The farmers and ranchers are having a difficult enough time this year, with grain and livestock prices being so low. Brought on, in part at least, by the unwillingness of this Administration and the Secretary to use all the marketing tools at their disposal to make gains on the world market stage. American agriculture is always one of the first issues taken off the table at trade negotiations, in favor of the hi-tech industry, of which I am very supportive, for which the United States is famous. For-

saking our ability to continue to produce our own supply of safe, reliable and cost effective food and fiber.

As we move into the next century, I am afraid for the future of American Agriculture. As due to over regulation, misguided approaches to land management and the lack of a solid and effective trade policy that our American farmer and rancher will become an endangered species in their own rights. Forcing us to import our food supply and pay additional costs associated with the lack of our own production. The land as we once knew it will revert to what many believe the pioneers first saw as they crossed this country. However, this will not be the case as the land will continue to feed upon itself and so make itself unsuitable for the wildlife that now flourishes with sound and meaningful management practices.

I ask you to work with these great people to allow them to compete with the rest of the world in trade for our agricultural commodities. Do not overburden them with regulations which the rest of the world does not impose for production purposes. Give them the opportunity to make a decent living off the land, and they will provide you with excellence in land management and protection.

Mr. Chairman, the Secretary, in his position has the opportunity and the tools available to secure and assure the future of the American farmer and rancher on the land. All he needs is to use those tools to assist and not over regulate the producer, instead provide them guidance and technical assistance. Instead the Department and the agencies use those same tools to overburden the producer with rules and regulations, making it difficult, if not in many cases impossible, for the producer to work with you and your agencies.

The time has come for the leadership in this Department to come out swinging for the future of American agriculture. Take on the fight for the producer and not for those groups which do not either understand or care about the farmer and rancher. The producer has placed their faith in you as sworn officials of their government to work with them and for them be it in Washington or in any other capitol in the world.

Don't turn your back on them, work for them and they will provide you with a healthy, clean, and reusable food and fiber supply. One which will provide not only for the health and well being of the consumer but also for the land and the environment in which they live. Remember they are the ones living on the land. They are the people who must work the land to make a living. It is the producer who must face the land on a daily basis, knowing that it is only from the land that their future is secure.

Thank you, Mr. Chairman.

STATEMENT OF SENATOR KOHL

Senator KOHL. Mr. Under Secretary, we appreciate your willingness to testify before the subcommittee today regarding the Natural Resource Conservation Service's proposed budget. These conservation programs were created to protect water quality and improve wildlife habitat.

In Wisconsin we have many farmers who take advantage of these programs and support them. However, we have heard serious concerns about your agency's ability to administer these programs, especially when you have full participation, as we do in Wisconsin.

For example, the Wisconsin NRCS office was so short of help that the Wisconsin Department of Natural Resources had to donate 100 staffers to help with the most recent conservation reserve program signup.

Because in Wisconsin we probably have as many miles of lake shore and river property as we do dairy cows, we are most interested in your agency's programs that protect and promote water quality, the Wetland Reserve Program and the Environmental Quality Incentives Program.

In fact, Wisconsin has one of the largest WRP programs success stories, Duffy's Marsh. Twelve local landowners worked with the county, State, and Federal agencies to restore a 1,700-acre wetland to its natural state.

Both the tourism and the dairy industries can and have coexisted in the past. But both are undergoing tremendous change and stress. We are counting on the NRCS to help us meet these challenges, and we hope to hear from you today how your agency will operate the environmental programs upon which many States depend.

Senator COCHRAN. Thank you, Senator.

Secretary Lyons, we appreciate very much your being here and submitting your statement for the record. We will print it in the record in full and the other statements that we receive from the witnesses.

You may proceed with any comments that you think would be helpful to the committee.

STATEMENT OF JAMES R. LYONS

Mr. LYONS. Thank you very much, Mr. Chairman. And I, too, appreciate the opportunity to be able to appear before the subcommittee today to discuss our proposed fiscal year 1999 budget for the Natural Resources Conservation Service.

If you had a chance to review the testimony, I think you can see it is an excellent discussion of all the programs that we administer and the rationale for the 1999 budget. I will spare you the details of that and ask that it be submitted as a part of the record.

Before I begin, Mr. Chairman, I want to commend you for your outstanding conservation leadership over the years, both in your role on the authorizing committee in effecting the creation of many of the conservation tools that we have to work with today, as well as obviously your outstanding leadership in the creation of the WHIP Program. And I hope you are going to join us, Friday to make an announcement related to that program.

Senator COCHRAN. I have submitted a statement with some quotes for you. I do not think I will personally be able to be at the news conference. I regret that I cannot—

Mr. LYONS. Well, that is unfortunate.

Senator COCHRAN. But I will be there in spirit anyway.

Mr. LYONS. You will be well recognized for the leadership role you have played. We appreciate it, as well as the role that Senator Bumpers has played over the years as a strong supporter of conservation, helping to put together the framework that now constitutes the conservation programs that we have here in the United States, which I think represent really the most outstanding set of tools for achieving the conservation goals of this Nation, as well as the leadership of your colleagues, Senator Burns and Senator Kohl, for their efforts in helping to promote good land stewardship across the United States.

With me today are a number of people who really play the key leadership roles in NRCS and in my office. If I could, I would just briefly introduce them for the record.

Tom Weber is our Acting Chief for the Natural Resources Conservation Service to my immediate left. Tom has served in an outstanding capacity since Paul Johnson elected to go back to his farm in Iowa.

He sends his regards. I saw him just last week, and he is having a wonderful time. And he does not miss the beltway at all, I can assure you, Senator Burns.

Senator BURNS. He probably does not like the hog market either, does he?

Mr. LYONS. Well, I think he is growing Christmas trees these days.

Senator BURNS. That figures. [Laughter.]

Mr. LYONS. But Tom has done an outstanding job, and I am sure that the committee is aware that the Secretary has announced the appointment of Pearlie Reed to become the next Chief of NRCS effective March 1.

Pearlie did an outstanding job as the Acting Assistant Secretary for Administration and helped us tremendously in working both on an administrative convergence and in addressing the civil rights concerns that have been raised in the Department. And we look forward to Pearlie's outstanding leadership as the next Chief of NRCS.

Also with me are Dr. Gary Margheim, Acting Associate Chief; Larry Clark, Deputy Chief for Programs; Carole Jett, who is Acting Deputy Chief for Soil Survey and Resource Assessment; Fee Busby, who is Deputy Chief for Science and Technology; Dwight Holman, Acting Deputy Chief for Management; and Ann Dubey, who is the Director of the Budget, Planning, and Analysis Division, who put our budget together for us.

If I could, I also want to introduce a new member of my staff. His name is Craig Cox. He is sitting behind me. You may be aware that Tom Hebert, formerly of the Senate Agriculture Committee staff and then my Deputy for Conservation Programs, elected to retire. All I can tell you is that he is taking 6 weeks off and collecting his breath before he engages in a new career in conservation.

We certainly miss Tom's assistance, but Craig, who also served on the Senate Agriculture Committee staff at one time will do an outstanding job as Tom's successor.

What I would like to do very briefly, Mr. Chairman, is talk a bit about the successes we have realized over the past decade in conservation, obviously focusing on the 1999 initiatives and what that budget does for us in furthering our efforts to achieve good land stewardship and promote sound conservation and talk a little bit about the opportunities that lie ahead.

I know, Mr. Chairman, that you and the members of the committee have seen over the past year this document, "Geography of Hope," which was constructed by NRCS under Paul's leadership to help to document some of the successful accomplishments in conservation we have realized, the tremendous achievements in reducing soil loss across the United States and improving water quality, in repairing damage to riparian habitat and promoting wildlife habitat across the Nation.

The legacy, particularly of the last 10 years in conservation, is an outstanding one in improving, as I said, wildlife habitat, in restoring wetlands, and in promoting a sound land stewardship based on the principle of voluntary commitment to conservation.

America's farmers and ranchers have shown their dedication to conservation, and through the assistance provided by NRCS over

the last 60 years, as well as the assistance provided in partnership with the conservation districts, America's farmers and ranchers have done an outstanding job in achieving much of the conservation achievements we recognize today and are documented in "Geography of Hope."

This budget is built upon that foundation of conservation achievements in a number of ways. You will see in our proposed budget that probably the largest proposed increase in funding is in the conservation operations area. In essence, Mr. Chairman, these are the funds that provide the support for the people who go out on the ground and provide conservation technical assistance and administer the programs that have been authorized by the farm bill.

The bottom line for us in conservation is people. People are conservation. And the work that is done one-on-one between landowners, conservation districts, and our conservationists is really critical to achieving what we have achieved in the past and critical to a successful continuation of those achievements in the future.

It is critical that we have the people and the resources, the financial resources, to continue with our conservation efforts. This budget places an emphasis on trying to achieve additional funding for that element of the program.

You will see, however, in the budget that we do call for a reduction in FTE's in personnel, as a result of some difficulties we have had in providing additional support for funding programs, for funding the technical assistance that is a part of the programs that are funded out of CCC.

And I know the committee is aware of some of the concerns we have there and the need to address these issues. And I welcome a dialog on the internal debate we have or how to provide support for those people and those programs.

I would also highlight that the budget, as we have submitted it, includes a number of increases in funding for programs that were authorized by the 1996 farm bill and are funded out of the CCC program.

For example, we proposed an increase of \$100 million for the Environmental Quality Incentives Program [EQIP]. This additional funding for EQIP is critical to continuing our achievements in conservation and is an integral part of the President's clean water action plan, which the President announced just last week at a meeting up in Baltimore.

What is exciting about the opportunities associated with this clean water action plan—and we will be sure to get a copy of the document to you, Mr. Chairman, and the members of the committee—is the focus it places on natural resource stewardship and land conservation as the key to accomplishing future gains in clean water.

Much of the success in clean water that we have realized over the last 25 years has really focused on what I would call the easy tasks. I am sure the industries that are impacted do not consider it easy.

The larger challenge is dealing with the pollution that comes from nonpoint sources, which includes both urban and suburban

runoff, as well as the runoff that occurs across rural landscapes from agricultural activities and forestry activities and the like.

This plan calls for a continuation of the voluntary approaches to dealing with those challenges through increased technical assistance and cost-share assistance, through using tools like EQIP to get the job done, and calls for a continued partnership between America's private landowners, primarily farmers and ranchers, and the conservation agents and agencies at the State and Federal level to achieve these goals.

I think it is a remarkable accomplishment. And I think in many respects, Mr. Chairman, it exemplifies what we have been achieving in conservation over the last 10 years. The recognition on the part of our partner in this report, the Environmental Protection Agency, that voluntary stewardship and technical assistance and conservation services is a key ingredient to achieving our long-term clean water goals, is, I think, a significant milestone in where we are headed.

This program does not call for any new regulatory strategies to continue our progress in dealing with clean water. But it does recognize the important contribution that private and public land stewardship can make to achieving those goals. And that is significant.

As a part of our conservation operations budget and related to the clean water action plan is \$20 million for grants to local interests and communities to help them in achieving their clean water goals in the context of watershed planning.

There is a great deal of enthusiasm and initiative and creative solutions that have been devised out on the ground by conservation districts, by RC&D's, by community groups and organizations that are working together with private landowners in partnership to improve water quality and address conservation needs. And we seek to provide some additional support for their efforts.

You will also find in the conservation operations budget additional funds to leverage additional contributions from State entities and State interests to further our efforts to improve conservation. This is an attempt to try and further the use of those Federal dollars and achieve those ends.

I would also mention that you will see in our budget a slight reduction in proposed funding for the Wetland Reserve Program. The reason for that is we are well on track to achieving the goals that were laid out in the 1996 farm bill. In fact, we believe we will achieve the enrollment of 975 million acres—975,000 acres.

Yes; that would be a lot of acres—975,000 acres by the year 2000, which is 2 years ahead of schedule. So I encourage you not to misread our commitment to conservation of wetlands by that reduced funding level.

You will also see, Mr. Chairman, that we ask for \$20 million, basically the remainder of the funds that were authorized for the Wildlife Habitat Improvement Program. I would dare say we could always use more money for that program. We have seen tremendous interest and success with that program.

And I think that is a program that benefits not only landowners but all of us who fish and hunt and enjoy the outdoors. And it

helps to demonstrate the contribution that agriculture is making to improving wildlife habitat.

You will also see an increase in funding for the Conservation Farm Option Program, which is the remainder of the installment of funds for that program, an attempt to try and come up with an innovative way to put 10-year conservation plans in place that provide a little more flexibility in that regard.

Let me close, Mr. Chairman, by emphasizing two things which you pointed out in your opening statement. I think the future challenges in conservation and land stewardship in the United States are on private lands. Seventy percent of the American landscape is privately owned.

And while we spend a tremendous amount of time debating what occurs on those lands that are in public ownership—and I know, Senator Burns, you and I will have many opportunities to discuss this issue—the real challenges that lie ahead, and I think the real accomplishments we are going to realize in the long term, have got to come from a working partnership with landowners and conservation agents who can provide the technical skills and the cost-share assistance to help them manage their lands, not only for long-term productivity, but from the standpoint of improving conservation overall.

This budget seeks to make investments that will further the progress that we already realize. And let me just say that with regard to the public land issues, Senator Burns, of course we will have another opportunity to address these issues next week in the Energy and Natural Resources Committee oversight hearing.

I know that there are many areas in which we disagree with regard to public land policy, but on the other hand I think there are many on which we do agree. And I hope we will have an opportunity to discuss some of those today.

And, Senator Kohl, I would point out that NRCS is stretched in many regards with the conservation challenges and opportunities that we face. I would characterize what is going on in conservation in Wisconsin as a tremendous opportunity, given the commitment of the residents of that State to leaving a legacy of conservation that they will all be proud of.

The State conservationist in Wisconsin is a former classmate of mine and a good friend, Pat Leavenworth. So I can assure you that the State is in good hands under Pat's leadership.

The role that Wisconsin DNR is playing right in programs like CRP is part of any effort really to develop a long-term partnership.

There is no doubt we can use the help, but we hope in a closer working relationship with State agencies like DNR, as well as the State department of agriculture, we can further our efforts to work together, to use our resources more efficiently and make sure that through collaboration we get better land stewardship and hopefully even a better legacy to leave behind.

With that, Mr. Chairman, I think Chief Weber has a few comments that he would like to offer.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Mr. Lyons. We will insert your prepared statement and the statement of Mr. Weber in the record.

[The statements follow:]

PREPARED STATEMENT OF JAMES R. LYONS

Mr. Chairman, Members of the Committee. It is my pleasure to outline for you the fiscal year 1999 budget request for the Department of Agriculture's Natural Resources Conservation Service (NRCS).

The budget plan that the President recently presented to Congress is an historic proposal. Founded upon the notion that the commitment and contributions of individuals will ensure a better tomorrow, the fiscal year 1999 budget proposal gives Congress and the Administration the opportunity to reverse three decades of budget deficits and burdening debt. In a sense, this Budget proposes to build a legacy for the American people of fiscal integrity and responsibility. It ensures our children the promising future of a productive and prosperous economy. Under this proposal, everyone has a part to play. And more than ever before, local people will be challenged to take the lead and ownership for that which they value the most.

I would like to speak today of another legacy which our 1999 Budget Proposal challenges us to begin. That is the legacy of conservation and land stewardship in America. We speak frequently about the programs and activities that we provide and attempt to quantify them in terms of dollars of financial assistance provided, and tons of topsoil that we preserve. However, we rarely take a step back and look not only at a bigger picture of the landscape, but to gaze beyond the horizon into the future of our resources. I believe we would all like to ensure that citizens who want to help themselves will have the resources and knowledge available to meet their future needs.

As we consider the fiscal year 1999 Budget and the personal commitment that we are asking of citizens, we find no better historic and present example of local leadership and ownership, than in America's conservation movement. In response to the alarming realization that the future viability and productivity of domestic agriculture was at stake, conservation activities on private lands were solidified and organized with a strength from which we continue to benefit. There are many parallels between the nation's response to the Dust Bowl and the current effort to balance the Federal budget. But more importantly, what I would like to talk about today, is how we proceed to the next level—how we foster a conservation ethic in America well beyond a balanced budget, the duration of current program authorizations, or even our own tenure as public servants.

What we have learned from witnessing the success of the Conservation Partnership over sixty years is that folks want to help themselves. They only need some guidance and a helping hand from time to time. This helping and guiding hand is the foundation upon which the conservation legacy must be built. We are all familiar with the story of how a house built upon sand was swept away by the rains, while the house built upon the rocks endured. So too, conservation must be founded upon a rock-solid base that will not erode with time.

This foundation is the conservation partnership which should be bolstered and strengthened so that it may serve us for generations to come. We sometimes refer to our farm programs as tools that are used to assist the landowner build conservation practices and structures. Furthermore, we might think of our conservation field staff as the carpenters with the knowledge and skills to put those tools to work. But we all know that we cannot build a lasting structure without a firm foundation. This groundwork is the legacy that we must preserve and strengthen for future generations.

Clean Water Initiative.—Perhaps no better example provides a picture of the legacy that NRCS strives to build than the Clean Water Action Plan. On October 18, 1997, the 25th anniversary of the Clean Water Act, the Vice President challenged Federal agencies to develop a clean water plan that would address three goals—protecting public health, preventing polluted runoff, and promoting community-based watershed management. More specifically, the plan calls for specific actions including identifying sources of nitrogen and phosphorus in water; achieving a net gain of 100,000 acres of wetlands per year by 2005; and promoting "smart growth" that is compatible with clean water.

The Clean Water Action Plan, contains common sense goals that are highly valued by the public. It also reveals a clear consensus that watershed-based assistance, and the kinds of voluntary conservation work NRCS supports are a preferred approach to ensuring lasting conservation measures in communities. As a result, NRCS will have a leading role in helping achieve the goals that are part of the President's Clean Water Initiative. On many accounts, the challenge that has been presented to Federal agencies involved in this initiative are far reaching and present a formidable task in the time frame that has been established. However,

the resource of NRCS technical assistance and the program tools that are presented in this budget proposal, represent the foremost resource that is available to the public to accomplish the goal of improving water quality across the nation.

The Clean Water Action Plan will help landowners. It will encourage Federal, State and local governments to develop agreements that clarify their roles and responsibilities, enhance coordination and efficiency, and reduce duplication effort. Citizens and landowners will realize a more streamlined process to government programs and assistance, with fewer office visits and program application forms required.

Without doubt, the environmental challenges facing agriculture with respect to water quality and availability are daunting. Every day we read or hear about concerns from across the country about the quality of drinking water supplies, conflicts over the availability of water for agricultural and urban uses, and about wildlife needing water and habitat in order to survive. For these and all the other similar issues, USDA does not accept the premise of many that places sole responsibility on agriculture. But USDA also believes that it is agriculture's primary responsibility to address these challenges aggressively and effectively.

The proposed fiscal year 1999 budget request strives for a balance in spending that will provide farmers and ranchers with sufficient financial incentives for conservation work, including targeted land retirement, while continuing to focus on technical assistance as the basis for these activities. The budget will allow us to continue to work cooperatively with state conservation agencies, local conservation districts, and our agency's many other public and private-sector partners in assuring an adequate measure of conservation on our Nation's working land.

The following table shows the major items in this year's budget request, including CCC funded programs, and contrasts them with the comparable figures from the two prior fiscal years.

[In thousands of dollars]

	Fiscal years—		
	1997	1998	1999
Appropriation:			
Conservation operations	620,219	633,231	742,231
Watershed and flood prevention operations	226,660	101,036	¹ 49,000
Resource conservation and development	29,377	34,377	34,377
Watershed surveys and planning	12,381	11,190	(¹)
CCC funding:			
Wetlands Reserve Program [WRP] ²	99,308	218,597	123,741
Wildlife habitat incentives [WHIP]		30,000	20,000
Environmental Quality Incentives Program [EQIP] ...	200,000	200,000	300,000
Conservation farm option [CFO]		15,000	25,000
Farmland Protection Program [FPP]	2,000	18,000	

¹ Technical Assistance for Watershed and Flood Prevention Operations and Watershed Surveys and Planning is included under the Conservation Operations Account.

² Does not include technical assistance costs funded from unobligated WRP appropriation balances; fiscal year 1997—\$12 million; fiscal year 1998—\$18 million; fiscal year 1999—\$4 million.

Now, let me describe how NRCS differs from other federal agencies and summarize the unique characteristics and assets that make it the foundation for a conservation legacy on private lands.

BUILDING UPON THE ASSETS OF THE NATURAL RESOURCES CONSERVATION SERVICE

NRCS provides natural resources conservation assistance primarily on private lands. More than 70 percent of the land in the contiguous United States is privately owned, including virtually all of the Nation's agricultural lands. It is on the private lands where millions of individual decisions are made by farmers and ranchers, that the ultimate success of the majority of our natural resource efforts will succeed or fail in helping meet the twin goals of productive agriculture and an economically and environmentally sustainable future.

Technical Assistance

The foremost tool that we use to meet our goal and the most fundamental building block of the conservation legacy is the technical assistance that our field staff and partners provide to our customers. We try hard to define what technical assist-

ance is on many accounts. There are tables and graphs that show the number of hours that a technician spends on a number of different functions on a day to day basis, and the many types of educational, engineering, and scientific functions that they serve. In addition, NRCS will continue to work toward quantifying assistance to fulfill provisions of the Government Performance and Results Act. But really, the definition of technical assistance is quite simple. It consists of all the things that our staff do to advance our mission of conserving, improving, and sustaining natural resources.

It has been said in athletics that the great teams are the ones that do all of the "little things". I believe that the success of NRCS and its partners are a testament to this theory. The tasks may not always be glamorous, and to a casual spectator they may very well remain overlooked. But still, all of the things NRCS staff do on a daily basis contribute greatly toward the common goal of moving the conservation effort forward. This might mean preparing a soil probe truck long before twilight to visit a rancher at the far end of the county. It might mean taking extra time to assist low-income producers to ensure that their program applications are clear and complete. Or it may entail transferring duty stations to another part of the region to assist fellow workers with Emergency Flood engineering work that could save a community. Conservation technical assistance takes many shapes and forms. However, our support of this work is fundamental to the conservation legacy we seek and ensuring the stewardship in the communities of tomorrow.

Civil Rights.—As we speak of building a legacy of land stewardship in America, I would like to underscore the contributions that NRCS is making toward ensuring equitable service and opportunity for all customers and employees of USDA. NRCS has had a good record of ensuring diversity and opportunity in the past, however I believe we can do better. Throughout various program and technical assistance activities, NRCS will work hard to provide the necessary outreach and assistance to ensure that our customers have easy access to services. In response to the Civil Rights Action Team report, the Secretary has undertaken many steps to improve the Department's activities and policies in this area. I am confident that NRCS will continue to seek proactive ways to better serve minority and low income customers. One of the hallmarks of the conservation assistance is that it is available to anyone, anywhere. That includes areas that are not typically designated as high workload areas based upon farm program participation, population, or other demographic factors. By offering basic and universal conservation assistance on a national basis, NRCS offers minority and limited resource farmers a needed helping hand. Clearly, a legacy of conservation on private lands must be built with the participation of everyone.

NRCS is the only Federal agency whose major purpose is to provide conservation technical assistance to private landowners across the country. The agency's focus is on helping landowners and users achieve natural resource and environmental goals while maintaining productive and profitable operations and economically viable rural communities. NRCS has had some significant successes in the past, and the structure is designed to continue that success in the future. A few of its many assets include the following:

Delivery system.—NRCS has a nationwide network of professional staff at the local level that provide conservation technical assistance to owners and users of privately-owned land. This nationwide delivery system is based on a partnership that combines a Federal natural resource presence at the local level with locally sponsored and controlled conservation districts and their employees and state conservation agencies and their employees. This conservation infrastructure is interwoven and interconnected at the local, State, and Federal levels with complex relationships and program support systems that are interdependent. The local field staff provide the kind of site-specific technical assistance individual private landowners need and want.

Technical skills.—NRCS' natural resource specialists are trained to deliver technological support to groups and individuals quickly, efficiently, and consistently nationwide. Through our regional framework, NRCS technical staff are able to apply their knowledge of soil science, engineering, landscape architecture, agronomy, biology, range management, economics, geology, and other fields with a much greater degree of sensitivity to local conditions. NRCS field staff working in partnership with the local conservation districts are used as a primary source of help by local people—and often by people administering programs for other Federal, State, and local agencies. About 9,000 staff are at the local level.

Technical excellence.—Throughout government and private industry, NRCS specifications for soil and water conservation practices are the national standard. In addition, the agency is the leader in soil classification and soil mapping. Recently, in

recognition of the vital importance of soil quality, NRCS has made a commitment to better understand and emphasize the fundamental role of soil quality.

Natural resource planning experience.—NRCS has vast experience in broad-scale planning in watersheds and other areas and site-specific planning on farms and ranches to address natural resource concerns. Effective natural resource planning in the future will require this type of planning process to develop effective solutions that meet the needs for a sustainable land and its people. NRCS is now serving as a catalyst by providing coordination to bring local people together with skilled technical people to develop and implement meaningful solutions. These planning efforts are provided through the Watershed Survey and Planning Program, the Resource Conservation and Development (RC&D) Program, and Coordinated Resource planning provided through Conservation Operations.

Partnerships and volunteerism.—Since its creation, NRCS has operated through voluntary cooperative arrangements with individuals, the private sector, and Federal, State, and local governments. The value of NRCS technical assistance is recognized by local and State partners; equally, we recognize the invaluable contribution of volunteers, who contribute immeasurably to conservation efforts. Americans from all walks of life have freely and generously given of their time to the volunteer arm of NRCS, known as the Earth Team. In fact, in fiscal year 1997, some 15,518 NRCS Earth Team volunteers donated 534,668 hours to conservation efforts. As calculated by the Points of Light Foundation, this equates to an additional \$8,300,000 in direct assistance to private landowners for natural resource protection, an increase of nearly 30 percent from fiscal year 1996.

Local people as decision-makers.—When NRCS provides conservation and program assistance, the agency works under mutual agreements with some 3,000 conservation districts that are established under state law. About 17,000 local conservation district supervisors provide the agency with invaluable guidance. The NRCS cooperative team structure is an established and practical example of how Federal programs can be managed with local guidance at the local level. It is crucial to remember that the agency's approach is a voluntary one. Our professionals provide options for problem-solving—developed in conjunction with customers, but it is the customers who make the final decisions.

Leverage.—State and local governments contribute substantially, with both people and dollars complementing NRCS technical assistance. Without NRCS technical assistance, which greatly enhances the value of State and local efforts, these funds almost certainly would not have been spent on natural resource protection. In a sense, this cooperation constitutes a two-way leveraging: State and local programs and NRCS benefit from each other's involvement.

Now I will describe our programs and plans for fiscal year 1999.

PROGRAM EFFECTS AND THE FISCAL YEAR 1999 BUDGET REQUEST

The activities of the Natural Resources Conservation Service serve the Nation in numerous ways and provide many indirect benefits. The programs and services provided by NRCS involve direct assistance to landowners on an individualized basis. However, this assistance results in even greater benefits for the public at large that encompass ensuring potable drinking water, cleaner air, and a sustainable supply of productive land. In many instances, NRCS involvement spurs local investment and as a result, enhances local economic activities as well. In other cases, NRCS is simply present to help landowners help themselves. By supporting voluntary conservation and fostering stewardship, the agency ensures support that is not available or provided by other government or private entities. In addition, NRCS serves as a vital link between the science of resource conservation and the practice of land stewardship on the ground. The data and expertise which the agency offers, are truly a treasure for the communities around the country that turn to NRCS everyday for help. These services are an essential component of the conservation fabric of the Nation. I will briefly highlight several for you.

Conservation Operations is the foundation for most of the agency's activities. Conservation Operations represents a long-standing and historical partnership of interests all working in a concerted effort toward a sustainable and productive nation. The following programs and initiatives are funded through conservation operations and represent the legacy of conservation on private lands:

America's private lands conservation is the cornerstone for most agency activities. This account (formerly Conservation Technical Assistance) has been renamed to more accurately represent its uniqueness as the sole federal conservation technical assistance program on private lands. The fiscal year 1997 appropriations were \$529,150,000; and the fiscal year 1998 comparable appropriations are \$541,739,000. The fiscal year 1999 budget request is \$589,110,000.

The proposed funding levels represent support to the functions and activities that are vital to meeting the mission of conserving, improving, and sustaining our natural resources for the future. Conservationists on the ground are under increasing demand for their services, as they tackle new programmatic responsibilities while retaining a commitment to the community for providing basic assistance to landowners in need. It is our goal to ensure NRCS staff support to grassroots watershed partnerships and the development of conservation plans for communities. Throughout the nation, NRCS conservationists facilitate and enable local action. Technical assistance funding ensures the presence of these individuals and promotes voluntary conservation.

During fiscal year 1997, NRCS assisted approximately 800,000 private landowners in preparing conservation plans and implementing conservation systems, as well as providing assistance to units of government in developing area wide conservation plans and goals. This resulted in conservation treatment on over 100 million acres of land, including cropland, rangeland, pastureland, woodland, and other land. While the Federal Agriculture Improvement and Reform Act (1996 Act) has provided valuable new tools to assist landowners with their needs, the workload associated with support for the Conservation Reserve Program (CRP), the Agriculture Market Transition Act (AMTA) and several others will place further demands on our field staff. Also, because both agriculture and the environment are constantly changing, the agency and programs are constantly evolving. NRCS is regularly required to provide new plans and conservation systems as land use and the needs of the landowner change. Our proposed increase in funding for America's Private lands Conservation is reflective of the increased need.

The proposed funding level for Conservation Operations also represents a continued cooperative effort between NRCS and its conservation partners including Conservation Districts, Resource Conservation and Development Councils, and other non-profit and community action groups. The relationship between NRCS and its partners represents a catalyst that empowers local people to become involved in conservation activity. In addition, the funds that are appropriated by Congress are leveraged and matched by the hard work and resources of the thousands of partners and volunteers in virtually every aspect of NRCS operations. The budget request calls for \$20 million to be set aside for Partnership Grants in support of the President's Clean Water Initiative. The grants will be used to strengthen the leadership of locally-based institutions through the hiring of non-federal watershed coordinators. The goal of this activity will be to improve water quality in watersheds that show particular signs of degradation.

In the past decade, major strides have been made in reducing erosion; improving soil and water quantity and quality, air quality, pasture and range conditions; improving and conserving wetlands and woodlands; enhancing fish and wildlife habitat; and reducing upstream flooding. We are proud of the gains that have been made. While the combined value of education, technical and financial assistance is well illustrated, more remains to be done. The proposed level of technical assistance funding will accelerate building the legacy of land stewardship that will benefit the Nation for generations to come.

Year 2000.—One of the necessary steps toward a legacy for conservation is to ensure that our technical tools and information infrastructure will be available for years to come. Many concerns have been raised with respect to information technology of NRCS and other USDA agencies. I am happy to report that all NRCS systems will meet the Office of Management and Budget target compliance date of March 1999. NRCS has 15 critical information technology systems. Renovation has been completed for eleven of these systems and are currently undergoing validation testing to ensure that they are compliant. The remaining four systems are being re-engineered and will be completed by March, 1999.

Highly Erodible Land Conservation (HELIC).—Since 1985, NRCS has devoted a significant portion of its technical assistance resources to helping farmers and ranchers meet the highly erodible land conservation provisions. With NRCS technical assistance, more than 1.7 million plans have been prepared covering about 142 million acres of highly erodible land, and 95 percent of those plans were implemented by the mandated deadline of December 31, 1994. Between 1985 and 1995, technical assistance was provided to nearly one million decision-making land owners and users each year; one result is that soil erosion has been reduced by over a billion tons annually. By the end of fiscal year 1995, all the highly erodible plans were installed. The Federal Agriculture Improvement and Reform Act of 1996 provided amendments that have made HELIC compliance requirements more farmer friendly and have provided USDA with additional options in assisting producers with compliance status, reduced the burden of complying with the HELIC provisions and have provided USDA with additional tools to use in working with producers.

However, all producers who receive USDA program benefits must fully apply a conservation plan or use an approved conservation system on highly erodible land. Therefore, NRCS continually assists producers in developing plans for land that they acquire and in making changes in their current plans so that their practices may reflect changes in cropping systems, weather conditions, and economic incentives. Our experience has shown that approximately 20 percent of producers will change their conservation systems each year. This figure may be slightly higher in the next few years as producers begin to respond to market signals as a result of the Agricultural Market Transition Act Program (AMTA).

Wetland determinations and certifications.—The 1996 Farm Bill changed Swampbuster to give farmers greater flexibility in complying with wetland conservation requirements and in making wetlands more valuable and functional. As a result, NRCS now determines areas subject to Swampbuster and responds to requests from farmers who plan activities that may adversely impact wetlands. NRCS certifies wetland determinations only upon request when clients propose a project to alter the hydrology or bring new land into production. Responding only to “need” ensures that requests from clients are serviced in a timely manner and that certifications are conducted where absolutely necessary. Certified determinations stay in effect as long as the land is used for agricultural purposes (unless a violation occurs) or until the owner or operator requests a review after natural events change the topography or hydrology of an area. Under the terms of the 1994 Wetlands Memorandum of Agreement (MOA), certified wetland determinations will be valid for both Swampbuster and 404 of the Clean Water Act (CWA). Landowners have continued to request a number of certified wetland determinations and these requests are expected to increase as these issues continue to play themselves out in Congress. Also, the enrollment in AMTA generated requests to NRCS for over 25,000 new wetland determinations.

Aside from determinations, changes initiated by the 1996 Act have increased the activities of NRCS in wetland mitigation. NRCS provides assistance to landowners who wish to enhance existing wetlands, restore former wetlands, and create new wetlands to offset loss from planned conversions or alterations. These options, while creating increased opportunity and flexibility for landowners, require a great deal of attention by NRCS field staff, who assess the function and values of individual wetlands and provide the customer with technical assistance in every phase of the mitigation process. Other changes by the 1996 Act include policies in determining if a planned activity will have a minimal or inconsequential effect on wetland functions, and also revises the concept of abandonment. When done under an approved conservation plan, landowners with farmed wetlands and farmed wetland pastures may allow an area to revert to wetland status and convert it back at a future date without violating Swampbuster. Thus far, interest and participation in these wetland activities has been widespread among landowners. While NRCS welcomes the opportunity to provide landowners with additional services and flexibility, marked workload increases are seen throughout the Nation.

Grazing Land Conservation Initiative (GLCI).—This grassroots-driven initiative has helped NRCS better define the resource needs and benefits generated when grazing lands are improved. NRCS has been requested by this group to continue technical assistance to livestock producers on private grazing lands. Grazing lands include rangelands, pasture, hayland, and grazed forestlands.

Natural Resources Inventory (NRI) analysis of range vegetation shows that over 15 percent of non-Federal rangelands are in poor condition; over 44 percent are in fair condition; 34 percent in good condition; and only 6 percent in excellent condition. The NRI indicates that 75 percent—nearly 299 million acres—of non-Federal rangelands need conservation treatment. Properly managed grazing land represents a renewable resource for producing food and fiber. Vegetative cover on well-managed grazing lands contributes to: 1) increased water quality and quantity; 2) improved wildlife habitat; 3) reduced soil erosion and sedimentation; and 4) improved riparian areas. For fiscal year 1999, an additional \$3 million is requested for NRI needs associated with Land Health Monitoring and assessment work in support of the President's Clean Water Initiative. This effort will enable NRCS to develop baseline assessments, integrate compatible inventories, and evaluate program impacts.

In addition, livestock management means better management of waste nutrients as well. No doubt, over the course of 1997, there was a heightened awareness on the part of the public about issues of animal agriculture and waste management. Conservation Operations will continue to support technical assistance for these unmet conservation needs and will provide additional assistance within current funding levels as the field level workload permits. In fiscal year 1998, NRCS was able to continue support for a Grazing Land Conservation Coordinator position in each of the fifty states. This position helps us to provide multi-resource technical

assistance to support grazing lands conservation and water quality improvement on rangelands and begin the process of rebuilding the agency's expertise in rangeland conservation, a capability demanded by our customers.

Urban Conservation

Another area of attention has been the work of NRCS in urban and suburban conservation. Natural resources do not recognize the boundary between urban and rural areas and to ignore their interaction within a watershed would not do justice to either. The watershed approach to resource conservation has been widely acclaimed and highly successful. However, when we begin to examine and work to rehabilitate the health of a watershed we must include all contributing factors that may be present, including community and residential elements. The efforts of NRCS are aimed to improve water quality and protect our natural resources while maintaining and enhancing production. The demand for assistance with issues such as water quality and soil erosion prevention are matters that effect everyone, and workable solutions must include the participation of everyone. NRCS has had great success in utilizing the science and technology that it has gained in its 60 year history to all types of resources in many settings. Likewise, the expertise in soil and water quality that the agency has gained is well suited and easily applied to help communities realize their goals for ecosystem health. We will continue to work together as neighbors to achieve actual goals.

Snow survey and water supply forecasts provide western states and Alaska with vital information on summer water supplies. The fiscal year 1997 appropriation was \$5,835,000; the fiscal year 1998 appropriation is \$5,835,000; and the fiscal year 1999 request is \$5,990,000. NRCS field staffs provide necessary leadership, standardization of procedures, and automation to a partnership of Federal, State, and local personnel to collect snow-pack data from more than 1,200 remote high mountain sites. Data are collected with many partners, including Conservation Districts, Bureau of Indian Affairs, Bureau of Land Management, Forest Service, the National Weather Service, Army Corps of Engineers, Bonneville Power Administration, and many State and local entities both public and private. After compiling and analyzing the data, NRCS is able to provide snowpack estimates and water yield on a monthly basis throughout the snow melting period. The knowledge gained through this effort supports critical decisions on billions of dollars of agricultural production, municipal water supply, hydroelectric and industrial water supply, flood control, and water flow requirements for fish and wildlife. This modest program contributes substantially to the economic and environmental well-being of a very large part of the country.

Soil Surveys provide the public with local information on the uses and capabilities of their soil resources. The fiscal year 1997 appropriation was \$76,409,000; the fiscal year 1998 appropriation is \$76,409,000; and the fiscal year 1999 request is \$78,323,000. Soil surveys are based on scientific analysis and classification of soils and are used to determine land capabilities and conservation treatment needs. The published soil survey for a county or designated area includes maps and interpretations with explanatory information that is the foundation of resource policy, planning and decision-making for Federal, State, county, and local community programs. Homeowners and landowners also use soil survey information when making decisions. Soil surveys are conducted cooperatively with other Federal agencies, land grant universities, State agencies, and local units of government, many of whom contribute funds and staff.

Soils information has been gathered over many years and is primarily contained in published soil survey manuscripts and maps. There is a need for digital soils data for use in geographic information systems (GIS). NRCS has the leadership role for coordinating the development, maintenance, and distribution of a modernized digital soils data base. Geographically referenced digitized soil survey data, along with orthophotography will provide the accurate reference base needed for computer-assisted conservation, natural resource planning, and for geographic referenced data sharing. In addition, digitizing the soil surveys provides efficiency when updating and maintaining the soil survey data.

Funding opportunities are constrained for all agencies; therefore, NRCS is aiming to expand the resources available for all. The budget includes \$20 million for bonus payments rewarded to those States that increase their conservation spending and/or maintain spending above a specified threshold. By leveraging these incentive payments, conservation funds from State and private sources can be increased. Also, to further increase contributions, the budget proposes that NRCS collect user fees for certain products and services.

Plant Material Centers assemble and test plant propagation and the usefulness of plant species for biomass production, carbon sequestration, erosion reduction,

wetland restoration, water quality improvement, stream bank and riparian area protection, coastal dune stabilization, and to meet other special conservation treatment needs. The Plant Materials Centers also focus on the important role of native species in ecosystem functions. The fiscal year 1997 appropriation was \$8,825,000; the fiscal year 1998 appropriation remained at \$8,825,000; and the fiscal year 1999 budget request is \$7,825,000. This reduced level requested for Plant materials Centers reflects the conclusion of an extensive renovation and modernization efforts that were started in 1994. Plant materials represent inexpensive, long-term conservation solutions to many environmental and natural resource problems and their maintenance costs are usually low. Many landowners and managers willingly use plant materials, if available, to meet their conservation needs.

The work at the 26 centers is carried out cooperatively with State and other Federal agencies, commercial businesses, and seed and nursery associations. Plant Materials Centers play an important research and development roles since most commercial nurseries will not develop new plant materials due to limited markets, but will grow and market the stock once a dependable plant has been developed. After species are proven, they are released to the private sector for commercial production.

Water Resources Assistance is a new account under Conservation Operations for fiscal year 1999. Water Resources Assistance contains the technical assistance dollars that have been previously included in the Watershed and Flood Prevention account. The fiscal year 1999 requested funding level for Water Resources Assistance is \$70,983,000. This is a \$9.8 million increase from fiscal year 1998. This requested funding level would enable approximately 92 Federal watershed coordinators to develop project work plans; coordinate volunteers, projects, and watershed council activities in 40 priority watersheds.

The funding request for fiscal year 1999 also includes an increase of \$1 million to evaluate the condition of the aging infrastructure created by previous works of improvement installed under our watershed programs and to help sponsors implement environmentally acceptable and economically justified watershed projects in a timely manner. NRCS has assisted project sponsors to install over 15,000 individual measures since 1944. An integral part of many of these projects was structures for flood and water control, municipal and industrial water supply, and recreation. Since their installation, conditions surrounding the structures have changed due to an increase in population, residences built below the structures, upstream land use changes, and changed Federal and State dam safety regulations. By fiscal year 2000, approximately 2,000 of the aging structures could require significant restoration. The safety and stability of these installations are in question with serious threats posed to life and property. Clearly, there are major public health, safety, and environmental risks that must be addressed so that a legacy of sound watershed projects can be ensured.

Watershed and Flood Prevention Operations is the first and only national program that helps local organizations plan and install watershed-based projects on private lands. It provides site-specific technical expertise and locally based watershed planning and financial assistance for plan implementation. The Watershed Program provides a process to solve local natural resource problems and avoid excessive regulation. Fiscal year 1997 funding for Public Law 534 and Public Law 566 was \$101,036,000; the fiscal year 1998 financial assistance funding was \$51,036,000; and the fiscal year 1999 request is \$49,000,000. The difference from fiscal year 1998 levels is due to a shift of technical costs to the Conservation Operations account and the presentation of financial assistance activities under Watershed and Flood Prevention Operations. The authorized purposes of watershed projects include watershed protection, flood prevention, water quality improvements, soil erosion reduction, irrigation water management, sedimentation control, fish and wildlife habitat enhancement, wetland creation and restoration, and public recreation. The program empowers local people as decision-makers, builds partnerships and requires local and State funding contributions and ownership.

We aim to focus resources to address the backlog of approved watershed infrastructure projects. NRCS recognizes the need to meet currently unfunded commitments to stakeholders and sponsors. Currently, there are over \$1.5 billion in need for Public Law 566 and Public Law 534 projects combined. Local sponsors have demonstrated their support and await action by their Federal partner to do the same. The process of allocating funding to approved projects will be based on a competitive process that funds those projects with the highest environmental and commercial benefits, which will enhance NRCS's ability to succeed in its strategic plan.

The Emergency Watershed Protection (EWP) program provides assistance to reduce hazards to life and property in watersheds damaged by severe natural events. An emergency is considered to exist when floods, fires, droughts, or other natural

disasters result in life and property being endangered by flooding, erosion, or sediment discharge. In calendar year, 1997, EWP was employed in 26 states providing disaster assistance including hurricane, flood, and fire rehabilitation.

Technical and financial assistance under the EWP program is available for small-scale, localized disasters not necessarily declared as national in scope. Among the emergency activities, generally performed with temporarily employed local labor, are disaster cleanup and subsequent rebuilding; restoring stream corridors, wetland and riparian areas; establishing quick vegetative cover on denuded land, steep land, and eroding banks; opening dangerously restricted channels; repairing diversions and levees, and assisting the Federal Emergency Management Agency when it plans and relocates communities away from floodplains.

Resource Conservation and Development (RC&D) is a program initiated and directed at the local level by volunteers. The fiscal year 1997 appropriation was \$29,377,000; the fiscal year 1998 appropriation is \$34,377,000; and the fiscal year 1999 budget request remains at \$34,377,000.

Each RC&D area encompasses multiple communities, various units of government, municipalities, and grassroots organizations. The RC&D's represent a creative approach for helping citizens address multi-jurisdictional natural resource and community development issues. NRCS provides coordination to the program which serves as a catalyst for these civic oriented groups to share knowledge and resources, and it leverages public and private funds to solve common problems—including economic development—in a given area. Assistance is obtained from the private sector, corporations, foundations, and all levels of government. Historically, every dollar of NRCS technical and financial assistance for this program and applied directly to local projects, has been matched by about \$13 from other sources. By fostering local ownership and self sustenance for conservation and rural development projects, we believe that RC&D will contribute greatly to the legacy of locally-led action. The 1999 request will support the 290 RC&D areas currently authorized as well as any new area authorizations made in 1998.

Commodity Credit Corporation Programs.—NRCS also administers, on behalf of the Commodity Credit Corporation (CCC), several cost-share programs, including those set forth in the Federal Agriculture Reform and Improvement Act of 1996 (1996 Act) and also provides technical assistance to individuals and groups participating in the Conservation Reserve Program, which is administered by the Farm Service Agency. The conservation programs provided by the 1996 Act, which NRCS administers on behalf of CCC, include the Environmental Quality Incentives Program (EQIP), Wildlife Habitat Protection Program (WHIP), Farmland Protection Program (FPP), and Conservation Farm Option (CFO). The 1996 Act also amended the Food Security Act of 1985, to the continued implementation of the Wetlands Reserve Program (WRP) which NRCS administers on behalf of CCC.

The Environmental Quality Incentives Program (EQIP) provides in a single, voluntary program flexible technical, financial, and educational assistance to farmers and ranchers who face serious threats to soil, water, and related natural resources on agricultural land and other land, including grazing lands, wetlands, forest land, and wildlife habitat. Assistance is provided in a manner that maximizes environmental benefits per dollar expended, while assisting producers with issues such as local environmental laws or community identified environmental needs.

Funds of the CCC are used to fund the assistance provided under EQIP. For fiscal year 1998, \$200 million was available to implement the EQIP. The program is primarily available in priority conservation areas throughout the Nation. The priority areas consist of watersheds, regions, or areas of special environmental sensitivity or having significant soil, water, or related natural resource concerns. For fiscal year 1997, nearly 71 percent of the EQIP financial assistance funding was provided within priority areas. The process for selecting these priority areas begins with the local conservation district(s) convening local work groups, which are a partnership of the conservation district, NRCS, Farm Service Agency, Farm Service Agency county committees, Cooperative Extension Service, and other state, local, and tribal entities with an interest in natural resources conservation. They develop proposals for priority areas, develop ranking criteria to be used to prioritize producer's applications for EQIP, make program policy recommendations, and other related activities. The priority areas recommended to NRCS by the local work group are submitted to the NRCS State Conservationist, who with the advice of the State Technical Committee sets priorities for the program, including approval of priority areas. Over 600 priority areas were approved by the State Conservationists and about 550 of these were funded. Funds are made available to the States based upon the quality of the priority area proposal, local initiatives, and the environmental needs of the affected areas.

The program has been very successful. We received nearly 60,000 applications in fiscal year 1997. NRCS estimates that it would require over \$550 million to fully fund all of the applications received last year, alone, which is three times the available financial assistance funds. After NRCS ranked the applications based on criteria developed at the local and state level, FSA county committees approved over 22,000 long-term contracts with farmers and ranchers. The EQIP financial assistance on these contracts will exceed \$174 million.

Based on the fact that requests for assistance far exceed available funding, there is a need to continue to prioritize and focus our efforts so that we meet our Congressional mandate to maximize environmental benefits per dollar expended. We expect that in fiscal year 1999, continued interest in animal nutrient management will spur an increase in EQIP participation in this area. The nutrient management focus of the program will help meet national objectives of water quality, while involving farmers and ranchers in voluntary and cooperative solutions. Utilizing inventory and assessment tools, NRCS will continue to build the capacity of local communities to inventory and assess their watersheds to identify needs for nutrient management and priorities for conservation treatment. In addition, EQIP outreach, education, and information efforts will include working with conservation partners to launch efforts within priority watersheds to inform landowners and communities of the opportunities to improve water quality and agriculture production through soil conservation and nutrient management. The 1999 budget proposal seeks by proposed legislation to increase funding for EQIP by a total of \$350 million through fiscal year 2003. NRCS would receive an additional \$100 million in fiscal year 1999 and fiscal year 2000, and \$50 million in each subsequent fiscal year through 2003. The increased funding would be directed toward technical, financial, and educational assistance to farmers in addressing problems associated with agricultural runoff and would support the President's Clean Water Initiative. The request will also help with increased assistance to minority and limited resource farmers to ensure participation in the program. The technical assistance component would be funded initially at the 10 percent level.

The Wildlife Habitat Incentives Program (WHIP) provides for implementing wildlife habitat practices to develop upland wildlife habitat, wetland wildlife habitat, threatened and endangered species habitat and aquatic habitat. WHIP provides a significant opportunity to restore native habitat, help landowners understand how to best meet their own needs while supporting wildlife habitat development, and to develop new partnerships with State wildlife agencies, nongovernmental agencies and others.

WHIP is a solely voluntary program, whose projects encompass a wide array of wildlife practices. Projects performed under the program include advancing the following measures: upland wildlife habitat, wetland wildlife habitat, threatened and endangered species habitat, fishery habitat and other approved activities. The budget proposal assumes 171,400 acres enrolled in fiscal year 1998 and an additional 114,300 acres enrolled in fiscal year 1999.

State NRCS offices have made an enormous effort to develop partnerships and outreach methods with government and private organizations to develop a program that targets specific state concerns. We propose to continue to facilitate development of the program in a fashion to ensure the greatest amount of success for wildlife for the funds appropriated. Based upon proposals currently on hand, NRCS anticipates that program funding needs continue to mount as the public becomes more aware of its successes and the multiple benefits that it offers. The fiscal year 1999 budget request assumes continued funding of WHIP at \$20 million. This level would conclude the authority granted under the 1996 Act.

The Farmland Protection Program (FPP) protects prime or unique farmland, lands of State or local importance, and other productive soils from conversion to nonagricultural uses. It provides matching funds to leverage funds from States, Tribes, or local government entities that have farmland protection programs. The FPP establishes partnerships with States, Tribes, and local government entities to acquire conservation easements or other interests in land. It protects strategic farmland from urbanization. It ensures that the valuable farmlands are preserved for future generations and also helps maintain a healthy environment and sustainable rural economy.

The easement acquisition is on a voluntary basis. Qualifying farmland must: (1) have a pending offer from a State, Tribe, or local farmland protection program; (2) be large enough to sustain agricultural production; (3) be accessible to markets for what the land produces; (4) have adequate infrastructure and agricultural support services; (5) have surrounding parcels of land that can support long-term agricultural production; and (6) experience urban development pressure. When selected, a

conservation plan consistent with other conservation programs is required for each farm.

The FPP was authorized in the 1996 Farm Bill. During fiscal year 1996, 53 entities from 20 States submitted proposals requesting Federal matching funds of \$130 million for 628 farms with 176,000 acres of valuable farmland at an estimated easement value of \$330 million. \$14.5 million of CCC funds were provided to match 37 government entity programs. That allocation will lead to the protection of approximately 76,000 acres of valuable farmland on 203 farms with an estimated easement value of \$116 million in 17 States once all easement acquisitions have been completed. Experience in the first request for proposals for the FPP indicates that demands are almost 10 times greater than the available Federal matching funds.

For fiscal year 1997, \$2 million was approved by Congress for use from CCC funds to purchase development rights from farmers and ranchers. In fiscal year 1998, the \$18 million approved by Congress exhausted the original authorized funds for the program.

The Conservation Farm Option (CFO) pilot program provides producers of wheat, feed grains, cotton, and rice who are enrolled in AMTA one consolidated USDA conservation program payment, in lieu of the many conservation programs that are available. Producers must implement a conservation plan that addresses soil, water, and related resources, water quality, wetlands, and wildlife habitat. The statute provides broad discretion in designing CFO pilots, and provides the opportunity to tap local agricultural initiatives and innovations for improving environmental quality.

We envision CFO as an opportunity to test the feasibility of innovative program delivery processes and innovative solutions to environmental concerns. We look to the locally-led effort to provide the ideas for innovative pilots. The innovations tested through the CFO may well be the basis for changes in statutory authorities for conservation programs into the 21st century. In fiscal year 1998, pilots will be determined through a Request For Proposal in the Federal Register. Funding for the CFO is provided through the Commodity Credit Corporation. The fiscal year 1998 funding for CFO is \$15,000,000. For fiscal year 1999, we are requesting authority for \$25,000,000 in CCC program funds, as authorized by the 1996 Act.

Wetlands Reserve Program (WRP) is a voluntary incentive program to assist owners of eligible lands to restore and protect wetlands and necessary adjacent upland areas. The Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act), re-authorized the WRP to be funded under the Commodity Credit Corporation (CCC) beginning fiscal year 1997, extended the duration of the program to 2002, added cost-share agreements, and restructured the contract payment terms and length.

WRP preserves, protects, and restores valuable wetlands mainly on marginal agricultural lands where historic wetlands functions and values have been either totally depleted or substantially diminished. Wetland restoration of such marginal lands provides landowners with a financial alternative to continued attempts to produce agricultural products on such high risk lands. Program delivery is designed to maximize benefits to wildlife, to provide for water quality and flood storage benefits, and to provide for general aesthetic and open space needs. Many of the WRP project sites are within areas that are frequently subjected to flooding and the flood storage being provided will lessen the severity of future flood events. The WRP is making a substantial contribution to the restoration of the nation's migratory bird habitats, especially for waterfowl.

The WRP is a mandatory program from a budget perspective but is offered to program participants on a strictly voluntary basis. Under the WRP, the Secretary of Agriculture acquires permanent easements and 30-year easements, enters into restoration cost-share agreements/contracts, provides for overhead costs associated with the cost of purchasing an easement or establishing an agreement, develops wetland restoration plans, cost-shares the restoration, and monitors the maintenance of the easements and agreements. Close cooperation with other Federal and State agencies and private conservation entities is an integral aspect of program delivery. The State Conservationist, in cooperation with the State Technical Committee, is responsible for WRP implementation and operations.

Beginning in fiscal year 1997, the program was funded under the Commodity Credit Corporation (CCC). The fiscal year 1997 program provided \$99,000,000 in CCC financial assistance funds to enroll approximately 125,000 acres involving more than 700 individual projects. The fiscal year 1998 program will provide \$218,597,000 in financial assistance to enroll approximately 212,000 acres. In fiscal year 1999, we propose enrolling an additional 164,000 acres at a cost of \$123,741,000. Technical assistance funding for fiscal year 1998 will be funded from fiscal year 1996 unobligated appropriated funds under the old WRP account due to the limitation on CCC reimbursements. Technical assistance funding for fiscal year

1999 will include both unobligated appropriated funds (\$4,000,000) and CCC funds (\$11,059,000).

From inception of the program in 1992 through 1997, interest in the program has been exceptional, providing approximately 449,250 acres enrolled in the program through the end of fiscal year 1997, and coupled with the fiscal year 1998 and fiscal year 1999 program sign-ups, approximately 825,450 are expected to be enrolled by the end of fiscal year 1999 through use of fiscal year 1997 and fiscal year 1998 CCC funding. We expect to reach the 975,000 acre enrollment goal mandated by the 1996 Act in fiscal year 2000, two years ahead of deadline. Historically, there have been more than five fold as many acres offered than the program could enroll. The fiscal year 1998 sign-up was the fifth that has occurred under WRP since fiscal year 1992. The fiscal year 1998 effort provided landowners with the continuous opportunity to seek enrollment in the program. States periodically rank all unfunded offers and seek allocation of funding for the highest ranked offers. By following this process, the maximum opportunity for landowner participation is provided and the WRP is assured of having the best possible list of ranked offers available for funding during the year.

In response to the 1996 Act, the fiscal year 1997 sign-up is separated into three components (i.e., permanent easements, 30-year easements, and cost-share agreements). Enrollment is targeted to achieve a balance, to the extent practicable, of each component. The level of enrollment established for 1998 is 212,000 acres with a requirement that the initial 32,000 acres of easements be limited to 30-year duration. Thus far, approximately 48,596 acres of 30-year easements have been enrolled. This enrollment was completed before the enrollment of permanent easements was initiated. The 48,596 acres represents approximately 60 percent of the 30-year easement offers that have been received. We would expect during fiscal year 1998 to easily fulfill the 75,000 acre enrollment that is called for in statute. Approximately 50,980 acres of permanent easements have been enrolled. This represents approximately 32 percent of the permanent easement offers. Approximately 4,154 acres of restoration cost-share agreements have been enrolled. This represents approximately 100 percent of cost-share agreement offers.

Under the continuous sign-up process the backlog lists for each of the program components will continue to be updated. Once the fiscal year 1998 enrollment process is completed, these lists will be available for immediate use in selection of the 1998 enrollment.

CONCLUSION

It is clear that as we consider the appropriations for the private lands conservation as part of the 1999 budget, that we stand at a crossroads. We have been granted a wealth of tools and resources, and have willing partners and customers to put them to work. We have the opportunity to establish a foundation for the future of conservation—fulfilling our commitment to the resources, while ensuring healthy and productive land is within our reach. Even more, we can instill a conservation ethic that will endure for generations.

However, these policy and financial commitments become moot unless the Department of Agriculture and NRCS, its lead conservation agency, have sufficient resources to deliver the technical assistance that farmers and ranchers time and again say they need to take advantage of the conservation opportunities now confronting them. Our partners in State and local governments and the private sector, responding to widespread public support for environmental protection efforts, have increased their financial commitments to conservation on private land in recent years. At the same time, they look to the federal government for a continuing commitment to technical assistance for private land and private landowners, not the diminishing commitment in real dollars that has been the trend over the past two decades. It is this technical assistance that, when coupled with the contributions of our many public and private-sector partners, will allow us to realize the full promise of the 1996 farm bill and to look beyond. Given the needed resources in this appropriation request, together we can ensure a conservation legacy for future generations.

That concludes my statement. I am looking forward to working with you in the months ahead to review the proposal and work together to maximize service to our customers and help them be good stewards of the land. I will take any questions that members of the committee might have.

PREPARED STATEMENT OF THOMAS A. WEBER

Mr. Chairman, it gives me great pride to represent the Natural Resources Conservation Service—NRCS—before the Committee, today. For over two decades I

have had the pleasure of serving among what I would consider to be the most committed and invaluable group of public servants and conservation professionals in this nation. It has been said so many times that the whole is greater than the sum of its parts. I feel this is especially true of NRCS. It has value far beyond the conservation programs, cost share dollars, or even the staff that comprise it. It is the unique combination of technical skills, partnerships, dedication to public service and commitment to working with people on the land that are the keys to its value. Therefore, rather than focusing on talk about numbers and budgets, I want to highlight leadership, partnerships, the accomplishments of our employees, and the challenges ahead.

NRCS has had the fortune of being led by a tremendous cadre of leaders who had a vision of natural resources for the future and the creativity and courage to see them through. Primary among them was Hugh Hammond Bennett who asserted that the solution to soil erosion was to tailor conservation practices to fit the individual situation and needs of the landowner. In recent history, the leadership of Paul Johnson crystallized in our minds the importance of conservation on private lands and how the success of voluntary conservation is the key to ensuring the productivity and health of the land for future generations.

But meeting the enormous task of performing conservation work on the nation's private lands takes far more than the work of a single individual or even a federal agency. It is instead through a partnership of a federal agency, local conservation districts, state conservation agencies and others, and the hard work of local people that we are able to accomplish all we do. We refer to it as the Conservation Partnership. It is a unique and effective delivery system, it is geared to meeting the needs of local people, and it has literally changed the landscape of the nation.

Last year brought about many new responsibilities, many challenges, and of course, many changes. I am proud to say that the dedicated employees of NRCS and our conservation partners collectively applied their knowledge and abilities to start putting Farm Bill programs to work for our nation's land and people. But more than simply implementing these programs, NRCS staff have strived to utilize these tools in creative ways to meet the resource needs of our customers. Just as Hugh Hammond Bennett originally asserted, we are using the programs to meet the greater needs of the land and landowner. Likewise, more than ever, we have strengthened the locally led approach to conservation.

Last year, our employees shared responsibility for the largest Conservation Reserve Program sign-up in the Department's history. They also helped to officially launch the National Conservation Buffer Initiative, which will protect water quality, wildlife habitat, and provide many more environmental benefits and implemented the Environmental Quality Incentives Program (EQIP) which has become one of the most popular conservation programs that is available. And more than its popularity among our customers, our field conservationists are finding it to be the useful tool to help landowners meet their conservation needs.

Thanks to your support and our employees efforts, landowners will share with people in their watersheds a future that has healthier land and cleaner water and air. We've seen tremendous progress where the conservation partnership have engaged communities in resource concerns and priority setting. Our employees and partners have also worked to improve outreach to underserved customers. That work is an example of what can happen when good people set out to achieve a common goal. We've made progress, but we need to accelerate our work with underserved individuals, communities, and groups and ensure that our legacy of conservation and stewardship includes everyone.

Nineteen ninety-eight is shaping up to be an exciting year in natural resource conservation. There are several programs being implemented—Wildlife Habitat Incentives Program (WHIP) and Conservation Farm Option (CFO). There are a lot of issues of concern to be addressed, including animal agriculture and the environment, water quality, wetlands, natural disasters, air quality, and farmland protection—to name just a few. We in NRCS are also putting a strong emphasis on continuing to enhance our technical capability. Our employees need to have the best technical skills available to provide quality service. As a result, we're providing additional training to employees and exploring new technology. It is important that as we focus upon new program activities and adapt to changes in producers needs, that we continue to address the needs of our employees. The goal is to make sure on all accounts that our staff have the best training and resources they need to serve our customers.

One of the goals of our agency-wide reorganization was to place a higher share of staff resources in the field to maintain and enhance service to our customers. This goal continues to be a high priority. We've recently given direction to agency leaders at all levels to maintain or, if possible, increase the number of field employees as

positions become vacant elsewhere in the agency. We're also making every effort to reduce the administrative workload of our field employees to increase the time they devote to getting conservation on the land working directly with landowners.

Throughout the agency, our focus is to maximize conservation benefits with the funds that are available. Therefore, the fiscal year 1999 budget proposes to increase support for the vital technical assistance that our field staff provide. You will note that the budget contains a renamed account entitled America's Private Lands Conservation. The funds for this program represent the support that is needed to get conservation activities on the ground. And while we have strived to give our field staff the tools they need to assist landowners, we also anticipate increased returns through cooperative efforts with federal and non-federal partners as well. Our participation in the President's Clean Water Initiative will help to improve the health of watersheds, restore wetlands, and help communities meet water quality goals.

The fiscal year 1999 budget proposal for NRCS will help to ensure protection and improvement of our natural resources for future generations. As the Under Secretary outlined, we have made much progress and the success of our many conservation programs is a testament to the commitment of so many landowners across the nation who want to help themselves. It is also proof that the heritage left behind by our predecessors can become a legacy of land stewardship if we are willing to take on the task. I believe that we can take on this task, and I am confident that the employees of NRCS and its conservation partners can meet the challenges for 1998 and beyond.

STATEMENT OF THOMAS A. WEBER

Senator COCHRAN. Chief, you are recognized. Welcome.

Mr. WEBER. Thank you, Mr. Chairman. It gives me a great deal of pride to be here today to represent the Natural Resources Conservation Service. It has been said so many times that the whole is greater than the sum of its parts. I feel this is especially true of the Natural Resources Conservation Service. It has value far beyond the conservation programs, cost-share dollars, or even the staff that comprise it.

It is a unique combination of technical skills, partnerships, dedication to public service, and commitment to working with people on the land that are the key to its values. Therefore, rather than focusing on numbers and budgets, I want to highlight partnerships, the accomplishments of our employees, and the challenges ahead in the few minutes I have here.

Meeting the enormous challenges and tasks of performing conservation work on the Nation's private lands entails far more work than an individual agency or person can accomplish. It is instead, through a partnership of a Federal agency, local conservation districts, State conservation agencies and others, and the hard work of local people that we are able to accomplish what we do.

We refer to this as the conservation partnership. It is a unique and effective delivery system that has been in place for over 60 years and is geared to meeting the needs of local people on the land. And it has literally changed the landscape of this Nation.

Last year brought many new responsibilities, challenges, and of course many changes. I am proud to say that our dedicated employees and our partners have collectively applied their knowledge and their abilities to put the farm bill programs on the land and to put them to work for the Nation's land and people.

We are using these programs as tools to meet the greater needs of the land and the landowners. And likewise, more than ever, we have strengthened what we call the locally led approach to conservation.

Last year our employees shared responsibility for the largest Conservation Reserve Program signup in the Department's history. They also helped to officially launch the national conservation buffer initiative, which will help to protect water quality, enhance wildlife habitat, and provide many of the environmental benefits.

In addition to that, the Environmental Quality Incentives Program was brought on board, which has become one of the most popular conservation programs in this Nation. Our employees and partners have also worked to improve outreach to underserved customers. We have made much progress there, but we need to accelerate our work with underserved individuals, communities, and groups and ensure that our legacy of conservation and stewardship includes everyone.

This is an exciting year in natural resource conservation. There are several programs that we are implementing this year, one mentioned earlier, the Wildlife Habitat Incentives Program.

In addition to that, we have the conservation farm option that will be soon coming out. There are also a lot of issues of concern to be addressed, including animal agriculture and the environment, water quality, wetlands, natural disasters, of which we have certainly had several here recently, air quality, and farmland protection to name just a few.

We have made much progress, and the success of our conservation programs is a testament to the commitment of so many of our landowners across the Nation who want to help themselves. A few examples of our progress: Total erosion on highly erodible cropland has been reduced 47 percent since the 1985 farm bill.

The rate of wetland loss has declined between 1982 and 1992 to approximately 79,000 acres per year.

Senator BUMPERS. Would you repeat that, please?

Mr. WEBER. The annual rate of wetland loss has declined between the periods of 1982 and 1992, based on our current statistical information, to about 79,000 acres per year.

Senator BUMPERS. Thank you.

Mr. WEBER. The number of waterways safe for swimming and fishing has doubled over the last 25 years. This is proof that the heritage left behind by our predecessors can become a legacy of land stewardship, if we are willing to take on the challenge. And the challenge is daunting.

Soil erosion on agricultural land still exceeds 2 billion tons annually. Nineteen percent of the Nation's streams do not meet water quality standards due to the environmental impacts of animal waste alone. There is some evidence that the rate of loss of rural land to urban development has actually begun to increase during the 1990's.

However, with your help I am confident that the employees of the Natural Resources Conservation Service and our conservation partners can meet these challenges in 1998 and beyond.

In closing, I want to share a story with you that portrays the real value of the Natural Resources Conservation Service, its employees. A few weeks ago I had the pleasure of hearing Mr. Jerry Clower, storyteller and entertainer from the State of Mississippi, speak of his land and the special relationship with what he called his conservationist over many years.

Now Mr. Clower spoke eloquently and proudly about conservation on his land and also helped—he was helped by his conservationist. And he talked about the enjoyment his grandchildren had on that land.

He spoke of the land as being America's conservation legacy. Later on Mr. Clower noted that he did not realize his conservationist was a Federal employee because that really never mattered to him.

The story points out the real value of NRCS. It is not the programs, it is not the authorities, and it is not the cost-share funds that are the most critical of America's private land conservation effort.

It is the cadre of highly trained, motivated and skilled individuals and technical people working directly with landowners that truly result in the conservation benefits we all enjoy today.

We must preserve and nurture this national treasure in order to pass on our conservation legacy to future generations.

Thank you, Mr. Chairman.

EQIP

Senator COCHRAN. Thank you, Mr. Weber, for your comments and your testimony.

In connection with the EQIP Program that was mentioned and is also discussed at length in the prepared testimony, you talk about selecting priority areas for attention and the fact that emphasis will be given in providing funds and technical assistance to these priority areas.

Has there been any designation or a map drawn to illustrate where these priority areas are? I am curious to know where the money is really going, where it has gone so far under this program, how much has been spent, and what you intend to do with the money you are asking us to appropriate for this next fiscal year.

Senator BUMPERS. Mr. Chairman, before he answers that question, are you alluding to the Water Resources Assistance Program, where he says they have 40 priority watersheds?

Senator COCHRAN. No; the Environmental Quality Incentives Program [EQIP] that he talks about.

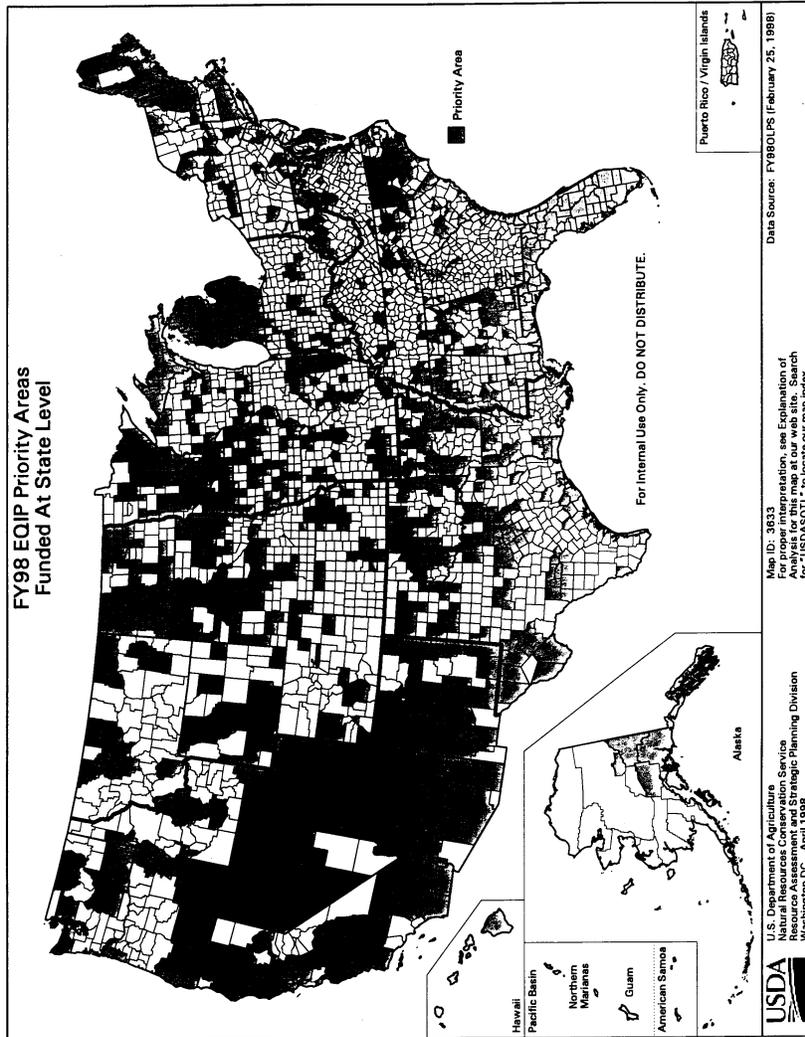

Senator BUMPERS. OK.

Senator COCHRAN. It talks about priority areas recommended to NRCS by local work groups and State conservationists, but then they talk about a national program for selecting priority areas. I am just curious to know, have they selected the priority areas? And if so, where are they?

Mr. LYONS. Mr. Chairman, we could provide for the record a map of the priority areas that have been designated in each State. They are identified. They are identified through a process that really begins from the ground up where local conservation districts and others help to identify these areas.

Then those nominations, if you will, are presented to the State technical committees, who then work to refine and identify those areas of priority. And it is on that basis that we set those priorities for allocations.

[The information follows:]

Senator COCHRAN. Well, I notice, to follow up on that, that you say in fiscal year 1997 nearly 71 percent of the EQIP financial assistance funding was provided within priority areas. The total amount, as I understand it, that you had to work with was less than \$200 million.

And I am just curious to know, are some areas of the country being left out of this priority program? Can you tell us more about where the money is going?

I do not think you have—you have a map. Do we have copies of the maps that we can look at or a table showing where the money has been spent or where you intend to spend it?

Mr. LYONS. Yes; I do not think we have a map with us, Mr. Chairman. We will certainly provide you the EQIP allocations.

Basically the way the process works is, the State technical committees provide oversight in each State. And they include a number of interest in entities chaired by the State conservationist. But this is a locally led effort to identify priority areas.

The additional funds, though, that are allocated beyond the 71 percent address statewide concerns and are not necessarily tiered toward any specific priority area. So it is really an attempt to have those on the ground to understand water quality and conservation concern needs, identify priorities, allocate funds primarily through that process, but then reserving some funds to address other statewide needs, again guided by what individual State technical committees advise.

EQIP PRIORITY AREAS

Senator COCHRAN. Do you leave up to the State technical committees and the State conservationist the authority to decide what areas are priority areas, or do you have regulations that you have promulgated that guide them?

Mr. LYONS. I am going to ask the Chief to offer those details.

Mr. WEBER. Thank you.

As part of the process the State conservationist working with the State technical committee gets the advice from the State technical committee, which is represented by a number of Federal agencies and organizations in the State, including State government.

This committee makes recommendations to the State conservationist in terms of which priority areas in the State should be funded and at what levels. It also makes recommendations in terms of what we are calling statewide concerns, which are issues that may cover a total portion of the remaining part of the State outside of priority areas, such as water quality, where you have perhaps some animal concentration issues you are dealing with. And they recommend the amounts of the allocation that should go toward those efforts.

The total allocation is given to the State based on the State resource needs, but the State conservationist with the input of the State technical committee makes the decisions. And with Farm Service Agency [FSA] concurrence in this process, they make the decisions on where the dollars will go in terms of how much to each priority area and to statewide concerns.

Senator COCHRAN. In the administration of this program, have you found that some States end up having to use all the money

under the program for the priority areas? Does everybody have 29 percent left over to use for local concerns that may be outside this classification scheme?

Tell me how that works as a practical matter.

Mr. WEBER. OK. Thank you.

We allow that discretion to each State. They receive x dollars for their allocation. Then, working with the State technical committee, they decide what are the best and highest priority uses for those dollars.

In some cases we may have States that are allocating 50 percent to the priority areas, and 50 percent to the areas of statewide concern. So it is going to vary from State to State what that percentage is. But they do have discretion within the dollars they have.

EQIP ALLOCATIONS

Senator COCHRAN. Well, I am a little bit confused in trying to figure out where the money is going. I guess you are going to show us a table where the money is going.

Mr. WEBER. Yes.

Senator COCHRAN. Can you tell us anything about that, or are you just going to furnish that for the record, referring to the earlier question that I asked?

Mr. LYONS. We will furnish that for the record, Mr. Chairman. [The information follows:]

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM (1998)

State	Technical assistance	Education assistance	Financial assistance	Totals
Alabama	\$620,000		\$2,580,000	\$3,200,000
Alaska	82,000	\$8,000	342,000	432,000
Arizona	981,000	197,200	3,890,800	5,069,000
Arkansas	1,092,000	120,000	5,278,000	6,490,000
California	1,448,000	611,000	5,499,000	7,558,000
Colorado	1,348,000	135,162	4,902,838	6,386,000
Connecticut	117,000	473,150	24,850	615,000
Delaware	212,000	9,000	892,000	1,113,000
Florida	925,000	5,400	3,843,600	4,774,000
Georgia	811,000	57,450	3,398,550	4,267,000
Hawaii	224,000	40,000	787,000	1,051,000
Idaho	787,000	50,000	3,306,000	4,143,000
Illinois	798,000	52,379	3,347,621	4,198,000
Indiana	655,000		2,525,000	3,180,000
Iowa	1,106,000	211,000	4,173,000	5,490,000
Kansas	1,053,000	25,000	4,110,000	5,188,000
Kentucky	549,000	35,130	2,306,870	2,891,000
Louisiana	832,000	144,700	4,334,300	5,311,000
Maine	544,000	104,450	1,896,550	2,545,000
Maryland	451,000	24,000	1,774,000	2,249,000
Massachusetts	175,000	20,000	665,000	860,000
Michigan	790,000		3,367,000	4,157,000
Minnesota	1,082,000	224,000	4,263,000	5,569,000
Mississippi	865,000	99,550	4,426,450	5,391,000
Missouri	957,000	121,000	3,897,000	4,975,000
Montana	1,208,000		5,056,000	6,264,000
Nebraska	954,000	64,100	4,004,900	5,023,000
Nevada	286,000	8,000	1,213,000	1,507,000

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM (1998)—Continued

State	Technical assistance	Education assistance	Financial assistance	Totals
New Hampshire	71,000	15,050	285,950	372,000
New Jersey	203,000	35,000	832,000	1,070,000
New Mexico	734,000	42,575	3,088,425	3,865,000
New York	929,000	37,728	3,593,272	4,560,000
North Carolina	1,123,000	4,597,000	5,720,000
North Dakota	851,000	164,676	3,463,324	4,479,000
Ohio	660,000	50,000	2,574,000	3,284,000
Oklahoma	1,060,000	126,471	4,204,529	5,391,000
Oregon	802,000	244,000	3,173,000	4,219,000
Pacific Basin	110,000	82,000	324,000	516,000
Pennsylvania	845,000	33,800	3,301,200	4,180,000
Puerto Rico	232,000	11,000	916,000	1,159,000
Rhode Island	48,000	9,000	190,000	247,000
South Carolina	395,000	1,685,000	2,080,000
South Dakota	826,000	84,400	3,437,600	4,348,000
Tennessee	581,000	23,513	2,451,487	3,056,000
Texas	3,122,000	264,260	12,948,740	16,335,000
Utah	783,000	80,000	2,975,000	3,838,000
Vermont	276,000	942,000	1,218,000
Virginia	500,000	15,000	2,116,000	2,631,000
Washington	950,000	172,612	3,876,388	4,999,000
West Virginia	344,000	10,000	1,455,000	1,809,000

Wyoming	763,000	21,500	3,090,500	3,875,000
Total	38,000,000	4,362,256	155,141,744	197,504,000
Undistributed	2,496,000

Senator COCHRAN. Well, let us just pick out a few States. Tell us about Wisconsin, Arkansas, Mississippi, and Montana. [Laughter.]

Mr. LYONS. Just to pick four States.

Senator COCHRAN. Just to pick four States at random.

Senator BURNS. And if you are having any trouble remembering the details in Montana, I will enlighten you.

Mr. LYONS. OK. Which States? [Laughter.]

Senator COCHRAN. Wisconsin, Arkansas, Mississippi, and Montana.

Mr. WEBER. Mississippi. OK.

Mr. LYONS. While Tom is looking at the allocations overall, I guess what I should explain, Mr. Chairman, is of course one of the problems we have with EQIP is it is oversubscribed. We estimate there is \$600 million in demand out there.

So not all producers are able to get the assistance and the financial support they seek. We only have \$200 million to allocate. And of course this year we are seeking an additional \$100 million to give us \$300 million overall.

So we have established this system to try and come up with an orderly way to make allocations based on what people on the group perceive to be priority conservation concerns. It puts the State technical committees in a tough position. They have to make tough calls.

But candidly, our view was it is better for them to make the calls there than for us inside the beltway to be making those calls.

Senator COCHRAN. Well, there are some decisions that are made in Washington though about the national priorities. And you talked about how this money was going to be used to support the President's clean water initiative and all these other new initiatives, which we think are important.

But what worries me is, you have made decisions as to how to spend this money nationally, and when you get right down to it, the State conservationists and the State committees are being given what is left over. And it is very, very little to do the conventional and the traditional things, to protect watersheds and protect farmland.

Mr. LYONS. I guess I would need to understand that more clearly, Mr. Chairman. But I see it differently. And of course—

Senator COCHRAN. Well, tell us what the facts are then.

Mr. LYONS. Well, the facts are—

Senator COCHRAN. What are the facts? Where does the money go? Where is the decision made as to the allocation of the funds. Can we find that out?

Mr. LYONS. Sure.

Senator COCHRAN. I have asked it about three or four times, and I have not heard a word about it yet. I have not heard a responsive answer to that question.

Mr. LYONS. Well, I will let Tom give you the details. And if that does not do it, we will go at it again.

Senator COCHRAN. OK.

Mr. WEBER. For fiscal year 1998, allocations for EQIP in Arkansas is \$6.49 million; the State of Mississippi is \$5.391 million; Wisconsin is \$4.357 million; and Montana is \$6.264 million.

Senator BURNS. What was Montana again?

Mr. WEBER. \$6.264 million. And those are based on—

Senator BURNS. Where did it go?

Senator COCHRAN. Let me finish my question, if I could, Senator.

Senator BURNS. OK.

Senator COCHRAN. Are these funds allocated to the States to spend in the national priority areas, or are these funds allocated for the States to spend based on decisions made by the State conservationist and the State committee?

Mr. LYONS. The allocations are made to the State for the State conservationist with the concurrence of the Farm Service Agency and the involvement of the State technical committee to decide where those dollars are spent.

Senator COCHRAN. And this is out of a total amount of \$200 million, these States got that much? Is that what you are telling me?

Mr. WEBER. Correct.

CLEAN WATER INITIATIVE

Mr. LYONS. The role of Washington is the initial allocation to the States. But once the States have those funds that Tom has described, then it is the State's role to determine where those moneys should go and how those allocations should be made.

And let me just clarify, Mr. Chairman. For an initiative, like this clean water initiative that I referenced, as we are attempting to

formulate that, our intent is not to create a new allocation formula or the like. We really are trying to determine ways in which we can mirror the most efficient delivery system out there.

And we may, in fact, simply elect to use something akin to what we are doing now with the EQIP allocation formula, because we certainly want those decisions to be made at a State and local level.

WILDLIFE HABITAT INCENTIVES PROGRAM

Senator COCHRAN. I am glad that you are going to be implementing the Wildlife Habitat Incentives Program. We think that it is a new initiative, as you pointed out, that may very well lead to the protection of habitat for wildlife, endangered species, migratory waterfowl, and other game animals and fowl as well.

We hope that you will continue to monitor that carefully and give us a report on participation and how it is going. If there are any changes that need to be made legislatively, we hope you will communicate those to us.

We also appreciate the fact that you have established conservation centers where farmers and landowners can come and find out how they can take advantage of the Federal programs. We know that you have established one which we attended together, the ribbon cutting in Mississippi.

Tell me how that is working out. Do you think that is going to be a wise investment of Federal funds? Will farmers and landowners be better able to take advantage of the Federal programs, like Jerry Clower talked about in your testimony, Chief?

Mr. LYONS. Let me offer my perspective on that, Mr. Chairman. I think the value of those institutes—and we have established several across the country. Of course the one you refer to is the Wildlife Habitat Institute that Pete Heard is heading up—is that is a mechanism to translate current research information and current technology into ways that can be rapidly used by State conservationists in applying that knowledge on the ground.

For example, with the Wildlife Habitat Institute, although housed in Mississippi, we have individuals in the Pacific Northwest, in Colorado, in New England, in several places across the country, who are in a position to work directly with the State conservationists or with conservation districts to help in accelerating and facilitating the use of that information to make sure that it is applied in a rapid way.

And we think it is going to pay off tremendously. It is a small investment, but I think it is, using modern communications technology, an opportunity to facilitate a national dialog by getting information to the ground very quickly.

SMALL WATERSHED PROGRAM

Senator COCHRAN. Let me conclude my questioning in this round with an observation and ask you to give me your reaction.

The suspicion is out in the farmland area of my State, the Mississippi Delta specifically and some other areas too, that the Soil Conservation Service approaches of the past by the new NRCS is to let low-lying areas flood, that this is good for the environment, good for the country, and that traditional watershed flood control

protection measures are out of date, out of favor, and are not being funded by this administration.

Is that true? And if that is true, why is that?

Mr. WEBER. OK. As you know, in the budget proposal the funding for the Public Law 566, Small Watershed Program, for the financial assistance side, which is to invest in contracts with landowners or build structures, is \$49 million. This is comparable approximately to what it was last year.

I would say the answer to the question is that we are supporting good conservation. And we have tools at our disposal to enhance conservation. The Wetlands Reserve Program certainly is applicable where there are needs and interested landowners in preserving wetlands and restoring wetlands.

The watershed program has been—we have gone through a review of the backlog on that program trying to ensure we have those projects that are really—that people are interested in continuing to work with us to put into place. We have done that. We are taking a look at the program to broaden it, to allow people to participate on land treatment aspects versus structural aspects.

But I would not say the agency prefers one over the other. We are simply trying to provide all the tools we can within the means that we have to deal with the natural resource issues.

And I would just share with you, we are also taking a look at the infrastructure issue on our old watershed projects, and we will share this with you as well, so you get a concept of that.

Senator COCHRAN. Thank you very much.

Senator Bumpers.

WETLANDS

Senator BUMPERS. Thank you, Mr. Chairman.

Chief, what role do you have in the 404 permitting process? Do you make the determinations of what are wetlands in this country?

Mr. WEBER. Part of our responsibility under the memorandum of agreement with Fish and Wildlife and the Corps of Engineers, is that we do wetland determinations on agricultural lands.

We are continuing to work with the Corps on revising the memorandum of agreement to allow greater flexibility on wetlands and the acceptance of wetland determinations that we make for those purposes.

Senator BUMPERS. You do not have to sign off on the plan. Let us assume that I am a farmer and I apply for 404 permitting process on 40 acres of my farm. You have previously determined that 40 acres to be wetlands, right?

Mr. WEBER. We may have, yes.

Senator BUMPERS. And it goes to the Corps for permission to do something with that.

Mr. WEBER. Yes.

Senator BUMPERS. Which it will also include some alternative plan to make up for the loss of that 40 acres, is that correct?

Mr. WEBER. A mitigation plan.

Senator BUMPERS. Yes; mitigation plan. So once that is submitted to the Corps, we are talking about this 40-acre plan, he says, Well, I will convert another 40 acres on my farm to wetlands, or

whatever plan he submits. Do you have any further signoff responsibility on that?

Mr. WEBER. I do not believe so.

Senator BUMPERS. That is solely with the Corps' discretion.

Mr. WEBER. That is solely the discretion of the Corps.

Senator BUMPERS. How are we doing on our preservation of wetlands in this country through the 404 permitting process?

Mr. WEBER. I am not familiar with what their accomplishments are. But overall—

Senator BUMPERS. I admit—I know that is not really your responsibility. Do you add anything to this from time to time? Do you add any wetlands to the national plan?

Mr. WEBER. Oh, absolutely. Well, the Wetlands Reserve Program is a wonderful example of—

Senator BUMPERS. I am not talking about the Wetlands Reserve Program. I am talking about coastal areas and so on. Do you find that you have overlooked lands or did you decide that lands should be added to the wetlands determination, or do you just do it one time and that is the end of it?

Mr. WEBER. We continue to work with landowners on their requests to do redeterminations or new determinations of wetlands on their lands. We are not doing—

Senator BUMPERS. But you are talking about working with owners to determine whether or not you made a mistake in the first place.

Mr. WEBER. Sometimes, yes.

Senator BUMPERS. He said you have declared this wetlands and it should not be. I can see how you work with them on something like that. But I am talking about any additional acreage that has not been determined to be wetlands.

Do you review the areas constantly, or does the State agency review and recommend to you that a certain area be declared a wetlands, even until this day?

Mr. WEBER. No; let me—

Senator BUMPERS. You said, I think you said this, Chief, that we have reduced the loss of wetlands by 79,000 acres a year in the period 1982 to 1992, is that correct?

Mr. WEBER. That is correct, based on our national resource inventory data.

Senator BUMPERS. How are we losing that 79,000 acres? I mean, how are we—let me rephrase the question. That is not a correct question.

You say we have reduced the loss by 79,000, right?

Mr. WEBER. We are—

Senator BUMPERS. How much are we still losing? That is the question.

Mr. WEBER. We are losing a net of 79,000 acres per year.

Senator BUMPERS. I think we are talking about two separate things. You said we have reduced the loss on an annual basis. So if we were losing 179,000 acres in 1982 and we are losing 100,000 acres now, we have reduced the loss by 79,000 acres, right?

Mr. WEBER. You could look at it that way, Senator Bumpers.

Senator BUMPERS. Over the 10-year period, we have cut 179,000 acres to 100,000. No.

Mr. WEBER. Yes.

Senator BUMPERS. Let me see, am I saying that right? You are saying we have reduced the loss. My question is: How much are we still losing?

Mr. WEBER. The answer to that is, we are still losing about 79,000 acres a year. If you set as a goal—of course, this was a Bush administration goal, no net loss, originally stated—then in relation to that goal, we are still 79,000 acres a year short. That is what we are losing every year.

Senator BUMPERS. How are we losing it?

Mr. WEBER. Various forms of conversion and development.

Senator BUMPERS. If a developer comes in and says, I want to use this 80-acre tract to build a subdivision, I understood that he had to come up with some mitigation plan. Does the mitigation plan have to be on an acre-per-acre basis?

Mr. WEBER. I think you are going to go well beyond my area of expertise, Senator.

Senator BUMPERS. Well, maybe—

Mr. WEBER. The Corps would play that role.

SOIL LOST

Senator BUMPERS. I ought to wait until the Energy and Water Committee meets, and we will ask the Corps of Engineers those questions. But you said that we were still losing 2 billion tons of topsoil a year.

Mr. WEBER. Yes.

Senator BUMPERS. What were we losing 10 years ago?

Mr. WEBER. About 3 billion.

Senator BUMPERS. Three billion?

Mr. WEBER. Yes.

Senator BUMPERS. How are you stemming the loss of topsoil? Well, I know that Iowa used to lose 16 tons of topsoil an acre per year. Now I understand they have done, through State laws out there, some fairly dramatic things to stem that kind of erosion. But how do you plan to stop the 2 billion tons that we are still losing?

Mr. WEBER. The Congress needs to take credit for the outstanding progress we have made, based on the 1985 farm bill. A lot of that reduction has come about because of the conservation lands provisions of that bill.

We continue to work with landowners on a voluntary basis to adopt different tillage practices that reduce erosion. We are working with them on the conservation buffers that were mentioned here.

We continue to work with them on the traditional practices of terraces and tillage and wind strips and those kinds of things. We are basically focusing on working with them on a one-on-one basis and trying to encourage additional conservation practices to go the next step versus any other option that we may have available to us right now.

BUFFER ZONES

Senator BUMPERS. You stated that you have identified 2 million miles of buffer zones along streams that you want to acquire, either by easement or some other way, is that correct?

Mr. LYONS. That is actually part of the CRP program, so it would be 10-year contracts.

Senator BUMPERS. Have you identified the 2 million miles?

Mr. LYONS. No; the way we have administered the program, Senator, is each State is in the process of promoting those enrollments. And again—

Senator BUMPERS. So that is just a ballpark figure.

Mr. LYONS. No; that is our goal. Two million miles is our goal.

Senator BUMPERS. Is that just a goal?

Mr. LYONS. Yes.

Senator BUMPERS. So you have not identified the areas.

Mr. LYONS. No; we are letting—again, we are having that determination made at the local level and working with landowners, because, again, it is a voluntary program.

WATERSHEDS

Senator BUMPERS. On page 20 at the bottom on water resources assistance, you state that the funding level would enable approximately 92 Federal watershed coordinators to develop project work plans, coordinate volunteers, projects from watershed council activities, and 40 priority watersheds.

Do you have a list of those 40 priority watersheds?

Mr. LYONS. Not at this point.

Senator BUMPERS. You do not?

Mr. LYONS. Not at this point, Senator.

Senator BUMPERS. How do you know there are 40?

Mr. LYONS. Well, that is what we will have funding for.

Senator BUMPERS. You do not know what they are, but you will have funding for 40.

Mr. LYONS. Yes.

Senator BUMPERS. When do you expect to have that?

Mr. LYONS. Well, part of what we have proposed in this clean water action plan is to go through a process where the States would lead us in identifying critical watersheds.

We have national information and on a gross basis have a rough assessment of watersheds that are relatively healthy, those that are at risk, and those that are maybe beyond our ability to restore.

As we develop that process, we would work with the States to identify priority watersheds. And then this funding would help us address at least 40 of those priority watersheds. But we still have to go through the process to actually identify what those watersheds would be.

PLANT MATERIAL CENTERS

Senator BUMPERS. We have a plant material center in Booneville, AR. You have 26 plant material centers in the country.

Mr. LYONS. That is correct.

Senator BUMPERS. The one in Arkansas, Senator Bond got very interested in the Booneville facility and came down and spent a day with me at their plant a couple of years ago. And he was interested in it for a reason that I did not realize they were working on. It was called agro-forestry, where they plant trees on pasture lands, and you cannot even plant trees on row cropping lands.

And I did not know I had the program going over there, but, I mean, they were planting pecan trees. A walnut tree full grown is worth something like \$20,000 or \$30,000. They were planting those kinds of trees.

Are you familiar with that program, anybody on this panel?

AGRO-FORESTRY

Mr. LYONS. I guess I am, Senator. There is actually an agro-forestry research center in Lincoln that helps develop that technology. I think the Forest Service has been a key player in that.

Senator BUMPERS. But does Senator Bond not have a facility? Are they not doing some work at the University of Missouri on that?

Mr. LYONS. The University of Missouri has been one of the universities that has provided some leadership in developing that technology.

Senator BUMPERS. Can you give me any idea as to how successful that has all been so far?

Mr. LYONS. I would have to provide that for the record, Senator.

Senator BUMPERS. I would like for you to do that, if you would.

Mr. Chairman, I have maybe three or four questions that I will submit in writing.

Senator COCHRAN. Thank you, Senator.

We have a vote on the floor. I am going to stay here as long as Senators want to ask questions, and then we will come back. I think there are two votes back to back. I would like both Senators here who have questions to ask them, if they would like.

Senator Burns.

WATERSHEDS

Senator BURNS. I really do not have that many questions. I just—the last answer really bothers me on these 40 areas. It has not been identified, and you want money for a program that you do not know what it is going to do. That bothers me.

And I want to tell private landowners and agriculture today that this is—we see a movement here of managing their farms to the point where it is going to be almost unbearable, if it is anything like living in a State where you have public lands.

I just want to tell American agriculture that today this is going way beyond what our responsibilities should be in the Department of Agriculture.

In the CRP this last time, I want to—in the signup—well, you wrinkle up your head, but the farmers out there—I was raised on a little old bitty 160 acres with 2 rocks and 1 dirt, and I can see that right now as the man that farms that will have no more rights to what he wants to do with that farm than he can fly to the Moon in a bucket. And I mean that, because of what happened in EQIP in Montana. And we worked with you and got that straightened out.

Where people were not—and every time you talk about we are going to make this decision on watersheds, it is a matter of decision made among agencies and maybe not among landowners. And I just see a creep here that is unbelievable.

I have some questions that I want to submit for the record. I would like an answer on them. But I am going to go through this budget very, very closely, very closely. Here we are cutting back on ARS and then flying out of here on programs that we do not even know what they are going to do than we can fly to the Moon in a bucket.

And that is—in other words, we are making our investment of hard-earned dollars in what I believe is in some wrong areas. And I am going to work with the chairman very closely on this.

I have some questions. We will go vote, and then I have some other things that I have to do. And I thank the chairman for his indulgence.

Senator COCHRAN. Thank you, Senator.

Senator Kohl.

WETLANDS RESERVE PROGRAM

Senator KOHL. Thank you. I have several questions for the record. I will just hit on one that is of particular interest to me. I understand that the Wetland Reserve Program has enrolled 9,800 acres since 1994 in my own State of Wisconsin. The State NRCS expects to spend \$6 million to enroll another 6,000 acres in 1998.

The last farm bill changed the WRP and created three programs: 30-year easements, permanent easements, and cost-share agreements. The permanent easements are very popular in Wisconsin.

My question is: Can the State NRCS supply all of its money to permanent easements?

They are concerned because they understand, or they have heard, that they must divide the money equally among the three options that I have just described. Can they spent all their money on permanent easements?

Mr. LYONS. We can work with the State of Wisconsin NRCS to allow that to happen. We are limited nationwide to the one-third, one-third, one-third. But we can work with them to make that work.

Senator KOHL. You can.

Mr. LYONS. Yes.

Senator KOHL. I appreciate that very much.

Thank you very much, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Kohl.

I have other questions, too. I was going to come back and ask some of them, but I think in view of the fact that we have two votes, it is going to require a lot of time away from the committee.

SUBMITTED QUESTIONS

I am going to close this hearing simply thanking you all again for your cooperation with our committee. We appreciate your being here. And we appreciate your responding to the questions that will be submitted in a timely fashion.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM DESIGNATION OF NATIONAL PRIORITY AREAS

Question. Authority exists under the Environmental Quality Incentives Program (EQIP) for the designation of national priority areas. Have regulations been promulgated to designate these priority areas? If yes, then have priority areas been designated?

Answer. Yes. On May 22, 1997, the final rule for the Environmental Quality Incentives Program (EQIP) was promulgated (7 CFR Part 1466). Included in the final rule are regulations relating to the designation of national conservation priority areas. No national conservation priority areas have been designated as of February 26, 1998.

Question. Has the agency evaluated any applications and provided funding for one or more national priority areas? If not, why?

Answer. The Natural Resources Conservation Service (NRCS) has received several requests for designation of national conservation priority areas. Requests have been received for areas such as the Mississippi Delta, Colorado River Basin, Great Lakes Basin, Illinois River (Illinois), and the Chesapeake Bay Basin.

At this time, we are not planning to designate national conservation priority areas because we feel it is important to continue our focus on addressing State priority areas and State natural resource concerns that have been identified through the locally led conservation process. NRCS will be evaluating the progress of locally led efforts, including later this year, to determine the desirability of designating national conservation priority areas in the future.

Question. What is the difference in a state priority area and a national priority area? How many state and national priority areas does the agency have the authority to designate?

Answer. A priority area, whether designated at a state level or at a national level, could be a watershed, a subwatershed, an area, or a region that can be geographically described and has specific environmental sensitivities or significant soil, water, or related natural resource concerns. The purposes and criteria for designating a priority area at the national level are not much different than those used at the state level. The general differences between a state-designated and a national-designated priority area would be the scope and the significance of the impacted natural resource. National conservation priority areas may be designated because the contributing or impacted area is multi-state or international in scope, and the impacted natural resource is determined to be of national or international importance. Currently, State level priority areas are appropriately addressing these identified priority needs. As mentioned above, we are continually evaluating this process to ensure this new program remains focused.

There is no statutory or regulatory limit to the number of state and national priority areas which may be designated. The major limitation is monetary. Focusing the program funds to areas with the most significant natural resource needs will assure that significant improvement can be made in the environmental conditions in those areas thereby maximizing environmental benefits per dollar expended.

Question. How much money is estimated for Mississippi's participation in EQIP in the fiscal year 1999 budget request?

Answer. NRCS has just begun the deliberation process for making EQIP funding decisions for fiscal year 1999. Local work groups and stakeholders at the local level are beginning to consider the natural resource and program needs in their local area. These recommendations will be forwarded to NRCS State Conservationist later this spring, who will involve State Technical Committees in the review and recommendation process. Designation of priority areas and natural resource concerns at the state level are not expected until August, 1998, after which national funding decisions recommendations will be made to the Regional Conservationists. Mississippi received \$5.3 million for EQIP in fiscal year 1998, and we do not anticipate at this time that the fiscal year 1999 funding level will significantly change if EQIP remains at \$200 million.

Question. Should the Mississippi Delta be designated as a national priority area, how much funding would be required to carry out this EQIP program?

Answer. A proposal submitted by the Delta Council, Stoneville, Mississippi, based on information developed by NRCS and other conservation partners in June, 1997, indicated a combined need of \$129 million (estimated) for water quality and water quantity measures in the Mississippi portion of the Delta alone. No such proposal or estimates have been submitted for the Louisiana and Arkansas portions of the Mississippi Delta. The Mississippi proposal requests an EQIP funding level of \$4

million per year for 7 years, for a total \$28 million. This would be matched with \$9.3 million local cost-share for a total of \$37.3 million. This would provide sufficient funding to implement conservation practices to reach an estimated 30 percent of the water quality and quantity goals for the Mississippi portion of the Delta.

EQIP TECHNICAL ASSISTANCE

Question. Does the agency have adequate technical assistance to carry out the activities that would be funded if the fiscal year 1999 budget request to increase EQIP by \$100 million is adopted?

Answer. While NRCS currently has sufficient staff and expertise to perform the technical requirements associated with a \$300 million EQIP in fiscal year 1999, the budget proposal assumes that technical assistance will be supported with Conservation Operations funds. In fiscal year 1997, NRCS implemented a direct time charge work measurement system for EQIP which helped document NRCS EQIP technical assistance costs of \$44.3 million or 22 percent of a \$200 million program. For fiscal year 1998, a 19 percent technical assistance level was approved by OMB. The fiscal year 1999 budget assumes a 10 percent technical assistance level or \$30 million from EQIP program funding, while the remaining estimated \$36 million costs would be absorbed within the Conservation Operations appropriations.

Question. How much money for EQIP technical assistance is assumed in the fiscal year 1999 request and how does this compare to the fiscal year 1998 level?

Answer. Technical assistance for fiscal year 1999 is assumed at a 10 percent level based on the proposed \$300 million request. Technical assistance for fiscal year 1998 was apportioned at a 19 percent level based on the \$200 million spending authority.

Question. What amount of this technical assistance, if any, will come from carry-over balances from previous fiscal years?

Answer. None. No carry-over may occur with Commodity Credit Corporation funds.

Question. Will any of the fiscal year 1999 budget request of \$100 million be used for technical assistance? If so, how much?

Answer. Yes. The budget assumes that technical assistance for fiscal year 1999 will be apportioned at a 10 percent level.

EQIP ASSISTANCE TO MINORITY AND LIMITED RESOURCE FARMERS

Question. What type of assistance to minority and limited resource farmers will the agency provide to increase their participation in the EQIP program? How will this differ from that provided in previous years?

Answer. There are several ideas being considered as we develop strategies for providing enhanced education, technical, and financial assistance to minority, limited resource, and socially disadvantaged farmers and ranchers. Under consideration are items such as:

a. Information and Outreach—Special efforts have been made to incorporate specific outreach actions and measurable goals into agency strategic plans at the national, state, and local level. Actions and measurable goals may be made for:

- informational meetings with members of the targeted audiences;
- news releases and fact sheets, including those through media sources which focus on the targeted audiences;
- involvement of other agencies and groups, including Cooperative Extension Service, 1890 and 1994 institutions, Hispanic servicing institutions, Research Education Access Program institutions, other agricultural and land grant institutions;
- involvement of churches and other community based organizations which represent or assist the target audiences;
- news releases to targeted media;
- assuring that local work groups will involve and obtain input from target audiences; and
- use of NRCS field guidance which includes reference materials, techniques, and methods for providing outreach, overcoming barriers, and assisting limited-resource producers, minorities, and Indian nations.

b. Education Assistance—Special efforts have been made to provide training and education assistance to target producers. Education may include:

- program requirements;
- how to apply;
- how to make assignment of payments to contractors and vendors;
- how to recognize natural resource conditions and environmental problems;
- understanding which conservation practices address natural resource and environmental concerns;

- how to install, establish, operate, and maintain conservation practices;
 - how to use own equipment and labor to establish conservation practices;
 - how to account for use of own labor and equipment when establishing practices;
 - and
 - how to submit expenses for establishing practices to receive payment.
- c. Technical and Financial Assistance—Emphasizing the use of low-cost conservation practices that are effective and affordable to the target audiences. This will also help to meet the overall program objective of maximizing environmental benefits per dollar expended. NRCS, working with other agencies and private industry, should develop conservation practice standards and specifications for low-cost conservation practices. If the funding level is increased to \$300 million, there will be increased assistance in these activities as well.

d. Farmer Mentoring—Assist with the establishment and sponsoring a farmer mentoring network. The initiative could be a coalition of farmers, farmer and commodity organizations, natural resource and environmental organizations, private industry, and government, whose purpose is to provide voluntary mentoring and help limited resource and socially disadvantaged farmers and ranchers who need special assistance to overcome their limitations and disadvantages.

Most of the ideas under consideration are not new or different than types of assistance provided in previous years. The primary difference is that many of these types of assistance were not widely or comprehensively used in conservation cost-share programs. The activities will be used in a concentrated manner and accountability will be vigorously upheld to assure the activities are implemented.

CONSERVATION PLANNING FOR EQIP

Question. Please explain what the conservation planning requirements will be for those who receive contracts, and how you intend to assure those requirements are not more comprehensive than the statute requires.

Answer. The conservation planning requirements for all EQIP participants will be the same. A conservation plan must be submitted by a participant that emphasizes sustainability of natural resources, is based on ecological, economic, and social considerations, and includes the producer's decisions and objectives for the farm or ranch. The plan must allow the participant to achieve a cost-effective resource management system, or some appropriate portion of that system, identified in the applicable NRCS field office technical guide, for the priority natural resource condition in the priority area or the significant statewide natural resource concern outside a funded priority area. To comply with the statutory provisions that a participant may implement only one conservation practice using EQIP, we believe that a whole farm or ranch conservation plan is not required. The program is flexible and although it encourages participants to voluntarily develop a conservation plan that is comprehensive and addresses multiple natural resource concerns, it is not a requirement. The likelihood of being assigned a higher priority for selection as a program participant depends on whether the conservation plan will result in significant environmental benefits to justify its priority. NRCS intends to regularly monitor and evaluate the manner in which the program is implemented to assure the statutory, regulatory, and program guidance requirements are carried-out and not involuntarily exceeded.

FLOOD PLAIN EASEMENTS

Question. In July 1997, the NRCS notified District Conservationists of the Department of Agriculture's new position on the purchase of flood plain easements rather than providing conventional measures for emergency conservation and watershed protection. The Mississippi Delta has survived because of the aggressive flood prevention and watershed practices carried on throughout the area. Should NRCS allow nature to take its course, the Mississippi Delta would be characterized by impassable roads, washed out bridges, sediment-laden streams, non-productive crop lands, and dead bottomland hardwoods all due to long-standing floods. What spurred this "new" policy change?

Answer. Section 382, Title III, of the 1996 Farm Bill Public Law 104-127 authorized the Secretary of Agriculture to purchase flood plain easements as another technique of assisting local communities devastated by a watershed impairment through the Public Law 566, the Small Watersheds Program. Some sites have been repaired several times with traditional techniques and easements offer a more permanent solution to flood devastation in some situations. This change did not eliminate traditional watershed activities, it only provided the opportunity for the use of easements when and where desired.

Question. Please provide more definitive explanations of incidences where flood easements would be preferred over repair.

Answer. The most obvious example is where the cost of the easement is less than the cost of the repair. Another would be where the damage happens too often for the landowner and he/she decides they want a more permanent solution. Participation is entirely voluntary so that no one is forced to sell an easement.

WETLANDS RESERVE PROGRAM

Question. People who own land adjacent to tracts of land under easement restrictions in the Wetlands Reserve Program (WRP) have experienced adverse impacts from the water management plans. Has the agency given any consideration to the terms of Wetlands Reserve Program contracts which affect the adjacent landowners?

Answer. The current easement provides the Secretary with the authority to determine the future vegetative and hydrology conditions of the easement. Before any wetland practice is implemented by NRCS or by the landowner, NRCS has the opportunity to evaluate if there will be an impact on the rights of adjacent landowners. This present authority in the easement, coupled with the NRCS engineering capability, makes it possible for NRCS to preclude activities on the easement that would impact the rights of adjacent landowners. Although we are not aware that this problem currently exists, if we learn of specific instances where it is occurring appropriate corrective action can be initiated.

Question. Does the agency have the ability to give high priority on the adjacent landowner's considerations when structuring the terms of the participant's contract regarding the maintenance of watershed protection?

Answer. The agency has the ability and does place a high priority to ensuring that the rights of adjacent landowners are not adversely impacted by restoration activities on the Wetlands Reserve Program easement. The NRCS does not implement or approve the implementation by others of wetland practices on Wetlands Reserve Program easements that would exceed the legal rights inherent in the easement. If a situation arises where an adjacent landowner's rights have the potential to be impacted as a result of actions taken on easement lands, NRCS will work with the impacted adjacent landowner and the fee owner of the easement area to assure that no adverse impact occurs. If an impact does inadvertently occur as a result of activities on the easement, (e.g., a man induced development or a less controllable event such as a beaver dam encroachment) NRCS will work with the adjacent landowner and fee landowner to resolve the problem.

Question. Why is the fiscal year 1999 budget request proposing a decrease in mandatory funding for the Wetlands Reserve Program from \$219 million in fiscal year 1998 to \$124 million in fiscal year 1999?

Answer. The Wetlands Reserve Program has a maximum acreage cap of 975,000 acres. At the end of fiscal year 1998, we will have approximately 320,000 acres yet to be enrolled under this cap. We are proposing to enroll essentially one-half of the remaining acres in fiscal year 1999 and fiscal year 2000 respectively. The fiscal year 1998 sign-up is estimated to enroll approximately 212,000 additional acres. The funding request for fiscal year 1999 will provide for the enrollment of 164,214 acres.

Question. What amount of money is needed in fiscal year 1999 to fund the technical assistance required to carry out this program? Is this amount included in the fiscal year 1999 request?

Answer. The projected amount of technical assistance funding needed to carry out the program in fiscal year 1999 is \$15,089,000. This amount is included in the request. This includes \$11.089 million through CCC under CCC Charter Act Section 11 and \$4 million will be provided from unobligated balances from prior year WRP appropriated funds.

Question. What amount of money from carryover balances in previous fiscal years is going to be used for technical assistance for WRP in each of fiscal years 1998 and 1999? What are the available carryover balances in each of these years?

Answer. We plan to spend \$18.2 million of carryover funds for technical assistance in fiscal year 1998 and \$4 million of carryover funds for technical assistance in fiscal year 1999.

Question. Mr. Undersecretary, you state that technical assistance funding for fiscal year 1999 will include unobligated appropriated funds (\$4 million) and CCC funds (\$11,089,000). Please explain.

Answer. The projected amount of technical assistance funding needed to carry out the program in fiscal year 1999 is \$15,089,000. We project that we will have approximately \$4,000,000 of appropriated funds that will not be obligated at the beginning of fiscal year 1999. We propose to utilize these funds along with \$11,059,000

of funds from the CCC to meet the total technical assistance funding need for the Wetlands Reserve Program in fiscal year 1999.

USE OF OTHER AGENCY RESEARCH

Question. Mr. Weber, in your statement you indicated that erosion still occurs by two billion tons per year. Does the agency use the research that CSREES, ARS, and land grant universities do on soil erosion to improve conservation practices by farmers?

Answer. NRCS works closely with CSREES, ARS, and other agencies at the national level in identifying research and extension needs and in setting priorities. We also work with ARS and land grant university scientists in conducting field research on erosion and other natural resource issues, and with Extension Specialists in training programs for staff and in extension educational programs for clients. Research results are used by NRCS in developing guidelines for conservation practices at the national and state levels. Extension programs help NRCS deliver technology to clients and to inform the public about resource issues. Examples of current cooperative efforts that are paying significant dividends to address soil erosion problems include work on erosion prediction models, conservation buffers, conservation tillage, and grazing land management.

URBAN RESOURCES PARTNERSHIP

Question. The administration initiated Urban Resources Partnership (URP) as an interagency, cooperative Federal partnership in 13 major cities and metropolitan areas. NRCS projects that \$2.5 million will be expended for URP in fiscal year 1998. This includes \$2 million for project activity and \$500,000 for staff costs. What does the agency project to spend in fiscal year 1999?

Answer. It is estimated that NRCS will allocate \$2 million for project activity for URP in fiscal year 1999. Staff cost are estimated at \$500,000 for URP in fiscal year 1999.

Question. How many matching non-federal dollars is NRCS expecting to receive in fiscal year 1998?

Answer. NRCS is estimating that the non-federal match for URP in fiscal year 1998 will be \$500,000.

AMERICAN HERITAGE RIVERS

Question. The Administration established the American Heritage Rivers (AHR) in 1997 to help communities restore and protect their communities. Ten rivers will be designated by the President. NRCS participated in the design of the AHR initiative. NRCS provided \$94,000 in fiscal year 1997 for staff time in designing the initiative. During fiscal year 1998, NRCS projects \$225,000 will be provided for staff time until the ten rivers are designated. When will the ten rivers be designated?

Answer. It is expected that the ten rivers will be designated by the President in April 1998.

Question. How much more money does the NRCS anticipate needing for fiscal year 1998? In fiscal year 1999?

Answer. Future support for this initiative will not be known until the ten rivers are designated. It is expected that the level of support in fiscal year 1999 will be comparable to fiscal year 1998.

Question. In fiscal year 1997, 60 percent of the funds came from the NRCS Conservation Operations account, and forty percent from the Watershed Surveys and Planning Account. What is the breakdown in percentages from these accounts in each of fiscal years 1998 and 1999?

Answer. Until the rivers are designated and the specific work that must be undertaken is known, an estimate of the breakdown is not possible.

NORTHWEST SALMON RECOVERY

Question. In fiscal year 1998 no funds will be allocated specifically for the Northwest Salmon Initiative from the Conservation Operations Account. However, there are 10 small watershed projects that included salmon as an integral part of their natural resource concerns. The fiscal year 1998 funding for the salmon recovery effort will be funded primarily through these projects. Where are these 10 small watershed projects located? How much money in fiscal year 1998 are each of these 10 small watershed projects receiving?

Answer. The fiscal year 1998 funds for the Public Law 566 program could only support nine Small Watershed Projects that included salmon as an integral part of their natural resource concerns.

The list is as follows:

Northwest salmon initiative projects

<i>State/project name/county(s)</i>	<i>Fiscal year 1998 allowance</i>
California: Hayfork Creek: Trinity	\$65,000
Oregon: Buck Hollow: Wasco and Sherman	180,000
Idaho:	
Mission-Lapwai: Nez Perce and Lewis	200,000
Tammany: Nez Perce	
Bedrock: Clearwater and Nez Perce	
Washington:	
Omak Creek: Okanagan	50,000
Tucannon Creek: Columbia/Garfield	60,000
Moxee Creek: Yakima	210,000
Tennile Creek: Whatcom	100,000
Total	1,115,000

These projects consist largely of land treatment measures that indirectly benefit salmon habitat as well as directly improve water quality through reduced erosion and sediment, improved animal waste management, and increase the efficiency of irrigation water.

Question. In the fiscal year 1999 budget request, how much money is designated for the Northwest Salmon Recovery program? From which accounts will the funds come and how much from each account?

Answer. Funds have not been designated at this time for the Northwest Salmon Recovery Program for fiscal year 1999. It is expected that funds spent for this purpose will come from the Watershed Surveys and Planning Program in the Conservation Operations account.

URBAN ENVIRONMENTAL RESOURCES INITIATIVE

Question. The Urban Environmental Resources Initiative is an environmental protection strategy for the citizens of the District of Columbia to help make the urban forests and related natural resources healthier. How much did NRCS contribute in fiscal year 1998 to this challenge cost-share initiative program?

Answer. NRCS contributed \$50,000 to the challenge cost-share initiative.

Question. From which account did this money come?

Answer. Conservation Technical Assistance under the Conservation Operations program funded this activity.

Question. How much does the NRCS plan to contribute in fiscal year 1999 and from which account?

Answer. NRCS plans to contribute \$50,000 in fiscal year 1999 to the challenge cost-share initiative; funds will come from the Conservation Operations Technical Assistance account under the Conservation Operations program.

Question. Does NRCS contribute to this program in other ways besides the challenge cost-share initiative program? Please explain and provide all moneys used and the accounts from which they come.

Answer. NRCS also provides technical assistance to the Initiative. In fiscal year 1998 a Resource Conservationist and a part time Administrative Assistant were brought in to provide the day-to-day management for the Initiative. In fiscal year 1998 \$200,000 was set aside for technical assistance to cover the cost of salaries and associated administrative expenses such as office space rental and equipment.

CONSERVATION OPERATIONS

Question. In the fiscal year 1999 President's Budget request, language is proposed to provide the authority to expand the use of Conservation Operations funds to support the technical assistance activities of other programs administered by NRCS such as EQIP, WRP, and CRP. Why has the Administration proposed this new language?

Answer. The Administration has proposed this new language to clarify the authority for NRCS to use funds appropriated under the Conservation Operations account for technical assistance and administrative activities in support of natural resource conservation programs, in addition to the conservation assistance authorized by the Soil Conservation and Domestic Allotment Act of April 27, 1935 (16 U.S.C. 590a-590f), for which responsibility has been delegated to NRCS. These would include the conservation of highly erodible land and wetlands under the Food Security Act of 1985, technical assistance under the Watershed Protection and Flood Prevention Act

(16 U.S.C. 1001–1009) and the Flood Control Act (33 U.S.C. 701), and technical assistance for some of the conservation programs funded by the Commodity Credit Corporation.

Question. Isn't this current practice?

Answer. NRCS is currently providing technical assistance through the Conservation Operations program for conservation of highly erodible land and wetlands (conservation compliance, sodbuster, and swampbuster) under the Food Security Act of 1985 and for some conservation programs funded by the CCC (Conservation Reserve Program and Environmental Quality Incentives Program). Congress noted this technical assistance support in the legislative reports accompanying the appropriations for fiscal year 1998. We have not used Conservation Operations account funds for technical assistance for the Watershed Protection Program or for the Flood Control Program.

Question. The fiscal year 1999 budget proposes to establish the America's Private Land Conservation Legacy (APLC) program by redirecting the appropriated resources formerly used for Conservation Technical Assistance (CTA). Please explain the need for the America's Private Land Conservation Legacy (APLC) program and how this program will differ from the Conservation Technical Assistance (CTA) program?

Answer. Nearly 70 percent of the United States, excluding Alaska, is private land—the single largest portion of our country's landscape. We believe that by renaming the CTA program, we are able to more properly identify the focus of our work. America's Private Lands Conservation Legacy program will increase the significance of conservation on private lands for environmental and economic benefits. The program will continue the 60 year conservation technical assistance support activities that have provided individuals, groups and communities with assistance in solving their conservation problems and achieving local and national conservation objectives. In addition, America's Private Lands Conservation Legacy program focuses conservation technical assistance on enhancing Locally Led Conservation efforts, expanding partnerships, achieving leveraging objectives, enhancing natural resource assessments for decision-makers, developing appropriate technologies and maintaining a readiness to respond to natural disasters.

The America's Private Lands Conservation Legacy program being refocused and rearticulated delivers to our conservation partners an integrated conservation process consisting of five basic products: technological innovation, information, conservation partnerships, conservation planning, and implementation of the conservation plans. The former traditional framework for delivering conservation are components of this approach.

Question. Does this proposed program require authorization?

Answer. Conservation technical assistance activities were authorized under the 1935 Soil Conservation and Domestic Allotment Act. Changing the name of these activities to America's Private Lands Conservation Legacy program does not require authorization.

Question. The fiscal year 1999 budget also proposes an increase of \$20,000,000 to encourage the States to increase their share of contributions to "designated programs" in support of the President's Clean Water Initiative. Which programs are designated for this increase in cost-share funds?

Answer. This funding can support the President's Clean Water Initiative and other efforts to strengthen locally led conservation and voluntary conservation efforts by encouraging more leveraging of limited Federal resources. This funding is part of the America's Private Land Conservation allocation, and will be used to support NRCS's efforts to help state and local entities who increase their contributions to the conservation effort. Programs supported by increased state and local contributions will be the ones to benefit from this funding.

Question. When would the "to be determined threshold level of contributions" from the States be announced? How will these levels be determined?

Answer. It has not been determined when these levels of contributions will be announced. They will be determined as the amount of state and local funding dollars are identified. Based on the total number of dollars identified per state, a percentage for each state will be decided by the NRCS America's Private Land Conservation program manager. The threshold levels of contributions will be determined at this same time.

Question. Currently in fiscal year 1998, what total amount of funds is given to the States for these activities? How are these funds determined?

Answer. Currently America's Private Land Conservation base funding is provided to NRCS managers to carry out various programs. This program would provide increased levels of support for NRCS in providing assistance under the programs receiving additional state and local contributions.

Question. Is this proposed \$20 million an increase to the fiscal year 1998 Conservation Operations budget?

Answer. Yes. The \$20 million is a component of the net \$47.371 million increase in America's Private Land Conservation Legacy Program.

Question. Please explain the proposed competitive partnership grants in the fiscal year 1999 budget request.

Answer. Federal, state, and tribal programs can help produce clean water and healthy watersheds, but the commitment and resources of local communities, private landowners, and citizens are essential to improving and maintaining lake, river, coastal, and wetland resources. Effective and strong partnerships are the foundation for both restoring impaired watersheds and sustaining watersheds that are currently healthy. The benefits of watershed partnerships, which typically involve those who live and work in the watershed, are multiple. They build grassroot constituencies with a commitment to long-term improvements. The watershed partnerships can generate new ideas and information and lead to a common understanding of individual roles, priorities, and responsibilities. They can promote a more efficient use of limited financial and human resources.

The competitive partnership grants are intended to be used to hire non-Federal, local watershed coordinators to identify and engage local watershed partners in the process of identifying natural resource problems, setting goals, and developing watershed restoration plans. These grants would be offered on a competitive basis to such groups as conservation districts, watershed districts, Resource Conservation and Development councils, land trusts and other non-profit and community action groups.

Question. If these grants are used to hire non-Federal, locally-based watershed coordinators, how many full-time equivalents (FTE) will be displaced? Are these displaced FTE's in the field?

Answer. The primary objective of the grants will be to hire non-Federal watershed coordinators. No full-time equivalents will be displaced. These non-Federal staff will complement any NRCS staff who are performing watershed coordination-type duties and functions.

NATIONAL RESOURCES INVENTORY COSTS

Question. An increase of \$3 million is proposed for additional land health monitoring and assessment and to enhance the National Resources Inventory (NRI). In fiscal year 1998, how much money is allocated for the NRI?

Answer. NRCS has allocated approximately \$30 million to support the 1997 baseline National Resources Inventory (NRI) and related activities in fiscal year 1998. This includes approximately \$26 million being used for field data collection.

Question. Does this come out of the Conservation Operations account currently?

Answer. These funds come out of the Conservation Operations account.

Question. How much money is estimated for fiscal year 1999?

Answer. The total estimated cost for the NRI for fiscal year 1999 is approximately \$33 million. The additional \$3 million is needed to evaluate soil quality and resource health, assess nutrient load, and integrate NRCS NRI data on private lands with Forest Service data on public lands. Inventory, monitoring and assessments will include the initiation of a continuous foundation NRI, the special NRI, and land health monitoring studies. Partnerships efforts include the integration of the NRI with the Forest Service's Forest Inventory Assessment and the National Agricultural Statistics Service's Agricultural Resource Management Study and the Mid-Atlantic Pilot of the Committee on Environment and Natural Resources Environmental Monitoring Initiative.

