternatives Program, delivery of the software product to USDA, and development of a plan to sustain the system in a user-friendly, widely available format. Evaluation of the WorkBench in November brought the following comments and recommendations: the WorkBench provides good linkages to relevant data bases and brings together essential information on pest management issues; the system should be placed on the World Wide Web for greater access and utility; tell potential users that it is available; and invest in high quality data bases to support and enhance data integrity of the WorkBench. In addition, we have a PMIDSS guidance committee that gives us input on an ongoing basis.

FARM AND RURAL BUSINESS FINANCE: ILLINOIS AND ARKANSAS

Federal funding for this project provides partial support for the Center for Farm and Rural Business Finance which conducts an on-going program of research and information focused on financing of farms and rural businesses in the United States. The long-range plan of work for this program focuses on three principal areas: (1) financial management and performance of rural businesses; (2) research on financial markets and credit institutions serving rural America; and (3) the impact of public policies and programs on the financial health of rural America. The need for the program is national in scope with some of the individual projects focusing on regional or local needs associated with particular commodities or situations. The need is greater now than when the program was first initiated because government commodity programs which reduced financial risk for agricultural producers have been substantially altered. Traditional characteristics of agriculture such as capital intensive businesses, variable prices and production and seasonality present unique risks with important implications for the cost and availability of financial capital

for farm and rural businesses. Identification of new sources of financial capital and innovative programs are essential to enhance the financial capacity for undertaking rural development programs and responding to growth opportunities in rural businesses.

The goal is to assist farmers and rural businesses with research-based information on financial management as they deal with changing and increasingly complex financial markets. The program has completed projects on the financial structure and efficiency of grain farms, risk and financial implications of vertical coordination in hog production, commercial bank access to agency market funds through government sponsored enterprises, and competitive challenges for bankers in financing agriculture. Additional projects in various stages of completion include examining time and risk attitudes of decision makers, risk-adjusted returns on Illinois farms, management performance and the role of nontraditional lenders, financial implications of property tax reform at the State level and investment options for farmers and businesses during high income periods. Other projects are weighing regulatory costs in rural lending, conducting statistical analysis of Chapter 12 bankruptcy filing data and identifying determinants of the type and terms of leases used in agriculture, and their impact on firm profitability.

The work has been underway since 1992. Appropriations were \$125,000 in fiscal year 1992, \$125,000 in fiscal year 1993, \$118,000 in fiscal year 1994, \$106,000 in fiscal year 1995 through fiscal year 1997, and \$87,000 in fiscal year 1998. Appropriations through fiscal year 1998 total \$773,000.

The non-federal sources and funds provided for this program in fiscal year 1992 totaled \$259,427 with \$58,427 in State appropriations, \$189,000 from industry and \$12,000 from miscellaneous sources. In fiscal year 1993, the total was \$287,890 with \$94,588 in State appropriations, \$133,000 from industry and \$25,000 from miscellaneous sources. In fiscal year 1994, the total was \$391,000 with \$221,000 coming from State appropriations, \$45,000 from industry and \$125,000 from miscellaneous sources. In fiscal year 1995 the total was \$185,000 where \$46,000 came from State appropriations, \$62,500 from industry and \$76,500 from miscellaneous sources. In fiscal year 1996, the total was \$344,000 where \$294,000 was appropriated from State sources and \$50,000 from private sources. In fiscal year 1997, \$125,000 was appropriated from State sources, \$103,000 was received through a National Research Initiative grant, and \$150,879 was received from the Council on Food and Agricultural Research. Non-federal support for fiscal year 1998 has not been identified.

The work is being carried out by the Center for Farm and Rural Business Finance. Investigators are located at the University of Illinois and the University of Arkansas. The original objectives of the program were amended with additional funding and new termination dates which now extend to fiscal year 1998. While initial objectives have been met, changing conditions and new financial environments call for continuing work to address new dimensions of the objectives as originally proposed. Anticipated completion date of these related objectives extend to August, 1998.

The project is evaluated periodically during the year through direct contact with the Director of the Center, as reports are received, and annually when proposals are received. The Project Investigators also prepare a biannual summary which details accomplishments during that period. The general objectives are met on a continuing basis with specific aspects being addressed as they evolve from year to year. One dimension, accomplished annually, is the sponsorship and conduct of a National Symposium for Agricultural Finance Executives which provides a valuable service as well as visibility for the Center. During this past year, the projects have addressed financial structure and efficiency of grain farms, vertical coordination in hog farms, competitive challenges to bankers, farm business planning, stochastic simulation analysis of Farm Credit System income allocations, and the impact of banking structure on rural financial markets. Evaluation of the program considers the focus of specific projects on current issues as well as review of the conduct and products from the various projects.

FLORICULTURE, HAWAII

The research carried out with these funds involves wholesale and retail U.S. and Japan market research, development of new varieties for aesthetic values and pest resistance, and pest and disease management strategies to meet quarantine needs and consumer expectations. The researcher believes the tropical cut flower and foliage industry in Hawaii, which includes anthurium, orchids, flowering ginger, bird of paradise, heliconia, protea, and cut foliage—ti leaves and other greens—is worth over \$50 million primarily in out-of-state sales. Development of disease resistant

cultivars and quarantine pest and disease management strategies which reduced pesticide usage are included in the national high priority improved pest management systems.

The original goal of the research was to develop superior Hawaii anthuriums, orchids, protea, and exotic tropical flower varieties with disease resistance, particularly to anthurium blight which devastated the Hawaii anthurium industry through the mid-1980's and reduced Hawaii's market share. Additionally, research focused on development of post-harvest handling practices and quarantine pest control. To date, a new anthurium cultivar has been patented and released. Additional blight resistant cultivars are being propagated and tested by the anthurium industry. Disease resistant protea germplasm has been obtained from South Africa and is being used in the protea breeding program. A post-harvest hot water dip treatment has been developed and is being used commercially on tolerant cutflower species to meet quarantine requirements.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$300,000; fiscal years 1990–1993, \$296,000 per year; fiscal year 1994, \$278,000; and fiscal years 1995–1998 \$250,000 each year. A total of \$2,762,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: State appropriations of \$87,937 in 1995, 1996, and 1997.

Research is being conducted by the University of Hawaii at Manoa and Hilo. The objectives in the original project were to maintain Hawaii floricultural industry competitive. This objective continues to be the principal direction for the projects. Because the industry and the markets are changing, pests are becoming either resistant or newer strains, and quarantines are changing with technology the objective remains valid. The individual projects funded under this Special Research Grant are evaluated through merit review to ensure that good science is being used. This evaluation is the major tool used to award funds to the projects.

FOOD AND AGRICULTURE POLICY INSTITUTE, IOWA AND MISSOURI

The Food and Agriculture Policy Research Institute (FAPRI) was established by Iowa State University and the University of Missouri, Columbia, in 1984. The purpose of the institute is to conduct comprehensive analyses and disseminate results about the economic impacts of U.S. food, farm, and trade policies to agricultural producers, agribusinessmen, and public policymakers. Iowa State conducts research on the economic interrelationships within and between domestic and foreign food and agricultural markets from the farm gate to market destinations; develops and maintains databases and analytical support systems to facilitate the analysis of agricultural and trade policy issues; and evaluates the impacts of U.S. and foreign commodity supply, demand, and public policy programs on agricultural trade. The University of Missouri maintains models of the domestic agricultural economy and directs its efforts primarily to the analysis of domestic policy issues. The two universities maintain linkages with a number of other universities who provide data and analytical support to the system. The universities maintain a comprehensive analytical modeling system of the U.S. and international food and agricultural sectors to evaluate near-and long-term economic implications of alternative farm policies for the basic commodities. The system is capable of providing economic information on potential impacts out to 10 years in the future of farm policies on farm prices, income, output, government program costs and means to enhance the management of farm programs at the national level. The Nation's agricultural sector and its components are subject to numerous Federal policies and programs. FAPRI is the only publicly supported, non-federal organization with the analytical capability to assess and evaluate the numerous public policies and programs affecting the agricultural sector and report results to a broad constituency including farmers, agribusinessmen, and Federal and State policymakers.

The original goal was to develop the analytical capability to assess and evaluate U.S. farm policies on the U.S. agricultural sector and disseminate this information to farmers, farm and other agricultural organizations, and public policymakers. The mission has been expanded to include assessment of trade and environmental policy impacts and their interaction with the agricultural sector at national, regional, and farm levels. The models in place are also used to assess fiscal and monetary policy implications and impacts of new technologies such as biotechnological innovations on the agricultural sector. Both institutions maintain large econometric models and data sets which are regularly updated to analyze farm and trade policy alternatives and the impacts of various programs on the several sub sectors of the agricultural economy. This update was especially valuable for conducting analyses to assess policy options for the 1996 farm bill. During the past year, the FAPRI completed roughly 50 studies addressing policy issues such as assessments of the 1996 Farm

Bill, alternative ethanol programs, the impact of changing interest rates, alternative crop insurance programs and the impact on U.S. agriculture of the European Union's Agenda 2000 policy reform. Numerous studies were completed addressing improvements made to the empirical modeling system to improve domestic and international policy capabilities. The FAPRI staff has made numerous public appearances throughout the U.S. before agricultural groups and Congressional committees and Executive branch groups addressing policy issues.

Grants have been awarded from funds appropriated as follows: fiscal years 1984–1985, \$450,000 per year; fiscal years 1986–1987, \$357,000 per year; fiscal year 1988, \$425,000; fiscal year 1989, \$463,000; fiscal year 1990, \$714,000; fiscal years 1991–1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal years 1995–1996, \$850,000 each year, and fiscal years 1997 and 1998, \$800,000 each year. The total amount appropriated is \$9,471,000.

The non-federal funds and sources provided for this grant are as follows: \$260,355 State appropriations, \$113,565 industry, and \$37,913 miscellaneous for a total of \$411,833 in 1991; \$321,074 State appropriations, \$51,500 industry, and \$35,100 miscellaneous for a total of \$407,674 in 1992; \$234,796 State appropriations and \$70,378 industry for a total of \$305,174 in 1993; \$78,286 State appropriations, \$43,925 industry, and \$29,750 miscellaneous in 1994 for a total of \$151,961 in 1994; \$80,155 State appropriations, \$37,128 industry, and \$42,236 miscellaneous for a total of \$159,519 for 1995; \$124,123 in State appropriations with no other funding for 1996; \$79,000 in State appropriations, \$50,000 industry and \$25,000 miscellaneous for a total of \$154,000 in 1997; and \$88,800 State appropriations, \$75,200 industry, and \$34,687 miscellaneous for a total of \$198,687 in 1998.

The program is carried out at the Center for Agriculture and Rural Development, Iowa State University and the Center for National Food and Agricultural Policy, University of Missouri. This is a continuing program of research and analysis for the purpose of assessing farm and related policy actions and other policies and proposed actions likely to affect the agricultural sector and its components. The annual proposal is carefully reviewed for adherence to stated objectives and progress before the special research grant is awarded. No formal evaluation of this program has been conducted.

FOOD IRRADIATION, IOWA

Since the Linear Accelerator Facility was placed in operation in March 1993, studies on the effect of irradiation on shelf-life extension, safety and quality of ground beef, beef steaks, ham, pork chops from loins, chicken breasts, and turkey have been conducted. Studies combining irradiation with high hydrostatic pressure and cooking, using whole chicken breasts, turkey and ham, have been conducted to determine the combination of these treatments that will yield a shelf-stable product while maintaining high eating quality. Several studies were conducted to determine whether consumers can detect a difference between irradiated and non-irradiated ground beef patties. Experiments were also conducted to investigate consumer acceptance of pork products irradiated to prevent trichinosis. Test markets of irradiated chicken breasts were conducted to determine consumers' willingness to pay for irradiated products. Research on the effect of packaging materials on quality of irradiated meat is in progress. The principal researcher believes consumers' attention and concern about the safety of fresh meat and poultry has increased with recent outbreaks of foodborne illness from *E. coli* O157:H7. The meat industry has also expressed interest regarding the quality of irradiated products, and how this process can be used to yield high quality fresh meats that are free of pathogens. The recent massive recall of over 25 million pounds of ground beef due to illness caused by *E. coli* O157:H7 contamination has resulted in huge economic losses. With the recent FDA clearance of irradiation of red meat, research needs leading to commercialization of this technology have been enhanced. Additionally, researchers from eight other research institutes have used the irradiation facility for research projects. Thus, the principal researcher believes this research to be of national, regional and local need.

The original goal of the research was to generate knowledge necessary to develop a research and technology transfer program leading to commercial use of irradiation of foods, whereby consumers would be provided with food products with enhanced safety. The effectiveness of irradiation, using an electron beam accelerator, in destroying known pathogenic bacteria in pork and beef has been determined. Mathematical models have been developed to predict the growth of bacteria in low-dose irradiated ground pork. Demonstration of irradiation technology has been presented to some commercial firms, and plans are being developed for some large scale test markets.

The work supported by this grant began in fiscal year 1991 when \$100,000 was appropriated for this project. The appropriations for fiscal years 1992 and 1993 were \$237,000 per year; fiscal year 1994, \$223,000; fiscal years 1995–1997, \$201,000 each year; and fiscal year 1998, \$200,000. A total of \$1,600,000 has been appropriated.

The project received \$1,037,270 in State of Iowa funds—\$1 million of which was for capital construction—in fiscal year 1991; \$37,942 in state funds and \$67,800 in industry grants in fiscal year 1992; \$68,897 in state funds, \$78,300 in industry grants and \$9,666 in user fees in fiscal year 1993; \$70,652 in state funds, \$35,420 in industry grants and \$47,788 in user fees in fiscal year 1994; \$72,772 in state funds, \$100,000 in industry grants and \$55,211 in user fees in fiscal year 1995; \$81,540 in state funds, \$115,300 in industry grants and \$50,963 in user fees in fiscal year 1996; and \$77,963 in state funds, \$253,450 in industry grants and \$46,550 in user fees in fiscal year 1997.

Research is being conducted at Iowa State University. The principal investigator anticipates that the project will continue through June 1998. Since irradiation continues to be viewed skeptically by many non-scientists as a tool for improving shelf-life and preserving food, and because optimal dose and use parameters are still being defined, additional research will be needed to move this technology to broader consumer acceptance and industry use to enhance safety of food products. Research on the factors affecting the quality of irradiated red meat will be primarily conducted using the Iowa State University facility.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal supporting the fiscal year 1997 appropriation was conducted on December 20, 1996. Previous studies funded under this project have provided useful information toward understanding how irradiation can be useful in eliminating or reducing foodborne pathogens in meat products. It is anticipated that the proposed research will continue to further the understanding of how irradiation can be used to improve shelf-life and enhance safety of meats and meat products.

FOOD MARKETING POLICY CENTER, CONNECTICUT

The Food Marketing Policy Center was established in 1988 at the University of Connecticut at Storrs. The Center conducts research on food and agricultural marketing and related policy questions. The general intent is to provide information that can contribute to improved performance of the food production and marketing system. The Policy Center is primarily an economic research organization, but conducts interdisciplinary research when appropriate and communicates results to the public. Key users include farmer and consumer organizations, agribusiness firms, public agencies, state legislatures, and the U.S. Congress. The Center facilitates research at cooperating institutions by organizing research workshops twice annually, furnishing common data bases, preparing research publications, and providing leadership for joint research efforts including the sponsorship of research conferences. The research proposal identifies an ongoing national need to continually improve the economic efficiency and operation of the U.S. food marketing system to benefit farmers, merchants, and consumers.

The ongoing research goal is to identify marketing problems and assess alternatives that improve economic performance of the U.S. agricultural and food marketing sector. The Center serves as a core research group for Regional Research Project NE-165, Private Strategies, Public Policies, and Food System Performance. The research agenda includes industrial organization, strategic marketing, food safety economics, agricultural cooperatives, and public policy including antitrust and regulatory issues. The Center conducts research on food marketing, including descriptions of food quality issues and enhancement policies; private label branding; advertising strategies for agricultural cooperatives; assessment of food retail mergers and competition; evaluation of dairy regulations; branded product marketing strategies; supermarket chain entry; oligopsony in agricultural markets; and the impact of agricultural cooperatives on food processor market performance.

The Center has prepared 45 working papers, 35 policy research reports, 16 policy issue papers, 8 books, and has reprinted and distributed 61 important journal articles to researchers, industry, and Federal and State legislators, and decision makers. This grant will be used to support research on nine projects with research targeted at two problem areas: analysis of impacts of changes in strategies, technologies, consumer behavior and policies on the economic performance of the food system, and to provide economic analysis of private and public strategies in order to assess their impact on improvement in food safety and other quality attributed. Projects include competitive strategy analysis of cooperatives and investor-owned firms; firm dominance in food manufacturing; advertising and the U.S. food system;

mergers, product relatedness and performance outcomes; effects of market structure and concentration on promotional activity; testing theories of oligopoly conduct; relationships between market structure, firm position and price levels; strategic responses to food safety and nutritional regulation; and, trade agreement effects on food quality and trade.

Grants have been awarded from funds appropriated as follows: fiscal year 1988, \$150,000; fiscal year 1989, \$285,000; fiscal year 1990, \$373,000; fiscal years 1991–1993, \$393,000 per year; fiscal year 1994, \$369,000; and, for fiscal years 1995–1998, \$332,000 each year. A total of \$3,684,000 has been appropriated.

The non-federal funds and sources provided for this grant are State appropriations as follows: \$234,259 in fiscal year 1991; \$231,741 in fiscal year 1992; \$201,288 in fiscal year 1993; \$234,557 in fiscal year 1994; \$219,380 in fiscal year 1995; \$134,399 in fiscal year 1996; and, \$135,490 in fiscal year 1997. The decline reflects a change in reporting only salary and related fringe benefits and excludes overhead for facilities and utilities.

The research is being carried out by the Agricultural Experiment Station at Storrs, and at the University of Massachusetts. The original proposal in 1987 was for 24 months. According to the principal researcher, the objective of conducting policy-oriented research on food manufacturing and distribution industries to assist state and Federal policy makers in improving the performance of the food system is still an ongoing public concern, given increasing levels of concentration in food processing. The current phase, initially funded in fiscal year 1997, will be completed in 2001. CSREES annually reviews project reports, succeeding annual project proposals, research studies and educational programs. A merit review of the fiscal year 1997 proposal was conducted in January 1997. An outside review is scheduled for April 1998. Assessment criteria include peer review of results and publications, administrative review and approval of proposals, and reports by external sources.

FOOD PROCESSING CENTER, NEBRASKA

The University of Nebraska Food Processing Center has been conducting short-term, highly applied research projects to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Projects were selected based on the estimated economic impact of the technical assistance or the criticality of the technical assistance to the future of the firm or venture. Priorities were placed on projects relating to the safety of the food product or process and to the fulfillment of regulatory mandates such as nutrition labeling, use of approved and effective ingredients, and adherence to regulations imposed by foreign governments. In addition, several research projects were conducted to improve or assess the quality, extend the shelf-life, or assess or improve the processing efficiency of specialty food products which impacted several processors or used alternative agricultural products. The principal researcher believes the primary impact of this project will be state-wide. Small and mid-sized food processing companies and entrepreneurs have limited technological capabilities for addressing issues related to product development, process development, product and process evaluation, food safety, quality assurance, and regulatory mandates. The short-term research and technology transfer projects conducted as part of this overall project will aid these companies in appropriately addressing these oftentimes complicated issues.

The goal of the research, as stated previously, is to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Technological evaluations were conducted for 181 individuals or companies interested in developing new food processing businesses. These evaluations included formulations, processes, processing equipment, packaging, shelf-life, sensory, nutritional attributes, microbiological quality, regulatory considerations, and other factors. Additionally, microbiological analyses, shelf-life assessments, sanitation audits, and nutritional analyses were conducted for numerous Nebraska food companies.

The work supported by this grant began in fiscal year 1992. The appropriations were \$50,000 per year for fiscal years 1992–1993; \$47,000 for fiscal year 1994; and \$42,000 for fiscal years 1995–1998 each year. A total of \$315,000 has been appropriated. The Food Processing Center received \$300,054 in State funds and \$1,515,721 in food industry grants and miscellaneous sources from 1992 through 1997.

Research is being conducted at the University of Nebraska. Because this project supports ongoing technical assistance to clients, the objectives are ongoing. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted

on January 12, 1998. Progress under previous grants for this project appears to be satisfactory, with numerous examples of assistance cited and summaries of short-term projects provided by the principal investigator.

FOOD SAFETY

This program is to provide funding for competitively-awarded research grants. It is the intention of this program to focus on very high priority issues each year and reflect major concerns under the Food Safety Initiative. The Request for Proposals (RFP) for fiscal year 1998 is planned to have a focus on major issues related to safety of fresh and minimally processed fruits and vegetables which are of increasing concern to the public. As a part of the needed research effort under the President's Food Safety Initiative, this program will address gaps in information available to support control measures in food safety. Several agencies have combined to establish priorities for research in support of regulatory actions in food safety and the RFP will reflect these priorities. The goal of this research program is to provide needed information about sources of contamination of food products, develop rapid sampling and detection systems, and provide support for various interventions to reduce contamination of food with human pathogens. Because this is new program and no awards have yet been made, there are no accomplishments to report at this time. The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$2,000,000.

Research projects will be funded at several land-grant universities after the proposals have been reviewed for scientific merit and responsiveness to the RFP. This program has been proposed for one year at this time but additional funds are being requested for fiscal year 1999 to support this important area. Because no projects are in progress as yet, no review of the program has been scheduled at this time. It is anticipated that reviews of progress on funded projects will be performed at regular intervals of 6–12 months.

FOOD SYSTEMS RESEARCH GROUP, WISCONSIN

The Group conducts research on contemporary issues affecting the organization and competitiveness of the U.S. food system in domestic and international markets. The issues include new technologies, market structure, and government policies and programs. Studies have been completed on pricing of cheddar cheese, fed cattle and hogs; changes in private label product markets; causes of structural change in the flour milling, soybean oil milling, wet corn milling, cottonseed milling, beef packing, and broiler processing industries; competition in U.S. food markets; and the relationship between U.S. food market structure and the industry's performance in global markets. The principal researcher believes that the U.S. food system is changing rapidly in response to a large number of global economic, social, and technological changes. Research is needed to determine the effects of these changes on the system's organization and performance, and to ascertain needed adjustments in public policies based upon sound research. There is a national need to assess and evaluate the organization and performance of the Nation's food industry to ensure that it continues to satisfy performance expectations of farmers and consumers and adheres to acceptable standards of conduct.

The original goal was to assess and evaluate the organization and performance of the U.S. food industry and provide recommendations for improvements. The Food Systems Research Group recently completed a study of the National Cheese Exchange which resulted in a major public report, Congressional hearings, and a Wisconsin task force. Alternative pricing mechanisms are being developed to avoid the problems of a very thin market which is used to price a large volume of off-market sales. The group is also examining the impact of "tough competition" policies on industry performance. Deregulation in the United States and privatization in the U.K., Mexico, and Eastern Europe provide empirical bases for evaluating the impact. The Group has completed numerous studies on economic structure and performance issues of the U.S. food manufacturing and distribution system. Basic research is conducted on market theories; effects of mergers, new technologies, and firm conduct on industry structure and organization; factors affecting industry prices, profits, efficiency and progressiveness; and impact of public policies and regulations on food system organization and performance.

Grants have been awarded from funds appropriated as follows: fiscal years 1976–1981, \$150,000 per year; fiscal years 1982–1985, \$156,000 per year; fiscal years 1986–1989, \$148,000 per year; fiscal year 1990, \$219,000; fiscal years 1991–1993, \$261,000 per year; fiscal year 1994, \$245,000; and fiscal years 1995–1998, \$221,000 per year. A total of \$4,247,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: State appropriations of \$120,304 in

1991; \$119,448 in 1992; \$85,188 in 1993; \$96,838 in 1994; \$59,435 in 1995; \$50,636 in 1996; \$56,421 in 1997; and \$69,626 in 1998.

The grant supports research at the University of Wisconsin, Madison. The original proposal in 1976 was for a period of 36 months. The current phase of the program will be completed in 2001. CSREES performed a merit review of the project in January 1997, as it evaluated the 1997 project proposal, and concluded that the project's researchers have done unique work on the structure, conduct and performance of selected segments of the food industry. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations are providing the research needed for public and private decision making. Research results appear in several peer reviewed professional journals and the popular press, and researchers have ongoing dialog with private and public decision makers.

FORESTRY RESEARCH, ARKANSAS

The Arkansas Forest Resources Center offers programs of teaching and research to the landowners of Arkansas and the surrounding region. This has been done through continuing education workshops for landowners, the development of a series of educational distance-learning tutorials, and the funding of 10 graduate assistantships for the first class in the new forest resources master's program. A partial list of workshops includes: Uneven-aged Silviculture of Loblolly and Shortleaf Pine Forest Types, Environmental Law & Policy, Timber Income Tax Update, Thinning Methods and Operations, Introduction to ArcView 3.0, Estate Planning, Forest Finance Applications: Basic Tools for Daily Practice, and Opportunities in Forest Regeneration. The educational thrust has combined Center and private dollars to establish one of only three ArcView Learning Centers for natural resources. To better provide the highly educated professionals needed to meet the challenges of natural resources, new educational tutorials are being developed in dendrology, tree ID, plant morphology, silvics, that aid in the (1) transitioning of transfers to institutions with forest resources offerings and (2) forest resources education of non-majors at institutions without forest resources faculty. Furthermore, Arkansas will activate a new Master's-level graduate program in the Fall 1998. Research projects address issues of species diversity, richness, redundancy, and the resilience of disturbed and undisturbed hardwood stands of the Delta. Furthermore, evidence exists that neo-tropical migratory birds are indicators of ecosystem health. Factors implicated as influencing their breeding range include habitat destruction/alteration, forest fragmentation, etc. Thus, issues of re-establishment and structure of regenerated hardwood stands are important for timber, nontimber values, and the quality of life enjoyed regionally, nationally, and internationally. Also, other projects are contributing to the development of (1) a biological control agent for the southern pine beetle, (2) alternative forest crops for the economically oppressed Delta region, and (3) technologies for enhanced fiber and wood production from nonindustrial and industrial lands. These issues will grow in importance as southern forests assume greater proportions of the national demand for fiber and wood.

The principal researcher believes that with the reduced levels of production of wood products from the Northwest, southern forests are increasingly bearing the brunt of producing the majority of wood products for the United States. This increased production makes more imperative the appropriate and efficient balance in the use of southern forests in producing timber and non-timber outputs. This would prevent these conflicts or at least reduce them significantly.

The thrust of goal one is developing alternative forest management strategies of achieving multi-resource objectives; i.e. joint production of timber, wildlife, recreation and other outputs of the forest on private industrial and non-industrial forest lands and public forest lands. Significant progress has been made in several areas. Some examples include: developing intensive fiber farming systems as alternatives to soybeans for Mississippi Delta farmers, taking the first step toward biological control of the southern pine beetle by discovering the nutrient needs of predators of the beetle so they can be grown and studies in artificial cultures, delivery systems for introduction of the bait, and conducting the first survey of nonindustrial landowners in Arkansas for 15 years. The survey show some areas for concern, such as the fact that the average age of landowners is over 60. There will be a massive change in ownership in the next 10-20 years. Landowners continue to not be aware of assistance programs and a concern about government programs and intervention on private land. This is information needed to prepare institutions for transitions and to design more effect programs. Ongoing projects include a broad array of topics, competitively awarded within the Center, concerned with best management practices, ecological characteristics, effects of different management intensities,

stream-side buffer zone effectiveness, effects of winter logging, and secondary processing efficiency.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995–1998, \$523,000 each year. A total of \$2,562,000 has been appropriated. The non-federal funding and its source provided to this grant in 1994 was \$411,726 State appropriations and \$380,000 industry for a total of \$791,726; \$491,301 State appropriations and \$785,262 industry for a total of \$1,276,563 for 1995; a total of \$695,204 from State and industry sources for 1996; a total of \$1,115,341 from these sources in 1997; and an estimated total of \$1,000,000 for 1998.

The Arkansas Forest Resources Center is administered from the School of Forest Resources on the campus of the University of Arkansas at Monticello. Grants were received in 1994–1998 with funds distributed for use over the 5 years following the activation year. This means projects initiated in 1994 will commonly mature in 1999, 1995 projects in 2000, 1996 projects in 2001, and so on. Projects are on schedule. Projects from 1994 funding are nearing completion. Forestry research is long term. Center objectives and selected projects will be continued using the infrastructure and capacity developed with these Special Research Grants. In 1991, an agency team visited Monticello and reviewed faculty qualifications, supporting sources, and the feasibility of the proposal. The team exit report indicated the faculty was highly capable, the infrastructure needed strengthening, and the proposal concepts were feasible. Since 1991, there has not been a formal program review; however, the agency is planning one in fiscal year 1998, pending fund availability.

The objectives outlined for fiscal year 1997 were to develop and evaluate alternative forest management strategies for achieving multi-resource objectives on private industrial and non-industrial forest land and to evaluate the environmental implications of forest management alternatives. Ongoing work addresses these issues.

Presently, the only criteria used to assess the projects would be the scientific review process, prior to publication. Since some of this research funding is used for extension and education, there are no commonly used assessment criteria other than attendance at courses and workshops. This makes an outside review by the agency extremely important in evaluation, since review team members will be selected with expertise in all these areas.

FRUIT AND VEGETABLE MARKET ANALYSIS, ARIZONA AND MISSOURI

The purpose is to provide timely knowledge of the impacts of trade, environmental, monetary, and other public policies and programs upon the Nation's fruit and vegetable industry to farmers, agribusinessmen, and policymakers through a program of empirical assessment and evaluation. The U.S. fruit and vegetable sector is experiencing increased growth from greater domestic and export demand. However, the growth of this sector depends upon its ability to compete domestically and internationally and to conform with the regulatory environment in which it operates. This program of research provides information to farmers and policymakers on the implications and impacts of various policies and programs such as environmental, trade, labor, and food safety. The goal is to develop the analytical capability to assess and evaluate public policies and programs impacting the U.S. fruit and vegetable industry and disseminate the results to policy makers, industry organizations, producers, and other users. Proposals have been submitted that outline long-range plans and specific projects for funding. Models have been developed for 17 major (as measured in production, consumption, and trade) U.S. fruits and vegetables with one additional crop model, strawberries, to be completed in the coming year. Trade models for those commodities with a significant import and/or export sector have also been developed. These models feed in to a larger food and agricultural sector model to support analyses of cross commodity and policy effects.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000, and for fiscal years 1995–1998, \$296,000 each year. A total of \$1,513,000 has been appropriated. The non-federal funding and its source provided to this grant in 1994 was \$50,073 State appropriations and \$11,000 industry for a total of \$61,073; \$21,876 State appropriations and \$36,624 industry for a total of \$58,500 for 1995; a total of \$62,400 from State and industry sources for 1996; \$50,000 from these sources in 1997; and an estimated \$50,000 for 1998.

The work is being carried out at Arizona State University and the University of Missouri. The university researchers anticipate that work is an ongoing project to look at the impact of various public policy proposals on the U.S. fruit and vegetable industry.

We have conducted no formal evaluation. However each annual budget proposal is carefully reviewed and work progress is compared with prior year's objectives. In-

formal discussions with congressional staff, USDA officials and industry representatives indicate that these analyses are extremely useful.

GENERIC COMMODITY PROMOTION, NEW YORK

The grant supports, in part, the National Institute on Commodity Promotion Research and Evaluation which provides objective analysis of national and state commodity checkoff programs designed to enhance domestic and export demand. The overall project proposal was merit reviewed at the university level; a competitive peer review process was used to select specific research projects. The principle researcher believes that producers are contributing about \$1 billion annually to commodity research and promotion funds designed to expand the domestic and export markets for their products. The number of commodity groups participating and the size of the funds available could continue to grow. The 1996 FAIR Act requires all Federally-constituted research and promotion boards to evaluate their programs at least every five years. The goal is to determine the economic effectiveness of generic promotion programs designed to increase the sales of agricultural commodities in domestic and international markets. Recent accomplishments include: the impact of promotion and other factors on the sales of almonds, beef exports, pork exports, and wheat exports; development of a major database of commodity advertising expenditures for future research; new methods of measuring advertising wearout; comparisons of research techniques to determine sensitivity of results based on various methods used.

The work supported by the grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000 and for fiscal years 1995-1998, \$212,000 each year. A total of \$1,083,000 has been appropriated. The non-federal matching funds and sources allocated to this grant by Cornell University are as follows: \$97,333 a year in State appropriations for 1994-96; \$125,650 for 1997; and \$130,430 for 1998. Collaborating institutions performing work under subcontract also contribute non-federal matching funds.

The work is being carried out at Cornell University in collaboration with eight other land-grant universities. The original proposal in 1994 was for a period of 21 months, however, the need to evaluate the benefits of commodity promotion and research programs is a growing regional and national concern, as producers take on greater responsibility for marketing their products. An increasing number of promotion and research programs are being evaluated. The current phase of the program will be completed in 1999. CSREES performed a merit review of the project in January 1997, as it evaluated the 1997 project proposal, and determined that the project provides leadership for a unique body of research and education on the impact of commodity promotion programs. Research results appear in several peer reviewed professional journals and popular press and researchers have ongoing dialog with private and public decision makers.

GLOBAL CHANGE

Radiation from the sun occurs in a spectrum of wavelengths with a majority of wavelengths being beneficial to humans and other living organisms. A small portion of the short wavelength radiation, what is known as the Ultraviolet or UV-B Region of the spectrum, is harmful to many biological organisms. Fortunately, most of the UV-B radiation from the sun is absorbed by ozone located in the stratosphere and does not reach the surface of the earth. The discovery of a deterioration of the stratospheric ozone layer and the ozone hole over polar regions has raised concern about the real potential for increased UV-B irradiance reaching the surface of the earth and the significant negative impact this could have on all biological systems including man, animals, and plants of agricultural importance. There is an urgent need to determine the amount of UV-B radiation reaching the earth's surface and to learn more about the effect of this changing environmental force. The Cooperative State Research, Education and Extension Service, CSREES, is in the process of establishing a network for monitoring surface UV-B radiation which will meet the needs of the science community of the United States, and which will be compatible with similar networks being developed throughout the world. This grant is part of a government-wide initiative. The research is closely coordinated with other Federal agencies involved in the U. S. Global Change Research Program Inter-agency UV-Monitoring Network Plan.

The principal researcher believes destruction of the stratospheric ozone layer, our shield from the full intensity of solar radiation, continues to increase. This creates a high priority need for information to document not only the levels of UV-B radiation reaching the earth's surface, but the climatology of that radiation. The United States, and the rest of the world, needs to know the strength of the UV-B radiation

reaching the earth and the potential impact on all forms of life, especially animal and plant life of agriculturally important species. The principal researcher believes this research to be of national as well as regional and local importance.

The USDA UV-B Network is to provide accurate, geographically dispersed data on UV-B radiation reaching the surface of the earth and to detect trends over time in this type of radiation. A primary problem which had to be overcome in order to reach this goal is the development of instrumentation adequate to make the measurements required for the monitoring network. A major advance occurred during 1996 with the availability to the network of a new multi-band instrument which will provide the spectral information needed to support both biological and atmospheric science research and to serve as ground-truth for satellite measurements. These instruments have been deployed and are currently in operation at twenty-six monitoring sites across the United States, including Hawaii. The researchers plan to have additional sites in Florida, Alaska, Puerto Rico, Southern California, Oregon, North Carolina, Tennessee, and Oklahoma operational by the summer of 1998. Two grants to design and build advanced spectroradiometers have been awarded under the National Research Initiative Competitive Grants Program. These instruments are to be used in a research network to make precise measurements of the total UV-B spectra at selected sites. The first of these instruments failed to meet spectral performance standards when tested and calibrated by the National Institute of Science and Technology. An alternative design which resulted in a much larger and more difficult instrument to deploy has been developed. The first two advanced instruments will be deployed at two test sites during the spring or summer of 1998.

To gain experience in network operation, broadband instruments along with ancillary instruments were installed at ten sites and have been in operation for the last 40-48 months. These sites are now equipped with a full compliment of instruments including the new multi-band instrument. Additional sites developed during the last 12 months are similarly equipped with broadband and the new multi-band UV instrument. Data from each site is transmitted daily to Colorado State University for preliminary analysis, distribution, and archiving. These data are available, within 24 hours of collection, on the Internet via a World Wide Web Site located in the Natural Resources Research Laboratory at Colorado State University. The Department of Agriculture is also a participant in the development of a central calibration facility at Department of Commerce facilities in Boulder, Colorado. The purpose of the central calibration facility is to ensure uniform and acceptable calibration and characterization of all instruments used in interagency UV-B monitoring programs.

The work supported by this grant began in fiscal year 1992, and the appropriation for fiscal years 1992-1993 was \$2,000,000 per year; fiscal year 1994 was \$1,175,000; fiscal year 1995 was \$1,625,000; fiscal year 1996 was \$1,615,000; fiscal year 1997 was \$1,567,000; and fiscal year 1998 is \$1,000,000. A total of \$10,982,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$162,000 state appropriations in 1993; \$183,106 state appropriations in 1994; and \$285,430 provided by Colorado State University in 1995.

Colorado State University is managing the operating network, which when completed will include all regions of the country. At least thirty sites are planned for the climatological network including sites in Hawaii, Alaska, and Puerto Rico in order to provide broad geographic coverage. Ten sites have been operational with broad band instruments for up to four years, and twenty-six sites are now operational with new generation instruments. The research level network will begin with the first instrument to be installed at the Table Mountain, Colorado instrument intercomparison site and the second possibly at the Department of Energy Solar Radiation site near Ponca City, Oklahoma as part of the Atmospheric Radiation Measurements field network. As with other weather and climate observations, this network will be an ongoing need for the predictable future. These measurements will provide information on the nature and seriousness of UV-B radiation in the United States and will provide ground truth validation to other predictions of UV-B irradiance. The project has now met its first objective of the establishment of a climatological network to monitor UV-B radiation at the surface of the earth. Years of operation will be required to measure trends in UV-B radiation and to develop models to predict the climatology of UV-B radiation.

The agency has assigned two technical staff to continuously monitor activities in the global change research program. A team of three experts in UV-B radiation measurement technology reviewed specifications for the development of the advanced spectroradiometers in July, 1996 prior to the procurement of major components of the instrument. A panel of radiation spectra scientists was brought in to review data derived from the new multi-band instruments in December, 1996 to advise on the interpretation and analysis of data derived from these instruments. Agency staff is in contact with program management on a weekly basis and has vis-

ited the program headquarters six times during the last year. A review of the UV-B Monitoring Program by a panel of technical experts from outside the Department is planned for 1998.

GLOBAL MARKETING SUPPORT SERVICES, ARKANSAS

This grant supports the University of Arkansas Global Marketing Support Services program to provide research and service to agribusinesses. The objective of the university research is to identify potential foreign markets for Arkansas products and to conduct and disseminate foreign market assessment and evaluation studies to agribusiness firms. The principal researcher believes the emerging importance of global trade to the nation's economy and the reduction of trade barriers worldwide present unprecedented opportunities for cooperative public-private-university research to develop expertise in world markets. The goal is to develop a university research and service organization to support international trade development activities by local area businesses. Research is conducted to determine the demand for specific Arkansas products in selected countries. Recent results include: twelve "Industry/Company Opportunity Reports" that provided local businesses with information about potential export markets; a report on consumer attitudes in Mexico and Columbia toward imported products; an evaluation of the food system in China, with emphasis on poultry sector; two new fact sheets; and additions to an electronic export information database that is accessed by local firms.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$47,000; for 1995 through 1997, \$92,000 a year; and for 1998, \$127,000. A total of \$450,000 has been appropriated. The non-federal funds and sources provided for this grant were \$90,000 per year in State appropriations for 1994 through 1996; \$51,700 for 1997; and \$80,000 for 1998. State appropriations to date total \$401,700.

This research is being conducted at the University of Arkansas, Fayetteville. The original proposal in 1994 was for a period of 12 months, but the objective of expanding the export capacity of small to medium-sized agribusiness firms will not be met until 2000. CSREES performed a merit review of the project in January 1997 as it evaluated the project proposal that year. The proposal was sent back to the university for revision because two of the three objectives did not adequately reflect the kind of work being done and the project was falling behind in the initiation of new research and the distribution of results. The project proposal was subsequently revised by the university and approved by CSREES. The main purpose of this project has been to encourage global business expansion as a means of economic development in Arkansas. To accomplish this purpose, the project leadership discovered that most of their effort had to be focused on the development of educational materials, training, and technical assistance to get firms ready for and involved in exporting. The initial objectives focused only on the development of primary research data and analysis of demand in international markets and lacked the emphasis on education. A February 1998 review of the project documented continued progress with the educational component.

GRAIN SORGHUM, KANSAS

This project was designed to address the lack of yield improvement in grain sorghum cultivars, particularly when grown under dryland conditions where a considerable portion of this crop is grown. The research will focus on identification of early maturing lines which will shift more of the production to grain and less to vegetative growth and thereby making more efficient use of the limited water supply. These funds are awarded by the institutions to scientists at Kansas State University working on sorghum. The focus of this research is toward the non-irrigated lands of Kansas where sorghum can produce a grain crop under conditions that would not be possible with corn and is, therefore, very important in the rotation with wheat. While the research is directed toward Kansas conditions, it would also apply to adjoining states. The original goal of this research is to identify/develop grain sorghum cultivars that mature earlier with more of the production in grain rather than vegetative growth. Studies conducted this past year have made progress toward identifying genetic characteristics controlling grain yield under a range of climatic conditions. Fiscal year 1998 request for proposal has been issued.

The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal years 1997 and 1998 is \$106,000 per year. Total appropriations to date are \$212,000. Research will be conducted at Kansas State University. This is a new project starting in fiscal year 1997, so the objectives have not yet been met. The research proposal will be peer reviewed prior to awarding of funds. Preliminary results contribute toward the understanding of factors controlling grains yield and the

development of higher yielding sorghum cultivars for Kansas. The project is subjected to the institutional review and approval process as well as CSREES review.

GRASS SEED CROPPING SYSTEMS FOR SUSTAINABLE AGRICULTURE

This program was developed to provide management systems for sustainable grass seed production without field burning of the straw residue following harvest which results in adverse air quality problems. Grass seed yields are often significantly reduced the following season if the residue is not burned. Funds from this grant are awarded competitively to scientists at Oregon State University, the University of Idaho, and Washington State University engaged in research on grass seed production. Each award has been merit reviewed by a peer scientist. The principal researcher believes that according to information provided by technical committees representing researchers and the grass seed industry, the need for this research is to develop sustainable systems of seed production that do not depend on field burning of straw residue. Much of the grass seed for the United States including lawn grasses is produced in the area. Field burning of straw residue creates unacceptable levels of air pollution and yields of some cultivar decline without burning. The original goal for this project is to develop grass seed production systems that do not depend on field burning of straw residue. To date joint planning by state experiment station administrators and researchers from the three states with industry input for an integrated regional research effort to solve the problem.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995–1998, \$423,000 each year. A total of \$2,162,000 has been. The nonfederal support for this project in fiscal year 1994 was \$266,055, \$298,052 for fiscal year 1995, \$282,053 in 1996, and \$301,650 in 1997.

The research will be conducted by the three state agricultural experiment stations in Idaho, Oregon and Washington. Completion of the initial objectives was anticipated to take 5 years and, therefore, should be completed in 1999. The entire project is reviewed annually by a steering committee for focus and relevance. The combined proposal is reviewed by CSREES before funds are awarded. Considerable progress has been made toward identifying the consequences of phased out field burning of straw residue on grass seed production. Current and future efforts are directed toward development of sustainable systems without field burning. This program is subject to annual comprehensive evaluation by a team of scientist, industry representatives and farmers. The results are used to guide research for the next year.

HUMAN NUTRITION, IOWA

This research aims to develop animal and plant foods with nutritionally optimal fat content and to improve utilization of foods containing non-nutrient health protectants, components that may reduce health risks. The research includes human and animal nutrient utilization, consumer food choices, and economic impacts of nutritional optimization of food production and processing. The fiscal year 1997 grant supports research efforts of 25 investigators from six disciplines through June 1998. The research addresses food quality, nutrition and optimal health. Much of the research focuses on improving the nutritional quality of foods important to the economy of the Midwest, while making those improvements economically feasible. The principal researcher believes this research to be of national, regional, or local need.

The goal of the Center for Designing Foods to Improve Nutrition, the administrative unit for this grant, is to improve human nutrition and health maintenance by determining how to improve animal and plant food fat content and how to increase availability of health-protectant factors in the human food supply. The research includes food production, processing, consumer choices, biological utilization, and economic impacts. This research has identified soy oils which can be naturally hardened, and results indicate feasibility of processing these oils into shortenings, which may provide human health benefits in comparison with chemically-saturated vegetable fats containing trans fatty acids. Additional work further verifying the feasibility of production of more highly unsaturated pork fat has also been conducted, and human feeding trials demonstrated lowered blood cholesterol in people fed the modified pork. The isoflavone daidzein, a novel health-protective component of soybeans, was demonstrated to lower circulating cholesterol in a mouse feeding study. Studies of isoflavone bioavailability suggested different human phenotypes in the intestinal breakdown of isoflavones. Ongoing studies are assessing the ability of soybean isoflavones during menopause to maintain bone density and reduce menopausal symptoms. Further evidence has been found that oxygenated carotenoids potentially found in processed fruits and vegetables have greater antioxidant ability and would be expected to decrease cancer and heart disease risk.

The work supported by this grant began in fiscal year 1991 with an appropriation of \$300,000. The fiscal years 1992–1993 appropriation was \$500,000 per year; \$470,000 in fiscal year 1994; \$473,000 in fiscal years 1995 through 1998. A total of \$3,662,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$293,000 university, \$312,869 industry, and \$14,000 miscellaneous in 1991; \$90,000 state appropriations, \$473,608 university, \$131,160 industry, and \$116,560 miscellaneous in 1992; \$307,500 state appropriations, \$472,081 university, and \$222,267 industry in 1993; \$486,000 university and \$254,000 private in 1994; \$210,000 university and \$200,000 private in 1995; \$613,770 university and \$207,811 private in 1996; and \$690,736 university and \$1,024,196 private in 1997.

Research is being conducted at the Center for Designing Foods to Improve Nutrition, Iowa State University. The original overall objective to design foods to improve nutrition is continuing to be addressed. A set of related objectives will be completed in 2000. The grant proposal for fiscal year 1996 was subjected to extensive peer review. In 1997 comprehensive merit review conducted by the university lead to major revisions proposed for fiscal year 1998.

HUMAN NUTRITION, LOUISIANA

Obesity is a major problem in the United States. This grant, entitled Dietary Fat and Obesity, will help answer three issues about this problem. Will reducing dietary fat reduce the risk for obesity? Do lean and obese subjects respond differently to changes in dietary fat intake and how is this influenced by exercise and weight loss? And finally, how do specific dietary fats affect the response to insulin and the development of insulin resistance? The fiscal year 1997 grant supports research through July 1998. CSREES requested that the university submit a revised comprehensive grant proposal for fiscal year 1998 which is now being reviewed.

The overall goal of this grant is to identify the basis for the susceptibility to obesity of some people who eat high fat diets and to understand how they differ from those people who are resistant to becoming obese when eating a high fat diet. They have identified a taste system which responds selectively to some fatty acids. The importance of this system in humans and its relation to obesity are under study. In the second experiment they have shown that carbohydrate intake is well regulated, but fat intake is not. In the third set of experiments the relation between basic genetic make-up and the response to dietary fat and insulin is being evaluated.

The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 was \$800,000 per year; for fiscal years 1994–1998 was \$752,000 per year. A total of \$6,160,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$523,100 state appropriations in 1991; \$515,100 state appropriations and \$2,216,606 private in 1992; \$536,100 state appropriations and \$940,000 private in 1993; \$627,000 state appropriations and \$3,775,000 private in 1994; \$546,100 state appropriations and \$3,100,000 private in 1995; \$1,471,000 state appropriations and \$2,488,000 private in 1996; and \$1,998,000 state appropriations and \$2,104,000 private in 1997.

Research will be conducted at the Pennington Biomedical Research Center, Louisiana State University. The anticipated completion date for the original objectives is fiscal 2000. The grant proposal for fiscal year 1996 was subjected to extensive peer review, and in January 1998 an on-site panel of researchers evaluated the proposed objectives and experimental protocols. On the basis of the critiques from the reviewers, the proposal for fiscal year 1998 was revised.

HUMAN NUTRITION, NEW YORK

The general objective is improving the knowledge base needed to evaluate and, when appropriate, implement, the increased reliance of plant-based foods that is at the core of current Federal dietary guidelines. Current dietary guidelines use this approach as a principal strategy to control energy consumption, reduce fat intake, modify the composition of ingested lipids, enhance the consumption of foods associated with reduced cancer risk, and simultaneously insure that macro- and micro-nutrient needs are met. The work brings together investigators whose expertise ranges from basic nutritional molecular biology to the behavioral sciences that are key in enabling consumers to adopt newly discovered knowledge easily and effectively. The fiscal year 1997 grant supports research through September 1998. CSREES has requested that the university submit a comprehensive grant proposal for fiscal year 1998.

Inappropriate diets and physical activity patterns are the second leading etiology of preventable morbidities and mortality in this country. As greater emphasis is

given to strategies that permit individuals to take increasing responsibility for their health and that are designed to achieve goals related to health promotion and disease prevention, the knowledge gained by work sponsored by this grant becomes increasingly valuable. This knowledge is expected to be of use to consumers in making informed food choices and to food producers and processors in anticipating consumer demands. The newly revised dietary guidelines reemphasize expected health benefits from the increased consumption of fruits, vegetables, and grain products. As pointed out in the response to the first question, investigations are carried out at the molecular, behavioral and community levels. Brief synopses typifying the accomplishments are reported. Changes in the American diet are expected to alter lipid metabolism by impacting fat levels and composition. Lipoprotein lipase is a pivotal enzyme that regulates lipid metabolism. New understandings about the enzyme were reported. Researchers identified in the promoter of lipoprotein lipase a silencing element that may play a major role in accounting for the tissue-specific expression of the enzyme and for its regulation. Using band shift assays it was demonstrated that the inhibitory factor is much more abundant in liver nuclear extracts than in fat or heart tissue.

The amount of essential sulfur amino acids is also altered by shifting to more plant-based foods. A researcher found that the cellular signal for the dramatic changes in rates of sulfur amino acid metabolism that occur in response to changes in dietary protein levels is the amino acid cysteine itself, not methionine or a metabolite of methionine or cysteine, and not an indirect response to the cellular redox state.

Work also has been done on strategies for improving food security by encouraging community-based initiatives linking research and extension. Approximately 300 food system stakeholders, from producers to consumers, were mobilized to develop community-based initiatives. These stakeholders are forming into 30 working groups across the region to implement their plans.

Another portion of the work focuses on the interrelationships among the behavioral factors that influence food choice at the community, family and individual levels. The approach involves a unique integration of research and intervention. They developed a model for understanding the development of trajectories for fruit and vegetable choice over the life course, and a conceptual framework for understanding the influence of ethnic identity on fruit and vegetable choice.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal years 1990–1991, \$556,000 per year; fiscal years 1992–1993, \$735,000 per year; fiscal year 1994, \$691,000; fiscal years 1995–1998, \$622,000 each year. A total of \$6,211,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$154,056 state appropriations and \$2,456 private in 1991; \$238,430 state appropriations and \$60,746 private in 1992; \$19,401 state appropriations and \$22,083 private in 1993; \$202,441 state appropriations and \$1,175 private in 1994; \$296,794 state appropriations in 1995; \$348,127 in state appropriations and \$39,593 private in 1996; and \$133,162 state appropriations in 1997.

Research is being conducted at Cornell University, New York. The original overall objective to integrate nutrition goals and food systems is continuing to be addressed. A set of new related objectives was submitted in 1997 and will be the research focus for the next three years. The grant proposal for fiscal year 1997 was subjected to extensive peer review, and the recommendations were incorporated into the ensuing experimental designs.

ILLINOIS-MISSOURI ALLIANCE FOR BIOTECHNOLOGY

The Illinois-Missouri Alliance has initiated a competitive grants program in agricultural biotechnology for research in targeted priority areas of need related to corn and soybeans. The scope of interest includes production, processing, marketing, utilization, inputs and support services, along with economic, social, environmental, and natural resource concerns. The Alliance has solicited research project proposals from scientists at Illinois and Missouri and other midwestern institutions, and have conducted peer reviews for science quality, commercial feasibility, and potential economic impact to select the proposals that will be funded. In 1997 the Alliance awarded five research grants at three institutions totaling \$1,012,859. The Alliance also issued a third call for proposals and received 20 proposals from 10 different universities. The proposals are being reviewed for awarding of fiscal year 1998 funds.

The principal investigator has indicated that the goal of the Alliance is the pre-commercial development of emerging biotechnology discoveries for agriculture. The midwestern region produces more than half of the nation's output of corn and soybean crops, and is critical to domestic food security and United States competitive-

ness in global agricultural markets. Alliance grants are awarded on a regional basis to advance corn and soybean production in the Midwest. The Alliance is implementing a research strategy that it hopes will generate important biotechnological developments that are rapidly adaptable to unique local soil, climatic and socioeconomic conditions of the region. Alliance grants are awarded to projects with a clearly defined marketable product or service derived from biotechnology research.

Fiscal year 1997 was the third year of funding for the Alliance. The research program focuses on the two major commodity crops, corn and soybeans, as produced, processed, and marketed in the midwest. The goal of this bio-technology program is to fund integrated research and development projects that will lead to specifically defined practical technologies for commercialization. The projects funded in fiscal year 1997 include efforts to: (1) obtain greater control of cell death in plants with a molecular suppressor of cell death from maize, (2) enhance the use of core technologies for genome based food analysis, (3) develop soybean varieties resistant to nematode infection, (4) reduce the environmental impact of higher corn yields, and (5) study industrial networks in biotechnological structure and significance.

The work supported by this grant began in fiscal year 1995 and the appropriations for fiscal years 1995 and 1996 were \$1,357,000 each year, and for fiscal year 1997, \$1,316,000. In fiscal year 1998, \$1,184,000 was appropriated, bringing the total appropriations to date to \$5,214,000.

The Alliance has not specified a required amount of matching funds, but it is expected that most projects will have commitments for significant direct and in-kind non-federal support. Since Alliance projects are only now getting underway, the exact amount of the non-federal contribution is still unknown. The non-federal contribution is expected to be substantial, and a system for accounting for future non-federal contributions is in place.

The research projects identified for funding in fiscal years 1995 through 1997 are being conducted at the University of Illinois, the University of Missouri, Iowa State University, Northwestern University, and Southern Illinois University. Each project proposal for Alliance funding has a target date for completion. The four initial projects were three-year studies with anticipated completions at the end of fiscal year 1998. Most of the second round of projects are also three-year studies with anticipated completions at the end of fiscal year 1999.

The Illinois-Missouri Biotechnology Alliance was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received and we are satisfied that the program is being administered in compliance with the purpose of the grant. A peer review panel of government and academic scientists will re-evaluate the project for scientific merit in 1998.

IMPROVED DAIRY MANAGEMENT PRACTICES, PENNSYLVANIA

The research focuses on developing methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. Individual research projects funded by the grant are determined by a competitive peer review process administered by the Institution using peers from other Institutions located primarily in other States. The principal researcher believes the local need is the identification and implementation of profit enhancing management strategies for Pennsylvania dairy farms in response to changing market conditions and emerging technologies. The current focus is to develop economically-viable solutions to issues confronting Pennsylvania dairy farmers such as dealing with animal waste in an environmentally-friendly manner, reducing the cost of forage production systems, including grazing systems, and to develop a better understanding of decision processes by dairy farmers.

The original goal of this research is the development of methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. A farm management survey is complete and analysis of results is in progress. Farm financial models have been developed and are undergoing field test on selected farms. Workshops to teach elements of business management to dairy farmers have been conducted, and survey instruments are in place to monitor effectiveness of workshops. Research is currently underway to develop improved models for nutrient management on northeastern dairy farms, to evaluate the potential role of intensive grazing systems to replace harvested forage, and to better understand how decisions are made by dairy farm families. Refinements of an expert computer based system to assist dairy farmers in controlling the udder disease, mastitis, is underway. A study to evaluate the induction of lactation on dairy profitability is underway. An additional study to evaluate the impact of im-

proved protein nutrition during late gestation on dairy cow performance has been initiated.

The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$335,000 per year. The fiscal year 1994 appropriation was \$329,000 and \$296,000 each year in fiscal years 1995–1998. A total of \$2,183,000 has been appropriated. During fiscal year 1992, \$354,917 were from State funds, and \$16,000 from Industry, for a total of \$370,917. During fiscal year 1993, \$360,374 were from State funds and \$16,000 from Industry for a total of \$376,374. Information is not available for fiscal years 1994–1997.

Research is being conducted at Pennsylvania State University. The principal researcher anticipated completion of the original objectives by March, 1994. The original objectives were met. Availability of continued funding has permitted the institution to develop a competitively awarded grant program within the institution to address priority issues related to management of dairy farms. Proposals are reviewed and ranked by peers in other institutions prior to award. It is anticipated that awards from the fiscal year 1998 appropriation will be complete in September, 2000. The agency accepts technical review of specific proposals funded by this grant on an annual basis. The overall proposal is reviewed by the agency on an annual basis. In addition, technical staff has conducted on-site review of the program in 1993 and in 1995. The overall objectives of the work funded by this grant has direct relationship to the development of Integrated Management System as well as to aspects of animal production systems on animal well-being and impact on the environment.

IMPROVED FRUIT PRACTICES, MICHIGAN

This research will involve a multidisciplinary approach to reduce chemical use on apple, blueberry, and sour cherry, three important Michigan fruit crops, and improve the management of dry edible beans and sugar beets. Research will be conducted on crop management techniques and reduced chemical use. The principal researcher believes Michigan's need for this research is to develop and maintain/expand their tree fruit and small fruits industry. There is a need to improve the culture and management of dry edible beans and sugar beets. The planned objectives of the research are to reduce the chemical contamination of the environment from fruit production and improve production practices for beans and beets through multidisciplinary research, including pesticides, and the development of new nonchemical production methods.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$494,000, and for fiscal years 1995–1998, \$445,000 each year. A total of \$2,274,000 has been appropriated. The nonfederal funds and sources provided for this grant in fiscal year 1994 were \$437,338 from state appropriations and \$135,000 from industry, for fiscal year 1995 were \$574,494 from state appropriations and \$127,000 from industry and a total of \$908,969 for 1996. The non-federal funds for 1997 totaled \$752,500.

Research will be conducted at Michigan State University. The Principal Investigators have reported significant progress toward improved cultural practices for these speciality crops which is expected to reduce the need for chemical pesticides. This project has not been subjected to a comprehensive review. The annual proposals including all of its sub projects are subjected to CSREES before they are approved. The project has progressed toward the objective of developing management practices and strategies for economical production of speciality crops in Michigan with reduced chemical pesticide use. This program is evaluated at the end of each research cycle and priorities adjusted for the next years funding. The evaluation is performed by scientist at Michigan State University.

INSTITUTE FOR FOOD SCIENCE AND ENGINEERING, ARKANSAS

As the flagship center for the Institute for Food Science and Engineering, the Center for Food Processing and Engineering has as its objectives to facilitate and encourage value-added research and improve the efficiency and effectiveness of processing agricultural products. Its research program includes thirty-seven projects which have been funded and are underway or complete. The Center requires that researchers acquire the financial support of industry to support their research. Thus, four additional research projects have been approved but are awaiting funding from industry. The next request for proposals by the Institute will be issued in February 1998. The Center for Food Safety and Quality, with a mission to conduct research on the safety and quality of foods relative to microbiological and chemical hazards, was activated on January 1, 1997. Fiscal year 1997 funds are supporting research from March 1, 1997 through February 28, 1998. CSREES has requested and received a proposal in support of the fiscal year 1998 appropriation. Projects

included for funding in the proposal submitted to CSREES have been reviewed by industry representatives for relevance and by scientists at the recipient institution for scientific merit.

The principal researcher believes the Institute will provide technical support and expertise to small and mid-sized food processors that usually do not possess adequate expertise in-house. The economy of the southern region will be improved through the creation of new jobs and a high multiplier effect from the research. The Institute will develop and disseminate scientific information and provide educational programs related to value-added further processing, storage and marketing of food products. These efforts will assure food safety, improve the sensory and nutritional quality of food and meet the nutritional requirements and food preferences of a changing society.

The original goal of this research is to establish an Institute of Food Science and Engineering at the University of Arkansas-Fayetteville. Research helped determine the cause of post-millage breakage of rice kernels and subsequent effects on quality and end use functionalities of rice products. A patent has been filed for a machine that uses new defect recognition methods and algorithms for high-speed accurate sorting of fruits and vegetables. Research has shown that bacteria, including *Salmonella typhimurium* and *Campylobacter jejuni*, in salt solutions and poultry processing water, either chiller water or scalding water, could be reduced or eliminated using low voltage pulsed electricity in a treatment tank or a flow-through system with a food grade electrolyte. A commercial brine chiller will be designed with the electrical pasteurization system, flow-through type, first for lab-scale tests and then for pilot-plant tests. Other research produced an enzymatic method to produce rice bran protein from non-heat treated, defatted rice bran and determining the effects of processing and storage on flavor of dill pickles. The initiative to provide technical support to new food entrepreneurs has generated 13 requests for assistance. Individuals interested in starting a food processing business were provided with information on such topics as regulations, safety, labeling, ingredients and packaging. In addition, information was provided on financial aspects of starting a business and on marketing products. Also, improvement in product quality and safety was provided. The Institute provided information to new food business entrepreneurs on food regulations, safety, labeling, ingredients, packaging, and financial aspects of starting a food business and on marketing products. Several products were evaluated and specific recommendations made to those entrepreneurs. An introductory publication and a comprehensive volume on "Starting a Food Business" were published. An Institute Newsletter is prepared quarterly.

The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$750,000 each year and \$950,000 for fiscal year 1998. A total of \$2,450,000 has been appropriated. The non-federal funds and sources provided for this grant include \$184,700 in state funds and \$93,000 from industry in fiscal year 1996, and \$187,357 in state funds and \$320,403 industry funds in fiscal year 1997. Thus far in fiscal year 1998, industry has provided \$93,599, with firm commitments of an additional \$55,000. In just over two years, industry has donated new equipment valued at \$360,000. The state has also provided facilities and administrative and clerical support estimated at \$303,694 through June 30, 1998. The Institute received, as a donation worth \$200,000 from industry, a trained sensory panel to qualify and quantify sensory properties of foods.

Research will be conducted at the University of Arkansas at Fayetteville. The principal researcher anticipates that work will be completed on the original goals in fiscal year 2001. The goals of this project related to establishing the centers of the Institute are sequential and have not been fully met. The Center for Food Processing and Engineering is fully operational and successful, the Center for Food Safety and Quality is operating well, and the activation of the Center for Human Nutrition is scheduled for 1999. The objectives related to research and service to industry, food entrepreneurs, and the general public would continue to be ongoing.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on January 8, 1998. The assessment was that satisfactory progress was demonstrated in meeting the goals of the Institute. The progress report submitted as part of the proposal is compared with stated objectives. If all goals are not met, then the reviewer considers issues that may have hindered completion of expected goals which may include equipment failure and methodology problems that were not anticipated.

INTEGRATED PEST MANAGEMENT

This special research grant develops new pest management tools to address critical pest problems identified by farmers and others in a crop production region, and to find new approaches to managing pests without some of the most widely used pesticides. Farmers have identified the lack of effective alternative pest management tactics as a primary reason for not implementing IPM on their farms. Where effective alternative tactics have been developed, they are widely and rapidly implemented by farmers. These projects are a key element of USDA's goal of helping U.S. agriculture implement IPM practices on 75 percent of U.S. crop acreage, and will help the Nation's farmers adjust to changes in pesticide availability resulting from implementation of the Food Quality Protection Act of 1996.

The goal of this research is to provide farmers with options that allow them to shift from sole dependence on pesticides to a greater reliance on natural control methods. At the core of the integrated pest management approach is a dual focus on improving profitability and protecting vital natural resources. The research supported by this special grant has made an important contribution to increasing knowledge about new approaches to pest management, but the need for continued investment in this area of research is greater than ever.

Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$1,500,000; fiscal years 1982 through 1985, \$3,091,000 per year; fiscal years 1986 through 1989, \$2,940,000 per year; fiscal year 1990, \$2,903,000; fiscal year 1991, \$4,000,000; fiscal years 1992 and 1993, \$4,457,000 per year; fiscal year 1994, \$3,034,000; and fiscal years 1995-98, \$2,731,000 each year. A total of \$55,399,000 has been appropriated. Non-federal funds are as follows: for fiscal year 1993, state appropriations, \$841,017, product sales, \$33,987, industry grants, \$17,081, and other, \$31,737; for fiscal year 1994, state appropriations, \$2,303,458, product sales, \$77,157, industry grants, \$210,110, and other, \$216,552.

This research is currently being carried out by State Agricultural Experiment Stations in more than 40 states. The economic and environmental pressures facing U.S. agriculture today are at least as great today as they were in 1981 when Federal funds were first appropriated for this special research grant. There will be a need for continued investment in research to develop new approaches to managing pests for the foreseeable future. Proposals are evaluated by multi disciplinary panels. The projects supported by this special research grant have consistently provided key knowledge needed in developing new approaches to pest management.

INTEGRATED PRODUCTION SYSTEMS, OKLAHOMA

This grant focuses on the development of efficient management systems for production of watermelons and blackberries under intensively managed conditions. The work will address biotic and abiotic production components under Southeastern Oklahoma conditions for use in production guidelines. This will include planting densities, fertilizer studies, weed management, and insect and disease control. The request for proposal has been issued, the grant will be competitively awarded to scientists working at the West Watkins Agricultural Research and Extension Center based on a merit review conducted by Oklahoma State University personnel. The principal researcher believes the need for this research is focused on the local area of Southeastern Oklahoma, an area that is economically-depressed and in need of alternative crops to diversify the dominant cow/calf livestock production. The original goal of this research was to develop new and alternative crops to supplement and diversify the cow/calf livestock agriculture of Southeastern Oklahoma with emphasis on horticultural crops. Work to date has shown promise for strawberries, blackberries, cabbage, melons, and blueberries. CD-ROM technology transfer to research results to support an expert system will be developed for grower use.

Work supported by this grant started in fiscal year 1984 and the appropriations were: fiscal year 1984, \$200,000; fiscal year 1985, \$250,000; fiscal year 1986, \$238,000; fiscal years 1987-1989, \$188,000 per year; fiscal years 1990-1991, \$186,000 per year; fiscal year 1992, \$193,000; fiscal year 1993, \$190,000; fiscal year 1994, \$179,000; fiscal years 1995-1998, \$161,000 each year. A total of \$2,830,000 has been appropriated. The nonfederal funds and sources provided for this grant were as follows: \$165,989 state appropriations in 1991; \$160,421 state appropriations in 1992; and \$164,278 state appropriations in 1993. Nonfederal support for 1994 was \$141,850 for state appropriations. Funds for fiscal year 1995 were \$129,552, for 1996 were \$146,000, and for 1997 were \$152,000.

This research is being done at the West Watkins Agricultural Research and Extension Center at Lane, Oklahoma, a branch of the Oklahoma State Agricultural Experiment Station. The original objectives of this project were to develop a production system for alternative crops with economic potential for southeastern Okla-

homa. Each year's funding cycle addresses specific crop and management objectives to be completed over two years time. These short term objectives have been met for each of the completed two-year projects. However the original objective of developing alternative cropping systems is very long term and have not been completed.

Each of the annual project proposals has been put through the institutions review and is reviewed by a CSREES scientist before approval. In addition to the annual review of individual proposals, a comprehensive review of the Lane Agricultural Center, where this research is conducted, was conducted in 1993. This review revealed that work supported by this grant is central to the mission of that station. This project is evaluated internally at the end of each year in order to set priorities for the next year.

INTERNATIONAL ARID LANDS CONSORTIUM

Fiscal year 1997 was the fourth year that CSREES funded the International Arid Lands Consortium. The Forest Service supported the program during fiscal year 1993 to develop an ecological approach to multiple-use management and sustainable use of arid and semiarid lands. Projects that began in 1994-1997 will continue to be funded to address issues of land reclamation, land use, water resources development and conservation, water quality, and inventory technology, and remote sensing. All proposals are peer reviewed and awarded competitively, whereby the principal investigator must be from a Consortium member institution. The principal researcher believes the consortium is devoted to the development, management, and reclamation of arid and semi-arid lands in the United States, Israel, and elsewhere in the world. The International Arid Lands Consortium will work to achieve research and development, educational and training initiatives, and demonstration projects. The current member institutions are the University of Arizona, The University of Illinois, Jewish National Fund, New Mexico State University, South Dakota State University, Texas A&M University, Kingsville, and Nevada's Desert Research Institute. The United States Department of Agriculture's Forest Service works very closely with The International Arid Lands Consortium through a service-wide memorandum of understanding. The Consortium's affiliate members include Egypt's Ministry of Agriculture and Land Reclamation Under secretarial for Afforestation and Jordan's Higher Council for Science and Technology.

The original goal of the Consortium was and continues to be acknowledged as the leading international organization supporting ecological sustainability of arid and semi-arid lands. To date, 45 projects have been funded, 31 of which are to conduct research and development, 12 for demonstration projects, and 5 for international workshops. Funds approximating \$2.68 million have been used to fund these projects.

The International Arid Lands Consortium was incorporated in 1991. Funds were appropriated to the Forest Service in 1993. Additional funds were received during each of the years that followed. \$329,000 has been appropriated from CSREES for fiscal years 1994 through 1998 for total appropriations of \$1,645,000 for the 5-year period. Members of the International Arid Lands Consortium have provided funds to support the Consortium office in Tucson, Arizona, and for printed materials as needed. Each member has provided travel and operations support for semi-annual meetings, teleconferences, and other related activities. In fiscal years 1993-1996, \$60,000 in state appropriations were provided. Industry provided \$84,083 and \$100,000 in fiscal years 1993 and 1995, respectively. Additional funds of \$34,000 were received during 1996 from the Egyptian affiliate member to enhance future collaboration. Amounts for fiscal year 1998 will be available during March 1998.

Research is currently being conducted at the University of Arizona, South Dakota State University, Texas A&M University, Kingsville, New Mexico State University, University of Illinois, and several research/education institutions in Israel. Almost all research and demonstration projects that started during 1993 and 1994 have been completed. The projects started in 1995-1997 are expected to be completed within 6 months to 2 years depending upon the nature of the research. Several demonstration projects were completed and 5 international workshops were held during 1994 through 1997. The International Arid Lands Consortium is an organization with long-term goals that will require research and development for many years. All projects are evaluated every 6 months and require progress reports that are peer reviewed by scientists identified by the Consortium. The completed projects have met all proposed key objectives. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of the agency.

IOWA BIOTECHNOLOGY CONSORTIUM

This consortium is the focal point for cooperative biotechnology research endeavors between Iowa State University, the University of Iowa and the City of Cedar Rapids, Iowa to develop and test methods to improve wastewater treatment processes for agricultural wastes. Whenever possible, efforts will be made to convert by-product materials in agricultural wastes into useful new products. Both fundamental and applied research studies will be conducted with the goal of enhancing the recovery and utilization of byproduct materials through studies involving fermentation, enzyme catalysis and bioprocessing. The expectation is that new and improved technologies will be developed from the research to reduce the burden of agricultural bioprocessing wastes on municipal waste management systems and to transform components of these agricultural wastes into commercially viable products. This overall project involves a coordinated approach by a diverse group of investigators, and funding decisions within each participating institution for individual studies are based on a competitive process with a peer panel review and evaluation. In addition, the project proposal submitted to CSREES, which combines the selected individual studies, is also peer reviewed for scientific merit by a biotechnology panel designated by the Agency.

Developments in biotechnology have added to the national need for improved management systems that increase the capacity and sophistication of agricultural waste processing. These researchers believe that technological breakthroughs are possible to deal effectively with the increasing burden of agricultural wastes and that useful byproduct materials can be recovered and recycled through bioprocessing of wastes, especially fermentation wastes. The principal investigators consider this research to be of national, regional, and local importance.

The original goals of this project were aimed at enhancing the recovery and utilization of by-product materials arising from new and emerging industries using biotechnology. Recycling agricultural wastes, isolating useful byproducts and developing value added processing remain the primary thrusts of the project. A cadre of scientists has been established by the Consortium to assist them in finding uses for the by-product waste streams generated by agricultural processing. The Consortium is also making important progress in bioconversion, biocatalysis, membrane concentration, and bioseparation of by-products. In fiscal year 1998, new studies are being initiated on value-added products related to culture of polysaccharide-producing bacteria, screening of agricultural seed processing fractions for biocatalysts, conversion of lignocellulose to lactic acid, and the use of waste by-products as feeds for livestock and aquacultural species.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,225,000; fiscal year 1990, \$1,593,000; fiscal year 1991, \$1,756,000; fiscal year 1992, \$1,953,000; fiscal year 1993, \$2,000,000; fiscal year 1994, \$1,880,000; fiscal years 1995-1996 \$1,792,000 each year; fiscal year 1997, \$1,738,000; and \$1,564,000 in fiscal year 1998. A total of \$17,293,000 has been appropriated. Non-federal funds and sources provided for this grant were as follows: \$623,803 from the State of Iowa, \$42,813 from the city of Cedar Rapids in 1991; \$768,287 from the State of Iowa, and \$365,813 from the city of Cedar Rapids in 1992; \$858,113 from the State of Iowa, and \$170,000 from the city of Cedar Rapids in 1993; \$841,689 from the State of Iowa, and \$36,000 from the City of Cedar Rapids in 1994; and \$1,016,505 from the State of Iowa, and \$36,000 from the city of Cedar Rapids in 1995.

Research is being conducted at Iowa State University and the University of Iowa, in collaboration with the City of Cedar Rapids. The Consortium was originally formed between the City of Cedar Rapids and the participating universities to assist the City in dealing with wastes associated with corn and oat processing and milling, biocatalysis to produce high-fructose syrups, and one of the largest fermentation facilities in the world. More recently, the diversified economic base of the Cedar Rapids area has attracted new biotechnology industries, which have added greatly to the volume of industrial waste streams. No firm date was established to complete this research at the beginning of the project. The researchers have worked closely with the City and the industries generating these agricultural wastes since 1989, and the nature of the studies have evolved as significant progress has been made in analyzing the waste streams and in devising laboratory procedures for extracting useful products. The City of Cedar Rapids is planning to invest funds from other sources in special waste treatment facilities to conduct large scale tests of new treatment methods. Thus, several years will be needed for these tests and to refine the existing separation technologies.

The Iowa Biotechnology Consortium proposal for fiscal year 1998 will be evaluated for scientific merit by a biotechnology peer review panel on January 29, 1998. The panel recommendations related to past progress and proposed future experi-

ments will be used in the approval process for the project. The Consortium was also featured in a biotechnology special grant seminar hosted by the Agency at which the principal investigators presented research progress and highlights to an audience of agency scientists, administrators, and awards management staff as a part of the program's post-award management. A site visit to the research facilities by the Program Manager for an assessment is anticipated during next year.

JOINTED GOATGRASS

Research is being conducted on control systems for jointed goatgrass in wheat production including integrated cultural management, seed bank studies, and modeling for management conducted as sub-projects by several states. The premier research project continues to be an "Integrated Management" study being conducted across states in the midwest and west. In this study, jointed goatgrass management is being evaluated based on planting dates, planting density, economic thresholds, and competitive varieties. Research is also being conducted on crop rotations, biological control, seed production and spread, and the development of computer-based decision aids. All funded work has a technology transfer plan and a national coordinator for technology transfer to insure that growers are fully informed about all options for managing this devastating weed. The National Technology Transfer Coordinator has been hired, with the concurrence of a steering committee, and that person is housed at the University of Nebraska To maximize cooperation among scientists, an annual meeting is held among all investigators and the national steering committee to strengthen collaborations and optimize the distribution of limited funds.

Jointed goatgrass infests nearly five million acres of winter wheat in the west and midwest and is spreading unchecked. It costs U.S. wheat growers an estimated \$145 million annually. Control of jointed goatgrass in wheat is impossible with current methods because its seed survives in the soil for five or more years. Jointed goatgrass has increased rapidly in the past 20 years because of the widespread adoption of conservation tillage systems. Jointed goatgrass proliferated in such reduced tillage systems, and it seriously impedes the universal adoption of such practices. The research involves scientists from other states.

The goal of this project is to reduce the devastating effect of jointed goatgrass on wheat production and quality and to prevent its continued spread into new, non-infested areas. A jointed goatgrass population model has been constructed including a post-harvest—fall—seed bank, spring seed bank, and fall and spring germination, seeding mortality, mature plants, and seed production. The underlying jointed goatgrass population model has been constructed with a vision that the weed management strategies are going to be long-term in nature and be focused on the impact of crop rotation, tillage, and weather on jointed goatgrass population dynamics.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000, and for fiscal years 1995–1997, \$296,000, each year, \$346,000 was appropriated in fiscal year 1998, bringing total appropriations to \$1,563,000. The non-federal funds and sources provided for this grant were as follows: for 1994, \$82,198 state appropriations, \$82,256 from industry, and \$14,871 miscellaneous; for fiscal year 1995, \$67,442 state appropriations, \$38,496 from industry, and \$13,304 miscellaneous; and for each fiscal year 1996 and 1997, an estimated \$70,000 state appropriations, \$50,000 from industry, and \$14,000 miscellaneous.

The research is being conducted by University scientists in the states with serious infestations including Washington State University—the principal coordinating institution—Colorado, Kansas, Nebraska, Oklahoma, Utah, Oregon, Idaho, Montana, Wyoming, and South Dakota. The project was initiated to accomplish significant results in about five years. The original objectives are being met, and the researchers anticipate that the original work may be completed in fiscal year 1999. Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. Grants are awarded on a competitive basis using a peer review process. An external review is being planned for 1998.

LANDSCAPING FOR WATER QUALITY, GEORGIA

The project is a comprehensive, multi-disciplinary, multi-institution, 5 phase, 5-year study directed by the University of Georgia, in partnership with private producers and other agencies. The researchers believe it will lead to development of management guidelines for animal-based agriculture based on landscape-scale environmental quality considerations. Participating institutions and agencies include: the University of Georgia; the Joseph W. Jones Ecological Research Center; the Middle South Georgia Soil and Water Conservation District; the U.S. Department of Agriculture's Agricultural Research Service, Natural Resources Conservation Service,

and Cooperative State Research, Education, and Extension Service; and the Georgia Department of Natural Resources. Key partners in this project include growers from Brooks and Thomas counties in Georgia. This project undergoes merit review by the Cooperative State Research, Education, and Extension Service.

The economies of scale associated with modern animal production and processing have led to concentration of livestock operations within a very small geographic area. This has often led to problems of regional water quality degradation. In the southeastern United States, these water quality problems have often been exacerbated by location of livestock confinement facilities on sites lacking adequate good cropland for proper management of manure and waste management. One such region experiencing rapid growth in poultry production is the Gulf-Atlantic Coastal Plain of Georgia. Research is needed to create the information necessary to develop land management strategies to prevent environmental degradation, while maintaining profitability, with the intensification of animal-based agriculture in this region and similar regions of the country.

The goal of this research project is to provide the knowledge base for the integration of increased animal production into a regional agricultural system without sacrificing water quality. The goal will be met by completing five specific objectives over a period of 5 years. The planned research is on schedule. Since the project began on February 1, 1996, progress has been made on three of the five objectives and work on the final two objectives was initiated during fiscal year 1997. Specific accomplishments include:

1. Completed installation and began sampling for chemical and biological water quality parameters at seven stream monitoring sites in the 390 square kilometer Piscola Creek Watershed, and continued sampling eight stream monitoring sites in the 340 square kilometer Little River Research Watershed.

2. Nearing completion of Geographical Information System databases for these two watersheds including information on soils, hydrography, topography, and landcover.

3. Began compiling a database listing all regulations, guidelines, and recommended management practices pertaining to animal agriculture and environmental quality in the southeast region.

4. Installation of stream sampling sites is now in progress in the Ichawynochaway Creek Drainage Basin—the final of the three study watersheds.

5. One year of chemical and biological water quality data has now been collected from the Piscola Creek Watershed and 2 years of data from the Little River Research Watershed.

6. Preliminary macroinvertebrate samplings were conducted in the Piscola Creek Watershed during 1997. Regular sampling is to begin in 1998. These samples will provide a good indicator of how non-point source pollution is affecting the streams' ability to support aquatic life.

The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal years 1996, 1997, and 1998 was \$300,000 per year. A total of \$900,000 has been appropriated. Information provided by the University indicates that \$202,000 in state funds was provided to support this grant during fiscal years 1996 and 1997. Similar amounts of state support are anticipated for future years. In addition, funds will be expended by the other participating non-federal institutions in support of this grant.

This research is being conducted by an interdisciplinary team of 19 scientists led by researchers at the University of Georgia's National Environmentally Sound Production Agriculture Laboratory in Tifton and Athens, Georgia. The experimental aspects of the project are being conducted in the coastal plain region of Georgia in watersheds that are representative of southern Georgia, southeast Alabama, and north central Florida. The anticipated completion date of the entire project is February 2002. Each of the project's five objectives will be completed by preset deadlines. The first deadline is January 31, 1998. The \$900,000 in Federal funds appropriated for this project will provide a good foundation for completing the objectives. Good progress has been made on the five objectives of this project, as determined by the agency's review of the progress reports and meetings with the principal researcher. We are working with the principal researcher to schedule a peer evaluation of the project during 1998.

LIVESTOCK AND DAIRY POLICY, NEW YORK AND TEXAS

The purpose of this grant is to assess the possible economic impacts on the U.S. livestock and dairy sectors from various macroeconomic, farm, environmental, and trade policies and new technologies. Both Cornell University and Texas A&M University conduct analyses of these policies and disseminate the information to policy-

makers, farmers, and agribusinessmen. Cornell focuses on sector-level dairy policies, and Texas A&M focuses on policies affecting livestock and dairy at the farm level.

Information on the implications of new and alternative farm, trade, and macro-economic policies affecting the livestock and dairy sectors is of special interest to policy-making officials, farmers, and others. Such information enables farmers and agribusinessmen to make necessary adjustments to their operations to enhance profitability and for public officials to consider alternatives to sustain adequate supplies and minimize public program costs. The original goal was to establish a specialized research program that could provide timely and comprehensive analyses of numerous policy and technological changes affecting livestock and dairy farmers and agribusinessmen and advise them and policymakers promptly of possible outcomes. This goal has been achieved and the program continues to provide timely assessments and evaluations of provisions and proposed changes in agricultural policies, the General Agreement on Tariffs and Trade, and the North American Free Trade Agreement; various income and excise tax measures; and alternative pricing measures for milk. The institutions are integrally involved in several current studies relating to dairy provisions in the 1996 farm legislation. These studies have contributed to the development of regulations called for in this legislation. Both institutions maintain extensive outreach programs to disseminate results of their analyses throughout the United States. They have organized a National Dairy Markets and Policy Extension Committee to advise and assist them in this effort.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal year 1990, \$518,000; fiscal years 1991–1993, \$525,000 per year; fiscal year 1994, \$494,000; and fiscal years 1995–1998, \$445,000 each year. A total of \$4,817,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$37,420 State appropriations in 1991; \$162,086 State appropriations and \$133,278 product sales for a total of \$295,364 in 1992; and \$301,817 State appropriations, \$1,412 industry, and \$7,121 miscellaneous for a total of \$310,350 in 1993; \$24,702 State appropriations, and \$5,961 industry for a total of \$30,663 in 1994; \$235,526 State appropriations for 1995; \$250,000 in State appropriations for 1996; and approximately \$245,000 in State funding for each of the years 1997 and 1998.

The research is being conducted at Cornell University and Texas A&M University. This program is of a continuing nature for the purpose of assessing existing issues and proposed policy changes affecting the livestock and dairy industries. We have conducted no formal evaluations of this project. Annual proposals for funding, however, are carefully reviewed and work progress is noted.

LOWBUSH BLUEBERRY RESEARCH, MAINE

Interdisciplinary research is being conducted on many aspects of lowbush blueberry culture and processing includes investigation into factors affecting processing quality, biological control of insect pests, sustainable pollination, weed, disease and fertility management, cold hardiness and ground water protection. Maine produces 99 percent of all lowbush blueberries or 33 percent of all blueberries in the United States. This work is of major local interest, and helps maintain the continued availability and high quality of this native fruit commodity.

The original research goal was to provide research answers to unique lowbush blueberry production, pest and processing problems. Research to date indicates that the field sanitizer was able to use heat to control insect pests without adversely affecting plant growth, providing a non-chemical alternative to pest management. Eumenid wasps were found to control red striped fireworm, providing a potential biological control. Native leafcutter bees and alfalfa leafcutter bees were found to increase lowbush blueberry fruit set and yield, providing an alternative to imported honeybees. Clonal variation was found to affect stem and flower bud hardiness that will prove to be important in clonal selection for planting. Control of monolina disease was found in using 4 ounces of propiconazole instead of 24 ounces of triforine thereby reducing the chemical needed for control of this disease. Boron and calcium were found to have more influence on the ability of the stigma to stimulate pollen germination than the germinability of the pollen grains themselves. A mechanical harvester was found to be effective and had yields and fruit quality comparable to hand harvest, providing growers with a more efficient tool to harvest blueberries. Economic weed thresholds have been determined for weed species, thereby giving growers a method to determine when to use control measures. Mowing proved as effective as wiping to suppress two of these species, providing a non-chemical control alternative. A rope wick wiper effectively controls weeds growing higher than blueberry plants without injuring the crop. Pesticide residues in lowbush blueberries were found to be well below federal tolerances. Carboxymethyl cellulose and various

gums were found to control berry leakage, thereby improving quality for use in baked products. Products for use in food industry are being extracted from cull berries, thereby improving utilization and reducing waste.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$170,000; fiscal year 1991, \$202,000; fiscal years 1992 and 1993, \$185,000 per year; fiscal year 1994, \$208,000; and fiscal years 1995, 1996, 1997, and 1998 at \$220,000 each year. A total of \$1,830,000 has been appropriated. Direct industry support from blueberry tax funds has been about \$65,000 in 1996 and 1997.

Research is being conducted at the University of Maine. The original objectives have not yet been met. The University of Maine researchers estimate that the project will be concluded at the end of fiscal year 2001 and have requested that funding be continued until then. The agency evaluates this project on a yearly basis as funding is renewed. Project proposals are peer reviewed by the University of Maine review mechanism. Progress reports are submitted to the Cooperative State Research, Education, and Extension Service on a yearly basis as part of the review of the proposed project.

MAPLE RESEARCH, VERMONT

The research is designed to increase understanding of how water moves from the soil into and through the maple trees affecting tree growth and sap production. It also examines the relationships of maple decline to acid precipitation. Moreover, the research measures the effectiveness of various fertilizer combinations in improving the health of declining maple trees. Lastly, the project is designed to identify sources of lead contamination in maple products and to begin testing lead-free equipment and possible commercial methods for removing lead from maple syrup. The project is annually subjected to the University's merit review process.

Maple products are an important cultural heritage, and a source of seasonal income in maple growing areas of rural America. Identifying source(s) of contaminants during processing and commercial methods to remove contaminants from products is important to assuring consumers that these food products are not harmful. The goal of this research is to conduct research on maple tree physiology, management of sugar maple stands, and related aspects of the maple syrup industry in Vermont and the Northeast. The U.S. Department of Agriculture approved an amendment to these goals to permit research on lead in maple syrup products.

Work under this project began in fiscal year 1985. Annual appropriations in support of this project are as follows: fiscal year 1985—\$100,000; fiscal years 1986–1987—\$95,000 per year; fiscal years 1988–1989—\$100,000 per year; fiscal years 1990–1993—\$99,000 per year; fiscal year 1994—\$93,000; fiscal years 1995–1997—\$84,000 each year; and fiscal year 1998—\$100,000. This sums \$1,331,000. Non-federal fiscal support for this project is provided by two primary sources and one secondary source. The primary sources are state appropriations and product sales. The secondary source is local support, but that support is not available each year. The total non-federal contribution from these sources provides an average ratio of .86 to 1. The low ratio was .6 to 1 early in the project. More recently, the ratio has been 1.1 to 1.

This research is being conducted at the Vermont Agricultural Experiment Station. The work, from this project, relative to maple tree physiology and management of maple stands has been completed. The new objective of identifying sources of heavy metals in maple syrup products and, subsequently, reducing them is underway. The anticipated completion date is 1999. Project proposals and progress reports are reviewed and evaluated annually by the U.S. Department of Agriculture. Satisfactory progress has been made on tree physiology and maple tree management. Progressive work on identifying sources and controlling maple syrup contaminants is in place and is being monitored by the Department.

MICHIGAN BIOTECHNOLOGY CONSORTIUM

The objective of the Michigan Biotechnology Consortium's research program is to develop bioprocessing technology to manufacture products from agricultural raw materials, to increase the utilization of raw materials, reduce surpluses, and to degrade agricultural and associated wastes, thereby decreasing environmental costs of agricultural products and processes, and to reduce the need to import foreign petroleum. Using the tools of bioprocessing, agricultural resources can be transformed into products equal in function and value to those currently made from petroleum. Bioprocessing may include fermentation, an enzymatic step, chemical catalysis, or physical modification of agricultural raw materials. The 1998 grant proposal will be peer reviewed for scientific merit. The principal researcher believes the results from the research will help to develop bioprocessing technologies to manufacture value-added

products from agricultural raw materials, which increases their utilization, reduces commodity surpluses, reduces environmental costs, decreases the need for foreign petroleum, and will contribute to regional and national priorities.

Besides increasing utilization, reducing surpluses and environmental costs, the goals of this research remain to select and develop market-viable technologies that form the basis for new companies, new jobs, and additional tax revenues for state, local and Federal governments. The Consortium has succeeded in developing numerous technologies that are now in the marketplace. Examples include the following: Production of lactic acid through fermentation using corn as the feedstock resulting in a polymer for biodegradable plastics and a disinfectant. A \$200 million plant has been built in Nebraska to produce lactic acid by this process for domestic and foreign markets. Corn was used as a feedstock to develop plant growth formulations to enhance plant growth and productivity and to reduce nitrogen fertilizer requirements. These growth promoters have shown productivity increases of greater than 15 percent with a reduction in nitrogen fertilizer use greater than 25 percent in a variety of crops. Biodegradable plastic resins developed from cornstarch were made to produce compostable films for lawn and leaf litter bags, agricultural mulch films, and other soluble films. Compostable bags are used widely throughout the United States. Biodegradable plastic resins from cornstarch were also developed for moldable products such as disposable cutlery, plastic containers, and toys and toothbrushes. The market for resins for use in formulation and extrusion of plastics for all applications is in excess of \$2 billion annually. Corn was also used for the development of all-natural flavors and derivatives including a salty-flavored compound that can replace monosodium glutamate in low sodium foods.

Low-cost, readily-available carbohydrates—from whey—were used to produce high-quality, high-value optically-pure chiral intermediates for the pharmaceutical and agrochemical industries. A sand/manure separation system for dairy farms was developed to cost-effectively separate manure from sand and recycle both components. Biodegradable adhesives have been developed from agricultural resources. Numerous enzymes have been characterized and are now in use to provide value added modifications in the processing of agricultural products. A stabilized phytase has been developed to improve digestibility of forage-based animal feeds and reduce animal wastes. Improved methods to clean up herbicides, pesticides and other agriculturally important materials have been developed.

Many of these products have been commercialized through licensing agreements with industrial partners or new company start-ups. In addition, there are many agri-based industrial products under development including: natural succinate-based green chemicals for surfactants and detergents; paint removers; green solvents from corn-derived materials; plant stress promoters; natural food preservatives; biobased membrane polymers for liquid crystal, medical device coatings, metals recovery and other uses; improved enzymes for processing starch and fructose production; food flavors and pigments; and production of animal feed additives from agricultural wastes.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,750,000; fiscal year 1990, \$2,160,000; fiscal year 1991, \$2,246,000; fiscal years 1992–1993, \$2,358,000 per year; fiscal year 1994, \$2,217,000; fiscal year 1995, \$1,995,000; fiscal years 1996 and 1997, \$750,000 per year, and fiscal year 1998, \$675,000. A total of \$17,259,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$1,750,000 in State of Michigan appropriations, \$160,000 from industry, and \$1,000,000 from miscellaneous in 1991; \$1,750,000 in State of Michigan appropriations, \$175,000 from industry, and \$1,000,000 from miscellaneous in 1992; \$1,750,000 in State of Michigan appropriations and \$100,000 from industry in 1993; \$1,750,000 in State of Michigan appropriations, \$175,000 from industry, and \$100,000 from miscellaneous in 1994; \$200,000 in State of Michigan appropriations and \$2,035,000 from industry in 1995; \$1,250,000 in State of Michigan appropriations and \$350,000 from industry and \$6,000,000 from miscellaneous in 1996; and \$402,500 from industry and \$10,000,000 from miscellaneous in 1997. A total of \$29,947,500 has been provided to support this work by non-federal sources.

The research is being conducted on the campus of Michigan State University and at the Michigan Biotechnology Institute International. Demonstrations of technology occur throughout the United States. The Consortium reports specific milestones for technology development over a five year period. Specific milestones for technologies which will be commercialized in fiscal year 1998 were established in fiscal year 1994 and updated annually. Historically, work under this grant has shown that it requires five years to successfully move commercially-promising technologies from the bench scale to the marketplace. The Consortium has been successful in effectively closing the gap between research and commercialization in the five year period.

Each year, new projects are initiated that require five years to complete. The principal researcher believes that continued funding is necessary to successfully transfer new technologies under development to the marketplace. The Michigan Biotechnology Institute was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. A peer panel of government and academic scientists re-evaluated the scientific merit of the project in 1998.

MIDWEST ADVANCED FOOD MANUFACTURING ALLIANCE, NEBRASKA

The stated purpose of the Midwest Advanced Food Manufacturing Alliance is to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. The Alliance involves research scientists in food science and technology, food engineering, nutrition, microbiology, computer science, and other relevant areas from 12 leading Midwestern universities and private sector researchers from numerous U.S. food processing companies. Specific research projects are awarded on a competitive basis to university scientists with matching funds from non-federal sources for research involving the processing, packaging, storage, and transportation of food products. Projects selected for funding are merit reviewed by non-participating university scientists, industry scientists and scientists from professional organizations. Close cooperation between corporate and university researchers assure that the latest scientific advances are applied to the most relevant problems and that solutions are efficiently transferred and used by the private sector. Fiscal year 1997 funds are supporting research from June 1, 1997 through May 31, 1998. CSREES has requested and received a proposal in support of the fiscal year 1998 appropriation. The principal researcher believes the food manufacturing industry is the number one manufacturing industry in the Midwestern region and that opportunities for trade in high value processed food products will grow exponentially on a worldwide basis. The Alliance is positioned to fill the void in longer range research and development for the food industry.

The goal, as stated previously, was to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. This is accomplished by conducting a research proposal competition among faculty from the 12 participating universities to fund research projects where matching funds are available from industry. Fourteen projects were funded from fiscal year 1994 funds with completion and final reports due by May 1, 1996. Ten projects were funded from fiscal year 1995 funds with anticipated completion and final reports due by August 31, 1997. Ten projects were also funded from fiscal year 1996 funds with anticipated completion and final reports due by May 31, 1998. Eleven projects were funded from fiscal year 1997 funds with anticipated completion and final reports due by May 31, 1999. Proposals are reviewed for scientific merit by independent scientists, and final selection of projects includes consideration of industrial interest and commitment on non-Federal matching funds.

The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995-1998, \$423,000 each year. A total of \$2,162,000 has been appropriated. Industry matching funds were \$823,148 in fiscal year 1994, \$414,164 in fiscal year 1995, \$576,600 in fiscal year 1996, and \$429,579 in fiscal year 1997.

The work is being coordinated by the Nebraska Agricultural Experiment Station at Lincoln. Specific research projects are also being conducted at ten other universities that are part of the Alliance. The overall objectives of the Alliance are ongoing. Funding supports the continuing and evolving needs and opportunities for foods manufactured and processed from U.S. produced crops and livestock. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on January 12, 1998. The principal investigator has provided descriptions of projects funded by this grant. Scientifically-sound, industry-relevant projects appear to be the basis of the project, with impactful results expected.

MIDWEST AGRICULTURAL PRODUCTS, IOWA

The Midwest Agribusiness Trade Research and Information Center does applied research to improve the global competitiveness and marketability of agricultural products produced in the Midwest and disseminates the results to small and medium-sized agribusinesses. Projects include analyses of potential markets for U.S. agricultural products and equipment/technology in several countries; attitudes of

foreign consumers; development of new/improved U.S. products to meet foreign needs. The overall project proposal received a merit review at the university level and individual research activities are reviewed by the principal investigator and other faculty. The principal researcher believes that agribusiness firms in the United States, especially small to medium-sized firms, have a large unrealized potential to expand export sales and foreign business ventures. These untapped opportunities exist in the Pacific Rim and in emerging markets such as Mexico, China, and Eastern Europe. The reluctance of small to medium-sized firms to explore these market opportunities is, in part, due to the high cost of market information and analysis and the perceived high risk of doing business in new markets. This project meets the needs of these firms at the local, regional, and national level.

The goal is to enhance the export of agricultural commodities, value-added products, and equipment produced by Midwestern agribusiness firms through research and education programs utilizing close-working relationships with those firms. Several studies were completed and distributed to interested firms, and new ones were initiated. Completed studies included: an analysis of conditions and prospects for agribusiness ventures in Egypt; market analyses for U.S. agricultural products in Cameroon, Senegal, and Côte d'Ivoire; an assessment of market opportunities for food processing equipment in China; Mexican consumer response to U.S. pork products; comparative advantage of U.S. pork in North American markets; impact of NAFTA on Midwest beef industry; an evaluation of the need for government regulation for maintaining or improving the quality of 12 export commodities; case studies of 16 outstanding food and agricultural exporters; evaluation of 60 varieties of corn for dry milling for the Mexican market; suitability of microsoy flakes for markets in Pacific Rim and African countries; use of the Internet for marketing goods and services. In addition several seminars and conferences were held, "Global Connections" newsletter was published regularly, and business contacts database kept up to date. As a result of much work to establish trading relationships with China, the Des Moines sister-city of Shijiazhuang, China established a trade office in Des Moines.

The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992-1993 was \$700,000 per year; fiscal year 1994, \$658,000; and fiscal years 1995-1998, \$592,000 per year. A total of \$4,426,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$185,495 State appropriations and \$373,897 industry for a total of \$559,392 in 1992; \$183,192 State appropriations and \$318,966 industry for a total of \$502,158 in 1993; \$127,948 State appropriations and \$500,394 industry for a total of \$628,342 in 1994; \$258,053 State appropriations and \$389,834 industry for a total of \$647,887 for 1995; \$165,425 State appropriations for 1996; \$162,883 State appropriations for 1997; and \$165,000 State appropriations for 1998. Industry contributions continue but were not reported for 1996-1998.

The program is carried out by Iowa State University. The original proposal in 1992 was for a period of 24 months, however, the objective of expanding the export capacity of small to medium-sized agribusiness firms is an ongoing regional and national concern. The current phase of the program will be completed in 2000.

CSREES performed a merit review of the project in January 1997, as it evaluated the project proposal for 1997, and concluded that the Midwest Agribusiness Trade and Research Center at Iowa State University has an impressive record of producing high quality, useful research and trade information for agribusinesses in the Midwest and other states. Research results appear in several peer-reviewed professional journals and the popular press.

MILK SAFETY, PENNSYLVANIA

The overall goal of the milk safety program is to provide insight into factors that help ensure an adequate and safe milk supply. Toward that end, the research has focused on factors that affect milk production, processing, manufacturing, and consumption. Special attention has been given to ways of preventing and/or treating pathogens that enter the milk supply. Projects are selected for funding each year based on competitive, peer reviews by scientists outside the recipient institution. The fiscal year 1997 grant will support research through June 30, 1999. CSREES has requested the University to submit a proposal in support of fiscal year 1998 funds, but the proposal has not yet been received due to the University's merit review process to select projects for funding. The principal researcher believes that the question of microbial safety is of paramount interest to the milk/dairy industry at all levels-national, regional and local. Dairy products such as milk, nonfat dry milk, cheese, butter, and cream have been associated with several large outbreaks of staphylococcal food poisoning, and coagulase negative Staphylococcus infections are

one of the most common intramammary infections of dairy cattle. *Listeria monocytogenes* is present in about 4 percent of raw milk, and it has the potential to grow to dangerous levels during refrigeration and storage, making pasteurization critical in preventing foodborne illnesses from this organism. Bovine mastitis is the most important infectious disease affecting the quality and quantity of milk produced in the nation, costing producers an average \$180 per cow per year. Ensuring safety of dairy products impacts not only consumer health and confidence in the safety of the food supply, but economic viability as well.

The research is aimed at minimizing or eliminating future foodborne disease outbreaks from milk and dairy products. Researchers demonstrated that when subjected to a sublethal heat shock prior to pasteurization, *Listeria monocytogenes* becomes much more heat-resistant than previously thought, likely requiring the design of new pasteurization guidelines that will ensure the safety of dairy products. In addition, they developed a simple, fast, sensitive, specific and inexpensive method for the detection of *Listeria monocytogenes* in dairy products that will allow dairy processors to rapidly and easily screen for the presence of this pathogen both in their products and in the processing environment. A computer model of *Listeria monocytogenes* growth in dairy foods under dynamic refrigeration conditions and during extended storage is under development to provide producers and processors with a proven technology for further enhancing the safety of fluid milk and related products. Another key accomplishment includes the discovery of potential approaches of enhancing natural defense mechanisms of the bovine mammary gland through vaccination and immunoregulation. Discoveries of factors influencing growth of *Staphylococcus aureus* could be used to prevent or contain growth of this pathogen in foods. Researchers have identified and sequenced a gene from this bacterium that is essential for growth under stressful conditions. Research also revealed that consumers having high general concern about milk and dairy product safety and nutrition were more likely to be female, to have lower levels of education, be non-white and report more attention to scientific news, health and nutrition news and news about government food safety regulatory attention.

Grants have been awarded for milk consumption and milk safety from funds appropriated as follows: fiscal years 1986 through 1989, \$285,000 per year; fiscal year 1990, \$281,000; fiscal year 1991, \$283,000; fiscal year 1992, \$284,000; fiscal year 1993, \$184,000; fiscal years 1994–1998, \$268,000 per year. A total of \$3,512,000 has been appropriated for milk safety and milk consumption. The University estimates that non-federal funds contributed to this project include the following costs and salaries: \$265,000 for fiscal year 1991; \$224,700 for fiscal year 1992; \$142,600 for fiscal year 1993; and \$252,168 for fiscal year 1995. No data are currently available for fiscal years 1994 and 1996.

The research is being conducted at the Pennsylvania State University. The researchers anticipate that research supported by this grant should be concluded in 1999. Continuing and evolving needs related to the safety of milk and dairy products are expected to reveal new related objectives. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. Since the agency has not yet received the proposal in support of the fiscal year 1998 appropriation, the review of the proposal supporting the fiscal year 1997 appropriation was conducted on March 13, 1997. At that time, the agency science specialist believed that the projects addressed important issues related to safety of milk and dairy food products, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

MINOR USE ANIMAL DRUGS

The National Agricultural Program to Approve Animal Drugs for Minor Species and Uses—NRSP-7—was established to obtain the Food and Drug Administration (FDA) approval of animal drugs intended for use in minor species and for minor uses in major species. The objectives of the program are to identify the animal drug needs for minor species and minor uses in major species, generate and disseminate data for the safe, effective, and legal use of drugs used primarily in therapy or reproductive management of minor animal species, and facilitate the Food and Drug Administration in obtaining approvals for minor uses. Studies are conducted to determine efficacy, target animal safety, human food safety, and environmental safety. The funds for the special research grant are divided between the four regional animal drug coordinators and the headquarters at Michigan State University for support of the drug approval program. The NRSP-7 funds are being utilized by the State Agricultural Experiment Stations where the regional animal drug coordinators are located as well as by other stations to develop data required for meeting approval requirements. Participants in the research program consist of the regional co-

ordinators, State Agricultural Experiment Stations, USDA's Agricultural Research Service, the U.S. Department of Interior, schools of veterinary medicine, and the pharmaceutical industry. Research priorities are continually updated through workshops and meetings with producer groups representing species categories such as small ruminants, game birds, fur-bearing animals, and aquaculture species. Each request for drug approval is evaluated by the technical committee according to established criteria which include significance to the animal industry, cost of developing the necessary data, availability of a pharmaceutical sponsor, and food safety implications. The fiscal year 1997 research grants terminate in April 1999. The 1998 grant proposals have been requested by the agency. All grants are reviewed by the university and the agency for relevance to industry needs and scientific merit.

Animal agriculture throughout the U.S. has relied on chemical and pharmaceutical companies to provide their industry safe and efficacious drugs to combat diseases and parasites. The high cost incurred to obtain data to approve these drugs, when coupled with limited economic returns, has limited the availability of approved drugs for minor uses and minor species. The economic losses due to the unavailability of drugs to producers for minor species and minor uses threatens the economic viability of some segments of the animal industry. The need for FDA/Center for Veterinary Medicine approved drugs to control diseases in minor species and for minor uses in major species has increased with intensified production units and consumer demand for residue-free meat and animal products. The program provides research needed to develop and ultimately culminate in drug approval by FDA/CVM for the above purposes. The goals are accomplished through the use of regional animal drug coordinators as well as a national coordinator to prioritize the need, secure investigators at federal, state and private institutions, and oversee the research and data compilation necessary to meet federal regulations for approval. All drug approvals are national, although industry use may be regional. For example, certain aquaculture and the game bird industries are concentrated in specific geographic sections of the country. The administration believes this research to be of national, regional or local need.

The original NRSP-7 goal to obtain approval by the Food and Drug Administration for animal drugs intended for use in minor species and for minor uses in major species remains as the dominant goal. In recent years, the research program has expanded or given additional emphasis to aquaculture species, veal calves and sheep. In addition, several new animal drug requests were recently received from the game bird. The importance of environmental assessment, residue withdrawals and occupational safety have increasingly been given more attention during the approval process to help assure consumer protection. To date, 286 drug requests have been submitted to the Minor Use Animal Drug Program for approval. Working in conjunction with many universities, twenty five public master files have been published in the Federal Register providing approval for drug use in minor species and 30 active research projects are being conducted in 15 states involving 18 animal species and 17 different drugs. Therefore, whereas a total of 286 animal drug requests have been submitted to the program since 1983, program funding has been available for only about one out of every five requests. In 1997, a Public Master File was prepared and published in the Federal Register for the use of clorsulon for control of liver flukes in goats. The research for this project was conducted in Florida. It is also anticipated that in the next year, ivermectin will be approved for use in bison.

The Center for Veterinary Medicine of the Food and Drug Administration is cooperating and supporting this program to the fullest extent. The program is a prime example of Federal interagency cooperation in coordination with academic institutions, pharmaceutical industries and commodity interests to effectively meet an urgent need.

Grants have been awarded from appropriated funds in the amount of \$240,000 per year for fiscal years 1982-85; \$229,000 per year for fiscal years 1986-1989; \$226,000 for fiscal year 1990; \$450,000 for fiscal year 1991; \$464,000 per year for fiscal years 1992 and 1993; \$611,000 for fiscal year 1994; and \$550,000 for fiscal years 1995-1998. A total of \$6,291,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$156,099 state appropriations, \$29,409 industry, and \$11,365 miscellaneous in 1991; \$265,523 state appropriations, \$1,182 product sales, \$10,805 industry, and \$59 miscellaneous in 1992; \$212,004 state appropriations, \$315 industry; and \$103 miscellaneous in 1993; \$157,690 state appropriations, and \$7,103 miscellaneous in 1994; \$84,359 state appropriations in 1995; \$191,835 non-federal support in 1996, and \$357,099 non-federal support in 1997.

The grants have been awarded to the four regional animal drug coordinators located at Cornell University, the University of Florida, Michigan State University and the University of California-Davis, and to program Headquarters at Michigan

State University. Research is conducted at these universities and through allocation of these funds for specific experiments at the State Agricultural Experiment Stations, the Agricultural Research Service, the U.S. Department of Interior, and in conjunction with several pharmaceutical companies.

Selected categories of the Special Research Grants program address important national-regional research initiatives. The overall objectives established cooperatively with FDA and industry are still valid. However, specific objectives continually are met and revised to reflect the changing priorities for FDA, industry, and consumers. Research projects for this program have involved 20 different animal and aquaculture species with emphasis given in recent years to research on drugs for the expanding aquaculture industry and increasing number of requests from the sheep, veal calf, and game bird industries. The minor use animal drugs program involves research on biological systems that by their nature are ever changing and presenting new challenges to agriculture. Especially with the new sensitivities about food safety and environment protection, there is a high priority for continuation of these ongoing projects.

The agency conducted a formal review of the Minor Use Animal Drug Program in 1997. An external review team of experts representing animal drug research and development, the veterinary profession, the pharmaceutical industry, and academia, found the program to be very productive. Recommendations from the review included a) improve the visibility of the Minor Use Animal Drug Program, b) improve working relationships with the veterinary and pharmaceutical communities, c) and acquire additional support for the program by pharmaceutical companies, universities, and the federal government to meet the identified national needs with emphasis on responsiveness to industry needs and food and environmental safety. Annually, grant proposals are peer reviewed and twice a year the agency and representatives of the program meet with representatives from the Food and Drug Administration to evaluate progress and to prioritize research requests. Workshops are held periodically to identify priorities for the program whereby producers, pharmaceutical companies, FDA, and researchers participate. GAO also conducted a review in 1991 and recommended additional support for the program.

MOLLUSCAN SHELLFISH, OREGON

The research under this program was initiated in fiscal year 1995. A repository for the conservation of genetic material of molluscan shellfish was established during the first year of the project. This repository is serving as a source of genetic material for current breeding programs aimed at commercial production of shellfish with desirable traits. Researchers are currently evaluating selected families in cooperation with the industry. The proposal is put through the university's peer review process and is reviewed by the CSREES Program Manager. The researchers indicate that there is a national need for a molluscan broodstock development program to benefit the commercial industry through conservation, genetic manipulation and wise management of the genetic resources of molluscan shellfish.

The goals of this research program are to establish a repository for genetic materials of molluscan shellfish, to establish breeding programs for commercial production of molluscan shellfish, and to establish a resource center for the industry, researchers and other interested parties in the U.S. and abroad. During the first two years of the program an oyster broodstock selection program was implemented in partnership with industry. Performance trials of selected stocks will continue at commercial sites.

The work supported by this grant began in fiscal year 1995 with an appropriation of \$250,000; fiscal year 1996 was \$300,000; and fiscal year 1997 and 1998 is \$400,000. A total of \$1,350,000 has been appropriated. The university estimates a total of \$135,454 of non-federal funding in fiscal year 1995 primarily from state sources; in fiscal year 1996 and 1997 no cost sharing was provided.

Research will be conducted at Oregon State University. Although the specific research objectives outlined in the original proposal were to be completed in 1996, researchers anticipated that the original broad objectives would be completed in 2002.

The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new proposal is submitted to CSREES for funding. The 1997 review, indicated that the researchers were well qualified to conduct the research, the research complements other research being funded through USDA, the research does address an important opportunity for the industry and that the research is being conducted in close cooperation with the private sector. The 1998 CSREES review will be completed within three weeks of submission of the proposal. The researchers are asked to develop a re-

search proposal consistent with the NSTC's Strategic Plans for Aquaculture Research and Development.

MULTI-COMMODITY RESEARCH, OREGON

The purpose of this research is to provide agricultural marketing research and analysis to support Pacific Northwest producers and agribusiness in penetrating new and expanding Pacific Rim markets for value-added products. The program examines the potential for increasing the competitiveness and economic value added by Pacific Northwest agriculture through improvements in food production, processing, and trade by assisting decision makers in developing economic and business strategies. The grant is not competitively awarded at the state or regional level, but the proposal is merit reviewed at the Experiment Station and the departmental levels. The principal researcher believes that Oregon and the other Pacific Northwest States produce a wide variety of agricultural commodities and products with commercial potential to export to Pacific Rim countries. Research and analysis is necessary to guide agricultural producers and processors in assessing these markets and developing market strategies and value-added products, and marketing strategies tailored to specific Pacific Rim markets. The principal researcher believes this research to be of national, regional and local need.

This goal of this research is to gain better specific understanding of the technical, economic, and social relationships that define Oregon's value-added agricultural sector, and examine how these factors affect the economic performance of this sector. This project will investigate and develop innovations in value-added agriculture to improve the economic performance of the agricultural and food manufacturing sectors in the Pacific North-west. The current research plan will examine economic variables that underlie competition in food production, processing and marketing in the Pacific Rim; address technological challenges in transport, storage, and quality maintenance; assist in testing and evaluating new product ideas; and, monitor the economic performance of the Oregon value-added agricultural industry.

Work in progress has resulted in research output in 4 topic areas: market research, packaging research, sensory research, and food processing industry strategic planning. Research output includes development of a pilot World Wide Web site for Pacific Northwest exports, data bases, survey work, and collaborative research activity with industry and with institute and university researchers in selected Asian countries. Manuscripts, working papers, journal articles, and several Masters of Science theses are outputs to date.

The research began in fiscal year 1993 with an appropriation of \$300,000. The fiscal year 1994 appropriation was \$282,000, and fiscal years 1995 through 1998 appropriations were \$364,000 for each year. The total amount appropriated is \$2,038,000. Non-federal funding for this grant was \$168,824 in State appropriations in fiscal year 1991, \$177,574 in State appropriations in 1993, and \$162,394 in State appropriations in fiscal year 1994. Due to a change in university policy regarding indirect costs, the university has not reported the amount of non-federal funds appropriated for fiscal years 1995-1998.

The research program is carried out at Oregon State University in Corvallis and at the Northwest Food Innovation Center in Portland, Oregon. This Special Grant is awarded on a year-by-year basis. Oregon State University traditionally requests funds for this project on an annual basis and has budgeted the funds to individual sub-projects on that basis. Progress on the original objectives is as follows: baseline data have been accumulated; an economic growth assessment model is being formulated and refined; global competitiveness is being assessed for value-added Pacific Northwest agricultural products; targets for performance are being worked out with agricultural industries; and, many trade teams have been involved in assessing the ability of U.S. based in industries to meet the demands for noodle production for Asian markets. Anticipated completion date is currently 1998. A CSREES merit review was dated July 1997. The work was found to be scientifically sound and of high priority to the region.

MULTI-CROPPING STRATEGIES FOR AQUACULTURE, HAWAII

In fiscal year 1993, the university redirected this research program to address the opportunities of alternative aquaculture production systems, including the ancient Hawaiian fish ponds on the island of Molokai. The university has developed a community based research identification process and has developed specific research projects to be included in this program. Current research includes work in the area of water quality characterization to accelerate permitting of aquaculture systems. Field testing of alternative species is underway. The proposal is placed through the university's peer review process and is reviewed by the CSREES Program Manager.

The principal researchers indicate that the primary need for this research is to assist the native Hawaiians in improving the profitability and sustainability of the ancient Hawaiian fish ponds and other appropriate aquaculture systems as part of a total community development program.

The original goal of this program was to develop technology for the coproduction of shrimp and oysters in aquacultural production systems. Research led to the development of oyster production systems that have been field tested under commercial conditions. The current research effort is aimed at developing sustainable commercial aquaculture production systems on the island of Molokai. Hatchery techniques have been developed for the culture of the Pacific threadfin. Techniques for the culture of two edible aquatic plants have been refined. Multidimensional field testing and evaluation of existing and restored ancient Hawaiian fish ponds is currently underway. Researchers are currently characterizing differences in water quality in fish ponds to establish criteria for fish pond permitting and management.

This research was initiated in fiscal year 1987 and \$152,000 per year was appropriated in fiscal years 1987 through 1989. The fiscal year 1990–1993 appropriations were \$150,000 per year; \$141,000 in fiscal year 1994; and \$127,000 in fiscal years 1995–1998, each year. A total of \$1,705,000 has been appropriated. The university reports a total of \$137,286 of non-federal funding for this program in fiscal years 1991–1994, \$318,468 in fiscal year 1995–1996 and \$116,730 in fiscal year 1997. The primary source of non-federal funding was from state sources.

Research is being conducted through the University of Hawaii on the island of Molokai. The completion date for the original project was 1993. The original objectives were met. The specific research outlined in the current proposal will be completed in fiscal year 1999. The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new grant proposal is submitted to CSREES for funding. In addition, in 1996 the CSREES program manager conducted a site visit to Molokai to meet with the principal investigator and industry cooperators. The 1997 review indicated that progress has been made in the implementation of the program despite the challenges of developing a community based program in such a unique social and cultural environment. The researchers are asked to develop a research proposal consistent with the NSTC's Strategic Plan for Aquaculture Research and Development.

NATIONAL BIOLOGICAL IMPACT ASSESSMENT PROGRAM

The National Biological Impact Assessment Program was established to facilitate and assess the safe application of new technologies for the genetic modification of animals, plants, and micro-organisms to benefit agriculture and the environment. This program was established in fiscal year 1989. During the last decade there has been an explosion of new information produced by rapid advances in biotechnology and its beneficial application to agriculture and the environment. The research proposed for this program fulfills an important national need to provide scientist easy access to relevant information that will facilitate the preparation of scientific proposals that comply with the oversight and regulatory requirements for testing potential biotechnology products and foster the safe application of biotechnology to benefit agriculture and the environment. This program supports the agricultural and environmental biotechnology community by providing useful information resources to scientists, administrators, regulators, teachers and the interested public.