TRANSFER OF OUTREACH PROGRAM TO DEPARTMENTAL ADMINISTRATION

Question. At the Administration's request, in the fiscal year 1998 budget the Committee moved \$193,000 from the Farm Services Agency for the Outreach Program for Socially Disadvantaged Farmers and Ranchers to NRCS Conservation Operations account. Now I note that the Secretary has moved this program account to the Departmental Administration account, and further, has transferred \$566,000, a difference of \$373,000, associated with administration of that Outreach program from Conservation Operations to the Departmental Administration account. Under what authority did you move this account and funding?

Answer. This account and funding were transferred under the Secretary's delegation of authority as provided in the Department of Agriculture Reorganization Act of 1994, Public Law 103-354, Section 212 (d)(1)(B).

Question. Why was this funding transferred from Conservation Operations to Departmental Administration?

Answer. The USDA Civil Rights Action Team report recommended the establishment of an Office of Outreach . . . "Assign responsibility for the Outreach and Technical Assistance to Socially Disadvantaged Farmers (2501) program to this new office to assure Department-wide implementation." The funds were transferred to Departmental Administration to cover the costs of salaries and related expenses of the eight FTE's operating the program in response to this recommendation.

GRAZING LANDS

Question. In each of fiscal year 1997 and fiscal year 1998, \$15 million was earmarked for the continuation of the grazing lands conservation initiative. Please update the Committee on this initiative and include any money in the fiscal year 1999 President's budget request for this project.

Answer. The Grazing Land Conservation Initiative (GLCI) has produced significant accomplishments over the past 2 years as a result of directing funds specifically to this activity. Technical assistance available to private grazing lands has increased by 160 staff years. Over 2,000 Natural Resources Conservation Service staff have received formal training in various aspects of grazing lands management. More than 11,000 individuals received technical assistance on 40 million acres of private grazing lands in 1997. Over 100 special grazing lands projects were established in partnership with State GLCI Coalition. An active marketing and outreach plan was implemented in each region of the Country.

In fiscal year 1997, \$10 million was earmarked for this effort. In fiscal year 1998, \$15 million is being directed to this activity. The fiscal year 1999 President's budget contains \$15 million this activity which is included in the base program.

STATUS OF SPECIFIC EARMARKS

Question. Please provide the Subcommittee with a status report on the activities and funding for fiscal year 1998 and the level of funding in the fiscal year 1999 budget request, if any, for the following projects and programs:

- agricultural development and resource conservation in native Hawaiian communities serviced by the Molokai Agriculture Community Committee,
- Great Lakes Basin Program for soil and erosion sediment control,
- ground water activities in eastern Arkansas, including Boeuf-Tensas, and Bayou Meto, and Kuhn Bayou,
- Great Lakes watershed initiative,
- Chesapeake Bay,
- GIS Center for Advanced Spatial Technology and the National Digital Orthophotography Program,
- Multi-year Rural Recycling and Water Resources Initiative in AR, LA, and MS,
- Indian Creek Watershed, MS,
- loess hills erosion problem, IA,
- Poinsett Channel main ditch no. 1, AR,
- alien weed pests in Hawaii,
- grazing lands initiative, WV,
- water treatment practices for wastewater from aquaculture in WV,
- poultry litter composting project in WV,
- feasibility study for watershed in Waianae, HI, and
- poultry-related pollution of the South Branch of the Potomac, including the poultry waste energy recovery project in Moorefield, and resource recovery at Franklin, WV.

Answer. The status of each follows.

MOLOKAI AGRICULTURE COMMUNITY COMMITTEE

The \$250,000 earmarked in fiscal year 1998 are targeted to addressing conservation and agricultural development needs of the Island of Molokai and its Hawaiian population. NRCS oversees the earmarked funds through an agreement with the Molokai-Lanai Soil and Water Conservation District. Most of the funds to date have been used for on-farm/ranch projects for irrigation and fencing. NRCS technical assistance provided through the ongoing Conservation Operations program is over and above the earmark. A decrease of \$250,000 is proposed for this item in fiscal year 1999.

GREAT LAKES BASIN PROGRAM FOR SOIL AND EROSION SEDIMENT CONTROL

This project has been active since its inception in 1991. No other federal agency contributes funding for this project. NRCS is contributing \$350,000 in fiscal year 1998. The project is expected to continue through the year 2002. \$750,000 will be

needed in each fiscal year through the year 2002 to complete this project. \$750,000 is included in the fiscal year 1999 budget request for this project. A decrease of \$350,000 is proposed for this item in fiscal year 1999.

EASTERN ARKANSAS GROUND WATER ACTIVITIES

Boeuf/Tensas.—To date the local sponsors continue to inform the public of water decline and water quality status as well as promoting solutions to the problems. The Arkansas NRCS irrigation team is developing critical aspects of the project which include digitized soils and data layers through the University of Arkansas for use in the NRCS Geographic Information System (GIS), inventories of streams, canals, reservoirs, utilities, farms, cultural resources, wildlife, and other important land use features and resource concerns are being identified. Approximately 50 percent of the inventory has been completed. A 3-party memorandum of understanding between NRCS, Arkansas Soil and Water Conservation Council (ASWCC), and the local irrigation district is being jointly developed.

It is anticipated NRCS will spend \$400,000 of Conservation Technical Assistance funds in fiscal year 1998 to provide assistance in support of the Boeuf Tensas project.

Goals for fiscal year 1998 include publishing maps of soils information for the 1.2 million acres within the project area, completion of data inventory for on-farm portions of the project area, completion of a water budget calculation for each tract of the 1.2 million acres with the project area, completion of the preliminary irrigation canal and/or pipeline delivery system for the entire 1.2 million acre project area, development of public information maps and fact sheets for project sponsor local information/education efforts, and coordination with the Corps of Engineers (COE) to proceed with planning efforts. No specific funding was included in the fiscal year 1999 budget for this project.

Bayou Meto.—To date the Natural Resources Inventory has been completed that includes GIS soils data layers, water quality and water quantity analysis, irrigation water needs analysis for more than 3000 tracts, wildlife, cultural resources, and a completed environmental assessment for the on-farm portion of the project plan. NRCS has completed a final areawide Natural Resource Conservation Plan for on-farm conservation practices and delivered the plan to the project sponsors. The COE has received authorization to proceed with planning for flood control and irrigation water supply and other purposes in this watershed. An initial coordination meeting was held in February between the COE, NRCS, and local sponsors and the details were agreed to as to the roles and responsibilities in the 1998 planning activities of each agency.

It is anticipated NRCS will spend \$200,000 of Conservation Technical Assistance funds in fiscal year 1998 to provide assistance in support of the Basin Wide Resource Assessment for the Bayou Meto project.

This project has been identified as a priority area for the Environmental Quality Incentives Program (EQIP). Financial assistance funding has been made available through EQIP to begin the land treatment phase for this project.

Goals for fiscal year 1998 include coordination and transfer of data and information from the completed on-farm portion of the areawide Natural Resources Conservation Plan to the COE to assist them with their efforts in moving into the planning phase of the delivery portion of this project and development of a cooperative agreement and work plan in cooperation with COE, Memphis District, to refine and complete the total Resource Conservation Plan for this project. No specific funding was included in the fiscal year 1999 budget for this project.

Kuhn Bayou.—To date the local sponsors continue to inform the public of water decline and water quality status as well as promoting solutions to the problems. The Natural Resources Conservation Plan has been completed. NRCS is currently performing some of the surveying and design functions for this project. A public meeting was held on August 19, 1997, and a decision was made by the local sponsors to complete the design phase of this project. Local sponsors and NRCS have entered into a Cooperative Agreement to complete the design with some funding provided by the local sponsors. Design completion is scheduled for August 1998.

It is anticipated NRCS will spend \$100,000 of Conservation Technical Assistance funds in fiscal year 1998 to provide design, surveying, and inventory work in the Kuhn Bayou project.

Goals for fiscal year 1998 include completion of the structural design for one large water control structure, completion of the design of the irrigation delivery canals and relief stations, incorporation of the irrigation pipeline design to assure water delivery to each tract, completion of 100 percent of the land rights work maps and provide to the local sponsors for land rights/easements acquisition, and preparation

of final cost and information/education package for local sponsor efforts in providing information to their clients. No specific funding was included in the fiscal year 1999 budget for this project.

GREAT LAKES WATERSHED INITIATIVE

Twelve demonstration farms, six in the Lake Erie drainage and six in the Lake Ontario drainage, are currently being established. The next phase of compiling data and analyzing results on practices such as integrated pest management, constructed wetlands for dairy facilities, bark bed filter strips, grass filter strips, stabilized livestock crossing systems, chemical mixing and rinsing pads, packed gravel barnyard treatment systems and alternative watering systems is continuing. This initiative is scheduled to run through the year 2002. NRCS technical assistance funds in the amount of \$75,000 will be needed each fiscal year through the year 2002. \$75,000 is included in the fiscal year 1999 budget request

CHESAPEAKE BAY

NRCS has been providing assistance to the Chesapeake Bay Program for over ten years. In fiscal year 1998, \$4.750 million has been allocated to the six States in the Chesapeake Bay area. We actively support and participate in the program by providing training to Conservation District employees, including Bay Technicians and Engineers; developing conservation plans as a basis for bay contracts; technical approval of engineering plans and designs; on-site technical evaluations of complex problem areas and inspections of works in progress. Staff contribute to the overall program of reducing erosion and sedimentation, nutrients, and improving water quality. Chesapeake Bay contracts for Best Management Practices treating thousands of acres and providing nutrient reductions of nitrogen, phosphorus, and potash.

During the past year, over 900 systems were planned with waste management components, over 3,200 conservation systems were planned, over 117 thousand acres benefited from the application of conservation practices, and riparian area protection and use of conservation buffers were actively planned and installed. No specific funding was included in the fiscal year 1999 budget for this project.

GIS CENTER FOR ADVANCED SPATIAL TECHNOLOGY

Work at the Center for Advanced Spatial Technology continues. Currently support is being given to an initiative to place completed Arkansas soil surveys on the Internet including the one for Woodruff County. Activities also include supporting the implementation of Field Office Computer Systems (FOCS) Geographic Information (FGI) at high priority NRCS Field Service Centers. The goal is to have FGI implemented in four Field Service Centers by the end of fiscal year 1998. In fiscal year 1998, \$48,000 has been provided to support the activities of the Center for Advanced Spatial Technology. No specific funding was included in the fiscal year 1999 budget for this project.

NATIONAL DIGITAL ORTHOPHOTOGRAPHY PROGRAM

The NRCS contributed \$6,225,000 to the National Digital Orthophoto Program in fiscal year 1998, and anticipates use of \$6,250,000 in fiscal year 1999. Approximately 30 percent (about 760 counties) of the conterminous US is now complete with high resolution digital orthoimagery. Another 40 percent of the country is in production. By the end of fiscal year 1998, orthoimagery for an additional 10 percent of the country is planned for production.

The success of this program is directly related to Federal, State and local agencies need for an up-to-date digital picture of the landscape to be used in a geographic information system. Good progress is also being made as a result of agencies willingness to cost-share and cooperate in the development and sharing of the data. The orthoimage provides a rich source of information for business activities like natural resource planning, transportation management, pipeline routing, urban planning, parcel mapping and delineation of wetlands and soils. The National Digital Orthophoto Program goal is to have orthoimagery in production over all private lands by the year 2000, and all Federal lands by 2002.

MULTI-YEAR RURAL RECYCLING AND WATER RESOURCES INITIATIVE

The data collection phase for the Mississippi Delta Water Resources Study has been completed with the final draft being compiled and completion of the draft anticipated by June 1, 1998.

Plans are being made to implement practices for the Mississippi Delta Recycling and Water Project within the Environmental Quality Incentives Program (EQIP) priority area during fiscal year 1998. No specific funding was included in the fiscal year 1999 budget for this project.

INDIAN CREEK WATERSHED

The Indian Creek Watershed Project is in the design stage and scheduled to be contracted for construction during fiscal year 1998. No specific funding was included in the fiscal year 1999 budget for this project.

LOESS HILLS EROSION PROBLEM, IOWA

Project sponsors plan to install thirty-eight erosion control structures during fiscal year 1998. These are in addition to the fifty-seven structures in fifteen counties in western Iowa that have been installed since the inception of this project in 1992.

This is a cooperative project involving support from all levels of government. In fiscal year 1998, the Federal government, through NRCS, contributed \$400,000 to this project. The State of Iowa contributed \$1 million (compared with \$400,000 in 1997), while county contributions were approximately \$575,000 (up from \$460,000 in 1997). NRCS has contributed \$400,000 annually since the project began.

In fiscal year 1997, a total of \$1.29 million was spent on this project. As a result, an estimated \$4,966,785 of local infrastructure and land was protected. Thus every dollar spent on the project during 1997 resulted in the prevention of almost \$4 in damages. Throughout the life of the project, \$4.3 million has been spent to prevent \$21 million in damages.

Project sponsors are seeking \$1 million from the Federal government in fiscal year 1999 for this project. It is estimated that a total of \$30.3 million is needed to complete this effort. At present levels of funding, it is estimated that it will require 18 years to complete this project. If the Federal government provided \$1 million annually, this figure would drop to 12 years.

During fiscal year 1997, \$400,000 of Federal funds were combined with \$400,000 in State funds and \$460,000 in local funds to build 13 stream stabilization (channel degradation) projects in 12 western Iowa counties. These projects will keep these streams from cutting deeper into the landscape and prevent an estimated \$5 million in damages to farmland, roads, bridges, and other infrastructure.

For fiscal year 1998, \$400,000 of Federal funds will be combined with \$1 million in state funds and \$740,000 in local funds to build 24 projects in 14 western Iowa counties. These projects will provide benefits roughly proportional to those listed above, preventing approximately \$8.5 million in damages to farmland and rural infrastructure. A decrease of \$400,000 is proposed for this item in fiscal year 1999.

POINSETT CHANNEL MAIN DITCH NO. 1, ARKANSAS

Technical assistance funding continues to be provided for channel improvement in the Poinsett Watershed Project located in Craighead and Poinsett Counties. To date, 31 of 36 floodwater retarding structures have been constructed. The five remaining structures have an estimated construction cost of \$1.5 million in financial assistance. Two channel improvement contracts for a water control structure and 1.3 miles of channel improvement have been constructed at a cost of \$954,511. The remaining approximate 17.7 miles of channel improvements have an estimated construction cost of \$4.1 million in financial assistance. Work is planned to be completed over several years. No specific funding was included in the fiscal year 1999 budget for this project.

ALIEN WEED PESTS IN HAWAII

NRCS has allocated \$20,000 in fiscal year 1998 to begin to address the alien weed pests in Hawaii. To date, NRCS has met and is working with the Big Island RC&D Council, Soil and Water Conservation Districts, and the Gorse Committee to formulate a plan to address the gorse problem on the Big Island. No specific funding was included in the fiscal year 1999 budget for this project.

GRAZING LANDS INITIATIVE IN WEST VIRGINIA

In fiscal year 1998 \$300,000 of appropriated funds are being used to support technical staff, the collection of forage and fecal samples and to provide education assistance to grassland farmers. Two grazingland specialists and field office staffs are providing direct on-farm assistance to farmers to improve their pasture management systems using both forage and economic analysis. Along with on-going assistance the goal is to improve over 65,000 acres of pasture for 125 farmers. In addition, 30

farmers will attend a 3-day forage and livestock school to improve their management and marketing skills. Over 500 forage and livestock fecal samplings indicate low quality forages due to mis-management resulting in lost income. Estimated economic benefits is \$15/ac/year once an improved grazing system is fully implemented by the farmer. This will result in an annual increased return of \$990,000 at existing funding levels. A decrease of \$300,000 is proposed for this item in fiscal year 1999.

WATER TREATMENT PRACTICES FOR WASTEWATER FROM AQUACULTURE IN WV

In fiscal year 1998 no funding was provided for this activity, however, two weeks of engineering time was spent developing Field Office Tech Guide standards for the treatment of waste-water from aquacultural activities. The development of these standards is an interagency effort and the participants comprise a part of the State Technical Committee. No specific funding was included in the fiscal year 1999 budget for this project.

POULTRY LITTER COMPOSTING IN WEST VIRGINIA

Investigations and contacts have been made on five sites outside the Potomac River Watershed. Currently this project is in the planning stage with application to start in early summer of fiscal year 1998. NRCS has allocated \$120,000 to fund the technical assistance needed for this project. A decrease of \$120,000 is proposed for this item in fiscal year 1999.

FEASIBILITY STUDY OF WATERSHED IN WAIANAE, HAWAII

This study was directed as a result of damage caused by heavy rains to this and other watersheds in November of 1996. An assessment of the feasibility of flood control projects or mitigative measures which would reduce the reoccurrence of damages was necessary. Through an agreement with the Corps of Engineers, Honolulu District, the Corps will carry out the assessment under the direction and coordination of NRCS. NRCS is spending \$200,000 for this item in fiscal year 1998. A decrease of \$200,000 is proposed for this item in fiscal year 1999.

POULTRY RELATED POLLUTION ON THE SOUTH BRANCH OF THE POTOMAC

NRCS has entered into a cooperative agreement with the West Virginia Department of Agriculture (WVDA) and Franklin, WV, to do the second phase of a feasibility study for a poultry waste digester. In fiscal year 1998, NRCS will provide \$90,000. NRCS has also entered into an agreement between WVDA and Moorefield, WV, for the operational expenses of the digester located in Moorefield. NRCS will provide \$50,000 in fiscal year 1998 for this effort. No specific funding was included in the fiscal year 1999 budget for this project.

POULTRY WASTE PROBLEM IN WEST VIRGINIA

Question. Several projects in West Virginia address the poultry waste problem in West Virginia. Are any of these projects repetitive in nature?

Answer. No, the various projects underway in West Virginia are not repetitive, though several are commonly directed toward meeting our goals relative to the Chesapeake Bay. For instance, five sites within the Potomac River Basin are receiving additional technical assistance to develop composting as an alternative utilization of poultry litter. In a separate cooperative agreement with the West Virginia Department of Agriculture, we are also supporting feasibility and operational assistance of separate projects in Franklin and Moorefield, West Virginia, the latter of which is focused on the utilization of poultry litter as an alternative energy source. We believe that the work associated with these activities will contribute to our overall efforts to address animal waste problems across the country.

Question. Are all of these projects related? If yes, does NRCS have a plan for these activities so that a common goal is reached to minimize the poultry waste problem in West Virginia? Which account under NRCS would this work be done?

Answer. These projects are related in the sense they are all focused on alternative uses of poultry litter. We expect that as we learn more about these technologies, and as they are better understood at the local level, our current progress relative to conservation programs and technical assistance will be enhanced. All of these activities are currently funded from our Conservation Operations and Technical Assistance funds.

COLORADO RIVER SALINITY CONTROL PROGRAM

Question. Are all current balances expended for the Colorado River Basin Salinity Control Program? If not, how much is available and in which fiscal year will it all be expended?

Answer. The Colorado River Basin Salinity Control Program has approximately \$5,661,000 left in obligated funds for contracts to be expended on installation of salinity control practices. It is expected that these funds will be expended by the year 2004.

Question. How many projects that once received funding through the Colorado River Basin Salinity Control Program are continued with funding through EQIP? Which projects are these?

Answer. There are 5 projects that once received CRBSCP funding that are currently receiving EQIP funding. These projects are Grand Valley, Colorado; Lower Gunnison Basin, Colorado; McElmo Creek, Colorado; Uinta Basin, Utah and Big Sandy River, Wyoming.

PLANT MATERIALS CENTERS

Question. The fiscal year 1999 budget request indicates a decrease of \$1 million for Plant Materials Centers because of the completion of renovation and modification work. Please list the renovations and modifications work which will be completed by fiscal year 1999, yielding this \$1 million in savings, and specify the completion date of each project.

Answer. A partial list of projects scheduled for completion in fiscal year 1998 can be found in the table provided. Their cost is about \$1 million.

Fiscal year 1998 plant materials renovation completions

<i>Plant center</i>	<i>Project: Maintenance, renovation, equipment</i>
Lockeford, CA	Heating-AC system.
Hoolehoa, HI and Pacific Basin	Re-roof equipment building.
Aberdeen, ID	Combine 10-ft header.
	Irrigation system at PMC office/greenhouse.
	Swather.
Corvallis, OR	Safety upgrade and expand existing storage shed.
Booneville, AR	Plot harvester.
Golden Meadow, LA	Machinery storage bldg. canopy.
	Grass drill.
Nacodoches, TX	No-till seeder.
Kingsville, TX	100 HP tractor.
Knox City, TX	¾-ton truck stakebed.
Manhattan, KS	Upgrade flood irrigation well number 3.
Bridger, MT	Dust collection system (safety need).
	Forage dryer.
Bismarck, ND	Tractor.
Ellsberry, MO	Renovation of electrical system.
Brooksville, FL	New roof two pump houses, paint all buildings.
Americus, GA	Irrigation pump and motor.
Coffeerville, MS	Plot combine.
	Laboratory operations.
Beltsville, MD	Irrigation hydrant for remote field.
	Greenhouse—Reskin and new heat system to improve efficiency.
Cape May, NJ	Office modification for handicap.
	Upgrade degraded facilities (paint, siding, gutters).
Alderson, WV	PMC development (in part) of physical facilities.

PLANT MATERIALS CENTERS

Question. Is any renovation and modification work scheduled for fiscal year 1999 or future fiscal years? Please provide for the record, by center and project, the work

needed, when the renovation/modification is scheduled to be done, and the amount of funding required.

Answer. Renovation and modification work is scheduled for fiscal year 1999 through fiscal year 2002 according to plant center needs that are now identified. In order to identify needs effectively, the program has a 5-year plan (1998–2002) that is updated annually. For the period fiscal year 1999–2002, a total of \$4.8 million, or about \$1.2 million/year, is needed. As with any farm operation, regular maintenance, facility renovation, and equipment replacement are important and key elements to avoid larger cumulative expenses in the future. In addition, the program is able to operate more productively and have safe and healthy working conditions with continued regular maintenance.

With 26 centers in the Plant Materials Program, needs vary from one location to another, by year, and according to the condition of buildings, roads, property, and equipment. A list of specific project needs is presented in the table below. The diversity of needs identified in the table illustrates the scope of operations in the program.

PROJECTED PLANT CENTER NEEDS: MAINTENANCE, RENOVATION, NEW CONSTRUCTION, AND EQUIPMENT ACQUISITION

Plant center/item project description	Fiscal year when planned with costs			
	1999	2000	2001	2002
Booneville, AR:				
New office building			\$200,000	
Items (3) less than \$10,000 each	\$12,500			
Tucson, AZ:				
Phase 3-PMC rehabilitation	56,700			
Brush machine (commercial size)	11,500			
Seed drill (Truax no-till drill)			12,000	
3/4-ton pickup				\$20,000
Items (2) less than \$10,000 each		\$3,000		8,000
Lockeford, CA:				
Panel van	20,000			
4-row bed shaper with rototiller	15,000			
Soil mixer		12,000		
Administration building roof			20,000	
Paint buildings				20,000
Seal asphalt				15,000
Bldg. area water pump				10,000
Seed bldg. dust system				10,000
Fire alarm				10,000
Item (3) less than \$10,000 each				14,000
Meeker, CO: No long-range update submitted in 1997				
Brooksville, FL:				
4-wheel ATV	12,000			
Plot vacuum harvester	35,000			
Upgrade office elect., heat/AC		18,000		
Expand conference and educational building		48,000		
Re-pave parking lots and driveway		65,000		
1/2-ton pickup truck			14,000	
Hydro seeder				15,000
Up-grade irrigation system				52,000
Items (7) less than \$10,000 each	7,000	22,000	4,000	
Americus, GA:				
Large scale (digital)	1,000			
Grass drill	10,000			
One row tractor	15,000			
Pave driveway	25,000			
Tractor 50–60 hp		25,000		
Hy-cycle sprayer		25,000		
Tractor 80–90 hp			35,000	
Greenhouse			30,000	
Seed germinator			10,000	
Van				18,000
Walk-in seed storage unit				30,000
Items (6) less than \$10,000 each	4,000	12,500	5,000	

PROJECTED PLANT CENTER NEEDS: MAINTENANCE, RENOVATION, NEW CONSTRUCTION, AND
EQUIPMENT ACQUISITION—Continued

Plant center/item project description	Fiscal year when planned with costs			
	1999	2000	2001	2002
Houehua, HI:				
Tractor, 42 HP	35,000			
Front end loader attachment for 595 tractor	10,000			
Paint/repair bldgs. (shop /seed)	30,000			
Parking lot/driveway paving	75,000			
Potable water hook-up	45,000			
Seed storage walk-in unit		27,000		
Paint PMC seed/equipment building		30,000		
Seed dryer/dust ventilation			25,000	
Paint office			10,000	
Items (2) less than \$10,000 each	9,000			
Aberdeen, ID: No long-range update submitted in 1997				
Manhattan, KS:				
Pickup truck 1/2-ton	14,000			
Tractor with loader (65 HP and 4 WD)	27,000			
Flail vac seed stripper		18,000		
Binocular microscope with camera attachment		10,000		
Pickup truck 1/2-ton (4 WD)			18,000	
Tractor (40 HP and 2 WD)			25,000	
Weed badger tree cultivator				20,000
Gated irrigation pipe for flood irrigation				17,000
Replace oil storage building				10,000
Items (2) less than \$10,000 each		9,000	9,000	
Galliano, LA:				
Pond cell construction (field D)	25,000			
Pickup truck 3/4-ton				15,000
Air boat	20,000			
Items (3) less than \$10,000 each	12,900			
Beltsville, MD:				
Small row crop tractor plus implements	26,000			
Replace 1976 Dodge 1/2-ton pickup	16,000			
Replace pavement around PMC	20,000			
Removal of nonfunctional solar panels	10,000			
New office building				200,000
Rose Lake, MI:				
Pickup truck		20,000		
Single row planter			15,000	
Items (9) less than \$10,000 each	9,500			5,000
Ellsberry, MO:				
Pickup 3/4-ton offset	12,600			
Combine (partial support)	50,000			
Pickup 1/2-ton offset		12,600		
Tractor, 65 HP		30,000		
Tractor, 18 HP		13,000		
Vehicle offset			12,600	
Computer update			20,000	
Items (12) less than \$10,000 each	30,700	6,500	12,000	
Coffeeville, MS:				
Tractor 75 hp w/cab and loader		50,000		
Seed cleaner (gravity table)			12,000	
Van (Suburban type)				28,000
Items (2) less than \$10,000 each	12,000			
Bridger, MT:				
Combine	100,000			
Wheel row sprinkler system	75,000			
Windrower		25,000		
4x4 3/4-ton pickup			18,000	
Metal storage shed			20,000	
Baler			12,000	
Fork lift			20,000	
Land plane			10,000	

PROJECTED PLANT CENTER NEEDS: MAINTENANCE, RENOVATION, NEW CONSTRUCTION, AND
EQUIPMENT ACQUISITION—Continued

Plant center/Item project description	Fiscal year when planned with costs			
	1999	2000	2001	2002
Greenhouse glass replacement			22,000	
Items (11) less than \$10,000 each	9,000	32,000	16,000	
Bismarck, ND:				
Van (4 WD suburban type)	35,000			
Greenhouse/lathhouse		75,000		
Computer equipment			20,000	
Tractor				45,000
Las Cruces, NM (fiscal year 1999 list only):				
Complete headhouse/lab interior	15,000			
Well for greenhouse area (6" × 200')	10,000			
20-ft. gooseneck trailer	15,000			
Renovate well #2	30,000			
Renovate seed storage bldg	30,000			
Hay swather	35,000			
Big Flats, NY:				
Re-roof seed barn and shop	14,000			
New pole barn	60,000			
Test plot planter	12,000			
Ford mower		11,000		
Tractor (50–60 hp)		38,000		
Pickup truck		16,000		
Computer equipment		15,000		
New office building			150,000	
Items (2) less than \$10,000 each	9,000		9,000	
Corvallis, OR:				
Expand existing storage shed	38,000			
Lab brush machine w/12 cages	15,000			
Flail-vac seed stripper	18,000			
Pond fencing and retrofit inlets	15,000			
Precision drill w/carbon banding	14,000			
Expand headhouse		75,000		
Van		19,500		
1½-ton truck		32,000		
Tractor 60 hp diesel			22,000	
Roof and paint office complex			11,600	
Items (16) less than \$10,000 each	7,700	26,700	7,600	19,000
Kingsville, TX:				
Mezzanine		30,000		
Road renovation		10,000		
Combine		100,000		
1-ton pickup			20,000	
20 HP tractor			15,000	
Irrigation pond renovation				10,000
Seed cleaner				20,000
Items (4) less than \$10,000 each	8,000	7,000	5,000	5,000
Knox City, TX				
Round hay baler	24,000			
Lawn tractor w/tiller		15,000		
Phone system			12,000	
Office/conference complex				160,000
Nacogdoches, TX:				
¾-ton heavy duty pickup				20,000
Small tractor			15,400	
Items (8) less than \$10,000 each	16,500	11,500	12,500	1,800
Pullman, WA (fiscal year 1999 list only):				
1-ton 4 WD extended cab pickup	30,000			
80–85 hp tractor w/cab and 4 WD	65,000			
Items (2) less than \$10,000 each	9,000			
Alderson, WV:				
Combine				110,000
Farm tractor—85 horsepower	60,000			

PROJECTED PLANT CENTER NEEDS: MAINTENANCE, RENOVATION, NEW CONSTRUCTION, AND
EQUIPMENT ACQUISITION—Continued

Plant center/Item project description	Fiscal year when planned with costs			
	1999	2000	2001	2002
Hay baler	10,000
Seed cleaner	15,000
Irrigation pump	10,000
Fork lift	20,000
4x4 pickup	22,000
Facility development (bldg. construction)	155,000	250,000
Items (9) less than \$10,000 each	35,500
Totals by year	1,699,100	1,297,300	906,700	907,800
Grand total: Fiscal years 1999–2002	4,810,900			

WATER RESOURCES ASSISTANCE

Question. The fiscal year 1999 budget request proposes \$6.9 million to provide technical assistance to watershed and rangeland coordinators. Currently in fiscal year 1998, how much technical assistance is provided to the 40 high-priority watersheds?

Answer. This is a new initiative in fiscal year 1999 and was therefore not funded in fiscal year 1998. These 40 high priority watersheds will be identified as those areas with the greatest water quality problems in line with the President's Clean Water Action Initiative and will, upon approval of this initiative, be selected through a locally driven, competitive process. The \$6.998 million under the Watershed Surveys and Planning Program would fund 92 federal watershed and rangeland coordinators in these watersheds. These coordinators would assist local people to identify problems, develop alternatives, write plans, coordinate volunteers, and implement projects in watersheds and grazing lands assistance at risk.

In addition, they would facilitate access to all USDA conservation financial assistance programs that can be used to support watershed restoration and clean water goals and to target the most critical sources of pollution in the watershed. Finally, these coordinators would enhance the technical capability of locally led watershed partnerships, particularly for problem identification, development of watershed restoration and pollution prevention plans, and monitoring progress.

Question. How many dollars are being spent on technical assistance for grazing lands assistance in 1998? How many FTE's are supported by this funding?

Answer. The agency earmark for grazing lands technical assistance increased to \$15 million for fiscal year 1998. Grazing lands specialists positions have been increased in the last two years by more than 160 FTE's, including the establishment of grazing lands specialists positions in 14 states previously with no qualified grazing lands specialists. All states are now receiving allocations in support of their workload associated with the Conservation of Private Grazing Lands Program. These increases were achieved through a combination of new hires, reassignments, and changes in job responsibilities. NRCS now has 360 staff assigned to provide grazing lands technical assistance.

Question. NRCS has installed over 15,000 individual watershed systems since 1944. Many of these aging structures are nearing their life span and possibly could require environmental restoration. The fiscal year 1999 budget request proposes \$1 million to provide educational assistance to watershed sponsors to inform them of repairs needed to old systems. Is there any educational assistance being provided to watershed sponsors in fiscal year 1998?

Answer. Through the Small Watershed Program, Public Law 534 and Public Law 566, NRCS has assisted local communities as well as individual farmers and ranchers install conservation systems in approximately 1,700 authorized watershed projects, in every state. Of most serious concern to this aging infrastructure is the 10,400 federally assisted project dams that are owned by the local communities (legal project sponsors). More than half of the project dams are more than 30 years old and in the next 10 years, almost 1000 of them will reach the end of their evaluated life. While most of the sponsor's dams are in acceptable condition we are aware of some that present hazards which could result to loss of life and property due to collapse or failure. Currently, there are no dedicated funds being provided for educational assistance to watershed sponsors in fiscal year 1998.

Question. How many individual watershed systems in need of environmental restoration have been identified to date?

Answer. Since the structures are considered to be “federally assisted” and are owned by the sponsors, who are bound by the Operations and Maintenance Agreement to keep the structures in good condition, we must rely on the sponsors to provide the data on the number or location of structures that are in need of rehabilitation or modification.

Question. Will the proposed \$1 million support educational assistance to watershed sponsors for all of these old systems?

Answer. Since this is a serious problem, we feel at a minimum, an educational effort with all sponsors should take place in order to increase awareness and affect sponsor action. We envision fact sheets, training workshops, and videos provided through a cadre of experts in the field. As part this budget item NRCS would utilize the “Training Aids for Dam Safety” package of workbooks and videotapes prepared by the Interagency Committee on Dam Safety. The package was professionally prepared and translated into several languages. It includes modules ranging from technical aspects of site inspections to safety program development.

USER FEES

Question. The fiscal year 1999 President’s budget request proposes the implementation and collection of \$10 million in user fees for certain types or areas of technical services and products. How will these user fees be implemented? Please list the type of services and products that are proposed to be financed by user fee collections.

Answer. Although we have not fully developed the appropriate fee schedules or implementation details, we anticipate the following types of services may be included under the proposed user fee program:

- Conservation Plans exceeding 16 hours of work;
- Foundation seeds—initial supply;
- Foundation plants;
- Testing for animal waste storage lagoons;
- Inspection and testing of dams;
- Water supply forecasts;
- Climate data;
- SNOTEL data;
- Soil survey publications;
- Wetland delineations; and
- Irrigation systems.

Question. Which constituent groups will be impacted by this proposal?

Answer. We expect all constituent groups to be affected, although some more directly than others.

Question. What is the estimated cost of these services currently?

Answer. We do not know the exact cost of the services affected, however, the President’s budget estimates the cost to be \$10 million. This amount currently supports about 133 FTE’s.

Question. What legislative authority is required and has the Administration submitted its legislative proposal to the Congress for consideration?

Answer. We have requested authority under the USDA Omnibus User Fee legislative package (AG 228, Title IV, Sec. 401) to prescribe and collect fees to cover the costs of providing information, technical assistance, and other services for all NRCS programs where the Secretary determines they are feasible. This package is under review at OMB and should be sent to the Congress shortly.

Question. How will NRCS assure that technical assistance maximizes the amount landowners actually have available to spend on conservation practices?

Answer. NRCS will do everything possible to assure this including reducing costs wherever possible.

CONGRESSIONAL EARMARKS

Question. The fiscal year 1999 President’s budget proposes a decrease of \$6.9 million for earmarked projects funded in the fiscal year 1998 Appropriations Act. Please list the projects and funding levels for each project affected by the proposed decrease of \$6.9 million for Conservation Operations.

Answer. The list of earmarks follows.

Hawaii:

Feasibility Study—Waianae Watershed	\$200,000
Molokai Agriculture Community Committee	250,000

Iowa:	
Loess Hills Erosion/Western Iowa	400,000
Trees Forever Program	100,000
Louisiana: Crowley Rice Research Station	125,000
Mississippi:	
Franklin County	3,000,000
Mississippi Delta Water Resources Study	350,000
New York:	
Westchester County SWCD	300,000
Pastureland Management/Rotational Grazing	300,000
Skaneateles and Owasco Watersheds	250,000
Oklahoma: Deer Creek Watershed	750,000
West Virginia:	
Poultry Litter Composting	120,000
Long-Range Grazing Land Initiative	300,000
Not Specified:	
Great Lakes Basin Program for Soil and Erosion Sediment Control	350,000
Community Leadership Alliance for Sustainable Development Program	100,000
Total, Selected Earmarks	6,895,000

Question. What is the justification for not continuing funding for each of these projects in fiscal year 1999?

Answer. Earmarks for specific local projects are actions that go outside the ordinary allocation process. Most of them focus on issues which are local in nature and do not provide benefits to regional or national priorities.

FORESTRY INCENTIVES PROGRAM

Question. The Forestry Incentives Program is very popular among my landowners in Mississippi. Why does the President's budget request propose to terminate funding for this program for fiscal year 1999?

Answer. The President's budget does not propose funding for the Forestry Incentives Program (FIP) for fiscal year 1999. We recognize the important goals of the program and the many indirect benefits that reforestation provides including water quality and wildlife habitat. However, in the interim, NRCS will continue to support landowners with FIP contracts as well as provide technical assistance with respect to vegetative cover, including trees on private lands. The agency also notes that programs such as the Wildlife Habitat Incentives Program (WHIP) and the Conservation Reserve Program (CRP) also encourage practices that include planting trees.

Question. How many participants receive funding from this program? Please list the number of participants, by state.

Answer. Totals on the number of participants who received funding for FIP in fiscal year 1997 will be provided for the record.

[The list follows:]

Fiscal year 1997 FIP participants

<i>State</i>	<i>No. of participants who installed practices</i>
Alabama	62
Alaska	1
Arizona	
Arkansas	100
California	18
Colorado	6
Connecticut	2
Delaware	11
Florida	120
Georgia	635
Guam	
Hawaii	
Idaho	7
Illinois	23
Indiana	55
Iowa	21
Kansas	
Kentucky	34
Louisiana	164

<i>State</i>	<i>No. of participants who installed practices</i>
Maine	36
Maryland	29
Massachusetts	8
Michigan	46
Minnesota	36
Mississippi	754
Missouri	14
Montana	6
Nebraska	2
New Hampshire	21
New Jersey
New Mexico
New York	32
North Carolina	166
North Dakota
Ohio	36
Oklahoma	16
Oregon	100
Pennsylvania	14
Puerto Rico	3
Rhode Island
South Carolina	489
South Dakota	6
Tennessee	16
Texas	334
Utah
Vermont	8
Virginia	375
Washington	57
West Virginia	27
Wisconsin	34
Wyoming	29
Total	3,953

WILDLIFE HABITAT INCENTIVES PROGRAM

Question. The Wildlife Habitat Incentives Program (WHIP) is a voluntary program that will provide a wide array of wildlife practices to address wildlife habitat issues throughout the nation. The budget assumes 3,400 contracts in fiscal year 1998 and 2,300 in fiscal year 1999. Have all of the assumed fiscal year 1998 3,400 contracts been awarded?

Answer. No. WHIP applications are accepted on a continuous sign-up basis. Most States initiated the program sign-up after February 1, with many waiting until the Secretary officially announced the release of funds on February 27. We anticipate the majority of the selections being made in late spring/early summer.

Question. Is the demand greater than the number of contracts which can be awarded with the funds available for this program in each of fiscal years 1998 and 1999?

Answer. Yes. When NRCS State Conservationists submitted their projected funding needs in 1997 in the State WHIP plan, instructions from the National office requested they submit estimated funding needs for a six month period. Requests were received from all 50 States, Puerto Rico and the Pacific Basin. The total amount of these requests was in excess of \$35 million. As news about the program has spread to many persons who would be eligible for WHIP but who have not historically participated in USDA programs, many of the NRCS State Conservationists have recognized that the original estimates were too conservative.

Question. How much funding is needed to provide adequate technical assistance to the WHIP program in each of fiscal years 1998 and 1999? What level of funding is currently available to provide needed technical assistance for this program and what level is included in the fiscal year 1999 request?

Answer. The budget assumes \$5 million for technical assistance in both 1998 and 1999. It is our belief that 25 percent of the total program level is needed for technical assistance for WHIP.

Question. Are any carryover balances from previous fiscal years proposed to be used for technical assistance for WHIP? What level is assumed, by fiscal year?

Answer. There are no carryover balances from previous fiscal years. 1998 is the first year of the program.

WATERSHED AND FLOOD PREVENTION OPERATIONS

Question. The fiscal year 1999 budget request proposes to fund high priority flood prevention projects under small watershed authority. Should this proposal be implemented, how many small watershed projects would not be eligible for funding under the flood prevention authority?

Answer. The total number of projects has not been estimated at this time. The high priority watersheds will be based on their ranking on a regional basis, since the ranking for 1999 will not be carried out until later summer based upon the funding received, the size and complexity will determine how far the dollars will stretch.

Question. Why has the Administration proposed to allow funds to be used to offer subsidized loans through the Rural Utility Service or Rural Business Cooperative Service to new and existing approved small watershed projects? How many loans does the agency assume to administer under this proposed provision?

Answer. There is an unfunded commitment of approximately \$1.5 billion for Public Law 78-534 and Public Law 83-566 projects. With an annual allocation of approximately \$50 million for construction, this unfunded commitment will not decline, since local communities request a greater dollar amount in new projects each year. Therefore, the subsidized loan program was developed to allow local sponsors to bear a greater part of the burden through loans. NRCS would not administer the loan program; it would be the responsibility of the Rural Utility Service. It is extremely difficult to estimate usage of these loans since this is a new concept. The budget request could fund approximately \$300,000,000 in loans.

Question. The fiscal year 1999 budget explanatory notes indicate that in 1954 the Watershed and Flood Prevention Act amended the flood prevention program, making it possible to administer the flood prevention program along the same lines as the Small Watershed Program. If the authority has existed since 1954 why is the Administration proposing a change in the funding accounts of Watershed and Flood Prevention and Conservation Operations now?

Answer. The Public Law 566 and Public Law 534 flood prevention programs are very similar in nature with the major exception of how they are authorized. NRCS has very little control over the selection of the broad Public Law 534 river basin in which is authorized by Congress, as opposed to Public Law 566 where planning starts are granted by NRCS under Public Law 566 at the request of local communities. There are many minor differences between the two as shown on the attached table. Over the years both programs have been managed using the National Watersheds Manual for policy guidance. It is prudent to operate these programs as similarly as possible to make government easier to understand by our clients.

COMPARISON OF DIFFERENCES BETWEEN PUBLIC LAW 566 AND PUBLIC LAW 534

Attribute	Public Law 566	Public Law 534
Scope	Nation-wide	Specific geographic areas approved by Congress.
Application	Specific request for federal assistance	None once authorized by Congress.
Initiation of Planning	Authorized by Chief	Authorized by Federal Legislation.
Plan Approval	<\$5 million—Chief/STC	Flood Prevention proj.—STC.
	>\$5 Million—Congress	Other than Flood Prevention—OMB.
Benefits and Costs	Analysis required by legislation	Not required by law, but by NRCS policy.
Financial Assist	Constr, Admin, Eng, LR for Rec and F&W ..	Same but also for any LR for single purpose FP structures and LT on National Forest Land.
Installation	Project Agreement Required	PA not req if NRCS does work.
Project Size	250,000 acre limit	May go above 250,000 if Congress deems it prudent.
Operation and Maintenance	Sponsor must have taxing authority	No special requirements.

Question. 414 watershed structures built in Mississippi over the last 50 years are greatly in need of repair and renovation. The Mississippi Conservation Partnership worked with the Mississippi Legislature in acquiring authorization for the Mississippi Soil and Water Conservation Commission to administer a program which addresses rehabilitation of these structures. The Commission is also lobbying the Mississippi Legislature to provide funding for this program. These State funds may

be provided only if matching Federal funds are appropriated. Does the NRCS have the authority to provide matching Federal funds for this type of rehabilitative work?

Answer. Our Office of General Council advises us that NRCS has no statutory authority to provide federal funds for rehabilitation of federally assisted dams.

Question. Does the fiscal year 1999 budget request contain funding specifically for this maintenance work? If yes, which account is it in?

Answer. The fiscal year 1999 proposed budget has no funds for rehabilitation or modification of watershed dams since NRCS does not have statutory authority to conduct such work. One hundred percent of the maintenance of the dams was assumed by the legal sponsors through an Operations and Maintenance Agreement executed with the federal government.

Question. Does the fiscal year 1999 budget request include funding for the following projects: Little Sioux and Mosquito Creek, IA; Little Auglaize Watershed, OH; Bush River, VA; and Potomac Headwaters, WV? If so, what amount of funding is included?

Answer. The budget is not built on named watersheds or projects, because of an unfunded commitment of approximately \$1.5 billion. Funds are allocated to NRCS regions who then use a formula to fund the highest priority projects. Therefore, funding for the Little Sioux and Potomac Headwaters (Public Law 78-534), and Little Auglaize, Bush River, and Mosquito Creek (Public Law 83-566) ranking will depend upon the other projects they are competing against. Construction on the Little Auglaize will be completed this fiscal year (1998). Funding needed for 1999 for the remaining three projects is \$3.0 million.

Question. Please list any small watershed projects and their proposed amount of funding in the fiscal year 1999 President's budget request.

Answer. There are no Small Watershed Projects specifically proposed for funding in the fiscal year 1999 budget. Beginning in fiscal year 1999, the \$1.5 billion backlog in authorized projects will be ranked in priority based on their net economic, environmental, and social benefits.

Question. Has the agency completed work on the following projects: Lower Otter and Dead Creek, VT; Lower Winooski River, VT; Barton and Clyde River projects, VT; Park River Dam, ND; and South Delta watershed project, MS? If not, please explain.

Answer. Work is continuing on all the watersheds this fiscal year 1998. However, there are no Small Watershed Projects specifically proposed for funding in the fiscal year 1999 budget. Beginning in fiscal year 1999, the \$1.5 billion backlog in authorized projects will be ranked by each Regional Conservationist in priority of their net economic, environmental, and social benefits.

Question. Please discuss the agency's role in assisting the Devils Lake Basin, ND, in locally coordinated flood response and water management activities.

Answer. The agency considers the impacted part of the Devil's Lake Basin to be a high priority area for implementation of wetlands easements through the Wetlands Reserve Program and floodplain easements under the Emergency Watershed Protection Program. The goal is to provide landowners an opportunity to place impacted lands that qualify for these two programs under an easement. We hope to be able to establish additional water retention capacity in the upper basin areas through the restoration of wetland basins. Although, this is unlikely to make a substantial contribution to lake levels, it is a step in the right direction.

Question. Does the NRCS continue to utilize conservation programs in providing water holding and storage areas on private land as necessary intermediate measures in watershed management? If not, please explain.

Answer. Land treatment practices continue to be an integral part of all watershed projects. In fact, approximately 50 percent of all new projects are for watershed management and composed entirely of land treatment rather than a combination of structural and land treatment practices.

Question. Please discuss the repercussions of and the Agency's position on the following limitations: (1) \$15 million on Public Law 534 projects, and (2) \$50 million on technical assistance.

Answer. The limitation on Public Law 78-534 projects has had no repercussions on the agency in 1998. That is about the amount of money that can be spent during the year. As for the Public Law 83-566 program, the reduction of \$10 million has seriously effected the capability that the agency has to provide technical assistance needed by sponsors to carry out the mission of the watershed program. There will be 125 fewer FTE's available to assist the sponsors, but on the plus side an additional \$10 million is now available for financial assistance against the \$1.5 billion unfunded commitment.

Question. Please explain how the Department has raised the priority of developing a storage capacity and improving the efficiency of delivery systems as the Senate Committee Report accompanying the fiscal year 1998 Appropriations Act directed.

Answer. Work to address limited water storage and inefficient delivery systems in Hawaii, noted in the Senate Committee report accompanying the fiscal year 1998 Appropriations Act, has progressed on three projects. Planning and the Environmental Impact Statement (EIS) has been completed on the Upcountry Maui project. The project was authorized for operations in August of 1997 by the Chief of the Natural Resources Conservation Service. NRCS is currently working on the designs and coordinating with the Hawaii Department of Agriculture and the Maui County Department of Water Supply on the land rights requirements for installation. NRCS anticipates that the project will be ready for construction in fiscal year 1999.

The Waimea-Paauilo watershed project has been replanned and a new reservoir site has been selected. The watershed plan and EIS work has been completed and NRCS is now preparing to begin the design phase and coordinating land rights and funding with the Department of Hawaiian Homelands and the Hawaii Department of Agriculture. The first phase of this project is expected to be ready for construction in two years.

NRCS is working closely with the Hawaii Department of Agriculture, the Hamakua Soil and Water Conservation District and local landowners in completing planning on the Hamakua Ditch Project. This is the top watershed planning priority for the NRCS staff in Hawaii, and they expect the planning to be completed by the end of this year.

Question. Please update the Subcommittee on the work to complete innovative community-based comprehensive resource management plans for West Virginia communities devastated by floods.

Answer. NRCS has focused community based assistance efforts to three areas heavily impacted by the flood of 1996. These are the North Fork of the South Branch River, Grant and Pendleton Counties; Upper Tygarts Valley River, Randolph County; and Knapps Creek, Pocahontas County. These efforts are led by local watershed groups consisting of landowners, interest groups, local governments, and other stakeholders. A holistic planning effort is underway with the North Fork Watershed Association assessing alternatives for flood protection; water supply; streambank erosion; forest land use and protection; wetland development and protection and soil erosion on upland areas. The plan should be completed by July 1998. The NRCS is pursuing cooperative efforts with the State of WV to develop a holistic plan for the South Branch Potomac Watershed (Grant/Hardy/Pendleton Counties). The Knapps Creek Watershed Association with NRCS assistance is assessing similar alternatives for flood protection and severe streambank erosion. They are currently seeking funding to carry out a geomorphology study for the watershed. A water resource plan has been developed for the Upper Tygarts Watershed which focused primarily on water supply needs. The Upper Tygart Watershed Partnership is currently preparing a Public Law 566 watershed application seeking assistance to develop a holistic watershed plan which would incorporate the results of the water supply study. Similar efforts are underway with the Inwood Watershed Association, Berkeley County; and the Dunlop Creek Watershed Association in Fayette County. NRCS is working with these groups to assist them in assessing alternatives and taking actions to address their land and water resource needs.

Question. Please update the Subcommittee on the need and plans made for a cost-share pilot flood plain project for the Tygart River basin in West Virginia.

Answer. The fiscal year 1998 Senate Appropriation Bill contained language that NRCS would pursue a pilot flood plain relocation program for the Tygarts River Basin, West Virginia. This pilot project would assess the effectiveness of a relocation project where home and business owners could elect to relocate from the floodplain over a five to ten year period. As owners move or relocate from the area, estate sales, or others as they desire could sell their homes or businesses to the government at their convenience. The project would assess the participation rate over the long term. Limited planning will continue in fiscal year 1998. No other activity is planned.

Question. The Secretary stated in his testimony before this Committee that the Department "will also continue to examine approved watershed plans to eliminate those projects that are now infeasible in order to reduce the backlog of unfunded work." What did the Secretary mean when he used the word "infeasible?"

Answer. Infeasible projects are those where there is little hope of ever getting the project installed due to a lack of sponsor interest, insurmountable environmental concerns, low benefit to cost ratio, changes in land use which precludes constructing a key component, lack of ability to obtain land rights, long term litigation, or other significant barriers.

Question. How does the agency plan to eliminate these projects?

Answer. In those projects where the sponsors agree that nothing further can be done, a supplement to the watershed plan will be prepared to eliminate the remaining works of improvement and the project closed. In cases where the sponsors are not willing to sign a supplement, the project will be put on the inactive list. A project on the inactive list cannot be reactivated until all the problems which caused it to be declared inactive are overcome by the sponsors. NRCS is constantly reviewing projects to reaffirm feasibility before proceeding further.

Question. Which projects have been determined to be "infeasible" by the Department to date? Please provide list by state.

Answer. The following projects have been determined to be unfeasible to date:

List of infeasible projects

South Fork Watershed	Arkansas.
Middle Fork Anderson River	Indiana.
Upper Big Blue Watershed	Do.
West Carroll Watershed	Louisiana.
Big Creek Watershed	Mississippi.
Brown's Creek	Do.
Dry Creek	Do.
Sowashee Creek	Do.
Town Fork Creek	North Carolina.
Starkweather Watershed	North Dakota.
Sebastian Martin-Black Mesa Watershed	New Mexico.
McKinney-Buzzard Watershed	Oklahoma.
Waterford-Guilford Creek Watershed	Do.
Cross Creek Watershed	Pennsylvania.
Little Shenango Watershed	Do.
Buffalo River Watershed	Virginia.

STAFF REDUCTIONS

Question. In your statement, Mr. Weber, you indicate that one of the goals of the agency-wide reorganization "was to place a higher share of staff resources in the field to maintain and enhance service to our customers." Was this goal achieved after the reorganization? If so, what was the increase in number of employees that were placed in the field?

Answer. At the end of fiscal year 1993, approximately 70 percent of the NRCS work force was located in offices below the State office. Currently, approximately 75 percent of the work force is located in offices below the State office.

Question. Mr. Undersecretary, you state in your testimony that currently 9,000 staff are at the local level. Is this number based on the fiscal year 1998 Conservation Operations appropriations?

Answer. This number is based on funding for all accounts administered by NRCS.

Question. Will this number be reduced under the fiscal year 1999 President's budget request?

Answer. If staff reductions occur in total, inevitably some loss will occur at the field level. However, we are trying to maintain the level of staff at the field level at 75 percent or better of the total NRCS work force.

Question. During the Department's streamlining initiative, how many NRCS full-time equivalents (FTE) have been reduced in the field and at headquarters? Please give the number of FTE's by fiscal year.

Answer. Since fiscal year 1993, NRCS has reduced FTE's for the agency by 1,896 FTE's. Of this amount, NRCS has reduced 159 FTE's from National Headquarters (NHQ) and 1,173 FTE's from the field staff. A more detailed breakdown follows:

Fiscal year	Total FTE	NHQ	All other ¹
1993 (Baseline)	13,790	537	13,253
1994	13,317	527	12,790
1995	12,163	502	11,661
1996	11,839	392	11,447
1997	11,894	378	11,516

¹ Includes State, regional, area, and all other offices except headquarters.

Question. How will the proposed administrative convergence affect the field staff in each States' county offices?

Answer. Convergence will produce a modern information technology infrastructure that the NRCS, Farm Service Agency and Rural Development Agency can share, thereby, making the field office staff more productive. In conjunction with convergence, various efforts are underway to re-engineer administrative and program delivery systems to lessen the administrative workload on field staffs.

Question. Will the field employees' administrative workload be lessened so that they can spend more time with the landowners?

Answer. The convergence of administrative and information technology functions in the Service Center agencies, when fully implemented, will reduce the time spent on administrative overhead and will free time up for program delivery.

Question. How will proposed administrative convergence affect service center staffing?

Answer. Administrative and information technology convergence will not directly affect offices below the State level. Overall, the State level administrative staffing will be reduced when the plan is fully implemented in fiscal year 2002. This reduction in administrative staffing would make more time available to program related activities at the State and field office level.

Question. How many FTE's are supported by the fiscal year 1999 budget request?

Answer. The fiscal year 1999 President's budget request will support approximately 11,412 FTE's.

Question. What is the fiscal year 1998 funded FTE level?

Answer. NRCS can support an estimated 11,944 FTE's with appropriated and carry-over balances available in fiscal year 1998.

Question. What is the total staff reduction expected in fiscal year 1999?

Answer. The total anticipated staff reduction for fiscal year 1999 is 532 FTE's. However, this assumed there would be no additional funding for emergency watershed programs.

Question. How much funding is needed in fiscal year 1999 to prevent staff reductions at the Headquarters level and in the field?

Answer. \$40.6 million would be required to prevent the reduction of 532 FTE's.

Question. Does the agency expect to cut any more FTE's in the coming fiscal years?

Answer. NRCS anticipates no additional cuts in staffing if the requested funding level for fiscal year 1999 is received and maintained.

COUNTY BASED WORKLOAD STUDY

Question. USDA has an outside consulting firm conducting a workload study of the farm and rural program delivery system of county-based agencies (FSA, NRCS, and RD) to be completed on September 18, 1998. What has the consulting firm been told to look at specifically regarding NRCS?

Answer. Since the USDA County based study is an independent study, the consulting firm is directed by the USDA Contract (based on the original Request for Proposals as printed in the Federal Register) to examine the following: existing legislative authorities, regulations to actual activities; evaluation of the workload implied by the program responsibilities to be carried out under the charge; developing a business process map(s) for each NRCS program; and, developing a profile report of the USDA customer base.

The goal of the study is the articulation of alternative approaches to organizing and staffing USDA's county-based operations in delivering services that are clearly linked to Federal policy and program priorities and that can be managed to meet Federal budget targets. The key objectives in meeting the goal of identifying alternative field service delivery systems include: the articulation of the charge to agencies as mandated by legislation and regulation; evaluation of the workload implied by the program responsibilities to be carried out under the charge; identification of options for organizing agency resources to meet customer needs and preferences; and, conceptualization of organizational structures that can effectively and efficiently match USDA resources with its customer base.

Question. Are streamlining and collocation of NRCS offices postponed until the study is completed?

Answer. NRCS continues to implement the Secretary's Streamlining initiative, started in 1994, with co-locating field offices into approximately 2,556 USDA Service Centers.

Question. As a result of this study, do you anticipate more office closings, centralization, or consolidation with the Farm Service Agency?

Answer. The study is just beginning and approximately 20 percent complete. Upon completion, appropriate policy makers will review the effort to identify any possible findings that may improve the Agency's service to farmers, ranchers, and other customers.

SUPPLEMENTAL APPROPRIATIONS

Question. Do you expect that you will submit a request for supplemental funds for emergency watershed projects, particularly in view of the flooding and the other problems that have arisen as a result of El Niño?

Answer. Preliminary estimates for disasters to date reflect a \$40 million need. However, an average for disaster activities in a typical year would be closer to \$150 million based upon an average annual expenditure over the past four years.

Question. What specific needs have been identified?

Answer. Immediate anticipated needs are estimated at \$25 million for California, although until the weather breaks, it is difficult to determine the exact need; \$10 million for Florida tornadoes; and \$5 million for the Northeast states hit by the January ice storm.

Question. Previous emergency projects identified in earlier years were repaired because of the lack of funds, or there were insufficient funds to cover all of the projects that were identified. Will fiscal year 1998 Emergency Supplemental funds be available for requests to meet these unfounded non-exigency needs?

Answer. All previously reported needs that are eligible for the Emergency Watershed Protection Program have been met and we have no projects awaiting funding at this time.

Question. What unfunded needs have been identified by the state conservationists around the country? Please provide a breakdown of the unfunded needs by State, and how you plan to distribute any supplemental funds that might be requested to the States for emergency watershed protection activities.

Answer. Anticipated needs are estimated at \$25 million for California, although until the weather breaks, it is difficult to determine the exact need; \$10 million for Florida; and \$5 million for the Northeast states hit by the January ice storm and an amount yet to be identified by the March 7-8, 1998, storm in the Southeast states. Other needs are anticipated, but cannot be identified until an emergency occurs.

Question. What unfunded Mississippi needs are outstanding from past fiscal years and what funding is estimated to be needed to meet these needs?

Answer. Mississippi requested no additional funds for unfunded needs at this time.

RESOURCE CONSERVATION AND DEVELOPMENT

Question. The fiscal year 1999 budget request for the Resource Conservation and Development (RC&D) is the same as the fiscal year 1998 funding level, \$34.4 million. According to the RC&D operation plan submitted to the Committees on Appropriations, the base funding of \$29.4 million would be used to provide technical assistance to the existing 290 RC&D Councils, and administrative and overhead support costs of the program. The additional \$5 million would be to authorize up to 25 new areas and increase base-level funding and provide financial assistance for the RC&D Councils. Does the agency again plan to implement this in fiscal year 1999 if the fund is provided? If not, how will the agency use this funding?

Answer. The President's Budget for fiscal year 1999 calls for an appropriation of \$34,377,000, the same as the fiscal year 1998 funding level. The RC&D operating plan submitted to the Subcommittees on Agriculture Appropriations covers fiscal year 1998. In fiscal year 1999, the Agency will use the funding to provide technical assistance through coordinators to 315 RC&D Councils, along with administrative and overhead costs of the program. This will allow the agency to maintain a level of funding for direct support and core technical assistance to authorized areas.

Question. The goal of the RC&D coordinator is to assist the Council in its activities and to become an empowered, self-sufficient Council that has the capacity to build effective public private partnerships. How many Councils have reached this goal since the inception of the program?

Answer. The coordinator provides technical assistance to the Council and in many cases functions as its only full-time staff. The coordinator provides access to USDA and other Federal programs. He or she aids the Council in the complexity of dealing with access to knowledge, information and resources, and a frequently changing council organizational structure. The structure change is due to Council sponsor members changing frequently, since many are local elected officials. Such changes often affect a Council's dynamics and effectiveness. The RC&D Councils are non-

profit entities made up of volunteer boards. The coordinator plays a pivotal role in bridging the transitions in Council membership, focus, and priorities.

Although many Councils have become very efficient at obtaining funding for specific projects, we have not assessed how many are "self-sufficient" without the assistance of a coordinator.

Question. Does the agency have an operating plan "to wean the Council off" of the use of a RC&D coordinator once it has reached this goal? If not, does the agency plan to implement one?

Answer. There is no proposal or plan to de-authorize or de-fund RC&D councils.

OKATOMA RIVER PROJECT

Question. I have been told that the Okatoma River needs the completion of work referred to as "desnagging". Could you explain the nature of this work?

Answer. Clearing and snagging is a process where fallen and badly leaning trees are removed from a water course. Much of the work is done by hand to minimize damage to the environment.

Question. Does the fiscal year 1999 budget request include any funding for the Okatoma River project in Covington County, Mississippi?

Answer. The budget is not built on named watersheds or projects, because of an unfunded commitment of approximately \$1.5 billion. Funds are allocated to NRCS regional conservationists who then use a formula to determine the highest priority projects to fund. Okatoma River's scoring will depend upon its ranking with other projects in the region.

Question. How much funding is needed to complete the "desnagging" of the Okatoma River? Can the agency finish this project within one fiscal year given that the needed amount of funding is provided by the Committee?

Answer. Approximately \$1.0 to \$1.5 million is needed. The project is presently in the final design phase and it is anticipated that the work could be completed in less than a year.

Question. How much money, by fiscal year, has the NRCS made available for this project?

Answer. Approximately \$50,000 of technical assistance funds for the survey and design has been expended during the last year. However, no financial assistance has been needed thus far.

SECTION 11 CAP

Question. Under current law, reimbursement for NRCS technical assistance for WRP is limited to available funds under the section 11 cap. The FAIR Act amended the Commodity Credit Corporation (CCC) Charter Act, section 11, to limit the total amount of CCC funds made available for reimbursement to the 1995 spending level, affecting reimbursement agreements of all other agencies competing for the limited funding source available. In addition to the section 11 cap, the FAIR Act prevents the use of reimbursable funds for purposes other than salary. CCC funds cannot be used for supplies, equipment, transportation expenses, etc., thus these funds will have to be absorbed through the Conservation Operations Account. What is the estimated amount of funds needed for those purposes not covered by CCC funds?

Answer. The technical assistance rate charged for the WRP is approximately \$80.00 per acre. The technical assistance activities under the WRP includes such items as eligibility determinations, wetlands restoration planning, development of detailed engineering designs, working with appraisers, surveyors, closing agents, attorneys, and construction contractors, and monitoring of prior, current and future WRP acres. The technical assistance rate was developed over time for the WRP. This charge is sufficient to fund the WRP technical assistance needs.

The FAIR Act of 1996 imposed restrictions on the uses of CCC funds, beginning in fiscal year 1997 with respect to certain activities. Funding for the WRP was made available through the Commodity Credit Corporation (CCC). Funding for NRCS technical assistance costs is authorized under the CCC Charter Act section 11 funds transfers.

Unobligated appropriated funds of approximately \$31.5 million were used to fund the technical assistance needs for the WRP for fiscal year 1997 and fiscal year 1998. For fiscal year 1999 approximately \$15.089 million is needed for WRP technical assistance activities. Of the total amount, \$4.0 million is anticipated from unobligated carry-over appropriated funds. The remainder, approximately \$11.089 million is expected to be transferred from CCC through the CCC Charter Act section 11 authorities.

Question. What available CCC funds and prior-year balances will be used and in what amounts by program?

Answer. For fiscal year 1999 approximately \$15.089 million is requested for WRP technical assistance activities. Of the total request approximately \$4.0 million are unobligated carry-over funds from the old appropriated WRP program. The remainder approximately \$11.089 million, of the total technical assistance funds needed for fiscal year 1999 are requested through CCC. For fiscal year 1999 the \$11.089 million in CCC funds are expected to be used to deliver the WRP program.

Question. Will appropriated funds be necessary to supplement available CCC funding? If so, how much, by program? What appropriated funds are included in the fiscal year 1999 request, by program?

Answer. The CCC Charter Act Section 11, as amended, does not guarantee that funds will be available for transfer or allotment to other government entities to assist it in the conduct of its business. Rather, the section 11 transfer is limited to an amount established on pre-1996 Farm Bill work activities. Technical assistance costs associated with CRP, WRP, FPP and CFO all fall within the Section 11 limitations. In order to deliver the WRP in fiscal year 1999, \$4 million in unobligated carryover appropriations will be used to fund technical assistance. For CRP, \$22 million in unobligated carryover appropriations will be used for NRCS technical assistance costs. In addition, approximately \$36 million in appropriated Conservation Operations account funding will be used to support technical assistance costs associated with the proposed EQIP level.

Question. Have agency lawyers revisited the section 11 cap and made a reinterpretation?

Answer. The Office of General Council (OGC) has not altered its initial position on its interpretation of the section 11 of the Commodity Credit Charter Act with respect to the provision of technical assistance under any CCC program including conservation programs.

RESEARCH STUDIES

Question. Does NRCS have research studies budgeted in the NRCS account? If so, how much funding has been used in past fiscal years for these studies?

Answer. NRCS does not have research studies built into the budget. We do, however, have cooperative agreements with other agencies and land grant institutions who conduct research from which NRCS customers benefit.

Question. Does the fiscal year 1999 budget request contain any funding for NRCS research studies, and if so, how much? Under what account can this request be found?

Answer. The fiscal year 1999 budget request does not contain any funding requests for NRCS research studies.

Question. How many FTE's that work on research studies are supported by the fiscal year 1999 budget request?

Answer. There are no FTE's in NRCS that work on research studies.

FRANKLIN COUNTY LAKE

Question. This Committee appropriated approximately \$3 million in fiscal year 1998 for technical assistance for Franklin County Lake. What is being done currently with the \$3 million appropriated for fiscal year 1998 to NRCS for Franklin County Lake?

Answer. A portion of the funds are presently being used to provide technical assistance to complete the necessary survey and design work for the Franklin County dam. Funds remaining at the end of this fiscal year will be carried over to provide technical assistance related to the construction of the dam, when construction funds become available.

Question. What authority under Conservation Operations, Watershed and Flood Prevention Operations, and Resource Conservation and Development does NRCS have to provide technical and financial assistance for the construction of the dam?

Answer. NRCS does have authority under the Watershed and Flood Prevention Operations and Resource Conservation and Development program to provide both technical and financial assistance for dams such as the one proposed in Franklin County. However, the fiscal year 1999 budget does not include a request for financial assistance in the RC&D program. Under Conservation Operations, we have the authority to provide technical assistance related to soil erosion and sediment control both functional elements of most dam construction.

Question. Is Franklin County designated as a watershed area? Would Franklin County be eligible for such designation?

Answer. Franklin County is not a designed watershed under the Small Watershed Protection and Flood Prevention Program. It could be eligible for such designation.

Question. Does the fiscal year 1999 budget request have any funds designated for Franklin County?

Answer. The fiscal year 1999 budget for Conservation Operations reflects a decrease of \$3 million for Franklin County.

Question. Should the Forest Service have available funds to provide financial assistance to the construction of the dam in fiscal year 1999, will the technical assistance appropriated in fiscal year 1998 be available?

Answer. If financial assistance is available for construction of the dam in fiscal year 1999, NRCS will use the funds appropriated in fiscal year 1998 to provide the necessary technical assistance.

MISSISSIPPI DELTA WATER RESOURCES STUDY

Question. In the fiscal year 1998 Appropriations Act, the Committee provided \$800,000 in Conservation Operations for the Mississippi Delta Water Resources Study. Is the total amount in the fiscal year 1998 Appropriations Act used by the State Conservationist of Mississippi on the Mississippi Delta Water Resources Study?

Answer. The fiscal year 1998 Appropriations directed \$350,000 to be used in the Mississippi Delta Water Resources Study and the total amount will be used to complete the Study.

Question. What activities were funded with the money provided for this study in each of fiscal years 1996, 1997, and 1998?

Answer. In fiscal year 1996 and fiscal year 1997, the activities funded included data collection and assimilation. These included water quality sampling collection, and testing; fish tissue collection and testing, and landowner interviews for crop budget generation as well as other economic data collection. In fiscal year 1998, activities included competing the design of conveyance systems, completing economic evaluations, and completing the final study reports.

Question. Does the fiscal year 1999 budget request propose any funds for this study, and if so, how much? In which account is this proposed request?

Answer. The Natural Resources Conservation Service plans to have this study completed during fiscal year 1998, and no funds will be needed to carry on this study beyond this fiscal year. The fiscal year 1999 budget for Conservation Operations reflects a decrease of \$350,000 for this item.

Question. Does NRCS have the authority under Conservation Operations to carry out the next phase of this project or would that funding have to come under the Watershed and Flood Prevention Operations account?

Answer. It was the intention of the Natural Resources Conservation Service to conduct the water supply study and report the finding back to the sponsors. The sponsors would have the responsibility of concurring with and implementing the findings. If the Natural Resources Conservation Service would have the responsibility of providing assistance in this endeavor, the sponsors would have to request assistance from the NRCS to plan the desired activity. Then we would have to request the authority to expend funds to the project. This should be an activity of the Watershed and Flood Prevention Operations Division and planned and implemented as an organized watershed.

FARMLAND PROTECTION PROGRAM

Question. The Farmland Protection Program's (FPP) authorization has expired. No funding for this program is requested for fiscal year 1999. Is all work completed in the Farmland Protection Program?

Answer. No. Work for the Farmland Protection Program (FPP) just started. The 1996 Farm Bill authorized \$35 million to establish a farmland protection program. A total of \$16.2 million was obligated to States and local government entities in fiscal years 1996 and 1997. As of January 31, 1998, more than 10,000 acres on 47 farms with a total easement value of \$18 million were acquired. Federal FPP funds contributed \$4.5 million (25 percent) and State and local government funds accounted for \$13.5 million (75 percent). Thus, only about 13 percent of the funds have been expended so far. This is due to the lag time the State and local entities have in order to process easement appraisals, surveys, and other procedures needed to record the easement deed. \$17.3 million will be obligated in fiscal year 1998. At the end of fiscal year 1998, the \$35 million will be exhausted, including technical assistance funds earned.

Question. Do carry over balances exist so that the technical assistance work can be completed? If yes, how much exists, by fiscal year?

Answer. The Farmland Protection Program implementation operates with few technical assistance funds, especially when we consider the cost of preparing con-

servation plans that are required for each farm for which an easement is acquired. A maximum of 4 percent of the appropriated funds is allocated for technical assistance. Technical assistance funds earned for fiscal years 1996 and 1997 were \$575,000 and \$80,000, respectively. \$720,000, four percent of the \$18 million appropriated, is reserved for technical assistance for fiscal year 1998. Since the funding for this program is provided through CCC, any unobligated funds do not carry over.

CIVIL RIGHTS ACTIVITIES

Question. Mr. Lyons, in your statement you say that the "NRCS will continue to seek proactive ways to better serve minority and low income customers." What proactive ways will the agency seek to better serve these customers?

Answer. Some of the proactive ways NRCS is using to better serve minority customers are: designation of a staff position in each state to serve as the program outreach manager; establishing a data base on minority customer groups and their location; development in each state of a program outreach plan targeted to minority and low-income customers; and, finalization of a multi-year strategic plan to address the conservation needs of minority and low-income producers.

GRAZING LANDS

Question. In fiscal year 1998, NRCS is able to continue support for a Grazing Lands Conservation Coordinator in each of the 50 States. Will the fiscal year 1999 budget request continue to support these coordinators in all 50 states?

Answer. The agency earmark increased to \$15 million for fiscal year 1998. All states are now receiving allocations in support of their workload associated with the Grazing Lands Conservation Initiative. The fiscal year 1999 budget does not request specific funding for grazing lands conservation coordinators, however, they would be supported in the Conservation Operations base funding.

SHARKEY SOILS

In response to the Sharkey Soils Study requested by the Committee in fiscal year 1998, our specialists in this area have raised pertinent and very important questions which I feel should be addressed. Please provide your response to these promptly.

SHARKEY SOILS COMMITTEE OPERATIONS

Question. Given the importance and complexity of the issues, would it not have been scientifically prudent to meet and discuss the technical issues in open debate?

Answer. In retrospect, it might have been prudent to physically meet, however, the co-chairs debated this and considering the short time line and the committee members individual circumstances, decided the electronic resource was best. Through the electronic venue, issues were discussed in open debate via e-mail. Every committee member had ample opportunity to express his opinion to any or all other committee members. Some members took advantage of this, while others did not. Informal face-to-face meetings were held at the Soil Science Society of America's (SSSA) Annual Meeting in Anaheim, CA. These were used informally because the entire committee could not come to the SSSA Annual Meeting. The committee chairmen both agreed that the scientific issues were addressed completely, scientifically, and critically by the procedures used. There is no apparent reason why more progress would have been made in a formal, debate-oriented meeting. The procedures used for the Sharkey Committee had precedence in that they were similar to those used to originally develop and to continue to develop the soil classification system—*Soil Taxonomy*. The system of e-mail exchanges used here followed a question, answer, debate format that has proven effective in dealing with complex scientific issues.

Question. Are e-mail and faxes the best method to address the complex issues in a scientific manner?

Answer. The committee co-chairs decided that for this committee's deliberations e-mail and faxes were the best methods to use to address the complex issues involved. Issues could be stated in writing so that all committee members knew exactly what issues were "on the table" at a given time. In addition, committee members could evaluate the issues by examining their own data, consulting reference materials in their libraries, examining scientific literature, or personally seeking clarification. The committee chairmen feel there would have been no apparent advantage to additional direct, face-to-face formal meetings. Finally, e-mail and faxes allowed the committee to keep a written record of all correspondence, questions, and debate. The record has been supplied to committee members who have requested it.

Question. Would it have been appropriate for members to have access to materials provided by others and have the opportunity to vote on issues?

Answer. Yes. The co-chairs made a diligent effort to keep all members fully informed of information supplied by others. In addition, key issues were voted on by the members. Unfortunately, not all members chose to vote on all issues. It should be noted that the full Sharkey Committee, which consisted of 22 individuals, was broken into subcommittees to address specific charges. Subcommittees were assembled by the co-chairs who selected members with particular expertise to address specific charges on a subcommittee. This was the only practical way to address all of the charges in the time allotted to the committee. Thus, subcommittees were sent correspondence related to their charges. If a member wanted to see correspondence related to another subcommittee it was sent to him whenever possible.

Question. Were conclusions based on opinions of various members or objective data relevant to Sharkey soils?

Answer. Both opinions and data relevant to Sharkey soils were used to make conclusions. Whether opinions or data were used depended on the specific charge. For example, charge 1 was to agree on the "concept and classification of the Sharkey series". The conclusions for this charge were based on data. Charges 4, 6, and 7 asked for definitions, and these were based largely on collective opinion or historical precedence. Charges 2, 3, and 5 were fulfilled by considering data and personal opinions of subcommittee members who had examined their data or who had extensive expertise in the subject.

Question. Would it have been appropriate for committee members to have had an opportunity to see and review the report before it was released?

Answer. It would have been desirable for committee members to have had an opportunity to see and review the report before it was released. This was not done because there was not time. Oral presentations on the report were presented in Washington, DC on December 8, 1997 to the Natural Resources Conservation Service's (NRCS) top staff. Reports were sent to the full committee on December 9, 1997. It is stated in the report (page 3) that ". . . individual committee members may not agree with all recommendations made here". Because the co-chairs made a diligent effort to keep the subcommittees focused on key issues via e-mail, subcommittee members should not have been surprised by the final recommendations made in the report. To the best of our knowledge, no committee member was surprised by the final recommendations.

MAJOR CONCERNS

Question. Why was the Sharkey series not correctly classified in the Vertisol Order since the adoption of *Soil Taxonomy* in 1965? It is one of the most extensively occurring soil series in the nation. What was the scientific basis for incorrect classification as Inceptisols?

Answer. When *Soil Taxonomy* was adopted in 1965, the Sharkey series, like other soil series, was classified based on existing data and the best collective judgment of soil correlators and other experts of the National Cooperative Soil Survey (NCSS). At that time, it was felt that Inceptisols was the best classification for the Sharkey series. As extensive research data have become available in recent years for soils of the Sharkey series, it has become apparent, and agreed to by experts of the NCSS, that the best classification for this series is Vertisols.

Question. Recommendations B, page 6. Recommendations 1 and 2 seem to conflict with each other. Recommendation 1 states two classifications must be given for the series and 2 states if one classification must be used, then it should be taken from the micro-low. What is the justification for this statement?

Answer. Vertisols within a single landscape can consist of two different, but paired soils—one occurring on a small ridge, and the second in an adjacent bowl-shaped depression. This pattern is regular, frequently occurring, and is produced by shrinking and swelling processes that occur in the soil. The most accurate way to describe this natural variability is with two soil classifications, because the committee agreed that a single classification does not fully describe the soil. It may not be practical to use two classifications for a single series in all cases. Therefore, if only one classification is used, the committee suggested the depression or micro-low be used to represent the soil's properties. The micro-low will tend to be wetter and its properties probably will have the greatest impact on how the soil is used.

Question. Was the Committee charged to redefine saturation? Does the attempt to redefine saturation mean Sharkey soils are not saturated according to the scientific definition of saturation? What effect would the proposed redefinition have on these soils; and would it apply to other soils as Mollisols, Inceptisols, Entisols? How will land owners react when told they are now going to redefine saturation?

Answer. The committee's charge was to: "Agree on a method of monitoring saturation". In order to monitor saturation, the term must be clearly defined to show exactly what is being monitored. The term "saturation" was not redefined in the report. Rather, the report recommends a method to monitor soil water using equipment that is commonly used to assess soil-water potentials in Vertisols. The report also recommends a new way to interpret soil-water data that can be used to determine natural saturation. This is not a new concept, and citations for its use in the scientific literature were included in the report (page 11). The method recommended for interpreting natural saturation applies only to Vertisols like the Sharkey series. It could be adapted to other soils but that was not the intent of the committee. The committee does not know how land owners will react to the recommendations of this report. The report describes a workable method to collect and interpret soil-water data.

Question. There appears to be no scientific basis for the 14 day wetting period suggested in Charge 2. Is this science or arbitrary choices between some who want 7 days and others 21 days despite data indicating months might be required? If data indicates 4 months why 14 days?

Answer. The 14-day wetting period was a suggested compromise based on best professional judgment. We state in the report that members of the committee who have made measurements of soil-water potentials in Vertisols were split on the duration of the recommended wetting periods, and estimates ranged from 7 to 21 days. It is pointed out in bold type (see page 18) in the report that further research may show the duration of the wetting period will have to be adjusted for different regions. We encourage more research on this topic.

Question. Define anaerobic—Does it mean zero oxygen?

Answer. The Glossary of Soil Science Terms (1996) defines anaerobic as "The absence of molecular oxygen".

Question. Does what happened in the past matter for modern usage, should it take precedence over the present?

Answer. Interpreting what has happened in the past is important "for modern usage" if it is the only way we can predict what will happen in the future. For example, a soil is considered to be a hydric soil if it contains one or more of the "Field Indicators of Hydric Soils". The Field Indicators are signs that the soil was anaerobic at some point in the past, and it is assumed that the soil will again become anaerobic.

Question. Can uniform, scientifically correct assumptions be made on conditions in the past; how far in the past?

Answer. Interpretations regarding whether the soil was anaerobic in the past can be made uniformly and scientifically if a uniform set of criteria are applied to the soil. Such a uniform set of criteria are the "Field Indicators of Hydric Soils" which were published by the NRCS in 1996. We do not know how far into the past, in terms of years, that interpretations can be made using the Field Indicators.

Question. Can one assume ancient soils were frequently flooded and saturated?

Answer. Relative to "ancient soil", if there are indicators in the soil that the soil was flooded or saturated, then presumably it was. Geomorphic processes occurring today such as flooding and saturation leave indicators in soils. When those same indicators are seen in ancient or relic soils then the processes that left those indicators are inferred to be the same processes that are occurring today.

Question. Should soil classification be useful in the present or the past?

Answer. Soils are classified, in our opinion, to help make assessments as to how well soils are suited for a given use and to communicate concepts about characteristics of soils. Classification should be useful for the present in order for us to predict how soils will function, and this includes a prediction as to whether the soil is a hydric soil.

Question. What is the water table depth in Sharkey soils?

Answer. The concept of a water table cannot be easily applied to Vertisols such as the Sharkey. The report recommends that water tables not be measured and that wells not be used to assess the soil-water conditions in Vertisols. Instead, measurements of natural saturation should be made using piezometers.

Question. Is the proposed "natural saturation" scientifically defined and justified?

Answer. Natural saturation is defined in the Soil Science Society of America's monograph "Methods of Soil Analysis. Part 1. Physical and Mineralogical Methods, Second Ed., 1986". This is the standard reference work that describes accepted ways of measuring soil properties. The complete reference citation is given for Klute (1986) on page 43 of the report. The concept of natural saturation is justified not only for use in Vertisols, but for all soils as is discussed in the above reference.

Question. Would criterion for classification of Vertisols in a wetland be the same as in upland landscapes?

Answer. In general, yes, the same criteria are applied to Vertisols for classification purposes, regardless of whether the soil is in an upland or wetland. We classify soils on the basis of properties that occur in the soil. We do not make an interpretation as to whether the soil is in a wetland or upland before the soil is classified.

Question. If only the ped surface is used to determine reduction, would this not leave most of the soil volume unused?

Answer. A portion of the matrix in Vertisols is considered "unused" if roots have not penetrated into it. Without roots the soil volume will probably not contain enough dissolved organic materials or microorganisms to produce the biochemical reactions (e.g., reducing chemical reactions) that must occur in hydric soils. The volume of space that is "unused" probably increases with depth. Within 30 cm of the surface, the volume of "unused space" is expected to be small because roots should be spaced closely, but the actual volume is not known at this time.

Question. Item 3, page 18 states, "the scientists who contributed to this report suggest that a wetting period of 14 days be adopted . . ." Are there not scientists who contributed to the report who strongly felt otherwise?

Answer. One of the 22 scientists who contributed to this report openly stated that the wetting period concept was not appropriate. The objections of this individual were debated within the subcommittee, and the best procedure that could be proposed is the one described in the report. As noted in our response to a previous question, the 14-day duration for the wetting period may have to be modified for some regions. This will only be determined after the concept is tested against data.

Question. Page 28, C3. If no positive reaction with a, a1-dipyridyl occurs why can't a simple statement be made that it is not reduced? Does any research or literature indicate any Vertisols have no Iron? You can't have it both ways.

Answer. The a, a'-dipyridyl dye only reacts with reduced forms of iron. Some soils do not contain enough iron for them to produce a reaction to the dye. It is not known that every single Vertisol contains sufficient iron to produce a reaction to the dye. From a practical standpoint, most Vertisols will probably contain sufficient iron for them to react to the dye when reduced. Nevertheless, the scientists who contributed to the report felt the possibility of a soil not having sufficient iron must be recognized.

Question. Can you have gray, clayey parent material that is not anaerobic?

Answer. Yes, this condition can exist.

Question. How do you interpret gray, clayey alluvial parent material that was previously eroded from soils that may have been located hundreds or thousands of miles away. What is the basis for inference of anaerobic conditions? Do all alluvial and coastal plain soils form under anaerobic conditions at some stage of their evolution?

Answer. We look for hydric soil Field Indicators that are composed of organic soil materials. Field Indicators made of iron are not reliable indicators to use to identify hydric soils in materials that do not contain iron. On the other hand, organic material accumulates in such anaerobic soils and a number of indicators have been identified for use. These have been published in the NRCS's publication: "Field Indicators of Hydric Soils in the United States", published in 1996. Alternatively, an odor of hydrogen sulfide gas may also be used as an indicator that the soil is anaerobic and reduced. We cannot say categorically that all alluvial and coastal plain soils formed under anaerobic conditions; however, we will assume that many did. These soils will be considered hydric soil today only if they contain Field Indicators of Hydric Soils. The coastal plain sediments can be very old, on the order of hundreds of thousands of years. Those coastal plain soils that are not hydric have changed color since they were deposited and do not contain the hydric soil Field Indicators.

Question. What are relic soil colors? Do they have meaning in current land use?

Answer. Relic or relict soil colors are colors that formed in the past and which persist in places where they could not form today. Such colors might have a use in determining whether the soil hydrology has been altered, if the colors could be accurately identified as relict. In our opinion, there is no simple, reliable way to identify relict colors. Making an interpretation that colors in a given soil are relict is no more than guesswork at the present time.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. In our strategic plan, we established two overall General Goals that state the outcomes that would fulfill our mission. These outcomes are:

—Individuals and their neighbors working together as effective and willing stewards of the natural resources on their property and in their communities.

—A healthy and productive land that sustains food and fiber production, sustains functioning watersheds and natural systems, enhances the environment, and improves urban and rural landscapes.

We then established a series of strategic objectives that identify the components of each goal that are of highest priority for the immediate future. For each objective, we identified long-term performance goals that set measurable targets for accomplishment. Goals and objectives and most performance goals are stated in outcome-related terms. That is, they refer to the condition of the land or to improved management practiced by non-federal individuals or entities. These performance goals are the basis for the performance goals in our annual performance plan. The objectives correspond to authorized purposes of one or more of the program activities in our budget.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The process drew on the technical and program experience of a team of headquarters and regional staff. This team drew on a wider circle of state and field level employees and national program managers. The team studied each of the performance goals for 2002 that are established in the strategic plan and identified program activities that contribute to meeting the long-term goal. The team determined which activities were most clearly outcome related and recommended those be used as performance measures for fiscal year 1999. The main problems that we encountered were in the area of data availability. For some natural resources objectives, such as water quality, there are not currently reliable annual data sources to support an annual performance goal.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The agency's Performance Plan includes several tables that map the linkage between the performance measures and the budget. Tables 3a and 3b in the plan show the relationships between the objectives in the strategic plan and the long-term and annual performance measures. Tables 4a and 4b in the plan then show the relationship between programs and strategic objectives. Table 5 in the plan presents information on the amount of funds from each budget activity that support each objective.

The performance plan includes measures that can be used as measures for each program. The measures, however, are designed to fit our larger programs. Some but not all activities of smaller programs are covered by the current set of measures. For example, activities of the RC&D Program that directly relate to resource conservation are covered by performance measures in the plan. RC&D activities that relate to community development are not.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Our budget provides funds through a structure of 13 accounts and activities. These programs are delivered through a single work force to customers who may participate in several programs. We are using the performance planning process as a means to integrate management of our program activities. Our performance planning structure, therefore, is natural-resource driven and very closely follows the structure of the outcome-related objectives in our strategic plan. We have very few single-program performance measures in our performance plan.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. At present we do not anticipate proposing changes to our account structure for fiscal year 2000.

Question. How were performance measures chosen?

Answer. The annual performance measures that support our strategic goal for a healthy land are measures of conservation on the land achieved with direct technical assistance provided by NRCS employees at the field level. A team that included representation of all regions identified possible measures and recommended those that most closely related to the long-term goals established in the strategic plan. We selected predominantly measures that we can now collect data on, or for which we expect to be able to collect data by the beginning of fiscal year 1999.

Performance measures for the goal for stewardship are primarily internal measures, such as training levels, that measure our capacity to provide quality assistance and customer satisfaction measures.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. We have implemented a reporting system that draws on the data stored in automated case files in the Service Centers. The intent of this Field Office Com-

puting System is that detailed information can be transmitted from the Service Centers to managers in state and regional offices and NHQ without employees at the field level doing anything other than that required to keep the records that they need to do their job in the field. Initially populating the data fields in the system is labor intensive, however. Not all field offices are fully utilizing the system at present. We have developed the concept that we call Future Directions that will utilize newer, more user-friendly information management technology to streamline the essential record-keeping at the field level.

We are also planning to use the National Resources Inventory to collect annual information on several key outcomes. We are evaluating use of a series of annual inventories on specific resource issues, with the intensity of sampling and therefore the cost, determined by the performance issue.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. We expect to have data for the current performance measures by March 2000. Work is underway to finalize definitions and determine data sources for those few measures for which we are not currently collecting data. We do, however, intend to continue refining measures over the next several years. This means that there likely will be some measures in the plan for any given year for which we may not have reliable baseline data or consistent current-year data.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The annual performance measures that support our strategic goal for a healthy land are key outcome-related measures that the committee can use to track the effectiveness of our combined programs.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. We tied our annual performance goals directly to the two outcome goals of our strategic plan. The annual performance measures for resource condition are all at least intermediate outcomes that measure improvements in natural resource management implemented by resources managers with NRCS assistance. We have included relatively few measures of internal processes in our performance plan.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcomes)?

Answer. Yes, most NRCS managers at all levels have a general understanding of the difference between outputs and outcomes. Because we are a field agency in which most of our employees are front line staff providing services directly to the public, most managers have first-hand knowledge of the results our customers want and can distinguish between the activities that employees perform and the changes on the land that result from that assistance to land users.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. The performance plan includes a goal for external customer satisfaction. We will ask customers not only overall satisfaction with our service, but also their judgment as to how well we met the USDA Service Center customer standards, which relate to courtesy, prompt service, reliable service, clarity and readability of information provided, and ease of use of forms. We will collect adequate demographic data to compare the satisfaction of various customer segments. The performance plan also includes a program-specific customer satisfaction goal for "Percent of water users fully satisfied with usefulness of Snow Survey And Water Supply Forecasting Program information."

The performance plan does not include performance measures specifically related to internal customer satisfaction nor do we presently plan to add such measures. We do intend to collect data on internal customer satisfaction relating to satisfaction with the appropriateness and timeliness of training in new technology, including both conservation technology and information management technology, and satisfaction with our efforts to ensure that all employees are treated fairly.

Question. How were the measurable goals of your fiscal year 1999 annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. In early 1997 we identified a tentative set of annual performance measures and made the necessary changes in the reporting system to automatically report the data entered in the field level case files. Most of these measures are items that were not reported nationally prior to implementation of the automated case file system. Adequate data for the new measures were not available in early 1997 to

support the initial phases of the budget formulation process for fiscal year 1999. Therefore, the fiscal year 1999 budget was developed with reference primarily to the program-specific performance measures that we have traditionally used. The targets for performance for each of the measures were developed later in the year, on the basis of available data and state-level managers' best judgment.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. If the committee changes a proposed number, we will be able to tell you the impact on the level of program performance in terms of program-specific outputs and the outcome goal most closely related to the program purpose. We could, for example, tell you the change in extent of acreage contracted for the Wetlands Reserve Program corresponding to a change in the WRP budget. This would relate directly to our performance goal for wetlands created or restored. We could not, however, trace with accuracy the impact of that change through all of the other goals that might be affected. To continue the example, a change in the assistance available for protecting wetlands could affect the acreage of cropland and grazing land where conservation systems were fully implemented, the miles of riparian area restored, or the number of watersheds restored to healthy functioning.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Performance information from the field is routinely reported quarterly. We have the capability to report more frequently should it be necessary.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. The difficulty we face in linking dollars to results in a meaningful way stems more from the nature of the results we seek to achieve than from our budget structure. Because natural resources are parts of an interrelated system, program activities that are undertaken primarily to achieve a specific goal will have effects on other components of the system. In our performance plan, we have attempted to show the linkage between programs and the primary performance goal(s) the funds support. However, the goal for any resource objective is based on the assumption that the funds requested to meet other objectives will also be available.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. We have not identified changes in our budget structure that would make the linkages clearer. We have, however, introduced modifications of the reporting system that will enable field staff to record the program that is the funding source for milestones recorded in the case files. When these data are consistently recorded, we will be able to tie activities to dollars more precisely.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Our strategic plan briefly describes key external factors that might influence the ability of the agency to achieve the goals in the plan. Our performance plan, therefore, refers only to the means and strategies by which the agency will achieve the goals.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. We are strengthening our capability to analyze resource and other data to identify emerging trends in production patterns and resource use to help anticipate changes that might intensify pressures on the resource base. We are also moving to a system of more annual resource inventories for key indicators so that we can identify where change is occurring and revise strategies before severe problems can develop. In addition we are strengthening our working relationships with other natural resources agencies in order to draw on their data and expertise.

Question. What impact might external forces have on your resource estimates?

Answer. The transition to market-driven agriculture could result in changes in land use and cropping patterns that affect the conservation needs on agricultural land, impacting the level of assistance producers need from USDA. Enactment of new requirements for resource protection, at either the national level or by a significant number of states, could greatly affect the level and kind of resources NRCS would need to help landusers meet their responsibilities. Changes in domestic or

international economic conditions could substantially alter agricultural commodity prices, farm incomes, and the ability of private individuals to maintain or enhance their investments in conservation of natural resources. Such changes could also affect the ability of state and local members of the conservation partnership to increase their contributions to joint conservation initiatives. Also, dramatic changes in weather patterns, such as those experienced with El Niño, could have significant impacts on resources needed for protecting natural resources and the environment.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. There is some overlap in the sense that several of our programs are authorized to address a wide range of resource goals. Rather than causing duplication, this overlap creates flexibility that permits us to tailor assistance to meet the wide range of conditions and needs in local areas across the country. In the performance plan, the programs that can be used to address goals are shown in the tables that map programs to resource objectives.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

—To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

—Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Fiscal year 1997 was the first year for which national data were reported for most of our performance measures, and the 1997 data were not available until mid-December. Therefore, we have had little opportunity to thoroughly analyze the new data. In addition, not all field offices are fully using the automated case file system. We expect to correct these weaknesses before early fiscal year 2000, when we begin to develop the first performance report required by the Results Act.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. We do not see any immediate need for substantive revisions. We are continuing to strengthen our reporting systems and to improve information on baseline resource conditions. We may make minor changes to the strategic plan through the fiscal year 2000 performance plan, as the Results Act permits, but we do not anticipate any need to consider substantive changes until the scheduled update that is required by the end of fiscal year 2000.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

ARKANSAS WATER RESOURCE PROJECTS

Question. For the past several years, this subcommittee has directed funds through NRCS to work toward solutions of serious ground water depletion problems in Eastern Arkansas. These areas have included Grand Prairie, Bayou Meto, and Boeuf Tensas. I have also worked through the Energy and Water Subcommittee to engage the U.S. Army Corps of Engineers in these efforts as well. In short, if we don't make better use of our available surface water resources, we will soon deplete the aquifers to the point they will not longer recharge. If there is no solution to this problem, the rice industry in the Mid South will be dead and along with it the economy of the entire region.

Answer. The status of these projects will be provided for the record.

EASTERN ARKANSAS GROUND WATER PROJECTS

Background:

(1) NRCS has been cooperating with the Corps of Engineers (Memphis District and Vicksburg District), State of Arkansas and local sponsors on Eastern Arkansas Ground Water Projects on a routine basis since 1986.

(2) 1986 to 1990: Eastern Arkansas Region Comprehensive Study that included all of eastern Arkansas North of the Arkansas River. Result: Five (5) identified critical ground water decline areas with solutions. NRCS was a partner with COE, ASWCC, and local sponsors.

(3) 1990–1991: Corps of Engineers was directed by Congress to choose one of the identified ground water decline areas as a pilot for further study with planning and implementation anticipated. This was the Grand Prairie area.

(4) 1991–1997: COE, ASWCC, NRCS, local sponsors plan Grand Prairie. NRCS was a partner with the COE, ASWCC and local sponsors in completing this detailed resource plan. NRCS performs the on-farm portion of the planning efforts and the

COE performs the major irrigation canal and pumping plant portion of the planning. Planning has been completed and local sponsors are awaiting funding.

(5) 1990–1991: Corps of Engineers Vicksburg district was directed by Congress to complete a Reconnaissance study for the Boeuf-Tensas Basin. This includes the eastern Arkansas Delta area south of the Arkansas River. This study was completed jointly by COE and NRCS. Result: An identified project but no authorities within the Corps of Engineers to continue planning assistance.

(6) 1992–1993: NRCS was directed by Congress through earmarked funds to begin efforts in planning the eastern Arkansas Water Conservation Projects. Specifically named were Bayou Meto, Boeuf-Tensas and Kuhn Bayou (Kuhn Bayou name has been changed to Point Remove by the local sponsors). NRCS has honored those commitments.

(7) Current situation: Efforts continued for planning on Grand Prairie, Bayou Meto, Boeuf-Tensas and Kuhn Bayou. Detailed accomplishments and goals are provided in the following questions.

GRAND PRAIRIE

Question. The fiscal year 1999 request before the Energy and Water Subcommittee includes \$14 million to initiate construction on two of these projects and I will also work to continue the feasibility study on the third. Continued involvement by USDA is also vital: Will you provide an update on NRCS activities related to Grand Prairie?

Answer. NRCS continues to cooperate as a partner with the Corps of Engineers, State of Arkansas and the local sponsors. The Planning document for this project was completed jointly by the Corps of Engineers and NRCS in March of 1997, as scheduled. NRCS completed the on-farm planning portion of this project. NRCS has been working closely during the past year in completing the plan review phase of this project and making additions and corrections as questions and/or issues have arisen.

NRCS provided about \$550,000 in financial assistance to landowners within the Grand Prairie and Bayou Meto critical ground water decline area to aid in on-farm water conservation measure installation during 1997 through the Environmental Quality Incentives Program. This program has worked well but available funding through NRCS will meet less than 3 percent of the area's needs. NRCS is looking forward to a continued strong relationship with the Corps of Engineers, State of Arkansas and the local irrigation district as this project moves toward implementation.

BAYOU METO

Question. Will you provide an update on NRCS activities related to Bayou Meto?

Answer. NRCS continues to work with the State of Arkansas and the local Irrigation District to move this project toward implementation. NRCS has completed planning for the on-farm portion of this project. The natural resource inventory has been completed that includes soils data layers, water quality and water quantity analysis, irrigation water needs analysis for more than 3,000 tracts, wildlife inventories, water quality analysis, cultural resources inventory using Geographic Information Systems and a completed environmental assessment for the on-farm portion of the project plan.

This on-farm portion of the plan identified the conservation practice treatment needs for the area as well as additional water diversion needs to support the water needs within the entire basin. NRCS provided about \$550,000 in financial assistance to landowners within the Grand Prairie and Bayou Meto critical ground water decline area to aid in on-farm water conservation measure installation during 1997 through the Environmental Quality Incentives Program. This program has worked well but available funding through NRCS will meet less than 3 percent of the area's needs.

Currently, NRCS is establishing a Global Positioning Surveying network across the entire Bayou Meto basin to facilitate future hydrology and hydraulic needs for evaluating irrigation delivery and flood control within the basin. NRCS is looking forward to participating with the Corps of Engineers as they become more actively involved in the Bayou Meto project. Our Arkansas staff is currently transferring data collected by NRCS to the Corps of Engineers to facilitate their work. NRCS and the Corps of Engineers continue to meet for scheduling work and sharing data to help in completing the overall basin plan.

Goals for 1998:

1. Coordination and transfer of data and information from the completed on-farm portion of the area-wide Natural Resource Conservation Plan to the Corps of Engi-

neers to assist the COE with their efforts in moving into the planning phase of the delivery portion of this project.

2. A cooperative agreement and work plan is being developed in cooperation with the Corps of Engineers, Memphis District, to refine and complete the total Resource Conservation Plan for this project. Additional goals for surveying, planning, environmental evaluation, and other data collection and analysis has not been completed at this time. Continued cooperation and teamwork between the COE and NRCS is a certainty.

Anticipated 1998 staffing: 3 staff years and \$200,000

Anticipated 1998 EQIP funding: \$500,000 for the Grand Prairie/Bayou Meto Basin

BOEUF TENSAS

Question. Will you provide an update on NRCS activities related to Boeuf Tensas?

Answer. To date the local sponsors continue to inform the public of water decline and water quality status as well as promoting solutions to the problems. The Arkansas NRCS irrigation team is developing critical aspects of the project which include digitized soils data layers through the University of Arkansas for use in the NRCS Geographic Information System (GIS), inventories of streams, canals, reservoirs, utilities, farms, cultural resources, wildlife and other important land use features and resource concerns are being identified. A three-party memo of understanding between NRCS, Arkansas Soil and Water Conservation Commission, and the local irrigation district is being jointly developed.

Current Status.—Approximately 50 percent of the inventory has been completed.

Funds spent/obligated and staff time.—A team has been established composed of soil conservationist, GIS specialists, soil scientists, economists and engineers working on various aspects of the project. Approximately 6 staff years will be devoted to this project during the fiscal year. Approximately \$400,000 of funding was expended during fiscal year 1997.

1997 Accomplishments

1. Completed compilation of all soils information for 1.2 million acres within the project area.
2. Completed 60 percent of the data inventory for on-farm portions of the project.
3. Completed 30 percent of a preliminary irrigation canal and/or pipeline delivery system for the entire 2 million acre project area.
4. Completed the initial cultural resources inventory.
5. Obtained digital quadrangle sheet map data.
6. Completed draft base map of entire project area.

Goals for 1998

- (1) Publish maps of soils information for the 1.2 million acres within the project area.
- (2) Complete data inventory for on-farm portions of the project area (60 percent complete now, goal of 100 percent for 1998).
- (3) Complete a Water Budget calculation for each tract for the 1.2 million acres within the project area (partially completed, 100 percent goal for 1998).
- (4) Complete preliminary Irrigation Canal and/or Pipeline Delivery System for the entire 2 million acre project area (40 percent complete, 100 percent goal for 1998).
- (5) Develop public information maps and fact sheets for project sponsor local information/education efforts.

Coordination efforts are underway with the Corps of Engineers for planning activities. Vicksburg District of COE has received authorization to proceed with planning efforts.

Anticipated staffing: 6 staff years and \$400,000

COOPERATION WITH OTHER ENTITIES

Question. Will you provide an overview of your ability and willingness to work with the U.S. Army Corps of Engineers, the State of Arkansas, and local sponsors of these projects?

Answer. The partnership formed between the Corps of Engineers and NRCS illustrates how federal agencies should work together, utilizing the strengths of both agencies, to serve the needs of the State of Arkansas, local project sponsors and the citizens within the project area. NRCS will continue to support this strong partnership effort within available resources and funding levels.

NRCS in Arkansas continues to struggle with staffing and funding levels to meet the needs of these critical resource areas. Our current budget projections indicate a reduction in staffing levels as demand for technical assistance increases statewide. This demand for technical assistance is expected to increase.

KUHNS BAYOU

Question. On a related matter, will provide an update of NRCS activities related to Kuhn Bayou?

Answer. NRCS has completed the project plan, 100 percent of the field survey needs, identified the land rights and easement acquisition requirements for sponsors to acquire the necessary land rights and easements, reevaluated the cost data and updated information for the local sponsors as they search for funding and completed approximately 30 percent of the project design. The local sponsors and NRCS have entered into a Cooperative Agreement to complete the final design by October of 1998. Coordination continues to occur with the Arkansas Game and Fish Commission.

Design Completion is scheduled for October of 1998.

Funds spent/obligated and staff time: Approximately 1.5 staff year (\$100,000) have been expended for technical assistance to the irrigation district during fiscal year 1997. All design activities will be completed prior to the local sponsors acquiring funding for project implementation.

Goals for 1998

1. Complete the structural design for one large water control structure (currently 30 percent, 100 percent fiscal year 1998).
2. Complete the design of the irrigation delivery canals and relief stations (currently 30 percent, 100 percent fiscal year 1998).
3. Incorporate the irrigation pipeline design to assure water delivery to each tract (100 percent completed).
4. Complete 100 percent of the land rights work maps and provide to local sponsors for land rights/easement acquisition (currently 80 percent).
5. Prepare final cost and information/education package for local sponsor efforts in providing information to their clients (20 percent).

Anticipated staffing for 1998: 2 staff years and \$100,000.

AGING INFRASTRUCTURE

Question. Your budget includes an increase of \$1 million to evaluate the condition of aging infrastructure and you suggest that by fiscal year 2000 you may have identified 2,000 structures in need of significant restoration. In Arkansas, I understand you have identified structures on the Muddy Fork of the Illinois River as part of this aging infrastructure. What other projects in Arkansas have you identified?

Answer. The \$1 million in the budget request is not to evaluate the condition of the infrastructure but to provide educational assistance to watershed sponsors concerning their need to examine and repair their older watershed structures. As these dams and structures age, the need for repair or replacement of existing structures becomes critical. The increased funding would enable NRCS to provide important educational assistance to communities and sponsors regarding the safety and status of conditions of existing structures. As part of this budget item, NRCS would utilize the "Training Aids for Dam Safety" package of workbooks and videotapes prepared by the Interagency Committee on Dam Safety. The package was professionally prepared and translated into several languages. It includes modules ranging from technical aspects of site inspections to safety program development. The Interagency Committee has also developed "Federal Guidelines for Hazard Potential Classification of Dams" which could provide the base criteria to classify the most threatening structures. This base criteria is very similar to current NRCS classification criteria and to the Corps of Engineers criteria that was used to inspect the nation's dams in the 1970's.

Regarding the Muddy Fork of the Illinois River Watershed, we recently assisted the sponsors/partners (Washington County Conservation District, City of Lincoln, Arkansas, Arkansas Game and Fish Commission, City of Prairie Grove, Arkansas and the Arkansas Soil and Water Commission) to develop a case study, which takes a snap-shot of the project. The case study examines the benefits planned, benefits realized and future opportunity benefits to encourage the community to take the necessary steps to protect this valuable investment of the infrastructure of which originally utilized a 50/50 local/federal cost-share. Currently, this project provides over \$542,000 of annual benefits which include flood prevention, recreation, two municipal and industrial water supplies for the cities of Prairie Grove and Lincoln. Other benefits include fish and wildlife habitat, habitat for endangered species, improved water quality, erosion control, increased employment and fire protection.

This case study conducted on the Muddy Fork did not provide an engineering study/evaluation on the integrity, soundness or remaining life-span of structures in the watershed. Depending on the engineering complexities of the specific structure,

we estimate that it will cost sponsors \$30,000 to \$50,000 per structure, to conduct a detailed engineering evaluation. This estimate would not include engineering costs for designing the rehabilitation or repair work. We are not aware of any other Small Watershed project sponsors in Arkansas who are considering a similar type of case study.

Question. Could you provide a list of projects in all states already identified?

Answer. Other states where sponsors have developed a similar, snap-shot, case study of which we are aware include California, Georgia, Iowa, Kansas, Mississippi, New Mexico, New York, Ohio, Oklahoma, Tennessee, Texas, Wisconsin and West Virginia. Other sponsors have very likely developed similar fact sheets on their projects to showcase the societal and environmental benefits of other Small Watershed Projects of which we are not aware.

Question. How much of a threat to public health and safety are posed by the structures?

Answer. Dams are classified under the national dam safety hazard criteria and in most states are regulated by state dam safety laws. Not all dams have been classified and some have an increased safety hazard due to development both upstream and downstream of the dams. Dams that do fail, pose a great threat to life and property.

Question. What criteria are you using to classify the most threatened structures?

Answer. There is no classification system which will yield a ranking of which are the most threatened structures. This is very subjective engineering work usually involving risk analysis studies.

Question. Have you initiated actions to correct identified problems and if so, what are they? If not, when do you plan to take corrective action?

Answer. In cases where dam safety problems have been discovered by our field staff, it is our policy to notify the sponsors (owners of the dam) and the state dam safety agency. We have provided technical assistance to the sponsors (owners of the dams) and recommended corrective measures to remove the immediate to life and property. However, beginning October 1, 1998 NRCS will charge sponsors for technical and consultative services for dam rehabilitation or modifications.

Question. When do you plan to initiate action on the Muddy Fork structures?

Answer. We have no plans to initiate any action on the Muddy Fork structures since we have no statutory authority nor funding to take action. The complete responsibility for operations, maintenance, rehabilitation, decommissioning, and modifications is the legal responsibility of the sponsors, owners of the dams. This case study conducted on the Muddy Fork did not provide an engineering study/evaluation on the integrity, soundness or remaining life-span of structures in the watershed. Depending on the engineering complexities of the specific structure, we estimate that it will cost sponsors \$30,000 to \$50,000 per structure, to conduct a detailed engineering evaluation. This estimate would not include engineering costs for designing the rehabilitation or repair work.

Question. What do you project the ultimate cost may be in bringing these structures up to standard?

Answer. No total cost has been estimated. The first step for the sponsors is to conduct a detailed engineering evaluation on the Muddy Fork structures in order to ascertain an engineer's estimate of the total cost to perform needed remedial work. NRCS has no statutory authority nor funding available for this task.

BACKLOG OF APPROVED WATERSHED INFRASTRUCTURE PROJECTS

Question. You mention there are over \$1.5 billion in need for Public Law 566 and Public Law 534 projects. Please provide the number, location, and costs associated with projects in Arkansas on the backlog.

Answer. We will provide that information for the record.
[The information follows:]

ACTIVE PROJECTS IN ARKANSAS WITH THEIR COSTS

Project/name	Obligations to date	Obligation needs
2027, Big Slough	\$958,120
2065, Buffalo River Tributaries	698,983	\$3,767,700
2052, Flat Rock Creek	10,408,737	1,673,520
2036, Forche Creek	15,711,680	1,121,760
2064, Gould Portion of Grady-Gould	197,422	1,095,540

ACTIVE PROJECTS IN ARKANSAS WITH THEIR COSTS—Continued

Project/name	Obligations to date	Obligation needs
2063, Little Red River	4,005,653	1,254,000
2034, North Fork of Ozan Creek	3,913,758	1,271,100
2053, Ozan Creeks	6,476,273	7,397,460
2042, Poinsett	14,031,395	8,839,560
2054, South Fork	4,386,669
2038, South Fourche	13,858,666	5,823,120
2050, Upper Petit Jean	5,637,321	11,037,480
Total	43,281,240	43,281,240

Question. Could you provide a list of the number of projects by state on the back-log?

Answer. We will provide that list for the record.

[The information follows:]

Number of active Public Law 566 projects by State

Alabama	17
Alaska	1
Arizona	8
Arkansas	12
California	15
Colorado	3
Connecticut	4
Delaware	4
Florida	7
Georgia	20
Hawaii	7
Idaho	14
Illinois	14
Indiana	6
Iowa	20
Kansas	24
Kentucky	21
Louisiana	15
Maine	5
Maryland	4
Massachusetts	3
Michigan	6
Minnesota	4
Mississippi	16
Missouri	17
Montana	4
Nebraska	16
Nevada	1
New Hampshire	1
New Jersey	3
New Mexico	8
New York	7
North Carolina	16
North Dakota	7
Ohio	14
Oklahoma	34
Oregon	5
Pennsylvania	14
PB	3
Puerto Rico	3
Rhode Island	1
South Carolina	20
South Dakota	3
Tennessee	19
Texas	28

Utah	6
Vermont	8
Virginia	14
Washington	12
West Virginia	12
Wisconsin	2
Wyoming	2
Total	530

WATER DISTRICTS BACKLOG

Question. Could you provide information relating to the number of water districts or associations on this backlog who have initiated local tax measures or some similar action in anticipation of the federal share being forthcoming?

Answer. We do not collect information on the number of water districts or associations who have initiated local tax measures or some similar action in anticipation of the federal share being forthcoming.

DIGITIZED SOIL MAPS

Question. You mentioned the need to proceed with categorizing soil types and inputting that information in a digitized format using GIS technologies. Would you please provide an update on the work of the GIS Center for Advanced Spatial Technology in Arkansas in developing soil digitized maps?

Answer. NRCS continues to maintain a strong relationship with the Center for Applied Spatial Technology (CAST) for the development and delivery of digital soil databases and other digital GIS databases for counties in Arkansas. Cooperative efforts between NRCS, CAST, University of Arkansas at Fayetteville, Agronomy Department, and the Arkansas Soil and Water Conservation Commission have resulted in digitizing of sixteen counties in the state. Five additional counties are planned to be completed by the end of calendar year 1998.

NRCS has also developed a cooperative agreement with CAST for placing the Woodruff County, Arkansas Soil Survey on the Internet. This is to be completed by the end of calendar year 1998 and will be the first county in the nation with comprehensive soil information on the Internet.

NRCS is also working with CAST to assist soil and water conservation districts and county governments to implement GIS technology. An example is the Union County Soil and Water Conservation District. GIS specialists from NRCS and CAST are jointly providing assistance to this conservation district to develop a plan to acquire hardware, software, and digital data layers needed to implement a GIS in their office. This GIS will be used by the district to collect and manage water well data for the Sparta/South Arkansas Critical Ground Water Area. NRCS and CAST will work together to provide the district with digital soils data, digital orthophotography, and digital USGS Rastergraphic data for this project.

SUPPLEMENTAL DISASTER ASSISTANCE

Question. El Niño and other storm events in recent months have caused major destruction in many parts of the nation. Does NRCS intend to submit an emergency budget request for disaster assistance?

Answer. The President submitted a budget request of \$40 million. NRCS is continuing to gather information on damages.

Question. What, if any, disaster estimates have you received from the affected states?

Answer. At this time we have not received any requests that we have not been able to fund. It is too early to tell in California since the weather has not cleared enough to be able to make any significant estimates. Our people in Florida are just beginning to gain access to various sites struck by tornadoes.

PLANT MATERIALS CENTERS

Question. Could you provide an update on the activities of the Plant Materials Center at Booneville, Arkansas?

Answer. The Booneville plant center has 15 studies that investigate various aspects of using plants for conservation purposes. They include:

1. Evaluation of selected grasses as filter strip cover with applied poultry litter.
2. Improving vegetative cover on reclaimed mined land in Arkansas.
3. Assembly and evaluation of big bluestem *Andropogon gerardi* Vitman.
4. Eastern Gamagrass (*Tripisacum dactyloides*) intercenter evaluation study.

5. Evaluation of 115 plant species for adaptation in West Central Arkansas.
6. Establishment of native warm-season grass species into existing tall fescue sod.
7. Determination of the variation in biomass, yield, and stand persistence among switchgrass breeding lines and standard commercial varieties.
8. Determining biomass dry-matter yields for selected switchgrass breeding lines and standard commercial varieties to be utilized as a bioenergy fuel source. (cooperative with 5 other states and 4 different agencies)
9. Indian grass (*Sorghastrum nutans*) variety evaluation.
10. Native grass establishment and seed increase for the Arkansas Heritage Commission and the White River Irrigation District.
11. Evaluation and selection of a cold hardy Bahiagrass cultivar.
12. Development of a crop residue resource quality database for predicting decomposition in soil erosion models.
13. Roadside establishment of native species for the Arkansas Highway and Transportation Department.
14. Bioengineering stream bank erosion control using plant materials.
15. Hackberry ecotype evaluation for windbreaks and wildlife habitats.

Results and progress in work has been presented at various meetings and conferences. It has also been summarized in technical reports, annual reports, and quarterly newsletters. A big bluestem cultivar release is planned in 2001, and an eastern gamagrass cultivar is planned for 2000.

Question. What is the funding level for the Booneville Center in fiscal year 1998 and what is projected for fiscal year 1999?

Answer. The Booneville Center operates on a budget of \$302,000 in fiscal year 1998. \$277,000 are from the Plant Materials program and \$25,000 are from other sources. A need for \$295,000 is projected for fiscal year 1999.

CLEAN WATER ACTION PLAN

Question. USDA and EPA recently announced the Clean Water Action Plan which is designed to carry forward the goals first outlined in the 1972 Clean Water Act. Since more and more attention is given to non-point source pollution, what assurances can you give that this program will not ultimately lead to more federal regulation of farmland?

Answer. The Clean Water Action Plan itself does not propose any new regulations for agriculture beyond what was laid out specifically in the Vice President's directive last October, and those were already underway by EPA before the Action Plan was developed. Further, the Action Plan is limited to what is currently authorized under law. We believe that the Action Plan can help agricultural producers address non-point source pollution through a voluntary, incentive based approach if the necessary funding is made available so USDA can provide the necessary assistance. For example, we believe that technical and financial assistance through EQIP and other farm bill programs can help prevent non-point source pollution at the source, and conservation buffers can help capture sediments and suspended nutrients before they reach surface water bodies.

Question. Similarly, how does your work in the area of Urban Conservation, where there is a tradition of EPA regulation, fit with the more traditional "voluntary" efforts in rural areas?

Answer. NRCS provides technical assistance to clientele in urban areas to address local natural resource concerns. These services are provided on a voluntary basis. While this technical assistance may help our customers address requirements from state, local, or other federal regulations, NRCS is not a regulatory agency and we do not envision any change to this status.

USER FEES

Question. Your budget includes collection of user fees for certain products and services. Please identify the type of fee and amount expected to be collected from each.

Answer. Although we have not fully developed the appropriate fee schedule type details, we anticipate the following types of services may be included under the proposed user fee program:

- Conservation Plans exceeding 16 hours of work;
- Foundation seeds—initial supply;
- Foundation plants;
- Testing for animal waste storage lagoons;
- Inspection and testing of dams;
- Water supply forecasts;
- Climate data;

- SNOTEL data;
- Soil survey publications;
- Wetland delineations; and
- Irrigation systems.

We do not know the exact cost of the services affected, however, the President's budget estimates the cost to be \$10 million. This amount currently supports about 133 FTE's.

Question. Which "users" are more likely to be affected?

Answer. Our first priority would be to focus on those customers who profit directly from the services we provide, such as private contracting firms which use our technical interpretations and soil surveys for consultive services. The extent of the customer impact will depend upon the number of fee items that are ultimately implemented.

Question. How do you expect these fees to be received by the conservation community and the farm community?

Answer. Since the majority of our clients have historically received most technical services free of charge from NRCS, we anticipate the new program to be received with some disfavor from constituents. Every effort will be made to collaborate with effected individuals and groups to explain and minimize any adverse impact of the fee for service program.

FARMLAND PROTECTION PROGRAM

Question. I have long been concerned about the loss of farmland to urban conversion and other uses that in time, will greatly reduce the ability to maintain adequate food supplies. You mention that no funds are budgeted for the Farmland Protection Program in fiscal year 1999 due to the fact that the \$18 million approved by Congress exhausted the original authorized funds for the program. To what extent has this program been successful in stopping urban conversion of farmland?

Answer. \$16.2 million were obligated to 41 programs in 18 States in fiscal years 1996 and 1997. When conservation easement acquisitions are completed, approximately 80,000 acres on 230 farms with an estimated easement value of \$134 million will be protected from conversion to nonagricultural uses in part with Federal funds. On an average, Federal matching funds account for about 25 percent of the recorded easement value, and State and local government entities contribute the rest of the 75 percent. State and local government entities also pay for all administrative costs incurred, such as easement acquisition, management, monitoring, and enforcement. As of January 31, 1998, more than 10,000 acres on 47 farms with a total easement value of \$18 million were acquired, among which Federal FPP funds contributed \$4.5 million (25 percent) and State and local government funds accounted for \$13.5 million (75 percent).

Question. If continued, what effect would it have in protecting our long-term ability to produce adequate food supplies?

Answer. One of the most significant features of the Federal Farmland Protection Program is to establish partnerships with State and local government entities. By doing so, the program provides the opportunity to leverage State and local farmland protection efforts. The program has generated lots of discussions as to what the local or State governments can do to better protect their resource base. As of June 1, 1997, about 491,000 acres on 3,321 farms with an easement value of \$901 million are permanently protected under various State and local farmland protection programs. If funding for the Farmland Protection Program continued, the benefits would outweigh the costs, not only to ensure long-term food supplies, but also to achieve other goals such as ground water recharge, wildlife benefits, better management of the natural resources, or just for open space and aesthetic values.

Question. What would you project the cost of such a goal might be?

Answer. The Farmland Protection Program (FPP) takes the approach that this is a grass-root effort. It is a locally-led process and FPP funds are used to supplement emerging and existing State, Tribal, and local programs. To continue the same process and at the same rate as in the past few years, we estimate that a minimum of \$50 million annually is needed. However, with new State and local programs emerging each year, this program has the potential of being 3 or more times that amount to match State and local funds.

QUESTIONS SUBMITTED BY SENATOR KOHL

CONSERVATION RESERVE PROGRAM

Question. Has the Conservation Reserve Program's wetland restoration option deterred interest in the WRP's 10-year cost share arrangements in Wisconsin and the Nation?

Answer. Specific information on which to base the answer to this question from a Nationwide perspective does not exist. However, in Wisconsin we do have information to show that NRCS personnel and others, while working with landowners, generally find that more landowners turn to the CRP wetlands option than accept the WRP 10-year cost share agreement option. This situation probably occurs throughout the Nation where the landowner has lands that meet the eligibility requirements of both programs. The Wisconsin experience also shows that a landowner may initially seek to enroll in the cost-share agreement option, but when presented with the 30-year and permanent easement option frequently picks one of the easements. In most instances the permanent easement option is the choice.

WETLANDS RESERVE PROGRAM PARTNERSHIPS

Question. Congress has encouraged NRCS to work in partnerships with other conservation entities to implement the WRP. What are the results of your efforts with this directive? Have you identified any program constraints that prevent partnerships?

Answer. The partnership effort continues to be a great success. Private and governmental conservation entities have become a critical factor in successful program delivery. For instance, in Wisconsin the Wisconsin Waterfowl Association is actively assisting with the identification of projects and with planning and completion of restoration activities. The National Fish and Wildlife Foundation has assisted with project identification and funding. The Department of Natural Resources is partnering in the acquisition and implementation of several important restoration projects. The Fish and Wildlife Service is assisting with project identification, design and construction. The Forest Service is providing help in completion of surveys and boundary marking. Throughout the nation a host of other entities are providing assistance (e.g., Ducks Unlimited, The Nature Conservancy, Delta Wildlife Foundation, Pheasants Forever, California Waterfowl Association, Minnesota Waterfowl Association, and a number of state agencies).