The original goal of the National Biological Impact Assessment Program was to provide easy access to reliable information on public health and environmental safety of agricultural biotechnology research. Its objectives were to increase the availability, timeliness and utility of relevant information to the biotechnology research community; facilitate the compliance of biotechnology research with oversight and regulatory requirements for testing biotechnology products; and provide informational resources to the scientific community that would foster the safe application of biotechnology to agriculture and the environment. This same goal continues today. Each year much new information is added and integrated into the computerized database. The system has evolved to adapt new computer technologies and is now available via internet and the World Wide Web. This computer-based information system now includes texts of federal agency biotechnology regulations, proposed rules and policy statements; databases of biotech companies, and research centers, institutional biosafety committees and state regulatory contacts; resource lists of publications, directories, bibliographies and meetings; monthly newsletters developed and distributed by this program; relevant Federal Register announcements; and links to other electronic information resources. In addition, this program provides biosafety training through workshops for academic and corporate scientists,

biosafety officers and state regulators. A Field Test Notebook has been developed as a reference text for these workshops.

Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$125,000; fiscal year 1990, \$123,000; fiscal years 1991–1993, \$300,000 per year; fiscal year 1994, \$282,000; and fiscal years 1995–1998, \$254,000 per year. A total of \$2,446,000 has been appropriated. The co-principal investigator of this grant is Head of the Department of Biochemistry and Anaerobic Microbiology at Virginia Polytechnic Institute and State University. The university contributes his time to administer this grant which amounts to approximately \$5,000 each year.

This grant award is with Virginia Polytechnic Institute and State University. Former and current partners in the program include The Pennsylvania State University, Louisiana State University, North Carolina Biotechnology Center, University of Arizona, University of Missouri, Michigan State University, Purdue University, and the National Agricultural Library.

There remains a continuing need to address the safety of field testing of genetically modified organisms to benefit agriculture and the environment. This continues to be a rapidly expanding field. Increasing amounts of new information needs to be properly integrated into the computerized information system each year. This program has been very successful in providing essential, updated information on the conduct of safe field experiments. Thus, the program remains a high priority and needs to be continued.

The National Biological Impact Assessment Program was extensively reviewed by an external panel of scientists in October 1994. The review report was highly complimentary regarding the Information Systems for Biotechnology funded by this special grant and recommended continuation of this program.

NEMATODE RESISTANCE GENETIC ENGINEERING, NEW MEXICO

This research is designed to investigate naturally occurring compounds from diverse sources that may confer pesticidal resistance if introduced into agronomic plants. The main target pests are plant parasitic nematodes. The work is using molecular biological techniques to incorporate genes into agronomic plants which will shorten the time frame to produce transgenic plants. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES. The principal researcher believes that the successful development of these techniques and subsequent transfer of nematode resistant genes into agronomic plants will provide an environmentally sound system for all plants susceptible to plant parasitic nematodes. The principal researcher believes that project has the potential for both regional and national application.

The original goal of this research was to provide an alternative approach for the control of plant parasitic nematodes through the use of molecular biological technologies to transfer pesticide resistance to plants. A nematode-stimulated promoter element was engineered for insertion in front of a bacteria toxin. A unique technique utilizing insect intestinal membrane vesicles were used as tools for detection of specific protein binding domains. The synthetic gene, CRY3A Bt has been successful in field trails on potato and eggplants.

The work supported by this grant began in fiscal year 1991 and the appropriations for fiscal years 1991–1993 were \$150,000 per year; \$141,000 was appropriated in 1994; and \$127,000 in fiscal years 1995–1998, each year. A total of \$1,099,000 has been appropriated thus far. The non-federal funds and sources provided for this grant were as follows: \$65,000 state appropriations in 1991; \$62,000 in state appropriations in 1992; \$75,000 in state appropriations in 1994; and \$75,000 state appropriations in 1995. For 1996, the University and the Plant Genetic Engineering Laboratory are providing matching contributions in faculty and staff salaries, facilities, equipment maintenance and replacement, and administrative support. In 1997, there were no matching non-federal funds. In 1998, \$48,000 state appropriated funds were provided.

Research is being conducted at the New Mexico State University, and at collaborating universities in the region. The completion date for this project is estimated to be in 2001.

The last evaluation of this project was a merit review conducted December 19, 1996. In summary, the overall goal of this project is to use molecular technology to develop pesticide capability in plants of agronomic importance. A plant transformation system was developed to improve the historically difficult transformation efficiently of monocots. In field trails of transformed eggplants and potatoes, high levels of effectiveness against insects have been found. Several potato and alfalfa lines have been transformed and established in field plots and are being tested at

this time. Other constructs are being used in many crops to determine resistance to nematodes and other crop pests.

NONFOOD AGRICULTURAL PRODUCTS PROGRAM, NEBRASKA

This work focuses on the identification of specific market niches that can be filled by products produced from agricultural materials, developing the needed technology to produce the product, and working with the private sector to transfer the technology into commercial practice. Major areas of application include starch-based polymers, use of tallow as diesel fuel, improvements in ethanol production, use of vegetable oil as drip oil for irrigation wells, production of levulinic acid, the extraction of wax from grain sorghum and production of microcrystalline cellulose from crop biomass. Projects are merit reviewed internally at the University of Nebraska. The principal researcher believes our ability to produce agricultural commodities exceeds our needs for food and feed. These commodities are environmentally friendly feedstocks which can be used in the production of many biochemicals and biomaterials that have traditionally been produced from petroleum. The production of the commodities and the value-added processing of these commodities is regional in scope.

The objectives are to identify niche markets for industrial utilization of agricultural products, improve and develop conversion processes as needed for specific product isolation and utilization, provide technical, marketing and business assistance to industries, and coordinate agricultural industrial materials research at the University of Nebraska, Lincoln. Accomplishments include developing a formula that combines starch from corn and wheat, plastic resin from polystyrene and polymethylmethacrylate and compatibilizing agents to make loose fill packaging materials. We are currently negotiating a licensing agreement with Biofoam for the commercial use of this technology. Crude degummed and dried soybean oil has been proven to be an effective drip oil for irrigation wells. Archer Petroleum in Omaha is developing a marketing plan for regional distribution through 2500 distributors. Bruning Grain Company is currently working with us on a Drip Oil II product that they hope to market in the summer of 1998. Crude beef tallow has been converted to methyl esters and studied as diesel fuel. Fuel tests and extensive engine studies have shown it to be compatible with petroleum diesel and diesel engines. More recent studies have improved the process for converting tallow to esters for fuel use. Starch has been converted to levulinic acid using acid hydrolysis and an extruder. A patent is pending and commercialization efforts are underway. A patent application has been prepared on our micro-crystalline cellulose production technologies. CSREES is currently working with M.C.C. Technologies on commercialization. Their goal is to commercially produce microcrystalline cellulose in 1998.

The work supported by this grant began in 1990 and the appropriation for fiscal year 1990 was \$109,000 in 1990; \$110,000 per year in fiscal years 1991-1993; \$103,000 in fiscal year 1994; \$93,000 in fiscal year 1995; and \$64,000 in fiscal years 1996-1998 per year. A total of \$827,000 has been appropriated. The non-Federal funding for this project is: in fiscal year 1992, \$315,000; fiscal year 1993, \$330,000; fiscal year 1994, \$330,000; fiscal year 1995, \$309,000; fiscal year 1996, \$251,000; fiscal year 1997, \$250,000; and fiscal year 1998, \$340,000. These funds were from Nebraska Corn, Soybean, Wheat, Sorghum and Beef Boards, World Wildlife Fund, Nebraska Bankers Association, United Soybean Board and National Corn Growers Association, Bioplastics, Inc., Biofoam, Inc. and M.C.C. Technologies, Inc.

This work is being conducted at the Industrial Agricultural Products Center, L.W. Chase Hall, University of Nebraska, East Campus, Lincoln, Nebraska. The objectives of the original projects have been completed. Specific objectives have been identified in each renewal request. This project is evaluated annually based on an annual progress report. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of this agency.

OIL RESOURCES FROM DESERT PLANTS, NEW MEXICO

The Plant Genetic Engineering Laboratory has been exploring the potential for the production of high value industrial oils from agricultural products. The effort has been focused on transferring the unique oil producing capability of jojoba into oilseed rape and soybean. With the development of technology to both isolate the enzyme components of oil biosynthesis and successfully transform the target plants, significant advances have been made with jojoba. In addition, oil enzymes have been studied in soybean, castor, oilseed rape, and meadowfoam. A peer panel of government and academic scientists is expected to re-evaluate the scientific merit of the project on January 29, 1998.

The principal researcher believes desert plant sources of valuable oils for industrial applications are typically low yielding and limited in climatic areas for farm production. Genetic engineering offers an opportunity to move genetic capability to high yielding major crops. Many of the oils and their derivative acids, waxes, and others can directly substitute for imports of similar polymer materials, especially petroleum.

The goal of the research is to transfer the unique oil producing capability of jojoba and other native shrubs into higher yielding crops such as oilseed rape and soybean. This is a form of metabolic engineering and it requires the transfer of coordinated groups of genes and enzymes into the host plant to catalyze the necessary biochemical reactions. Progress has included characterization and isolation of several lipid biosynthetic enzymes along with associated genes, binding proteins, and molecular enhancers.

This research began in fiscal year 1989 with a \$100,000 grant under the Supplemental and Alternative Crops program. Grants have been awarded under the Special Research Grants program as follows: fiscal year 1990, \$148,000; fiscal years 1991–1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995–1996, \$169,000 each year; and fiscal years 1997 and 1998, \$175,000 per year. A total of \$1,724,000 has been appropriated. Non-federal funds are not provided for operational portions of this research. However, New Mexico State University and the Plant Genetic Engineering Laboratory provide \$90,000 for in-kind support per year including faculty salaries, graduate student stipends, facilities, equipment maintenance, and administrative support services.

The research is being conducted by the Plant Genetics Engineering Laboratory at New Mexico State University, Las Cruces, New Mexico. An estimate of the total time in Federal funds required to complete all phases of the project is 3 to 4 years. The application of this research for improved management of natural resources will evolve and expand as technology in the area advances. The Oil Resources from Desert Plants, New Mexico project was evaluated for scientific merit by an agency peer review panel on January 7, 1997. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. A peer panel of government and academic scientists is expected to re-evaluate the scientific merit of the project on January 29, 1998.

ORGANIC WASTE UTILIZATION, NEW MEXICO

Composted dairy waste is utilized as a pretreatment to land application. Composting dairy waste before land application may alleviate many of the potential problems associated with dairy waste use in agronomic production systems. Composting may also add value to the dairy waste as a potential landscape or potting medium. High temperatures maintained in the composting process may be sufficient for killing enteric pathogens and weed seeds in dairy waste. Noxious odors and water content may be reduced via composting. Composted dairy waste may be easier to apply, produce better seed beds, and not increase soil salinity as much as uncomposted dairy waste. The principal researcher believes the research will address the utilization of dairy waste combined with other high-carbon waste from agriculture and industry, including potash and paper waste, for composting. This approach to waste management will have high impact for states where dairy and agriculture are important industry sectors. This is especially true for New Mexico and the southwest United States where the dairy business is growing rapidly. This research will also provide an additional pollution prevention tool for the industrial sectors dealing with potash and paper waste. The principal investigator believes this research to be of local, regional and national importance.

The original goal of the research was and continues to determine the feasibility of simultaneously composting dairy waste from agriculture and industry. The research will determine effects of utilizing composted waste, as opposed to raw waste, as a soil amendment on plant growth, irrigation requirements, and nutrient and heavy metal uptake. Phase I, to determine the feasibility of simultaneous composting dairy waste with available high carbon wastes from agriculture and industry, has been completed. Phase II, to determine the appropriate ratios of waste to carbon substrate for successful composting, is almost completed.

The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal year 1996 was \$150,000, and for fiscal years 1997 and 1998 \$100,000 per year. A total of \$350,000 has been appropriated. The non-federal funds for the duration of this grant from the state appropriation is \$75,000. There is another \$50,000 in-kind support from the industrial partners. Additionally, a sum of \$15,000 from the New Mexico State Highway Department has been leveraged by this project.

This work is being carried out in New Mexico under the direction of the Waste-Management Education and Research Consortium in collaboration with The Composting Council and industrial partners, such as Envio (Ohio), Plains Electric, and McKinley Paper (New Mexico). Completion date will be March 1999. Objectives are being met as the project continues. The project has been progressing according to the specified targets. Phase 1 of the projects has been completed and phases 2 and 3 are being completed according to the identified targets. This project has been evaluated based on the semi-annual progress report and research findings presented at the annual Composting Council Conference. The cognizant staff scientist has reviewed the project and determined that this research is conducted in accordance with the mission of this agency.

PASTURE & FORAGE RESEARCH, UTAH

This research is designed to develop and evaluate management systems for grazing-based livestock production systems appropriate to the needs and conditions faced by Utah producers. Utah State University will conduct field research to determine optimal forage, appropriate nutrition and management for cattle and sheep in a forage-based production that will optimize returns with minimum environmental impact. Results from simulated intensive grazing management studies indicate six harvest cycles between May 15 and October 1. Orchard grass, meadow bromegrass and tall fescue were most promising forage plants. Future work will address weed control, stocking rate, animal performance and economic returns. This information will be incorporated into production in Utah.

The work supported by this grant in fiscal year 1997 was \$200,000 and appropriation for 1998 is \$225,000. A total of \$425,000 has been appropriated. Non Federal funds in support of this work for fiscal year 1997 was \$360,200.

The research is being conducted at the Utah Agricultural Experiment Station. The principle investigators anticipate the completion date for these objectives to be in 2002, at which time the pasture management guides using these results are anticipated. The initial proposal for fiscal year 1997 received a complete peer review through the institution's project approval process and was reviewed by CSREES scientists. The fiscal year 1998 proposal and those for each year thereafter, will be subjected to the same level of review.

PEACH TREE SHORT LIFE IN SOUTH CAROLINA, SOUTH CAROLINA

Progress continued in 1997 with focus on the evaluation and longevity and productivity of Guardian rootstocks on peach tree short life sites in the southeast and replant sites throughout North America. More fundamental work has involved the biochemical characterization of the egg-kill factor produced by a bacteria on nematode eggs. Other basic studies involved the cloning of genes associated with production and expression of toxins from bacteria. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

According to the principal researcher the problem of disease on peach, nectarine, and plum trees in the southeastern United States effects is very great. More than 70 percent of peach acreage in the southeast is effected. Research continued in 1997 on the improvement of rootstocks and the use of the cultivar Guardian BY520-9 has potential to benefit the entire peach rootstock industry including California, New Jersey and Michigan where bacterial canker is a problem. The goal of this research was the continued evaluation of productivity of peach Guardian BY520-9 rootstocks on peach tree short life and investigations into novel management for ring nematodes by bacteria. Recent accomplishments include the increase in bulk commercial production of Guardian seed while two new Guardian selections have had very good nursery trails. Guardian rootstock continues to be tested in 22 states and is performing well. A marker for a gene for rootstock resistance to two root-knot nematode species was sequenced and successfully use to correctly sort current commercial rootstocks according to their known nematode resistance or susceptibility. A major find is that the egg-kill factor produced by the bacteria kill root-knot nematode eggs as well as ring nematode eggs.

Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$100,000; fiscal years 1982-1985, \$192,000 per year; fiscal years 1986-1988, \$183,000 per year; fiscal year 1989, \$192,000; fiscal year 1990, \$190,000; fiscal years 1991-1993, \$192,000 per year; fiscal year 1994, \$180,000; fiscal years 1995-1998, \$162,000 per year. A total of \$3,203,000 has been appropriated. The non-federal funds and sources for this grant were as follows: \$149,281 state appropriations in 1991; \$153,276 state appropriations in 1992; \$149,918 state appropriations in 1993; \$211,090 state appropriations in 1994; \$193,976 in state appropriations in 1995;

\$169,806 in state appropriations in 1996 and 1997; and \$150,693 state appropriations in 1998.

This research is being conducted at South Carolina Agricultural Experiment Station. The researchers anticipate that the work may be completed in fiscal year 1999. Adequate progress has been made to assure that the objectives will be met before the completion date. The last agency evaluation of this project was a merit review completed January 5, 1997. In summary, the evaluation of peach rootstocks with resistance to peach tree short life is of continued importance in managing this disease. The use of biological control strategies in suppression of plant parasitic nematodes are a complementary area of research in that it can enhance disease management by protecting the peach rootstocks. Progress was made in all the objectives in 1997. Some accomplishments were the increased production and release of commercial Guardian seed and continued evaluation of rootstock in 22 states and provinces. A molecular techniques that separates resistant and susceptible peach rootstocks was validated.

PEST CONTROL ALTERNATIVES, SOUTH CAROLINA

This grant supports research and technology transfer to provide growers with alternatives for managing pests and to implement the use of new alternatives reducing the sole reliance on chemical pesticides. The investigators contributing to the research and technology transfer at South Carolina believe that need for the development of alternatives for managing pests on vegetables is a regional and national problem. Contributions from the South Carolina work are projected by South Carolina to impact vegetable production in the Southern region and consumers of vegetable production from the Southern region.

The goal of this program is to investigate alternative methods of managing insects, plant diseases, and nematodes in vegetable crops as complements to or as substitutes for conventional chemical sprays. Principal accomplishments appear to rest in a four year comparison of study plots of organically grown and conventionally grown vegetables. Residual nutrient levels in subplots treated with organic sources of fertilizer were greater than in subplots which received inorganic source of fertilizer. After four years of summer cropping followed by winter cover crop treatments, no herbicides nor pesticides have been applied to the study area. Weekly scouting has determined that harmful insect thresholds have not been reached. Naturally occurring beneficial insects were sufficient for pest control. The role of indigenous predators, parasites, and pathogens in controlling insect pests are being evaluated. Technology transfer to conventional and IPM systems has resulted in modified thresholds for caterpillar pests in collards and tomatoes which incorporate the impact of beneficials in the system and a sampling plan for tomato fruitworm which considers numbers of parasitized eggs used to schedule insecticide sprays.

This work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$125,000 per year. In fiscal year 1994 the appropriation was \$118,000 and in fiscal years 1995 through 1998, \$106,000. A total of \$792,000 has been appropriated. South Carolina has provided \$124,860 per year from State appropriations. This research and technology transfer program is being conducted at the South Carolina Agricultural Experiment Station, Clemson University at Clemson, Florence, and Charleston, South Carolina.

The original objectives of the project were for five years. Funding last year completed the five-year duration and researchers indicated that the work would be completed by the end of the last fiscal year as we reported to you last year. Objective A: Develop and evaluate microbial pest control agents for control of plant pathogens and insect pests of vegetables, is defuse and non-conclusive. It would be far superior for continued work in this area to be submitted to competitive peer review programs where the investigators would need to clearly focus specific activities and receive the benefit of the comments of peer scientists. Objective B: Determine the efficacy of innovative cultural practices for vegetable production systems in South Carolina. Objective C: Assess the role of indigenous predators, parasites, and pathogens in controlling insect pests; determine environmental and biological factors that influence the abundance and distribution of these indigenous beneficials; and consider the presence of natural enemies, as well as pests, in management decisions, is the area where the most progress appears evident and has been cited in the accomplishments in my response to your earlier question. We feel that the base of information and orientation of the research in this area is adequate and of quality that the investigators could compete well in competitive grant programs such as sustainable agriculture or regional IPM grant programs, and would benefit from the peer review process. Progress in this area is an ongoing process as explanations are sought for the results being obtained. Objective D: Evaluate and develop germplasm, breeding

lines and cultivars for resistance to major pathogens of commercially important vegetables. Objective E: Transfer new technology to user groups, has not demonstrated any progress that would not be anticipated from ongoing conventional sources of funds. We evaluate this project annually when we process the grant. An on-site comprehensive merit review of this project is scheduled by CSREES for June of 1998.

PEST MANAGEMENT ALTERNATIVES

This special research grant supports projects that help farmers respond to the environmental and regulatory issues confronting agriculture. These special grant funds support research that provides farmers with replacement technologies for pesticides that are under consideration for regulatory action by EPA and for which producers do not have effective alternatives. The passage of the Food Quality Protection Act of 1996—FQPA—makes this special research grant of critical importance to the Nation's farmers.

New pest management tools are being developed to address critical pest problems identified by farmers and others in a crop production region, and to identify new approaches to managing pests without some of the most widely used pesticides. Farmers have identified the lack of effective alternative pest management tactics as a primary reason for not implementing IPM on their farms. Where effective alternative tactics have been developed, they are widely and rapidly implemented by farmers. These special research grant funds are awarded on a competitive basis to all eligible research institutions through the Pest Management Alternatives Program or PMAP. Research priorities for PMAP are established with the help of a database analysis system, which draws upon the expertise of the land-grant university system, commodity groups, and others.

The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber is dependant on access to safe, profitable and reliable pest management systems. For a variety of factors, farmers and other pest managers have fewer chemical control options available to them than they did at the beginning of the decade, and this trend is likely to continue at an accelerated rate. The Food Quality Protection Act of 1996 (FQPA) will have significant impacts on pest management systems in the United States over the next decade, and the "minor use"—high value crops grown on relatively few acres—will be particularly hard hit. For these reasons and others, it is essential that farmers be provided with new pest management tools and better information so they can remain competitive in today's global marketplace.

This research is conducted to help farmers respond to the environmental and regulatory issues confronting agriculture by providing them with new options for managing pests. The research supported by this special grant is identifying new ways to manage pests without key pesticides that may no longer be available as FQPA is implemented. Some highlights of the research funded through PMAP include progress on surface amendment to reduce air pollution by Telone, a fumigant; latent infection assessment and fungicide mixtures for brown rot control; development of a pesticide use/pesticide recommendation database; implementation of alternatives to carbofuran for control of rice water weevil; substitution of behavioral control for organophosphate sprays against apple maggot; pheromone mating disruption in orchards; biodegradable fiber barriers for root maggot control; pesticide risk mitigation by improved application technology; and integration of natural enemy thresholds for greenbug management in wheat. Progress on additional research has been made to collect data on alternatives for pest management in watermelon insects and diseases of cucurbit crops in the South Central States; on developing IPM and monitoring networks in Northeastern vegetable crops; assessment of insecticide and IPM usage in alfalfa and small grains; and alternative management practices for minor tree fruit crops.

Grants have been awarded from funds appropriated as follows: fiscal years 1996 through 1998, \$1,623,000 per year. A total of \$4,869,000 has been appropriated. Non-federal funds are not required by this grants program. All states are eligible to compete for this funding. This research is currently being carried out by State Agricultural Experiment Stations and other research institutions located in 23 states.

The economic and environmental pressures facing U.S. agriculture today are at least as great today as they were in 1996 when federal funds were first appropriated for this special research grant. There will be a need for continued investment in research to develop new approaches to managing pests for the foreseeable future as the Food Quality Protection Act of 1996 is implemented.

Proposals are evaluated by multi disciplinary panels. The projects supported by this special research grant have consistently provided key knowledge needed in developing new approaches to pest management.

PESTICIDE CLEARANCE (PEST MANAGEMENT FOR MINOR CROPS—IR-4)

The Pest Management for Minor Crops (IR-4) Program, formerly the Pesticide Clearance Program, is a joint effort between the State Agricultural Experiment Stations, CSREES, and the Agricultural Research Service. IR-4 provides the national leadership, coordination and focal point for obtaining tolerance and safety data for pesticides and biological control agents for specialty crops such as horticultural crops. In many cases, the agricultural chemical industries cannot economically justify the time and expense required to conduct the necessary research for pesticides with small market potential. With assistance from IR-4 registration-related costs are manageable, and producers of a large number of small acreage crops such as vegetables, fruits, nuts, spices and other specialized crops have access to necessary pest control products. Protocols are written after careful review and inputs from representatives of grower groups, industry and researchers. The researchers then carry out field trials on priority needs to determine their effectiveness, safety and usefulness and then analyze the field grown commodities, where appropriate, to identify and quantify any residues that may persist. All of this is done according to the Environmental Protection Agency's (EPA) Good Laboratory Practices guidelines. The research program then assimilates the data from all the participating experiment stations, grower groups and chemical industry, and petitions are written for tolerances and Federal registration or reregistration. The 1996 grants terminate between March 1996 and March 1998.

The basic mission of IR-4 is to aid producers of minor food crops and ornamentals in obtaining needed crop protection products. IR-4 is the principal public effort supporting the registration of pesticides and biological pest control agents for the \$31 billion minor crop industry. This is a national research effort which identifies needs by a network of users and state university and Federal researchers. This research is highly significant to national and regional as well as local needs. The goal is to obtain minor use and specialty use pesticide registrations and assist in the maintenance of current registrations and to assist with the development and registration of biopesticides and safer pesticide products useful in IPM systems for minor crops. During the past five year period, over 1600 new minor food use clearance requests were submitted to IR-4 from growers, state and federal scientists and extension specialists. After evaluation and prioritization, nearly 1300 studies were conducted involving 2610 field reports and 2230 laboratory reports. Accomplishments included the registration of a fungicide to control eastern filbert blight on filberts resulting in an economic benefit of \$4 million per year. Without the availability of this product, it is estimated that one-third of the filbert orchards in the producing states of Idaho, Oregon and Washington would have gone out of business. IR-4 recently provided data for a national registration for a new herbicide on cucumbers for broadleaf weed control. It is estimated by Washington scientists that growers will realize a savings of \$1,000,000 in herbicide and labor costs on 2500 acres of the crop grown in that state alone. With more than 130,000 acres of cucumbers produced nationally, the potential savings are enormous.

IR-4 provided residue data to support the FIFRA 88-mandated reregistration of more than 600 minor uses identified by growers as critical needs. One of these was streptomycin for the treatment of edible dry beans grown for seed on 15,000 acres in California and valued at \$4 million annually. California seed is sold to growers in Colorado, Nebraska, Minnesota, the Dakotas, Wisconsin, Michigan and New York where a disease known as halo blight can devastate untreated bean plantings. For this reason, growers will not purchase seed that is not treated with streptomycin.

Registrations for the control of insect disease and weed pests of commercially grown ornamental crops continues to be an important objective of the IR-4 Project. Since 1977, IR-4 has assisted with the registration of over 5000 pesticides and biological pest control agents on woody nursery stock, flowers and turf grass. During the past two years, IR-4 has developed data to allow the use of a herbicide for the control of yellow nutsedge and other grassy weeds in woody and perennial ornamental crops. In California alone, over 100,000 acres are treated with this herbicide, thereby saving growers \$1.6 million compared to hand weeding. IR-4 also continues to work closely with nurserymen and growers to develop pesticides such as azadirachtin, a naturally occurring insecticide, for integrated pest management systems.

Biopesticides have been an important IR-4 thrust since 1982. IR-4 conducts a competitive grants program to develop research data to support the registration of

microbial and biochemical pest control products on minor crops. Equally important, IR-4 interacts with public sector and venture capital registrants to assist with Experiment Use Permits and provide guidance on EPA registration procedures. The Pesticide Clearance program continues to have a high productivity which, according to EPA, supports 40 percent of all EPA pesticide registrations.

Grants have been awarded from appropriated funds as follows: Program redirection in fiscal year 1975, \$250,000; fiscal year 1979, \$500,000; fiscal years 1977-1980, \$1,000,000 per year; fiscal year 1981, \$1,250,000; fiscal years 1982-1985, \$1,400,000 per year; fiscal years 1986-1989, \$1,369,000 per year; fiscal year 1990, \$1,975,000; fiscal year 1991, \$3,000,000; fiscal years 1992-1993, \$3,500,000 per year; fiscal year 1994, \$6,345,000; fiscal year 1995 through 1997, \$5,711,000 per year and fiscal year 1998, \$8,990,000. A total of \$61,519,000 has been appropriated.

The non-federal funds and sources provided for this grant were as follows: \$891,856 state appropriations and \$65,402 industry in 1991; \$1,002,834 state appropriations and \$104,292 industry in 1992; \$1,086,876 state appropriations and \$310,133 industry in 1993; \$550,160 state appropriations, \$408,600 industry, and \$924,169 miscellaneous in 1994; \$775,432 state appropriations, \$266,714 industry, and \$751,375 miscellaneous in 1995; and an estimated \$800,000 state appropriations, \$250,000 industry, and \$800,000 miscellaneous in each year of 1996 and 1997.

Field work is performed at the State and Territorial Experiment Stations. Laboratory analysis is conducted primarily at the California, New York, Florida and Michigan Agricultural Experiment Stations with assistance by the Oregon, Hawaii, North Dakota, Arkansas, North Carolina, Washington, Virginia, Mississippi, Idaho, Pennsylvania and New Jersey Agricultural Experiment Stations. Protocol development, data assimilation, writing petitions, and registration processing are coordinated through the New Jersey Agricultural Experiment Station. ARS is conducting minor use pesticide studies at locations in California, Georgia, Illinois, Maryland, Ohio, Oregon, South Carolina, Texas, and Washington. ARS laboratories in Georgia, Maryland, and Washington are cooperating with analyzers.

Selected categories of the Special Research Grants program address important national and regional research initiatives. The pesticide clearance program, also referred to as pest management for minor crops and also IR-4, involves research on biological systems that by their nature are ever changing and presenting new challenges to agriculture. The IR-4 workload is anticipated to be long term because of the sensitivities about food safety and the environment, and the eventual loss of a large number of conventional pesticide registrations for minor crops because of the 1996 Food Quality Protection Act. IR-4 developed a strategy in 1989 to defend needed minor use pesticides that were subject to reregistration but would not be supported by industry for economic reasons. In 1997, IR-4's updated its strategic plan to focus on the registration of biopesticides and safer pest control technology for minor crops in addressing the Food Quality Protection Act. That Act calls for more extensive residue data requirements which would take into account an additional safety factor for infants and children. The IR-4 program thrust will be carried out along with the traditional minor crop pesticide clearance program.

Each year the program is peer reviewed and reviewed by CSREES' senior scientific staff. A summary of those reviews indicate excellent progress in the achieving the objective of providing safe pest controls for minor users. In December, 1997, CSREES sponsored a nine-member peer panel review of the IR-4 program, conducting an on-site review at Rutgers University. A final report is expected in early 1998. In addition to the yearly evaluations, the program received an on-site external review sponsored by CSREES in December 1990, and a GAO review. These previous reviews have resulted in significant improvement in the IR-4 programs productivity and quality of research. Additionally, the customers served by IR-4 have provided input to the program to enhance its effectiveness.

PESTICIDE IMPACT ASSESSMENT PROGRAM

Research funded by the National Agricultural Pesticide Impact Assessment Program (NAPIAP) discovers, gathers, publishes, and distributes information relating to the use and effectiveness of pest management alternatives essential to the maintenance of U.S. agricultural crops and livestock production. These data involve evaluating the biologic and economic impact and consequences of restricting the use or availability of key pesticides through voluntary cancellations or regulatory action. NAPIAP data augments National Agricultural Statistic Service (NASS) data by conducting commodity based assessments and crop profiles on minor-use or small acreage crops. All projects are peer reviewed through a regional competitive process.

This program provides the Environmental Protection Agency (EPA) and the USDA with information on the use, importance and effectiveness of pest manage-

ment alternatives essential to U.S. agricultural crops and livestock production. NAPIAP, in responding to the information needs of EPA for implementation of the Food Quality Protection Act, has focused its studies on minor crop production systems. To insure relevance and focus, minor crop producers provide input to NAPIAP, thus permitting coordination of studies and information gathering with NASS, the Environmental Protection Agency, and the United States Department of Agriculture's Office of Pest Management. Nationally, EPA uses these data in making environmentally sound regulatory decisions within the regulatory framework of the Food Quality Protection Act and the economic balance of U.S. agriculture. USDA uses these data to identify commodity sites where there are critical pest threats to production because no or few pest management alternatives exist. This national research and information delivery effort involves interactions with scientists in all State Agricultural Experiment Stations and Cooperative Extension Services. Through this cooperative interaction, the USDA and EPA receive state generated agricultural information needed for sound regulatory decision-making and the state partner receives federal funds, participatory input into the regulatory process, and direct access to timely regulatory information.

The National Agricultural Pesticide Impact Assessment Program (NAPIAP) has been an on-going research effort whose original goal in 1977 was to gather data to provide comprehensive assessments documenting what would be the impact on agriculture if certain pesticides would no longer be available. A federally coordinated network of state scientist contacts was developed in the intervening years as broader and more environmentally enlightened goals evolved within this program. Today the NAPIAP's goals are defined in its strategic plan as: first, in collaboration with USDA, EPA, and Land-Grant partners, to focus activities on collecting and delivering high quality, science based pest management information for use in the regulatory process; and second, maintain and enhance a strong partnership between the USDA and the Land Grant System in order to continue the positive interactive flow of vital pest management information between the USDA, the regulatory community, and production agriculture.

Grants have been awarded from funds appropriated as follows: Fiscal years 1977-1981, \$1,810,000 per year; fiscal years 1982-1985, \$2,069,000 per year; fiscal years 1986-1988, \$1,968,000 per year; fiscal year 1989, \$2,218,000; fiscal year 1990, \$2,437,000; fiscal years 1991-1993, \$2,968,000 per year; fiscal year 1994, \$1,474,000; and fiscal years 1995-1998, \$1,327,000 per year. A total of \$43,571,000 has been appropriated. The majority of the cost of the state scientist and the NAPIAP program is born by the state partner. The exact contribution of each state is not known, nor has this information been requested to be reported to the federal partner during the duration of this program. The federal program funds provided to the states by the Cooperative State Research, Education, and Extension Service have been used by state partners to partially defray their costs of staffing a Pesticide Impact Assessment Program State Liaison Representative on their Land Grant campus. The remaining program expenses, beyond the federal program funds, of program participant salaries, facility costs, clerical support expenditures, supplies and program costs of the program's State Liaison Representative have been born by each state and these costs are considered the state funding provided to support this program. State estimates of their matching support for this program have ranged from 3 to 6 times the federal dollars that have been provided to support their cooperative efforts.

This work is underway at State Agricultural Experiment Stations in 50 states and 5 Territories. The distribution of competitively awarded regional research grants is coordinated through a lead state in each of the four regions of the United States: namely, California—West; Ohio—North Central; Pennsylvania—Northeast; and Florida—South. The National Agricultural Pesticide Impact Assessment Program has been an on-going research effort to gather relevant pest management information necessary for changing. A federally coordinated network of state scientist contacts was developed in the intervening years to address the information needs of the regulatory agency. NAPIAP is a multi-agency on-going program which attempts to address the increasing needs for pest management information by EPA. The combined data needs of the Food Quality Protection Act, IPM implementation documentation, and Government Performance and Results Act will be resulting in an even greater need for pest management information. Thus the original objectives have been met but data needs continue to change and grow.

A comprehensive evaluation and review of the National Agricultural Pesticide Impact Assessment Program was conducted in February 1995. The review panel's report was published in June 1995. The review team was composed of 10 scientists from EPA, Industry, commodity groups, the federal government, and the Land Grant System. A recurring theme which emerged from the 1995 review was a direc-

tive to focus the NAPIAP program on data collection on the benefits of pest management alternatives. In response to this recommendation, CSREES brought together the programmatic and budgetary components of the program into a single coordinated NAPIAP effort. Each of the 14 recommendations provided by the review panel were addressed and implemented. In 1997, the USDA Office of Pest Management policy assumed programmatic leadership for NAPIAP to direct the program's activities to the informational needs of FQPA.

PHYTOPHTHORA ROOT ROT, NEW MEXICO

Work has continued to focus in general on the development of strategies for sustainable vegetable production in irrigated lands. Work has continued on the search for Phytophthora root rot resistance in chilies, identification of molecular markers for rot tolerant genes, investigation on irrigation modification as a means to manage root rot, and soil bed temperature control as a means to manage disease. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES. The principal researcher believes that since Phytophthora disease threatens chili production in west Texas, New Mexico, and Eastern Arizona, this problem is of state-and regional significance. The original goal was to improve chile production through genetically superior cultivars, combined with new improved cultural practices. Researchers have developed a highly effective disease screen that selects resistant seedlings, found that genes for resistance to root rot do not provide protection against Phytophthora foliar blight, that a wild species of Capsicum is immune to the fungus, and that molecular markers are useful to introgress genes for tolerance. They also found that alternate row irrigation and drip irrigation significantly reduce Phytophthora root rot. Control of soil temperature with soil mulches can greatly impede the progression of root rot in the irrigated field.

The work supported by this grant began in fiscal year 1991 with an appropriation of \$125,000 for that year. The fiscal years 1992-1993 appropriation was \$150,000 per year; \$141,000 in fiscal year 1994; and \$127,000 in fiscal years 1995-1998, each year. A total of \$1,074,000 has been appropriated. Non-federal funds from state appropriations and the California Pepper Commission were \$255,614 in 1997; and \$253,614 in 1998.

Research is being conducted at New Mexico State University. The anticipated completion date for the original objectives was 1995. These objectives have not been met. Related programs deal with research and development efforts designed to prevent or manage diseases impacting vegetable production in irrigated areas, and co-operators estimate that the objectives of these programs should be met by 2002.

The last agency evaluation was made in December, 1996. In summary, the development of resistant cultivars and research on interactions of Capsicum and Phytophthora for developing strategies for irrigated crop growers to be competitive in the international economic arena continued. More than 26,564 seedlings were screened for resistance to root rot and/or foliar blight in the greenhouse. This technique allows the resistant plants to be saved and used in the breeding program. Field evaluations of advanced lines continued with 11 green chile lines and 18 paprika lines tested for release. Two jalapeno lines were released by this program.

PLANT, DROUGHT, AND DISEASE RESISTANCE GENE CATALOGING, NM

The objective of this work will be to identify important genes in crop plants that result in the ability to resist stress caused by drought and disease organisms. CSREES has requested the university to submit a grant proposal that has not yet been received. The focus of this research will be to improve plant resistant to drought and disease for New Mexico crops. However this information can have application through out the nation especially in the arid/semi arids.

The goal of this research is to produce better adapted crops for New Mexico. The work will be started in 1998 and therefore no results have been obtained at this time. The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$150,000. The project has not yet started and the availability of nonfederal funds has not been determined.

The research will be conducted at New Mexico State University and is anticipated to require four years to meet the major objectives. The project is anticipated to be reviewed annually by the project approval process of the institution.

POSTHARVEST RICE STRAW, CALIFORNIA

The postharvest rice straw special grant was initiated in May 1997 and has two main objectives: (1) characterize current capabilities, costs and constraints in harvesting and handling rice straw as a renewable material for commercial products

and (2) investigate alternative harvest and handling systems and evaluate their specialized equipment and system designs. Although this special research grant is awarded noncompetitively, the proposal is reviewed for merit by the university before submission to CSREES and reviewed by CSREES for technical merit and allowable costs and procedures. California legislation mandates reduction in the amount of open rice straw burning, the principal method of rice straw disposal. Efficient harvest and handling may make rice straw a suitable raw material for user businesses while meeting straw burning regulations and improving air quality. The goal is to demonstrate efficient and economic rice straw harvest and handling, thereby establishing rice straw as a feedstock for value-added manufacturing and other uses. This project is only recently initiated and is fully organized, including outreach to the rice industry.

The work supported by this grant began in fiscal year 1997. The appropriation for fiscal year 1997 was \$100,000 and fiscal year 1998 is \$300,000. A total of \$400,000 has been appropriated. The University of California-Davis cites cooperation by the California Rice Industry Association and the California Rice Research Board. Cost-sharing support from non-federal funds is not included. Cost-sharing may become available from industry later in the project as prototype harvest and handling equipment and systems for rice straw are developed and tested.

Research will be conducted at the Department of Biological and Agricultural Engineering, University of California-Davis, California. It is anticipated by the University of California-Davis that the postharvest rice straw project will be completed in 2002, after a five year-period to meet objectives. Since 1997 was the first year for the postharvest rice straw project, no evaluation has been conducted.

POTATO RESEARCH

Scientists at several of the State Agricultural Experiment Stations in the Northeast, Northwest, and North Central States, are breeding new potato varieties, high yielding, disease and insect resistant potato cultivars, adapted to the growing conditions in their particular areas, both for the fresh market and processing. Research is being conducted in such areas as protoplast regeneration, somoclonal variation, storage, propagation, germplasm preservation, and cultural Practices. CSREES published a request for proposals in the Federal Register and awarded eight grants competitively based on a scientific peer review.

The principal researcher believes this research effort addresses needs of the potato producers and processors. Research areas being studied include storage and postharvest handling of potatoes and their effect on potato quality. Potato producer and processor needs are breeding and genetics, culture factors, and pest control on potato production. The original goal was to improve potato production through genetics and cultural practices as well as improve storage for quality potatoes for processing and fresh market. This research has resulted in a number of new high yielding, good quality, disease and insect resistant, russet type cultivars, which are now being used in the processing industry and in the fresh market. Research by the Pacific Northwest States of Washington, Oregon, and Idaho has resulted in the release of a number of cultivars, including Gemchip, Calwhite, Century Russet, Ranger Russet, Frontier Russet, and Chipeta. In addition, North Dakota developed Norkatah as a result of this program.

Grants have been awarded from funds appropriated as follows: fiscal year 1983, \$200,000; fiscal year 1984, \$400,000; fiscal year 1985, \$600,000; fiscal years 1986-1987, \$761,000 per year; fiscal year 1988, \$997,000; fiscal year 1989, \$1,177,000; fiscal year 1990, \$1,310,000; fiscal year 1991, \$1,371,000; fiscal years 1992 and 1993, \$1,435,000 per year; fiscal year 1994, \$1,349,000; and fiscal years 1995 through 1998, \$1,214,000. A total of \$16,652,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$401,424 state appropriations, \$4,897 product sales, \$249,830 industry, and \$30,092 miscellaneous in 1991; \$567,626 state appropriations, \$6,182 product sales, \$334,478 industry, and \$44,323 miscellaneous in 1992; \$556,291 state appropriations, \$9,341 product sales, \$409,541 industry, and \$44,859 miscellaneous in 1993; \$696,079 state appropriations, \$21,467 product sales, \$321,214 industry, and \$226,363 miscellaneous in 1994; \$935,702 state appropriations, \$35,376 product sales, \$494,891 industry, and \$230,080 miscellaneous in 1995; and an estimated \$900,000 state appropriations, \$10,000 product sales, \$400,000 industry, and \$200,000 miscellaneous in each of 1996 and 1997.

The research work is being carried out at the Cornell, Idaho, Maine, Maryland, Michigan, North Dakota, Oregon, Pennsylvania, and Washington State Agricultural Experiment Stations.

The project was initiated to accomplish significant results in about five years. Because the research is based on genetic varietal development, progress is developing new potato varieties takes from 5 to 10 years. Beginning in fiscal year 1997, these funds have been awarded on a competitive basis using a scientific peer review. In addition, the agency has at least one formal meeting with representatives from the potato industry to review research needs.

POULTRY CARCASS REMOVAL, ALABAMA

This is a new grant which is being funded for the first time in fiscal year 1998. This project is intended to examine the problem of disposal of dead chickens using alternative procedures. The procedure to be investigated is to pelletize and dehydrate the chicken carcasses so that they can then be used as a safe and high quality animal feed product. The disposal of dead chickens is an increasing problem due to refusal by most land fill operations which take solid waste to continue to accept animal carcasses. This is a need that is being recognized at all levels, national, regional and local. The goal of this research is to develop an economically-feasible procedure for disposal of chicken carcasses using a process that pelletizes and dehydrates the carcasses and produces a safe and high quality animal feed. Because it is a new project there is no progress to report at this time.

Fiscal year 1998 is the first year of funding for this project and \$300,000 has been appropriated. Information is not available on non-Federal funding support. The research work will be carried out at the University of West Alabama and Alabama Protein Recycling. The anticipated completion date is March 15, 1999. Because the work is just now being initiated, there has been no evaluation.

PREHARVEST FOOD SAFETY, KANSAS

The project is to examine the incidence of shedding of *E. coli* 0157:H7 in feces of beef cattle and the impact of various management procedures such as calving, weaning, routine cattle handling for vaccination, etc. on the frequency and amount of shedding of these bacteria. The study is designed to provide information about small and large cow-calf operations in Kansas. This project was reviewed for merit by three scientists in CSREES prior to the initial award and for the renewal in fiscal year 1997. The presence of *E. coli* in cattle destined for slaughter and entry of meat products into the human food chain has given impetus to the need for understanding the ecology of the organism and the impact of management strategies, including herd size, on the prevalence of the organism and likelihood of contamination of meat supplies. Other organizations such as the National Cattlemen's Beef Association and the Livestock Conservation Institute have given strong support for increased numbers of projects on topics related to preharvest food safety such as this one. The principal researcher believes this research to be of national and regional need.

The original goal of this research was to determine the relative incidence of shedding of *E. coli* 0157:H7 from beef cattle in small and large cow-calf operations and the impact of various management events in the production cycle on this bacterial shedding. The principal researcher expects this information will assist in reducing the prevalence of this organism in beef cattle and, thus, reduce the incidence of food-borne illness in humans due to this bacterium. To date, the research team has established new highly effective and rapid detection systems utilizing nested PCR and enriched culture systems for identifying the *E. coli* organism in feces of cattle. They have demonstrated significant increases in recovery of *E. coli* from feces using these methods when compared to prior culture systems that were in use. The co-operating herds have been identified and sampling is in progress. Collaborative arrangements have also been established with scientists at the University of Nebraska-Lincoln for doing more intensive work with animals that are identified as "shedders". Data collected to this time supports the concept that stressful incidents such as calving caused a marked increase in shedding of *E. coli* in feces of cows. At this time they have met all of their goals on time and expect to continue to do so.

The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996, 1997, and 1998 was \$212,000 per year. A total of \$636,000 has been appropriated. Non-Federal funds have been contributed to this project as follows: In fiscal year 1996 non-federal funds provided to this project were \$150,000 in state appropriations and \$91,450 in contributed indirect costs; 1997 non-federal funds provided to this project were \$90,300 in contributed indirect costs and \$165,000 in state appropriated funds.

This research is being conducted at Kansas State University, University of Nebraska-Lincoln and at ranches in Kansas, Nebraska and Colorado. The anticipated

completion date was October 1, 1998 for the original objectives. At this time, the research team has completed all objectives that were planned for Year 01 and Year 02 of the grant and are working on the objectives for Year 03. Because of a slight delay in the start of the funding, it is anticipated that the other original objectives will be completed by March 1999 and the project should be finished by September, 1999.

The project was evaluated on October 28-29, 1997 during a site visit by W. C. Wagner on the Kansas State University campus. The group has excellent collaborative activities in place and they are proceeding very well. It was impressive to see how they have utilized this approach to be successful in meeting their objectives. There are multiple units involved in the project and they are coordinating this work with the Food Safety Consortium which includes Kansas State University, Iowa State University and the University of Arkansas. They have met their objectives as listed in the original proposal for the first two years of the project. Their results to date suggest that the infection of cattle with *E. coli* is probably a rather transient event and may not establish the true carrier state as one normally thinks of it. While certain events such as calving increase the rate of shedding in the feces and was thought to be a response to stress at that time, other types of stress such as trucking for 150 miles do not result in an increase in shedding of *E. coli* by the animals.

PRESERVATION AND PROCESSING RESEARCH, OKLAHOMA

Research has focused on the effects of preharvest and postharvest factors on the market quality of fresh and minimally processed horticultural products, including factors affecting marigold petal pigment content, minimal processing procedures for extending the shelf life and reducing the oil content of pecans, and harvest quality evaluations for watermelons, pecans and peaches. Researchers are developing harvester prototypes for multiple harvest of marigold flowers and drying and threshing systems for marigold petal drying and separation. Work is being finalized to develop a fruit orienting mechanism for incorporation into an on-line grading system and to develop integrated harvesting/postharvest handling systems for fresh market and processing market horticultural products. Research is also ongoing to develop methods to determine textural properties of pecans, determine optimum operating parameters for supercritical carbon dioxide and other alternative partial oil extraction, and develop and optimize modified atmosphere packaging techniques for pecan shelf life extension. Fiscal year 1997 funds are supporting research through June 30, 1999. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1998 appropriation.

The principal researcher believes that technological improvements in fruit, nut and vegetable handling systems are critically needed to supply domestic markets and to support continued participation in international commerce and thus serves the national need. New environmentally friendly processing systems have been developed and are being commercialized in Oklahoma which have broad application to numerous crops with international marketing potential. Regionally, processing systems under development for commercial adaptation provide crucial solutions required for market expansion of pecans, affecting product market potential and value throughout the southern U.S. Locally, improvements in postharvest handling and processing are necessary to support growth of the industry and ensure competitive involvement in national and international commerce of horticultural commodities uniquely suited for production in Oklahoma. New extraction facilities will also have a positive impact on local economies, incorporating a new value added processing industry and providing local employment opportunities.

The goal of the research has been to define the major limitations for maintaining quality of harvested fruits, vegetables and tree nuts and prescribe appropriate harvesting, handling and processing protocols to extend shelf life and marketability of harvested horticultural commodities, thus maintaining profitability of production systems and assuring an economic market niche for Oklahoma producers and food processors. A systems approach to develop complementary cropping, harvesting, handling and processing operations has resulted in development of improved handling systems for cucurbit and tree fruit crops. Matching funding has supported development of nondestructive processing systems for partial oil reduction of tree nuts, to extend shelf life and lower the calorie content for the raw or processed product, resulting in development of a business plan for a commercial facility. Funding has been secured for construction of a commercial extraction facility in Oklahoma, pending successful pilot testing which is underway. Technologies and procedures previously developed for cucurbit and tree fruit systems are now being applied to support development of profitable okra, pepper, sage, basil, tree nut, sweetcorn, and

marigold cropping, handling and light processing systems, with a targeted completion date of 2000. Research from this project provided the basis for commercial high relative humidity storage of peaches and to attract companies to the state to construct new value added food processing facilities.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986, \$142,000; fiscal year 1987, \$242,000; fiscal years 1988 and 1989, \$267,000 per year; fiscal year 1990, \$264,000; fiscal year 1991, \$265,000; fiscal year 1992, \$282,000; fiscal year 1993, \$267,000; fiscal year 1994, \$251,000; and fiscal years 1995–1998, \$226,000 each year. A total of \$3,251,000 has been appropriated. Support from the State of Oklahoma, through the Oklahoma Agricultural Experiment Station and through the Oklahoma Centers for Advancement of Science and Technology, have been provided as follows: fiscal year 1991, \$126,900; fiscal year 1992, \$209,783; fiscal year 1993, \$219,243; fiscal year 1994, \$308,421; fiscal year 1995, \$229,489; fiscal year 1996, \$366,570; and fiscal year 1997, \$397,881; for a total of \$1,858,287 in state funds. An additional \$16,100,000 was committed by the State of Oklahoma for development of an Agricultural Products and Food Processing Center to support, among other programs, the horticulture processing initiatives. The Oklahoma State University Division of Agriculture Sciences and Natural Resources appropriated approximately \$2 million dollars in recurring funds to staff the facility.

This work is being conducted at the Oklahoma State Agricultural Experiment Station, in conjunction with ongoing production research at the Wes Watkins Agricultural Research and Extension Center and the South Central Agricultural Research Laboratories.

The principal investigator anticipated that the fiscal year 1997 grant would support work through June 1999. It is expected that ongoing research will be completed in 2002. Additional related objectives beyond this date would address further opportunities for horticulture industry growth and economic development. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal supporting the fiscal year 1997 appropriation was conducted on December 20, 1996. Though research progress was satisfactory, development and commercial adoption of new practices and equipment has been less certain. The project was evaluated as part of a comprehensive CSREES program site review in the fall of 1995, with a recommendation by the review team to continue the value-added product development.

REGIONAL BARLEY GENE MAPPING PROJECT

The objectives of this project are to: construct a publicly available medium resolution barley genome map; use the map to identify and locate loci, especially quantitative trait loci controlling economically important traits such as yield, maturity, adaptation, resistance to biotic and abiotic stresses, malting quality, and feed value; provide the framework for efficient molecular marker-assisted selection strategies in barley varietal development; identify chromosome regions for further, higher resolution mapping with the objective of characterizing and utilizing genes of interest; and establish a cooperative mapping project ranging from molecular genetics to breeding that will be an organizational model for cereals and other crop plants. The fiscal year 1998 grant proposal has been requested but not yet received. All funds are awarded on a competitive basis.

The principal researcher believes barley breeders nationwide need information about the location of agriculturally important genes controlling resistance to biotic and abiotic stresses, yield, and quality factors in order to rapidly develop new, improved cultivars and respond to disease and pest threats. This project provides that information along with appropriate molecular markers to track these traits through the breeding and selection process. The original goal of this project has been to develop a restriction fragment length polymorphism map for barley and associated important genetic traits as a map to provide closely linked molecular markers for barley breeders. The project successfully mapped 300 molecular markers. Portions of the map are described as very dense and contain key location points for enhanced utility. The project is now using the map to locate quantitative traits loci of economic importance. These include genetic determinations for yield, maturity, rust resistance, plant height, seed dormancy, and components of malting quality. Technical papers have been published to report research results to the scientific community.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$153,000; fiscal year 1991, \$262,000; fiscal years 1992–1993, \$412,000 per year; fiscal year 1994, \$387,000; and fiscal years 1995–1998, \$348,000 each year. A total of \$3,018,000 has been appropriated. The nonfederal funds and sources provided for this grant were as follows: \$203,760 from industry in 1991; \$212,750 from industry

in 1992; \$115,000 from industry in 1993; and \$89,000 from industry in 1994; and \$35,000 from the State of Washington and \$108,000 in other nonfederal funding, for a total of \$143,000 in 1995. Nonfederal funds were \$163,000 for 1996 and \$178,240 in 1997.

Research is being conducted in the following state agricultural experiment stations; Oregon, Colorado, Washington, Montana, Idaho, North Dakota, Minnesota, New York, Virginia and California. The original objective of the "Regional Barley Gene Mapping Project" was to produce a genetic map of agronomically important traits of the barley genome. The anticipated time to complete this task was estimated at 10 years with completion in 1999. Many important genes have been mapped, some of which are being used to improve barley cultivars. Agronomically-important barley genes identified through this work is being used in barley breeding across the nation to improve yield and quality of the crop. Additions to this map are expected to aid future breeding efforts. This project is made up of many competitively awarded sub projects that are reviewed annually by a peer panel and selected for relevance to the original objective and scientific merit of the proposed research. This project has been judged as an exceptionally productive project which serves as a model for multi institutional-multi disciplinary competitively awarded research project.

REGIONALIZED IMPLICATIONS OF FARM PROGRAMS

The purpose of this research is to estimate the impacts of farm, trade, and fiscal policies and programs and assess their alternatives on the economic viability of typical crop and livestock production operations located in different regions of the United States. There is a national need for research that provides an assessment and evaluation of the potential impacts of Federal farm, trade, and fiscal policies on the economic viability and competitiveness of farmers located in different regions of the United States. Policy impacts vary regionally because of differences in farm productivity, input costs, climate, farm enterprises and size. The research results are widely used by farmers and public policymakers concerned about minimizing policy and program inequities between regions and farm sizes.

The original, as well as current, goal was and continues to be to provide the farm community, extension, and public officials information about farm, trade, and fiscal policy implications by developing regionalized models that reflect farming characteristics for major production regions of the United States. The researchers have developed a farm level policy analysis system encompassing major U.S. farm production regions. This system interfaces with existing agricultural sector models used for farm, macroeconomic, and trade policy analysis. The universities have expanded the number and types of representative farms to 80. Typical farm models also are being developed for Mexico and Canada under a collaborative agreement for use in analyzing impacts of the North American Free Trade Agreement.

Approximately 25 policy studies were completed this past year at the request of policymakers and farm groups including analyses of the impacts of various farm policy proposals on representative crop farms in the U.S., land tenure arrangements for program crops in connection with the implementation of the 1996 FAIR Act, conservation reserve program impacts on farms west of the Mississippi river, and revised baseline projections for representative farms. The representative farms were used extensively for analysis of farm level impacts of the alternative farm program proposals considered for the 1996 farm bill as well as implementation alternatives after passage of the bill. Various income and estate tax options, including capital gains proposals, for the 1997 tax legislation were analyzed for their impacts on representative United States farms.

The work supported by this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$346,000. The fiscal years 1991-1993 appropriations were \$348,000 per year; \$327,000 in fiscal year 1994; and \$294,000 in each of the fiscal years 1995 through 1998. A total of \$2,893,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$288,843 State appropriations and \$46,773 industry for a total of \$335,616 in 1991; \$45,661 State appropriations in 1992; \$33,979 State appropriations in 1993; \$40,967 State appropriations in 1994; \$161,876 State appropriations in 1995; \$187,717 State appropriations for 1996; \$137,100 in 1997; and \$161,400 for 1998.

Research is being conducted by the Texas A&M University and University of Missouri at Columbia. This program is of a continuing nature for the purpose of assessing the impacts of existing policies and issues and proposed policy and program changes at the individual firm level for feed grain, wheat, cotton, rice, oilseed and livestock producers. No formal evaluation of this project has been carried out; how-

ever, the CSREES representative is in frequent communication with the principal investigator concerning policy analyses procedures and studies.

RICE MODELING

The purpose of this research project is to develop a rice industry model with domestic and international components to aid U.S. farmers, millers and policymakers in making production, investment, marketing and public policy decisions. Research is needed to assist both the U.S. rice industry and national policymakers in assessing the impact of existing and proposed changes in public policies for rice. This research enables improved analysis of both international and domestic policy changes on rice production, stocks, prices of substitute crops and consumption. It has been, and is being used to analyze the impacts of farm policy proposals on the U.S. rice industry, to analyze the impact of World Trade Organization (WTO) and the Uruguay Round agreements on U.S. trade, and to analyze the impact of emerging rice importing and exporting countries on U.S. rice exports. The principal researcher believes this research addresses national, regional, and local needs. The original goal of this research was to develop improved global, national and regional models to analyze the impact of foreign and domestic policy changes, and forecast changes in production, trade, stocks, prices of substitute crops, farm prices, and consumption.

The work actually began about four years ago and federal research grants from various sources have totaled roughly \$2 million prior to this year. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$395,000; for 1998, the appropriation is \$296,000, for a total of \$1,086,000. The non-federal funds over the 4 years prior to this year totaled approximately \$500,000. For the 1996 fiscal year, state appropriations were \$178,000; for 1997, \$150,000; and for 1998, are estimated to be roughly \$150,000 as well.

The research is being carried out at the University of Arkansas-Fayetteville and the University of Missouri-Columbia. The researchers anticipate that the domestic portion of the rice model will be complete by September 30, 1997. The international modeling research is a little over half completed and the researchers estimate another 5 years is required. The purpose of constructing the models, however, is to provide on-going analyses of the impact of various policy proposals on the U.S. rice industry.

We have conducted no formal evaluation of this project. However, each annual budget proposal is carefully reviewed for adherence to stated objectives and annual progress is discussed with the principal investigators.

RURAL DEVELOPMENT CENTERS

The overall objectives of the research agenda of the five rural development centers are to: Improve economic competitiveness and diversification in rural areas; support management and strategic planning for economic development; create community capacity through leadership; assist in family and community adjustments to stress and change; and promote constructive use of the environment. The function of the Centers is to increase the productivity of regional faculty both in doing research on rural issues and in using that research to do effective outreach with rural communities. These projects have undergone a merit review. The number of research faculty who are addressing broader rural issues is declining in many places. The multi-disciplinary, multi-state work supported by the Centers becomes even more crucial in a period of reduced research emphasis. Critical needs are being met by Center support including public lands policy, changing rural migration patterns, fiscal alternatives for local-governments, and forest stewardship education. Specific needs for regional research are reviewed annually by the Centers. The focus of proposals varies from year-to-year depending on the shifting priorities of rural clients.

The Rural Development Center mission is to strengthen rural families, communities, and businesses by facilitating collaborative socioeconomic research and extension through higher education institutions in the various regions. Research programs are undertaken after evaluating broader regional and national priorities. Following are some accomplishments of selected research activities conducted under the auspices of various centers.

A research study funded by the Northeast Rural Development Center assessed the consumer credit knowledge of rural poor and ethnic minorities and determined their use and management practices. An educational program that focuses on the wise use of consumer credit was developed and offered to a diverse extension audience. In-service workshops also were offered to extension educators in several states in the Northeast. Two additional Northeastern states, New York and New Jersey, have duplicated the curriculum for distribution to all counties. This program was coordinated with and contributed to the development of a short video that promotes the

Money 2000 program, a program that encourages participants to save and/or reduce debt by \$2,000 by the end of the year 2000. The video was distributed widely to extension personnel within the region and nation, and to financial counselors at several military bases.

The Southern Rural Development Center partially funded and provided all logistical support for a National Conference, "Linking Family and Community Strengths." The conference was also supported by CSREES, W. K. Kellogg Foundation, Farm Foundation, National 4-H Council and the other regional rural development centers. The conference was funded to support 12 mini-grant (\$1,000) projects that would transform learning at the conference to action.

Using a Western Rural Development Center supported Business R&E (retention and expansion) program, New Mexico State University Extension has assisted seven communities expand their economic base by saving and creating local jobs. Seven jobs were saved in Silver City when task force members facilitated a propane company's move to a new location. The Clovis task force intervened with city officials to save a \$1 million business complex. The R&E staff in Torrance County created 75 jobs by helping a commercial greenhouse find suitable land. BC Hydro in Burnaby, British Columbia recently requested and received permission to adapt the Business R&E program materials for use in rural Canada.

Grants have been awarded from funds appropriated as follows: fiscal year 1971, \$75,000; fiscal year 1972, \$225,000; fiscal year 1973, \$317,000; fiscal years 1974-1981, \$300,000 per year; fiscal years 1982-1985, \$311,000 per year; fiscal years 1986-1987, \$363,000 per year; fiscal year 1988, \$475,000; fiscal year 1989, \$500,000; fiscal year 1990, \$494,000; fiscal years 1991-1993, \$500,000 per year; fiscal year 1994, \$470,000; and fiscal years 1995-1998, \$423,000 per year. A total of 10,118,000 has been appropriated. Non-federal funds available to the four Regional Centers for Rural Development were: fiscal year 1991, \$1,117,000; fiscal year 1992, \$790,000; fiscal year 1993, \$900,000; fiscal year 1994, \$776,591; and fiscal year 1995, \$710,050; for a total of \$4,293,641 across the five years for which there are complete data.

The regional rural development centers include the following. Northeast Regional Center for Rural Development, Pennsylvania State University. North Central Regional Center for Rural Development at Iowa State University; Southern Rural Development Center at Mississippi State University; and Western Rural Development Center at Oregon State University. There is also a rural development project at North Dakota State University which receives funding from the annual Rural Development Centers appropriation. Most of the research sponsored by the four regional centers is actually performed by resident faculty at land-grant universities in the respective region through subcontracts from that center's grant. The regional rural development centers were established to provide an on-going "value added" component to link research and extension and by doing so to increase rural development under the special conditions in each region. The work of the Centers is being carried out in all 50 states and in some territories. The Centers compile a report of annual accomplishments and share those with the states in the region. The list of needs is constantly evolving and is being addressed through projects that are matched to the constantly shifting local agenda. The current phase of the program will be completed in 1998.

The Centers enlist the help of academic and private/public foundations personnel on advisory committees and boards of directors to help establish operating rules and provide professional, technical counsel and peer evaluation of Center projects and the principal investigators. The projects are evaluated annually by the advisory committees and the boards of directors against the five key issue areas and the objectives of each project for relevance, achievement, and initial impacts. Follow-up evaluation is carried out by the Center staffs in order to assess long-term impacts of these projects on local communities.

RURAL POLICIES INSTITUTE

The Rural Policy Research Institute is a consortium of three universities designed to create a comprehensive approach to rural policy analysis. The Institute conducts research and facilitates public dialogue to increase public understanding of the rural impacts of national, regional, state, and local policies on rural areas of the United States. There is a need to be able to estimate the impacts of changing programs and policies on rural people and places. Objective public policy analysis can provide timely and accurate estimates of the impacts of proposed policy changes to allow more reasoned policy discussions and decisions. The principal research believes this research to be of national, regional, or local need.

The original goal of the Rural Policy Research Institute was to create a new model to provide timely, accurate, and unbiased estimates of the impacts of policies and new policy initiatives on rural people and places. The Institute has completed a number of successful policy research projects and developed three analytic models central to its mission. These projects focus on the rural implications of health care, education, housing, rural development, tax and telecommunications policy proposals. In addition, the Institute uses expert panels to provide policy decision support to a number of policy making groups at national and State levels. The expert panels and other collaborative research have, over the life of RUPRI, involved 150 scientists representing 16 different disciplines in 60 universities, 40 states, and three foreign countries have participated in RUPRI projects. Currently 50 nationally recognized scientists and policy practitioners from 38 institutions and organizations serve on RUPRI panels, task forces or work groups.

The work supported by these grants began in fiscal year 1991 and the appropriation for fiscal year 1991 was \$375,000. The fiscal year 1992 appropriation was \$525,000; for fiscal year 1993, \$692,000; for fiscal year 1994, \$494,000; and fiscal years 1995–1998, \$644,000 each year. A total of \$4,662,000 has been appropriated. Aggregated non-federal funds to support the Rural Policy Research Institute across the three universities involved include unrecovered indirect costs, salary support from university and other non-federal sources, and various other grants, contracts, and reimbursable agreements. They amounted to \$316,458 for fiscal year 1991; \$417,456 in fiscal year 1992; \$605,302 in fiscal year 1993; \$537,834 in fiscal year 1994; and \$584,516 in fiscal year 1995, for fiscal year 1996, \$576,782; and \$186,859 in 1997. Total to date is \$3,225,207.

The Institute's member universities are: the University of Missouri-Columbia; the University of Nebraska-Lincoln; and Iowa State University, Ames. Current funding will sustain activity through January 1999; however the original objectives were directed at building a permanent, on-going, policy analytical capability. We have conducted no formal evaluation, however, annual project proposals are carefully reviewed.

RUSSIAN WHEAT APHID, COLORADO

Funding will support two key areas of research that are needed to assure long-term and sustainable Russian wheat aphid management. These are: 1) Discovering new crop genes which provide resistance to the Russian wheat aphid and incorporating them into commercially acceptable wheat varieties, and 2) Integrating the available control tactics into the most effective, efficient, and environmentally sound production systems for the Great Plains.

The Russian wheat aphid is an exotic pest that entered the western United States without its normal complement of biological control agents. This insect was first discovered in North America in 1986 and rapidly became the most important insect pest of wheat in the western United States. From 1986–1991 the total economic impact was estimated to be in excess of \$657 million. In the same period, some 17.5 million pounds of insecticides were used nationally for Russian wheat aphid control. The cost to American farmers of insecticide treatments was over \$70 million. In addition, the intense use of insecticides on a crop that previously received little insecticide treatment raised concerns about the impact on water quality, human health, food safety, non-target organisms, and general environmental quality. Since the onset of the infestation, Colorado has lead all states in economic losses due to the pest. Direct losses in Colorado have been as high as \$27 million in a single year with an average direct loss of above \$11 million per year, since 1987. The goals of the research are to: (1) discover new crop genes which provide resistance to the Russian wheat aphid and incorporate them into commercially acceptable wheat varieties, and (2) integrate the available control tactics into the most effective, efficient, and environmentally sound production systems for the Great Plains.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$200,000. State appropriations and the Colorado Wheat Administrative Committee have demonstrated strong support for this effort. Research will be conducted on the campus of Colorado State University, at Colorado State University research stations, and on the farms of cooperators throughout Colorado. Outreach and extension activities will be focused on wheat growers in Colorado, Nebraska, Wyoming, Kansas, New Mexico, Texas, and Oklahoma. This is a new project and has not been evaluated by CSREES.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, MISSISSIPPI

Research related to seafood safety, quality and by-product utilization has been supported by this grant. Funds from the fiscal year 1997 grant are supporting re-

search through September 30, 1998. CSREES has requested the University to submit a proposal, which has not yet been received, in support of fiscal year 1998 funds. It is expected that funds from the fiscal year 1998 appropriation will support research to screen domestic and foreign aquaculture products for the presence of bacteria resistant to currently used antibiotics, to develop and evaluate a rapid method to detect histamine in seafood, to evaluate processes for the recovery of value-added flavor extracts from shrimp processing by-products, and to determine impact of implementation of HACCP regulations on microbial quality of seafood products.

The principal researcher believes that national needs reflected in the project include providing consumers with affordable alternative seafood products. Alternative sources of seafood protein are needed because of a drastic decline in natural harvests due to over exploitation. Other national needs addressed in this project include reducing pollution during seafood and aquaculture food processing by converting by-products into value-added food ingredients or materials. Regionally, much is unknown about the short and long-term effects of the new seafood HACCP regulations on the livelihood of Mississippi seafood and aquaculture food producers and processors who are typically small and lack sufficient resources to remain competitive. Continuation of this project will provide continued assistance to Gulf-Coast seafood processors in meeting new U.S. regulations as well as new international regulations that are important for Mississippi export products. Locally, catfish processors are a major employer of the severely economically depressed Delta region of Mississippi. By further enhancing the value of catfish products, this project seeks to improve the livelihood of individuals both on the Gulf coast and in the aquaculture region of the state. The original goals of the research were to improve the quality and safety of catfish and improve the utilization of catfish byproducts and underutilized marine species. Due to successes of the original project, subsequent efforts are focusing on additional uses of seafood and aquaculture foods by improving processing strategies and providing alternative products from waste materials. The project has thus expanded to include crab, shrimp, oysters, freshwater prawns, hybrid striped bass, and crawfish. FDA has passed rulings affecting the potential viability of Mississippi seafood and aquaculture harvesters and processors; emphasis is thus being placed on addressing possible adverse consequences resulting from these changes.

The work supported by this grant began in fiscal year 1990 when \$368,000 was appropriated for this project. The appropriations for fiscal years 1991-1993 were \$361,000 per year; fiscal year 1994, \$339,000; and fiscal years 1995-1998, \$305,000 each year. A total of \$3,010,000 has been appropriated. The State of Mississippi contributed \$1,949 to this project in fiscal year 1991; \$41,286 in fiscal year 1992; \$67,072 in fiscal year 1993; \$91,215 in fiscal year 1994; \$147,911 in fiscal year 1995; and \$61,848 in fiscal year 1996. Product sales contributed \$7,044 in 1991, \$13,481 in 1992, \$13,704 in 1993, and \$5,901 in 1994. Industry grants contributed \$14 in 1992 and \$31,796 in 1993. Other non-federal funds contributed \$80 in fiscal year 1991, \$838 in 1992, and \$17,823 in 1993. The total non-federal funds contributed to this project from 1991 through 1996 was \$501,962.

Research is being conducted by scientists in the Departments of Food Science and Technology and Agricultural Economics of the Mississippi Agricultural and Forestry Experiment Station at Mississippi State University and at the Coastal Research and Extension Center, Seafood Processing Laboratory, in Pascagoula, Mississippi.

The principal investigators anticipate that research on the original objectives will be completed in 1999. Continuing needs by Mississippi seafood and aquaculture harvesters and processors related to improved quality, safety and utilization will require research and development of new technologies to expand this industry.

An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. Since the agency has not yet received the proposal in support of the fiscal year 1998 proposal, the last review of the proposal was conducted on March 7, 1997. At that time, the agency science specialist believed that the projects addressed needs and interests of the regional seafood and aquaculture industries.

SMALL FRUIT RESEARCH

Research carried out using funding for this Special Research Grant has been to enhance the production and quality of small fruits in the Pacific Northwest which includes Idaho, Oregon, and Washington. Research has been focused on cold hardiness, breeding and genetics, and pest management. Proposals are selected after examination of their relevance to priorities identified within the region.

The principal researchers believes Washington, Oregon, and Idaho are important states for growing, processing, and marketing small fruits such as strawberries, blackberries, raspberries, grapes and cranberries. Research is needed to help solve

the myriad of problems in order to remain competitive and expand markets. The original goal of this project was to improve the production and quality of small fruits in the Pacific Northwest through research on cold hardiness, breeding and genetics, and pest control. Research progress to date for Oregon is the evaluation of new strawberry germplasm from Chile and North America for resistance to fruit rot, aphids, spider mites, and weevils; virus indexing of small fruit germplasm; better color stability of processed strawberries; increasing cranberry production through better weed control; and improving wine quality. Work is continuing in Washington on fruit physiology; cold hardiness of strawberries, grapes, and red raspberries; pest management of cranberries; and breeding of pest resistant strawberries. Idaho work continues on postharvest research for better marketability and adapting small fruit crops to high elevation growing conditions. Oregon and Washington are jointly carrying out marketing studies to identify new market niches for berry crops and wines.

The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal year 1991 was \$125,000. The fiscal years 1992 and 1993 appropriation was \$187,000 per year, fiscal year 1994 was \$235,000, and fiscal years 1995-1998 are \$212,000 each year. A total of \$1,582,000 has been appropriated. The nonfederal funds and sources provided for this grant were as follows: 1991, \$1,562,078 state appropriations, \$40,933 product sales, \$62,993 industry, \$357,266 other nonfederal; 1992, \$1,465,969 state appropriations, \$90,453 product sales, \$119,164 industry, \$287,976 other nonfederal; 1993, \$1,539,255 state appropriations, \$91,954 product sales, \$161,141 industry, \$416,712 other nonfederal; 1994, \$368,375 state appropriations, \$45,430 industry and \$90,822 other nonfederal; and \$1,185,249 for fiscal year 1995. A complete accounting of 1996 funds is not yet available from the states involved.

The research is being conducted at Oregon State University, Washington State University and the University of Idaho. Oregon State University is the lead university. The original objectives are still valid. Therefore, this is a continuing process with some priorities changing somewhat but still within the objectives. The project proposals are evaluated through a peer review mechanism and the adherence to the research priorities.

SOUTHWEST CONSORTIUM FOR PLANT GENETICS AND WATER RESOURCES

New Mexico State University, Los Alamos National Laboratory, Texas Tech University, the University of Arizona and the University of California at Riverside entered into a cooperative interdisciplinary research agreement constituted as the Southwest Consortium on Plant Genetics and Water Resources to facilitate research relevant to arid and semi-arid land adaptation. The overall goal of the Consortium is to bring together multi-disciplinary scientific teams to develop innovative advances in plant biotechnology and related areas to bear on agriculture and water use in arid and semi-arid regions. All grants made to the participating Institutions are awarded competitively by a scientific peer review process.

The Southwest Consortium for Plant Genetics and Water Resources is addressing the need for an integrated program that identifies specific problems of southwest agriculture, coordinates water and biotechnology research aimed at solving these problems, and facilitates the transfer of this information for commercialization. The specific research objectives of the Consortium include the development of crops with resistance to: drought and temperature extremes, adverse soil conditions, and pests and parasites. The Consortium is also identifying technologies for improved water and nutrient delivery. This research is highly significant to national, regional and local needs. The original goals of this Consortium remains to facilitate research to provide solutions for arid and semi-arid crop adaptation. Five participating institutions have developed research plans consistent with the Consortium's goals. Sub-grants are awarded competitively following peer review to support research that would solve problems unique to southwest agriculture. Specific attention is given to interdisciplinary agricultural research. Since its inception in 1985, the Southwest Consortium has provided essential support for the establishment of baseline data on new, forward thinking research relevant to the improvement of arid lands agriculture. Several areas of accomplishment are noted. One area is the identification of chromosome regions conferring water use and transpiration efficiency in wheat; another the impact of water stress on host plant resistance to aphids and whiteflies on melon; a third, the genetic variation for deposition and demobilization of stem water-soluble carbohydrates in spring wheat; and the biochemical and molecular mechanisms of salt-tolerance.

Grants have been awarded from funds appropriated as follows: fiscal year 1986, \$285,000; fiscal years 1987-1989, \$385,000 per year; fiscal year 1990, \$380,000; fis-

cal years 1991–1993, \$400,000 per year; fiscal year 1994, \$376,000; and fiscal years 1995–1998 \$338,000 each year. A total of \$4,748,000 has been appropriated. The Consortium's host institution, New Mexico State University, reports matching non-federal funds of \$80,000 in state appropriations in 1992; \$100,000 in 1993; \$100,000 in 1994; \$100,000 in 1995; and \$100,000 estimated in state appropriations for each of the fiscal years of 1996 and 1997. These funds exist in the form of researchers' salaries, facilities, equipment maintenance and administrative support.

Research is being conducted by a consortium of institutions comprised of New Mexico State University, Los Alamos National Laboratory, Texas Tech University, University of Arizona, and University of California at Riverside. New Mexico State University is the lead institution. The project was initiated in 1986 and accomplished significant results in the first five years. Currently additional and related objectives have evolved and anticipated completion date for these is 2001. Many of the objectives of this research have been met. Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. A summary of that review indicated progress in achieving the objectives. An external review is being planned for 1998.

SOYBEAN CYST NEMATODE, MISSOURI (BIOLOGY AND MANAGEMENT OF HETERODERA GLYCINES)

The research being funded by this grant is crucial to the development of effective management strategies to understand host parasite relationships of the pathosystems and each of its components. Work has dealt mainly with identifying *Heterodera glycines*-resistant genes and incorporating them into agronomically superior cultivars. Basic studies elucidate the fundamental biology of the cyst nematode in regard to new management strategies. Applied work dealt with evaluating production systems and to new management strategies. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES. The principal researcher believes that although this research is focused on the soybean cyst nematodes in Missouri, the problems is of regional and national significance. The soybean cyst nematode, *Heterodera glycines* is the most serious pest of soybean in the United States. The problems continue to increase in the Midwest where 12 states have yield reductions in soybean because of this nematode. Due to the nematodes ability to adapt to resistant varieties over time, new varieties are continually needed. The original goal of this research was managing soybean cyst nematode through the development of new resistant soybean varieties and the use of biological and cultural management strategies. To date, several nematode resistant soybean line have been or will be released. The need for breeding soybean lines to develop resistant varieties with a broad spectrum of resistance continues. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Other aspects of the works relate to field management strategies for these nematodes including cultural and biological applications. Accomplishments in these areas include use of a fungal pathogen of nematode eggs and the use of trap crops to reduce nematodes and improved soil health.

Grants have been awarded from funds appropriated as follows: fiscal year 1979, \$150,000; fiscal years 1980–1981, \$250,000 per year; fiscal year 1982, \$240,000; fiscal years 1983–1985, \$300,000 per year; fiscal years 1986–1989, \$285,000 per year; fiscal year 1990, \$281,000, fiscal year 1991, \$330,000; fiscal years 1992–1993, \$359,000, fiscal year 1994, \$337,000; fiscal years 1995–1997, \$303,000 per year and fiscal year 1998, \$450,000. A total of \$5,955,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$105,012 state appropriations in 1991; \$84,368 state appropriations in 1992; \$168,017 state appropriations in 1993; \$118,725 state appropriations in 1994; \$33,498 in 1995 and 1996; \$33,723 in state appropriations in 1997; and \$37,445 in state appropriations in 1998.

This research is being conducted at the Missouri Agriculture Experiment Station and the University of Missouri. The anticipated completion date for the major objectives was 1996. Many objectives are being met but genetic interaction of the soybean cyst nematode/soybean is extremely complex. The anticipated completion date of the continuing research is in 1999. The last evaluation of this project was a merit review in December, 1996 and the renewal project will be evaluated in 1998. In summary, continued development of new management strategies for the soybean cyst nematode is extremely important. Progress in meeting the objectives in each goal continues with new varieties with nematode resistance being released yearly as well as excellent progress in other management strategies. Two new soybean strains were developed with resistance to soybean cyst nematodes and root-knot nematodes. A Plant Variety Protection has been applied for the cultivar Maverick that is nema-

tode and root rot resistant. A chitinase gene was successfully cloned in *Rhizobium* that may protect soybean plants from soybean cyst nematodes.

SPATIAL TECHNOLOGIES FOR AGRICULTURE, MISSISSIPPI

CSREES has requested the university to submit a grant proposal that has been received, and is being reviewed. This project will evaluate the Components of Advance Spatial Technology for Agriculture (ASTA), also known as site-specific farming as precision farming to improve the level of Crop Management and thereby improve farm income and while avoiding adverse environmental impacts. Integration of ASTA Components included computers, Global Positioning, Geographic Information System and Yield Monitor will permit combining yield maps with agronomic data and variable rate technology for application of seed fertilizer and pesticides, as well as other management practices to specific sites as precisely the right amounts for optimum production with minimum inputs. The project is composed of sub projects representing the contribution disciplines. The sub projects are selected using a competitive peer review process from proposal from scientist within the institution.

The proposed research under this Special Research Grant will focus on evaluation of site specific technology evaluation and utilization for the major agronomic crops in Mississippi. In addition, the technology evaluation information would apply to many other crops where every site-specific or precision farming systems are used. The original goal of this project is to develop production management strategies utilizing site-specific technologies to enhance crop production efficiencies and environmental quality.

The work supported by this grant begins in fiscal year 1997, and the appropriation for fiscal year 1997 was \$350,000, and fiscal year 1998 is \$600,000. A total of \$950,000 has been appropriated. The estimated state support for this project in 1997 was \$297,000.

Research will be conducted at the Mississippi Agricultural Experiment Station. The principal investigators anticipate the completion date for these objectives to be in 2002. The project is evaluated by a coordinating committee at the end of each year in preparation for the next cycle of field work. To date research studies have been initiated for all of the objectives. These are designed as multi-year studies and definitive results are not yet available. These initial results are being used to refine and focus the research for subsequent cycles.

STEEP III—WATER QUALITY IN PACIFIC NORTHWEST

The STEEP III study was established in 1996 as the third phase of the tri-state STEEP Program entitled "Solutions to Environmental and Economic Problems," to meet the needs of farmers and ranchers in the Pacific Northwest in solving severe problems with soil erosion and water quality, while maintaining economically and environmentally sustainable agricultural production. An open call for research proposals is held by each of the three states, Idaho, Oregon, and Washington. Awards are made competitively after both internal and external peer reviews within the states, and merit review by the agency. The principal researcher believes the Pacific Northwest wheat region is subject to severe wind and water erosion, which has taken a heavy toll of the topsoil in a little more than 100 years of farming. Due to the hilly terrain, water erosion has reduced potential soil productivity in the high rainfall areas of the region by about 50 percent. Wind erosion has reduced productivity on the sandy soils in the lower rainfall areas. Also, off-site environmental costs of water erosion are large. Although many of these are difficult to measure, they include damage from sediment to recreational areas, roadways, and other areas which costs taxpayers millions of dollars annually. Wind erosion, which occurs mostly in the spring and fall, also can be costly and environmentally damaging, and causes increasing concerns for human health and safety from blowing dusts. Water quality degradation is of increasing concern in the agricultural areas of this region, since sediment is a major pollutant of surface water runoff which may contain varying amounts of chemicals. The complex hydrology of the region's landscape has made it difficult to identify the sources of these chemicals in surface and ground waters.

The primary goals are: to obtain and integrate new technical/scientific information on soils, crop plants, pests, energy, and farm profitability into sustainable, management systems; to develop tools for assessing the impacts of farming practices on soil erosion and water quality; and to disseminate conservation technology to the farm.

The original STEEP and STEEP II projects for erosion control, and the successor STEEP III program for erosion and water quality control, have provided growers a steady flow of information and technologies that have helped them meet economic, environmental, and resource conservation goals. Through the adoption of these tech-

nologies, the researchers believe that growers of wheat, barley, and other alternative crops have been able to reduce soil erosion, improve water quality, and maintain or increase farm profitability. This has been accomplished through a tri-state, multi-disciplinary approach of basic and applied research and through technology transfer and on-farm testing to assist growers with applying these research findings on their farms. The on-farm testing program has been especially successful because growers are involved directly in the research and education effort. For example, the on-farm testing program has evaluated conservation options that growers can use to meet conservation compliance requirements in managing crop residues on agricultural lands for soil and water management purposes.

STEEP programs have helped position farmers with new conservation technologies, such as direct seeding management systems, well in advance of deadlines to meet current and anticipated policy requirements. This preparation protects farmers against potential penalties and loss of government program benefits.

The work supported by this grant began in fiscal year 1991, and the appropriations for fiscal years 1991–1993 were \$980,000 per year; in fiscal year 1994, \$921,000; in fiscal year 1995, \$829,000; and in fiscal years 1996–1998, \$500,000 per year. A total of \$6,190,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$938,812 state appropriations, \$63,954 product sales, \$156,656 industry, and \$16,994 miscellaneous in 1991; \$1,025,534 state appropriations, \$75,795 product sales, \$124,919 industry, and \$88,696 miscellaneous in 1992; \$962,921 state appropriations, \$62,776 product sales, \$177,109 industry and \$11,028 miscellaneous in 1993; \$1,069,396 state appropriations, \$46,582 product sales, \$169,628 industry, and \$22,697 miscellaneous in 1994; and \$1,013,562 state appropriations, \$31,314 industry, and \$107,151 miscellaneous in 1995. In 1996, Washington received \$231,724 state appropriations; Oregon passed Measure 5 which reduced revenues and imposed funding restrictions so they were unable to provide any non-federal cost-sharing or matching funds; and Idaho contributed \$81,525 state support, and \$86,242 in estimated non-federal grant support, for a total non-federal contribution of \$167,767. In 1997, Washington received \$197,234 state appropriations; Oregon continues to have Measure 5 as law and continues to be unable to provide non-federal cost-sharing or matching funds; and Idaho contributed \$27,235 state support and \$24,525 in estimated non-federal grant support for a total non-federal contribution of \$51,760.

The work under STEEP III will be done at laboratories and field research sites at the University of Idaho, Oregon State University, and Washington State University. Cooperative on-farm testing will be conducted in cooperation with growers on their fields in Idaho, Oregon, and Washington. The STEEP II project was completed in 1995, and the results were compiled in a final, 5-year report in January 1997. The STEEP III project started in 1996 and will continue through the year 2000 as a 5-year project.

The agency's program manager annually reviews progress reports, proposes new research on the STEEP Program, and attends the annual meetings to assess progress. The program is evaluated within the states each year by three committees: grower, technical, and administrative. Annual progress is reported at an annual meeting and compiled into written reports. These reports and the meeting are reviewed annually. Grower and industry input is solicited at the annual meeting on research objectives and accomplishments. The most recent annual meeting held in January 1998, highlighted direct-seeding technology, and attracted over 950 attendees, of which 70 percent were growers from the tri-state region. Farmer surveys are distributed at each annual meeting, and results are compiled to assess the extent to which the objectives are being successfully achieved.

SUSTAINABLE AGRICULTURE, MICHIGAN

This project is intended to develop agricultural production systems that are productive and profitable as well as being environmentally sustainable. More specifically, this project will examine how to achieve a high nutrient flow from soil to crops and animals, and back to soil, with low loss to ground and surface waters. The grant is allocated, by the Michigan Agricultural Experiment Station, to priority areas within the general area of sustainable agriculture. Within each of those areas grants are awarded based on research merit and proposal submission. The projects and proposals undergo annual formal review within the Michigan system prior to submission to CSREES, and then review within CSREES.

The principal researcher believes there is a need to understand the biological processes occurring Michigan's high-nutrient-flow crop and animal systems. With high water tables, networks of lakes and slow-moving streams, and concern about

environmental standards, field contamination by agricultural production materials is a high priority.

The specific goals of this research are to develop an agroecological framework for decision-making, develop crop and cover crop rotations, develop water table management strategies, and develop rotational grazing systems. Accomplishments to date include an extension publication on agroecology, development of on-farm compost demonstration sites, collection of research data and computer software models on water table management, and completion of initial research trails on rotational grazing at three sites in Michigan.

The work supported by this grant began in fiscal year 1994 with an appropriation of \$494,000; \$445,000 were appropriated in fiscal years 1995 through 1998, bringing total appropriations to \$2,274,000. Matching funds were provided at the state level for \$511,900 in fiscal year 1994, \$372,319 for fiscal year 1995, and \$359,679 in fiscal year 1996. Matching funds provided for this research include state funds in the amount of \$25,313 for fiscal year 1992, \$26,384 for fiscal year 1993, \$27,306 for fiscal year 1994, and \$36,091 in fiscal year 1995.

This work is being carried out in Michigan at several locations by Michigan State University. Locations include the Kellogg Biological Station and the Upper Peninsula Experiment Station. This project is currently scheduled to go through March 31, 2000.

A formal evaluation of the Principal Investigator's program was concluded in 1997, commissioned by the C.S. Mott Foundation through an independent consultant. The project continues to have annual peer review.

SUSTAINABLE AGRICULTURE AND NATURAL RESOURCES, PENNSYLVANIA

This project studies the cycling of nutrients in soil and crops with special emphasis on the development of indices for measurement of soil health. This project is awarded on the basis of peer evaluation to scientists working in the Northeast U.S. on indices for soil health especially with regard to animal waste application to soil. The project undergoes regular internal evaluation and assessment as part of Penn State's major effort in soil quality and nutrient management research. Degradation of soil health/quality by excessive application of animal waste is a most serious problem for agriculture both in the mid-Atlantic region and throughout the nation. State governments both regionally and nationally are attempting to address the issue of soil and water degradation by intensive animal agriculture. Traditional soil test results are not providing the needed answers for effective nutrient—manure—management.

The original goal of this research was to understand the cycling of nutrients from animal agricultural production systems through soil and water into crops and back to food for animals or directly to humans in the case of vegetable production. Conventional science in the late 1980's and early 1990's held that if only all animal wastes were composted, the nutrient management problems would disappear. However, the results of this research to date show that this is a more complex problem. If farmers are to manage their farm lands properly, indicators of soil quality and health must be developed that can be used by agricultural producers and consultants. Efforts under this project have been devoted to this goal.

With continued growth in numbers and size of concentrated animal operations (CAO's) and the increasing number and severity of water related problems (Pfiesteria) in the region, it is apparent that our understanding of nutrient cycling is not sufficient to prevent such outbreaks. Research in 1996 and 1997 has indicated that many factors not usually considered in manure management may influence the amount and kinds of soil organic matter (SOM) and associated microbial populations. SOM and its associated microbial biota plays a major role in nutrient accumulation and release from soils. This research has now elucidated at least one SOM indicator of soil health that will be useful in more effectively managing manure application to soils. It is hoped that in the next year others will be identified.

The work supported under this grant began in fiscal year 1993. The appropriation for fiscal year 1993 was \$100,000 and \$94,000 was appropriated in each of the fiscal years 1994 through 1998 for a total of \$570,000. A total of \$369,574 in matching support from university, state and private industry sources was provided in fiscal year 1997.

Research is being conducted by the Pennsylvania State University with cooperators throughout the state. The anticipated completion date for the overall original project objectives is in June 30, 1999. The project is meeting the key objectives set forth in 1996. A significant indicator for soil health has been identified. Further work is continuing to determine if it will be useful as a guideline for manure management especially with regard to the high end soil loading problems associated with CAO's.

Interim evaluation of this project will be done prior to June 30, 1998. Criteria used to assess the quality of the science will be peer reviewed throughout the northeast region. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff.

SUSTAINABLE AGRICULTURE SYSTEMS, NEBRASKA

This project is aimed at integration of field crops, animal production, agroforestry, livestock waste management, and diversified enterprises to meet production, economic, and environmental quality goals. The grant was awarded competitively within the University of Nebraska, and the integrated farm project has been reviewed annually for technical merit and progress toward goals by the internal review process of the university.

Farmers and ranchers in Nebraska and throughout the Midwest face increasing difficulties in maintaining profitable operations that are sustainable under increased production costs and more stringent environmental regulations. They continue to seek alternative production systems, integration of crop and animal enterprises, value-added products, including those from woody perennials, and new marketing approaches to secure more of the food dollar. Work on crop residue utilization is important to assess the loss of erosion mitigation when grazing occurs as well as the benefits of winter forage to production of lean beef. Erosion is still a major problem with monoculture cropping, and work with contour strips, residue management, and animal grazing is necessary to provide recommendations to farmers for how to manage fragile lands.

This project has involved several components, with a number of results to date. In improving erosion control through grazing, calves were fed cornstalks from October through March, and fed some supplements. The calves had lower costs of production and reduced need for grain feed. The researcher's work on integrative cropping and agroforestry has shown that diversifying rotations centered around soybeans has provided increased economic returns. In the objective dealing with compost utilization, compost has provided increased sources of nitrogen and improved soil quality. Reports from this project have been disseminated through extension and through a sustainable agriculture newsletter.

This project began in fiscal year 1992, with an appropriation of \$70,000; subsequent appropriations are as follows: \$70,000 in fiscal year 1993; \$66,000 in fiscal year 1994; and \$59,000 in fiscal years 1995 through 1998. Total appropriations to date are \$442,000. Matching funds provided for this research include state funds in the amount of \$25,313 for fiscal year 1992; \$26,384 for fiscal year 1993; \$27,306 for fiscal year 1994; \$36,091 in fiscal year 1995 and fiscal year 1996 \$24,267.

Research is being conducted by the University of Nebraska at several locations in Nebraska, with the major part of the project at the Agricultural Research and Development Center near Mead, Nebraska. The current project proposes work through March 31, 1998. It is expected that current objectives of the project will be met by this time period.

Findings from this project have shown that young cattle can be fed with lower costs if cornstalks are used as part of their rotation. This system also allowed for a cropping pattern that reduced erosion. The corn, soybean, and agroforestry system showed the highest net income of the systems tested.

SUSTAINABLE PEST MANAGEMENT FOR DRYLAND WHEAT, MONTANA

This research will address pest issues of the dryland wheat areas of eastern Montana. The proposed research is specifically designed to address pest issues of the dryland wheat area of eastern Montana. The proposal addresses pest management issues under cropping sequences and tillage practices utilized in the region for wheat production.

Objectives of the research are to evaluate the sustainability of pest management using four cropping sequences and two tillage systems on large experimental blocks representing different farming regions in Montana and to investigate the interaction of crop rotation, tillage systems, and pest management. In addition, the researchers will analyze physical and biological properties of soil as affected by cropping sequence and tillage systems and evaluate weed species composition as affected by cropping sequence, tillage system, and weed management decisions. Presence and impact of plant pathogens as affected by cropping sequence and tillage systems will be determined. Part of the study will also be to ascertain the arthropod community within each cropping system and determine the impact of tillage on species composition. Profitability, marketing, and environmental benefits of diversified cropping systems will be examined. Study results will be assimilated and transferred into practical solutions to farmers' problems relative to confines of dryland wheat pro-

duction. Study sites were surveyed in fall of 1997, baseline soil samples were taken, and replicates measured. Winter wheat was seeded in designated treatment rows in each replicate. To facilitate seeding under no-till conditions, a Conservation Pak air seeder was purchased with funds awarded in fiscal year 1997 to this project. The remaining crop treatments will be seeded in spring 1998.

This work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$200,000 and fiscal year 1998 is \$400,000. A total of \$600,000 has been appropriated. Non-federal funds of \$42,000 from the Montana Wheat and Barley Committee were provided for project support during 1997.

Research will be conducted at Montana State University Experiment Station. The project is proposed for a duration of 3 years and therefore should be completed after fiscal year 1999. The expected completion date of the project is fiscal year 1999. Assessment of the precision of biological control organisms and estimates of profitability, marketability, and risk will be used to assess progress. Yearly progress reports will be used to track the effectiveness of the program of research.

SWINE WASTE MANAGEMENT, NORTH CAROLINA

The objectives of this project are: (1) to develop a prototype system for treatment of animal waste which will be used to study and optimize new and innovative swine waste management treatment process; (2) to provide funds for additional technical staff to perform the work under this project; (3) to purchase additional analytical equipment; and (4) to provide funding for operation of the prototype facility. The prototype facility will consist of a set of eight tanks which will be connected by piping or hoses to enable researchers to test a variety of different strategies for treatment of animal waste, including anaerobic or aerobic digestion, removal of nutrients such as nitrogen and phosphorus and alterations in the sequence of these various operations. This project was funded following merit review of the proposal by scientists within CSREES with expertise in animal waste research. The principal researcher has stated that North Carolina now ranks second in the US in both pork and poultry production. The problem of waste management has become critical because adequate land for application of waste is not available in some areas, water quality problems have been noted in both surface and ground waters, nutrients from several lagoon failures have created serious pollution problems in rivers and coastal areas, and communities have become less tolerant of odor problems.

The original goal of this research was to enhance the design, development, and implementation of alternative swine waste management strategies and treatment systems. The institution also is enhancing the capability of an Environmental Analysis Laboratory which supports this project as well as other projects on animal waste management. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$215,000 and fiscal year 1998 is \$300,000. A total of \$515,000 has been appropriated.

During fiscal year 1997 there were \$114,000 in state funds and \$82,389 for in kind support from industry (donated equipment) that were provided from non-federal sources in support of this work. This research is being conducted at North Carolina State University in Raleigh, North Carolina.

The original anticipated completion date was October 1, 1997. Due to funding not starting until March 1, 1997, the original objectives are now approaching completion and should be done by March, 1998. Additional objectives have been proposed which will have a completion date of March, 1999. CSREES conducted an evaluation of the progress of this work during January 26-28, 1998.

TILLAGE, SILVICULTURE, AND WASTE MANAGEMENT, LOUISIANA

This research has five components: Rice and Cotton Tillage, Bald Cypress and Water Tupelo Silviculture, and Dairy and Poultry Waste Management. More specifically, the Rice Scientists are looking for ways to improve stand establishment; the Cotton Scientists are focusing on the use of tillage systems to combat harmful insect populations; the Waste Management Scientists are quantifying the environmental and economic effectiveness of approved dairy and poultry waste disposal systems; and the Silviculturists are conducting a problem analysis on factors affecting Bald Cypress and Water Tupelo regeneration. The project is annually subjected to the university's merit review process. The principal researchers hypothesize that since the crops, forests, and waste issues addressed by this project extend beyond the state borders this research has, at a minimum, multi-state to regional application.

The original goals were to: improve conservation tillage in rice and cotton farming, to determine the effectiveness of no-discharge dairy waste treatment facilities, to determine acceptable land treatment levels for poultry waste disposal, and to evaluate wetland forest regeneration processes. All components of the project have

established research studies and monitoring progress. Each year the principal investigator initiates a review of the sub-projects. In this fashion, he promotes good dialogue and cooperation among the sub-project investigators and their respective departments.

The work began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000. For fiscal years 1995–1998, the appropriation was \$212,000 per year. This sums \$1,083,000. State funding in support of these areas of research exceeds \$750,000 annually.

Investigations are being conducted on the main campus at Louisiana State University as well as the Experiment Stations at Calhoun and Washington Parish, Louisiana. The original work was scheduled for completion in 1999. Early term objectives have been met. Most of the added experiments are scheduled for closure in 1999 as well.

The last field evaluation was completed on December 12, 1995. The evaluation summary complimented the scientists on the interdisciplinary components associated with this project, along with their investigative procedures, report writing, and external networking. A 1998 field review is tentatively scheduled for March 9–10.

TROPICAL AND SUBTROPICAL RESEARCH

The Tropical and Subtropical Research—T STAR—Program is operating in coordination with the T STAR Caribbean and the T STAR Pacific Administrative Groups. State Agricultural Experiment Stations that are members of the Caribbean group are Florida, Puerto Rico, and the Virgin Islands; members of the Pacific group are Hawaii and Guam. The proposals are peer reviewed and are then selected for funding by the administrative groups.

Non-member institutional interests are represented by the Executive Director of the Southern Region Agricultural Experiment Station Directors, who is a member of the Caribbean group, and the Executive Director of the Western Region Agricultural Experiment Station Directors, who is a member of the Pacific group. The Agricultural Research Service also has representation on the two groups, as does the CSREES scientist who manages the T STAR grant program. Funds for the program are divided equally between the two Basin Administrative Groups.

The research objective of the program developed by the principal is to improve the agricultural productivity of many of the subtropical and tropical parts of the United States. Special research grants have been awarded for research on controlling insect, disease and weed pests of crops; increasing the production and quality of tropical fruits, vegetables and agronomic crops; promoting increased beef production through development of superior pastures; detection of heartwater disease of cattle and the influence of heat stress on dairy cattle reproduction; better use of land and water resources; developing computer models for efficient crop production systems and animal feeding systems; developing computer models for land-use decisions; using biotechnology methodologies for improving plant resistance to viral and bacterial diseases; using biotechnology to develop non-chemical, or biological, strategies for controlling insect pests; and potential for growing new speciality crops. Fiscal year 1998 proposals have been requested. The principal researcher believes there is a need for the T STAR program to provide research-generated knowledge that enables informed choices in the responsible use of natural resources, facilitates the health and well being of American citizens through improved food safety and nutrition, provides frontline protection for the rest of the nation's farms and ranches from serious plant and animal diseases and pests, and enhances the ability of U.S. farmers to produce crops efficiently and economically and/or to introduce new crops and agricultural products with export potential to gain market share abroad. On a regional basis, the T STAR program addresses the unique challenges of practicing tropical agriculture, that is presence of pests year-round, heat stress, post-harvest processing to meet regulatory requirements for export, etc. The local need of Americans living in tropical regions of the nation for T STAR knowledge-based products to design and implement sustainable agricultural development within fragile tropical agroecosystems—particularly on tropical islands—and to develop new crops and niche markets.

The original goal of this research was to increase the production and quality of tropical crops; control pests and diseases of plants and animals; promote increased beef production and conserve land and water resources. In fiscal year 1996, grants were supported for research on control strategies for Melon thrips; the biochemical nature of resistance to rust in nutsedge; development of bioherbicides for nutsedges; development of tomato cultivars with resistance to the spotted wilt virus; development of pheromones for monitoring and controlling the citrus root weevil; reducing the effects of heat stress in dairy cattle; development of a decision support system

for vegetable production; finding cucurbits with resistance to silverleaf, developing a computer program for optimal supplementation strategies for beef and dairy cattle on tropical pastures; characterizing new strains of citrus tristeza virus in the Caribbean basin; determining the economic threshold for the citrus leaf miner on limes; using viral replicase genes to engineer rapid detection methods for geminiviruses; developing markers of bacterial spot resistance genes in tomato; breeding snap and kidney beans for resistance to golden mosaic virus and for heat tolerance; searching for resistance to papaya bunchy top disease; developing weed controls for yam production; and bioengineering ringspot virus resistance in papaya.

The operation of the tropical and subtropical research program was transferred from ARS to CSREES, with CSREES funding being first provided in fiscal year 1983. Funds in the amount of \$2,980,000 per year were appropriated in fiscal year 1983 and 1984. In fiscal year 1985, \$3,250,000 was appropriated. In fiscal years 1986, 1987, and 1988, \$3,091,000 was appropriated each year. \$3,341,000 was appropriated in fiscal year 1989. The fiscal year 1990 appropriation was \$3,299,000. The fiscal years 1991–1993 appropriations are \$3,320,000 per year; \$3,121,000 in fiscal year 1994; \$2,809,000 in fiscal years 1995–1996; and \$2,724,000 in fiscal years 1997 and 1998. A total of \$49,270,000 has been appropriated.

For fiscal year 1997, more than \$1 million of nonfederal funds were provided to the T STAR program from state appropriations. These state funds were in the form of faculty salary time commitments and indirect costs covered by the institutions.

This research is being conducted in Florida, Puerto Rico, Virgin Islands, Hawaii, and Guam. Work is also being done in other Pacific and Caribbean countries through agreements between institutions but not using federal funds.

Research on tropical crop and animal agriculture to increase productivity, net profits, decrease harmful environmental impacts, conserve water, and natural resources. The need to continue with this project has been expressed by producers in the area, importers in the U.S. mainland and the institutions involved.

The projects that are funded by the T STAR Special Research Grant have been peer reviewed by panels of scientists in the U.S. to assure that good science is undertaken. Also, as part of the grant renewal process, progress reports are reviewed by the two Administrative Groups and by the grant manager at the national level. Workshops in which research results and their application for agricultural production are developed every two years. Research papers are published in the appropriate regional, national, and international forums available.

The development in 1995 of the Strategic Plan for T STAR provided a mechanism to define priorities, examine program direction, and recommend operational changes. One of the principal points considered was to bring the Caribbean and Pacific Basin components closer and better coordinated. T STAR and the coordination which it implies was an outcome that will make this program better.

URBAN PESTS, GEORGIA

This research is focused on urban pests with specific emphasis on termites and ants. This project has been evaluated annually by CSREES. The principal researcher believes subterranean termites and ants are significant economic pests in the Southeastern United States. Damage and control costs for termites in Georgia were estimated at \$44.5 million in 1993. It is estimated that professional pest control operators apply over 23 million pounds of active ingredients in and around homes each year. Chemicals currently registered for controlling these pests are less efficacious than desired and applied at an intensity that exceeds most agricultural settings.

The goal of the termite research is to better understand the foraging activities of subterranean termites and their responses to selected environmental cues in order to tailor monitoring and predictive strategies with efficacious conventional and alternative methods of control. Additionally, an objective is to improve the management of subterranean termites through studies of the termite genome, cuticular chemistry, morphometric characteristics and termite behavior. Specific accomplishments in the termite research are as follows: Collection of three full years of data on over 80 different subterranean termite colonies in four of the major soil provinces in Georgia was completed in early 1997. Research with conventional termiticide chemistry has demonstrated the interaction between soil type and termite tunneling activity and the potential role these interactions play in the incidence of reported termite treatment failures using these currently registered materials. The past years research also involved investigations of a naturally occurring fungus as a potential control agent. Research on the concept of baits as a termite control tactic have raised concerns about the practical application of this recently registered technology.

This work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 was \$76,000 per year. In fiscal year 1994 the appropriation was \$71,000 and in fiscal years 1995 through 1998 the appropriation was \$64,000 each year. A total of \$555,000 has been appropriated. The non-federal funds and sources provided for this grant by fiscal year were as follows: 1991—none, 1992—\$26,000, 1993—\$18,000, 1994—\$59,530, 1995—\$59,539, 1996—\$30,000, 1997—\$80,000.

This research and technology transfer program is being conducted at the University of Georgia, Department of Entomology, Athens, Georgia. The grants have been processed on a year to year basis pending the availability of funds, however, the original objectives were essentially a five to eight year plan of work. CSREES entomologists judge that excellent progress has been made on foraging behavior and the identification and development of termite baits.

This project has been evaluated on an annual basis by CSREES through the progress reports. This year a site visit by CSREES has been scheduled by CSREES on February 10. This is a new project and has not been evaluated by CSREES. The project will be evaluated by review of the proposal and the annual project reports.

VIDALIA ONIONS

This is the first year that the research on *Vidalia* onions is funded. CSREES has requested the university to submit a grant proposal that has not yet been received. This research is important to the State of Georgia and is directed to improving the quality of *Vidalia* onions. The proposed goal of this research is to investigate production practices to improve *Vidalia* onion culture. The specific objective is to improve onion quality and enhance competitiveness of the product.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$84,000. Since this is the first year funding was provided for this project, non-federal funding information is not available. Research will be conducted in Georgia and the anticipated completion date for the original objectives is five years based on objectives reachable within a year time frame. As this is the first year of funding for this project, an evaluation has not yet been done.

VITICULTURE CONSORTIUM, NY AND CA

The University of California and Cornell University in New York conducted research on varietal responses of grapes, modeling of water requirements, management of diseases including phyloxera and other cultural aspects of grape production. Funds were used by the lead institutions to fund projects in the various grape producing states within their region. Grants were made based on peer reviewed proposals and selected competitively by regional groups based on priorities developed by researchers, extension, and industry personnel.

The research being carried out is designed to help the viticulture and wine industries remain competitive in the U.S. and in the global market. Both these industries have a positive effect on the U.S. balance of payments. The original goal of this research is to maintain or enhance the competitiveness of the U.S. viticulture and wine industry in the global market.

Grants have been awarded from funds appropriated as follows: fiscal year 1996, \$500,000; fiscal year 1997, \$500,000; and fiscal year 1998, \$800,000. A total of \$1,800,000 has been appropriated. In 1997, the viticulture industry provided \$500,000 for projects following the same criteria and priorities as in the federally funded ones. In effect, this is an industry match of funds. Research is being conducted in various states which include California, Washington, New York, and Pennsylvania.

The research priorities set by the guidance group were not all addressed nor will they be in the near future. No evaluation has been made yet. However, proposals for continued funding are evaluated for progress by a guidance group made up of research, extension, and industry persons.

WATER CONSERVATION, KANSAS

This research program is designed to develop and disseminate technical and economic information on the efficient use of water for irrigated crop production in western Kansas. The following objectives comprise this program for the sixth year of the project:

1. Develop regression models to estimate the longevity of subsurface drip irrigation systems using calculations of annual system performance deterioration based on 13 years of operating pressures and flow rates;
2. Evaluate utilization of livestock effluent with subsurface drip irrigation and its effect on water redistribution and corn water use patterns;

3. Develop best management practices for nitrogen fertigation using subsurface drip irrigation systems for corn;

4. Estimate the long run economic impacts of irrigation efficiency improvements for irrigated corn, wheat, and grain sorghum in the farm sector and affiliated sectors of the High Plains economy;

5. Disseminate irrigation research information and best management practice recommendations to Kansas irrigators through a series of extension bulletins and updates based on research-based information.

Results from a 4-year study were summarized into a Best Management Practice for nitrogen fertigation for corn using subsurface drip irrigation on deep, well-drained, loessial silt loams in western Kansas. Corn yield, crop nitrogen uptake, and water use efficiency all plateaued at the same level of total applied nitrogen, 160 pound per acre nitrogen fertigation rate, with an average yield of 213 bushels per acre. The results emphasize that high-yielding corn production also can be efficient in nutrient and water use. Using earlier studies as a guide, a new study was initiated in 1997 to use the best management practice of daily subsurface drip irrigation with periodic additions of nitrogen fertigation. Results from 1997 showed that reducing the irrigation capacity from full irrigation to 50 percent irrigation did not reduce yields. Corn yields averaged an extremely high 277 bushels per acre for these treatments. This sub-study was initiated as a result of the changes in the Federal farm program which allow greater planting flexibility. These changes removed the need of irrigators to protect base acreages, so economic efficiency will be a strong determinant in water/land allocation strategies. This sub-study along with economic and system longevity analyses will be continued in 1998.

The principal researcher indicates that corn is the principal irrigated crop in Kansas and throughout the Great Plains. The principal researcher believes any realistic attempt to address overdraft of the High Plains Aquifer must address improvements in irrigation efficiency in corn production. The most common irrigation methods are furrow and sprinkler irrigation. The need to conserve water has focused attention on more efficient alternatives such as subsurface drip irrigation. This research will be of particular significance within the state and region. However, it also has national and international applications as advanced irrigation systems, such as subsurface drip irrigation, will be needed to improve irrigation water use efficiency in the next century.

The research goal is to determine the feasibility of subsurface drip irrigation and other alternative irrigation systems in western Kansas to sustain irrigated corn production to support the beef feedlot industry. The project also supports an educational effort through collection and dissemination of information on efficient irrigation methods. Subsurface drip irrigation acreage is increasing in Kansas and farmers are obtaining results on their own farms.

The work supported by this grant began in fiscal year 1993 with an appropriation of \$94,000; \$88,000 in fiscal year 1994; and \$79,000 in fiscal years 1995-1998 each year. The total funds appropriated are \$498,000. The non-federal funds and sources provided for this grant were as follows: \$781,232 state appropriations, \$55,205 product sales, \$60,907 industry and miscellaneous in 1991; \$868,408 state appropriations, \$37,543 product sales, \$35,484 industry and miscellaneous in 1992; \$833,324 state appropriations, \$54,964 product sales, \$144,225 industry and miscellaneous in 1993. Amounts for other fiscal years are not available.

The research is being conducted at Kansas State University. The field portion of the research is being conducted on Research Centers at Colby and Garden City, Kansas. Additional work is being carried out on campus at the Departments of Agronomy and Agricultural Economics in Manhattan, Kansas.

The original anticipated completion date for the project was May 31, 1998. The original objectives of the project appear to be on track for completion by that date. One of the most important objectives of the study is to evaluate longevity of the subsurface drip irrigation systems. These sites are unique to the region and very little information is available on system longevity. Pressing water quality problems of a regional and national scope has necessitated a change in the objectives to developing nutrient management practices under subsurface drip irrigation and utilization of livestock wastewater with subsurface drip irrigation. Additionally, changes in the federal farm program which allow greater planting flexibility has an effect on how irrigators make water/land allocation decisions. Field and economic studies related to allocation strategies, nutrient management and wastewater utilization should be completed in 3 years. The project has been peer reviewed. The reviewers felt the project concept to be valid and the timetable for accomplishments to be on target.

WATER QUALITY

The agency continues support of the national, competitively-awarded grants program as part of the Department's Water Quality Initiative. This program supports research to investigate the impacts of non-point source pollution from agriculture on water quality, and to develop improved, sustainable agricultural practices and systems that protect the environment and are economically profitable. Also, this program supports research on five Management Systems Evaluation Area projects as part of the Midwest Initiative on Water Quality to develop new farming systems that protect water quality, with research located at ten sites throughout the Corn Belt. This program is conducted jointly with the State Agricultural Experiment Stations, the U.S. Department of Agriculture's Agricultural Research Service and Natural Resources Conservation Service, the U.S. Environmental Protection Agency, the U.S. Geological Survey, extension specialists, and other Federal, State, and local agencies. The water quality grants have supported more than 300 research projects across the country. In fiscal years 1996 and 1997, funds were awarded to the five Management Systems Evaluation Areas projects in the Midwest to continue the water quality systems research started in 1990. In 1996, new projects were initiated as Agricultural Systems for Environmental Quality. The new projects focus on watershed-scale agriculture production systems that reduce pollution of soil and water while maintaining productivity and profitability.

The public is concerned about the possible risks to the environment, to soil quality, and to water quality resulting from the use of agricultural chemicals. Improved methods of detection of very minor amounts of chemicals in water have made the public, farmers, and policymakers more concerned about the use and management of these agricultural chemicals and wastes, while meeting the challenge of maintaining the efficiency and productivity of agricultural production systems. Water quality continues to be of high priority at local, regional and national levels. Results from the research are providing technologies to reduce pollutants, guidelines for site-specific farming and improved farming systems.

The original goals of the program were to determine the extent to which agriculture has impacted groundwater quality, and to develop new and improved, cost effective agricultural systems that enhance ground water quality. During the past 3 years, focus and allocation of resources have increased for surface water quality. Major progress has already been made on these goals. Examples of some of the results of recently completed research include the following:

1. Ohio's Management System Evaluation Area project has identified agricultural systems components that maintain profitability and minimize groundwater impact of farming on the bottomlands of the Scioto Valley.

2. Nebraska's Management System Evaluation Area indicates that irrigated corn can be produced profitably with less water and nitrogen than most farmers apply.

3. Ohio's Lake Erie Agricultural Systems for Environmental Quality project, along with other State and Federal projects, is making excellent progress in reducing phosphorus loading in two major watersheds that discharge into Lake Erie. Watershed phosphorus budgets indicate that the net annual accumulation of phosphorus in the Maumee watershed has dropped from 23,000 metric tons to 2,600 metric tons. Farmers are no longer applying "buildup" levels of phosphorus to their fields—a major cultural change.

4. In Indiana, the Indian Creek and the Little Pine Creek Agricultural Systems for Environmental Quality watersheds, located near West Lafayette, are providing data from 22 stations to test and calibrate models for water quality management.

5. In North Carolina, a 7-acre wetland is effectively removing nitrates from the runoff and drainage of a 950-acre watershed during the warm season; a Site-Specific Farming workshop was held at Greensboro, North Carolina, and attracted some 200 participants and several industrial and educational displays have been developed for the Agricultural Systems for Environmental Quality project.

The work under the Water Quality Program began in fiscal year 1990 with an appropriation of \$6,615,000. The subsequent appropriations were as follows: \$8,000,000 in fiscal year 1991; \$9,000,000 in fiscal year 1992; \$8,950,000 in fiscal year 1993; \$4,230,000 in fiscal year 1994; and \$2,757,000 in fiscal years 1995–1997; and \$2,461,000 in 1998. A total of \$47,527,000 has been appropriated for the Special Research Grants Water Quality Program. The non-federal funds in support of the Water Quality program, provided by state appropriations, industry, product sales, and other local sources, have averaged approximately \$1,000,000 per year since the program began in 1990.

Funds provided under the Water Quality Program have been awarded to institutions in virtually every state, so work is being carried out in all parts of the country. The Management System Evaluation Area projects of the Midwest Initiative on

Water Quality are headquartered in Iowa, Minnesota, Missouri, Nebraska, and Ohio, with satellite locations in North Dakota, South Dakota, and Wisconsin. Three new projects located in Indiana, North Carolina and Ohio were initiated in fiscal year 1995.

The original goals of the Department's Water Quality Research Plan were to: (1) assess the seriousness and extent of agriculture's impact on groundwater quality, and (2) develop new and improved agricultural systems that are cost effective and enhance ground water quality. These original goals have been met; however, water quality programs need to have a long-term focus. The physical processes that link production practices to water quality, and the socioeconomic processes that characterize adoption can both be of long duration. The adoption process, from first learning about a practice through implementation, can take years. While assistance is designed to speed up this process, overall progress can still be slow. Therefore, adequate resources must be made available for an extended period of time to ensure successful completion of the project.

The original project was developed for 5 years with the expectation that it would be reviewed and possibly extended beyond the 5-year period if warranted. The 1995 review of the program identified a need for increased attention to surface water quality problems. In 1996 and 1997, new water quality problems emerged—hypoxia, pfiesteria, etc.—which required renewed efforts. The research funded under the Special Research Grants Program has produced significant progress in understanding the impacts of agricultural practices on surface and groundwater pollution, and in developing improved agricultural systems that are economically and environmentally sustainable. Implementation of some of these improved agricultural systems is already underway in a number of states. The focus over the next 5 years will be on developing and implementing agricultural systems that reduce the nutrient and contaminant loadings in the waters and watersheds.

An external review team evaluated the Management System Evaluation Areas and associated component projects in 1995. All Management System Evaluation Area projects have an impressive record of successfully implemented interdisciplinary teams to study water quality problems. A major conference on Management System Evaluation Area and Agricultural Systems for Environmental Quality results is being planned for 1999.