The lack of authority under the WRP to provide CCC funds to Federal or State agencies for salaries and expenses is a major program constraint. If we could reimburse these entities with CCC funds the added valuable expertise that we could enlist would greatly increase program effectiveness. The WRP statute does not specifically address the use of cooperative agreements as an aspect of program implementation. This continues to be cause for concern for some who would be more comfortable with specific authority in the statute and not so much reliance on appropriations act report language.

CONSERVATION RESERVE PROGRAM IN WISCONSIN

Question. As I mentioned in my opening statement, the State Department of Natural Resources lent staff to the NRCS offices to help complete the Conservation Reserve Program sign up in Wisconsin. What are you going to do to make sure it doesn't happen again?

Answer. NRCS views the willingness of federal and State wildlife and forestry agencies, and local wildlife organizations to cooperate and work along side with USDA agencies during the 15th CRP sign up, as a good sign that USDA is sincere in its efforts to forge a partnership in improving the environment. It's a true testimony to the locally led process, whereby local people provide input into a USDA program(s). The Federal Agriculture Improvement and Reform Act of 1996 provided a provision for a locally led initiative. The 15th CRP sign up proved that other federal and State agencies and organizations stands ready to assist USDA in implementing Farm Bill programs.

Many people, besides staff from the Natural Resources Conservation Service and the Farm Service Agency, assisted during the sign up period for both the 15th and 16th Conservation Reserve Program during 1997. This was a collaborative effort with many State agencies and conservation organizations. We strongly encourage, partnership efforts such as this in the delivery of these programs.

QUESTIONS SUBMITTED BY SENATOR BYRD

STATUS OF POTOMAC HEADWATERS PROJECT

Question. Please provide a status report on the Potomac Headwaters Land Treatment Watershed Project, complete with pertinent timetables and participation rates. [The information follows:]

Contracts signed 1997	116
Contracts signed 1998	21
Carryover applications 1997	121
New applications 1998	46

Total contracts and applications 304

Federal funds expended in fiscal year 1997 was \$2,116,241. Federal funds available for contracts in fiscal year 1998 are \$2,230,000.

Recently updated projected funding costs are as follows:

Fiscal year	Federal financial assistance	Federal technical assistance	Total Federal	State	Operator	Total project
1997	\$2,116,300	\$300,000	\$2,416,300	\$423,260	\$1,693,040	\$4,532,600
1998	2,230,000	900,000	3,130,000	446,000	1,784,000	5,360,000
1999	300,000	700,000	1,000,000	60,000	240,000	1,300,000
2000		700,000	700,000			700,000
2001		300,000	300,000			300,000
2002		200,000	200,000			200,000
2003		200,000	200,000			200,000
2004		60,000	60,000			60,000
2005		60,000	60,000			60,000
2006		60,000	60,000			60,000
2007		30,000	30,000			30,000
Totals	4,646,300	3,510,000	8,156,300	929,260	3,717,040	12,802,600

The participation rate based on the need for agriculture waste storage facilities is 108 percent. The plan identified a need for 162 facilities. At this time requests have been received for 337.

A supplemental watershed agreement is being prepared between NRCS and sponsors to accommodate this increase in participation.

Question. How does participation in this project compare with similar projects in other watersheds?

Answer. Participation rates in similar projects include Opequon Creek Watershed West Virginia, with 70 percent of planned agriculture waste facilities.

Question. Please provide a full list of all flood control projects in West Virginia that are currently under construction, the cost associated with that construction, and a timetable for the completion of each project.

Answer. The following is a list of flood control projects under construction in West Virginia, including the federal construction cost and the time table for completion:

1. Cranberry Creek Channel Improvement Project, Raleigh County
 - Federal Cost: \$16,355,289
 - Completion Date: May 1998
2. Little Whitestick Channel Improvement Project, Raleigh County
 - Federal Cost: 5.0 million
 - Construction bids received on March 3, 1998
 - Completion Date: August 2000
3. Lost River Dam No. 27, Hardy County
 - Cost \$4,446,435
 - Completion Date: August 1998
4. Upper Mud Recreation Facilities, Lincoln County
 - Cost \$1,219,142
 - Completion Date: June 1998.

Question. Please provide a full list of flood control projects in West Virginia for which feasibility studies have been completed.

Answer. A list of all Public Law 566 and Public Law 534 projects in West Virginia that are currently being installed will be provided.

Public Law 566 projects currently being installed

Brush Creek	Opequon
Elk Twomile Creek	Piney Creek-Soak Creek
Headwaters of Indian Creek	Teter Creek
Howard Creek	Upper Buffalo Creek
Little Whitestick-Cranberry Creeks	Upper Mud River
Mill Creek	Wheeling Creek

Public Law 534 projects currently being installed

Potomac:	North and South Mill Creek
Cacapon River	North River
Potomac headwaters	Patterson Creek
Lost River	South Branch Upstream of U.Tract
Lunice Creek	South Fork River
New Creek-Whites Run	

EQIP IN WEST VIRGINIA

Question. Please provide a status report of the Environmental Quality Incentives Program in West Virginia.

Answer. In fiscal year 1997, West Virginia received \$2.0 million to carry out the EQIP program. Over 990 applications were received for the program, requesting about \$6.7 million in financial assistance. Just over \$1.8 million financial assistance was obligated in 362 EQIP contracts with eligible producers. These contracts will treat natural resource concerns and environmental problems on over 24,000 acres. The average contract was for \$5,000 and will treat 68 acres. The program was primarily delivered in four priority areas: Mid Ohio River Basin; Central West Virginia Hills; Potomac Headwaters; and the Little Kanawha River Basin.

In fiscal year 1998, \$1.8 million has been allocated to West Virginia. Of this amount, nearly \$1.4 million will be used for financial assistance to eligible West Virginia producers. The program will be focused in the same priority areas as in fiscal year 1997.

ALDERSON, WEST VIRGINIA PLANT MATERIALS CENTER

Question. Please provide a status report on construction of the Plant Materials Center in Alderson, West Virginia.

Answer. Construction activities are underway in Alderson, WV. Development of the building site was completed in September, 1997. Plans and construction drawings for the seed barn are complete, and the construction contract was awarded to an 8A construction firm. Anticipated date of issuance of the Notice to Proceed with construction is April 1, 1998, but the notice could be issued earlier if weather conditions permit.

SUBCOMMITTEE RECESS

Senator COCHRAN. This concludes today's hearing. We will have another hearing on Tuesday, March 3, at 10 a.m., in this room, SD-138 of the Dirksen Senate Office Building, to hear from Department of Agriculture witnesses regarding the budget request for the Rural Economic and Community Development Programs.

Until then, the subcommittee stands in recess.

[Whereupon, at 11:10 a.m., Thursday, February 26, the subcommittee was recessed, to reconvene at 10 a.m., Tuesday, March 3.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

TUESDAY, MARCH 3, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Bumpers, and Harkin.

DEPARTMENT OF AGRICULTURE

**STATEMENT OF JILL LONG THOMPSON, UNDER SECRETARY, RURAL
DEVELOPMENT**

ACCOMPANIED BY DENNIS KAPLAN, BUDGET OFFICE

RURAL UTILITIES SERVICE

STATEMENT OF WALLY BEYER, ADMINISTRATOR

RURAL HOUSING SERVICE

STATEMENT OF JAN E. SHADBURN, ADMINISTRATOR

RURAL BUSINESS-COOPERATIVE SERVICE

STATEMENT OF DAYTON J. WATKINS, ADMINISTRATOR

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION
CORPORATION

STATEMENT OF ROBERT ARMSTRONG, EXECUTIVE DIRECTOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order. We are pleased to continue our review of the President's budget request for the next fiscal year. This morning, we are specifically reviewing that portion of the budget which funds the Department of Agriculture's rural development programs.

We are pleased to have with us the Under Secretary for Rural Development, Jill Long Thompson, and other witnesses who have responsibilities in related areas. I will invite the Secretary to make whatever comments she would like to make and introduce the panel. First of all, I am going to call on my good friend the distin-

guished Senator from Iowa, Mr. Harkin, for any opening statement he might have.

Senator Harkin.

STATEMENT OF SENATOR HARKIN

Senator HARKIN. Mr. Chairman, thank you very much.

I want to welcome this distinguished panel here again this morning because what you all deal with really is just absolutely critical to the quality of life in all of rural America, kind of small towns that dot my State of Iowa and, indeed, the State of Mississippi too. What you do really is the lifeblood of how people live and whether they have good jobs, and places to live, and electricity, and telecommunications, clean water, wastewater facilities. These are all the things you deal in.

Coming from a small town myself where only just a few years ago they tested all of the wells in my town including the well that I drank from all my life, and none of the wells tested fit to drink, which a lot of my political opponents always pointed out that is probably what was wrong with me, drinking that water all my life.

We finally got good water through the help of your agency. This predated your time being there. I am just saying that it meant a lot to people there to have that and now we have wastewater facilities there also. The rural business cooperatives that we have seen spring up have just been a dramatic engine for economic growth in our country.

I just want to take my few minutes, Mr. Chairman, and just again return to a topic that you are very familiar with I know, and I know Senator Bumpers always hits me a little bit about this because I always bring it up all the time, that is: the need to increase our support for getting new nonfood, nonfeed agricultural products into the market. I think this is one of the best ways to increase not only farm income, but rural income, to create jobs and foster economic growth in rural America.

To that end, Mr. Chairman, it has been a bipartisan effort. I am speaking specifically here of AARCC. I first started working on it with Ed Madigan when he was in the House. I greatly appreciate, Mr. Chairman, especially the support that you have given as chairman of this subcommittee to AARCC and also that Senator Bumpers has also provided over the years.

I just want to emphasize once again the importance of the Alternative Agricultural Research and Commercialization Corporation and the success it has had with its limited funding. It leverages. It has leveraged private capital. From \$3 to \$4 of private money has been invested for every \$1 of Federal money. That is pretty darned good leveraging. That means that AARCC has spurred some \$120 million of private investment in new agricultural products.

Again, these are always open for interpretations and whether it is good or not, but I think it can be safely said that AARCC has created over 5,000 new jobs, it has generated a new demand for over 250,000 acres' worth of farm commodities. Again, AARCC is set up so it gets repaid as those new markets grow. It is supporting a wide range of new products from relatively low technology to high technology, but all based on farm materials. Of course, I brought

my crop with me here. Mr. Chairman, this is a tabletop. It is really nice with my name on it. [Laughter.]

It really looks like granite. They are making those now. That was one of the investments made by AARCC.

You are just in time to hear my thing on AARCC. How lucky can you be? [Laughter.]

Your timing is perfect.

Senator BUMPERS. Can you start over again?

Senator HARKIN. I just wanted you to see. You can have one of these tables too. If you are a nice guy, you can have one of these tables too. Find out how much they cost.

These are some of the new products. I know in looking at your testimony, Secretary Thompson, we are now importing wall panels made of wheat straw from England. Can you imagine that? We are importing wall panels made of straw from England. We are the wheat producers in the world, not England, so I am thinking this ought to be an American product. If they can do it there and we can ship it all the way here and it can be competitive, it makes no sense to me why we cannot be spurring this here, a lot of things: industrial oils and greases, cleaning products, packaging materials.

Senator Daschle told me last week about using millet. Now, you know these little plastic peanuts that you get in boxes, you know, that packages things up and stuff? It takes I do not know how many thousands of years for that to decompose and all of that kind of stuff. They now have a millet that they use.

Senator COCHRAN. Biodegradable?

Senator HARKIN. Biodegradable totally. The good thing about it is you can ship a small box of this. You can put it through a microwave or something like a corn popper, and it pops it up so you do not have to have big boxes to ship this stuff in.

Senator COCHRAN. Then you can eat it?

Senator HARKIN. Then you can eat it. Put it on your cereal after you are through emptying the box out. These are the good things that we can work with, biomaterials, all of that. Anyway, we are moving forward. It is a snail's pace because of the shortage of funds. I have argued for years that AARCC should not be funded at the \$10 million level. It could effectively use at least twice that much next year and more thereafter.

Really, again I know I sound like a broken record on this, but just the history of it has been great and we are moving ahead in it. I think that there is just a lot of promise out there, especially with the leveraging of the private money that we get. I just want to thank Secretary Thompson, I want to thank Mr. Armstrong and all of the people at AARCC who have worked so diligently. I think you are doing a great job, and I just hope that we can provide the resources.

I know we are under a bind with the budget and the money that we have. Mr. Chairman, I am very respectful of that, and I know you have a heck of a time trying to balance all of those things. I just hope that we can come up with some more funding for AARCC to spur more of these kinds of product developments.

Thank you very much, Mr. Chairman, for letting me do my annual thing here on AARCC.

Senator COCHRAN. Thank you. Well, you have done it very well this time. We appreciate the props.

We are also delighted Senator Bumpers is here, the distinguished ranking member of the subcommittee.

Senator, I have already introduced Ms. Thompson and welcomed her to the hearing, but we would be delighted to hear any comments or opening statement that you might have.

STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Mr. Chairman, I will insert my opening statement into the record.

I do want to acknowledge that Secretary Thompson came down to Arkansas last year to College Station for an announcement. College Station is an ultrapoor section. It is an unincorporated village outside Little Rock that was devastated by a tornado—400 poor black citizens. Secretary Thompson's appearance there on behalf of the Department of Agriculture and the U.S. Government was a real shot in the arm to those people.

I want to personally thank her again, and also Mr. Shadburn and Mr. Beyer and Mr. Romano, who is here this morning, thank all of them for the attention they gave us. This is a particularly appropriate time to thank them for that because that tornado was, I believe, a year ago the day before yesterday or Saturday, I forget which. I just wanted to publicly acknowledge your compassion and your attention to an area not just there, but Arkadelphia which is going to be a brand new city.

Incidentally, Harry Thomason, you know, who is Linda Bloodworth Thomason's husband and producer of some note, "Coach" and a host of other shows, has taken it on himself to try to restore—he wants to restore Arkadelphia, which I think was his home, to make it just like it was around the turn of the century, particularly the courthouse and a few other buildings there.

I have seen tornadoes devastate towns in my State. When I was Governor, I used to go out. At first I would not go because I thought it sort of looked like I was trying to take a political advantage of other people's misery. I found out they not only want you there, but it is a great comfort for somebody in authority, an authoritative position, to show up when tornadoes occur.

I can name communities in my State that were just leveled which are now brandnew cities. I mean, except for the tragedy of the deaths it was almost a good thing because they are just beautiful cities. Arkadelphia will not be any exception. College Station is going forward thanks to you with things they never dreamed would ever come their way.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Ms. Thompson, we appreciate your being here again. Please introduce the panel of witnesses who are with you and proceed as you like.

STATEMENT OF JILL LONG THOMPSON

Ms. THOMPSON. Thank you. Thank you all for your very kind words. I am very appreciative. I must tell you that for me this is a labor of love, and working with you over the past 2½ years and

reaching out and working with communities across the country has been just 100 percent pleasure for me. Again, so I thank you very much.

With me today are Dayton Watkins, who is the Administrator of the Rural Business Cooperative Service; Dennis Kaplan, who is with the Office of Budget and Program Analysis; Jan Shadburn, with the Rural Housing Service; Wally Beyer with the Rural Utility Service; and Bob Armstrong with the Alternative Agricultural Research and Commercialization Corporation. It is quite a mouthful.

If it pleases the chairman, I will simply summarize my remarks and submit the statement for the record.

Senator COCHRAN. We appreciate your giving us the statement in advance and it will be printed in the record in full. You may summarize it as you like.

Ms. THOMPSON. Well, Mr. Chairman, I am very pleased to be here today and to present to the subcommittee the "President's Budget Request for Rural Development" for fiscal year 1999. This particular request reflects the budget's strong commitment to the needs of rural areas even when balancing the Federal Budget has been his highest priority.

I think the President's commitment to balancing the budget, as well as the commitment of both the House and the Senate, to deficit reduction and balancing the budget have resulted in unprecedented economic growth. I think it really presents a very important lesson to us as a nation. The lower deficit has generated the lowest interest rates in decades, and that has lowered the cost of capital, which has generated new investment in plant and equipment and it has created millions of new jobs.

In addition, the level of home ownership in this country has reached an alltime high of 66 percent, and perhaps the best news is that the misery index, the combination of unemployment and inflation, is at its lowest level in 30 years.

Almost all of the new jobs that have been created are in the private sector. Government has been a very important partner in this expansion, but its role has been to create an environment of investor confidence and this is the way that our economy works best. This is also the role we think appropriate in rural areas to help create the environment that generates the confidence and private investment.

I wish that I could report today that the full benefits of the economic expansion have reached rural areas, and we are beginning to see some improvement in the net creation of new jobs and some increases in salaries, but not as much as I would like to see. After a full decade of decreasing real income, rural wages are beginning to increase because of the tight labor markets.

However, income levels in rural areas continue to lag behind those in urban areas and rural areas continue to experience very high poverty rates. The rural median household income is only about 77 percent of that in urban areas and additionally the median household income for African-American and female headed households is only about 50 percent of the overall rural median income.

One disturbing fact is that employment still does not always lift a family out of poverty in rural areas. A typical rural wage is below

the poverty line and is not sufficient to support a family of four. Poverty in rural areas is 2 percentage points higher than it is in urban areas, 15.6 percent compared with 13.4 percent, respectively. Poverty in the rural South is just under 20 percent.

Probably, the most devastating effect of rural economies is that 3.2 million rural children live in poverty and 48 percent of the African-American children in rural areas live in poverty. It is very difficult for these children to attain the educational levels that will be necessary to compete for jobs in this information technology-dominated economy.

These are the reasons that the President is committed to continuing Federal investment in rural areas. Yet, he is cognizant, as we are at USDA, that the Federal Government alone cannot solve these problems. An additional benefit of the economic expansion is that interest rate-sensitive programs administered by the rural development area are 40 percent less costly than they were in fiscal year 1993. We are in the enviable position of being able to deliver these programs to rural America at less cost.

The budget request for the programs administered by rural development agencies totals \$10.4 billion, requiring \$2.2 billion in budget authority. These are increases of about \$540 million and \$110 million, respectively, over the levels enacted for fiscal year 1998. I will briefly, if you would like, go through the three agency areas and highlight the requests in those three agency areas.

RURAL UTILITY PROGRAMS

If you would prefer that I be briefer, just indicate so and I will be glad to cut it even shorter. In the Rural Utilities Service, the programs that are administered by rural development contribute significantly to the economic viability of rural communities. Perhaps, none are more important than the programs that provide the basic infrastructure investment because economic growth and vitality cannot occur without the systems that provide water and sewer, electric, and telecommunications service.

The telecommunications and electric industries throughout this country are in the vortex of change and a monopolistic supply is giving way to open competition. While the generally held perception that competition will drive down cost may be true for the two industries from a macroeconomic perspective, we have to be vigilant that rural areas are treated fairly in the process.

The Telecommunications Deregulation Act continued the universal service concept and that ensures that rural areas will continue to have access to the telecommunications network at a reasonable cost. The administration is in the process of addressing similar issues for electric service. A lack of consumer density in rural systems combined with the fact that construction costs in rural areas is virtually the same as in urban areas means the cost per rural consumer is much higher.

The budget authority requested for the Electric and Telecommunication Loan Program is \$40.3 million, which will support lending levels totaling \$1.7 billion. When we factor in the private capital that accompanies this investment, the total investment in electric and telecommunications grows to \$5.1 billion.

Due to the growing demand for electric loans, we are also proposing a new Treasury rate direct loan program of \$400 million, which would require budget authority of only \$840,000. The reason that we are proposing this program rather than increasing the request for the Federal financing bank is that the FFB financing has traditionally been used only for generation and transmission loans and distribution borrowers have expressed some reluctance to use the FFB authority because of the additional time needed to process the loans.

The budget authority requested for telecommunications loans, including the rural telephone bank, totals \$10.3 million. As you all are very well aware, there are still many rural areas that cannot access the full benefits of modern telecommunications because the basic switching equipment has not been modernized.

Also, as you are very familiar, in prior years we have proposed immediate privatization of the rural telephone bank, but because of concerns of the bank's ability to suddenly begin operating effectively as a private lending institution in a deregulated environment without a transition period, the administration is now proposing that the bank operate as a performance-based corporation. As such, it would be required to set specific targets and strategic goals to be achieved in not less than 10 years.

For the distance learning and telemedicine loans and grants, the budget requests a lending level of \$150 million and a grant level of \$15 million. The request for grants is an increase of \$2.5 million. The loan request is the same as enacted for 1998.

For water and waste, we are requesting \$1.3 billion in loans and grants for this program, which is a slight increase over the amount made available in 1998. This level of funding would provide new water service to about 500,000 rural residents, improved water service to an additional 400,000 rural residents, provide new or improved waste disposal service to about 410,000 rural residents, and in the process support about 30,000 jobs primarily in the construction trades.

RURAL HOUSING PROGRAMS

In the Rural Housing Service, we believe very strongly that no single factor contributes more to community stability than does home ownership, and even though home ownership is at an alltime high there are still some very serious needs that are not being met in housing.

The budget request for the Rural Housing and Community Facilities Program is \$5.5 billion, requiring \$895 million in budget authority and 65 percent of that is for rental assistance. This represents an increase in the program level of \$300 million over the 1998 level and an increase of \$27 million in budget authority. The request for the home ownership program, which is the flagship program, is \$4 billion of which \$1 billion is for direct loans, the same amount enacted for 1998. The average income for families borrowing under this program is \$17,000, which is barely above the poverty level.

For the Guaranteed Ownership Program, we are requesting \$3 billion. Together these two programs would finance over 60,000 new and improved homes. In addition, we are again proposing leg-

isolation that would permit use of the Guaranteed Loan Program for refinancing direct loans and that is because if these loans could be made available to borrowers who do not have enough equity in their homes to refinance in the private market but are paying interest rates in excess of the existing market rates, then they would be allowed to refinance their homes with this program. We are currently prohibited from refinancing direct loans.

For multifamily housing and rental assistance, we are requesting \$250 million of which \$100 million is for direct loans, requiring \$48 million in budget authority, which is a decrease from the level enacted for 1998. This level of funding will provide 1,100 new units and will provide for the rehabilitation of just under 5,000 units. The average income of tenants in this program is \$7,300 a year. We are also requesting \$150 million for the Guaranteed Multifamily Housing Program, which has operated as a pilot program for the past 2 years. This program serves tenants with higher incomes up to 115 percent of an area median income.

For rental assistance, the budget requests \$583 million. That is a \$42 million increase over 1998. Of this amount, \$544 million is needed for expiring contracts and the remainder will be used for rehabilitation and construction and servicing, as well as for farm labor housing.

We are again requesting \$26 million for the Mutual and Self-Help Program, which as you know provides technical assistance required for families engaging in the construction of their own homes. For the community facilities programs, we are requesting a total of \$418 million, \$200 million for direct loans, \$210 million for guaranteed loans, and \$8 million for grants. As you know, these programs finance a wide variety of facilities throughout rural America.

RURAL BUSINESS-COOPERATIVE PROGRAMS

In the Rural Business-Cooperative Service, we believe that the key to improving economic conditions in rural America is the creation of business opportunities and jobs and the role of the Federal Government is to assist in creating the environment that generates the private investment.

Our budget request for the Rural Business-Cooperative Service Program totals \$1.2 billion, which requires \$77.6 million in budget authority for the flagship program, guaranteed business and industry loans we are requesting \$1 billion and \$50 million for direct B&I loans.

Direct lending will be targeted to those traditionally underserved areas of the country for the rural economic development loan and grant programs. We are requesting \$15 million in loans and \$11 million in grants, \$35 million for intermediary relending, and \$40.3 million for the rural business enterprise grants.

For assistance to cooperatives, as Senator Harkin so eloquently stated, we are seeing quite an interest in developing cooperatives in a variety of areas across the country. We are requesting \$1.7 million in rural cooperative grants and \$2 million for Federal, State research on cooperatives.

Research on cooperatives has not kept pace with the growth in cooperatively owned businesses, and particularly with respect to

nontraditional cooperative activity such as processing and retail and export cooperatives. In addition, we are also requesting \$2 million for the appropriate technology transfer for rural areas programs.

For the Alternative Agricultural Research and Commercialization Corporation, we are requesting a total of \$10 million, \$8.5 million for investments and \$1.5 million for administrative costs. This level of funding is expected to help bring six new products to market and would create about 1,000 new jobs in rural America.

SALARIES AND EXPENSES

Finally, the request for salaries and expenses for rural development is \$527 million and that is an increase of \$18 million over 1998. There are several reasons for the increase. First, because of all of the organizational changes that have occurred within rural development over the past few years, we have lost a disproportionate share of employees at the lower level of employment. Even though we have used every means available to keep them, that just has not happened. That has caused our average salary costs to increase significantly. While our costs are less than they would have been without those changes, they are still more than they are going to be in this fiscal year 1998.

If sufficient funding is not available for salaries and expenses, then it will be necessary to execute a reduction in force to remain within our available funding levels. That action would only exacerbate the problem, because a RIF will in turn eliminate additional lower paying positions and that drives the average salary cost even higher. The vast majority of these staff are in our field offices and are primarily responsible for delivering the programs that we are discussing today. I feel that we really need them to continue doing the work that they are.

Another reason for requesting an increase is that in order to retain our employment level through 1998 we have deferred investment and information technology and training, and that is something that we cannot afford to continue to do. Investments in information technology and training are means through which we can realize additional efficiencies, but there are some initial investment and startup costs to accomplish that.

With that, Mr. Chairman, I will conclude my formal remarks and we will be glad to answer any questions that you or the committee have.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Ms. Thompson. Your complete statement will be made part of the record along with the statements of the other witnesses.

[The statements follow:]

PREPARED STATEMENT OF JILL LONG THOMPSON

Mr. Chairman, I am very pleased to be here today to present to the subcommittee the President's Budget request for Rural Development for fiscal year 1999. This request reflects the President's strong commitment to the needs of rural areas even when balancing the Federal Budget has been his highest priority. I think the President's commitment to balancing the budget and the resulting unprecedented economic growth presents us with a very important lesson. The lower deficit has gen-

erated the lowest interest rates in decades, thereby lowering the cost of capital which has generated new investment in plant and equipment and created millions of new jobs. In addition, the level of home ownership in this country has reached an all time high of 66 percent. Perhaps the best news is that the "misery index", the combination of unemployment and inflation, is at its lowest level in 30 years.

Almost all of the new jobs that have been created are in the private sector. Government has been a very important partner in this expansion, but its role has been to create an environment of investor confidence, and this is the way our economy works best. This is also the role we think appropriate in rural areas, to help create the environment that generates confidence and private investment.

I wish I could report to you that the full benefits of this economic expansion have reached rural areas. We are beginning to see some improvement in the net creation of new jobs and some increase in rural salaries, but not as much as I would like to see. After a full decade of decreasing real income, rural wages are beginning to increase because of tight labor markets. However, income levels in rural areas continue to lag behind those in urban areas, and rural areas continue to experience very high poverty rates. Rural median household income is only about 77 percent of that in urban areas. Additionally, median household income for African American and female headed households is only about 50 percent of the overall rural median income. One disturbing fact is that employment still does not always lift a family out of poverty in rural areas. A typical rural wage is below the poverty line and is not sufficient to support a family of four. Poverty in rural areas is 2 percentage points higher than it is in urban areas, 15.6 percent and 13.4 percent respectively. Poverty in the rural south is just under 20 percent. The unemployment rate is 16 percent higher in rural areas than in urban areas. And as I stated last year, the most devastating effect of rural economies is that 3.2 million rural children live in poverty and 48 percent of the African-American children in rural areas live in poverty. It is very difficult for these children to attain the educational levels that will be necessary to compete for jobs in this information technology dominated economy.

These are the reasons that the President is committed to continuing Federal investment in rural areas. Yet, he is cognizant that the Federal government alone cannot solve these problems. I recently had an opportunity to review a report prepared by a USDA Task Force on rural poverty. Its authors concluded that a healthy rate of economic growth is essential to the alleviation of rural poverty, but it is not {by itself} a sufficient condition to bring the adjustments needed. The report was written in 1961.

I think the authors also had the answer to much of the problem of rural poverty when they stated "the problems of rural economic stagnation are so deep-seated and the effects are so widespread on all community facilities, resources and attitudes, that the only development program that will work is one that attacks many problems simultaneously, and in depth". The President recognized this approach when he created the Empowerment Zone/Enterprise Community (EZ/EC) legislation, the concept of which is to address the structural economic problems comprehensively and in depth.

As noted in the President's Budget, the Kentucky Highlands, one of the three rural empowerment zones, has used \$11 million of its EZ funds to expand the amount of investment capital. From the amounts obligated to date, they have leveraged an additional \$38 million in private capital for 11 new manufacturing enterprises creating 575 new jobs, and they have commitments to create an additional 1,600 jobs. According to one of the EZ/EC Board Members, the current unemployment rate for the three county area is below 6 percent for the first time in memory. The President's budget provides for a second round of EZ designations, five for rural areas and 15 for urban areas. This comprehensive and in depth approach was also part of the Administration's thinking in the Rural Community Advancement Program (RCAP) which we have discussed previously with the subcommittee. The budget again requests the authority to transfer funds among the program areas within RCAP to provide us the flexibility to address problems as they need to be addressed. The budget also provides for the 3 percent set-aside of the RCAP funding for federally recognized Indian tribes as authorized by the 1996 Farm Bill.

RURAL DEVELOPMENT BUDGET REQUEST

An additional benefit of the economic expansion is that the interest rate sensitive programs administered by Rural Development are 40 percent less costly than they were in fiscal year 1993. We are in the enviable position of being able to deliver these programs to rural America, at less cost. The budget request for the programs administered by the Rural Development agencies totals \$10.4 billion requiring \$2.2 billion in budget authority. These are increases of about \$450 million and \$110 mil-

lion respectively over the levels enacted for fiscal year 1998. This includes the program level and budget authority, \$2.8 billion and \$715 million, requested for the programs under RCAP.

RURAL UTILITIES SERVICE

Mr. Chairman, each of the programs administered by Rural Development contributes significantly to the economic viability of rural communities, but perhaps none are more important than the programs that provide basic infrastructure investment. Economic growth and vitality cannot occur without the systems that provide water and sewer, electric, and telecommunications services. The presence of these systems does not guarantee economic growth. But one thing is an absolute certainty: growth and stability will not occur without them. These programs are responsible for much of the economic growth that has occurred in rural areas during the past fifty years, but as you well know, many rural areas still have not prospered and many of the infrastructure systems that we have built are now old and they need to be replaced. These programs are still very much needed in rural America, but the measurement of need has shifted from prior years when success was the number of farms or households connected to electricity and telephone systems for the first time to the amount of economic activity generated by these investments.

ELECTRIC AND TELECOMMUNICATIONS

The telecommunications and electric industries throughout this country are in the vortex of change. Monopolistic supply is giving way to open competition and while the generally held perception that competition will drive down cost may be true for the two industries from a macro-economic perspective, we must be vigilant that rural areas are treated fairly in the process.

The Telecommunications Deregulation Act continued the "universal service" concept which ensures that rural areas will continue to have access to the telecommunications network at reasonable cost. The Administration is in the process of addressing similar issues for electric service. The lack of consumer density in rural systems, combined with the fact that construction cost in rural areas is virtually the same as in urban areas, means the cost per rural consumer is much higher. On average, revenue per mile for urban utility systems is 8 times that of rural areas. This, of course, translates to higher rates in rural areas and puts rural systems at a competitive disadvantage with neighboring systems. We are working with electric borrowers to ensure they are in the best possible competitive position and to ensure that our loan security is protected when the electric industry is deregulated.

BUDGET REQUEST

The budget authority requested for the electric and telecommunication loan programs is \$40.3 million. This will support lending levels totaling \$1.7 billion and factoring in the private capital that accompanies this investment, the total investment in electric and telecommunications grows to \$5.1 billion. This level of investment will provide new or improved service to at least 1.8 million residents of rural areas and in the process support over 34,000 jobs primarily in the construction trades.

Due to the growing demand for electric loans, we are also proposing a new Treasury rate direct loan program of \$400 million which requires budget authority of only \$840,000. We are proposing a new direct loan program rather than increasing the request for the Federal Financing Bank (FFB). The reason for this request is, since FFB financing has traditionally been used only for generation and transmission loans, distribution borrowers have expressed some reluctance to use the FFB authority because of the additional time needed to process the loans. This new authority requires authorizing legislation which will be submitted to Congress in the very near future. The total budget authority requested for electric loans is just under \$30 million.

The budget authority requested for telecommunications loans, including the Rural Telephone Bank, totals \$10.3 million. There are still many rural areas that cannot access the full benefits of modern telecommunications because the basic switching equipment has not been modernized. Most of the exchanges in this category for the past few years are being sold and the new owners are installing newer equipment. We do not provide financing for the purchase of these systems, but we are financing the new equipment, and require that the equipment that we finance will provide the capability to provide subscribers full access to modern telecommunications.

As you know, in prior years the Administration has proposed immediate privatization of the Rural Telephone Bank. Because of concerns of the Bank's ability to suddenly begin operating effectively as a private lending institution in a deregulated environment, without a transition period, the Administration is now proposing the

Bank operate as a performance based corporation. As a performance based organization, the Board and managers would be required to set specific strategic and financial goals, one of which would be to achieve privatization in not less than ten years, and more quickly if possible. The Bank would have the authority to hire its own personnel, and funding for salaries and expenses and the subsidy cost of loans would be requested from balances in the liquidating account. Legislation is necessary to effect this proposal.

DISTANCE LEARNING/TELEMEDICINE LOANS AND GRANTS

For Distance Learning/Telemedicine loans and grants the budget requests a lending level of \$150 million and a grant level of \$15 million. The request for grants is an increase of \$2.5 million. The loan request is the same as enacted for 1998. The demand for this program continues to grow, not only because of the education and medical benefits that it provides rural areas, but also because more and more people are beginning to realize its potential as an economic development tool. As firms are assessing areas for opportunities to locate facilities in rural areas, among the first questions asked are about the quality of education and health care. This program provides the opportunity to rural areas to reap immediate benefits in education and medical care, but the presence of these capabilities also provides the longer term benefits of attracting new growth.

WATER AND WASTE DISPOSAL LOANS AND GRANTS

Mr. Chairman, the value and benefits of this program are best demonstrated by comments made in 1995 by the manager of a water system in the southwestern part of the country—"Thanks to the Department of Agriculture, we have running water in our faucets. We hauled water in barrels and water tanks until you gave us a loan and grant * * * for the first time since the town was founded the citizens were able to get a drink of water from a faucet. Without your help, it never would have happened." This statement was made following completion of a Water 2000 project awarded in 1995.

The 1980 Census reported 2.1 million rural Americans did not have any drinking water flowing into their homes. The 1990 Census reported that this number had been reduced to just over 1 million and since the Water 2000 Initiative was implemented in fiscal year 1995, Rural Development has invested \$1.3 billion in loans and grants that have afforded just under 300,000 people the opportunity to have safe, clean water in their homes for the first time.

Water 2000, as ambitious, challenging and rewarding as it is, is a small part of the water and waste disposal program in rural America. The Drinking Water Infrastructure Needs Survey conducted periodically by the Environmental Protection Agency estimates the total investment needed in small systems (serving less than 3,300 people) to bring them into compliance with the Nation's Drinking Water standards is \$37 billion. A similar investment is needed for water disposal systems. At present the applications for loan and grant assistance through this program total over \$3 billion.

The budget requests \$1.3 billion in loans and grants for this program, a slight increase over the amount made available for fiscal year 1998. This level of funding would provide new water service to about 500,000 rural residents, improved water service to an additional 400,000 rural residents, provide new or improved waste disposal service to about 410,000 rural residents and in the process support about 30,000 jobs primarily in the construction trades.

RURAL HOUSING SERVICE

No single factor contributes more to community stability than does home ownership. Since the early 1970's USDA's rural housing programs have played a key role in improving the availability and quality of housing in rural America. These programs reach families and individuals who cannot otherwise afford decent, safe, and sanitary housing. The Rural Housing Service (RHS) has financed over 2 million single family homes since the inception of its home ownership program. RHS has been particularly successful in reaching those residents that the private market and other government programs cannot reach—low and very low income families living in isolated rural areas.

SINGLE FAMILY HOUSING

The budget request for the rural housing and community facilities programs is \$5.5 billion requiring \$895 million in budget authority, 65 percent of which is for rental assistance payments. This represents an increase in the program level of

\$300 million over the 1998 level and an increase of \$27 million in budget authority. The request for the home ownership program, the flagship program, is \$4.0 billion of which \$1.0 billion is for direct loans, the same amount enacted for 1998. The average income for families borrowing under this program is \$17,000, barely above the poverty level. For the guaranteed ownership program we are requesting \$3.0 billion. These two programs will finance over 60,000 new and improved homes. Each home constructed provides 1.75 years of employment, over \$50,000 in wages and over \$20,000 in taxes for the local economy.

In addition, we are again proposing legislation that would permit use of the guaranteed loan program for refinancing direct loans. These loans would be made available to borrowers who do not have enough equity in their homes to refinance in the private market and are paying us interest in excess of the existing market rates. We are currently prohibited from refinancing direct loans.

MULTI-FAMILY HOUSING/RENTAL ASSISTANCE

For the multi-family housing programs, we are requesting \$250 million, of which \$100 million is for direct loans, requiring \$48 million in budget authority. This is a decrease from the level enacted for 1998. This level of funding will provide over 1,100 new units and will provide for the rehabilitation of just under 5,000 units. The average income of tenants in this program is \$7,300.

We are also requesting \$150 million for the guaranteed multi-family housing program which has operated as a pilot program for the past two years. This program serves tenants with much higher incomes, up to 115 percent of area median income, than in the direct program and is therefore much less costly. The budget would provide for the construction of about 4,100 units.

For rental assistance, the budget requests \$583 million, a \$42 million increase over the 1998 level. Of this amount \$544 million is needed for expiring contracts and the remainder will be used for rehabilitation, new construction, and servicing, as well as for farm labor housing consistent with the recommendations of the Civil Rights Action Team. Rental assistance payments are made to the developers of the projects as the difference between the 30 percent of income required by the tenants and the market rental cost of the unit.

MUTUAL AND SELF HOUSING GRANTS

We are again requesting \$26 million for the mutual and self-help program which provides the technical assistance required for families engaging in the construction of their own homes. As you are well aware, Mr. Chairman, this is one of the most rewarding programs that we administer. It provides not only a decent, safe housing unit, but it also provides a measure of self confidence and self assurance for the family and it is the only way the participants will ever have the opportunity to own a home. One measurement of success for this program is that the delinquency rate is significantly below that of the direct loan program. The participants are incredibly and justifiably proud of their accomplishment.

COMMUNITY FACILITIES

For the community facilities programs we are requesting a total of \$418 million, \$200 million for direct loans, \$210 million for guaranteed loans, and \$8 million for grants. These programs finance a wide variety of facilities throughout rural America, but the priorities are health and safety projects. During the past two years RHS has also placed an emphasis on funding child care centers. The decrease in real income for rural families during the 1980's; the fact that close to 50 percent of rural workers have income that is near or below the poverty level; and the fact that women are filling many of the new jobs created in rural areas dictate that child care facilities be available in rural areas. This is critical for families to make the transition from welfare to work. RHS, working with a national non-profit organization, began the rural child care initiative in 1996 and since then we have increased the number of child care projects funded from 6 in 1992 to 44 in 1997 and we expect to fund even more in 1999.

RURAL BUSINESS-COOPERATIVE SERVICE

The key to improving economic conditions in rural areas is the creation of business opportunities and jobs and the role of the Federal government is to assist in creating the environment that generates private investment. Economic growth tends to occur with concentrations of population and investment capital, or is associated with the abundance of extractable natural resources. For too many years, this country has been attempting to apply what is known about economic growth in urban

areas to rural areas. This is not practical. And it is equally true that there is no single "solution" that can be employed in each situation. Rural areas hold two key advantages in economic development, the abundance of natural resources, including agricultural production, and a labor pool that has a tremendous work ethic.

We can be more effective if investment is channeled into businesses associated with what is readily available in rural areas. The concentration of agricultural production and processing causes the migration of investment capital out of rural areas and the population tends to follow in hopes of economic improvement. In addition, the out-migration of capital and people diminishes prospects for attracting external capital.

The question is, "how do we maximize the advantages that rural areas have to offer". One solution is to ensure that a larger portion of the income generated from agricultural production remains in rural areas. One way this can be done is through the establishment of more businesses engaged in processing and marketing of agricultural commodities. The processing of food and non-food as well as feed and non-feed uses of agricultural commodities in rural areas helps retain income and capital needed for other investments in rural areas.

With the \$1.0 billion requested for the Business and Industry loan guarantee program, I intend to set aside \$200 million exclusively for the use of cooperative businesses. These funds will be available only for cooperatives for a time certain, and if not used for this purpose will be available for other loans. We will also continue to work closely with AARC and other organizations to ensure that no investment opportunity is missed and we will continue to work with cooperative associations to develop other investment opportunities, both for the Rural Business-Cooperative Service and for AARC.

BUDGET REQUEST

Mr. Chairman, the budget request for the Rural Business-Cooperative Service programs totals \$1.2 billion, requiring \$77.6 million in budget authority. For the flagship program, guaranteed Business and Industry loans, we are requesting \$1.0 billion, and \$50 million for direct B&I loans. Direct lending will be targeted to those traditionally under-served areas of the country. For the Rural Economic Development loan and grant programs (cushion of credit) we are requesting \$15.0 million in loans and \$11 million in grants; \$35.0 million for Intermediary Relending loans and \$40.3 million for Rural Business Enterprise Grants.

For assistance to cooperatives, we are requesting \$1.7 million in Rural Cooperative grants and \$2.0 million for Federal/State Research on Cooperatives. Research on cooperatives has not kept pace with the growth in cooperatively owned businesses, particularly with respect to non-traditional cooperative activity such as processing and retail and export cooperatives. In addition, we are also requesting \$2.0 million for the Appropriate Technology Transfer for Rural Areas program. The volume of requests handled by this office has grown significantly in recent years and the level of financial support has remained constant. We need to increase funding for this activity in order to respond quickly to customers.

AARCC

For the Alternative Agricultural Research and Commercialization Corporation we are requesting a total of \$10.0 million, \$8.5 million for investments and \$1.5 million for administrative costs. This level of funding is expected to help bring 6 new products to market and will create about 1,000 new jobs in rural America based on agricultural commodities. Mr. Chairman, this helps retain more income in rural America and I would like to do more of this. This program can take what has been a waste product like wheat straw or peanut hulls, which actually have a negative value, and develop new products and creating positive economic values for farmers and producing jobs for other rural residents. Other countries invest much more in this type of activity than we do and we are losing business opportunities. For example, a firm in England is exporting non-load bearing wall panels made from wheat straw to this country, of all places. The largest wheat producing country in the world is importing products made from wheat straw.

SALARIES AND EXPENSES

The request for Salaries and Expenses for Rural Development, \$527 million, an increase of \$18 million over 1998. There are several reasons for this increase. First, because of all of the organizational changes that have occurred within Rural Development over the past few years, we have lost a disproportional share of the lower level employees, even though we have used every means available to keep them, such as buyouts and early retirements of our more senior employees. This has

caused our average salary costs to increase significantly. While this is a situation I would not have preferred, it is something that has to be dealt with because the alternative is no better. If sufficient funding is not available for salaries and expenses then it will be necessary to execute a reduction-in-force (RIF) to remain within available funding. This action will only exacerbate the problem because a RIF will, in-turn, eliminate additional lower level employees driving the average salary cost even higher. The vast majority of these staff are in our field offices and are primarily responsible for delivering the programs we are discussing today. We need to keep them employed.

Rural Development is blessed with very dedicated and hard working staff that have maintained a positive attitude toward public service through our reorganization, restructuring and streamlining efforts. They know the value of the programs we deliver because most of them live and work in the communities in which we provide assistance.

Another reason for requesting an increase is that in order to retain our employment level through fiscal year 1998, we have deferred investment in information technology and training, something we cannot again afford to do. Investments in information technology and training are means through which we can realize additional efficiencies. In fact, the Secretary's plan for achieving efficiencies through convergence of the administrative services of the three county based mission areas is dependent on investments in the common computing environment and re-engineering of our business practices. Achieving additional savings through administrative efficiencies will provide the flexibility for all three mission areas to continue to support the staffs responsible for delivering the programs. We will also better utilize support staffs by directing their efforts to more critical needs rather than maintaining antiquated, staff intensive systems. Of the \$18 million increase for salaries and expenses, \$8.5 million is for investments in information technology; most of this is for maintenance of our existing systems, proceeding with service center implementation, and accomplishing the changes in systems necessitated by the Century date change.

Providing support to the very dedicated employees of Rural Development is a priority equal to funding any of the programs we have discussed. Without the employees we will not be able to continue to deliver the programs as effectively as we have in prior years and many needs in rural areas will not be met. I ask for your very serious consideration of this request.

This concludes my comments. Thank you for the opportunity to appear before the subcommittee. The Administrators and I will be most happy to answer any questions you and members of the subcommittee may have.

PREPARED STATEMENT OF WALLY BEYER

Mr. Chairman, members of the subcommittee, thank you for the opportunity to appear here today to discuss the President's budget and program proposals for fiscal year 1999. I want to begin by thanking you and the members of the subcommittee for our productive working relationship over the years. A relationship that, I am proud to say, has helped rural America contribute to the nation's continuing prosperity.

Rural America continues to be a vital part of our nation and its economy. As we look to the future, we see an environment of challenge and opportunity. The global marketplace is redefining rural America. Rural America's customers and competitors are no longer just down the road, but around the world as well. National and global changes are constant and rapid.

Safe, affordable, modern utility infrastructure is a key component of economic competitiveness. The telecommunications and electric industries are at the vortex of change. Rural America is at a critical juncture, and the challenge is to secure its role, as well as its future, in a rapidly changing national and global economy. USDA/RUS is helping communities meet this challenge.

To secure this role, rural America must reinvest in infrastructure, provide quality education, and continue to address quality of life issues. Rural youth must be provided with educational opportunities that will enable them to compete with the best and brightest from around the world. The aging rural population must have affordable access to quality health care, and rural businesses need state-of-the-art communications technologies to foster new economic growth, create new jobs and enhance the quality of life.

Through a successful local/public partnership with the federal government, RUS programs help provide needed capital and critical credit support to leverage private capital for infrastructure financing. RUS programs focus scarce resources into areas

burdened by poverty, low population density, and high out-migration. These factors, contributing to a lack of economies of scale, make it significantly more expensive to construct infrastructure in rural areas.

As rural America is changing to meet these challenges, USDA/RUS is changing as well. We are reinventing program delivery, streamlining our organizational structure, and leveraging private investment. We embrace these changes as new opportunities. Our goal is to help provide rural America with the tools and resources necessary to realize the full extent of its potential. This requires creative thinking, commitment, and value-added program delivery. From the point of initial contact, to project reality, the USDA/RUS role has never been more important.

THE FEDERAL PARTNERSHIP WITH RURAL AMERICA

The nearly \$42 billion RUS loan portfolio includes investments in approximately 7,000 small community and rural water and wastewater systems, and 2,000 telecommunications and electric systems, servicing approximately 84 percent of America's 3,096 counties. This 60-year old local/federal partnership is a classic American success story. It is a partnership providing critical infrastructure to 80 percent of the nation's landmass while enhancing the lives of 25 percent of the nation's population. That infrastructure spurs economic growth, creates jobs, and improves the quality of life in rural America. The vitality of rural communities truly depends on access to modern, reliable, and affordable utilities.

TELECOMMUNICATIONS

This year's telecommunications budget proposes \$4.895 million in budget authority to support \$50 million in direct telecommunications loans and \$810 thousand in budget authority to support \$300 million in Treasury-rate loans, as well as \$4.638 million in budget authority to support \$175 million in Rural Telephone Bank (RTB) loans. Implementation of the Telecommunications Act of 1996 poses many challenges for rural consumers. RUS continues to work with our borrowers to assure that rural citizens share in the benefits of the digital revolution. I am very proud of the role RUS plays in assuring that citizens outside America's great urban centers have affordable and quality service. Our borrowers are providing modern, reliable telecommunications service that enables rural Americans to benefit from the rapidly improving technologies of the information age. Continued capital investments and operational and technical support are critical to maintaining that level of quality in areas served by RUS borrowers.

The budget also reflects our commitment to move the RTB toward privatization within the next 10 years. The RTB is proposed to become a performance based organization, under which the RTB can demonstrate its financial and managerial independence, as an intermediate step towards full privatization. This move toward independence is consistent with funds for subsidy budget authority and administrative expenses being transferred from the unobligated RTB liquidating account balances in fiscal year 1999.

DISTANCE LEARNING AND TELEMEDICINE

In the Distance Learning and Telemedicine (DLT) Program, the budget request of just over \$15.2 million in budget authority will support \$150 million DLT Loans and \$15 million in DLT grants.

The Distance Learning Telemedicine Program provides financial assistance for rural education and health care providers utilizing state-of-the-art telecommunications technologies. The DLT loans and grants provide for needed infrastructure and end-user equipment for rural areas. This program is a powerful complement to the new schools, libraries and rural health care discounts recently authorized by the FCC, which primarily focus on the recurring monthly telecommunications costs to those entities.

When Vice President Gore announced the 1997 DLT awards, he stated "This country cannot afford a digital divide between those who have access to the benefits of the Information Superhighway, and those who do not." A range of financing options that includes loans, grants, and combinations of the two makes this program a flexible tool and resource for any rural community that wants to use telecommunications to bring the advantages of technology in the 21st Century to rural America's students and citizens.

The DLT Program is making a real difference in people's lives. RUS made a grant to the Fiber Optic Consortium United Schools (FOCUS) project. This initiative united eight school districts in Northeast Montana to share teachers and other course resources in foreign languages, vocational agriculture, science and mathe-

matics, and for staff training. These same facilities are used by the community for fire, emergency medical, and environmental training.

Since 1993, the DLT program has funded 192 projects totaling \$52 million in 41 states and one U.S. territory. These projects serve 850 schools and learning centers and 600 hospitals and rural health clinics. The DLT program provides seed money to leverage almost two times its investment from other private and public sources.

Simply put, rural Americans must be connected to America's Information Superhighway. USDA/RUS is the catalyst for the rural connection.

ELECTRIC PROGRAM

The Electric Program budget proposes \$30 million in budget authority to support a program level of over a billion dollars. The RUS Electric Program continues to serve as one of the most effective local/public partnerships of the federal government. Today's program ensures that all areas of our nation have access to reliable, reasonably affordable, electric energy.

Fiscal year 1997 budget authority for RUS loans and loan guarantees enabled 136 rural electric utilities in 33 states and the Marshall Islands to upgrade their electric systems to provide more reliable and efficient electric service to their customers.

Over the last several years, changes have been made in the electric lending program to reduce the overall federal cost of the program. This year's proposal contains \$1 billion of funding for the electric program, an increase from \$925 million in fiscal year 1998. In an effort to reduce the cost of the electric program and provide yet another financing tool to meet increasing demand, the Administration proposes a new Treasury Rate Loan Program to complement its existing loan programs. This \$400 million loan program can be generated with only \$840,000 of budget authority.

Each RUS electric loan dollar leverages three dollars from private sources. RUS provides only 1/3 of the \$3 billion annual capital needs of the RUS borrowers. The following chart illustrates leveraging of the Federal dollars:

INVESTMENT IN ELECTRIC PLANT—YEARS 1991 THROUGH 1996

[Dollars in millions]

Year	Gross additions to plant	RUS	Funds advanced FFB	Private and general capital expended
1996	\$3,212	\$682	\$93	\$2,437
1995	3,269	809	211	2,249
1994	3,344	618	242	2,484
1993	2,833	388	169	2,276
1992	3,104	401	208	2,495
1991	2,833	592	98	2,241

We believe that RUS has a continuing role to play in assuring that electric systems serving rural communities have access to the capital needed to maintain reliable, high quality, affordable electric service to support economic development and meet new environmental requirements.

In the coming years, rural distribution and power supply systems will require assistance in upgrading and replacing an aging electric infrastructure to support growing electricity demand, new technologies, and a more competitive industry structure. For example, RUS financing will enable rural electric systems to replace aging, inefficient and undersized electric transformers and conductors to enhance the reliability of distribution and transmission systems to meet load growth while cutting line losses, improving energy efficiency, and reducing carbon and other air pollution emissions.

RUS is also working very closely with borrowers facing financial stresses from past nuclear and large base-load generating plant investments and from increasing pressures from wholesale and retail competition. In each instance, RUS is diligent in ensuring that work-out agreements maximize the recovery to the Federal taxpayers. Today, RUS is actively working with 6 financially stressed borrowers as compared with some 15 borrowers 3 years ago.

WATER AND WASTE DISPOSAL PROGRAMS

This budget seeks \$503 million in budget authority for Water and Waste grants and \$126 million in budget authority to support \$839 million in loans.

The RUS Water and Waste Disposal (WWD) program improves the quality of life of thousands of rural Americans each year by bringing safe drinking water and environmentally sound wastewater facilities to those rural communities in the greatest need. The program is delivered by a field network of Rural Development employees who provide "hands-on" technical and financial assistance. The funding for this program is contained in the Rural Community Advancement Program (RCAP), and could be enhanced as a result of the flexibility of funding offered by RCAP authorizations. This funding is also part of the Environmental Fund for America.

WATER 2000 PRESIDENTIAL INITIATIVE

The demand for this program is high. As of January 1998, \$3.7 billion of unfunded loan and grant applications were on hand. Based on the Administration's belief and policy that low income, high unemployment and high poverty areas—especially those with water-related public health problems—represent the greatest need, we increasingly target drinking water and waste disposal investments to those areas.

In a state-by-state safe drinking water assessment performed in 1995, RUS found that at least 2.5 million rural Americans had very critical needs for safe, dependable drinking water, including one million rural residents who had no water piped into their homes. Approximately 5.6 million more were found to have serious needs under Safe Drinking Water Act standards. The costs of meeting all of these needs was estimated at \$10 billion. Water 2000 is an initiative to clearly assess rural drinking water needs and target loan and grant investments to address them.

Under Water 2000 targeting guidelines, over three fiscal years, RUS has committed almost \$1.3 billion in loans and grants to over 1,000 of the high priority safe drinking water projects throughout the nation. Water 2000 projects serve communities with the most limited financial resources and highest poverty rates. They are financed with significant grant assistance and our lowest interest rate loans to ensure safe drinking water at affordable cost. We estimate that the Water 2000 projects funded through September 1997 will serve an estimated 1,900,000 rural Americans and leverage approximately \$437 million in additional investments from other federal, state, and local sources. For the first time ever, 280,000 Americans will receive water from properly maintained and tested public sources.

A good example of Water 2000 in action is a project funded with Water and Waste Disposal loans and grants for the Pueblo of Acoma, in New Mexico, in fiscal year 1997. The RUS investment is allowing the Pueblo, which has an annual median household income of less than \$17,000 (slightly above the national poverty standard), to expand and improve its drinking water treatment and distribution system to overcome serious water quality, quantity, and dependability problems. To overcome the constraints of the relatively low income of the population and limited resources of the community, New Mexico Rural Development field personnel worked closely with Pueblo officials to develop a fundable application. In April 1997, Rural Development announced a grant/loan package of \$1.5 million, to be combined with funds from the State of New Mexico, to allow the Pueblo to develop Phase One of a drinking water system that will supply 177 homes, two schools and a Head Start center, and a 25 bed Indian Health Service hospital that serves three pueblos.

In summary, we are very proud of our record of bringing drinking water and wastewater facilities to thousands of rural Americans—serving those who truly need our services the most.

THE NEW TELECOMMUNICATIONS AND ELECTRIC COMPETITIVE ENVIRONMENTS

To ensure that newly formulated policies address the role of rural utility systems in a deregulated marketplace, RUS has assumed a proactive role in discussions with FCC, FERC and our partners within the executive branch to protect and enhance RUS loan security, and improve the lives of rural residents. As this nation grapples with telecommunications and electric market reforms, the RUS will remain in the forefront of these discussions and will lead the policy debate as it impacts on rural Americans. In an ever-changing legislative and regulatory environment, ensuring the security of a \$42 billion loan portfolio while providing modern, high quality, reliable, and affordable infrastructure in rural America will present a formidable challenge into the 21st century.

The February 2nd issue of U.S. News and World Report article outlines, in human terms, the impacts of a deregulated environment in rural areas. It points out that in Arizona alone, 5,000 rural Americans remain involuntarily phoneless. The spokesperson for one of America's large for-profit telecommunications companies was quoted as asking "Why should we be spending money in expensive rural areas if we need to upgrade our network in the cities to compete with competitors?" No

other statement better illustrates the need for the RUS program to provide financial support to high-cost rural areas.

Financial support mechanisms will be critical to supporting high costs, rural areas in a market driven, for-profit environment. The stage is now set for serious reflection on the rural challenges of electric infrastructure deregulation in state legislatures and Congress as well.

Although the pace of restructuring in the electric industry may have slowed, many states are moving ahead. At last count, 10 states have passed legislation providing for retail electric competition and 6 state public service commissions have issued comprehensive restructuring orders to promote competitive retail electric markets. Other states are continuing to study the issue and may act on legislative recommendations in 1998 or 1999. Many unanswered questions remain concerning how to transform America's \$200 billion plus electric industry from a traditional, monopolistic, industry to a more competitive, market-based, consumer-driven environment. One of those questions is, what happens to electric rates in high cost rural areas?

In a recent letter to Energy Secretary Peña, Secretary Glickman expressed concern that in a restructured marketplace, electric rates in high cost to serve rural areas will likely increase.

"In examining the potential effects of restructuring on rural areas, it is important to consider the common practice of 'cost-averaging' across customer classes within utility systems. This practice has been supported historically by public utility systems. It most often occurs when utilities use revenues from industrial and large commercial consumers to offset other fixed costs within the system. This is done to maintain reasonably affordable cost of service to residential customers and to balance the high cost of service in rural areas."

In a competitive environment, larger industrial and commercial power purchasers in high cost areas will be lured away from incumbent utilities. New competitors will engage in "cherry-picking". The Secretary went on to state that "Although distribution companies may be able to institute "wire charges" to cover delivery cost of another company's power, these charges may not be sufficient to maintain reasonably affordable rates for smaller customers."

CONCLUSION

USDA/RUS continues to be an integral part of rural America's future. Rural America's ability to capitalize on new opportunities depends, to a large extent, on the success of RUS in meeting its goals of creating modern community facilities and infrastructure. RUS is enabling rural communities to utilize state-of-the-art telecommunications technologies to improve education and health care. By continuously reinventing our programs to address the changing needs of rural residents, RUS will achieve its ambitious goals, and continue to play a significant role in advancing rural America's quality of life and enhancing its competitiveness in the global marketplace.

Thank you Mr. Chairman for the opportunity to appear before your committee.

PREPARED STATEMENT OF JAN E. SHADBURN

Mr. Chairman and members of the Committee, thank you for this opportunity to testify today on the President's fiscal year 1999 budget proposal and discuss some of the accomplishments and goals of the Rural Housing Service.

The Rural Housing Service continues to provide opportunities to rural families which help them improve their standard of living, move out of poverty and build for the future. We enable rural communities to enhance the quality of life of their residents and to strengthen their economic competitiveness and sustainability. We accomplish this by providing rural people and communities access to credit—which, as you know, is often limited in rural areas. We also subsidize loans and rents and provide technical assistance and support to complete their community development efforts.

Our community facilities direct and guaranteed loan and grant programs provide funding for essential facilities such as health care centers, fire stations, municipal buildings and day care centers. These facilities allow rural communities to improve the quality of life for their citizens and remain competitive in attracting jobs and businesses.

In the rural United States, 5.6 million households live below the poverty line. Almost one quarter of rural households pay more than 30 percent of their income for housing with more than four of every 10 rural poverty level households paying more than 50 percent of their income for housing. Minorities in rural America are dis-

proportionately likely to be low-income or in poverty and have housing problems. One third of African-American households, and almost one third of Hispanic households, pay more than 30 percent of their income for housing. Rural African-American households are far more likely to live in seriously inadequate housing than are rural white households or urban African-American households. Native Americans continue to be the most poorly housed population in America.

Our programs are largely targeted to lift these populations out of poverty and provide stability for the family, the community and rural America. Some communities have been rebuilt from disaster or economic downturn, others have reversed the outward migration of their people and jobs and have built a sustainable economy and tax base. We have invested in two of our most vital assets—our people and our small communities—and enabled them to have a part of the American Dream. To assure our programs meet the needs of rural America, RHS has developed five strategies to further the implementation of the Rural Development Strategic Plan.

The five strategies are as follows:

- Support self sufficiency;
- Expand access to our programs to all eligible rural Americans;
- Continue reinvention;
- Expand partnerships and leveraging opportunities; and
- Protect the government's interest.

SUPPORT SELF SUFFICIENCY

The RHS home ownership programs offer rural people and their families the most basic piece of the American Dream—the chance to own their homes. The President's fiscal year 1999 Budget requests a program level of \$1 billion for the Section 502 Direct program and \$3 billion for the Section 502 Guarantee program. This \$4 billion dollar program level will provide approximately 65,000 homes for individuals and families in fiscal year 1999 and ensure that the home ownership opportunities that are accessible in suburban and urban America are equally available to rural America.

RHS has also proposed legislation to permit the use of Federal guarantees to help graduate current direct loan borrowers to private credit. Many of our borrowers do not have sufficient equity to graduate and qualify for conventional credit. Further, they are statutorily prohibited from graduating to our guaranteed program. The President's fiscal year 1999 Budget requests an authorization of \$100 million for graduating direct loan borrowers into the guaranteed program.

The Mutual Self-Help Grant program enables low and very-low income rural families to become homeowners through the efforts of their "sweat equity" contribution while simultaneously building and stabilizing their communities. The sweat equity contributed by these families not only builds communities, but also reduces the cost of the mortgage and enables the Agency to reach a lower-income customer. The majority of the mortgages are provided by the Agency's Direct 502 loan which allows the interest rate to be subsidized down to as low as 1 percent based on income.

These Self Help borrowers have exceptional track records—both lower delinquency rates and better graduation. Over half have paid off their loans in full or graduated to private credit. Approximately 27,000 self-help loans have been made since the program's inception in 1971, providing housing for approximately 1,000 families per year. In fiscal year 1995, RHS received over a 100 percent increase in the grant program. In fiscal year 1998, the program expanded to 46 states with an estimated 121 grantees serving approximately 1,600 new homeowners. The fiscal year 1999 request of \$26 million would enable RHS to serve over 100 grantees.

Time and time again we hear stories of how participating in the self-help program has truly turned borrowers lives around—enabling them to achieve the equity from home ownership that can finance children's education, launch entrepreneurial careers and move families towards financial independence.

For example, Rudy and Angie Lopez lived from one paycheck to another; he was a cook, she was a waitress. Owning a home seemed out of reach until they qualified for the Mutual Self-Help Housing program. After completing their home, Rudy and Angie Lopez decided to open their own business. Now they operate Rudy and Angie's Mexican Restaurant in Grover Beach, California.

In support of Secretary Glickman's Civil Rights Action Team Report, the Administration is requesting a significant increase for Farm Labor Housing over the available level in fiscal year 1998. For fiscal year 1999, the \$20 million increase in budget authority would provide for \$32 million for farm labor housing loans and \$13 million for grants. These additional funds will address some of the worst housing in the country by providing increased safe and affordable rental housing for our farm-

workers. The horrendous housing conditions that some of these families endure impact their health and their quality of life.

In Molalla, Oregon, Soledad Morales lives with her farmworker husband, his elderly mother, and her four children; she cares for other farmworker's children in her apartment. Before they moved into RHS' farmworker housing, they lived together with many families. "Meal preparation and access to the bathroom were the worst part; with so many in one kitchen and one bathroom, sometimes I'd have to get up at 2:00 a.m. to bathe or make my husband's lunch, and sometimes I'd have to wait until 11:00 at night. It was chaotic and impossible to keep clean, since there wasn't agreement about cleanliness."

"Our health is better here; I think we live better. The children live better because they have the freedom to play outside in the lawns, playground and court. There's also counseling, classes, more access to programs, more communication. Also, here, those of us who give and receive childcare can participate in co-payment and reimbursement programs that we couldn't access before, due to the condition or distance of our homes from services."

This is just one example of the thousands of hardworking, low-income American families whose housing and quality of life will benefit from the increased funding requested for farm labor housing loans and grants in fiscal year 1999.

The President's fiscal year 1999 request for Community Facilities program levels provides an increase of approximately \$50 million over the available levels in fiscal year 1998. We have significantly increased the utilization of the guaranteed program. In reviewing applications for assistance, we first consider if the project can be funded by a guaranteed loan. If this is not feasible, we look at a blended approach prior to considering the direct loan and/or the grant program. As a result of this approach, we have significantly expanded the number of guaranteed loans made to rural communities by approximately 100 percent between fiscal year 1995 and fiscal year 1997.

Access to high quality, affordable child care is a major priority for many young working rural families. The benefits of this kind of care are numerous: children are nurtured in a safe environment, parents have the opportunity to enter the work force to earn sufficient income to obtain an acceptable standard of living, and employers maintain a work force whose productivity is not impaired by unstable child care arrangements. Recognizing the importance of providing excellent child care to America's low-income rural families, the Rural Housing Service has consistently invested in child care facilities through the Community Facilities program.

In fiscal year 1997, 19 States obligated \$8.8 million in direct and guaranteed Community Facility loans and grants for 32 new child care centers. Five of these centers are funded through a new partnership that includes RHS, the Federal Housing Finance Board, Head Start, the Freddie Mac Foundation and the Rural Local Initiatives Support Corporation (Rural LISC). These partnerships and others go beyond funding to provide technical assistance and build capacity.

RHS programs also enable many rural elderly residents to remain self sufficient by continuing to live independently. The Section 504 repair loan and grant program, the Section 515 multi-family housing program and the Section 521 rental assistance program all enable elderly residents to live independently. For others who can no longer be independent, RHS helps provide a decent quality of life in their own rural communities. The Community Facilities Programs finance assisted-living, adult and child day care, emergency services, nursing homes and health care facilities to help improve the quality of life.

These programs are helping people like Ms. Caroline Young, a 70 year old tenant currently living in LaPaula Villa Apartments, a 515 complex located in Friars Point, Mississippi, a poor Delta town. Ms. Young rented a home on the outskirts of Friars Point, prior to moving to the complex four years ago. The living conditions were deplorable, with cracks in the walls and floor. Ms. Young indicated she could see the ground through the cracks. The house was very old and extremely cold in the winter months. Even though the home had gas heat, she had to wear layers of clothes to keep warm. Now that she lives in the 515 project, she feels her health has improved significantly. Ms. Young said, "it's like living in a mansion compared to my previous living conditions."

If it were not for the Section 515 multi-family housing and rental assistance programs, Ms. Young would likely not have been able to live independently in a decent safe environment. Ms. Young sought other housing options before finding a vacancy at a local 515 project, including an assisted living facility and a group home, both of which would have resulted in a greater cost to the government.

For fiscal year 1999, the President's Budget requests \$583 million for rental assistance. This level is needed to renew \$544 million of expiring contracts, enabling 37,516 elderly individuals and families to continue to live in decent and affordable

housing. In addition to renewals, based on the fiscal year 1999 loan and grant request for Farm Labor Housing, \$8.4 million of rental assistance will be used specifically to ensure affordability for all new Farm Labor tenants. For Section 515, \$5.9 million has been requested to preserve affordability in projects eligible for prepayment and prevent displacement of tenants.

EXPANDING ACCESS TO OUR PROGRAMS TO ALL ELIGIBLE RURAL AMERICANS

Under Secretary Glickman's leadership, the Rural Housing Service is continuing its outreach to underserved communities and populations. Native Americans are among the poorest housed groups in America and mortgage financing has not been widely available on Tribal lands. In 1995, USDA and HUD jointly conducted a series of home ownership conferences to enhance opportunities for lending on Native American lands. One result of these conferences is a comprehensive guide for Rural Development staff called "Lending on Native American Lands." In addition, RHS is working closely with Fannie Mae and several Tribal councils to better serve Native Americans' housing needs.

RHS has also improved the quality of life on tribal lands by expanding the use of the Community Facilities programs by Native American communities. The Agency has placed increased emphasis to provide funding opportunities to tribal colleges through the Community Facilities loan and grant programs. In fiscal year 1997, the Agency provided a total of \$9,950,000 in financing through the direct, guaranteed and grant program to Native Americans. This funding provided day care, administrative, medical and food preparation facilities.

RHS has been promoting outreach activities to historically underserved customers. For example, RHS has participated in the "Home Ownership Opportunities for Women" (HOW) partnership, one of 58 national partners in the President's Home Ownership Initiative. HOW is committed to increasing national home ownership rates for women.

On July 11, 1997, Secretary Glickman and HUD Secretary Cuomo signed a Memorandum of Understanding outlining the responsibilities between the two Departments on how to manage Fair Housing complaints. This MOU provides a more efficient and streamlined process for handling discrimination claims. In addition, RHS has worked hard to ensure that all of our borrowers and staff follow the Fair Housing Laws. We are continuing to incorporate a Fair Housing training component at all national housing training meetings.

REINVENTION AND PARTNERSHIPS

We are continuing our reinvention and partnership efforts we initiated over three years ago. Our reinvention efforts in the single family 502 direct loan program were a great success and have set the standard for future efforts. We reduced the size of the 502 regulation by almost 90 percent and made it easy to read. We are currently streamlining and simplifying our other housing programs. As we move to a balanced budget with the President's fiscal year 1999 Budget request, we all recognize the need for automation and modern technology to increase our efficiency, improve our customer service and cut costs. The USDA field structure has been reduced in the number of offices and employees. We have to work harder and smarter to continue to reach our customers. The ongoing reinvention of the housing programs include the following:

- Continuation of our Congressionally mandated servicing for escrow and taxes of the single family housing portfolio. The DLOS initiative, which automated our loan origination and servicing functions, established the Centralized Servicing Center (CSC) in St. Louis. In September of 1997, the Agency completed the last phase in the transfer of approximately 700,000 single family loans for 550,000 plus borrowers from the states to one centralized facility in St. Louis. This was a massive undertaking and one of the largest portfolio transfers, private or public, in history.
- We are proceeding with the reinvention of the guaranteed single family housing and the mutual self help regulations. We will create new handbooks for both programs that will act as a guide for our employees and customers.
- Reinvention of the multi-family regulations will ease the burden on our borrowers and our staff. This streamlining effort, which will include the Section 515 Multi Family Housing and the Section 514/516 Farm Labor Housing programs, will be completed by the end of 1998.

EXPANDING OUR PARTNERSHIPS AND LEVERAGING OPPORTUNITIES

I would like to share with you our continued efforts to build partnerships and leveraging opportunities which expand our limited resources, drive dollars into rural

communities, and build private, nonprofit and other public sector participation in local rural development efforts, increasing their likelihood of success.

The goal of the President's National Partnership for Home Ownership is to provide home ownership to an additional eight million Americans by the year 2000. In support of the President's Initiative, we have formed many successful partnerships. Let me tell you about one.

The Rural Home Loan Partnership, formed in June of 1996 by RHS, the Rural Local Initiatives Support Corporation (Rural LISC) and the Federal Home Loan Bank System, enables more families below 80 percent of area median income to achieve home ownership. RHS provides a fixed-rate, subsidized 502 mortgage to cover a portion of the cost of a house, while a local bank provides financing for the remaining portion. Private non-profit community development corporations (CDC's) identify and counsel eligible borrowers and aid in the development of affordable housing opportunities. This partnership is just one example of our leveraging success. In fiscal year 1997, with all partners, we leveraged 46.24 percent or \$125,699,475 of the Section 502 low-income allocation with \$58,149,512 from lenders.

RHS' loan guarantee programs have brought increased numbers of financial institutions into partnership with the Agency. Over 2,000 lenders now participate in the Section 502 guarantee loan program which serves low and moderate-income residents.

In the 515 multifamily housing program, we increasingly employ partnerships with state housing finance agencies, CDBG and HOME funds, the private sector and local community organizations. This has allowed RHS to reach larger numbers of low-income tenants with limited budget authority.

In the new Section 538 Guarantee Multi Family housing program, we have completed two years under a demonstration mode and are in the third year of operation. For fiscal year 1996 and fiscal year 1997, the Agency provided \$41 million in guarantees for 25 projects, which when leveraged with other funding, financed total development costs of \$71.5 million. For fiscal year 1998, the Agency proposes to issue final regulations and a Notice of Funding Availability in the late Spring.

In the Community Facilities programs for fiscal year 1997, RHS has leveraged over 50 percent of its Direct funds and 26.5 percent of the guarantee funds, with state, local and private partners. RHS developed a new partnership with the Department of Health and Human Services Head Start, the Freddie Mac Foundation and Rural LISC (Local Initiatives Support Corporation) to expand the number of child care centers in rural America and demonstrate a variety of financing models.

PROTECTING THE GOVERNMENT'S INTEREST

I would like to offer my appreciation for the reforms to the Section 515 program that were passed by this Committee in the fiscal year 1997 Appropriation Act. The Department worked diligently to expedite the implementation of these reforms, and they were published as an interim rule on May 7, 1997 and as a final rule on December 23, 1997. In developing these rules, RHS worked extensively with stakeholders representing for-profit and non-profit developers as well as housing advocacy groups, state housing finance agencies and other interested parties.

As a result of this Congress' and the Administration's efforts to provide the necessary tools to provide the proper oversight and management, the 515 portfolio is healthier and safer today. The tenants' and government's interest are protected.

In March of 1998, a joint effort between the Office of Inspector General (OIG) and the Rural Housing Service will begin. This will include joint participation between National and field staff from both RHS and OIG to identify and review projects, owners and management companies in 12 states that potentially are at risk for financial abuse. This will allow RHS and OIG to assess the recent legislative changes including the equity skimming provision and their effect on curbing fraud, waste and abuse in the 515 program.

We have become concerned, as I know this Committee has, with the increasing need for budget authority for our rental assistance program, which has grown from \$404 million in 1993 to \$541 million last year, and is projected to reach \$650 million by 2000. We are exploring ways to address this issue while preserving the safety net for rural families. We will work with the Congress on this effort in the coming months.

Since 1994, the Agency has placed a high priority on rehabilitation of Section 515 Multi Family projects. Currently, the 515 Multi Family portfolio consists of over 18,000 projects with over 458,000 units. With this large and aging portfolio, the Administration is committed to preserve the integrity of these structures and protect both the tenants' and government's interest.

Now I would like to highlight the following points from the fiscal year 1999 Budget proposal.

For section 502 direct single family housing loans in fiscal year 1999, we are requesting a loan level of \$1 billion. This is the same level provided in the fiscal year 1998 Appropriation Act. For the Section 502 guaranteed loans, we are requesting a loan level of \$3 billion.

In the section 515 multi-family housing loans, a loan level of \$100 million is requested for fiscal year 1999. The loan level request for housing repair loans (Section 504) is \$25 million. For domestic farm labor housing loans, we are requesting \$32 million program level, a \$17 million increase over fiscal year 1998 to meet the needed housing for farm workers consistent with the recommendations in Secretary Glickman's Civil Rights Action Team Report. We are requesting \$5 million for two loan programs for housing site development. This significant increase over current levels will allow the Agency to effectively serve applicants on a national level.

The loan level request for the Multifamily Housing guarantee program (section 538) is \$150 million. This will allow RHS to have a fully operational program that will provide approximately 2,000 units to low and moderate-income tenants in rural areas.

The budget authority appropriation requested for the housing and community facilities loan programs is \$231 million, approximately \$13 million less than in the 1998 appropriation.

An increase of \$42 million to \$583 million is requested for rural rental assistance in 1999.

For the Self Help Technical Assistance Grants we are requesting \$26 million, the same level as appropriated in fiscal year 1998.

The housing grant programs are being requested for fiscal year 1999 under the Rural Housing Assistance Grants Program. Within this program, our requests include \$13 million for farm labor grants, \$25 million for housing repair grants, and \$9 million for housing preservation grants. The supervisory and technical assistance grant program and the compensation for construction defects grant program will continue to operate in fiscal year 1999 with small amounts of carry-over funds which will be available.

The community facility program request is included in the proposed Rural Community Advancement Program. Within that overall program, we project that \$200 million will be available for direct community facility loans and that another \$210 million will be available in the guaranteed loan program. Approximately \$8 million is proposed for community facility grants. The appropriation requested within RCAP to support the community facility programs is \$36 million for fiscal year 1999. This is \$10 million more than is available for fiscal year 1998.

For administrative expenses, the Budget requests \$429 million. This is a \$15 million increase from fiscal year 1998. RHS's ability to successfully implement the Centralizing Servicing Center and deliver the programs in the field and protect the portfolio requires this increase in administrative expenses.

This is the conclusion of my statement. I appreciate the opportunity to appear before this Committee today and as always, I will respond to any questions that you may have at this time. For release only by the Senate Committee on Appropriations

PREPARED STATEMENT OF DAYTON J. WATKINS

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you today to report on our progress in rural development and to present the Administration's fiscal year 1999 Budget for the Rural Business-Cooperative Service (RBS).

DEMOGRAPHIC DATA ON RURAL DEVELOPMENT

As I am sure the Subcommittee will agree, we in RBS firmly believe that, there cannot be a strong America without an equally strong and participating rural America. The USDA Economic Research Service (ERS) in a 1995 report identified a reshift of population from urban areas back to rural communities. This underscores an increased need for our programs. The proportion of real poverty is worse in rural areas than in the cities according to ERS data. In some areas of the rural south and on some Indian reservations, poverty and its associated ills of poor health, poor nutrition and poor educational opportunities is staggering.

The RBS is a component of the Rural Development Mission area and as such strives to make significant contributions to the enhancement of life for rural Americans. In partnership with the other agencies of the Rural Development Mission area, we share in the belief that a strong rural America requires a continuing in-

vestment from all levels of government and the private sector in people, education, technology, health care, infrastructure and social and community affairs. Certainly, there can be no sustainable development without employment. According to the ERS report, the unemployment rate in rural areas is 16 percent higher than in urban areas. There is energy and resources for business development in rural areas which can be harnessed to address this issue. Our efforts have been focused on leveraging this energy and investment potential to maximize employment in rural communities. The rural business programs proposed in this Budget will create and save about 83,000 jobs.

These investments will enable rural Americans to continue advancing in the economic mainstream of this great nation and help citizens build sustainable rural communities. The RBS contribution to this effort continues to be our ability to make our financial and technical resources available to rural America.

PARTNERSHIPS FOR RURAL DEVELOPMENT

These resources facilitate the building of partnerships within rural communities when leveraged with public, private, and non-profit resources and stimulate economic growth and development. New jobs, paying higher wages, are created or saved. This further enhances the ability of rural citizens to be able to meet the individual needs of their families for the basic necessities of life.

This is accomplished by assisting rural residents in acquiring adequate income to pay for the educational expenses of their children, meet their housing needs, and building their pride and self esteem. This means helping new entrepreneurs implement their dream of owning and operating their own businesses by providing for the credit and financing needs of rural business owners who are unable to find credit from traditional sources. Further, it means helping agricultural producers analyze alternative business forms, like cooperatives, which offer greater economic opportunities than currently found in the marketplace. Each of these efforts touches rural America in a meaningful way. Our responsibility is to provide efficient and cost effective access to our programs so that rural Americans can maximize the resultant benefit.

A paramount objective is to use this opportunity to be creative in developing new concepts and approaches to serving our customers. To ensure that rural Americans continue to have access to our programs and services, we are continuing to develop and advance new and exciting initiatives. These initiatives will focus more resources on individuals, businesses and communities that have not been traditional participants in our programs. By continuing this effort, we can and will be instrumental in increasing the contributions made to the overall growth of rural America by putting underutilized resources to better use. This is consistent with the overall strategic goals and objectives of the Rural Development Mission Area.

To meet our goals, objectives, and the growing demand for our services and resources, our strategy is to continue along the direction begun last year to increase strategic alliances through creative partnerships with other Federal departments and/or agencies of the United States Department of Agriculture, corporate America, educational institutions, non-profit organizations and others. Through strategic alliances, we can serve more people and communities because more organizations will be available as resources to rural residents.

ROLE OF AGRICULTURAL COOPERATIVES

We endeavor to enhance the quality of life for rural Americans by encouraging the use of cooperatively owned businesses as a self-help tool in the marketplace. Our programs of research, technical assistance, education/information, finance and assistance in starting new cooperatives are designed to establish viable business entities that help individual farm operators and other rural residents retain access to markets and sources of supplies and services in a sector that is rapidly becoming vertically integrated and industrialized. Cooperatives are a means for rural people, both farm and non-farm, who typically have weak market power compared to buyers and suppliers, to be treated more fairly in the marketplace.

The existence of these rural cooperative businesses is an important component to most rural communities providing jobs, opportunity for purchase of more reasonably priced supplies and services, and a market outlet and improved returns for farm products. A noticeable trend in recent years has been the attempt to add value to raw commodities by primary and further processing in the communities near the source of production. The Cooperative Services Program continues to augment these efforts by helping to determine feasibility, assistance in the development of new cooperatively owned businesses, and maintaining statistical data on aggregate trends and commodity sector developments.

Since 1926, USDA has worked as a partner to farmer cooperatives, helping interested groups of agricultural producers form new cooperatives and working with existing cooperatives to improve their efficiency and expand the scope of services to members. This work is carried out by our National Office staff who specialize in research, technical assistance, statistics and educational/informational activities and the State Rural Development Offices that are identifying Cooperative Development Specialists on their staffs to assist in starting and servicing the needs of new cooperatives. We are further aided by partnerships with universities, State departments of agriculture, and non-profit associations through various programs aimed at strengthening rural people's ability to use mutual self-help efforts to earn a decent living and to enhance their quality of life.

OUTREACH THROUGH INNOVATIVE PROGRAMS

The National Commission on Small Farms recently released its report *A Time To Act* which points to the role of cooperatives in assisting small farm operators to survive and prosper in a rapidly changing production agriculture. The Department is formulating a response to the recommendations in this report that will address effective marketing methods and other needs of small farmers throughout the nation. We will be an integral part of this overall effort since group action, so prominently recommended in the report, is also the focus of our programs. As part of this effort, we want to determine how under served rural Americans can utilize the cooperative form of business to help overcome market access barriers.

During the past year, we implemented a Cooperative Value-Added Program funded from the Fund for Rural America. Eligible applicants were institutions of higher learning or nonprofit associations that would provide technical assistance to specific value-added projects. We were surprised, and a bit overwhelmed, to receive 104 applications requesting a total of \$19.4 million. After review, 18 projects were funded up to \$75,000 each for a total of \$1.1 million. We think this experience is good evidence of the expanded interest in the value-added strategy.

Another major initiative of this Mission Area is to expand the types of cooperatives serving rural America. Legislation has been developed and introduced at the Secretary's request under which we would assist rural residents interested in forming cooperatives for rural non-farm business. Based on our proven track record of success, we believe we can maximize their chances for business success. Successful nonagricultural cooperatives can assist rural residents to obtain increased access to technology, housing, rural utilities, health care and other shared services. These services will strengthen the infrastructure of many rural communities that are faltering by providing stable businesses, more reasonable prices for goods and services, and increased earnings for products sold.

RE-INVENTION OF PROGRAMS

Last year, in my testimony to the Subcommittee, I discussed the sweeping revisions we were making to the regulations for our Business and Industry Guaranteed Loan Program. The new regulations are shorter, clearer, and more logically organized. They're certainly more concise, taking up about one-half the pages of the previous regulations. The new regulations shift some responsibility for loan documentation and analysis from the Government to the lenders. We've made the program more responsive to the needs of the lenders and businesses, and created an environment for easier and faster application processing.

This year, I'm pleased to be able to update the Subcommittee on recently published revisions to the Intermediary Relending Program regulations. These regulations were published in final on February 6, 1998. The new regulations expand the current \$2 million cap on loans to intermediaries to a \$15 million cap to any one intermediary in annual increments of \$1 million. The regulation is more user-friendly and authorizes the Rural Development State Offices to process applications at the State level, rather than submitting applications to the National Office for processing. This change will speed up the applications process and allow State Offices to work closer with borrowers to provide immediate feedback concerning their applications. There will continue to be a nation-wide competition for funding the applications.

A revised priority scoring system will help us target more funding to the neediest communities such as those in low-income or in under served areas, those with declining population, or communities faced with economic restructuring or natural disasters. In addition, the eligible purposes for loans to businesses have been expanded.

Mr. Chairman, since the streamlined Business and Industry Guaranteed Loan Program regulations were published last December, demand for the program has in-

creased 300 percent. This increased demand for the program will mean that the quality of the applications and the opportunity of providing funding to the communities most in need will be enhanced.

Now, I'd like to address our specific programs and their accomplishments in a little more detail.

BUSINESS PROGRAMS

To meet our goals and objectives and the growing demand for our services and resources, we have increased partnerships and strategic alliances with other Federal agencies. One example is the implementation of a Memorandum of Understanding between Rural Development and the U.S. Department of the Treasury to carry out the Community Adjustment and Investment Program under the North American Free Trade Agreement (NAFTA). We estimate that this partnership will provide for an additional \$75 million in business and industry guaranteed loans in fiscal year 1998.

For all business programs, the emphasis this year is to provide program funding in our targeted areas of greatest need. This objective is supported in the Performance Goals identified in the Rural Development Strategic Plan, the Administrator's Priority Goals, and the priority selection criteria of the various regulations that are used to score and select projects. To demonstrate our earnestness, Rural Development State Directors' annual performance will be evaluated, in part, based upon how well they accomplish the program objectives of providing financial assistance to targeted areas and areas of greatest need.

The following are examples of how the Business and Industry Guaranteed Loan Program, the Rural Business Enterprise Grant Program, the Intermediary Relending Program, and the Rural Economic Development Loan and Grant Program provide economic opportunities in America:

*B&I Guaranteed Loan Program and Rural Economic Development Loan Program:
Freshwater Farms, Inc., Mid Delta Employment Zone, Mississippi*

Freshwater Farms, Inc., was originally incorporated in November 1982 under the name "Humphreys County Catfish Processing" by Mr. Robert Edwards. In September 1986, a group of nine local catfish farmers and businessmen joined with Mr. Edwards to provide new capital, new management, and increased catfish supplies. Stock in the company was issued equally to all ten stockholders, a new ten-member Board of Directors was elected, and the name was changed to Freshwater Farms, Inc. Under this leadership, the company has grown in annual sales from \$4 million to \$18 million, in employment from 75 to 170, and the number of stockholders has increased to 19.

The Rural economic Development Loan Program provided a \$400,000 loan to Twin County Electric Power Associate to finance the processing equipment for Freshwater Farms.

Rapid growth, requiring continuous repair and renovation, placed a considerable strain on the company facilities and resulted in inefficiencies and added expenses. Yet, even with these disadvantages, the company has proven itself to be a low-cost processor in the industry, delivering a quality product to markets in over 20 States. By relying almost exclusively on stockholders to supply catfish, the plant has been able to operate at near maximum capacity and has been profitable during varying market conditions.

In order to supply additional processing capacity for the stockholders, who have expanded their operations, the Board of Directors unanimously agreed to build a completely new facility which would accommodate future sales of \$30 million, improve efficiencies, and increase employment from 170 to 235. An increase of 65 new jobs and the economic activity associated with these jobs have a very positive impact upon the unemployment rate, sales tax revenues, property tax revenues, and welfare rolls. The facility is located in the Mid Delta Employment Zone, one of only three Federally designated Rural Empowerment Zones in the United States. The new facility is a source of pride for the owners, employees, and the community as a whole. Had the new facility not been built, production would have been reduced in order to meet ever increasing environmental regulations, and employment would have been reduced by nearly 40 jobs.

Rural Business Enterprise Grant: Town of Medway, Maine

A \$30,000 rural business enterprise grant was awarded to the Town of Medway to develop an industrial site. The project was a cooperative effort between the town, the State of Maine, private business, and RBS. In addition to the \$250,000 provided by the funding partners, Great Northern Paper, Inc., donated the land for the roadway.

The project enabled Medway to bring in much-needed employment. Earthgro, Inc., a manufacturer and processor of bark, wood chips, and other forest byproducts, initially provided 16 new jobs when the company started a new operation in the industrial park in 1997. The business now provides 25 jobs and is Medway's largest employer. Since this is a new operation, it did not just relocate the company's existing jobs.

Medway is an economically depressed area which has depended on the paper mills located in adjacent towns to provide jobs. Since 1990, the mills have eliminated more than 2,500 jobs, significantly affecting Medway's economy. The area unemployment rate exceeded the State rate by approximately 50 percent. This project provided immediate jobs to the area, and it is expected that additional businesses will locate to the park in the future, thus further mitigating economic distress in the area.

Intermediary Relending Program: Northeast Delta and Macon Ridge Enterprise Communities, Louisiana

Magnolia Home Health Services of Tallulah, Louisiana, is a family owned home health care business situated in rural Madison Parish, within the Northeast Delta Enterprise Community. The family saw the need to provide home health care services to this impoverished Delta Region and developed a plan to implement the service. After several unsuccessful attempts to obtain funding through traditional lenders, the business presented a plan to Northeast Delta Enterprise Community. The Northeast Delta Enterprise Community was not yet set up to provide business loans, and Macon Ridge Economic Development Region, Inc., stepped in and provided a loan of \$112,500.

Magnolia Home Health Services has not only provided rural Madison Parish with quality home health care, but has grown well beyond the projected 10 employees to a staff of more than 20. In addition to Madison Parish, it now serves a total rural population of 12,463 including areas of Tensas Parish and Richland Parish, which are within Macon Ridge Enterprise Community.

The business has been so successful that it paid the original loan of \$112,500 down to \$38,000 in just over a year, \$50,000 ahead of schedule. The business is still growing and has certainly boosted the economy and health care service in Madison and surrounding parishes.

Rural Economic Development Loan Program: Winnebago Cooperative Telephone Cooperative, Lake Mills, Iowa

A \$350,000 zero-interest loan was made to the Winnebago Cooperative Telephone Cooperative for the purpose of assisting the Larson Manufacturing Company of Lake Mills with its plant expansion.

Larson Manufacturing Company produces aluminum wood core storm doors, aluminum windows, and energy saving products. The Company's overall plant expansion included the purchase of land, site preparation, building of roads, sewer and water extensions, construction of a 70,000 square foot building, parking lots, and the purchase of new manufacturing equipment. An additional \$2.43 million was leveraged from other funding sources for a total project cost of \$2.78 million. It was estimated that the project would increase production capacity by 25 percent and warehouse capacity by 50 percent.

It was projected that 50 new jobs would be created within two years of completion of the project. Plant representatives have indicated that, in less than one year, the employment projection had already been surpassed. The jobs created in this small rural community of 2,143 population consist of sales managers, sales persons, truck drivers, general production workers, warehouse workers, production coordinators, forklift operators, and office support staff. The new jobs have led to an increase in the long-term productivity and per capita personal income in the rural areas of north central Iowa and south central Minnesota.

Rural Economic Development Loan and Grant Program: Chariton Valley Rural Electric Cooperative, Albia, Iowa

A \$300,000 grant was made to the Chariton Valley Rural Electric Cooperative of Albia, Iowa, to establish a revolving loan fund program. The electric cooperative provided \$60,000 of its own funds and made loans totaling \$360,000 to the Albia Industrial Development Corporation to renovate a vacant industrial building in Albia and to purchase 24 acres of land to expand an industrial park. These loans were leveraged with \$662,000 of financing from private sources.

After renovation of the 102,000 square foot industrial building, one-half of the space was sold to a metal fabricating business which employs 33 people. The business holds the option to purchase the remaining building space. In the interim, a plastics company proposes to lease the remaining space for a period of three years.

At the end of the lease term, the plastics company intends to build a 100,000 square foot building in the new industrial park.

COOPERATIVE SERVICES

The Cooperative Services Program devotes its efforts to promoting the understanding and use of the cooperative form of business as a viable option for rural residents. As government support programs are changed and encouragement is given to a more market driven policy, farm operators, ranchers and other rural residents are realizing that they need more effective forms of group action in the marketplace to represent their economic interests.

Cooperative Services conducts studies, alone or in conjunction with other Federal or state institutions, to provide farmers with information on economic, financial, organizational, legal and social aspects of cooperative activity. Technical advice assists farmer cooperatives in the development and operation of viable organizations to better serve the Nation's family farmers. Educational assistance provides farmers and other rural residents with a proper understanding, use and application of the cooperative tool.

The Nation's agricultural sector is currently experiencing rapid structural change often referred to as the "industrialization of agriculture." United States businesses involved in agriculture are finding it increasingly necessary to have a coordinated and controlled supply of a narrowly defined raw product. As previously mentioned, the report "A Time To Act" by the National Commission on Small Farms has recommended an expanded use of cooperatives as a means for smaller farm operators to access markets.

A major initiative by RBS has been to encourage the staffing of Cooperative Development Specialists in each State Office. These individuals, either solely or collaterally, provide a more localized source of expertise in guiding the development of new cooperative businesses and helping to determine their feasibility. We are confident they will become a more important source of assistance to emerging businesses as they gain more expertise.

Development of a sound knowledge base acquired through research is essential to offering sound technical and cooperative development assistance. This program utilizes researchers at the 1862 and 1890 universities as well as state departments of agriculture on important agricultural cooperative marketing projects. As an example, Purdue University completed research on cooperative coordination in the hog-pork sub-sector that may help maintain the status of independent hog producers.

There has been a lapse in supporting research on cooperatives in recent years, and the 1997 budget includes \$2 million for the Federal/State research on cooperatives program. This money will be used in partnerships with State Departments of Agriculture and State universities and colleges to fill the void and make up for lost ground. Among the new areas for research are the role that cooperatives can fulfill as Federal farm price supports are ratcheted down and perhaps eventually terminated, the emergence of collaboration between farm operators in farm production cooperatives, evaluation of types of strategic alliances developed between cooperatives and with investor owned firms, identification of key successes and problems of "new generation" cooperatives, and operational adjustments being made by cooperatives to global competitors.

We met recently with representatives from the 1994 Native American institutions and encouraged them to develop, with our help, teaching modules on cooperatives that fit into their expanding curriculums. We also encouraged development of a Cooperative Center of Excellence at one or more of their institutions.

As an example of technical assistance, we worked with Shoreham Apple Growers of Vermont, an apple packing and warehouse operation serving the majority of apple growers in the state, to develop a plan to revitalize its organization. A business plan and financial projections were developed with the help of Cooperative Services staff to enable them to obtain bank financing required to keep in operation. The cooperative was also assisted in adopting operational and record keeping changes required for its long term survival.

The emerging alpaca industry is characterized by its geographical dispersion and its lack of organization at the producer level. This past year, Cooperative Services staff worked closely with producers throughout the western states to establish the framework for a producers' association that will facilitate development of industry strategies and orderly marketing. From a disorganized group of producers at the beginning of the year, the alpaca association has emerged with a strategic plan, experienced officers, and a sense of direction that will carry them forward as an effective marketing cooperative.

Small vegetable growers in Arkansas have been assisted in growing tomatoes to supply Burger King. The growers are attempting to structure a cooperative that will continue to provide them market access to the growing produce market. Similar efforts are being made in eastern Kentucky to assist small producers accustomed to growing tobacco to engage in vegetable production as a parallel crop and to market it through a local cooperative packing facility.

RURAL COOPERATIVE DEVELOPMENT GRANTS

Another source of assistance to developing cooperatives is the funding of new and existing cooperative centers through the Rural Cooperative Development Grant Program. This partnership with institutions of higher learning and nonprofit associations permitted us to fund 11 centers for a total of \$1.7 million in 1997.

The program is used to facilitate the creation or retention of jobs in rural areas and enhance producers' incomes through the development of new rural cooperatives, value-added processing, and other rural businesses. Grants are competitive and awarded based on specific selection criteria.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS (ATTRA)

We have also been providing extensive support for the Appropriate Technology Transfer for Rural Areas program which provides producers and agribusiness advisors information on use of the best sustainable production practices. Encouragement of such practices lessens dependence on agricultural chemicals and is more environmentally friendly.

The ATTRA program handled over 18,000 requests this past year and continues to be a major source of information on sustainable agriculture throughout the country through its 800 telephone number and the use of the Internet. We're asking for \$2 million, an increase of \$700,000, for the ATTRA program to accommodate expanding requests for information.

NATIONAL SHEEP INDUSTRY IMPROVEMENT CENTER

The National Sheep Industry Improvement Center was established this past year. The Center has held three public hearings, developed a strategic plan, and hired an Executive Director. This program will become operational under the Board's direction this year and will assist development of infrastructure in the sheep and goat industries through a \$20 million revolving fund provided in the Federal Agriculture Improvement Act of 1996.

FISCAL YEAR 1999 BUDGET REQUEST

The fiscal year 1999 Budget requests a program level of \$1.2 billion for the Rural Business-Cooperative Service including amounts under the Rural Community Advancement Program. The Federal loan guarantee as used in the Business and Industry Program is an extremely cost effective mechanism to meet capital needs of rural businesses. Under Federal Credit Reform, business and industry guaranteed loan program borrowers or the cooperating financial institutions pay an up-front fee which is pooled as a reserve to be used in future years to cover losses in the program. This reserve remains in the Treasury and draws interest until it is needed. In this way, the participants in the program "self insure" the program against losses and minimize the cost of the program to tax payers. The result of this self insurance feature is that the loan subsidy rate, that is, the proportion of the program cost that must be provided from tax money is currently less than a penny on the dollar.

As part of the Rural Community Advancement Program (RCAP), the Budget requests program levels of \$1 billion for business and industry guaranteed loans, \$50 million for business and industry direct loans, and \$40.3 million for rural business enterprise grants.

The Intermediary Relending Program of the Rural Development Loan Fund is requested at the \$35 million level.

The Rural Economic Development Program budget proposal includes a \$15 million loan level and \$11 million for grants.

The total program request for Cooperative Services is \$5.7 million. This includes \$1.7 million for cooperative development grants and \$2 million for appropriate technology transfer. Federal/State cooperative marketing research agreements are proposed at \$2 million.

For administrative expenses, the budget includes \$29.9 million for the Rural Business-Cooperative Service. Although this amount is slightly greater than the current level, the increase is less than the rate of inflation and will call for a reduction in employment in 1999 and belt tightening in other administrative activities.

EMPOWERMENT ZONES AND ENTERPRISE COMMUNITIES

The Rural Business-Cooperative Service continues a strong fiscal year 1999 Program in Empowerment Zones and Enterprise Communities. The Budget estimate includes a program level of \$31 million to be reserved for these designated areas. We are also proposing legislation to provide for additional rural Empowerment Zones as authorized in the Taxpayer Relief Act of 1997.

CONCLUSION

Mr. Chairman, this concludes my formal statement on the fiscal year 1999 Budget. I would be happy to respond to any questions the Subcommittee may have regarding the business and cooperative development programs of the Rural Development Mission Area.

PREPARED STATEMENT OF JEFFREY W. GAIN

Mr. Chairman and members of the Subcommittee, I am pleased to testify today on the President's fiscal year 1999 budget proposal of the Alternative Agricultural Research and Commercialization Corporation (AARCC). It is a pleasure to provide you with an update on the Corporation's investment successes and the impact the AARCC Corporation is having on the economy of rural communities.

I am not a federal employee and am not here to support the growth of another Federal bureaucracy. I do, however, own and operate a diversified farming operation near Hardin, Illinois, producing grain, orchard crops, and livestock. I also serve as Chair of the Corporation's Board of Directors. I am here today on behalf of the mostly private sector members of the AARCC Board of Directors to testify to the unique opportunity the AARCC Corporation offers to add value to agricultural raw materials and create economic opportunities in rural communities.

The committee has copies of the latest Source Book which lists many of the AARCC-supported companies and the products now being produced and sold. The committee also has a copy of our first annual report as a corporation. You will notice such industrial products as absorbents, building materials, lubricants, cleaners, and others. Many of these products are made from what was considered agricultural waste.

As an aside, I would be remiss if I did not point out that because of their very nature, these products may be environmentally friendly. In many instances, they replace finite or polluting raw materials such as petroleum. Certainly, using renewable, sustainable raw materials from agriculture can be viewed as having a positive impact on the environment.

I would like to offer the committee a short background on how we got to where we are today. Congress created the AARCC Center in the 1990 Farm Bill and reauthorized it in the 1996 Farm Bill as a wholly-owned corporation of the U.S. Department of Agriculture (USDA). AARCC's creation followed a 1987 report of the New Farm and Forest Products Task Force. I served on that task force which met for 2½ years. The task force recommended developing and commercializing a wide array of new farm and forest products utilizing the excess productive capacity of American agriculture as a way to revitalize ailing segments of rural America.

When we downsize agricultural production through set-aside or other non-production incentives, we also downsize rural communities and the infrastructure which supports agricultural production. Rural America must harness the productive capacity of idled acres by producing crops for value-added industrial use, or by growing new unsubsidized industrial crops. The U.S. "farm plant" is running under capacity. The National Agricultural Statistics Service reports that in 1996, only 336 million out of a possible 430 million acres of cropland were cultivated in the United States. Approximately 94 million acres of cropland, or 22 percent of our total productive capacity, lay idle. Companies in the U.S. must create and sell bio-based, value-added industrial products from agricultural and forestry materials and animal by-products if we hope to restore productivity and economic vitality to Rural America and expand world markets for U.S. agricultural products.

It is true that many of the things we make today from petroleum can, in fact, be made using biodegradable materials. This is not a new idea. USDA's four regional research laboratories were built in 1938-41 to find new uses for farm products. A national Presidential Commission on Increased Industrial Uses of Farm Products studied new uses in 1956-57. I have already mentioned the work of the 1985-87 USDA Task Force. Predating all these activities was the formation of the "Chemurgic Council" in 1935 under the leadership of Wheeler McMillen with financial support from Henry Ford. Other notables on the council included Thomas Edi-

son, Irene du Pont, MIT President Karl Compton, Nobel Prize winning physicist Robert Milliken, General Motors Vice President Charles Kettering, and Sears, Roebuck & Company Board Chairman Robert E. Wood. George Washington Carver was also a leader in the work of finding new uses for agricultural materials. Henry Ford even built a car body from vegetable plastic and plant fibers. He felt we could "grow our cars." Today we are beginning to see a move in Europe to a car which can be totally recycled. Increased use of vegetable fibers is part of that effort. Here in the U.S. a number of car manufacturers are also moving toward a "green" automobile.

The AARC Corporation, a unique venture capital entity, is attempting to restart the bio-based economy by investing in small businesses that are using agricultural materials to produce environmentally-friendly industrial products. The decision as to which companies and industrial sectors should receive AARC Corporation investments is made by a largely private sector board. Eight of the 11 members of the AARCC Board are from the private sector representing processing, financial, producer, and scientific interests.

It is important to recognize the AARC Corporation intends to make a profit for the Federal government from these investments and reinvest those repayments in other companies. But AARCC has a larger mandate. Unlike private sector venture capital firms, the AARC Corporation's investment strategy considers much more than profit, also referred to as return on investment (ROI). In pursuing AARCC's investment strategy, no one variable—ROI, jobs creation, or agricultural material used has priority. Investment decisions are made after weighing these three factors in order to maintain a balance in our portfolio. To date the AARC Corporation has invested \$33 million in Federal funds, leveraging an initial \$105 million in initial private investments creating more than 5,000 new jobs in rural communities. AARCC continues to be an engine for rural development by investing in technologies that create real jobs and increase the use of agricultural materials or agricultural wastes.

AARCC's first investments were made in 1993. We know that not all the companies in which the AARC Corporation invests will be successful. However, many will. The venture capital industry norm for portfolio performance is that companies do not begin to break even until 75 months after the initial investment, somewhere between the sixth and seventh year. Even so, some 15 companies have already repaid the AARC Corporation over \$200,000 in royalties. The business plan anticipates a continued and steady increase in repayments over the next 5 years.

We are constantly working with those companies in which we have invested to help them secure additional outside financing. Because the AARCC partnership places the USDA "stamp of approval" on these companies, it gives private investors a better "comfort level" and many partners have been able to attract significant follow-on financing from private sources. The AARC Corporation has secured an additional \$3 dollars in private follow-on financing for each \$1 dollar it has invested.

Many AARCC companies have succeeded in penetrating difficult to access retail distribution channels for consumer products. Those marketing efforts are continuing. Perhaps the biggest near-term market for AARCC-supported companies, however, is government. To help jump-start these companies, as part of the 1996 Farm Bill, Congress included language which gives Federal procurement preference to products produced by AARCC partners. The preference language is part of the new Agricultural Acquisition Regulations (AGAR), which govern USDA purchases, recently published in the Federal Register. This year, similar information will be included in the Federal Acquisition Regulations (FAR), which govern all Federal purchases. As part of on-going marketing efforts to the Federal government this past fall, AARCC and 30 of its partners participated in the National Marketplace for the Environment here in Washington attended by Federal procurement officials, private buyers, and environmental organizations.

With the necessary resources, the AARC Corporation can continue and even expand its role in creating value-added products and jobs that benefit rural America. With the AARC Corporation investment serving as a catalyst, private sector funds, which otherwise would not be available, will be committed to these companies. The AARC Corporation respectfully requests \$10 million in 1999 to continue its mission. An appropriation at this level would enable the AARC Corporation to fund approximately 20 new investments. In addition, these funds would make it possible for AARCC to provide follow-on financing to some of its existing portfolio companies which have begun to transition from the start-up stage of their development to intermediate stage in which they are beginning to penetrate markets and make sales. At the requested funding level of \$10 million, AARCC can attract some \$30 million in private capital investment in its portfolio companies, thereby creating hundreds of new jobs in rural communities.

In conclusion, AARCC's venture capital approach is quite different from that of traditional government loan or grant programs. Indeed, AARCC may be seen as a model for public/private cooperative developments and several other Federal departments are investigating the possibility of establishing AARCC-like programs. The AARCC model of eventual self-sufficiency, coupled with the program's role as an engine for economic development, makes it an attractive option for a new way of doing the government's business.

BIOGRAPHICAL SKETCHES

JEFFREY W. GAIN

Jeff Gain was appointed to the Board of Directors of USDA's Alternative Agricultural Research and Commercialization (AARC) Corporation in 1995 and serves as Chairman of the Board. The AARC Corporation makes equity investments in small, mostly rural-based companies to commercialize industrial uses for agricultural materials. Mr. Gain currently manages his farm in Calhoun County, Illinois, and is also engaged in agricultural policy, marketing, and management consulting.

Mr. Gain served for 10 years as the Chief Executive Officer the National Corn Growers Association, retiring October 1, 1994. Prior to that, he was Executive Director of the American Soybean Association from 1977 to 1984. He is one of the original founders of the New Uses Council, formed in 1990 to serve as an advocate for commercializing new industrial uses for agricultural raw materials and to help coordinate public and private sector activities in that regard. He was Chairman of the New Uses Council from 1991 to 1993.

Mr. Gain was one of the founders of the St. Louis Agri-Business Club and served as its first president. He was named the Agri-Business Leader of the Year by the Club in 1985. He also served as a member of USDA's New Farm and Forest Products Task Force, which resulted in the new industrial uses initiatives for U.S. agriculture. The Task Force recommendations in 1987 led to the creation of the AARC Corporation in the 1990 Farm Bill.

For his work in promoting the development of industrial products from agricultural materials, he received the Outstanding Leadership Award from the American Crop Protection Association. Most recently, he was presented the prestigious Wheeler McMillan Award from the New Uses Council. Mr. Gain has traveled extensively on various agricultural marketing missions to Europe, South America, and Asia, including the People's Republic of China.

Jeff is a native of Rushville, Illinois, and has a B.S. degree in management from the University of Illinois. After graduation as a Lieutenant, he served as a Public Information Officer and as an admiral's aide in the U.S. Coast Guard. He then served as Executive Secretary of several Illinois county chapters of the American Farm Bureau Federation and was director of Commodity Programs for the Illinois Agricultural Association for 10 years. He has two daughters, Ann and Gretchen, and a 6-year old son, Jeffrey.

ROBERT E. ARMSTRONG

Dr. Armstrong joined the Alternative Agricultural Research and Commercialization (AARC) Corporation in early 1993. Since that time, he has assumed a variety of increasing responsibilities, culminating in being named Executive Director in 1997.

The AARC Corporation is a wholly-owned corporation of the U.S. Department of Agriculture (USDA). Operating under the guidance of a largely private-sector Board of Directors, the Corporation functions as a venture capital firm that invests in companies commercializing non-food/non-feed products derived from agricultural raw materials. The AARC Corporation currently has \$35 million invested in companies throughout the U.S. As Executive Director, Dr. Armstrong is responsible for the daily operations of the Corporation, as well as the on-going growth and management of the Corporation's portfolio.

He was graduated *summa cum laude*/Phi Beta Kappa with a B.A. degree in psychology from Wabash College in Crawfordsville, Indiana. He holds an M.A. in experimental psychology from Oxford University, Oxford, England. In addition, he holds an M.S. in biology and a Ph.D. in agronomy (plant breeding and genetics), both from Purdue University in W. Lafayette, Indiana.

His early professional work centered on Third World issues, and he has worked in a number of developing countries. His work includes projects related to famine

relief and food availability in Sahelian Africa, agricultural development in the Persian Gulf and deforestation in Southeast Asia.

Dr. Armstrong is a Vietnam veteran and continues to serve in the U.S. Army Reserve. He has two sons and two daughters and is married to the former Leslie Carlson, a career USDA employee.

DELTA REGION ECONOMIC DEVELOPMENT PROGRAM

Senator COCHRAN. Ms. Thompson, we appreciate your comments and the written statement that you submitted. There is a proposal the administration has made to create a Lower Mississippi Delta regional economic development program and to have it administered, in effect, by the Appalachian Regional Commission or in some way be managed by the Appalachian Regional Commission staff.

The President's budget request includes \$426 million for the Appalachian Regional Commission and a \$26 million program is proposed for the Lower Mississippi Delta Region. Senator Bumpers has taken an active role in earlier years, and I cosponsored his initiative to establish a study commission to see if there were ways that we could deal with problems of poverty, education, economic development, transportation, and the like in this region. A lot of information was compiled and work was done and the Commission went out of business after it made its recommendations.

I like the idea of targeting funds to this region because it is one that has characteristics that are similar throughout the area. I am curious to know what your reaction would be if the Congress decided to approve the idea, but place the responsibility for administering the program in the Department of Agriculture, and specifically under your jurisdiction. What would your reaction be to that?

Ms. THOMPSON. Well, I think that it could be extremely valuable to that region of our country. The reason I do is that this particular approach would be a broader regional approach to partnering with communities. The more we learn about the role that the Federal Government can play, the more I personally and we as a department appreciate that we work best as a partner and the communities have the greatest potential for sustainable growth when each community works harmoniously within the community, but also partners and joins with other communities in a larger regional area, that long-term sustainable growth and economic and social development are going to occur probably only if there is a regional approach to economic development and rural development.

NATIONAL CENTERS FOR EXCELLENCE

Senator COCHRAN. Earlier this year, I think in January, you announced that you were establishing some national centers for excellence to provide technical expertise to rural America. One of those centers is to be located, as I understand it, at Mississippi Valley State University in Itta Bena. The center is to receive \$100,000 and a Peace Corps fellow to assist as liaison between the community and the university. What other funds would be available to support this center's activity, and what is the status of it now?

Ms. THOMPSON. Well, this, as you stated, is a new initiative. The funds, additional funds, that would be available would be funds through our traditional programs that are administered in rural development. I think this is an excellent approach to economic de-

velopment because community colleges have always served a variety of purposes in the communities.

In addition to providing education opportunities, they very typically are doing outreach and working with community leaders, both local government leaders as well as business leaders, and so I believe that there is considerable potential for this partnering to occur between us and the community colleges and the community colleges and their communities that they are serving. As they put together plans and initiatives for their own communities, then that will allow them to come back to us, or us to go to them, to discuss and explore how the programs that are administered through rural development at USDA could also benefit those communities.

RURAL UTILITIES SERVICE

Senator COCHRAN. The Rural Utilities Service is one of those agencies that ends up being under some pressure from time to time because of the growing awareness of deregulation, the idea that we are going to have a new national energy policy in utility service. What is being done to prepare for these changes, and are these changes having any effect on the ability to provide utility services in rural America under the traditional government programs that are administered by the agency?

Mr. Beyer, would you be able to respond to that?

Ms. THOMPSON. I would ask Mr. Beyer to elaborate on that.

Mr. BEYER. Thank you, Mr. Chairman and Senator Bumpers. I would be happy to respond to that. Thank you for the question. The electric and telecommunications industries, as you know, are in a revolution. It is a milestone in the history of providing infrastructure services, moving from the old traditional monopoly structure to an open-access, market-based price, customer choice.

The telecommunication industry has now moved over to the Federal regulatory and the Public Service Commission activities in rulemaking to comply with the legislation, which is another difficult, very difficult process from the standpoint of providing support into high-cost-to-serve areas. I think, you know, we are going to be all right, but there are a couple of critical things that we are working with, with the FCC and with the Public Service Commission where we have an opportunity.

Basic to our loan security issue is certified areas, which is now multiple. States can issue as many certified areas as they wish. The second principal thing for our loan security traditionally has been the universal service pool mechanism that exists in the telecom industry. About 65 cents out of every revenue dollar, on the average, of the RUS borrowers comes from that pool, which includes toll separation.

There is another part that addresses the high-cost-to-serve areas and high-cost-to-maintain-and-operate areas. That pool is now about \$20 billion that is generated from within the infrastructure, and is a huge issue at FCC in the rulemaking.

We are working with the FCC and making as much input as we can to stand up for the rural systems, obviously. You know, it is going to continue to evolve and we are hopeful that in the end—Congress will provide a public policy that says we need to support the high-cost-to-serve areas so that we don't end up with infra-

structure have-nots and haves in this country. I am marching forward with that 50-year-old, 60-year-old policy that has been enacted since the Rural Electrification Act.

Senator COCHRAN. One provision of the budget request suggests the Administrator of RUS will have the ability to move subsidy budget authority among the electric loan programs under your jurisdiction. Is this something that is going to require additional legislation to provide that authority, or do you suggest or does the budget suggest that you now have that authority? What is the reason for that?

It seems to me it might bypass the appropriations process where we appropriate specific amounts and identify subsidy levels and the like in our bill. Now we are going to have the provisions of the bill ignored and instead we are going to see the administrator moving subsidy authority among the programs without any further action by Congress?

Mr. BEYER. Well, Mr. Chairman, we view that as a tool in managing the dollars invested in infrastructure. If there is a need for additional hardship loans, we would like some authority to utilize budget authority to increase hardship loans from funds that are not being utilized. It would simply be another tool for us to better manage the portfolio.

Senator COCHRAN. I assume the answer is that you think you have that authority now? No new legislation is required?

Mr. BEYER. No, my understanding is we do not have that authority now.

Senator COCHRAN. This proposes that that authority be given?

Mr. BEYER. Appropriation legislation is required, Mr. Chairman.

WATER 2000 INITIATIVE

Senator COCHRAN. I see. The President's Water 2000 Initiative has a goal of providing clean running water by the year 2000 to all rural households. Is that something that is possible under the budget that is proposed by the President? I suppose that should be asked of the Secretary?

Ms. THOMPSON. Under the budget that is being proposed, we will not be able to reach every household by the year 2000, but we have made tremendous progress over the last several years in this initiative. The numbers in the beginning of 1993, before the Water 2000 Initiative, were about 400,000 households with about 1 million rural residents without any running water. Through the Water 2000 Initiative we are now down to about 300,000 households and about 800,000 residents without running water.

The challenge gets greater the closer we get to reaching the goal because we are now reaching the hardest to reach clients, and so it is a real challenge.

Because I have an optimistic nature, I think it is important to keep working toward that goal that was established in the Water 2000 Initiative. I think it is also important to realize that it is a very, very difficult goal to achieve given our commitment to also balancing the budget.

I, as well as our Administrator and others in the Rural Utilities Service—John Romano was recognized earlier—we will continue to have a very, very strong commitment to reaching as many homes

as we can by the year 2000. You know, there is always 2001 and we can just keep moving forward at that point as well.

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. Thank you, Mr. Chairman.

HOME OWNERSHIP LOANS

Mr. Shadburn, let me ask you, Secretary Thompson alluded to the President's commitment to add 8 million homeowners by the year 2000. Is that correct?

Mr. SHADBURN. Yes, sir.

Senator BUMPERS. How many of those are not going to be in rural areas, but how many of those are you going to be responsible for under the Agriculture Department housing programs? Do you have any idea?

Mr. SHADBURN. In terms of—

Senator BUMPERS. Have you been assigned any kind of a quota on this?

Mr. SHADBURN. We have not been assigned a quota, but obviously we are working with our rural partners throughout the Nation to look and see how we can take \$4 billion in the housing programs to maximize the total number of units we can place toward reaching that 8 million goal that the President has set.

Senator BUMPERS. Well, it is a very laudable goal, but it is a pretty long stretch, I think, to get there. I applaud the President for doing it.

DELTA REGIONAL COMMISSION

Secretary Thompson's statement, I was especially impressed with the statistics you gave about poverty still being fairly pervasive in the rural areas, and especially in the South. Let me just add my own comments to what the chairman has already mentioned, and that is, the Appalachian Regional Commission [ARC]. I will tell you now, I am not for putting this \$26 million in the ARC. I would like to see the Delta Commission stand on its own. They have unique problems. I just do not want it to get lost in the Appalachian Regional Commission.

I have a lot of time invested in that in my life, and the President has too. The only person I would yield to in my commitment to the delta is the President, because when he was Governor he did everything but stand on his head down there to try to help those people.

DELTA TEACHERS ACADEMY

In any event, one other question I wanted to ask you on the delta and you mentioned education and the role it plays in rural areas. Are you familiar with the Delta Teachers Academy?

Ms. THOMPSON. I am not, per se.

Senator BUMPERS. You are not. Is anybody here?

Senator COCHRAN. I am. [Laughter.]

Ms. THOMPSON. Is there a role that we can play through community facilities or distance learning with the Delta Teachers Academy? I may have someone here.

Senator BUMPERS. I will submit a question to you in writing on that, because that is something that Senator Cochran and I are

both committed to. It is a \$3.5 million program. It is for the delta. I want it continued, and I would like to see it expanded. I would like to get the Department's view on how well they are performing.

Ms. THOMPSON. Well, we will be very happy to respond.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS

Senator BUMPERS. Yes; for many years, Senator Cochran's former colleague in the House, Jamie Whitten, and I fought vigorously, long, and hard over a program which was originally housed in Memphis. I do not think—Jamie is not with us anymore and I am reluctant to say that I think Jamie turned against it when it moved from Memphis to the University of Arkansas. Of course, that is what peaked my interest.

In any event, we had a long, rather volatile battle about that. I was always convinced that in the coming days as we looked for different methods of farming using less herbicides, less pesticides that the so-called appropriate technology transfer program at the university had great potential.

I think Jamie was right to some extent. Back when I was fighting it—I guess that has been 10 years ago—he had some arguments on his side. They were not as busy as they would have you believe, but now all of a sudden—not just all of a sudden, but the demands on their services have been increasing almost exponentially. Really, this is not a question. It is just a statement that applauds you for asking—who has that program?

Mr. WATKINS. [Raising hand.]

Senator BUMPERS. Mr. Watkins, I want to applaud you for the request for the increase in that program, because they are really—the demands on them are increasing dramatically as you probably know. I am sure that is the reason—is that the reason you have asked for the increase?

Mr. WATKINS. Yes, sir; actually, Senator Bumpers, the demands on the program, as you have already indicated, are growing exponentially. Information requests are coming from farmers, from small farmers, from extension agents throughout the entire country. One of the things that you suggested in a previous hearing, I believe, was that we consider bringing technology, the use of Internet and computers to that program. That is something that we would like to see going forward as well. That is part of the reason for the request for an increase.

Senator BUMPERS. Sometime, Mr. Watkins, if you get a chance, I wish you would go down to Fayetteville and look at the brewery.

Mr. WATKINS. I certainly will.

WATER AND WASTE PROGRAMS

Senator BUMPERS. Mr. Beyer, I will probably submit some questions to you in writing, but I wanted to ask you, first of all, it is my understanding that private companies are making efforts to buy some of these rural water programs. Is that true?

Mr. BEYER. Senator Bumpers, Mr. Chairman—

Senator BUMPERS. Systems, I mean, some of the systems.

Mr. BEYER. In some cases where a community starts growing out into a rural area, then, you know, you have a little bit of a con-

frontation between the community and the rural areas. There is some of that.

Senator BUMPERS. Is that presenting any kind of a problem for you?

Mr. BEYER. Well, we have looked at this this particular year, and, you know, we do not think the problem is wide enough for Federal legislation. We would not recommend that at this point in time. It is all down to the local community issues. Where communities work together, where the rural people work together with their urban neighbors, they work this out and they sell it. Where they do not work together, it is a very, very difficult process and they fight.

You know, unless it really spreads all over, it would not be our recommendation that there be Federal legislation. That would just create another big problem.

Senator BUMPERS. I do not have any planned. I just wanted to know what kind of a problem it was, if any, for you.

Mr. BEYER. It crops up here and there. I can give you some numbers, if we go back and look at it. We would be happy to do that.

ELECTRICAL RESTRUCTURING

Senator BUMPERS. OK. Mr. Beyer, you and I have discussed electrical restructuring in my office, but I think two or three questions for the record might be helpful. It is no secret that the co-ops in the municipalities are the biggest opponents, I think, generally of electrical restructuring.

Now I would assume since the President has said that he feels electrical restructuring will go a long way toward helping with the global warming problem, that the Agriculture Department, the Rural Utilities Service, you are not adamantly opposed to this bill, even though most of your members in the co-op, electrical co-ops, out there are. What is the official position of the Agriculture Department? I assume it is the same as the President's, is it not?

Mr. BEYER. Yes, sir.

Ms. THOMPSON. It is precisely the same as the President's. [Laughter.]

Mr. BEYER. To the letter. The dilemma is that as we move along in this country toward molding a new infrastructure it is a very complicated process as you all know.

Senator BUMPERS. Well, let us get down to the heart of it. There are two or three things. No. 1, they have enjoyed a great deal of independence—

Mr. BEYER. Right.

Senator BUMPERS. A lot of Government assistance, never had a better friend than Senator Cochran and me. I do not enjoy being on the opposite side of them for the first time really in my public career. I must say that I really have some reluctance to say this publicly, but I think their fears are largely unfounded.