WEED CONTROL, NORTH DAKOTA

The project is designed to reduce the environmental pollution caused by the extensive usage of herbicides for weed control and provide growers with environmentally safe weed control systems. The present project addresses crop production practices; weed biology and herbicide resistance; and efficient herbicide usage. In crop production practices, systems experiments have been established at three locations that include crop rotation, tillage, seeding method and timing. These variables are incorporated into sustainable, reduced tillage and conventional systems. Results being monitored include the effect of weed control intensity on long-term weed infestations and economic returns. The emphasis in weed biology research is with kochia, wild oat, and green foxtail that are herbicide resistant. In efficient herbicide usage, several factors are being studied such as application methods to improve weed retention of herbicides and weed-detecting sprayers to treat only areas where weeds are present.

The research addresses new methods to control weeds using systems control with multi-year, multi-crop rotations, reduced pesticide applications, that better simulate a typical on-farm sequence than short-term grants. Some variables included in the research are reduced pesticide applications and techniques to enhance herbicide efficacy. The original goal was to develop new, efficient weed control methods. To accomplish this, long-term field experiments have been initiated to obtain basic crop-weed biology and production system information. The first three years of the rotation experiments have been completed in 1993 through 1995. Changes in weed populations were beginning to occur in 1995 and the environmental conditions were atypically wet during these three years; these observations support the need to complete at least two cycles of the rotation for a total of at least eight years to obtain reliable scientific information. The improved efficiency of weed control method has developed adjuvants to overcome the antagonism of salts, which naturally occur in water and reduce the efficacy of some herbicides. Another approach is adjuvants to reduce the herbicide rate required and/or to improve their performance consistency. Kochia genetic lines have been developed that are homozygous for resistance to various studies to determine inheritance and possible spread of herbicide resistance. Fields are being monitored for the development of kochia resistance to dicamba. A better understanding of how herbicide resistant weeds occur in a population should

be useful to developing methods to prevent herbicide resistance from becoming an unmanageable problem.

The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$500,000 per year; \$470,000 in fiscal year 1994; and \$423,000 per year in fiscal years 1995 through 1998. A total of \$3,162,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: no matching in 1991; \$27,030 state appropriations in 1992; \$48,472 state appropriations in 1993; \$41,969 state appropriations in 1994; \$71,847 state appropriations in 1995; and an estimated \$70,000 state appropriation in each of the fiscal years of 1996 and 1997.

Research is being conducted at North Dakota State University. The original anticipated completion date was a minimum of 5 years, with an additional 5 years currently being projected. The original objectives have been satisfactorily met, but the research with biological traits of herbicide-resistant weeds require more time, depending upon whether the traits prove to be simply inherited or involve multiple genes with a complex inheritance. The anticipated completion date of the additional and related objectives is 2001. Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. The review indicated progress in achieving the objectives.

WHEAT GENETICS, KANSAS

This project provides partial support for the Wheat Genetics Resource Center at the University of Kansas, which focuses on collection, evaluation, maintenance and distribution of exotic wheat related germplasm needed to develop new wheat cultivar resistant to disease, insects and environmental stress. The principal researcher believes most cultivated varieties of wheat are derived from common sources. They lack the rich genetic diversity needed to develop resistance to diseases, insects and environmental stress. The replacement of genetically rich primitive cultivar and land races by modern, more uniform cultivars all over the world is causing erosion of wheat germplasm resources. New pests or those that have overcome varietal resistance pose a constant threat to the Nation's wheat production. Genetic resistance often resides in wild relatives of wheat. The researchers believe this program, which was established in Kansas, is providing service to wheat breeders nationwide.

The original goal of this research was to enhance the genetic diversity available to wheat breeders nationally and internationally by collecting, evaluating, maintaining and distributing germplasm derived from wild relatives of wheat. To date 25 germplasm releases have been made containing new genes for resistance to such pests as Hessian fly, greenbug, leaf rust, soilborne mosaic virus and Russian wheat aphid. Germplasm stocks with resistance to leaf rust and powdery mildew are under development. Evaluation of germplasm for important resistance genes was carried out by Center scientists and cooperating institutions. The Center filled 30 requests from U.S. wheat breeders for seed from the germplasm collection and 57 requests for seed of germplasm releases, as well as large numbers from international breeders.

Work supported by this grant began in fiscal year 1989. Appropriations were for fiscal year 1989, \$100,000; fiscal year 1990, \$99,000; fiscal year 1991, \$149,000; fiscal years 1992-1993, \$159,000 per year; fiscal year 1994, \$196,000; fiscal years 1995-1997, \$176,000 each year, and \$261,000 in fiscal year 1998. A total of \$1,651,000 has been appropriated. The nonfederal funds provided for this grant were as follows: \$493,285 state appropriations, \$31,414 product sales, and \$84,610, other non-federal in 1991; \$414,822 state appropriations, \$14,259 product sales, and \$102,086 other non-federal in 1992; and \$533,848 state appropriations, \$32,297 product sales, and \$163,937 non-federal in 1993, \$468,960 in 1994; \$563,671, non-federal funding for 1995, \$457,840 of non-federal support for 1996 and \$495,820 in 1997.

This research is being conducted at Kansas State University by the Wheat Genetics Resource Center. The collection, evaluation and enhancement of Wheat germplasm is a continual process. Therefore this project does not have a defined completion date. This Special Grant has not been subjected to a comprehensive review. However, each annual proposal is peer reviewed at the institution and reviewed by CSREES scientists.

WOOD UTILIZATION RESEARCH

The research includes: meeting environmental objectives in timber harvesting and forest products manufacturing; exploiting pesticides developed from forest trees; wood machining; reduced chemical needs for pulping and bleaching of paper; helping

small and mid-sized wood products companies remain or become competitive in the global economy; assessing the impact of international standards adoption on the demand for certified wood products; and developing new products from wood and recycled materials. Each Center has a somewhat different procedure for awarding grant monies to individual projects.

Four research centers conduct research to improve the utilization of species that grow in their regions; i.e., western conifers, southern pines, Lake States hardwoods, and northeastern forests. The other two research centers conduct research in machining of wood and incubator technology transfer. Wood industry incubator work contributes to rural development of local economies. The forest products industry ranks among the top ten manufacturing employers in 46 of the 50 States. Many local economies are dependent on these jobs.

The goal is to generate new knowledge that will benefit the forest industry. Additional emphasis has been placed on environmental stewardship, resource extension, technology transfer, and scientist education. Extending the resource benefits forest ecosystems and increases the competitiveness of the forest products industry. Consumers benefit from more efficient production. Hand-held calculator programs developed by this research have resulted in savings of nearly \$1,000,000 to woodworkers. Research has reduced the cost of cleanup of superfund sites by tenfold due to the use of biodeterioration technology. Systems analysis of woodworking operations has allowed managers to improve the efficiencies of operation. Improvements in membrane pressing of cabinet doors has improved production and product quality. The research developed a dielectric wood defect detection system to improve automated production systems. Research developed control of emission of volatile organic compounds into the atmosphere during drying and pressing of lumber through microbial degradation of contaminants in an air stream. Research has found ways to recycle used treated wood into usable commodities.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$3,000,000; fiscal years 1986 through 1989, \$2,852,000 per year; fiscal year 1990, \$2,816,000; fiscal years 1991 and 1992, \$2,852,000 per year; fiscal year 1993, \$4,153,000; fiscal year 1994, \$4,176,000; fiscal years 1995 and 1996, \$3,758,000 per year; and fiscal years 1997 and 1998, \$3,536,000 per year. A total of \$45,845,000 has been appropriated.

Mississippi State University non-federal funds were: State appropriations, \$2,498,800, \$2,178,725, \$2,353,225, \$2,331,691, \$2,650,230, \$2,778,535, and \$2,582,617 for 1991, 1992, 1993, 1994, 1995, 1996, and 1997, respectively. In addition, industrial funds averaged \$667,700 for the 5 years from 1993 to 1997 in support of the Mississippi Forest Products Laboratory. Oregon State University state appropriations were: \$1,337,962, \$1,394,304, \$1,256,750, \$1,252,750, \$1,417,755, \$1,117,000, and \$1,100,000 for 1991, 1992, 1993, 1994, 1995, 1996, and 1997, respectively. Estimated non-public support averages \$500,000 per year. Michigan State University non-federal contributions for 1997 totaled \$580,500. Three new locations were added in 1994: University of Minnesota-Duluth non-federal match was \$590,000, \$550,000, \$560,000, and \$371,930 for 1994, 1995, 1996, and 1997; North Carolina State University was \$126,000, \$165,000, \$135,000, and \$163,216 for 1994, 1995, 1996, and 1997; University of Maine was \$600,000, \$445,723, \$459,100, and \$477,464 for 1994, 1995, 1996, and 1997.

There are six locations. The initial three—Oregon State University, Mississippi State University, and Michigan State University—were joined by the University of Minnesota-Duluth, North Carolina State University, and the University of Maine in fiscal year 1994. The original objective was to build and maintain three strong regional centers of wood utilization research. These centers have been established and three more centers have been added. Projects begun in 1998 will be completed by 2002.

On site reviews of centers are conducted on a rotating basis. Each center's plans are reviewed yearly or more frequently. Progress reports are reviewed yearly. Center directors last met together for joint planning in June 1996. Centers all have advisory committees or research committees which meet periodically. We conduct informal on-site reviews periodically. The Minnesota and Oregon sites were visited in 1996. The North Carolina site was visited in 1997. A Departmental panel reviewed the original three centers in 1992 and 1993. At that time, the original objectives were broadened to include more consideration for environmental concerns. The centers have increased their focus on helping industry meet environmental objectives by conducting research leading to sustained timber production; extending the timber supply through improved processing; developing new structural applications for wood; and developing wood extractives to substitute for pesticides, preservatives, and adhesives.

WOOL RESEARCH

The overall goals for this research are to develop objective measures of wool, mohair, cashmere and other animal fibers to improve the quality of wool products while enhancing the profitability of the U.S. sheep and Angora goat industries. Specific objectives include: develop and evaluate measurement techniques for rapid objective evaluation of wool, mohair, cashmere and other animal fibers; increase the use of objective measurements to increase fiber production, quality and income to producers; and increase consumer acceptance of fabrics made from these fibers.

Collaboration exists among researchers in Texas, Wyoming, and Montana associated with this grant and other federal, university and industry scientists to assure responsiveness to the needs of those involved in wool and mohair production, marketing, and processing. The sheep and goat industries and the principal researchers believe that this research to be of national, regional and local need. The research on wool, conducted by means of this grant, represents the only research efforts in the U.S. focused on improving the efficiency of measuring and assuring wool, mohair and cashmere quality for garments made from these fibers.

The overall goal for this research is to develop objective measures of wool, mohair, cashmere and other animal fibers with a focus on improving the efficiency of determining the quality of products made from these fibers while enhancing the profitability of the sheep and Angora goat industries. Computer software programs have been developed to provide an automatic image analysis system to make rapid and inexpensive measurements of the average diameter and distribution of animal fibers as well as other fiber properties including fiber length and color. Each of these properties are used for grading and processing to determine ultimate softness, durability, dye characteristics, comfort, and garment price.

Grants have been awarded from appropriated funds in the amount of \$150,000 for fiscal years 1984–1985; \$142,000 per year for fiscal years 1986–1989; \$144,000 for fiscal year 1990; \$198,000 for fiscal year 1991; and \$250,000 per year for fiscal years 1992–1993; \$235,000 for fiscal year 1994; \$212,000 per year for fiscal years 1995–1997, and \$300,000 for fiscal year 1998. A total of \$2,881,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$150,913 state appropriations, \$11,800 product sales, \$5,817 industry, and \$3,556 miscellaneous in 1991; \$111,394 state appropriations, \$25,451 product sales, \$41,442 industry, \$3,068 miscellaneous in 1992; and \$152,699 state appropriations, \$39,443 product sales, \$40,804 industry and \$3,556 miscellaneous in 1993; \$150,094 state appropriations, \$35,284 product sales, \$36,484 industry and \$3,556 miscellaneous in 1994; and \$67,345 state appropriations, \$10,000 product sales; \$34,325 industry contributions in 1995; \$39,033 non-federal support in 1996, and \$174,486 non-federal support in 1997.

The research is in progress at the Texas A&M University, Texas Agricultural Experiment Station at San Angelo, the University of Wyoming at Laramie, and Montana State University at Bozeman. The original objectives to improve the efficiency and profitability of wool, mohair and cashmere production and marketing are still valid. Specific objectives for individual laboratories and experiments are continually revised to reflect the changing research priorities for the wool, mohair, and cashmere industries and to satisfy consumer demands for products from these fibers. It is anticipated that five years will be required to complete the current research.

Each year grant proposals are peer reviewed. The principal investigators meet annually to evaluate progress and re-evaluate research priorities according to industry needs. Because the research encompassed in this grant is a component of a regional research project, accomplishments are reported annually to scientific peers and representatives from the sheep, goat, wool, mohair, and cashmere industries. In addition, the overall regional research project is peer reviewed every third year. Annually, an agency representative reviews grant proposals and periodically visits the research facilities and assesses progress. The most recent visit was in May of 1994 whereby it was determined that the stated objectives were being addressed and that they were consistent with industry needs. An external review of the overall program is being planned by the agency for May of 1998. Program effectiveness and relevance to industry needs will be assessed by experts representing the sheep and goat industries and peers from the scientific community.

AGRICULTURAL DEVELOPMENT IN THE AMERICAN PACIFIC

The Agricultural Development in the American Pacific (ADAP) project is a primary means for Land Grant research, extension, and instruction programs of the five participating institutions—American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam and University of Hawaii—to collaborate and cooperate to enhance their impact on Pacific tropical agri-

culture and communities. ADAP is a mechanism to address common regional client-based issues while maintaining cultural, rural, economic and environmental integrity. This special research grant is awarded noncompetitively to a program planned and approved by the five involved land grant institutions.

The principal researcher believes the five participating institutions are geographically dispersed yet facing many similar issues which can be served through extensive networking and communication. In addition to a capacity building degree studies program for bachelors, masters and doctoral students, ADAP in 1996 opened a new area in faculty/staff development to improve institutional capability and credibility. In 1997, each ADAP institution self-determined their best means for electronic communications. ADAP brings together the five Deans/Directors to discuss agriculture and human resources issues facing isolated, tropical ecosystems in the Pacific, and to plan and implement activities to address those issues. Priorities are categorized in three areas: sustainable systems, collaborations/partnerships, communication systems. Activities range from joint/collaboration efforts to overcome taro leaf blight in the Pacific, to seeking recognition of Pacific tropical agriculture by NASULGC.

ADAP's original goals are to develop human resources within the institutions, to more effectively manage agricultural programs within and among the institutions, and to focus resources available on agricultural issues of the Pacific. Projects include: animal health survey, livestock waste management, dietary guidelines for Pacific foods, youth-at-risk assessment, and market information collaboration with "state" Departments of Agriculture.

This work has been underway for seven years with an annual appropriation of \$650,000 to the former Extension Service. In fiscal year 1994, an appropriation of \$608,000 was made to CSREES to continue the ADAP program. The fiscal year 1996, 1997, and 1998 were \$564,000 each year. The appropriation total to CSREES is \$2,300,000. Non-federal funds are not provided. Unspecified in-kind support, such as facilities, equipment and administrative support, are provided by each institution and, in some specific projects, by non-ADAP collaborating institutions.

This work is being carried out by American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and the University of Hawaii. The ADAP program has been gradually achieving original program objectives, particularly in the areas of improvement in institutional capacity and communications.

A formal review of the ADAP program was conducted July 1-10, 1997, and included visits by review team members to American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam and University of Hawaii. The review focused on the degree of achievement of goals set forth in the five-year 1992 strategic plan. Recommendations were made to improve the structure and effectiveness of delivery of programs to address Pacific tropical agriculture issues for island communities. At the conclusion of the review, ADAP incorporated review recommendations, and prepared and adopted the new, five year 1997 strategic plan.

AGRICULTURAL WASTE UTILIZATION, WEST VIRGINIA

The Poultry Waste and Energy Recovery Project, commonly referred to as the POWER Project, applies American technology to a traditional European waste treatment technology. It is a documented demonstration of a high-rate resource recovery system that converts municipal and agricultural waste into valuable energy and odorless, pathogen-free products. The project's main research goal is to reduce the nutrient run-off to the Potomac River. The research will also assess the biological and environmental value of the fertilizer produced.

The current need for this technology is local, national, and international. The beneficiaries of this technology will be both the people and the environment anywhere in the world where problems of food, fertilizer, and energy shortages are currently in conflict with the preservation of environmental quality. The direct benefits include enhanced and expanded waste water treatment capacity and municipal solid waste capacity, creation of new jobs, and revenue from by-products and water quality improvement.

The research goal will go beyond the testing of waste materials in the digester and proceed with a program to compare the microbiological loading of rivers, where known environmental pollution is measurable, and where the total viable counts of the rivers could be determined in real-time with a bioprobe. Specific microbial analysis may be able to correlate specific microbial counts with either inorganic nutrient pollution or organic pollution from farming activities.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$360,000. This is a new project in fiscal year 1998 and specific information on the source and amount of non-federal funding for this project is not yet available.

Research will be conducted at Moorefield, West Virginia. The anticipated completion date of the original objectives is approximately two years. Since this is a new project in fiscal year 1998, the agency will conduct the initial review of this project when the proposal is submitted to CSREES for funding.

NATIONAL ALTERNATIVE FUELS LABORATORY

Research addressed the effects on fuel economy and power output of ethanol addition to petroleum blendstocks, environmental effects of ethanol addition to conventional and reformulated gasoline, and development and demonstration of an economical, ethanol-based, biodiesel-containing alternative to leaded aviation gasoline. Information dissemination activities included promoting ethanol fuels in the Red River Valley and the upper Midwest through speeches, presentations, and published articles.

The researchers believe it is crucial to U.S. energy security that renewable domestic fuels are represented accurately in the marketplace by easily accessible unbiased scientific data on their performance and environmental effects. These data are generated and publicized through partnerships developed between the research organization and both public and private sectors. The regional need for the research is derived from recent and ongoing disease problems and world market demand trends with barley and wheat, in which North Dakota ranks first and second, respectively, in U.S. production. Current effort is focused on implementing a cooperative project to build a biomass-to-ethanol plant that would spur market-driven crop diversification based on the need for regionally-optimized feedstocks.

The original goal was to develop a database of at-the-pump-sampled conventional, reformulated, and alternative transportation fuels sold in the upper Midwest and throughout the United States to enable current and historic comparisons of different gasolines. The database provides a means of diagnosing and tracking fuel performance and environmental effects resulting from different fuel formulations, additives, and contamination problems. The database is used in conjunction with another primary objective, which is to provide consumers and potential alternative fuels marketers with information on conversion of crop residues, agriculture processing wastes, high-cellulose-content municipal wastes, and other biomass materials to alternative fuels.

The work began in fiscal year 1991 and was, in part, sponsored by this grant. Appropriations in fiscal years 1991–1993 were \$250,000 per year. In fiscal year 1994, it was \$235,000; \$204,000 in fiscal year 1995; and \$218,000 per year in fiscal years 1996, 1997, and 1998. A total of \$1,843,000 has been appropriated. In fiscal year 1997, approximately \$140,000 in non-federal collaborative research funding was secured by project personnel. A total of \$985,000 in non-federal funds have been allocated toward performance of program objectives over the duration of this grant. For fiscal year 1994, non-federal funding was \$105,000. Fiscal year 1995 and 1996 totals were \$50,000 and \$60,000, respectively. Over fiscal years 1991–1993, non-federal funding was \$630,000.

The University of North Dakota Energy and Environmental Research Center located in Grand Forks conducts the work. The completion date for the original objectives was April 30, 1992. That work was completed, and its results published. In 1995, the program scope was expanded and industry collaborations increased. Development of an ethanol-from-biomass production facility and commercialization of bio-based vehicle and aviation fuels could be completed within five years, by fiscal year 2003.

In July 1996, the U.S. Department of Agriculture conducted an on-site evaluation. Based on its ability to collaborate with industry and its performance of much needed biofuels development work, the program was given a favorable review. Research objectives, including those involving dissemination of research results to the public and performance of unbiased scientific research on energy and environmental issues impacting alternative fuel development and use, are being met. A summer 1998 evaluation is planned.

ANIMAL WASTE MANAGEMENT, OKLAHOMA

This research project is designed to develop sustainable, environmentally-safe, and ecologically-sound best management principles and practices for beneficial animal waste applications for "High Plains Agriculture" in support of rural economic development through a Federal-state-local partnership. Emphasis will be placed on

the rapidly expanding hog industry in the semiarid region, but information gained will also be applicable to the beef and dairy industries.

The Oklahoma Panhandle is the most productive agricultural region in the state with agricultural receipts in excess of \$800 million. Nationally, Texas County in the Panhandle ranks number one in the state and in the top 15 of all counties in the U.S. relative to cash receipts. The rapid expansion of the hog industry in this semiarid region will only strengthen that position. The rapidly expanding swine industry was projected to add \$650 million in pork and value added products in Oklahoma in 1997 with the slaughter and processing of over 4 million hogs per year. Information gained from this study will provide the data base to develop best management practices to maximize beneficial nutrient use and minimize nuisance odor in semiarid soil/cropping and rangeland production systems. Practices developed will have significant implications regionally, nationally, and internationally. The semiarid agro-ecosystem is unique with climatic conditions consisting of low rainfall that promotes both dryland and irrigated agricultural practices; extremes in high and low temperatures; soils characterized with alkaline pH, low in organic matter, and high in calcium carbonate. This unique agro-ecosystem makes information gained from more humid environments inapplicable.

The original goal of this research is to develop best management practices that will: protect ground water supplies from pollution of nutrients, salts, and pathogens; maintain air quality; and minimize odors derived from the entire hog-house, lagoon, land-application, soil-cropping and or rangeland production system, thus maintaining the quality of life in the rural sector.

The work supported by this grant begins in fiscal year 1998 and the appropriation for the fiscal year 1998 is \$250,000. Specific information on the source and amount of non-federal funding for this project is not yet available.

Research will be conducted at The Oklahoma Panhandle Research and Extension Center located in Goodwell, Oklahoma. The Center will provide the land area and a portion of the facilities and equipment necessary to conduct the major portion of the study. Other study sites will be developed on private land in cooperation with hog operations in the panhandle region. This is a new project and an application has not yet been submitted. The agency will conduct the initial review of this project when the proposal is submitted to CSREES for funding.

CENTER FOR AGRICULTURE AND RURAL DEVELOPMENT

The research provides current economic information on international trade in agriculture and analyses of the implications of trade policy alternatives on the agricultural sector of the United States and other countries.

According to the proposal, trade negotiations and agreements are of national concern to policymakers, farmers, and agribusiness industries because of the implications for maintaining or opening markets and establishing improved terms of trade and prices. Typical agreements are extremely complex, requiring analysis by specialists to determine outcomes and to provide objective and accurate information to those impacted by such agreements. The goal is to assess and evaluate various proposals affecting agricultural trade, to provide analytical support to the Office of the U.S. Trade Representative, and to provide information to farmers and agribusiness firms on the competitive implications of such agreements. Theoretical studies and empirical and descriptive analyses of policy issues and technical problems pertaining to the Uruguay Round of negotiations were completed and provided to negotiators and the agribusiness community. Studies included the development of international trade models and assessments of trade options for meat, dairy, feed and cereal grains, oilseeds, and other commodities; impacts of the agreement upon selected countries; and reforms needed for compliance. Analyses included determination of the value and implications of export subsidies, import protection, and internal support mechanism and levels. Knowledge developed in this phase is now being used to monitor the effects of the Uruguay Round Agricultural Agreement (URAA).

This grant supports six projects focusing on URAA and World Trade Organization (WTO) monitoring and implementation problems; implications of the URAA and WTO for Eastern Europe, Baltic, and the Newly Independent States; development of a model to assess the North American Free Trade Agreement and its linkages with the General Agreement on Tariffs and Trade; trade implications of U.S. food and development aid in developing countries; integration of China into world agricultural markets; and special projects as requested for the U.S. Trade Representative's office.

This research program was initiated in fiscal year 1989. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$750,000; fiscal years 1990 and 1991, \$741,000 per year; fiscal years 1992-1993, \$750,000 per year; fiscal year

1994, \$705,000; fiscal year 1995, \$612,000; fiscal year 1996, \$655,000; and, for fiscal years 1997 and 1998, \$355,000 each year. A total of \$6,414,000 has been appropriated.

The non-federal funds and sources provided for this grant are as follows: \$111,210 State appropriations and \$175,616 miscellaneous for a total of \$286,826 in 1991; \$113,779 State appropriations and \$173,117 miscellaneous for a total of \$286,896 in 1992; \$120,138 State appropriations and \$164,707 miscellaneous for a total of \$284,845 in 1993; \$161,673 State appropriations and \$32,000 miscellaneous for a total of \$193,673 in 1994; and \$161,000 State and \$30,000 miscellaneous for a total of \$191,000 in 1995; \$70,000 State appropriations and \$44,000 for a total of \$114,000 in 1996; and \$60,325 in State appropriations and \$61,500 in miscellaneous funds for a total of \$121,825 in 1997. Information is not yet available on non-federal funding in 1998.

The research program is carried out by the Center for Agriculture and Rural Development at Iowa State University and university researchers anticipate that the work should be completed in 1998 with analysis of the final agreement of the Uruguay Round and related trade agreements and dissemination of these results. An informal evaluation of this project takes place as a part of each annual project review and approval process.

CENTER FOR HUMAN NUTRITION, MARYLAND

This research aims to assess the severity and causes of obesity among inner city, suburban, and rural school children in the state of Maryland. Specifically, the research will provide information on the role of food and physical activity as factors potentially leading to excess weight in children and adolescents. According to the latest national surveys, there are over 90 million overweight adults in the U.S. It is believed that weight gained during childhood and adolescence poses the greatest risk for an adult to become permanently overweight. Obesity, in turn, contributes to important chronic conditions such as diabetes, hypertension, and heart disease. It is acknowledged that the prevalence and causes of obesity vary in different social and geographic settings. Understanding this information is essential for the implementation of nutrition education programs and prevention activities.

The goal of this research will be to determine the prevalence of obesity, and will attempt to identify risk factors in children attending public schools in Baltimore City, Baltimore County, and Washington County in Maryland. The study will provide information on dietary energy intake, food preferences, and physical activity in children and adolescents.

The work supported by this grant began in fiscal year 1998 with an appropriation of \$150,000. The projected non-federal funds and sources provided for this grant are as follows: \$56,000 university, \$23,000 industry, and \$7,000 miscellaneous.

Research will be conducted at the Center for Human Nutrition, John Hopkins School of Public Health, in Baltimore, Maryland and the anticipated completion date is 2000. The grant proposal for fiscal year 1998 will be subject to extensive peer review.

CENTER FOR NORTH AMERICAN STUDIES, TEXAS

The purpose of this grant is to develop linkages with educational and other institutions in Mexico and Canada to share data and faculty, conduct research identifying trade opportunities and marketing problems, conduct policy analysis, and develop a broad range of training programs preparing agricultural/agribusiness firms for international marketing opportunities. The research proposal received a merit review at the university prior to submission to CSREES. The program director believes that citizens of the United States, Mexico and Canada have some similar concerns about the impact of the North American Free Trade Agreement (NAFTA), and that new, innovative approaches involving international cooperation are needed to assess and evaluate these issues. Research and training are needed to provide information to evaluate alternatives for expanding U.S. exports and to resolve potential social, economic, and environmental conflicts.

The goal is to promote strong agricultural ties among the three North American countries, ensure the continued competitiveness of U.S. agriculture, and foster greater cooperation among the three countries in resolving critical agricultural issues of common interest. As a result of this project, cooperative study, research, policy analysis, and training programs have been developed and presented to U.S. producers and agribusiness managers, reaching over 2,600 people regarding trade opportunities in Mexico, impacts of expanded trade on selected agricultural sectors, and the procedures of international marketing. The Center recently co-sponsored the Tri-National Research Symposium, "NAFTA and Agriculture: Is the Experiment

Working?" in San Antonio with 215 participants, of which 100 were from Mexico. The proceedings are available electronically through the Symposium Web page on the Internet. Research comparing the competitiveness of major agricultural production sectors is focused on Mexico's dairy, livestock, meat, feed grain, and fresh vegetable industries. Information databases on North American agriculture are being built to support the Center programs and are accessible on the Web. The electronic database on NAFTA currently contains over 2,400 articles from major U.S., Canadian, and Mexican publications. A study of trans-boundary trade and environmental linkages found that existing institutions in both countries do not adequately address environmental losses or gains.

Work supported by this grant began with an appropriation of \$94,000 in fiscal year 1994; \$81,000 in 1995; and \$87,000 per year for 1996 through 1998. A total of \$436,000 has been appropriated. The non-federal funds and sources provided for this grant are as follows: \$39,000 State appropriations in fiscal year 1994; \$54,000 in 1995; \$60,000 in 1996 and 1997; and \$84,500 in 1998.

The program is being carried out at Texas A&M University through the Texas Agricultural Experiment Station in collaboration with other segments of the Texas A&M University System and Louisiana State University Agricultural Center. The original proposal in 1994 was for a period of 12 months. The current phase of the program will be completed in the year 2001.

CSREES performed a merit review of the project in July 1997, as it evaluated the 1997 project proposal, and concluded that progress on all four objectives continued to be good: U.S.-Mexican linkages resulted in a successful conference on NAFTA and some new research projects; potential markets for U.S. dairy and other products in Mexico were completed; impact of eliminating the Canadian Grains Transportation Act was studied; and several training programs were conducted.

DATA INFORMATION SYSTEM QUESTIONS

Cooperative State Research, Education, and Extension Service—CSREES—has funded two major activities, both currently underway, that underlie the design and development of the Research, Education, and Economics Information System—REEIS. A cooperative agreement with the University of Arkansas has been funded to provide national leadership in coordinating the efforts of our university partners in helping us determine appropriate content for REEIS. The University of Arkansas is also providing essential services in managing and coordinating a national Steering Committee responsible for overseeing the overall design, development, testing, and implementation of the Research, Education, and Economics Information System—REEIS. The Steering Committee had its first meeting in June of 1997. It held its second meeting in February 1998 to review progress on REEIS developments to date and to formulate action plans and strategies for future tasks. In addition, work under a contract with a major private sector information technology firm is in progress. The contract calls for conducting a strategic information audit of databases and information practices within the Research, Education, and Economics mission agencies and State partner institutions. Deliverables from the first phase of the audit include an inventory of existing databases currently targeted for inclusion in REEIS, specifications for a comprehensive needs assessment that will identify gaps between current user needs for information, and the ability of existing databases to satisfy those needs, and specifications for a retrieval language that will assist users in accessing and searching REEIS databases.

USDA's Research, Education, and Economics—REE—mission agencies and their university partners lack a central, integrated, user-friendly electronic information system capable of providing access to thousands of programs and projects for which they are responsible that focus on food, agriculture, natural resources, and rural development. Such an information system is increasingly needed to enable the Department and its partners to readily conduct both comprehensive baseline and ongoing assessments as well as evaluations of research, education, extension, and economic programs and projects. In recent years, this need has become more urgent for several reasons. First, the United States needs a visionary public funded research and development program to produce essential knowledge and innovations for meeting growing competition in a global market—which is largely attributable to the expanding research and development efforts of foreign nations. Second, a comprehensive information system is needed to serve as a primary reference source for development of new research and education projects on such diverse issues as increasing productivity in agriculture and processing, improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Third, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds to provide a basis for

redirecting funds to higher priority problems. Fourth, the Government Performance and Results Act (GPRÁ) has imposed reporting demands which current, decentralized information systems are not prepared to adequately satisfy.

The original goal of this initiative was to develop an information system that can provide real-time tracking of research, extension and education projects and programs; has the capability to communicate vertically between field, State and Federal locations; will enable the REE agencies and their partners to conduct rapid and comprehensive policy assessments and program evaluation analysis; facilitates assessment of technologies and practices employed in extension, education, economics, and research activities at the field and/or regional levels; provides clear and transparent public access to relevant parts of the information; and provides information management tools to enhance the timeliness and accuracy of REE-wide responses to inquiries about program objectives and expenditures.

The first phase of a strategic information audit is underway. To date, a total of 36 REE mission area databases have been targeted as candidates for inclusion in REEIS. Detailed descriptions of each of the databases are the main components of a prototype REEIS database catalog that has been developed and which is intended to serve as an inventory and descriptive, interactive tool for locating information about databases in REEIS. World Wide Web access to the database catalog via the Internet has been demonstrated, and this feature is currently undergoing review and evaluation within the agency, by partner institutions, and by an outside expert as an appropriate, publicly-accessible user interface to REEIS. In addition, specifications for a comprehensive needs assessment as well as specifications for a controlled vocabulary for use in searching databases in REEIS have been prepared and are being submitted to the REEIS National Steering Committee, the REE mission agencies, and State partner institutions for review and comment.

Congress first appropriated \$0.4 million for REEIS in fiscal year 1997 to begin planning its design and development. An additional \$800,000 was appropriated in fiscal year 1998, for a total of \$1.2 million. In fiscal year 1997 the REEIS National Steering Committee was established to provide advice and guidance throughout the development and implementation process. Since its inception, the Committee has met twice, first recommending a plan of action and work specifications for conducting a strategic information audit and comprehensive needs assessment, and second to review and evaluate contract deliverables. The Committee is comprised of both users and producers of Research, Education, and Economics agencies' data and includes program officials, program leaders, and information system managers from USDA and other Federal agencies, and program/project leaders representing partner institutions. Also in fiscal year 1997 a private sector firm was engaged to conduct the first phase of a strategic information audit which is in progress. Specifications are being developed for conducting a comprehensive needs assessment in fiscal year 1998. Results of the needs assessment are expected to form the base of data on which detailed design specifications for a REEIS prototype are to be developed. Non-federal funding does not apply at this time.

Leadership responsibility for REEIS resides within the CSREES's Science and Education Resources Development division. This provides for effective linkage within the REEIS platform of the Current Research Information System, the Food and Agricultural Education Information System, and appropriate extension databases. CSREES is working closely with all REE mission agencies and with the university system via a cooperative agreement with the University of Arkansas. We hope also to use the Intergovernmental Personnel Act to secure an IPA from another university to carry out REEIS essential management responsibilities. A sizeable effort is currently underway through a contract with a major private sector information technology firm to design, develop, test, and implement REEIS. The first phase of a strategic information audit is presently being conducted by the firm and is expected to form the basis for system design specifications for REEIS. One staff person has been assigned full time to manage and coordinate agency contracting activities and serves as the REEIS technical information program manager.

It is anticipated that REEIS can become operational during the year 2000. The fiscal year 1997 appropriation of \$400,000 covered start-up costs such as establishment of a National Steering Committee, preparation and specifications for contracting with an outside firm, contractor selection, pre-award negotiation and, subsequently, pre-design system analyses currently conducted under contract by a major private sector information technology firm. Contract efforts include preparation of an inventory and prototype catalog of REE mission agency databases, a World Wide Web user interface to the catalog, specifications for a comprehensive needs assessment, and specifications for a controlled vocabulary to assist user access to REEIS databases. The \$800,000 increase for fiscal year 1998 will allow for implementing, testing, refining, and maintaining the catalog prototype and its World Wide Web

interface, the conduct of the needs assessment, creation and maintenance of a comprehensive data dictionary, and development of detailed specifications for designing and developing the system, including recommendations for in-house hardware, operating system, and platform.

The requested increase for fiscal year 1999 will allow for the development, testing, and refining of the REEIS prototype, and cover operating costs associated with updating and maintaining the REEIS database catalog and data dictionary. Based on the recommendations of the REEIS National Steering Committee, the first year effort included the objective of conducting a strategic information audit as a prerequisite for the development of design specifications. The first phase of the audit is nearing completion, as planned. The conduct of the comprehensive needs assessment comprises the second phase of the audit and is targeted to begin in April, 1998. Results of the assessment are to form the basis for the development of detailed design specifications.

The Research, Education, and Economics Information System meets a high priority national need for an operational, up-to-date and continually responsive national information system. REEIS is being designed to meet the data information needs of all REE agencies and their university and private sector cooperators. It will link data systems on research, education, extension, and economics. To achieve effective response for its users, annual maintenance costs will be ongoing.

Products generated from the first phase of the strategic information audit are currently undergoing review and evaluation by the REE mission agencies, the REEIS National Steering Committee, our State partner institutions, and outside sources. In August, 1997, prior to start of the information audit, a project management plan for conducting the first phase of the audit and specifications for the REEIS database catalog were reviewed internally by a REEIS team of information professionals and program leaders representing each of the four REE mission agencies. The Web-accessible interactive catalog prototype is being demonstrated this week for review and evaluation by the REEIS National Steering Committee, and action plans are being formulated by the Steering Committee to review drafts of additional contract deliverables. The most recent evaluations involved independent reviews by both the REEIS team and the National Steering Committee of draft specifications for a comprehensive needs assessment and a critique of the REEIS catalog prototype by a well-known and highly regarded information technology expert. At the REEIS National Steering Committee (February 25–26, 1998), these reviews will be reported. Evaluations of final specifications of the needs assessment, the REEIS database catalog, and specifications for a controlled vocabulary are scheduled to be completed by March 16, April 15, and May 15, 1998, respectively.

GEOGRAPHIC INFORMATION SYSTEM

The program is designed to transfer evolving geographic information systems technologies to state and local governments and others in the public and private sectors. The current program is being carried out by a non-profit corporation, The National Center for Resource Innovations. The directors and participants of the Center are the sub-contractors who are carrying out the program by working on agro-environmental problems at the national, regional, state and neighborhood levels. They represent a wide spectrum of site-based expertise including four academic institutions, one regional development authority, and one non-profit corporation. A new site at the Southwest Indian Polytechnic Institute has been added by Congress this year. This institutional arrangement has helped fill a role in linking some of the otherwise disparate efforts of agencies and academic institutions to apply them in the now seven regions of the country. This project is needed to transfer relevant technology to state and local governments whose limited training budgets and, sometimes, isolated location make it difficult to use the latest technology. This is particularly true for Native American communities.

The technology developed in the Center program is useful in improving the management of natural resources. While concentrating on issues related to agriculture, the independent, non-profit nature of the National Center for Resource Innovations facilitates linkages across disciplinary and institutional barriers, and makes it possible to use analyses at the state and local levels which were initiated at the federal level. While the early phases of the geographic information system concentrated on building information systems related to rural physical and natural resources, the current challenge is to integrate human economic, social and demographic information in order to better understand the relationship of human communities to the landscape. At the other end of the spatial scale, the role of the public sector in geographic information system-based precision farming technologies, data capture, and information synthesis is the subject of a current study group.

The original goal of this work was to serve as a pilot project for the transfer of geographic information systems technology related to natural resources to local governments. The Center has carried out this function. Economic and biological data are being presented in maps and tabular formats to state and local governments and individuals. The Chesapeake Watershed project has linked national and regional programs with seven state conservation entities in an effort to develop better watershed models and decision support systems. This year, the Center will reach Native American communities using their own distance-learning networks originating at the Southwestern Indian Polytechnic Institute. It is anticipated that the fiscal year 1998 grant will support work under this program through March 1999.

Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$747,000; fiscal years 1992 and 1993, \$1,000,000 per year; fiscal year 1994, \$1,011,000; fiscal year 1995, \$877,000; fiscal year 1996, \$939,000; and fiscal years 1997 and 1998, \$844,000 per year. A total of \$7,756,000 has been appropriated since the beginning of the program.

For fiscal year 1990 through fiscal year 1997, to date, the work in this program had \$5,009,834 in non-federal support. In fiscal year 1990, non-federal support was \$714,940 consisting of equipment, databases, and other miscellaneous contributions from foundations, city, and state governments. In fiscal year 1991, non-federal support was \$25,000 from county government. In fiscal year 1992, non-federal support was \$366,016 from county government, computer companies, and state governments consisting of equipment, software, facilities, and miscellaneous support. In fiscal year 1993, non-Federal support was \$713,900 consisting of financial and miscellaneous support from foundations, county and state governments. In fiscal year 1994, the non-Federal support was \$713,643. In fiscal year 1995, the non-Federal support was \$987,000. In fiscal year 1996, it was \$567,173. It was \$456,582 in fiscal year 1997. In 1998, it is anticipated that non-federal dollars will exceed \$1,000,000.

The National Center for Resource Innovation-Chesapeake Bay is located in Rosslyn, Virginia. This group is working under a cooperative agreement with the U.S. Department of Agriculture's Natural Resources Conservation Service to work with 13 northeastern states. The southeastern center in Valdosta, Georgia, in affiliation with the South Georgia Regional Development Center, has developed a comprehensive plan of the City of Adel as a model for other urban centers in the 10-county region. The southwestern center, in Fayetteville, Arkansas, serves several local governments through its training facilities at the University of Arkansas, basing its technical approach on expertise and past experiences with the Federally-developed system known as GRASS. They have developed pilot projects for some local jurisdictions and state level databases which they have provided online. Central Washington University focuses on training for state planning and on three local governments and the Yakima Nation in the Yakima watershed. The north central center in Grand Forks, North Dakota, in affiliation with the University of North Dakota, focuses on relating real time weather data to other spatial attributes. The University of Wisconsin-Madison, functioning as the Great Lakes center, continues a long history of involvement in the application of this technology at the local level with strong focus on soils/land-use and the institutional aspects of the integration of a new technology. Native American communities will be reached through the Southwestern Indian Polytechnic Institute facilities in Albuquerque, New Mexico.

The original objectives to build institutional frameworks for developing and disseminating geographic and related information to local decisionmakers is constantly evolving. Each site has developed approaches to addressing regional needs for modern technologies, and many innovative applications have been implemented. Technologies, including Internet-based educational and information exchange, have been developed to respond to the Center's customers. The Center has been asked to include these new technologies in order to bring its primarily rural users into new eras of public education and information management.

Proposals have been internally reviewed by Departmental personnel in different agencies. Over the last 3 years, the program has also been externally reviewed by local advisory committees and qualified professionals inside and outside of government. Their various comments and suggestions are sent to the agency for the merit review.

GULF COAST SHRIMP AQUACULTURE

Work under this program has addressed research needs necessary for the development of a U.S. marine shrimp farming industry. Studies have been conducted on growout intensification, prevention and detection of diseases, seed production, and the development of high health and genetically-improved stocks. Performance trials on selected stocks in various production systems have been conducted. Seed produc-

tion systems have reached commercial feasibility. Protocols for viral detection have been improved and have led to the development of specific pathogen free stocks of commercial importance. A number of important viral pathogens of marine shrimp have been identified. Researchers have responded to viral infections that have impacted the U.S. shrimp farming industry. Researchers will intensify efforts aimed at preventing new introductions of exotic viral pathogens. In fiscal year 1998, emphasis will be placed on the industry seed supply, disease control, biosecurity in production systems and the evaluation of shrimp viruses moving through processing and commodity channels.

The principal researcher indicates that there is potential to enhance domestic production of marine shrimp through aquaculture in order to reduce the annual trade deficit in marine shrimp, which is approximately \$2 billion. Research could improve the supply of high quality seed, improve shrimp health management, and enhance production efficiency in shrimp culture systems. The U.S. has the opportunity to become a major exporter of shrimp seed and broodstock, and disease control technologies, products and services.

The original goal was to increase domestic production of marine shrimp through aquaculture. Studies have been conducted on growout intensification, prevention and detection of diseases, seed production, and the development of specific pathogen free stocks. Commercially-viable shrimp seed production systems have been developed. Diagnostic techniques for a number of important viral pathogens have been developed. High health genetically-improved stocks are being developed and evaluated under commercial production conditions. Researchers have responded to severe disease outbreaks caused by the introduction of exotic viral pathogens into U.S. shrimp farms. In addition, scientists are currently developing biosecurity protocols to prevent additional introductions of viral disease agents.

Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$1,050,000; fiscal year 1986, \$1,236,000; fiscal year 1987, \$2,026,000; fiscal year 1988, \$2,236,000; fiscal year 1989, \$2,736,000; fiscal year 1990, \$3,195,000; fiscal year 1991, \$3,365,000; and fiscal years 1992–1993, \$3,500,000 per year; fiscal year 1994, \$3,290,000; and fiscal year 1995, \$2,852,000; fiscal year 1996, \$3,054,000; and fiscal years 1997 and 1998, \$3,354,000 per year. A total of \$38,748,000 has been appropriated.

The U.S. Marine Shrimp Farming Consortium estimates that non-federal funding for this program approaches 50 percent of the Federal funding for fiscal years 1991–1997. The source of non-federal funding is primarily from state and miscellaneous sources. In-kind contributions from the industry were not included in this estimate, but are substantial as the program is dependent upon industry cooperation to carry out large scale commercial trials.

The work is being carried out through grants awarded to the Oceanic Institute, Hawaii and the Gulf Coast Research Laboratory in Mississippi. In addition, research is conducted through subcontracts at the University of Southern Mississippi, Tufts University, the Waddell Mariculture Center in South Carolina, the Texas Agricultural Experiment Station, and the University of Arizona. The anticipated completion date for the original specific research objectives was 1987. The original specific objectives have been met, however, broader research goals have not been met. Researchers anticipate that the specific research outlined in the current proposal will be completed in fiscal year 1999.

The agency evaluates the progress of this program on an annual basis. The institutions involved in this program submit a detailed accomplishment report each year prior to the submission of the new grant proposal. In addition, the agency conducts an in-depth on site review of the program every three years. The 1998 review of the program indicates that the progress during the last twelve months has been well documented; the proposal is well written; the proposed research is consistent with the NSTC Strategic Plan for Aquaculture Research and Development; close linkage between the research and the U.S. shrimp farming industry has greatly enhanced the commercialization of research findings; and facilities and expertise are very good. The CSREES Program Manager met with the technical committee of the consortium during the proposal development for the fiscal year 1998 proposal.

MARICULTURE, NORTH CAROLINA

CSREES has requested the university to submit a grant proposal that has not yet been received. The proposal is reviewed by the university's peer review process and is reviewed by the CSREES Program Manager. Since this is the first year of this project, CSREES will send the proposal out for external peer review. The researchers indicate that there is a regional and national need to develop aquacultural production systems for a variety of marine finfish. The researchers also indicate that

the proposed research is consistent with the NSTC's Strategic Plan for Aquaculture Research and Development. The goals of this research program is to develop sustainable aquaculture production systems for marine finfish. The researchers will develop culture technologies and evaluate marine finfish species that have some potential for commercial aquaculture production. Research is likely to focus on reproduction, growth and nutrition, and system design. Technologies developed may also have some application to stock enhancement programs to support restoration of depleted commercial stocks of fish.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$150,000. The university estimates a minimum of \$90,000 of non-federal funding in fiscal year 1998 primarily from state sources. As the program develops, additional non-federal funding is expected.

The research will be conducted at the Center for Marine Science Research at the University of North Carolina at Wilmington. The anticipated completion date for the original objectives is fiscal year 1999. The project will be initiated in fiscal year 1998.

The agency will evaluate the progress of this project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to CSREES for funding. Since this is the first year of the program, CSREES will conduct an external peer review of the proposal. The researchers have been asked to develop a research proposal consistent with the NSTC's Strategic Plans for Aquaculture Research and Development.

MISSISSIPPI VALLEY STATE UNIVERSITY

Funds were used for curriculum development, and to generally strengthen academic programs, including accreditation and re-accreditation. Of the ten programs eligible for accreditation, nine have been accredited. Assessment of the criteria has begun for the remaining eligible program. Academic programs have been broadened to include more agriculture-related courses consistent with the needs of students from the Mississippi Delta, students from other parts of the State, as well as out-of-state students. Curriculum additions have had a positive impact on student enrollment. Courses continue to be modified to reflect the needs of graduates as well as employers in the Mississippi Delta, with particular emphasis on those areas that employers have the greatest need. The funds continue to provide enhancements related to other program and administrative support areas that positively impact program delivery and administration at Mississippi Valley State University. The project has been merit reviewed.

The primary need for this project is to satisfy a local need. The need is for strengthening university capacity and curriculum development at Mississippi Valley State University. Degree programs in Accounting, Mass Communications, Music and Public Administration have been added since the 1988 plan was developed. The Criminal Justice program has been developed into a departmental unit with social work in order to provide for improved administration and academic counseling. A master's program in Criminal Justice is now offered. The baccalaureate major in chemistry and master's program in Elementary Education have been reinstated.

The original goal was to provide funding to strengthen the academic programs of the university. The academic programs have been strengthened as evidenced by student recruitment, which has improved to show a positive ratio between applications received and students admitted. Approximately one half of the applicants are enrolled. Increased quality of instruction and programs have benefitted students. This is reflected in the higher graduation rate, increased student enrollment, enriched faculty and improved community relationship.

This program was initiated in fiscal year 1987. Grants have been awarded from funds appropriated as follows: fiscal year 1987, \$750,000; fiscal years 1988 and 1989, \$625,000 per year; fiscal year 1990, \$617,000; fiscal year 1991, \$642,000; fiscal years 1992 and 1993, \$668,000 per year; fiscal year 1994, \$593,000; fiscal year 1995, \$544,000; and fiscal years 1996—1998, \$583,000 per year. A total of \$7,481,000 was appropriated.

Mississippi Valley State University received State and private funding during the period of this grant. The State figures provided here are for enhancement funds gained above the University's standard formula generated funds. The sources and amounts are as listed:

Fiscal year	State	Private	Total
1987	\$168,640	\$168,640
1988	186,036	186,036

Fiscal year	State	Private	Total
1989	\$68,658	190,258	258,916
1990	207,879	369,358	577,237
1991	333,263	337,700	670,963
1992	349,427	470,220	819,647
1993	35,750	358,680	394,430
1994	590,890	568,970	1,159,860
1995	841,654	530,300	1,371,954
1996	1,197,917	590,824	1,788,741
1997	309,717	755,629	1,065,346

These funds are intended to strengthen programs at Mississippi Valley State University. The program has been carried out on the campus at Itta Bena and at off-campus sites in Anguilla and Greenville and the Greenwood Center since the Spring Semester of 1996. The objectives of the current grant will be completed by September 30, 1998.

The program has been evaluated on an annual basis by the agency. The annual progress report for fiscal year 1997 revealed progress in the academic programs. For example, the Social Work Department had significant positive changes in the quantity and quality of the faculty. The Business Department offered a component dealing with Agricultural land lease in the business law classes and the other classes had topics on input and output analysis, agricultural stimulations and initial farm planning. The major objectives of this project have been met. The funds are now used to maintain the level attained since receiving these funds. The fiscal year 1998 proposal will be peer reviewed.

NATIONAL CENTER FOR PEANUT COMPETITIVENESS

This is a new research project initiated by the Congress in fiscal year 1998. CSREES has not received the grant proposal which was recently requested from the University of Georgia. The goal is to conduct economic, genetic, and biotechnological research to develop globally competitive production systems. The work supported by this grant begins in fiscal year 1998 and the appropriation is \$150,000. This research is being conducted at the Griffin, Georgia research station of the University of Georgia. The anticipated completion date is September 2000. CSREES will review the project proposal when it is received and later evaluate the results of the research.

PM-10 STUDY, CALIFORNIA AND WASHINGTON

The research on the effect of PM-10 particulate emissions from agricultural land on air quality is being conducted by scientists at the University of California-Davis and Washington State University. Also cooperating in these studies are: the Department of Agriculture's Agricultural Research Service and Natural Resources Conservation Service; State Cooperative Extension Services; U.S. Environmental Protection Agency; California Air Resources Board and Washington Air Quality Control District; Washington Department of Ecology; and farm and agricultural organizations; and private farmers, ranchers, and growers in both states. The California program has focused on developing and refining methods to accurately measure and detect the sources of PM-10 emissions from various agricultural practices, and to investigate alternative practices for reducing potential air pollution on susceptible California crops and soils. In addition, the California project is also measuring PM-2.5 and even more refined size distributions, as well as identifying the constituents in all emissions samples in order to better characterize the size distribution and possible sources of the emissions. The California research has been expanded beyond the harvesting of crops to include emissions from cattle feedlots, dairies, and the poultry industry. This is in direct response to the monitoring data that shows that peak emissions occur in November through January, which do not coincide with crop production activities. The Washington State University scientists are using refined instruments on field sites to measure and predict the effects of wind erosion and agricultural practices in the Columbia River Basin region on PM-10 emissions, with the assistance of a portable wind tunnel. Alternative cropping systems, tillage practices, rotations, and weed control practices are being developed and compared for control of PM-10 emission pollution under Columbia River Basin conditions.

The principal researcher believes there has been growing national concern over the potential health and safety aspects of air pollution from dusts and suspended particulate matter, resulting in passage of the 1990 Clean Air Act which requires

the monitoring and control of such pollution. Because of particular problems from PM-10 emission in the arid regions of the Western U.S., research on the role of agricultural operations in intensively cultivated soils in California and the Columbia River Basin, as sources of PM-10 pollution, will assist growers to develop alternative agricultural management practices to control PM-10 emissions.

The original goals of this research were to measure the PM-10 emission rates from significant crop and tillage practices, to determine the source of PM-10 emissions on soils in agricultural regions of southern California and the Columbia River Basin in the Pacific Northwest, and to explore cost-effective alternative agricultural practices to control these emissions. The third year of field measurements are being completed on PM-10 emissions on production practices on almonds, figs, walnuts, wheat, and from dairy farms and feedlots in California, and on a number of agricultural practices in the rainfed and dryland croplands in the Columbia River Basin. Susceptible climatic and soil conditions and tillage and cropping practices have been identified and are being used to develop prediction tools to assist growers to adopt alternative practices to reduce potential air pollution by PM-10 particulate emissions. Measurements continue to be taken in these areas. Plans have also been developed to study the impacts of land preparation techniques on emissions.

A Light Detection and Ranging system has been developed at the University of California at Davis. This instrument allows a snapshot of the shape of an emission plume from a source such as a harvester. It will allow estimates on the amount of material emitted into the atmosphere and its subsequent transport.

The work supported by this grant began in March 1994. The appropriation for fiscal year 1994 was \$940,000; fiscal year 1995, \$815,000; and for fiscal years 1996, 1997, and 1998, \$873,000 per year. A total of \$4,374,000 has been appropriated. In California, the program is matched by State funds in the form of salaries, benefits, and operating costs. In Washington, there were no state or non-Federal funds in support of the PM-10 project in 1994 and 1995. In 1996, state support was \$22,566, and in 1997, state support was \$102,364.

This work is being directed by participating scientists at the University of California-Davis, and at the Washington State University and the anticipated completion date of the original objectives of this project is 2000. The first four objectives of the project on soil particle characterization are anticipated to be completed in 1999. The objectives on field control will continue. A manual of control practices is being developed for use by growers to reduce wind erosion on agricultural land. Implementation and development of these management practices will be a major role of this project in the future. Quarterly and annual reports on the entire project to date are available.

The agency's program manager annually reviews the research progress reports and proposed new research, and attends the annual meetings of the program to assess progress. The program is also evaluated each year by technical, administrative, and agency personnel. Progress is reported at research review meetings three times a year. Grower and public advisory committees are consulted for input on research progress and objectives. A formal on-site review by a panel of experts was conducted of the Washington program in November 1997, and a formal review report was prepared.

WATER QUALITY—ILLINOIS

The Illinois Groundwater Consortium grew out of a fiscal year 1990 appropriation of \$500,000 to Southern Illinois University at Carbondale to focus on the short- and long-term effects of agricultural chemical contamination on the environment, the groundwater, and ultimately, human health, and welfare. As a result of this appropriation, the University joined forces with the Illinois State Geological Survey, Illinois State Water Survey, University of Illinois Cooperative Extension Service, and the University of Illinois Agricultural Experiment Station to create the Illinois Groundwater Consortium. The Consortium's primary mission is to work toward providing a scientifically-valid basis upon which agricultural chemical management and regulatory decisions can be based. The Consortium has worked to address the concerns of the agricultural and agrichemical industries as well as the concerns of the agencies charged with protection of environmental quality. Projects supported with Consortium funding are peer reviewed by researchers at 35 different universities and agencies from across the Nation, and results are presented and critiqued annually at the Consortium's Research Planning Conference. Examples of projects currently under study supported with Consortium funding include:

1. The Role of Flooding and Land Use Practices on Erosion Rates and Agrichemical Loadings in the Southwestern Illinois Sinkhole Plain;

2. Mechanism of Transport of Nutrients in Alluvial Aquifers During Normal and Flood Conditions;
3. Dynamic Modeling of Sediment, Nutrient, and Pesticide Transport in Agricultural Watersheds During Severe Storm Events;
4. A Community Based Sampling Program for Evaluating Long-Term Flood Impacts on Rural Well Water Quality;
5. Management Strategies for Riparian Water Supply Wells;
6. An Investigation of Temporal Changes in Soil Permeability Within the Vadose Zone of Areas Inundated by Floods;
7. Effects of Flooding on Salamanders in the Horseshoe Lake Conservation Area;
8. Developing a Geographic Information System Database to Monitor Plant Population Dynamics in the Floodplain: A Model Based on *Boltonia Decurrens*, a Threatened Species;
9. Modeling Flood Flows in Flat, Tile Drained Watersheds; and
10. The Effect of Flood Dynamics on Chemical Fate and Transport: Implications for Agricultural Management.

The fiscal year 1998 appropriation is targeted to research pertaining to the impacts, recovery, and remediation of the Midwestern region after flooding. The 1993 and 1995 flooding of the Mississippi, Missouri, and Illinois Rivers, and their tributaries, created devastating effects on the farm lands, communities, and natural resources of the area. These effects have major implications for agricultural practices, water quality, and public policy decisions. This natural catastrophe has resulted in a need for further studies examining the impact of the flooding on surface/groundwater, soils and their rehabilitation, biodiversity, and on economic and public policy in the region. In addition, there is the need to disseminate results to the public to enable the Consortium findings to be beneficial in the near term to those needing the information. To facilitate this work, the Consortium expanded its participant institutions to include Southern Illinois University at Edwardsville. Southern Illinois University at Edwardsville's strategic location in the heart of the flood damage area, as well as its qualified research scientists who work in the Consortium's high priority research areas, strengthen the capabilities of the Consortium. The priorities of the Consortium are: (1) the funding of research upon which public policymakers working on land use or groundwater protection issues in flood plain areas can base decisions and (2) the broad dissemination of this information. The projects funded by the Consortium are providing researchers opportunities to obtain data upon which larger projects can be built. Without this initial data, funding from other competitive sources would be difficult to obtain.