Now, California has allowed municipalities and, I think, co-ops to opt in or opt out of their program. There are some people who think we ought to do that here. I have always felt this thing will only really work well if you don't make any exceptions. I am not going to make an exception for TVA and I would not make an exception for the PMA's, municipalities, co-ops, or anybody else be-

cause I think everybody ought to have a chance to enjoy the benefits of competition, picking and choosing whom they want to provide them with electricity.

I must say because of the political and other alliances I have had with the co-ops I just want to ask this question. Their principal concern, at least I think it is their principal concern, is, as I have always said, the guy that lives down at the end of the lane. Now INRON, for example, may come and pick off some of your industrial customers and the Arkansas Electric Co-Op through one of their regional co-ops supplies one of the biggest steelmills in the United States.

The point is they have got a contract which the steelmill must honor, but at some point that is going to be up for renewal and the co-op may get it and they may not. That is competition. When you are in the steel or aluminum business, you cannot stay in business unless you compete and unless you have a competitive electric rate.

The fear is that the big customers are going to be picked off, the little guy at the end of the lane is going to be left—this is the traditional case—and his rate is going to go up. Now I want to give you the opposite of that and then ask you to comment.

No. 1, there are a few States that allow competing distribution lines to be built, but I do not think very many. In my State, you cannot just walk in and build a competing distribution line. Let us assume for a moment that that is not a problem, that people cannot come in and build a distribution line.

Let us assume further that the steelmill, that you lose the steelmill and not just because of my bill, because as I said in my illustration the REA is having to compete for that business anyway, but at the end of that contract, say, they lose it. That takes a big chunk out of their revenue. They have generating capacity that they have gone in debt for to supply the steelmill. When the steelmill leaves, let us assume that they now have a 50-percent excess in generating capacity that they cannot use.

Is everybody with me so far?

[No response.]

Senator BUMPERS. The question then becomes, What are you going to do with the rest of your customers? How are you going to pay for it? Now, No. 1, under my bill as you know, and it is the only bill in the House or Senate either one that provides for stranded costs. I feel very strongly about that, because that just takes away a lot of arguments against the bill, but I also think it is right to do that.

In my State under the bill, the co-op has the right to collect stranded cost. You know who sets the amount of stranded cost they are entitled to recover? They do.

Let us assume that they wind up with a generating plant that they owe \$2 billion and they lose \$1 billion of generating customers, customers who would use that generating capacity, so they are stuck. They say, "How do we get our \$1 billion back?" You get it through stranded costs. They set it themselves.

That means that the steelmill or any other customer—now that steel would apply because that is a private contract—but most every customer in the co-op system if they leave the system and the co-op has stranded cost there will be a wire charge against the

people who have left to make sure that people's rates do not go up until that stranded cost is collected.

Do you follow me on what I am saying, Mr. Beyer?

Mr. BEYER. Yes, sir; yes, I do.

Senator BUMPERS. Now, you still have the distribution line to the guy at the end of the lane. My question is, How is the co-op hurt? They are going to recover their cost of the lost generating capacity, and nobody else is going to be able to build a distribution line to somebody else that they are going to lose customers with. Why is that not a fair deal?

Mr. BEYER. Well, Mr. Chairman and Senator Bumpers, my sense is that most people agree there needs to be some mechanism to recover that cost on generation and transmission facilities, high-cost stuff. When you get down to the distribution system where the folks are, where the meters are, the wire system, if you please, if you take a big load like a steelmill, for example, out of that system there is a huge revenue loss. You are suggesting that they will pick that up with a wire charge.

The wire charge is going to be a big issue because I can tell you that the average cost to operate a distribution system in our loan portfolio—excluding power costs now, this is everything—is 2.9 cents a kilowatt hour. It ranges from, you know, probably 1.5 to 6 cents. Now, if that steelmill is on a 6-cent line, there is going to be some negotiations.

The Public Service Commission will probably get involved, and probably some lawsuits, because those entrepreneurs, those power marketers, that want that steelmill to make some profit are not going to be interested in what happens to that system. They are not going to want to pay a 6-cent wire charge. Therein, I think, lies the dilemma.

I just want to go on and say that—and I am sure this is the administration's position—I really feel that competition in the electric industry would in the long run now, I am talking about, would be useful.

I also feel very strongly that the high-cost-to-serve areas will continue to need some support. It simply costs more money to build a capital investment to build, per consumer to build, lines in high-cost-to-serve areas in rural America and it costs more to operate. We have some figures on that. It simply costs more. Not unlike the telecom, this universal service is to me one of the critical elements of deregulation in our portfolio along with the stranded investment as well.

To me it is not such a huge issue. I mean, it is not a multibillion-dollar issue. With a little tweaking and a continuation of Federal policy that has been there for 60 years, this thing could work. This thing could really work. There is going to be a lot of—you know, EEI is not going to want it. There is going to be all kinds of opposition to it. You know more about that than I do, really. In the end, if Congress sets up some financial support mechanism that does not have to be huge in my judgment, it will work. I think that will work.

Senator BUMPERS. Mr. Beyer, I want you to know that I want to be accommodating.

Mr. Chairman, I will finish after this. I have taken too long, but obviously this is a big issue with me and I can talk about it for a long time. Let me just suggest that, if you will, along the lines we are talking about—because nobody is any more concerned—I have got more people at the end of the lane than just about anybody in the country, and I do not want those people to be penalized as a result of this legislation. If this legislation does not work for everybody, then it is no good.

I believe strongly it will, but there is one other thing I might just say by way of digression, and that is: I try every time I speak to groups to disabuse them of the notion that they are going to have a 20-percent utility cut almost immediately. The truth of the matter is the benefits of competition are down the road. It is going to take a little while to flesh this whole thing out. Stranded costs are going to have to be taken care of. In the long run, I think it is the right thing for us to do.

I am concerned as much about the REA as I am anything else. I wish I could dampen their opposition to this bill. I understand they have done their own thing for a long time, and I can understand that. If you would, just assume that I have asked you this question to be responded to in writing and include in your answer some of those figures you have said that you have. Because as I say, it seems to me that as long as the co-ops own the distribution lines and they get their stranded costs, there really should not be much left to recover in order to service the guy at the end of the lane. That is sort of the point I am trying to make.

Mr. Chairman, thank you very much.

RURAL HOUSING PROGRAMS

Senator COCHRAN. Thank you very much, Senator.

In the budget request for housing, there are proposals to increase funding for some of the housing programs and there is also a proposal for some legislative changes, one of which would require tenants to pay a monthly minimum rent to cover costs of the Rural Housing Service finance programs. Specifically, though, there are requests to decrease funds for a number of these housing programs: Section 515 multifamily housing programs, the Direct Housing Repair Loan Program, the Rural Housing Preservation Grant Program.

MULTIFAMILY HOUSING

In a meeting I recently had with the Inspector General for the Department of Agriculture, he told me that there were serious problems of fraud and waste and abuse in some of these programs. He specifically mentioned the 515 program. Is the Department cooperating with the Inspector General to try to get to the bottom of some of these problems, and is that why you are requesting decreased funding for some of these programs?

Ms. THOMPSON. Well, in a moment I would like to defer to Jan to talk about some of the specifics of our housing programs. We are more than cooperating with the Office of Inspector General. We are working as a partner with the Office of the Inspector General in particular to address the issue of equity skimming among 515 multifamily housing borrowers, and feel very strongly that this is an

important program that for the most part is working well to serve some of the lowest income individuals and families in rural America.

There are a few borrowers who are simply not adhering to the rules and are taking advantage of the program, and more significantly taking advantage of the people who live in the facilities and are to be the ultimate beneficiary of the programs.

With regard to some of the lower requests, some of the decisions are made simply because we have to make some tough fiscal decisions that if we are serious about balancing the budget, and we are serious as I know you are, we just have to make some tough choices. That explains part of it. Jan Shadburn can answer some of the more specific questions regarding the specific programs that you have referenced.

Senator COCHRAN. Thank you.

Mr. SHADBURN. Yes; Mr. Chairman, we have initiated several administrative changes over the last couple of years to strengthen the 515 program. We have also initiated the reforms that the Appropriations Committee enacted, and we have those in place.

We feel very comfortable with the steps that have been taken to strengthen the program over the last couple of years, as well as initiating this OIG/USDA partnership to look at incidents of fraud, waste, and abuse. We have been working with the 12 States on the reforms that we have enacted with the OIG, and looking at creating a model that identifies the potential for fraud, waste, and abuse. Obviously no one is more interested in the future integrity of the 515 program than the Under Secretary and myself. We want to make sure that we do prevent fraud, waste, and abuse, as well as making sure that we continue to provide safe, sanitary, and affordable living conditions for our tenants.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION

Senator COCHRAN. The AARC program, as I understand it, is under a legislative mandate to phase out its loan programs into a totally private ownership situation. Could you tell us, Mr. Armstrong, what the timetable is for this phasing out or sunseting of the program and whether or not you are prepared to meet those dates? Help us understand what the funding needs are going to be in view of the legislative timetable.

Mr. ARMSTRONG. Thank you, Mr. Chairman. Before I answer your question, I want to take a second and introduce Mr. Jeff Gain, the chairman of our board. As you know, AARCC is run by a largely private sector board of directors, and Mr. Gain serves as our chairman. He is my boss and I thought it would be nice to introduce him.

In answer to your question, Senator, in the 1996 farm bill the mandate was that by the year 2001 we would present a plan to privatize. The actual privatization date was not set, but the plan is to be submitted by 2001. We are ahead of that date in terms of our preparation of the plan.

At the moment, we are working through a number of scenarios that we would identify as likely endpoints for AARCC when we do privatize. Would we become a small business investment corporation? Would we put it up for sale in private markets? Would we be-

come a government-sponsored enterprise? Those decisions are being worked through by the board after they identify what they think makes the best economic sense, then we will take it to the secretary and then bring it to the Congress.

Now, in preparation for all of this, you know, AARCC has done a business plan where we have projected out our repayment schedule over the next 5 or 6 years. In fiscal year 1998, we project \$300,000 in repayments. We are right on target for that. In fiscal year 1999, we are projecting we will recover about \$1.7 million. If some of the notes—and which I feel certain they will—the repayment agreements that we have in place are paid off on time, we will be right on target for that.

Now to get to the question of the appropriations to meet this repayment schedule, in determining the business plan we laid out appropriations through 2001. In fiscal year 1997, we actually fell short. The number that we placed in our business plan was \$10 million. We received \$7 million, but we still have been able through our investment strategy to recover the \$300,000 in fiscal year 1998 that we were projecting would be derived from that fiscal year 1997 investment.

My point is that the \$10 million that is being requested in this year's appropriation, although it is \$2 million less than what we had in our business plan, and the business plan was put together 3 years ago, it is less than what was in the business plan. We feel we can still track with the repayment schedule, and that is really the key to making sure that we are financially sound to privatize.

Senator COCHRAN. What would be the projected outyear appropriations? Do you have those in your timetable? Will the \$10 million level be funded for the balance until you get to 2001?

Mr. ARMSTRONG. No, sir; not for the balance. Actually, we increased it in the business plan. Now that is strictly AARCC's Board of Directors' business plan, not anything to do with the administration's budget. In the business plan, we had projected \$15 million for the next 3 years and then dropped it back down to \$12 million for the final 2 years of the business plan.

Senator COCHRAN. OK. Will the schedule for repayments continue to go up over that period of time in your view or in the business plan? What is contemplated with respect to repayments?

Mr. ARMSTRONG. In the business plan repayments, Mr. Chairman, as I said \$300,000 is anticipated for fiscal year 1998 and we are at—oh, already here at the first of March we are at \$248,500, I think, is the actual figure. I am very confident by the end of the fiscal year we will have \$300,000; next fiscal year is projected \$1.7 million; in 2000 we are projecting \$3.801 million; \$7.9 million; and in 2002 \$12.2 million.

As we have structured these investments, you know, some of them are based on a royalty repayment, some of them are predicated on a company undergoing an IPO or an acquisition. We have identified a core within the AARCC's portfolio that we feel is going to carry the bulk of this repayment. That is very typical of how the private sector venture capital fund works. You know, there is a certain core that really carries the rest of the investments forward.

In total, we are looking at, just through the year 2002 we are looking at, almost \$26 million anticipated in repayments. I do not

anticipate a problem in meeting that sum, particularly given the strength of three or four of those core companies that we have identified to focus on.

Senator COCHRAN. My impression of the program has been that it has worked pretty well. I know that you have had an opportunity to be, you know, more closely involved in assessing the quality of the performance. What is your impression overall of this program? Is it one that we should continue, or are we just throwing money away by supporting AARCC?

Mr. ARMSTRONG. Gosh, Senator Harkin is not here.

Senator COCHRAN. I know, he has left. [Laughter.]

Mr. ARMSTRONG. Well, obviously, Senator, we do not feel that this is good money after bad. The real crux of the question, I think, is why isn't the public sector doing this? If this is such a great idea, why isn't the private sector doing this? I think the answer to that is the private sector is doing it, but we have had to show the way; in a sense, jump off the bridge.

The idea of investing in agriculture to many in the private sector is simply an agricultural loans for major agriculture projects like irrigation or for farming equipment or for seed money to buy next year's seed or whatever. We are about value added. We are about investing in companies that use these raw materials from agriculture to process and manufacture things that then are not nonfood and nonfeed.

Our long-term vision, our 100-year vision is really transforming the economy to one based on biology they derive from agriculture, as opposed to the one we have at present based on geology, which uses petroleum. The advantages are numerous. The environmental advantages, the life cycle cost analysis of our products versus something made out of petroleum, you cannot compete with our products because there is hardly any disposal issue. The private sector is just now beginning to realize that this biologically based economy makes some long-term sense.

As I say, we have been the first to jump off the bridge in a sense in these investments, but as Senator Harkin pointed out we, we attract \$3, \$3.50, \$4, private sector dollars, for every \$1 of public money that we put in. More and more we are getting attention from the private sector. We are developing a network based on environmental investment funds, based on socially responsible investing funds.

We are beginning to understand what AARCC does and we are using them as coinvestors. I think the momentum that the public sector has started, the momentum needs to continue. I think the 2001, 2002, 2003 timeframe is appropriate, and then AARCC as an investment portfolio sunsets out of the Federal Government.

The mission, however, the mission of this bio-based economy of job creation in rural America, and that is really what it is an engine of, if you use biologically-based materials because of literally the physical chemistry in the molecules, you have to process and manufacture close to the source. You cannot drag it out of the ground like we can with petroleum and bring it one-half way around the world and still make any money. As we use these biological molecules, then the jobs are going to have to go to where they are, and that is rural America.

Ms. THOMPSON. Mr. Chairman, could I also answer that?

Senator COCHRAN. Sure, Secretary Thompson.

Ms. THOMPSON. The private sector does not traditionally invest in, whether it is venture capitalists or rural lenders, they simply do not invest in the kinds of development traditionally that we are investing in. There is tremendous potential for the small firms that we are partnering with, but there is even greater potential for the agricultural community and rural communities in general because of the technological development that comes as a result of these investments. I can say without any reservation, without any question that this is something that ought to be invested in, and that many rural communities will benefit down the road in the long run as a result of a very small investment.

BUSINESS AND INDUSTRY PROGRAMS

Senator COCHRAN. Mr. Watkins, I know that you and I have talked in the past about how can we do a more aggressive job and more active job of identifying needs for loans and technical assistance to develop business opportunities and job opportunities in rural communities and small towns. For a while, I was a little aggravated because it seemed like the administration was interested in having meetings, not in making loans. There were meetings being held all over the Mississippi Delta and my State and other States. You were traveling around and identifying folks to come talk about how we could help the people who need help in these areas.

I think we have finally gotten around to seeing some money loaned and some businesses started and expanded. I wondered if you could give us a report on how you see the progress that has been made? Has it been good? Tell me what you are doing with the money that you are supposed to be awarding to these borrowers in rural communities.

Mr. WATKINS. Thank you very much, Mr. Chairman. You are exactly correct. The business activity in rural America has mushroomed beyond actually our own estimates. At the end of fiscal year 1997 in our flagship, the Business and Industry Loan Guarantee Program, we had more than \$950 million in applications and preapplications pending. We only had a fund of about \$815 million that we could finance business deals. We project a very similar activity in fiscal years 1998 and 1999.

You know, we certainly cannot take credit. We can take credit for having gone around the country, as you said, and held all of those meetings, but a part of that was required in order for us, one, to get the lenders back to the table to participate in the program; and then, second, to alert businessowners and entrepreneurs in rural America that this opportunity existed for them to gain access to this kind of financing. It has worked. You know, we are creating and saving and maintaining a lot of jobs in rural America.

As the Under Secretary mentioned in her testimony, you know, the poverty line and the wage rates and wage levels in rural America are certainly behind urban America. We are still financing traditional businesses that are located or that have always been located in rural communities. We are beginning, though, to focus on

value added companies that are agriculture related, but that are adding value to their agricultural product.

We are also interested in trying to attract high-technology companies, companies that are, in fact, affiliated with AARCC that are invested in by AARCC. We see those in the future as having some tremendous value and benefit to increasing the standard of living to Americans in rural America. The picture is very bright. You know, it is certainly not any brighter than the picture for the U.S. economy.

MISSISSIPPI DELTA

Senator COCHRAN. Do you have any statistics from the last fiscal year about how many loans were made or how many jobs were created so we will know what the money went for and what was the result of the loans that were made, Madam Secretary?

Ms. THOMPSON. Yes; we do. We have funded projects totaling just under \$160 million in the Mississippi Delta, of which about \$75 million has been for water and waste disposal projects and about \$80 million for business loans and grants. In fiscal year 1997, specifically we funded \$65 million in various types of projects.

In my testimony I made mention, in the written testimony I made mention, of the lowest unemployment rate in the Kentucky Highlands Empowerment Zone counties in recent history. You, of course, are very familiar with the warehousing facility in the zone in Mississippi and the number of jobs that are going to be created there.

Senator COCHRAN. That would be good to have for the record, particularly as to what has happened this year too.

Ms. THOMPSON. I will be happy to do that.

Senator COCHRAN. Thank you very much. Secretary Glickman made a statement the other day which caught my attention. He said that the Department had awarded \$1.1 million in rural business enterprise grants to 10 States to support business development in economically depressed areas. We only appropriated \$40,000 for rural business enterprise grants, and we were wondering where the money came from to make up the \$1.1 million in grants. Do you think he misspoke, or do we have our numbers confused in my notes?

Ms. THOMPSON. There was \$41 million appropriated?

Senator COCHRAN. Well, my notes say \$40,000. I am not sure that is right, but anyway that is what my notes say.

Ms. THOMPSON. I am sure what we did—

Senator COCHRAN. For rural business enterprise grants.

Ms. THOMPSON. I am sure what we did was within the law but—

Senator COCHRAN. Yes, sure, I am not suggesting—I am just curious whether it was reprogrammed or whether maybe these were not grants. Maybe they were grants plus some guaranteed loans or something and he just grouped it all under one. It sounded like the Government was giving away \$1 billion in grants for business subsidies, and we did not remember appropriating any money, but just a little bit of money for it.

Ms. THOMPSON. I believe it was \$41 million.

RESEARCH ON COOPERATIVES

Senator COCHRAN. OK. Thank you. There is also another item that I was going to ask about. There is an increase proposed in your budget request of \$2 million in funding for research on cooperatives. I am curious to know what research is being done by the Department on cooperatives and what the increased amount of money will be used for? What will this extra funding accomplish; what you are going to find out when you do this research on cooperatives?

Ms. THOMPSON. We actually have not been doing much research over the last several years, but because of opportunities that are developing as a result of the 1996 farm bill and the phasing out of the commodity program, there has been a considerable increase in interest. We are very strong advocates of the cooperative approach to business development and growth, because it allows small producers in rural America to gain advantage in the food chain in the marketing of their products, either through value added or through a marketing cooperative.

There are also, we believe, some new kinds of opportunities in existence out there, and that is what the research will be used for, to determine in a very methodological way how, in a methodologically sound way how, we might better provide technical assistance and so forth to individuals and entities that are interested in pursuing the cooperative approach to business development and growth.

Senator COCHRAN. Will this money be used for additional staff at the Department of Agriculture here in Washington to do the research, or would you contract out the research activity and actually pay some outside group to do the research? How do you propose to spend the money?

Ms. THOMPSON. It will be, I believe, entirely through contracting. As you know, we are downsizing at the Department of Agriculture and don't expect that we will be adding new positions, and also believe that the kinds of research that need to be done can be done through contracting with universities that are involved in cooperative research already.

SUBMITTED QUESTIONS

Senator COCHRAN. We really do appreciate your assistance to our committee by being here this morning and providing the information that you have and by agreeing to respond to questions for the record. We have some additional questions that we will submit for the record so that we will fully understand the requests and what the needs are for these funds, and how the programs that we are funding are working, and whether changes need to be made in them.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

RURAL BUSINESS-COOPERATIVE SERVICE

Question. The budget includes \$200 million for guaranteed loans that will be directed to cooperative-owned businesses. How much demand does the agency have for these loans?

Answer. Due to the fact that many cooperatives operate businesses that are incorporated we cannot give you an accurate indication of demand at this time from our automated management information system. We are, however, in the process of surveying our field offices to determine the demand. Results of that survey will be provided to your office.

Question. In fiscal year 1998 and in the fiscal year 1999 budget request, the Rural Cooperative Development program grants were allocated \$1.7 million. The National Cooperative Business Association claims that there is a need for \$5 million to fund grant requests. How many grant requests does the agency have on hand and how many grants will be funded with the \$1.7 million appropriated?

Answer. In fiscal year 1997, the agency received 30 applications for the Rural Cooperative Development Grant program. Those applicants requested a total of \$4.8 million. Eleven grants totaling \$1.7 million were awarded. Unsuccessful applicants, and any other eligible applicants can apply for the fiscal year 1998 program which will be announced in the spring of 1998. The number of grants to be funded with the \$1.7 million appropriation will not be determined until the applications are received and scored.

INTERMEDIARY RE-LENDING PROGRAM (IRP)

Question. The fiscal year 1999 budget request proposes an increase in the intermediary relending direct loan subsidy. The explanatory notes says this increase is due to two factors—the cashflow model has been changed and the new methodology for calculating the subsidy cost. What is meant by “the cashflow model has been changed?”

Answer. We found an error in the Cashflow model we had been using and corrected it. The cash flow model was adding the two year grace period to the term of the loan when calculating the amortization schedule.

Question. What is the backlog for the Intermediary Re-lending Program (IRP)?

Answer. As of March 10, 1998, there are 31 IRP projects pending for a total of \$25,650,000. The balance of remaining IRP fiscal year 1998 funds available, including the amounts earmarked for the Pacific Northwest (PNW) and Empowerment Zones and Enterprise Communities (EZ/EC) initiatives, is \$18,990,506. For fiscal year 1997, the number of loan requests unfunded at the end of the fiscal year, by State, was as follows:

INTERMEDIARY RELENDING PROGRAM LOAN REQUESTS NOT FUNDED IN FISCAL YEAR 1997

State	Number	Amount
Alabama	1	\$1,000,000
Alaska	1	750,000
Arkansas	1	1,000,000
California	1	1,000,000
Hawaii	1	750,000
Idaho	4	3,150,000
Illinois	1	1,000,000
Kentucky	3	2,390,000
Louisiana	1	2,000,000
Michigan	1	600,000
Minnesota	2	1,500,000
Mississippi	1	2,000,000
Montana	2	200,000
North Carolina	3	5,500,000
New Hampshire	1	500,000
New York	2	1,200,000
Pennsylvania	1	1,000,000
South Carolina	1	1,000,000

INTERMEDIARY RELENDING PROGRAM LOAN REQUESTS NOT FUNDED IN FISCAL YEAR 1997—
Continued

State	Number	Amount
Vermont	1	500,000
Total	29	27,040,000

Question. What major changes have been made to this program?

Answer. The new regulation was published in the Federal Register and became effective on February 6, 1998. The regulation for the Intermediary Relending Program (IRP) is renumbered and completely reorganized and rewritten for improved clarity. Major program changes include the following:

- Definitions are provided for “Agency IRP loan funds,” “IRP revolving fund,” and “revolved funds.” Each section of the Regulation that imposes a requirement states whether that particular requirement applies only to Agency IRP loan funds or to everything in the IRP revolving fund (including revolved funds). This will result in the reinstatement of some requirements on loans made from revolved funds that had been determined to be unenforceable under the previous Regulation.
- A new purpose statement is provided.
- The program is made available in the Republic of Palau, the Federated States of Micronesia, and the Republic of the Marshall Islands.
- Eligibility requirements are revised to provide that applicants with any outstanding delinquent debt to the Federal Government are not eligible.
- State Offices are authorized to accept and process applications without the application having to go through the National Office. State Directors may delegate IRP responsibility to other offices under the State Director’s jurisdiction provided the staff has had adequate training. The National Office will continue to allocate funds based on a quarterly national ranking of priority scores.
- Eligible loan purposes have been expanded to include refinancing (under certain conditions), management consultant fees, educational institutions, commercial fishing, revolving lines of credit (under certain conditions), and hotels, motels, and other tourist and recreational facilities except golf courses, race tracks, and gambling facilities.
- The definition of agriculture production is revised and exceptions to the prohibition against loans for agriculture production are eliminated.
- Security requirements are revised to provide that no assignments of promissory notes or collateral documents will be obtained at loan closing. The documents must, however, be assignable. The Intermediary will agree to provide additional security or documents later if requested to protect the Agency’s interest.
- Guidelines are provided for rates and terms of loans to ultimate recipients. All rates and terms must be within limits established in the intermediary’s work plan.
- Loan ceilings are revised to provide that, subject to certain conditions, intermediaries may receive initial loans of up to \$2 million and subsequent loans of up to \$1 million per year to a total of up to \$15 million.
- The ceiling on the size of loans to ultimate recipients is raised to \$250,000. However, no more than 25 percent of the intermediary’s portfolio may be used for loans of over \$150,000.
- A requirement is added for the intermediary to establish a reserve for bad debts.
- Loan disbursement procedures are revised to allow intermediaries to draw up to 25 percent of their loan at loan closing.
- The contents of a complete application and work plan are revised to eliminate some unnecessary items; provide more detail on what should be covered regarding relending plans; add certifications regarding debarment, Federal debt collection policies, and lobbying; provide goals, strategies, and anticipated outcomes; provide information on technical assistance available to ultimate recipients; and provide for streamlined applications for subsequent loans.
- The priority scoring system is revised by reducing the number of points for other funds, adjusting the threshold for points based on service area income compared to the poverty line, adding a category of points based on service area income compared to statewide income levels, adding a category of points for service to under represented groups, and providing additional guidance regarding justification for Administrative points.

—The frequency of required reports from intermediaries is adjusted to quarterly during the first year and until all Agency funds have been advanced, then semi-annually unless there are servicing problems.

Question. Please provide information on the performance of the IRP to date, by fiscal year.

Answer. The following chart provides the performance of the IRP to date by fiscal year.

INTERMEDIARY RELENDING PROGRAM—ALLOCATIONS/LOANS/OBLIGATIONS SINCE PROGRAM INCEPTION

Fiscal year	Allocation	Number of loans	Amount obligated	Average loan amount	Number of jobs created/saved over life of loan ²
1988 ¹	\$14,000,000	9	\$13,990,000	\$1,544,444	11,890
1989	14,000,000	13	13,625,980	1,048,152	11,580
1990	19,135,000	15	19,050,000	1,270,000	16,190
1991	32,500,000	28	32,499,540	1,160,698	27,625
1992	32,500,000	35	32,500,000	928,571	27,625
1993	32,500,000	42	32,500,000	773,809	27,625
1994	77,365,918	71	77,365,918	1,089,661	65,760
1995	85,153,646	81	85,153,646	1,051,279	72,380
1996	37,638,655	47	37,638,655	800,822	31,990
1997	37,155,765	53	37,155,765	701,052	31,580
Totals	381,948,984	394	381,479,504	968,222	324,245

¹ Fiscal year 1998 was the first year the new program was implemented as a result of the 1985 Farm Bill authority.

² Historically, other funds have been leveraged to assist borrowers at the rate of \$3.75 for every dollar of IRP assistance. Over the 30-year life of an IRP loan, for each \$4,000 of initial IRP program funding, a total of 3.4 jobs will be created/saved.

As of December 31, 1997, no loans are delinquent under the current IRP Program which was authorized by the 1985 Farm Bill. However, there are delinquent loans under the old Rural Development Loan Fund (RDLF) Program that were inherited from HHS, which makes the total delinquency rate below 1 percent.

RURAL ELECTRIC

The fiscal year 1999 budget proposal signals a shift in Rural Utilities Service (RUS) programs from the highly subsidized direct 5 percent and municipal rate electric loans to direct Treasury rate electric loans at an interest rate that is tied to the Government's cost of money. This proposal would result in an additional \$400 million in available loans to consumers. This proposal would require legislation, I understand.

Question. Instead of requesting a new program, the Administration can propose to simply increase the request for direct Federal Financing Bank (FFB) loans. Why did the you not request an increase for direct FFB loans?

Answer. The proposed Treasury rate program would differ somewhat from the FFB program. First, the FFB program is a loan guarantee program; that is, RUS guarantees loans made by FFB. The Treasury rate program would be a direct loan program in which the borrower deals with only one federal agency. RUS would administer all phases of the program, as it does with the hardship and municipal rate programs. The Treasury rate program would, therefore, be a more customer friendly financing source for RUS borrowers.

The Treasury rate program would also be a less costly alternative to RUS borrowers. FFB interest rates reflect Treasury's cost of money plus one-eighth of one percent (0.125 percent). Under the proposed RUS Treasury rate program, this one-eighth of one percent would not be added thereby reducing the interest rates to RUS borrowers.

Question. Why can't you use these FFB funds, along with the transmission and generation loans? Why are distribution borrowers reluctant to use the FFB program?

Answer. The Treasury rate program is intended to supplement, not replace, the FFB program. FFB offers a complex range of financing options that many borrowers, especially smaller distribution borrowers, find confusing. In addition, FFB's former reluctance to allow borrowers to refinance high interest loans has disillusioned some borrowers. Although current law now provides for refinancing of FFB

loans, many borrowers believe that dealing with FFB represents an unnecessary complication. In contrast, the Treasury rate program would offer borrowers a simple, streamlined financial tool. By offering a wider range of financing options, the RUS program becomes more flexible and more responsive to the constantly evolving electric utility industry.

Question. Are any costs associated with this legislation in budget authority or outlays?

Answer. The cost associated with this legislation is \$840,000 in budget authority to support a lending level of \$400 million. The subsidy rate for this program would be very low, only 0.21 percent.

Question. Should the authorizing committee decide not to pass this proposed legislation, what would the fiscal year 1999 estimate be to meet the current demand for direct electric loans?

Answer. The estimates to meet the current demand for direct electric loans are \$7.172 million in budget authority to support a lending level of \$55 million for hard-ship rate loans, and \$56.940 million in budget authority to support a lending level of \$650 million for municipal rate loans.

Question. How many loans will be supported with a loan level of \$400 million?

Answer. Approximately 80 Treasury rate loans would be supported by a loan level of \$400 million.

A provision in the Balanced Budget Act of 1997 states that the surcharge on the Treasury's Federal Financing Bank (FFB) loans is to be deposited in the RUS account held by the Treasury and used to finance the cost of the guaranteed loans for electricity and telecommunications.

Question. Why is the Administration proposing to implement this in fiscal year 1999 when you had the authority to do it fiscal year 1997?

Answer. Legal issues arose concerning the appropriate implementation of the enacting legislation. The Administration is in the process of resolving these issues for implementation in fiscal year 1999.

Question. In a GAO report it was suggested that RUS should use a repayment rate of no less than 100 percent to control the vulnerability to losses on guaranteed loans. What percentage of guarantee does the RUS use for these loans? Why?

Answer. A report entitled "Rural Utilities Service: Opportunities to Operate Electricity and Telecommunications Programs More Effectively" issued by GAO in January 1998 notes, on pages 2 and 17-18, that RUS guarantees 100 percent of FFB loans, and that some rural development programs reduce their exposure risk by guaranteeing less than 100 percent of a loan. RUS' risk would not, however, be reduced by lowering the guarantee percentage. As the report goes on to note, on page 2, since FFB is a part of the Treasury Department, the "risk to the federal government as a whole would not be reduced if the FFB continues to be the sole source of loan funds."

Traditional lending practice may suggest that a loan should be guaranteed for less than 100 percent to help ensure that the lender is diligent in its loan processing and servicing because a portion of its own funds would be at risk. In the case of FFB loans, however, RUS performs virtually all processing and servicing functions, while FFB establishes the terms and conditions of the loan. Reducing the amount of the guarantee would, therefore, have no practical effect on FFB's vigilance.

The subsidy rates for fiscal year 1999 seem to be higher than for fiscal year 1998, yet interest rates decreased.

Question. Can you explain the reasons for this increase?

Answer. Most of the increase in subsidy rates for electric and telecommunications programs can be attributed to a change in the methodology used in calculating the subsidy rate. The change is the direct result of the Federal Credit Reform Act of 1990 being amended by the Balanced Budget Act of 1997. The 1997 Act requires that the Treasury discount rate utilized to calculate the subsidy be the same for all cash flows, regardless of whether the loan disbursement is made in the budget year or in subsequent years. In the past, the Treasury discount rate utilized in calculating the subsidy rate could be different, based upon Office of Management and Budget (OMB) Economic assumptions, for each loan disbursement year.

While interest rates have recently decreased, the interest rate used in this year's OMB Economic Assumptions is not lower than that used last year. The OMB Economic Assumptions used to calculate fiscal year 1999 subsidy rates were based upon a Treasury discount rate of 6.11 percent for 20-year plus loans regardless of when the loans were disbursed. The fiscal year 1998 subsidy rates were based upon a Treasury discount rates of 6.1 percent for first year disbursements, 5.76 percent for second year disbursements, 5.48 for third year disbursements, and 5.24 percent for fifth year and all later disbursements for 20-year plus loans.

Question. How does this new calculation affect the program level and loan subsidy for the electric and telecommunications programs?

Answer. This change in the calculation methodology has a greater affect on loan programs that have low disbursement rates in the first year and/or slower annual disbursement patterns. The electric and telecommunications programs experience both; therefore, the impact is more clearly evident and is less likely to be offset by other technical assumptions.

RURAL TELECOMMUNICATIONS

The Economic Research Service (ERS) is requesting an increase of \$200,000 for an interagency research activity with USDA's Rural Utilities Service (RUS) and the Department of Energy (DOE) to expand Research, Education and Economic's (REE) capacity to assess the potential impacts of electric utility deregulation.

Question. Will this project be completed in fiscal year 1999, or do you anticipate funding requests in future fiscal years?

Answer. We expect that ERS will be asked to extend its research on issues associated with electric utility deregulation for one additional fiscal year beyond 1999.

Question. Will RUS and DOE fund any portion of the research project? If so, how much is being provided by each agency? If not, why?

Answer. DOE is not funding any portion of the research project beyond its commitment to provide a series of model runs, using its Policy Office Energy Modeling System (POEMS) computer model, to provide input into the analytic framework being developed by ERS. RUS is currently exploring options that may allow RUS to contribute financially to the project.

Question. What will be the role of each agency in this project?

Answer. DOE has committed to provide ERS with the output of several model runs of its POEMS model using ERS developed scenario assumptions. DOE has not yet provided the requested model runs because it is still calibrating its POEMS model. RUS has made operational and trade area data on rural electric cooperatives available to ERS.

The fiscal year 1999 budget request cuts the Rural Utilities Service (RUS) 5 percent hardship telecommunications loan program from \$75 million to \$50 million. In the President's budget request for fiscal year 1998, the program was cut from \$75 million to \$40 million. The other loan programs were left intact.

Question. How much total backlog in loan requests exists for this program?

Answer. As of March 1, 1998, hardship loans approved totaled \$65.1 million, with an additional \$61.5 million in applications on hand. With an authorized lending level in fiscal year 1998 of \$75 million, we estimate that, based upon the number and amount of applications currently on hand and anticipated by the end of the fiscal year, the hardship program will have a backlog—or excess demand over available funding—of \$79 million at the end of fiscal year 1998.

RURAL TELEPHONE

The fiscal year 1999 President's budget request also proposes that the Rural Telephone Bank (RTB) become a performance-based organization "to establish its financial and operational independence prior to its being privatized within ten years."

Question. The Administration has proposed in the last two fiscal years to privatize the RTB. Why has the Administration changed its position and now proposed to make the RTB a performance-based organization before it is privatized?

Answer. We became concerned with the Bank's ability to make an immediate transition to a private entity given deregulation of the telecommunications industry. We chose a more gradual approach with privatization to occur within ten years. During this period we expect full retirement of the government's investment of just under \$600 million, if the limit on retirement of this debt is removed by the Congress.

Question. Does this require legislation?

Answer. Establishing the Bank as a Private Base Organization (PBO) would require legislation. RUS would craft legislation to fit the Bank's needs. Once established, the Bank could pursue privatization efforts while still under the U.S. Department of Agriculture (USDA) umbrella. As the proposed budget language stated, the Bank would hire its own Chief Executive Officer (CEO) and Chief Financial Officer and begin to take independent responsibility for its operations, acting more like a private corporation than a government agency. As a PBO, the Bank would "enjoy" a less restrictive operating environment than its current organizational structure provides. A primary reason for establishing a PBO is to foster the more efficient operation of a government agency performing a public purpose. One of the key qualifications to becoming a PBO is the ability to generate cash flow. The PBO status

is a way for the government to increase operating efficiency by allowing certain exemptions from government rules; yet at the same time, maintain control over the function the agency is performing. For most government agencies, becoming a PBO is a permanent status. However, for the Bank, it is a stepping stone to privatization. At the direction of the CEO, the Bank would focus its efforts on becoming a fully private entity within ten years while fulfilling its mission of providing financing for rural telecommunications infrastructure. PBO status will heighten the goal of privatization and provide a platform for the Bank to structure itself for complete privatization.

Question. Does this proposal result in budgetary savings? If yes, how much?

Answer. If the Bank were able to use its cash reserves in the liquidating account to pay administrative expenses and cover loan subsidies, those amounts would not require appropriations as they do now. Federal Credit Reform currently limits the use of those funds in the liquidating account to meet advances on loans obligated prior to fiscal year 1992 and to pay expenses associated with those loans, i.e., debt service to Treasury, dividends to shareholders, and retirement of government stock.

Question. Will the government's Class A stock still be repaid?

Answer. To transition the Bank from a government agency/PBO to a fully privatized entity within ten years, as the proposed budget states, all of the Class A stock of the Bank must be retired.

Funding for the RTB's loan subsidies and administrative expenses are proposed to be paid for by transferring funds from unobligated balances in the bank's liquidating account.

Question. Would this proposal not affect the bank's solvency and ability to privatize?

Answer. As of December 31, 1997, the liquidating fund balance totaled \$493 million. Principal outstanding on loans in the liquidating account totals more than \$1.2 billion while Treasury debt associated with those loans—excluding A stock—totals only \$316 million. Last year, the budget authority required for a \$175 million loan program was \$3.7 million. The use of liquidating account funds for administrative expenses and loan subsidies would only decrease slightly, and temporarily, the amount of funds available for retirement of Class A stock and other purposes. The repayment of principal on loans in the liquidating account and associated interest on those loans in future years will enable the Bank to generate sufficient capital to privatize on its own.

Question. How were subsidy costs of loans and administration handled last year? Does this proposal save money?

Answer. The funds were appropriated in fiscal year 1998. The proposal is to use funds in the liquidating account in fiscal year 1999.

RURAL HOUSING SERVICE

The fiscal year 1999 budget request proposes an increase of \$42 million for rural rental assistance, from \$541 million to \$583 million.

Question. What is the breakdown of funding for rural rental assistance for renewal of contracts, new construction, and for repair and rehabilitation?

Answer. The following chart provides a breakdown for the projected use of rental assistance in fiscal year 1999:

RENTAL ASSISTANCE CHART

Type of unit	Existing demand in units	Number re- quested in units	Total funds requested
Renewals	37,516	37,516	\$551,898,000
New construction:			
515	1,667	1,003	12,868,000
Farm labor	658	658	8,442,000
Servicing	100,000
Rehab	326	292	4,289,000
Debt forgiveness	401	401	5,900,000
Total	140,568	39,870	583,397,000

Note.—This chart assumes that all renewals and Farm Labor new construction will be funded. Funding for Section 515 new construction and rehabilitation units will be limited. At this time, we estimate that the \$17 million available will be split 75 percent towards new construction and 25 percent towards rehabilitation needs.

Question. How does the difference in the subsidy rate and the separate line items for single-family credit sales of acquired property and multi-family credit sales of acquired property affect these loans? Does this save money in fiscal year 1999 and other future fiscal years?

Answer. Our proposal to have separate line items for single family and multi-family is designed to make the credit sale programs easier to administer. Combining these two programs with different subsidy rates and providing a single cohort is not typically done. With more closely related program, this would be feasible. Operating this program through two accounts will better serve the Agency in addressing portfolio management.

Question. The fiscal year 1999 budget request proposes a decrease of \$1.8 million in rural housing preservation grants which will support 2,500 units. At the fiscal year 1998 appropriated level, how many units are supported? Why does the Administration propose to cut these grants which are used for elderly housing?

Answer. For fiscal year 1998, the Housing Preservation Grant (RPG) Program was appropriated \$10,820,000. The Agency estimates that 2,500 units will be repaired/rehabilitated.

The Administration believes the fiscal year 1999 request balances the high demand for all the housing programs while striving to maintain financial restraint necessary to balance the budget.

Question. The fiscal year 1999 budget request proposes legislation to allow Section 502 single-family housing direct loan borrowers to graduate to guarantee financing, and then ultimately to strictly conventional private financing. The projected subsidy rate for the program in fiscal year 1999 is negative, so no additional subsidy budget authority is required. However, would this program cost in out years? If so, what subsidy appropriations are projected to be required?

Answer. We do not anticipate future budget authority costs from this proposed legislation. Section 502 Direct borrowers who use the Guaranteed Rural Housing loan program as a vehicle for refinancing will generally be seasoned home owners with adequate loan repayment histories. We would expect defaults for these established borrowers to be minimal.

RURAL COMMUNITY ADVANCEMENT PROGRAM

The 1996 FAIR Act authorizes the Rural Community Advancement Program (RCAP) which has 5 funding streams that include a rural communities facilities account, rural utilities account, rural business—cooperative account and the federally recognized Indian tribe account.

Question. Do Federally recognized Indian tribes not already qualify for these programs under the RCAP? How would the 3 percent reserve account be administered?

Answer. Federally recognized Indian tribes do qualify for these programs. The reserve account would be administered by the National Office. Tribes would submit applications through the State Offices and, following review for eligibility, the applications would be submitted to Washington for decisions.

Question. How much funding has been received by Indian tribes during the past three fiscal years? What percentage of the total RCAP program dollars will the set-aside receive for each fiscal year?

Answer. Over the past three fiscal years Indian tribes have received \$14,138,798 in Water and Waste loans, \$13,753,307 in Water and Waste grants, \$11,757,806 in Business and Industry guaranteed loans, \$1,313,860 in Rural Business Enterprise grants, and \$23,381,730 in Community Facilities loans, totaling \$64,345,501, which is roughly equivalent to 3 percent of the RCAP budget authority over the same period.

Question. How much funding have the Mississippi Choctaw Indians received in the past two fiscal years?

Answer. During the past two fiscal years the Mississippi Choctaw Indians have not received any funding.

Question. Is there a demand and/or need from the Rural Development State Directors to transfer funds between the different funding streams, rural community facilities, rural utilities, and rural business and cooperative service? If so, between which accounts would they most want to transfer?

Answer. There is a need by the State Directors to transfer funds between the different funding streams to manage their program monies more efficiently and to address more appropriately the unique and changing needs in each state. It is not expected that transfers of funds would be used frequently, but the ability to do so would be very useful when it is needed in a state. The amounts of funds transferred, and the direction of the transfers, would vary from year to year depending on the needs in the states.

The Administration did not propose in the fiscal year 1999 budget request to earmark funding for Rural Alaskan Villages for water and waste grants. In fiscal year 1998, the Committee earmarked \$15 million for direct water and waste loans for Alaska. The fiscal year 1999 budget also proposes a decrease of \$7.2 million for water and waste grants.

Question. Should the Committee again earmark funding for direct water and waste loans for the Rural Alaskan Villages, would the funding for water and waste grants need to be increased rather than decreased as the fiscal year 1999 budget proposes to supplement loans? If so, how much?

Answer. In the event that the Committee earmarked funding for direct water and waste loans, funding for water and waste grants would not need to be increased.

Question. How much funding would Alaska receive if no funds are earmarked? Why did the Administration propose not to earmark this funding for Alaska?

Answer. If no funds were earmarked Alaska would receive a state allocation of about \$1.8 million in direct water and waste loan funds and approximately \$1 million in grants. The policy of the Administration is to eliminate all earmarks that do not have a specific statute requiring an earmark in the appropriation language or those that are not included in specific policy initiatives.

RURAL DEVELOPMENT—LOWER MISSISSIPPI DELTA DEVELOPMENT CENTER, INC.

The Department has urged the Lower Mississippi Delta Development Center (LMDDC) to become involved with the Enterprise Zone/Empowerment Community program and to become partners with these Federally approved communities of the Delta to work on a variety of regional efforts in order to attract non-government funds.

USDA has provided LMDDC with funds for three separate fiscal years and this has allowed the Center to stay open and to work on a variety of agricultural and rural development activities. This money has been given to the Center at the end of the fiscal year, once USDA has evaluated and allocated its funds. Because of limited funds, the Center wants assurance of this continued funding and is asking that report language be included in the fiscal year 1999 committee report to instruct USDA to include approximately \$200,000 for the Center.

Question. How much money has USDA provided to the Center in past fiscal years? Was this grant money?

Answer. USDA has provided approximately \$400,000 since 1994 to the Center for the purposes of updating the socio-economic characteristic data contained in the original report on the Lower Mississippi Delta, to develop a data base of development success stories throughout the Delta that could be utilized by other communities, and to retain staff of the Center to permit them to continue to work on behalf of the residents of the Delta area. The funds were not grant money, but rather salaries and expense monies and were provided to the Center through a cooperative agreement.

Question. How did the Center use this funding?

Answer. The bulk of the funding was used to update the socio-economic data that was contained in the original report on the Delta which primarily reflected the 1980 Census information.

Question. What sort of work is USDA currently doing with the Center? What does it plan to do in the future?

Answer. The most important role of the Federal government is to help create an environment that attracts private investment and creates jobs. This is what we are attempting to accomplish with the Empowerment Zones; providing tax incentives and infrastructure investment as well as directed job training, education and counseling and a variety of other services through a well orchestrated plan with specific objectives directed by local residents. We have also recently been working with the Lower Mississippi Delta Center and the EZ/EC designated areas to get them to work together to improve the region. A partnership agreement will be signed in March to effect this cooperation.

Question. How much funding will the Center need to help with these projects?

Answer. The Center has indicated that it may need as much as \$200,000 over the next two years.

Question. Has the agency included funding for the Center in the fiscal year 1999 budget request? If not, why?

Answer. The budget constraints under which we are working do not provide the flexibility to fund activities such as the Center's operations and therefore no funds were requested.

SALARIES AND EXPENSES

Question. In what areas of Rural Development does the decrease of 150 staff years occur in the fiscal year 1999 budget request, and how will those reductions be accomplished?

Answer. The reductions occur throughout the Mission Area; 80 in the Rural Housing Service; 49 in the Rural Utilities Service; and 24 in the Rural Business-Cooperative Service. The reductions will primarily come from administrative areas rather than program areas. We anticipate that administrative convergence will provide the reductions.

Question. The President's request for Salaries and Expenses for fiscal year 1999 is significantly higher than the level enacted for fiscal year 1998 which was close to the fiscal year 1997 level. With streamlining and the conversion of loans to a new servicing system, one would assume the administrative expenses should be decreasing. Why is there such a significant increase in cost?

Answer. The request for Salaries and Expenses for Rural Development, \$527 million, is considerably higher than the level requested and appropriated for fiscal year 1998. There are several reasons for this. First, because of all of the organizational changes that have occurred within Rural Development over the past few years, we have lost a disproportional share of the lower level employees, even though we have used every means available, to keep them. This has caused our average salary costs to increase significantly and while this is a situation I would not have preferred it is something that has to be dealt with because the alternative is no better. If sufficient funding is not available for salaries and expenses then it is necessary to execute a reduction-in-force (RIF) to remain within available funding. This action would only exacerbate the problem because a RIF will, in-turn, eliminate additional lower level employees driving the average salary cost even higher. The vast majority of these staff are in our field offices and are primarily responsible for delivering the programs. We need to keep them employed.

Another reason is the need for investment in Information Technology. In fiscal year 1998, we decided to defer investment in information systems and training in order to maintain our employment level. We cannot afford to make the same decision in fiscal year 1999. Information systems and training are means through which we can realize additional efficiencies in future years and we need to maintain our investments in these areas. Converging the administrative systems of the three county based organizations into one and completing the move into the service center which will house the three mission areas can be accomplished if we have a common computing environment. Further, in order to continue to function, we must maintain our legacy systems while we are building new systems to replace them and we need to complete the Year 2000 assessments and corrections where necessary.

The Department of Agriculture is in the midst of converging the administrative system of the three county-based organizations into one system.

Question. What is the status of the administrative convergence? How will this affect Rural Development?

Answer. The Secretary announced his decision on March 16, 1998 to proceed with administrative convergence, implementing the plan developed by the three Under Secretaries. A manager of the planning effort has been selected and the planning will commence shortly. The Secretary is still committed to having a new administrative structure in place on October 1, 1998.

Question. Are there any savings in the fiscal year 1999 budget related to administrative convergence?

Answer. There are no savings reflected in the fiscal year 1999 budget attributed to administrative convergence but, from the perspective of Rural Development, consolidation of the administrative functions at headquarters and in the field will provide the flexibility needed to ensure an effective program delivery system remains in place.

Question. Why does the fiscal year 1999 budget request propose a significant increase in the Rural Housing Services' salaries and expenses account amounting to \$15.2 million?

Answer. The Rural Housing Service has by far the largest staff of the three agencies, so pay costs will necessarily be large. In addition, the account includes the management initiatives for the mission area. For instance, \$8.5 million of the total covers information technology needs, including the \$1.5 million mentioned later regarding Rural Utilities service information technology. The balance of the increase is salary related.

Question. The fiscal year 1999 budget request proposes an increase of \$1.5 million for the Rural Utilities Services' information technology. This increase will be used for software development for the century date change, among other things. Will this

funding proposed in the fiscal year 1999 budget for the computer system century date change complete these efforts?

Answer. Yes. The funding proposed in the fiscal year 1999 budget will complete Rural Development's Year 2000 conversion efforts.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. Rural Development established one strategic plan which supports the three agencies in the mission area. The Rural Development Strategic Plan contains a mission statement which encompasses the role of the entire mission area and three Goals, one for each agency. It also contains four broad Management Initiatives which support the entire mission area. By having a Goal for each agency, alignment with the existing budget structure, which is agency-based, is achieved. The Annual Performance Plan for the mission area consists of a Purpose Statement for the mission area, an Annual Performance Plan for the Management Initiatives, and separate Annual Performance Plans for each agency. The separate Annual Performance Plans for each agency facilitate the reconciliation of the Plan with the budget request. The Goals in the agency Annual Performance Plans, which align with the Objectives in the strategic plan, are supported by one or more quantifiable performance measures to be achieved during the fiscal year.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Since the Goals and funding are by agency, and the performance measures are aligned to the Goals, there were no particular difficulties encountered. The primary challenge was determining how to aggregate the numerous programs included in the budget into reasonable Program Activities in the Annual Performance Plan. Many of the programs are used jointly when providing assistance, for example, grant programs are often combined with a loan to assist a community. Attempting to develop separate performance goals for both the grant and loan programs would be tedious and generally meaningless. We have instead aggregated performance goals along major program activities, i.e., single family housing, multi-family housing, water and waste, telecommunications, etc.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. As indicated above, we do not have performance measures for each account since they are often used together to finance a project. We have aggregated the accounts into various program activities which result in a more meaningful expression of the expected impact on the public.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Agency performance plans focus on the major programs that account for, by far, the bulk of the mission area's funding. Performance measures are not provided for all of the small programs and activities. Further, in some cases performance measures reflect achievements in similar programs and programs that are often used concurrently (i.e. certain loans and grants). We are continually refining the process as we learn from our experiences. Measures will change as we determine what best indicates the outcomes of programs and what is most useful for our management and monitoring purposes. For instance, in future submissions guaranteed and direct single family housing measures will probably be desegregated to describe more effectively our results in improving housing in rural areas.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. Rural Development does not propose any changes to the account structure for fiscal year 2000.

Question. How were performance measures chosen?

Answer. Performance measures in the five-year strategic plan were developed over time through a series of drafting sessions involving major stakeholders and were then refined through reviews by mission area and other Departmental officials. Performance measures in the annual plans are based on measures in the long range plan but are limited to data that are currently available or will likely be available in fiscal year 1999.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Existing data collection systems in place have been able to produce most of the information necessary to address performance measures which have been pro-

posed. The mission area is considering changes to the data collection systems to allow the use of performance measures for which data is not currently available, provided the data is needed for purposes other than just reporting performance under the Government Performance and Results Act.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Reliable data should be available for the performance measures included in the fiscal year 1999 Annual Performance Plan, for which the first performance report is due in March 2000.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. Performance goals reflecting the themes from Rural Development's Strategic Plan would be the most useful to use to track results. These themes include leveraging, partnering, and directing resources to the weakest communities, and are consistent with the Rural Community Advancement Program (RCAP). For most programs we have developed a handful of measures that, together, describe the results of the program activity. Identifying only one measure for a particular program could lead to focusing too narrowly on only one facet of that program or activity.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The development of outcome measures has been a significant challenge for the mission area. The limited size of our programs mean that there is not a National outcome which can be verified through existing data. The impact of our programs are on the individuals and communities who received assistance and on their immediate, surrounding community. Developing data to measure this impact is expensive for the agency and would have a significant reporting burden for the public. We have elected, instead, to use existing data, such as the number of loans made, to project the impact on the local community through the number of jobs produced using a recognized multiplier which currently exists. As we develop or enhance our systems in the future, we will be looking for opportunities to obtain better outcome data so long as the cost and impact are reasonable.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The mission area has conducted performance measurement training sessions for program managers and their staffs. They have developed an understanding of the difference between inputs, outputs, and outcomes.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. A sample performance measure for external customers is; "obtain feedback from Program Customers for: (applicable program). A sample performance measure for internal customers is; "Reduction in program and EEO complaints backlog."

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The measurable goals in the Annual Performance Plan were not used to develop the fiscal year 1999 budget. The long lead time in the development of the budget required that the fiscal year 1999 budget be developed ahead of the Annual Performance Plan.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. The impact of budget number changes by the committee could be determined for those measures which are budget sensitive. The impact of some changes could not be defined, for example, the impact on customer service if staffing levels were reduced.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. We are relying on existing data bases for most performance measures. We can, therefore, monitor performance during the year for most measures.

The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Question. Have you faced such difficulty?

Answer. Yes. Because several of our programs are often used together to assist a customer, having performance measures for each budget account would result in a great deal of duplication or tedious sorting out of data to a level that is meaningless to the user.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. For GPRA reporting purposes, combining of similar accounts would be helpful.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. Combining like accounts (those with the same basic purpose and customer) would result in a reduction in the number of accounts which both the agency and the Congress must manage. It would be easier for a third party to understand the budget document.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. A modified account structure would not necessarily result in a strengthening of accountability.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The Performance Plan discusses extensively the potential impacts of external factors on goal achievement. The ability of the mission area to achieve the goals of its strategic plan can be impacted by a variety of factors beyond its control including macroeconomic influences, legislative and other regulatory changes, and reductions in funding.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. No steps have been defined as the identified external factors are beyond the control of the mission area.

Question. What impact might external factors have on your resource estimates?

Answer. Changes in legislative, regulatory, or funding levels will impact our ability to assist our customers. Significant changes in the economy will affect the amount of funds we have available, after considering Treasury's discount rate. Likewise, changes in the economy may impact our delinquency and loss rates.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. We have identified no overlapping functions or program duplication for the specific customers we have been mandated to assist.

Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

Question. To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. To the extent that performance measures are based upon existing data bases, they are basically mature. Outcome-based measures which are not tied to an established data base will be much less reliable.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The concept of impact or outcome-based data is very new and very little experience exists for relating the cost of such data to its usefulness.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The current mission area strategic plan has been several years in development, clearly defines our priorities, and is adequate to meet our needs. While we have no plans for substantive changes, we are committed to reviewing it this year to ensure the recommendations from the Departmental civil rights activities are adequately included. At the time of that review there may be other areas in need of enhancement.

QUESTION SUBMITTED BY SENATOR MCCONNELL

RURAL COMMUNITY DEVELOPMENT VENTURE CAPITAL

The Rural Community Development Venture Capital Demonstration which is authorized in section 761 of the Federal Agriculture Improvement and Reform Act of 1996. Under this demonstration, the Secretary may designate ten organizations per year to establish and operate rural venture capital pools. Using federal guarantee authority, these rural venture capital programs will seek to encourage private sector investors in rural business enterprises. This is a very important demonstration. Economic Research Service reports indicate that there is a lack of investment or equity capital for rural businesses. Most rural businesses have neither the size nor the proximity to private sector investment company to attract much private sector equity investment.

In August, 1996 USDA published in the Federal Register a notice of intent to publish regulations on the demonstration. Nothing has been published since that time.

I have written, along with Senator Leahy, to the Secretary urging the Department to get regulations so that the Subcommittee may consider an appropriation for the program.

Question. Please provide the Subcommittee with a status report on the regulations and a date certain for publication.

Answer. This program is authorized as part of the Rural Community Advancement Program Rural Development Trust Fund in the 1996 Farm Bill. The Agency is considering options available for promulgating regulations to implement this program. As part of that process, an advanced notice of proposed rule making was published in the Federal Register on April 9, 1997, requesting suggestions for implementing this authority. Five comments were received and are being considered in the drafting of the regulation. The fiscal year 1998 Appropriations Bill does not appropriate funding for this program, and the President's fiscal year 1999 Budget does not request funding for this program. However, we are in the process of developing a proposed rule. We anticipate publication of the proposed rule by early calendar year 1999.

 QUESTIONS SUBMITTED BY SENATOR BUMPERS

LOAN SUBSIDY RATES

A couple of years ago, rising interest rates cut the program level of many rural development loan programs nearly in half. Last year Congress enacted legislation that helped avoid that problem by locking in the loan subsidy amount over a period of years. In addition, you state that lower interest rates will reduce the costs of these programs. Still, we see the subsidy rates increase for fiscal year 1999. For example, \$67 million in BA for the water and wastewater loan program in fiscal year 1998 provided a program level of \$691 million. For fiscal year 1999, the budget increases the BA to \$126 million (nearly double) but the program level only increases to \$764 million (roughly 10 percent).

Question. Please explain why the subsidy rate increase by this amount.

Answer. Provisions in the Balanced Budget Act of 1997 changed the economic assumption requirements for subsidy calculations on all Federal credit programs. Previously, economic assumptions provided by OMB assumed a declining baseline of Treasury interest rates used for the present value calculations of loan subsidy rates. This declining interest cost baseline assumption drove down the subsidy rate for loan programs that are long term disbursements. Under provisions of the new law, Treasury interest rates are held constant and are based on actual Treasury rates from the current year.

The water and wastewater loan program is a long term disbursing program, with loans expected to disburse over six or more years, and the bulk of the loan program level being disbursed in years two through four.

OMB economic assumptions for the fiscal year 1998 President's Budget assumed a baseline of Treasury interest rates used for discounting the present value calculation of loan subsidy costs as follows: 6.16 percent for fiscal year 1998, 5.76 percent for fiscal year 1999, 5.48 percent for fiscal year 2000, 5.29 percent, for fiscal year 2001, and 5.24 percent for fiscal year 2002 and thereafter. The average Treasury rate of this forecasted baseline is 5.586 percent. OMB economic assumptions for the fiscal year 1999 President's Budget assume a constant baseline of 6.11 percent for fiscal year 1999 and thereafter. This is an increase of over one half of one percent from the average Treasury rate baseline assumed in the preparation of the fiscal

year 1998 President's Budget and is enough of an increase to double the subsidy costs in fiscal year 1999.

Question. What would the subsidy rate have been if the process of previous fiscal years had been used?

Answer. We are unable to provide specific estimates of the subsidy rates, but it is reasonable to assume the rates would be lower than the rates used in the President's budget.

Question. Were the subsidy rates in the fiscal year 1999 budget directed by OMB and if so, did USDA appeal these rates?

Answer. These subsidy rates calculated for fiscal year 1999 were not directed by OMB. After the Balanced Budget Act of 1997 was passed, OMB and Agency officials realized that these new provisions in the Credit Reform Act would drive up subsidy costs, so we worked together to provide the budget authority necessary to offset these technical changes that were now required by law without exposing these loan program levels to substantial cuts.

RURAL COMMUNITY ADVANCEMENT PROGRAM (RCAP)

The 1996 Farm Bill created the RCAP with funding flexibility greater than provided in the appropriations acts. The Farm Bill envisioned USDA being able to transfer certain funds between rural development programs. This subcommittee has not provided you that full amount of flexibility. Still, you request this ability again for fiscal year 1999.

Question. Had you been granted full flexibility in fiscal year 1997 or fiscal year 1998, how would you have administered the programs differently?

Answer. It is impossible to predict how the funds would have been used differently if we had been granted full flexibility to transfer funds under RCAP. With the full authority to transfer funds, the State Directors would have been afforded the flexibility to respond to their unique, changing needs and circumstances.

Question. With the exception of natural disasters, what events have occurred that would have led you to shift funds from accounts where you had allocated the funds in the first place?

Answer. One example of an unanticipated occurrence was the dramatic increase in demands for the B&I program that appeared subsequent to the publication of revised regulations on December 23, 1996. Since that date demand for the B&I program has increased by 300 percent.

Question. In other words, if you wanted more funds for water and sewer, why didn't you allocate them to that account in presentation of the budget request?

Answer. The key concept in the RCAP program is the ability to provide State Directors the flexibility to respond to unanticipated needs or events. Our budget request reflects the best information that we have available at this time, but the ability to respond and reallocate funds in the future to changing situations, unique to states or regions and identified by local staff, would greatly increase Rural Development's effectiveness.

WATER AND WASTEWATER PROGRAMS

Question. Please provide information regarding attempts by private water distribution companies to acquire systems financed by RUS.

Answer. Nationwide, few attempts have been made by private companies to purchase RUS financed water systems. The most significant activity has been in the State of West Virginia, where at least three systems have been purchased and several others are under consideration. In Kentucky, one RUS-financed system is in the process of being purchased by a private company.

Question. Is this trend viewed as potentially harmful to RUS programs and customers?

Answer. Since the volume is so small, we do not anticipate that these sales will have a harmful impact on RUS programs. When RUS grant funds are used to finance all or a portion of a system, RUS' consent to the sale of the facilities is required under the terms of the grant agreement. Based upon information reviewed at the time of sale, customers have benefited from lower water rates and, in some cases, improved quality of water. Our concerns are the effect of water rates in future years and whether the private company will provide service to "pockets" of low income rural residents that may be less profitable for the company to serve.

Question. Is there a role in RUS programs for private well installations as a means to reduce total overall project costs and if so, what precautions would be necessary to ensure safety standards for customers and to protect overall RUS program integrity?

Answer. In rural America, most wells are, and will continue to be, privately owned and maintained by individual homeowners, farmers, and businesses. For RUS to finance individual or cluster wells with RUS water and waste disposal funds, applicants must be eligible public bodies, nonprofit organizations, or recognized Indian tribes that would own and operate the facilities. Even though our regulations have permitted such financing for many years, we have financed no projects recently. Applicants could propose individual or cluster wells rather than a piped water system as the solution to provide drinking water to residents of a particular community. We have discussed the possibility of three pilot projects with water well industry representatives. RUS regulations require that applicants comply with all applicable Federal, State, and local laws and regulations pertaining to water quality. If individual or cluster wells are proposed, the Federal and State rules that apply to community water systems may not apply, depending upon the circumstances and the States in which the facilities are located. Water systems proposing individual or cluster wells would be expected to provide essentially the same quality water that a community water system would. If the usual RUS requirement of complying with all applicable laws and regulations would not assure water quality, an appropriate loan condition would likely be added to the loan agreement.

ELECTRIC AND TELEPHONE PROGRAMS

Last week, a national news broadcast portrayed the rural electric programs as wasteful, misguided, or both. These are not new attacks. In fact, a GAO study released in January of this year also made suggestions on ways this program and the rural telephone program could be operated more efficiently.

Question. Please respond to the claims made by last week's news story and the recommendations contained in the GAO study.

Answer. I am pleased to have the opportunity to respond to the statements made in this broadcast. The broadcast contained many half-truths and I appreciate the opportunity to clarify the information provided. The broadcast pointed out that America is now fully electrified. While this is generally true, the challenge today is to maintain the rural electric infrastructure intact and to provide the same high levels of service that all Americans have become accustomed to, while holding rates at reasonable levels.

Electric infrastructure, like all infrastructure, requires periodic maintenance to prevent the potholes from ruining the road, so to speak. Electric systems also require improvements to accommodate the new technologies that we all enjoy. This maintenance and improvement is inherently more expensive, on a per consumer basis, in rural areas than in urban areas, while revenue per mile of line is far lower for RUS borrowers than for most investor-owned utilities. Today, the main emphasis of the RUS program, and, in fact the electric industry as a whole is on ensuring the continuing availability of high quality electric service at affordable rates.

The broadcast discussed a number of specific RUS borrowers and provided isolated facts and statistical data about each—facts that, without a more complete discussion of the borrower's profile, were quite misleading. I appreciate the opportunity to provide background on each.

The borrower that serves Vail, Colorado, has not received an RUS loan since 1991. The borrower voluntarily rescinded this 1991 loan in 1995, before the loan was fully advanced.

The borrower that serves Hilton Head, South Carolina, serves four counties in that state. Three of these counties are classified as poverty counties, with one of the three having the lowest per capita income in the state. Recent RUS loans have been targeted only to provide service in those poverty-stricken counties. It should be noted that if the lucrative Hilton Head Island consumers were "cherry picked" off the system by an investor-owned utility, we estimate that rates to the RUS borrower's remaining consumers would increase by 20 percent.

Hoosier Energy Rural Electric Cooperative in Indiana submitted its last loan application to RUS in 1990. After resolution of all outstanding issues, RUS approved the loan in 1995 contingent upon Hoosier executing addenda to its wholesale power contracts with its member systems. Since Hoosier and the member systems could not agree on these addenda, RUS never released the loan and no funds have been advanced.

Withlacoochee River Electric Cooperative in Florida serves over 140,000 consumers, as stated in the broadcast. The number of customers served, however, is not truly indicative of an entity's need for RUS financing. Withlacoochee, for example, serves only about 17 consumers per mile of distribution line, about half the consumer density of the average investor owned utility. Moreover, 130,000 of Withlacoochee's 140,000 consumers (92 percent) are residential with very little com-

mercial or industrial base to support affordable service rates. This relatively low consumer density and the nature of the consumers allow Withlacoochee to meet the statutory tests for a municipal rate loan with a 7 percent cap on the interest rate. Its average revenue per kilowatt hour is higher than the state average, indicating that its service territory is indeed expensive to serve, and both the average per capita income and the median household income of its consumers are lower than the state average and median, respectively.

The broadcast also discusses Soyland Power Cooperative. As you are aware, Soyland's financial problems were the result of investments in nuclear power plants. RUS' loans to Soyland were made under the 1978 National Energy Policy Act that encouraged investment in nuclear plants, initially restricted the use of natural gas, and, by 1990 forbade its use in power plants. The assumptions behind this policy with respect to projections of costs of construction, load growth, and the economy turned out to be inaccurate.

Soyland's problems go back to a small minority share in the Clinton Nuclear Station. Because of cost overruns and significant delays in the construction of the Clinton Nuclear Station, and interest rates that were among the highest ever in this nation's history, Soyland's investment quadrupled. During the decade of the 1980's, Treasury did not allow RUS borrowers to refinance their high interest-rate loans. This investment, coupled with a sagging rural economy left Soyland economically unviable. Please also note that Soyland has not received an RUS loan since 1984.

GAO Study.—RUS provided GAO with a detailed response to the recommendations contained in the January 1998, study entitled "Rural Utilities Service: Opportunities to Operate Electricity and Telecommunications Loan Programs More Effectively." The complete text of the RUS response is provided for the record.

RURAL UTILITIES SERVICE'S RESPONSE TO GAO REPORT ENTITLED RURAL UTILITIES SERVICE: OPPORTUNITIES TO OPERATE ELECTRICITY AND TELECOMMUNICATIONS LOAN PROGRAMS MORE EFFECTIVELY

We appreciate the opportunity to review and comment on the draft General Accounting Office (GAO) report entitled "Rural Utilities Service: Opportunities to Operate Electricity and Telecommunications Loan Programs More Effectively."

The report offers a number of recommendations to make these loan programs more effective and less costly. The report mentions a portion of 7 U.S.C. 930. We believe that your abbreviated version of the provision does not accurately reflect the meaning of the provision. The provision in its entirety states:

"It is hereby declared to be the policy of the Congress that adequate funds should be made available to rural electric and telephone systems through direct, insured and guaranteed loans at interest rates which will allow them to achieve the objectives of the Rural Electrification Act of 1936, as amended, and that such rural electric and telephone systems should be encouraged and assisted to develop their resources and ability to achieve the financial strength needed to enable them to satisfy their credit needs from their own financial organizations and other sources at reasonable rates and terms consistent with the loan applicant's ability to pay and achievement of the Act's objectives."

We recognize that the goals of the report: "(1) make the electricity and telecommunications loan programs more effective and less costly for the government and (2) decrease RUS' vulnerability to loan losses" are, to some extent, contradictory. Financially stronger borrowers have easier access to reasonably priced private sector capital, while borrowers in greater need of a government subsidy are poorer credit risks. Nonetheless, these goals can be reconciled in order to support the electric and telecommunications infrastructure that is vital for rural communities, while maintaining the integrity of the RUS loan portfolio.

GENERAL COMMENTS

Since the report recommends fundamental changes in the RE Act, we believe that it is important for its readers to have a comprehensive understanding of the current characteristic of RUS borrowers and the uncertainty surrounding the industries in which they operate.

Rural communities

The Rural Electrification Act of 1936, (7 U.S.C. 901 et seq.) (RE Act) is intended to benefit rural communities by supporting their electric and telecommunications infrastructure. The residents of these communities are the true beneficiaries of the RE Act. The benefits of low interest loans are reflected in rates to residential electric and telecommunications customers in rural areas, and in rates for commercial and industrial service that make rural communities attractive to business opportunities.

The implication that a change in the composition of a borrower's service territory should disqualify that borrower from participating in the RUS loan programs is not fundamentally sound. Many borrowers' service territories include both rural and non-rural customers. This diversity of customer base contributes to the financial health of the utility, helps maintain reasonable rates for rural customers, and reduces the risk of RUS loans. We believe that this diversity of customer base will be critically important to the long-term financial stability of borrowers as their industries become more competitive at the local level.

Congress recognized this changing nature of borrower when it enacted the Rural Electrification Loan Restructuring Act of 1993. It set interest rate eligibility based upon per capita income of consumers, rate disparity, and consumer density. This Act also revised the definition of "rural" for new borrowers of both the electric and telecommunications loan programs. We suggest, therefore, that caution be used in strictly applying classifications such as rural, urban, and metropolitan to service territories as the measure of whether an RUS borrower is achieving the Congressionally stated policy objective of the RE Act.

The changing environment of the electric and telecommunications industries

The movement to a more competitive environment in both the electric and telecommunications industries substantially increases risk both for utilities and for customers in areas that are seen as less profitable to serve. New telecommunications regulations take effect January 1998, and their impacts will be felt gradually. The impacts of restructure of the wholesale end of the electric industry are just beginning to be felt. Statutes and regulations to make the retail end of the electric industry more competitive are under development at both the federal and state levels. The increased risk of both industries affects capital markets and the ability of utilities to attract private sector capital. RUS urges, therefore, that any recommended changes to RUS loan programs take this volatility into consideration.

The nature of RUS borrowers

The report makes repeated mention of what it terms borrowers' "profit". The repeated use of the term "profits" shows a lack of understanding of the characteristics of cooperative organizations. In fact, most electric borrowers and many telecommunications borrowers are cooperatives owned by the consumers they serve. Rather than earning profits that yield dividends to shareholders, these cooperatives allocate their "margins" earned during any reporting year as patronage capital to their members. These patronage capital allocations result in de facto rate reductions to the cooperative members, reducing the cooperative's operations to a break-even level. The benefits of these patronage allocations, therefore, flow to the consumers/subscribers who are, coincidentally, the intended beneficiaries of the RUS programs. The member-sourced earnings of RUS cooperative borrowers are not considered profits by the Internal Revenue Service and as such, are exempt from federal income tax.

OPPORTUNITIES TO MAKE THE LOAN PROGRAMS MORE EFFECTIVE AND LESS COSTLY

The report states that "opportunities exist to make the loan programs more effective and less costly." We have analyzed the report's conclusions and recommendations, along with the underlying premises and data, and we offer the following:

Loans are sometimes made to borrowers serving large customer populations

The report bases its findings to a great extent on significant mischaracterizations of RUS borrowers. While a few RUS borrowers do, in fact, serve large customer populations, most borrowers serve small subscriber populations and are considered small businesses according to the size standards established by the Small Business Administration (SBA). The telecommunications borrower specifically cited as an example illustrates this point. The borrower serves a city and the surrounding sparsely populated rural area. RUS financing was not used to provide service to the city because it does not meet the Urban/Rural test of the RE Act. The only telecommunications plant financed by RUS was that dedicated to serving rural subscribers outside the city. Absent RUS financing, prudent business practice would dictate that this borrower invest its higher cost capital in the areas in which it will earn the best return—the high density urban area. Ultimately rural area service would be improved only after the higher density city subscribers, if at all. Under the Telecommunications Act of 1996, as competition comes to rural areas, the pressure to invest in competitive markets will place even greater pressure on the availability of capital to improve service in rural areas. It is important to note that over 85 percent of RUS' telecommunications borrowers have less than 10,000 subscribers, near-

ly 70 percent serves less than 5,000, and the medium number of subscribers per borrower is less than 2,800.

We strongly disagree with the use of customer size as a criterion for determining eligibility for loans. Large customer population alone is not an accurate measure of a borrower's financial strength or its ability to attract capital. The average RUS electric borrower serves between 5 and 6 consumers per mile of distribution line, while the average investor owned utility (IOU) serves about 35 consumers per mile. Because the electric and telecommunications industries are highly capital intensive, a utility that serves a large number of mostly residential consumers over a large geographic area may not be able to achieve the economies of scale necessary to attract steady infusions of private sector capital at interest rates that can support reasonable electric and telecommunications rates for rural consumers.

Loans with subsidized interest rates are made to financially healthy borrowers that may not need RUS' assistance

The RUS electric and telecommunications programs provide a financial incentive to encourage rural electric and telecommunications utilities to provide modern service in areas that otherwise might not be well served, or served at all. RUS is, therefore, quite different from other Federal lending programs, particularly the single-family housing program. High financing costs of capital investments in sparsely populated areas may inhibit the construction of necessary facilities and/or dramatically increase electric and telecommunications rates. It is critical, therefore, to the provision of reliable service that all rural borrowers, including those that are financially healthy, be afforded the opportunity to obtain Federal financing to make improvements in rural service areas.

The report notes that many RUS borrowers have high equity levels and favorable debt to asset ratios and alleges that RUS borrowers do not invest significant amounts of their own funds in plant nor obtain non-Federal financing when opportunities exist. Many RUS borrowers maintain these somewhat favorable statistics because they have, in fact, invested considerable amounts of their internally generated capital in plant. In 1996 alone, a total of \$1.5 billion was expended by RUS borrowers on telecommunications plant, of which RUS financing accounted for only \$261 million.

By investing the cash generated by operating margins in plant, a borrower's debt-to-asset ratio improves as does its ability to generate positive margins. Plant that is financed by internally generated funds is, by definition, debt free thereby alleviating the impact that additional interest expense would have on a borrower's margins while increasing the borrower's equity. Equity, it should be noted, is a measure of an entity's operations and is not cash, as the report seems to imply.

The debt to asset ratio, (or similar measures of leverage such as equity to assets, or debt to equity) is certainly a valuable component of an analysis of creditworthiness but only when interpreted correctly. In evaluating creditworthiness, private sector lenders compare loan applicants to industry benchmarks. The report discusses debt-to-asset ratios for borrowers that obtained loans between 1994 and 1997. The figure cited is the ratio prior to obtaining the new debt, and the report implies that a debt to asset ratio of less than 70 percent is looked upon favorably by lenders. Comparisons to other electric utilities, however, show otherwise. DOE figures show that the average debt to equity ratio for IOU's is about 48 percent.¹ Virtually all IOU's are vertically integrated. RUS data for the same year shows that distribution borrowers had an average debt to asset ratio of about 40 percent, and G&T's about 70 percent. In the light of the IOU benchmarks, the ratios for RUS borrowers, even if the ratios are blended as a surrogate for vertical integration, do not seem as favorable. By this measure RUS borrowers have a distinct disadvantage in capital markets.

Finally, the current ratio can hardly be considered an appropriate tool for measuring ability to obtain long-term debt. A ratio that indicates to what extent current assets are available to meet current obligations simply does not demonstrate a borrower's long-term borrowing capability.

A graduation program could assist in moving financially healthy direct loan borrowers to commercial credit

The report correctly notes that the RE Act offers electric borrowers the opportunity to voluntarily graduate out of the direct loan program by prepaying direct loans at a discount. It is important to note that the discounted value is calculated on a net present value basis thereby resulting in no cost to the Government. To

¹ Financial Statistics of Major U.S. Investor-Owned Electric Utilities 1995, DOE/EIA-0437(95)/1, Department of Energy, Table 29.

date, 115 borrowers have prepaid their loans and we expect that there will be more. Borrowers who take advantage of this opportunity are ineligible for direct loans for 10 years.

Specifically, the electric borrower cited in the report to support GAO's recommendation of forced graduation is, in fact, voluntarily moving away from the RUS program. RUS has not advanced loan finds to this borrower since 1975, over 22 years ago. The borrower has been repaying its debt and now owes RUS only \$128,000. Its total long-term debt from all sources is approximately \$145,725 and interest on all long-term debt by 1996 was only \$3,211. This borrower has achieved a high TIER and current ratio, and high levels of equity by avoiding all financial leverage, a rare feat, indeed, in the electric industry, or any industry today. By graduating itself from all lending programs, this borrower is truly an anomaly. The medium TIER for electric borrowers in the United States and in this borrower's state are 2.44 and 2.62, respectively.

A recent RUS analysis of borrowers who graduated out of RUS under this provision shows two significant trends. First, these borrowers tend to be stronger according to a number of measures. They are typically characterized by: ability to realize economies of scale measured by high consumer density and kWh sales per mile of line; size measured by larger number of consumers (as noted above, one of the report's suggested criteria for measuring strength), total kWh sold, and total utility plant; and newer plant. Interestingly, equity as a percent of total assets seems to be almost the same for borrowers who graduated and borrowers that did not. Also, most of these borrowers serve in states where electric rates are at or below the national average, and their territories show higher load growth.

Finally, while these graduated borrowers are not eligible for direct RUS loans for 10 years, the law leaves them the option of applying for a loan guarantee. As the report points out, the lender is almost always the Federal Financing Bank (FFB), part of the Treasury Department. The interest rate is one-eighth of one percent above Treasury's cost of borrowing, and RUS guarantees 100 percent of the loan. In other words, if these graduated borrowers find that private sector capital is no longer affordable, the RE Act offers a backstop.

Similarly, recent lending activity indicates that a number of RUS telecommunications borrowers have sought financing through non-Federal sources. Borrowers are, in fact, seeking alternative financing through CoBank and/or the Rural Telephone Finance Cooperative as indicated in the GAO report. We believe that this voluntary graduation protects rural communities against the capital risks inherent in the restructuring of the industry.

We are extremely concerned about requiring electric and telecommunications borrowers to refinance their direct loans with private sector financing at this time. In contrast to the relatively stable operating environment of the water and waste disposal program that currently graduates borrowers, the operating environment of the electric and telecommunications industries is highly volatile. The Federal Energy Regulatory Commission is implementing wholesale competition in the electric industry, and many provisions and impacts of wholesale restructuring are not yet clear. At the same time, the Federal Communications Commission (FCC) is implementing the Telecommunications Act of 1996 which will have a dramatic impact on revenue streams for rural telecommunications providers.

RUS direct loans for electric infrastructure are generally available only to borrowers that serve at retail, and restructuring of the retail side of the electric industry has barely begun. The 105th Congress has already seen five bills introduced in the Senate and seven in the House that would, in some form or another: allow, promote or require retail competition; revise or remove restrictions on utility holding companies; institute new requirements on sources of energy sold; or otherwise profoundly alter the industry. In a few states retail choice of electric supplier will be available to all consumers in a few months. Other states are still exploring options.

While not mentioned in the report, the Telecommunications Act of 1996 will have a profound effect on the telecommunications industry. RUS is closely following the FCC as it moves toward implementing the Telecommunications Act, and believes that rural telecommunications service providers will be affected in at least these ways. RUS telecommunications borrowers receive, on average, 65 percent of their revenues from long distance access charges and cost pooling; however, nationwide, telecommunications service providers receive only 44 percent of their revenues from these sources. The Telecommunications Act will change the way in which revenues from these sources are collected and distributed. Access charges will decline at a controlled rate and cost pooling (the current method for collecting and disbursing funds to cover high cost service) will be completely restructured. The rulemaking process intended to design the new universal service cost pooling support mechanism is scheduled to begin in 1998; however, until that mechanism is operational,

the degree of negative impact on borrowers' revenue streams cannot be fully determined.

While small rural telecommunications companies may be protected (depending upon the policies of their state regulatory commissions) in the short-term from competition in their service areas, competition will ultimately come, in some form, to all areas of the nation. Initially, competition will most likely come from another service provider who will attempt to serve the lowest cost subscribers in an area. This will leave RUS borrowers with only their high cost subscribers to serve, thereby reducing the density of the service area and increasing the average cost per subscriber.

Since the debate over retail choice in the electric industry has barely begun, impacts are even more uncertain. We believe that this uncertainty will be reflected in higher costs of private sector capital for electric and telecommunications utilities. Decreasing revenues and increasing costs will strain rural service providers and may endanger universal service. Forcing direct loan borrowers to private sector financing during this period of uncertainty may leave them paying extremely high interest rates that would be directly translated into higher electric rates for rural consumers. Since the vast majority of these borrowers are, as noted above, cooperatives, they cannot raise equity capital by selling stock. Since they are small businesses, as well, they may lack the large cash flow cushion that can protect large businesses against such "sticker shock." Even borrowers that have been historically strong could be left with no alternative other than raising rural service rates.

OPPORTUNITIES TO DECREASE RUS' VULNERABILITY TO LOAN LOSSES

The report made several recommendations for decreasing RUS' vulnerability to loan losses: "(1) limit loan size and total amount of debt outstanding to a borrower, (2) reduce loan guarantees from 100 percent and (3) establish policies to preclude loans to risky borrowers. Second only to RUS' mission of financing high quality electric and telecommunications service to rural consumers reasonable rates, is its concern for the creditworthiness of its borrowers and the security of its loans. It is important to note that the telecommunications program, based upon its policies and procedures currently in place, has an outstanding record of loan repayments—zero defaults since its inception. Equally important to consider is the fact that the majority of loan losses in the electric program arise from investments in ill-fated nuclear plants that were either constructed at costs substantially higher than initial projections or totally abandoned during the construction phase.

Loan and debt limits could reduce RUS' vulnerability to losses

We do not agree that loan limits equate to a reduction in vulnerability to loan losses. RUS cannot make a direct loan or loan guarantee unless the agency determines that the borrower will be able to repay the loan according to its terms and conditions, and that the security for the loan is adequate. These determinations are based on the borrower's past performance, its management and operating environment at the time of loan approval, and projections of load growth and financial performance. Applications for electric loans include long-range financial forecasts as well as engineering studies of facilities that will be constructed with loan funds. The requirement that security for a loan be adequate effectively limits the borrower's total amount of secured debt.

Lending limits also constrain a borrower's ability to take advantage of certain economies that arise from system-wide improvements. A single loan may finance the upgrading and improvement of an entire electric or telecommunications system. All pertinent plant could be constructed under a single contract under one simplified competitive bidding process. This method is, by far, the most efficient way for small utilities to construct plant. If loan limits were imposed, system-wide construction would take place only in small segments thereby significantly increasing the cost to serve rural subscribers. Increased subscriber costs are certainly not in the best interest of rural ratepayers, rural electric or telecommunications service providers, or the Federal lending programs that finance such service.

Establishing policies to preclude loans to certain risky borrowers would reduce future exposure to loss

We believe that this recommendation is based on faulty premises. The rule² in the report implements the new statutory authority of the Secretary of Agriculture to compromise, adjust, reduce, or charge off debts or claims owed to the govern-

²The rule, adding a new subpart Y to 7 CFR Part 1717, was published September 26, 1997, at 62 FR 50486.

ments. The rule adequately addresses the issues raised in the report by requiring credit support in the full amount of the loan as a condition of any subsequent loan.

ELECTRIC PROGRAM ISSUES

Impacts of the electric loan program in maintaining electric infrastructure

The electric loan program provides an efficient and effective use of taxpayer funds to support electric infrastructure. The subsidy amounts cited in the report actually support relatively high lending levels. The total subsidy for fiscal years 1994 through 1996 for electric hardship rate loans was \$49.6 million while the lending level was \$273.9 billion. For municipal rate loans during this period, \$148.9 million in subsidy supported lending levels of \$1,489.8 billion.

This subsidy actually generates increases in electric utility plant far greater than what lending levels indicate. For example, in calendar year 1995, RUS advanced a total of \$860 million in direct and guaranteed loan funds to electric borrowers. During the same year, additions to plant by electric borrowers totaled almost four times this amount, \$3.3 billion. In calendar year 1996, RUS advanced \$1.02 billion to borrowers, and additions to plant totaled \$3.3 billion. Borrowers make up part of this difference with internally generated funds, and part with loans from non-RUS sources. In the case of municipal rate loans, most borrowers are required to obtain part of their debt financing from a supplemental source with no RUS guarantee.

Financially healthy borrowers obtain municipal rate loans at interest rates lower than rates on hardship rate loans

The report's description of the interest rate structure for municipal rate loans is generally accurate. We emphasize only that, as a general principle, short-term interest rates are lower than long-term rates. A borrower that locks in a low rate for a short term runs the risk of a sharp increase in the rate when the advance rolls over.

Moreover, the federal subsidy is based on the difference between RUS interest rates and the rate at which RUS borrows from the Treasury. While the interest rates on RUS borrowings and municipal interest rates may not rise and fall strictly in tandem, they do follow similar trends. In other words, the subsidy rate does not necessarily increase when municipal rates fall, and vice versa.

TELECOMMUNICATIONS PROGRAM ISSUES

Nonrural Areas

RUS strongly supports its policy of making loans for service to nonrural areas when it is incidental to providing service in rural areas. In instances where telecommunications service is to be provided in a nonrural area, RUS applies a "necessary and incidental" test to determine that, without financing plant in a particular nonrural area, the rural area would suffer the consequences by receiving less or no service. In addition, when making a loan to a telecommunications borrower where funds are to be used in a nonrural area, RUS conducts Urban/Rural studies to determine that the majority of the benefit from the financing will be derived by the rural residents. Defining a rural area is simply not as easy as assigning a number. These policies enable RUS to apply judgment in making loans that ultimately benefit the residents in rural areas, be they rural, extremely rural, or some mixture. The goal of "universal" service can only be achieved if service is provided in areas, both rural and nonrural.

Once again, we appreciate the opportunity to review and comment on the draft report. If you wish to discuss these comments on a more detailed basis, we are available at your request. While we welcome suggestions that will improve the operational efficiency of our loan programs, any recommendations that are forthcoming should take into consideration the revolution that is taking place in both the electric and telecommunications industries. Due to the numerous uncertainties surrounding the eventual evolution of these industries, it is important the RUS lending programs remain flexible in their abilities to provide financing to ensure modern, reliable electric and telecommunications service to rural America.

The report states that loans are sometimes made to borrowers serving large customer populations. I emphasize again that, although a few RUS borrowers serve large customer populations, the vast majority have customer bases that are, quite small, by industry standards. Furthermore, all but a handful are small businesses according to the Small Business Administration's size standards, which are based on MWH sales for electric utilities and number of employees for telecommunications companies.

I strongly disagree with the use of customer base as a criterion for determining loan eligibility. Large customer size alone is not an accurate measure of a borrower's

financial strength or its ability to attract capital. The electric and telecommunications industries are both capital intensive, and a utility that serves a large number of customers over a large geographic area may not be able to attract steady infusions of private capital at interest rates that can support reasonable electric and telecommunications rates for rural consumers.

The report also asserts that RUS makes loans to financially healthy borrowers that may not need RUS assistance. The measures of financial health used in the report do not accurately measure a borrower's true borrowing strength. High equity, for example, does not automatically translate to credit worthiness for a cooperative. The debt-to-asset ratio of RUS borrowers is not nearly as favorable as indicated in the report, when the ratio is compared with industry benchmarks. Similarly, the current ratio has little or no relevance to a utility's long-term borrowing capability.

GAO recommends a graduation program to forcibly move borrowers out of the RUS program and into private sector financing. RUS now offers electric borrowers the opportunity to voluntarily prepay their RUS debt at a discounted present value. Borrowers who choose this option are ineligible for direct loans for 10 years. To date, 115 borrowers have voluntarily moved to private sector financing, and I fully expect that there will be more.

I am also concerned that requiring electric and telecommunications borrowers to graduate to private sector financing would be detrimental to the rural economy at this time. In contrast to the relatively stable operating environment of the water and waste disposal program that currently graduates borrowers, both the electric and telecommunications industries are now in a state of flux. Forcing borrowers to "fire sale" refinancing could place them at a competitive disadvantage, leading to higher electric rates for rural consumers.

GAO believes that RUS' vulnerability to loan losses could be reduced through loan and debt limits, and by precluding loans to certain risky borrowers. I disagree. RUS cannot make a loan unless the agency determines that the borrower will be able to repay the loan according to its terms and conditions, and that the security for the loan is adequate. Imposing rigid limits on the size of individual loans, or the borrower's total debt could constrain the borrower's ability to take advantages of economies of scale, or to build facilities to serve consumers in areas of rapid growth.

An absolute prohibition on loans to risky borrowers could adversely impact electric and telecommunications service to needy consumers in rural areas. RUS prefers its current individualized approach, one in which the agency can place conditions on certain loans to mitigate risks.

Question. Please provide your views of the current trends in electricity deregulation and its effect on the rural electrification programs?

Answer. RUS is concerned about the potential impacts of electric industry restructuring on RUS borrowers and on Federal financial interests in these borrowers. RUS is also concerned about the continued availability of reliable, reasonably priced, electricity in rural areas.

Experience with deregulation in other industries has not been a positive one for many rural consumers. Too often, the unfortunate and unintended consequence of deregulation has been a decline in the quality and availability of service and an increase in costs in rural areas. Airline and railroad deregulation are prominent examples. If experience in other industries is any guide, the benefits and costs of electric industry restructuring will be spread unequally both geographically and among customer classes. This has prompted concern that if implemented too quickly and without adequate safeguards, electric utility restructuring could bring rural Americans higher prices and degradation of reliability and safety.

The underlying premise of deregulation is that competition among suppliers will result in lower prices, technological innovation, and more choices for consumers. In many cases, powerful industrial consumers are already negotiating lower electric rates either from their historical providers, or by switching to lower cost providers. In either case, the historical provider is left with fixed costs that must be recovered from a shrinking revenue base. To the extent that the historical provider is unable, in a competitive market, to charge rates sufficient to recover these costs, the costs are stranded. Because almost all RUS borrowers are consumer-owned entities, there are no shareholders with which to share stranded costs.

Competition in generation alone, is unlikely to significantly affect many of the factors that contribute to the higher costs of serving rural systems. To achieve the benefits offered by electric industry restructuring while preserving access to reliable and affordable electric service, the transition must take into account the special circumstances of rural electric systems and their customers.

The Administration is continuing to develop its comprehensive policies on electric industry restructuring. RUS believes that rural areas can share in the benefits of

a competitive retail electric market if adequate safeguards are provided to assist high-cost to serve rural areas, and reliability of service is ensured.

Many RUS borrowers serve small, scattered, mostly residential loads that may not attract competitive interest to produce significant savings for most consumers. RUS is concerned that as a result of competition, larger customers will increasingly be "cherry picked" from RUS borrowers, requiring these borrowers to raise rates to the remaining customers to meet fixed costs, including debt service payments. If rates rise too sharply for the remaining consumers, the economic base of the community could be threatened. If, however, competitive pressures prevent a borrower from charging sufficient rates, the borrower's ability to meet its debt service payments is threatened.

It is almost impossible today to determine the magnitude of stranded cost exposure of RUS borrowers, except to say that all generation assets are potentially at risk, and that nuclear facilities and other high cost producers are at the greatest risk. Various proposals for retail choice transition have been introduced in the 105th Congress and in various State legislatures and public service commissions. These proposals differ greatly in their likely impacts on power supply borrowers and on the extent of permissible recovery of stranded costs.

USDA is also concerned that the future availability of investment capital for rural electric infrastructure can be jeopardized if current and future investments are allowed to become stranded.

RUS currently has approximately \$31 billion in outstanding electric loans. Typically, RUS loans are used to leverage two-thirds of investment capital from private sources. These loans are the lifeblood in maintaining and improving rural infrastructure. If these loans become stranded, the investment resources from federal programs as well as private sources could easily diminish.

Question. Please explain why you think the "universal service" concept should be applied to electrification programs?

Answer. The universal service concept dictates that all customers, including those that are high-risk, and or costly to serve, will be assured access to reliable electric service at just, reasonable, and affordable rates. The obligation imposed on utilities to provide universal service to all customers within their territories at just and reasonable rates has long been a fundamental and highly-valued premise of electric utility regulation.

Even today, providing electric service to rural areas requires more capital investment and higher costs of operation and maintenance and results in lower revenue per mile of line than service in most urban and suburban areas. The availability of universal service and the investment in a safe, reliable electric infrastructure in rural America should not be put at risk during or after the transition to a more competitive electric industry.

In a "deregulated" competitive electric industry, retail electric providers will be able to pick and choose the areas and customers they serve based upon their expectation of profits to be won, and not on the customer's need for service. In a competitive environment, profit-maximizing retail electricity providers will be attracted first to high-volume, high-load factor industrial and large commercial customers. They may demand unacceptably high prices to serve low-volume, low-load factor residential and small commercial consumers, if they are willing to serve them at all.

Question. Other than loan subsidy rates, why would the proposed Treasury rate direct loan program be an improvement over continued FFB activities?

Answer. The proposed Treasury rate loan program would supplement, not replace, the FFB loan guarantee program. A Treasury rate loan program would offer a number of advantages. It would be a direct loan program, not a loan guarantee. The borrower would have only one federal agency to work with. FFB loans offer a complex range of options for long- and short-term interest rates, amortization schedules, and the ability to prepay or refinance the loan. These options confuse many borrowers while a new direct loan program could be simpler. FFB interest rates reflect Treasury's cost of money plus one-eighth of one percent. FFB also charges a small annual servicing fee to cover certain administrative costs. The Treasury loan program would not have the interest rate adder or the fee.

The Treasury rate loan program would allow RUS to offer a range of financing options in a customer friendly format. FFB financing would still be available to power supply borrowers and to distribution borrowers that favor the range of choices offered by FFB.

Question. In what ways might the Treasury rate proposal be harmful to electric utility borrowers?

Answer. I do not believe the Treasury rate proposal could be harmful to electric utility borrowers, to rural Americans, or to the government.

Question. Has RUS engaged in a survey to determine the problems and costs associated with "an aging electric infrastructure" and if so, would you provide that information to the Committee?

Answer. RUS has not surveyed borrowers concerning the problems and costs associated with aging electric plant. Our understanding of the problems posed by aging electric system components is based on historical information on in-service dates of electric plant and trends in requests for loan funds and system upgrades. Electric systems, just like other forms of infrastructure, require maintenance and periodic replacement of components as the systems age. Demand for electricity has also been growing in many rural electric service areas thereby requiring distribution and transmission facilities to be upgraded to preserve safety and reliability.

EMPOWERMENT ZONES/ENTERPRISE COMMUNITIES (EZ/EC)—DELTA INITIATIVE

The USDA budget suggests legislation will be submitted to create additional rural Empowerment Zones. Additionally, the Appalachian Regional Commission is suggesting expansion of their activities to include the region of the Lower Mississippi River Delta.

Question. Do you think the ARC initiative for the Delta could largely be conducted under the EZ/EC initiative? Have you discussed the Delta initiative with the ARC? Please describe how the benefits from the current EZ/EC program have helped the Delta.

Answer. We believe that implementing the recommendations of the Lower Mississippi Delta Commission fits closely with the objectives and implementation methods of the EZ/EC Initiative. Two organizations in the Mississippi Delta region—the Lower Mississippi Delta Development Commission and the Southern EZ/EC Forum—have already taken major steps to build a coalition through which this can occur. We have met with the ARC to discuss the proposal to expand their service area to include the Delta. We are concerned about their proposal to increase the size of their organization and favor an approach that would direct a larger proportion of the funds to development projects in rural communities by using an organizational structure that is already in place. Since this Administration has come into office, USDA Rural Development has invested more than \$446 million in the 219 counties of the Lower Mississippi Delta region. In addition, the EZ/EC Initiative will invest over \$60 million in Social Services Block Grants. At the rate these dollars are being leveraged nationally, this will result in approximately \$600 million in total investments in these poor communities.

Question. Since you note the importance of assistance for children to attain appropriate educational levels in regions like the Delta, are you aware of the work of the Delta Teachers Academy and if so, would you provide your views on this program?

Answer. I am not familiar with the Academy, I understand this is a project funded by the Extension Service.

CENTRALIZED SERVICE CENTER

Last year, there was much discussion about the effect of budget cuts and FTE ceilings on the work force at the St. Louis Service Center.

Question. Please provide an update on workload and FTE's currently employed and projected for fiscal year 1999 at the Service Center.

Answer. September of 1997 marked the completion of the conversion of loans from the field to the new Dedicated Loan Origination and Servicing system and the transfer of servicing activities to the Centralized Servicing Center (CSC) in St. Louis. The CSC provides full servicing of these loans from closing to acceleration of the account, with a Full Time Equivalency (FTE) authorized level of 633 employees, we project our workload to remain constant in fiscal year 1999 and our FTE requirements to remain at 633.

Question. What is the status or special needs of information technology at the Service Center?

Answer. All information technology initially planned is in place and operational in the Centralized Service Center (CSC). With any portfolio conversion of this size, modifications to the current system is an ongoing process. These modifications to the software are unique because of the Congressional mandated Supervised Credit that must be available to our borrowers to preserve home ownership though economic or other hardships individuals and families may experience. For this reason, we have had to modify the private sector serving software we purchased to ensure these servicing options were handled in a consistent and efficient manner. These servicing features include: 7 day a week, 24 hours voice response for detailed information on loans; nationwide consistency for servicing, including payment assistance, moratorium, reamortization and other services; centralized cash management pro-

viding fiduciary control; a monthly statement sent to each borrower; escrow of taxes and insurance; and expanded (7:00 am–6:00 pm) customer service representatives to handle more complex issues for our borrowers.

We will continue to monitor our program needs in conjunction with the constant changes in technology, increased use of technology, and the needs to respond quickly to requests for information and prepare a plan to achieve this result.

Question. To what extent are you coordinating information technology for the Service Center with overall Department needs?

Answer. The Centralized Service Center (CSC) identifies their program needs, prepares the proper documentation for approval by the Information Resource Management organization. Like every other organization in the Department of Agriculture, the CSC is currently under a \$25,000 limit on any technology purchase without a waiver from the Department. The waiver requires concurrence by all USDA mission areas involved in the CSC initiative and also ensures that any and all technology is Year 2000 compliant, unless emergency situations exist.

SECTION 502 SINGLE FAMILY HOUSING

You state the goal of the President's National Partnership for Home Ownership is to provide home ownership to an additional eight million Americans by the year 2000.

Question. What rate of program increase per year will we need to see in order to realize this goal?

Answer. For fiscal year 1999, we estimate that we will provide home ownership to approximately 65,000 individuals or families in rural America. RHS is only one of the 65 national organizations working together to meet this goal. Increases in our direct and guaranteed home ownership programs would assist additional home ownership in rural America, however, we have not formulated our appropriation request fiscal year 2000 at this point.

Question. What amount of this program do you intend to support through the direct and through the guaranteed program?

Answer. As mentioned in the previous answer, the fiscal year 1999 request would allow us to provide home ownership to approximately 65,000 rural individual or families. This figure includes the entire request for both the direct and guaranteed 502 programs.

Question. What is the policy rationale for the statutory prohibition of graduating a 502 "direct" borrower to the guaranteed program?

Answer. The Department does not have a rationale for the prohibition, in fact we have transmitted proposed legislation to Congress to repeal the statutory prohibition. One of the RHS goals is to graduate borrowers to commercial credit. Additionally, the 502 guaranteed program provides 100 percent financing which will enable direct borrowers to refinance who don't have the financial capability for a down payment.

SECTION 515 MULTI-FAMILY HOUSING

Question. Please describe the status of Section 515 housing rehabilitation and include the number of projects and, to the extent possible, the number of units for which rehabilitation has been complete and the number of projects/units still in need of repair or upgrades.

Answer. Since fiscal year 1995, the Agency has dedicated approximately \$194 million in repairing and rehabilitating our existing portfolio, which equates to nearly 640 projects. Our most recent survey, conducted September 1997, indicated \$106.4 million outstanding repair needs. For fiscal year 1998, we estimate approximately \$50.5 million will be used for this purpose.

Question. The budget reduces the 515 program substantially and, instead, provides an increase for the Section 538 guaranteed program. What has been the response from developers in accepting the guaranteed program over the direct?

Answer. The Section 538 program is not a replacement or substitution for the 515 program, which is, a below-market-interest-rate loan program. Loan guarantees cannot significantly lower the costs of borrowing enough to allow occupancy by the low- and very-low-income households which the 515 program serves. However, developers understand that the Section 538 will play an important role in providing rental housing in rural America for low to moderate-low income families.

Question. Has shifting from the direct to the guaranteed program had any effect on the ability of developers to acquire tax credits?

Answer. As previously stated, the Section 538 program is not a replacement or substitution for the 515 program; however, many developers expect to use the LIHTC program in conjunction with the Section 538 Program as the two programs

are compatible. The combination of tax credits and a guaranteed loan achieves rents that are affordable to low-income households in those rural areas where median incomes are relatively high because the LIHTC program must be used for households with incomes at 60 percent of area median income, while households eligible for the Section 538 program are those whose incomes at the time of initial occupancy do not exceed 115 percent of the median income of the area.

GALT, CALIFORNIA

Last year, there was substantial debate about an amendment that would have affected rural housing programs in Galt, California. Had this amendment been adopted, it would have served as a precedent USDA felt detrimental to its mission.

Question. Please provide an update on continuing negotiations with the City of Galt regarding this problem.

Answer. The Department has worked with a mediator from Sacramento State University to access the scope and cost for the full mediation process. The mediator has met with the principals and is preparing a preliminary analysis for the Department to review for consideration of a contract. The principals have agreed to work together to identify the goals of the mediation process.

Question. Have other requests similar to those of Galt been brought to the Department's attention and if so, what is the status of those requests?

Answer. The grantees of the Mutual Self-Help Grant Program and farm labor housing providers have reported instances where communities have resisted the construction of affordable low-income housing. Barriers include local building approvals and zoning restrictions. Many of these cases are resolved on the local level with negotiations conducted between the housing provider and the local community, including elected officials. We are currently not aware of a situation similar to Galt where a City or local government is attempting to halt all construction of RHS low-income housing. Our experience has been that after the RHS housing has been constructed and occupied, the community and neighbors are very supportive. The Agency strives to ensure the housing reflect the local building styles including amenities and we take great measures to ensure the high quality of our rental housing is maintained.

BUSINESS AND INDUSTRY LOAN PROGRAM

You mention that since last December, the demand for the Business and Industry Guaranteed Loan Program has increased 300 percent.

Question. What is the explanation for this rate of increase?

Answer. This rate of increase is the result of three factors:

1. The streamlined Business and Industry Guaranteed loan program regulations were implemented, which reduced these regulations by 50 percent, reduced the number of forms required (from 19 to 6), and made the forms available to the public in an automated electronic format;
2. An aggressive program outreach initiative was conducted by National and State Office staff; and
3. The eligible loan purposes were expanded to include such purposes as the financing of hotels, motels, bed-and-breakfasts, and some recreational-type facilities.

Question. What is the source of the additional \$75 million in Business and Industry loans resulting from the Community Adjustment and Investment Program under NAFTA?

Answer. In conjunction with the North America Free Trade Agreement (NAFTA), the U.S. Department of Treasury entered into a Memorandum of Understanding with USDA, which enabled USDA to administer a guaranteed loan program, with budget authority provided by funds available through the Community Adjustment and Investment Program (CAIP), using its RBS B&I Guaranteed Loan Program regulations. The funds for this program are available because of deposits made into the CAIP as the result of the provisions of NAFTA.

COOPERATIVE DEVELOPMENT

You mention that the role of cooperatives might replace some of the support of the traditional farm price support programs that were discontinued in the 1996 Farm Bill.

Question. What are some examples of cooperatives serving this function? Are any currently in place and if so, in what fashion? What are you doing to support this concept? Are you consulting with the Commission on 21st Century Agriculture on this issue?

Answer. Cooperative strategies can be adopted by farmers to assist them in increasing net farm incomes and reducing their exposure to fluctuating prices. There

are a range of roles that cooperatives can play, some strictly private sector initiatives that we in the public sector can encourage, and others requiring cooperatives to take on a more public role in the marketplace. These strategies have two basic dimensions: (1) Giving farmers more market power in negotiations relative to other players in the food sector, and (2) aiding farmers to get a larger share of the consumer's food dollar. Some of these strategies could include more use of pooling, value-added production, global marketing, enhanced bargaining, and operation of a cooperative managed supply control system. Cooperatives in some commodity areas, particularly non-program commodities, are currently involved in some of these activities. Cooperative investment in value-added processing has been particularly active in recent years.

RBS has historically promoted use of cooperative strategies for improving farm income through its program of research, technical assistance and education. These activities continue. The Department is presently examining possible strategies and contingencies for the post-price support era, including strictly cooperative-base strategies and others. We want to be prepared, with well thought out options, to ensure that the well being of American farms will be sustained over the long run. We are in the beginning stages of this process and not yet to the point where we are consulting actively with outside groups. When we get to that stage, however, we will involve a broad range of individuals and organizations to insure that our policies are effective and address the needs of all American farmers.

APPROPRIATED TECHNOLOGY TRANSFER RURAL AREAS (ATTRA)

The budget proposes \$2 million for ATTRA, and increase of \$700,000 above the fiscal year 1998 level.

Question. Please provide an update on the activities at ATTRA. Please describe any effects on ATTRA that have resulted from the program not receiving an increase for a number of years. Please describe the role ATTRA has served in USDA's overall strategy to attain sustainable farming methods on a national scale.

Answer. In fiscal year 1997, ATTRA responded to and provided information to more than 18,000 requests about sustainable agriculture received through its national toll-free phone lines, its new Web page, and direct contacts at workshops and agricultural trade shows. Already in fiscal year 1998, ATTRA staff are struggling to respond to more than 9,000 requests in the first 5 months of the fiscal year. ATTRA staff members provide leadership, technical training and materials to regional and national efforts on professional development in sustainable agriculture for extensionists, Natural Resources Conservation Service staff and others. The ATTRA newsletter updates 8,000–10,000 groups, individual farmers, educators and others about sustainable agriculture news and resources of interest.

The greatest impact of level funding has been on staffing. Key areas in the program are now severely understaffed because funding limitations have prevented filling positions to meet increased overall demand. The number of requests has more than doubled in 7 years while funding has remained level, but there has been no corresponding increase and, in some cases, reductions in the number of staff hours available to serve those needs. Especially hard hit have been the areas of pest management, marketing, livestock, and agronomy, as well as operational areas such as computer/information management and staffing for the toll-free phone lines. The program is now faced with implementing limitations on numbers and types of requests, and staff struggle with a backlog in updating of highly requested materials. Labor projections needed to meet current and future demands indicate that the program is understaffed by 50–60 percent, and the proposed increase would allow a modest staff increase to partially offset the impacts of chronic under staffing.

With its toll-free (and now electronic) access, ATTRA continues as the unique sustainable agriculture information source available to farmers across the country, and is in a special position to promote and interpret USDA efforts in sustainable agriculture, such as the results of the Sustainable Agriculture Research and Education (SARE) program, to a broad audience. ATTRA has been a visible and easily accessible place for farmers to start or to deepen their practice of sustainable farming methods, no matter what their geographic location. Several editions of a national expertise directory and other ongoing contacts have been produced and maintained by ATTRA and publicized through the USDA-sponsored Sustainable Agriculture Network (SAN). These and other networking tools have helped those practicing, researching and learning sustainable farming methods to more easily find each other across the United States. Also, ATTRA staff are in a unique position to provide information to USDA and other Federal agencies on farmer interests and needs in sustainable agriculture.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION
(AARCC)

You mention that a number of companies which have participated in AARC have repaid over \$200,000 to the AARC Corporation.

Question. At what point do you think the program will be self-sustaining?

Answer. AARCC's 10-year business plan projects three repayment scenarios. The low case has AARCC recovering its investments on a dollar:dollar basis. Even at that rate, the American taxpayers still gain, as jobs have been created and unused land put to use.

In the intermediate case, the plan projects a 6 percent return on the money. The high case projects a 10 percent return. Presently, the repayments are tracking with the high case scenario.

We believe AARCC will have the financial resources to be independent of appropriated funds by the end of fiscal year 2002. The business plan projects that to be the case, regardless of which repayment scenario is realized.

RURAL UTILITIES SERVICE

Your testimony refers to a letter which Secretary Glickman recently sent to Energy Secretary Peña expressing concern that, even if rural coops are permitted to recover their stranded costs associated with generation (as provided for in the Bumpers/Gorton bill), rural coops may not be able to "maintain reasonably affordable rates for small consumers." As I understand this statement, Secretary Glickman is suggesting that a coop will not be able to recover all of its distribution costs.

Question. While a coop may lose generation customers as a result of retail electric competition, it won't lose distribution customers. Why would a coop not be able to recover all of its distribution costs as long as it retained all of its distribution customers?

Answer. Secretary Glickman did not assert, as a general matter, that a cooperative would not be able to recover all of its distribution costs under retail competition. Rather, the Secretary cautioned that "wires charges" imposed by distribution utilities to deliver another supplier's power may not be a sufficient replacement source of revenue to assure reasonably affordable electric service for smaller customers.

Secretary Glickman's letter expressed the Department's concern that the benefits of cost averaging—a key tool for assuring affordable universal electric service—could be lost under retail competition. Electric systems and regulators would no longer be able to rely on the practice of averaging the costs of servicing high and low cost customers to support reasonably affordable rates for smaller customers. The operating efficiencies and revenues from larger customers have historically helped to lower average systems costs and benefited smaller customers. With the loss of generation revenues from large industrial customers, an important source of revenue support for affordable service could disappear. Moreover, utilities could face higher costs to provide power to remaining customers with less attractive load profiles. The result is likely to be upward pressure on rates for residential and small commercial customers. This threat is one reason why USDA believes that it is essential that an adequate safety net be assured for rural and other costly to serve customers as part of electric industry restructuring.

Question. Secretary Glickman's letter seems to suggest that residential and commercial customers will have to pay more if a coop loses its industrial customers. However, a coop won't lose an industrial customer for distribution service and it will be able to recover all of its stranded costs from generation customer losses as a result of retail competition under the Bumpers/Gorton bill. Therefore, wouldn't you agree that rates charged to residential and small commercial customers should not rise when retail competition is implemented?

Answer. We do not agree that rates charged to residential and small commercial customers should not rise when retail competition is implemented. There is already evidence that they could rise, which prompts USDA's concerns over consumer impacts. Most state retail choice plans would impose transition charges on retail customer bills for stranded cost recovery, in addition to the costs of electric service. Unless a regulatory device is adopted to defer these costs—as in California and Massachusetts—the retail choice transition could increase costs for many customers in the short term. Additional costs for unbundling, customer education, and creation of power exchanges and independent system operators will be ultimately passed through to retail customers. These costs are likely to be proportionately higher on a per customer basis for smaller utilities.

Question. Please identify what you perceive to be the risks of retail electric competition, assuming the recovery of stranded costs from customers leaving a system, to residential and small commercial customers of rural coops.

Answer. Under several state plans, and, as we understand it, the Bumpers-Gorton bill, stranded costs will be recovered from all customers, not just those leaving the system to obtain the benefits of competitive supplies. This one-time, up-front recovery of stranded costs, if spread to all customers over a short transition period, could substantially raise rates in the short-term for residential and small commercial customers. While larger customers leaving the system to obtain lower wholesale energy costs may see no net increase in service costs, USDA has yet to see any indication that small residential and commercial customers in scattered rural communities will attract the aggressive attention of competitive energy providers or are likely to do so in the future. The recovery of stranded costs from all consumers, therefore, will only tend to raise rates to rural residential and small commercial customers.

Even today, providing electric service to rural areas requires more capital investment and higher costs of operation and maintenance and results in lower revenue per mile of line than service in most urban and suburban areas. The larger industrial loads have, in the past, provided rural electric cooperatives with a mechanism to average these higher costs of service, thereby allowing the cooperatives to provide residential service at rates that, while still higher than most urban and suburban areas, were more affordable rates. In a "deregulated" competitive electric industry, retail electric providers will be attracted first to high-volume, high-load factor industrial and large commercial customers. If these lucrative consumers are "cherry picked" from the system, all cost averaging mechanisms will disappear and residential and small commercial rates will, most certainly, rise. USDA does not view short-term stranded cost recovery for investments in generation assets as a substitute for the support for affordable universal electric service.

QUESTIONS SUBMITTED BY SENATOR HARKIN

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION (AARCC)

Question. AARCC in some ways functions as a venture capital entity. To what degree do government accounting standards accurately reflect the AARCC portfolio? How do those standards differ from the standards used in the private sector regarding the capture of audited financial statistics?

Answer. AARCC functions very much as a private sector venture capital (VC) fund does. Our expectations of return on investment (R.I.) are not as high, given our other concerns for job creation and use of agricultural land. However, our basic investment strategy and deal structure closely resemble private sector arrangements. Thus, we own shares in a lot of companies that at present are difficult to value. Moreover, the value of our equity positions change over time.

In the private sector, a venture capital firm receives its investment money from limited partners. In effect, AARCC has one limited partner—the U.S. taxpayer and their funds appropriated to the Corporation by Congress.

Private sector limited partners have an expectation that the overall value of the fund will appreciate over time. When money is invested, an exit strategy is negotiated that gives the fund an overall expected return at the end point. Calculation of the value of the investment at any point preceding the exit, however, is problematic, as discussed above. Typically, a private sector firm values the investment by looking at the price it paid for its shares and comparing that to the most recent purchase by another party. Thus, if the VC firm paid \$10 per share last year and the most recent sale this year was for \$20 per share, the firm would calculate its investment as having doubled in value. So, if the total investment was \$1 million, the VC firm would show it to be worth \$2 million today. From the perspective of the limited partners who provided the initial capital, their investment is appreciating in value, leading up to the exit.

Auditors, however, do not view the calculation of a portfolio's current value in the same manner. Their concern is with dollars out and dollars in. Thus, an investment of \$1 million will appear as a debit, until money is recovered. Furthermore, they calculate an allowance, or discount factor, which is essentially a measure of the probability of loss. The allowance is calculated based on a number of objective and subjective measures. An investment of \$1 million last year, with zero allowance—i.e., a 100 percent probability of recovery—is carried forward as a \$1 million debit. There is no room for calculating any appreciation.

Thus, an investment will not show any record of appreciation until repayment begins, at which time income will be recognized. Because of the structure of venture capital investments, repayment may be several years in the future. AARCC's portfolio, then, may appear to be depreciating in the near-term, as it will show only debits.

Independent of the financial audits performed on AARCC, we have made our own informal estimation of the portfolio's value, based on procedures discussed above as being typical of the VC industry. Based on that approach, we estimate AARCC's portfolio has increased in value by about 20 percent since 1993.

Question. What is your assessment of the AARCC portfolio?

Answer. The AARCC Board of Directors prepared a 10-year business plan for the Corporation. It shows no appropriations following 2002, and it projects repayments through that same year. There are three repayment scenarios: low; medium; and high. The high case scenario anticipates \$300,000 being repaid by the end of fiscal year 1998. To date, AARCC has received \$247,713.75 in repayments. Thus, the portfolio is performing at the high end of the financial projections. Additionally, as part of the Corporation's 10-year strategic plan, the Board set goals of 10,000 new jobs created as a result of AARCC investments and 500,000 acres of unused farmland being put back into production. We estimate that halfway through the 10-year plan, approximately 5,000 jobs can be attributed to AARCC investments and 250,000 acres are in use as a result.

Question. How is the AARCC portfolio performing at this time?

Answer. The AARCC Board of Directors prepared a 10-year business plan for the Corporation. It shows no appropriations following 2002, and it projects repayments through that same year. There are three repayment scenarios: low; medium; and high. The high case scenario anticipates \$300,000 being repaid by the end of fiscal year 1998. To date, AARCC has received \$247,713.75 in repayments. Thus, the portfolio is performing at the high end of the financial projections. Additionally, as part of the Corporation's 10-year strategic plan, the Board set goals of 10,000 new jobs created as a result of AARCC investments and 500,000 acres of unused farmland being put back into production. We estimate that halfway through the 10-year plan, approximately 5,000 jobs can be attributed to AARCC investments and 250,000 acres are in use as a result.

Question. What is AARCC's capacity to effectively use a funding level of \$20 million for fiscal year 1999?

Answer. AARCC's vision of agriculture in the 21st century sees a diverse crop mix, with fibers available for numerous industrial uses. Some of the fibers will be from waste, e.g. wheat straw, others will be from plants grown specifically for the fibers. In order to use the fibers, they will require a variety of processing/pulping steps. What we envision are regionally placed mini-mills that can process a variety of fibers for a variety of uses. We have held several meetings with pulping experts and farmers during the past year, all of whom agree with the agricultural, technical, and economic soundness of our vision. With additional funding, AARCC would move to establish a pilot facility, in conjunction with a grower's group, to demonstrate the feasibility of the concept.

Additionally, there is a group of companies that constitute the real financial opportunity in the AARCC portfolio. With additional funding we would make further investments in them, helping to move them towards an Initial Public Offering (IPO).

Question. What effect can the work of AARCC have on rural America in 20 years?

Answer. AARCC's role in the next 20 years will be part of its 100-year vision for the economy and rural America's role in that economy. Presently, the basic raw material for the world's economy is petroleum. We envision an economy where the basic raw material is derived from biological sources—primarily plants and animals. Given the physical and chemical nature of petroleum sources, it is profitable to extract the raw material from one part of the world, transport it halfway around the globe to process it, and transport it even further to manufacture a finished product. The physics and chemistry of biological raw materials do not allow for such economics, however. To be profitable, the processing and manufacturing of bio-based products must be done close to the source of the raw materials. Hence, the growth of jobs in this new bio-based economy takes place in rural America. As stated previously, our 10-year strategic plan estimates 10,000 new rural jobs as a result of AARCC investments.

There are other advantages to shifting from an economy based on geology to one founded on biology. By their chemical structure, the waste and by-products will be largely biodegradable and eco-friendly. Moreover, the raw materials will be domestically produced and annually renewable. To borrow a phrase used by just one group of producers: The U.S. is the Saudi Arabia of corn. The further national security

and geopolitical implications of such a bio-based economy are evident. Rural America will be the focal-point of this new economy.

Question. Some ask: if investing in value-added enterprises in rural areas is such a good idea, why isn't the private sector doing just that? What is your answer to that question?

Answer. AARCC's role has been and continues to be to serve as a catalyst for the development and manufacture of bio-based products, using the raw materials produced by our vast agricultural capacity. A catalyst is needed, because the price of petroleum still makes it difficult for such bio-based products to compete. However, with improvements in bio-processing, the cost differential is shrinking. Also, when two comparable products—one petroleum-based, the other bio-based—are subjected to life-cycle cost analysis, the disposal costs of the bio-based product usually make it more competitive. We are at the beginning of the transition from geology to biology, and AARCC's catalytic role is still needed.

The private sector is not ignoring the transition. For every dollar that AARCC invests, approximately \$3.50 of private sector money is invested in AARCC projects. In addition, there are several examples of follow-on multi-million dollar investments in AARCC companies, where the private sector investment was initially attracted by AARCC's "USDA Seal of Approval" on a project.

The AARCC Board of Directors has a 10-year strategic plan and a 10-year business plan that do not anticipate appropriations after fiscal year 2002. During this transitional phase, however, it is the Board's view that AARCC needs to continue to identify and fund those companies that are the nucleus of the bio-based economy.

BUSINESS AND INDUSTRY LOAN PROGRAM

Question. What is the current level of demand for the B&I loan guarantee program? What is the expected value of applications for fiscal 1998 that the Department is likely to not be able to fulfill because of budget limitations.

Answer. As of March 6, 1998, there were 469 applications on hand for a total of \$923,543,753, with approximately \$500 million of the fiscal year 1998 \$1 billion allocated amount either obligated or authorized for funding. The level of demand for the B&I Guaranteed Loan Program has remained relatively constant throughout the year. Based on the above, we expect \$900 million of applications will not be funded due to funding limitations this fiscal year.

Question. If the Department promoted the program to a significant degree, what would be the likely increase in B&I applications?

Answer. Current efforts to promote the program are centered around informing lenders and local governments of its availability as well as responding to general inquiries from businesses. Since publication of the new regulation on December 23, 1996, the demand for the program has increased by over 300 percent. With increased promotion of the program, we can only anticipate the program will continue to grow at a significant rate.

Question. What is the Department's belief concerning the loss of employment and economic growth in rural America because of the shortage in B&I loan funds?

Answer. Based upon our response to your question 1. above and the expectation that \$900 million of applications will not be funded in fiscal year 1998 due to the lack of available funding, we project 34,200 will not be either created or saved due to the lack of sufficient funding.

Question. In your personal opinion and based on your research, how critical is the need for enhanced credit in rural areas?

Answer. Numerous studies, including one conducted by the USDA Economic Research Service and testimonies at the September 4, 1997, Senate Agriculture Committee hearing on Rural Credit, indicated that there are areas in rural America that have a lack of access to sufficient capital to meet their economic development needs. Without this credit, these areas do not have the same opportunities other rural areas have in providing economic opportunity for their residents.

Question. What are your views concerning the proposal by Senator Bennett to expand the authority of the Farm Credit System and Farmer Mac to allow them to acquire business loans from rural banks?

Answer. We are currently evaluating the proposal by Senator Bennett to expand the authority to Farmer Mac. If that proposal provides additional capital to rural businesses, then we support it. Recently the Under Secretary for Rural Development has been asked to chair a task force to evaluate ways the Department may work with Farmer Mac in order for Farmer Mac to expand its involvement in providing economic opportunities for rural commercial lenders and businesses.

RURAL HOUSING SERVICE

Question. What would the impact of an increase in the FHA loan limits, as proposed by the Administration, be on rural housing and on the rural housing programs of the Rural Housing Service?

Answer. The base HUD 203(b) loan limit in much of rural America is currently \$86,317. An increase in the loan limit, such as the one being proposed, could prompt an increase in lending activity. This is especially true for new construction type homes, where some have argued that the current base is not high enough to support building a new home in some areas.

Regarding the impact to the rural housing programs of the Rural Housing Service, the Agency has a mandate to ensure that the dwellings being financed are modest in design and cost. The proposed uniform HUD 203(b) level exceeds \$200,000. Of course, given the incomes of the customers the Agency serves, it is unlikely that any could afford such a sizable loan. By statute, maximum loan limits for the Guaranteed Rural Housing loan program are tied to HUD 203(b) limits. The guaranteed program has an income gap that will constrain costs with an increased 203(b) limit. The section 502 Direct loan program currently uses 203(b) limits as an index for gauging maximum loan amounts and modest housing, and this philosophy may have to be examined if a single, uniform 203(b) limit is adopted. The Agency is currently exploring alternative definitions of modest housing and will publish the results in the Federal Register in the future.

 QUESTIONS SUBMITTED BY SENATOR KOHL

SECTION 502 SINGLE FAMILY HOUSING

Question. Section 502, Direct Single Family Program Housing, has seen a four-fold increase in funding for guaranteeing housing loans since fiscal year 1994 while your Direct 502 funding has been cut in half over that same time period. Has the Agency analyzed how higher equity requirements that banks have for loan approval will impact lower-income users of the program?

Answer. The Section 502 direct program serves low and very low-income rural residents who can not obtain commercial credit under similar terms. Additionally, we offer payment assistance which reduces the interest rate down to as little as 1 percent based on income. This program serves low and very low income residents under 80 percent and 50 percent median income respectively. The Guaranteed Rural Housing loan program is designed to serve low and moderate income families, under 115 percent median income, and provides for 100 percent financing. The Agency's loan guarantee takes the place of the traditional down payment terms lenders require. Approximately 27 percent of the Guaranteed loans made during fiscal year 1997 went to low income families primarily due to the prevailing low interest rates in the commercial market.

Question. The State of Wisconsin is the only state that has changed their Section 502 formula that establishes "targeted" counties. They found that the allocations formula approved by USDA inadvertently targeted larger urban counties. I have two concerns with this situation; first, why did Rural Development's national office create a formula that targeting funds to areas that not completely rural? Second, if the formula is skewed, are funds currently targeted to the rapidly developing rural/urban area?

Answer. The Agency's allocation formula is based on the following criteria for the Section 502 Housing Loan Program and the data source for each of these criteria is based on the latest census data available. The States use these same criterion adjusted with State and county census data to allocate to the field offices:

- State's percentage of the National number of rural occupied substandard units;
- State's percentage of the National rural population;
- State's percentage of the National rural population in places of less than 2,500 population;
- State's percentage of the National number of rural households between 50 and 80 percent of the area median income; and
- State's percentage of the National number of rural households below 50 percent of the area median income.

There are a number of factors that contribute to larger numbers of loans being made in rural areas adjacent to more metropolitan areas. The first factor is the higher income limits as determined by HUD, of families living in these areas. The second is the higher section 203(b) loan limits that are allowed in higher cost areas. Another contributing factor is the proximity of these rural areas to metropolitan areas offering good and plentiful job opportunities. Also affordable, new housing is

more plentiful due in part to the more aggressive nature of the real estate market to serve the low-income population.

The Agency has included in its goals providing outreach and targeting areas with the greatest need and that have historically been underserved. Another goal is to use 30 percent of the guaranteed funds in these targeted counties. We believe the Agency is making every effort to offer and use its home ownership programs in areas with the greatest need.

RURAL TELECOMMUNICATIONS

Question. For the second year in a row, the Rural Utility Service hardship telecommunications loan program was cut. However, there is an increasing demand for loans from that program. Last year there was a \$68 million backlog in requests, and for fiscal year 1998 the RUS is projecting a \$60–\$100 million backlog. With such high demands on the program, when can we expect funding to stabilize or increase?

Answer. As of March 1, 1998, hardship loans approved for fiscal year 1998 totaled \$65.1 million, with an additional \$61.5 million in applications on hand. With an authorized lending level for fiscal year 1998 of \$75 million, we estimate that, based upon the number and amount of applications currently on hand and anticipated by the end of the fiscal year, the hardship program will have a backlog—or excess demand over available funding—of \$79 million at the end of fiscal year 1998. As you are aware, the hardship loan program has a fixed interest rate of 5 percent per annum, thereby resulting in much higher subsidy appropriation per loan dollar than our Treasury or near Treasury rate programs.

QUESTIONS SUBMITTED BY SENATOR LEAHY

RURAL EMPOWERMENT ZONES AND ENTERPRISE COMMUNITIES

Despite the fact that Vermont is the most rural state in the nation, no area of the state qualified for designation as a Rural Empowerment Zone or Enterprise Community during the 1994 competition. I support the EZ/EC program, which has done a great deal to revitalize the Old North End in Burlington, Vermont. However, I am concerned that the areas facing the greatest long-term and persistent problems of unemployment and poverty—our rural areas—can not even compete for this valuable funding. In particular, a three-county area of the state known as “the Northeast Kingdom” has consistently held some of the highest unemployment rates in the state, with residents held back by the lack of job opportunities, training and investments.

As I mentioned in my questions last year, the National Science Foundation has shown that the way the government measures poverty today, a basic criteria for eligibility as an EZ/EC, is inaccurate and that shelter costs among other things should be factored into the measure. The findings of a report by the Peace & Justice Center in Vermont supports the argument that poverty in Vermont is underestimated. Other states have conducted similar surveys, with largely similar results.

Question. How will the proposed Rural Empowerment Zones be funded? Will Enterprise Communities be considered again as well, or will this competition be limited to Zones? If it will be limited to Zones, is that based on requirements of the authorizing language or was it a choice of the Administration.

Answer. Although new Zones have been authorized, funding legislation language has not been introduced as yet for Round II of the Empowerment Zone program. Since Round I was funded through Social Service Block Grant (SSBG) funds, it is assumed Congress may use the same vehicle for Round II.

The Taxpayer Relief Act of 1997 authorized five (5) Rural Zones and no Enterprise Communities for Round II. The President’s budget called for \$200 million (\$100 million for USDA and \$100 million for Housing and Urban Development (HUD) for the Rural Zone program in Round II, giving a total of \$40 million for each of 5 Zones over a 10 year period. Unless that is changed in the funding legislation the new designations will be limited to Zones only.

Question. Can and will the Department take into consideration the National Science Foundation’s recommendations and studies like the Vermont report I mentioned above when setting the eligibility criteria for the new round of awards?

Answer. The Empowerment Zone & Enterprise Community legislation requires that we use the 1990 census figures along with the poverty levels in determining eligibility. The criteria are as follows: legislation limits the program to rural communities of 30,000 population or less, and not exceeding 1,000 square miles in size. The pervasive poverty and distress criteria require a minimum poverty rate of 20 percent in each census tract, or 25 percent poverty rate in 90 percent of the census

tracts, or a 35 percent poverty level in 50 percent of all census tracts used in the application. For Round II the authorizing legislation drops the 35 percent poverty level criterion, and adds criteria for selecting communities with out-migration concerns. New legislation would be required to change the basic criteria to include such factors as underemployment.

Question. I understand that communities which applied for EZ/EC status during the 1994 competition but were unsuccessful, have still been able to tap into program funding that the Department has set-aside for EZ/EC's. Will that option continue to be available for unsuccessful applicants, and if so, please describe the programs affected and how communities can tap into them?

Answer. It has been our experience that more potential designations provide greater incentives for community participation. Community participation is essential to the success of this program. With only five Rural Empowerment Zones in Round II the likelihood of small, impoverished rural communities taking the time, effort and money to prepare an in-depth proposal is greatly diminished. The new Round II legislation also allows, for the first time, tribal lands and the problem of out-migration to be addressed, thus further reducing the potential for success of an individual community.

Even participating communities that are not designated end up winners by going through the rigorous strategic planning process required by the program. At USDA we call them our Champion Communities. In Round I, over 225 rural communities participated by pulling together community resources and developing a strategic plan, only 33 communities were designated, the rest were champion communities.

Champion Communities.—Today there are nearly 200 Rural Champion Communities who lost out in the Round I designation competition, yet they have been successful in attracting federal and state dollars to their communities over \$100 million federal dollars in housing, water/sewer funding, business programs and other assistance. They have been successful because they had developed a strategic plan of action for the Round I EZ/EC Application. These were not special set-asides, they were normal USDA programs available to most rural communities, but these Champion Communities had strategic plans that put them a step or two up on competing rural communities for federal, state and private programs designed to improve their economic and social conditions.

VENTURE CAPITAL PROGRAM

Question. Administration testimony indicates that rural America is losing business opportunities because we don't fund programs that help diversify local rural economies. Everyone acknowledges there is a lack of investment capital in rural areas. Yet the administration does not support a demonstration program which would work to get venture capital to rural America. Section 761 of the 1996 farm bill provides for the use of a limited amount of guarantee authority to attract private investor funding for rural venture capital pools. Why is no funding requested for this program in fiscal year 1999? On December 11, 1997 I wrote to Secretary Glickman clarifying the intent of the fiscal year 1998 Agriculture Appropriations Report language regarding the Venture Capital funding and requesting that the Department proceed with the development of rules for this program. Three months later I have not yet received a response to that letter, and have received no indication that work on these regulations is proceeding. When does the Department expect regulations for the program to be published? Is the Department consulting with outside organizations with experience in venture capital in the development of those regulations?

Answer. The Agency is considering options available for promulgating regulations to implement this program. As part of that process, an advanced notice of proposed rule making was published in the Federal Register on April 9, 1997, requesting comments for implementing this authority. Five comments were received and are being considered in the drafting of the regulation. The fiscal year 1998 Appropriations Bill does not appropriate funding for this program, and the President's fiscal year 1999 Budget does not request funding for this program. However, we are in the process of developing a proposed rule. We anticipate publication of the proposed rule by early calendar year 1999.

In addition, the Department has consulted with House and Senate staff on implementation of the program and have had limited consultation with outside organizations. Since regulations will be published as a proposed rule, with a public comment period, additional opportunities will be afforded to outside organizations with experience in venture capital funding to comment.

CENTRALIZED LOAN SERVICING

I am hearing from an increasing number of Vermonters about problems they have experienced with the USDA Centralized Loan Servicing program. Some have told of treatment at the hands of Rural Housing personnel that would not be acceptable in any lending situation. An example of these problems follow.

One constituent initially wrote to me in January when RHS raised her payments from \$300 to \$451, even though her husband's income had decreased and she was not working. An RHS worker in St. Louis was rude to her on several occasions and told her the Vermont office had been doing the calculations wrong all along, resulting in a history of underpayment. The Vermont office advised her to apply for a review of interest credit and she got permission to continue paying the \$300 a month. By February 10, RHS did reduce the payment amount to \$210 a month, but the constituent no longer trusts RHS and wants to refinance because the fluctuating interest rates (up to 13½ percent) are hard to take. Her next problem was getting the information she needed regarding the recapture fee. When she finally got her payoff packet, she couldn't believe they still owed \$48,000 recapture fee on a loan that was originally \$43,000 sixteen years ago. When she called centralized servicing with questions, she couldn't find anyone who could answer her questions. A month later she finally found a bank to refinance her home, but the bank pulled out after all the paperwork was approved and the appraisal was scheduled. The reason given: the bank didn't agree to RHS subordination requirements. This came up after she had put the appraiser in touch with St. Louis to make sure he understood the specific requirements that RHS had been telling her. The branch manager told her the bank was afraid of being sued by RHS if, for instance, the bank had to foreclose on the mortgage and failed to contact RHS. Instead, the bank is only willing to finance the entire amount, including the amount subordinated by RHS, and option the constituent would not be able to afford. She is now searching for another lender who will refinance the home and work with RHS subordination requirements.

Question. What is the current first year delinquency rate for loans serviced at the centralized servicing center?

Answer. As of March 14, 1998, the first year delinquency rate at the Centralized Service Center (CSC) was 11.7 percent for borrower delinquency and 11.0 percent for loan delinquency. The borrower figure represents subsequent loans for repair or rehabilitation work on their homes. Some of these loans are delinquent due to the impact of conversion of all of the single family direct loans in the field to the CSC and the transition to a new system.

Question. What is the current overall delinquency rate?

Answer. As of March 20, 1998, the overall delinquency rate for all loans serviced at the CSC is 19.8 percent. This includes subsequent loans that many borrowers have taken for repair or rehabilitation work on their homes. In any conversion of a large portfolio, whether public or private, the delinquency rate is expected to spike initially as staff and customers adjust to a new system and implementation conversion problems are fixed. We expect the delinquency rate to fall significantly by the end of the fiscal year.

Question. What were the first year delinquency rates and overall delinquency rates during the year preceding the switch to the centralized servicing system.

Answer. The first year delinquency rate was 7.3 percent during 1996. The overall delinquency rate on September 30, 1997, (the effective date of the last conversion) was 15.0 percent.

Question. What is being done to correct problems which appear to be causing RHS personnel to contact loan recipients with inaccurate information on loan delinquency or payment levels?

Answer. The Section 502 borrowers initially receive payment assistance which subsidizes the interest rate down to 1 percent based on income. Our regulations require that we verify the income for each borrower on an annual basis and make adjustments to the subsidy if there were changes in income. In the conversion of the loan portfolio to the Centralized Service Center (CSC), we experienced delays in recertifying the payment assistance to borrowers. Performance in the processing of expired payment assistance has improved significantly. There were many issues in obtaining complete subsidy renewal packages from borrowers. If necessary documentation for subsidy renewal was not forwarded to the CSC in a timely manner, the borrower would be billed at the note rate of their mortgage. Plans are under way to utilize field personnel to assist in those cases where the borrower has not sent in the complete package. Currently, approximately 70 percent of recertification packages received at the CSC are completed and processed immediately. The remaining 30 percent of incomplete packages require additional contact to obtain the necessary information needed to certify income. The 70 percent completion rate of recertifi-

cation packages is a significant from when the CSC first began operations, as the borrowers adapted to the new system.

Question. What difficulties are harried RHS loan recipients who seek to refinance their homes in the private market facing from RHS and what is RHS doing to make this transition smoother for clients who feel they can be better served in the private market?

Answer. The Section 502 borrowers initially receive payment assistance which subsidizes the interest rate down to 1 percent based on income. Our regulations require that we verify the income for each borrower on an annual basis and make adjustments to the subsidy if there were changes in income. In the conversion of the loan portfolio to the Centralized Service Center (CSC), we experienced delays in recertifying the payment assistance to borrowers. Performance in the processing of expired payment assistance has improved significantly. There were many issues in obtaining complete subsidy renewal packages from borrowers. If necessary documentation for subsidy renewal was not forwarded to the CSC in a timely manner, the borrower would be billed at the note rate of their mortgage. Plans are under way to utilize field personnel to assist in those cases where the borrower has not sent in the complete package. Currently, approximately 70 percent of recertification packages received at the CSC are completed and processed immediately. The remaining 30 percent of incomplete packages require additional contact to obtain the necessary information needed to certify income. The CSC modified request forms to educate our borrowers when completing the recertification packages. This has resulted in a significant improvement from the 30 percent rate of completed forms received in the CSC in March of 1997 compared to the current rate of 70 percent.

FUND FOR RURAL AMERICA

Question. The Senate Agriculture Committee, on which I am also a member, is currently in conference with the House on a bill to reauthorize agricultural research programs. The Senate bill also corrected a technical error in the Farm Bill which eliminated funding for the Fund for Rural America in fiscal year 1998. If funding for the program is restored for fiscal year 1998, will the Department be ready to publish a Request for Proposals and administer a competition in fiscal year 1998, and when would that RFP be published? What division of funding between research and rural development would you anticipate? During the fiscal year 1997 competition virtually all of the funding for rural development was used to simply boost funding for current programs. The role of the Appropriations Committee has traditionally been to establish the appropriate program funding levels. I was very disappointed that the Department chose to dedicate such a large percentage of the rural development dollars in the Fund to changing those program levels. If funding is restored for fiscal year 1998 will the Department take a more creative approach to the rural development funding piece? In particular, there is a real need for funding for initiatives which do not fit neatly within a specific rural development program, but achieve the same goals such as economic and infrastructure development. Will the Department consult with the authorizing and appropriating committees when deciding on the focus of a potential fiscal year 1998 competition?

Answer. The Department's ability to respond to restored funding for fiscal year 1998 will depend on the timing of the funding restoration and the legislation itself. The Department has made no decisions on the division of funding between research and rural development. Regarding the use of funds for rural development in fiscal year 1997, the statute required the funding to go through existing programs. Our ability to be innovative was constrained by the statute and existing program regulations. We chose to dedicate a significant amount of funding to Section 502 housing because of the decrease in the program level. If funding is restored for fiscal year 1998, the Department will still be restricted, by the statute and program regulations, in its ability to be creative. The Department would be pleased to discuss with the authorizing and appropriating committees your views on how the funds should be used.

LAN/WAN/VOICE

Question. Can you comment on how the Department is implementing the cost savings from a common computing and telecommunications environment in local USDA service centers?

Answer. The Business Process Reengineering (BPR) efforts underway are the foundation for all Information Technology investments. The base infrastructure provided by Service Center implementation initiatives like the Common Computing Environment and the LAN/WAN/VOICE project are essential to implement reengineered business processes such as Rural Development's Dedicated Loan Origination

and Servicing (DLOS) System. For example, LAN/WAN/VOICE installations at the DLOS sites permitted timely implementation of the DLOS system. The cost savings from DLOS implementation are already reflected in Rural Development's budget which has already been reduced by Congress to account for the DLOS reengineering effort. In the future, the Service Center implementation's BPR's underway will result in additional cost savings to Rural Development and the other partner Agencies. We are in the process of validating the cost savings resulting from BPR.

SECTION 515 HOUSING PROGRAM

I am very concerned with the continuing decline in funding for the Section 515 Multi-Family housing program. In fiscal year 1999 the Department is proposing a decrease in funding of approximately \$30 million.

Question. What would the impact of this reduction be on the number of people served and the number of units created or rehabilitated in comparison to fiscal year 1998?

Answer. With a program level of \$150 million for the Section 515 program, in fiscal year 1998, the Agency will use approximately \$99.5 million for new construction and \$50.5 million for repair/rehabilitation purposes. At these levels, the Agency estimates that we will build 2,287 new units and repair or rehabilitate 5,012 existing units. A reduction of \$50 million for fiscal year 1999 would result in only 1,667 new units and the repair or rehabilitation of 2,445 existing units, if costs remained constant. Consequently, less families will be served with the reduced funding.

Question. Please provide me with this same data over a 10 year period of time—I am interested in seeing the comparative funding levels and number of units created over the past 10 years.

Answer. The information follows:

SECTION 515 APPROPRIATIONS AND OBLIGATIONS—FISCAL YEARS 1988–1998

[Run Date: March 9, 1998]

Fiscal year	Allocations	Obligations to date	Units built
1998 ¹	\$150,000,000	\$110,000,000	2,468
1997 ²	153,132,327	152,497,187	1,913
1996 ³	151,009,628	151,009,628	2,853
1995	183,319,000	182,037,517	11,542
1994	540,107,000	509,380,278	15,340
1993	573,900,000	569,704,650	14,787
1992	573,900,000	564,262,480	15,396
1991	576,185,201	573,904,776	16,063
1990	571,904,000	568,236,051	15,996
1989	554,934,000	551,503,713	16,465
1988	554,935,000	551,503,713	16,465

¹The \$110 million figure represents obligations to date including one subsequent loan. Approximately \$94 million will be used for new construction.

²\$95.9 million was used for new construction. The balance was used for rehabilitation/repair.

³Approximately \$74.4 million was used for new construction. The balance was used for critical health and safety and deferred maintenance.

QUESTIONS SUBMITTED BY SENATOR BYRD

WATER AND WASTE

Chairman Cochran, Senator Bumpers, members of the subcommittee, and Undersecretary Thompson, I am pleased to be here today to review the U.S. Department of Agriculture's (USDA) Rural Development (RD) programs. These programs address one of my long-standing priorities—community infrastructure that meets the basic needs of our citizens. In particular, the Rural Utilities Service (RUS) programs provide small rural communities with grants and loans for water and waste disposal systems—infrastructure that I deem a fundamental element of modern civilization.

Incredibly, in these United States, nearly 8 million people do not have access to safe drinking water. Now, let me repeat that, 8 million people in the United States of America, the most prosperous and powerful nation on the face of the earth, do not have access to a reliable source of clean drinking water. That, in my view, is

a national disgrace. National safe drinking water needs are assessed at some \$10 billion. In West Virginia, in 1995, 176,000 families were without an adequate supply of safe drinking water, and the estimated cost of needed water development projects in my state alone is \$1 billion dollars.

The USDA's efforts to provide safe drinking water to American families are generally laudable, if underfunded. I have maintained for years that our budget slights the most basic needs of the people, and that we must take action to restore common sense to our budget priorities. This hearing is a welcome opportunity to renew attention to the critical need for federal investment in basic infrastructure, and I have several questions regarding the President's proposed budget in this regard.

First, I am pleased that the proposed budget for water and waste water systems includes an approximately \$100 million increase for the loan programs. You state in your prepared remarks that this proposed budget will provide new water service to about 500,000 rural residents. I would be interested in reviewing a state-by-state breakdown of the residents expected to benefit from this budget.

Question. Do you have such a breakdown?

Answer. The estimate was based upon nationwide averages. We can allocate this estimate, by state, using the amount of funds initially allocated per state and the same ratio of loan and grant dollars to people served.

Question. If not, I would appreciate your providing me with such a chart.

Answer. The following table is submitted for the record.

RUS water systems—estimate of people to be serviced in fiscal year 1999

Alabama	12,061
Alaska	1,172
Arizona	3,976
Arkansas	9,148
California	12,777
Colorado	3,872
Connecticut	3,173
Delaware	1,010
Florida	11,310
Georgia	15,815
Hawaii	899
Idaho	3,496
Illinois	12,469
Indiana	11,554
Iowa	7,369
Kansas	5,112
Kentucky	14,376
Louisiana	10,022
Maine	4,443
Maryland	4,459
Massachusetts	3,884
Michigan	16,931
Minnesota	8,858
Mississippi	12,910
Missouri	11,463
Montana	3,197
Nebraska	3,123
Nevada	965
New Hampshire	3,043
New Jersey	3,144
New Mexico	3,982
New York	14,489
North Carolina	19,548
North Dakota	2,116
Ohio	17,152
Oklahoma	7,819
Oregon	6,013
Pennsylvania	20,298
Puerto Rico	21,008
Rhode Island	742
South Carolina	10,131
South Dakota	2,525
Tennessee	13,296
Texas	21,008
Utah	1,689

Vermont	2,403
Virginia	11,889
Virgin Islands	515
Washington	7,194
West Pacific Areas	515
West Virginia	9,319
Wisconsin	10,126
Wyoming	1,373
Unallocated	83,593
Totals	504,774

It is my understanding that Water 2000 was designed to assist those communities with the most limited financial resources and highest poverty rates. I have been advised that many West Virginia communities awaiting federal assistance for water and waste disposal systems would require substantial grant funds to make water or waste water systems economically feasible for the community to operate.

Question. Do you agree with this assessment? Does a similar assessment exist nationwide?

Answer. We agree that there are rural communities in West Virginia and in other parts of the country that need substantial grant funds in order to construct or improve a water or waste disposal system. However, the majority of rural communities across the nation can afford to repay a loan to cover some, if not all, of the construction-related costs and successfully operate the system. We assist communities in constructing facilities that are modest in size, design and cost which helps lower the overall project cost and the need for grant funds. Additionally, the lowest income communities can qualify for a loan with an interest rate of 4.5 percent thereby helping to lower user rates. A majority of the loans made by the Agency were at the 4.5 percent rate or the intermediate rate, which is currently 4.875 percent. Higher income communities pay the market rate which is now 5.25 percent.

If this assessment is accurate, the loan programs are effectively worthless to many small towns, unless accompanied by a grant.

Question. Given this situation, why has there been no proposed increase in funding for the water and waste disposal grant program?

Answer. The requested budget authority levels for water and waste disposal loans and grants reflects budgetary considerations and the funding needs of all Rural Development programs. The Rural Development State Directors have been given authority to transfer budget authority between the water and waste loan and grant accounts. This provides them with the flexibility necessary to match dollars with the needs of their States.

Question. Under your proposed budget, when will the goals of Water 2000—to provide reliable, clean water for rural Americans—finally be reached in the nation? In West Virginia?

Answer. We see the policy initiative of Water 2000 as a continuing effort to help rural people achieve a better quality of life. Bringing clean water to rural households is only part of the battle. Once water is available, it must continue to meet Safe Drinking Water Act standards. Over 60 percent of the water and waste loan and grant funds is used for expansion, replacement, and renovation of existing systems, replacements and renovations necessary for the systems to provide quality service to their rural customers.

Question. If additional funding were provided for Rural Development programs, would you agree with me that priority should be given to the water and waste disposal accounts?

Answer. The water and waste programs have over \$3 billion in funding requests on hand. If additional funding were provided for Rural Development programs, the water and waste programs should receive consideration for these funds.

QUESTIONS SUBMITTED BY SENATOR BUMPERS FOR SENATOR DORGAN

RURAL AREA ECONOMIC PARTNERSHIP (REAP)

In fulfillment of a promise made by the President in 1993 to address rural out migration and the resulting economic hardship, the USDA's Office of Rural Development signed a Memorandum of Understanding with several entities in North Dakota to create the Rural Area Economic Partnership (REAP) Pilot Program. The President made a commitment to the REAP zones because the standard EZ/EC programs did not work for areas of high out migration.

I think the grassroots organization of the REAP zones is going well. However, I have some concerns that USDA is presenting what might be usual Department expenditures in these zones as commitments toward the President's promise of \$10-\$25 million for each of the zones as demonstration areas.

Question. I have received a report from USDA on expenditures in the REAP zones, but I would like the Department to provide for the record a dollar figure on what it believes was provided to the REAP demonstration areas in fiscal year 1997 above and beyond the funds these areas would normally receive through USDA programs.

Answer. USDA Rural Development assistance to participating North Dakota counties has risen sharply over the level for the period of 1991-1995. The 14 county area encompassed within the two REAP zones show an average of less than \$3 million a year in Rural Development funding dollars (not including single family housing) during 1991-95. During the fiscal years 1996 and 1997 and a small portion of fiscal year 1998 the annual average to the REAP counties is approximately \$12 million annually.

Question. What formal planning and accounting mechanism is in place to assure that funding promised to the REAP zones is delivered?

Answer. The Office of Community Development is in the process of completing a data base program for all related rural development programs that will provide an annual tabulation of all of this information for the future.

Currently, applications for certain USDA grant and loan programs submitted from the REAP zones receive up to five additional points. These programs are the Rural Business Enterprise Grants (RBEG), Rural Economic Development Loan and Grant Program (REDLG), Business and Industry (B&I) and the Community Facilities (CF) Program.

This means that the REAP zones receive no additional points for the Water and Waste Program, the Intermediary Relending Program, several important rural housing programs, and the Forest Service economic development programs.

Question. What is the rationale for applying the additional points only to those four programs listed? What steps are being taken to incorporate the REAP zones into all aspects of Rural Development's portfolio?

Answer. With the exception of the Forest Service economic development program, which is not in the North Dakota Rural Development portfolio, the North Dakota State Director for Rural Development gives maximum points to all Rural Development programs to the extent allowed by regulations.

Currently USDA is working to establish the first ever rural Enterprise Zone (EZ) based on, in part, out migration. Rural North Dakota has suffered from staggering net outmigration (more than 15 percent) and the accompanying economic stagnation.

Question. How is USDA going to inform and involve local entities interested in pursuing the designation for the Rural EZ?

Answer. In coordination with the official announcement of Round II during the month of April, USDA has tentatively scheduled 12 Regional Workshops strategically placed around the country. One workshop, which will have a large concentration of communities with problems of outmigration, is tentatively scheduled to be held in South Dakota.

We will officially notify all Members of Congress with the specific dates, times and places of these workshops as they are finalized. We would hope that Members would provide this information to their communities and to other special interest groups within their states and Districts.

All State Rural Development offices will be involved in contacting and informing state agencies, community interest groups, and others. The USDA Office of Inter-governmental Affairs.

SUBCOMMITTEE RECESS

Senator COCHRAN. This will conclude our hearing today. We will continue to review the Department of Agriculture budget at another hearing on Tuesday, March 10 in this room 138 of the Dirksen Senate Office Building. At that time, we will be looking at the budget request for the Department's food, nutrition, and consumer services programs. Until then, the subcommittee stands in recess.

Ms. THOMPSON. May I?

Senator COCHRAN. Please.

Ms. THOMPSON. Mr. Chairman, I do not know that I have appropriately thanked you for your leadership on rural development issues. I sort of went into my budget testimony without doing that. As I have traveled around the country and had an opportunity to meet with community leaders in communities that are really challenged, I know from firsthand experience talking with these leaders, these folks, that your leadership is truly making a difference. Your leadership here in the U.S. Senate is truly making a difference. Because I continue to live in a rural community and my husband sits on a local school board of a small school, I also know from that experience how valuable your leadership is. Thank you for the very strong support that you give to rural America.

Senator COCHRAN. Well, I appreciate very much the kind remarks. I am grateful to you for saying that, and I look forward to continuing to work with you and your staff and associates in helping achieve even better success in the future. Thank you very much.

The hearing is adjourned.

[Whereupon, at 11:30 a.m., Tuesday, March 3, the subcommittee was recessed, to reconvene at 10:11 a.m., Tuesday, March 10.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

TUESDAY, MARCH 10, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:11 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Burns, and Bumpers.

DEPARTMENT OF AGRICULTURE

**STATEMENT OF SHIRLEY R. WATKINS, UNDER SECRETARY, FOOD, NU-
TRITION, AND CONSUMER SERVICES**

ACCOMPANIED BY DENNIS KAPLAN, BUDGET OFFICE

FOOD AND NUTRITION SERVICE

STATEMENT OF YVETTE JACKSON, ADMINISTRATOR

**ACCOMPANIED BY RONALD J. VOGEL, ASSOCIATE DEPUTY ADMINIS-
TRATOR, SPECIAL NUTRITION PROGRAMS**

CENTER FOR NUTRITION POLICY AND PROMOTION

STATEMENT OF RAJEN ANAND, EXECUTIVE DIRECTOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

Today we continue our review of the budget request for fiscal year 1999 submitted by the President for the Department of Agriculture and related agencies. We are specifically reviewing today the request for programs and activities of the Food and Nutrition Service of the Department of Agriculture.

The Under Secretary for Food, Nutrition, and Consumer Services is Ms. Shirley R. Watkins, whom we welcome to the hearing today. She is accompanied by others responsible for activities in the Service. We will invite her to introduce her associates and colleagues on the panel.

I notice that this year's request represents about 68 percent of the total budget authority proposed for all USDA programs and activities under the jurisdiction of this committee. Sixty-eight percent. Now, that ought to illustrate to everyone how important it is for us to review this budget proposal carefully and to understand the programs that are funded by this appropriations request.

Some of the better known programs, of course, are the Child Nutrition Programs. We see a \$1.5 billion increase in mandatory funding is required to support these programs for fiscal year 1999. We have the Food Stamp Program; the Special Supplemental Nutrition Program for Women, Infants, and Children [WIC]; and other food assistance programs to review in this hearing.

We appreciate very much the cooperation with the subcommittee of Ms. Watkins and others who have endeavored to stay in touch with us and keep us aware of problems and situations regarding the funding of these programs. We had a difficult time last year resolving some of these differences with our friends over in the other body, but nonetheless, we worked our way through a number of issues and we were happy to see the administration become creative, as we have suggested they might have to, in order to continue to carry out responsibilities that are required of them by law.

I have been impressed with the work of Ms. Watkins and others who have tried very hard to see that those who do need assistance in meeting their own nutrition needs have that assistance available.

We cannot do it all through these programs. There are many others who are involved, many private organizations, foundations, churches, neighbors, friends, and others who all are committed, I think, to the proposition that nobody in America ought to go without food. That we are a rich country; we are a caring country; and that working together, Federal, State, and local governments and private associations and charities surely can meet all these needs that exist out there.

So, we are not in this alone. That is another point that I want to make. To assume the responsibility for trying to solve every problem that we have in this country and the world too through appropriations from this committee is probably a mistake from the beginning. But we do feel that we have a role to play and a very important one—a role of leadership.

So, we will seek to work with the administration to define that role in a thoughtful way and a responsible way and to provide the funds that are available to us under the allocation process. We cannot generate money out of the air. We have to have it allocated to us under a budget resolution, and that is yet to be completed.

So, with those realities in mind, we welcome Ms. Watkins and her associates. I am happy to now yield to my distinguished friend and colleague from the State of Arkansas, Senator Bumpers.

STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Thank you very much, Mr. Chairman.

Do you know why you are impressed with Secretary Watkins? She is from Arkansas. [Laughter.]

And you know what else? She is from Hope, AR.

Senator COCHRAN. Oh, my goodness.

Senator BUMPERS. Is this nepotism? Did you go to school with you know who? [Laughter.]

We are very proud of Secretary Watkins, and I agree with you, Mr. Chairman. She is doing an excellent job.

I just wanted to welcome her and her colleagues to the hearing this morning. This is something that should not be terribly con-

troversial, just a few questions about how some of these programs are working.

PREPARED STATEMENT

With that, Mr. Chairman, I will ask unanimous consent that I be permitted to insert my opening remarks for the record.

Senator COCHRAN. Without objection, it is so ordered.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

It is a pleasure to welcome Secretary Watkins to our subcommittee not only as a representative of the Department of Agriculture, but also as a fellow native Arkansan. I also want to extend my welcome to the other USDA officials who are with us today.

I am often asked by constituents why food stamps and other programs associated with "welfare" are included in "farm" legislation. It seems to make little difference to them whether that legislation is a farm bill or an agriculture appropriations bill. The more cynical answer to that question is that you have to include programs in farm legislation that have the support of urban Members of Congress in order to assure passage. In other words, if you want to pass legislation for agricultural research, conservation, or rural development, you had better include provisions to provide assistance to large numbers of people in the cities as well.

As is usually the case, a more accurate answer can be found in history. In 1936, the forerunner of the Food Stamp program began as the Commodity Distribution to Needy Families Program. This New Deal era program was not designed primarily as a "food assistance" program. Instead, the main purpose of this program was to create markets for farm assistance purposes. The original federal food assistance program was a farm program. Gradually, the program evolved by 1975 into the nation-wide Food Stamp program it is today, by far the largest single program in this subcommittee's jurisdiction.

The Food Stamp program may be the largest single program we fund every year, but it is by no means the only food assistance program in our appropriations bill. The Child Nutrition Programs, the WIC program, the various commodity distribution programs, and others, all contribute to our national standard that there is no place in the United States for hunger. These programs are expensive, but they go far to reduce future health care costs and to calm the national conscience in a recognition that the well being of all our people does matter.

In recent times, the Congress has given much attention to so-called Welfare Reform and the concept that people need to take greater responsibility for themselves. To a large extent, Welfare Reform is tied to food assistance. Changes in the Food Stamp program were a part of Welfare Reform. We are now presented with proposals to revisit some of the reform provisions that have been concluded as overly harsh. There is certainly nothing wrong with expecting more responsibility, especially among our adult populations, but we must keep in mind our own responsibilities to children and other members of our society who may have nowhere else to turn but to a benevolent government.

I do not mean to imply that food assistance is totally a governmental responsibility. For many years before the government linked farm and food assistance together in 1936, churches, synagogues, and numerous charities and civic groups joined together in a common cause to protect the most vulnerable among us. The USDA food assistance programs are not designed to replace the traditional charitable efforts, but supplement and support them. In fact, this subcommittee has provided funding to help with transportation and other administrative costs to facilitate the donation of food from various donors through the TEFAP program. In addition, the Secretary is now committed to develop a nation-wide food gleaning program to make use of the billions of pounds of food that is wasted every year at our retail and food service outlets. Just because the United States is a land of plenty does not excuse ours being a land of wastefulness.

Concurrent with consideration with the fiscal year 1999 appropriations bill is congressional attention to reauthorization of the Child Nutrition Programs and WIC. The purpose of that legislation, as with this subcommittee's responsibility, is to assure that national resources are put to best use and that all our people are given adequate opportunities to proper nutrition and a healthy life. I look forward to hearing today's testimony by our friends from USDA and to working with Senator Coch-

ran and others on this subcommittee in crafting the coming year's appropriations bill to assure the mission of us all is properly achieved.

STATEMENT OF SHIRLEY R. WATKINS

Senator COCHRAN. Ms. Watkins, we have a copy of your statement, which we appreciate very much. It will be printed in full in the record. We encourage you to make whatever comments you think would be helpful to the committee. Please introduce those who are with you.

Ms. WATKINS. Mr. Chairman and Senator Bumpers, thank you very much for letting us appear before you this morning. I would like to present the staff who are joining me today. Yvette Jackson, the Administrator for the Food and Nutrition Service. She has previously appeared before this committee as the Deputy Administrator for the Food Stamp Program. We also have to my right Ron Vogel who is the Associate Deputy Administrator for Special Nutrition Programs for the Food and Nutrition Service; Dr. Rajen Anand who is the Executive Director for the Center for Nutrition Policy and Promotion; and Dennis Kaplan who is the Department's Deputy Director for Budget, Legislative, and Regulatory Systems in the Office of Budget and Program Analysis. And in the audience, we also have the Deputy Under Secretary for the Food and Nutrition Service, Julie Paradis.

FOOD AND NUTRITION SERVICE FISCAL YEAR 1999 BUDGET REQUEST

Mr. Chairman, I appreciate so much this committee's support for these programs and you have shown that throughout the years.

As you have indicated, I am submitting my written testimony for the record, and I do have a few comments that I would like to make.

The fiscal year 1999 budget request for the Food and Nutrition and Consumer Services totals some \$39.2 billion. This includes \$25.1 billion for the Food Stamp Program, another \$9.2 billion for the Child Nutrition Programs, \$4.1 billion for the WIC Program, \$317.1 million for the Commodity Assistance Program, and \$111.8 million for our Food Program Administration.

The Food and Nutrition Service funds more than 100 million meals every day, and most of these go to poor families. We strive to enhance the public's confidence in these programs by ensuring that they are efficient, that they have program integrity, and that there is fairness in the programs.

Additionally, these programs support American agriculture by providing families and individuals the means to purchase food products and by purchasing commodities for donation to many of the public and private cooperators at both the State and the local levels.

We view the 15 food assistance programs—and I like to call them Nutrition Assistance Programs—collectively as the critical link to alleviating hunger in this country. Each one of these programs plays a significant role in the nutrition and health of children and families.

THE FOOD STAMP PROGRAM

I want to address first our largest program and that is the Food Stamp Program.

The Clinton-Gore administration will submit legislative proposals to restore food stamp benefits to legal immigrants with certain exceptions and to ensure that common administrative costs are allocated fairly among TANF, food stamps, and Medicaid.

In fiscal year 1997, FNS had significant success in the Food Stamp Program, and I would just like to cite some of those.

Continuing the nationwide campaign to increase payment accuracy. In the last 5 years, there has been a steady decline in the overpayment error rate. The rate has fallen from 8.3 percent in fiscal year 1993 to 6.9 percent in fiscal year 1996. This reduction has resulted in a savings of nearly \$665 million.

Increasing recipient fraud disqualification from 94,000 in fiscal year 1996 to 105,000 in fiscal year 1997. This is an increase of about 12 percent.

Some 28 States have implemented EBT, and 13 of those systems are statewide, as of the end of December 1997.

We are going to contract for approximately 35,000 onsite and postauthorization store visits annually beginning in fiscal year 1998 to supplement FNS' oversight of retailers. We disqualified over 1,500 retailers for violations during fiscal year 1997. Of those, 933 were permanent disqualifications for trafficking violations. This represents a 23-percent increase from fiscal year 1996.

THE CHILD NUTRITION PROGRAM

The next area I would like to address is the Child Nutrition Program whose authorization expires at the end of this fiscal year. We do have a legislative proposal to reauthorize WIC and several child nutrition programs as they expire at the end of this fiscal year. That should be in your hands sometime before the day is over.

Beginning with the school meals, these programs we feel are the foundation in nutrition supplying children with food that they need and low-income adults with the help to meet their families' food budget. Every day we serve 26 million schoolchildren a nutritious school lunch, while about 7 million children eat a school breakfast.

Low-income children served by the National School Lunch and School Breakfast Programs need basic nutrition assistance not just during the school year, but they also need that assistance in the summer as well. The Summer Food Service Program fills that critical need in providing meals at schools and at recreational sites during the summer. We have made a concerted effort to reach more children in the Summer Food Service Programs. Only a fraction of the needy children who eat a school lunch during the regular school year also receive a meal in the Summer Food Service Programs.

In fiscal year 1999 we estimate that in excess of 149 million meals will be served. That is an increase of about 8.6 million meals over the fiscal year 1998 projections. In addition, we estimate that the summer program will serve almost 2.6 million children. That is an increase of almost 150,000 children over 1998.

In our Nutrition Education and Training Program, that program has a 19-year history of delivering cost-effective nutrition education, training, technical assistance as a component of our Child Nutrition Programs. Funding NET at the requested \$10 million level will enable State and local food authorities to use the established NET infrastructure to deliver nutrition education to students, educators, and parents, as well as our food service personnel in the schools and in child care centers. The NET infrastructure offers an effective and cost-efficient vehicle for reaching some 94,000 schools across the Nation.

The other area is our Child and Adult Care Food Program. That program provides assistance in reimbursements and commodities to child and adult care programs across the country. This includes providing nutritious meals to serve preschoolers and elementary school age children in child care arrangements, and also to impaired adults who need day care services. Last year our CACFP subsidized over 1½ billion meals to children in day care homes, children in family day care, and the impaired adults in the adult day care setting.

THE WIC PROGRAM

The other area I would like to comment on is our WIC Program. It is a program whose purpose is to improve the health and nutrition of at-risk, low-income, pregnant, breastfeeding, postpartum women, infants, and children up to their fifth birthday. This program is one of our stars. The fiscal year 1999 budget request meets the President's full commitment to fully fund the WIC Program. The requested funding of \$4.1 billion will maintain the projected fiscal year 1998 participation level of approximately 7.5 million participants.

In the WIC Program, we are striving to improve the overall program management and again program integrity. This spring we plan to issue guidance to State agencies on more uniform application of science-based nutritional risk criteria. The core risk criteria were developed through a yearlong process with Federal-State partnerships. The criteria will ensure the consistency in the nutritional assessment of WIC applicants. This budget request also assumes the continued success of State agencies to obtain significant savings in the cost of infant formula to the program.

In fiscal year 1997, an additional 1.9 million participants per month were served because of the great success States had in collecting almost \$1.3 billion from infant formula manufacturers. This program continues to collectively save money and contribute to healthier mothers, babies, and children who will enter school unfettered by the consequences of poor nutrition and inadequate health care in their formative years.

Mr. Chairman, every dollar that is spent on WIC services for low-income pregnant women saves \$1.77 to almost \$3.13 in Medicaid costs for the first 60 days after birth. That is a success.

I am aware of this committee's concern about the level of funds that were carried over from one year to the next. Our fiscal year 1999 request assumes that \$130 million will be carried into and out of fiscal year 1999. This level is about \$20 million less than what we project as being carried into fiscal year 1998. We believe that

these are the minimum levels necessary for our State and Indian tribal organizations to maintain the current participation levels in this grant program. These State and local operators must live within their budgets. Collectively these States underspend their available resources from about 3 to 4 percent so that they can ensure that they are on target.

These carryover issues manifested themselves during the four WIC listening sessions I had around the country with a diverse group of recipients and program operators, health care providers, and State officials. They disclosed a variety of issues. Because the Federal grant is only one source, and sometimes the only source for WIC funds in most States, the States exercise extreme caution to ensure that they do not spend more than their Federal grant.

In addition, because the States commonly distribute WIC food benefits to participants in the form of checks and vouchers, it is difficult for them sometimes to determine the program's cost until after those vouchers and checks have been redeemed and processed. So, the unspent funds relate to specific situations or circumstances that sometimes limit program participation.

In one State, as an example, they described that they were installing a new computer system, so they wanted to use that to verify WIC eligibility and to issue WIC food vouchers temporarily. That reduced the amount of time that they had for the clinical staff to certify and serve new clients, because they instead had to spend more time learning the new software and operating procedures.

Having unspent Federal WIC funds did not necessarily indicate a lack of need for the program benefits. Some States even reported that more eligible individuals could have been served by WIC had it not been for the reasons related to the program's structure and/or State-specific situations or circumstances.

Another program area where we have made some changes is the WIC Farmers' Market Nutrition Program. It has been moved from our WIC account to the Commodity Assistance Program account. This was done to ensure that we had funds available for the operation of the program. We believe that this change will enable States to improve the program for WIC recipients as well as facilitate better program planning for our farmers.

CENTER FOR NUTRITION POLICY AND PROMOTION

Our budget supports the Center for Nutrition Policy and Promotion that was established in 1994. The focal point for this program is for USDA to promote the health of all Americans through good nutrition by linking the scientific research for the dietary needs of the consumer. The importance of this mission cannot be overstated particularly when 4 of the 10 leading causes of death in our country are related to poor diet. That is a significant contributing factor. The budget for the Center is shown in our FPA account which is over some \$2.5 million.

STUDIES AND EVALUATION

As I come to closure, Mr. Chairman, there are four more issues that I would like to address.

One, the administration strongly believes the funding for studies and evaluation should be with the entity administering the pro-

grams in order to maximize the value of these efforts in our food assistance programs. As such, this budget proposes the return of funding for studies and evaluations to the Food and Nutrition Service agency.

TRAINING AND TECHNICAL ASSISTANCE

Two, we are requesting \$2 million to provide training and technical assistance to State and local school cooperators to promote safe food handling in our school meals preparation.

FOOD GLEANING

Three, one of Secretary Glickman's top priorities is ensuring that USDA does everything within its power to expand the recovery and food gleaning process so that we can have wholesome food for distribution to Americans in need. While this administration firmly believes that the fundamental Federal nutrition assistance program, such as food stamps and WIC and our National School Lunch and School Breakfast Programs, will continue to be the first line of defense for Americans facing hunger, recovered and gleaned food can increasingly provide nutritious additions to the diets of low income Americans and provide some access to food banks and soup kitchens.

FOOD PROGRAM ADMINISTRATION

Finally, our budget request for our Food Program Administration account is \$111.8 million. In recent years our FPA account has not been enough to keep demand with the rising demands made on this agency. As you indicated, Mr. Chairman, over 68 percent of Agriculture's budget is in food assistance programs, and these reduced administrative funds has required that more than 18 percent reduction be made in our staffing since 1993 and nearly a 40-percent reduction since the early 1980's. Recent OIG and GAO audits have cited FNS for insufficient staff to ensure program compliance with statutory requirements in program areas. And clearly, ensuring proper program and financial management for an agency managing almost \$40 billion in program funds must be a top priority.

Mr. Chairman, I appreciate your allowing me to make these brief remarks. This concludes my oral presentation. I would be happy to answer any questions that you and the other members may have. Thank you very much.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Madam Secretary. We appreciate your comments and the full statements which you have submitted for our hearing record.

[The statements follow:]

PREPARED STATEMENT OF SHIRLEY R. WATKINS

Mr. Chairman. Members of the Subcommittee, it is my pleasure to appear before you for the first time to discuss the President's Fiscal Year 1999 Budget Request for USDA's Food and Nutrition Programs. In July, 1997 I was confirmed as the Under Secretary for Food, Nutrition, and Consumer Services (FNCS), responsible for the Nation's domestic nutrition assistance programs which provide access to a more nutritious diet for persons with low incomes and which encourage better eating

choices among the Nation's children and their families. These programs include the anchor programs of Food Stamps, Child Nutrition and the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). I am accompanied today by Yvette Jackson, the Administrator of the Food and Nutrition Service, who has previously appeared before you as the Deputy Administrator for the Food Stamp Program, George Braley, the Associate Administrator of the Food and Nutrition Service, Dr. Rajen Anand, Executive Director of the Center for Nutrition Policy and Promotion and Stephen Dewhurst, the Department's Director of the Office of Budget and Program Analysis.

The Food, Nutrition and Consumer Services is responsible for ensuring that all Americans have access to healthful diets and nutrition information. We accomplish this by providing nutrition assistance to needy families, school-age children and women, infants and children at nutritional risk. We make available nutrition education and information to all Americans, regardless of income, and provide health referrals to certain program participants. FNCS sponsors and supports research aimed at improving the nutritional quality of diets consumed not only by the participants in our programs, but by all Americans. We strive to enhance the public's confidence in our programs by ensuring the efficiency, integrity and fairness of our programs. Finally, we support American Agriculture by providing families and individuals the means to purchase food and food products and by purchasing commodities for donation to our many public and private cooperators at the State and local levels. Together, these programs provide a nutrition safety net for low-income Americans. We view the food assistance programs collectively as the critical link in alleviating hunger in this country. They are absolutely crucial to many millions of Americans. I do not wish to forget for one minute the responsibility that this Administration and I have to ensure both the program and financial integrity of each program and that the delivery of benefits to all qualified recipients be accomplished with integrity and timeliness.

The Department is the lead Federal Agency in human nutrition and is charged with the goal of promoting a healthy and well nourished population through research and nutrition education. The Center for Nutrition Policy and Promotion, established in 1994, serves as the focal point within USDA to promote the health of all Americans, including those participating in the food assistance programs, through good nutrition by linking scientific research to the dietary needs of the consumer.

The importance of this mission cannot be overstated when one considers that in 4 of the 10 leading causes of death in our country, poor diet is a significant contributing factor: heart disease, cancer, stroke and diabetes account for 1.4 million deaths annually, nearly two-thirds of the total deaths in the U.S. Diet also plays a critical role in other health concerns such as obesity, hypertension, and osteoporosis. Taken together, these diet-related diseases cost society an estimated \$250 billion each year in medical cost and lost productivity.

ECONOMIC SUCCESS

Our Administration has led the Country to exceptional economic success. The Country is currently experiencing record job creation, extremely low unemployment rates and projections of continuing low inflation. Our budget projections reflect these strong economic conditions; notwithstanding these successes, there continue to be many, many people who genuinely need the food assistance these programs provide. FNS programs, particularly WIC, the Child Nutrition Programs and the Commodity Assistance Programs are in increasing demand insofar as they help low-income Americans transition from welfare to work.

PROGRAM HIGHLIGHTS AND INITIATIVES

LEGISLATION

The Clinton Administration will submit legislative proposals to restore food stamp benefits to legal immigrants with certain exceptions and to ensure that common administrative costs are allocated fairly among Temporary Assistance to Needy Families (TANF), Food Stamps and Medicaid. There will be proposals to reclassify recipient claims as State rather than Federal debt and to reauthorize WIC and several Child Nutrition Programs whose authorization expires at the end of this fiscal year.

FOOD STAMP PROGRAM

Restore Benefits To Legal Immigrants

The Administration proposes to restore Food Stamp benefits for vulnerable groups of legal immigrants. Upon signing the 1996 welfare law, the President pledged to

work toward reversing the harsh, unnecessary cuts in benefits to legal immigrants that had nothing to do with moving people from welfare to work. The President believes that legal immigrants should have the same opportunity, and bear the same responsibility, as other members of society. The fiscal year 1999 budget would provide Food Stamp benefits to 730,000 legal immigrants at a cost of \$2.5 billion over five years. The proposal expands access to Food Stamps for families with children, people with disabilities, the elderly, and refugees and asylees.

The Balanced Budget Act of 1997 helped somewhat by restoring SSI and Medicaid eligibility to elderly and disabled legal immigrants who were already in the United States at time of enactment.

This proposal would restore food stamp benefits to the most vulnerable groups of immigrants—children and their families; the elderly; and the disabled. This proposal also recognizes that refugees often need more than five years to become established in this country; thus, it lengthens eligibility from five years to seven for refugees and those granted political asylum. It also provides food stamp eligibility to certain Hmong and highland Lao tribal members who entered the United States after the Vietnam conflict. Finally, it restores eligibility to certain Native Americans in reservations that span United States/Canadian borders.

Allocate Administrative Costs Fairly

An unanticipated consequence of the landmark welfare reform legislation is the ability of States to gain a windfall by reallocating common administrative costs to the Food Stamp and Medicaid Programs. Prior to welfare reform, common administrative costs in the Food Stamp, Medicaid, and Aid to Families with Dependent Children (AFDC) programs were charged primarily to AFDC. These charges were included in the State TANF grants created by welfare reform. As a result, if States now share common administrative cost among the programs, they can claim additional payments from the Federal Government in the Food Stamp and Medicaid Programs without a reduction in their TANF grant thereby experiencing a windfall.

To mitigate this windfall, starting in fiscal year 1999 States will be required to allocate common administrative costs among all three programs in a manner which results in each program paying its fair share. Costs will be shifted from TANF to Food Stamps and Medicaid; however, the TANF block grant will not be reduced. Instead, the Federal share of administrative costs for the Food Stamp and Medicaid programs will be reduced from 50 percent to 47 percent. This proposal is administratively simple to implement and it removes the incentive for inflated cost allocation by establishing a uniform Federal share of administrative costs.

Recipient Claims

Finally, we will be submitting legislation to reclassify claims against food stamp recipients for erroneous benefit issuance as State debt rather than Federal debt. We believe this proposal's effect to be cost-neutral in the near term; however, we think that if States respond to the incentives being proposed, it has great potential to substantially increase collections in the future.

REAUTHORIZATION

The authorization for several of our programs expires at the end of this fiscal year. We will be submitting cost-neutral legislation to reauthorize the WIC, Summer Food Service, Child Nutrition Commodity Distribution Program, and State Administrative Expense Programs. We will also submit proposals to improve the operation, management and integrity of the National School Lunch and School Breakfast Programs, the Child and Adult Care Food Program and the WIC Program.

PROGRAM INTEGRITY

In fiscal year 1997, FNS had success in combating fraud and abuse while promoting program integrity. In the Food Stamp Program, FNS aggressively continued its nationwide campaign to increase payment accuracy and has been successful in obtaining commitments from many States to make payment accuracy a top priority. Since fiscal year 1993, there has been a steady decline in the overpayment error rate. During this period, that rate has fallen from 8.3 percent in fiscal year 1993 to 6.9 percent in fiscal year 1996, resulting in a savings of nearly \$665 million. The payment (overpayment and underpayment) error rate in fiscal year 1996 was 9.22 percent. This is down about 12 percent from the 1995 rate of 10.30 percent.

FNS collected a total of \$186 million in recipient claims in fiscal year 1997. Recipient fraud represented \$60 million of the total, errors by households represented \$104 million and errors by the State Agency represented \$22 million of this total.

The Federal Debt Collection processes (Federal Tax Refund Offset and Federal Salary Offset) resulted in collections of almost \$60 million in fiscal year 1997. This represents an approximate 50 percent increase from the previous fiscal year.

Recipient fraud disqualifications have increased from 94,124 in fiscal year 1996 to 105,759 in fiscal year 1997, an increase of about 12 percent over fiscal year 1996. Although Federal reimbursement and retention rates have dropped over time, States have continued to invest increasing amounts of State funds into fraud control.

During fiscal year 1997, FNS' Compliance Branch completed intensive investigative efforts in several major urban areas—Detroit, New Orleans, Los Angeles, Jersey City, Miami, and Philadelphia—in which almost 1200 suspect stores were investigated. Approximately 550 of those stores were found to have committed food stamp violations and, of those, almost 200 were found to have trafficked in food stamp benefits. Based on Compliance Branch cases, Department of Justice (DOJ) levied penalties of over \$1 million against retailers convicted of making false claims.

Electronic Benefit Transfer (EBT) continues to be a positive means of combating food stamp trafficking. At the end of December 1997, 28 States had implemented EBT systems, 13 of those being Statewide.

During fiscal year 1997, FNS successfully deployed an automated anti-fraud profile system known as ALERT in all active EBT areas. The ALERT system analyzes individual EBT transactions for patterns of violations both for investigation selection and support as well as for taking direct administrative action against retailers found in violation.

Funds provided by this Committee resulted in successful contracting for pre- and post-authorization visits to participating stores. In fiscal year 1997, FNS tested contracting for on-site store visits and will contract for approximately 35,000 on-site store visits annually beginning in fiscal year 1998 to supplement FNS oversight of retailers. This effort should significantly improve program integrity.

FNS disqualified 1,561 retailers for violations during fiscal year 1997; of those, 933 were permanent disqualification for trafficking violations. This represents a 23 percent increase over fiscal year 1996 and reflects results from combining the use of EBT data, targeted sweeps and joint efforts involving FNS, USDA/Office of the Inspector General (OIG) and State Law Enforcement Bureaus (SLEB's).

In the School Nutrition Programs, each school food authority must be reviewed over a 5-year cycle. In conducting these reviews, we assist States in determining whether Federal reimbursement is properly claimed. We believe this information indicates that these reviews are useful in recovering improperly paid Federal funds as well as providing a tool to improve the management of local food services.

Also on the business side of the school food service programs, FNS has continued its review of dairy and other food vendors' pricing practices and has followed through with active suspension and debarment when warranted.

In the WIC Program, we are striving to improve overall program management and integrity. This spring we plan to issue guidance to State agencies on more uniform application of science-based nutritional risk criteria. The core risk criteria were developed through a year-long Federal/State partnership and will ensure consistency in the nutritional assessment of WIC applicants. In the near future we will propose new vendor regulations that will establish mandatory uniform sanctions across WIC State agencies for the most serious WIC violations, and require the disqualification of any WIC vendor who has been disqualified from the Food Stamp Program. In addition, we plan to address issues of income documentation in policy as well as during the reauthorization process.

HIGHLIGHTS

Child Nutrition Participation

We are proud that the Child Nutrition Programs continue to be a source of nutritious meals for our Nation's children. We are also aware that a large portion of our participating children are needy, and in some cases the meals they receive in schools or child care facilities may be all that they have to eat all day. It is vital that sufficient funds continue to be available for these programs. In view of this, I wish to bring to the Committee's attention the fact that we are experiencing an increase in the total number of meals served in the School Lunch Program. After remaining stable through the 1980's and the first part of the decade of the 1990's, we have seen the total number of school lunches served rise by more than a million a year. This increase is attributable at least in part to increased enrollment in schools caused by our recent "mini-baby boom" and improved quality and service. Consequently, the total reimbursement in the Program will increase beyond the nor-

mal adjustment for changes in the Consumer Price Index, and our appropriation request reflects this.

WIC PROGRAM

Consistent with this Administration's long-standing goal, this budget proposes funding to continue WIC participation at its expected fiscal year 1998 level of 7.5 million women, infants and children every month. This budget request assumes the continued success of State agencies to obtain significant savings in the cost of infant formula to the Program. In fiscal year 1997, an additional 1.9 million participants per month were served because of the great success States had in collecting almost \$1.3 billion in rebates from infant formula manufacturers. This program continues to collectively save money and contribute to healthier mothers and babies and children who will enter school unfettered by the consequences of poor nutrition and inadequate health care in their formative years. President Clinton and this Administration is committed to this continued success.

WIC FARMERS' MARKET NUTRITION PROGRAM

The funding request for this popular adjunct to the main WIC Program has been moved in the fiscal year 1999 budget from the WIC account to the Commodity Assistance Program account. This was done to ensure that funds for FMNP are not dependent on the WIC Program and can be allocated on a timely basis to ensure effective operation of the program. We believe this change will enable States to improve their program planning and development.

STUDIES AND EVALUATIONS

In this budget, the Administration reiterates its belief that the studies and evaluations for the Food Assistance Programs should remain with the entity administering these programs. Both the President and the Secretary of Agriculture have stated their belief that the funding for studies and evaluations of the Food Assistance Programs belongs with FNS and this budget supports that belief.

The three FNS research accounts are used to determine if policy objectives are met; test innovations; and describe what works, what does not work, and why. These accounts are instrumental in enabling the Agency to respond to the oversight responsibilities of Congress. FNS research has a proven track record of improved government performance. For example, FNS research established a basis for future assessments of the efficacy of food assistance programs by developing the first credible measure of the food security of the American population; provided the foundation for historic changes in domestic nutrition programs by providing the only nationally representative data on the nutrients provided to children in the Child Care, School Lunch and School Breakfast Programs; made critical contributions to the emergence and expansion of EBT, supporting the first demonstrations of feasibility and cost-effectiveness; helped fight fraud and abuse and improve program operations; generated the only data-based estimates of the prevalence of food stamp trafficking and WIC overcharging; and documented the Federal cost savings associated with participation in the WIC Program.

With the funding requested for fiscal year 1999, the Agency will be able to support efforts to help States identify effective ways to design programs using the new flexibility provided by welfare reform and understand the consequences of change, continue critical updates of basic program information; address Congressional questions about the impact of legislative changes and collect and analyze data to provide Congress with outcome measures of program performance.

The relatively small investment made on FNS research will help to protect the \$37 billion investment made in the Federal nutrition programs. This research is most effective when done in conjunction with food assistance program operations. Without such research support, we run the very real risk of making crucial policy decisions without adequate information which may lead to unforeseen consequences.

FOOD SAFETY

We are requesting \$2 million to provide technical assistance to State and local school cooperators to promote and enhance safe food handling in school meals preparation. We would use these funds to provide training and technical assistance on safe food handling to cooperators. The funding would be used to enhance the health and safety of children participating in school meal programs by operating training workshops for local food service professionals and revise, print and distribute an updated version of "Serving it Safe".

FOOD RECOVERY AND GLEANING

One of the top priorities of Secretary Glickman is ensuring that USDA is doing everything within its power to expand the recovery and gleaning of excess, wholesome food for distribution to Americans in need. While this Administration firmly believes that the bedrock Federal nutrition assistance programs—such as Food Stamps, WIC, and the National School Lunch and Breakfast programs—will continue to be the first line of defense for Americans facing hunger, recovered and gleaned food can provide nutritious additions to the diets of low-income Americans.

In June of 1997, USDA released a study indicating that 96 billion pounds—or 27 percent—of the 356 billion pounds of food produced in this Country each year is lost to human consumption at the retail and food service levels. In response to the study, USDA joined with key non-profit organizations in co-sponsoring the first-ever National Summit on Food Recovery and Gleaning—at which we jointly set a National goal of increasing the amount of food recovered by 33 percent over the 1.5 billion pounds currently recovered by the year 2000, which will provide an additional 500 million pounds of food a year to feeding organizations. At a time when food banks across the Nation are reporting increasing need but decreasing donations, such a boost is vitally needed.

USDA has taken a wide variety of steps to begin reaching the goal of a 33 percent increase, such as: working with the National Restaurant Association to produce a food recovery handbook for their members; facilitating the ability of hunters to donate venison to food banks; empowering schools to do more to donate excess food from the National School Lunch Program, encouraging airlines to donate meals not served; working with the Department of Transportation to develop a comprehensive way to boost the transportation of recovered foods; facilitating the donation of excess food from the Department of Defense; and providing technical assistance to thousands of community-based groups and private citizens across the Country who seek to help.

As we have intensified these efforts, we have heard more and more requests from States and nonprofit groups for limited Federal funds to help implement and expand such efforts as a cost-effective way to supplement traditional ways of fighting hunger. That is why we are proposing the creation of a \$20 million food recovery and gleaning grant program to provide limited seed money for such efforts; we anticipate this Federal money will leverage a great deal of matching funds from private, nonprofit, and State and local governmental sectors. We are not seeking to create a large-scale Federal bureaucracy, but rather to empower community-based efforts. The funds are needed primarily to support start-up costs so that local communities can develop an infrastructure to begin their own food rescue operations.

FOOD PROGRAM ADMINISTRATION [FPA]

Our budget request for FPA is \$111.8 million. In recent years, FPA funding has not been sufficient to keep up with the rising demands made on the Agency. Reduced administrative funding has required more than an 18 percent reduction in staffing since 1993 and nearly a 40 percent reduction since the early 1980's.

Recent OIG and GAO audits have cited FNS for insufficient staff to ensure program compliance with statutory requirements. Reported areas of insufficient oversight include retailer integrity and food stamp fraud, the Agency's financial statements, documentation and collection of food stamp recipient claims, frequency of management evaluations required by program regulations, oversight of the Child and Adult Care Food Program, oversight of State information technology, and State cost allocation and claiming.

Clearly, ensuring proper program and financial management for an Agency managing almost \$40 billion in program funds must be a top priority. It is imperative that FNS maintain a minimum work force to meet the challenges of program delivery and keep pace with new legislation and changing program needs. This budget is the bare minimum needed to effectively deliver our programs to children, needy families and individuals to help those less fortunate obtain access to a more healthful diet, and provide nutrition education to the American public.

CNPP is charged with developing nutrition policy and providing research-based human nutrition education and information to all Americans, including those involved in Food Assistance Programs, and has become the Department of Agriculture's focal point for linking nutrition research to the consumer. Center staff develop integrated nutrition education research programs and assist policy makers in devising better strategies to target nutrition programs cost-effectively to different customers in order to assist all Americans in adopting healthy, nutritious eating patterns that match lifestyles.

The CNPP staff strive to improve the dietary behavior of all Americans by translating nutrition guidance into consumer-oriented promotion programs. The Center has already accomplished many valuable activities that have helped Americans to gain a better understanding of good nutrition and proper diet. As an integral part of the FNS Food Program Administration budget, we are requesting \$2.542 million to continue the work of the Center and help Americans enjoy healthier diets and lives.

CONCLUSION

In conclusion, Mr. Chairman, I appreciate the support this Committee has shown throughout the years for these programs. I am also grateful for the opportunity to present the fiscal year 1999 budget proposals for the Food and Nutrition Assistance Programs. I will be happy to answer any questions that you or the other Members may have.

PREPARED STATEMENT OF YVETTE JACKSON

Mr. Chairman, thank you for the opportunity to appear before this subcommittee to discuss the fiscal year 1999 budget request proposed for the U.S. Department of Agriculture's Food and Nutrition Service (FNS).

1999 BUDGET REQUEST

The Food and Nutrition Service requests \$39.2 billion in new budget authority in fiscal year 1999. This includes contingency reserves of \$1.0 billion for the Food Stamp Program and \$20 million for the Supplemental Nutrition Program for Women, Infants, and Children (WIC). The request is an increase of \$1.5 billion above the fiscal year 1998 appropriation level. The increase is driven by legislative proposals in the Food Stamp Program, food recovery and gleaning initiatives, program integrity initiatives, increased meal service and overall inflationary adjustments. Our budget request reflects this administration's continued commitment to providing access to healthful, nutritious diets to low income families and to maintaining effective and efficient program operations.

FOOD STAMP PROGRAM

The Food Stamp Program is the primary source of federal nutrition assistance for low-income Americans. The mission of this program is to assure access to a nutritious, healthful diet for low-income Americans and improve their knowledge of good nutrition, thereby improving the nutritional status of low-income households and strengthening the food and agriculture economy. We are requesting \$25.1 billion for the Food Stamp Program, including a benefit reserve of \$1.0 billion to ensure funding availability to meet any unforeseen economic disturbances, natural disasters and changes in the estimated savings due to welfare reform. The amount includes \$1.2 billion for the Nutrition Assistance Program for Puerto Rico, as well as funds for nutrition assistance for the Northern Marianas, \$75.0 million for the Food Distribution Program on Indian Reservations and \$100 million for commodity purchases in the Emergency Food Assistance Program. Based on the current economic forecast for fiscal year 1999:

- The average unemployment rate is projected to be 5.1 percent;
- Food Stamp Program participation is projected to average 21.6 million persons monthly; and
- The average monthly benefit is projected to be \$76.41 per person.

In fiscal year 1998, all welfare reform changes have been fully implemented and unemployment is at a record low. As a result, average monthly participation is estimated to be 21.07 million compared to 22.859 million in fiscal year 1997. However, beginning in fiscal year 1999 we project that participation will rise slightly to 21.64 million due to a projected slight increase in both the unemployment rate and the overall population.

Although we have requested a benefit reserve since the early 1990's, the need for this reserve has become increasingly important given the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) of 1996. More than one-third of all food stamp households receive Temporary Assistance for Needy Families (TANF), and these households receive over half of all food stamp benefits. The combination of these households encountering time limits on their TANF eligibility, the flexibility afforded States under Welfare Reform and the uncertainty of some of the effects of welfare reform makes it difficult to anticipate the direction and magnitude of changes in food stamp costs. This benefit reserve is necessary in the event of un-

predictable changes and protects the program's ability to get food to people who need it.

FOOD STAMP PROGRAM INTEGRITY

In fiscal year 1999, FNS will continue its efforts for increased integrity in the Food Stamp Program. The budget request includes funding for increased investigative sweeps. Approximately 850 stores redeeming over \$100 million in food stamps annually will be investigated during these sweeps. Funding is also requested for increased error reduction activities, as well as funding to support enhanced Integrated Quality Control and Disqualified Recipient Systems.

FOOD STAMP PROGRAM LEGISLATIVE PROPOSALS

The Food Stamp Program legislative proposals offer two changes to the Personal Responsibility and Work Opportunity Act of 1996 (PRWORA). The first proposal would provide exemptions to the restrictions on eligibility for permanent non-citizen residents. When the President signed welfare reform legislation in 1996, he indicated that some provisions were too harsh on some program participants. Legal immigrants are one such group being affected by the legislation. The Balanced Budget Act of 1997 helped by restoring SSI and Medicaid eligibility to elderly and disabled legal immigrants who were already in the United States at the time of enactment. The changes proposed in this budget would:

- Restore food stamp eligibility to permanent resident families with children without regard to the date of entry into the U.S.;
- Restore eligibility to permanent residents who are age 65 and over or who are disabled provided they had permanent resident status prior to passage of the PRWORA;
- Extend the refugee and asylee exemption from the strict eligibility requirements for non-citizens from 5 years to 7 years from their date of entry;
- Restore eligibility to Hmong immigrants who came to the U.S. after the Vietnam War; and
- Restore eligibility to certain Native Americans whose reservations straddle the U.S. and Canadian borders.

This proposal will increase spending on food stamp benefits by \$535 million in fiscal year 1999.

Another unanticipated consequence of the welfare reform legislation is that it allows States to claim reimbursement for common administrative costs in the Food Stamp and Medicaid programs that are already included in the TANF block grant programs, thereby providing the States a financial windfall. Our second proposal would alter the allocation of administrative costs between the TANF, Medicaid, and Food Stamp Programs. The change will require States to allocate common administrative costs equally among all benefiting programs in fiscal year 1999. To address the windfall to States from the new cost allocation (costs will be shifted out of TANF to Food Stamps and Medicaid, but the TANF block grant will not be reduced), the federal share of food stamp administrative costs will be reduced from 50 percent to 47 percent starting in fiscal year 1999. This proposal is administratively simple to implement and will save an estimated \$180 million in fiscal year 1999 in the Food Stamp Program.

In addition, we intend to submit a proposal that would reclassify claims against food stamp recipients for erroneous benefit issuances as State debt rather than Federal debt. We estimate that this proposal will be cost-neutral in the immediate future; however, if States respond to our proposed incentives, collections may be substantially increased in the long run.

ELECTRONIC BENEFITS TRANSFER [EBT]

EBT continues to greatly assist the FNS effort to reduce food stamp trafficking. By December 1997, 28 states had implemented EBT systems—13 of them Statewide. FNS successfully deployed an automated anti-fraud profile system known as ALERT in all active EBT areas. The ALERT system analyzes individual EBT transactions for patterns of violations both for investigation selection and support as well as for taking direct administrative sanction action. The ALERT system helps us target limited resources to deal with the most egregious violators.

FOOD STAMP PARTICIPATION UNDER DEBT COLLECTION ACT OF 1966

FNS's early work with the Federal Tax Refund Offset Program (FTROP) as a debt collection initiative for Food Stamp State agencies has expanded in 1996 and 1997 to incorporate provisions of the Debt Collection Improvement Act. Under this Act

and under the authority provided by the Food Stamp Act, FTROP is now a mandatory part of Food Stamp State agency operations. FNS is working with cooperating State agencies to implement Treasury's offset programs, which include the Federal Tax, Salary, and Administrative Offset Programs. In 1997, 43 State agencies participated in the Federal Tax Refund Offset Program and as a result, collected almost \$60 million. Since the effort began in 1992, Food Stamp State agencies have collected more than \$170 million in delinquent recipient claims using these two forms of offset. In December 1997, 47 State agencies submitted 380,000 records valued at \$216 million to Treasury. Based on past collection trends, FNS conservatively projects 1998 collections to be about \$85 million. FNS is working with the remaining nonparticipating State agencies to bring them into the effort for the fiscal year 1999 offset activity.

THE FOOD DISTRIBUTION PROGRAM ON INDIAN RESERVATIONS [FDPIR]

FDPIR delivers benefits under the authority of the Food Stamp Act to needy Native Americans who do not have access to the regular Food Stamp Program. There is currently \$75 million available in fiscal year 1998 and \$75 million is budgeted for fiscal year 1999. Participation estimates for fiscal year 1999 average 127,000 persons monthly. Participation in this program has increased in recent years and our budget request reflects this trend.

CHILD NUTRITION PROGRAMS

The purpose of the Child Nutrition Programs is to assist State and local governments to deliver healthful, nutritious meals to children in public and nonprofit private schools, child care institutions, certain adult day care centers, and summer recreation programs. We are requesting a total of \$9.2 billion for the Child Nutrition Programs. The request is \$1.5 billion more than the fiscal year 1998 appropriation. The increase is largely attributable to growth in meals served in the National School Lunch Program, the School Breakfast Program, and the Child Care Program and an increase in the number of free meals served. This budget request will provide the funding necessary to support the National School Lunch, the School Breakfast, Summer Food Service, the Child and Adult Care Food and the Special Milk Programs. We estimate that in fiscal year 1999 the requested funds will support: 4.5 billion school lunches, 1.3 billion school breakfasts, 1.6 billion meals in centers and family day care homes, 149.3 million summer food service meals, and 143.5 million half-pints of milk.

FNS will continue its efforts to streamline the administration of the Child Nutrition Programs at the State and local levels through regulations and policy guidance.

The Agency is not requesting major changes in the Child Nutrition account since authorization of the Summer Food Service Program, State Administrative Expense, Commodity Distribution and other Child Nutrition authorizations expire at the end of this fiscal year. We will be proposing some cost neutral simplification and integrity enhancing measures as part of a reauthorization package, which is forthcoming.

CHILD NUTRITION PROGRAM INTEGRITY

Since 1988, the Department of Justice and a number of States have been investigating and prosecuting dairies for illegal bidrigging. The Food and Nutrition Service is committed to promoting integrity in all of its programs. The School Lunch Program is not an exception; for example, we established a task force dedicated to pursuing procurement and nonprocurement suspension and debarment activities whenever and wherever suitable cause is present. The Agency joined forces with the Department of Justice and the Defense Logistics Agency to identify offenders including companies involved in the food, juice, and dairy businesses, as well as Food Service Management Companies. In accordance with Child Nutrition Program regulations and the Federal Acquisition Regulation, FNS proposed debarment of those companies who have been convicted of a criminal offense, entered into a civil settlement or involved in illegal activities such as price fixing, bidrigging and food adulteration.

At the time of our budget request, FNS had identified 199 companies and individuals subject to suspension and debarment. Of these, actions have been initiated against 161. FNS has taken final administrative action in 142 cases with 85 entities debarred for 3 years from future involvement on a nonprocurement or procurement basis with all Federal programs. Compliance agreements aimed at protecting the Federal interest have been signed or are under discussion for an additional 50 corporations. Voluntary Exclusions have been signed or are under discussion with 6 corporations. Actions are currently pending on 38 cases. FNS will continue to pursue appropriate debarment action as deemed necessary.

SCHOOL MEALS INITIATIVE, TEAM NUTRITION AND COORDINATED REVIEW

The School Meals Initiative for Healthy Children involves a comprehensive, integrated plan for improving the nutritional standards of school meals, including dramatically improving the quality of USDA commodities provided to local school districts as well as improving their availability. On May 29, 1996, President Clinton signed the Healthy Meals for Children Act (Public Law 104-149), which further increases flexibility for local school meal planners and reaffirms the nutrition standards established in prior law and regulations. The new law authorizes schools to continue using the traditional meal pattern and authorizes States to approve schools to use "any reasonable approach," within guidelines established by the Secretary. In fiscal year 1997, the Department initiated action to formalize regulations to allow the use of the traditional meal pattern. At the request of State agencies, FNS will be conducting extensive training in fiscal year 1998 on how to conduct nutrition assessment reviews of school food authorities. These nutrition assessment reviews will determine how well school food authorities are progressing towards meeting the Dietary Guidelines for Americans and other nutrition standards. Training sessions are planned for all seven regions.

In fiscal year 1999, we are requesting a total of \$10.0 million for Team Nutrition. This represents an increase of \$2.0 million over the fiscal year 1998 appropriation. The increase in funds will continue and expand training and technical assistance and nutrition education efforts begun under the School Meals Initiative. Training efforts will focus on assisting school food service authorities in improving business practices and extending nutrition education efforts to the Child Care and Summer Programs. Almost half of the requested funds will provide support directly to the school food service community through technical assistance materials and training provided by either the States or the Federal government.

Our budget also requests \$4.3 million for Coordinated Review. We are planning to make this program more effective, more user-friendly more useful for the schools.

SUPPLEMENTAL NUTRITIONAL PROGRAM FOR WOMEN, INFANTS AND CHILDREN [WIC]

The purpose of the WIC Program is to improve the health of nutritionally at-risk, low-income pregnant, breastfeeding and postpartum women, infants and children up to their fifth birthday. The fiscal year 1999 request meets the President's commitment to full funding in the WIC Program. The requested funding of \$4.1 billion will maintain the projected fiscal year 1998 participation level of 7.5 million participants. We have also requested a \$20 million contingency reserve for WIC, to be used if unforeseen increases in food prices jeopardize maintenance of participation levels.

We believe a major reason for WIC's success is its emphasis on nutrition education through the provision of educational materials, as well as, individual and group counseling. One-sixth of funds available for administrative and program services are earmarked for nutrition education activities which totaled over \$165 million in 1997. Also, special emphasis is placed on alerting participants to the dangers of substance abuse during pregnancy, including smoking and alcohol use. During pregnancy, participants are also alerted to the benefits of breastfeeding their newborns. Breastfeeding is further promoted by providing an enhanced food package to women who receive no infant formula, by permitting breastfeeding women to participate for a longer period of time than other postpartum women, and by providing breast pumps and other aids that directly support breastfeeding. WIC also works in conjunction with the Centers for Disease Control and Prevention and other public and private organizations to increase access to immunization services and coverage rates.

WIC EBT

FNS is engaging in activities complementary to the FSP to advance EBT systems to improve program benefit delivery and client services for the WIC Program. In April 1995, Wyoming implemented an EBT system which uses smart card technology and off-line authorization to deliver FSP and WIC benefits and to facilitate the exchange of client data during clinic visits. Current operations include WIC/FSP in Natrona County, Wyoming and WIC in six other counties, projected to total 2,100 FSP households and 3,000 WIC families, 39 WIC-authorized retailers and 45 FSP-authorized retailers. Statewide expansion is being considered. Our strategic goal is to increase the number of States issuing WIC benefits via EBT to 4 in 1999.

COST CONTAINMENT INITIATIVES

In an effort to use their food grants more efficiently, all geographic WIC State agencies and most Indian Tribal State agencies have implemented cost containment

activities. Savings generated by competitive bidding, rebates, least cost brands, use of economical package sizes, etc., as well as home delivery or direct distribution systems allow State agencies to provide benefits to more participants by reducing food package costs.

The most successful strategy has been competitive rebate contracts between State agencies and infant formula companies. Rebates have enabled WIC Programs to dramatically decrease the cost of infant food packages. In addition, ten State agencies are involved in three multi-State contracts, relating to infant juice and cereal. Fiscal year 1997 rebate savings were estimated to be almost \$1.3 billion. The average monthly food cost has been kept stable for the past 10 years.

MANAGEMENT IMPROVEMENTS

As part of WIC's reauthorization this year, we will be proposing several integrity improvement measures. For example, we are concerned that not all States are assessing WIC income eligibility evenly. We are proposing new laws to require that income documentation, sufficient to demonstrate eligibility, be presented at certification. We will also be proposing tighter controls over vendors.

COMMODITY ASSISTANCE PROGRAMS

The Commodity Assistance Program combines funding for the Commodity Supplemental Food Program (CSFP), administrative funding for The Emergency Food Assistance Program (TEFAP), the Nutrition Program for the Elderly (NPE) and Pacific Island Assistance, the Farmer's Market Nutrition Program, which was formerly included in the WIC appropriation and the Food Recovery and Gleaning Program. The budget requests:

- \$96 million in support of women, infants, and children and elderly caseload in CSFP,
- \$45 million for TEFAP administrative expenses plus the \$100 million for commodity purchases available in the Food Stamp Account, allowing for a total program of \$145 million.
- \$140 million for NPE which will fund an estimated 250.6 million meals at a payment rate of 55.86 cents per meal, and
- \$15.0 million for the Farmer's Market Nutrition Program.
- \$20.0 million for the Food Recovery and Gleaning Program.

FOOD RECOVERY AND GLEANING

The budget includes \$20.0 million for a new grant program to aid community-based gleaning and food recovery efforts. Given that a USDA study indicates that 27 percent of the food produced in this country is lost to human consumption at the retail and food service level, and given that food banks around the country are reporting an increasing need but a decreasing supply of food, there is an urgent need to intensify public/private partnerships to glean and recover excess food for distribution to Americans in need.

Of the \$20.0 million, about \$19.5 million will be used for competitive grants, cooperative agreements, and other assistance to community-based food recovery efforts. Non-profit groups—as well as state, local, and Tribal governments—have increasingly indicated to USDA that they need additional resources to help the Nation reach the goal of increasing the amount of excess food recovered by 33 percent over the current baseline of 1.5 billion pounds a year. While such entities are willing to bring significant resources of their own to aid food recovery—and while volunteers will provide much of the labor for such efforts—additional Federal assistance is needed to help these entities pay for vital items such as: vehicles and fuel to transport recovered and gleaned food; salaries for volunteer coordinators and training programs for volunteers; heating and refrigeration equipment and facilities to ensure food safety; printing for handbooks and instructional materials; equipment to harvest, sort, load, and process food; computer programs to match up donors to recipients; offices from which to operate; containers to hold the food, etc.

We anticipate this Federal money will leverage significant matching funds from the private, non-profit, and state and local governmental sectors. We are not seeking to create a large-scale Federal bureaucracy, but rather to empower community-based efforts and encourage community volunteerism.

STUDIES AND EVALUATION

In fiscal year 1998 FNS' funds for research on our food assistance programs were transferred to Economic Research Service. The fiscal year 1999 request includes restoration of research funds at FNS. Both the President and the Secretary of Agri-

culture have expressed their strong belief that funding for studies and evaluation should remain with FNS, the agency which administers the programs to be studied.

Prudent use of these funds requires that research on our programs be based on expert knowledge of program detail. FNS needs relevant, practical and focused research to enhance our ability to manage our programs effectively, measure the effectiveness of program operations and alternatives, and identify reliable program performance measures. Therefore, we strongly urge you to restore this funding to FNS.

GOVERNMENT PERFORMANCE AND RESULTS ACT

The FNS Annual Performance Plan (APP) has been submitted as part of the fiscal year 1999 budget request. The goals outlined in the APP are directly linked to the achievement of the Agency's strategic goals and objectives.

FOOD PROGRAM ADMINISTRATION

Funding for Food Program Administration (FPA) is requested in the amount of \$111.8 million. The FPA appropriation funds the majority of salaries and administrative expenses of the Agency. In recent years, FPA funding has not been sufficient to keep up with the rising demands made on the Agency. In fact, reduced funding has required more than an 18 percent reduction in staffing since 1993—a 37 percent reduction since 1980. FNS understands the importance of downsizing in the Federal government. Toward that goal, the Agency has been diligent in implementing efficiencies and met its fiscal year 1999 target quite some time ago.

Since the FPA appropriation finances 90 percent of the work force administering FNS programs, it is the critical account that ensures program and financial integrity and effective use of other FNS program appropriations. Recent OIG and GAO audits, between 1995 and 1997, have cited FNS for insufficient staff to ensure program compliance with statutory requirements. Reported areas of insufficient oversight include retailer integrity and food stamp fraud, the Agency's financial statements, documentation and collection of food stamp recipient claims, frequency of management evaluations required by program regulations, oversight of the Child and Adult Care Food Program, oversight of State information technology, and State cost allocation and claiming. Many of FNS' functions are labor-intensive and require constant staff attention. Payment accuracy, store investigations, and on-site reviews are critical to our Agency's mission and require intensive staff focus and travel funding.

The Food Stamp Program loses more than \$1.4 billion a year in overpaid benefits. More dollars are lost through inaccurate State requests for federal administrative funds. Current staffing levels are clearly insufficient to provide adequate oversight, conduct claims collections reviews, and provide needed technical assistance to States to make improvements. Although we have made great strides in reducing error rates over the last three years, which saved approximately \$660 million during this period, reduced staff is making it difficult to continue these efforts. Management evaluations of state operations in all our programs require additional attention. For example, in WIC, we need to strengthen our review of state information systems, our review of administrative funds and state caseload management. These areas are essential to ensure the sound management of the resources Congress has made available for WIC. Additionally, new data analysis tools, EBT and new authorities in Welfare Reform provide the Agency with a tremendous opportunity to increase program integrity among food stamp retailers. Unfortunately our limited and overburdened staff cannot utilize these tools to crack down on fraud.

New legislation and changing program needs have imposed significant new and ongoing administrative burdens on the already strained staff. Diminishing staff resources do not allow the Agency to keep pace with legislative changes, such as Welfare Reform, Government Performance and Results Act, the Chief Financial Officers Act, the Debt Collection Improvement Act, and the Healthy Meals for Healthy Americans Act, to name a few. At the same time, the Agency is called on to improve the nutrition of program recipients, strengthen program integrity, and implement EBT Nationwide.

Clearly, ensuring proper fiscal and program management for an Agency managing almost \$40 billion in program funds must be a top priority. It is imperative that FNS maintain a steady work force to meet the challenges of program delivery and keep pace with new legislation and changing program needs. Mr. Chairman, we strongly believe the request is the smallest budget feasible to ensure that we maintain adequate vigilance over the resources entrusted to us by the Congress on behalf of the American taxpayer.

Included in the FPA request level of \$111.8 million is \$2.542 million to continue the work of the Center for Nutrition Policy and Promotion.

CONCLUSION

FNS is committed to providing food and nutrition assistance for the Nation's children and low-income families. Our fiscal year 1999 request reflects this commitment. Further, we believe that our request of \$39.2 billion is crucial to continued efficient program operations.

Mr. Chairman, this summarizes the fiscal year 1999 FNS budget request. I will be happy to answer any questions that you may have.

BIOGRAPHICAL SKETCHES

SHIRLEY R. WATKINS

Shirley Robinson Watkins was nominated Under Secretary of Food, Nutrition and Consumer Services (FNCS) by President Clinton on May 19, 1997. She was confirmed by the Senate on July 31, 1997. As Under Secretary, she has authority over the Food and Nutrition Service and the Center for Nutrition Policy and Promotion. In this position, she oversees a budget of over \$40 billion for USDA's 15 food assistance programs, including the Food Stamp Program, the National School Meals Programs, and the WIC Program.

Mrs. Watkins is the first African-American to be named FNCS Under Secretary, as well as the first person named with direct management experience in the school meals programs at the local level. She brings to this position a life-long commitment to the health and nutritional well-being of children and families.

Prior to this appointment, Mrs. Watkins was USDA Deputy Assistant Secretary for Marketing and Regulatory Programs, where, from 1995 until 1997, she oversaw 80 domestic programs and 8,000 domestic and international employees charged with protecting U.S. agricultural interests. From 1993 to 1995, she served as the FNCS Deputy Under Secretary, where she worked closely with all aspects of USDA-administered domestic food assistance programs.

Before joining USDA in 1993, Mrs. Watkins served as Director of Nutrition Services for the Memphis (Tennessee) City Schools for 17 years, where the school lunch program received national recognition. Previous positions within the school system included food service supervisor, home economics teacher, and elementary teacher. From 1960 to 1962, she served as a home demonstration agent with the University of Arkansas Extension Service.

Mrs. Watkins received a bachelor of science degree from the University of Arkansas at Pine Bluff, and master of education from the University of Memphis.

YVETTE JACKSON

WASHINGTON, Sept. 2, 1997—Agriculture Secretary Dan Glickman today announced he has named Yvette Jackson the Administrator of the U.S. Department of Agriculture's Food and Consumer Service. FCS oversees federal nutrition assistance programs.

Jackson is the first African-American woman to head the Food and Consumer Service. Since 1994, she has served as the agency's Deputy Administrator in charge of the Food Stamp Program. As FCS Administrator, Jackson will oversee USDA's 15 nutrition assistance programs, including the School Lunch and School Breakfast Programs, the Special Supplemental Nutrition Program for Women, Infants, and Children—the WIC program—and the Food Stamp Program. She will manage an agency budget of \$40 billion and a staff of 1,700.

"I take great pleasure in announcing the appointment of Yvette Jackson as the Administrator of the Food and Consumer Service," Glickman said. "She has done an outstanding job directing the Food Stamp Program, and she has made a career out of helping people in need. I look forward to working with her to continue to make our programs even more responsive to the people who need them."

Jackson began her career with the Pennsylvania Department of Public Welfare 26 years ago as a caseworker in the Philadelphia County Assistance Office. She assumed increasing management responsibilities, culminating in her appointment as Pennsylvania's Deputy Secretary of Income Maintenance in March, 1991. As deputy secretary, Jackson oversaw the administration of the state's income security and medical assistance eligibility programs—including the Food Stamp Program, Aid to Families with Dependent Children, State General Assistance, Child Support Enforcement, and Medicaid.

A native of Philadelphia, Jackson holds a bachelor's degree in social welfare from Temple University and a Masters of Social Work from Rutgers University.

RONALD J. VOGEL

Career Highlights

Mr. Vogel has been with the Food and Nutrition Service for 17 years. He is presently the Associate Deputy Administrator for Special Nutrition Programs. In this position, he has operational responsibility for programs such as WIC, the Child and Adult Care Food Program, the National School Lunch and Breakfast Programs, the Summer Food Service Program, and a variety of commodity distribution programs, including TEFAP and the Food Distribution Program for Indian Reservations.

Prior to his current position, Mr. Vogel was Director of the Supplemental Food Programs Division, which includes WIC and the Commodity Supplemental Food Program. During his tenure in this position, he received the Secretary's Distinguished Service Award for promoting the health and well-being of low-income women, infants, and children and received a Public Health Service commendation for efforts to promote childhood immunization through WIC.

Previous assignments included Director of the Program Information Division in which he was responsible for FNS' financial and program information management information systems. In this position he also developed and implemented the Agency's long-range Financial Management Automation Plan and the National Data Bank, an executive-level program information and reporting system.

Before coming to FNS, Mr. Vogel was employed in the private sector as a program evaluation specialist. His work in this capacity focused on a variety of federal social service programs including Head Start, the Basic Educational Opportunity Grant Program (Pell Grants) and the Section 8 Public Housing Assistance Program.

Education

Mr. Vogel received his undergraduate degree from the University of Virginia. He holds a Master of Arts degree in sociology from Duke University. He pursued post-Masters studies at Duke as a James B. Duke Fellow.

RAJEN S. ANAND

Dr. Rajen S. Anand serves as the Executive Director and chief executive officer of the Center for Nutrition Policy and Promotion in the United States Department of Agriculture.

The mission of the Center is to improve the nutritional status of all Americans by serving as the focal point for linking scientific research to the dietary and socio-economic needs of the consumer. The Center coordinates the overall nutrition education policy within the Federal government.

Before joining the Department of Agriculture in 1995, Dr. Anand was Professor of Physiology at the California State University, Long Beach, where he had taught physiology, pathophysiology and metabolism since 1970. He served as the founding chair of the Department of Anatomy Physiology (1985-1989), which was started from scratch under his leadership. He served as chair of the Department of Communicative Disorders (1990-1992) on a special assignment. As the Department head, he was responsible for recruitment, evaluation and supervision of faculty and staff and served as an advocate and leader of the academic unit. He managed the fiscal resources, developed the budget, and carried out the administrative operation, space allocation and equipment maintenance.

In 1994, Dr. Anand was appointed by Education Secretary Richard Riley to serve on the 11-member National Committee on Foreign Medical Education and Accreditation. He was reappointed for another 3-year term in 1997.

He received his Ph.D. in human physiology, nutrition and biochemistry from the University of California, Davis in 1969. He also holds a doctorate in veterinary medicine (D.V.M.). He completed post-doctoral fellowships at U.C. Davis in metabolism, and at the UCLA-Harbor Medical Center in pediatric endocrinology.

Dr. Anand was honored with several academic awards including the Outstanding Professor Award at the Long Beach campus. He also was twice recipient of the Meritorious Performance and Professional Promise Award. At the University of California, Davis he was bestowed with the Outstanding Student Award in 1967 and 1968, and Hertzendorf Memorial Award in Physiology in 1969 (for outstanding academic achievements and humanitarian qualities).

Dr. Anand is a member of the American Physiological Society, Sigma Xi, Phi Kappa Phi Honor Society and American Association for Advancement of Science.

Dr. Anand has published more than 35 scientific research articles in national and international journals. He is also a freelance journalist and has written over 350 news stories and articles for various newspapers and magazines.

FOOD GLEANING AND RECOVERY

Senator COCHRAN. I am going to ask a couple of questions, then yield to my colleagues on the committee for any questions or additional comments that they have.

You mentioned at the conclusion of your remarks the Food Recovery and Gleaning Program. When the Secretary was before our committee, he talked about this program too, and he indicated that the Government could be a facilitator without costing any money, but I noticed that the budget proposes that we spend \$20 million on the program. That seems to me to raise a question as to why the administration has now determined that Federal funding is required for a program that appeared to be one where we would be a facilitator.

There is also a statement in the prepared testimony talking about a Department study indicating that 27 percent of the food produced in the country is lost to human consumption at the retail and food service level. We would like to have a copy of that study if you could submit that for our review.

What is your reaction to the question that we have to ask, and that is, what are you going to do with the money? How are you going to spend \$20 million facilitating a gleaning and food recovery program?

Ms. WATKINS. Mr. Chairman, I appreciate you asking that question, and this is an area that both the Secretary and I are very concerned about. We will provide you with a copy of the study.

[The information follows:]

ESTIMATING AND ADDRESSING AMERICA'S FOOD LOSSES

(By Linda Scott Kantor, Kathryn Lipton, Alden Manchester, and Victor Oliveira)

The U.S. food supply is the most varied and abundant in the world. Americans spend a smaller share of their disposable income on food than citizens of any other country and choose from an average of 50,000 different food products on a typical outing to the supermarket. In 1994, the food supply provided an estimated 3,800 calories per person per day, enough to supply every American with more than one and a half times their average daily energy needs. Given this abundance, few of the Nation's resources have traditionally been devoted to measuring or reducing food waste.

In recent years, growing concern about hunger, resource conservation, and the environmental and economic costs associated with food waste have raised public awareness of food loss. This in turn has accelerated public and private efforts to make better use of available food supplies by recovering safe and nutritious food that would otherwise be wasted.

Of course, not all food that is lost is suitable for consumption (fig. 1). Some losses—like the condemnation of diseased animals at the slaughtering house, or the discard of moldy fruit from the produce shelf at the supermarket—are necessary to ensure the safety and wholesomeness of the U.S. food supply. Such foods are not recoverable for human use.

FIGURE 1

WHILE SOME FOOD IS RECOVERABLE, SOME IS NOT

Not recoverable for human consumption

- Livestock condemned at slaughter because of disease.
- Diseased or otherwise unsafe produce.
- Spoiled perishable food, including meat, dairy, and prepared items.
- Plate waste from foodservice establishments.
- Losses of edible portions associated with processing, such as skin and fat from meat and poultry, and peels from produce.

Recoverable for human consumption

- Edible crops remaining in farmers' fields after harvest.
- Produce rejected because of market "cosmetics" (blemishes, misshapen, etc.)
- Unsold fresh produce from wholesalers and farmers' markets.
- Surplus perishable food from restaurants, cafeterias, caterers, grocery stores, and other foodservice establishments.
- Packaged foods from grocery stores, including overstocked items, dented cans, and seasonal.

Likewise, plate scraps are appropriately discarded at eating establishments out of health considerations. In addition, not all food that is lost is economically recoverable. Food recovery efforts are often limited by financial and logistical constraints that make it difficult to match recovered food with potential recipients.

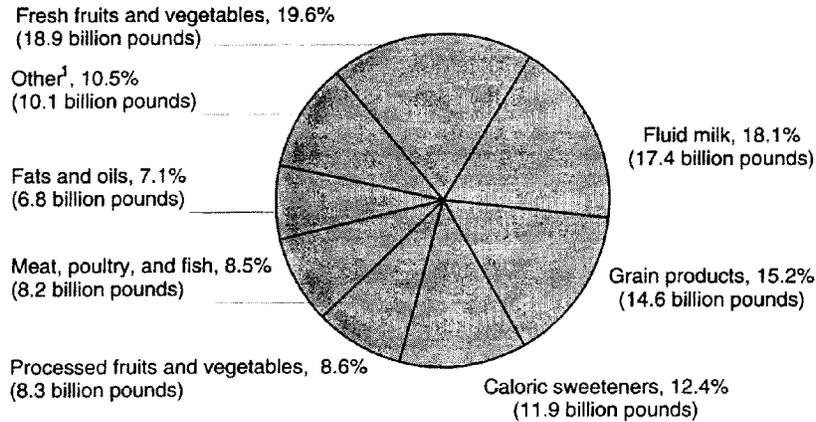

Nevertheless, large quantities of wholesome, edible food, are lost at every stage of the marketing system. Examples of such losses include meats, bread, and other foods prepared by a restaurant or caterer but never served and the discard of blemished or overripe produce, which may be unmarketable for cosmetic reasons, but are otherwise nutritious and safe.

Even a modest increase in the recovery of such wholesome foods could reduce hunger by supplementing existing food-assistance efforts; provide tax savings to farmers, supermarkets, and foodservice establishments that donate food; and lessen the environmental impacts of waste disposal. Understanding where and how much food is lost is an important step in reducing waste and increasing the efficiency of food recovery efforts.

USDA's Economic Research Service (ERS) recently undertook a review of the current data on food waste and built on this knowledge to generate new estimates of food loss by food retailers (supermarkets, convenience stores, and other retail outlets), and consumers and foodservice establishments (storage, preparation, and plate waste in households and foodservice establishments). These losses were estimated by applying known waste factors, gathered from published studies and discussions with commodity experts, to the amount of edible food available for human consumption in the United States. However, losses of nonedible food parts such as bones, pits, seeds, and peels, were excluded (see box about measuring food loss).

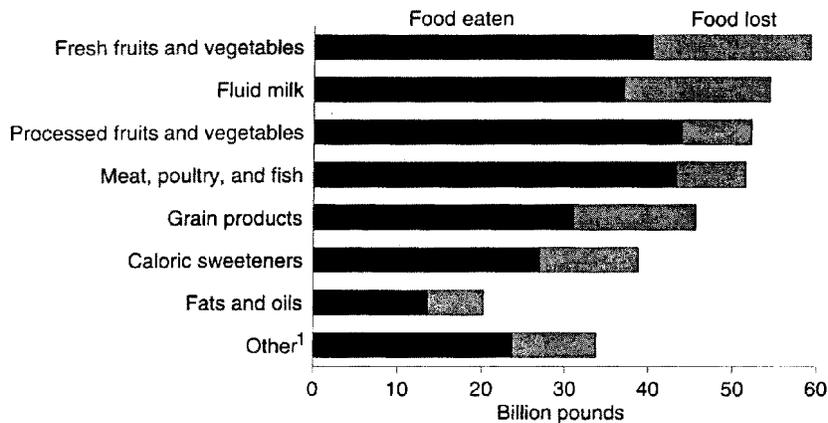

According to the new ERS estimates, about 96 billion pounds of food, or 27 percent of the 356 billion pounds of the edible food available for human consumption in the United States, were lost to human use at these three marketing stages in 1995 (fig. 2). Fresh fruits and vegetables, fluid milk, grain products, and sweeteners (mostly sugar and high-fructose corn syrup) accounted for two-thirds of these losses (fig. 3).

Figure 2
More Than 96 Billion Pounds of Edible Food Was Lost by Retailers, Foodservice, and Consumers in 1995

¹ Includes eggs, peanuts, tree nuts, dry beans, peas, and lentils, and dairy products other than fluid milk.

Figure 3
Food Losses Vary by Commodity--Largest Losses Were in the Fresh Fruits and Vegetables, Fluid Milk, and Grain Products Sectors in 1995

¹ Other includes eggs, peanuts, tree nuts, dry beans, peas, and lentils, and dairy products other than fluid milk.
 Source: Economic Research Service, U.S. Department of Agriculture.

ERS does not know the share of these losses that are recoverable. However, we can get an idea of the significance of loss by calculating the potential benefit of recovery. On average, each American consumes about 3 pounds of food each day. If even 5 percent of the 96 billion pounds were recovered, that quantity would represent the equivalent of a day's food for each of 4 million people. Recovery rates of

10 percent and 25 percent would provide enough food for the equivalent of 8 million and 20 million people, respectively.

The loss estimates presented here are tentative and are intended to serve as a starting point for additional research. Many of the studies on which these estimates are based date from the mid-1970's or before. Dramatic changes have occurred in the food marketing system since then, including innovations in food processing technology and unprecedented growth in the foodservice sector. While we made crude adjustments for these changes in our analysis, additional research—especially updated data on foodservice, processing, and household food losses—is needed to add precision to these estimates and to provide a more complete picture of food loss across the entire marketing system.

FOOD LOSSES BEGIN ON THE FARM . . .

Food losses begin on the farm even before a commodity moves into the marketing system. Although ERS was not able to quantify food losses that occur on the farm or between the farm and retail levels, anecdotal evidence suggests that such losses can be significant for some commodities.

Periodic preharvest losses occur, for example, because of severe weather, such as droughts and floods, or pest infestations. For example, each year an average 7 percent of U.S. planted acreage was not harvested during 1994–96. Freezes that periodically damage Florida's citrus crop and natural disasters like Hurricane Fran, which destroyed agricultural crops in North Carolina in the fall of 1996, are examples of causes of such losses. Most of these commodities are not recoverable for human use.

On the other hand, many harvesting losses, especially losses of commodities like fruits and vegetables, are often well-suited for recovery efforts. Economic factors, which affect producers' willingness to bring their product to market, are the most common source of such losses.

For example, minimum quality standards for fresh produce set by State and Federal marketing orders, bumper crops that reduce commodity prices, and consumer demand for blemish-free produce often result in the removal of safe and edible produce from the food marketing system. With such requirements in mind, fruit and vegetable producers often harvest selectively, leaving small, misshapen, or otherwise blemished produce in the field, since these commodities would likely be discarded in the packing shed or processing plant.

Harvesting losses can also be attributed to technological factors, such as increased mechanization, equipment malfunction, and new management practices. Commodities can be lost because mechanized harvesters cannot retrieve the entire item or because the machines are unable to discriminate between immature and ripe products. However, these losses are often viewed as an acceptable tradeoff between field efficiency (lower production costs and faster operation) and increased yields.

Many farmers mitigate harvesting losses by using leftover crops as fertilizer or animal feed. Harvesting losses are also reduced through gleaning efforts, in which volunteers collect leftover crops from farmers' fields where it is not economically profitable to harvest a crop or after a field has been mechanically harvested.

. . . AND CONTINUE INTO PROCESSING AND MARKETING

Food is subject to additional loss as it leaves the farm and enters the food marketing system.

Some loss occurs in storage, due to insect infestations or mold, deterioration, or improper transportation and handling. Produce, dairy, meat, and other fresh items are subject to shrinkage (loss in weight or volume) due to inadequate packaging or simply the passage of time. Also, fresh foods stored or transported at improper temperatures can deteriorate, wilt, or suffer bacterial degradation or microbial growth. Frequent handling by food processors, brokers, and wholesalers can lead to additional losses. According to published studies, a typical food product is handled an average of 33 times before it is ever touched by a consumer in the supermarket.

Food-safety regulations also divert some product from the human food chain. According to USDA's Food Safety and Inspection Service (FSIS), 0.2 percent of hogs, 1.7 percent of calves, and 0.4 percent of chickens and turkeys were "condemned" or otherwise rejected at slaughter in 1993 and could not be used for human food. After slaughter, some meat is trimmed away because of bruises and other defects. In addition, some viscera, especially livers, are condemned due to safety concerns. Although some of these losses may be preventable through improved farm management and marketing practices, once food becomes spoiled, it is no longer available for human use.

Food losses also occur when raw agricultural commodities are made into final food products. Some of these losses, like removing edible skins from fresh produce, are a normal and necessary part of food processing. For example, about 20 percent of the weight of a fresh apple is lost when it is processed into applesauce. Other processing losses, such as the removal of skin and trimming of fat from meat and poultry, are due to consumer demand for more healthful food choices. Still others, like the increased trimming associated with pre-cut produce, are the result of increased demand for convenience foods from consumers and the foodservice industry.

Although such losses are usually not suitable for direct human consumption, they are often diverted for use in animal feed or as ingredients in other food products. For instance, fresh potatoes lose about half of their weight when they are processed into frozen french fries. Although this appears to represent a "loss" of edible fresh potatoes, most of the "loss" is actually recovered and used by processors for other potato products, such as dehydrated potato flakes and potato starch; and potato skins are often sold to renderers for animal feed.

DAIRY PRODUCTS AND FRESH PRODUCE ACCOUNT FOR LARGEST SHARE OF RETAIL FOOD LOSSES

An estimated 5.4 billion pounds of food, less than 2 percent of edible food supplies, was discarded at the retail level in 1995 (table 1). Nearly half of these retail losses came from fluid milk and other dairy products and fresh fruits and vegetables. These findings are consistent with published studies on supermarket discard, which show that fresh produce, dairy products, and other perishable items make up the largest share of retail food losses. Overstocking, overtrimming, improper stock rotation, and post-holiday discard of seasonal items like Halloween cookies are the main reasons that retailers discard food.

TABLE 1.—LARGE FOOD LOSSES OCCURRED AT THE RETAIL, FOODSERVICE, AND CONSUMER LEVELS IN 1995

Commodity	Edible food supply, ¹ million pounds	Losses from edible food supply—					
		Retail food loss		Foodservice and consumer food loss		Total retail, foodservice, and consumer food loss	
		Million pounds	Percent	Million pounds	Percent	Million pounds	Percent
Grain products	45,606	912	2	13,682	30	14,594	32
Fruit	48,338	707	2	10,609	23	11,316	23
Fresh	22,389	448	2	6,717	30	7,165	32
Processed	25,949	259	1	3,892	15	4,152	16
Vegetables	63,077	999	2	14,947	24	15,946	25
Fresh	36,830	737	2	11,049	30	11,786	32
Processed	26,247	262	1	3,898	15	4,160	16
Dairy products	76,276	1,525	2	22,883	30	24,408	32
Fluid milk	54,474	1,089	2	16,342	30	17,431	32
Other dairy products	21,802	436	2	6,541	30	6,977	32
Meat, poultry, and fish	51,466	515	1	7,720	15	8,235	16
Red meat	30,350	303	1	4,552	15	4,856	16
Poultry	17,108	171	1	2,566	15	2,737	16
Fish and seafood	4,008	40	1	601	15	641	16
Eggs	7,918	158	2	2,328	29	2,486	31
Dry beans, peas, and lentils	2,263	23	1	336	15	359	16
Tree nuts and peanuts	1,861	19	1	276	15	295	16
Caloric sweeteners	38,827	388	1	11,473	30	11,861	31
Fats and oils	20,250	203	1	6,564	32	6,767	33

Another important component of food loss is stock removed from retail shelves because it has reached its "sell-by" date. Such losses chiefly apply to fresh perishable items such as dairy and bakery products. A rise in the number of instore bakeries and freshly prepared specialty and deli items may mean that supermarkets are managing larger quantities of highly perishable food products with shelf lives as short as a few days. Some of these items, such as day-old bread and expired dairy products, are safe to eat for a short time and are potentially recoverable.

Canned fruits and vegetables, breakfast cereals, pasta, and other nonperishable food products get discarded because of crushed, dented, or otherwise damaged packaging, and expired shelf dates. For example, losses of processed fruit and vegetables, including fruit juices (on a fresh-fruit equivalent basis), were estimated at 521 million pounds, or almost 10 percent of total retail food losses in 1995. Most of these losses occur in inventory control, storage, and handling.

High failure rates for new food products may have increased retail food losses in recent years as the number of new product introductions has risen. More than 16,000 new food products—including new sizes, packaging, flavors, and brands of existing products—were placed on U.S. grocery store shelves in 1995, more than double the fewer than 8,000 introduced in 1988. Although ERS does not know the success rate for such products, industry experts estimate that more than 90 percent of new food products are removed from the market.

Food recovery programs, which collect such damaged or unmarketable products from food retailers and distribute them to charitable food organizations, can convert these safe but otherwise "unsaleable" items into consumable food and provide a tax benefit to food retailers who donate their products.

PLATE WASTE CONTRIBUTES TO LARGE LOSSES

From foods forgotten and spoiled in the refrigerator to the uneaten vegetables tossed in the garbage, consumer and foodservice food waste is the single largest source of food loss in the marketing chain. Estimated at 91 billion pounds, this food loss accounted for 26 percent of the edible food available for human consumption in 1995. Fresh fruits and vegetables accounted for 19 percent of consumer and foodservice food losses, with an estimated 18 billion pounds discarded annually. An additional 16 billion pounds of fluid milk—the equivalent of one-third of an 8-ounce glass per person per day—and 14 billion pounds of grain products were also lost. Together these foods accounted for more than half of total estimated consumer and foodservice food losses in 1995, partially reflecting their relative importance in the diet when consumption is measured by the weight of food.

Common sources of foodservice food losses include overpreparation of menu items, expanded menu choices (which can make management of food inventories more difficult), and unexpected fluctuations in food sales due to sudden changes in the weather or other factors beyond the control of foodservice operators. In addition, consumer plate loss may be on the rise at restaurants and other eating places due to a growing trend toward the "upsizing" of food portions.

Unless consumers take home uneaten portions for later consumption, restaurants must discard such plate leftovers for health considerations, meaning that increasing amounts of food may be going to waste.

Household food losses occur because of overpreparation, preparation discard, plate waste, cooking losses, spoiled leftovers, and breakage, spillage, and package failure, either in the home or en route from the point of purchase. A variety of factors, including household size, income, and food-safety concerns, influence the type and quantity of foods lost at this level.

Archaeological examinations of household garbage by researchers at the University of Arizona's Garbage Project revealed that household waste is generally lower for frequently purchased staple items like bread, milk, and cereal than for less frequently used specialty products such as sour cream, hot dog buns, or items bought on impulse. They also concluded that large quantities of single food items, entire heads of lettuce, half-eaten boxes of crackers, and sprouted potatoes—rather than plate scraps—account for the largest share of household food loss.

A 1987 study by the University of Oregon, which examined the reasons that households discard food, suggests that consumer education may play an important role in reducing consumer food loss. In the case of perishable food, knowledge of, or misconceptions about, food safety were the single most important determinants of household food discard. The study indicated that many main meal planners confused quality defects with edibility and were unable to accurately assess whether a food was safe to eat. Such assessments were particularly difficult for consumers under the age of 35. All households had difficulty interpreting package dating information, such as "sell-by" dates or expiration codes.

LOOKING FOR SOLUTIONS: FOOD RECOVERY, RECYCLING, AND EDUCATION

Many public and private assistance groups, food retailers, food manufacturers, policymakers, and consumers have looked for ways to prevent food losses, recover lost food, and reduce solid waste. These efforts reach into every corner of the food marketing system. They include food recovery projects to feed the hungry, recycling projects to conserve resources and reduce waste disposal costs, and educational campaigns and economic incentives to prevent food loss.

FOOD RECOVERY EFFORTS FEED THE HUNGRY

Despite the abundance of food in the United States, hunger is a reality for some Americans with limited financial resources. In 1995, 36.4 million people in this country were living in poverty (annual income of less than \$15,569 for a family of four). According to USDA food consumption data for the early 1990's, almost 12 percent of U.S. households with annual incomes below the poverty line reported that they sometimes or often did not get enough to eat. USDA spent almost \$38 billion providing food assistance to an estimated 45 million people—about 1 in every 6 Americans—at some time during 1996. In addition, an estimated 150,000 nonprofit organizations, including food banks and neighborhood charity outlets, provided more than 10 percent of the U.S. population with a portion of their nutritional needs. However, even with the extensive network of Federal and private food-assistance programs, almost 20 percent of requests for emergency food assistance went unmet in 1995, according to the U.S. Conference of Mayors.

Thus, other sources of food must be utilized.

The term food "recovery" refers to the collection, or recovery, of wholesome food from farmers' fields, retail stores, or foodservice establishments for distribution to the poor and hungry. Food recovery programs operate across the United States and target many different levels of the food marketing system (see box on food recovery efforts). A few are large operations with offices in many States, but most are small local programs that depend largely on the efforts of volunteers from the surrounding community.

"A Citizen's Guide to Food Recovery," recently published by USDA, classifies these efforts into four major types:

Field gleaning—the collection of crops from farmers' fields that have already been mechanically harvested or on fields where it is not economically profitable to harvest;

Perishable food rescue or salvage—the collection of perishable produce from wholesale and retail sources such as supermarkets;

Food rescue—the collection of prepared foods from the foodservice industry, including restaurants, hotels, and caterers; and

Nonperishable food collection—the collection of processed foods with longer shelf lives.

Once surplus food has been "recovered" or prevented from going to waste, volunteers pick up and deliver the food to groups that serve the needy, either directly through neighborhood charitable organizations, such as food pantries and soup kitchens, or indirectly through food banks. In addition to providing additional quantities of food to hungry people, food recovery efforts can also provide food banks with the ability to offer clients more variety and nutrients in their diets by adding fiber-rich fresh fruits and vegetables and grain products to the typical offerings of non-perishable canned and boxed goods.

Food recovery also has benefits that extend beyond providing food to the needy. For example, the additional food supplied by recovery programs allows agencies that serve the disadvantaged to reallocate money to other needed services, money that they would have otherwise spent on food.

These efforts also provide clean fields and tax savings for farmers who donate unharvested crops and reduce waste-removal fees for supermarkets and foodservice establishments. For example, if 5 percent of retail, foodservice, and consumer food losses in 1995 were recovered rather than discarded as solid waste, about \$50 million dollars annually could be saved in solid waste disposal costs for landfills alone. If 10 percent of food losses were recovered, savings for landfill disposal costs would be about \$90 million. These savings would increase to \$200 million with a 25-percent recovery rate.

In addition, large amounts of labor, energy, and other inputs are dedicated to producing food. For example, ERS estimated total U.S. farm production expenses—including seed, fertilizer, and other inputs, and labor, machinery, and other operating expenditures—to be \$180 billion in 1995. Food recovery and other loss reduction programs can make more efficient use of these resources by reducing the amount of food that goes to waste.

Food recovery, however, is not without cost. Recovery operations face a number of logistical and financial obstacles in the course of turning "lost" food into food suitable for consumption. At times, these obstacles are quite formidable. They include locating food donors and making them aware of organizations that channel donated food to the needy; obtaining financial resources for transporting, storing, and packaging donated foods; securing labor, whether paid or volunteer; and training those workers in safe food handling and preparation methods. Second Harvest, the Nation's largest domestic charitable hunger relief organization, spends more than \$5 million annually transporting food from fields, restaurants, and supermarkets to local food banks that serve the needy.

Until recently, many potential food donors were reluctant to participate in food recovery efforts because they feared legal liability if someone were to become ill from eating their donated foods. The Bill Emerson Good Samaritan Food Donation Act, passed by Congress and signed into law by President Clinton in 1996, promotes food recovery by limiting the liability of food donors to instances of gross negligence or intentional misconduct. It also establishes basic nationwide uniform definitions pertaining to the donation and distribution of nutritious foods, which will ensure that donated foods meet all quality and labeling standards of Federal, State, and local laws and regulations.

FOOD WASTE RECYCLING AND BYPRODUCT USE

Technological advances in food processing and food byproduct development can reduce food loss. For example, many food parts that would have been discarded by food processors 10 years ago are finding new value in industrial raw materials or in other food products. These products include livestock feeds, biodiesel (a fuel made from vegetable oils and animal fats), adhesives and solvents derived from citrus oils, pharmaceutical products made from cow's and goat's milk, and juice products and vinegar made from apple peels.

The large volume of shells from raw eggs processed into liquid egg products, for instance, can be used as a source of calcium in poultry feed or as fertilizer. Eggs taken out of their shells by processing machines may also mean lower rates of processing loss, since up to 30 percent of the egg white can stay with the shell when shells from raw eggs are removed manually. Similarly, the introduction of frozen concentrated orange juice has reduced marketing losses for fresh fruit by enabling processors to use bruised or blemished fruit for juice and the nonjuice portions for cattle feed.

Current research on alternative uses for recycled food waste is focusing on animal feed and compost. For example, research is being conducted on the efficient extraction of food waste materials, known as wash water solids, from dairy processing plants. Extraction of these solids reduces waste disposal fees and results in additional income for dairy processors who sell the recovered material for animal feed.

Food waste can also be blended with other organic compounds, such as newspaper, and composted. The resulting organic material could be developed into a soil-conditioning product. Research is also being conducted on converting food waste into a biodegradable film similar to that used for plastic trash bags. The goal is to develop an organic film that would decompose rapidly and could be used in lawn waste composting operations.

CONSUMER EDUCATION AND ECONOMIC INCENTIVES

While food recovery and recycling technologies may help to utilize food that would otherwise be discarded, programs designed to prevent food loss in the first place may be particularly useful in reducing consumer and foodservice food losses. A number of programs are currently being implemented.

According to *The Wall Street Journal*, economic incentives are largely behind the Boston Market restaurant chain's recent adoption of a computer program that monitors food inventories. As menu items are sold and entered into the cash register, the program converts these items, such as cole slaw or mashed potatoes, into raw ingredients. At the end of each day, food inventories that remain in the kitchen are weighed and entered into the computer where they are compared with estimated food uses based on product sales. The difference between used and remaining inventories provides an instant estimate of preparation and storage losses. Since initiating the program, the chain's self-reported food loss has declined from 5 percent to 1 percent of food inventories.

Some local communities are successfully reducing food and other waste by requiring households and businesses to pay for solid waste disposal based on the amount of trash that they generate, usually by charging higher fees for each additional trash container used. According to the U.S. Environmental Protection Agency (EPA),

there are currently more than 2,000 such programs in place nationwide, with average reductions in household solid waste of 25 to 45 percent. A 1994 study conducted for the EPA reported that food accounted for about 8.5 percent of municipal solid waste collected from households and businesses.

Education programs that help consumers change their food discard behavior may also be effective in preventing food loss. For instance, educational programs that help meal planners determine appropriate portion sizes and distinguish between spoiled and safe food can help consumers reduce plate waste and better utilize leftovers. Improved meal planning and purchasing skills—including information that helps consumers understand the meaning of manufacturers' expiration codes, and "use-by" and "sell-by" dates—can reduce the discard of food items.

Government-sponsored initiatives, such as USDA's publication of *A Citizen's Guide to Food Recovery*, along with local efforts to train food recovery volunteers in the safe handling and preparation of rescued food, can increase the safety and efficiency of food recovery efforts. Recent legislation that reduces the liability of food donors has increased the amount of food recovered to feed the needy. Educational programs that increase the awareness of food loss by manufacturers, retailers, and consumers may reduce the amount of food loss and in turn the environmental and economic costs of waste disposal.

Over the long run, the reduction and recovery of uneaten food in the United States is a complex undertaking requiring the involvement of public and private institutions, as well as consumers. Efforts to reduce or prevent food loss must be balanced against the cost of conserving and recovering food. However, successful food recovery programs can provide many benefits to society which can offset a portion of these costs. Among other things, food recovery programs can help to reduce hunger; provide tax savings to farmers, food manufacturers, retailers, foodservice operators, and others that donate food; conserve landfill space; and lessen the costs and environmental impact of solid waste disposal. While our estimates of food loss lack precision, they identify an important issue in the food system that deserves closer attention.

FOOD RECOVERY EFFORTS REACH ACROSS MARKETING SYSTEM

A Citizen's Guide to Food Recovery.—USDA has recently published *A Citizen's Guide to Food Recovery*, a resource guide on food recovery programs for businesses, community-based organizations, private citizens, and local governments. The Guide is designed to support food recovery by showing communities, individuals, and businesses how to support existing food recovery efforts or to begin new programs in their communities. The Citizen's Guide and other sources of information about gleaning and food rescue efforts, including most of those listed below, are available free of charge by calling toll-free 1-800-GLEAN-IT or through the Internet at <http://www.usda.gov/fcs/glean.htm>.