The Illinois Groundwater Consortium was established to coordinate and support research on agricultural chemicals in Illinois groundwater. The recent Midwest flood of the Mississippi, Missouri, and Illinois Rivers, and their tributaries, created devastating effects on farm lands that have major implications for agricultural practices and water quality in the region as well as effects in other states in the Midwest. The Consortium provides information to facilitate short-term and long-term systems studies of the effects of flooding on groundwater and surface water upon which to base policy management decisions. Research areas characterizing short-term and long-term projects completed, underway, or proposed for each research area include:

Short-Term

- Effect of extended inundation on soil productivity
- Movement of chemicals (pesticides, herbicides, heavy metal, other chemicals) from flooded soils into surface and groundwater
- Impacts on soil fertility and nutrient balance caused by flooding
- Changes in nitrogen-fixing bacteria or pesticide microbic activity due to flooding
- Impacts of flooding on plant and aquatic life, including endangered and dangerous species, and microbial communities
- Effectiveness of riparian buffer strips under flooded conditions
- Groundwater quality changes resulting from flood related land-use developments in both the bottomlands where farming practices change and in the uplands where new communities are being developed

Long-Term

- Effectiveness of methods of remediation for flooded soils
- Changes in surface and groundwater quality over time with changes in flooding conditions
- Changes in soil chemistry and productivity over time
- Long-term effects and recovery of microbic activity
- Effects of time on recovery (and eradication) of plant and aquatic life

- Recommendations for long-term, systems-based planning and management for watershed and bottomland management
- Examination of public policy decisions with implications for agriculture and water quality in light of flooding effects and recovery
- Long-term implication for public policy decisions and management of the river systems

Research grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$600,000; and fiscal years 1992–1993, \$750,000 per year; fiscal year 1994, \$666,000; fiscal year 1995, \$460,000; fiscal year 1996, \$468,000; and fiscal years 1997 and 1998, \$492,000 per year. A total of \$5,172,000 has been appropriated. The non-federal funds and sources provided for this grant were as follows: \$255,891 state appropriations in 1991; \$447,237 state appropriations in 1992; \$644,054 state appropriations in 1993; and \$623,124 state appropriations in 1994. Non-federal and state funds for 1995–1997 have exceeded the federal funds.

The work is being carried out by the Illinois Groundwater Consortium and coordinated by the Carbondale campus of Southern Illinois University. The research is being conducted by staff at the University of Illinois, Southern Illinois University-Carbondale, the Southern Illinois University-Edwardsville, the Illinois State Geological Society and the Illinois State Water Survey at locations across the State of Illinois and in Missouri.

This project was planned as a 5-year study of the impacts and recovery of flooding in the Midwest. In the original proposal and subsequent proposals, we identified both short-term objectives which are project goals that could be accomplished within 1–2 years and long-term objectives which are project goals that could be accomplished within 2–5 years. In calendar year 1997, we completed 3 years of studies involving 26 projects, and in calendar year 1998, we will begin 4 new projects and continue 12 projects. These projects are spread across areas identified as high priority, including studies of flood impacts on soil productivity and remediation, movement of chemicals in water and soils, bacteria and microbial life, plants and aquatic life, and on public policy impact. Results of projects completed in previous year and progress reports on projects underway are published each year as part of the Proceedings of the annual conference of the Illinois Groundwater Consortium and in the Illinois Groundwater Consortium's Groundwater Bulletin. Dissemination of both of these publications is broad-based, utilizing mailing lists to public and private institutions and individuals kept by the University of Illinois Cooperative Extension Service, the Illinois Groundwater Consortium, as well as dissemination through related conferences and workshops. Progress in meeting short-term and long-term objectives has been excellent. The most complex task is coordinating research projects on flood issues involving multiple issues, such as biological, social, economic and political issues, where effective solutions await the expansion of research databases. Due to waterborne contaminant problems within the Mississippi River Basin and sub-basins, it is anticipated that the projects will continue beyond the year 2000.

From its beginning, the projects funded through the Illinois Groundwater Consortium involve reviews by at least three faculty/researchers drawn from 35 different universities, state, and federal labs and surveys, U.S. Department of Agriculture's research laboratories, and other research centers. The reviewers rate proposals on criteria pertaining to scientific merit, quality of the research team, likelihood of the work resulting in publications and grant support from other sources, and relatedness of the project to the key objectives of the Illinois Groundwater Consortium. This peer review system enables the Consortium's Advisory Committee to select projects with high scientific merit from the group of proposals submitted for funding consideration. The titles, principal investigators' names and affiliations, and budgets are submitted to the U.S. Department of Agriculture for review along with the Consortium's proposal for funding.

WATER QUALITY—NORTH DAKOTA

The original goal of this research was to develop an understanding of the occurrence, transport, and fate of agricultural chemicals found in representative field settings in the Northern Great Plains region of the United States. In 1996, the scope of the program was expanded to include additional water management issues in the Red River of the North drainage basin. The Red River Water Management Consortium, a partnership between public and private sectors, was established to address critical water quality and quantity issues in an area where agriculture is the predominant industry. A major objective of the Red River Water Management Consortium is to use results from the initial phases of this research program to find economical, practical, and timely technological solutions to water problems of the re-

gion. By providing cofunding for the program, Red River Water Management Consortium members become active stakeholders in the research and ensure the practicality of the work performed.

The focus of current work is on: (1) the assessment, development, and implementation of new technologies for addressing water quality and quantity concerns within the basin; (2) water resource assessment and analysis, including the development of mechanisms for providing easy access to water-related information so proper water management decisions can be made; (3) the determination of agricultural, industrial, municipal, and recreational impacts on water resources, both current and potential, and the identification of potential solutions to water quality and quantity problems and needs; (4) water quality monitoring and coordination of monitoring activities; (5) education and information dissemination on water issues facing this region of the United States; and (6) the development of a watershed management strategy for the Red River of the North Basin focusing on water quality and quantity to ensure continued economic development of the area.

The original focus of the work was on agricultural chemicals in groundwater which potentially presents both a public health and an environmental quality problem of significant short-and long-term importance. The goal of this work was to provide a scientifically valid basis upon which meaningful agricultural chemical management and regulatory decisions could be made. The establishment of the Red River Water Management Consortium provided a mechanism for transferring results of the initial research to vested stakeholders of the region and for addressing water quality and quantity issues resulting from agricultural practices and development. The overall goal of the Red River Water Management Consortium is the development of a long-term watershed management strategy focusing on water quality and quantity which can be used as a model for watershed management in other agricultural regions in the United States.

The original goal of the research program was to understand the occurrence, transport, and fate of agricultural chemicals in representative field settings in the northern Great Plains region so scientifically valid decisions could be made for their management and regulation. Work on five of the seven sites originally instrumented under this program has been completed. Research at the two remaining sites is directed toward answering questions that have arisen during the course of this research program, specifically to determine the long-term trends in nitrate concentrations in surficial aquifers under irrigated agriculture and to determine the source and trends for sulfate.

Researchers have established the Red River Water Management Consortium as a mechanism for transferring the results of the initial research to vested stakeholders in the region and to the general public in order to address water quality and quantity problems resulting from agricultural practices and agricultural development.

In 1989, \$1.0 million was appropriated under the groundwater research program. Beginning in 1990, funds have been earmarked under the Direct Federal Administration program. Work supported by this grant was initiated in fiscal year 1990 with an appropriation of \$987,000. Subsequent appropriations have been \$750,000 in fiscal year 1991, \$500,000 per year in fiscal years 1992–1993; \$470,000 in 1994; \$407,000 in fiscal year 1995; and \$436,000 in fiscal years 1996–1998. A total of \$5,922,000 has been appropriated for this water quality research program.

Red River Water Management Consortium members provide co-funding to support their participation in the program. Co-funding provided by Red River Water Management Consortium members for fiscal year 1996 totaled \$59,700 and for fiscal year 1997 totaled \$80,000. Interest in this program continues to grow, and it is expected that at least \$100,000 in cost-share will be obtained during fiscal year 1998 through membership fees. These funds are provided directly to the program and do not include in-kind costs incurred by the participants which are estimated to be several hundred thousand dollars.

Field activities to determine the long-term trends of nitrate and sulfate and to determine the source of sulfate are being conducted in cooperation with the North Dakota State Water Commission, which is providing an estimated cash equivalent funding in the amount of \$33,660 for sample analysis and approximately \$12,000 for field instrumentation. Instrumentation of sites occurred in fiscal year 1997, and sampling and analysis will continue through fiscal year 1999.

Consortium members' dues are also used to provide in-kind services for match in other projects being performed by the Red River Water Management Consortium. A major project sponsored by the U.S. Environmental Protection Agency and local contributors to restore riparian areas in the Red River of the North Basin has been funded and will provide \$175,000 for consortium activities over the next 4 years.

The amount of in-kind services provided from Consortium member fees is \$9,000 per year.

The U.S. Corps of Engineers has contracted through the Red River Water Management Consortium a \$100,000 6-month effort to improve the decision-making capability regarding ongoing flooding within the Devils Lake Basin, a sub-basin of the Red River of the North Basin. This work is intended to produce decision support tools, forecasts, data, and forums that can be continued to be used by the Corps St. Paul district, the states of North Dakota and Minnesota, the International Joint Commission, and the people of the Devils Lake region after the project has been completed.

Research is being conducted at the University of North Dakota through its Energy and Environmental Research Center and at field sites and agricultural product-processing facilities in North Dakota, Minnesota, and Montana. In addition, a portion of the pesticide research was conducted at North Dakota State University. Cooperative efforts have resulted in work also being performed at cooperative institution locations such as the University of Waterloo, Victoria University, University of Montana, the Red River Resource Conservation and Development Council offices, and the North Dakota State Water Commission.

The anticipated completion date for the original objectives of the project, specifically the field-related research, was fall 1995. This research has been completed; and the sites have been decommissioned, with the exception of those relating to long-term nitrate and sulfate monitoring and analysis. Work on nitrate and sulfate trends and occurrence is scheduled for completion in 1999. The Red River Water Management Consortium was established in 1996 as a mechanism for transferring the information derived from this research program to the technical community and to the public for use in addressing water quality and quantity issues relating to agriculture and agricultural development. It is anticipated that Red River Water Management Consortium activities will continue for several years in order to meet the objectives as defined by the non-federal sponsors and the agency.

The last agency evaluation of this project was conducted in September 1996. The U.S. Department of Agriculture Technical Project Officer attended a meeting of the Red River Water Management Consortium to evaluate and determine the status of this effort, which is currently the focus of research program activities. All project objectives were met for the first-year Consortium activities. A meeting of this group will occur in March 1998.

BEEF IMPROVEMENT, ARKANSAS

The Arkansas Beef Improvement Program utilizes beef cattle farms to demonstrate cost-effective management practices. An Arkansas Beef Improvement Program Executive Committee provides overall direction for the program. A second approach the Arkansas Beef Improvement Program is taking is conducting workshops presented at the county level. The Arkansas Beef Improvement Workshops are usually scheduled for three evenings for two hours each evening and teach producers techniques learned in the Arkansas Beef Improvement Program to enhance efficiency and profitability. Other than an annual CSREES review, the project has not undergone a merit review.

Although local problems and situations are addressed, the decision-making process used to solve those problems is universal. Goal setting, evaluation of resources, and selection of management practices that complement those goals are foundations for the decision-making process. It is this process that is the backbone of the Arkansas Beef Improvement Program and Workshops.

The original goal of the Arkansas Beef Improvement Program was to enhance the profitability and efficiency of Arkansas cattle producers. Accomplishments to date include the establishment of demonstration farms, collection of benchmark data including soil tests, production information, forage analyses and budgets, and renovation of pastures to increase grazing capacity. Identification of mineral deficiencies in beef cattle have been detected and corrected through proper supplementation and ration balancing. The average production cost per farm decreased 35.4 percent from 1993 to 1996. Various management changes including parasite control and forage/pasture management have been instituted. Use of a cow-calf enterprise budget has helped the producers identify both efficient and inefficient management practices and take corrective actions. Additional accomplishments for the Beef Improvement Program:

- The break-even cost/pound of beef sold decreased from \$0.54 to \$0.37 (\$0.17/pound).
- Net calf crop percentage increased from 85.6 to 92.3 percent—an increase of 6.7 percent.

- Total pounds of beef sold per animal unit had a net increase of 46 lb., 451 to 507 lb.
- Cow cost decreased from \$246.70 to \$159.36.
- Supplemental feed costs decreased by \$16.73 per animal unit resulting in a total farm saving of approximately \$2,100.
- Return over specified cost increased from \$100.37 to \$213.37 per cow—a 113 percent increase (based upon 1993 price per pound received).

The sum of \$200,000 per year has been devoted to this project from fiscal year 1993 through 1995. In fiscal year 1996 through 1998, \$197,000 was appropriated per year for a total appropriated amount of \$1,191,000. Non-federal state funds of \$95,000 have been provided annually, from 1993 to 1997, for a total of \$475,000.

Six Arkansas demonstration farms were selected the first year of the Arkansas Beef Improvement Program, and four more were selected the second year. The first six farms have completed their fifth and final year of the program. Five new farms were added to the Arkansas Beef Improvement Program. Therefore, the program has used 15 farms—one in each of 15 counties to reflect the different types of cattle operations cattle producers in the area. Farm sizes ranged from 140 to 920 acres with an average of 360 and herd sizes ranged from 20 to 170 head, averaging 66 head per farm.

The Arkansas project started with 6 demonstration farms in 1992 and added 4 more farms in 1993. When the farms were selected, it was agreed the Extension team would work with the Arkansas cattle producer for 5 years. Therefore, the first 6 demonstration farms completed the program at the end of 1996, and the remaining 4 farms will complete the program at the end of 1997. Data from the final year as well as an Arkansas Beef Improvement Program Producer Survey and County Agent Survey will be collected and summarized for evaluation. Arkansas Beef Improvement Program Workshops were developed and have been implemented at the county level. The next phase of the program is to introduce Arkansas Beef Improvement Projects. These projects—stocker cattle, cow herd performance, calving and breeding season, pasture renovation, and hay quality and supplementation—are designed to increase the number of county Extension agents and producers involved with the Arkansas Beef Improvement Program and to evaluate on a more in-depth level these important management situations. A CSREES review of the project is conducted annually. The 1996 review noted the project is taking a sound approach to improving beef production efficiency and profitability in Arkansas.

DELTA TEACHERS ACADEMY

The Delta Teachers Academy project is provides approximately 525 teachers at 35 sites throughout the seven Lower Mississippi Delta states with development opportunities by teaming them with university scholars in on-site sessions and residential summer institutes. It is also supports the professional development of over 650 Academy graduates throughout the region. The subjects focused on during these training opportunities are English, geography, history, mathematics, and science. The Delta Teachers Academy grant is not awarded competitively; however, we require annual applications reporting the previous year's accomplishments and describing activities and expenditures planned for the upcoming year. These applications undergo merit review by at least three of our Ph.D. level staff before grant awards are made.

According to the grant recipient, the 219-county area comprising the Lower Mississippi Delta region has been cited in reports by the Educational Testing Service and the National Center for Education Statistics as notably lagging in student performance in core academic areas. In 1989, Volunteers in Service to America characterized the area as the poorest region in the country. According to the Southern Regional Education Board, at least five of the Delta states have 20 percent or more of their school-age populations in poverty, with Mississippi topping the list at 34 percent. In its report to Congress in 1990, the Delta Development Commission cited serious educational problems including poor student performance in core content areas, demoralized teachers with little or no opportunity for academic development, and region-wide difficulty in recruiting and retaining qualified teachers. The Commission also stressed the links between these problems and the pervasive poverty and depressed economic conditions that characterize much of the seven-state Delta region. The Commission's report also cited that 75 percent of the region's workforce lacks the basic reading skills necessary for technical training and specifically cites the need for improved teacher training as one means for breaking the cycle of poverty and economic non-competitiveness.

The original and continuing goal of the project is to address the problem of insufficient professional development opportunities for the elementary and secondary

teachers of the seven-state region. The Academy project has focused on the core subjects of English, geography, history, mathematics, and science. Humanities, language arts, social studies, reading, civics, and interdisciplinary subjects are also covered by some sites. The Delta Teachers Academy began by offering educational development activities for 100 teachers from approximately 50 rural districts at 10 sites. Training has now been expanded to include 525 teachers at 35 new sites across the entire seven-state region. In addition, there are over 650 graduates of the program whose professional development is sustained through the Academy's Fellows Program and who are leading teacher in-service training back at their home schools.

A total of \$17.161 million dollars has been appropriated to the Department of Agriculture for this project, including \$2 million dollars in fiscal year 1994, \$3.935 million dollars in fiscal year 1995, \$3.876 million dollars in fiscal year 1996, \$3.850 million dollars in fiscal year 1997, and \$3.500 million dollars in fiscal year 1998. There are no non-federal funds identified for this project.

The Delta Teachers Academy project is coordinated out of The National Faculty's Southern Region office in New Orleans, Louisiana. The project is being conducted at 35 sites selected from within the seven-state Lower Mississippi Delta region including the states of Arkansas, Kentucky, Illinois, Louisiana, Mississippi, Missouri, and Tennessee.

The original objective was to provide three full years of training to each faculty team established by the Delta Teachers Academy program. Training consists of four two-day academic sessions and one two-week summer institute for each team. This objective has been met for the original 24 faculty teams first funded under the fiscal year 1994 Department of Agriculture grant and for the 15 additional teams established in 1995. One new team established in fiscal year 1996 has received two years of training, and 19 new teams established in fiscal year 1997 have received one year of training. As of the end of the fiscal year 1997 grant, 39 of the 40 faculty teams established by the Delta Teachers Academy will have met the original objective of the program. Objectives for the fiscal year 1998 grant include providing training activities to 300 teachers at the 20 continuing sites, sustaining the professional development of the project's 650 graduates through the Academy's Fellows Program, and expanding professional development activities to 225 teachers at 15 new sites throughout the seven-state Delta region. The anticipated project completion date for the 20 current sites is September 30, 2000, while the completion for any new program sites established in fiscal year 1998 would be in the year 2001.

A site visit of the Delta Teachers Academy offices in New Orleans, Louisiana and of the National Faculty's Summer Institute at Tulane University was conducted by the Cooperative State Research, Education, and Extension Service's National Program Leader for Higher Education and Evaluation, during July 1996. The site visit confirmed that participating teachers are enthusiastic about the Delta Teachers Academy program, that the instruction provided by The National Faculty's university scholars is on target and appropriate to the K-12 teachers' needs, and that the facilities are suited to program requirements. The site visit further confirmed that the Delta Teachers Academy has strengthened the participating teachers' ability to teach by improving their content knowledge base, helped them become leaders of other teachers by requiring them to conduct staff development back at their home schools, and had a positive impact on student learning. School superintendents report greater student enthusiasm, more homework, and higher test scores for students whose teachers were in the Delta Teachers Academy program.

EXTENSION SPECIALIST, ARKANSAS

This program develops, refines and validates technology for family farm production systems that enhance biological and economic efficiencies and product qualities of the Ozark Highlands in the south central United States. The applied research and extension programs help small farmers in the region to improve their production efficiency, minimize risk when no risk capital is available, combine enterprises on limited acres to make more efficient use of labor and equipment, and improve family record-keeping systems. The program promotes sustainability of small family farms in a whole farm context including land resources, labor resources and capital.

The program addresses research and educational needs of limited resource hillland family farmers producing forages, ruminant animals and horticultural crops. In many cases, technologies applicable to small farms have not been assembled into systems that these farmers can adopt with confidence and limited risk. The regional center conducts research to develop profitable systems and through the Extension programs, extends these systems to people who wish to improve productivity while remaining in rural areas. With the small/family farm focus, there is need to evalu-

ate the economic applicability of various research projects; and to transfer research information that can be used by these farmers to evaluate alternative enterprises, improve efficiency for conventional and value-added products, and enhance their incomes.

The goal of the project was to develop a small/family farm management and marketing education program for the area serviced by the South Central Family Farm Research Center located at Booneville, Arkansas. Currently, the general objective is to further develop and extend an educational program that transfers useful technology developed by the Center to small/family farmers in the Center's ten-State service area. This program provides support in alternative agriculture and marketing to county and state Extension personnel who assist local producers in evaluating these technologies and adopting those which are economically feasible. Within the past two years, a computerized farm management record keeping system has been developed and disseminated to assist producers in the region and nationwide to enhance their profits. Scientifically-based data on enterprise planning, production and marketing of alternative crops and livestock has been provided directly to clientele in 15 states and two foreign countries to assist them with their operations. Sound credible information has been provided to over 10,250 stakeholders through direct contacts, meetings, mailings and telephone conversations. Program personnel have worked with commodity organizations and other groups to form a network that delivers comprehensive programs on sustainable agriculture to end-users.

The project has been underway since 1992. Appropriations of \$100,000 have been made in each of the fiscal years 1992 through 1995. Appropriations in fiscal year 1996 and fiscal year 1997 were \$99,000 for each year. The same amount, \$99,000, has been appropriated for fiscal year 1998 bringing the total to \$697,000. State matching funds have been provided through the Arkansas Cooperative Extension Service in fiscal year 1992 through fiscal year 1997. The amounts are \$59,040 in fiscal year 1992, \$55,680 in fiscal year 1993, \$54,250 in fiscal year 1994, \$54,446 in fiscal year 1995, \$54,446 in fiscal year 1996 and \$46,346 in fiscal year 1997. The total is \$324,200.

The work is headquartered at the South Central Family Farm Research Center located at Booneville, Arkansas. It is being carried out primarily in Alabama, Arkansas, Georgia, Kentucky, Louisiana, Mississippi, Missouri, Oklahoma, Tennessee and Texas, the 10-state area served by the Center. The original proposal in 1992 was for a 12-month period. However, the program emphasis has changed over time with the educational needs of the target audience and as the research program of the Center has evolved. During the current year, the emphasis is on development, management and dissemination of whole-farm systems consistent with the farm enterprise mix that exists within the region. Current program objectives are to be met by February 1998.

CSREES conducted a merit review of the program in January 1997 when the proposal for the current year was received. An Executive Summary of the previous year's activities indicated the objectives of developing and disseminating a computerized recordkeeping system had been met; and that direct assistance had been provided to clientele within 15 states and two foreign countries. Publications on alternative farming systems have been completed and educational materials were made available to county Extension agents, agency personnel and producers. Evaluation efforts during the current year include documentation of requests and the compilation of address lists that will be used by Extension agents in follow-up activities.

EXTENSION SPECIALIST, MISSISSIPPI

The Basic Weather Service and Extension project is designed to fill a void in weather data due to closure of the Ag Weather Service facility in Stoneville, Mississippi. The funding will be used to gather and disseminate critical agricultural weather data for producers and researchers in Mississippi and surrounding states to use to make management decisions and formulate research projects. The funds are not awarded competitively.

The grant proposal states that the Ag Weather Service facility was closed recently at Stoneville, Mississippi. This action has created a void in the availability of and access to critical weather data that producers and researchers use to make management decisions and formulate research projects, respectively. The goal of the project is to collect, maintain, and disseminate weather information for producers and researchers in Mississippi and surrounding states. Electronic weather stations and links with other web sites to deliver weather data are being installed and developed.

The funding for fiscal years 1997 and 1998 is \$50,000 each year, for a total of \$100,000. The State of Mississippi through the Mississippi Cooperative Extension Service and Delta Research and Extension Center is providing \$41,350 in state ap-

propriated funds to support this project in 1997 and 1998. The project will be conducted at the Delta Research and Extension Center in Stoneville, Mississippi, is expected to continue into a Phase II program It will be evaluated in Phase II.

INCOME ENHANCEMENT DEMONSTRATION, OHIO

CSREES funds support the Agricultural Business Enhancement Center which plays a role in the development of the agricultural sector of Northwest Ohio. The Center provides a variety of management training programs, helps farmers and other agribusinesses develop comprehensive business plans, and facilitates business networking. CSREES performs an annual merit review of this project.

The Center seeks to enhance economic opportunity and agricultural competitiveness Northwest Ohio. To be successful in business, farmers and other agribusiness firms must be able to adapt to a large number of major changes affecting the entire food system from the farmer to the consumer. These include changes in farm programs, globalization of markets, new technologies, information systems, consumers' concerns for food safety and nutrition, and society's concern for protecting the environment. Individuals, families, firms and communities in Northwest Ohio need to understand the changes, develop and implement effective strategies for dealing with change.

The original goal of the project was to help people develop new businesses and restructure and expand existing businesses in order to enhance incomes in Northwest Ohio. Recent accomplishments include workshops to improve the management and marketing capacity of local farms and agribusiness firms. Business planning has been a major topic at workshops and several firms have been assisted in completing plans. The Center completed its tomato processing plant feasibility study and accompanying business plan but was unsuccessful in finding a sufficient number of producers to invest in a cooperative or to find a private investor. At the close of the fourth annual workshop for women in agriculture, 65 percent said their participation would improve management of the family farm. A new study is underway to determine the feasibility of farmers markets at Ohio Turnpike plazas.

The project began in 1991. Appropriations have been as follows: \$145,000 in fiscal year 1991; \$250,000 in fiscal years 1992 through 1995; and \$246,000 in fiscal years 1996 through 1998. Appropriations to date total \$1,883,000. The State of Ohio has appropriated the following funds: \$35,100 in fiscal year 1991; \$72,368 in 1992; \$56,930 in 1993; \$30,547 in 1994; \$49,935 in 1995; \$51,432 in 1996; \$48,664 in 1997; and \$50,500 in 1998. Non-federal funding provided to date totals \$395,476.

The Agricultural Business Enhancement Center is located in Bowling Green, Ohio and serves eight counties in the Toledo Metropolitan Area. Project leadership and some data analysis is being provided by the Department of Agricultural Economics, Ohio State University, Columbus, Ohio. The original proposal in 1991 was for a period of 12 months, however, the ongoing needs of producers and agribusinesses to adjust to major changes in the agricultural sector continues to provide the Center with many challenges. The current phase of the program will be completed in September 1998.

CSREES performed a merit review of the project in January 1997 as it evaluated the proposal for that year, and concluded that the project plays a role in enhancing the competitiveness of the agricultural sector in eight counties of Northwest Ohio and that it has been effective in stimulating economic development in the area.

INTEGRATED COW/CALF MANAGEMENT—IOWA

The CHIPS program is an integrated cow-calf resource management (IRM) program that originally targeted an eleven county area in southeast Iowa. The intent of the program is to improve the area's rural economy by maximizing the profit potential of individual livestock operations. The CHIPS concept was also initiated to promote the development of forage systems that utilize highly erodible land (HEL), including land to be released in the CRP program. The geographical area where CHIPS services are offered has systematically expanded from the original target area, with services extended to over 36 Iowa counties in 1997. Further expansion of the CHIPS program in area covered, services offered, and cooperators served is currently underway, with technical support being extended to an additional 14 counties in central and northwest Iowa in 1998.

The majority of Iowa's beef cow operations utilize extensive areas of marginal land that is highly erosive (HEL) and should not be intensively farmed with row crops. These rolling hills are capable of producing high quality forages and are supportive to the cattle industry. Fiscal year 1996 marked the beginning of the release of Conservation Reserve Program (CRP) contracts—with thousands of these acres categorized as HEL. The CHIPS program assists producers in making management

decisions regarding these CRP acres. CHIPS's supports cow-calf production on this marginal ground and provides one-on-one assistance as economic and production decisions are made.

The overall goal of CHIPS is to have a positive effect on the area's economy by improving the long-term profit potential of the local cattle industry. To address this broad project goal, CHIPS has set forth the following objectives:

- Improve profit potential of cooperator farms. Identify issues and trends in management data.
- Raise the awareness and understanding of over 2,000 agricultural producers in Iowa about cow-calf production on highly erosive land and the IRM concept.
- Provide CHIPS cooperators with intensive technical assistance to develop goals and individualized farm recommendations, including management areas such as pasture and forage production, rations, utilization of resources, record systems, and government farm program compliance. It is anticipated that 200 cow-calf operations will be involved in this technical assistance program during 1998.
- Help producers develop management skills to improve efficiency and reduce costs of production as CHIPS recommendations are implemented.

During 1997, over 130 cooperators, involving approximately 11,000 beef cows, participated in the CHIPS program. Four full-time technicians have conducted over 600 farm/office consultations during fiscal year 1997 to develop specific on-the-farm recommendations and to assist with the problem solving and decision-making process. These contacts involved a wide variety of technical assistance, with primary emphasis on nutrition, cost-effective ration development, genetic evaluation, value-added practices, and cow production concerns. Over 80 cooperators have incorporated the Cow Herd Appraisal of Performance Software (CHAPS) and Standardized Performance Analysis (SPA) programs in their operations. During fiscal year 1997, 3,300 head of beef animals were permanently identified to facilitate record and data collection. More than 13,000 cattle were weighed and monitored to evaluate performance and production levels. Approximately 400 forage samples were collected and analyzed, with the information being utilized in over 200 individualized ration recommendations. CHIPS technicians on a monthly basis highlight selected management recommendations. These financial and/or performance impacts are summarized and reported to personnel associated with the program.

'Networking' projects have been developed and initiated through the efforts of the staff involved with the CHIPS program. A CHIPS Heifer Development Program was initiated in November, 1996, coordinating the management of over 200 breeding heifers from ten CHIPS cooperators. The goal of this project was (1) to incorporate technological advances in the area of heifer development, and (2) to improve the genetic base of these ten operations through the use of artificial insemination, EPD use, and nutritional management. Over 95 percent of the enrolled heifers were diagnosed pregnant at the end of the project, with approximately 65 percent bred by artificial insemination. These results are both above industry averages. A CHIPS Feedlot Program has also been developed and reviewed. The purpose of this effort would be to provide cooperators, regardless of the size of the operation, an opportunity to retain ownership of their animals from birth to market. This value-added approach will expand the marketing opportunities for individual cow-calf operations and improve the profit potential for cooperators with genetically superior animals. Survey results indicate that cooperation with existing feedlot operations may be necessary to make this proposed program successful. Further review will occur at a later date. CHIPS personnel in conjunction with the Iowa Cattlemen's Association are also monitoring a statewide bull test evaluation.

For fiscal years 1992 and 1993, \$138,000 was approved; \$276,000 for fiscal year 1994; \$350,000 for fiscal year 1995; \$345,000 for fiscal year 1996; \$345,000 for fiscal year 1997; and \$300,000 in fiscal year 1998. Federal funding through fiscal year 1998 totals \$1,892,000. CHIPS participants pay client fees of approximately \$3.00 per cow. This fee structure is on a sliding scale which adjusts for cow herd size. To date, approximately \$75,000 have been collected from CHIPS cooperators.

The CHIPS program is currently being operated in 16 counties in southeast Iowa, 7 counties in the south central area, and 14 counties in east central and southwest Iowa. The expansion effort currently underway will extend the CHIPS IRM concept to an additional 14 counties in Iowa, offering program services to northwest and central Iowa.

The initial CHIPS program had a three year time period. Objectives and goals of the CHIPS program will continue to be modified and adapted to meet the needs of the cooperators and to adjust to the rapidly changing cattle industry. The level of technical assistance and method of program delivery will require adaptation to meet 'new' emerging objectives. These industry challenges strongly support the need for the CHIPS program. An example is the closing of the Monfort beef packing plant

in Des Moines, Iowa. This closure depressed market prices and the profit potential of beef producers. To address this issue, CHIPS is expanding value-added services to its cooperators. A retained ownership demonstration in cooperation with Iowa State University and agribusiness partners is currently being finalized. This would support value-added ownership, incorporate the latest technologies, and provide birth-to-market information to the producer. A new projections program is also being incorporated into the CHIPS program that will utilize past production and financial records to analyze available resources and develop a systems approach to the operation's future direction. Discussions with representatives from Precision Beef Alliance, a value-added pasture-to-plate program, have also been initiated. These innovative program services combined with the one-on-one technical support, record systems, and available networking opportunities will assist CHIPS cooperators in being flexible and adaptive to the ever changing economic conditions which exist in today's cattle industry.

A 'Think Tank' of beef industry representatives will be assembled in 1998 to review the CHIPS program. The objective of this group will be to make recommendations regarding the focus, direction, and future of this IRM program. This is the initial step in determining how the program will be funded in the future, where CHIPS fits in the industry's service area, and what industry groups will be involved. The 'Think Tank' process will help determine the services, technical assistance, and administrative structure of the CHIPS program in the future. This process should also improve the efficiency, flexibility, and impact potential of the services offered to participants. These recommendations will be incorporated with funding requests as other potential funding sources are investigated.

Evaluation of the CHIPS program is currently underway. The intent of the evaluation process is to (1) determine the production and financial impact of the program to participating producers, (2) analyze the services and technical assistance being offered, and (3) determine which programs should continue to be supported. This evaluation effort was initiated in December, 1997 with an anticipated completion date of April, 1998. To determine if the project's key objectives are being met, three areas of the program are being reviewed. (1) The reproductive (CHAPS) and financial (SPA) records are currently being analyzed to evaluate both short-and long-term operation impacts, (2) a questionnaire is being prepared to determine the production changes that have been incorporated by cooperators, and (3) the future needs of the cooperators will be surveyed. Three Iowa State University Extension personnel are conducting the study with the assistance of the CHIPS technicians.

The record evaluation process will analyze the production changes realized by incorporating the record keeping programs. This will compare production trends reflected by the record analyses, actual productivity changes, and financial impact. The questionnaire will summarize managerial changes that have occurred during the producer's involvement with the CHIPS program. If possible, economic impact associated with these changes will be reported.

NATIONAL CENTER FOR AGRICULTURAL SAFETY

Fiscal year 1998 is the first year for funding this project. CSREES has requested the university to submit a grant proposal that has not yet been received. The project director believes this training center to be of national, regional and local need. Farming continues to be one of the most dangerous occupations in our nation. An estimated 800 farmers, family members and farm employees die in work incidents annually. Most of these incidents are preventable if safe procedures are adopted while performing farm chores. The adoption of safe work habits is dependent upon the relevance of safety education to the at-risk agricultural audiences.

The original goal of this center is to provide practical, hands-on training methods for reducing the level of preventable injuries, illnesses and deaths among farmers and ranchers in the United States. It has been surmised that trainees and students will respond more positively to real life scenarios and actual simulations of farming hazards. The National Education Center for Agricultural Safety (NECAS) is offering practical training initiatives concentrating on the hazards that negatively impact farm work, including hazardous work: with equipment and chemicals; around livestock; in confinement facilities; and while harvesting grain and forage crops.

The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 is \$195,000. Specific information on the source and amount of non-federal funding for this project is not yet available.

Training under this grant will be conducted at the National Education Center for Agricultural Safety, located on the campus of Northeast Iowa Community College in Peosta, Iowa. The anticipated completion date of the original objectives is ap-

proximately March 31, 1999. The agency will conduct the initial review of this project when the proposal is submitted to CSREES for funding.

PILOT TECHNOLOGY PROJECT, WISCONSIN

Primary industrial extension activity of the Manufacturing Technology Transfer program is the delivery of technical assistance to manufacturing companies. Executive direction in determining the assistance required will be provided by the University of Wisconsin—Stout's Northwest Wisconsin Manufacturing Outreach Center (NWMOC) with direct consultation and long-term in-plant assistance delivered primarily through the efforts of university Project Managers and Co-op students. Direct assistance may be delivered through staff of the University of Wisconsin System—both two-and four-year institutions, and Extension services—the Wisconsin Technical college System; secondary schools; the private sector—professional societies, and private consultants, or attendance at state or national seminars. The project also draws on many other state resources to add expertise and capacity to network facilitation and in-plant extension activities. The project has undergone a merit review.

America's manufacturers continue to face tremendous global competition. There are enormous pressures to improve the quality of products; reduce the time consumed to bring new products to market; and there remains an ever increasing demand to reduce the costs of products. Currently there is a strong movement in manufacturing to use speed-to-market combined with new product introduction as a tool to obtain a competitive advantage. While high quality and cost efficiencies continue to be mandatory commitments for today's manufacturers, great value is now being placed on speed-to-market. Large companies are not the only ones influenced by these trends. Small and medium-size manufacturers often supply larger firms. Hence, they must be able to quickly process large amounts of information and solve complex problems.

The Manufacturing Technology Transfer program's principal objective is the development of a competitive, secure manufacturing base through the mechanism of industrial extension. The program principally targets small and medium size manufacturers in rural Wisconsin. This funding will: (1) continue to provide valuable industrial extension service to the target audience; (2) support the continued empirical development of an industrial extension model, and (3) investigate the use of new manufacturing technologies to support global competitiveness of manufacturers. Productivity improvements were reported by the companies showing economic impact to the region through implementation of:

- a. Client operations assessment/plant evaluation and strategy development.
- b. Opportunities for productivity improvements.
- c. Implement new organizational and operational methods.
- d. Investigate new manufacturing technologies.
- e. Establish quality assurance/total quality systems.
- f. Establish ongoing training programs.
- g. Deliver on-site instruction in new technologies, improved methods and processes.

This project has been underway since fiscal year 1992 and was funded for \$165,000 in fiscal year 1992, fiscal year 1993, fiscal year 1994, fiscal year 1995, and for \$163,000 in fiscal year 1996, fiscal year 1997, and fiscal year 1998 for a total of \$1,149,000. No non-federal funds have been provided for this project.

The work will be carried out by the University of Wisconsin-Stout and the original proposal in 1992 was for a period of 12 months. However, the Manufacturing Technology Transfer Program was developed as a continuously evolving industrial extension strategy for serving the needs of the manufacturing community. The Manufacturing Technology Transfer Program is measured by success in meeting the objectives of the past five years' proposals, including the delivery of modernization assistance and development of an industrial extension model. The current phase of the program will be completed in 1998.

To measure the success of the project, a client evaluation process has been developed which includes an evaluation questionnaire. Evaluations indicate forward strides in job creation, new businesses, expanded productivity, and enhanced international competitiveness.

RANGE POLICY DEVELOPMENT, NEW MEXICO

The Range Policy Development project has collected local economic data throughout the State. Local data have been used to develop an economic model to help explain the relationships among local economies and primary industries. The model is intended to enable policymakers to better understand how local and State econo-

mies are tied to primary industries, especially those industries that use public lands. The initial focus of the project has been on the livestock grazing industry.

In New Mexico and throughout the western states, many local economies are dependent on the use and management of public range and forest lands. However, there exists a great deal of disagreement about the true level of dependence of individual communities on these public land-based industries and, consequently, disagreement about the local, statewide, and regional impacts of public policies that alter the use and management of these lands. Through better understanding of how public lands impact local and regional economies, we may be better able to predict the outcomes of potential legislation or amended land use policies, resulting in policies that enhance, rather than detract from, local economies. Early results from this project have been encouraging and have spawned a six-state collaboration to design a regional economic model, based on the New Mexico prototype.

New Mexico is in the process of developing detailed input-output models for each county, from local and state tax revenue data. Economists are following up with workshops across the state to present information from economic forecasts to local decisionmakers. Further, the project calls for increasing the utility of the models by expanding the scope of the database to include industries in addition to the grazing enterprises.

This project was initiated in December 1994. In fiscal years 1994 through 1998, \$142,560 was appropriated each year for a total of \$767,240. The \$197,000 appropriated for fiscal year 1998 has yet to be awarded, as we have to receive and review a request from the institution. The project budget does not indicate any non-federal support. However, Agricultural Research Stations in five other States have economists currently working to expand upon the New Mexico project, ultimately to build a regional model.

According to the project director, most of the original objectives have been accomplished. In this second phase of the project, the investigators are collecting data to allow incorporation of other industry and government sectors into the model. Objectives for this phase should be completed near the end of 1998.

The proposal for continued funding underwent merit review by an agency team of National Program Staff in May 1997, and a review of progress to date was conducted by the project liaison in September 1997. The reviews focused on criteria including the relevance of the project goals, the suitability of the proposed research methods, and the extent of progress made toward addressing the goals of the project. Both reviews found that phase one objectives had been met, and progress had been made toward the objectives of the second phase of the project.

RURAL DEVELOPMENT, OKLAHOMA

This program provides financial and technical assistance to small business to create and retain jobs in rural Oklahoma and to stimulate the local economies. The program is carried out through financial services, business incubators, problem-solving assistance to small and medium-sized manufacturers and technical assistance to rural small businesses. The program is expanding to include assistance to rural small businesses to enter international trade. The program continues to evaluate new products and processes that may result in new industries or be applied to improve existing manufacturing processes. The project has undergone a merit review.

The increased demand for small business financing and technical assistance verifies the need for the program. Each year financing secured for small businesses has significantly increased. The demand for business incubators is also on the rise. Last year, Rural Enterprises (REI) agreed to manage two more business incubators bringing the total REI-managed facilities to thirteen. Also small businesses continue to need access to technical and business management assistance, worker training, and international trade assistance in order to stay competitive in domestic and world markets.

The original goal of the program was to create jobs in rural Oklahoma by providing a systematic access to improved technology, training, financial and business management assistance. Many accomplishments have resulted including financial assistance. REI is a Certified Development Corporation for the Small Business Administration as well as a designated Certified Development Financial Institution. As a result, REI has been successful in obtaining financing for entrepreneurs and rural small businesses totaling \$119,060,129. Special technical assistance efforts have included 1) problem-solving assistance to small manufacturers; 2) training and dissemination of information on ISO9000 to assist rural businesses compete with a global market; 3) providing manufacturers with a "Quick View Assessment" program which enables manufacturers to compare their facilities and operations with other companies across the United States and 4) working one-one-one with small

businesses providing on-site assistance with inventory control, cash flow management and marketing.

Appropriations to date are as follows: \$433,000 in fiscal years 1988 and 1989; \$430,000 in fiscal year 1990; \$431,000 in fiscal year 1991; \$300,000 in fiscal years 1992 through 1995; and \$296,000 in fiscal years 1996 and 1997; \$150,000 in 1998. Appropriations total \$3,669,000. No non-federal funds have been provided for this project.

The work is being carried out at Rural Enterprises, Inc., in Durant, Oklahoma and the original proposal in 1988 was for a period of 12 months. However, the objectives of Rural Enterprises, Inc., are on-going because of the nature of the activity. The clientele is diverse and decentralized. The engineering and management consultation model being pursued with individual clients results in a situation where hundreds of problems are being pursued simultaneously and when solved are replaced by new issues resulting from international competition, regulations, training needs, and changeover costs. The next phase of the program will be completed in 1998.

REI itself conducts an on-going evaluation process to measure the organization's effectiveness and efficiency in accomplishing its objectives and this is documented on a quarterly basis through our reporting system. Over 6,000 jobs have been created and retained for new and expanding businesses as a result of this program. The program has met its key objective of job creation in rural Oklahoma.

RURAL DEVELOPMENT THROUGH TOURISM, NEW MEXICO

The Rural Economic Development Through Tourism Project involves applied research and outreach focused on locally-based tourism development strategies to enhance economic opportunity in small and rural communities in New Mexico. Components of the agenda support training of local leadership and tourism professionals, strategic planning and market development, and technical assistance to communities. The proposals submitted are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural tourism as a development strategy.

The applied research and outreach project was designed by the State Cooperative Extension Organization to increase the ability of the public sector to enhance economic opportunity for rural communities through tourism development. A regional task force composed of Extension professionals and community leaders from business, industry, education, and local, state, and Federal government was developed to guide and advise the development and implementation of locally-based programming and research. The results include video training materials, a public relations package, image studies and profiles, regional tourism guides, development of tourism bus packages, festival planning workshops, development of regional tours, and a mini-grants program for tourism development.

In fiscal years 1992 through 1996 the amount of \$230,000 was appropriated per year. The fiscal year 1997 appropriation was \$227,000 and \$247,000 was provided in 1998. Total appropriated funds to date are \$1,624,000. Fiscal year 1992 included \$38,764 in state matching funds. Fiscal years 1993, 1994, 1995, and 1996 included \$39,360 of state matching funds. Fiscal years 1997 and 1998 include \$39,040 state matching funds.

Applied research and outreach is being carried out through New Mexico State University. The original completion date was September 30, 1993 and the original objectives of this research have been met. The additional objectives being presented for the current year will be completed by March 31, 1999.

The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Impacts include increases in attendance of local festivals, increase in number of tour bus visits to New Mexico, training to over 700 tourism employees in the region, and establishment of a number of new businesses. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

RURAL REHABILITATION, GEORGIA

The program has tested the feasibility of providing satellite-based adult literacy education, in association with vocational rehabilitation services, to handicapped adults in rural Georgia. The program has developed curriculum, tested and adapted

technology, established student recruitment and retention strategies, expanded to Statewide coverage, and provided successful adult literacy education.

A state task force has estimated that 25 percent of Georgia's adult population is functionally illiterate. Functional illiteracy is regarded in Georgia as a form of disability. The extent of adult functional illiteracy is similar throughout much of rural America. The original goal of this program was to prove that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. This program has demonstrated that satellite-based literacy training, in cooperation with vocational rehabilitation services, can successfully provide adult literacy education designed to improve critical reading, writing, and thinking skills, for handicapped rural adults. Over the past nine years, test scores and attendance and completion rates of students in the satellite-based program have shown that distance learning is an effective delivery system for instructing low-level readers and non-readers. Test scores and attendance rates of students in this program have been comparable to those of students in traditional, urban classes.

Funding for this program was initially appropriated in fiscal year 1989, and the program has been in operation since March 1989. Through fiscal year 1998, appropriations for this program have been as follows: \$129,000 in fiscal year 1989; \$256,000 in fiscal years 1990, 1991, and 1992; \$250,000 in fiscal years 1993, 1994, and 1995; and \$246,000 in fiscal years 1996, 1997, and 1998. Funds appropriated to date total \$2,385,000. These Federal funds are typically used for program innovation and quality improvement.

The fiscal year 1998 source of non-federal funds provided for this program are state appropriated funds from the Georgia Department of Adult Education. Prior years sources also included private contributions from the Woodruff Foundation and other local foundations. Through fiscal year 1998, the total amount of non-federal funds provided for the project has been \$8,006,901. The breakdown by fiscal year is: \$164,000 in fiscal year 1988; \$270,500 in fiscal year 1989; \$809,675 in fiscal year 1990; \$656,765 in fiscal year 1991; \$65,000 in fiscal year 1992; \$1,019,821 in fiscal year 1993; \$20,000 in fiscal year 1994; \$872,500 in fiscal year 1995; \$1,500,000 in fiscal year 1996; \$1,319,320 in fiscal year 1997; and \$1,309,320 in fiscal year 1998.

The Georgia Tech Satellite Literacy Project is sponsored and operated by four organizations: Georgia Institute of Technology's Center for Rehabilitation Technology, The Center for Rehabilitation Technology, Inc., Literacy Action, Inc., and the Georgia Department of Technical and Adult Education. The program grantee is CRT, Inc., a private, not-for-profit business advisory board to the Center for Rehabilitation Technology, College of Architecture, Georgia Institute of Technology, from which the literacy instruction has been provided.

It was anticipated that it would take three years to demonstrate that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. That original objective was met in fiscal year 1991. Additional objectives since fiscal year 1991 have been to expand the outreach of the satellite based adult literacy program to enough additional sites throughout the state of Georgia so that all potential participants have reasonable access to the program, and to continually upgrade the quality of class programming and the technical capacities of the system. The fiscal year 1997 technological upgrades expanded the capacity of the program more than twenty-five-fold, from seventy-seven to over 2,000 downlink sites, and a six-fold increase in broadcast hours, and made materials available as supplemental tools to all Georgia literacy classes. As of December 1997, the Georgia Tech Satellite Literacy Program is in a period of transition from that of providing literacy instruction via direct television broadcasts to classrooms to that of development and dissemination of technology-based instructional aids. The project has been renamed the Lifelong Learning Network, or LNN. This change is being made based upon the request of the major sponsor, The Georgia Department of Technical and Adult Education, Office of Adult Literacy. The LNN will develop and produce video-based instructional supplements, technology-based curriculum and training for adult literacy practitioners, and multi-media projects for literacy students.

The agency receives annual reports on the project that are used, together with agency merit review, to assess its progress. Based on these reports, the agency has found that the project has made progress in demonstrating the feasibility of utilizing distance learning technology and teaching methods to provide adult literacy education programs to handicapped adults throughout the state of Georgia. The project has applied distance education technology to both control the program cost per participant and, most recently, to expand the availability of the program.

TECHNOLOGY TRANSFER PROJECTS, OKLAHOMA AND MISSISSIPPI

The original work involved the transfer of uncommercialized technologies from Federal laboratories and universities to rural businesses and communities. The objectives have evolved to providing more one-on-one assistance to small manufacturers. This type of assistance responds to the stated needs of the small manufacturing community and fills a recognized gap in the existing service provider community. This project has undergone a merit review.

Manufacturing extension programs throughout the country have identified one-on-one engineering technology assistance as a need for small manufacturers as they attempt to become more competitive and profitable. The primary goal of these programs is to contribute to an increase in business productivity, employment opportunities and per capita income by utilizing technology and information from Federal laboratories; Rural Enterprises Development Corporation and Industrial Technology Research and Development Center in Durant, Oklahoma; Mississippi State Food and Fiber Center; Vocational-Technical Education System; Center for Local Government Technology; Cooperative Extension Service; and other university departments and non-campus agencies. Specific program objectives are to:

- Develop greater profitability of existing enterprises.
- Aid in the acquisition, creation or expansion of business and industry in the area.
- Establish and effective response process for technological and industrial related inquires.
- Devise effective communication procedures regarding the program for the relevant audiences.

Funding appropriated to date is as follows: \$350,000 in fiscal years 1984 and 1985; \$335,000 in fiscal year 1986; \$333,000 in fiscal years 1987 through 1990; \$331,000 in fiscal years 1991 through 1995; and \$326,000 in fiscal years 1996, 1997 and 1998. Appropriations to date total \$5,000,000. Oklahoma State University and Mississippi State University have provided considerable amounts of matching support from state funds over the life of the project. Over the past four years, support has included a significant portion of engineering faculty salaries as well as the administrative support of county and district extension staff.

The work is being carried out at Mississippi State University and Oklahoma State University. The original proposal in 1984 was for 12 months. The original objectives have been, and continue to be met. Although individual client projects have a beginning and end, the technology transfer process is continuous. Over the past years, specific and measurable annual objectives and the achievement of objectives have been documented in annual reports. The objectives of both programs have been to: (1) continue the delivery of high-quality engineering assistance and technology transfer services to small manufacturers; (2) conduct joint workshops, client referral, and joint research and application projects; and (3) demonstrate a value of service to clients many times project operating costs. The current phase of the program will be completed in 1998.

Site visits and merit reviews have been conducted annually on these projects as well as client surveys by project staff themselves. Survey results have documented job creation, productivity enhancement, and local community economic activity. The Technology Transfer program has impacted the integration of emerging technologies that are benefitting the citizens, ranging from assisting small businesses and industries in integrating new computer hardware and software for conducting electronic commerce to providing extensive online information resources. The Technology Transfer Funds have served as a catalyst for the development of a long range telecommunications network plan for the total Extension Service to link all county extension offices and research centers directly to the Mississippi data/video backbone and provide access to the Internet.

WOOD BIOMASS, NEW YORK

The objective of this project is to expand, implement, and gain acceptance of wood biomass as a sustainable, renewable, and environmentally-affable fuel source. In addition, the project is deemed to support the promotion of alternative forest products for the Nation's Central and Northern Hardwood forests regions.

The principal researchers hypothesize that the project is of national interest. Biomass research studies through the U.S. Departments of Agriculture and Energy span 20 or more years. Henceforth, the Nation is in a position to scientifically produce environmentally-affable fuels for power generation systems. Complementing the planned fuel supply are many sidebar benefits including carbon sequestration, rural economic development, wildlife habitat, and soil erosion and sedimentation associated with conventional agriculture.

The goal of this project is to promote, through applied research and technology transfer, wood biomass as a sustainable wood supply for (1) power generation, (2) alternative farm products, (3) wise stewardship of land resources, and (4) enhanced farm profitability. To accommodate these goals, scientists at the State University of New York are planting willow trials on several sites and under several conditions. Site preparation and planting has occurred on several locations, and more are planned. Cornell University, a partner institution in the project, has hired a technology transfer specialist to coordinate educational activities resulting from this work. Common events include field days, news articles, videos, and exhibits.

The original program began with an appropriation of \$200,000 in fiscal year 1995. An additional \$197,000 was appropriated by the Congress for fiscal years 1996, 1997, and 1998 for a total of \$791,000. Four state partners and approximately 18 private partners contribute resources at a ratio of nearly 1.5 to 1 nonfederal funds for this project.

The field work is being conducted on private and state land near Syracuse, New York. Electronic and print media allows Cornell University's technology transfer activities to extend far beyond that point. The completion date for the original objectives of the project, willow cultivar planting, was September 30, 1996.

With the addition of some new dimensions to the project, the completion date is now March 31, 1999. Because of the timing of one of the fiscal awards, some weather-related problems, and some land-contract problems, all of the original objectives have not been met. Most of the unmet objectives should be completed by early spring 1999.

A field review of the project was conducted on August 20-21, 1997. Excerpts from the review report include (1) positive accolades for their quarterly progress reports, (2) positive accolades for the outreach program being conducted by Cornell University, (3) praise for the scientific outreach by the principal investigators, (4) praise for connecting the willow biomass program to the poultry waste and riparian issues in New York State, and (5) praise for gaining the acceptance of willow biomass as an agricultural crop for state property tax purposes. On the concern side, the Agency's project administrator flagged the delay in establishing the demonstration farm and requested diligence in bringing this aspect of the project to fruition. This is a new project which will not begin until Spring 1998; therefore, no evaluation has been conducted.

CSREES BUILDINGS AND FACILITIES

Question. Please provide the Committee with a summary report on each of the facilities funded through CSREES' Buildings and Facilities Program, including the federal funds provided, the total estimated cost of the project, the current status of the project, and the available non-federal project match.

Answer. This information is provided below.

CSREES BUILDINGS AND FACILITIES PROGRAM—STATUS OF PROJECTS
 [Dollars in thousands]

Name and location of facility	Total cost of project	Total Federal funds appropriated ¹	Match obtained ²	Funds needed to complete project	Plan to complete facility and source of funding ³	Status of facility
Poultry Science Facility, Auburn University (Auburn, AL).	\$15,000	\$6,000	\$2,652	\$6,348	Total funds needed to complete the facility will come from the State and private sources.	Design work is underway.
Alternative Pest Control Containment/Quarantine Facility, University of California (Davis/Riverside).	38,118	10,921	265	26,932	Total funds needed to complete the facility will come from the State and private sources. As an option, they would reduce the size of the facility to meet the total amount raised.	Design work has been completed at the Riverside campus; some construction has been approved. There has been no activity approved at the Davis campus.
Agricultural Biotechnology Laboratory, University of Connecticut (Storrs).	20,000	3,915	10,000	6,085	Matching funds in the amount of \$10M were obtained from the State. Plans include building the facility in 3 phases as funds become available. Funds needed to complete project will be sought from private sources.	Programming and design work has been completed.
Center for Applied Aquaculture, Oceanic Institute (Waimanolo, HI) ^{1a} .	11,450	6,375	1,350	100	Remaining funds needed will be coming from private sources.	Design and construction work underway at multiple sites.
Agricultural Biotechnology Facilities, University of Idaho (Moscow).	13,479	5,900	5,500	2,079	Funds needed to complete the facility will be sought from a combination of State and private sources.	Design work is underway.
Holmes Hall Renovation, University of Maine (Orono) ...	1,105,220	561,000	544,220	Funds needed to complete the facility will be sought from the State.	Efforts have been focused on obtaining the required matching funds.
Institute for Natural Resources and Environmental Sciences, University of Maryland (Multiple locations).	20,000	10,000	3,415	6,584	Funds needed to complete the facility will be sought from the State. Plan includes reducing the number of project components from 6 to 3.	Design work is underway.

CSREES BUILDINGS AND FACILITIES PROGRAM—STATUS OF PROJECTS—Continued
 [Dollars in thousands]

Name and location of facility	Total cost of project	Total Federal funds appropriated ¹	Match obtained ²	Funds needed to complete project	Plan to complete facility and source of funding ³	Status of facility
Center on Hunger, Poverty and Nutrition Policy, Tufts University (Boston, MA) ^{1b}	15,850	7,350	7,924	Not applicable. This project was included on this chart to show information in footnote 1b.	Design work is underway.
Center for Molecular Biology, Rutgers University (New Brunswick, NJ).	47,200	17,836	27,200	2,164	Funds needed to complete the project will be sought from public and private sources.	Phase I has been completed. Design work is underway for Phase II.
Center for Research on Human Nutrition and Chronic Disease Prevention, Wake Forest University (Winston-Salem, NC).	108,607	18,108	50,607	39,892	Funds needed to complete the facility are being sought from private donors. Plan includes an option to change the scope of the facility if the campaign is unsuccessful.	Construction ongoing.
Animal Care Facility, North Dakota State University (Fargo, ND).	10,058	1,918	5,000	3,140	Facility will be completed in two phases. Funds in hand will build Phase I (Livestock Care Research Facility). Phase II will build a Laboratory Animal Care Research Facility. No plan has been offered to obtain funds needed to complete Phase II.	Design work is underway.
Food Processing Pilot Plant, North Dakota State University (Fargo, ND).	1,478	750	15	713	Funds needed to complete the facility will be sought from a combination of in-kind contributions and contributions from private sources.	Efforts have been focused on obtaining the matching funds needed.
Grain Storage Research and Extension Center, Oklahoma State University (Stillwater).	975	495	240	240	Funds needed to complete the facility will be sought from private sources. Plan to complete the facility are unchanged.	Would like to begin the design phase of the project.

Coastal Institute on Narragansett Bay, University of Rhode Island (Kingston).	41,194	12,500	1,990	26,704	Costs incurred for match purposes are under review by CSREES. Plans to complete the project include reducing the number of the buildings to be built from six to four.	Design work is underway.
Agricultural, Biological, and Environmental Research Complex, University of Tennessee (Knoxville).	38,500	10,434	5,468	22,598	Funds needed to complete the facility are being sought from the State.	Efforts have been focused on obtaining the required matching funds.

¹ All funds have been obligated except for the following:
a. Oceanic Institute—Funds from fiscal years 1994 and 1995 in the amount of \$3,581,000 pending receipt and approval of a proposal.
b. Tufts University—Funds from fiscal year 1997 in the amount of \$820,000 pending receipt and approval of a revised proposal.
² Matching funds are required equivalent to the total Federal funds appropriated less the 3 percent administration fee.
³ All plans were submitted within the required time frame. Plans are under review but have not been approved by CSREES.

FUND FOR RURAL AMERICA

Question. Of the fiscal year 1997 funds made available from the Fund for Rural America for research, please provide a list of the projects approved, including a description of the project, where the center will be located/or research will be carried out, and the amount of the award.

Answer. Fund awards have been made from fiscal year 1997 funds as part of two programs—the Planning Grant Program with awards made in September, 1997 and the Standard Grant Program with awards made in February and March, 1998. The Planning Grant awards totaled \$881,000 and are summarized in Table 1. Standard Grant awards are being made as the administrative work is completed. Awards totaling \$19.2 million were made February 27, 1997 and the remaining standard grants will be made over the following 2–3 weeks. Standard Grants will ultimately total \$32 million and exhaust fiscal year 1997 funds. Table 2 summarizes the Standard Grant awards made as of March 2, 1998.