In addition to creating the Citizen's Guide, USDA has taken a wide variety of steps to promote citizen service related to food recovery and gleaning:

Food Recovery Roundtables.—Secretary of Agriculture Dan Glickman has convened "round tables" around the country to bring together interested nonprofit groups, corporate leaders, social service agencies, and Government officials for collaborative action on food recovery.

AmeriCorps Summer of Gleaning.—In the Summer of 1996, as one part of its AmeriCorps program, USDA sponsored a special AmeriCorps "Summer of Gleaning" program that implemented 22 food recovery projects in 20 States. The program was based on the so-called "volunteer generator" model, in which a handful of compensated AmeriCorps members recruit volunteers to help implement large-scale tasks. The 88 AmeriCorps members in the summer program recruited over 1,600 volunteers who helped pick, sort, deliver, and prepare recovered foods.

USDA National Hunger Clearinghouse.—USDA has contracted with World Hunger Year, a national nonprofit organization, to develop the USDA National Hunger Clearinghouse. The Clearinghouse established a communications network and comprehensive database identifying all known organizations providing hunger and poverty-related services, particularly organizations supporting food recovery efforts.

Food Safety Training for Food Recovery.—USDA's Cooperative State Research, Education and Extension Service (CSREES), in conjunction with the Cooperative Extension System, is helping local hunger groups recover food safely. Nationwide outreach programs like Purdue University's Safe Food for the Hungry and S.T.R.E.T.C.H. (Safety, Training, Resources, and Education to Combat Hunger) teach food-assistance workers how to transport, store, and prepare food safely. They also show groups dedicated to feeding the hungry how to create nutritious meals from the most commonly donated foodstuffs and bulk supplies.

USDA's Food Safety and Inspection Service (FSIS) is working with the Chef and Child Foundation, the philanthropic arm of the American Culinary Federation, to expand food-safety training for people serving food to the needy at nonprofit feeding program sites, including soup kitchens and shelters.

National Collaboration of Youth.—USDA signed a Memorandum of Understanding with NCY, an umbrella group for such youth organizations as the Boy and Girl Scouts, Big Brothers/Big Sisters, YMCA of America, and the Boys and Girls Clubs. The agreement specifies how the over 40 million members of NCY organizations will be encouraged to volunteer to recover food.

Federal Cafeterias, Schools, and Farmers' Markets.—In conjunction with USDA efforts, the Washington cafeterias of the Department of Justice, the Department of Energy, and the Office of Personnel Management are donating excess food to the DC Central Kitchen in Washington, DC. The DC Central Kitchen plans and distributes 3,000 meals per day, 7 days a week, to 95 charity outlets across the Washington metropolitan area. The Kitchen is in part staffed by homeless workers 48 per year who receive 3 months of on-the-job training in food preparation and management from professional chefs who volunteer their skills.

USDA is also helping school districts in both the Washington, DC, and Wichita, KS, areas to involve students in community service activities related to fighting hunger and recovering food. USDA is also working with the nonprofit groups Rock & Wrap It Up! and FoodChain to help students recover food from the School Lunch Program, restaurants, and concerts.

In addition, USDA is helping to promote food recovery from farmers' markets nationwide, including markets held at Federal agencies.

Public Service Announcements.—USDA worked with the Fox Television Network to air a plot-related public service announcement on the television show Party of Five that promoted food recovery and provided viewers with the 1-800-GLEAN-IT telephone number to obtain the Citizen's Guide and other information about gleaning and food rescue.

National Summit on Food Recovery.—USDA, the Congressional Hunger Center, and the nonprofit groups Second Harvest and FoodChain will cosponsor a National Summit on Food Recovery, which will be modeled on President Clinton's Summit on America's Future. The Summit will bring together leaders from State, county, and city governments, Indian tribes, nonprofit organizations, religious groups, large corporations, and small businesses. All attendees will be asked to make specific commitments to increase food recovery prior to the event.

National Week of Food Recovery.—President Clinton will declare a National Week of Food Recovery, during which food recovery volunteer projects will occur nationally.

The Federal Government is not alone in its food recovery efforts. Foodservice operators, retailers, nonprofit organizations, and individual citizens are also involved.

FoodChain.—FoodChain is the Nation's largest network of prepared and perishable food rescue programs. It opened its doors in 1992 with a staff of one. Today, 116 member programs and 22 associate programs participate in FoodChain, distributing nearly 100 million pounds of food to some 7,000 social service agencies each year.

Foodservice.—Hundreds of nationwide and regional restaurant chains of various sizes, along with individual foodservice outlets, are channeling unsold food to local food recovery programs.

Second Harvest.—Second Harvest, the largest domestic hunger relief organization, rescued 811.3 million pounds of food in 1995 from going to waste by soliciting donations of food and grocery products from the Nation's food industry.

Society of Saint Andrew (SoSA).—The SoSA Gleaning Network has recovered more than 200 million pounds of fresh fruits and vegetables since its founding in 1979, and distributed them to food pantries and soup kitchens across the United States.

"Unsaleable" Food Products.—The food industry has developed a Joint Industry Task Force on Unsaleables to develop new strategies and incentives to improve the condition of dented, bruised, or otherwise damaged food products for food banks. These "unsaleables" are channeled through Product Reclamation Centers, which help retailers recover the food for organizations that assist the needy.

MEASURING FOOD LOSS: ABOUT THE ESTIMATES AND THE DATA

Food is lost at every stage of the U.S. marketing system. However, due to the enormous size and diversity of the American food industry, few studies estimate aggregate marketing losses across the entire food sector. Typically, researchers report food losses as a percentage of food servings, household food stocks, or retail inven-

tories at specific points in the marketing system, such as fresh fruit and vegetable losses in supermarket produce departments, household plate waste, or preparation and storage losses in foodservice operations.

In this study, food loss was estimated by applying these loss factors, gleaned from published studies and discussions with commodity experts, to the amount of food available for human consumption in the United States in 1995. Losses at the retail, foodservice, and consumer level were estimated for 260 individual foods, which were aggregated into the food groups listed in table 1. However, preharvest, on-the-farm, and farm-to-retail losses were not measured.

The amount of food available for human consumption was obtained from national food supply and utilization data, collected and published annually by USDA's Economic Research Service (ERS). These data measure flows from production to end uses of several hundred commodities. ERS commodity specialists construct supply and utilization data sets from a wide variety of sources within the Government and food industry. Food available for consumption is calculated as the difference between available commodity supplies (the sum of production, beginning stocks, and imports) and other uses (seed, feed, and industrial consumption, and exports). These components are either directly measurable or estimated by Government agencies using sampling and statistical techniques.

In this study, the amount of food available for consumption was estimated by adjusting these food supply estimates for the removal of nonedible food parts—peels, skins, bones, pits, and seeds. These adjustments were based on ERS conversion factors that account for processing, trimming, and other weight reductions that occur as raw agricultural commodities are made into semiprocessed and final food products available for consumption at the retail, household, and foodservice levels. These reductions ranged from 5 percent for fresh fruit to more than 30 percent for meat, poultry, and processed vegetables.

Limitations inherent in the food supply data suggest that the loss estimates for the consumer, retail, and foodservice sectors presented in table 1 understate total losses for most agricultural commodities. For example, the food supply data for dairy products measure the consumption of manufactured foods, such as ice cream, skim milk, and mozzarella cheese. As a result, the loss estimate for this group includes only the share of processed dairy foods lost to human use. It does not include the loss of raw milk that occurs earlier in the marketing system as the milk is shipped from the farm to the processing plant and used in manufacturing.

Also, estimates of retail, foodservice, and consumer food losses are likely understated due to limitations in the published studies on which these estimates were based. Food loss, particularly at the consumer level, is by nature difficult to measure accurately. Participants in household surveys on food waste, for example, tend to be highly "reactive"—changing their behavior during the survey period out of reluctance to acknowledge how much food they typically discard. Also, archeological examinations of household garbage may underestimate losses due to some food being fed to pets or being discarded in drains and garbage disposals. In addition, only a very limited number of studies, most of them conducted in school and university cafeterias, have successfully measured plate waste at the institutional and foodservice levels.

TRANSPORTATION AND STORAGE

Ms. WATKINS. What we have done is that we have had opportunity, since the food recovery and gleaning summit that was held in September, to visit many gleaning centers and operations around the country and listen to the concerns that people are having. One of the things that we are finding is that 27 percent and sometimes greater amounts of food are being left in the fields and in other areas. Food banks and soup kitchens are having difficulty with transportation. They need some way to go in and recover those foods. Storage facilities and bins are another issue, as well as how do you get the food stored properly so it is safe and the handling done in the appropriate manner for those foods that are being gleaned.

It is our opinion that if we are to facilitate the removal of all of this food and make it so that it is accessible to food banks and soup kitchens and to other entities in the communities, that we provide seed money to communities to actually provide the infrastructure that they need for food recovery and gleaning.

We have heard people, even in the District, tell us that they would love to go out and glean the food, but they have no way to go out there to get it. They have no place to put it once it is returned. If you are gleaning perishable products, those products need to be stored in a safe and sanitary environment so that we would not have foodborne illnesses from food products that are recovered or gleaned.

PROGRAM AND FINANCIAL INTEGRITY

Senator COCHRAN. One other provision of the budget that caught my attention is the proposal for appropriating a \$1.45 million increase over this year's level for program and financial integrity advancement. I noticed in your statement, in your comments too, that a new initiative is underway to try to crack down on abuse and fraud in the Food Stamp Program. This is an important undertaking and I commend you for that. I know that progress has been made in this area from meetings with the inspector general and looking at GAO audit reports. I think that is something we have to acknowledge and commend.

But my question is, what are you going to do with the additional \$1.45 million requested when the Inspector General's Office is also proposing an increase for the same thing? What is the Service going to do with this additional money?

Ms. WATKINS. The Inspector General's Office makes recommendations that we are to follow through on various program integrity issues. We are unable to follow up on either the inspector general or GAO's recommendations because of the staffing situation.

We also have a need to provide technical assistance to both State and local personnel who are operating these programs. We need to make certain that we are providing people the appropriate and necessary means in which to operate a business. Mr. Chairman, I feel that we have a lot of work to do in that area, and we have not been able to do that. If we are going to maintain program integrity, it is critical that we help people in States and weed out the bad actors so that these programs are recognized as providing the benefits for those for whom they are critically needed.

This is a big business and I do not take that lightly. I think if we are operating almost a \$40 billion operation, it has to be operated as a nutrition business.

PARTICIPATION IN FOOD STAMPS AND SCHOOL BREAKFAST

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. Thank you, Mr. Chairman.

Madam Secretary, let me ask you. You have a proposal to expand food stamp benefits.

Well, first of all, the budget request assumes an additional 572,000 food stamp participants. Now, the number of participants has been declining, has it not?

Ms. WATKINS. The number has been declining, Senator Bumpers.

Senator BUMPERS. The breakfasts in the school lunchrooms has been increasing I understand.

Ms. WATKINS. That has been increasing.

Senator BUMPERS. Incidentally, what is the cause for that, do you know? Just more kids going to school?

Ms. WATKINS. The cause for the increase in the breakfast program?

Senator BUMPERS. Increase for breakfast.

Ms. WATKINS. Well, we are working aggressively with our State and local partners to increase those programs and providing access to those programs. So, that is why you would see an increase. We have seen an increase over the years in our breakfast program. As people understand the real benefits of the program, more and more school food authorities and educators are looking at that program as a viable opportunity for them to help children be ready to learn.

Senator BUMPERS. If somebody gets kicked off welfare and they go into a minimum wage job, their children are still eligible for those things, are they not?

Ms. WATKINS. They still are eligible for both the school nutrition programs and the WIC Program.

Senator BUMPERS. Now, Madam Secretary, the 572,000 increase in food stamp recipients, is that mostly illegals?

Ms. WATKINS. I am going to ask Yvette if she would answer your question, Senator Bumpers.

Ms. JACKSON. Illegal immigrants have never been eligible to participate in the Food Stamp Program. The President's proposal will not change that. Instead the President's proposal is to restore food stamp eligibility to certain categories of legal immigrants who lost eligibility as a result of—

Senator BUMPERS. Of legal immigrants?

Ms. JACKSON. Of legal immigrants.

Senator BUMPERS. The illegals have never been eligible for food stamps.

Ms. JACKSON. Illegals have never been eligible for food stamps. That is correct.

The category of legal immigrants that the President is proposing to restore benefits for includes families with children. We are anticipating that that would cover about 540,000 legal immigrants, also disabled and elderly immigrants who had their SSI and Medicaid restored as part of the Balanced Budget Act but not their food stamps. Also the proposal would extend the exemption for refugees from 5 to 7 years. That would affect an additional 105,000 legal immigrants.

So, the proposal is to restore benefits to certain categories of legal immigrants who lost their eligibility as a result of welfare reform.

ADMINISTRATIVE SAVINGS AND OFFSETS

Senator BUMPERS. Secretary Watkins, the administration proposal, their new initiatives. You are asking for \$2.5 billion to implement those. Is that correct?

Ms. WATKINS. That is correct.

Senator BUMPERS. My question is, You list offsets to make up for that which are estimated at \$1.2 to \$1.4 billion. Staff tells me they think those are the same offsets that have been identified for funding of the agriculture research title. Is that correct?

Ms. WATKINS. Dennis?

Senator BUMPERS. My question is, If that is correct and the conferees to the research title use those savings for new research programs, do you have any alternative plans for how you are going to pick up that money? It looks to me like it is kind of a race for jurisdiction here, whoever meets first and uses those offsets. I think they are the same. Do you follow my question?

The administration is asking for \$2.5 billion. You are saying that the savings required in other programs to achieve this is going to come from certain administrative savings totaling \$1.2 to \$1.4 billion. My question is, I think these are the same savings that have been targeted for offset as a part of the conference discussion in the agricultural research title. We cannot use those offsets in two places obviously.

Ms. WATKINS. I am going to ask Dennis Kaplan to address that.

Senator BUMPERS. He does not act like he wants to.

Ms. WATKINS. I know it. [Laughter.]

That is the reason why I thought I would tell him.

Senator BURNS. In fact, he wants to borrow your hardhat.

Mr. KAPLAN. They are the same offsets. It is the administration's position they ought to go to food stamps, and if the research bill conference comes out first, we are going to have to relook at the issue.

Senator BUMPERS. You are going to be looking for something else.

Mr. KAPLAN. Yes, sir.

Senator BUMPERS. Well, I thought that was the right answer.

FOOD STAMP PROGRAM AND WIC RESERVES

Madam Secretary, when was the last time we had a food stamp reserve that was triggered? You are asking for \$1 billion reserve in the food stamp account, and my question is, When was the last time we triggered the reserve account? Mr. Kaplan, anybody?

Ms. WATKINS. Late 1970's.

Senator BUMPERS. Pardon?

Ms. WATKINS. More recent than late 1970's? Mr. Chairman, Senator Bumpers, let me get back to you on that.

Senator BUMPERS. That might be a place to find some of those offsets. I do not think you really need that reserve if you have not used it since the 1970's.

Ms. WATKINS. Let me get back with you. I am not sure that that is the correct answer, and I want to make sure I am giving you the right answer. I do not want to give you a wrong answer.

[The information follows:]

Fiscal year 1992 was the last time that the food stamp reserve was triggered. At that time, \$0.9 billion of a \$1.5 billion reserve was used to cover increased program participation.

Senator BUMPERS. OK.

While we are on reserves, I wanted to ask you about the WIC reserve. You are asking for what?

Ms. WATKINS. \$20 million.

Senator BUMPERS. \$75 to \$100 million. How much are you asking for—just a moment.

What kind of carryover did we have in the WIC fund last year?

Ms. WATKINS. We had \$150 million approximately last year in carryover/carryout.

Senator BUMPERS. And what do you anticipate this year?

Ms. WATKINS. \$130 million.

Senator BUMPERS. \$130 million?

Ms. WATKINS. Right.

Senator BUMPERS. Why do we always have this big carryover in the WIC Program?

Ms. WATKINS. Well, that was one of the things that I tried to explain in my oral presentation. One of the things that happens is that the States try very carefully not to overspend. At the same time it becomes very difficult for them, as they move through the year, not knowing how many actual participants they are going to have in that program. So, they try not to overspend, and as a result they end up sometimes at the end of the year with carryover money. These carryover funds can vary because of a wide variety of issues in a State. For example, they do not know what that food cost is going to be because of the manner in which the coupons and the checks are redeemed.

As someone said to me, it is not an exact science. It is a very, very cumbersome and a difficult process. So, they try not to overspend, and we want to make certain that we have adequate moneys in our carryover funding so that they serve the number that we have. They have moneys, but they are bound not to overspend. So, they are not going to overspend.

Senator BUMPERS. But you are asking for a \$20 million reserve in the WIC.

Ms. WATKINS. That is right.

Senator BUMPERS. Senator Cochran and I are going to be desperate, when we sit down to mark this thing up, trying to find money because we are going to be way short, close to \$1 billion.

Ms. WATKINS. It is very difficult for us to get the exact number in WIC State or local participants that we are going to have each month. If you cut it back, we would not be able to serve the 7.5 million that we estimate—

Senator BUMPERS. My guess is if you ran short in the WIC Program, we would have a second or a third supplemental in a New York minute because it is a very popular—

Ms. WATKINS. In a New York minute—

Senator BUMPERS. I do not think we are ever going to let WIC run out of money.

Ms. WATKINS. Well, the only problem, Senator Bumpers, is that sometimes we are criticized severely if we do not have the exact numbers and come back and ask for a supplemental. So, we take our bet on trying to have the money in advance, rather than have to come back to you and ask for a supplemental.

STUDIES AND EVALUATION TRANSFER

Senator BUMPERS. This next question is not the sexiest question in the world. My staff insists I ask it, so I will. [Laughter.]

In 1998 we transferred the studies and evaluation activities of the Food and Nutrition Service to the Economic Research Service. Now this year you are asking that it be transferred back. Why?

Ms. WATKINS. The administration asked that that money not be transferred initially, and it was. We are requesting that those funds be returned to FNS so that we can control the surveys, the research, and the studies that are done for those programs. They are program specific. ERS is an outstanding organization that is in the economic research service area. Their research expertise does not necessarily lie in the nutrition research area.

So, we think it is critically important that that area be returned back to FNS so that we also can request research and thereby make adequate program decisions. It is a little difficult for me to go to another mission area in another agency to request a variety of research that I need done if I am going to make solid management decisions. That is why the administration is requesting that those funds be returned to FNS.

Senator BUMPERS. I do not have any objection to that.

Ms. WATKINS. Thank you, Senator Bumpers.

Senator BUMPERS. I have a couple of questions that I will submit in writing, one probably on the WIC farmers' market, another one on TEFAP, another one on the WIC immunization program. That is something that I got started several years ago and I have been trying to monitor it as closely as I could to see how well it is working. When I go down and visit these conferences where CDC and the WIC administrators—they do not like each other very well or very much, but they have sort of made a peace. I think that program is working reasonably well, but I am still a little bit troubled about the role USDA has in that compared to CDC and so on.

ELECTRONIC BENEFIT TRANSFER CARDS AND FRAUD

But my final question to you this morning is on the EBT cards. For years some of us have thought that was going to be a panacea to fraud. Apparently you are still experiencing, in the 25 States that use EBT cards, close to a 10-percent fraud. Is that correct?

Ms. WATKINS. In that neighborhood, Senator Bumpers.

Senator BUMPERS. How does most of that occur? Does somebody just give their card to somebody else for money and they go in and buy the groceries?

Ms. WATKINS. Some of it. In some instances, that is the way it happens. Yvette may want to elaborate more on that.

Senator BUMPERS. Ms. Jackson?

Ms. JACKSON. EBT does not eliminate fraud. It gives us, for the very first time, an electronic tracking, a record, of every single transaction so that we can go back and identify suspicious or fraudulent activity that we never had the capacity to identify in the past. What we are able to do with EBT is to identify both the retailers who are committing fraud, as well as for the very first time the recipients who are also abusing their benefits. As a result, we are able to take swift action that we were only able to do in the past through actual onsite, undercover investigations. So, we think this is a tremendous tool for us.

We also have implemented an automated tracking system that provides us with profiles to help us identify suspicious activity with the help of a vendor. That computer system is available not only to the FNS staff, but it is also available to the Office of the Inspector General and available to States so that we can collectively work together in identifying and prosecuting food stamp fraud. Certainly this is above the capacity that we were able to do prior to EBT.

Senator BUMPERS. Ms. Jackson, do you save anything administratively? Do you save administrative expense with these cards?

First of all, how often do you send out a card to a recipient?

Ms. JACKSON. Most States are issuing a card one time. They do make replacements if the person should lose the card. One of the benefits of the card is that if a person should misplace or lose their card, it can be electronically deactivated immediately with no more than a phone call from the recipient. So, it is much more secure than the paper coupons.

We save Federal dollars because with EBT we are no longer dealing with the cost of printing, distribution, storing, and then the cost of ultimately destroying the coupons because they only get used one time. So, we have savings to the Federal Government in terms of the paper process.

We also reduce losses due to theft and loss of the coupons because, again, the card is more secure. Of course, as I said, it gives us a much, much better tool to identify and crack down on fraud.

Senator BUMPERS. Madam Secretary, you must be doing a good job. This subcommittee has jurisdiction over \$57 billion and 70 percent of it is yours, and there are only three Senators here and not a single reporter. [Laughter.]

So, you must be doing OK.

Ms. WATKINS. Senator Bumpers, my goal is to stay out of the Washington Post. [Laughter.]

Senator BUMPERS. Well, if you were in my position, you would be trying to avoid subpoenas. [Laughter.]

I am the only person in Arkansas that has not been subpoenaed so far. [Laughter.]

Senator BURNS. We will see if we cannot take care of that this afternoon.

Senator BUMPERS. And I am knocking on wood.

Senator COCHRAN. Senator Burns.

Senator BURNS. Thank you very much, Mr. Chairman.

I want to continue on with the EBT card. I was around when we started that program, and I am very supportive of it.

I do not think you quite answered—went to length in Senator Bumpers' question. How is fraud committed with these cards?

Ms. JACKSON. Generally it is committed at the retailer site where there is collusion between the recipient who holds the card and the retailer. So, the retailer will swipe the card and input information that would indicate, for example, that they sold 100 dollars' worth of food, when, in fact, what they did was they gave \$50 cash to the recipient and then came back, of course, and got reimbursed as if they had actually sold 100 dollars' worth of food. So, it is collusion between the person with the card and the retailer.

Senator BURNS. On that card is there a picture of the recipient, a personal picture just like a driver's license or something like that?

Ms. JACKSON. A photo is not required. It is allowed. Many States do not include the photo on the card because of the cost. However, the individual has to use the card in conjunction with a personal identification number so that they have to input that personal identification number in addition to presenting the card.

Senator BURNS. The only people that we had complaints from, Senator Bumpers, when we put the card in is it cost some people at the county courthouse because they did not have near as many people counting out stamps and storing the darned things. I just knew that it had to be a pretty fair program that needed to be looked into. So, I appreciate its continuing.

I think you are right. It probably does give you a better paper trail when fraud is committed when you have to identify the retailer or the merchant and the recipient.

Also, I want to just pledge my support in my county when I was commissioner in Yellowstone County, MT. My wife is a school-teacher and it is unbelievable to me—of course, I was raised on a farm, so everything is unbelievable to me. [Laughter.]

The number of young people that go to school in the morning without breakfast. I will tell you in some schools in Yellowstone County, when we started feeding kids breakfast, all at once we have seen a different kind of student because I just do not think hungry kids learn. I am a bigger supporter of the breakfast than I am of lunch, to be right honest with you. I think it does more for the young person. But I cannot believe the amount of people that send their kids to school without breakfast.

Of course, I have always been very supportive of the WIC programs, and I believe in those a lot.

There are other areas I do not agree with you, but that does not make any difference. You stay out of that Washington Post and you will always be a hero to me. [Laughter.]

Thank you very much.

Is the card continuing to grow in acceptance in other States? Now, you have it in place in 25 States. I remember the pilot program started out in Baltimore and Cleveland and they had some troubles at first, but then they really got ironed out. So, you are doing a very good job.

Ms. JACKSON. We anticipate, Senator, that by the end of this calendar year over 50 percent of the food stamp caseload will be receiving their benefits electronically, and we do not anticipate any difficulty in States meeting the congressional mandate to have EBT nationwide by the year 2002.

Senator BURNS. Good enough.

I thank the chairman. I appreciate that very much.

Senator COCHRAN. Thank you, Senator Burns, for your contribution to the hearing and your helping the work of this committee. It is very important, and we appreciate it very much.

WIC FULL PARTICIPATION

Madam Secretary, there is an indication in the budget that we are trying to fund the WIC Program to achieve this level of full participation. I have heard that every year. We use it, and I try to convince Senators to support our appropriation figure based on our effort to achieve this longstanding goal of full participation.

Where do we get the 7.5 million we say is the full participation level? Is there any evidence that you know of that supports 7.5 million as the full participation level for the WIC Program?

Ms. WATKINS. Mr. Chairman, I am going to ask Ron Vogel to explain that for you.

Mr. VOGEL. Thank you. [Laughter.]

Senator, we believe, given the estimation methodologies that we use, that there are approximately 9 million people, women, infants, and children, in this country that are fully eligible for the WIC Program. That means they are both income eligible and demonstrate some form of nutritional risk. We believe, that of that number, it is reasonable to assume that about 7.5 million individuals on a monthly basis will avail themselves of WIC services. So, when we say that 7.5 million represents a fully funded program, we mean that is the number of people that we expect in any given month that would need the services of the program and seek those services.

Senator COCHRAN. That is good. I needed that because if I get asked that question, I did not know what I was going to say when I am managing the bill on the floor. So, I am fully armed now with an answer. Thank you.

WIC FOOD PACKAGE COSTS REDUCTIONS

Secretary Glickman in his prepared statement before the committee said that efforts continue to reduce the overall cost of WIC food packages, and he set that at 10 percent by 2002. That is his goal. Could you describe for us what the Food and Nutrition Service or your office is doing to achieve that goal? When did that effort

begin and what have we achieved up to this date to cut the overall cost of the package?

Ms. WATKINS. Mr. Chairman, one of the things that we are doing is working with States on their bidding practices. We are very proud of what States have done on the WIC food packages and reducing those costs. Obviously, as they reduce their food package cost, they are doing a variety of things at the State and the local level to reduce those costs. I am going to ask Ron to share some of the kinds of things that the agency has done over the past several years that will give you the indication of what those States have actually done in reducing those costs. Ron?

Mr. VOGEL. First of all, I would like to point out that that is a goal, in terms of reducing the food package costs by the year 2002 by 10 percent, that we have committed to and we will be working with our States to achieve that.

The kinds of things that we intend to do to try to meet that goal, Senator, is to continue to seek ways to reduce the cost of infant formula in the program. States have done a remarkable job to this point, but we believe there are still some additional things that can be done. To that extent, we intend to propose a rulemaking very shortly that we think will increase the savings in this area.

Likewise, we are going to be working with our State cooperators to improve vendor management. You are aware that, depending on the vendors that participate in this store, the food package costs can fluctuate significantly. So, we are working with our State cooperators to improve vendor management, and we will have two rulemakings that we are going to be proposing this year that will help States improve vendor management. We expect that that will also have an effect in reducing food package costs.

Of course, we always encourage States to look at ways to reduce the food package costs by emphasizing store brands and economical package sizing. States are very aggressive in this area, Senator, and given that the situation that confronts us with a tight budget situation in the years ahead, States will have to be more aggressive in looking at food package cost savings if they intend to expand participation.

Senator COCHRAN. Is competitive bidding one of the techniques?

Mr. VOGEL. Competitive bidding with respect to infant formula is required by law and all States are engaged in that practice. There are other States that on their own have engaged in competitive bidding for other foods, infant juices, infant cereals, and the State of Delaware actually competes their vendor positions on the program.

Senator COCHRAN. At the administration's request, we remember including that language in the appropriations bill, the legal authority to require the competitive bidding. I notice that you suggest that we ought to make that permanent law in our bill. There is a reauthorization bill coming down we understand, but we do not know when it is coming and what it is going to have in it.

Is that one of the things that you might consider putting in your bill that will be proposed by the administration to Congress?

Mr. VOGEL. There is already a requirement in existing law to competitively bid for infant formula. Our reauthorization proposal will suggest no other extension of that practice in maintaining WIC

food package costs, but we will have a rulemaking, as I indicated, so that we will regulatorily enhance the effectiveness of the competitive bidding for infant formula.

Senator COCHRAN. What is your expectation for presenting the reauthorization bill to Congress?

Ms. WATKINS. We would expect that you would have that before the day is over.

Senator COCHRAN. Wow.

Ms. WATKINS. We thought you were going to have it before I got here this morning. I was just going to give it to you, but we did not get the transmittal letter for the Secretary to sign before I left the office. So, we will do that as soon as we get back. You will have it before the day is over.

Senator COCHRAN. Could you tell us anything about what the impact is going to be if Congress approves your reauthorization request on the appropriations needs?

Ms. WATKINS. It is a cost neutral reauthorization package.

Senator COCHRAN. That sounds good. That means it is not going to cost any more than it would have if you had not asked for reauthorization. It is just going to cost the same as projected under current law.

Ms. WATKINS. That is exactly right. There are some differences in the out-year costs, but as balanced over the 5-year period, it is going to be cost neutral.

WIC ELECTRONIC TRANSFER PROGRAM

Senator COCHRAN. Tell me how the electronic benefit transfer program works in the WIC Program. I understand the Food Stamp Program. But when I was reading my notes in preparation for the hearing, I understand from your testimony that FNS is engaging in activities that complement the Food Stamp Program. I am not sure I understand what that means. "To advance electronic benefit transfer systems to improve program benefit delivery and client services for the WIC program." I did not know we had an EBT program for WIC.

Ms. WATKINS. We do have some pilots going on now in EBT for WIC that are very similar to the food stamp model. It will be very similar to that program.

Senator COCHRAN. Are there funds being used in this fiscal year's budget that we appropriate for this purpose, and have you included a request for next fiscal year for that program?

Ms. WATKINS. We have included funds for the 1999 budget in this budget year's request. There are some funds in there for States to implement the WIC EBT program, and we are working with those States that are doing the pilot currently.

Senator COCHRAN. I understand in your budget notes that you hope to increase the number of States to four that are going to be participating in that program. What States are they, do you know?

Ms. WATKINS. Do you want to give the name of the States, Ron?

Mr. VOGEL. The only State right now, Senator, that has an actual operative WIC EBT system is the State of Wyoming.

Senator COCHRAN. But there are not many WIC recipients out there either.

Mr. VOGEL. No, sir; there are not that many. But the technological challenges, therefore, are probably a lot greater for a State like Wyoming than they would be for a more populous State. We are pleased with what Wyoming has managed to accomplish here.

There are 10 other States, Maine, New Hampshire, Texas, New Mexico among those, that are close to putting a pilot version of WIC EBT into place. And that is really our goal, by the year 2002 is to have another three States join Wyoming in being able to deliver WIC benefits through an EBT system.

FOOD STAMP PROGRAM EMPLOYMENT AND TRAINING

Senator COCHRAN. There were some questions I was going to ask you that Senator Bumpers has already asked and there are other questions that I intend to submit and ask you to respond to for the record.

There is one question though that I do want to ask and that is about a request for \$6.7 million for employment and training in the Food Stamp Program. I assume this means for recipients rather than administrators. What kind of employment and training program do you have going on that costs \$6.7 million or that you hope to have going on?

Ms. WATKINS. Yvette is going to answer that for you.

Ms. JACKSON. I was confused because I was not aware that we were going after any additional money. It is just an inflation adjuster for fiscal year 1998. Basically in the Food Stamp Program, as part of the balanced budget agreement, additional funds were added to the Food Stamp Employment and Training Program to allow States to offer work slots to any able-bodied adult who is subject to the work requirement. That means that for anyone between the ages of 18 and 50 who is considered able-bodied, they can only receive food stamps for 3 months out of any 36-month period unless they are working 20 hours a week, involved in a workfare program, or in an employment and training program of 20 hours per week. So, we have a request from the balanced budget agreement that extends over a 5-year period to increase State employment and training funds to guarantee that anyone who is willing to work is given that opportunity in order to continue to be eligible for the food stamp programs.

Senator COCHRAN. Who gets the money? Do you contract this out or do the States contract it out? Do you manage the program? How does it work?

Ms. JACKSON. States use a combination. Many of them do contract out. Many of them are using other governmental and non-profit organizations to act as work sites for workfare. We anticipate that most States will be creating workfare slots to offer work opportunities for their able-bodied adults.

Senator COCHRAN. You do not manage the program from here though. You let the States manage the program.

Ms. JACKSON. Yes; it is managed at the State level.

CNP REAUTHORIZATION

Senator COCHRAN. On the child nutrition programs, I understand that the reauthorization there will be cost neutral as well, improving operation and management, integrity of the national school

lunch and school breakfast programs, and the child and adult care food programs. Is that going to be included as a part of the overall package for reauthorization?

Ms. WATKINS. Yes, sir; it is.

NATIONAL FOOD SERVICE MANAGEMENT INSTITUTE

Senator COCHRAN. What funding, if any, is included in the budget request for next year for the National Food Service Management Institute?

Ms. WATKINS. We have included \$2 million. Let me just be sure that I have got that actual for you. We have asked for an additional \$1 million for the Institute. They started out and they have had the same amount since its inception, and we asked for an additional \$1 million this year, in addition to over \$500,000 that we would provide to the Institute out of our team nutrition funding stream. That would be provided to the Institute.

In addition, we are looking at possibly using the Institute to do the training for food safety for our food service personnel in schools and child care facilities.

Senator COCHRAN. That sounds like a good idea to me, and I hope that we are able to get the funding approved to meet that request. This involves the handling and management of the food stuffs so as to lessen the likelihood of contamination and problems with respect to the school lunch programs and other feeding programs run by the schools.

Ms. WATKINS. That is exactly right, Mr. Chairman. One of the things we did a couple of years ago was to begin the process of developing food safety materials and food handling materials for school nutrition personnel. We have completed that handbook, but we did not have the resources in which to offer the training for the staff, and that is what the \$2 million is for. Obviously, we want to look at areas where there are already instruments in place, people in place, facilities in place to actually do that training, and we would not do it from the Federal level. If we are going to do it, we think the best place to do it is through the Institute and working with States and local school nutrition staff.

SUBMITTED QUESTIONS

Senator COCHRAN. As I indicated, there are additional questions that we will submit for the record, and any elaboration on questions that we have asked you that you feel would be helpful to the committee, we encourage you to include as additional statements with that submission when you respond to our written questions.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD AND NUTRITION PROGRAM RESEARCH

Question. When signing the fiscal year 1998 Appropriations Act last November, the President noted his concern about the provision in the bill transferring funding for research on nutrition programs from the Food and Nutrition Service to the Economic Research Service. The President's fiscal year 1999 budget now proposes to restore this funding to the Food and Nutrition Service.

Why does the Administration believe that the Food and Nutrition Service can better oversee and administer these research funds?

Answer. The best place to house research responsibilities for food assistance programs is with the agency, the Food and Nutrition Service (FNS), that administers the programs. It is the proximity of research, program, and policy staff that ensures a research program that is practical and relevant to program operations and policy development. Housing the research function within FNS achieves the critical balance between independence and effective communication with the programs served, taking advantage of FNS' ongoing, operational relationship with State and local administrative agencies and other related Federal agencies.

In addition, the range of issues surrounding FNS programs is very broad. They demand techniques that go beyond typical economic analyses if we are to reliably address the concerns of Congress and States. We are often required to initiate new nationally representative data collection efforts as well as complex demonstration activities (such as those that established the viability of Electronic Benefit Transfer). While the Economic Research Service (ERS) is a capable research organization, the expertise to administer such activities has been developed over the years in FNS.

FNS has managed one of the strongest applied policy research programs in all of government with a proven track record of conducting research relevant to program needs. The time it would take to replicate this in ERS seems a poor use of government resources. Moreover, efforts to coordinate between ERS and FNS and its program cooperators seems to introduce an unnecessary complexity into USDA operational procedures.

Question. How has the Food and Nutrition Service been involved in the food assistance and nutrition research program being carried out by the Economic Research Service for fiscal year 1998?

Answer. The Food and Nutrition Service (FNS) entered into a working relationship with the Economic Research Service (ERS) shortly after the fiscal year 1998 appropriation was signed into law. Meetings to outline the terms of this relationship took place between the FNS Administrator, Associate Administrator, other senior FNS staff, and ERS leadership. There have been extensive briefings between FNS research and program staff and ERS research staff on FNS food assistance program operations and the Agency's policy information needs. We gave ERS a complete description of our research priorities for fiscal year 1998 and we have worked hard to respond to all of ERS' information needs. We have also given ERS extensive background materials on our previous research projects and the competitive contracting process, as well as appropriate staff points of contact within FNS.

Question. Is the fiscal year 1998 food assistance and nutrition research program reflective of the Food and Nutrition Service's priorities?

Answer. To help the Economic Research Service (ERS) start off in the right direction the Food and Nutrition Service (FNS) provided them with a detailed description of FNS' information needs. ERS is now in the final stages of preparing a plan of action. Indications are that they will initiate research on many, but not all, of our priority information needs.

It is too soon to tell whether the implementation of the research will remain practical and relevant to FNS program operations and policy development. When study funding and authority were located with FNS we were able to make mid-course adjustments quickly so that studies were able to reflect current FNS priorities while the effect on study budgets was minor. While the need to coordinate across agencies is a challenge, we expect to work closely with ERS to achieve the best results possible.

Question. What is the Economic Research Service doing specifically that the Food and Nutrition Service does not agree with or would do differently?

Answer. The Economic Research Service (ERS) put a lot of hard work into their response to our priorities and many aspects of it are good. The most significant area of disagreement concerns whether ERS is underinvesting in work of immediate relevance in favor of data development efforts that will not require funds until future years. Specifically:

1. Given the substantial policy interest in ensuring the success and measuring the consequences of welfare reform, the Food and Nutrition Service (FNS) would invest more in research aimed at helping States overcome potential barriers in creating work opportunities for persons subject to a three-month time limit on food stamp participation and at determining outcomes for the two groups most affected by new restrictions on eligibility for food stamps, legal immigrants and able-bodied adults without children. We are concerned that the approach taken by ERS as well as the funds budgeted may not be sufficient.

2. ERS' proposal was unable to pursue the full range of policy and program issues contemplated in our proposed study of the Summer Food Service Program. Recognizing that resource constraints often force difficult decisions, we have suggested that further discussion of the scope and scale of this study is warranted to ensure that it produces information of greatest relevance to FNS. We are urging ERS to focus on nutrient quality and the characteristics of program sponsors, sites and beneficiaries. No previous work has examined the nutrient quality of Summer Program meals; previous research efforts, albeit somewhat dated now, have dealt with the issue ERS intends to pursue (the characteristics of program sponsors and providers).

3. ERS proposed to allocate nearly twenty percent of their budget to data development. While FNS understands and supports ERS' interest in this area, we wonder if the resources proposed to expand survey samples in the future for the Continuing Survey of Food Intake of Individuals (where current plans call for the next round of data collection no earlier than fiscal year 2000) and the National Health and Nutrition Examination Survey might not be better used as described above as well as to support relevant analyses of recently released data from these surveys, which remain underutilized.

SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

Question. The explanatory notes indicate that the Administration is seeking an increase of \$145.5 million for fiscal year 1999 to "meet the long-standing bi-partisan commitment to funding in the WIC Program at a full participation level of 7.5 million."

Please summarize the methodology used to estimate the 7.5 million WIC "full participation" level.

Answer. The President's Budget proposes to fully fund the WIC Program and serve 7.5 million women, infants, and children throughout fiscal year 1999. The full funding participation level, providing adequate funding to serve all eligible persons who would choose to participate in WIC, has been assumed to be approximately 7.5 million persons for budget purposes for the past several years. This target was originally based on a budget estimate prepared in 1993 by the Congressional Budget Office. It is also consistent with the Food and Nutrition Service's (FNS) full participation estimate produced in 1996 using 1994 WIC eligibles data.

Previous estimates of full participation have assumed that, on average, approximately 80 percent of all persons fully-eligible for the program would participate. We now know that higher participation rates by the target population can be achieved. This is supported by the experience of the Food Stamp Program, where participation rates for families with children under 5 are over 90 percent, and the Aid to Families with Dependent Children (AFDC) program, where participation rates since 1990 have ranged from 82 percent to 86 percent.

Given that the estimated number of fully-eligible persons is 9 million, and that actual participation in WIC and other low-income assistance programs serving children exceeds the 80 percent previously assumed, a full funding participation target for fiscal year 1999 of 7.5 million remains reasonable and prudent.

The full participation estimate is based on the number of individuals who are income-eligible for WIC. First, the number of infants, and children income-eligible is taken directly from the most recent Current Population Survey (CPS). The number of pregnant women is estimated as 75 percent of the number of infants, taking into account the fact that women are only pregnant for 9 months out of a year. Postpartum and breastfeeding women are estimated as 37 percent and 17 percent, respectively, of income-eligible infants. These factors were empirically derived from analyses of 1990 Census data, and the 1988 National Maternal and Infant Health Survey (NMIHS). The result is the total number of women, infants, and children income-eligible for WIC. We estimate, based on 1996 data, that 11.1 million persons are income-eligible for the Program.

Second, the total number of women, infants and children income-eligible for WIC is used to estimate the number who are also at nutritional risk, and therefore fully eligible for WIC using factors derived from the National Health and Nutrition Survey II (NHANES II). Overall, we assume that approximately 4 out of 5 income-eligible persons are also at nutritional risk, which indicates that 9 million persons are fully eligible for the Program.

The third step is to estimate how many of those fully eligible would actually participate in the Program, assuming no funding constraints. As noted above, FNS previously arrived at an estimate of 7.5 million women, infants, and children, by combining the above methodology with the assumption that, on average, 80 percent of those fully eligible would choose to enroll in the Program. Since then, FNS has learned that a participation rate of 80 percent is likely to be low, based on the par-

ticipation rates for comparable types of individuals in the Food Stamp and AFDC Programs. Therefore, even though the estimated fully eligible population has declined somewhat in recent years, FNS has maintained constant its estimate of full participation at 7.5 million to account for increasing participation rates among those eligible. In the Food Stamp Program, the participation rate for families with children under 5 is over 90 percent. In the AFDC program, participation rates since 1990 have ranged from 82 percent to 86 percent.

A copy of USDA's most recent WIC eligibility update is provided for the record. [The information follows:]

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS AND CHILDREN
(WIC)

ELIGIBILITY AND COVERAGE ESTIMATES 1996 UPDATE—U.S. AND OUTLYING AREAS

Overview

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) is a Federal-State nutrition and health assistance program for low-income childbearing women, infants and young children. To be eligible, an applicant must meet three basic criteria:

(1) *Categorical.*—Participants must be pregnant women, breastfeeding women up to 1 year after delivery, non-breastfeeding postpartum women up to 6 months after delivery, infants up to 12 months of age, or children up to their fifth birthday.

(2) *Income.*—The maximum income limit is 185 percent of the U.S. Poverty Guidelines (e.g., \$29,693 for a family of four as of July 1, 1997). In addition, individuals are automatically considered income-eligible if they receive benefits under the Federal Medicaid, Aid to Families with Dependent Children (AFDC),¹ or the Food Stamp Program (FSP). Income limits for the AFDC and FSP are below the WIC income cutoff; however, in some cases, Medicaid serves persons over 185 percent of poverty.

(3) *Nutritional Risk.*—Participants must be certified to be at nutritional risk. Three major types of risk are recognized: medically based risk, such as anemia, underweight, maternal age, history of pregnancy complications or poor outcomes, etc.; diet-based risk—inadequate dietary patterns, as determined by 24-hour food recall or food-frequency analysis, and predisposing risk conditions, such as homelessness and migrancy.

1996 ESTIMATE OF WIC ELIGIBLE

[Numbers in thousands]

	Pregnant women	Postpartum and breastfeeding women	Infants	Children	Total
1995:					
Income eligible	1,300	931	1,748	7,313	11,292
Fully eligible	1,187	855	1,661	5,499	9,202
Participation (CY)	689	900	1,817	3,541	6,947
Coverage (CY) (percent)	58	105	109	64	75
1996:					
Income eligible	1,262	903	1,697	7,235	11,097
Fully eligible	1,148	822	1,612	5,426	9,009
Participation (CY)	712	963	1,835	3,769	7,279
Coverage (CY) (percent)	62	117	114	69	81

Estimates of persons eligible for the WIC program are used for several purposes. They provide an indication of the number of persons who would participate in WIC if funds were available. As such, the eligibles estimates are an important component in developing program budget estimates used in the President's budget request and

¹ The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (Public Law 104-193) replaced AFDC with the Temporary Assistance for Needy Families (TANF) program. TANF recipients will continue to be considered automatically income eligible for WIC as long as the income standards established by States for TANF are not less restrictive than those for AFDC.

the Congressional budget process. Finally, the eligibles estimates provide a basis for estimating program coverage that is, for determining what share of the eligible population the program is currently reaching. Based on the March 1997 Current Population Survey (CPS), FNS estimates that 9 million women, infants and children were fully eligible for the WIC Program in 1996, a 2 percent decrease from the number estimated eligible in 1995. A total of about 11.1 million women, infants and children fell below the WIC income eligibility limit in 1996, vs. an estimated 11.3 million in 1995.

Program Coverage

The decrease in the estimated number of WIC income-eligibles, combined with an increase in average monthly participation of over 300,000 for the calendar year, allowed overall program coverage to increase by six percentage points, from 75 percent in 1995 to 81 percent in 1996. This coverage estimate does not factor in increases in participation that have occurred since 1996.

Estimated coverage of pregnant women is approximately 62 percent for 1996. This represents the proportion of women at all stages of pregnancy who are participating in WIC. Because women are very unlikely to participate in WIC for a full 40 weeks of pregnancy, this rate should be expected to be significantly below 100 percent. For example, if all eligible pregnant women were to participate for six months of their pregnancy, the calculated participation rate would equal 65 percent.

Estimated coverage rates for infants and breastfeeding/postpartum women were over 100 percent in 1996. These extremely high coverage rates are likely attributable to some disparities between the methodology used to estimate income-eligibles and the certification practices in the WIC program, as well as the imprecision inherent in any survey-based estimate. Recent Medicaid expansion and income variability during pregnancy and the postpartum period may also be important factors. Newly available and ongoing research sponsored by USDA will provide additional information on these aspects of WIC participation dynamics. However, these data do strongly suggest that the program has likely achieved virtually full coverage of persons in these categories at the national level. Estimated coverage of children also rose substantially from 1995 to 1996, from 64 percent to 69 percent.

The estimate of 9 million WIC eligible persons in 1996 assumes that about 4 out of 5 income eligible persons are also at nutritional risk and thus fully eligible for the WIC Program. The estimates of pregnant, postpartum and breastfeeding women are based on the count of infants from the CPS and relationships found in the 1990 Decennial Census.

WIC Full Participation

The President's Budget proposes to fully fund the WIC Program and serve 7.5 million women, infants, and children throughout fiscal year 1999. The full funding participation level, providing adequate funding to serve all eligible persons who would choose to participate in WIC, has been assumed to be approximately 7.5 million persons for budget purposes for the past several years. This target was originally based on a budget estimate prepared in 1993 by the Congressional Budget Office. It is also consistent with the Food and Nutrition Service's (FNS) full participation estimate produced in 1996 using 1994 WIC eligibles data.

Previous estimates of full participation have assumed that, on average, approximately 80 percent of all persons fully-eligible for the program would participate. We now know that higher participation rates by the target population can be achieved. This is supported by the experience of the Food Stamp Program, where participation rates for families with children under 5 are over 90 percent, and the AFDC program, where participation rates since 1990 have ranged from 82 percent to 86 percent.

Given that the estimated number of fully-eligible persons exceeds 7.5 million, and actual participation in WIC and other low-income assistance programs serving children exceeds the 80 percent previously assumed, a full funding participation target for fiscal year 1999 of 7.5 million remains reasonable and prudent.

Question. Is this the same methodology that was used for the full participation estimates for each of the past 6 years (fiscal years 1993 through 1998)? If not, please describe the differences in the methodology and set of assumptions for the WIC full participation estimates used in each of these years and the reasons for those differences.

Answer. No, it has been revised. We have changed our assumptions about full participation in the absence of funding constraints.

In fiscal year 1993, the Food and Nutrition Service (FNS) estimated that 8.6 million persons were fully eligible for the WIC Program in 1991. This estimate was based on data from the 1992 Current Population Survey (CPS). While FNS did not

specifically estimate a full participation level that year, the participation target produced that year for the fiscal year 1995 budget was 7.5 million participants. This estimate was based in part on FNS' eligible analysis as well as a separate analysis produced by the Congressional Budget Office (CBO).

No WIC eligible or participation estimates were released in fiscal year 1994. In fiscal year 1995, FNS substantially revised its methodology for estimating the WIC eligible population. The major changes made were:

- To incorporate newly-released demographic data from the 1990 Census (previous estimates used 1980 Census information)
- To include an adjustment for the 1990 Census undercount.

In addition, FNS developed an explicit estimate of the number of persons who would participate if no funding constraints existed, i.e., if WIC were full-funded. This was based on an assumption that 80 percent of fully-eligible persons would participate.¹ Using this assumption, we estimated that 7.9 million persons would participate if funds were available, based on a fully-eligible estimate of 10.1 million persons.

In fiscal year 1996, using the same methodology as in fiscal year 1995, FNS estimated that 7.5 million persons would participate in a fully funded program, based on an estimated fully-eligible population of 9.4 million persons.

In fiscal year 1997, we estimated that the fully eligible population was 9.2 million, using the same methodology as the two previous fiscal years. However, we now know that participation rates higher than 80 percent can be achieved by the target population. This is supported by the experience of the Food Stamp Program, where participation rates for families with children under 5 are over 90 percent, and the Aid to Families with Dependent Children program, where participation rates since 1990 have ranged from 82 percent to 86 percent.

Our current estimate is that 9.0 million persons are fully eligible for WIC, based on 1996 data. Given that the estimated number of fully-eligible persons exceeds 7.5 million, and actual participation in WIC and other low-income assistance programs serving children exceeds the 80 percent previously assumed, a full funding participation target for fiscal year 1999 of 7.5 million remains reasonable and prudent. Thus, FNS has supported a participation target of 7.5 million in fiscal year 1999 and continues to do so.

Question. What would be the full participation levels for each of fiscal years 1998 and 1999 using the same methodology used for the fiscal year 1994 full participation estimate?

Answer. FNS typically has used the most recent WIC eligibles data to identify an appropriate participation target for the budget year. The agency does not project this eligibles data for future years. Thus, our 1999 budget target would be associated with 1996 eligibles data, and no separate estimate for 1998 exists. Our most recent available data indicate that 9 million women, infants, and children were fully eligible for WIC in 1996. Using the same methodology used for fiscal year 1994, including the assumption that 80 percent of fully eligible women, infants, and children would choose to participate yields a full participation estimate of 7.2 million for 1998 using 1996 income data. However, we now know that this estimate is low.

The President's Budget proposes to fully fund the WIC Program and serve 7.5 million women, infants, and children in fiscal year 1998 and fiscal year 1999. The full funding participation level, providing adequate funding to serve all eligible persons who would choose to participate in WIC, has been assumed to be approximately 7.5 million persons for budget purposes for the past several years. This target was originally based on a budget estimate prepared in 1993 by the Congressional Budget Office. It is also consistent with the Food and Nutrition Service's full participation estimate produced in 1996 using 1994 WIC eligibles data.

Previous estimates of full participation have assumed that, on average, approximately 80 percent of all persons fully-eligible for the program would participate. We now know that higher participation rates by the target population can be achieved. This is supported by the experience of the Food Stamp Program, where participation rates for families with children under 5 are over 90 percent, and the AFDC program, where participation rates since 1990 have ranged from 82 percent to 86 percent.

Given that the estimated number of fully-eligible persons exceeds 7.5 million, and actual participation in WIC and other low-income assistance programs serving children exceeds the 80 percent previously assumed, a full funding participation target for fiscal year 1999 of 7.5 million remains reasonable and prudent.

¹ It was also assumed that a small portion of these participants would participate in the Commodity Supplemental Food Program (CSFP).

Question. Secretary Glickman indicated in his prepared testimony before this Committee that efforts continue to reduce the overall cost of WIC food package by 10 percent by 2002.

Please describe this effort. Are you seeking to reduce each part of the package—food costs and administrative expenses—by 10 percent? If no, why? When did this effort begin and what was the overall cost the WIC food package at the time (please give separate breakout of food and administrative cost portions of package). In other words, what are the base WIC package food and administrative cost levels from which the 10 percent reduction you hope to achieve by 2002 will be measured?

Answer. The proposal to reduce the cost of the WIC food package by 10 percent was introduced in the Food and Nutrition Service (FNS) submission to Congress regarding the Government Performance Review Act (GPRA) in fiscal year 1997. Although this is a new initiative, it is important to note that the fiscal year 1997 food package cost is just 0.5 percent higher than it was in fiscal year 1990 mainly due to the cost containment achievements of infant formula rebate contracts. During the same period inflation of the cost of the Thrifty Food Plan for a family of four, which is based on actual average retail food prices, was 21 percent.

FNS is in the process of preparing a WIC policy memorandum to State agencies that will reiterate the GPRA initiative to reduce the WIC food package by 10 percent by 2002. This correspondence will remind State agencies of the various methods they can employ to reduce WIC food costs without negatively impacting the nutritional integrity of the WIC food packages. For example, in addition to continuing WIC infant formula rebate contracts, State agencies could also enter into rebate contracts with manufacturers of other WIC foods such as cereals and juices. FNS has two rules in Departmental clearance now that will provide further guidance for States agencies. One rule addresses maximization of WIC infant formula rebate savings through use of contract bid criteria which should yield the greatest savings. The other rule addresses improvements in WIC vendor management which emphasizes selection of low-risk vendors and vendor training and monitoring methods useful in reducing fraud and loss prevention. In addition, the Department has facilitated cost-containment discussion sessions at several program management/integrity meetings and conferences to encourage State agencies to explore and pursue various methods of food cost containment. Most recently FNS co-sponsored with the National Association of WIC Directors the Electronic Benefits Transfer/Program Integrity Meeting in December 1997. This meeting featured a spokesperson from the General Accounting Office (GAO) who addressed GAO's recent study of how the WIC Program could lower its costs.

As explained in FNS instruction 804-1, State agencies also have the authority to make administrative adjustments in the WIC food packages for the purpose of cost containment that would affect the brands, types and forms, but not the prescribed quantities, of WIC foods. Quantities of WIC foods prescribed may only be adjusted on a case by case basis for nutritional reasons. For example, State agencies could limit WIC food selections on the basis of the lowest cost brands or store brands that generally cost less than national brands; lowest cost packaging of WIC foods; and, the lowest cost forms or alternatives within WIC food categories.

Question. Secretary Glickman also indicated in his testimony before this Committee that the Department is working with states to expand other promising cost control activities and is undertaking a series of management reforms to improve WIC program integrity.

Would you summarize the cost control activities and management reforms which have been implemented or are planned.

Answer. There are a number of measures that the Food and Nutrition Service (FNS) encourages States to employ to reduce their operating costs, and states continue to pursue others to the extent possible given their unique circumstances. States have used, both individually and in conjunction with other States, competitive bidding to attract rebate contracts from manufacturer of infant formula and, more recently, other WIC approved foods. Restrictions on the number of food retailers permitted to participate in the program has also helped hold costs in check for states. In addition, limiting authorized food selections has contributed sizably to containing food package costs.

FNS will continue to actively promote among States the adoption and expansion of any and all appropriate cost containment measures. One recent example of our effort to promote and propagate the adoption of various measures was the inclusion of several cost containment sessions at the FNS/National Association of WIC Directors (NAWD) co-sponsored National Program Integrity conference in December 1997. Specifically, one such session featured a spokesperson from the General Accounting Office (GAO) who addressed GAO's recent study of how the WIC Program could lower its costs.

One management reform recommended in GAO's study was ensuring state agencies are requiring participants to provide evidence that they reside in the states where they receive WIC benefits and provide identification when their eligibility is certified and when they receive food or food vouchers. To this end, the Department has issued a draft policy memorandum underscoring these state obligations and emphasizing their significance for ensuring the program's integrity. FNS has also issued draft policy which will make nutritional risk eligibility assessments more consistent from state to state.

In addition to the aforementioned policy and/or procedural reforms, the WIC Program has initiated the following program integrity assurance efforts over the last year.

Program Integrity Conference.—In December 1997, FNS co-sponsored with NAWD a national conference to focus States attention on the program's potential vulnerability to participant and/or employee fraud and abuse. State and local agency WIC staff were trained on ways to detect and prevent such abuses.

Program Integrity Profile.—FNS recently compiled data from a survey sent to states in 1997, requesting information on their integrity assurance policies and procedures, for the purpose of producing a National summary or profile of the many safeguards States employ to ensure program integrity. Thirty-one State agencies responded to the survey. FNS is currently seeking responses from the remaining State agencies so that a National program integrity profile can be produced.

Income Eligibility Assessment Study.—FNS has contracted for a WIC Participant Characteristic study to be performed, a portion of which will examine participant income levels to validate participant income eligibility.

Integrity Reporting System.—After working with states on revising their vendor data collection systems, the WIC Program expects to produce a more detailed and informative National vendor integrity monitoring profile in 1999. The annual profile report should better reflect the many vendor management and monitoring efforts of state agencies.

Infant Formula Rebate Rule.—This rule revises current regulations by requiring States to utilize the lowest net wholesale cost bid criteria, unless retail prices do not vary by more than 5 percent, as mandated in fiscal year 1998 appropriations language. In addition, this rule will ensure that infant formula rebate contracts are competitively bid.

Question. The WIC program is up for reauthorization this year. The prepared testimony indicates that the Administration will propose a cost-neutral reauthorization bill.

When will this legislative proposal be submitted to the Congress for consideration?

Answer. The legislative proposal was submitted on March 10, 1998.

Question. Would you please outline for the Committee the reforms/changes that the Administration will propose be made in the WIC program.

Answer. The Administration's proposal would:

- Eliminate authority allowing State agencies to spend forward food funds. These funds would be returned to the Department on the established schedule and then reallocated to those State agencies which have indicated that they would be able to use them by the end of the current fiscal year. These changes would make unused funds available for allocation to State agencies that can use them and would help reduce the level of program funds that are carried over into subsequent fiscal years.
- Allow State agencies to spend forward an additional 4 percent of unspent Nutrition Services and Administration (NSA) funds are for developmental costs of Electronic Benefit Transfer (EBT) with prior approval from the Food and Nutrition Service.
- Extend through fiscal year 2002 the authority to use unspent NSA funds, up to \$10 million, to support infrastructure—including management information systems—breastfeeding promotion and support projects, and special grants to State agencies for projects with regional or national significance.
- Require State agencies to offer infant formula rebate contracts to the bidder offering the lowest net price unless the State agency demonstrates to the satisfaction of the Secretary that the weighted average retail price for different brands of formula in the State does not vary by more than five percent. This provision would codify a limitation found in the WIC appropriation in recent years.
- Require all applicants to present documentation of household income or of participation in one of the adjunctive programs—Medicaid, Food Stamps, or Temporary Assistance for Needy Families—at the time of certification. This change would strengthen and clarify the Department's authority to require State agencies to review income documentation when making initial income eligibility de-

terminations and increase overall program integrity and accountability. This provision would also require the Secretary to promulgate regulations governing when and how income verification would be required. State agencies currently have the option to verify income eligibility information. This proposal would not eliminate optional verification in addition to the verification requirement by the Secretary under this proposal.

- Require that individuals be physically present in order to be certified for program benefits. Most State agencies already require applicants to be present at certification. However, a few States certify applicants, especially children, solely on the basis of referral data presented by the parent/primary caregiver without the child's presence at the time that the application is made. This proposal would require that all applicants appear in person to be certified for WIC participation. While referral data can provide basic information by which nutritional risk can be determined, the competent professional authority should be able to observe the applicant for critical health or developmental problems, or situations of abuse not necessarily detectable exclusively through referral data from a clinic or other health care provider at the time of application. Physical presence can also facilitate the immediate delivery of important referral services—such as age-appropriate immunization—by the WIC local agency. Finally, physical presence guards against fraudulent certifications of nonexistent (“ghost”) applicants, a problem identified by auditors in past years.
- Require permanent disqualification of WIC vendors who have been convicted of trafficking in WIC food instruments. This proposal would require State agencies to permanently disqualify, except in hardship situations, WIC vendors who have been convicted of trafficking in WIC food instruments, or of the sale of firearms, ammunition, explosives, or controlled substances—as defined in 21 U.S.C. 802—in exchange for WIC food instruments. Such disqualification would become effective upon receipt of the notice of disqualification. The vendor would not be entitled to compensation for any revenues lost, even if the disqualification is subsequently reversed through administrative or judicial review. Whenever the State agency identifies a hardship situation, the State agency would be required to assess a civil money penalty in lieu of disqualification. This proposal would ensure greater integrity in WIC vendor management.
- Allow WIC-developed nutrition education and breastfeeding promotion materials to be distributed at WIC expense to Commodity Supplemental Food Program (CSFP) State agencies. This proposal would allow nutrition education materials, including breastfeeding promotion materials, developed with WIC Federal funds to be provided in bulk quantity to State agencies administering the CSFP at no cost to the CSFP. This sharing would reduce duplication of effort, assure consistency of nutrition messages to similar populations, and represent a more cost-effective use of limited resources for the two programs.

Question. The WIC Directors Association recommends that USDA, in consultation with States and the Association, establish a national plan, including funding mechanisms, for WIC Management Information Systems development, WIC Electronic Benefit Transfer (EBT) pilot development, and for full implementation of these systems.

What is your view on the need for this plan?

Answer. The Department is planning a meeting with the National Association of WIC Directors (NAWD) and State representatives in the near future to further discuss Management Information Systems (MIS) and Electronic Benefit Transfer (EBT) system development issues, cost efficiencies, and funding support strategies. The Department is always eager and prepared to work with States and the NAWD on any plans affecting program performance.

Since 1990, the Food and Nutrition Service (FNS) has hosted four National meetings devoted to technology, the most recent being a meeting in December 1997 co-hosted with NAWD. In 1993, the Department prepared a technology action plan which outlined three major goals as a road map to development of MIS including, system foundation, systems innovation, and system integrity. The Department has demonstrated its commitment to the area of technology for many years and has assigned MIS development a high priority when allocating regional discretionary funds and infrastructure grants. Since 1995, States have spent an average of approximately 45 percent of their infrastructure grants or a total of \$12,155,962 on automated information systems. As a result of these initiatives and emphasis, all States and most Indian Tribal Organizations are automated and many are in the process of upgrading their systems. However, while we believe progress in this area has been substantial, there is need for more consistency in MIS system development across States.

In 1994 WIC issued an EBT vision statement jointly with the Food Stamp Program, which begins with the pledge that WIC and the Food Stamp Programs will work together to create user-friendly benefit delivery at food retail stores using EBT systems which are cost effective and efficient. WIC State agencies interested in pursuing EBT systems development have had to rely on competitive grants to help support development of pilot EBT projects. Since 1994, the WIC Program has had only one State, Wyoming, pilot an EBT system, and this was in one county of the State. Information gathered via this project has been helpful to some six other WIC States which plan to pilot EBT systems within the next 2 years. The WIC Program will be monitoring these States during this period and developing its overall plan for EBT, given the unique characteristics and requirements of the Program. To date, \$6.7 million in Federal funding has been provided by FNS to 11 State agencies for EBT systems design, development, pilot implementation, and evaluation.

Question. Would you please summarize your current plans for the delivery of WIC benefits using EBT, and what funds are being used in fiscal year 1998 and included in your fiscal year 1999 budget for this purpose and where they are found.

Answer. The Food and Nutrition Service's (FNS) plans for the delivery of WIC benefits using Electronic Benefit Transfer (EBT), reflects WIC States plans for system development and implementation. In August 1997, FNS submitted four-year goals to the Vice President's Reinvention Impact Center Initiative which included an increase in the number of States issuing WIC electronic benefits from 1 in 1997, to 7 in 2000. Currently, there are at least seven States which are planning to pilot EBT systems before the year 2000.

In fiscal year 1998, FNS has earmarked about \$3,200,000 of multi-purpose funds for EBT systems design and development. The Department fiscal year 1999 legislative proposal included a \$10,000,000 line item for infrastructure funding, from which some support to States EBT development efforts would be drawn. Additionally, the Department has proposed legislation to permit States to spend up to 5 percent of their NSA grant for EBT systems design and development costs.

Question. Please summarize what success we are experiencing in the WIC program with (1) the promotion of breast feeding; (2) the delivery of nutritional services to WIC clients; and (3) increasing immunization services and coverage rates in conjunction with the Centers for Disease Control.

Answer. The following describes the successes we are experiencing in the WIC Program in these three areas:

Breastfeeding Promotion

WIC is making steady progress towards reaching the Surgeon General's goal to increase to at least 75 percent the proportion of mothers who breastfeed their babies in the early postpartum period, and to maintain at least 50 percent the proportion who continue breastfeeding until their babies are five to six months old. Nationally, WIC State agencies reported spending approximately \$50 million last year on breastfeeding. These efforts are showing a positive trend in WIC breastfeeding rates.

The Department plans to begin gathering national data on actual incidence and duration of breastfeeding in the WIC Program from WIC State agencies in 1998. Past traditional sources of information have been the WIC monthly Financial Management and Participation Report and proprietary data from the Ross Laboratories Mothers Survey, the only source and duration information available. Based on the WIC monthly Financial Management and Participation Report, in 1996 an average of 292,273 breastfeeding women participated in the WIC Program each month, or 36 percent of the postpartum women served by WIC. Data from the 1995 Ross Survey indicated that of infants participating in WIC whose mothers responded to the survey, 46 percent were breastfed in the hospital, and nearly 13 percent were breastfed at 5 to 6 months.

The Ross data as well as other information suggest that WIC breastfeeding rates are growing, and are growing at a faster rate than non-participants. For example, the Ross data showed that between 1989 and 1995, the percentage of WIC mothers breastfeeding in the hospital increased by more than 36 percent, while the percentage of non-WIC mothers breastfeeding in the hospital increased 12.9 percent. Duration of breastfeeding among WIC participants is also increasing: the percentage of WIC infants breastfeeding at 6 months of age increased by 51.2 percent between 1989 and 1995. During the same period, the percent of non-WIC infants breastfeeding at 6 months increased 22.7 percent. We believe the substantial efforts directed at improving breastfeeding rates in WIC by Federal, State and local personnel are responsible for this encouraging trend.

State and local WIC Programs have implemented several different types of breastfeeding promotion initiatives that influence feeding choices aimed at the dif-

ferent audiences (e.g. women, their doctors, other health professionals, and family members). The major Federal initiatives are:

A Breastfeeding Promotion Consortium.—A consortium representing over 25 government, advocacy, and health professional organization that meets regularly to exchange ideas on how the Federal government and private health interests can work together to promote breastfeeding.

A National Breastfeeding Campaign.—A project being conducted by USDA in cooperation with Best Start Social Marketing, Inc. to increase the initiation and duration of breastfeeding among WIC participants based on social marketing research. Forty WIC State agencies are currently participating.

Physician Training.—Food and Nutrition Service (FNS) has cooperated with the department of Health and Human Services to provide training for physicians to increase their effectiveness in promoting breastfeeding among their patients.

A Physician's Breastfeeding Promotion Kit.—FNS is cooperating with Best Start and the Department of Health and Human Services to develop a kit with patient education and outreach materials to assist physicians.

Delivery of Nutritional Services

The WIC Program has repeatedly demonstrated its effectiveness in improving the nutritional status of low-income women, infants and children. Improved pregnancy outcomes, such as increased full-term gestations, higher birth weights and greater head circumferences in newborns, have been directly linked to the decrease in infant mortality in the United States. A recent study by Dr. Jean-Pierre Habicht of Cornell University, released in early March, indicates that household participation in the WIC Program has significant positive effects on the nutrient intake of preschool-aged children. Of the 15 nutrients examined in this study, WIC participation increased the intake of 10 of them, most notably iron and zinc.

Immunization Services

- Because WIC is the largest single point of access to primary health care services for low-income preschool children, there are many immunization studies, evaluations, and demonstrations in WIC clinics throughout the Nation. They range from the cost effectiveness of immunization assessment in WIC to validating the accuracy of manual versus automated immunization assessment tools. All show that collaboration and resource sharing between WIC and Immunization Programs improve the service delivery capacity and quality of both programs.
- Studies about the WIC and immunization linkage have been conducted by CDC in Chicago, Boston, and Chattanooga in 1995/96 (see attached abstracts). Each of these studies showed increases in immunization coverage rates among WIC participants. Increases ranged from 17 to 26 percentage points over baseline within 12 months of program implementation. These findings were reported by Walter Orenstein, MD, Director of CDC's National Immunization Program before the Subcommittee on Public Health and Safety of the Senate Committee on Labor and Human Resources.
- CDC, in conjunction with WIC State agencies, conducted demonstration projects in Chicago, New York, and San Antonio to determine the most effective methods of increasing access to immunization through the WIC Program. Data from these projects show that intensified collaboration and resource sharing between State/local WIC and Immunization Programs improve the service delivery capacity and quality of both programs.
- In Oregon, the Department of public Health has teamed with AmeriCorps VISTA's to provide assistance to the WIC and immunization programs. This assistance has enabled both programs to provide the best possible solutions to the immunization barriers in their area. The percentage of fully immunized children has risen dramatically in Oregon due to the involvement of these volunteers in immunization promotion activities in WIC.
- Outreach workers in Milwaukee make immunization reminder calls to WIC participants and the child is followed until the completion of the primary immunization series. In addition to outreach, six WIC sites have a special program that places the family on monthly food voucher pick-up if the WIC infant's immunizations are incomplete. Coordination with other outreach programs in Milwaukee decreases duplication of efforts and increases access to other resources. The project has reduced the number of children without immunization records up to 17 percent.
- In April 1996, seven Michigan WIC clinics pilot tested a WIC automated immunization assessment system. These sites found that the availability of an automated assessment system has drastically increased the number of WIC infants

and children receiving an immunization assessment and referral for needed vaccinations.

Question. The fiscal year 1999 budget proposes that permanent authority be granted to State agencies through the Appropriations Act to procure infant formula using competitive bidding systems based on the lowest net price. At the Administration's request, this language has been carried in the Appropriations Act for the past two years and is now the practice of State agencies. Why are you proposing to make this permanent law through the Appropriations Act rather than through the WIC reauthorization bill or by regulation?

Answer. As the Committee on Appropriations requested in report language, the Department is publishing a proposed regulation in April of 1998 with a final rule to be published September 1998, that will make permanent the requirement for State agencies to procure infant formula using competitive bidding systems based on lowest net price. We are also seeking permanent statutory authority in the reauthorization bill.

Question. The Appropriations bill is also carrying language requested by the Administration last year to grant the Secretary of Agriculture the discretion to allocate WIC funds recovered from the previous fiscal year outside the regulatory funding formula. The fiscal year 1999 budget requests that the Appropriations Act language be revised to allow the Secretary the discretion to provide a portion of WIC food funds to states to meet inflation, and a portion to states receiving less than their fair share of funds, unless the Secretary has published a revised funding formula regulation prior to the allocation of fiscal year 1999 funds.

Why isn't authority allowing the Secretary the discretion to allocate WIC funds outside the current regulatory formula being sought through the WIC reauthorization rather than the appropriations bill?

Answer. The Department is currently clearing a proposed regulation revising both the food and nutrition services and administration funding formulas. While we fully anticipate publishing a final rule prior to the allocation of fiscal year 1999 funds, we wanted a mechanism in place in the event the final rule is not published in time to allow the Secretary discretion in allocating the funds.

The appropriations bill has been used in the past for providing such discretion. We did not include this in our reauthorization bill because we do not anticipate needing this authority on a continuing basis once the funding formulas are revised.

Question. When does the Secretary plan to publish a new funding formula regulation for the WIC program? Is there reason to believe that this new regulation will be in force in time for use in the fiscal year 1999 funds allocation?

Answer. The Secretary anticipates publishing a proposed funding formula regulation in the Spring of 1998 and the final rule prior to the allocation of fiscal year 1999 funds.

Question. Can you tell us what revisions in the funding formula will be proposed?

Answer. The proposed WIC food funding formula will help to ensure food funds are allocated to States that can utilize the funds to maintain current participation as well as to direct additional funds, if available, to States that are serving a lesser proportion of their WIC eligible population as compared to other States. The proposed nutrition services and administration funding formula simplifies the funding formula by deleting obsolete components and will update existing components to more equitably distribute funding among WIC State agencies.

Question. Did the Secretary use the flexibility granted to him by the Appropriations Act to allocate fiscal year 1998 WIC funds to States? If not, why? If yes, how were the funds allocated, and provide a comparison of the amount each State received versus what the state would have received under the provisions of the current regulations.

Answer. The Secretary has not used the flexibility granted to him by the Appropriations Act. The Act provides the Secretary the authority to allocate funds recovered from fiscal year 1997 first to States to maintain stability funding levels, as defined by regulation, and then to give first priority for the allocation of any remaining funds to States whose funding is less than their fair share of funds, as defined by regulations, in such a manner as he deems appropriate. The allocation would be based on the State agency's ability to effectively utilize and manage the funds. It is estimated that the total available fiscal year 1998 funds will be adequate to bring States to stability funding and only a very small amount to fund States that have received less than their fair share of funds. Since there will be very little money available for those States receiving less than their fair share of funds, we do not anticipate that it will be necessary to utilize the provision.

Question. What is the difference between States' spend-forward and carryout?

Answer. State spend forward authority is authorized by law and allows States to retain a specified percent of unspent food and Nutrition Services and Administra-

tion (NSA) funds and utilize them in the subsequent year. These funds remain at the State level and can not be recovered by the Food and Nutrition Service. WIC carryout is the term used to refer to unspent recoverable food and NSA funds. These unspent funds are recovered from WIC State agencies and reallocated through the funding formula to those States eligible to receive additional funds.

Question. The participation estimates in the fiscal year 1999 budget assume that States will reduce their level of spend-forward in fiscal year 1998 from \$50 million to \$30 million. What evidence is there that this reduction in the projected spend-forward estimate will occur?

Answer. The fiscal year 1998 appropriations language directed the Department to recover fiscal year 1997 food spendforward funds for reallocation to States in fiscal year 1998 for maintenance of participation. Because these funds would be recovered and reallocated in fiscal year 1998, we expect States to spend a greater proportion of their total fiscal year 1998 funds to support participation in fiscal year 1998, thus reducing spendforward into fiscal year 1999 by at least \$20 million.

Question. Please provide for the record for each of fiscal years 1989 through 1999 the actual/proposed WIC carryover and spend-forward balances from the previous fiscal year.

Answer. The information is provided for the record.
[The information follows:]

UNITED STATES DEPARTMENT OF AGRICULTURE, FOOD AND NUTRITION SERVICE
SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS AND CHILDREN

Fiscal year	Proposed total unspent recoverable and spendforward funds ¹	Actual unspent recoverable funds	Actual Spendforward funds	Actual total unspent recoverable and spendforward funds
1988-89		\$9,252,000	\$18,893,644	\$28,145,644
1989-90		25,608,000	24,997,867	50,605,867
1990-91		28,072,000	26,646,077	54,718,077
1991-92		73,382,000	27,429,625	100,811,625
1992-93		66,232,294	34,662,544	100,894,838
1993-94		97,256,535	35,658,673	132,915,208
1994-95		136,766,131	39,498,515	176,264,646
1995-96	\$150,000,000	137,478,745	47,203,091	184,681,836
1996-97	245,000,000	121,623,106	63,411,766	185,034,872
1997-98 ²	150,000,000			
1998-99	130,000,000			

¹Total unspent recoverable and spendforward estimates based on the President's Budget Requests. These amounts are not available for fiscal years prior to 1995.

²Based on information provided by WIC State agencies as of February 1998, the actual amount of unspent recoverable and spendforward funds going from 1997 into 1998 will be \$149,686,793.

Question. The fiscal year 1999 budget requests a \$20 million WIC contingency fund to avoid participation reductions from unexpected food price increases. Last year, when a \$100 million contingency fund was proposed, the Committee was told that the Administration had "not established a fixed technical approach" for determining the circumstances under which contingency funds would be spent. Can you now tell us under what circumstances contingency funds would be spent if the proposed reserve is approved?

Answer. The Department would spend the requested contingency funds to cover any unanticipated food price increases some State agencies may experience which would jeopardize their ability to maintain their caseload levels.

Question. Please provide detail on how the \$10 million for WIC infrastructure, special projects, and breast feeding promotion/support is being used. Provide a list of specific projects funded and the amount provided for each for each of fiscal years 1996, 1997, and 1998.

Answer. The breakout of expenditures for the multi-purpose grants in fiscal years 1996, 1997, and 1998 is provided for the record.

[The information follows:]

FISCAL YEAR 1996 MULTI-PURPOSE GRANTS

The following table summarizes the breakout of expenditures for multi-purpose grants in fiscal year 1996:

Infrastructure grants to State agencies	\$7,828,467
Special project grants to State agencies	1,811,533
Breastfeeding promotion and support and infrastructure	360,000
Total	10,000,000

To date, the Department has allocated a total of \$7,828,467 to WIC State agencies for State-specific infrastructure grants to help support the overall goal of reaching more participants and providing quality program service. Each of our 7 regional offices received \$1 million for allocation to WIC State agencies in January 1996 and an additional \$828,467 was awarded in September 1996. A total of 45 WIC State agencies received infrastructure grants that were awarded on a competitive basis. The following table summarizes the breakout of the categories of how the funds are being expended.

<i>Categories of infrastructure funds expenditures</i>	<i>Total funds allocated</i>
Automated management information and integrated data systems	\$2,505,270
Electronic benefit transfer (EBT) projects	1,629,237
Immunization data systems	129,885
Breastfeeding promotion and support	125,600
Management technologies and improvement of access to services ...	1,043,351
Facility renovation and non-ADP purchase	2,395,124
Total	7,828,467

The Food and Nutrition Service (FNS) awarded \$1,766,324 to five State agencies to support special state projects in fiscal year 1996. These special state projects are of national or regional significance and are relevant to current WIC policy issues, designed to produce a demonstrable impact and be transferable to other WIC programs. The projects also suggest innovative or creative approaches to improving the delivery of WIC services. The following table summarizes fiscal year 1996 special project grants.

<i>State agency/project</i>	<i>Amount allocated¹</i>
Arkansas: Methods for defining local clinic costs	\$501,806
California: Evaluation of the effectiveness of nutrition education methodology	450,844
Minnesota: Develop/implement a store-based nutrition education strategy for high-risk participants	254,129
Missouri: Develop/implement nutrition education strategy for Farmer's Market Nutrition Program local agencies	256,706
Nebraska: Evaluation of integrated approach to grants management at the service delivery level	302,839
Total	1,766,324

¹ Funds in the amount of \$45,209, the balance of the \$1,811,533 special project grant funds, were utilized for technical support to State agencies for developing grant requests.

The final \$360,000 of the \$10 million total was used to support a variety of efforts to promote and support breastfeeding and infrastructure in the WIC Program. Several publications were developed and produced and other promotional efforts have been conducted, as well as coordination with and support of the Healthy Mothers/Healthy Babies Coalition's breastfeeding efforts.

FISCAL YEAR 1997 MULTI-PURPOSE GRANTS

The following table summarizes the breakout of expenditures for multi-purpose grants in fiscal year 1997:

Infrastructure grants to State agencies	\$7,000,000
Special project grant to State agencies	2,000,000
Breastfeeding promotion and support and infrastructure projects ...	1,000,000
Total	10,000,000

To date, the Department has allocated a total of \$7 million to WIC State agencies for state-specific infrastructure grants to help support the overall goal of providing quality program service. Each of our 7 regional offices received \$1 million for allocation to WIC State agencies and grants were awarded to 33 State agencies on a competitive basis. The following table summarizes the breakout of the categories of how the funds will be expended.

<i>Categories of funds expenditures</i>	<i>Total funds allocated</i>
Automated management information and integrated data systems	\$4,711,921
Electronic benefit transfer (EBT) projects	772,951
Service integration, coordination and co-location	166,700
Breastfeeding promotion and support	152,888
Management technologies and improvement of access to services	312,612
Facility renovation and non-ADP purchase	882,928
Total	7,000,000

FNS set aside \$2.0 million to support special state projects in fiscal year 1997. FNS funded six special state projects of national or regional significance that are relevant to current WIC policy issues, designed to produce a demonstrable impact, be transferable to other WIC programs and suggest innovative or creative approaches to improving the delivery of WIC services.

<i>State agency/project</i>	<i>Amount</i>
Illinois: Feeding with Love: The Impact of Nutrition Education on the Bottle Feeding Habits of WIC Preschoolers	\$182,111
Mississippi: Breastfeeding promotion and support	399,745
Montana: WIC/IDEA: Integrated data for evaluation and assessment	600,000
New York: Effects of WIC participation on children's growth and readiness to learn	215,198
North Carolina: A model for evaluating and monitoring the effectiveness of the WIC Program for children	508,808
Virginia: Distance training on community-based nutrition education for WIC professionals: Implementation and evaluation	94,133
Total	1,999,995

The final \$1.0 million of the \$10 million total is being used to support breastfeeding promotion and support activities and infrastructure projects of national significance, including Electronic Benefit Transfer projects. The utilization of these funds is being monitored to insure that the agency's goals are effectively addressed.

FISCAL YEAR 1998 MULTI-PURPOSE GRANTS

The following table summarizes the breakout of expenditures for multi-purpose grants in fiscal year 1998:

Infrastructure grants to State agencies	\$3,675,000
Special project grant to State agencies	2,000,000
Breastfeeding promotion and support and infrastructure projects ...	1,125,000
EBT grants to State agencies	¹ 3,200,000
Total	10,000,000

¹ Estimated.

To date, the Department has approved for allocation a total of \$3.675 million to WIC State agencies for state-specific infrastructure grants to help support the overall goal of providing quality program service. Each of our 7 regional offices received \$525,000 for allocation to WIC State agencies and grants were awarded to 26 State agencies on a competitive basis. The following table summarizes the breakout of the categories of how the funds will be expended.

<i>Categories of funds expenditures</i>	<i>Total funds allocated</i>
Automated management information and integrated data systems	\$1,887,503
Electronic benefit transfer (EBT) projects	475,735
Breastfeeding promotion and support	352,833

<i>Categories of funds expenditures</i>	<i>Total funds allocated</i>
Management technologies and improvement of access to services	467,158
Facility renovation and non-ADP purchase	491,771
Total	3,675,000

FNS has set aside \$2.0 million to support special State projects in fiscal year 1998. As in fiscal year 1997, FNS will fund special State projects of National or Regional significance that are relevant to current WIC policy issues, designed to produce a demonstrable impact and be transferable to other WIC programs. The projects should also suggest innovative or creative approaches to improving the delivery of WIC services.

The final \$4.325 million of the \$10 million total will be used to support breastfeeding promotion and support activities and infrastructure projects of significance, including Electronic Benefit Transfer (EBT) projects. At this time, we anticipate approximately \$3.2 million will be used to fund State EBT projects.

Question. Please provide monthly WIC participation levels, and food and administrative costs for fiscal year 1997 and for fiscal year 1998 to date.

Answer. Monthly WIC participation levels, and Food and Nutrition Services and Administration (NSA) costs for fiscal year 1997 and for fiscal year 1998 to date are provided for the record.

[The information follows:]

Fiscal year/month	Participation	Food cost per person	NSA cost per person
1997:			
October	7,485,231	\$32.12	\$11.65
November	7,419,915	31.54	9.02
December	7,287,742	33.06	13.43
January	7,500,710	32.23	9.61
February	7,442,551	31.15	11.01
March	7,448,023	31.69	12.28
April	7,449,767	31.14	11.94
May	7,385,190	30.77	9.46
June	7,367,474	30.45	8.24
July	7,378,422	30.68	13.10
August	7,346,892	31.39	13.16
September ¹	7,370,476	33.49	13.17
1998:			
October ¹	7,425,011	31.82	10.87
November ¹	7,292,317	32.22	8.77
December ¹	7,261,451	32.18	13.14

¹Indicates these amounts are not yet final; obtained from preliminary State reports for months in which financial activity is not closed-out (verified and reconciled).

Question. Do you have any thoughts on how the WIC program could be improved to increase the nutrition of at-risk mothers and children?

Answer. The last review of the WIC food packages was completed in 1992. The Department's Center for Nutrition Policy and Promotion is conducting a current comprehensive review of the WIC food packages to determine if all of the nutritional aspects of the packages are still appropriate for the WIC population. This review will recommend refinements, if needed, that would best serve WIC Program objectives. The review will assure that the food packages are consistent with the Dietary Guidelines for Americans jointly published by USDA and DHHS in 1995, subsequent to the last WIC food package review. This review is expected to be completed by early summer. The Department is also issuing a policy memorandum to allow WIC State agencies greater flexibility in designing foods packages to that better accommodate food preferences.

The Department has also recognized that nutrition education for preschoolers has not been as prominent as that provided to women for themselves and their infants. Therefore, the Department has recently produced a nutrition educator's kit for children entitled Tickle Your Appetite. The kit is designed to communicate key nutrition messages to WIC preschool participants in WIC clinics, at home, and in communities. The lively video segments, catch songs, engaging lessons, and attractive handouts offer a variety of ways to effectively communicate with children and their

caregivers about nutrition. The Department is also conducting a National Breastfeeding Campaign with Best Start Social Marketing, Inc. to increase the initiation and duration of breastfeeding among WIC participants. In addition, a new publication has just been distributed entitled *After You Deliver* which contains sections on good nutrition, role/sources of folic acid in the diets of women of child-bearing age; and the benefits of breastfeeding to both mother and infant.

The Department will continue to develop and promote initiatives to educate WIC participants about nutrition and how it relates to their overall good health. Since WIC is supplemental, WIC will continue its efforts to refer participants to other nutrition sources such as the Food Stamp Program, National School Lunch and Breakfast Programs, Summer Food Service Program for Children, Child and Adult Care Food Program, and the Farmers' Market Nutrition Program.

Question. Has there been any evidence that there has been a decline in the amount of breakfast cereal consumed by WIC participants? Does this have any impact on the program's ability to increase the nutrition of at-risk mothers and children?

Answer. The Department does not collect data on cereal consumption by WIC participants. However, we are aware that there are more than 80 WIC-eligible cereals. Numerous WIC agencies also have submitted letters to USDA stating that the current number of cereals available to WIC participants provide them an adequate selection to meet their individual food preferences and nutritional needs. Therefore, there is no reason to believe that WIC participants are not eating the cereals they receive in their WIC food packages that deliver iron as one of the target nutrients.

Question. Is there any evidence that indicates that women decline to participate in the WIC program or that their consumption of nutritious breakfast foods decreases if the food package does not include branded products or preferred brands?

Answer. The Department does not have any data that addresses this question. However, the current selection of WIC cereals and juices, that includes both national brands and store brands, offers sufficient variety to provide broad appeal to participants. If the selection of WIC foods were severely restricted to only store brands, without including some National brand types, this limitation may impact participant usage. Like any other nutritious food, WIC foods can only benefit participants if they consume them. The ability to include several leading national brands as well as store brands helps to ensure that the majority of participant food preferences will be met.

Question. Are states trying to expand enrollments and broaden the definition of nutrition vulnerability while restricting food choices for WIC participants? If so, do you think this is a good idea?

Answer. WIC State agencies work hard to serve as many eligible applicants as possible within the funding levels that are allocated to them each year. By law, States are required under cost containment strategies to reduce food costs. At the same time, they must be mindful that WIC food packages maintain their appeal to participants in order to assure that they are consumed. While cost containment may result in placing some limitation on the brands of WIC foods that participants may obtain with their food instruments, the actual range of foods that comprise the prescribed WIC food package must continue to be available.

For example, of the 80 cereals that meet Federal regulations, a State might allow 10 of the less expensive yet still popular cereals from which WIC participants might choose, based on personal preference. All participants must have access to all food in the package—for example, for a pregnant women: cereal, juice, eggs, peanut butter, or beans, peas or lentils, milk, or cheese in lieu of some milk.

In addition, rather than broadening the definition of nutrition risk, the Food and Nutrition Service (FNS) (working closely with the National Association of WIC Directors) has just issued a draft WIC policy memorandum which when final, will make the criteria used to determine an applicant's nutrition risk status consistent from State to State, and will eliminate from use any nutrition risk criteria that are not supported by scientific documentation.

FNS will continue to initiate and support program improvements that empower WIC State agencies to target WIC program benefits to those with the greatest need, while making the most efficient use of available funds to serve as many eligible women, infants and children as possible without compromising the integrity or negatively impacting the credibility of the WIC Program overall.

Question. Is there evidence that young children who eat nutritious, healthy breakfasts continue these habits through their teenage years?

Answer. In order to determine that young children who eat nutritious, healthy breakfasts continue these habits through their teenage years data would have to be collected on the same group of children from early childhood through their teenage

years. The Food and Nutrition Service (FNS) is not aware of any such longitudinal study that has been conducted to date which focused particularly on breakfast.

However, a 1994 article published in the American Journal of Public Health does address general food choice behaviors in children. The article titled Longitudinal Tracking of Adolescent Smoking, Physical Activity, and Food Choice Behaviors was reviewed in Nutrition Education for School-Aged Children: A Review of Research released by FNS in 1994. According to FNS report the article concluded that "the children that are making poor food choices in early elementary grades are likely to be the children that are making poor food choices in junior and senior high."

Data that compares the prevalence of eating breakfast for younger students to that of older students is also available. The School Nutrition Dietary Assessment Study (SNDA), released in October 1993, found that younger students are more likely to eat breakfast than older students. After controlling for other characteristics, SNDA found that 94 percent of 6- to 10-year-old students eat breakfast, compared with 87 percent of 11- to 14-year-olds students, and 77 percent of 15- to 18-year-old students.

It is important to note that the SNDA data is cross-sectional and not longitudinal. The SNDA data did not track children's eating habits over time, it compared the eating habits of children in different age groups at one point in time.

FNS is currently supporting a study of the National Center for Education Statistics to examine the relationship between children's nutritional status and their cognitive performance and school progress. This study will also examine the possible links of participation in school nutrition programs to learning in the early and middle elementary school years. This study is longitudinal and will track the same group of children's participation in the School Breakfast Program from when they are in kindergarten to when they are in fifth grade.

Question. When determining which infant formula manufacturer offers the lowest net price to the WIC program, FNS limits states to considering only those rebates offered on the traditional milk-based and soy-based formulas. This policy could discourage the use of innovative formulas that would provide infants with optimal nutritional value, and could impede the development and introduction of new formulas that can be used to meet specific dietary needs.

Isn't it in the best long-term interest of WIC infants and the program to encourage and properly account for any and all rebates paid on formulas used in the program?

Answer. It has always been a priority in the WIC Program that infants receive the infant formula that best meets their nutritional needs. It is the Department's belief that the nutritional needs of the vast majority of infants can be met by the infant formula product line offered by each infant formula manufacturer. As a result of expanded infant formula product lines, the Department is updating the current rebate regulations to address these new products to ensure rebates are maximized to the extent possible. The revised regulation will promote competitively-bid infant formula rebate contracts which will ensure contracts are awarded to the bidder with the lowest net price. This regulation will also ensure that infants continue to receive the infant formula that best meets their nutritional needs.

WIC FARMERS MARKET NUTRITION PROGRAM

Question. Why does the fiscal year 1999 budget propose to fund the WIC Farmers Market Nutrition Program through the Commodity Assistance Program rather than the WIC program? Why not simply request a change in the WIC account language to allow these funds to be allocated at the beginning of the fiscal year?

Answer. As you know, recent Agriculture Appropriations Acts have made FMNP funding available only if not needed to maintain WIC caseloads. The Department believes the FMNP is a valuable program and that its funding should not be contingent on maintenance of WIC participation. As such, the FMNP was placed in the commodity account in an effort to ensure that funding for the program is continued uninterrupted, and to clearly disassociate its funding from that of the WIC Program.

Question. Funding for the WIC Farmers Market Nutrition Program was increased from \$6.75 million to \$12 million for fiscal year 1998. I understand that this additional funding allowed five states to join the program. How was the funding increase allocated to expand the number of markets in States participating program versus bringing additional States into the program? How many requests were not met?

Answer. In accordance with the authorizing law, all current State agencies were first provided with a base grant amount equal to their previous year's funding level which totaled \$7,494,721. After base amounts were satisfied, consistent with the law, remaining funds of \$4.5 million were divided in a ratio of 75 percent for current States for expansion and 25 percent for new States that would like to begin a pro-

gram. These funds represent the level of opportunity for program growth and expansion through which more persons and more markets are able to participate in the program above last year's levels.

The amount of funds appropriated for the program was sufficient to satisfy the full funding requests of the five new States that were seeking to initiate the program. In addition, funding was sufficient to immediately fully satisfy the requests of all State agencies that were seeking expansion funding, except New York. New York requested almost \$1 million, a substantially higher amount than requests of other State agencies. New York has been allocated \$748,563 and will receive the balance of its funding request once we have completed the close-out process and recovered unspent funds from fiscal year 1997.

Question. Please provide detail for the record on how the additional funds were allocated, by state, and the requests from states which were not funded.

Answer. All State agencies received their full expansion requests except New York which received \$748,563 of its requested amount of \$930,668. A table showing Farmers' Market Nutrition Program Grants is provided for the record.

[The information follows:]

FMNP FISCAL YEAR 1998 GRANT AMOUNTS

State	Expansion request	Fiscal year 1998 base grant allocated	Expansion allocated	Total grant allocated
Alaska		\$106,050		\$106,050

Total	4,189,235	7,746,105	4,007,845	12,000,000

Question. The fiscal year 1999 budget requests \$15 million for the WIC Farmers' Market Nutrition Program, a \$3 million increase from the fiscal year 1998 level. How will these additional funds be allocated?

Answer. In accordance with the authorizing law, we must first provide all current State agencies with a base grant amount that is equal to their previous year's funding level. After base amounts are satisfied, the law provides for any remaining funds to be divided in a ratio of 75 percent for current States for expansion and 25 percent for new States that would like to begin a program.

Question. How many WIC participants, by state, are currently receiving farmers market benefits through this program?

Answer. The information is submitted for the record.

[The information follows:]

Fiscal year 1997 WIC participants receiving farmers' market benefits

¹ New State for fiscal year 1998.

Question. What changes, if any, are you proposing be made in the WIC Farmers' Market Nutrition Program as part of the WIC program reauthorization?

Answer. We are proposing two changes as part of the reauthorization. They are:

1. Elimination of criteria for ranking new State Plans. This proposal would eliminate the legislatively-specified criteria for ranking new State Plans. Current law requires the Secretary to establish objective criteria for the approval and ranking of the Farmers' Market Nutrition Program (FMNP) State plans. The law also requires that certain factors, some of which are unclear and others that have become outdated, be considered in the ranking process. This proposal would continue to require the Secretary to establish objective criteria for ranking new State Plans, but would eliminate the specific factors currently stipulated for this process, thus enabling the Department to use more appropriate measures of a State's potential success in managing a program.

2. Revise the 30 percent match requirement to apply only to the administrative portion of FMNP costs, rather than to the total cost of the program. This proposal would revise the matching requirement for participating FMNP State agencies (currently 30 percent for geographic States and 10 percent for Indian Tribal Organizations (ITO's) with demonstrable financial hardship) so that it is applied only to the administrative portion of FMNP program costs, rather than to the total cost of the program. This revision would result in a reduced match amount for States and ITO's, and would be applied on a similar basis with the match requirement for other programs, such as the Food Stamp Program, that are administered by the Department through the Food and Nutrition Service. It will also enable more States to participate in the FMNP that have heretofore been unable to do so because they could not meet the larger match requirement.

FOOD RECOVERY AND GLEANING

Question. Would you please explain the program you propose—what it will achieve, who will be eligible for the funding and for what purposes, whether it requires legislative authority, how the funds for the program will be allocated, and how you will ensure these grants will enhance efforts rather than replace existing funding for states, local or nonprofit groups for existing efforts.

Answer. The basic idea of the program is provide a small amount of Federal seed money to non-profit groups, as well as State, local, and Tribal governments, to allow such entities to build the local infrastructures needed to dramatically expand the amount of excess yet wholesome food that is recovered and gleaned and distributed

to Americans in need. This assistance would allow entities to get new food recovery programs off the ground, as well as to expand the successful food recovery efforts that many organizations are already operating. We intend to require non-Federal matching funds for any project to which USDA provides Federal funds. We anticipate this Federal money will leverage a great deal of matching funds from the private, non-profit, and state and local governmental sectors. \$20 million in Federal spending has the ability to generate the eventual donation of hundreds of millions of dollars worth of food. We are not seeking to create a large-scale Federal bureaucracy, but rather to empower community-based efforts and encourage community volunteerism.

In June of 1997, USDA released a study indicating that 96 billion pounds—or 27 percent—of the 356 billion pounds of food produced in this country each year is lost to human consumption at the retail and food service levels. In response to the study, USDA joined with key non-profit organizations in co-sponsoring the first-ever National Summit on Food Recovery and Gleaning—at which we jointly set a National goal of increasing the amount of food recovered by 33 percent by the year 2000. This would provide an additional 500 million pounds of food a year to feeding organizations. At a time when food banks across the Nation are reporting increasing need but decreasing donations, such a boost is vitally needed.

While community organizations are willing to bring significant resources of their own to aid food recovery—and while volunteers will provide much of the labor for such efforts—additional Federal assistance is needed to help these entities pay for vital items such as: vehicles and fuel to transport recovered and gleaned food; salaries for volunteer coordinators and training programs for volunteers; heating and refrigeration equipment to ensure food safety; printing for handbooks and instructional materials; equipment to harvest, sort, load, and process food; computer programs to match up donors to recipients; offices from which to operate; containers to hold the food, etc.

We anticipate that aid would be given out in the forms of grants, cooperative, agreements, and technical assistance. We do not believe that separate legislation is needed to give USDA authority to do so, however it would be necessary for the fiscal year 1999 Agriculture Appropriations Bill language to specifically state that USDA has the authority to “provide food recovery and gleaning-related grants, cooperative agreements, technical assistance, and other assistance to national and local non-profit groups, as well as State, local, and Tribal government agencies.”

We are in the process of obtaining input from non-profit groups and from states about the details of how the program should be structured. We would also greatly welcome input from the Committee and other Members of Congress on this matter.

CENTER FOR NUTRITION POLICY AND PROMOTION

Question. The Administration transferred responsibilities of the Human Nutrition Information Service from the Agricultural Research Service to create the Center for Nutrition Policy and Promotion within the Food and Nutrition Service in 1994. The prepared testimony submitted to this Committee indicates that the Center is the “focal point” within USDA to promote the health of all Americans.

Please provide examples of how the Center, since its creation, has promoted good nutrition linking scientific research to the dietary needs of participants in each of USDA’s food assistance programs.

Answer. The U.S. Department of Agriculture (USDA) established the Center for Nutrition Policy and Promotion to improve the nutritional health of all Americans, including participants in USDA’s food assistance programs, by linking scientific research to the consumer.

The Center links scientific research with food assistance program participants and other consumers in several ways. One basic way it accomplishes this is by coordinating USDA’s efforts to integrate information from scientific research with the nutrition education messages and implementation policies of the Center and other government agencies. Center staff study key scientific reports and other scientific literature, conduct consumer research in-house or by contract, and use the findings to develop consumer-oriented guidance materials. Some specific examples are described below.

The Center served as the lead within USDA to coordinate with HHS the review of the Report of the Dietary Guidelines Advisory Committee and the preparation of the 1995 Dietary Guidelines for Americans. Title III of the National Nutrition Monitoring and Related Research Act of 1990 (Public Law 101-445) requires that USDA and HHS update the dietary guidelines every five years. The Dietary Guidelines provide the best, most current advice from health and nutrition experts, based on the latest scientific research. They serve as the basis for Federal nutrition policy,

and are used in developing food and nutrition standards for nearly all food assistance programs, including the National School Lunch and Breakfast Programs; the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC); the Food Stamp Program, and the Child and Adult Care Food Program (CACFP).

The 1995 Dietary Guidelines were the first to include the Food Guide Pyramid graphic. The Food Guide Pyramid, released by USDA in 1992, is a tool that consumers can use to implement Dietary Guidelines recommendations in their own diets. The Pyramid graphically illustrates USDA's research-based food guidance system that translates nutrient recommendations into recommendations on food intakes, and provides a framework for selecting the kinds and amounts of foods to provide a nutritionally adequate diet. The Center is updating the research that supports the food guide to incorporate changes in food composition, food consumption, nutrition recommendations, and food technologies that have occurred since the original research was conducted. In addition, the Center has initiated development of a food guide pyramid adapted specifically for children from two to six years of age. As part of this effort, the Center has analyzed children's current diets and compared their food and nutrient intakes to Food Guide Pyramid recommendations. CNPP has also sponsored qualitative research with children, parents, and caregivers to obtain suggestions for prototype products and materials that would be useful for this audience. This adaptation of the Food Guide Pyramid for young children is anticipated to be widely used by participants in USDA's CACFP and WIC Programs.

The Food Guide Pyramid has already been used extensively by Federal agencies, including USDA, in nutrition education programs and materials. Many food assistance programs have developed and/or utilize materials that incorporate nutrition messages based on the Dietary Guidelines and the Food Guide Pyramid. Programs include the National School Lunch Program (through Team Nutrition and additional efforts), WIC, and the CACFP.

Other examples of Center projects that promote the health of participants in USDA's food assistance programs include the Healthy Eating Index (HEI), an aggregate measure of overall diet quality released by the Center in 1995. The HEI provides a picture of the foods people are eating, the amount of variety in the diet, and their compliance with specific dietary recommendations. The HEI report showed that the diets of most Americans need improvement; the average score was 64 of a possible 100 points. Follow-up analysis has shown that low-income individuals are more likely to have poor HEI scores, as are individuals from the teen years to middle adulthood. From this initial research, the Center plans to expand the use of the HEI by creating a "consumer-friendly" version of the HEI that will allow consumers to evaluate their own diets and identify behaviors that will improve their dietary status. Access to a summary measure of healthful eating will help consumers, particularly those participating in food assistance programs, to adopt dietary practices that will meet recommendations of the Dietary Guidelines for Americans and the Food Guide Pyramid. With minor modifications, the consumer-friendly HEI could also be used by States and localities to quickly monitor and assess the dietary status of their populations.

The Center is also responsible for the development of USDA food plans, including the Thrifty Food Plan (TFP) which serves as the nutritional basis for food stamp benefit levels. Currently the Center is updating the 1983 TFP to reflect current dietary guidance, including the 1995 Dietary Guidelines for Americans and the Food Guide Pyramid. Phase I of this update involves generating a market basket showing amounts of foods in different food groups that food stamp households can use to prepare a week's worth of nutritious, low-cost menus. Phase II, which has been initiated under contract with the Pennsylvania State University, involves testing sample menus based on the TFP market basket for overall acceptability with food stamp households. Results of this evaluation will provide valuable information that can be used in developing nutrition education materials for food stamp program participants and other low-income consumers.

Finally, the Center also conducts research and analysis related to the Personal Responsibility and Work Opportunity Act of 1996 (Public Law 104-193). Projects include:

STUDY OF THE USE OF FOOD STAMPS TO PURCHASE VITAMINS AND MINERALS

The Center has a lead role in a study of the use of Food Stamps to purchase vitamins and minerals. The Personal Responsibility and Work Opportunity Act of 1996 (Public Law 104-193) directs the U.S. Department of Agriculture to study the potential consequences of allowing the use of food stamps to purchase vitamins and minerals in consultation with the National Academy of Sciences, and the Center for Disease Control and Prevention. Along with the Food and Nutrition Service, the Center

is participating in this study and taking the lead in analyzing two major data sets: the Consumer Expenditure Survey of the Bureau of Labor Statistics and the USDA Continuing Survey of Food Intakes by Individuals to better understand the extent of purchases and the effect of these purchases on food expenditures and nutritional status. A third survey, NHANES III by the Centers for Disease Control is also being analyzed.

ESTIMATED IMPACTS OF WELFARE REFORM ON HOUSEHOLD FOOD EXPENDITURES, FOOD CONSUMPTION, AND NUTRITIONAL STATUS

Two Center studies conducted within the past year built on the economic and nutrition literature on the relationships among household food expenditures, food consumption, and nutritional status in different types of households to better understand the impact of potential changes in household income, food stamp receipt, and labor force participation. Representative households affected by welfare reform provisions were identified, their sources of income, food expenditures, and nutritional status as characterized by the Healthy Eating Index explored, and estimated changes were assessed. Results were disseminated in the form of two presentations and two papers at the American Agricultural Economics Association, and the American Statistical Association Annual Meetings. A third paper entitled "Maintaining Food and Nutrition Security: The Role of the Food Stamp Program and WIC" was submitted for publication in the Center's peer reviewed journal, the Family Economics and Nutrition Review.

WELFARE REFORM AND CHILD SUPPORT

Two additional studies conducted by the Center explored current policy relating to child support in the wake of Welfare Reform. The Child Support Enforcement Amendments of 1984, as well as the Family Support Act of 1988, emphasized the importance of enforcing child support measures given the large percentage of non-custodial parents who do not pay child support. Welfare reform continued and strengthened this theme. The studies compared Center estimates of the costs of raising children to state awards of child support and to actual child support payments in order to better understand the relationship between adequate awards and the poverty rate among single parent households with children as well as their participation in welfare programs. Results will be disseminated in two papers: "Child Care and Welfare Reform," and "Do Child Support Awards Cover the Cost of Raising Children?" to be published in the Spring/Summer 1998 issue of the Family Economics and Nutrition Review.

Question. Please provide examples of how the Center, since its creation, has promoted the health of all Americans through good nutrition linking scientific research to the dietary needs of the consumer.

Answer. The U.S. Department of Agriculture (USDA) established the Center for Nutrition Policy and Promotion (CNPP) in 1994 to provide a mechanism for improving the nutritional health of all Americans by linking nutrition research to the dietary needs of the consumer. Center staff develop integrated nutrition education, promotion and research programs for all consumers including, but not limited to, customers of food and nutrition assistance programs. Some specific examples of how the Center seeks to fulfill its mission are described below.

The Center is called upon by media, nutrition educators, and policy makers to provide leadership in developing, interpreting, and promoting Federal dietary and nutrition guidance. This guidance is currently embodied in the Dietary Guidelines for Americans and the Food Guide Pyramid. The Dietary Guidelines for Americans serve as the basis for Federal nutrition policy. They provide nutrition guidance for the general public, based on the preponderance of current scientific and medical knowledge. Title III of the National Nutrition Monitoring and Related Research Act of 1990 (Public Law 101-445) requires that USDA and the Department of Health and Human Services (HHS) update the dietary guidelines every five years. The Center served as the lead within USDA to coordinate with HHS the review of the Report of the Dietary Guidelines Advisory Committee and the preparation of the 1995 *Dietary Guidelines for Americans*.

In preparation for Dietary Guidelines 2000, the Center worked with the Agricultural Research Service and HHS during 1997 to prepare the charter to establish a Dietary Guidelines Advisory Committee. To assist the Committee in its deliberations, the Center is also coordinating production of a "basebook" of information analyzing current dietary patterns in light of the most recent dietary guidance.

The Food Guide Pyramid, released by USDA in 1992, is a tool that consumers can use to implement Dietary Guidelines recommendations in their own diets. The Pyramid graphically illustrates USDA's research-based food guidance system that trans-

lates nutrient recommendations into recommendations on food intakes, and provides a framework for selecting the kinds and amounts of foods to provide a nutritionally adequate diet. Because the process of providing science-based dietary guidance must be dynamic in order to stay current, the Center is updating the research that supports the food guide to incorporate changes in food composition, food consumption, nutrition recommendations, and food technologies that have occurred since the original research was conducted. In addition, in 1997 the Center developed a decision-making framework for revising the Food Guide Pyramid based on changes in dietary standards, using the newly released Dietary Reference Intakes for calcium and related nutrients.

Building upon recommendations from a 1996 working session focusing on the Dietary Guidelines and children, the Center has initiated development of a food guide pyramid and Pyramid-based nutrition messages specifically for children from two to six years of age. As part of this effort, the Center has conducted a comprehensive analysis to identify the target audience, and examined children's current food and nutrient intakes in light of existing Pyramid recommendations. CNPP has also held a series of discussions with leading nutrition educators on key behavioral and developmental factors in feeding young children, and sponsored qualitative research with children, parents, and caregivers to obtain suggestions for prototype products and materials that would be useful for this audience.

The Center vigorously promotes use of the Dietary Guidelines and the Food Guide Pyramid in all nutrition education programs within USDA and in the Federal and private sectors. The Dietary Guidelines Alliance represents one such effort. CNPP acts as a USDA liaison to this coalition of food industry, health, and government organizations that strives to assist consumers in putting the Dietary Guidelines into practice. In 1996, the Center participated in a presentation on the Alliance's consumer research findings related to reaching consumers with meaningful health messages. In 1997, the Center also initiated a popular factsheet series, "Nutrition Insights," to highlight dietary guidance issues with health professionals who work with the media and consumers. In addition, the Center has conducted a seminar series since 1995 to provide a forum for policy makers and professionals to discuss current nutrition research and policy issues.

The Center also responds directly to requests from the public. Specifically, during fiscal year 1997, the CNPP received 264 telephone calls from reporters, editors, and fact checkers; approximately 50 calls from television and radio producers; 15 from news services; 32 from book authors and publishers; some 60 advertising agencies and food companies; 70 professional nutrition and dietetic associations; 50 calls from universities/colleges; approximately 100 Federal and State agencies; 48 congressional offices; 8 international calls (research and government); and over 100 calls from the general public. The Center also received over 5,000 calls on its Publications Hot Line for publications. In addition, the Center's Internet website receives approximately 20,000 hits per week or the equivalent of over 1 million downloads per year.

Also, for the past three years since the Center for Nutrition Policy and Promotion was formed, the Center has sponsored a seminar series known as "Nutrition Issues for the 21st Century." The theme for last year's series was "Improving the American Diet Through Successful Nutrition Intervention." During the year the Center held six seminars where some of the Nation's leading experts in nutrition, diet, nutrition education and related fields spoke to a diverse audience of nutrition professionals, food industry representatives, Capitol Hill committee staff, advocacy organizations, and Federal policy makers.

The Center publishes and contributes to the peer reviewed quarterly journal, *Family Economics and Nutrition Review*, which is currently in its 55th year of publication. Publication of the Journal further contributes to the Center's mission to link research to the consumer by mainly reaching information multipliers in the fields of Family Economics, Extension, and Nutrition.

The Center participates in other Government efforts to improve the nutritional status of the population. For example, the Center contributed to the re-formulation of the Healthy People 2000 Objectives. It is also an active contributor to the Healthy People 2010 Objectives effort.

CNPP also provides leadership in research and analysis of food, nutrition, and economic data critical to national policy decisions. Projects include:

HEALTHY EATING INDEX PROJECT

In 1995, CNPP released the Healthy Eating Index (HEI), an aggregate measure of overall diet quality. This and follow-up activities are responsive to the mandates of Public Law 101-445, The National Nutrition Monitoring and Related Research

Act (7 U.S.C. 5301 et seq.), which directs the HHS and USDA to “improve the methodologies and technologies, including those suitable for use by States and localities, available for the assessment of nutritional and dietary status and trends;” and to “develop uniform standards and indicators for the assessment and monitoring of nutritional and dietary status, for relating food consumption patterns to nutritional and health status, and for use in the evaluation of Federal food and nutrition intervention programs;” (7 U.S.C. 5313, Sec. 103(b)6–7). The HEI used data from USDA’s 1989–90 Continuing Survey of Food Intakes by Individuals (CSFII) to provide a picture of the foods people are eating, the degree of variety in the diet, and their compliance with specific dietary recommendations. In a press release, the HEI was hailed by the American Dietetic Association as “the most accurate measurement to date of how Americans eat.” The HEI report showed that the diets of most Americans need improvement; the average score was 64 of a possible 100 points. Follow-up analysis has shown that low-income individuals are more likely to have poor HEI scores, as are individuals from the teen years to middle adulthood. Because the HEI is based on data from CSFII, updates are possible only when that data set becomes available. USDA’s Agricultural Research Service collected CSFII data for 1994, 1995 and 1996. Center staff are in the process of producing updates to the HEI for those three years.

PROJECT TO DETERMINE EXPENDITURES ON CHILDREN BY FAMILIES

Since 1960, the U.S. Department of Agriculture has provided estimates of food and other major expenditures (housing, clothing, etc.) on children from birth through age 17 by husband-wife and single-parent households. The expense estimates are provided by age of child, family income, and region of residence. The most recent estimates are based on the 1990–1992 Consumer Expenditures Survey updated to 1997 costs using the Consumer Price Index for various budgetary components. The 1997 update of the average percentage of household expenditures attributable to children in husband-wife households reflects a 2–3 percent increase. For the overall United States, child-rearing expense estimates ranged between \$8,060 and \$9,170 per year for a child in a two-child, married-couple family in the middle income group. The report, *Expenditures on Children By Families*, is updated annually. Results are used in developing State child support guidelines and foster care payments to help ensure that children receive an adequate standard of living. A survey by the American Public Welfare Association found that approximately half the States in the U.S. used the results in setting foster care payments.

PROJECT TO MAINTAIN AND UPDATE THE NATIONAL FOOD SUPPLY DATABASE MANAGEMENT SYSTEM AND TO PUBLISH UPDATED NUTRIENT CONTENT OF THE U.S. FOOD SUPPLY

The Center publishes periodically a report on food supply nutrient per capita estimates, and is responsive to food supply activities specified in the Ten Year Comprehensive Plan for the National Nutrition Monitoring and Related Research Program of the National Nutrition Monitoring and Related Research Act (7 U.S.C. 5301 et seq.). The newest Update of the Nutrient Content of the U.S. Food Supply was published in October 1997. Future work will involve updates of the food supply fortification files to be more reflective of current fortification of such commodities as cereal products, fruit juices and drinks, and milk-based meal replacements. In addition, plans are to improve per capita estimates of edible offals, and low-fat or fat reduced commodities.

Question. Please explain how the Center links scientific research, including research conducted by federal agencies (e.g., Department of Health and Human Services’ agencies such as NIH and CDC, the FDA, and USDA’s research agencies, including the Human Nutrition Centers of the Agricultural Research Service) to the dietary needs of the consumer and uses that information to promote the health of all Americans. Please explain how this information is transmitted directly to Americans.

Answer. The Center works with USDA’s Agricultural Research Service (ARS) and the Department of Health and Human Services (HHS) to produce *Nutrition and Your Health: Dietary Guidelines for Americans*. Title III of the National Nutrition Monitoring and Related Research Act of 1990 (7 U.S.C. 5341) requires the Secretaries of Agriculture and HHS to jointly publish every five years a report entitled, *Dietary Guidelines for Americans*. The Dietary Guidelines represent the Federal Government’s policy on nutrition. They provide nutritional and dietary information and guidelines for the general public, based on the preponderance of current scientific and medical knowledge, including research originating from ARS and HHS. In 1997, the Center worked with ARS to develop and finalize a Memorandum of Understand-

ing with HHS to provide a framework for cooperation between USDA and HHS for preparing the fifth edition of Nutrition and Your Health: Dietary Guidelines for Americans to be released in the year 2000. The Center vigorously promotes use of the Dietary Guidelines in all nutrition education programs within the Department and in the Federal and private sectors. The Center has made copies of the bulletin Nutrition and Your Health: Dietary Guidelines for Americans available to consumers via the Consumer Information Center in Pueblo, Colorado and over the Internet. The Center initiated a popular fact sheet series, Nutrition Insights, targeted to nutrition and media professionals. The series is designed to respond in a timely manner to consumer confusion over "junk science" or other current issues, based on Federal dietary guidance. Center staff also build Federal dietary guidance principles into speeches, articles, and numerous interviews with the popular press on Dietary Guidelines concepts.

The fourth edition of Nutrition and Your Health: Dietary Guidelines for Americans, released in 1995, included the Food Guide Pyramid graphic for the first time. The Food Guide Pyramid was developed by USDA and released in 1992 as a tool that consumers can use to implement Dietary Guidelines recommendations in their own diets. The Food Guide Pyramid has been extensively used by Federal Agencies in nutrition education programs and materials. The Food Guide Pyramid brochure is available to consumers via the Government Printing Office and over the Internet. A recent survey of consumers by the American Dietetic Association found that about 70 percent of respondents are familiar with the Food Guide Pyramid graphic. The Center is continually updating the science base that supports the Food Guide Pyramid, to incorporate significant changes in food composition, food consumption, and food technology, as well as changes in nutrition recommendations such as the new Dietary Reference Intakes being issued by the National Academy of Sciences' Food and Nutrition Board.

The Center serves as Acting Chair of and provides staff for the Dietary Guidance Working Group (DGWG) of the Human Nutrition Coordinating Committee. The Center's leadership fulfills USDA's responsibility to ensure that the Federal Government "speaks with one voice" when issuing dietary guidance, as mandated by Title III of the National Nutrition Monitoring and Related Research Act of 1990. The DGWG reviews all USDA and HHS publications and materials that contain dietary guidance for the general population to ensure consistency with the Dietary Guidelines for Americans. In fiscal year 1997, fifteen draft publications produced by USDA and DHHS Agencies were reviewed.

The Center is a liaison member of the Dietary Guidelines Alliance. The Alliance is a coalition of food industry, health organizations, and government agencies to help consumers implement the Dietary Guidelines. The Alliance is an example of how the Center has been able to extend its limited resources to promote the Dietary Guidelines. The Alliance represents a unique public-private partnership to improve the dietary behavior of Americans. The messages and materials developed through the partnership will be used by health professionals, industry, and government in education, counseling, and communications initiatives.

Question. The fiscal year 1999 budget requests an additional \$252,000 to support the Publication of the Dietary Guidelines for Americans, which the law requires USDA and the Department of Health and Human Services (HHS) to publish every five years. How does USDA and HHS share this cost? And, which USDA agency was responsible for the cost of publishing Dietary Guidelines for Americans in each of the past years it was published (prior to the creation of the Center)?

Answer. The cost of publishing the Dietary Guidelines for Americans can be broken down into two categories. The first category is the cost of reviewing research and completing supporting documents for the Dietary Guidelines Advisory Committee (DGAC) and publishing the Committee's report. The DGAC is a panel of eleven nationally-recognized experts in nutrition and health. Authority for the Committee is provided by 42 U.S.C. 217A, Section 222, of the Public Service Act, as amended. Committee members serve without pay, but do receive reimbursement for travel and per diem. This cost has been shared between USDA and HHS, with each Department alternating in taking the lead responsibility for these expenses. For example, in 1995 HHS was primarily responsible for these costs, and for the 2000 DGAC, USDA will bear the primary responsibility for these costs.

The second category is the cost of publishing and distributing the consumer bulletin, Nutrition and Your Health: Dietary Guidelines for Americans. This cost has always been primarily borne by USDA, with HHS contributing funds by riding the print order for the bulletin. In 1980, 1985, and 1990, USDA's Human Nutrition Information Service paid for this cost. In 1995, the Center for Nutrition Policy and Promotion paid for this cost, as it will do again in 2000.

In 1995, the costs for design and printing of the bulletin were approximately \$115,000. The Center is requesting \$252,000 in additional funds for fiscal year 1999 to support development and publication of the Dietary Guidelines bulletin because additional consumer research is essential before the next edition of the Dietary Guidelines is released. There has been little research conducted to assess consumer understanding and perceived usefulness of the Dietary Guidelines bulletin since the mid-1980's. The 1995 DGAC specifically requested in its report that the Departments gather information about consumer understanding of the Dietary Guidelines messages prior to convening the next DGAC. The Center has requested funds to conduct a comprehensive study to focus on: (1) a thorough review of the available research data and information on consumer understanding and use of the bulletin and Dietary Guidelines concepts; (2) telephone interviews with nutrition educators to assess uses of the Dietary Guidelines concepts and the 1995 bulletin; and (3) market research with consumers. Results of this research will be made available to the next DGAC and will also be used by the Center in its nutrition guidance efforts.

Question. Please explain the U.S. Action Plan on Food Security which I understand is being developed by the Center for Nutrition Policy and Promotion.

Answer. The domestic section of the U.S. Action Plan is being jointly developed by Under Secretary for Food, Nutrition, and Consumer Services, and the Assistant Secretary for Health of the Department of Health and Human Services (HHS). A technical working group is co-chaired by a USDA representative from the Center for Nutrition Policy and Promotion and a HHS representative and includes representation from the Department of Veterans Affairs, Bureau of Indian Affairs, Census Bureau, Bureau of Labor Statistics, Administration on Aging, Environmental Protection Agency and other agencies. The domestic section of the Plan builds on the Center's September 1996 report, Nutrition Action Themes for the United States, and the World Food Summit's Declaration and Plan of Action adopted in Rome in November 1996. The papers in the Plan are for discussion purposes and draw views from the Federal government, States, and private entities. The Action Plan presents no new government commitments and is to be completed by Spring, 1998.

Question. I understand that the Center for Nutrition Policy and Promotion has been assigned the responsibility of redesigning the Food Stamp Program Thrifty Food Plan. Please explain this effort and, if it requires any funding, whether these costs are being borne by the Center or the Food Stamp Program and why.

Answer. The Center is responsible for the development of the USDA food plans, including the Thrifty Food Plan (TFP) which serves as the nutritional basis for food stamp benefit levels. The TFP specifies quantities of different types of food that households may use to provide nutritious meals and snacks at relatively low cost. Currently, the 1983 TFP Market Basket is used as the basis of the food stamp allotment and its cost is updated each year for inflation. The Center is updating the 1983 TFP to reflect current food in the market place and current dietary guidance including dietary recommendations for total fat, saturated fat, and cholesterol. An interagency working group consists of representatives of the Center, the Food and Nutrition Service (FNS), and the Economic Research Service (ERS) was convened and met periodically to provide overall guidance.

Phase I of the revision uses a mathematical programming model and incorporates current dietary guidance along with information on current consumption patterns to generate a market basket providing the foods with which a low cost nutritious menu can be prepared.

Phase II utilizes these market basket foods to develop two weeks of household menus. To this end, CNPP nutritionists and economists are working with researchers from Penn State University to test whether it is feasible to produce menus and recipes that meet the nutritional and costs constraints of a revised TFP and, at the same time, are acceptable to the intended audience. In particular, the researchers have developed several recipes, tested them in a food laboratory for sensory acceptability and incorporated them into one-week menus. The menus and recipes for one week are currently being tested for overall acceptability with 4 food stamp households. It is anticipated that additional menus should be completed in the next few months at which time they will also be field tested.

The TFP revision is scheduled for completion in fiscal year 1998. Most costs are borne by the Center which (as its predecessors) has been charged with this responsibility. Contract costs of \$169,481 to support the Penn State University work and a \$50,000 transfer of funds to ERS to develop a price data base needed for the update of the TFP were borne by FNS, even though the Center directed these sub-projects.

Question. Please provide a separate object class breakdown for each of fiscal years 1997, 1998 and 1999 for the Food and Nutrition Service food program administration account, and, separately, for the Center for Nutrition Policy and Promotion.

Answer. The information is provided for the record.
[The information follows:]

FOOD AND NUTRITION SERVICE—CLASSIFICATION BY OBJECTS

[1997 and estimated 1998 and 1999]

	1997	1998	1999	
Personnel compensation:

FOOD STAMP PROGRAM

Question. Would you please give us a summary report on the progress we've made to date with the electronic benefits transfer (EBT) delivery of Food Stamps—what we've achieved; what problems, if any, we've encountered; and when you expect the rest of the states to implement EBT Food Stamp delivery systems.

Answer. Currently, there are 30 States with operating Electronic Benefit Transfer (EBT) systems and 16 of these systems are Statewide. Approximately 43 percent of all Food Stamp Program benefits are now delivered through EBT systems. If all State plans are met, we expect there to be 41 States (including the District of Columbia) with operating EBT systems by the end of fiscal year 1998. We also expect to meet the legislative mandate to have all States operating EBT systems by October 1, 2002.

As States move forward and implement their EBT systems, they have benefited from those States that have gone before them, and implementation has become more routine. Nevertheless, a substantial effort is still required of any State to actually get these systems up and running. Issues each State must continue to address include achieving cost neutrality while providing satisfactory service to their recipients, and entering into agreements with the food retailers in their State that are mutually satisfactory to both the State and the retailers.

Question. The fiscal year 1999 request for the Food Stamp Program includes \$6.7 million for employment and training. What success have we had with Food Stamp Program employment and training activities?

Answer. The \$6.7 million increase is to cover basic inflation that State's Food Stamp Employment and Training (E&T) Programs will experience in fiscal year 1999.

Federal E&T funding was fixed at \$75 million a year through fiscal year 1996. Funding in fiscal year 1997 increased to \$79 million and then in fiscal year 1998 to \$212 million to meet the challenges of the Balanced Budget Act. States have generally chosen to serve as many recipients as possible through the relatively low cost job search component. Annually, this has resulted in over 1 million recipients being asked to take responsibility in seeking employment in order to participate in the Food Stamp Program.

Question. In each of the past three fiscal years, and in fiscal year 1998 to date, how many Food Stamp recipients have been trained and employed? What has been the cost per participant of these activities?

Answer. A table is provided for the record that depicts the number of mandatory and volunteer participants placed into Food Stamp Employment and Training (E&T) Program activities. The cost per participant figure represents total Federal 100 percent E&T grant expenditures, plus total Federal and State administrative expenditures over and above the 100 percent grant, divided by the number of participants. The fiscal year 1998 numbers are taken from preliminary first quarter data (October, November, December 1997).

[The information follows:]

Fiscal year	Participants	Cost per participant
1995	1,474,796	\$143
1996	1,377,148	163
1997	1,221,219	164
1998	252,825	154

While most of the above E&T participation includes job search, the Food and Nutrition Service does not collect information on the outcome of the job search activity.

Question. The prepared testimony indicates that the Administration will submit a proposal to reclassify claims against food stamp recipients for erroneous benefit issuances as State debt rather than Federal debt. You indicate that this proposal will be cost-neutral in the immediate future but, if States respond to proposed incentives, collections may be substantially increased in the long run. What response would be necessary from the States and what level of collections could be achieved in the out-years?

Answer. We are working on the details of a proposal to enhance state incentives to collect food stamp claims. The proposed incentives allow certain States to retain an increased share of collected claims. Some States would be rewarded for improved claims collections. Other States with exceptionally high claims collection rates would also be rewarded. It is reasonable to expect that States will respond to the opportunity to retain a higher share of collections by increasing their claims collections efforts.

However, at this point the incentive plan is structured so that incentives are paid only if total collections increase from the base year. Thus, there is no risk to the Federal government if claims collection increases fail to materialize. On the other hand, if States do increase their claims collection efforts and successfully collect a higher share of their overissuance, both the States and the Federal government share in the increased collections.

This proposal is still under development within the Administration so some of its features may change as additional discussion takes place.

CHILD NUTRITION PROGRAMS

Question. Secretary Watkins, you indicate that you will be submitting cost-neutral legislation to reauthorize the Child Nutrition programs, which will include proposals to improve the operation, management and integrity of the National School Lunch and School Breakfast Programs, and the Child and Adult Care Food Programs. Please summarize your major proposals to improve the operation, management and integrity of these programs.

Answer. The Department's reauthorization legislation submitted to the Congress on March 10, 1998 contains a number of proposals which would improve the management and integrity of these programs. First, State agencies would be given the authority to retain up to one-half of the funds recovered in State conducted audits or reviews to be used for program improvements under the Child Nutrition Programs. This proposal is being made in conjunction with one under which the current authority for funding of State audits under the Child and Adult Care Food Program (CACFP) would be removed. The CACFP is the only Child Nutrition Program in which separate funding for audits is available and it has been the Department's experience that numerous States have not been able to use this funding effectively and as much as 30 percent has not been used at all. We believe that these two proposals combined will result in improved program oversight and increased management effectiveness at the State level.

The Department is also proposing to remove beginning in fiscal year 2001 the requirement in current law that the Department directly administer local level Child Nutrition Programs. States would be required to assume administration of these programs if they wished to have them available within their States. The Department believes that local level program operators and program beneficiaries would be better served by State agencies that are closer to and more knowledgeable about the organizations and individuals participating in these programs.

With regard to State Administrative Expense (SAE) funding, the proposals would eliminate the ten percent transfer limitation which unnecessarily ties the hands of State agencies and, if removed, would allow States to determine where such funds can be best utilized.

With regard to the National School Lunch and School Breakfast Programs, the Department is proposing to require that all schools participating in the National School Lunch and School Breakfast Programs obtain twice yearly health and safety

inspections covering their food service operations. This is intended to help ensure that meals provided to school children are prepared and served in the most suitable environment, consistent with State or local standards.

In the CACFP, the Department is proposing that categorical eligibility for free meals for Even Start participants be reinstated to avoid duplicative eligibility determinations; timeframes for State approval of institution applications be relaxed somewhat to allow for better State-level evaluations of applications; timeframes for participation by institutions "moving towards tax exempt status" be revised to enhance State oversight of participation by such institutions; and the Department be authorized to reserve a small amount of funds each year to help ensure proper implementation of the family day care home tiering requirements and to provide for overall improved program quality and integrity.

Question. What funding is included in the fiscal year 1999 request for the National Food Service Management Institute (NSFMI)?

Answer. The budget includes two million dollars for the NSFMI in 1999.

Question. The National Food Service Management Institute (NFSMI) has played an important role in the school meals initiative. Please describe the cooperative agreements with NSFMI funded with the \$500,000 provided for this purpose for fiscal year 1998.

Answer. The cooperative agreements funded with the \$500,000 provided in fiscal year 1998 are continuations of two ongoing projects: the Hands On Team and the Customer Service Help Desk. The Hands on Team is a two year pilot project which supports the implementation of the nutrition goals of the School Meals Initiative for Healthy Children by providing a cadre of consultants who will assist school food authorities with technical assistance in all areas of food service, including menu planning, nutrient analysis, standardized recipes, food preparation, food storage, food purchasing, equipment, action plans, merchandising ideas and nutrition education. Site visits began in the Fall of 1997 and preliminary evaluations show overwhelming interest from school food authorities. Funding of this pilot project included 100 site visits, and as of October 31, 1997 requests for assistance had exceeded this number. Since a number of these requests for assistance had to be declined, 1998 funds will be used to fund site visits to some of those schools beyond the 100 initially included in the pilot project who had requested assistance.

The Customer Service Help Desk project, which provides technical assistance and materials via a toll free telephone number and Internet site, is entering its fourth year. Currently the Help Desk averages 250 questions per month.

Question. Of the \$10 million requested for the school meals initiative for fiscal year 1999, how much is for cooperative agreements with the NSFMI and what work is planned for fiscal year 1999?

Answer. While the specific amount which will be available in fiscal year 1999 has not been determined, we anticipate an additional \$500,000 in funds for cooperative agreements with the National Food Service Management Institute (NFSMI). Several projects have been identified for possible funding. It is anticipated that the Customer Service Help Desk would continue through 1999, although the level of funding may be reassessed based on service levels. The NFSMI, in cooperation with the Food and Nutrition Service (FNS), is expanding their current publications role to include the distribution on a cost recovery basis, of a number of FNS publications. One of the publications which will be turned over to the NFSMI for distribution is *Serving It Safe*, an extremely popular food safety guide. There is a need for this publication to be updated regularly in order for the food safety guidance to remain current, and the NFSMI has agreed to assume this task. Distance based training in the area of cooperative purchasing, with concurrent Internet chat rooms are also being considered. In addition, the NFSMI is currently working on some financial management materials for school food service, which could be adopted by State agencies. These would be instructional materials which would provide standardization of documentation and consistency in reporting and record keeping at the local level.

The NFSMI and FNS work together with the NFSMI's National Advisory Committee to determine major projects and priority needs. The National Advisory Committee is comprised of representatives from State agencies, local programs, professional organizations, universities, food industries and Federal agencies. The yearly meeting of the committee is scheduled for March 27-29, 1998.

Question. Please provide a detailed accounting on how the funds made available for the school meals initiative have been used in each of fiscal years 1996, 1997 and 1998, and what is proposed for fiscal year 1999. Identify and include the use of any unobligated balances from funds provided in previous fiscal years.

Answer. The following information is submitted for the record. Table 1 identifies spending categories by year in which the funds were appropriated. The fiscal year

1998 allocations represent the current spending plan and the fiscal year 1999 allocations are projected. Table 2 provides a breakdown of funds obligated in the year in which appropriated and funds carried over into the next fiscal year.

[The information follows:]

TABLE 1.—SCHOOL MEAL INITIATIVE: SPENDING BY CATEGORY

	Fiscal year—			
	1996	1997	1998 (estimate)	1999 (estimate)
I. Food service training and technical assistance:				
Technical assistance materials	\$1,914,756	\$1,105,027	\$1,682,192	\$3,200,000
Print and electronic food service resource systems	97,755	385,200	400,000	400,000
NFSMI cooperative agreement for food service	250,000	800,000	500,000	500,000
II. Children's education resources: In-school education materials and community education materials	3,640,958	1,163,500	868,913	¹ 1,300,000
III. Food service training grants to States	1,965,703	4,000,000	4,000,000	4,000,000
	² 1,629,278	² 2,120,722		
IV. USDA/FCS direct training and education	12,663	360,200	27,050	50,000
V. Children's communications and technology	91,600	5,000		
VI. Team nutrition partnership support: Resources for team nutrition schools and partnership network support	168,080	54,475	15,525	50,000
VII. Evaluation and administration	685,451	5,876	506,320	500,000
Total	10,456,244	10,000,000	8,000,000	³ 10,000,000

¹ Includes resources for the Child and Adult Care Food Program (CACFP) and Summer Food Service Program (SFSP).

² \$3,750,000 was reprogrammed to section 6(a)(3) of the National School Lunch Act to provide grants to States to fund activities that would have otherwise been supported by the NET Program. Both fiscal year 1996 Carryover funds and fiscal year 1997 Current year funds were used.

³ Includes \$2 million to fund School Food Service Systems Improvement Initiative to improve business practices in school food service.

TABLE 2

Fiscal year appropriated	Funds obligated in year appropriated	Funds carried over and obligated in the next fiscal year
1996	\$4,794,060	\$5,662,184
1997	7,955,722	2,044,278
1998	8,000,000	
1999	10,000,000	

Question. The budget proposes a decrease of \$4 million reflecting expiration of the Kentucky/Iowa demonstration projects. Why? What impact will this have on those now being served through each of these projects?

Answer. The Department's budget submission for the Child Nutrition Programs was a "current services" proposal. However, the Department's reauthorization bill for the Child Nutrition Programs, which was submitted to the Congress after the budget request, proposes that the Kentucky/Iowa demonstration projects be made a permanent part of the Child and Adult Care Food Program (CACFP) in those two States. If this proposal is approved, the benefits currently available to children in Kentucky and Iowa under the demonstration project would continue to be available under the CACFP.

Question. For each of fiscal years 1997 and 1998, please provide detail on the food service training grants awarded to states, identifying the state, the amount of the grant award, a brief description of the project. For each of these years, please list the projects which have been awarded food service training grants.

Answer. The information is submitted for the record.

[The information follows:]

Arizona, \$162,780

Arizona Department of Education in collaboration with a training coordinator will develop a three-day train-the-trainer module that will include principles of adult learning, development and implementation of school-based comprehensive health and nutrition programs, overview and practical application of recommended nutrition education curriculum and instructional strategies for classroom and food service staff to support the classroom to cafeteria link of nutrition education and healthy food choices. They will also establish a cadre of trainers/mentors to provide a minimum of two additional TN Training workshops and technical assistance to school districts developing comprehensive school health programs to promote lifelong healthy eating habits in children and adolescents. They also plan to provide Local Level TN Training Grants to a minimum of 15 school districts with the majority of their schools enrolled as Team Nutrition Schools for the development of model comprehensive school health programs to promote lifelong healthy eating habits in children and adolescents.

California, \$270,400

The California Department of Education will utilize funding for three separate projects: Local TN Training Grants; a CD-ROM Development for Nutrient Standard Menu Planning (NSMP) Training; and a Portable Computer Lab for NSMP Training. The Local TN Training Grants will be designed to provide comprehensive, action-oriented delivery of training programs at the district and school level to provide training for teachers on the use of Team Nutrition curriculum; develop garden-enhanced nutrition education projects; and provide professional development opportunities for school nutrition staff. Development of a NSMP Course on CD-ROM will facilitate hands-on computer experience and will improve the status of the school meals by training school nutrition directors and menu planners to comply with the School Meals Initiative for Healthy Children and meet the goals identified by the USDA. California will also establish a cost-effective portable computer lab to enable the Department of Education, Nutrition Education and Training (NET) Program to significantly increase its ability to offer NSMP Training in support of the School Meals Initiative for Healthy Children.

Illinois, \$168,520

The Illinois Team Nutrition Training Grant involves three distinct activities aimed at assisting Illinois schools in adopting a school wide approach to promoting healthy eating. The first activity, the comprehensive healthy education project, will be a collaborative effort between Illinois NET and the Illinois Department of Public Health. School staff will be provided with essential information on how to develop and implement a school health program that promotes healthy eating through two training workshops. NET will also provide competitive local grants to 10 school districts in order to enable them to plan and implement health programs that will serve as models for all schools. The second activity will provide Illinois elementary and junior high schools with access to fun, interactive, educational exhibits through the use of mobile education units. The third activity, development of a NET web site, will increase the access of educators and food service staff to NET resources, information and services. The web site will also contain up-to-date information on Team Nutrition activities and grant opportunities in Illinois.

Iowa, \$299,000

Iowa's proposal seeks to expand the availability of training opportunities as well as the number of trainers. The project will accomplish these goals by applying the energy, resources and broad connections of a Statewide coalition of public sector agencies and the resources of the State NET Program to develop and provide the food service training/coalition building capacity of an existing, sustainable framework, i.e., Area Education Agencies (AEA's). Three strategies will be used in this grant. First, the NET Coordinator and Iowa Nutrition Education Network staff will develop and implement a competitive grant program for AEA's. Six AEA's will be chosen to assist at least five school districts in their area to implement TEAM Nutrition. A second strategy will be to provide direct training to food service staff in the 30 school districts that implement TEAM Nutrition as part of this grant. They will contract with the National Food Service Institute to conduct the master trainer workshop. The Iowa School Food Service Association has agreed to organize a cadre of 30 members who will also complete this training and conduct ten hands-on training sessions around the State. The third strategy will be to seek private funding to develop a Statewide media campaign that will build on and feature the TEAM Nutrition concepts being developed at the local, Regional and National levels.

Kansas, \$192,260

Kansas is implementing activities to enhance and expand Team Nutrition and the Kansas Comprehensive Training System (KCTS) for School Nutrition Professional Development. These activities will include: (1) developing a standardized, comprehensive, job-category-based framework for Kansas' formal training program; (2) forming a State organization of Team Nutrition Supporters to provide a comprehensive directory of resources and an annual Team Nutrition Event packet; (3) implementing and supporting 10 model programs to demonstrate healthy school meals based upon the "Keys to Excellence: Standards of Practice for Nutrition Integrity"; and (4) providing incentives to 200 additional Kansas schools to implement nutrition education which supports the cafeteria-classroom link.

Maine, \$94,562

The Maine Department of Education will coordinate with the Maine Technical College System to enhance the delivery of a sustainable training program for school nutrition personnel Statewide and offer expanded training opportunities. The program will offer three levels of training. The first level of basic instruction will be expanded to include an orientation to school food service course. The second level of skill development will use technical college faculty, school nutrition directors, State agency staff, local chefs and other appropriate individuals to train school nutrition staff on implementation of the Dietary Guidelines. Level three, continuing education, will be expanded to recognize the expanded skill training courses in the tri-annual certificate renewal process. Maine will also provide Local TN Training Grants to eight school systems to develop a team approach to implementing the Team Nutrition Schools principles in their educational programs. Also, Maine will continue their partnership with the Maine Nutrition Network and expand their efforts targeted to low income schools by providing parallel resources to any Team Nutrition Schools.

Maryland, \$300,000

The Maryland Team Nutrition Training Project will develop a Statewide cadre of trained resource professionals to assist schools to conduct effective nutrition education activities. At least 50 Cooperative Extension and school food and nutrition service professionals will be trained to assist Team Nutrition schools in five geographic regions of the State. Other project objectives include: increasing the number of Team Nutrition schools in Maryland to 40 percent of all public schools; conducting comprehensive training in nutrition education, food safety and the School Meals Initiative; developing a sustainable relationship with the Maryland Cooperative Extension Service in order to increase available technical assistance to schools and awarding a minimum of eight competitive training mini-grants to both local educational agencies and community organizations.

Michigan, \$299,952

The Michigan Department of Education in collaboration with Michigan State University Extension (MSUE) and the Michigan Team Nutrition Steering Committee has integrated a two component strategy of peer mentor/coaching to assist and support school food service directors train their staff (on-site) with the Healthy Cuisine for Kids (HCK) curriculum; and comprehensive multi-dimensional support for Michigan Team Nutrition Schools. This grant project is designed to increase the number of Team Nutrition schools, and further assist enrolled Team Nutrition schools build strong partnerships with communities, as they continue to actualize Team Nutrition. They plan on accomplishing this by training peer mentor/coaches in HCK, training 420 food service teams in a one day train-the-trainer workshop, offering on-site technical support, using newsletters to train and sustain Team Nutrition Partners, offering five school districts Demonstration Training Mini-Grants, enhancing Team Nutrition through Partnering and Support with MSUE, and developing and using a World Wide Web for Team Nutrition sustainability.

Minnesota, \$292,220

The purpose of this grant is to address a wide range of local training needs in order to implement the Healthy School Meals Initiative. The project consists of three parts. First, the development and provision of effective, local-use training resources, which includes the development of a videotape training resource packet, and conducting 20 statewide workshops for school food service managers, supervisors and directors on the requirements and successful implementation of Food Based Menus and NuMenus. Second, development of improved resource materials and services using new technologies, including a website to provide access to digital versions of the materials developed. Third, through a competitive grant process, pro-

vide four to six local Team Nutrition Training grants to school districts to develop and implement model district-wide training plans and nutrition education programs.

New Hampshire, \$107,143

The New Hampshire Department of Education plans to provide between 2 and 20 grants to local school districts for innovative district-wide training programs which meet Team Nutrition Training Grants criteria. They also plan to establish a partnership with the New Hampshire Dietetic Association and provide a training session for dietitians regarding the School Meals Initiative and encourage their involvement in assisting schools with nutrition committees, developing nutrition policies and Team Nutrition projects. Other projects include expanding services which began through a partnership with the Vermont Department of Education by providing a management seminar for New Hampshire and Vermont food service directors and managers. The partnership with the New Hampshire School Food Service Association will be strengthened by having them provide the management seminar and provide the materials and training for "Meeting the Challenge" to school food service staff. In addition, New Hampshire plans on contracting with the National Food Service Management Institute for three additional components of a NET needs assessment to expand the information available to the NET Coordinator when planning future training efforts.

New Jersey, \$189,640

The New Jersey proposal is a joint venture involving two major partners: the Nutrition Education and Training Program and the Bureau of Child Nutrition. A number of secondary partners including the Academy of Professional Development, the Dairy Council, the American Cancer Society, the New Jersey Parent Teacher Association and the New Jersey School Food Service Association are also involved. The proposal has three goals: strengthen the State's training capacity, establish classroom-cafeteria link, and improve project management techniques. The building training capacity objectives are: expanding the New Jersey Professional Development and Training Cadre; conducting statewide training for school food service personnel; establishing and maintaining three regional computer assistance menu analysis sites and USDA Internet site access; developing and disseminating a quarterly newsletter; conducting statewide and regional school food service institutes; and developing and disseminating user-friendly handbook for Food Based Menu Planning Options. The classroom-cafeteria link will involve expanding the Power 3 Club Manual and developing quarterly newsletters and linking parents to Power 3 Club by regional Super Saturdays and TN Calendars and academic activities.

North Dakota, \$77,144

The training project designed by the North Dakota Department of Public Instruction will utilize several approaches which will allow the agency to continue and enhance the sustainable training infrastructure initiated with funding received under the 1995 Team Nutrition Training Grant. The training activities proposed in the grant proposals are: (1) conduct focused technical assistance/training meetings for school nutrition personnel; (2) conduct enhanced training for cadre members; (3) conduct culinary skills workshops for school nutrition personnel; and (4) develop and broadcast a third satellite training seminar. In addition, provide funds to assist in providing nutrition information to students.

Oregon, \$129,020

Oregon's TN Training Grant proposes to conduct train-the-trainer workshops to strengthen the NETPRO Oregon training cadre in order to provide a series of three comprehensive, interrelated School Meals Initiative (SMI) training and technical assistance events for Oregon's school food authorities. The first event is Healthy School Meals Workshop which is an eight hour train-the-trainer workshop for food service directors/managers and key food service staff to improve knowledge and skills in the areas of resources, nutrition, culinary skills, and menu planning. The second event is Mission: Nutrition! which is a day long nutrition extravaganza involving the entire school community. The goal is to create a nutrition awareness culture throughout the school community which supports the production of quality meals meeting USDA nutrition requirements and promotes nutrition education for students. The third event is a school food authorities SMI review which focuses on each school food authorities progress towards meeting SMI regulations.

Rhode Island, \$299,886

The Rhode Island grant project will expand on the current Team Nutrition Training Program by launching the TNT Institute. The Institute will be a resource for school districts to use for food service training and the development of nutrition edu-

cation activities in the classroom. It will be able to address the training needs of school food authorities. The Institute will also be responsible for increasing the involvement and empowerment of parents and community members to play an active role in improving the diet of children through schools.

South Carolina, \$300,000

The South Carolina grant will expand and refine the training infrastructure to support systematic and consistent training and technical assistance by establishing 12 training centers to provide training for directors, operators and managers for continuous improvement of meal quality and service to students and coordination of technical assistance. The project is also designed to establish community-based allowances to advocate for community and media support for Healthy School Meals through training school food service directors in social marketing and social learning techniques. It will also establish a demonstration program in four middle schools for building collaborate program and partnerships that support healthy school meals to serve as models to be replicated by other middle schools. Also, they will deliver Target Your Market training to assist directors and managers in marketing school nutrition programs.

South Dakota, \$299,886

The South Dakota Department of Educational and Cultural Affairs proposes a three-pronged program to meet the intended purpose of the Team Nutrition Training Grant for Healthy School Meals. The Program design includes: (1) a "Summer Institute" experiential training program offering academic credit for school-based teams to receive comprehensive training in team-based nutrition education with a continued follow-along technical assistance component to assist teams to carry out school-based programs; (2) a supplemental grants program for the selected team schools in South Dakota to develop and implement their team-based solutions for nutrition education; and (3) comprehensive enhancement of nutrition education activities for Food Service Certification Programs.

Utah, \$275,520

This project—Going for the Gold in School Nutrition—aims at creating long-range training plans for the State and for each individual school district. Training will be geared towards kitchen managers, and it will focus on implementing the School Meals Initiative, particularly NuMenus. Some of the topics to be covered include standardization of recipes, nutrient analysis, menu planning, and food preparation techniques. The project is divided into four levels. The first level is the Olympic Organizing Committee, which will set up a five year integrated delivery plan to reach all levels of the school nutrition programs. The Bronze Medal Level, the second level, will develop a district wide training program for school food service personnel. The third level, Silver Medal Level, will support training at the local level, while the fourth level, Gold Medal Level, will create a one week high-level manager training program at a local college.

Vermont, \$94,471

The goal of this proposal is to increase support for the School Meals Initiative by drawing educators and school leaders into the project while continuing to enhance the capacity of managers to operate high quality school meal programs. Six major activities are planned, including a series of seminars for managers of school food authorities comprised of single schools serving grades K through 12; a management conference to provide concrete management skills for food service managers and directors; a 5-A-Day-Project designed to provide schools with training and materials to conduct classroom hands-on activities with fruits and vegetables; awarding Local TN Training Grants to schools to implement action plans to strengthen comprehensive health programs in their schools; create a Team Nutrition Schools Network to increase awareness of the School Meals Initiative; and hold a School Leaders Conference to attract school administrators and school board members to learn about their roles in operating a high quality nutrition program.

West Virginia, \$155,803

The West Virginia Department of Education project aims at providing training to enable site managers and head cooks to implement changes in their schools' nutrition programs to reflect healthy meal standards. Five 10-hour regional workshops covering all 55 school districts will be conducted throughout the state. The proposal also aims at expanding the state's training infrastructure by identifying Health Meals Mentors and developing their abilities to transfer knowledge and skills to other cooks. Twenty class participants will be selected as mentors/trainers. The De-

partment will also maintain a network of local trainers to support the development and delivery of project training and monitoring activities.

1998 TEAM NUTRITION TRAINING GRANTS

On January 5, 1998, all State agencies that administer the National School Lunch Program and/or Nutrition Education and Training (NET) Program were invited to compete for a Team Nutrition Training Grant. Applications to apply for a grant are due to the Food and Nutrition Service April 1, 1998, and grant awards will be announced on July 10, 1998.

Question. For each of fiscal years 1997 and 1998, please provide detail on how the Nutrition Education Training funds are being spent, including the amount awarded to each state under the program, and a list of the projects/activities being funded by each respective state, including the cost of each project/activity.

Answer. In fiscal year 1997 each State Nutrition, Education and Training (NET) program was awarded \$66,951 out of the Team Nutrition appropriation since no funds were appropriated for NET in 1997. In fiscal year 1998 State NET programs received apportioned NET funding based on the State student enrollment. Funding levels for all 50 States and the U.S. territories is submitted for the record.

The Food and Nutrition Service (FNS) does not gather information on specific projects/activities funded by NET on a yearly basis. At the State level, the NET program is not a centralized bureaucratic program. A high proportion of the grant funds, and most of the programmatic activity is conducted by a variety of educational institutions, consultants, local authorities and professional associations. Less than 40 percent of NET funds are used for program administration and coordination. The remainder of NET funds is generally used for service delivery including mini-grants to local schools, program activities and program products. Program activities include teacher training, provision of classroom resource materials, evaluations and needs assessments. Program products include curriculums, print and other media materials, training materials, promotional materials, and education program materials.

[The information follows:]

<i>State</i>	<i>1998 funds</i>
Alabama	\$50,000
Alaska	50,000
American Samoa	50,000
Arizona	50,000

Virginia	60,527
Washington	53,539
West Virginia	50,000
Wisconsin	52,415
Wyoming	50,000

Note: \$50,000 is the minimum grant amount for States set in the authorizing statute.

COMMODITY SUPPLEMENTAL FOOD PROGRAM

Question. As we achieve full participation in the WIC program, there should be a corresponding decline in WIC-type participation in the Commodity Supplemental Food Program (CSFP). You indicated that the number of WIC participants in the program decreased in fiscal years 1995 and 1996. What was the decrease in CSFP WIC-type participation in fiscal year 1997 and what decreases are projected in each of fiscal years 1998 and 1999?

Answer. The decrease in participation in WIC-type participation in the Commodity Supplemental Food Program in fiscal year 1997 was approximately 8 percent. The Department is not projecting a decrease in participation for fiscal year 1998 or 1999. The Department is expecting a small increase of 6 percent in participation in fiscal year 1998 and, as in the WIC program, no increase in fiscal year 1999.

Question. What growth have we witnessed in elderly participation in the Commodity Supplemental Food Program in each of the past two fiscal years? What participation levels are projected for each of fiscal years 1998 and 1999? Please provide for each of these years (1996–1998) the number of elderly participating in the program who also were eligible for Food Stamp Program assistance.

Answer. In fiscal year 1996 there was an increase in participation in elderly participation in the Commodity Supplemental Food Program (CSFP) of approximately 10 percent. In fiscal year 1997 the increase was approximately 11 percent. The Department is projecting an increase of 11 percent in fiscal year 1998 and a decrease of 2 percent in fiscal year 1999. The income eligibility standard for the elderly for the Food Stamp Program is 100 percent of net income, which is considered to be less stringent than 130 percent of gross income. The standard for the CSFP is 130 percent of income as defined for local benefit programs. Therefore, most elderly persons participating in the CSFP are likely to be eligible for the Food Stamp Program. However, we do not have any data reflecting the percentage of CSFP participants who also participate in the Food Stamp Program. In 1995, 199 thousand elderly persons participated in the CSFP, in 1996 and 1997, 219 and 243 thousand, respectively, participated.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The agency's strategic goals are those goals that the agency plans to achieve incrementally by the year 2002. The annual performance goals are those goals and activities for fiscal year 1999 that the agency believes will lead to the achievement of the year 2002 goals. The plan also specifies the fiscal, capital and human resources required to achieve these goals and ongoing program obligations. As a result, the fiscal year 1999 budget request is linked directly to agency's goals for that fiscal year.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The Food and Nutrition Service (FNS) Annual Performance Plan (APP) identifies the strategic and annual performance goals and management initiatives the agency plans to achieve in fiscal year 1999. The fiscal, capital and human resources required to achieve these goals and initiatives are provided in the APP at the strategic goal level. Using a matrix format, FNS linked these resources directly to the major program activities in the Program and Financing Schedules. This cross-walk provides a clear picture of how the FNS budget and program activities relate to and support achievement of the strategic performance goals and initiatives.

In terms of difficulties encountered, the effort to resource load the specific annual performance goals is a difficult one. Insofar as the FNS budget structure is not presently aligned with the Strategic Plan/APP, the resource loading of annual performance goals will, of necessity, have to be done in an "off-line" manner.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The Food and Nutrition Service (FNS) Annual Performance Plan measures are indirectly linked to the budget. Currently, the fiscal year 1999 FNS budget is linked to the strategic plan goals and objectives. The annual plans goals and measures are derived directly from the strategic plan. Thus, while the performance plan linkage to the budget is not perfect, it does cover a major portion of program activity accounts.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The Food and Nutrition Service (FNS) Annual Performance Plan structure differs slightly from the account and activity structure in the budget justifications in that it reflects strategic and annual goals that may span more than one program account. However, the basic structure is similar. We are prepared to discuss these slight differences with Committee staff.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. At this time, the Food and Nutrition Service (FNS) is exploring ways of achieving an ever closer alignment between performance planning and the budget account structure. Insofar as fiscal year 1999 was the first year of performance planning, FNS has yet to gain full understanding of all of the implications of annual and strategic planning relative to the budget account structure and to the eventual achievement of our objectives and goals. We believe that the congruence between the two will occur as the agency gains more experience with strategic and annual planning.

Question. How were performance measures chosen?

Answer. The Food and Nutrition Service (FNS) developed or chose performance measures based on two criteria. First, the measures had to be direct, that is, to the extent possible, the agency chose measures that assessed program outcomes directly and, to the extent possible, avoided proxy measures. Second, the measures had to be feasible, i.e., data were already available or could be collected at a reasonable cost. Following the Government Performance and Results Act guidelines, FNS chose or developed measures that were both outcome-based and quantitative for all its strategic objectives.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The agency plans to use outside data sources for the verification of the Food and Nutrition Service (FNS) performance data. For example, these sources include state monitoring reports. Consequently, there will likely be no cost to the agency to obtain this data. The agency plans to use several approaches in obtaining the needed original performance data. First, FNS plans to use data already collected by other federal agencies, when appropriate. With this approach, FNS obtains the data it requires with minimal cost.

Second, the agency originally planned to use its existing research funds to collect data that cannot be obtained through other agencies. This approach would have allowed the agency to collect needed performance data using existing funds. However, the shifting of food assistance program study funding to the Economic Research Service (ERS) for fiscal year 1998 has caused us to adjust our plans. We are working with ERS to meet some of our annual performance plan needs, and look forward to restoration of funding to FNS in fiscal year 1999 (as requested in the fiscal year 1999 FNS budget) to continue information development for the Annual Performance Plan as had been envisioned.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. The Food and Nutrition Service (FNS) will have reasonably reliable data for most of the performance measures contained in the fiscal year 1999 Annual Performance Plan. The agency does, however, need to develop data sources for some measures, particularly for the Child and Adult Care Feeding Program and Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). The agency originally planned to develop some of these data sources through its research and evaluation activities. However, the shifting of food assistance program study funding to the Economic Research Service (ERS) for fiscal year 1998 has caused us to adjust our plans. We are working with ERS to meet some of our annual performance plan needs, and look forward to restoration of funding to FNS in fiscal year 1999 (as requested in the fiscal year 1999 FNS budget) to continue information development for the Annual Performance Plan as had been envisioned.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. In writing the agency's Annual Performance Plan, the Food and Nutrition Service (FNS) went through a careful, extensive, comprehensive process involving the entire agency, to develop appropriate performance goals. The agency believes that the goals in the final plan accurately reflect the priorities of the agency for fiscal year 1999 and that achievement of these goals will assist the FNS in accomplishing its strategic goals. Therefore, FNS believes that all of the goals in the plan are important and that individual goals cannot be singled out as more important than others.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The majority of the annual performance goals in the agency's fiscal year 1999 Annual Performance Plan are stated as outcomes. The Food and Nutrition Service (FNS) chose measures that will directly measure these goals and, as a result, the measures are also outcome-oriented. For the limited number of annual performance goals that are process- or output-oriented, the agency chose or developed appropriate output measures. For example, for its Food Distribution Program, FNS plans to conduct a customer satisfaction survey in fiscal year 2000. In fiscal year 1999, our goal is to develop and test the survey instrument and procedures (an output goal). The performance measure for this goal is an output measure.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, the Food and Nutrition Service (FNS) believes that program managers understand the difference between output and outcome goals. In writing the Annual Performance Plan, FNS involved all of the agency's program managers in developing the annual goals. Program managers were assisted in this process by staff with expertise and experience using different types of performance measurement, including output and outcome measures. As a result of this process, FNS believes that all managers involved, understand the difference between workload and effectiveness goals.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. The Food and Nutrition Service (FNS) plans to survey its external customers regarding their satisfaction with the agency's performance in a variety of areas including service provision, responsiveness to inquiries, timeliness of food deliveries, and program streamlining and simplification. Internally, FNS will query satisfaction with the budgeting process and availability of program and financial data.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The measurable strategic and annual performance goals provided in the fiscal year 1999 Annual Performance Plan represent some portion of the priorities the Food and Nutrition Service (FNS) plans to achieve in the various FNS program areas. The fiscal year 1999 budget information, fiscal, capital and human resources, reflected in the plan justification identifies the resources needed (1) to achieve both the annual performance goals and (2) to achieve all other program activities that are not applicable to any specific annual performance goal.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Because the individual resource loading of any particular annual performance goal would be accomplished apart from the budget account structure, the

Food and Nutrition Service would have to assess the impact (of any budget level change) to a particular annual performance goal off-line from the budget structure.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. The Food and Nutrition Service (FNS) plans to obtain performance data from several sources. First, the agency intends to use data already collected by other federal agencies, where appropriate. Obtaining this data will not be affected by FNS' technological capability. Second, FNS originally planned to use its existing research funds to obtain data that could only be obtained through large data collection efforts. Obtaining performance data using this method also would not have been affected by FNS' technological capability. Because these funds were eliminated for FNS and transferred to the Economic Research Service (ERS) for fiscal year 1998, FNS is working with ERS to address some of the FNS Annual Performance Plan information needs. The fiscal year 1999 FNS budget proposed restoring of these research funds. Third, FNS planned to use the agency's existing administrative data where appropriate. For most performance data, FNS' current technological capability is adequate to obtain this data.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Have you faced such difficulty?

Answer. Yes. The Food and Nutrition Service (FNS) does recognize this as a problem. It is true that the present budget structure does not directly align with the annual performance goals and results. In developing its Government Performance and Results Act plans, FNS aligned the budget with the strategic plan goals. FNS then derived the annual plan goals directly from the strategic goals. Although the annual goals were derived from the strategic goals, they are not the same. Since the results are based on annual performance goals, the linkage between the budget and the results is similar.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. The Food and Nutrition Service is currently exploring ways of how to achieve an ever clearer linkage between the budget account structure and performance results although they are similar. We believe that as the agency gains more experience in strategic and performance planning, ways will be found to improve the alignment between performance results and the budget account structure.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. As indicated in response to a previous question, the Food and Nutrition Service (FNS) is exploring ways to achieve an improved linkage between the budget account structure and performance results. Should our efforts to do so prove less than satisfactory, then FNS may wish to consider some changes to our overall strategic planning/annual planning/budget process, including possible modifications to the budget structure.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. At this time, the Food and Nutrition Service has no definitive plan in modifying the present budget structure and therefore is not in a position to predict how any modification would strengthen accountability in program performance.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Following instructions received on preparing Annual Performance Plans, the Food and Nutrition Service did not identify any external factors that could influence goal achievement. These factors are, however, included in the agency's strategic plan.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. While the agency has not included the influence of external factors in its annual performance plan, we have taken them into account elsewhere (i.e., the strategic plan) and have identified some steps to deal with them should they arise.

Question. What impact might external factors have on your resource estimates?

Answer. Changes in the economy, unemployment, number of persons in poverty, and changes in food cost are all external factors that significantly could change pro-

gram finance needs. However, the Food and Nutrition Service does not anticipate that external factors will have significant effects on our resource estimates.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. In developing the both the strategic plan and the Performance Plan, the Food and Nutrition Service (FNS) has identified areas where FNS' achievement of its goals is dependent upon the activities and cooperation of other programs. For example, one of FNS' annual goals is to increase the availability of nutrition and nutrition-related information for low-income households. The Food Stamp Program encourages States to provide nutrition messages and information to low-income households. FNS cooperates with the USDA Extension Service and others in the development, production and distribution of these nutrition education materials. This needed cooperation, as well as other areas where cooperation is needed, is identified in the Performance Plan.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The majority of our performance measures are sufficiently mature to assess the level of achievement in our fiscal year 1999 Annual Performance Plan. In the majority of cases we have identified baseline and target measures that will allow the agency to assess annual goal achievement as well as progress toward meeting its strategic goals and objectives.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The Food and Nutrition Service (FNS) believes that it has sufficient experience to make reasonable accurate resource estimates. It will be, however, constrained in making the estimates largely because of the unavailability of timely and reliable data on some of the measures identified for the strategic and annual performance plans. A significant portion of the latter will be due to the elimination of funding for the agency's research and evaluation activities for fiscal year 1998. FNS planned to use some of these resources to collect data directly related to the measurement of achievement of annual and strategic objectives.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The Food and Nutrition Service (FNS) believes that its strategic plan is a flexible, evolving document. As such, FNS is prepared to revise its plan in the future if the need arises. However, having just completed writing the fiscal year 1999 performance plan, and not yet implementing it, it is too early for FNS to tell what form any future revisions might take.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

FOOD STAMPS

PARTICIPATION LEVELS

Question. The budget request includes an increase of 572,000 Food Stamp participants. However, economic indicators suggest Food Stamp roles should continue to decline.

Please explain why Food Stamp participation should increase during a period of economic improvement?

Answer. The primary indicator of Food Stamp Program participation is unemployment level or the actual number of people who are unemployed at any time. The unemployment level varies with unemployment rate and with the number of people in the work force. During periods of stable unemployment rates, unemployment level will still rise as population rises. The Office of Management and Budget currently forecasts that the unemployment rate and the total number of unemployed persons will increase in fiscal year 1999—thereby increasing the number of eligibles and consequent participation in the Food Stamp Program.

PROPOSED PROGRAM EXPANSION LEGISLATION

Question. The Administration is proposing legislation to expand eligibility of Food Stamp benefits to certain populations. It is suggested the legislative proposal would cost an additional \$2.5 billion over five years. The savings required in other pro-

grams to achieve this expansion is identified as coming from certain administrative savings (estimated at \$1.2 to \$1.4 billion).

Are these savings not the very same savings now targeted for offsets as part of the conference discussion on the Agricultural Research Title legislation?

Answer. Yes. The President's proposal and the Agricultural Research Title legislation both seek to recapture a possible windfall to States as a result of switching from a primary to benefiting method of State administrative cost allocation between the Temporary Assistance to Needy Families, Food Stamp and Medicaid Programs.

Question. If the conferees to the Research Title use these savings for new research programs, does the Administration have plans for alternative savings for Food Stamps.

Answer. It is a priority of the Administration to restore eligibility to many of the legal immigrants made ineligible for food stamps due to welfare reform. The cost of the Administration's proposal is included in the President's balanced budget for fiscal year 1999. The budget funds these initiatives by continued cuts in government programs, by closing unwarranted tax loopholes, and from the passage of tobacco legislation. The Administration understands that as Congress reviews the submitted budget, a certain level of give and take will be necessary. We look forward to working with Congress on this subject.

Question. If the savings estimates are correct (not to exceed \$1.4 billion) what other offsets have been identified to achieve the full \$2.5 billion cost?

Answer. The Administration has submitted a balanced budget for fiscal year 1999—the first time in 30 years that such a budget has been proposed. Within tight constraints, the budget proposes major initiatives that will continue the President's investments in high priority areas—from helping working families with child care expenses to allowing Americans age 55 to 65 to buy Medicare. These initiatives include restoring eligibility to many of the legal immigrants made ineligible for food stamps by welfare reform. The budget funds these initiatives by continued cuts in government programs, by closing unwarranted tax loopholes, and from the passage of tobacco legislation.

PROGRAM RESERVE

Question. The budget proposes a \$1 billion reserve for the Food Stamp account. When was the last time a Food Stamp reserve was triggered and what was the cause?

Answer. Fiscal year 1992 was the last time any of the reserve funds were used. The President's fiscal year 1992 Budget Request estimated the average program participation would be 22.4 million persons per month. However, during the course of the fiscal year, participation in the program was greater than anticipated and averaged 25.4 million persons per month for the fiscal year. In fiscal year 1992 \$900 million of \$1.5 billion was actually needed and used in fiscal year 1992 to cover increased program participation. Thus, the President's 1993 Budget included a formal request for \$1.5 billion appropriated subject to such a specific request for fiscal year 1992.

Question. What projections for fiscal year 1999 suggest a reserve is needed now?

Answer. The reserve would be used to cover the costs of any unforeseen economic or other circumstances that cause an increase in required program payments. The reserve is important given the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA). Over one-third of all food stamp households received Aid to Families with Dependent Children (AFDC), which PRWORA replaced with Temporary Assistance for Needy Families (TANF), receive over one half of all food stamp benefits. As these households encounter time limits on their TANF eligibility, and with the effects of welfare reform still largely unknown, it becomes increasingly difficult to anticipate the future course of food stamp costs.

Question. If the purpose of the reserve is to meet changing conditions resulting from Welfare Reform, what "changes" have been identified since passage of that legislation?

Answer. A benefit reserve is important given the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 ("welfare reform"). Welfare reform has given States broad new authority under the TANF block grant. The choices States continue to make about the level and form of benefits provided can affect Food Stamp Program costs dramatically. Over one-third of all food stamp households receive AFDC—which welfare reform replaced with Temporary Assistance for Needy Families (TANF)—and they also receive over half of all food stamp benefits. In addition, as these households encounter time limits on their TANF eligibility, it becomes increasingly difficult to anticipate the effect on food stamp costs. To the extent that they replace lost welfare benefits with increased earnings, food stamp benefits may

fall. But to the extent that they remain sufficiently poor to retain food stamps while losing TANF, food stamp costs may increase.

SAVINGS FROM ENFORCEMENT

Question. For several years, the Food Stamp program has been moving toward EBT cards to protect program integrity and to promote program efficiency. Also, efforts such as "Operation Talon" have been reported as being successful in stopping Food Stamp fraud. It is also stated that during fiscal year 1997, 1200 suspect stores were investigated of which approximately 550 were found to have committed violations.

What program savings have been achieved due to these efforts?

Answer. Operation Talon is a law enforcement initiative in which information of law enforcement agencies is matched with food stamp caseload data to detect and apprehend individuals who are fleeing felons or parole/probation violators. The Food and Nutrition Service (FNS) has supported this initiative by encouraging State cooperation with the USDA Office of Inspector General (OIG) and local law enforcement agencies. Further, we are continuing to work with OIG and are providing program guidance to the State agencies regarding follow-up to the identification of fleeing felons as it affects program eligibility, claim establishment, fair hearings and appropriate disqualification action. While the results of Operation Talon collected by OIG show the initiative is successful, FNS does not have specific program data about savings resulting from Operation Talon.

State agencies are required by law to operate Electronic Benefit Transfer (EBT) systems in a cost-neutral manner. That is, in a way that the Federal cost of issuing benefits in the State using an EBT system does not exceed the Federal cost of delivering coupon benefits under the previous coupon issuance system. Based on measurements of cost neutrality among State agencies currently operating EBT systems, the Department expects that program costs will decrease with the implementation of EBT Nationwide.

There is no dollar cost to the Program when retailers commit violations. Food stamp benefits have already been issued to the recipients who then choose to violate the program by dealing with a retailer who will violate program regulations. However, retailers removed from the program as a result of an investigation are no longer able to provide an avenue to divert funds from the intended purpose of the program. Removing violating retailers from the program also impacts on other retailers who may be considering violating and improves program image.

Question. What savings are projected for the coming fiscal year?

Answer. The major thrust of Operation Talon is to use Food Stamp Program data to allow law enforcement agencies to identify, locate, and arrest fugitives from justice. The results of Operation Talon collected by OIG show this initiative is successful. State agencies are not required to report specific program data about savings resulting from Operation Talon. Therefore, while information available to the Department indicates that program savings do occur, FNS has not projected reductions in program for the coming fiscal year.

State agencies are required by law to operate EBT systems in a cost-neutral manner. That is, in a way that the Federal cost of issuing benefits in the State using an EBT system does not exceed the Federal cost of delivering coupon benefits under the previous coupon issuance system. Based on measurements of cost neutrality among State agencies currently operating EBT systems, the Department expects that program costs will decrease with the implementation of EBT nationwide. Food stamp printing, shipping and processing costs are projected to decrease by \$19 million in fiscal year 1999. Most of the decreases are attributed to EBT implementation.

Question. Have these efforts and their resulting efficiencies provided any reductions in program costs as reflected in appropriations requests? If not, why?

Answer. No, because the savings either can not be projected or do not occur. The exception is food stamp printing, shipping and processing costs which are projected to decrease by \$19 million in fiscal year 1999, as reflected in our appropriation request. Most of the decreases are attributed to EBT implementation.

Question. What information led to the 1200 stores being deemed "suspect" and does the high rate of violations among those stores indicate a much larger problem nation-wide?

Answer. In fiscal year 1997, the Food and Nutrition Service (FNS) conducted 4,627 investigations of retailers authorized to accept food stamp benefits, 2,084 of which were found to have committed program violations. Retailer investigations conducted by FNS are based on specific information that indicates potential fraud and are not selected as part of a random sample. Various statistical information, auto-

mated analyses, complaints from the public and leads developed by investigators from sources outside of the agency are used to target suspect retailers for investigation. Therefore, to take a high rate of violation among a group of specifically selected retailers and project it nationwide would be inappropriate. Retailers that redeem the majority of food stamp benefits have not proven to be a problem.

OTHER EFFECTS OF WELFARE REFORM

Question. In certain states and local jurisdictions, "cash-out" benefits have been provided in lieu of Food Stamp coupons or EBT cards. This effort has been largely underway as experiments in Welfare Reform as ways to make welfare recipients more responsible for their actions.

What effect have these changes had on USDA programs?

Answer. Cash-out projects have been very limited and, therefore, we have not seen a significant effect on the administration of USDA programs. We see EBT as the preferred means of providing food stamp assistance. However, wage supplementation programs, a form of cash-out in which the cash value of the food stamp allotment is provided to a private employer to subsidize the food stamp recipient's wages, may be more difficult to administer than other forms of cash-out. This distinct form of cash-out is not a matter of simply providing a household with cash instead of coupons, but rather an opportunity to move recipients into actual employment. In a wage supplementation program, the State agency must work with the employer to track the cash paid to the employer, and the amount of wages paid to the food stamp recipient in order to ensure that the wage subsidy is used properly.

Question. Have "cash-out" benefits had an effect on levels of nutrition or health generally within the population of traditional Food Stamp beneficiaries?

Answer. In the early 1990's the Food and Nutrition Service conducted scientifically rigorous evaluations of the effects of cashing out food stamps on the food expenditures and/or the nutrients available to households in four demonstration sites.

The findings of these studies suggest that cash-out reduces household food expenditures. The "slippage effect", the amount by which retail food spending will decrease when the same level of assistance is provided as cash rather than as food stamp coupons, is between 15 to 30 percent of every dollar of benefits. At the benefit levels in the President's 1999 Budget Request this is a \$3 to \$6 billion reduction in food expenditures with no reduction in program costs.

During the demonstrations there was some evidence that cash-out reduced the availability of some nutrients. For many nutrients the average nutrient availability remained above the Recommended Dietary Allowances for both cash and coupon recipients. The demonstrations were not designed to assess the long-term nutritional consequences of cash-out. The substantial reduction in food expenditures coupled with the evidence that cash-out reduced some nutrient availability during the demonstration suggest that cash-out may increase nutritional risk over time, at least for some households. Electronic Benefit Transfer offers a superior alternative, for it maintains the linkage to food while reducing stigma for participants.

CHILD NUTRITION PROGRAMS

NET

Question. Prior to Welfare Reform the Nutrition, Education and Training Program (NET) was included in mandatory spending at \$10 million annually. Since the conversion of these programs to discretionary spending, the funding levels have fallen.

What is the current status of the NET program?

Answer. Historically the Nutrition Education and Training Program (NET) has delivered quality and cost-effective nutrition education, training and technical assistance as a component of the Child Nutrition Programs. The NET infrastructure offers an effective and cost efficient vehicle for reaching the 94,000 schools across the Nation. State and local school food authorities use the established NET infrastructure to deliver nutrition education to students, educators, and parents as well as food service training in schools and child care centers. NET's infrastructure and quality standards also assist local schools in providing nutritious meals and improving the health and nutrition behavior of our Nation's children. Recently, State and local NET cooperators have been responsible for much of the local success of the Team Nutrition effort that Food and Nutrition Service launched to support its Schools Meals Initiative.

The NET infrastructure consists of:

1. Established program structures that allow for maximum State flexibility in meeting the diverse needs of their target audiences;
2. Five year NET Strategic Plan which established a National framework;

3. State action plans based on assessed local needs;
 4. Program monitoring and evaluation component;
 5. Local resource centers which efficiently disseminate instructional materials;
- and

6. Cadre of nutrition education and food service training professionals.

The reduction in NET funding levels over the past two years has hampered NET's efforts to fully support the infrastructure that it created and provide the level of quality services that had previously been offered. However, State NET Coordinators have continued their successful long-term working relationships with local school districts, parent-teacher organizations, public health agencies, county extension, local head start agencies, community colleges and the private sector. The extent of NET's local, State, and Federal support was demonstrated in 1997 by the more than 400 letters received by USDA from teachers, food service personnel, nurses, principals, and public health officials at the local, State, and Federal levels in support of continued funding for NET at the \$10 million level.

Question. What problems, if any, have resulted from the lower funding levels?

Answer. The reduced level of funding of \$3.75 million that occurred in fiscal year 1997 and fiscal year 1998 has had a negative impact on State agencies' ability to maintain the valuable infrastructure which delivers technical assistance, education and training services required to support the implementation of the School Meals Initiative. Some States have suffered loss of qualified and experienced trainers and resources that provided teacher training and support nutrition education instruction for children in local schools. Unless funding is restored to the \$10 million level this trend will continue with fewer State and local NET cooperators available to support School Meals Initiative and the local successes of the Team Nutrition effort.

Question. Is the Administration doing anything to try and restore NET as a mandatory item?

Answer. The Administration is confident that Nutrition, Education and Training (NET) can continue its excellent record of service as a discretionary program if it receives the requested level of funding. Therefore, the Administration is not seeking to restore NET as a mandatory item.

FOOD SAFETY TECHNICAL ASSISTANCE

Question. The budget request includes \$2 million to provide technical assistance to state and local school cooperators to promote and enhance safe food handling.

Are these activities being coordinated as part of the Administration's Food Safety Initiative?

Answer. Yes. The current request for funds will be used for training and technical assistance to the School Food Authorities to assist them in expanding and reinforcing the safe food handling practices of school food service production staff. The form this training takes will be coordinated with projects under development by the Food Safety Training and Education Alliance (FSTE), of which the Food and Nutrition Service is a member. FSTE is a group made up of members from Federal, State and local governments, from trade associations and from professional organizations. FSTE is currently identifying existing training and education materials, including multi-lingual materials, and combining them with the USDA/Food and Drug Administration Foodborne Illness Education Information Center.

Question. If not, what efforts are being taken to avoid any duplication of effort?

Answer. Duplication is being avoided because the Food and Nutrition Service (FNS) food safety technical assistance is being coordinated as part of the Administration's Food Safety Initiative. FNS previously developed and distributed *Serving It Safe*, a comprehensive training package covering food service sanitation and safety, to 23,000 School Food Authorities. This publication was based on the Food Code developed by the Food and Drug Administration. The current request for funds will be used for training and technical assistance to the School Food Authorities to assist them in expanding and reinforcing the safe food handling practices of school food service production staff.

WIC

WIC CARRYOVER

Question. Much of the debate of the WIC program in recent years has been the size of the carryover of funds from one fiscal year to the next. Better management of the program is important to reduce the size of the carryover as a means of achieving better program efficiency and making better use of limited Committee resources.

What is the expected WIC carryover for the current fiscal year?

Answer. It is estimated there will be \$100 million in recoverable funds and \$30 million in spend forward funds at the end of fiscal year 1998.

Question. What is the projected WIC carryover for the coming fiscal year?

Answer. It is estimated there will be \$100 million in recoverable funds and \$30 million in spend forward funds at the end of fiscal year 1999.

Question. What steps are being taken to better manage the size of the carryover?

Answer. The Food and Nutrition Service (FNS) has submitted a participation and expenditure monitoring plan to the Office of Management and Budget and to its Regional offices. The plan incorporates the continuation of monitoring/guidance which is a routine part of FNS' oversight activities including close review of monthly participant and expenditure data. Any State reflecting a significant increase or decrease in participation will have its situation reviewed and appropriate action will be taken, if necessary.

The agency has drafted proposed regulations revising both the food and nutrition services and administration funding formulas to better allocate WIC Program funds in a more stable funding environment. The revised food funding formulas should help ensure food funds are allocated to States that can utilize the funds to maintain current participation as well as to direct additional funds, if available, to States that are serving a lesser proportion of their WIC eligible population as compared to other States. The proposed rule is in the clearance process.

FNS is also proposing legislation to limit the spendforward authority for food funds. The elimination of food funds spendforward would make additional funds available for allocation to State agencies. In turn, this should reduce the amount of unspent funds.

Question. Since eight states and the District of Columbia provide their own funds to supplement federal WIC appropriations, do those states have large carryover amounts?

Answer. The information providing carryover amounts for WIC State agencies which received State funding in fiscal years 1996 and 1997 is provided for the record.

[The information follows:]

State agency	Fiscal year—			
	1996 State Ap- propriation	1996 carryover ¹	1997 State Ap- propriation	1997 carryover ¹
Alaska	\$26,000	\$660,383	\$26,600	\$363,510
Wash., DC	513,222	452,000	519,067
Indiana	190,000	2,687,946	3,955,339
Maryland	2,391,383	40,000	1,137,881
Massachusetts	16,200,000	1,354,529	13,783,217	2,742,793
Minnesota	2,950,000	2,950,000	303,337
Nebraska	24,985	35,177	16,760	2,205,642
New Mexico	1,431,600	68,493	1,379,600	963,795
New York	21,000,000	2,530,092	21,000,000	2,623,557
North Carolina	1,200,000	3,306,536	1,350,000	2,990,252
Pennsylvania	4,884,000	5,800,374	2,000,000	6,478,993
Texas	17,015,684	1,540,094	17,098,204
Washington	3,438,911	8,767,714	2,161,089	6,117,054

¹ Includes unspent recoverable and spendforward funds.

Question. If more states provided funds of their own, would that reduce the fear of states running out of federal funds and, thereby, reduce the annual program carryover?

Answer. Generally, States provided with significant amounts of State appropriated funds for the WIC Program, such as New York and Massachusetts, had little or no Federal funds available for recovery. They do, however, spend forward Federal funds. For other States there appears to be no correlation between the provision of State funds and the level of Federal carryover.

WIC RESERVE

Question. Similar to the Food Stamp request, the budget proposes a reserve for WIC. However, the WIC program continues to hold carryover funds from one fiscal year to the next. It is understood that the nature of the WIC program requires there will always be a "structural" carryover between \$75 and \$100 million.

Why would an additional reserve be necessary when carryover continue to exceed \$75 to \$100 million?

Answer. The Department has requested the contingency reserve to cover any unanticipated food expenditures some State agencies may experience which would jeopardize their ability to maintain their caseload levels. As the Department expects food cost inflation to generally remain modest, it is believed that a \$20 million reserve is sufficient to resolve any special situations that might occur in fiscal year 1998.

The \$75 to \$100 million carryover amounts are unspent funds that are identified at closeout and recovered and reallocated through the funding formula the year after appropriated. These funds are part of the overall budget process and are used to support participation estimates. The contingency fund, however, would be additional funds made available to support current WIC caseload when appropriated food funds are insufficient to support participants already receiving WIC benefits due to unexpected events such as sudden increases in food costs or natural disasters.

WIC IMMUNIZATION

Question. Promoting childhood immunization is a purpose of the WIC program. A provision of the Labor-HHS appropriations act requires that 15 percent of CDC grants to states (approximately \$21 million) for immunization activities should be directed through the WIC program. The budget justification materials indicate that only \$950,000 was transferred to the WIC program in fiscal year 1997 and no funds are to be transferred in fiscal year 1998 or fiscal year 1999.

What is the status of WIC immunization activities?

Answer. The Food and Nutrition Service (FNS), the Centers for Disease Control and Prevention (CDC), the Department of Health and Human Services (DHHS), the National Association of WIC Directors (NAWD), the Association of State and Territorial Health Officials (ASTHO) and the American Academy of Pediatrics (AAP) have an ongoing cooperative effort to increase immunization rates among preschool-aged participants in the WIC Program. Through a strong partnership, these co-operators, are working to improve the quality of services and the health status of children under 2 years of age who are in need of nutrition assistance and/or immunizations.

As a result of this National initiative, numerous special immunization promotion activities are taking place.

- The WIC Program has regulatory responsibility to coordinate with immunization services and the degree of coordination is dictated by the priorities of State and local WIC agencies. Many WIC local agencies are located on site with health care services where immunizations are available. Other local agencies refer participants to health care services in the community.
- FNS, CDC, NAWD, ASTHO and AAP are developing a National Strategic Plan as a general guideline for States to consider to facilitate an increase in immunization coverage rates among WIC participants. Many of the ideas advanced in the plan were adapted from State initiatives that employ creative service delivery and cost sharing approaches.
- CDC, in conjunction with WIC State agencies, conducted demonstration projects and evaluations in several cities to determine the most effective methods of increasing access to immunization through the WIC Program. Data from these projects show that intensified collaboration and resource sharing between State/local WIC and immunization programs improve the service delivery capacity and quality of both programs.
- FNS is an active member of the Interagency Committee on Immunizations which is implementing an action plan to improve immunization services for preschool-age children and target resources to high-risk and hard-to-reach populations. FNS is also an active participant of the Immunization Education and Action Committee of the Healthy Mothers, Healthy Babies Coalition and the National Vaccine Advisory Committee.
- Through WIC and other food assistance programs, FNS cooperates with CDC and many other national organizations to actively promote the annual National Infant Immunization Week.
- NAWD, ASTHO, CDC, and FNS co-hosted a WIC immunization promotion conference, entitled "Working Together for Healthier Children," on February 12 and 13, 1997. The conference fostered positive communication at the State level between Immunization Programs and the WIC Program by: increasing understanding of each programs' goals and objectives; and highlighting win-win situations in State and local WIC and immunization partnerships. The conference

also focused on State WIC Directors' and Immunization Program Managers' concerns.

- FNS, CDC, NAWD, and ASTHO have formed the WIC/Immunization Research and Evaluation Subcommittee. The purpose of the this group is to coordinate research and evaluation activities directly related to immunization promotion efforts in WIC. The Subcommittee facilitates and reports on strategies that improve vaccination coverage rates among WIC participants.
- The Administration's Childhood Immunization Initiative has provided funds to States to strengthen their immunization infrastructure. These funds make vaccination services more widely available by helping public programs buy more vaccines and improve community service and outreach efforts. Many WIC State agencies use the funds to extend clinic hours, hire more staff, increase education efforts, and help create a national tracking system.
- During 1995, the Senate Committee on Appropriations, submitted the following in a report to accompany the 1996 DHHS Appropriation Bill: 1) The Committee directs CDC to ensure that all grantees receiving Immunization Action Plan (IAP) funds reserve 10 percent of those funds for the purpose of funding immunization assessment and referral services in WIC sites; 2) Immunization grantees must use the funds for WIC linkage unless the grantee can document that assessment and referral are taking place in WIC sites without the need for specific funds.
- FNS has been active and supportive of strengthening State Immunization Information Systems as a major initiative to improve immunization status assessment and referrals among WIC children. To further promote this linkage, in fiscal year 1996 FNS awarded grants totaling \$946,793 for State WIC/Immunization System Linkage Grants to nine WIC State agencies to design, develop, and implement information system linkages between State Immunization Information Systems and WIC data systems at the State and local levels. Made possible through funding from the Centers for Disease Control and Prevention's National Immunization Program, the purpose of this partnership is to enhance automation capabilities in WIC clinics to facilitate accurate and efficient assessment of the immunization needs of WIC infants and children.
- During 1997, the 31st National Immunization Conference, held in Detroit, Michigan, the WIC Program was a prominent point of discussion. Representatives from FNS and State and local WIC staff presented workshops and poster sessions. The conference provided WIC with an opportunity to show the more than 2,000 attendees from both private and public sectors WIC's commitment to improving the quality of services, preventing the occurrence of health problems, and improving the health status of WIC participants under 2 years of age. It also provided an opportunity to further showcase WIC as the most important program to coordinate with to raise immunization coverage rates.
- FNS has developed a new publication, entitled "After You Deliver—Health Tips for Moms," which has just come off press in March, 1998. It contains a section "Immunize Against Disease" which emphasizes that shots are needed from birth through adulthood; why they are needed; and where they may be obtained. This publication is being distributed to all WIC State and local agencies for use in educating participants about the importance of age-appropriate immunizations.

Question. What level of funds are being transferred to WIC state agencies that are not reflected in the USDA budget justification materials?

Answer. In fiscal year 1996, approximately \$1 million in funding was provided from the Center for Disease Control (CDC) to nine WIC State agencies to design, develop and implement information system linkages between State immunization information systems and WIC data systems at State and local levels. No additional funds were designated to be transferred from CDC in fiscal years 1997, 1998, and 1999.

Although CDC was not able to provide these specific resources in these years, it is important to note that WIC nutrition services and administrative funds may be expended on a wide range of immunization activities for WIC participants. Such expenditures are allowable WIC expenditure because they enhance WIC's role as an adjunct to health care, and immunization is certainly one such example of the kind of health service to which WIC refers on a routine basis. Such efforts range from comprehensive immunization screening and referral procedures and media campaigns to sending immunization reminders to clients to reimbursable activities an example of this is the actual administration of shots to WIC children, for which WIC receives compensation from immunization resources. The WIC regulations do not set standards on the level of effort that must be expended by WIC agencies. Instead, the type and intensity of immunization activities being carried out is at the discre-

tion of individual WIC State agencies and other offices within State Health Departments based on their priorities and resources.

Question. Would it be advisable to transfer funds directly from CDC to USDA rather than to the states? If so, why?

Answer. In fiscal year 1996, approximately \$1 million in funding from the Center for Disease Control (CDC) was provided to nine WIC State agencies to design, develop and implement information system linkages between State immunization information systems and WIC data systems at State and local levels. No additional funds were designated to be transferred from CDC in fiscal years 1997, 1998, or 1999.

CDC considers the WIC Program one of its most important allies in raising and maintaining immunizations coverage rates among children at risk of vaccine-preventable disease. As such, a well coordinated ongoing cooperative effort has been developed between CDC and WIC at the Federal, State and local level. Since CDC has the primary responsibility for and is the leading expert on immunizations, and has an established working relationship with the Food and Nutrition Service, it would be desirable to maintain any available funding pertaining to immunizations under the direct management of CDC.

WIC PROGRAM MANAGEMENT

Question. As we approach full funding for WIC, it becomes more difficult to provide fine-tuned management for the program. Among the larger challenges for the program is bringing states with low participation rates (the so-called low "Fair Share" states) up to the same level with states (so-called "Stability Grant states") that maintain high, if not full, participation rates.

What is USDA doing to help Fair Share states increase their participation rates?

Answer. The proposed regulation revising the funding formulas will contain a provision that will direct additional funds, if available, to States that are serving a lesser proportion of their WIC eligible population as compared to other States—under fair share States. Over time, under fair share States will receive additional funding so that they have the opportunity to add participants to bring them closer to the level of service provided by State agencies that have received allocations above their fair share—the stability grant States.

Question. What are the budget implications of these activities?

Answer. There are no budget implications associated with the provision in the proposed funding formula regulation that would allocate additional funds, if available, to the under fair share States. The President's Budget Request for the WIC Program for fiscal year 1999 continues to support a full participation level of 7.5 million. The revised funding formula has no impact on the requested budget amount or the estimated number of participants to be served by the WIC Program.

Question. If more funds are directed to Fair Share states as a percentage of total funding, what steps will USDA take to protect the levels of Stability Grant states?

Answer. The proposed funding formula will continue to retain the stability component as part of the food funding formula. Stability will be defined as the prior year grant, and adjustments for inflation will occur if funds are available. In a stable funding environment, the vast majority of available funds will be allocated as stability funding, which will allow for consistent participation levels from year to year for most State agencies.

WIC FARMERS MARKET

Question. The budget request proposes an increase and to move the WIC Farmers Market program to the Commodity Assistance Program account.

Will the increase allow program expansion to new states or will it be used to increase activities in states already part of the program?

Answer. In accordance with the authorizing law, we must first provide all current State agencies with a base grant amount that is equal to their previous year's funding level. After base amounts are satisfied, the law provides for any remaining funds to be divided in a ratio of 75 percent for current States for expansion and 25 percent for new States that would like to begin a program. This split guarantees that a quarter of any funds available for program expansion will always be reserved for new State agencies.

COMMODITY ASSISTANCE PROGRAMS

TEMPORARY EMERGENCY FOOD ASSISTANCE PROGRAM (TEFAP) DONATIONS/FOOD
CLEANING

Question. USDA continues to provide funding for food and administrative costs of food donations. At the same time, the Department is actively supporting food gleaning activities. In fiscal year 1997, TEFAP food purchase activities totals \$130.2 million for 268 million pounds of food. That same year, the donated food only accounted for \$29.5 million for 49.7 million pounds.

Is USDA's Gleaning Initiative expected to increase the amount of bonus commodities available through TEFAP?

Answer. No. Given that the USDA Food Recovery and Gleaning Initiative focuses on the free donation of excess food, it will not have any direct impact on the purchase of food through the bonus commodities program. However, it is important to note that much of the food provided to food banks, food pantries, food rescue groups, and other emergency feeding organizations through the Food Recovery and Gleaning Initiative will often be very similar to the types of food provided through bonus commodity purchases.

Question. What factors determine state allocations for TEFAP?

Answer. Section 214(a) of the Emergency Food Assistance Act of 1983 (EFAA) mandates the allocation of TEFAP commodities to States through a formula based 60 percent on the number of persons in the State with incomes below the poverty line, relative to national figures, and 40 percent on the average monthly number of unemployed persons in the State, again relative to national figures. Section 204(a)(1) of the EFAA in turn mandates that TEFAP administrative funds be allocated among the States on the same basis.

Question. What are the projections for food donations in fiscal year 1998?

Answer. While we cannot provide an accurate projection of foods to be donated to the Emergency Food Assistance Program (TEFAP) given that bonus purchases depend on rapidly changing market conditions, thus far in fiscal year 1998, the Department has donated to TEFAP \$16.6 million in bonus canned salmon, frozen turkey, dry beans, dried fruit, and instant nonfat dry milk. In addition, purchases for food donations to TEFAP estimated at \$5 million are currently in progress for fresh and frozen fruits and additional dry beans. Further, the Department has authorized up to \$30 million to procure pork products to be donated primarily through TEFAP. Additional substantial purchases for food donations are currently under consideration.

Question. To what extent will the Gleaning Initiative play a part of TEFAP donations in fiscal year 1998?

Answer. The Food Recovery and Gleaning Initiative donations will have no direct impact upon the distribution of TEFAP commodities because they will be distinctly different programs with different focuses. The Food Recovery and Gleaning Initiative will focus on aiding community-based efforts to distribute food that is donated from the private sector for free directly to emergency feeding organizations, while the TEFAP program will continue to focus on purchasing commodities that are distributed through state agencies. However, it is important to note that many of the emergency feeding agencies that will be the ultimate recipients of food distributed through the Food Recovery and Gleaning Initiative will be the same emergency feeding organizations that ultimately receive TEFAP commodities.

Question. If the Gleaning Initiative is to become part of TEFAP, will there need to be an increase in the funds appropriated for TEFAP administrative costs?

Answer. We do not intend to make the Food Recovery and Gleaning Initiative a formal part of TEFAP, but rather to treat it an independent effort. We intend to ensure that the grants, cooperative agreements, technical assistance, and other assistance provided through the \$20 million requested are utilized, in part, to cover some costs that are often handled by TEFAP Administrative funds, such as transportation, processing, packaging, sort, heating and refrigeration, and distribution of gleaned and recovered food. Thus, state TEFAP should not need additional funds—other than any funds they might receive from the \$20 million—to benefit from this Initiative.

Question. Is it anticipated that the Gleaning Initiative will ever supplant or reduce the level of funding needed for USDA food assistance programs?

Answer. No. The Food Recovery and Gleaning Initiative is intended as a cost-effective supplement to, not a replacement for, existing Federal nutrition assistance programs. While USDA firmly believes that the bedrock Federal nutrition assistance programs, such as Food Stamps, WIC, and the National School Lunch and Breakfast programs, will continue to be the first line of defense for Americans facing hunger.

There is so much potential for gleaned and recovered food to provide nutritious additions to the diets of millions of low-income Americans. We see a terrific opportunity that we should capitalize on. We expect this relatively small investment to make a big difference in food recoveries and improve nutritional intakes of the needy far beyond its modest cost. Recovered food, like TEFAP food, helps needy families through temporary hard times, supplementing Food Stamps for some, and providing necessary sustenance on an occasional basis for others.

FOOD PROGRAM ADMINISTRATION

STUDIES AND EVALUATIONS

Question. The fiscal year 1998 Appropriations Act transferred the studies and evaluations activities of the Food and Nutrition Service to the Economic Research Service (ERS). The request for fiscal year 1999 would return them as prior to fiscal year 1998.

What has been the effect of not having these programs housed with the Food and Nutrition Service?

Answer. It is too soon to tell. Food and Nutrition Service (FNS) provided Economic Research Service (ERS) with a detailed description of FNS' information needs. They are now in the final stages of preparing a plan of action. Indications are that they will initiate research on many, but not all, of our priority information needs. It is also likely that ERS will pursue some lines of inquiry that are of lesser importance and relevance to the FNS.

It is also too soon to tell whether the implementation of the research will remain practical and relevant to FNS program operations and policy development. When study funding and authority were located with FNS we were able to make mid-course adjustments quickly so that studies were able to reflect current FNS priorities while the effect on study budgets was minor. While the need to coordinate across agencies is a challenge, we expect to work closely with ERS to achieve the best results possible.

Question. How many studies or evaluations have been conducted by ERS?

Answer. Economic Research Service (ERS) has not had time to complete any studies or evaluations funded in fiscal year 1998. On January 29, 1998 the General Accounting Office (GAO) released a report listing food assistance-related research projects conducted by the Food and Nutrition Service (FNS) and ERS during the past 3 fiscal years ("Food Assistance: Information on USDA's Research Activities," GAO/RCED-98-56R). After meeting with FNS and ERS officials to discuss their research activities during this period, the GAO identified 23 nutrition and food assistance projects conducted by ERS during the past 3 fiscal years.

Question. How many studies or evaluations did the Food and Nutrition Service conduct in fiscal year 1997?

Answer. The Food and Nutrition Service (FNS) started 9 studies during fiscal year 1997. On October 1, 1997 FNS had a total of 57 ongoing and new research projects underway.

Question. Please explain your reasons for returning these programs to the Food and Nutrition Service.

Answer. The best place to house research responsibilities for food assistance programs is with the agency, the Food and Nutrition Service (FNS), that administers the programs. It is the proximity of research, program, and policy staff that ensures a research program that is practical and relevant to program operations and policy development. Housing the research function within FNS achieves the critical balance between independence and effective communication with the programs served, taking advantage of FNS' ongoing, operational relationship with State and local administrative agencies and other related Federal agencies.

In addition, the range of issues surrounding FNS programs is very broad. They demand techniques that go beyond typical economic analyses if we are to reliably address the concerns of Congress and States. We are often required to initiate new nationally representative data collection efforts as well as complex demonstration activities (such as those that established the viability of Electronic Benefit Transfer). While the Economic Research Service (ERS) is a capable research organization, the expertise to administer such activities has been developed over the years in FNS.

FNS has managed one of the strongest applied policy research programs in all of government with a proven track record of conducting research relevant to program needs. The time it would take to replicate this in ERS seems a poor use of government resources. Moreover, efforts to coordinate between ERS and FNS and its program cooperators seems to introduce an unnecessary complexity into USDA operational procedures.

FUNDING LEVELS

Question. The budget request includes an increase in Food Program Administration funding over the fiscal year 1998 amount. In fiscal year 1998, an increase was provided above fiscal year 1997 after having been kept level for several years.

What additional activities in Food Program Administration did the increase in fiscal year 1998 provide?

Answer. The fiscal year 1998 appropriation provided an additional \$1,591,000 for the Food Program Administration account above fiscal year 1997 levels. This increase was designated for funding 50 percent of the combined anticipated fiscal year 1998 pay raise and the annualization of the fiscal year 1997 pay raise.

Even with the \$1.6 million increase, the agency was forced to further reduce staff by 27 staff years to cover the remaining 50 percent of the pay raise. The Food and Nutrition Service (FNS) cannot sustain additional cutbacks in staff without serious impediment to its mission. For example, activities that ensure program integrity, such as payment accuracy, store investigations, and on-site reviews, are labor-intensive, require a great deal of staff attention and travel funding, and are critical to our agency's mission in both the Food Stamp and Special Nutrition Programs. Keeping error rates low, which saves the government millions of dollars, can only be accomplished with staff attention. Changing program needs and new legislation have imposed significant, new, and ongoing administrative responsibilities at the same time that the agency has been called to improve the nutrition of program recipients, strengthen program integrity, and implement EBT nationwide. The agency also requires staff to take advantage of the new data analysis tools, EBT and new authorities in Welfare Reform that have provided a tremendous opportunity to increase program integrity among food stamp retailers.

The budget request is necessary to maintain staffing levels. It is imperative that FNS preserve a steady work force to ensure adequate oversight for fiscal and program integrity, reduce fraud and abuse, keep pace with changing legislation and program needs, progress towards improving the nutrition of program recipients, and still accomplish its mission.

Question. What other activities would you perform if the fiscal year 1999 request was provided?

Answer. The request budget increase of \$4,150,000 will provide support for the Food and Nutrition Service (FNS) food assistance programs.

After providing for mandatory personnel costs, such as the pay raise, the requested increase will allow the agency to implement several important initiatives. FNS will implement an agency-wide Civil Rights Program Complaint Prevention Program, manage the agency's diversity effort, and fund reasonable accommodations for disabled individuals. FNS will also be able to support the publication of the Dietary Guidelines for Americans. With a very modest request of \$1.45 million for the Program and Financial Integrity Advancement Initiative, the agency can work towards improving integrity in both the program and financial areas. These areas are essential to preserving billions of taxpayer dollars and have been under increased scrutiny from both the General Accounting Office and the Office of Inspector General. The focus on program integrity would concentrate on meal claiming and participant eligibility in both the Child and Adult Care Food Program and the National School Lunch Program; improved integrity of the Food Stamp Quality Control System; and vendor management and strengthening eligibility determination procedures within the Women, Infants and Children Program. Funding for financial integrity will allow the agency to enhance information and financial systems, as well as program oversight of State agencies. FNS would perform reviews of State agencies to prevent improper Federal charging and claims for reimbursement; examine expenditure validation; oversee special program activities; ensure consistent and efficient implementation of program policy; and train State agency personnel.

SUBCOMMITTEE RECESS

Senator COCHRAN. This concludes today's hearing, and I appreciate very much the cooperation of all witnesses.

The next hearing we will have will be on Tuesday, March 17, at 10:30 a.m. in this room, 138 of the Dirksen Senate Office Building.

We will hear from the Department witnesses on the budget request for the food safety, marketing, and regulatory programs of the Department of Agriculture.

Until then, we stand in recess.

[Whereupon, at 11:16 a.m., Tuesday, March 10, the subcommittee was recessed, to reconvene at 11:22 a.m., Tuesday, March 17.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

TUESDAY, MARCH 17, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 11:22 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran and Bumpers.

DEPARTMENT OF AGRICULTURE

STATEMENTS OF:

**CATHERINE WOTEKI, PH.D., R.D., UNDER SECRETARY, FOOD
SAFETY**

**MICHAEL DUNN, ASSISTANT SECRETARY OF AGRICULTURE, MAR-
KETING AND REGULATORY PROGRAMS**

ACCOMPANIED BY DENNIS KAPLAN, BUDGET OFFICER

FOOD SAFETY AND INSPECTION SERVICE

STATEMENT OF THOMAS J. BILLY, ADMINISTRATOR

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

STATEMENT OF TERRY L. MEDLEY, ADMINISTRATOR

AGRICULTURAL MARKETING SERVICE

STATEMENT OF ENRIQUE FIGUEROA, ADMINISTRATOR

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

STATEMENT OF JAMES R. BAKER, ADMINISTRATOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

I apologize to all of our witnesses and those who are here for the subcommittee hearing about our conflict this morning with the markup of the supplemental appropriations bill which we have undertaken to address.

We have statements from all of our witnesses, and I am very pleased with your attendance at our hearing and the furnishing of the statements for our review.

Our hearing focuses specifically this morning on the request submitted by the President for funding of programs and activities of

the Department of Agriculture's Food Safety and Inspection Service and Marketing and Regulatory Programs. We are pleased that Under Secretary for the Food Safety and Inspection Service, Catherine Woteki, and the Assistant Secretary for Marketing and Regulatory Programs, Michael Dunn, are here to lead our discussion of this budget request. There are others who accompany them. We appreciate the attendance of all witnesses.

Because we have the statements, we will print them in the record. I have questions which I will submit for your attention and review and timely response. We will print that all in the record, but because of the shortage of time and the encroachment on our schedule of the full committee's activities, we will not undertake a full discussion of all of these issues. I hope you agree that this is appropriate. There are other things on the schedule later this morning that require witnesses' attention and also Senators'.

Senator Bumpers, the ranking minority member of the subcommittee, sends his regrets. He is still at the full committee markup. I escaped so I could come here and give this subject our attention for the time that we do have available.

USER FEE PROPOSAL

So, I am going to stop talking except to make one observation about the budget submission, and that is my very serious disappointment with the continued insistence by the administration to submit a budget request for activities under the jurisdiction of these witnesses and assume that Congress is going to enact massive new user fees to fund the budget request.

Just to give you an example of the seriousness of this situation as it affects the budget of the Food Safety and Inspection Service, the budget request is for \$150 million. That is \$440 million below the current fiscal year appropriated level. When you look at the other sections of the bill, for example, the Agriculture Marketing Service, or Grain Inspection, Packers and Stockyards Administration, we have a \$31 million shortfall in the budget for those activities because of the proposal from the administration assuming that user fees will be enacted to recover those needed funds, to operate the programs, to do the things that are required by law under the statutes by these agencies.

So, if you add all that together, what you have got here is a budget request that is over \$600 million short of the necessary level to do the work required by these agencies.

We start out in our appropriations process without the authorizing legislation even being proposed by the administration, and we know it is not going to be enacted. It has been proposed in the past and has not been enacted, but it is proposed again with a straight face that this is a legitimate budget process. Of course, it is a disgrace to put the committee in that kind of position at the outset.

What if the committee just said, OK, we will appropriate the request submitted by the President for these activities and we presume the administration will present legislation to correct the shortfall and lobby the Congress effectively between now and the beginning of the fiscal year to enact the legislation, impose the user fees on whomever and at whatever cost to pay these fees and ex-

penses for these activities? That is one option. This is the most irresponsible option and we will not do that.

So, we will take from other programs either in the administration's budget request and provide funds from those other programs or come up with funds from programs that other members of the committee might suggest that we cut to provide the funds needed here.

These are important areas. Food safety is something that is important to every American citizen, not just those who are in the business of processing meat and poultry, marketing those products or growing those products. It is important to everybody, and we are not going to put in jeopardy the lives and the safety of American citizens by being irresponsible with the way we deal with this challenge.

But having said that, I am going to stop and let the witnesses make whatever comments they would like to make about the subject at issue and make whatever comments you think would be helpful to the committee as we approach this interesting challenge.

PREPARED STATEMENTS

We have prepared statements from Senators Bumpers and Burns which will be made part of the hearing record. Shall we start with Ms. Woteki?

[The statements follow:]

PREPARED STATEMENT OF SENATOR BUMPERS

I would like to thank Secretary Woteki and Secretary Dunn for appearing before our subcommittee. I also want to extend a welcome to the other USDA officials here today representing the various agency missions under the larger umbrella of food safety, marketing, and regulatory functions. I would also be remiss if I did not give special recognition to fellow Arkansan, Jim Baker, who is with us today as head of the Grain Inspection, Packers and Stockyards Administration (GIPSA). Welcome to you all.

Last week we heard from the USDA agencies charged with protecting our people from the tragedy of hunger. Their budget request, by the represents the single largest segment of this subcommittee's annual appropriations bill. However, unless the food they make available by their efforts is safe, their entire mission fails as do those of us all. Ensuring a safe food supply for the American people is one of the most important responsibilities of the federal government and of this subcommittee.

Our commitment to food safety has come a long way since that day, almost a century ago, when President Teddy Roosevelt read Sinclair Lewis' description of food processing and reportedly threw his breakfast out a White House window. Along with our commitment has come technology and through the combination of these two driving forces we are able to maintain strong consumer confidence and the ability to lay claim to the fact that the United States has the safest food supply in the world.

In fact, we are now engaged in a new technological breakthrough in the realm of food safety. For years, the primary tools of FSIS inspectors were their very senses, literally. The system of food safety inspection on which we have relied for decades, the organoleptic system, is based on the simple perceptions of sight, smell and touch. While tests based on these senses can reveal much, there is certainly much that remains hidden. To replace this antiquated system we now have in place the Hazard Analysis at Critical Control Points (HACCP) system which, finally, brings the arbiter of science to the task.

The HACCP system was implemented two months ago for the 300 largest meat and poultry operations in the nation. Over the next two years, the small and very small operations are to be brought into HACCP as well. Once complete, the entire U.S. meat and poultry supply will reach consumers only after being submitted through a process based on scientific method and which should achieve the highest levels of safety reasonably attainable.

That is not to say that this new system will not be wrought with a series of growing pains as the old system is replaced by the new. I and, I am sure, many of my colleagues have already heard of problems with the new system and the costs associated with them. I am told that if these problems in program administration are not worked out before HACCP is mandated for the smaller companies, there are many small firms that won't survive the business disruptions that will befall them. I fully expect Secretary Woteki, Mr. Billy, and others associated with implementing HACCP to see the process is handled properly and fairly.

In my view, the key to the new system is sound science. The capability of HACCP in protecting our food supply is only as good as the science used in its process. As highly as I expect USDA to ensure fairness in administering HACCP, I am adamant about the use of the best science available in the program's implementation. Not long ago, a food safety issue was raised in my state and I quickly learned that various federal and state agencies all had different views on what had been and would be considered safe levels for human consumption. That is unacceptable. By finally bringing all parties to the table we were able to achieve a consensus, but science should be the final arbiter when it comes to food safety and we must settle for only the best.

Currently, the Senate is considering regulatory reform legislation. I intend to closely examine that bill as it comes to the Senate floor and I may offer an amendment better to ensure that regulatory actions related to science are tied to sound science. For example, if we were to ask the regulated community and the regulators to comment on the science now employed in the HACCP system, we might very well get two different views. If that is the case, it may be appropriate to assign certain decisions to a more objective analysis. A story in the Washington Post last week noted that a recent EPA brochure on "Pesticides on Food: Consumer Information" was considered "alarmist" by the grocery industry and "milquetoast" by environmental and consumer groups. There may be times when taking action that pleases no one may be evidence you have done your best. When it comes to science, we must always ask why not the best?

In previous hearings, this subcommittee has made pretty clear it's collective views on the various user fee assumptions in the fiscal year 1999 budget. By far, the largest single user fee proposal is that of FSIS to cover the costs of all inspection activities, a proposal that goes beyond any similar proposal previously submitted. It has been suggested that opposition to FSIS users fees is some indication of caving to the interests of the meat and poultry companies. I wish to set the record straight.

Regardless of the economic importance of the meat and poultry industries to a state like mine, which is substantial, there are issues tied to the user fee proposals that go far beyond the imposition of higher production costs for the hundreds of companies around the country. The programs of FSIS maintain the basic protections of food safety for all Americans. Although the President's budget this year seems lush with various user fee proposals, I don't see anyone rushing forward to propose user fees for basic police or fire protection. There are certain functions of government that should be borne by the public they serve. Food safety is and must remain at the top of that list. That is a matter of policy that must always transcend economics.

But if we want to talk about the economics of the user fee proposal, let's at least be honest about it. With all due respect to USDA, I find the analogy of the user fees to an almost unmeasurable price increase at the consumer level disingenuous. The meat and poultry industries are highly competitive, especially at the consumer level. To pretend that the companies are going to pass on the cost of user fees to consumers is ludicrous. The meat case in your local grocery store is the last place you are going to pay for FSIS user fees. Therefore, let's stop pretending that the "public" is still going to pay for the costs of inspection.

It is equally unrealistic to assume that the companies themselves are going to absorb these costs as long as they have someone else on which to pass them. Enter the producer. Of all federal agencies, USDA should be familiar with the long-held view that the agricultural producer is the one member of our economy who always buys his inputs at retail and sells his products at wholesale. Due to the nature and structure of the farm economy, anyone who is honest will quickly acknowledge that this user fee proposal will not be borne by the consumer or the companies. It will be borne, as always, by the sector of the economy least capable of absorbing it, the farmer. In fact, I have been told that some poultry grower contracts contain provisions that will adjust downward the price paid to the grower in the event these fees are enacted. I am not willing to tell the beef producer or contract poultry grower in my state to brace themselves for another economic hit in the name of "public policy".

As our marketplaces become more and more "global", we must be ever vigilant about the health and safety of the products that cross our borders. In my own state and across much of the South, the Imported Fire Ant is showing us how damaging newly introduced species to this country can become. In fact, the Fire Ant came to this country many years before the age of supersonic jets that can now carry bacteria, disease, and pests across the planet in a matter of hours.

The Fire Ant is only one example. The people of Hawaii are constantly on guard against the introduction of Brown Tree Snakes which have already, by accident, taken over the island of Guam. Imported, as well as native, pests and diseases continue to be a threat to our agricultural base as well as human health and safety.

We have seen some success. Brucellosis in cattle is nearly eradicated from the country. In many states, the boll weevil has been eliminated. But even with these goals in sight, we must stay vigilant. Until a disease is truly eliminated or a pest is eradicated completely, we remain at risk from reintroduction or resurgence. We can easily recognize the economic and public health benefits of these efforts and they must continue.

Just as our markets must be safe from pestilence and disease, they must also be made fair and equitable. As suggested in my earlier comment regarding user fees and the producer, the American farmer does not always fit into the classic model of American economics. The American consumer profits from the affordability and availability of a variety of foods that would not even be imaginable a generation ago. There is much at stake for the producer and consumer alike. Whether we ever stop to recognize it, every one of us fits into at least one of those two categories.

There are some items with the budget proposal of the agencies before us with which I find strong disagreement. However, I believe our goals are the same. I look forward to the testimony today and to engage in a productive dialogue in which all views can be aired in order for us to proceed with the task before us.

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman. I appreciate you calling this hearing this morning. As we look at the budget for the Department of Agriculture I see this as one of the more important hearings on the calendar. Both the Food Safety Inspection Service and the Agencies within Marketing and Regulatory Programs represented here today have a great deal to do with the way the people in the state of Montana go about their daily business.

As with most of the agencies which we have seen come before this committee, I am again concerned with the way that these agencies budgeting for the coming fiscal year. We once again see additional fees tacked onto services provided by these agencies in the form of user fees. Fees which this committee, has in the past, and appears will again this year look unfavorably upon.

As I look upon this budget for this year, I am concerned with the way the funds have once more been directed by the Department of Agriculture. I see funding cuts in areas where we have restored funds in past years. I also see programs continually proposed which this committee and Congress have told the Department that they are not inclined to agree with the Administration.

Last year, Assistant Secretary Dunn came before this committee with a proposal to move to a cooperative arrangement in states with large predator problems to pay an additional share of the costs associated with predator control. States like Montana where a large portion of the predator problem is placed on the state by actions of the Federal government. Unfortunately we see this proposal brought before the Committee once again.

In the area of Wildlife Services, we continue to see large cuts made in the budget. Yet in many of our rural states we see the population of predators on the rise. I have heard time and again, that the people who receive the services of the agencies involved in this program should pay additional funds to take care of the problem of predator control. A problem which has been placed on them by this government.

I have a number of producers of both sheep and cattle who have told me of the losses they experience to both coyotes and wolves in Montana. Yet under your plan they would be forced to expend additional dollars to protect their private property from animals forced on them by this government. I have also been informed that the Wildlife Services Agency in Montana will effectively be out of money for predator control before the end of the current fiscal year. Well wolves and coyotes don't understand high finance of this particular nature, and they will continue to feed on the livestock in the field.

Mr. Dunn, simple math will tell you that as wolf populations increase, damage to livestock will also increase. Wolves killed 70 head of livestock (both sheep and

cattle) in Montana, Idaho and Wyoming in 1996. By 1997, livestock kills increased to 140. Doesn't seem like a lot, unless of course you own one or two of those animals. Wildlife Services has \$200,000 available in the fiscal year 1998 for wolf management, and I understand, anticipates a shortfall of about \$70,000. In fiscal year 1999, \$535,000 will be needed to address the escalating cost of livestock losses, a shortfall of over \$200,000 from current program levels. With math like that it is not difficult to understand why the people on the ground don't trust the management of agencies within not only the Department of Agriculture but also the Department of the Interior.

This past year, the Animal Plant Health Inspection Service (APHIS), developed certain protocols to provide for additional trade in livestock with our neighbors to the north in Canada. However, they set forth their protocols before our neighbors did so and now we are faced with a program that shows little potential for future development. This does not assist our producers in meeting the needs that they have on the ground, or that were explained to them in the development of this trade process.

I have to tell you also Mr. Secretary, that I am more than a little concerned about what is happening with the funds that this Committee provided for the construction and operation of a bison quarantine facility in Montana last year. I have heard little or nothing about what has been done with the state to facilitate the construction and operation of the pens in Montana. I will be interested in hearing what has been going on and what APHIS plans for this facility.

On the ground in states like Montana, our producers are looking for some means of finding what the market is like on fatten cattle. Producers have come to you for a number of years providing options for you to choose, yet today we have no more of an idea of what is happening in the market than we did several years ago. Proposals have been put forward, and this past month the National Cattlemen's Beef Association supported a resolution on providing transparency in the cattle market. I will be interested in hearing what is being done to address these concerns.

On the issue of Food Safety. Well I guess we had better start spending our funds in that area of concern. It appears that this Administration is driving this country on a course where we will be required to purchase our food and fiber from foreign countries. I just don't know if the rest of the world takes as much care and concern in the commodities that they produce, as the American farmer and rancher does in producing the same commodities here in the United States.

As a result I joined with several Senators in introducing a bill that would require that all meat be labeled as to the Country of Origin. After much debate within the livestock industry and with other industries associated with meat sales we have developed another proposal which we will unveil soon. However, throughout this entire process I have heard nothing from the Department on what their position on this would be.

Overall, Mr. Chairman, I am supportive of the work and the mission of the Agencies before the Committee today. I am a vocal supporter of the work that APHIS provides. I will commit myself to working with both you and the ranking member of this Committee to find a way to provide the funding necessary for these agencies.

Thank you, Mr. Chairman.

STATEMENT OF CATHERINE WOTEKI

Dr. WOTEKI. Thank you, Mr. Chairman. I appreciate your introducing my statement and Mr. Billy's statement into the record. What I would propose to do is to just very briefly summarize some key information relevant to some of the points that you have just made.

Mr. Billy is sitting to my immediate left and to his left is Mr. Dennis Kaplan from our Office of Budget and Policy Analysis.

FISCAL YEAR 1999 BUDGET REQUEST

The budget that we have proposed for fiscal year 1999 is a program level of \$709 million, which reflects a net increase of \$34 million over our 1998 current estimate.

We are proposing in fiscal year 1999 to conduct our meat and poultry and egg inspection activities using our current level of staffing.

The programmatic increases that are contained in our request would continue the implementation of our new regulatory approach based on hazard analysis and critical control points. It also contains funds that would be used for a variety of different purposes under the President's interagency food safety initiative.

Collectively these increases would be used to continue implementation of HACCP, to extend HACCP training to the egg processing inspectors, to help to acquire some additional tools that would improve inspectors' ability to evaluate the product they are inspecting and also to facilitate the redeployment of inspectors to strengthen our compliance efforts.

FOOD SAFETY INITIATIVE

Overall the President's budget includes a \$101 million request for an interagency food safety initiative. Of this sum, \$11 million would come to the Food Safety and Inspection Service. The initiative identifies a number of very high priority food safety activities that provide a very integrated approach to reducing foodborne illnesses. In addition, these funds would help FSIS to facilitate the transformation of State programs to hazard analysis and critical control point systems by fiscal year 2000.

Funds also requested under the President's food safety initiative would focus on expanding consumer education, helping to develop voluntary measures to reduce the risk of pathogenic contamination that could occur on the farm or on the ranch.

USER FEE PROPOSAL

In the near future, the administration will be transmitting to you, to the Congress, the legislation necessary to support our fiscal year 1999 budget proposal to recover the full cost of the Federal meat, poultry, and egg products inspection through user fees. We do believe that the user fee proposal is important to ensure that we have sufficient resources to provide for the mandatory inspection services needed to meet the increasing demand from industry. The proposal will have an overall effect on prices, to the extent that we have been able to estimate, that will amount to less than 1 cent per pound of meat, poultry, and egg products. We also believe that implementation of a user fee should be designed and must be designed to be fair and equitable to promote accountability and efficiency and also to minimize the impact on the competitive balance among the affected industries.

Approximately \$150 million of appropriated funds are requested to convert the Federal program to user fees and also to continue our obligations to States to help them in maintaining their State inspection programs.

We thank you for the opportunity to appear before you and I would also like in closing to thank you and the committee for your favorable actions this year on our budget request.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Dr. Woteki. Mr. Billy and Mr. Kaplan, we appreciate your presence as well. We will insert the

complete statements of Dr. Woteki and Mr. Billy in the hearing record.

[The statements follow:]

PREPARED STATEMENT OF CATHERINE E. WOTEKI

Mr. Chairman and Members of the Subcommittee, I am pleased to appear before you today to discuss the President's fiscal year 1999 budget for the Food Safety and Inspection Service. With me are Deputy Under Secretary for Food Safety Caren Wilcox, FSIS Administrator Thomas Billy, USDA Budget Director Stephen Dewhurst, and representatives from the FSIS budget office. Before I begin, I would like to thank you for looking favorably on our fiscal year 1998 budget request. This funding has helped us make progress in fulfilling our Federal responsibilities of maintaining a safe food supply while we make improvements in the inspection program.

BROADER FOOD SAFETY CHALLENGES

I would like to start by commenting briefly on our broad food safety agenda. As Congress pointed out in report language that accompanied the Department of Agriculture Reorganization Act of 1994, one of USDA's basic missions is to ensure the safety and quality of the Nation's food supply. The increasing importance of food safety issues to the future of agriculture led Congress to create this separate Sub-cabinet office to lead the effort to reform our food safety programs. It is my goal that the Under Secretary's office focus on long-term planning and policy development, on our legislative program required to ensure food safety, on oversight of the Food Safety and Inspection Service, and on providing general assistance and advice regarding food safety issues, as requested by the Secretary.

My office also has broader responsibilities related to our critical mission, and the inspection of meat, poultry and egg products. One example of our involvement in food safety activities that provide support to our inspection activities is our leadership in the international Codex Alimentarius Commission. Coordinating the United States' position on international food safety issues has required that my office develop expertise across agency and commodity lines. Although we also must take into account trade issues and the international community's interest in those trade issues, these issues are secondary to Codex's public health orientation and mission.

Secretary Glickman has also asked me to assume a leadership and coordination role consistent with our basic mission in such food safety areas as the President's Food Safety Initiative, which, among other things, includes the President's directive to develop and carry out a plan to ensure the safety of domestic and imported fruits and vegetables. We are working closely on these efforts with the Department of Health and Human Services, the Environmental Protection Agency, and other USDA agencies.

FARM TO TABLE STRATEGY

Our central responsibility of safeguarding the nation's meat, poultry, and egg supply provides us with a broad perspective on the problem of ensuring food safety. We recognize that not all contamination of meat and poultry and egg products occurs in the slaughter and processing plants we regulate. It can occur during animal production, during storage and transportation, and in distribution. It can occur in the grocery store and in restaurants. And, of course, it can occur in the home. This is the basis for our farm to table food safety strategy.

As you know, the President's 1998 and 1999 Food Safety Initiative embraces the farm to table philosophy of addressing food safety problems. Increased funding for research on microbial pathogen detection and prevention and agricultural production practices and for education and training of food handlers at home and in the commercial sector—as well as for surveillance, risk assessment, inspection, and strategic planning—is essential to making further improvements in food safety.

For example, while many consumers have a good foundation of food safety knowledge, there are some persistent misconceptions as well as confusion about specific food handling practices. Because we believe education is key to changing risky behaviors, the Federal government has used funds provided in fiscal year 1998 to launch the "Fight BAC" campaign to reduce the incidence of foodborne illness by educating Americans about safe food handling practices. "BAC," which is short for bacteria, is a green, slimy-looking character, and the result of a private-public partnership consisting of industry, consumer groups, and government. The "BAC" character puts a face on foodborne bacteria, which we believe will help Americans remember that they have the power to control bacteria in their home kitchens. Be-

cause "BAC" is a cartoon character, children are naturally attentive to him. We hope that "BAC" will be a carrier of food safety messages to consumers at a young age.

RESEARCH

Because of our experience with meat, poultry and egg products, we are positioned, I believe, to make recommendations on food safety research priorities and to develop effective consumer and industry education programs. Because FSIS is not a research agency, we must reach out to research agencies within the Federal government and to the private sector to meet our research needs. For that reason, FSIS has developed a Food Safety Research Agenda as one means of communicating with those outside of FSIS about our recommended priorities in food safety research.

INSPECTION RESPONSIBILITIES

I would like to talk now about our critical inspection responsibilities. I want to emphasize my commitment to fulfilling our basic mission—ensuring the safety of the nation's meat, poultry, and egg supply. Protection of the public health is our mandate, and that is what guides all that we do.

Of course, our primary vehicle for meeting our responsibilities is our inplant inspection and oversight of the products we regulate. While no country in the world can boast of an absolutely safe food supply, I—along with many others—believe the United States has the world's safest food, including meat, poultry, and egg products.

IMPORTANCE OF HACCP IMPLEMENTATION

I am pleased to say that we have begun the first phase of our new meat and poultry inspection system. There are some 300 plants that were required to implement HACCP as of January 26 of this year. These plants account for about 75 percent of the meat and poultry slaughtered in the United States. I am also pleased to report that HACCP implementation in these plants is going well. However, HACCP implementation is an ongoing process that will need fine tuning in the weeks and months ahead. This is to be expected with such a complex change. FSIS has already requested some changes from a few plants, and all of these companies have responded positively and have adjusted their HACCP plans to prevent future problems before they occur. I can assure you that the Agency is committed to working out any problems as they arise and to a common sense approach to problem solving.

Over the next two years, we will continue to work with all plants to make HACCP as effective as possible. We recognize that implementation of HACCP by smaller plants presents its own set of unique preparation problems. However, the Agency is ready. For example, approximately 380 small plants have participated in our HACCP small plant demonstration workshops. We also have available, technical guidance and materials consisting of software, videos, and written materials designed to assist the small plant owner or operator with developing their own HACCP plans. We are committed to improving food safety through HACCP. That commitment and follow-through will continue.

OTHER ITEMS OF NOTE

Government Performance and Results Act

The strategic plan we have developed is consistent with the Government Performance and Results Act, which calls on all Federal agencies and departments to coordinate their activities to be more effective, efficient and to avoid duplication. To this end, FSIS has communicated with agencies, both within and external to USDA, about common issues and interests in food safety. Our goal, as stated in our "Strategic Plan 1997-2002," is to enhance public health by minimizing foodborne illness from meat, poultry, and egg products. Our goal is a 25 percent reduction in the number of foodborne illnesses associated with meat, poultry, and egg products by the year 2000. This goal will be achieved by accomplishing all the daily tasks necessary to satisfy objectives in pathogen reduction, implementing the President's Food Safety Initiative, implementing our farm to table food safety strategy, fostering Agency cultural change, and cooperating with international groups on food safety matters.

Year 2000

FSIS, as with others in both the public and private sectors, is faced with a major technical challenge known as the "Year 2000 Problem." This refers to the possibility some computer systems in government and business may malfunction or cease to function as the year changes from 1999 to 2000. FSIS began working in 1997 to en-

sure that its systems are prepared to support the inspection program successfully into the year 2000 and beyond. For example, FSIS has designated eight of its automated information systems as mission critical. FSIS is making these systems "Year 2000 Compliant" using existing resources. A project plan is in place to carry out four major phases—assessment, renovation, validation and implementation—covering the period 1997 through 1999. We expect to finish all systems validation in 1998, and will complete implementation of systems by March 1999.

BUDGET HIGHLIGHTS

For 1999, the budget proposes a program level of \$709 million, a net increase of \$34 million over the 1998 current estimate. In 1999, FSIS will continue the process of transforming the inspection process with current staffing levels. In fiscal year 1999, the budget includes programmatic increases to build on the investments begun with the implementation of the Pathogen Reduction and HACCP systems rule and the President's Interagency Food Safety Initiative. Approximately \$2 million is requested to improve the Federal inspection system by providing HACCP training to egg processing inspectors, acquiring tools that will improve an inspector's ability to evaluate product, and facilitating the redeployment of inspectors to strengthen compliance efforts.

The President's 1999 budget includes an increase of \$101 million for the Interagency Food Safety Initiative, which includes \$11 million for FSIS. The initiative identifies a number of high priority food safety activities that provide an integrated approach to reducing foodborne illness. With the additional funds, FSIS will facilitate the transformation of State programs to Hazard Analysis and Critical Control Point systems by fiscal year 2000, work cooperatively with other Federal agencies to expand consumer education, and develop voluntary measures to reduce the risk of pathogenic contamination of animals on the farm. These new activities would build on the successes and fill the gaps identified in the President's 1998 Food Safety Initiative.

In the near future, the Administration will be transmitting to Congress the legislation necessary to support the 1999 budget proposal to recover the full cost of providing Federal meat, poultry, and egg products inspection through user fees. Requiring the payment of user fees for Federal inspection services would ensure that sufficient resources are available to provide the mandatory inspection services needed to meet increasing industry demand. The overall impact on prices as a result of these fees has been estimated to be less than one cent per pound of meat, poultry, and egg products production. The implementation of the user fee authority would be designed to be fair and equitable, promote accountability and efficiency, and minimize the impact on the competitive balance among affected industries. Approximately \$150 million in appropriated funds are requested to convert the Federal program to user fees and for maintaining State inspection programs.

CONCLUSION

These are a few of the issues I wanted to bring to your attention today. I believe we are on the right path to an even safer food supply. We have a good framework in place for making significant food safety improvements. I look forward to working with you to build the best food safety system we can.

Thank you again for the opportunity to appear here and discuss our goals to enhance food safety and the progress we have made. I will be happy to answer any questions you or other Members of the Subcommittee may have.

PREPARED STATEMENT OF THOMAS J. BILLY

Mr. Chairman and Members of the Subcommittee, I am pleased to appear before you today to discuss the President's fiscal year 1999 budget request for the Food Safety and Inspection Service, FSIS.

Having worked to promote food safety for most of my career in public service, I recognize the importance of working toward an essential and clearly defined goal. Our goal in food safety is to achieve the greatest possible reduction in the risk of foodborne illness associated with the consumption of meat, poultry, and egg products, consistent with available science and technology. Toward that end, we are applying resources in a prudent manner to make fundamental changes in inspection and build on our partnerships with other Federal agencies, the States, industry, academia, our employee organizations, consumer groups, and other interested segments of the public.

These are exciting times in food safety and it is because of your support that we are making real progress in improving food safety. Now, I would like to tell you how we are fulfilling our responsibilities and about our initiatives for better ensuring the safety of meat, poultry, and egg products.

CURRENT INSPECTION ACTIVITIES

FSIS has a long, proud history of protecting the public health. Our mission is to ensure that the Nation's commercial supply of meat, poultry, and egg products is safe, wholesome, and accurately labeled, as required by the Federal Meat Inspection Act, the Poultry Products Inspection Act, and the Egg Products Inspection Act.

FSIS inspects approximately 6,000 plants that slaughter cattle, swine, sheep, goats, horses, chickens and turkeys and process eggs as well as produce a wide range of processed products, including hams, sausage, stews, pizzas, and frozen dinners.

In fiscal year 1997, our domestic inspectors examined approximately 72.9 billion pounds, dressed weight, of meat and poultry and 3.2 billion pounds of egg products for public consumption. While the inspection of domestically produced meat, poultry, and egg products consumes the bulk of FSIS resources, FSIS also recognizes the vital importance of inspecting imported products. To ensure the safety of imported products, FSIS maintains a comprehensive system of import controls to carry out the requirements of the Federal meat, poultry, and egg products inspection laws.

This system of import controls involves two major components: oversight and reinspection. In order to ensure that exporting countries have government controls equivalent to those of the United States, FSIS conducts a rigorous review of such before they can become eligible to export product to the United States. Additionally, periodic in-country reviews, including on-site plant audits, are carried out to maintain such eligibility.

Reinspection of meat and poultry products that enter the United States is based on statistical sampling and verifies that the country's inspection system is working. Approximately 70 import inspectors covering some 124 active import inspection locations carry out this reinspection. In 1997, FSIS passed 2.5 billion pounds of imported meat and poultry products for entry into the U.S.

Another part of the FSIS food safety program involves our laboratories, which provide scientific and technical support to inspection personnel through laboratory testing for microbiological contamination, chemical and antibiotic residues, pathology diagnostics, processed product composition, and economic adulteration.

FSIS currently operates three multidisciplinary laboratories to carry out food safety and composition tests. During fiscal year 1997, over 141,000 residue, chemical and microbiological analyses were performed on meat, poultry, and egg product samples by federally operated laboratories.

FSIS also conducts compliance and enforcement activities to address situations where unsafe, unwholesome, and inaccurately labeled products have been produced or marketed. FSIS investigates cases of administrative, civil, or criminal violation of meat, poultry, and egg product regulations and works in conjunction with the USDA Office of the General Counsel and the Department of Justice to correct problems and prosecute offenders when necessary.

In fiscal year 1997, 26,142 compliance reviews were conducted. As a result of these reviews and other compliance activities, more than 44 million pounds of meat, poultry, and egg products were detained for noncompliance with the respective laws. Fifty recalls were conducted involving almost 27.9 million pounds of product. In addition, 22 convictions were obtained against firms and individuals for violations of the meat and poultry inspection laws.

CHANGES UNDERWAY IN FSIS

In 1997, FSIS began implementing a comprehensive food safety strategy. This included implementation of the requirements for sanitation SOP's and microbial testing for generic *E. coli* at slaughter. In addition, we began implementation of a major agency reorganization which will be completed by fiscal year 1999. I'd like to discuss these key changes further and changes under our food safety strategy that continue in 1998 and are planned for 1999.

PATHOGEN REDUCTION AND HACCP

On July 25, 1996, FSIS published the final rule on Pathogen Reduction and the Hazard Analysis and Critical Control Point system, known as HACCP. This rule addresses the limitations of the traditional organoleptic inspection system in dealing adequately with the problem of pathogenic microorganisms—harmful bacteria—on raw meat and poultry products, which contribute significantly to foodborne illness

in the United States. HACCP's objective is to directly target and systematically reduce harmful bacteria on raw products, as well as other likely hazards, thereby reducing the risk of foodborne illness.

As required by the HACCP rule, on January 27, 1997, all plants had to implement plant-specific Sanitation Standard Operating Procedures, SSOP's, to ensure that they are meeting their responsibility for proper sanitation of facilities, equipment, and operations. The written SSOP's must describe the specific measures plant management will put in place to prevent direct product contamination. Follow-up reviews indicate that SSOP's are effective in the vast majority of plants; however, in about 14 instances, we have had to move into an enforcement mode to stimulate companies to correct their sanitation systems.

In addition, all slaughter plants began testing their products for generic *E. coli* as an indicator of process control effectiveness for preventing fecal contamination, the primary pathway for pathogenic bacteria. Both of these measures were in preparation for full HACCP implementation, which began January 26 of this year in federally inspected large plants.

Overall, some 300 large plants have moved to improve the safety of meat and poultry products by implementing their HACCP plans, which are based on the seven principles established by the National Advisory Committee on Microbiological Criteria for Foods. These HACCP plans are designed to meet performance standards for Salmonella that went into effect at the same time as the HACCP requirements.

From the very beginning of the process of developing the HACCP rule, we have held frequent public meetings to receive input from our constituencies and to provide assistance to plants required to implement the provisions of the HACCP rule. Consistent with our emphasis on communication and assistance, in December and January, we held HACCP implementation meetings around the country to brief the management of large plants on how the agency would conduct inspection subsequent to the January 26 deadline. We found these meetings, held in Washington, DC, Des Moines, Iowa, Denver, Colorado, and Memphis, Tennessee, to be very useful in aiding a smooth transition to the new regulations.

HACCP implementation will continue to be phased in according to plant size. Large plants with 500 or more employees implemented their plans on January 26. Small plants with 10 to 499 employees must have a plan in place by January 25, 1999, and very small plants, with fewer than 10 employees or annual sales of less than \$2.5 million must have a plan in place by January 25, 2000.

HACCP remains a work in progress that will need fine-tuning in the weeks and months to come. This is to be expected with such a complex change, and I assure you that we are committed to working out any problems as they arise. In recognizing the special difficulties that all plants, especially small plants, will face, we have initiated an aggressive program to provide assistance to these plants. We are providing technical assistance and recently held a round of meetings targeted to the communication needs of small and very small plants. FSIS district managers are on call 24 hours a day, 7 days a week, to make rapid decisions and respond to emergencies. In addition, the Technical Services Center is operating a HACCP Hotline with four lines open between 6 a.m. and 6 p.m. Central Time, Monday through Friday, and an electronic message and paging service 24 hours a day, seven days a week. As a result of questions we have received regarding implementation, we have published a number of documents in the Federal Register clarifying certain aspects of the HACCP regulations, including offering an option for early HACCP implementation, to small and very small plants.

By January 25, 2000, all provisions of the final rule will be implemented. The final rule sets an important framework for performing our food safety mission, but it is not the culmination of our strategy for change. We will continue pursuing our goal of reducing the risk of foodborne illness and additional opportunities to improve the way we carry out inspection activities, to promote both food safety and the efficient use of resources.

Our nation's meat and poultry is far and away the safest and highest quality in the world. However, the HACCP final rule assures consistency between meat and poultry inspection across the country and will help us move toward a seamless national food safety program. There will be greater consistency in both Federal and State inspection, as well, based on a common, consistent regulatory framework.

INSPECTION CHANGES

HACCP is permitting us to make improvements in the inspection process and will permit us to redeploy some of our current in-plant inspection work force to HACCP verification tasks, and to new tasks outside of traditional in-plant settings in furtherance of our farm-to-table strategy. Our budget request includes a proposal to in-

crease support for these efforts, especially for travel to multiple destinations to perform monitoring and reviews.

We are making progress on addressing food safety risks to products once they leave Federally inspected plants by working closely with other government agencies, professional groups, academia, and industry. At the transportation level, we are working with FDA to develop guidelines covering the safety of foods during distribution. We are placing particular emphasis on time and temperature control as a means of minimizing the growth of pathogenic microorganisms. At the retail level, we are working again with FDA and with State officials to ensure the adoption of science-based standards and to foster HACCP-type preventative approaches—largely through the Food Code process.

FEDERAL-STATE COOPERATION IN FOOD SAFETY

In FSIS, we have a long history of working with State-administered meat and poultry inspection programs, and we are now in the process of taking steps to strengthen, and hopefully expand these programs. We consider them an integral part of the national regulatory system for ensuring the safety, quality, and accuracy of labeling of the Nation's meat and poultry supply.

Describing the State programs as part of the national system is an extremely important concept, because we cannot look at the Federal and State programs as separate entities. On the contrary, they must be considered as parts of a whole, and any initiatives we undertake must be carried out with that perspective in mind. That is why we have worked closely with the States throughout the rulemaking and implementation process as a means of ensuring that the provisions in the HACCP rule are appropriate for State, as well as Federal, plants. This intergovernmental cooperation is the basis for our budget request for special assistance with HACCP implementation in the State programs.

CHANGES IN THE FSIS ORGANIZATION

To help reach our strategic goal of reducing the risk of foodborne illness, we began implementing a major reorganization of the agency in 1996, which was needed to optimize the management structure and allocation of our resources in performing our regulatory responsibilities. Originally, we expected the reorganization to be fully implemented by fiscal year 1999, but we exceeded our own expectations and much of the reorganization was completed in 1997. The change in organizational structure was designed to make the best possible use of agency resources so that FSIS could meet the future food safety and consumer protection challenges. The reorganization is based on a top-to-bottom review of the Agency's regulatory roles, resource allocations, and organizational needs.

We have flattened and streamlined management structures both at headquarters and in the field, recognizing that the Agency needs fewer non-frontline staff. As we continue streamlining the organization, we will continue to increase the proportion of resources deployed to the frontline work force—food inspectors, in-plant veterinarians, import inspectors, laboratory personnel, compliance officers, and first-level supervisors.

I am very proud that we have reduced the number of headquarters units reporting to the Administrator by nearly half, from thirteen to seven, eliminated one layer of management, and reduced the number of supervisory positions. In fiscal year 1997, we reduced the number of field management offices from 46 field offices to 18 district offices and four field support offices. The 18 new district offices have already demonstrated that they will make supervisory spans of control more manageable and better balance the workload. In addition, administrative services provided to field locations were consolidated with the opening of the Financial Processing Center in Des Moines, Iowa, and assumption of further personnel support in the existing Personnel Operations Branch in Minneapolis, Minnesota.

A new Technical Services Center opened in Omaha, Nebraska, in June 1997. Center employees provide technical expertise and guidance to inspection personnel on the interpretation, enforcement, and application of domestic and import regulations, policies, and systems. The Center is also available to industry and enables FSIS to provide much quicker and more consistent technical assistance in inspection across the country. An example of this assistance is the newly operating HACCP Hotline that I mentioned earlier.

EMPHASIS ON PUBLIC HEALTH IN PERFORMANCE

Our strategic goal is to reduce to the greatest possible extent the risk of foodborne illness associated with eating meat, poultry, and egg products. In short, we want food to be safer so that fewer people will get sick. As you know, the Government

Performance and Results Act of 1993, known as GPRA, directs Federal agencies to measure the results of their programs in terms of societal impacts. Year after year, we have been able to tell you how many pounds of product we inspected and how many laboratory tests we conducted. What we now need to tell you is how these programs make a difference to public health.

Within our Strategic Plan and Annual Performance Plan, our goal is supported by six objectives, which incorporate strategies for enhancing the public health by minimizing foodborne illness. These objectives are to:

- Reduce pathogens on raw products by continuing the implementation of the Pathogen Reduction/HACCP rule;
- Collaborate with other public health agencies and stakeholders to implement the near term program objectives contained in the President's National Food Safety Initiative;
- Develop a comprehensive strategy for promoting food safety from farm-to-table;
- Continue the necessary cultural changes to support HACCP and HACCP related food safety initiatives by training the work force to carry out the re-defined regulatory procedures, and by ensuring industry and State programs understand their new roles and responsibilities;
- Assure HACCP equivalent systems for imported products; and
- Streamline and improve the effectiveness, efficiency, and diversity of administrative and human resources support functions.

In order to obtain much needed baseline data on the incidence of foodborne illness in the U.S. that is attributable to consumption of meat, poultry, and egg products, FSIS began working with the Centers for Disease Control and Prevention, CDC, and the FDA in 1995, to monitor seven foodborne illness "sentinel sites" through the FoodNet system. The sites include Northern California, Oregon, the Minneapolis/St. Paul metropolitan area, the Atlanta metropolitan area, Connecticut, several counties in upstate New York, and counties around Baltimore, Maryland. The data from FoodNet will enable us to estimate the national incidence of the major foodborne diseases and to explore what relationships may exist between specific pathogens and the types of meat, poultry, and other food products associated with them. FoodNet information will assist in reviewing the impact of HACCP programs and will trigger changes, where appropriate, to prevent future outbreaks of foodborne illness. This information is critical to improving the overall performance of our food safety mission because it will demonstrate the effectiveness of present and new strategies and greatly assist efforts to reduce the risk of foodborne illness.

As you know, we were directed by you in the fiscal year 1998 Committee Report to report on the incidence of foodborne illness in cooperation with CDC. Data for 1997 will be finalized by the end of March, and we will be able to provide the report in April.

We are continuing our nationwide baseline studies to measure the levels of pathogens that currently exist on meat and poultry products. With this and other information, we expect to know earlier in the process if a potential public health problem exists and take the necessary action to further reduce risks.

As a regulatory agency focused on public health, we must be able to rapidly adjust our policies and procedures to new information and emerging public health risk. With our enhanced front-line capability under the new organizational structure, we were well equipped to fulfill our food safety responsibilities in the 1997 product recalls. We demonstrated that we are able to address immediate public health problems, as well as adjust our regulatory policies and procedures as necessary.

PRESIDENT'S NATIONAL FOOD SAFETY INITIATIVE

The President's Food Safety Initiative is an integrated, multi-agency plan for improving the safety of the Nation's food supply. Building on the 1998 initiative, the FSIS budget proposal will support efforts to reduce the risk of foodborne illness from the farm to the table. Addressing the need for increased efforts to address food safety on the farm, the initiative supports development of voluntary measures that producers can utilize to reduce pathogenic contamination of animals before they reach the slaughterhouse. In addition, to move toward a seamless national food safety program, FSIS proposes to increase the share of Federal funding to assist State programs with HACCP implementation. Mindful of our responsibilities to consumers, we also propose an expansion of food safety education. These proposals will work in tandem with complementary proposals within USDA and in other Federal programs to reduce the risk of foodborne illness.

REGULATORY REFORM

FSIS is making steady progress in reforming its existing regulations and is delivering on the commitment we made in December 1995 when we described our regulatory reform strategy in an advanced notice of proposed rulemaking. FSIS has already ended the prior approval requirements for facility blueprints and equipment, and most partial quality control programs through a final regulation that was published in August 1997.

The Agency continues working to convert command and control regulations into performance standards in an effort to achieve consistency with the HACCP final rule. We have published a proposal to change all of the detailed sanitation requirements into performance standards. We have also published a proposed regulation on one uniform set of rules of practice. We are in the final stages of clearing a final rule to establish a performance standard for certain cooked meat and poultry products that will be the model for a series of product food safety performance standards, which will eventually encompass all categories of products. Whenever possible, FSIS has replaced the separate meat and poultry provisions with a single regulatory requirement that takes differing characteristics of meat and poultry into account.