TABLE 1.—*Planning Grant Awards*

<i>Principal investigator/institution/State/title</i>	<i>Amount</i>
Johannes, J., Montana State University, MT, Planning Grant: Rural Development System	\$25,000
Simon, M., Kentucky State University, KY, Small Farm Center	25,000
Blasé, M., University of Missouri, MO, Diversifying U.S. Cropping System	24,800
Young, R., University of Missouri, MO, Farm/Environmental Policy Support System	24,000
Skees, J, University of Kentucky Research Center, KY, Managing Catastrophic Risks in the Farm and Food System and Rural Communities	24,900
Barrick, R., University of Illinois, IL, Virtual Center for Rural Community Development Planning Grant	25,000
Downing, J., Iowa State University of Science and Technology, IA, Agro-Oceanic Nutrient Flux Center	25,000
McKean, J., Iowa State University of Science and Technology, IA, National Consortium for Pork Technology and Education	25,000
Olson, D., Iowa State University of Science and Technology, IA, Center for Sanitary Barriers to U.S. Meat Exports	25,000
Smith, W., Louisiana State University of Agricultural Center, LA, FRA Gulf-States Forest Production International Trade Center	24,500
Legg, L., University of Minnesota, MN, A Consortium for Site Specific Resource Management	25,000
Schoeneberger, M., USDA/FS-Colorado, CO, Acceptability for Conservation Buffers	25,000
Lemenager, R., Purdue University, IN, "Center for Innovative, Coordinated Beef System in the Eastern Corn Belt"	25,000
Baughman, M., University of Minnesota, MN, Center for Nonindustrial Private Forestry Education	25,000
Hoover, M., North Carolina State University, NC, International Center for Decentralized Wastewater Treatment Planning Grant	25,000
Harris, T., University of Nevada-Reno, NV, Policy for Western Public Lands	25,000
Cropp, R., University of Wisconsin-Madison, WI, Center for Cooperative Enterprise	25,000
Rosson, C., Texas Agricultural and Experimental Station, TX, International Trade Extension to Rural Communities of the Mid-Continent	25,000
Carey, H., Forest Trust, NM, "Developing the Research Capacity of Rural, Forest Dependent Communities"	25,000
Shelton, A., Cornell University, NY, Center for Biologically-Based Pest Management: Identifying Opportunitites for Rural Agriculture	24,100
Cannell, R., Virginia Polytechnical Institute, VA, Planning Grant for Establishing a Recirculating Aquaculture Center	25,000
Gilbert, J., University of Wisconsin-Madison, WI, Maintaining Land and Community: Planning Grant Proposal for a FRA Center on Minority Land Loss and Recovery	25,000
Hamilton, T., USDA/Madison, WI, Value-Added Wood Products Consortium for Rural Economics	25,000
Endter-Wada, J., Utah State University, UT, Proposal for An Intermountain West Center for Sustainable Agriculture and Environmental Stewardship	24,600

<i>Principal investigator/institution/State/title</i>	<i>Amount</i>
Beasley, D., North Carolina State University, NC, National Center for Manure and Animal Waste Management	25,000
Desjarlais, J., Turtle Mountain Community College (1), ND, Planning for a Rural Development Center for the Turtle Mountain Band of Chippewa	5,000
McLellan, M., Cornell University, NY, Planning Grant: Food Venture and Process Technology Center	25,000
Rochin, R., Michigan State University, MI, Latino Population and Agro-Industrial Expansion: Implications for Community Development	25,000
Andre, P., National Agricultural Library (1), MD, Increasing the Availability for Electronic Information in Rural America	25,000
Jojola, M., Southwestern Indian Polytechnical Institute (1), NM, Southwest Indian Virtual Extension Center (SIVCE)	25,000
Nault, L., Ohio State University, OH, Cereal and Oilseed Quality Center	25,000
Berg, M., Little Hoop Community College, ND, Land Grant Relationships Between LHCC and North Dakota State University	5,000
Hoffman, M., Cornell University, NY, Center for Land Stewardship Focusing on Vegetable Production in the NE U.S.	25,000
Carlson, C., "Fort Kelnap College, MT (1)", MT, Fort Kelnap College FRA Center Planning Proposal	5,000
Maier, D., Purdue University (1), IN, Center for Value-Adding Rural Enterprise (CARE)	5,000
Seronde, J., "Navajo Community College, AZ (1)", AZ, Planning for Native American Rural Development	5,000
Godfrey, G., Haskell Foundation/Haskell Indian Nations University (1), "International Extension, Education, and Research Center"	25,000
Lee, J., Mississippi State University, MS, Center for Policy Devolution and the Rural South	25,000
Wissman, D., "Grain Industry Alliance, KS (1)", KS, Planning Grant for Center Grain-Based Rural Enterprise	5,000
Bonsi, W., Tuskegee University, AL, Planning Grant for Integrated Study of Food Animal and Plant Systems (CISFAPS)	25,000

TABLE 2.—Standard Grants Made as of March 2, 1998

<i>Proposal No./PI last name/institution/State/title</i>	<i>Amount awarded</i>
9704746, Jones, University of Arizona, AZ, Food Losses from the Farm to the Consumer	\$540,000
9704750, Glenn, USDA-ARS, MD, Integrated Manure Management on Dairy Farms for Conservation of Natural Resources and Profitability	380,000
9704752, Krissoff, U.S. Department of Agriculture Economic Research Service, DC, Market Development for Organic Agricultural Products	200,000
9704763, Peeples, "Peeples Consulting Associates, Inc.", VA, "Premium Diesel"—Evaluating U.S. Market Opportunities for Biodiesel as a Motor Fuel Additive"	31,000
9704765, Daniel, "Boehringer Ingelheim/NOBL Laboratories, Inc.", IA, Implementation of a Food Safety Improvement System For Sustaining the Competitiveness of the Independent Pork Producer and Packer	340,000
9704777, Rochin, Michigan State University, MI, Latinos in the Rural Midwest: Community Development Implications	185,000
9704783, Swallow, University of Rhode Island, RI, Decision Information and Support Structures to Sustain Farm Forest and Open Space in Rural Communities of Southern New England	400,000
9704785, Paustian, Colorado State University, CO, Developing Soil C Sequestration as a Commodity for Co2 Emission Mitigation in U.S. Agriculture	400,000
9704796, Humenik, North Carolina State University, NC, Advanced Waste Treatment for Environmentally Sound and Sustainable Swine Production	350,000
9704808, Rice, Kansas State University, KS, Implementation of Best Management Practices in the Blue River Basin of KS and NE	400,000
9704812, Moser, Michigan State University, MI, "Enhancing Rural Economies Through Comprehensive Extension, Research, and Partnering Approaches Using Multi-county Clusters in Michigan with"	450,000

<i>Proposal No./PI last name/institution/State/title</i>	<i>Amount awarded</i>
9704827, Halbrecht, University of Vermont and State Agricultural College, VT, Balancing Economics and Environmental Impacts of Phosphorus Management	395,000
9704830, Wyman, University of Wisconsin, WI, Leveraging Community and Industry wide Resources to Foster Biointensive IPM	50,000
9704844, Goldman, University of Wisconsin, WI, Are Value Added CV Health Claims Valid for Vegetables? Onion-induced Antiplatelet Activity	378,918
9704852, Kastner, Kansas State University, KS, HACCP Implementation and Evaluation in Small and Very Small Meat/Poultry Plants	440,000
9704879, Jones, Washington State University, WA, Development and feasibility of perennial wheat for highly erodible lands	370,000
9704882, Gillespie, Cornell University, NY, "Retail Farmers' Markets and Rural Development: Entrepreneurship, Incubation, and Job Creation"	325,000
9704889, Hall, "Michael Fields Agricultural Institute, Inc.", WI, Diversifying Corn-Soybean Rotations for Profit and Environment in Upper Midwest	420,000
9704916, Klonsky, University of California, CA, Increasing Adoption of Sustainable Agriculture and Positive Community Impacts	400,000
9704922, Spittler, Cornell University, NY, Safe Practice Assessments for Gleaned Fresh Produce in Food Rescue	447,826
9704928, Camazine, Pennsylvania State University, PA, Improving the Health and Productivity of Honey Bee Colonies	450,000
9704950, Swan, Pennsylvania State University, PA, Economic and Environmental Benefits of Watershed Restoration in Rural Communities	365,000
9704985, Emara, University of Delaware, DE, DNA Marker Technology in Commercial Broiler Breeder Selection Programs	300,000
9704986, DiMaio, Tri-Community Action Agency, NJ, New Jersey Cooperative Gleaning Program	574,591
9704998, Souza, University of Idaho, ID, Improved Marketability for Wheat Grown in the Pacific Northwest	400,000
9705019, Fauth, "Land O'Lakes, Inc.", MN, Community Food Sourcing to Facilitate Rural Economic Development	400,000
9705048, Grohn, Cornell University, NY, Optimizing and Delivering Dairy Herd Health and Management Decisions	300,000
9705078, Ray, University of Arizona, AZ, Development of Guayule as New Crop for the Production of Hypoallergenic Latex	500,000
9705126, Hedrich, Iowa State University, IA, Legume Phyto Chemicals: Improving Utilization	490,000
9705135, Grauke, USDA-ARS Pecan Breeding & Genetics, TX, Conservation and Utilization of Pecan Genetic Resources	310,000
9705157, Etter, University of Arizona, AZ, Revitalizing the Navajo Wool and Mohair Industry	25,000
9705162, Sapers, "USDA, ARS, NAA, ERRC", PA, Ensuring the Microbiological Safety of Fresh Apples	420,000
9705205, Milner, Pennsylvania State University, PA, Inhibitory Effects of Allium Foods	300,000
9705216, Akridge, Purdue University, IN, Distance Delivered Master of Business Administration Degree in Food/Agriculture	400,000
9705218, Parker, University of Vermont, VT, Improved Greenhouse Technologies Supporting New England Family Farms	140,000
9705247, Vaillancourt, North Carolina State University, NC, Mobilizing National Resources to Combat Emerging Food Animal Diseases	450,000
9705301, Miles, Center for Public Interest Research, MA, National Student Food Salvage Program	64,440
9705364, Baker, Purdue University, IN, A Comprehensive Risk Management Education Program for Corn Belt Agriculture	300,000
9705407, Hagan, Manomet Center for Conservation Sciences, MA, Integrating Economic and Ecological Goals on Private Industrial Forestland in Maine	425,000
9705412, Kimmerer, SUNY College of Environmental Science and Forestry, NY, Native American Model of Ecological Restoration and Community Enhancement	300,000
9705450, Shackelford, USDA-ARS, CO, Consumer evaluation of beef classified for tenderness	400,000

<i>Proposal No./PI last name/institution/State/title</i>	<i>Amount awarded</i>
9705513, Henkel, Jr., University of New Mexico, NM, Rural Agricultural Enterprise Network	330,00
9705546, Smith, Tuskegee University, AL, A Biotechnical Experimental Learning Program for Rural Alabama	193,800
9705570, Swan, Washington State University, WA, Distance Delivery of a B.S. Degree in General Agriculture in a Tri-State Region	450,000
9705599, Johnson, 228 Cheatham Hall, VA, The Forest Bank: Concept to Reality	420,000
9705633, Punches, Oregon State University, OR, Evaluation of Small-Diameter timber for Value-Added manufacturing	435,000
9705634, Bundy, Iowa State University, IA, Development of Standard Method of Odor Quantification using Olfactory and Chemical Analysis	375,000
9705645, Schmidt, University of Vermont and State Agricultural College, VT, CyberSkills: A Prototype for Regeneration in Rural Communities	300,000
9705682, Fluharty, University of Missouri-Columbia, MO, Innovations for Increasing Equity Capital in Rural Communities	435,000
9800477, Bomash, University of Minnesota, MN, Enhancing Rural Development Agribusiness Through Electronic Commerce	250,000
9800499, Griegio, Northern New Mexico Community College, NM, Northern New Mexico Distance Education Project	204,427
9800503, Travis, Pennsylvania State University, PA, Improving Farmer's Access to Pest Management Tools Through Integration with the NII	219,645
9800507, Crawford, Iowa State University, IA, Telecommunications Education Partnership Program for Rural Development in Southwest Iowa	175,000
9800516, Medeiros, Ohio State University, OH, Using Technology to Provide Nutrition Education for High Risk Students	150,832
9800527, Carlascio, United Tribes Technical College, ND, 1994 Tribal Land-Grant Colleges Information Infrastructure Development	199,712
9800537, Michaelson, Eastern Washington University, WA, "Rural Schools, Careers, and Community Development"	161,539
9800545, Cville, Center for Civic Networking, MA, Public WebMarket Expansion Project	112,000
9800550, Dunham, University of Minnesota, MN, Integrating World Wide Web Technology into Our Teaching and Learning Environment	227,827
9800552, Gallagher, Oregon State University, OR, Rural West Internet Masters Project	123,121
9800554, Stark, National Center for Small Communities, DC, An Off-System Road to the Information Superhighway	75,539
9800555, Smith, University of Georgia, GA, Internet and Computer Technology of Transfer of Information to Dairy Producers	212,358

Grand Total of 1997 Standard and Telecommunications Grants 19,267,575

Question. Please explain in detail the review and selection process for center and research proposals. How were the peer panels selected and who served on these panels? What criteria were used to evaluate the proposals within the three broad areas of: (1) international competitiveness, profitability, and efficiency; (2) environmental stewardship; and (3) rural community enhancement?

Answer. The proposal review and award selection process was based on a competitive, peer evaluation of applications submitted in response to an open solicitation. The selection of peer panel members was made by Fund staff working with: the university, client, and stakeholder communities; professional associations; federal, state, and local governments; private industry and not-for-profit organizations; and the Research, Education, Extension, and Economics Advisory Board. Peer evaluators were organized into subject panels, with the panels chaired by a university principal assisted by a Fund program manager. The panels followed the same general guidelines of primary, secondary, and tertiary review and open panel discussion of each proposal that is used by the National Research Initiative and the National Science Foundation. However, the concept of "peer" was expanded to include experts drawn from across disciplines (e.g., the biological, physical, and social sciences) and functions (e.g., research, education, and extension).

All proposals were evaluated initially by a subject-specific panel. Approximately 30 of these panels made the first round of funding recommendations for Planning

Grants in the summer of 1997 and Standard Grants in the fall of 1997. In both cases, the results of these first level panels were evaluated by a second-level overview panel designed to integrate results across crop and livestock science, environment, rural development, etc. to ensure Fund dollars were allocated to maximize their problem-solving impact.

The criteria used in the subject and overview panels are summarized below in Table 3. The subject panels focused most heavily on merit and relevance but also considered potential contribution to the Fund's broader program goals. The overview panels focused more on the third criterion and generally assumed that the first level panels had covered merit and relevance questions. The same criteria were applied across the three broad areas identified in the Fund's mandate: agriculture, environment, and rural development. However, the panel chairperson and members were asked to draw on their expertise, the FAIR Act language establishing the Fund, and the language included in the USDA Request For Proposals to make the more specific judgements regarding the substantive content of the proposals necessary to make a final rating and recommendation for funding.

Table 3. Fund Grant Selection Criteria

- Scientific and Technical Merit.
- Relevance
 - Relevance to agriculture, the environment, the rural development and USDA activities in these areas; priority given to proposals that address activities in two or more of these areas
 - Involvement of appropriate agriculture, environment, and rural development "communities of interest" in problem prioritization i.e., addressing user-identified/community-problems agendas.
- Contributions to Broader Fund Goals
 - practical, multidimensional problem solving with measurable short to intermediate term (2–5 and 5–10 year) impact
 - leveraging previous public and private investment in research, education and extension; targeting "break through" activities
 - forging research, education, and extension partnerships; building inter-institutional and interdisciplinary physical, biological, and social science teams that foster "system" approaches;
 - establishing partnerships with clients and stakeholders to address cross-cutting problems and strengthens dissemination/adoption
 - potential for replication—i.e., duplication, adoption, or adaption in other problem areas or different locals
 - facilitating the transition from "a program-based agriculture to a science and technology-based" agriculture; comparable shifts for environmental and rural development activities.

Question. How many proposal were received? How many were approved? Please breakdown this data by the three broad areas above for which proposals were solicited.

Answer. Statistics on Fund applications and awards follow.

	Planning grants	Standard grants ¹
Proposals Received	461	1,181
Primarily Agriculture	184	459
Primarily Environment	62	223
Primarily Rural Development	121	161
Primarily Food		111
Other ²	84	227
Proposals Awarded/Pending Award	36	115–120
Primarily Agriculture	19	47
Primarily Environment	6	23
Primarily Rural Development	7	29
Primarily Food		14
Other ²	4	7

¹As of 3/1/98, 61 Standard Grants had been awarded and another 59 were in final administrative review. Hence, the range of 115 to 120; subject area subtotals add to 120 although a final decision on as many as 3 to 5 awards is pending the outcome of administrative review.

²Includes proposals focusing on education, information systems, etc., topics applicable to all subject areas.

Question. How were project applications screened to prevent projects funded through special research or administrative grants or other competitive grant programs from also receiving funds under this program?

Answer. Two approaches were taken. First, applicants were required to submit to CSREES information on other funding sources. The Fund staff and CSREES administrative staff reviewed this information on support from other sources—both support already in hand and applied for. Second, reviewers were asked and Fund staff focused on the relevance of a proposal to the Fund's particular program goals. This entailed determining if a proposal was eligible for support from another, possibly more appropriate, funding source. This consideration led to the elimination of several excellent proposals when the work was judged more appropriately supported through the National Research Initiative Program or the Small Business Innovation Research Program.

GOVERNMENT AND PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The Cooperative State Research, Education, and Extension Service (CSREES) has developed an annual Performance Plan that links to that of the Research, Education, and Economics (REE) Mission Area. The Plan relates program activities to the mission and goals of the agency (as described in the Agency strategic plan) to the budget request submitted in support of research, extension and education activities. More importantly, it reflects the role of CSREES in enabling land-grant universities and other partners who carry out the research and extension activities authorized in the CSREES budget.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. In framing the agency strategic plan, a number of forums were utilized to focus on goals and objectives that would direct the use of budget resources toward shared national priorities. This included the establishment of a Partnerships Working Group, comprised of CSREES administrators and partner university administrators to link program activities with outputs and outcomes; planning and hosting regional orientation sessions to share the strategic planning concept with agricultural research, extension, and education administrators and evaluation staff; the development of electronic planning and reporting software to facilitate planning and reporting by partner institutions; and the appointment of a joint agency-university task force to consider alternative planning and reporting and insure that GPRA accountability standards are met through the preparation of performance plans and reports.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The agency performance plan is linked to performance measures that relate to the President's budget. Because of the complexity of the agency budget and the large number of components in its accounts, individual components were aggregated around five agency goals for more efficient planning and reporting. Using the five goals gives a national focus to programming that is planned and conducted in a dynamic process in the states by partner institutions and other award recipients. In this process, all program activities relate to the following goals: an agricultural production system that is highly competitive in the global economy; a safe and secure food and fiber system; a healthier, more well-nourished population; greater harmony between agriculture and the environment; and enhanced economic opportunities and the quality of life among families and communities.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Because of the complexity of the agency budget and the large number of components in its accounts, activities were aggregated in the performance plan around the five agency goals for more efficient planning and reporting. This means that the individual components in the account and activity structure do not have performance measures that are specifically linked to those accounts.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. CSREES does not plan to propose any changes to its account structure for fiscal year 2000.

Question. How were performance measures chosen?

Answer. Performance measures were chosen to reflect critical actions necessary to achieve shared and national priorities in agriculture and which describe the purposes and impact of the federal investment in research, extension, and education.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The agency response to data collection and verification under GPRA relies on existing data sources—enhanced Current Research Information System (CRIS), Food and Agricultural Education Information System (FAEIS), and university information systems, new joint data and analysis activities and collaborative efforts to collect data from states. Strategies were developed to solicit input from our university partners in the design of an electronic planning and reporting system. Under this strategy the partner universities provide data collection and verification as program plans and reports made to USDA. In addition, the agency is developing an integrated management information system, Research, Education, and Economics Information System (REEIS), to link databases and provide improved analytical capacity.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No. The agency plan includes performance measures for which reliable data will be available for the first performance report.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. In the development of our performance plan, we included critical program goals that can be used to track short and intermediate program results. These include research and education in food safety, pesticide clearance and other pest management initiatives, and expanded competitive grants to enhance the nation's agricultural knowledge base, to name a selected few.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The agency plan reflects substantial internal and partnership discussions to identify outcome/output measures which demonstrate that the goals in the plan have been met, including those noted in the previous answer.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, the plan specifies agency and collective program activities as outputs and university partnership and grantees' work as the outcomes which address objectives.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers?

Answer. Customer satisfaction measures for the agency will include, but not be limited to expert assessments (such as would be needed to assess impacts of genome research and discovery), customer surveys (such as would be needed to measure scope and effectiveness of selected extension programs), economic data or social survey data, and physical monitoring (such as would be valuable to determine effects of research-based changes in best management practices affecting environmental quality or public health indicators). Examples of customers would include Federal agencies (e.g. Agricultural Research Service, Department of Energy, National Science Foundation, Environmental Protection Agency, etc.), land-grant universities, agricultural producers and consumers of information related to the food and agricultural sciences.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The agency identified approaches to addressing relevant national issues (e.g. food safety, water quality, waste management, youth and families at risk, food genome initiative, small farms, etc.) in the formation of the budget. The measurable goals—and budget necessary to achieve the goals—contribute to achieving the strategic plan of CSREES.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. In collaboration with university partners, we will be able to describe the likely impact on programs and achievement of goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. We are working to develop the technological capability to measure and report performance throughout the year. We have completed modernization of CRIS,

are developing REEIS, and are in the final phases of a three-year project to establish integrated grants tracking and financial management. With university partners, we have developed a National Impact Database and are updating the form and format of state plans and reports so that they can be submitted and updated through a World Wide Web-based system.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Because of the complexity of the agency budget and its many lines, individual programs were aggregated around five general agency goals for more efficient planning and reporting. While the current account structure has offered a challenge in the way we respond to the requirements of GPRA, we feel we have been successful in using the five goals to give a national focus to programming that is planned and conducted in a dynamic process in the states by partner institutions and grantees.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Although changes in the budget account structure might clarify linkage of dollars to results in a meaningful way, that is not the solution to the challenges CSREES faces in responding to GPRA. Through a partnership with the system of State Agricultural Experiment Stations, land-grant and other colleges and universities, and other public and private research and education organizations, CSREES is USDA's principal link to the university systems for the initiation and development of agricultural research and education programs. Additionally, CSREES is the Federal partner in the Cooperative Extension system, a nationwide non-formal educational network. The challenge CSREES faces is capturing and reporting research and education results of our partners who conduct and deliver activities supported in the CSREES Budget. We are currently engaging our Partners in dialogue to help them understand the role of the Federal partner in response to GPRA. This will allow CSREES to be more responsive to the GPRA mandate. In concert with our Partners, we have prepared impact statements highlighting research, education, and extension accomplishments supported by the Federal investment.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. CSREES does not propose to modify its budget account structure at this time.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. CSREES does not propose to modify its budget account structure.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The Strategic plan includes this information in detail, but it is not included in the performance plan.

Question. If so, what steps have you identified to prepare, anticipate, and plan for such influences?

Answer. CSREES funding, in concert with State and other sources of funding, encourages and assists State and other public and private institutions in the conduct of agricultural research and education activities. These activities contribute to the five goals of the agency. CSREES will work with its university partners, other Federal agencies, and private sector organizations to address external factors that could influence goal achievement.

Question. What impact might external factors have on your resource estimates?

Answer. The achievement of national priorities and shared goals related to agricultural knowledge is dependent not only on Federal funding, but also state and private dollars. In addition, advances in related sciences have substantial impact on technology development and adoption in agriculture.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. There are no overlapping functions or program duplication in the plan, however there is substantial ongoing need for coordination with the Agricultural Research Service and among institutions.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The questions raised under the Results Act are new in terms of its accountability measures. Initially, there will be deficiencies. However, over time, the measures will mature and provide the desired responses.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Although we strive for accurate resource estimates, externalities, including program leveraging, unanticipated costs of conducting research and extension, and breakthroughs or problems in research may influence resources.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No, we do not see a need to make substantive revisions in our strategic plan.

QUESTIONS SUBMITTED BY SENATOR GORTON

SPECIAL RESEARCH GRANTS

Question. The regional research grants are all but zeroed out in CSREES's budget. Does USDA understand the importance of regional research? For example, rice research cannot be conducted in Washington state just as apple research cannot be conducted in Arkansas. Does CSREES understand the importance of NOT nationalizing research programs?

Answer. As a part of the Administration's efforts to balance the budget and direct spending to higher priority areas, projects earmarked for specific institutions were proposed for elimination. Funding distributed by formula under the Hatch Act could be used to continue aspects of these projects if they are deemed to be of high priority at State or local levels. Additionally, researchers could apply for funding under the National Research Initiative competitive research grants program or obtain funding from State and local governments and/or private sources, such as industry, to continue these projects.

REGIONAL RESEARCH

Question. I am seriously concerned about the fact that smart, experienced agriculture scientists are being frightened away from doing any public related research. Does the USDA understand the breakdown of morale in the agricultural research community as a result of continued elimination of regional research?

Answer. Regional research is part of the formula funding mechanism authorized by the Hatch and Evans-Allen Acts. Over the last several years funding for these programs, both regional research and state-specific research, has remained constant, but resulted in an erosion of real dollars because of inflation. Most federally-funded research programs have increased the availability of competitive funding for research relative to formula funding. Recently, the National Science Foundation, members of the US Congress, and others have urged USDA to increase competitive research funding relative to formula funding as a way to improve the quality of research. We agree with that recommendation. In fiscal year 1999 the budget includes, for the first time, a small, \$15 million reduction in Hatch funding to be offset by about a \$40 million increase in competitive funding. This proposed change in federal policy is causing some concern among scientists and administrators at land grant universities because formula funding has provided a substantial support base for agricultural researchers. That base provides a foundation for on-going basic and exploratory research; it provides support for new researchers and others less capable of acquiring competitive grants. Overall, we believe the change will improve the effectiveness of agricultural research.

Question. Does USDA realize that if all regional funding is privatized there could be a serious breakdown in the varieties of commodities produced in this country?

Answer. Large amounts of public and private research and cooperation between the public and private sectors have made US agriculture the marvel of the world. We intend to continue that effective research partnership by investing public research dollars in critical areas where there is a significant public interest and where private industry is unlikely to take the risk. We have no intention of privatizing regional research. In fact, many regional research activities provide a critical mass of researchers working together to solve complex problems. However, the mix of formula funding and competitive funding is likely to shift in the years ahead, as explained in the answer to the above question. USDA is very concerned about having

a very broad genetic base from which to create new varieties and is proposing a \$10 million Food Genome Competitive Research Grants Program as part of the fiscal year 1999 budget proposal for CSREES. The proposed program will enable USDA to cooperate with similar programs of the National Science Foundation and the National Institutes of Health on plant and animal genetics.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

DECREASES IN CSREES AQUACULTURE CENTERS

Question. Aquaculture is rapidly being recognized as one of the great growth potential industries in U.S. agriculture. Yet, the budget proposal recommends a decrease for the Aquaculture Centers program. How do you justify this decrease at a time when the industry is most at need for more research and development?

Answer. Funding for the Aquaculture Centers program would be reduced so that other high priority National issues can be addressed in keeping with the Administration's goal to reduce the Federal deficit. The reduction is not expected to have a negative impact on the program, as alternate funding from formula programs, State and local governments, and private sources could be used to support projects that are deemed to be of a high priority.

Question. What other actions might the agency be taking to ensure U.S. aquaculture remains competitive?

Answer. The agency has taken steps to assure that aquaculture research and development can be addressed through the various funding authorities used to support other sectors of agriculture including formula funds, the National Research Initiative (NRI), and the Fund for Rural America. The agency has also provided leadership for coordination of all Federal programs in support of aquaculture development through the Joint Subcommittee on Aquaculture, under the National Science and Technology Council, Office of Science and Technology Policy. In addition the Joint Subcommittee on Aquaculture is currently revising the National Aquaculture Development Plan.

DELTA TEACHERS ACADEMY

Question. Please provide an update on activities of the Delta Teachers Academy.

Answer. The Delta Teachers Academy is a 100 percent USDA-funded program of The National Faculty. The Delta Teachers Academy is administered from The National Faculty's regional office in New Orleans, Louisiana. In addition to USDA funds, the project sometimes realizes cost savings when participating school districts do not bill The National Faculty for their incurred released time costs, choosing instead to absorb those expenses themselves.

The Delta Teachers Academy continues to serve the Lower Mississippi Delta Region, which is comprised of 219 counties and parishes clustered around the Mississippi River and encompassing portions of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, Missouri, and Tennessee. The project focuses on educational improvement in the core subject areas of English, geography, history, mathematics, and science by providing long-term academic enrichment to approximately 525 elementary and secondary school teachers at 35 sites by teaming them with university scholars for in-service training sessions during the school year and continuing with summer institutes. Through its Fellows Program, the Delta Teachers Academy is also sustaining the professional development of over 650 Academy graduates throughout the region.

The fiscal year 1998 project is providing orientation sessions at 15 sites established in fiscal year 1997 and is training 225 new participants. The 1998 project is also conducting 125 academic sessions to 35 continuing teacher teams and will conduct 15 two-week summer institutes for 525 school teachers in the Delta Region. The project is also conducting 10 one-day seminars for 90 Delta Teachers Academy Fellows and is planning the first conference for Academy graduates. As part of the fiscal year 1998 project, the Delta Teachers Academy will also publish three issues each of its newsletters entitled "Currents" and "Fellows Exchange."

Question. Please provide an evaluation of the accomplishments of the Delta Teachers Academy in terms of educational improvement and the socio-economic implications of the program.

Answer. This project addresses the problem of insufficient professional development opportunities for K-12 teachers in a region of pervasive poverty and depressed economic conditions. Over the past six years of its operation, the Delta Teachers Academy has demonstrated proven benefits for participating teachers including increased content mastery, revitalized classroom teaching, and enhanced ability to ini-

tiate curricular and instructional change. In addition, this project potentially could have a significant regional impact by helping to achieve long-range goals for economic development through improved educational performance. Past project evaluations conducted by USDA, the General Accounting Office, and by private firms, have documented a positive impact on student learning and motivation resulting from increased enthusiasm and improved effectiveness of teachers involved in the project.

Results of a recent survey of 144 Delta Teachers Academy participants conducted by Westat, Inc., using a stratified random sample methodology, indicate that 89 percent of the teachers agree that the program provides useful information that strengthens their subject matter competency and the content of their classroom work, 92 percent reported developing challenging new teaching skills and strategies as a result of the program, and 90 percent felt more prepared to assume a leadership role in their schools and school systems as a result of their experience. Analysis of program impacts indicate that the longer a teacher is in the program, the greater and more positive the impact. In addition, the analysis found that teachers who increased their knowledge of the tools and procedures used in their subject area had exceptionally strong impacts on student performance measures such as student work habits, attitudes, interests, aspirations, and achievement.

Question. Would you agree that a well educated population is an important goal for the revitalization of rural areas and if so, do you think the Delta Teachers Academy is working toward that goal?

Answer. Yes, a well educated population and a work force equipped with modern technological, scientific, and communications skills are vital components for rural revitalization and economic competitiveness. The Delta Teachers Academy, through its teacher development programs and activities, is providing a very real service and helping to build a solid foundation toward the goal of rural revitalization in the Lower Mississippi Delta Region.

QUESTIONS SUBMITTED BY SENATOR KOHL

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION PROFESSIONAL DEVELOPMENT PROGRAM

Question. I continue to follow with interest the sustainable agriculture extension funding known as the Professional Development Program. The program provides for competitive grants for training and outreach activities to promote sustainable agriculture practices. Can you tell us what the program has accomplished to date? How many projects have been funded? How many training events have been held? Nationwide, what percentage of Extension agents and NRCS field staff have participated to date?

Answer. In the four years since the Professional Development Program was first funded, 125 projects have been funded through a regional competitive grants process. In addition, small grants of approximately \$10,000 per year have been made to each state and island protectorate to conduct state-level programming complementary to the regionally funded projects.

To date, 226 training events have been held, involving 11,541 participants. Of those, 6,720 were Extension faculty and 875 were NRCS staff. Thus virtually 100 percent of the approximately 2,500 Extension agents nationwide who have agriculture and natural resources responsibilities—the primary audience for the program—have been exposed to sustainable agriculture concepts and information sources through one or more SARE-funded events. In addition to this accomplishment, our state extension leaders for SARE report that a smaller proportion, which varies greatly from state to state, are at an advanced stage where they are experienced at applying sustainable agriculture concepts in their day-to-day work and are able to teach others. In most states, NRCS field staff are participants, but no more than one-third of those field staff have participated to date. Farm Services Agency field personnel have also expressed interest in SARE's Professional Development Program in some states, and represent another high-priority audience that has barely been tapped.

Question. The budget request for this program is for level funding at \$3.3 million. What funding level would be necessary to fulfill the Farm Bill mandate for this program, including comprehensive curricula development, complete field staff training, and innovative outreach projects in each region of the country?

Answer. The SARE Professional Development Program, authorized as the Sustainable Agriculture Technology Development and Transfer Program, was authorized up to \$20 million per year. If fully funded, comprehensive curriculum could be developed and extended to all agricultural professionals in Extension, Natural Re-

sources Conservation Service, Farm Services Agency, and other interested agencies, as well as reaching a critical mass of private-sector professionals, for example, crop consultants, pest consultants, and agricultural lenders whom our agency staff tell us also influence producers' decisions.

Question. Why does the budget request not include an increase to begin to reach those program mandates?

Answer. The budget request does not include an increase for this program because other competing priorities were judged more critical in the current environment of very limited budgets.

QUESTIONS SUBMITTED BY SENATOR LEAHY

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION (SARE)

Question. I was pleased to hear the President give such strong support for research programs in his State of the Union Address and in the fiscal year 1999 budget proposal. However I am concerned about several areas of research which I believe did not receive the funding they need in the Administration's budget. In particular, while the Department did increase funding for the SARE program by \$2 million, this increase is inadequate to meet the increasing demand for this critical program. The President's Council on Sustainable Development concluded that "sustainable U.S. agriculture will require research that focuses on integrating productivity, profitably, and environmental stewardship." I appreciate that the Department did increase funding in the ATTRA program to \$2 million. However, \$15 million is also needed to fund the SARE program. In addition to the current heavy demand for the program, implementation of the Food Quality Protection Act and the Organic Foods Production Act will leave many producers desperately seeking information on alternative practices. What impact is the Department expecting implementation of the Food Quality Protection Act and the Organic Foods Production Act to have on the SARE and ATTRA programs, and how will the funding increases in these programs be used to address it?

Answer. The Food Quality Protection Act requires EPA to establish new risk-based standards for a very large number of pesticides. USDA's Office of Pest Management Policy has been created to more fully engage EPA as it implements FQPA. USDA and EPA have signed a Memorandum of Understanding that commits the two agencies to work together when regulatory action by EPA would reduce farmer competitiveness, limit producers ability to adopt practices such as IPM, and ensure consumers a safe, abundant, high quality of food and other agricultural products. It is likely, however, that a number of pesticides, including some commonly used chemicals, will be restricted or even unavailable. Producers who rely on these materials for effective pest control will be looking for alternatives from SARE, ATTRA and other sources. SARE-funded research will contribute to the CSREES and department-wide effort to provide producers with research-based alternatives. Eighteen percent of SARE projects funded over the past ten years have dealt primarily with pest management, and many others have included pest management in the study of crop and livestock production systems.

CSREES and its land-grant university partners have been directing resources from several programs to begin providing science-based solutions to the challenges presented by FQPA: the Minor Crop Pest Management Program, IR-4; the National Agricultural Pesticide Impact Assessment Program, NAPIAP; the Pest Management Information Decision Support System; the Pesticide Applicator Training Program; the Pest Management Alternatives Program; and the Integrated Pest Management (IPM) Program. SARE will coordinate its efforts in pest management with these other programs through interaction with national program leaders and through interaction at the regional level such as through service on SARE technical review committees. One of SARE's particular strengths in pest management is that it includes research and extension of pest management alternatives in the context of whole farming systems, including such factors as soil and crop management, water management and marketing. Another great strength of SARE is that producers are directly involved at all levels of the program: they serve on the Administrative Councils that set program direction and recommend projects to fund and they are active participants in SARE projects. These characteristics help ensure that SARE findings are useful to farmers and therefore aid greatly in their rapid adoption.

The Organic Foods Production Act will stimulate greatly increased interest by producers, processors and marketers who want to take advantage of this emerging market which has been expanding by about 20 percent per year. SARE has funded dozens of research and education projects on organic production and marketing in

its ten-year history. An increased communications effort will be required to ensure that the public has the information it needs from these projects, and new research and education projects will be needed to find answers to the many questions that organic producers will face as they take advantage of the organic market.

The Appropriate Technology Transfer for Rural Areas (ATTRA) is the national sustainable farming information center that links people involved in full-or part-time farming to information and resources on sustainable agriculture. ATTRA program service are available to farmers, Extension agents, researchers, farm organizations, and others involved in commercial agriculture, including market gardeners and small farmers. ATTRA is funded through a cooperative agreement between the private nonprofit National Center for Appropriate Technology (NCAT) and the USDA Rural Business—Cooperative Service (USDA-RBS). Congress must annually approve ATTRA's funding because it is included as part of USDA's budget proposal.

Question. How could additional funding for the SARE program, over the \$10 million recommended by the Department, be used to further aid producers?

Answer. Additional SARE funds could be used to aid producers who are eager for new information on a variety of sustainable agriculture topics such as improving soil quality, reducing nutrient run-off into surface and groundwater, managing pests effectively with reduced reliance on pesticides, diversifying cropping systems in ways that improve profits as well as protect the environment, taking advantage of new marketing opportunities, and enhancing communities through locally-owned value-added production and marketing. These benefits would come from increased communication of results from the more than 1,000 projects that SARE has funded over the past ten years, plus new research findings from an increased number of SARE grants. An increased communications effort could tailor packages of information to specific types of producers who have different needs and interests, for example, limited-resource producers, ranchers, market gardeners, organic producers, large conventional grain producers, and so forth. Increased funding would also develop new information on production and marketing alternatives that are both scientifically sound and of practical use to farmers and ranchers in the short term, and would allow additional investments in longer-term trials that are critical to our understanding of long-term impacts of farming methods.

HATCH ACT/MCINTIRE-STENNIS COOPERATIVE FORESTRY ACT

Question. In light of the Administration's support of research programs, I cannot understand the Department's dramatic reduction in funding for the basic land grant research funding programs. The Hatch Act, the McIntire-Stennis Cooperative Forestry Act, and the Smith-Lever Act form the basis of Land Grant College research programs. The kinds of cuts the Department is proposing would be devastating, certainly to the University of Vermont, and I am sure to other Land Grants around the country. Over the last ten years base funds for Land Grant research has declined sixteen percent even while other research program budgets were increasing. The National Association of State Universities and Land-Grant Colleges recommended \$178,352,000 for the Hatch Act, \$21,665,000 for the McIntire-Stennis program, and \$283,797,000 for the Smith-Lever program—all modest increases, well below the increases provided for other research areas. Instead, the Department has proposed \$153,672,000 for the Hatch Act, \$19,882,000 for McIntire-Stennis, and \$257,753 for Smith Lever almost \$50 million below the NASULGC request. For Vermont alone this would mean a reduction of \$355,000. Has the Department identified the areas of research which would be affected by this dramatic decline in funding for the basic Land Grant Research?

Answer. The laws authorizing Federal formula programs enable the States to determine how to use their formula allocations to address critical issues facing agriculture in their States, region, and the Nation. The Department has not identified the areas of research which would be affected by the proposed reductions in the Hatch Act and McIntire-Stennis Cooperative Forestry formula programs because such decisions will be made by the States according to priorities at the State, regional, or local levels. Extension activities affected by the proposed reductions in the Smith-Lever formula program will also be made by the States according to priorities at the State, regional, or local levels.

Question. What are those areas of research?

Answer. The areas of research affected by the proposed reductions in the Hatch Act and McIntire-Stennis Cooperative Forestry formula programs will be determined by the States. Extension activities affected by the proposed reductions in the Smith-Lever formula program will also be made by the States according to priorities at the State, regional, or local levels.

Question. What are the fiscal year 1998 funding levels through these three programs to each of the Land Grant Colleges, and what would those institutions receive if the cuts recommended by the Department were adopted?

Answer. The information follows:

HATCH ACT FORMULA DISTRIBUTION, FISCAL YEARS 1998 AND 1999

Recipient	Fiscal year—	
	1998	1999
Auburn University	\$3,554,184	\$3,269,684
University of Alaska	887,889	827,373

Question. Why did the Department choose to cut funding for these basic research programs even as the Administration was promoting the need for increased funding for research?

Answer. The Administration advocates a broad range of funding mechanisms in support of university-based agricultural research, education, and extension. These mechanisms, including formula programs, competitive grants, special grants and projects, and other programs—such as Smith-Lever 3(d)—are interdependent and jointly contribute to the success of our knowledge-based system of agriculture. The priorities which define Federal support for programs in agricultural science and education are developed through a collaborative, State/Federal process of consultation with stakeholders, mutual planning, and in almost all cases, joint investment. Due to budget constraints, we have proposed decreases for Hatch Act, McIntire-Stennis Cooperative Forestry, and Smith-Lever formula funding to generate the resources needed to address issues of broad public concern that cut across State lines or other boundaries.

FUND FOR RURAL AMERICA

Question. I am a strong supporter of the Fund for Rural America and was especially pleased with the innovative approach the research office took to implementing its portion of the program. However, I am growing increasingly concerned about the results of the first round of funding. I wrote to the Department in support of several Vermont applications to the Fund almost a year ago. Decision dates on the awards have slipped continually from an original target date of October I believe. To this day, to my knowledge no announcements have been made regarding funding awards. In addition, I have heard from a number of organizations which had applied for funding, voicing confusion about calls they had received from the Department which appeared to award them grants on one hand, and then warn them that they might not actually receive the funding. When will the Department be making Fund for Rural America research awards?

Answer. The first round of Fund Planning Grants was made in September, 1997. The second round of Fund Standard Grants is being made in two increments; the first half was made in late February, 1998 and the second half will be made in March, 1998 after completion of final programmatic and administrative review.

Question. Will Congressional offices receive early notification as is standard with grant awards? What caused the delay in making grant awards?

Answer. Congressional Offices are being notified as is standard, but with the lead time slightly reduced to get the Fund awards out sooner. The USDA Congressional Relations Staff has been in contact with their counter parts in the Members' Offices and notifications have been hand delivered to expedite the process.

Delays in the first round of Fund awards relate to several factors. Initial delays involved in designing and starting-up a new program. These delays will be substantially reduced in the future. Secondly, innovative design of the first round of Fund grants. The January, 1997 Request For Proposals included provision for two simultaneous proposal submission, evaluation, and award tracks—one for Planning and Center Grants and the other for Standard Grants. We plan to streamline processes in round two by combining scientific and technical review activities for all types of proposals related to similar problems, issues, or scientific disciplines. In addition, the competitive grants program of the Fund did not allocate dollars to issues prior to receiving and reviewing proposals. This decision to support the best proposals across a wide range of disciplines and functions required new processes to support award recommendations. An overview panel to evaluate the merit of grant rec-

ommendations across subject areas was conducted to guide final award recommendations. The Fund legislation also calls for a "relevance review" by the Research, Education, Extension, and Economics Advisory Board. Together these factors worked to delay awards 2-3 months beyond our plans.

Question. What problems led to the confusion with potential recipients about awards, and what steps is the Department taking to ensure that these problems do not recur?

Answer. In an effort to fund as many high quality proposals as possible, Fund staff entered into discussions with investigators about focusing proposed work on specific objectives and possible budget savings. Many applicants interpreted budget negotiations and poorly-worded staff correspondence as a commitment prior to final award. The Department decided to postpone Center Grant awards. This allowed Fund staff to expand the number of grants funded, but also entailed changing signals to grant applications who otherwise would not have been funded.

Given the number of proposals received and the dollars available for award, the Fund success rate is about 10 percent. This means there are substantial numbers of excellent proposals which cannot be supported by the program this year.

Question. I am also very concerned about the gap in funding for the Fund. A drafting error in the Farm Bill inadvertently eliminated funding for the initiative in fiscal year 1998. I have been working with my colleagues on the Agriculture Committee to restore this funding in a agriculture research authorization bill. However, I have been disappointed by the lack of active support from the Department for efforts to resolve this problem and restore the Fund in fiscal year 1998. If funding for the program is restored for fiscal year 1998, will the Department be ready to publish a request for proposals and administer a competition in fiscal year 1998, and when would that RFP be published?

Answer. The Department will move expeditiously to announce a fiscal year 1998 competition should the language in question be passed. Even if the language remains as in the original enabling legislation, we plan to release the second Fund Request For Proposals later in fiscal year 1998 in order to make the second round of grants as early in fiscal year 1999 as possible.

Question. The fiscal year 1997 competition focused on several specific areas of research. What areas of research, education, or extension will the Department focus on in an fiscal year 1998 competition?

Answer. The first program description and request for proposals (RFP) for the FRA competitive grants program emphasized integrated research, education, and extension activities designed to address practical, short to intermediate term problems that cut across agriculture, environment, and rural development. This first RFP was designed to solicit a broad range of proposals in which the importance of problems would be established through community relevance as described in the proposal. The second Request For Proposals will address these same concerns, but with a significant tightening in award criteria and more program explanation designed to reduce the number, while maintaining the quality, of the proposals submitted.

For example, we will clarify integration, client/stakeholder linkage, and evaluation criteria. We also plan to include extensive reporting of award examples in the RFP text in an effort to improve guidance to the research, education, and extension communities. Hopefully, these efforts will allow us to continue funding an unusually strong, balanced portfolio of grants, while reducing the cost of competition to the community and program managers.

Question. Will the Department consult with the authorizing and appropriation committees when deciding on the focus of a potential fiscal year 1998 competition?

Answer. The Department is considering authorizing and appropriating committee concerns about the next RFP as expressed through vehicles such as these hearings and other communications. We also are prepared to brief committee and member staff in greater detail on the awards made from fiscal year 1997 funds and regarding plans for the next round of Fund activities.

ECONOMIC RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD AND NUTRITION PROGRAM RESEARCH

Question. The President when signing the fiscal year 1998 Appropriations Act last November, noted in his statement his concern about the provision in the bill transferring funding for research on nutrition programs from the programs' administra-

tion to the Economic Research Service (ERS). The President's fiscal year 1999 budget proposes to transfer this funding back to the Food and Nutrition Service (FNS). Would you please explain how the ERS is executing the nutrition research and evaluation program transferred to it from the Food and Nutrition Service for fiscal year 1998 and why the Administration believes that ERS is not the appropriate agency to oversee and administer these research funds?

Answer. The Economic Research Service has developed a comprehensive research program for addressing the needs of the Nation's food assistance and nutrition programs. The ERS food and nutrition assistance research program includes three broad areas of research: (1) dietary and nutrition outcomes, (2) program targeting and delivery, and (3) program forecasting and budget analysis. The dietary and nutritional outcomes area includes studies of program impacts on enhancing the access and choice of palatable, nutritious, and healthy diets of program participants. The program targeting and delivery area addresses how successful the programs are at targeting and reaching needy, at-risk population groups; program gaps and overlap; difference between rural and urban program delivery; outreach; waste, fraud and abuse; commodity procurement and distribution; public and private partnerships; and alternative benefit delivery mechanisms. The third area, program forecasting and budget analysis, focuses on how program needs change with local labor market conditions, economic growth, recession, food price inflation and general inflation; how changing State welfare programs interact with food and nutrition programs; and projections of program participation, benefit levels, and overall budgetary needs.

ERS has consulted with many government agencies, private and nonprofit organizations, universities, and the Food and Nutrition Service to solicit input for program development. A recent conference conducted under the auspices of the National Academy of Sciences was sponsored by ERS to help design and focus the program. ERS plans to operate a nationally diverse program which draws on the research capabilities of the public and private sectors, including the nation's academic institutions.

Despite the excellent work that ERS has done, the Administration believes this research and evaluation program should be administered by the Food and Nutrition Service. FNS has detailed knowledge of the country's food programs and, because they administer and have oversight responsibility for the programs, they understand their research and evaluation needs.

Question. How has shifting the \$18.5 million for evaluations of food stamp, child nutrition, and WIC programs to the ERS from FNS affected full-time equivalent (FTE) personnel requirements?

Answer. ERS has not used any of the \$18.5 million allocation to hire new staff nor has any of this money been used to support existing staff. ERS has, however, reallocated existing resources to address this important activity and has assigned some of the most senior management and research staff to this. A new position, Deputy Director for Food Assistance Research, was created to help administer the program. Nearly 20 researchers have been directed to focus on food assistance issues. These researchers will help implement our extramural research program. ERS's senior administrative officer has also been detailed to this project to manage the business side of the operation and the Agriculture Research Service's Contracts Office that supports this project has also given this activity its highest priority.

Question. What FTE reductions, if any, are associated with the fiscal year 1999 budget proposal to transfer funding for the research program from ERS back to the FNS?

Answer. Since ERS has reallocated and detailed existing staff to support this project, we do not foresee any need for FTE reductions associated with the transfer of funding back to FNS in the fiscal year 1999 budget proposal.

SITUATION AND OUTLOOK REPORTS

Question. There was concern earlier this year among some commodity groups regarding the possible reduction in frequency of the publication of certain Situation and Outlook Reports. Please summarize for the Committee which groups expressed concern and the nature of their concern. What change was made in the distribution of these reports and why? Has ERS now reassured the concerned commodity groups that they will have continued access to all necessary information provided in the Situation and Outlook Reports?

Answer. Field crop and livestock reporting has been reduced in most cases from 12 monthly reports to 6 reports annually. Annual yearbooks for these commodities continue to be produced. Specialty crop reports have been reduced by 1 issue each year.

Report frequency has been reduced in order to free a small amount of additional time for ERS analysts to pay more attention to maintaining and improving the quality of ERS and USDA forecasts and market analysis. In past years, short-term outlook reporting has been maintained and even expanded as staff has declined, at the expense of research and analysis to support USDA forecasts and commodity analysis. In the judgement of Agency management, this could not continue without compromising the quality of Departmental analysis. ERS continues to fully participate in the monthly Departmental estimates process, and the additional research will improve the quality of these estimates and commodity analysis support for the Department and other clients.

ERS has heard directly from: the American Sugar Alliance; the National Cotton Council; a number of firms and associations concerned with cottonseed production and marketing; and several private purveyors of livestock information, news, or newsletters. Members of the American Sugar Alliance (ASA) expressed an overall concern about the quantity of ERS resources devoted to sugar market analysis and reporting, as well as specific concerns about frequency and accessibility of sugar market information reporting, and of ERS's role in the Department's interagency commodity estimation committee process. They were greatly relieved to learn that ERS is not planning any modification of its role in the interagency process, at least for the short run. But ASA appears to remain concerned about ERS levels of resource allocation to sugar market analysis.

The National Cotton Council's (NCC) communication with ERS took the form of a request for more information about and explanation of planned changes, rather than a particular complaint. ERS staff briefed an NCC official, with apparent success.

Cottonseed interests were dismayed by ERS cancellation of a monthly, autoFAXed fact sheet on the forecasted supply of and demand for cottonseed. As a consequence of feedback from the industry, that cottonseed data series has been reestablished and now appears in the agency's Oilseeds Situation and Outlook Report, although it is now available 6 rather than 11 times per year.

The private firms that make their livelihood by repackaging, summarizing, or interpreting periodic information released by ERS on livestock market indicators remain concerned that they will have less frequent access to the information that acts as a feedstock for their own services. ERS plans to help direct these firms to the original sources (such as the Commerce Department) of some of that ERS-reported information, and will continue to make the full set of information available at a reduced frequency of reporting.

ERS is expanding its electronic distribution of material through developing commodity briefing rooms on our Web site, through continued monthly e-mail dissemination of critical data, and through some increase in the content of tables in Agricultural Outlook magazine. We have also been meeting and talking with commodity and industry groups, and listening to their needs and concerns. We have accommodated most of the concerns expressed by our clients and are convinced that we will be delivering products that are better and more useful for most of them.

ELECTRIC UTILITY DEREGULATION

Question. ERS is requesting an increase of \$200,000 for an interagency research activity with USDA's Rural Utilities Service (RUS) and the Department of Energy (DOE) to expand REE's capacity to assess the potential impacts of electric utility deregulation. Will this project be completed in fiscal year 1999, or do you anticipate funding request in future fiscal years? Will RUS and DOE fund any portion of the research project? If so, how much is being provided by each agency? If not, why? What will be the role of each agency in this project?

Answer. We expect that ERS will be asked to extend its research on issues associated with electric utility deregulation for one additional fiscal year beyond fiscal year 1999.

DOE is not funding any portion of the research project beyond its commitment to provide a series of model runs, using its Policy Office Energy Modeling System, (POEMS), to provide input into the analytic framework being developed by ERS. RUS has agreed to provide \$100,000 in fiscal 1998 to partially support ERS analysis of electric utility deregulation issues of interest to them. In addition, RUS has indicated a willingness to fund necessary POEMS model runs required to support the ERS analysis, in the event DOE does not provide ERS the needed model runs.

Using ERS developed scenario assumptions, DOE has committed to provide ERS with the output of several model runs of its POEMS model. DOE has not yet provided the requested model runs because it is still calibrating its POEMS model. RUS has made operational and trade area data on rural electric cooperatives avail-

able to ERS. ERS is making available its rural economic and farm cost and returns survey data bases, certain modeling capability, and providing primary support to persons who are conducting analyses on the effects of electric utility deregulation on rural consumers, businesses, farmers and on the competitiveness of rural regions.

FOOD SAFETY INITIATIVE

Question. ERS is requesting an increase of \$906,000, for a total budget request of \$1,391,000, for an interagency research effort to understand the benefits and costs of programs and policies to improve the safety of the Nation's food supply. Considering that this is a collaborative effort, please provide the Committee with a prioritized account of how the ERS funds will be spent, and what other agency funding will be contributed to this effort, by agency. How will the research being conducted by ERS differ from that conducted by other USDA agencies, the Food and Drug Administration, and the Centers for Disease Control? What measures are being taken to ensure there is no duplication of research efforts?

Answer. Our funding request falls into three categories. The first is surveillance activity—ERS is asking for \$253,000 (an increase of \$253,000 from fiscal year 1998). Other agencies contributing to this effort include the USDA Food Safety and Inspection Service (FSIS)—\$1,500,000 (no change from 1998), Food and Drug Administration (FDA)—\$6,038,000 (\$2,200,000 increase from 1998), and the Centers for Disease Control and Prevention (CDC)—\$19,000,000 (\$4,500,000 increase from 1998).

The second category is for risk assessment and cost/benefit analysis—ERS is asking for \$686,000 (an increase of \$653,000 from fiscal year 1998). Other agencies contributing to this effort are USDA Agricultural Research Service (ARS)—\$4,818,000 (increase of \$320,000 from 1998), USDA Cooperative State Research, Education, and Extension Service (CSREES)—\$1,962,000 (increase of \$1,812,000 from 1998), FSIS—\$1,000,000 (increase of \$1,000,000 from 1998), USDA Office of the Chief Economist (OCE)—\$158,000 (increase of \$98,000 from 1998), and FDA—\$13,532,000 (increase of \$7,200,000 from 1998).

The third category is for educational efforts to promote food safety. ERS is asking for \$420,000 (no increase from fiscal year 1998). Other agencies contributing to this effort are CSREES—\$7,365,000 (increase of \$5,000,000 from 1998), FSIS—\$2,500,000 (increase of \$2,500,000 from 1998), USDA Food and Nutrition Service (FNS)—\$2,000,000 (\$2,000,000 increase from 1998), and OCE—\$420,000 (no increase from fiscal year 1998).

ERS plans to use the increased appropriation to support collaborative research in food safety economics. We plan to fund extramural research with cooperators in the land grant university system, and to work cooperatively with economists from the Centers for Disease Control and Prevention, Food Safety and Inspection Service, and the Food and Drug Administration. Working collaboratively in this manner will allow us to leverage our resources to support expanded research without adversely affecting other components of the ERS program.

ERS is the only USDA agency conducting research on the economics of improved food safety—the benefits of safer food and the economic consequences of interventions in the food system to reduce or prevent microbial contamination of the food supply. We are collaborating with economists from CDC and FDA in the "FoodNet" surveillance program to develop better national-level estimates of the benefits of improving food safety. We are also conducting research on how providing information on food safety through education, outreach, and food labeling can help influence consumer behavior and encourage safer food handling and preparation practices. We will be working with FSIS to provide guidance on how consumers make choices regarding safe food handling and preparation. This will enable USDA to more effectively target educational efforts under the Food Safety Initiative to promote awareness of food safety and help consumers protect themselves from foodborne health risks.

ERS is represented on multiple committees charged with the development of research plans under both the National Food Safety Initiative and the Initiative to Ensure the Safety of Imported and Domestic Fruits and Vegetables. We are actively coordinating with economists from CDC and FDA to ensure that our research efforts represent true inter-agency collaboration and to ensure that we are not duplicating efforts. The National Food Safety Initiative established the Risk Assessment Consortium, as part of the Joint Institute for Food Safety and Applied Nutrition, a collaborative activity of the FDA's Center for Food Safety and Applied Nutrition and Center for Veterinary Medicine and the University of Maryland. ERS is a member of this Consortium, which includes scientists from many Federal agencies, as well as from the academic community and the private sector. ERS will work collaboratively with consortium members to provide economic assessment of food safety

risk management and risk reduction strategies, with an emphasis on food safety risks from microbial pathogens.

SMALL FARMERS

Question. ERS is requesting an increase of \$350,000 to organize and lead an inter-agency research activity to assess whether or not USDA is meeting the information needs of small farmers, niche marketers, and other casualties of an industrializing agricultural sector. Will this project be completed in fiscal year 1999, or do you anticipate funding requests in future fiscal years? Please provide the Committee with an account of how the \$350,000 will be spent. How will ERS' involvement in this initiative relate, for example, to the CSREES \$4 million request to support integrated research and education activities to address the resource constraints on small farmers?

Answer. The request is for a one-year, one-time budget increase. The full funding will be obligated in fiscal year 1999, although the project may not be completed until sometime in fiscal year 2000. We do not anticipate the need for funding beyond fiscal year 1999.

The vast majority of the funding will be spent on focus group and survey methodology, the development of survey instruments, and the implementation, editing, and analysis of a broad scale survey questionnaire. We expect that most of that work will be obtained through cooperative research agreements and/or contracts. The only in-house expenditure foreseen is to hire a full-time but temporary research assistant to act as project officer and liaison between ERS project managers and the Agency's cooperators in carrying out the project.

The proposed ERS project is unique in that it investigates the commodity market, marketing, financial, and other economic information needs of small and socially disadvantaged farmers. Its findings should serve as a guide to public data collection and economic reporting programs, as distinct from extension information programs focused on dissemination and customization of related data and information. Certainly, though, this project's findings should be complementary to CSREES efforts.

Question. Regarding the research project to assess the information needs of small farmers, you state in your prepared testimony that subsequent plans would be designed to reform and modify USDA programs in the manner suggested by the assessment. What role will ERS play in monitoring the implementation of any recommended changes?

Answer. The implementation of recommended changes in the ERS market analysis and information program will be monitored in-house in order to provide documented input into the Agency's GPRA assessments.

COUNTY-BASED STUDY

Question. The Secretary indicated when he testified before this Committee that USDA now has an outside consulting firm conducting a workload study of the farm and rural program delivery system of county-based agencies. Did the ERS contract out for this study? If so, what is the cost of this study and from where were those funds taken? What has the consulting firm been told to look at specifically?

Answer. The Department has contracted with Coopers and Lybrand, the accounting and consulting firm, for a study concerning the operation of the USDA county-based agency operations. The goal of the study is the identification of alternative approaches to organizing and staffing these offices in delivering services that are: (1) clearly linked to Federal policy and program priorities and (2) transparently managed to meet Federal budget targets. Although the ERS Administrator has responsibility for the project's management, no ERS appropriations were used to support the \$800,000 contract, which is funded by CCC, FSA, NRCS, and RD. ERS participates only to the extent that it responds to requests for data or analyses in accordance with its usual responsibilities. A detailed statement of work for the county study has been prepared, and if requested, could be provided to the Committee.

ERS REIMBURSEMENT POLICY

Question. In the fiscal year 1998 Appropriations Act, the committee encouraged the Department to consider the relationship between the core analytical program of the ERS and the short-term and longer-term needs of other USDA program agencies, including the circumstances under which reimbursement to the ERS would be appropriate. Has the Department carried out this Committee directive? How has ERS' core analytical program been defined and under what circumstances will ERS be able to charge USDA agencies for research more specific to their short and longer-term needs?

Answer. ERS has adopted a reimbursement policy which broadly defines the agency's core analytical program and the circumstances under which full or partial reimbursement will be sought as a condition for providing services to other agencies. When reimbursement is determined to be appropriate, the level of reimbursement is negotiated between ERS and the requesting agency. Since most program agencies have a staff of economists, ERS seeks to design its assistance so as to emphasize development of the program agency's capacity to perform its own short-term, program-oriented analyses.

The ERS reimbursement policy is as follows: The ERS core program of research and analysis is aimed at understanding key relationships and causal factors underlying economic behavior, trends and resource management decisions in the food, agricultural, and rural sectors. This body of work is informed by the longer run analytical needs of USDA program agencies, as identified in a collaborative process with ERS, and changes to accommodate shifts in their research requirements. When program agencies seek assistance that is not a component of this core research program (for example, risk assessments, cost-benefit analyses, or program evaluations), such work should be performed by ERS only on a reimbursable basis. Recognizing that the program agencies employ half of the Department's economists, ERS assistance should emphasize development of the program agency's capability to perform its own short term, program-oriented analyses.

Question. How much ERS research is conducted in-house and how much is contracted out?

Answer. In fiscal year 1997, 4 percent of ERS research was contracted out.

Question. Please explain the increased funding for the following object classifications from the fiscal year 1997 to the fiscal year 1998 level: (1) travel, (2) printing and reproduction, and (3) research and development contracts and agreements.

Answer. All of these projected increases are due to the fiscal year 1998 appropriation increase to evaluate food stamp, child nutrition, and WIC programs.

PRIORITIZING RESEARCH PROJECTS

Question. How does ERS prioritize the research projects it conducts for other USDA agencies and other organizations with the agency's normal workload? Please provide the Committee with a prioritized list of projects planned for fiscal year 1998.

Answer. ERS develops and maintains an integrated set of division plans of work (a part of the GPRA process). Each division conducts an intensive review and planning process annually, but the work plans are considered living documents that are continually reviewed and revised as problems, issues and conditions change. The work plans are developed taking into account the analytical needs of the Department and its program agencies. These needs are communicated to ERS in a number of ways. Some come in the form of specific requests for short-or long-term assistance and studies but, more frequently, needs are jointly identified through continuing exchange of information and discussion. For example, FAS and ERS have formed a Senior Coordination Task Force, co-chaired by the agencies' Associate Administrators which has a standing monthly meeting scheduled for exchange of information on program status and communication of needs and requests. Also, ERS participates regularly in the weekly staff meeting held by the Chief Economist. Similar but usually less formal exchange takes place with other agencies. The ERS Administrator has also initiated a series of briefings for senior managers of the Department's Mission Areas. The purpose of these briefings is to discuss analytical work ERS has done and is doing in support of that Mission Area and to elicit comments on the degree to which this work is meeting needs. Thus, many of the projects ERS does for other agencies are totally integrated into and are considered a part of the core program of the agency. Projects that are less closely related to our core program and for which reimbursement is received are considered of lower priority but, since reimbursement is received, additional resources are available so that these projects do not substitute for higher priority projects. Normally work plans do not rank order projects other than to identify those that are congressionally mandated and a selected few, usually inter-divisional projects, that have been identified as especially time or policy sensitive.

As an indication of the extent and variety of analytical work done in support of other agencies the latest compilation of such projects is attached. If the Committee would also like copies of current division work plans, these can be provided.

[The information follows:]

ERS RESEARCH SUPPORTING USDA AGENCIES

AGRICULTURAL MARKETING SERVICE (AMS)

Analysis of the Effectiveness of the Dairy Promotion Programs.—USDA is required to submit an annual report on the producer and processor dairy promotion programs to the Congress by July 1 of each year. ERS prepares an independent evaluation of both programs to ensure program funds are properly accounted for and that the programs are administered in accordance with the respective acts and orders.

Regulatory Flexibility Act (RFA) Analysis.—The RFA requires that AMS make initial and final regulatory analyses available to the public whenever a proposed rule or rule change under a federal marketing order would have an economic effect on small handlers of products under the marketing order. ERS has developed a spreadsheet-based modeling structure for AMS use in analyzing the effect of marketing rule changes on small handlers.

AGRICULTURAL RESEARCH SERVICE (ARS)

Evaluation of Agricultural New Uses Research.—The ERS Office of Energy is working with ARS and the University of California-Davis to develop technical information on soyink and wheat starch as a concrete substitute. ERS will help develop a specific set of economic procedures for setting priorities for new uses research.

CENTER FOR NUTRITION POLICY AND PROMOTION (CNPP)

Technical Assistance on the USDA Thrifty Food Plan.—ERS provided technical assistance and price data to assist CNPP in making revisions to the thrifty food plan. The project is completed.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES)

Sustainable Agriculture Economic Impact Study.—The objective of this study led by CSREES and the Environmental Protection Agency is to determine the implications of widespread adoption of more sustainable production systems in the United States. ERS is coordinating six cooperative agreements with the Universities of Maryland, Montana State, Nebraska, Ohio State, Tennessee, and Washington State. ERS will submit cooperator reports with an overview and summary to CSREES.

National Environmental Monitoring.—ERS helps CSREES by being a reviewer of environmental monitoring research efforts.

FARM SERVICE AGENCY (FSA)

Implementation of the Conservation Reserve Program.—ERS provides economic analysis of alternative program levels, analyzes environmental impacts of the Conservation Reserve program, and evaluates long-run scenarios for establishment of minimum environmental benefit index levels for sign up acceptance. ERS has assembled data and developed air and water quality scoring look-up tables for use by local FSA and NRCS offices for EBI scoring of offers.

Evaluation of Commodity Procurement Procedures.—ERS conducted a case study for peanuts and flour to identify any commodity procurement practices that could prevent FSA from making efficient use of funds and to examine the cost effectiveness of alternative procurement practices.

Annual Cotton Transportation Cost Study.—ERS estimates the cost of marketing U.S. cotton in northern Europe which is determined in part by transportation costs. This cost estimate is used by FSA to calculate the adjusted world price (AWP).

FOOD AND NUTRITION SERVICES (FNS)

Household Food Insecurity and Hunger Validation Studies.—ERS is analyzing the extent to which household's reporting food insufficiency have lower nutrient intakes. Data from the 1989–91 Continuing Survey of Food Intake by Individuals (CSFII) will be used to assess the relationship between the "USDA food sufficiency" question and nutrient intake of all household members.

Determinants of Food Behaviors.—ERS is developing a concept paper to identify issues, problems, data, and alternative modeling approaches for developing comprehensive food and agriculture policy models. Emphasis is being directed to linkages and relationships among low income populations, food and nutrition programs, farm programs and policies, and the food production, processing, and marketing system. The concept paper will be the basis for future program developments.

Impacts of Household Resource Constraints on Food Sufficiency.—ERS will analyze the determinants of food insufficiency using data from the Survey of Income

and Program Participation (SIPP). The survey provides information on proximal causes of food insufficiency including a lack of money or food stamps to buy food, a lack of working kitchen facilities, a lack of transportation, and nonparticipation in available food programs.

FOOD SAFETY AND INSPECTION SERVICE (FSIS)

User Fees for Meat and Poultry Inspection.—ERS is conducting a broad-based evaluation of the issue of charging user fees for meat and poultry inspection. The study includes reviewing economic literature dealing with user fees and other charges levied against the private sector in support of public health and safety. Use of fees elsewhere in Government and in other countries will also be included.

Economic Support for Food Safety Regulations.—ERS is responding to a FSIS request in three areas. The research includes providing methodology for estimating the costs of illness from bacterial foodborne diseases, developing a common methodology for valuing loss of life, and developing a shared data system to facilitate analysis of entry and exit and efficient plant scale in the meat industry. The effort includes helping FSIS in doing cost/benefit analyses of proposed FSIS regulations. Foreign Agricultural Service (FAS)

Analysis of Trade Agreement Snapback Provisions.—The tariff snapback provision of the Canada-U.S. Trade Agreement requires monitoring acreage and market prices for fresh market fruits and vegetables. ERS maintains a spreadsheet acreage database with the acreage data and formulas required to determine acreage-based snapback eligibility. This information is regularly provided to FAS.

Analysis of Chile's Policies and NAFTA Accession.—ERS has an ongoing project to assess economic implications of an expansion of NAFTA to include Chile in support of a Free Trade Area of the Americas (FTAA).

Analysis of Trade Promotion Programs.—ERS is working with FAS and the Trade Promotion Coordinating Council (TPCC). The TPCC is coordinated by OMB. The ERS role is to provide government agencies participating in the TPCC with technical assistance to analyze the costs and benefits of trade promotion. ERS was specifically asked to assist in the process by using Computable General Equilibrium modeling capabilities.

Federal Interagency World Food Summit Working Group.—ERS is inventorying existing research and determining the need for additional research in support of USDA World Food Summit follow-up Activities.

Ukrainian Emerging Democracies Project.—ERS is working with Ukrainian analysts to establish an on-going Ukrainian capability of producing a series of commodity reports and to develop the capability to analyze policy issues. The project includes help in establishing dissemination procedures and training of analysts in preparing and delivering briefings for agricultural decisionmakers.

China Technical Assistance Project.—ERS is providing technical assistance to Chinese analysts for the purpose of establishing commodity supply and demand balance sheets with short-term forecasts for major commodities.

Bulgarian Policy Analysis.—ERS initially provided a resident advisor to the Bulgarian Ministry of Agriculture in addition to training Bulgarian analysts to conduct analysis of agricultural and trade policy issues. Additional training of new analysts will be conducted in cooperation with analysts from the Polish Institute of Agriculture and Food Economics.

Agricultural Information in Transition Economies.—Transition economies face difficulties in establishing agricultural information systems. A conference was arranged for countries implementing agricultural information systems. Follow up work has involved establishment of Internet procedures and facilitating country to country information exchanges.

Mexican Emerging Market Project.—ERS is collaborating with Mexico to strengthen its market information and analysis system. This project will significantly improve USDA's ability to serve the information needs of the wide range of U.S. producer groups affected by developments in Mexican agriculture.

Romania Emerging Democracies Project.—ERS is working with Romanian analysts to establish an on-going series of commodity and policy issue reports and to establish regular dissemination mechanisms to make the information available to agricultural decisionmakers.

Taiwan Technical Assistance Project.—ERS provided assistance through the American Institute in Taiwan to help develop a production and marketing information system in Taiwan. This involved developing commodity situation and outlook reports, quantitative models, and database and survey methods. ERS provided training to help Taiwanese analysts conduct policy alternative analyses. The project has been completed.

Slovakia Policy Analysis ERS analysts helped the Slovaks to prepare short analytical pieces on current policy issues.—The ERS role was to help identify the problem, provided training in the methodological tools needed to conduct analysis and review the final product. The project has been completed.

FOREST SERVICE (FS)

Noxious Weeds.—The USDA Forest Service and the Bureau of Land Management in the Department of Interior head up a Federal Interagency Committee for Management of Noxious and Exotic Weeds. ERS is assisting this committee by providing economic input to assess noxious weeds issues. One of the ERS tasks is to manage a cooperative agreement with the University of Maryland to develop methodology to assess the cost effectiveness of management strategies to control noxious weeds.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION (GIPSA)

Regional Hog Procurement Study.—ERS and NASS are analyzing hog transaction data from four hog packers. The study is aimed at developing better information regarding hog pricing and procurement in the western cornbelt.

Assessment of Western Organization of Resource Council Petition.—The Western Organization of Resource Councils has petitioned GIPSA to make rules prohibiting certain procurement practices by meat packers. A GIPSA team is tasked with making recommendation regarding GIPSA's response to the petition. ERS is assisting the team to evaluate economic arguments made in public comments.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

Florida Everglades.—ERS is assisting in developing the USDA action plan for Federal-State Florida Everglades restoration efforts.

OFFICE OF RISK ASSESSMENT AND COST-BENEFIT ANALYSIS (ORACBA)

Economic Support for HACCP Benefit/Cost Analysis.—ERS participated in the Food Safety Working Group chaired by ORACBA and collaborated on the development of a fault tree model for E. Coli 0157:h7 in hamburger. ERS also provided assistance in the review of benefit/cost analyses associated with Hazard Analysis at Critical Control Point (HACCP) systems and other Departmental proposals for reducing pathogens in meat, eggs, and poultry. This project has been completed.

OFFICE OF THE SECRETARY, USDA

Economic Impact of the Methyl Bromide Scheduled Phaseout.—USDA policy-makers need information about the economic impacts of the scheduled phaseout of methyl bromide (MB) and the economic viability of alternatives to MB. ERS is estimating economic impacts of the phaseout of the use MB on important crops; including impacts on producers, consumers, production, prices, and international trade. As part of this effort, ERS is organizing workshops involving agricultural scientists, grower groups, and the pesticide industry in an effort to assess and share information.

OFFICE OF THE USDA CHIEF ECONOMIST (OCE)

NAFTA Monitoring Task Force.—ERS has a continuing effort to monitor the impacts of the North American Free Trade Agreement (NAFTA). ERS prepares periodic reports that cover agricultural commodity trade, employment, environmental effects, and policy actions in the United States, Mexico, and Canada.

Climate Change and Agriculture.—ERS took the lead in writing white papers on the impact of climate change on agriculture and possible impacts of climate change mitigation policies. The assignment included preparing briefings in response to questions from the Senate on the above issues. ERS provided ongoing support and analysis for the Framework Convention on Climate Change.

OFFICE OF THE USDA GENERAL COUNSEL (OGC)

Assessment of IBP Trade Practices Case.—ERS assisted OGC critique an industry analysis of IBP marketing practices and reviewed hearing exhibits for economic relevance and analytic soundness.

RISK MANAGEMENT AGENCY (RMA)

An Examination of How Farm-Level Decisionmaking Affects Insurance Decisions.—ERS is using time series farm business records from Illinois and Kansas to examine how crop yield and revenue risk affect the whole farm risk portfolio.

Development of a Dynamic Multi-Year Aggregate Risk Model to Assess Policy Decisions.—ERS is developing a model to determine the relationship between farm-level yield impacts and aggregate effects at the national level. The assessment includes focusing on risk within the year and also year-to-year interrelationships.

Yield Forecasting for Crop Insurance Premium Rate Setting.—ERS is analyzing whether the estimates of means and variabilities of individual farm yields can be improved by taking account of additional county or nearby farm yield data

Analysis of Actuarial and Economic Issues Underlying Crop Insurance Rate Setting.—ERS is examining whether premium rate discounts should vary by unit size and if so, how the magnitudes of the discount would vary by crop and region. Another area of work deals with factors used to adjust the base county rate to farms with yields above and below the base county yield. A third area focuses on premium rate variation relating to length of continuous participation and crop and region.

Evaluation of Existing Crop Insurance Programs.—ERS is examining the actuarial aspects of underwriting and other issues associated with crop insurance for peaches, potatoes, and peaches.

Feasibility Studies on Insuring Various Commodities.—ERS has undertaken feasibility studies on insuring approximately 51 agricultural commodities.

Review of Alternative Revenue Insurance Products.—ERS has analyzed various revenue insurance and market value protection products. Work is now underway to assess the potential for producers to adversely select among insurance products.

Risk Management Strategies Under the 1996 Farm Act.—Risk management options being analyzed in this area of work include various risk management tools such as crop insurance, revenue insurance, price futures and options, and yield futures.

RURAL BUSINESS-COOPERATIVE SERVICES (RBCS)

EZ/EC Background Assistance.—ERS is preparing economic information packages for the use of local leaders to help them understand aspects of community development and economic growth. The resource books are based in part on community interviews. The resource book for the Mississippi Delta is complete, the book for the Texas Rio Grande Valley is nearly complete, and the interviewing stage in the Kentucky Highlands has been completed.

RURAL HOUSING SERVICE (RHS)

Rural Housing Service Research Initiative.—ERS is exploring the feasibility of conducting surveys on the characteristics of participants in the RHS single family and multifamily housing programs. The surveys would provide a data base and analysis to help RHS assess the match between RHS assisted housing and the demographic needs of rural areas, develop performance indicators to measure program effectiveness, and explore the effects of changing Federal policies on RHS housing programs and their participants.

RURAL UTILITIES SERVICE (RUS)

Rural Electric Utility Deregulation.—The ERS Office of Energy is exploring the issues involved in deregulating the electric utility industry. The objective is to analyze the potential impact on agriculture, rural areas, and rural development.

USDA WORKING GROUP ON WATER QUALITY

Water Quality Program.—The USDA Working Group on Water Quality is a multi-agency group. ERS meets regularly with representatives of this group to discuss issues and progress of the USDA Water Quality Program and develop plans of work and to identify economic issues.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's strategic goals, and program activities in its budget request?

Answer. ERS's annual performance goals of enhanced understanding of economic issues by policy makers, regulators, program managers, and those shaping the public debates directly flow from ERS's mission to provide economic analysis on efficiency, efficacy, and equity issues related to agriculture, food, natural resources, and rural development to improve public and private decision making. The annual performance goals parallel ERS's strategic goals. ERS program activities—research, development of economic indicators, and dissemination of research results and economic information—directly support the strategic and annual performance plan goals.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. ERS research, development of economic indicators, and information dissemination activities are focused on topics that ensure ERS can meet its performance goals of enhanced understanding of economic issues by policy makers, regulators, program managers, and those concerned with agricultural competitiveness, food safety, good nutrition, environmental quality, and rural prosperity. The link between the goals and the activities needed to attain them was an easy one for ERS to make.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. ERS's budget has one appropriation item, economic analysis and research. The Performance Plan's five goals are linked and dependent on funding levels allocated within the agency.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. ERS performance planning structure does not differ from its account and activity structure.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. ERS does not propose any changes to its account structure for fiscal year 2000.

Question. How were performance measures chosen?

Answer. ERS has always been concerned with its performance and maintained information on its analytical outputs, their use, and their impacts on decisions about U.S. agriculture, food, natural resources, and rural development. ERS began a review of its planning and performance measurement systems in fiscal year 1995 when it provided all managers training on the Government Performance and Results Act (GPRA) and results oriented management approaches. At that time, a group of middle managers reviewed and redrafted ERS performance measures. Subsequent mission area-wide activities in 1996-97 provided senior and middle ERS managers additional opportunities to test and refine ERS's performance measures including exchanges with staff at other government research agencies that were engaged in pilot GPRA projects and staff at private research oriented companies. The performance plans external reviews included meetings convened by the National Agricultural Research, Extension, Education, and Economics Advisory Board and included individuals from agri-business, public interest groups, and universities. The measures have also been critiqued extensively within USDA. Lessons reinforced were: do not make performance measurement so difficult that no one has time to work on achieving goals; good planning is an ongoing process and assessments will lead to further refinements; staff will perform to indicators—make sure measures lead to correct outcomes; and research agencies face special difficulties in tying research results to broader outcomes.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance measures?

Answer. ERS will be able to produce and verify the data needed to underpin measures specified in its performance plan. ERS would like to get more feedback from users outside the federal government, but is carefully considering the costs of doing so, not just to ERS, but government wide and to society. The present requirements that must be completed before contacting non federal users (including the 60 day advertisement of intention in the Federal Register and the lengthy time involved in clearing any questionnaire/focus group/survey instruments) involve considerable costs to the government. Furthermore, this extensive clearance process regarding such contacts reflects legislative and executive concern about respondent burden—even for voluntary responses.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. ERS will have sufficient and reliable data to complete its March 2000 performance report.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The performance goals for each major goal specify quantitative goals for research outputs and qualitative goals with regard to enhancing understanding of important economic issues. Simplistic reliance on quantitative output measurements, however, can inhibit rather than contribute to successful outcomes. Care

must be taken in setting and measuring against quantity output goals to ensure that quality is not sacrificed for quantity. Quantitatively and definitively establishing the link that decision makers make particular decisions because of the provision of analyses is widely acknowledged as extremely difficult. ERS narratives will be essential to demonstrate that ERS ensured policy makers, regulators, program managers, and organizations shaping public debate had high quality, objective, relevant, timely, and accessible analyses. The narratives will cover ERS anticipation of issues and the timeliness of output, review prior to release, customer views on relevance and accessibility of ERS analyses, and how ERS analyses contributed to informed decision making on economic issues related to agriculture, food safety and nutrition, natural resources, and rural development. The narratives will provide perspective on ERS success in bridging customer satisfaction measurement—e.g., responsiveness and courtesy shown to customers—with basic outcomes goals—e.g., improving the efficiency and effectiveness of policies and programs that meet societal equity standards.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure the goals in the plan include a significant number of outcome measures?

Answer. Interpreting outcome measurements is not a straightforward process for research organizations. The cause and effect relationship between research outputs and eventual outcomes is complex. The challenges facing those interpreting performance measures for a public information and analytical organization such as ERS are even greater. Public information can be freely used without attribution. Its widespread use and effects may be difficult to fully measure. Delays between when research results are presented and when their effects are fully assimilated are variable and can be long. Specific outcomes are influenced by quality research results, as well as other factors. If ERS analysis is objective, analysis on the efficacy, efficiency, and equity impacts of specific policies, programs, and regulations will at any one time support some customers' proposals but not others. Analysis may show that an export promotion program helps corn exporters at the expense of beef exporters. Research may show that a water allocation proposal costs farmers but benefits recreation interests. Corn exporters and farmers in such cases may not fully appreciate the relevancy, accessibility, and objectivity of ERS analysis. Rigorous adherence to standards of disciplinary excellence contributes greatly to the quality and objectivity of ERS analyses and their defensibility in the face of politically-motivated criticism. The narratives that ERS will include in its performance reports will be key to showing how ERS analysis enhanced understanding by policy makers, regulators, program managers, and others of key economic issues relating to competitiveness, food safety, good nutrition, environmental quality, and rural prosperity.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. ERS has a head start in making sure that program managers understand the difference between workload and effectiveness measures. Most ERS employees are economists with substantial interest, training, and experience in understanding efficacy, efficiency, and equity concepts. In addition, ERS has augmented program managers training specific to GPRA requirements beginning in fiscal year 1995 and provided all managers training on GPRA and results oriented management approaches.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers?

Answer. ERS will include a variety of qualitative indicators to help measure the relevance, productivity, and quality of its program and outputs, and to understand how ERS research results are used by decision makers and thus affect outcomes. Indicators will include: (1) call backs for follow up information/analysis from policy makers; (2) requests for ERS staff as primary speakers at important meetings and conferences; (3) articles in major public media that correctly and effectively use ERS analysis and data; and (4) changes in legislation, regulation, and designs of social science programs related to agriculture, food, natural resources, and rural areas. To ensure that the outputs present data and analyses that are high quality, comprehensive, objective, relevant and accessible, ERS routinely provides its customers many opportunities for feedback, conducts rigorous peer reviews before analysis is released, and uses a wide variety of proven and innovative dissemination systems.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The interaction between goals and budget developed is not unidirectional. The allocation of resources across goals reflects efforts to balance economic information needs among competitiveness, food safety, nutrition, environmental, and rural

development issues. The level of funding affects ERS ability to produce and disseminate research results and economic indicators and thus the particular targets that can be set and met.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and achievement of various goals?

Answer. ERS will be able to indicate the likely impact on the level of program performance and achievement of various goals due to increases or decreases in its funding.

Question. Do you have technological capability of measuring and reporting program performance throughout the year on a regular basis, so the agency can be properly managed to achieve the desired results?

Answer. ERS could prepare program performance reports at anytime during the year. However, the nature of research outcomes, including the often long evolution between provision of economic analysis and any particular public and private decisions, means that more frequent detailed measurement and reporting may not be cost-effective.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear meaningful way. Have you faced that difficulty? Would the linkages be clearer if your budget account structure were modified? If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure? How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Because ERS's budget has one appropriation item, economic analysis and research, ERS does not face difficulties in linking performance across various accounting and reporting structures and presenting its budget by performance goals.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate and plan for such influences? What impact might external factors have on resource estimates?

Answer. ERS's fiscal year 1999 performance plan discusses external factors that influence goal setting and achievement. ERS's future depends on its ability to achieve national prominence as a center of excellence for economic analysis on agriculture, food, environmental, and rural issues. Policy makers and program managers in program implementation agencies increasingly will be called to defend the efficiency and equity consequences of public policies, regulations, and programs. Tighter budgets in other USDA mission areas will decrease their already limited internal ability to anticipate the economic effects of policies and programs. ERS must clearly identify its role as the intramural social science research agency at USDA, with a focus on maintaining its core analytical activities while remaining responsive to short-term information demands.

ERS will continue to be asked to do more with declining real resources as demand for information grows in a knowledge-based and increasingly complex society. The agency will continue to pursue and integrate useful new information technologies into agency operations to help improve staff productivity and meet ERS performance goals despite fewer staff resources.

ERS will adjust its research program to the changes in the larger policy context. Changing perceptions about the role of government regulation is accelerating the search for more voluntary and market-based measures to promote public good. The agricultural policies and programs in the 1996 Farm Bill raised new issues regarding the structure and geographic location of agricultural production, as well as the volatility of prices in response to international shocks and weather. Increasing scale and concentration of agricultural activities raise environmental and economic issues pertaining to waste management. Rapidly changing economic, social, and medical environments raise challenging questions about the nutritional quality and costs of good diets and their implications for individuals, society, and the food industry. International trade agreements are shifting the focus of trade barriers away from tariffs toward issues relating to food safety and environmental quality. Continued evolution of the social, economic, and industrial structure of rural areas will change policy debates regarding the well-being of rural people and communities.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so does the Performance Plan identify the overlap or duplication?

Answer. Because ERS's economic analyses cover all aspects of USDA's mission, the crosscuts between ERS research and the missions and goals of other USDA agencies is extensive and complicated. ERS, even before new GPRA requirements, was cognizant that its unique contribution is provision of external economic analysis and took care not to duplicate or overlap with program functions in other agencies.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. ERS performance measures are sufficiently mature to allow funding decisions to consider actual performance compared to target with the caveats about the complexity of measuring performance for a public research organization given in answers to prior questions.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997.

Answer. ERS will not need to revise its strategic plan based on its fiscal year 1999 performance plan.

QUESTION SUBMITTED BY SENATOR CRAIG

Question. I am troubled by a recent ERS decision to cutback in its work on short-term commodity supply-demand analysis. It is my understanding that ERS has reduced its situation and outlook reporting by 50 percent. Yet ERS officials have told us that American producers will not pay the price for these cutbacks—that all previously available data will continue to be readily accessible through other means. Can you elaborate on this and show where this information will be published and in what form?

Answer. Much of the data provided in ERS outlook reports will continue to be available from the originating agency—the National Agricultural Statistical Service, the Foreign Agricultural Service, and the Bureau of the Census, for example. Our Situation and Outlook reports will continue to contain the data they have always contained. In months when they are not published, critical data and data that are unique ERS products will be available, in most cases, through a combination of commodity briefing rooms on the ERS Web site, through monthly E-mail distributions of critical commodity data, and through some increase in the content of tabular material in Agricultural Outlook magazine.

NATIONAL AGRICULTURAL STATISTICS SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

AQUACULTURE CENSUS DATA COLLECTION

Question. NASS has requested a one-year increase of \$500,000 and 2 staff-years to conduct an aquaculture census, which would provide for the first time detailed State and national data about aquaculture production. Please explain the importance of the census, what data will be collected, and who will use this data. Is this a one-time cost or will it be necessary to conduct this census every so many years? What future year funds will be required for this census?

Answer. The NASS request of \$500,000 would fund a census of all farms participating in the 1997 Census of Agriculture that produced and sold \$1,000 or more of aquaculture or aquaculture products. Under this proposal, NASS would conduct an extensive aquaculture census every 5 years following the census of agriculture. The \$500,000 funding would be for fiscal year 1999 only and would be dropped from the NASS budget base in fiscal year 2000.

The aquaculture census would provide, for the first time, national and State level detailed data about aquaculture production, and would be the only source of nationally consistent data for all types of aquaculture. The current NASS aquaculture program is limited to providing statistics for catfish and trout production in major States. This census would provide periodic statistics related to the production of finfish, shellfish, and animal aquaculture, which is one of the most rapidly changing segments of agriculture.

Aquaculture is an emerging industry and therefore does not have the infrastructure to collect, compile, and publish industry statistics. The aquaculture census would provide improved information on the present and possible future supply of aquaculture and aquaculture products for a broad range of data users, including in-

dustry representatives, producers, marketing and trade groups, Federal and State organizations, policy makers, and colleges and universities. Accurate and timely data are needed in order for aquaculture to be recognized as a significant sector of the agricultural industry. The aquaculture industry needs data to competitively compete for research and development funds, to efficiently plan and market aquaculture products, and to develop new products. Aquaculture data are necessary in order for the industry to receive higher priority in the certification and re-certification process for obtaining pharmaceuticals for use in aquaculture production. Aquaculture production is expanding in response to the problem of declining fisheries worldwide. Marine aquaculture can provide new employment opportunities through jobs that are near towns formerly dependent on fishing.

CENSUS OF AGRICULTURE—NEW RESEARCH

Question. In your prepared statement, you mention that the growing diversity and specialization of the Nation's farm operations have greatly complicated procedures for producing accurate agricultural statistics. You further state that considerable new research will be directed at improving the census of agriculture to be conducted in 2003. Has funding for the new research been included in the fiscal year 1999 budget? If so, where is it included? If not, do you anticipate a need for additional funding in future fiscal years?

Answer. Yes, funding for on-going research related to new sampling and survey methodology, improved data collection techniques, and increased use of enhanced computer technology is included in the NASS budget under each budget activity. This research is integrated with NASS's on-going programs and is therefore not identified as a separate item. Requests for additional research funds are not anticipated in future fiscal years.

AGRICULTURAL ECONOMICS AND LAND OWNERSHIP SURVEY

Question. NASS has requested an increase of \$100,000 and 1 staff-year to begin preparatory work needed to conduct the Agricultural Economics and Land Ownership Survey. Why is the Agricultural Economics and Land Ownership data collection done through a separate survey and not included in the census of agriculture?

Answer. The Agricultural Economics and Land Ownership Survey (AELOS), historically conducted every 10 years following the census of agriculture, is a survey of farm and ranch operators that participated in the census of agriculture, and the landlords of those operators. AELOS provides the only comprehensive source of data on agricultural land ownership, financing, and inputs by farm operators and landlords for each State. Separate questionnaires are used to collect data on farm operating expenditures, capital improvements, assets, and debts for agricultural production from operators and their landlords. AELOS is conducted as an independent survey from the census of agriculture for two major reasons. First, a separate survey is required because AELOS is based on a sample of farmers and ranchers who participated in the census who meet certain criteria for size and type of operation, along with their corresponding landlords. Second, because the AELOS questionnaire is quite detailed it would not be feasible to include those questions on the census form.

PESTICIDE USE DATA COLLECTION

Question. The NASS budget includes funds to collect data on pesticide use in nursery and greenhouse crops where farm worker exposure is potentially high. Will this effort in any way relate to that carried out under the Agriculture Marketing Service (AMS) Pesticide Data Program (PDP)? If not, why?

Answer. AMS's responsibility in the Pesticide Data Program is to collect pesticide residue data on fruits and vegetables. AMS does not collect pesticide use data.

RESEARCH PROJECTS

Question. How does NASS prioritize the research projects it conducts for other USDA agencies and international organizations with the agency's normal workload? Please provide the Committee with a prioritized list of projects for fiscal year 1998.

Answer. NASS places a high priority on providing statistical services to all USDA agencies and international organizations. Because each year the total requested projects has remained fairly constant, NASS has been able to maintain the staff and infrastructure to complete all requested projects without significantly impacting the agency's core program.

The following is a list of all the surveys done on a reimbursable basis in fiscal year 1997.

[The information follows:]

NATIONAL AGRICULTURAL STATISTICS SERVICE REIMBURSABLE SURVEYS, FISCAL YEAR 1997

Source	Project
Agricultural Marketing Service	Cheese Price Data. Milk Price Data. Pesticide Data Program. Pesticide Recordkeeping.
Agricultural Research Service	Assistance on Food Consumption Survey Data. Cotton Model Survey. Employee Climate Survey.
Animal Plant Health Inspection Service	National Animal Health Monitoring System. Animal Damage Control. Agricultural Quarantine Inspection.
Economic Research Service	Agricultural Resource Management Survey.
Farm Service Agency	Employee Climate Survey. County Estimates. Farm Operating Loan Program. Feed Grain County Estimates.
Forest Service	Grazing Fees.
Rural Development	Cash Flow Models.
Department of Interior	Grazing Fees.
State Departments of Agriculture	Crop Reporting Services.

NASS REIMBURSEMENTS

Question. Do other USDA agencies requesting work from NASS reimburse NASS for the work requested? If not, when is reimbursement required?

Answer. If the requested work can be accomplished in two days or less, reimbursement is not requested. Otherwise, NASS negotiates a reimbursable agreement with the requesting agency to provide funding that covers NASS's costs for the project.

NASS RESEARCH

Question. How much NASS research (both in dollars and in number of studies) is conducted in-house and how much is contracted out?

Answer. The majority of NASS research dollars are for intramural activities. Only a small amount is expended for extramural research.

RESEARCH DOLLARS AND NUMBER OF STUDIES BY FISCAL YEAR

Item	Fiscal year 1997 actual	No. of studies	Fiscal year 1998 estimate	No. of studies	Fiscal year 1999 estimate	No. of studies
Intramural	\$3,182,000	37	\$3,276,000	40	\$3,220,000	40
Extramural	190,000	7	205,000	6	229,000	6
Total	3,372,000	44	3,481,000	46	3,449,000	46

OBJECT CLASSIFICATIONS

Question. Please explain the increased funding for the following object classifications from the fiscal year 1997 to the fiscal year 1998 level: communications, utilities, and miscellaneous charges; printing and reproduction; advisory and assistance services; other services; and purchases of goods and services from Government Accounts.

Answer. Most of the increase from fiscal year 1997 to fiscal year 1998 in the cited object classes is attributable to data collection and processing activities associated with the 1997 Census of Agriculture, which peaks in fiscal year 1998.

[The information follows:]

NATIONAL AGRICULTURAL STATISTICS SERVICE

[Dollars in thousands]

Selected object classes	Fiscal year—		Increase	Explanation of increase
	1997	1998		
Communications, utilities, and miscellaneous charges (23.3)	\$3,467	\$6,210	\$2,743	Postage for census questionnaires
Printing and reproduction (24.0)	345	625	280	Printing of questionnaires for irrigation and horticulture surveys
Advisory and assistance services (25.1)	132	339	207	Consultants for the Agricultural Statistics Board archives
Other services (25.2)	19,762	24,206	4,444	Data collection activities for the census
Purchases of goods and services from Government Accounts (25.3)	11,066	14,868	3,802	Contract with the Census Bureau for the census mail-out and ADP

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The NASS annual performance plan parallels the NASS strategic plan. Both plans are framed by the NASS mission statement, the five REE general outcomes which are the NASS general goals in both plans, and the NASS objectives under each of the five general goals. In addition, the strategies for achievement of the objectives are contained in both plans, and the performance measures outlined in the strategic plan are part of the Performance Goals and Indicators table in the performance plan for each of the general goals. The applicable budget program activities are indicated for each general goal in the performance plan, and for the fiscal year 1999 budget request, the dollars and FTE's for each of the three NASS budget activities are cross-walked to the five general goals. The corresponding funding levels and FTE's for fiscal years 1997-99 are also shown under each of the general goals of the performance plan.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. NASS maintains cost data for all major program activities under each of NASS's budget categories: agricultural estimates, statistical research and service, and the census of agriculture. These cost data include Agency administrative and infrastructure costs. These major activities and associated costs were then categorized into the five general goals which frame both the strategic plan and the annual performance plan. Sometimes it is difficult to determine where a given statistics program best fits under the five broad general goals. In this case, categorization is determined by which goal is most supported by the statistical data generated by that program.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The NASS performance plan is linked to the budget. The three program budget accounts have been aggregated as they apply to the performance measures. Each goal and corresponding objectives list the applicable budget activities and the funding and FTE levels. Also, the resource table at the end of the annual performance plan provides an even more detailed breakdown by individual budget program activity for each of the five general goals.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The annual performance plan is framed by the five general goals, but each goal is cross-walked to the applicable budget activities; funding and FTE levels are shown by general goal as well as by individual budget activity. NASS's program activities are agricultural estimates, statistical research and service, and census of agriculture.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. Not at this time.

Question. How were performance measures chosen?

Answer. The measures in NASS's annual performance plan were chosen because they are indicators of performance for key core NASS activities, representing each

budget category, under each of the five REE general goals. NASS also wanted a mix of measures based on external customer input and internal evaluations. NASS held several meetings to obtain input from both field and Headquarters employees on the measures that would best gauge NASS's performance.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. NASS carefully examined each performance goal to determine which would benefit most from measures based on customer input, in order to limit costs and the respondent burden on NASS customers and data users.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No. NASS anticipates having performance data available for each measure in time for the first performance report.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. NASS recommends tracking the performance goal listed under general goal 1, since this represents the largest part of NASS's agricultural statistics program. The other key performance goal for NASS is listed under goal 5, which contains the measures for the census of agriculture.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Developing meaningful outcome measures for an agency which doesn't deliver a program, but instead supplies information such as agricultural statistics is extremely difficult. NASS took the approach of formulating meaningful outcome measures which assess NASS's ability to provide accurate, unbiased, meaningful, useful data on time with no errors. Assessing these attributes requires a mix of internal measures and surveys of NASS customers and data users.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. NASS program managers are knowledgeable about the distinction between output and outcome measures. NASS first began strategic planning efforts in 1994, and all levels of NASS employees have been involved in the development of internal agency performance measures down to the Branch level since 1996.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Each of the NASS customer satisfaction measures included under the five general goals require surveys of both internal and external customers, since there is a mix of both for every statistical product and data series produced by NASS. Some of the measures included under the three management initiatives in the fiscal year 1999 Annual Performance Plan are obtained from periodic surveys of NASS employees.

Examples of customer satisfaction measures included the performance plan are: percent of data users who rate NASS data as important or essential to the orderly marketing of agricultural products; percent of agricultural leaders surveyed who rate NASS chemical use data as important or essential to analysis and risk assessment; and percent of stakeholders who rate NASS census and economic data as important to their work.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. NASS did consider the level of support for each of the five REE general goals and corresponding performance goals and measures in decisions related to the development of the fiscal year 1999 budget, particularly the new initiatives.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, particularly since adjustments would most likely be made to new budget initiatives, each of which have a unique performance indicator in the annual performance plan. Significant downward adjustments to NASS's core programs could have significant effects on program coverage, accuracy, and timeliness measures as well as customers' evaluation of the agricultural statistics program.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Some of the internal performance measures related to accuracy and timeliness can be monitored throughout the year. Others, especially those reliant on external customer surveys, are more conducive to annual reporting. However, customer surveys could be staggered during the year if the customer and data users for a particular data series or product were unique.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty? Would the linkages be clearer if your budget account structure were modified? If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure? How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. NASS's present budget accounting structure cross-walked with the REE general goals allows for the development of meaningful performance indicators and resource allocations. The only weakness in this design may be that the REE general goals which each agency in the REE Mission Area adhere to, are quite general, which makes it difficult to make specific budget decisions about NASS program activities.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate and plan for such influences? What impact might external factors have on your resource estimates?

Answer. The NASS performance plan alludes to key external factors which are explicitly listed in the strategic plan. For example, one key external factor influencing NASS is the increasing demand among data users for new kinds of information provided in different forms. These pressing needs always require an assessment of NASS resources and priorities. The demand for increased coverage in the 1997 Census of Agriculture for minority farm operators, including American Indians, prompted NASS to initiate additional steps in the census mail list building process and to introduce new procedures to collect census information on American Indian reservations. Rapid changes and continued concentration in the agricultural industry has required NASS to modify procedures for collecting and publishing information for certain sectors. The need to sustain, and even increase, NASS standards for accuracy, timeliness, and relevancy in order to meet rising public expectations requires constant technology upgrades, training, and improved survey technology. Changes in priority can result in shifts in resource allocations.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. The development of the NASS performance plan has not identified any overlapping functions or program duplication. However, duplication related to NASS merging responsibility for the census of agriculture with the current agricultural statistics program have been identified and are being eliminated.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that, to what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Available resources could heavily influence the attainment of performance measures. In addition, the customer service performance measures for fiscal year 1998 are targets which were set without the use of baseline data, so actual survey data acquired starting this fiscal year could potentially be much different than these targets.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No substantive revisions are necessary at this time.

QUESTION SUBMITTED BY SENATOR BUMPERS

CENSUS OF AGRICULTURE IMPROVEMENTS

Question. Explain why you think USDA will do a better job conducting the Census of Agriculture than previously done by the U.S. Census Bureau. When will the current Census be available?

Answer. The consolidation of the agricultural census and the existing NASS agricultural estimates program benefits the government, census respondents, and data users. The government realizes improved efficiencies in both census programs and NASS current surveys. In fiscal year 1998, NASS realized a budget decrease of \$1 million in list frame development and costs due to efficiencies gained from NASS conducting the census of agriculture. Additional decreases are proposed in the fiscal year 1999 budget. Census respondents incur less burden because they are no longer reporting information to two different Federal agencies. Data users will enjoy a "one-stop shop" for agricultural data, with earlier release of census data and improved coverage and accuracy. Many of these efficiencies and improvements in timeliness and accuracy are directly attributable to the involvement of NASS's 45 field offices in the conduct of the census.

Results of the 1997 Census of Agriculture will be available starting in February 1999.

QUESTION SUBMITTED BY SENATOR CRAIG

CENSUS TRANSFER

Question. What effect would current Congressional proposals to move the annual Agricultural Census from the Department of Commerce to the Department of Agriculture have on this important survey? Does NASS support these changes?

Answer. NASS was appropriated funding to conduct the census of agriculture starting with the fiscal year 1997 budget. Legislation to transfer the authority to conduct the census of agriculture from the Department of Commerce to the Department of Agriculture, Public Law 105-113, the Census of Agriculture Act of 1997, was signed by the President on November 21, 1997. NASS supported the change and is committed to conducting a census of agriculture that will equal or exceed the quality formerly produced by the Bureau of the Census, Department of Commerce.

SUBCOMMITTEE RECESS

Senator COCHRAN. We are going to continue our hearings. Our next hearing is going to be on Thursday of this week in this room. We will review the Department's budget request for natural resources and environment programs at that time.

I again want to thank Dr. Gonzalez and all of our witnesses who have been here today for your assistance in understanding the budget request and the implications of it.

Until then, the subcommittee stands in recess.

[Whereupon, at 11:05 a.m., Tuesday, February 24, the subcommittee was recessed, to reconvene at 10:06 a.m., Thursday, February 26.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

THURSDAY, FEBRUARY 26, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:06 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Burns, Bumpers, and Kohl.

DEPARTMENT OF AGRICULTURE

STATEMENT OF JAMES R. LYONS, UNDER SECRETARY, NATURAL RE-
SOURCE AND ENVIRONMENT

NATURAL RESOURCES CONSERVATION SERVICE

STATEMENT OF THOMAS A. WEBER, ACTING CHIEF

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order. Today we continue our hearings reviewing the budget request submitted by the President for Agriculture, Rural Development, and related agencies. This morning we are specifically reviewing the budget requests of the Natural Resources Conservation Service.

We are pleased to have with us Under Secretary for Natural Resources and Environment James Lyons. He is accompanied by a number of individuals from the Natural Resources Conservation Service, including the Acting Chief Thomas Weber.

We appreciate the presence of all of you this morning to help us understand the proposals of the administration with respect to the accounts funded under this agency.

We are a little concerned about the proposal submitted by the administration insofar as it contains assumptions that the Congress is going to authorize user fees to be imposed on landowners and others who have the benefit of some of the services provided by this agency.

It is unlikely that Congress is going to approve this request. And so the assumption, insofar as it takes into account additional funding from these sources, is probably flawed and unrealistic.

We are also concerned about the proposal to consolidate watershed and some of the other programs in the operations accounts and wonder what the practical consequences would be for watershed and flood prevention efforts. This is an area that has been

very important, particularly in the part of the country that I represent. We worry that the watershed activity might very well disappear and not be available to landowners and local areas if this request is approved as it is submitted by the administration.

So these are some concerns that I hope the witnesses can address, and explain, as you see it, what the practical consequences of the proposals will be.

In all other respects though, we hope that we can continue to support the important work to protect our land and water resources. This is a very important area. Conservation is essential if we are to maintain a capacity to produce agriculture commodities that are important for our Nation's well-being and our economic well-being as well.

We are also interested in some of the initiatives that the Congress has passed in recent years establishing new ways to encourage conservation activity on private lands. There is just no way for the Government to obtain fee title to enough land to provide wildlife habitat and resource conservation to do the job.

We have to have the cooperation of private landowners. We have to respect their property rights. We have to respect their goal to use their land to make a living. And this all has to be worked out in a compatible way.

We think there are some important new initiatives that we should fund to try to encourage and do a better job of soil and water conservation in this process.

So having said that, I am prepared now to yield to other members of the committee for any opening comments that they would care to make. And then we will hear the testimony of our witnesses.

Senator Bumpers.

STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Thank you, Mr. Chairman. Mr. Chairman, I will submit my prepared remarks for the record and just simply echo some of the things you said; and that is that user fees—this subcommittee has never been very friendly toward the proposals for user fees, not likely to be this year either.

Second, in visiting with the Secretary the other day, I was very pleased to know that they have a goal of 2 million miles of buffer zones along streams in this country. And I think that is of critical importance.

Third, there is in my State a critical problem, which the President is helping us address. And it deals with the rapidly depleting underground aquifers in east Arkansas, the Mississippi River alluvial aquifer.

And the President, in the Energy and Water Subcommittee, has asked for \$11.5 million to start helping us divert water from service streams to the rice fields. Rice is of critical importance to us. We raise 43 percent of it. And it is fairly critical to Mississippi, too. They raise a lot of rice.

And incidently, Mr. Chairman, Mississippi is also a part of that Mississippi River alluvial aquifer. You have heard me say these things before, I know, but it is of such critical importance I have

to keep talking about it until we really know that we are on our way.

We are talking about probably \$1 billion overall to divert enough water on the Mississippi and the Arkansas and the White and the other rivers of east Arkansas to make up for the loss of the aquifer.

It is estimated that by the year 2015 the 200-foot aquifer will be virtually depleted. We use such tremendous amounts of it for rice growing. So we don't have an awful lot of time to deal with that.

But while that is energy and water and the Corps of Engineers will be called upon to start that project, I wanted to just say that ties in with this subcommittee's responsibilities and this particular agency's responsibilities.

I think that pretty well summarizes. I am pretty well pleased with this budget. We will obviously have to make some changes in it, probably have to make some cuts in it. But generally, I think it is a pretty good budget, Mr. Chairman.

PREPARED STATEMENT

Senator COCHRAN. Thank you, Senator. Your complete statement will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

I would like to welcome Secretary Lyons, Mr. Weber, and other officials from USDA to our hearing this morning. The work of the Natural Resources Conservation Service (NRCS) has long been important to my state. Arkansas is known as the Natural State and I see the role of NRCS, in a large measure, as an agency friendly to the purpose of keeping Arkansas a "Natural State".

That is not to say that my state, and the entire country, do not face serious conservation challenges. Water and wind erosion still cause problems and water pollution in spite of the dramatic improvements since the 1970's remain serious threats to the health and safety of the American people. We made great progress since the Dust Bowl days of the Depression largely due to the predecessor agency of NRCS. But we still have a long way to go.

Water pollution problems from point sources have been greatly reduced since the first Clean Water Act. As a result, more and more attention is given to non-point source pollution, which means farms. The American farmer is a world leader in conservation. His livelihood is tied to protection of his land and water resources. Any farmer who is willing to watch his farm wash into gullies and downstream will not be a farmer for long. It is the role of NRCS to assist the American farmer in doing what he does naturally.

In my own state of Arkansas, we face some serious conservation problems. The ground water supplies in East Arkansas are being depleted at an alarming rate and we have no choice but to start making use of our abundant surface water supplies. In the western part of my state, the incredible growth in the livestock industry poses serious challenges to watersheds in the form of waste management. Similar challenges are heard from coast to coast and NRCS remains the single agency at USDA, and perhaps in government, best suited to rise to the call.

The budget submission for NRCS appears as an improvement from the previous year. Increases are found in important accounts and would go far in helping the cause of conservation. I hope we can accommodate them. Unfortunately, the NRCS budget is only a part of the larger budget submission which does present major challenges for this subcommittee. I notice, however, that even the NRCS budget contains proposed user fees which have never been popular with this subcommittee and are a dangerous foundation on which to build a budget.

I note that the prepared statements of Mr. Lyons and Mr. Weber provide a good overview and I look forward to their comments. Let me simply end my remarks by restating my commitment to conservation and I will work with Senator Cochran to develop a bill for the coming fiscal year that will do all we can to give USDA, and America's farmers, the tools they need.

STATEMENT OF SENATOR BURNS

Senator COCHRAN. Senator Burns.

Senator BURNS. Thank you, Mr. Chairman, and thank you for holding this hearing this morning. Of course, I would imagine the Secretary down here understands what our problems are with this.

I am glad to hear that Arkansas would like to divert some water. We would, too. And we will—

Senator BUMPERS. We will sell it to you.

Senator BURNS. We will take all that in consideration whenever that time comes. I think the Senator from Arkansas understands what I am talking about. We have not had a lot of luck in storing water way upstream from where he is for use later. And I am still a big proponent of that, and I will probably be a proponent of what he is trying to do down in Arkansas.

But that great river system is in the center of our country, and it supplies a lifeline to a lot of things. We continually have this administration usurping the process of getting some things done. And I think the moratorium on the roads in the West and the roadless areas of this country is one of those.

We have talked with Secretary Glickman, and we want to resolve that problem as soon as we can. One wonders about this whole business of providing food and fiber for this Nation and then put all the restrictions on the people who are responsible for those provisions to get it done. And I am very concerned about that.

I am concerned about user fees. I am concerned about this business of counties that depend on public lands for economic livelihood, the receipts that are derived from those lands of harvesting and providing for America from a renewable resource, not a finite resource. And I am concerned about public safety that money provides.

I am concerned about schools and roads that are provided by those dollars, that renewable crop that we have there, and will continue to be concerned about that and the approach this administration has taken to deal with some of those problems.

I need not go into this business, that Mr. Lyons and I disagree on many things, although we agree on some. I still say I made my greatest mistake 2 years ago. I capitulated, and I should not have done that. But nonetheless, that is water under the bridge, and that is my mistake, and I will live with it forever, I think.

But I am concerned about their approach to public lands and how they are managed, especially from a renewable resource standpoint, and denying, absolutely denying, the people that live in those neighborhoods any kind of an opportunity to do what they do best. And that is they manage those lands and move this decision process out of this 17 square miles of logic-free environment where we get our eyes glazed over and our brain completely becomes dead.

So with that, I appreciate this hearing. And as we move through this process, I am satisfied there is going to be a lot of changes in the budget, as it has been presented to this Appropriations Committee.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Senator Kohl.
 Senator KOHL. Thank you, Mr. Chairman.
 Mr. Under Secretary—

PREPARED STATEMENT

Senator BURNS. I would like to submit my—I am sorry. Senator, if I might, I would submit my full statement for the record.

Senator COCHRAN. Without objection, it is so ordered.

Senator BURNS. I am sorry. Thank you.
 [The statement follows:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman. I appreciate you calling this hearing this morning so we learn more about what the Administration plans for the budget for the Department of Agriculture for fiscal year 1999. I appreciate seeing this particular portion of the Agriculture budget come before the subcommittee this early in the year. With our expedited appropriations process this year I thank you having some of the more controversial agencies come before the committee early.

As we are all well aware one of the primary agencies in this Subcabinet level position is that of the Forest Service. We are all also very aware of the fact that this subcommittee does not fund that portion of the Department, instead that funding comes from the Interior Appropriations Subcommittee. With this in mind, I know and understand that this is not the place to bring up decisions regarding the Forest Service. However, Mr. Chairman I would be totally negligent to my duty to my constituency if I did not bring up my utter disappointment in the Forest Service, this level of management and the Department if I did not take a moment to discuss the recent decision on the construction of roads in our national forest system.

In early January it came to our attention that the Forest Service was preparing some sort of plan to deal with the construction of roads in national forests. Soon there after, myself and several members of the Energy and Natural Resources Committee sent a letter to Secretary Glickman outlining our desire to work with the Department and the Forest Service to come up with a plan to address this issue. Approximately a week after that letter we were informed by the Forest Service that they were developing a plan and would be informing us of it as soon as it was prepared and signed off on by the higher ranking officials in the Administration.

So any thought of working in a cooperative manner had slipped out the door without so much as even an official reply to our letter. Another opportunity to work out a plan in due process to benefit all the people had escaped. Instead the Administration took this opportunity to once again issue an executive proposal to implement what they know will be a controversial plan. I am so disgusted by this Administration taking every opportunity to circumvent process when they do not see it going the way that they like to see. Instead of a process which we could all participate in, this Administration forces upon people the will of the special interest groups which support them.

Then just a little over two weeks ago, prior to the hearing with Secretary Glickman, we found out that there were plans to circumvent the process even further. The Forest Service was prepared to cancel the public meetings they had previously announced and just move forward with their plan. Thankfully this week, the Forest Service announced that they were extending the comment period on this very issue, and would host a series of public forums throughout the west. This due only to fact that Senator Craig and I caught the Secretary and voiced our complaints in person.

I never realized it would be so very difficult to defend the interests and rights of my constituents in this town. I never dreamed that the Forest Service and the Department of Agriculture were so prepared to totally disregard the voices and concerns of the citizens of rural forested America. As I stated to Secretary Glickman, I am severely disappointed and alarmed by this action taken by himself, the Chief of the Forest Service, Under Secretary Lyons.

I have said my piece on this issue now, and I thank the Chairman for his indulgence on this matter, since as I stated this is not an agency issue funded by this committee but it is one of vital importance to the people of rural Montana. I will go into this further this year during hearings before the Interior Appropriations Subcommittee and the Energy and Natural Resources Committee.

I have stated in the previous hearings before this committee I am displeased, shocked and somewhat stunned to see the budget that the Administration has pro-

posed for the Department of Agriculture. Times are difficult enough on the farm and ranch in rural America at this today, and the federal government is doing nothing to ease the pressure on these hard working people. Additional rules and regulations are continually being proposed forcing these people research and respond in order to deal with the Federal government.

This past year, for an example, people applying to place land in the Conservation Reserve Program (CRP) were forced to rewrite and reapply every time an additional sign up was announced for additional acreage to be included in the program. It is not the issue that they should have to reapply, but instead the concern arises from the rules governing each sign up period. Rules which changed not only prior to the sign up, but after the sign up had begun, and even again after the sign up had closed. Basically, Mr. Chairman, the rules were changing daily if not hourly on the ground.

The results of this confusion led to some of the best producing land in the state of Montana being placed in CRP. Excluding those marginal lands which the program was originally designed to protect. It was my understanding that the Conservation Reserve Program was a program developed to take marginal, environmentally sensitive lands out of production and allow them to be reseeded in grasses. This then would serve to protect those lands, the environment and enhance wildlife opportunities in areas of a sensitive nature.

Instead in Montana what has occurred, by the development of the indexes used to judge the fields was the exact opposite of what the program was intended to do. We have large sections of good solid producing land coming out of production, and those areas with highly sensitive land will continue to see the plowshare breaking the soil. This just does not make sense to me or to the people trying to protect the lands on which they plant.

Furthermore, during the sign up periods, people were provided with certain sets of rules and standards by which their land was judged for suitability for inclusion in the program. Only to find out afterwards, that during the process the rules and standards had changed. Ultimately these people found that what they thought they were applying to put into CRP was not eligible for the program under the rules which were finally implemented.

In a large operation it might be possible to overcome this type of realignment of seed purchase for cover forage, but on many of the smaller operations who count on this land for stable income, well it completely wipes out their cash reserve for the coming planting season. Making nearly impossible to either continue their enrollment in the program or plan for planting costs for the upcoming year. Much of this confusion was due to a lack of communication between the officials from the Natural Resource Conservation Service (NRCS) and the Farm Services Agency.

For the past several years I have supported funding for the Grazing Lands Conservation Initiative, the grassroots organization working on behalf of private landowners. This organization combines the efforts of conservation based organizations and the private land owner to work with NRCS for technical assistance on the private property owners pasture and grazing land. However, it appears that NRCS is not willing to provide an accounting of where the funding is being used to the people directly involved.

If the agency is not willing to provide this information to the participants, I will seek assistance from this committee to have them provide it. This is again another indication of the unwillingness of this agency to work with the public in the role of technical assistance instead they exert pressure in the role of a regulator.

I have read with interest your side of the story as it relates to the funding and actions during the recent implementation of the Environmental Quality Incentives Program (EQIP). Unfortunately what you detailed did not occur in my state of Montana. Instead of local districts selecting the priority areas of concern, it was the state Director doing so on his own initiative. I appreciate the work of your staff here in Washington in working with my state staff to make sure this was straightened out before the program became a catastrophe in Montana.

However it is my concern that we are taking funding to assist our producer on the world market to pay for this program. At a time when we are being out marketed and out traded on the world market forcing our domestic grain supply to continue to build to the detriment of the market price.