To supplement these planned regulatory reform activities, we have developed guidance material to assist the industry in meeting HACCP requirements, as mentioned earlier. The materials include guidance on how to collect the required samples for generic *E. coli* testing of both livestock and poultry carcasses; how to develop HACCP plans; how to identify food safety hazards associated with processes at inspected establishments; and thirteen generic HACCP models. We have printed these materials in quantity and we distribute them without charge. Public meetings that I discussed as part of HACCP implementation have facilitated useful communications with various segments of the industry and have assisted implementation of regulatory reform. In addition, FSIS has completed implementing Directives for the HACCP final rule and revision of the automated system, which schedules inspection procedures to accommodate HACCP implementation in large establishments. Finally, the Agency has published the first of a series of policy notices designed to clarify its expectations about certain aspects of HACCP implementation, which address misunderstandings that the industry has communicated informally.

EGG SAFETY

I'd like to now address our strategy for egg products. As you well know, USDA has the responsibility to regulate the safety of egg products, while FDA has the responsibility to regulate the safety of shell eggs. This shared jurisdiction necessitates that USDA and FDA work closely together to develop a food safety strategy for these products, and that is exactly what we are doing.

The HACCP final rule that is now being implemented does not address egg safety, but egg safety is certainly part of our agenda. FSIS and FDA firmly believe that a farm-to-table food safety strategy must include eggs, be science-based, and address the entire farm-to-table chain. FSIS' 1999 budget request proposes implementation of HACCP in the Egg Products Inspection program and calls for establishment of a microbiological baseline and training for the egg products inspection work force.

Egg safety is of particular concern to us because of the prevalence of foodborne illnesses caused by the pathogen *Salmonella enteritidis*, or *SE*, through the consumption of eggs and egg products. Data from CDC indicate that *SE* is one of the most commonly reported causes of foodborne illness in the United States and has been increasing since 1976. Contaminated eggs have been the most commonly identified food source for outbreaks of *SE*, therefore we must take a comprehensive approach to improve the safety of both shell eggs and egg products.

USDA, FDA, CDC, and academia are continuing to conduct a quantitative risk assessment for *SE* in eggs and egg products to help ensure that any actions taken will address the human risks identified. The risk assessment will give us a more definitive understanding of the risks from shell eggs and egg products, and it will help us evaluate the alternative ways in which the risks might be reduced. It will also tell us what additional data are needed and help us to prioritize data collection efforts; and to focus our risk/benefit analysis.

To address these broad and complex issues, we are continuing to work jointly with FDA to develop an advanced notice of proposed rulemaking, or ANPR, that meets our farm-to-table and science-based criteria. The ANPR will look at eggs during production, packing, processing, labeling, distribution, retail, and preparation. We are seeking a rational and comprehensive approach to addressing the safety of eggs and egg products. We are mindful of the requirement in the 1998 Appropriations Act to promulgate a final rule requiring a 45 degrees Fahrenheit ambient air temperature for the transportation and storage of eggs. While we believe this ANPR is the appro-

appropriate way to proceed, we will promulgate the required final rule if we cannot publish a more comprehensive regulation within the required time.

INFORMATION TECHNOLOGY

Through the Field Automation and Information Management project, or FAIM, which you have supported, we are able to reinforce both the Agency's field reorganization and HACCP implementation by equipping our inspection personnel with information technology. All large HACCP plants are now covered by FAIM as of January 1998, the effective date of the HACCP rule for these plants.

With FAIM implementation and new automation capability, lab results are available for immediate overnight distribution. Our work force has direct access to necessary regulations and directives, and can communicate and keep in contact with other inspection personnel via e-mail. FAIM also enables inspectors to receive on-site training in such areas as HACCP, beef and poultry slaughter techniques, and import inspection.

In October 1997, the Industry Advisory Council and Chief Information Officers Council jointly published a report titled "Best IT Practices in the Federal Government." In that publication, FAIM was cited as one of the top twenty Information Technology Programs in the Federal Government.

INTERNATIONAL CHANGES

FSIS remains committed to working through the Codex Alimentarius Commission to continue to stress the role of science in international standard setting and to actively participate in the process. Over the past year, the FSIS Office of Codex has accomplished a great deal. A U.S. Codex site on the FSIS web site was established, a Codex Strategic Planning document was published as a notice in the Federal Register, and a public meeting on Codex strategic planning was held here in Washington, DC. Also, FSIS published a notice in the Federal Register informing the public of the sanitary and phyto-sanitary standard setting activities of the Commission, and a public meeting was held to take comment on the U.S. positions on issues to be considered by the Codex Alimentarius Commission and its Executive Committee.

Significant achievements were made at the June 22, 1997 meeting of the Commission. At that meeting, the Commission adopted three vitally important food safety standards through documents forwarded from the Food Hygiene Committee. One document outlines the basic principles of good hygiene as applied throughout the food chain by governments, food producers, and consumers, alike. The second document provides guidance to countries on the application of HACCP. The third document provides a framework to address the occurrence of microbial organisms including important pathogens such as *E. coli* O157:H7 and Salmonella in food.

The Commission endorsed the inclusion of the four science principles in the Codex Procedural Manual, approved the inclusion of principles of risk assessment, and began work on the elaboration of principles of risk management. The incorporation of these important human health factors and a scientific and systematic approach to their application in the Codex process will facilitate future Codex work.

Major progress was achieved by adopting the Codex General Standard on Food Additives (GSFA). This standard has been a prime goal of the Commission, and one sought by the U.S. for some time. It is tailored after the U.S. approach.

The Commission also adopted standards for 170 food additives, which can be used in any food, within the constraints of Good Manufacturing Practices. This list of additives comprises a substantial fraction of the food additives currently in use in international trade. These standards were urgently needed to remove one of the principal barriers to trade in value-added processed foods, which had been subject to differing national food additive standards.

I am also pleased to report that I was selected to be a Vice-Chairman of the Codex Alimentarius Commission at the 22nd Session of the Commission. I will serve as Vice-Chairman through the 23rd Session of the Commission, scheduled to be held in Rome in June 1999.

1999 BUDGET REQUEST

We welcome the increased emphasis being placed on food safety throughout USDA and other Federal programs and support the initiatives included in the President's Food Safety Initiative.

To continue making food safety improvements and to accomplish our goals, the 1999 budget proposes a program level of \$709 million—an increase of \$33.6 million over the amount provided for 1998. To continue transformation of the Federal inspection program, this proposal includes a net increase of \$20.7 million, of which \$18.4 million will support the current Federal inspection work force through manda-

tory pay increases and non-salary costs increases and \$2.3 million will support new initiatives. In addition, the request includes \$11.3 million for the President's Food Safety Initiative and \$1.6 million in State program-related initiatives.

In fiscal year 1999, FSIS will again continue the process of transforming the inspection process within the current staffing ceiling, a commitment we made in the 1997 budget. We are maintaining the same inspection staffing levels in 1999 that we have in 1998, and are equipping our work force to perform in-plant inspection under HACCP requirements while planning to utilize other redeployed personnel to assure the safety of inspected meat, poultry, and egg products in-distribution. Widening inspection coverage to both the in-plant setting and in-distribution as we implement HACCP is critical to implementing our farm-to-table food safety strategy.

In fiscal year 1999, FSIS proposes to build on the changes and investments we have begun during the last few years. I am confident that the results will improve both food safety and FSIS' efficiency. Let me describe the initiatives for program investment covered by this budget request.

1999 BUDGET INITIATIVES

I spoke earlier of the importance of the President's Food Safety Initiative and for fiscal year 1999, our request will strengthen our partnerships with consumers, producers, and the State programs to improve overall food safety. We are requesting \$0.5 million for food safety education of consumers and those who prepare food, which will focus on food handling behaviors and improving the food safety awareness of children and youth. An increase of \$3.0 million is requested to provide producers with the information they need to implement voluntary measures to reduce pathogen contamination of animals before slaughter. Of this amount, we will use \$1.0 million to conduct risk assessments that will lead to the development of appropriate voluntary control strategies for application by producers. The remaining \$2.0 million will be used for producer education. This education is necessary to ensure that producers understand the changes that are occurring in the industry due to the implementation of HACCP, and to inform them of the ways in which risk mitigation strategies can assist them in meeting these new challenges. We do not, nor are we seeking authority to, mandate on-farm practices. We have been working with producers to develop voluntary animal management practices to improve food safety and more can be done to assist them in their efforts to improve food safety from farm-to-table.

The Initiative also includes a \$7.8 million increase in special assistance to facilitate the adoption of HACCP by State Inspection Programs that is short-term enhanced funding for HACCP implementation. Successful implementation of HACCP by States is critical to ensuring that their requirements are "equal to" Federal requirements. Specifically, \$5.8 million of the increase is needed to extend the FAIM project to the State inspection programs. This funding will ensure that State programs have the necessary automated infrastructure support in time to fully implement the provisions of the HACCP final rule. The FAIM project will save FSIS and the States developmental costs, and provide for consistency in food safety data and information nationwide. A \$1.3 million increase in special assistance is needed for equipment to assist States in meeting HACCP requirements for extensive laboratory testing for pathogens. An additional \$0.7 million is needed to develop and deliver HACCP training so that State inspection personnel will be able to perform in the same manner as their Federal counterparts. To assist the States on a short-term basis through the transition to HACCP, the budget includes new appropriations language that will increase the Federal share of funding for these initiatives from 50 percent to 75 percent.

Redeployment of inspection personnel to perform new inspection work within the plant and in-distribution enables FSIS to operate within existing staffing levels, but requires increased operating support to assure peak performance. We are proposing an increase of \$2.3 million for upgraded HACCP inspection technology within the plant, implementation of HACCP in the Egg Products Inspection program, and specialized equipment and increased travel for in-distribution compliance activity.

As I have stated, the State inspection programs perform a key role in ensuring a safe and wholesome, nationwide food supply. We are requesting a net increase of \$1.6 million in support of State inspection programs. About half of the increase will provide the federal share of increased State inspection costs, and the balance will enable FSIS to perform intensified audits of all 25 State inspection programs in 1999, which is needed to assure that their requirements are "equal to" the Federal program. These comprehensive reviews will enable FSIS to assist and monitor efforts in managing the extensive changes required by both the industry and State inspection programs as a result of mandatory HACCP provisions.

USER FEES

The budget assumes enactment of legislation to recover a total of \$573.4 million in new user fees to cover the full cost of the Federal inspection program. For 1999, we are requesting an appropriation of \$149.6 million for the Grants to States program, special assistance for State programs, and leave liability and start-up costs for the new user fee program. This proposal is intended to assure that resources are available now and in the future to provide the level of inspection necessary to meet the demand for such services and maintain consumer confidence, within the balanced Federal budget context.

We are currently evaluating a user fee plan to assess inspection fees based on pounds of inspected product by industry segment, including slaughter, processing, egg products, and import inspection. The overall impact on consumer prices as a result of these fees would be less than one cent per pound of meat and poultry production.

To accomplish a balanced Federal budget, cost burdens must be shifted from taxpayers to those who benefit directly from the provided services. The food industry profits in the marketplace from the level of consumer confidence provided by the Federal inspection programs. Additionally, the inspection programs provide a level playing field in maintaining standards of safety, wholesomeness and labeling among individual industry entities competing for market advantage.

CONCLUSION

Mr. Chairman, this concludes my prepared statement. Thank you for the opportunity to testify and speak to the Subcommittee on how FSIS is meeting its responsibilities in working with Congress and other partners to improve the safety of meat, poultry, and egg products, and thereby reduce the incidence of foodborne illness. I will be happy to answer any questions that you or other members of the Subcommittee may have.

BIOGRAPHICAL SKETCHES

CATHERINE WOTEKI

Dr. Catherine Woteki is Under Secretary for Food Safety for the U.S. Department of Agriculture. In this position, she is USDA's top food safety official, overseeing implementation of the new science-based inspection system for meat and poultry.

Prior to being sworn in to her present position on July 31, 1997, she served as Acting Under Secretary for Research, Education, and Economics. From 1994 to 1995, she was Deputy to the Associate Director of Science of the Office of Science and Technology Policy. From 1990 to 1994, she was Director of the Food and Nutrition Board, Institute of Medicine, National Academy of Sciences.

Dr. Woteki was born in Fort Leavenworth, Kansas. A biology and chemistry major at Mary Washington College in Fredericksburg, Virginia, she pursued graduate studies in human nutrition at Virginia Polytechnic Institute and State University, Blacksburg, Virginia, and received a Ph.D. in human nutrition. She is a registered dietitian.

For two years, she performed clinical research in the Department of Medicine of the University of Texas Medical School at San Antonio. She was appointed assistant professor in the Department of Nutrition and Food Science at Drexel University in Philadelphia in 1975. In July 1977, she joined the Congressional Office of Technology Assessment as Nutrition Project Director.

From 1980 to 1983, she worked for the U.S. Department of Agriculture in two capacities: as leader of the Food and Diet Appraisal Research Group in the Consumer Nutrition Center, and as Acting Associate Administrator of the Human Nutrition Information Service. Dr. Woteki was Deputy Director of the Division of Health Examination Statistics, National Center for Health Statistics, U.S. Department of Health and Human Services, from 1983 to 1990.

Dr. Woteki has published 48 articles and numerous technical reports and books on food and nutrition policy and nutrition monitoring. During her tenure as Director of the Food and Nutrition Board, she directed studies that resulted in 20 publications by the Institute of Medicine. Dr. Woteki is the co-editor of "Eat for Life: The Food and Nutrition Board's Guide to Reducing Your Risk of Chronic Disease," a book selected by the Book of the Month Club.

Dr. Woteki received the Elijah White Award from the National Center for Health Statistics, the Special Recognition Award from the U.S. Public Health Service, and the Staff Achievement Award from the Institute of Medicine. She was selected as

the outstanding alumna of the College of Human Resources, Virginia Polytechnic Institute and State University, in 1987. She also presented the 1997 Lenna Frances Cooper Memorial Lecture at the annual meeting and exhibition of the American Dietetic Association. She and her husband, Tom, reside in Washington, D.C.

CAREN A. WILCOX

Caren A. Wilcox is Deputy Under Secretary for Food Safety of the U.S. Department of Agriculture. Her position is part of the restructuring of USDA's 1994 reorganization plan. Her key responsibilities include working with the Under Secretary and the Administrator of FSIS on the implementation of the Hazard Analysis and Critical Control Points [HACCP] system, a science-based process control system to improve the safety of American meat and poultry. She also works on many of the President's initiatives as they impact food safety mission responsibilities. Wilcox oversees certain areas of responsibility for the Under Secretary including assignments in strategic and communications planning regarding the Office of the Under Secretary.

Prior to her present appointment, which began November 18, 1997, she was with the U.S. Small Business Administration where she was regional advocate for the mid-Atlantic states and the District of Columbia. In this position, she worked to enhance the growth of small businesses in the region. She also served as executive vice president of the National Association of Women Business Owners [NAWBO].

At USDA, Wilcox combines her experience in the small business community with almost 20 years in the food industry, having served as manager, then director of government relations for Hershey Foods Corporation. While with the corporation, she was involved in the establishment of voluntary HACCP programs in its plants, and sat on the corporate oversight committee which reviewed food safety and quality issues. She also planned, organized, and managed public policy development and legislative representation of the corporation at all levels of government.

In 1993 and 1994 she aided the Clinton administration by working with the business community on such issues as the President's economic programs, health care, school-to-work, GATT, and the Summit of the Americas. She served as Deputy Director for Business in the Political Department in the Clinton/Gore Campaign in 1992 in Little Rock.

Ms. Wilcox, a longtime resident of Pennsylvania, graduated from Wellesley College in Massachusetts and received her master of arts in international relations from the University of Pennsylvania in Philadelphia. She also served as assistant dean of the College of Liberal Arts for Women at the university. Early in her career, Ms. Wilcox was involved in international educational programs and worked at Institut IMEDE in Lausanne, Switzerland.

Ms. Wilcox has received many awards for her outstanding leadership at senior levels of business, government, academia, and public affairs management. She presently resides in Washington, DC.

STATEMENT OF MICHAEL DUNN

Senator COCHRAN. Mr. Dunn, Mr. Secretary, you may proceed.

Mr. DUNN. Thank you, Mr. Chairman. I appreciate the opportunity.

With me here today is Mr. Baker, who is the Administrator of the Grain Inspection, Packers and Stockyards Administration; Dr. Figueroa, who is the Administrator of the Agricultural Marketing Service; and Mr. Medley, who is the Administrator of the Animal and Plant Health and Inspection Service. These three Administrators make up the marketing and regulatory programs.

Beneficiaries of program services, as well as taxpayers, provide for the funds needed to operate marketing and regulatory program activities. In total, the appropriations and user fee resources are proposed to carry out \$804 million of program level activities. Beneficiaries of these services pay over \$397 million. Currently marketing and regulatory programs administer over 50 percent of the Department's user fee programs. These programs have been

market tested and continue to meet the demand of the market's challenges.

In fiscal year 1999, the budget request proposes to appropriate \$11.8 million for the Grain Inspection, Packers and Stockyards Administration, \$59.7 million for the Agricultural Marketing Service, and \$423 million for the Animal and Plant Health Inspection Service.

We will, as you pointed out, be submitting legislation for \$31 million more in user fees. The budget assumes that these would be passed.

GRAIN INSPECTION, PACKERS AND STOCKYARDS

The 1999 budget proposes an increase of \$795,000 for monitoring and analyzing packer competition and industry structure, \$750,000 to broaden the size and scope of poultry compliance investigation, and \$225,000 to establish electronic filing procedures.

In addition, the budget requests \$3 million to reorganize the 11 packers and stockyards field offices in order to implement the Office of Inspector General's recommendations for improving packers and stockyards' investigative capabilities.

MARKETING AND REGULATORY PROGRAMS

Legislation required us to publish two pieces of proposed rules this year, one for national standards for organic production, and the other for milk marketing order reform. Both of these rules have made extensive use of the Internet. For the organic standards alone, we have received over 17,000 comments.

We are requesting \$10.5 million for three efforts to expand the Pesticide Data Program for the Agricultural Marketing Service.

First, we request an additional \$2.5 million to restore the funding to the level available in 1996.

Second, we need \$1.7 million to protect American agriculture from unnecessary losses in pesticide registration.

Third, we are requesting \$6.3 million to begin microbiological testing of fruits and vegetables as part of the President's food safety initiative.

The budget includes an increase of \$300,000 to expand International Market News reporting.

The budget also includes a request of \$500,000 for the National Organic Standards Program to be started up. These funds will be recouped through user fees and deposited in the Treasury.

APHIS

The 1999 budget request is an example of good government. They are proposing to do more with less. The 1999 APHIS request for salary and expense is \$9.9 million below that of 1998. Even so, APHIS proposes to spend \$13 million more on high-priority efforts such as the \$4.6 million increase for the National Animal Health Monitoring System.

PREPARED STATEMENTS

Mr. Chairman, I appreciate the opportunity to come before the committee, and we will submit the written testimony of myself and the Administrators.

Senator COCHRAN. Thank you very much.
[The statements follow:]

PREPARED STATEMENT OF MICHAEL DUNN

Mr. Chairman and members of the Committee, I am pleased to appear before you to discuss the activities of the Marketing and Regulatory Programs of the U.S. Department of Agriculture and to present our fiscal year 1999 budget proposals.

With me today are Terry Medley, Administrator of the Animal and Plant Health Inspection Service, Enrique Figueroa, Administrator of the Agricultural Marketing Service, and James Baker, Administrator of the Grain Inspection, Packers and Stockyards Administration. They have statements for the record and will answer questions regarding specific budget proposals.

STRATEGIC GOALS

Our goals contribute to the Department's three strategic goals that support the rural economy, assure food safety and sensibly manage the natural resources. Specifically, the MRP goals include: enhancing consumer access to safe, affordable, and quality products and to assure producer access to competitive markets; and facilitating the global marketing of U.S. agricultural products.

FUNDING SOURCES

The Marketing and Regulatory Program activities are funded by both the taxpayers and beneficiaries of program services. In total, the appropriations and user fee resources are proposed to carry-out \$804 million of program level activity.

On the appropriation side, we are requesting \$417.8 million for salaries and expenses and \$5.2 million for buildings and facilities for the Animal and Plant Health Inspection Service; \$58.5 million for Marketing Services and \$1.2 million for the Federal-State Marketing Improvement Program for the Agricultural Marketing Service; and \$11.8 million for the Grain Inspection, Packers and Stockyards Administration. Legislation will be submitted to recover \$31 million more in user fees and the budget assumes that this legislation will be enacted. The budget also assumes enactment of legislation authorizing new license fees to recover the cost of administering the Packers and Stockyards Act (P&S Act), additional fees for selected APHIS activities, and additional fees for developing grain standards and methods to improve techniques for grain inspection. I will use the remainder of my time to highlight the Department's budget requests for the Marketing and Regulatory Programs.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

GIPSA's strategic plan was developed to guide the agency into the next century and to help ensure that our programs and services remain relevant to our customers and American agriculture. It was developed in a cooperative effort with all GIPSA employees and our customers. The two goals in the strategic plan that will guide them through the upcoming years include: ensuring a fair, open, and competitive marketing environment for livestock, meat, and poultry; and promoting and protecting the integrity of the domestic and global marketing of U.S. grain for the benefit of American agriculture.

Program Plan and Accomplishments

During 1997, GIPSA's Packers and Stockyards Program had 1,335 stockyards; 6,900 market agencies/dealers; and 2,125 packer buyers registered to engage in the livestock marketing business. There also were approximately 6,000 slaughtering and processing packers; an estimated 6,500 meat distributors, brokers, and dealers; and 210 poultry firms subject to the P&S Act.

In fiscal year 1997, GIPSA concentrated resources on providing financial protection and promoting fair business practices and a competitive marketing environment for livestock, meat, and poultry. The Agency conducted over 1,800 investigations, disclosing 515 violations of the Packers and Stockyards (P&S) Act. During fiscal year 1997, 46 formal cases were resolved and 29 new court cases were filed to bring subject firms into compliance with the provisions of the P&S Act. These complaints

alleged violations of the P&S Act, including failure to compete in the purchase of livestock, paying livestock sellers on the basis of false and inaccurate weights, failure to pay and failure to pay promptly for livestock, operating without bond coverage, and delayed weighing of live poultry.

In February 1997, the USDA Office of the Inspector General (OIG) issued an evaluation report which concluded that the P&S program needed to reorganize its national and regional offices. They found that the 11 regional offices did not provide enough staff to perform the full range of investigations, including complex anti-competitive practice investigations, and that P&S needed to incorporate economic, statistical, and legal expertise in its field offices. The National Commission on Small Farms came to the same conclusion. GIPSA has Departmental approval to restructure its P&S Programs that consolidates 2 operating divisions and 6 branches into a single policy/litigation support office at headquarters. This office will focus on the core responsibilities under the P&S Act—competition, fair trade practices, and payment protection. The 11 field offices will be consolidated at 3 regional locations. Another 35 resident agents will operate out of their homes or a few small suboffices. Resident agents will handle the most basic services and routine investigations in outlying areas.

GIPSA's Federal grain inspection personnel work with over 2,000 State and private inspectors to provide high-quality inspection and weighing services on a user-fee basis. Federal inspectors service 42 export elevators located in Georgia, Illinois, Indiana, Louisiana, Maryland, New York, Ohio, Oregon, and Texas. A small Federal staff also provides service at 6 export elevators in Eastern Canada for U.S. grain transshipped through Canadian ports. Eight (8) delegated States provide service at an additional 20 export elevators located in Alabama, California, Minnesota, Mississippi, South Carolina, Virginia, Washington, and Wisconsin. Sixty-five (65) designated agencies service the domestic market under GIPSA supervision. In 1997, this unique mix of Federal, State, and private inspection agencies provided 2.1 million inspections on over 225 million metric tons of grains and oilseeds; weighed over 97 million metric tons of grain; and issued over 87,000 official weight certificates.

For an average cost of 27 cents per metric ton of grain in fiscal year 1997, exporters received USDA export certificates from GIPSA. These certificates facilitate the marketing of over \$20 billion worth of grains and oilseeds. Likewise, here at home, buyers and handlers requested over 1.9 million inspections that facilitated the trading of 124 million metric tons of cereals and oilseeds destined for domestic use.

In fiscal year 1997, GIPSA continued to work closely with the U.S. grain handling industry on Electronic Data Interchange (EDI), an industry-driven electronic commerce initiative that is designed to automate the exchange of financial transaction documents among businesses. GIPSA established the standardized electronic file format that will be used for the EDI system and by official inspection providers.

GIPSA believes that America's producers are entitled to a market that treats them fairly and honestly. In fiscal year 1997, GIPSA completed a long-term investigation of charges against ConAgra, Inc., one of the Nation's largest food companies. In March 1997, ConAgra paid an \$8.3 million penalty after pleading guilty to Federal charges of adulteration, improper grading, and improper weighing of grain by the company's grain division, Peavey Grain. GIPSA continues to enforce its 1995 enactment of a prohibition on adding water to grain, which remains an enduring legacy of GIPSA's commitment to ensuring the integrity of the American grain marketing system and to safeguarding the rights and well-being of America's producers.

GIPSA'S 1999 BUDGET REQUEST

To fund these important initiatives and to enable GIPSA to remain a valuable part of American agriculture, GIPSA's total program level request for fiscal year 1999 is \$71.6 million, of which \$11.8 million represents appropriations. The remaining \$59.8 million represents continuing user fee authority for inspection and weighing services, and the implementation of new user fees for standardization and methods development activities in the grain program, and license fees to fund the Packers and Stockyards' (P&S) program.

For fiscal year 1999, the President's budget proposes a total program level for grain inspection of \$53.6 million, with \$4.6 million appropriated for compliance activities. The fiscal year 1999 budget also assumes enactment of legislation to authorize the collection of \$3.6 million in new user fees to cover the costs of grain standardization activities and \$2.8 million for methods development activities.

The budget proposes an increase of \$225,000 to allow GIPSA to establish electronic filing procedures for annual reports, which is consistent with the requirements of the Paperwork Reduction Act of 1995; an increase of \$795,000 for activities in the packer competition and industry structure areas; an increase of \$750,000 for

poultry compliance activities; and \$3 million for the one-time costs of reorganizing P&S' headquarters and field structures.

Finally, the fiscal year 1999 budget assumes enactment of legislation to authorize the collection of license fees to administer all activities under the P&S Act. All meat packers, live poultry dealers, stockyard owners, market agencies, and dealers, as defined in the P&S Act, would be subject to the license fees. Also included is a legislative proposal regarding a statutory dealer trust to require livestock inventories and accounts receivable due from the sale of livestock to be held in trust for unpaid cash sellers when a dealer fails to pay for livestock. The \$225,000 cost to implement this provision would be recouped through license fees.

AGRICULTURAL MARKETING SERVICE

The strategic goals for AMS include: facilitating the strategic marketing of U.S. agricultural products in domestic and international markets, and ensuring fair and competitive agricultural marketing through marketing tools and regulations.

AMS' activities include the dissemination of market information, development of grade standards that are used in the voluntary grading programs funded by user fees, protection of producers from unfair marketing practices, statistically reliable testing of commodities for pesticide residues, oversight of industry funded programs to promote agricultural products, and research and technical assistance aimed at improving efficiency of food marketing and distribution. AMS also administers marketing agreements and orders at the national level and purchases commodities that support domestic feeding programs.

Program Accomplishments and Plans

AMS published the proposed rule on Federal Milk Marketing Order reform in late January with a comment period that has been extended until April 30, 1998. To draft the proposed rule, we solicited comments from all sectors of the public and industry. AMS received nearly 3,700 comments and participated in 250 meetings with over 22,000 people. During the comment period we are holding listening sessions to continue the national dialogue.

AMS was successful in advancing U.S. interests in international commodity standards through active participation at the Economic Commission for Europe (ECE) and Codex. For example, ECE work was completed on pork cut specifications and begun on beef cut specifications that will result in standards that closely mirror existing U.S. standards being adopted throughout Europe. To facilitate international trade, AMS held several seminars for small business exporters to better acquaint them with import requirements in several key markets. In a cooperative effort between AMS and other government representatives from Canada and Mexico, the NAFTA Advisory Committee on Private Commercial Disputes Regarding Agricultural Goods developed a consensus recommendation to establish an industry-driven mechanism for the resolution of private commercial disputes involving fresh fruit and vegetable commerce between the 3 countries. AMS also worked with Mexico and Canada to conduct a series of seminars for fruit and vegetable shippers regarding import requirements for each country.

On December 16, 1997, AMS published the proposed rule for the National Organic Standards Program. Public meetings have been scheduled for February and March to provide USDA an opportunity to present the public an overview of the rule, respond to questions, and obtain public comment. The final rule will facilitate the movement of organic products domestically and internationally by assuring consumers of the validity and integrity of the organic label for the quality of product they are looking for in the marketplace.

AMS expanded the use of the Internet for program delivery to improve customer service. Daily market new reports will be made fully available through the Internet and we have placed the proposed rule for the Organic Standards Program on the Internet to facilitate public discussion and comment.

AMS Funding

For 1999, we are requesting a budget of \$58.5 million for the Marketing Services Program and \$1.2 million for the Federal-State Marketing Improvement Program. AMS will continue to improve ongoing program activities while achieving management efficiencies. For 1999, we are requesting program increases of \$11.8 million and a \$1 million decrease for Market Development and Assistance due to completion of marketing assistance to Alaska.

An increase of \$0.3 million is needed to expand international market news reporting. Agricultural exports are playing an increasingly important role in the U.S. agricultural economy. In 1998, agricultural exports are expected to increase by \$1.2 billion to a total of \$58.5 billion. Market surveys conducted by AMS have indicated

a stronger demand for export market information by the industry as they seek opportunities for increased international trade in the post-GATT and NAFTA economy. With the additional resources requested, AMS will be able to develop or obtain reports from major export markets and incorporate them into existing market news reporting. Improving AMS' ability to gather time-sensitive overseas market information will have a significant positive impact on the ability of U.S. products to take advantage of timely placement in the international marketplace.

In support of the recommendations made by the Secretary's Advisory Committee on Agricultural Concentration, AMS' 1999 budget request includes an increase of \$0.5 million to expand reporting of livestock and poultry markets to help ensure fair competition. AMS will improve market coverage and provide more detailed market information through: (1) increased reporting on terms of contract sales or captive supply transactions, (2) expanded reporting that includes value-based pricing indicators, (3) reporting share of slaughter by grade and yield, (4) reporting daily live cattle and hog crossings from Canada and Mexico, (5) increasing the reported volumes of forward sales of boxed beef, (6) expanding producer reported hog marketing information, and (7) reporting regional and national marketing of the direct feeder pig trade.

With the publication of the final rule for the National Organic Standards Program expected in early fiscal year 1999, AMS will require an additional \$0.5 million to ensure effective national implementation of the program. Additional personnel will be needed to review applications, develop and distribute manuals, and provide accreditation of certifiers. Once the program is established, growers and handlers will be assessed a certification fee and certification agents will be assessed fees for USDA accreditation to recover program costs. The user fees collected will be deposited into the Treasury rather than serving to offset the appropriation. As a result, we need additional appropriations authority in order to meet the anticipated expenses to implement the program.

For 1999, the budget includes an increase of \$10.5 million for the Pesticide Data Program (PDP). The requested increase includes \$2.5 million to maintain the sampling levels necessary for statistical reliability. For 1996 the PDP operated with a budget of \$11.6 million. In 1997, the funding was shifted to the Environmental Protection Agency (EPA) and the program had an operating budget of \$10.6 million, with spending at \$8.8 million. The program was shifted back to AMS for 1998 with a budget of \$8 million, plus \$1.8 million provided to AMS from carryover from EPA. With the additional funds requested for 1999, AMS will be able to maintain statistically reliable sampling, upgrade the program's laboratory capability to test a broader range of commodities and to conduct more specific analyses of greater use to EPA. At the current \$8 million level of funding, the program would have to drop up to 4 States from the program or reduce sampling rates by 13 percent. These actions would destroy the statistical sampling infrastructure of the program.

The budget request for PDP also includes an increase of \$1.7 million to establish a rapid response capability necessary to support risk assessment analysis for minor use pesticides. With the implementation of the Food Quality Protection Act, there is an increased demand for providing the EPA pesticide residue data for minor-use pesticides on a rapid basis. EPA will need the data to conduct dietary risk assessment reviews for over 9,000 tolerances over the next 10 years as required by the Food Quality Protection Act (FQPA). Without the data, EPA will be required to make conservative assumptions about pesticide levels that could result in over-estimation of risk and loss of pesticide registrations. The increased funds will permit increased sampling of specific commodities at a faster rate.

In support of the President's Food Safety Initiative, the AMS budget includes an increase of \$6.3 million to establish a microbiological data program. Utilizing the existing programmatic infrastructure of the PDP program, AMS will establish a statistically reliable estimate of microbiological contamination on domestic and imported fruits and vegetables. This information will be used by other agencies to assess the risk of contamination and will assist in the development of appropriate intervention strategies for ensuring the safety of these commodities.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

The APHIS Strategic Plan was developed to guide the agency into the next century and to help ensure that its programs and services remain relevant to our customers and American agriculture. The Agency has identified 5 strategic goals to achieve its expanded role. They include: safeguarding U.S. plant and animal resources from foreign pests and diseases; quickly detecting and responding to outbreaks of foreign agricultural pests and diseases; effectively managing domestic plant and animal pests and diseases and wildlife damage; ensuring the humane care

and treatment of animals; and facilitating the development of safe and effective scientific pest and disease control methods.

APHIS provides leadership in anticipating and responding to issues involving animal and plant health, conflicts with wildlife, environmental stewardship, and animal well-being. With its customers and stakeholders, APHIS promotes the health of animal and plant resources and facilitates their movement in the global marketplace. Global trade has changed the responsibilities of APHIS. A significant new commercial protection role has fallen to APHIS—to respond to other countries' animal and plant health import requirements and to negotiate science-based standards that ensure America's agricultural exports are protected from unjustified trade restrictions. The development of new "rules" of trade through World Trade Organization (WTO), GATT, and other agreements now must address sanitary and phytosanitary barriers based upon risk assessment procedures, regionalization and equivalence. APHIS is ready to meet the opportunity and challenge to develop new partnerships with States, industry, and the public through prevention, monitoring systems and response actions.

Program Plan and Accomplishments

One of the most visible jobs performed by APHIS is the Agricultural Quarantine Inspection (AQI) program which works to protect American agriculture and enhance trade. This is the Agency's first line of defense in protecting American agriculture from exotic pests and diseases and helps facilitate the entry of U.S. agricultural products into international markets. In 1997, APHIS inspected approximately 77 million passengers from international arrivals. The predeparture and preclearance programs intercepted 65,000 pests. Without these measures to mitigate the spread of pests and diseases via imports of contaminated commodities, U.S. exporters would face a challenge of meeting another country's Sanitary and Phytosanitary measures (SPS) requirements would increase dramatically.

Recently, APHIS' SPS was involved with the resolution of trade barrier issues worth nearly \$7 billion in exports of U.S. agricultural commodities. This represents about 12 percent of the total \$60 billion of U.S. agricultural exports in fiscal year 1996. Three issues: (1) wheat exports threatened by karnal bunt, (2) poultry meat to Russia, and (3) poultry meat to China—were worth a total of \$6.6 billion, or about 95 percent of the total value of APHIS' SPS accomplishments. All three issues were related to legitimate concerns about plant or animal health for countries importing U.S. products.

The Animal Health Monitoring and Surveillance program maintains the capability of consistent disease surveillance and detection, emergency disease preparedness and response, animal health monitoring, and epidemiological delivery. It enables APHIS to rapidly eliminate outbreaks of foreign animal diseases, to assess the risk of new and emerging domestic animal health issues, and to support APHIS' control and eradication programs. In 1997, APHIS conducted 316 investigations for suspected foreign animal diseases. APHIS' proactive animal health monitoring and disease surveillance program produced and interpreted scientifically valid information used by policy makers, producers, and consumers.

On the plant side, APHIS took quick action to address pest and disease outbreaks. Medflies were detected in the Tampa, Florida area in late May, posing a serious threat to Florida's \$6 billion agricultural market. In response to these captures, APHIS and the State of Florida were able to rapidly start a cooperative Medfly emergency program. The sterile fly release area covered more than 313 square miles. No wild Medflies have been detected in Florida since late August 1997; the emergency program is expected to be completed in fiscal year 1998.

APHIS used its contingency funds to implement the citrus canker emergency project in the Palmetto, Florida area where an outbreak was detected in June 1997. If citrus canker spread to commercial groves and nurseries, it would be very disruptive to commercial production of grapefruit, which is Florida's leading fresh market produce.

Recently, we have seen a surge of foreign animal diseases in Europe and elsewhere. Hog cholera has been diagnosed in Belgium, Germany, Spain and several other countries. As a result, we have implemented science based import restrictions. Hog cholera has also been confirmed in the Dominican Republic, following the outbreak of a highly virulent strain in neighboring Haiti a year earlier. APHIS is providing officials in the Dominican Republic with technical and laboratory assistance in diagnosing and managing the outbreak and has increased its agricultural quarantine inspection and monitoring efforts at ports of entry.

Another foreign animal disease we are monitoring closely is bovine spongiform encephalopathy (BSE), better known as "Mad Cow disease." Since 1989, the Department has severely restricted the importation of cattle, other ruminants, and rumi-

nant products from Great Britain and other countries where BSE exists. APHIS has also educated veterinary practitioners, laboratory diagnosticians, and producers on the clinical signs and pathology of the disease. In addition, the Agency conducted a comprehensive program for BSE surveillance, which involves laboratory examination of brain tissue from high-risk cattle. As of October 31, 1997, we have examined more than 6,508 cattle brains from throughout this country and found no evidence of the disease.

To make meat and poultry more plentiful and affordable, APHIS is continuing to make headway in several domestic animal health programs. Currently, the cooperative State-Federal bovine tuberculosis eradication program has only three infected cattle herds under quarantine, all in Texas' El Paso Milkshed area. In July 1997, APHIS detected and quarantined an infected beef herd on the Hawaiian Island of Molokai. This herd has been depopulated. Nationwide eradication is projected by the end of 1999.

With California's recent advancement to brucellosis-free status, we have now eradicated the disease in 40 States as well as the U.S. Virgin Islands and Puerto Rico. Another 6 States are in the qualifying period for brucellosis-free status and have no known infection. Nationwide, as of February 12, only 11 cattle herds in Texas and 1 domestic bison herd in South Dakota are known to be infected. This compares to 39 herds under quarantine a year earlier. Eradication in cattle herds is still on track for the end of 1998.

We are also making strides in reaching a long-term solution to the Yellowstone bison problem. In June, APHIS, the Forest Service, the National Park Service, and Montana officials announced agreement on a long-term approach for managing brucellosis in the Yellowstone bison population. This interim plan meets the primary goals of maintaining a wild, free-ranging population of bison and also addressing the risk of brucellosis for livestock interests in the area.

Successes in the boll weevil eradication program utilizing the Farm Service Agency loans allow for a reduced appropriations request. This mostly grower-funded and managed program needs 100 percent participation and is mandated by State law following a positive grower referendum. The program funded at least 70 percent by non-federal cooperators, has been extremely successful in improving cotton yields and reducing production costs on over 4 million acres in the eradicated areas. The rate of return on funds invested in boll weevil eradication is estimated to be \$12 for every \$1 in program cost. Economic studies indicate that once boll weevil eradication is accomplished there is an estimated yield increase of at least 69 pounds per acre, pesticide savings of at least \$30 per acre, and land value increases of \$14 per acre. The goal of eradicating this pest is by 2003.

This past year, the Animal Damage Control program underwent a name change to Wildlife Services (WS) which more accurately reflects its program operations. Cooperative efforts allow us to make the best use of our funds. In fiscal year 1997, the WS budget for field operations was almost \$23 million. For that same period, the cooperative funds provided by States, industry and private individuals totaled approximately \$24 million—reflecting a projected increase of about \$1 million from the previous year. The willingness of many States to provide more than a dollar-for-dollar match shows commitment and a large measure of customer satisfaction. We are working toward the goal of having, within the next 2–3 years, cooperators in States with large direct control efforts to pay for at least 50 percent of the program benefits they receive.

APHIS recently shifted its strategy to conduct more in-depth Animal Welfare Act inspections, particularly of those licensees and registrants with historical compliance problems. This approach resulted in a slight decrease in the overall number of inspections, but a significant increase in the amount of time spent inspecting facilities. Similarly, we redirected our enforcement efforts away from a rigid, "one size fits all" philosophy to a flexible approach that evaluates cases on their individual merits.

The Agency continued its efforts to trace back dogs and cats sold by class B dealers to research facilities. In fiscal year 1997, we were able to trace back about 95.5 percent of animals sold to research to their original source—up from approximately 40 percent in fiscal year 1993. We believe all these and many other efforts are leading to one positive end: Improved welfare for all animals protected under the AWA.

APHIS continued developing a strategic plan for the horse protection program that would provide for more effective use of resources and gain increased compliance with the Horse Protection Act. This plan has been developed jointly with horse industry organizations and APHIS veterinarians. This partnership will place increased regulatory authority and enforcement responsibilities on USDA—certified organizations.

Future challenges to the environment cannot be ignored. As the world population increases, we must develop methods to ensure that our agricultural production keeps pace with growing food demands while remaining stewards of the earth, water, and air. APHIS is well positioned to see that many of the necessary solutions are coming by way of agricultural biotechnology.

As part of its regulatory mission, APHIS oversees the field testing of genetically engineered plant varieties to ensure that they pose no significant impact on the environment or agriculture. Since the first field trial under our regulations in 1987, they have evaluated more than 3,600 field trials at more than 14,000 sites throughout the United States.

APHIS also makes decisions about whether to deregulate new plant varieties, thus clearing the way for their commercialization. These new plant varieties may hold the key to meeting our biggest future challenges in agriculture—those of feeding a growing world population while sustaining our environmental resources. In 1997, a corn hybrid engineered for resistance to the European corn borer averaged 15 more bushels per acre than other corn hybrids, without the use of additional pesticides.

With the benefits of increased international trade, come new scientific responsibilities and the essential need for trading partners to exchange information. In this regard, a great challenge for APHIS is the need to educate our trading partners about the safety and benefits of these new, genetically enhanced plant products. In addition to ensuring that genetically engineered plants pose no danger to agriculture or the environment, we need to help governments and consumers across the world understand that they are safe. Increased understanding of the benefits of these products, as well as the extent to which they are tested, is critical to their acceptance and success in the international marketplace.

On August 4, 1997, the Denver Wildlife Research Center in Lakewood, Colorado officially closed and the National Wildlife Research Center (NWRC) in Fort Collins, Colorado opened. As of that date, all NWRC headquarters' personnel began working out of a combination of permanent and GSA leased facilities in Fort Collins. Work on the new headquarters office/laboratory building on 43 acres on the foothills research campus of Colorado State University was initiated shortly thereafter. Occupancy of the 82,000 square foot building is expected to begin in late 1998, at which time all personnel will be located at one site after about four years in transition.

The Integrated Systems Acquisition Project (ISAP) is an APHIS strategic initiative to replace aging, obsolete, and non-integrated Information Technology platforms. The ISAP initiative will result in an integrated hardware and software platform across the entire Agency to provide information and data sharing at all levels of the organization. The Agency will fully redeploy in-house and contractor resources to comply with Year 2000 requirements.

APHIS' 1999 BUDGET REQUEST

The budget request proposes \$417.8 million for salaries and expenses. The fiscal year 1999 budget proposes a redirection of \$12 million from APHIS' appropriations for the cotton growers share of boll weevil eradication to a USDA loan program. The redirection from boll weevil eradication results without a reduction in program operations by relying on the foundations to borrow cost sharing funds from CCC. The program successes in brucellosis allow an \$8 million redirection to higher priority activities which help the Agency comply with international trade agreements. The budget assumes increased cost sharing from beneficiaries of Wildlife Services activities. Also, this budget supports activities to significantly increase agricultural exports. It maintains funding for our important data gathering and risk analysis used in negotiations concerning sanitary and phytosanitary trade barriers and restrictions on genetically engineered products entering world markets. Funding increases are provided for Pest and Disease Exclusion activities such as Agricultural Quarantine Inspection at the borders. APHIS will likely inspect upwards of 85 million passengers potentially carrying banned agricultural products into the United States.

The budget also assumes enactment of legislation to recover the costs of providing certain costs for animal welfare, veterinary biologics, pink bollworm, biotechnology and the Swine Health Protection Act. We believe that the identifiable beneficiaries of these Federal programs, rather than the general taxpayer, should pay for the services they receive.

An appropriation of \$5.2 million is proposed for general maintenance and to support continued modernization of APHIS facilities in 1999 and to complement the Agricultural Research Service's request to continue modernization of the Plum Island Animal Disease Center.

This concludes my statement. I am looking forward to working with the Committee on the 1999 budget for the Marketing and Regulatory Programs. We believe the proposed funding amounts and sources of funding will provide the level of service desired by our customers—the farmers and ranchers, the agricultural marketing industry, consumers, as well as the taxpayers who desire a balanced budget. We are happy to answer any questions.

PREPARED STATEMENT OF TERRY L. MEDLEY

Mr. Chairman and members of the Committee, I am pleased to report on our accomplishments and the challenges facing APHIS as we work to help ensure a wholesome, affordable food supply while stimulating global economies, safeguarding agricultural resources, and protecting ecological systems.

OUR MISSION

APHIS leads the way in anticipating and responding to issues involving animal and plant health, conflicts with wildlife, environmental stewardship, and animal well-being. Together with our customers and stakeholders, we promote the health of animal and plant resources to facilitate their movement in the global marketplace and to ensure abundant agricultural products and services for U.S. customers.

OUR FOCUS

Over the past 25 years, APHIS has played a key operational role in USDA's efforts to protect America's animal and plant resources from agricultural pests and diseases. The continued profitability and viability of U.S. agriculture, however, now also depends on the ability of U.S. producers to be competitive in a world market. In recent years, APHIS expanded beyond just regulating the imports of agricultural products in the U.S. to reduce the risk of exotic pests and diseases. Aggressively promoting U.S. exports will continue to be a dominant USDA focus for stimulating domestic farm employment and income. A significant new commercial protection role has fallen to APHIS—to respond to other countries' animal and plant health import requirements and to negotiate science-based standards that ensure America's agricultural exports are protected from unjustified trade restrictions. APHIS' protection role has also expanded over the years to include important functions related to the welfare of animals and to interactions with America's wildlife.

The Agency has identified five strategic goals to help us achieve our expanded role. I would like to address each of those goals and our accomplishments toward fulfilling them.

GOAL 1

Safeguard U.S. plant and animal resources against introductions of foreign pests and diseases while meeting international trade obligations

Exports climbed to \$59.8 billion in 1996; the U.S. share of global agricultural trade has also increased. Today we are the world's leading exporter of agricultural products, commanding a 23 percent share of world agricultural trade—up from 17 percent a decade ago. Our agricultural trade surplus totaled \$27 billion in 1996—the largest in history—making the agricultural sector the largest positive contributor to the U.S. balance of trade.

Consider for a moment APHIS' work to protect American agriculture and enhance trade. The Agricultural Quarantine Inspection (AQI) program is the Agency's first line of defense in protecting American agriculture from exotic pests and diseases and helps facilitate the entry of U.S. agricultural products into international markets. In 1997, APHIS inspected approximately 77 million passengers from international arrivals, and the predeparture and preclearance programs and intercepted 65,000 pests. For 1999, total inspections are expected to reach 85 million—48 million funded through user fees and the remainder through appropriated funds. These efforts protect domestic producers and industries. But without these measures in place to mitigate the spread of pests and diseases via imports of contaminated commodities, the challenge U.S. exporters would face in terms of meeting another country's Sanitary and Phytosanitary measures (SPS) requirements would increase dramatically. APHIS personnel have made and continue to make major contributions in resolving issues related to the World Trade Organization (WTO) Agreement on the Application of SPS Measures.

Export Issues

Recently, APHIS' SPS accomplishments included assisting in the resolution of trade barrier issues worth nearly \$7 billion in exports of U.S. agricultural commodities. This represents about 12 percent of the total \$60 billion of U.S. agricultural exports in fiscal year 1996.

The \$7 billion of unjustified trade restrictions on U.S. exports involved a wide variety of issues with a total of 16 countries. The value of export markets enhanced by these efforts ranged from a low of \$400,000 for an individual issue (export access for goats to Taiwan; swine to Vietnam) to a high of \$4.9 billion (worldwide wheat export markets retained after a threatened cutoff due to Karnal bunt in the United States). The median value of the SPS issues was \$5 million.

Recently, APHIS' efforts to retain markets threatened by SPS concerned nearly \$6 billion of exports. The retention of U.S. wheat export markets threatened by the discovery of Karnal bunt in some areas of the United States was the largest contributing issue (\$4.9 billion). Another large market retained in fiscal year 1996 was the \$700 million Russian poultry meat market which was threatened by Russian concerns about sanitary controls of the U.S. poultry industry. A third major SPS accomplishment, expansion of poultry meat exports to China, was worth an estimated \$1 billion.

These three issues—(1) wheat exports threatened by Karnal bunt, (2) poultry meat to Russia, and (3) poultry meat to China—were worth a total of \$6.6 billion, or about 95 percent of the total value of APHIS' SPS accomplishments. All three issues were related to legitimate concerns about plant or animal health for countries importing U.S. products. The issues were resolved in the United States' favor because APHIS scientists were able to demonstrate that the commodities involved posed negligible risks to the importing countries.

Import Issues

In fiscal year 1996, consistent with its obligations under the SPS Agreement, APHIS enabled the importation of several previously prohibited commodities into the United States. Examples are citrus from South Africa and fruit trees from France. Through the use of risk assessments, APHIS determined that these commodities, worth almost \$16 million in increased exports for the countries involved, did not pose a threat to U.S. animal and plant health. These import issues are considered APHIS SPS accomplishments, because prohibiting the importation of these commodities might have been considered an unjustified SPS trade barrier. By actively heading off potential challenges, APHIS was able to show its commitment to the SPS Agreement while still maintaining adequate safeguards for U.S. agriculture. In agriculture, the U.S. is likely to be the clear winner when SPS standards are science-based and fair.

One of the most significant concepts introduced under the SPS agreements is regionalization—the idea that, for trade purposes, we can recognize pest and disease free zones or areas of low pest or disease incidences. Under these agreements, countries are committed to adapting their import requirements to the health conditions of the specific zone or area from which a plant or animal commodity originates. The concept of regionalization recognizes that health conditions vary tremendously across a country as a result of ecological, environmental, and quarantine differences. The burden of demonstrating a free or low prevalence area is on the exporting country.

Under NAFTA and GATT, we are working to ensure opportunities for trade occur. As with any commodity, once the opportunity to trade is negotiated, a lot of work has to be done to make sure the pest and disease requirements are met and maintained. A crucial part of fair and free trade is establishing a process for resolving commercial trade disputes. Under NAFTA, a trilateral advisory committee of Mexico, the United States, and Canada are working to develop such a process. In addition, we have and will continue to use the trade dispute settlement process under the World Trade Organization to challenge countries who are not living up to their commitments under the free trade agreements.

For its part, Mexico recently permitted the importation of U.S. sweet cherries from Washington, Oregon, and California in accordance with an approach designed to prevent the introduction of pests of concern. Just last September, Mexico officials recognized Arizona's citrus production areas as free of Mediterranean and Mexican fruit flies, removing any phytosanitary barriers to the export of those fruits. We also continue to discuss the possibility of permitting Florida citrus exports to Mexico. With every such decision rooted firmly in scientific information, we move much closer to fully actualizing the principles and agreements to which we have committed.

GOAL 2

Quickly detect and respond to introductions of foreign agricultural pests and diseases or other emerging agricultural health threats, to minimize production losses and export market disruptions

APHIS' domestic programs which monitor, survey, impose Federal quarantines, and conduct eradication programs, is the force that permits U.S. agricultural commodities to be as widely accepted throughout the world as they are today. Without the maintenance of a strong domestic program, APHIS' ability to certify to the SPS requirements of other countries would be marginal.

Our Animal Health Monitoring and Surveillance program maintains the capability of consistent disease surveillance and detection, emergency disease preparedness and response, animal health monitoring, and epidemiological delivery. It enables APHIS to rapidly eliminate outbreaks of foreign animal diseases, to assess the risk of new and emerging domestic animal health issues, and to support APHIS' control and eradication programs. In 1997, APHIS conducted 316 investigations for suspected foreign animal diseases. APHIS' proactive animal health monitoring and disease surveillance program produced and interpreted scientifically valid information used by policy makers, producers, and consumers. This program delivered objective information addressing animal health as it pertains to U.S. trade, agricultural productivity, public health, and on-farm quality assurance. Through effective partnerships with animal commodity producer groups—and with State governments, university researchers and other Federal Agencies—the program met producers' and the U.S. Public's information demands in a cost-effective, collaborative manner minimizing duplication of effort.

On the plant side, APHIS took quick action to address pest and disease outbreaks. Medflies were detected in the Tampa, Florida, area in late May, posing a serious threat to Florida's \$6 billion agricultural market. In response to these detections, APHIS and the State of Florida were able to rapidly start a cooperative Medfly emergency program. The sterile fly release area covered more than 313 square miles. No wild Medflies have been detected in Florida since late August 1997; the emergency program is expected to be completed in fiscal year 1998.

APHIS funded efforts for the citrus canker emergency project in the Palmetto, Florida, area where an outbreak was detected in June 1997. To effectively prevent the spread of citrus canker in Palmetto, APHIS and the State of Florida established a quarantine zone of 34 square miles and in Miami, the quarantine zone was more than 361 square miles. If citrus canker spread to commercial groves and nurseries, it would be very disruptive to commercial production of grapefruit, which is Florida's leading fresh market produce.

Also in 1997, APHIS used contingency funds to battle an Asian longhorned beetle (ALB) emergency control project in New York State. The program consists of tree removal, detection and delimiting surveys, and education efforts. During fiscal year 1997, the program achieved drastic reductions of ALB populations in areas that had been heavily infested. If ALB spreads, it would threaten trees nationwide and pose problems for the sugar maple industry in upstate New York and its surrounding areas.

In addition to these eradication programs, APHIS closely monitored two other animal disease situations. The first is the outbreak of vesicular stomatitis in the Western States. In response to this disease situation, Canada and the European Union have prohibited the importation of horses, ruminants, and swine from these States. APHIS continues to work with the affected States to closely monitor the situation and help producers meet trade requirements.

The second disease situation is a low pathogenic strain of H7N2 avian influenza that has been detected in 14 commercial poultry flocks near Lancaster County, Pennsylvania, last year. At the State's request, we have authorized the production and storage of an H7N2 vaccine for possible emergency use. APHIS will utilize the avian influenza vaccine as a tool only in the unlikely event of an outbreak of the highly pathogenic form of the disease.

Our commitment to preventing the entry of foreign agricultural diseases and pests remains as strong as ever. We recognize that our initiatives to prevent the entry of agricultural diseases and pests have taken on increasing importance in this era of growing international trade and travel. Now more than ever, export opportunities hinge on a country's ability to prevent the entry of agricultural diseases, to document scientifically the health of its agricultural industry, and to respond quickly and decisively to disease and pest emergencies in the event prevention strategies are breached.

To improve its emergency management strategy even further, APHIS has streamlined its Regional Emergency Animal Disease Eradication Organization to improve

Departmental responsiveness to animal disease emergencies. Now, two highly prepared and trained regional teams can be dispatched immediately at the first indication of foreign livestock or poultry disease, such as in 1996 when exotic Newcastle disease was detected at a pet bird facility in Missouri and vesicular stomatitis was diagnosed in horses and cattle in Arizona, New Mexico, Colorado, and Utah.

Recently, we have seen a resurgence of foreign animal diseases in Europe and elsewhere. Hog cholera has been diagnosed in Belgium, Bulgaria, Croatia, the Czech Republic, Germany, Italy, the Netherlands, and Spain. As a result, we have implemented appropriate import restrictions. Hog cholera has also been confirmed in the Dominican Republic, following the outbreak of a highly virulent strain in neighboring Haiti a year earlier. APHIS is providing officials in the Dominican Republic with technical and laboratory assistance in diagnosing and managing the outbreak and has increased its agricultural quarantine inspection and monitoring efforts at ports of entry.

Another foreign animal disease we are monitoring closely is bovine spongiform encephalopathy (BSE). Since 1989, we have severely restricted the importation of cattle, other ruminants, and ruminant products from Great Britain and other countries where BSE exists. We have also educated veterinary practitioners, laboratory diagnosticians, and producers on the clinical signs and pathology of the disease. In addition, we conduct a comprehensive program for BSE surveillance, which involves laboratory examination of brain tissue from high-risk cattle. As of October 31, 1997, we have examined more than 6,508 cattle brains from throughout this country and found no evidence of the disease.

GOAL 3

Effectively manage plant and animal pests and diseases and wildlife damage which pose risks to agriculture, natural resources, or public health

U.S. livestock and poultry producers provide households throughout the Nation—and the world—with high quality, affordable products. Because of their efforts, Americans are eating more meat and poultry than ever before. Estimates indicate that the average American adult eats more than 160 pounds of meat and poultry a year. Per person, that's 1.5 pounds more meat and poultry consumed per year than 10 years ago.

To make meat and poultry more plentiful and affordable, APHIS is continuing to make headway in several domestic animal health programs. Currently, the cooperative State-Federal bovine tuberculosis eradication program has only three infected cattle herds under quarantine, all in Texas' El Paso Milkshed area. In July 1997, APHIS detected and quarantined an infected beef herd on the Hawaiian Island of Molokai. This herd has been depopulated. We are still aiming for nationwide eradication by the end of 2000.

In regard to pseudorabies, with the addition of Tennessee in August and the U.S. Virgin Islands this month, 26 States and two U.S. Territories—including Puerto Rico—are currently free of the disease. Since 1992, the number in infected herds has dropped from approximately 8,000 to nearly 2,000. Nationwide eradication of this disease is also set for the end of 2000.

With California's recent advancement to brucellosis-free status, we have now eradicated the disease in 40 States as well as the U.S. Virgin Islands and Puerto Rico. Another six States are in the qualifying period for brucellosis-free status and have no known infection. The number of herds under quarantine has declined from 959 herds in fiscal year 1991 to 11 cattle herds as of February 12, 1998. The number of newly infected herds has also declined, from 400 in fiscal year 1991 to 64 in fiscal year 1997.

We are also making strides in reaching a long-term solution to the Yellowstone bison problem. In June, APHIS, the Forest Service, the National Park Service, and Montana officials announced agreement on a long-term approach to manage brucellosis and the Yellowstone bison population. This plan meets the primary goals of maintaining a wild, free-ranging population of bison and also addressing the risk of brucellosis for livestock interests in the area.

While livestock and poultry producers face many challenges in their efforts to meet the rising demand for their products at home and abroad, they can be reassured that they do not face these challenges alone. APHIS is working hard to protect the health of U.S. livestock and poultry and to facilitate agricultural trade based on fair, science-based standards.

The cooperative boll weevil program uses judicious application of pesticides based on the extensive and timely use of pheromone traps to reach the goal of eradicating the pest by 2003. This mostly grower-funded and managed program needs 100 percent participation and is mandated by State law following a positive grower referen-

dum. The program, funded at least 70 percent by non-federal cooperators, has been extremely successful in improving cotton yields and reducing production costs on over 4 million acres in the eradicated areas. The rate of return on funds invested in boll weevil eradication is estimated to be \$12 for every \$1 in program cost. Economic studies indicate that once boll weevil eradication is accomplished there is an estimated yield increase of at least 69 pounds per acre, pesticide savings of at least \$30 per acre, and land value increases of \$14 per acre.

Clearly, success in APHIS' active control programs such as brucellosis and boll weevil will require less funding as the pests and diseases are eradicated. This will allow APHIS to strategically focus on prevention by increased monitoring and surveillance, using the latest diagnostic techniques.

This past year, we changed the name of the Animal Damage Control Program to Wildlife Services (WS) to more accurately reflect what we do. Besides protecting agricultural resources, WS continued its efforts to protect public health and safety, property and threatened and endangered species. WS also continued its interagency agreement with the National Agricultural Statistics Service (NASS) to determine the magnitude and extent of wildlife damage to various agricultural resources. In January 1997, NASS surveyed approximately 1,500 catfish producers. Sixty-eight percent of the respondents indicated they had spent some effort to avoid wildlife caused losses to their catfish crops. The overall cost of preventing losses and damage were projected to have cost catfish producers about \$17 million during 1996.

In 1998, the WS program is partnering with the Federal Aviation Administration (FAA) and the Department of Defense (DOD) on the National Performance Review's Reinvention Impact Center Initiative to increase airline safety and reduce economic losses to aircraft. Partnering with FAA and DOD will allow for greater leveraging of resources to provide a safer environment for the flying public and military personnel both domestically and internationally. Approximately 10,000 civilian aircraft and 3,000 military aircraft collide with wildlife in the United States each year. These strikes have resulted in the loss of human life and economic damage to aircraft of approximately \$300 million annually.

During fiscal year 1997 and fiscal year 1998, WS personnel assisted Texas Department of Health officials distribute over 5 million oral rabies vaccine baits to stop the canine strain of rabies in coyotes and foxes in south and central portions of Texas. To date, the vaccines have been successful in stopping the spread of this disease. WS personnel also assisted with either oral rabies vaccine bait distributions, monitoring, or surveillance activities in Vermont, Ohio, and New York to stop the spread of the Mid-Atlantic strain of rabies in the raccoon population in those States.

The wolf management programs in Idaho, Montana, Wyoming, and Minnesota continues to accelerate as the number of wolves increase and disperse into previously wolf-free areas. The rapidly expanding wolf population and resulting requests for assistance, continues to present a challenge for WS. In March 1998, the Fish and Wildlife Service (FWS) plans to reintroduce Mexican wolves into Arizona. With funding from the FWS, WS has placed a wolf management specialist in that State. Two other Wolf Management Specialists are presently located in Minnesota and Montana where they work closely with officials from the FWS, National Park Service, and livestock producers.

It is gratifying to see the support for WS from Congress and the States where we provide service. Cooperative efforts allow us to make the best use of our funds. In fiscal year 1997, WS' budget for field operations was almost \$23 million. For that same period, the cooperative funds provided by States, industry and private individuals totaled approximately \$24 million—reflecting a projected increase of about \$1 million from the previous year. Their overall nationwide dollar-for-dollar match commitment is the ultimate measure of customer satisfaction.

GOAL 4

Ensure the humane care and treatment of animals covered under the Animal Welfare Act and the Horse Protection Act

After 30 years of focusing almost entirely on conducting as many inspections as possible, we shifted our strategy to conducting more in-depth inspections, particularly of those licensees and registrants who historically had compliance problems. This approach resulted in a slight decrease in the overall number of inspections, but a significant increase in the amount of time spent inspecting facilities. We used this time to take a closer look at licensees' and registrants' animals, facilities, and records. Similarly, we redirected our enforcement efforts away from a rigid, "one size fits all" philosophy to a flexible approach that evaluates cases on their individual merits. This approach enables us to work with individuals who recognize their errant ways and want to improve the welfare of their animals. At the same time,

it allows us to impose stringent sanctions on licensees and registrants who continue to show little or no effort to provide better care or housing for their animals. The success of this approach is becoming evident in two ways. First, there is an increasing number of facilities found in full compliance upon inspection; currently about 56 percent. Additionally, we have taken prompt and severe action when the violations were egregious or normal efforts to achieve compliance failed. During the year, 43 Animal Welfare Act licenses were suspended or revoked, or unlicensed operators disqualified from having a license. A record sanction of \$175,000 was also assessed from a dog dealer whose license was permanently revoked. During 1997, we were able to reduce a backlog of AWA cases that developed over the past several years by about 25 percent.

Under our umbrella strategic direction initiative, we also began preparing our Animal Care (AC) program for the 21st Century. This change initiative involves employees from all levels of the program and is aimed at making AC a recognized leader in the field of animal welfare.

In fiscal year 1997, we advanced the initiative in many ways, such as equipping all AC field personnel with laptop computers on which they now generate inspection reports and developing a formal risk-based inspection system that will eventually enable us to direct our limited inspection resources where they are needed most.

Complementing this initiative were numerous special projects. These projects included our increased emphasis on public outreach, which resulted in a quarterly report to the program's stakeholders. They also included AC's efforts to partner with another APHIS unit in inspecting animal handlers at airports.

Perhaps most impressively, however, were our ongoing efforts to trace back dogs and cats sold by class B dealers to research facilities. In fiscal year 1997, we were able to trace back an impressive 95.5 percent of animals sold to research to their original source—up from approximately 40 percent in fiscal year 1993. We believe all these and many other efforts are leading to one positive end: improved welfare for all animals protected under the AWA.

APHIS continued developing a strategic plan for the horse protection program that would provide for more effective use of resources and gain increased compliance with the HPA. This plan has been developed jointly with horse industry organizations and APHIS veterinarians. This partnership will place increased regulatory authority and enforcement responsibilities on USDA-certified organizations.

GOAL 5

Facilitate the development of safe and effective veterinary biologics, biotechnology-derived products, and other scientific methods for the benefit of agricultural producers and consumers and to protect the health of American agriculture

Of course, the future also holds other challenges and hard realities that cannot be ignored. For example, as the world population increases, we must develop methods to ensure that our agricultural production keeps pace with growing food demands. Moreover, as we do so, we must remain sensitive to the toll we take upon the environment. We cannot afford to sacrifice our natural resources. Fortunately, these challenges are already prompting new ways of thinking, leading to the development of new solutions. APHIS is well positioned to see that many of these solutions are coming by way of agricultural biotechnology.

As part of our regulatory mission, APHIS oversees the field testing of genetically engineered plant varieties to ensure that they pose no significant impact on the environment or agriculture. Since the first field trial under our regulations in 1987, we have evaluated more than 3,600 field trials at more than 14,000 sites throughout the United States.

Overall, derivatives of 48 different plant species have been field tested to date, including species as diverse as sugar cane, poplar trees, turfgrass, rice, and sunflowers. Derivatives of most major U.S. crops—corn, soybeans, potatoes, tomatoes, cotton, and tobacco—have each had a large number of trials.

APHIS also makes decisions about whether to deregulate new plant varieties, thus clearing the way for their commercialization. In 1992, Calgene's delayed-ripening tomato, the Flavr Savr, became the first genetically modified crop approved for deregulation. Since then, we have deregulated nearly 30 more products—including varieties of virus-resistant squash and papayas; insect-resistant cotton, corn, and potatoes; herbicide-tolerant corn and soybeans; high-laureate canola; and delayed-softening tomatoes. The wave of new products shows no sign of slowing. These new plant varieties may hold the key to meeting our biggest future challenges in agriculture—those of feeding a growing world population while sustaining our environmental resources. For example, herbicide tolerant plants like the Roundup Ready soybeans enable farmers to reduce herbicide applications drastically. Insect-resist-

ant crops like Bt cotton and corn can result in increased yields and substantial decreases in pesticide use. For example, in 1997, a corn hybrid engineered for resistance to the European corn borer averaged 15 more bushels per acre than other corn hybrids, without the use of additional pesticides.

In addition to these developments, plants like the papaya and the potato are being genetically engineered for resistance to viral diseases. We estimate that viral disease and damage cause about 20 percent of all vegetable crop loss. Scientists are also working on crops with additional nutritional or medicinal properties, as well as plants that can tolerate a variety of adverse environmental conditions, such as soil salinity and drought.

With the benefits of increased international trade, come new scientific responsibilities and the essential need for trading partners to exchange information. In this regard, a great challenge for APHIS is the need to educate our trading partners about the safety and benefits of these new, genetically enhanced plant products. In addition to ensuring that genetically engineered plants pose no danger to agriculture or the environment, we need to help governments and consumers across the world understand that they are safe. Increased understanding of the benefits of these products, as well as the extent to which they are tested, is critical to their acceptance and success in the international marketplace. If we can meet this challenge, the rewards for the environment and people around the world will be considerable.

On August 4, 1997, the Denver Wildlife Research Center in Lakewood, Colorado officially closed and the National Wildlife Research Center (NWRC) in Fort Collins, Colorado opened. As of that date, all NWRC headquarters' personnel began working out of a combination of permanent and GSA leased facilities in Fort Collins. Work on the new headquarters office/laboratory building on 43 acres on the foothills research campus of Colorado State University was initiated shortly thereafter. Occupancy of the 82,000 square foot building, which is being constructed by GSA, is expected to begin in late 1998, at which time all personnel will finally be located at one site after about four years in transition.

During 1997, WS methods development established new or continued work on existing cooperative agreements which enhance the Center's research program. One example is the agreement with the DOD to continue research into the development of chemical control methods for brown tree snake control on Guam. The NWRC has 20 identified research projects that seek to address the research needs of its stakeholders. These projects are between 3–5 years in duration and are developed around nationwide research needs assessments conducted in 1989 and 1996. Two examples of projects regarding coyote studies include a study to determine the effectiveness of using llamas as livestock guarding animals, and a project to evaluate the effectiveness of chemical reproductive control on coyotes. Another ongoing research project is the management and analysis of the FAA's National Database on bird and other wildlife strikes with aircraft, which can be a serious economic and safety problem for civilian aircraft in the United States. Pilots and others report strikes to the FAA. Biologists now have over 17,000 strike reports from 1989 through 1997 edited and accurately entered into a National Wildlife Strike Database. This database already is proving to be invaluable in providing biologists, aeronautical engineers, and airport managers with specific information on strike histories.

The Integrated Systems Acquisition Project (ISAP) is an APHIS strategic initiative to replace aging, obsolete, and non-integrated Information Technology platforms. The ISAP initiative will result in an integrated hardware and software platform across the entire Agency to provide information and data sharing at all levels of the organization. The Agency will fully redeploy in-house and contractor resources to comply with year 2000 (Y2K) requirements. Of the 145 applications in APHIS, 21 have been identified as mission critical and are scheduled for Y2K remediation. All 21 mission critical applications will be made Y2K compliant by September 1998 with implementation no later than March 1999.

FISCAL YEAR 1999 BUDGET REQUEST

The 1999 Budget proposes an appropriation level of \$417.8 million for Salaries and Expenses, a \$9.9 million decrease below the 1998 current estimate. A critical part of this request is pay and retirement costs of almost \$8.6 million. This funding is crucial to maintaining our existing infrastructure to carry out all Agency programs.

The Agricultural Quarantine Inspection (AQI) program is the Nation's frontline defense against the introduction of dangerous agricultural pests and diseases from other countries. The 1996 FAIR Act set up the funding mechanism for the AQI—User Fees program which inspects international passengers, aircraft, ships, railcars,

and trucks. Essentially, there are three funding parts—Congressional appropriation; the reserve amount at the end of 1996; and collections over \$100 million. An appropriation of less than \$100 million means either that more funding must come from the reserve available at the end of 1996 which is rapidly becoming depleted, or that fees to the public will have to be increased unnecessarily to offset funds that have already been collected, but cannot be used until 2003. With the \$100 million appropriation, we can address increased traffic of Asian and European agricultural products into the United States. This has created the need for increased inspections to reduce the risk of introducing exotic agricultural pests into the U.S. APHIS will likely make over 85 million inspections to intercept banned agricultural products from entering the United States.

Animal Health Monitoring and Surveillance is the corner stone of our animal health infrastructure and is key to preserving and enhancing America's animal health. Without this program, we could not quickly detect and respond to introductions of foreign agricultural disease that may cause production losses and export market disruptions. The budget requests a \$4.6 million increase from fiscal year 1998. We intend to expand the National Animal Health Monitoring System to routinely identify diseases and death loss trends in sentinel feedlot and dairy cattle and swine. The Agency would enhance its emergency preparedness and response capabilities by upgrading its Foreign Animal Diseases Reporting and Networking System and developing and training on biological terrorism and other emerging disease issues. Finally, we would also work cooperatively with State and Federal wildlife agencies to investigate, study, and evaluate disease conditions in wildlife.

The budget proposes an increase of \$259 thousand for pest detection activities, which would be contributed toward cooperative research agreements to improve responses to plant pest and disease outbreaks and infestations, such as Karnal Bunt. Beyond the increase in fiscal year 1999, APHIS also plans to devote \$1 million to develop a strong fruit fly trapping and detection program to prevent the recurrence of fruit flies in Florida, which the state is expected to match. By detecting intrusions quickly, we will be able to control them within available funds and avoid the need for large, expensive emergency programs. These measures would reassure our international trading partners of APHIS' commitment to fruit fly control and deter them from prohibiting the entry of U.S. citrus and other agricultural products. At the same time, this would enable APHIS to cooperate with Florida on a similar basis as will California, providing an equal safeguarding level of this country's two largest citrus exporting states.

The budget provides a program increase of \$0.7 million to strengthen fruit fly exclusion and detection activities. The agency will carry out Environmental Protection Agency recommendations to minimize the use of pesticides by strengthening domestic fruit fly detection and control by increasing detection surveys in expanding urban areas where introduction is most likely. The increased funding will assure U.S. trading partners of our commitment to fruit fly control and ease entry of U.S. produce into foreign countries. The budget also requests a program increase of \$0.6 million for international programs. APHIS would open new offices in Southeast Asia and Brazil to direct APHIS Sanitary/Phytosanitary (SPS) activities. The Agency has taken on greater responsibility for resolving SPS conflicts since the signing of the World Trade Organization agreement. Further, funds would be used to resolve SPS standards requirements for U.S. agricultural trade. Such funding would help meet the Secretary's goal to double agricultural exports over the next several years.

The 1999 request for screwworm proposes a \$1.4 million program reduction. Active eradication efforts will focus on Costa Rica and Panama where the total land mass is less than in Nicaragua and eradication costs can be reduced. The Agency will begin sterile fly releases into Panama, the last country before the barrier is established in the Isthmus of Panama. The program expects to begin planning for the new Panama facility in fiscal year 1999 with an architectural and engineering study.

The budget proposes an \$8.5 million program reduction in brucellosis eradication expenditures. APHIS has 9 States in the final stages of eradication and anticipates that all 50 States will be in Class "Free" Status by the end of 1999. The budget proposes a program reduction for boll weevil of \$12.2 million below the 1998 current level. The Agency is gradually transferring full operational responsibility for program activities where the boll weevil no longer exists to grower organizations. APHIS would continue to oversee and provide technical support to boll weevil detection and control activities in eradicated and non-infested areas. Growers can pay a greater share of program costs due to loans made available from USDA's Farm Service Agency. Therefore, funding above the Administration's request for both the brucellosis and boll weevil programs is not needed in fiscal year 1999 and can be used for other priority needs.

The 1999 budget proposes a program reduction of \$3.4 million (for a net reduction of \$2.5 million) for Wildlife Services (WS) which represents a total increase of \$2.3 million, or 10 percent above the Administration's proposal for fiscal year 1998, as a result of several changes that we have made. Subject to the overall funding level, the proposal still calls for a reasonable (minimum 50 percent) match for all States, to reduce the significant disparity among States. The proposal allows States from two to three years to reach that goal. In addition, the basic infrastructure of each State will be funded by the Federal government, regardless of that State's contribution. Finally, funds have been set aside for needs that may cross State boundaries, and therefore may not be the responsibility of any single State. These changes address concerns that were raised with last year's proposal. However, behind the proposals in both years is the Administration's belief that cooperators in States that receive benefits should pay a reasonable portion of the government's costs of providing these benefits, and that the current significant disparity among States forces States and taxpayers to make up the difference.

For buildings and facilities, we proposed \$2 million for general maintenance. The Agency has not received general maintenance funding for the past two years making additional funding necessary to maintain existing facilities. APHIS controls and operates a broad range of facilities throughout the United States and overseas in support of our mission. These facilities include veterinary laboratories, animal quarantine and holding facilities, quarantine greenhouses, sterile insect rearing and production facilities, plant and soil analysis laboratories, and biological control laboratories and have a value of approximately \$186 million. Many of these facilities are over 20 years old. As the controlling Agency, APHIS is responsible for maintaining these facilities in a good state of repair and complying with national, State, and local building codes, the Life Safety Code, the National Fire Code, Occupational Safety and Health Administration regulations, and the Environmental Protection Agency regulations. The budget also proposes \$3.2 million to support continued modernization of Plum Island Animal Disease Center.

The proposed budget assumes passage of legislation to collect fees for animal welfare inspection, veterinary biologics, biotechnology, pink bollworm, and Swine Health Protection Act inspection activities. In total, the fees would make up \$9.9 million.

FINAL THOUGHTS

Much has been said about the primary mission of APHIS—whether it is to protect American agriculture from foreign diseases and pests, or to facilitate the export of American food and fiber products by helping our farmers and producers meet the animal and plant health standards of importing countries. Without question, APHIS' role as a domestic regulatory agency is still key. However, because of our role in developing and enforcing import requirements, as well as in providing key services to facilitate exports, APHIS must also focus its resources on issues relating to international trade. In fact, the two roles are inseparable.

To succeed in the 21st century—and by that I mean to feed our populations, sustain our environment, and encourage economic growth through healthy agricultural trade—we will need to be effective in both roles by using all of the tools within our reach. We will need to explore and use the technologies available to better our crops and our production. In addition, we will need to build trust in trade with science-based decisions. In this global trade environment, where our actions and livelihoods are increasingly interdependent, it is crucial that we strive to make those decisions that will help ensure our mutual benefit.

We appreciate the Committee's strong support of our programs in the past, and look forward to meeting the challenge of protecting and strengthening American agriculture in the future. We will be happy to answer any questions.

PREPARED STATEMENT OF ENRIQUE E. FIGUEROA

Mr. Chairman and Members of the Committee, I am pleased to have this opportunity to represent the Agricultural Marketing Service and to present our fiscal year 1999 budget proposals.

Although I am new to the Agricultural Marketing Service, or AMS, I am familiar with the economic and trading challenges faced by U.S. agriculture in domestic and international markets. Before coming to AMS, I was an associate professor at Cornell University's Department of Agricultural, Resource and Managerial Economics. At Cornell, my work was focused on horticultural product marketing issues. While at Cornell, I also served as a member of Secretary Glickman's NAFTA Advisory Committee on Private Commercial Disputes Regarding Agricultural Goods. Several

years ago, I worked as a staff assistant for the House Committee on Agriculture, and spent four years with the California Conservation Corps. Since coming to AMS in November, I have been able to put my agricultural background to use for this agency and the customers we serve.

MISSION, GOALS, AND PROGRAMS

I would like to take a few moments at the outset to review the agency's mission and strategic goals before I present our budget proposals.

Our mission in AMS is to facilitate the strategic marketing of agricultural products in domestic and international markets, while ensuring fair trading practices, and promoting a competitive and efficient marketplace, to the benefit of producers, traders, and consumers of U.S. food and fiber products. AMS' two major strategic goals are: (1) to facilitate the strategic marketing of U.S. agricultural products in domestic and international markets, and (2) to ensure fair and competitive agricultural marketing through marketing tools and regulations.

Our first goal aims to enhance the efficiency of agricultural marketing, which will allow producers to maximize returns while reducing overall marketing costs, resulting in better values to consumers. AMS programs related to this goal include Market News, Quality Standards, Organic Certification, Pesticide Data, Wholesale Market Development, Transportation Services, Commodity Purchase Services, Grading and Certification, and Commodity Research and Promotion programs. Our Market News program provides timely, accurate, and unbiased market buying, selling, and pricing information on numerous agricultural commodities. Commodity standards provide a common language of quality for buyers and sellers in the U.S. and abroad. AMS user-funded grading and certification services provide an impartial evaluation of product quality so that purchasers can buy commodities without having to personally inspect them. The Organic Certification program is developing national standards and definitions to govern the production and handling of "organic" agricultural products so that consumers can be assured of the validity and integrity of the label. The program will accredit agents who will certify organic products to facilitate trading between the states and abroad. Our Pesticide Data Program develops and communicates comprehensive, statistically-reliable information on pesticide residues in food for use in Government dietary risk assessments and policy decisions. Since the nation's transportation system is crucial for agricultural products to reach their markets, AMS provides technical assistance to shippers and carriers and participates in transportation regulatory actions. We also provide economic analysis and recommend improvements to domestic and international agricultural transportation. AMS purchases selected meats, fish, poultry, fruits and vegetables to remove excess supplies from markets while providing a dependable supply of agricultural commodities for the National School Lunch and other domestic feeding programs. Research and promotion programs are used by agricultural producers to broaden and enhance national and international markets for various commodities. These AMS programs are directly related to USDA's strategic goal to open, expand, and maintain global market opportunities for agricultural producers.

The aim of AMS' second goal is to ensure fair and competitive trading in agricultural markets for the benefit of producers and consumers of agricultural commodities. AMS programs that accomplish this important goal include Shell Egg Surveillance, Federal Seed, Pesticide Recordkeeping, Marketing Agreements and Orders, Plant Variety Protection, and the Perishable Agricultural Commodities Act, or PACA program. The Shell Egg Surveillance program promotes fair competition in the sale of consumer grade shell eggs by monitoring the proper disposition of certain undergrade and restricted eggs through regular inspections of shell egg handling operations. Marketing orders and agreements also help serve this goal by facilitating orderly marketing, and assuring equitable returns to producers and a dependable, reasonably-priced supply of products to consumers. The PACA program protects producers, shippers and distributors from loss due to unfair and fraudulent practices in the marketing of perishable agricultural commodities. These activities also help serve USDA's first strategic goal, and some serve USDA's second goal—to ensure a safe, affordable, nutritious, and accessible food supply.

FUNDING SOURCES

The wide range of activities provided by AMS are funded from a variety of sources. AMS is uniquely entrepreneurial among governmental organizations. For the vast majority of our programs, our ability to "stay in business" depends on the earnings generated from customers who are under no obligation to buy our services, and who request those services only if they believe the service adds a proven value to their products in the marketplace. Nearly 75 percent of AMS funding is revenues

generated from services provided to satisfied customers. This entrepreneurial climate drives us to be customer service-oriented, cost-conscious, committed to performance that will satisfy our customers, and innovative in service delivery. Customers pay for our services in grading, inspection and certification, and industry-generated self-help programs like research and promotion reimburse us for our oversight assistance to ensure that the programs comply with legislative intent and provisions. AMS also administers activities to protect and promote a level playing field in trade. Licenses and fees fully finance these programs. Finally, some of our activities provide a public good for millions of beneficiaries—such as issuing daily market reports and procuring food for Federal feeding programs. These activities are appropriations funded.

CURRENT ISSUES AND ACCOMPLISHMENTS

I would like to review a few current issues and accomplishments of the past year.

Federal Milk Marketing Order Reform

AMS has completed drafting the proposed rule on Federal Milk Order reform in accordance with the mandate of the 1996 Farm Bill. To reach that goal, we engaged academics, solicited public comments, and released proposals and other documents to spark national debate and lead to a reform package. In preparation for the proposed rule, AMS received nearly 3,700 comments and participated in 250 meetings with over 22,000 people. The proposed rule was published on January 20. The initial 60-day comment period was recently extended until April 30. During the comment period, we anticipate holding listening sessions to continue as broad a national dialogue as possible.

Rail and Other Transportation Issues

U.S. agriculture faces increased reliance on market forces and export markets at a time when the performance and integrity of the transportation infrastructure is becoming an issue. Rail car shortages, crumbling locks, and old roads can result in bottlenecks that impede the most efficient movement of agricultural commodities. With a responsibility to monitor and represent the interests of agricultural shippers, Assistant Secretary Dunn has announced that AMS will take the lead in conducting a broadly based study to examine the transportation needs of U.S. agriculture.

In October and December, AMS represented agricultural interests when rail car congestion problems at the Union Pacific/Southern Pacific's Houston rail hub spread throughout the western states. USDA filed written comments, and testified at emergency meetings of the Surface Transportation Board, or STB, to recommend alternatives that would quickly improve service to grain shippers. The STB issued orders that addressed USDA's requests and recent data from the railroads indicate that progress is being made to alleviate the rail car shortages and improve performance for shippers.

International Activities and Issues

In the international arena, AMS continues to be successful in advancing U.S. interests in international commodity standards, through active participation at the Economic Commission for Europe, or ECE, as well as Codex. For example, last March, ECE work was completed on pork cut specifications and progressed on beef cut specifications that will be adopted throughout Europe and should closely mirror existing U.S. standards. AMS has increased price reporting data from foreign markets and made contacts for future international market reporting. We also held several seminars for small business exporters to better acquaint them with import requirements in key international markets. In cooperation with government representatives from Canada and Mexico and under AMS leadership, the NAFTA Advisory Committee on Private Commercial Disputes Regarding Agricultural Goods developed a consensus recommendation to establish an industry-driven mechanism for the resolution of private commercial disputes involving fresh fruit and vegetable commerce between the three countries. AMS also worked closely with the Canadian and Mexican governments to conduct a series of seminars for fruit and vegetable shippers regarding import requirements for each country.

Voluntary HACCP for Fruits and Vegetables

AMS has been piloting a voluntary HACCP program for fresh-cut fruits and vegetables. This Quality Through Verification, or QTV, program encompassed five fresh cut fruit and vegetable firms during its pilot phase. The program was reviewed by FDA, which has regulatory responsibility for the safety of produce, and received that agency's support as an important component of FDA's overall effort to enhance the safety of produce. This year, we expect to complete a memorandum of understanding

with FDA outlining the respective responsibilities of each agency in the program's operation. Several dozen additional firms are awaiting acceptance into the program, and we expect to extend QTV service to many of those firms.

Expanded Use of Internet

Another improvement in service to our customers is our expanded use of the Internet to enhance program delivery. In 1998, all of our daily market news reports will be available through the Internet, and we are exploring additional opportunities to use the Internet to make proposed rules available for public comment. In addition, we will expand the amount and depth of information on such topics as commodity procurement actions through our web site, following up on the recent business process re-engineering we undertook for our Commodity Procurement program.

FISCAL YEAR 1999 BUDGET REQUESTS

Let me turn now to our budget requests for fiscal year 1999. We are requesting a net increase in Marketing Services funds of \$11.9 million which would cover the following activities: \$320,000 for international market reporting, \$500,000 to expand market reporting to address the potential effects of market concentration, \$505,000 to expedite nationwide development of the Organic Certification Program, \$2.5 million to maintain statistically reliable sampling and testing in cooperation with all ten participating states in the Pesticide Data Program, \$1.7 million to initiate a rapid response capability in the Pesticide Data Program to meet requirements of the Food Quality Protection Act of 1996, \$6.3 million for the Microbiology Data Program (part of the Administration's Food Safety Initiative), \$770,000 for pay costs, and \$329,000 for added retirement costs. Our budget request also reflects a decrease of \$1 million that was provided in fiscal year 1998 for salmon marketing. This request will assure our goals of facilitating the strategic marketing of U.S. agricultural products in domestic and international markets while ensuring fair and competitive markets for the benefit of producers and consumers. Let me explain these program requests in more detail.

International Market News

To effectively compete in foreign as well as domestic markets, U.S. agriculture must have ready access to consistent, accurate, timely, and reliable information on international prices. With an increasing share of agriculture's income dependent on market expansion and export growth, USDA's role is to protect and expand the position of American agricultural products in foreign markets. Tariff reductions, resulting from international agreements, and rising incomes in many countries have continued to drive demand for U.S. agricultural products and expand our export markets. But international marketing challenges continue, and we want to ensure that a lack of market information is not a barrier to market access and, therefore, an impediment to the continued growth of U.S. agricultural exports.

AMS is currently collecting limited international market information, but more in-depth information from a wider array of markets is needed. In a recent AMS customer service survey, respondents requested market information from 23 countries in Europe, North and South America, and the Pacific Rim for all fresh fruits, vegetables, and tree nuts. Various poultry and egg industry associations—the National Broiler Council, National Turkey Federation, United Egg Producers, United States Egg Marketers, National Poultry and Food Distributors Association, and USA Poultry and Egg Export Council—have also requested additional international market information. Our poultry market news program receives between 50 and 60 inquiries per week from various sources requesting information on international markets. Comments from customer surveys also indicate a strong need for more information regarding international market conditions. Our dairy market news program has concentrated on covering the dairy product markets of the U.S.' major international trade competitors, but now there is a growing need for dairy product information in those areas that are potential markets for U.S. dairy products such as Mexico, South America, and the Pacific Rim countries. The U.S. Dairy Export Council, a private organization consisting of dairy product processors, exporters, producers, and suppliers, has specifically requested market news for the Pacific Rim.

We firmly subscribe to the principle that market information makes markets more efficient and contributes to the competitiveness of U.S. agriculture. In order to facilitate the development of international market news within available resources, AMS reporters have been working to establish contacts with private companies and government sources in foreign markets to collect and exchange market information. Industry has been so keenly interested in foreign market information that demand exceeds AMS resources. Additional personnel and increased automation would allow us to develop or obtain additional reports from major export markets and incor-

porate them into AMS' market news reports to the benefit of U.S. trade. Improving the availability of information on overseas markets should have a significant positive impact on the continued ability of U.S. products to compete successfully in the international marketplace.

Domestic Market Reporting to Address Agricultural Concentration

In domestic markets as well, we must also ensure that the lack of information is not a barrier or impediment to marketing opportunities for our producers. Increasing concentration within the meat and poultry industries has raised concerns over potential non-competitive behavior. Although there are some positive effects of concentration on the marketplace, the concern for potential non-competitive behavior by large companies leads to distrust and suspicion by many growers and smaller segments of the industry. A lack of complete market information only worsens the situation, fueling mistrust and suspicions of unfair market practices. The Secretary's Advisory Committee on Agricultural Concentration recommended that price discovery and reporting be enhanced wherever possible to ensure fair competition. Although AMS has developed several new reports in response to the advisory committee recommendations, such as export reporting, our resources are not sufficient to meet our commitments to agriculture in this critical area. Producers need all the information they can get to successfully compete in today's markets. New and expanded market reports will provide broader coverage of market information and a more in-depth look at market activity. Although a lack of resources limits our ability to be fully responsive, we have taken some initial steps to address these information needs. However, to realize their full potential, these initiatives will require additional AMS reporters covering more markets and improved information technology.

Organic Certification

Sales of organic foods are estimated at more than \$3.5 billion and growing at a rate of 22 percent a year. With this growth has come multiple definitions of what constitutes an organic product, resulting in confusion among buyers and consumers. The Organic Foods Production Act of 1990 required the Secretary to establish an organic certification program for producers and handlers of agricultural products that are produced using organic methods. With recommendations from the National Organic Standards Board, or NOSB, and public input from certifiers, consumers, producers and handlers, AMS has developed a public-private partnership that encourages innovation within the boundaries of organic principles and legislative intent.

In fiscal 1997, AMS focused on completing and clearing the proposed organic rule. The rule was published in the Federal Register on December 16, 1997. For the first time, AMS is providing one of the most open and accessible public rulemakings in Federal experience—a fully electronic public rulemaking via the Internet. Four public information meetings to discuss the proposed rule were scheduled for February and March in various locations across the country, and these meetings will provide an opportunity for USDA to present an overview of the proposed rule, respond to questions, and expand the public dialogue on this important program.

There are now approximately 28 states with some type of organic legislation in place, ranging from labeling laws to full-scale certification programs. Of these, only 11 states have certification programs in operation. Some are planning to adopt the national program and possibly implement certification programs; some states have established requirements for organic producers, but leave certification to private organizations; and others with existing programs likely will revise their organic programs when the Federal program goes into effect.

National standards and definitions of agricultural products that are organically produced will facilitate the movement of products between States and assure consumers of the validity and integrity of the organic label. Beyond the domestic market, nomenclature and standards for organic production will facilitate international marketing of U.S. organic products. After the final rule is implemented, we will work to harmonize the eventual program standards with those of existing and developing international organic programs.

AMS needs additional resources to expedite nationwide development of the program, ensure labeling integrity, and facilitate global trade of our country's organic products. Once the program is fully established, we will charge fees to certifying agents for USDA accreditation, as authorized by current legislation. Fees collected will be deposited into the U.S. Treasury.

Pesticide Data Program

Pesticide residue data are a critical component of the Food Quality Protection Act, or FQPA, of 1996. The Act requires the Secretary of Agriculture to ensure the improved collection of pesticide residue data and the increased sampling of foods most

likely consumed by children. AMS' statistically reliable procedures are designed to make unbiased estimates of residues in products collected in the ten cooperating states that represent almost half of the U.S. population. The pesticides targeted for data collection are selected by the Environmental Protection Agency, or EPA, in consultation with AMS. The commodities chosen for testing are among those most prevalently consumed by the American public.

The fiscal year 1998 Appropriations Act provided \$8 million in funding to AMS for the Pesticide Data Program, or PDP—a lower funding level than was made available for the program in previous years; in fact, about 30 percent less than the fiscal year 1996 level. With the additional funding requested for PDP program operations, we will be able to maintain statistical reliability of the data and provide the level of sampling and testing that will meet the needs of the EPA and other government agencies in responding to public health concerns.

In addition to the FQPA, our pesticide residue testing has served the Department in several other important areas. AMS residue testing results have been used to confront barriers to international trade of U.S. agricultural commodities and are useful in the establishment of international standards. USDA's Foreign Agricultural Service, or FAS, uses data from the program to convince foreign governments that our food is safe. Pesticide data also have been used in the development of international standards by international organizations such as the Codex Alimentarius Commission and the World Health Organization.

Rapid Response Initiative

Title III, Section 301(c) of the FQPA directs the Secretary to ensure improved sampling and collection of pesticide residue data. To further respond to the requirements of the FQPA, AMS proposes to initiate a rapid response capability for pesticide residue testing. In the next ten years, EPA is required to review more than 9,000 tolerances to ensure compliance with the more stringent safety standards of the FQPA. Under FQPA, EPA needs to complete risk assessment evaluations for pesticides with common toxic mechanisms and using aggregate exposure models. Up to date pesticide residue data generated by the Pesticide Data Program will allow the EPA to conduct realistic dietary risk assessments. A rapid response capability will increase productivity, especially for a commodity where PDP has collected data for other commodities in the same class, and for acute pesticide toxicity studies requiring single serving size surveys. PDP would add these commodities at a special sampling rate that provides a rapid response while maintaining statistical reliability. Without up to date and accurate residue data, EPA will be forced to make more conservative assumptions about residue levels that could potentially overestimate risk.

Microbiology Data Program

As part of the President's Food Safety Initiative, AMS proposes to initiate the Microbiology Data Program. The program is designed to address increasing public concerns about microorganisms in the U.S. food supply by helping to determine the incidence, number, and type of important foodborne microorganisms in domestically-produced and imported products with statistical reliability. With the data collected, a national database can be established identifying the incidence of key microorganisms in fruits and vegetables. The data will be used to establish "benchmarks" that can be used to evaluate the effectiveness of procedures to reduce or eliminate harmful foodborne microorganisms. The program also will provide Federal public health agencies with statistically reliable microbiological data to assess the impact of various regulations and agricultural practices. The produce industry and regulatory health agencies will benefit from data that enables them to assess processing and handling techniques from the farm almost to the grocery store, and identify the most effective modifications to the food distribution system. As a result, both the quality and the wholesomeness of the food supply will be improved. Stakeholders—including state agencies, consumers, growers, processors, retail stores, food handlers, food transporters, medical institutions, academia, global traders, and international organizations setting international standards—will benefit from this valuable data that will be available for study and decision making.

To minimize the cost of this initiative, AMS proposes to use the existing infrastructure of the Pesticide Data Program for statistically-reliable sampling, including the laboratory capacity of participating State and Federal laboratories, and the electronic data reporting capabilities already in place with PDP. The 10 states currently participating in the PDP—California, Colorado, Florida, Maryland, Michigan, New York, Ohio, Texas, Washington, and Wisconsin—will be asked to also participate in the microbiology program. Initially, fresh fruit and vegetables will be sampled; other products could be included later. Organisms initially under consideration are *E. coli*,

Listeria monocytogenes, *Salmonella*, and *Shigella*. Fruit and vegetable samples will be obtained at food terminal markets and chain store distribution centers.

The proposed microbiological program offers a unique and innovative approach to identifying foodborne pathogens and focusing on those hazards in the food distribution system that present the greatest risks. No similar program exists at either the State or Federal level. AMS will coordinate our activities with other agencies within USDA, including ARS, NASS, ERS, and FSIS, as well as the FDA, and the Centers for Disease Control and Prevention, or CDC. CDC's primary responsibility is surveillance and tracking of foodborne illness; FDA notifies CDC of findings related to regulatory and laboratory investigations; and State and local health departments report foodborne illness cases after their investigations. Outbreaks involving restaurants or institutions are more likely to be recognized than those involving foods prepared in the home. Fruits and vegetables can become contaminated with pathogenic and spoilage microorganisms while growing, or during harvesting, processing, and distribution. Two earlier CDC reviews of foodborne illness revealed that fruits and vegetables can act as a vehicle in transmitting foodborne illness. Questionable practices in food production and handling, mass preparation of prepared meals, the trend toward greater consumption of meals away from home, the emphasis on increasing fresh fruits and vegetables in the diet, and product distribution logistics can all raise the risks of foodborne illnesses. The proposed program will help to gain important insight on the presence of pathogens in our food supply.

BUDGET REQUEST SUMMARY

In total, our 1999 budget request includes \$58.5 million in appropriated funding for our marketing services programs and \$1.2 million for Payments to States and Possessions. In addition, we are requesting \$11 million for formulation and administration of marketing agreements and orders and \$6.3 million for administration of commodity purchase services from Section 32 funds.

Thank you for this opportunity to present our budget proposals.

PREPARED STATEMENT OF JAMES R. BAKER

Mr. Chairman and members of the Committee, I am pleased to submit the fiscal year 1999 budget proposal for the Grain Inspection, Packers and Stockyards Administration (GIPSA).

GIPSA is part of USDA's Marketing and Regulatory Programs, which are working to ensure a productive and competitive global marketplace for U.S. agricultural products. GIPSA's mission is to facilitate the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and to promote fair and competitive trading practices for the overall benefit of consumers and American agriculture.

Our mission is carried out in two major segments of American agriculture. GIPSA's Packers and Stockyards Programs (P&S) ensure open and competitive markets for livestock, meat, and poultry. The Agency's Federal Grain Inspection Service (FGIS) provides the U.S. grain market with Federal quality standards and a uniform system for applying them.

GIPSA has both service and regulatory roles. The Agency provides financial protection to livestock producers and ensures fair and competitive markets. It also provides impartial, accurate measurements of grain quality to create an environment that promotes fairness and efficiency in the U.S. grain marketing system.

The existence of GIPSA as an unbiased, third-party entity helps ensure a fair and competitive marketing system for all involved in the merchandising of livestock, meat, and poultry, and grain and related products.

ORGANIZATION

GIPSA is comprised of approximately 800 personnel, including full-time, temporary, and intermittent employees. GIPSA personnel are situated in field locations across the country to serve our customers.

Of GIPSA's Packers and Stockyards Program's 180 allotted staff years, approximately 28 percent are located at headquarters. Following the planned reorganization of this program, the total staff located at headquarters will be reduced to no more than 20 percent of total staff years. During fiscal year 1997, GIPSA concentrated P&S program resources on providing financial protection and promoting fair business practices and a competitive marketing environment for livestock, meat, and poultry. The Agency conducted over 1,800 investigations, disclosing 515 violations of the Packers and Stockyards (P&S) Act. Most violations are corrected on a voluntary basis with several resulting in livestock and poultry producers receiving

additional funds for the sale of their product. During fiscal year 1997, 46 formal cases were resolved and 29 new cases were filed to bring subject firms into compliance with the provisions of the P&S Act. These complaints alleged violations of the P&S Act, including failure to compete in the purchase of livestock, paying livestock sellers on the basis of false and inaccurate weights, failure to pay and failure to pay promptly for livestock, operating without bond coverage, and delayed weighing of live poultry. GIPSA is appealing an adverse decision in the IBP, Inc., case which alleged that the packer had given undue or unreasonable preference to a select group of feedlots.

Federal grain personnel work with over 2,000 State and private inspectors to provide high-quality inspection and weighing services on a user-fee basis. Federal inspectors service 42 export elevators located in Georgia, Illinois, Indiana, Louisiana, Maryland, New York, Ohio, Oregon, and Texas. A small Federal staff also provides service at 6 export elevators in Eastern Canada for U.S. grain transshipped through Canadian ports. Eight delegated States provide service at an additional 20 export elevators located in Alabama, California, Minnesota, Mississippi, South Carolina, Virginia, Washington, and Wisconsin. Sixty-five (65) designated agencies service the domestic market under GIPSA supervision. In 1997, this unique mix of Federal, State, and private inspection agencies provided 2.1 million inspections on over 225 million metric tons of grains and oilseeds; weighed over 97 million metric tons of grain; and issued over 87,000 official weight certificates.

This, of course, is only a brief summary of our accomplishments. I'd like to now provide some more in-depth information about our programs and their activities.

GIPSA'S PACKERS AND STOCKYARDS PROGRAMS (P&S)

GIPSA Strategic Goal No. 1.—Ensure a fair, open and competitive marketing environment for livestock, meat, and poultry.

GIPSA's P&S program provides financial protection and promotes fair business practices and a competitive marketing environment for livestock, meat, and poultry. Our programs foster fair and open competition, and guard against deceptive and fraudulent practices affecting the movement and price of meat animals and their products. We also work to protect consumers and members of the livestock, meat, and poultry industries from unfair business practices. To carry out these important roles, GIPSA:

- Administers the Packers and Stockyards Act of 1921.
- Carries out the Secretary's responsibilities under Section 1324 of the Food Security Act of 1985, which permits States to establish "central filing systems" to prenotify buyers, commission merchants, and selling agencies of security interests against farm products, and issue regulations and certify the systems that meet the criteria in the statute.
- Enforces the Truth-in-Lending Act, the Fair Credit Reporting Act, and the Freedom of Information Act as each relates to persons and firms subject to the P&S Act.

The production and marketing of livestock, meat, and poultry are important to American agriculture and significantly impact the Nation's economy. The Commerce Department estimates the annual wholesale value of livestock, meat, and poultry products to be \$105 billion. At the close of fiscal year 1997, there were 1,335 stockyards; 6,900 market agencies/dealers; and 2,125 packer buyers registered with GIPSA to engage in the livestock marketing business. There also were approximately 6,000 slaughtering and processing packers; an estimated 6,500 meat distributors, brokers, and dealers; and 210 poultry firms subject to the P&S Act.

GIPSA's P&S Programs continues to provide payment protection to livestock and poultry producers by focusing on the financial area. Financial investigations during fiscal year 1997 resulted in \$1.9 million being restored to custodial accounts established and maintained for the benefit of livestock sellers. Packer and poultry trust activities also returned \$264,000 to livestock sellers and \$10,000 to poultry growers during the fiscal year. Dealers and market agencies are required to meet solvency requirements, a critical component of payment protection of the P&S Act. During fiscal year 1997, 186 insolvent dealers and market agencies corrected or reduced their insolvencies by \$34.4 million.

GIPSA closely monitors anticompetitive practices which may be impeding the free trade of livestock. Any practice, agreement, or understanding that excludes potential buyers from bidding in open competition is considered a restraint on competition. Examples of such practices include apportioning territories, price agreements or arrangements not to compete, and payoffs or kickbacks to buyers. A high priority is placed on investigating all complaints and further developing information received

concerning the failure of livestock dealers, market agencies, or packers to compete for the purchase of livestock.

During fiscal year 1997, GIPSA issued an administrative complaint against two dealers alleging they failed to conduct their buying operations in competition with and independently of one another. The complaint alleged the dealers entered into arrangements for the purpose and with the effect of restricting competition and thereby controlling the prices for slaughter cows at auction markets. Another investigation is underway to determine if other livestock dealers and packers in the Northwest region of the United States have entered into similar types of arrangements to restrict competition.

GIPSA is currently conducting a broad investigation of fed steer and heifer procurement in the Texas Panhandle. The investigation was initiated in the summer of 1996 and includes 16 months of procurement data, over 37,000 transactions, and over 6 million head of cattle. Transaction data from packers has been collected, processed, and documented. Preliminary descriptive and graphical analyses have been completed and portions have been reported to the industry. Purchase and slaughter patterns over the period of investigation have been examined to identify potential occurrences of aberrant or unusual procurement practices. While the analyses conducted thus far have not disclosed obvious violations of the P&S Act, econometric and statistical analyses of the data are still being documented to identify relationships between spot market prices and non-spot purchases, and to reveal relationships that may not be apparent in the descriptive and graphical analysis. Completion of the investigation will depend on the findings of the econometric analysis. Two university researchers are collaborating on the econometric and statistical analyses.

An investigation of slaughter hog procurement in the central United States also is underway. The investigation includes analysis of contractual arrangements between packers and hog producers, and will analyze price relationships between various procurement arrangements. The data also are being analyzed to ensure that firms are actively competing and to gain a better understanding of each firm's procurement operations. The investigation involves procurement data from a dozen major hog slaughter plants in the western Corn Belt. These plants slaughtered approximately one-third of the Nation's slaughter hogs in 1996. Descriptive and graphical analyses should be completed and available by late spring 1998. Econometric and statistical analyses are underway with the cooperation of personnel from USDA's Economic Research Service and National Agricultural Statistics Service. While these analyses will take several months, they should be completed by late this year.

Other major investigations underway include an investigation of slaughter lamb procurement in the Western United States and two poultry investigations. The slaughter lamb procurement investigation is focussing on evaluating competition and the use of supply contracts. One of the poultry investigations currently being conducted focuses on alleged discriminatory treatment of contract growers by a major poultry firm. The investigation involves analyzing settlements of nearly 1,000 growers over a 2-year period. The other poultry investigation is being conducted to determine whether contract settlements that base payment on grower cost comparisons contain unfair elements. Data collection for both of the poultry investigations has been completed and analysis of the data is currently underway.

Also in fiscal year 1997, GIPSA published an Advanced Notice of Proposed Rulemaking in the Federal Register seeking comments on the need for additional rules to protect contract poultry growers regarding (1) grower payment based on performance compared with other growers for a specified time period (usually all growers whose birds are killed within a 1- or 2-week period); (2) the accuracy of feed weights and feed delivery and pickup procedures; and (3) procedures for weighing live birds picked up for slaughter and the accuracy of the weights. We are concerned that contract poultry growers are in an unequal bargaining position with the integrated poultry companies and is considering the need to issue substantive regulations to provide growers with assurance that their settlements will be equitable. A review committee analyzed over 3,400 comments received in response to the notice. Recommendations of the committee and an analysis of grower comparison settlements by major poultry companies currently are being reviewed to determine the need for further regulation to ensure fair grower settlements.

In order to create a forum for public discussion, the Department of Agriculture published a petition requesting rulemaking to restrict certain procurement practices regarding forward contracting and packer feeding. The petition was submitted by the Western Organization of Resource Councils. USDA received over 1,700 comments on the Federal Register notice by the April 14, 1997, closing date. A USDA team with economic, legal, and industry expertise was established to review and

analyze the comments received. USDA is continuing to move forward on this matter and a decision regarding the petition is anticipated in the near future.

Finally, in fiscal year 1997, GIPSA took preliminary steps to restructure its P&S program. The headquarters and field office structures of the P&S program were put in place in 1963. Since that time, there have been minor adjustments to both the field and headquarters structures, but the basic framework has remained unchanged. The field structure, which currently includes 11 regional offices, was designed to provide area coverage. The headquarters structure divides the enforcement activities into two program divisions with six branches based on the major titles in the P&S Act—a Packer and Poultry Division, which covers the responsibilities under Title II of the Act, and a livestock Marketing Division, which covers the activities under Title III.

Major structural changes and most of the concentration in the livestock and meat packing industries have taken place since the current P&S structure was established. As the industry structure has changed, the lines between Titles II and III enforcement activities have become increasingly blurred. In addition, livestock and poultry production and slaughter has become concentrated in relatively narrow geographic areas.

In an Evaluation Report released in February 1997, the USDA Office of the Inspector General (OIG) concluded that the P&S program needed to reorganize its national and regional offices, because its 11 regional offices do not provide enough staff to perform the full range of investigations, including complex anticompetitive practice investigations, and that P&S needed to incorporate economic, statistical, and legal expertise in its field offices.

GIPSA recognizes the need to restructure its P&S program to enhance its ability to address competitive issues. The Agency's restructuring plan is consistent with OIG's recommendations.

At headquarters, two operating divisions and six branches will be consolidated into a single policy/litigation support office with three branches that focus on the core responsibilities under the P&S Act—competition, fair trade practices, and payment protection. The 11 field offices will be consolidated into 3 regional offices with approximately 35 resident agents operating either out of their homes or 1 of 3 sub-offices. Resident agents will handle the most basic services and routine investigations in outlying areas.

One-time costs associated with consolidating the field offices and relocating displaced employees are projected at \$3 million. The appropriation needed to fund the reorganization is included in the Department's fiscal year 1999 budget request as a one-time increase. While the Administration continues to seek additional resources to address competitive issues in the livestock, meat, and poultry industries, the restructuring itself will be budget neutral except for the one-time cost.

The restructuring of the P&S program is vital to meeting the Department's responsibility, and industry's concerns, relating to competitive behavior in the livestock, meat, and poultry industries. While the restructuring plan is budget neutral in the out years, it represents a unique opportunity to strengthen P&S' ability to investigate anticompetitive practices and provide greater flexibility and efficiency in Agency operations.

GIPSA'S FEDERAL GRAIN INSPECTION SERVICE

GIPSA Strategic Goal No. 2.—Promote and protect the integrity of the domestic and global marketing of U.S. grain for the benefit of American agriculture.

GIPSA's grain program plays a critically important role in facilitating the marketing of U.S. grain and related commodities. We provide the U.S. grain market with Federal quality standards and a uniform system to apply these standards. Through this program, GIPSA provides descriptions (grades) and testing methodologies for measuring the quality and quantity of grain, rice, edible beans, and related commodities, and, provides an array of inspection and weighing services, on a fee basis, through a unique partnership of Federal, State, and private laboratories.

By serving as an impartial third party, GIPSA ensures that the standards are applied and the weights recorded in a fair and accurate manner. Our presence in the market advances the orderly and efficient marketing and effective distribution of U.S. grain and other assigned commodities from the Nation's farms to domestic and international buyers.

Our guidance in carrying out these important tasks is provided by the U.S. Grain Standards Act (USGSA) and the Agricultural Marketing Act of 1946 (AMA) as it relates to the inspection of rice, pulses, lentils, and processed grain products. Under these two Acts, GIPSA:

- Establishes official U.S. grading standards and testing procedures for eight grains (barley, corn, oats, rye, sorghum, triticale, wheat, and mixed grain), and four oilseeds (canola, flaxseed, soybeans, and sunflower seed) under the USGSA; and for rice, lentils, dry peas, and a variety of edible beans under the AMA.
- Provides American agriculture and customers of U.S. grain around the world with a national inspection and weighing system that applies the official grading and testing standards and procedures in a uniform, accurate, and impartial manner.
- Inspects and weighs exported grain and oilseeds. Domestic grain and oilseed shipments, grain and oilseed imported into the United States, and crops with standards under the AMA are inspected and weighed upon request.
- Monitors grain handling practices to prevent the deceptive use of the grading standards and official inspection and weighing results, and the degradation of grain quality through the introduction of foreign material, dockage, or other nongrain material to grain.

Through these permissive and mandatory programs, GIPSA promotes the efficient and effective marketing of U.S. grain and other commodities from farmers to end users.

For an average cost of 27 cents per metric ton of grain in fiscal year 1997, exporters received USDA export certificates from GIPSA on which they relied to facilitate the marketing of over \$20 billion worth of cereals and oilseeds. Likewise, here at home, buyers and handlers requested over 1.9 million inspections that facilitated the trading of 124 million metric tons of cereals and oilseeds destined for domestic use.

While current services are effective and efficient, GIPSA recognizes that to remain relevant in today's marketplace, continuous service improvement is essential and ongoing.

In fiscal year 1997, GIPSA continued to work closely with the U.S. grain handling industry on Electronic Data Interchange (EDI), an industry-driven electronic commerce initiative that is designed to automate the exchange of financial transaction documents among businesses. GIPSA established the standardized electronic file format that will be used for the EDI system and by official inspection providers.

GIPSA also continues to assist major export elevators in their ongoing efforts to integrate automation into official weighing and grain handling operations. Five fully automated weighing systems have been approved; five systems are being installed or debugged; and one system is in the proposal preparation stage. GIPSA continues to respond to inquiries from other elevators regarding automation initiatives. In addition, GIPSA has established a team of experts to develop, in partnership with the grain industry, an automated grain inspection system that will improve the efficiency and productivity of U.S. grain handling facilities, thereby making them more competitive in today's global marketplace.

Also in fiscal year 1997, GIPSA began implementing an enhanced quality assurance and quality control program to ensure the quality and accuracy of official inspection results nationwide. The program balances national and localized monitoring, and emphasizes proactive actions to prevent problems from occurring. The new program will greatly improve GIPSA's efforts to provide our customers with the accurate and timely information they need to market America's grain.

GIPSA continued cooperative efforts with the National Institute of Standards and Technology and the National Conference on Weights and Measures to standardize commercial grain inspection equipment as part of the National Type Evaluation Program (NTEP). GIPSA serves as the sole NTEP laboratory for grain inspection equipment. In fiscal year 1997, another grain moisture meter model was certified as conforming to NTEP requirements, bringing to seven the number of NTEP-certified models. The calibration data collected by GIPSA during fiscal years 1995, 1996, and part of 1997 were used as the basis for numerous grain moisture meter calibration changes to improve the accuracy and consistency of commercial grain moisture measurements.

Our efforts to facilitate the marketing of U.S. grain are not limited to technological applications to service delivery. In fiscal year 1997, to further GIPSA's commitment to providing market-oriented inspection and weighing services, the Agency initiated a nationwide program to encourage and facilitate GIPSA field-level outreach to the U.S. agricultural community. Agency representatives conducted group and private meetings with field managers, producers, handlers, and processors throughout the United States to educate our customers about the official system, demonstrate the Department's commitment to U.S. agriculture, and explore better ways to serve the industry. This effort has resulted in GIPSA's undertaking creative and innovative initiatives to meet our customers' needs.

For example, a farmers' cooperative in Iowa recently approached GIPSA for an innovative inspection and weighing approach to help them take advantage of railroad incentives, avoid demurrage, and improve their overall efficiency. The cooperative needed to improve their ability to manage grain inventories and increase railcar loading efficiency; to get onsite grade results to maximize their blending capabilities and stay within contract limits; and a training process to improve the quality assurance/control skills of the cooperative's employees. To meet the cooperative needs, GIPSA had to take a new approach to providing official services. The solution was an innovative cooperative agreement among three official agencies to provide inspection service to the cooperative. Using three mobile inspection labs, official inbound truck and bin inspections are provided at ten rail loading sites. This arrangement has allowed the cooperative to handle greater volumes of grain more quickly and efficiently. Further, the sampling and grading seminars that are routinely conducted for cooperative employees by official inspectors has increased the use of uniform sampling and grading techniques, thereby providing the cooperative's managers with an accurate assessment of the quality of their grain inventory.

As an integral part of America's grain handling infrastructure—a superior infrastructure of storage facilities, rail lines, and waterways that makes American agriculture preeminently successful in the global marketplace—GIPSA will continue to provide all members of the U.S. grain handling system with the innovative, high-quality official inspection services they need to efficiently and effectively meet the challenges of a changing marketing environment.

Our commitment to reaching our customers does not end at our borders. Exporters, importers, and end users of U.S. grains and oilseeds, as well as other USDA agencies, USDA cooperator organizations, and other governments, frequently ask GIPSA personnel to travel overseas to represent USDA at grain marketing and grading seminars, meet with foreign governments and grain industry representatives to resolve grain quality and weight discrepancies, help other countries develop domestic grain and commodity standards and marketing infrastructures, assist importers with quality specifications, and train local inspectors in U.S. inspection methods and procedures. At home, GIPSA regularly holds seminars and meetings to educate our worldwide customers about the quality and value of U.S. grain exports. In fiscal year 1997, GIPSA representatives met in the United States with 81 teams from 38 countries to provide information, technical guidance, and educational seminars. These international outreach efforts help promote greater harmony between U.S. and international standards. This, in turn, facilitates the export of U.S. agricultural products by reducing the risk of new barriers in today's open and freer global marketplace.

GIPSA believes that America's producers are entitled to a market that treats them fairly and honestly. In fiscal year 1997, GIPSA's commitment to this tenet was exemplified as a long-term GIPSA investigation came to fruition in a legal action against ConAgra, Inc., one of the nation's largest food companies. In March 1997, ConAgra agreed to pay \$8.3 million in penalties after pleading guilty to federal charges of adulteration, misgrading, and misweighing of grain by the company's grain division, Peavey Grain. The settlement culminated a 4-year investigation conducted by GIPSA, USDA's Office of the Inspector General, and the Farm Service Agency. Central to the case was the work of GIPSA investigators, who documented ConAgra's widespread practice of adding water to grain to increase its weight. GIPSA determined that the addition of water to grain could degrade American agriculture's reputation for quality and excellence, and defraud buyers of U.S. grain. The conclusion of the ConAgra case complimented GIPSA's 1995 enactment of a prohibition on adding water to grain, which remains an enduring legacy of GIPSA's commitment to ensuring the integrity of the American grain marketing system and to safeguarding the rights and well-being of America's producers.

The grain program will continue to work to ensure our relevance and value to American agriculture. We are reaffirming our commitment to facilitating the marketing of U.S. grain by responding to our customers' needs and providing the highest quality grain inspection and weighing services to all whom we serve—from farmer to domestic and international end users, and all those in between.

Our efforts in fiscal year 1998 will focus on networking the Federal, State, and private partners comprising the system, and working with our customers to identify how we can apply automation to reengineer our administrative and inspection processes to achieve greater efficiency and productivity. In fiscal year 1998, our commitment to improved efficiency and effectiveness will continue to serve American agriculture well, as U.S. agricultural exports are expected to total over \$56 billion ("Outlook for U.S. Agricultural Exports," February 1998).

GIPSA accomplished a great deal in fiscal year 1997 and much is planned for fiscal year 1998. Our efforts to continuously improve our programs and services were

further guided by the Agency's Strategic Plan, developed under the provisions of the Government Performance and Results Act.

YEAR 2000

A great deal of planning and action also is underway to ensure that all GIPSA systems are Year 2000 (Y2K) compliant. GIPSA's Y2K efforts are of the highest priority and are focussed on addressing three basic areas of compliance: information technology, vulnerable systems, and telecommunications.

GIPSA recognizes that disruption of our automated systems—including database reporting systems—would be extremely disruptive to the U.S. agricultural markets we serve. For example, GIPSA maintains an Export Grain Information System (EGIS), a comprehensive database of inspection and weighing information for all export grain that receives official services. It contains data on the number of carriers, volume of grain, number of lots and volume of lots at various grade levels. The database represents 90 percent or more of the grain exported from the United States (the remaining portion is exported under official inspection waiver provisions and is not, therefore, included in the system). Overall, EGIS provides the critically important information on the amount of specific grains available for export from the United States at a given time.

This data on grain availability influences trading prices. Each week, EGIS reports are released to the public at precisely 11:00 AM Eastern Standard Time on Monday mornings. This time was established in cooperation with the Chicago Board of Trade to allow traders on the floor of the exchange to make bids prior to the close of the Market on Monday afternoons. Weekly updated EGIS data also is provided to USDA's Economic Research Service, Foreign Agricultural Service, and Agricultural Marketing Service, as well as to external customers such as Bluewater Shipping, Cargill, Columbia Grain, Continental, Koch Agriculture, and Sparks Commodities who rely on the data to support their critical grain trading functions.

GIPSA is committed to ensuring that all needed resources are available for this effort—our success is of utmost importance to agency operations and to ensuring that there is no service disruption to our customers in America's cereal, oilseed, livestock, poultry, and meat markets.

CIVIL RIGHTS

In addition to improving our services and programs in fiscal year 1997, GIPSA also accomplished a great deal in the area of civil rights. The Secretary of Agriculture's goal is that each employee and customer of the Department of Agriculture be treated fairly and equitably, and with dignity and respect. The Secretary appointed a Civil Rights Action Team (CRAT) to develop recommendations to address institutional and underlying problems and ways to implement actions to ensure accountability and follow up on civil rights issues. The team's report laid the groundwork for many initiatives undertaken to address civil rights in USDA.

In keeping with the CRAT report and in support of the Secretary's goal, GIPSA took a number of actions in fiscal year 1997. We established the agency's first Office of Civil Rights; adopted, by policy, the Secretary's policy of zero tolerance for reprisal; established a civil rights performance standard for managers and supervisors; implemented mandatory civil rights training for all employees; resolved many Title VII employment discrimination complaint cases at the lowest level; broadened Title VI reviews to ensure that GIPSA maintains its record of zero complaints of discrimination in service delivery; provided continuous support, resources, and funding for programs at 1890 land grant and other minority institutions; and established an outreach liaison to insure that all employees and customers are treated with dignity and respect.

These are only some of the steps taken by GIPSA to support civil rights improvement in USDA. Like the Secretary, GIPSA has and will continue to make Civil Rights a part of our everyday work and an abiding priority.

FISCAL YEAR 1999 BUDGET REQUEST

To fund these important initiatives and to enable GIPSA to remain a valuable part of American agriculture, GIPSA's budget request for fiscal year 1999 is \$11.8 million for appropriations and a limitation of \$42.6 million in our revolving fund. GIPSA also proposes to collect \$21.5 million in new user and license fees in fiscal year 1999.

For fiscal year 1999, the President's budget proposes an appropriation request for grain inspection of \$4.6 million for compliance activities. The fiscal year 1999 budget also assumes legislation to authorize the collection of \$3.6 million in new user fees

to cover the costs of grain standardization activities and \$2.8 million for methods development activities.

The budget also assumes legislation to authorize the collection of \$15.1 million in new user fees to cover the cost of the P&S Program. There are proposed increases of \$225,000 to allow GIPSA to establish electronic filing procedures for annual reports, which is consistent with the requirements of the Paperwork Reduction Act of 1995; \$795,000 for activities in the packer competition and industry structure areas; and \$750,000 for poultry compliance activities; and \$3,000,000 for the one-time costs of reorganizing P&S' headquarters and field structures.

GIPSA's fiscal year 1999 budget request includes an increase of \$4,200,000 in one-time start-up costs to convert to new user fees and license fee status, and to maintain an adequate reserve. It is anticipated that \$3,000,000 would be used for P&S activities and \$1,200,000 would be used for standardization and methods development activities. Therefore, to summarize, the fiscal year 1999 request of \$11.8 million consists of ongoing expenses of \$4.6 million for grain compliance activities, a one-time increase of \$3.0 million for relocation expenses, and a one-time request of \$4.2 million for up-front costs for the transition to user-fee financing.

The increase of \$225,000 will allow GIPSA's P&S Programs to implement the requirements of the Paperwork Reduction Act that call for developing simpler reporting requirements for businesses and to provide for electronic submission of reports. Sustained low prices for beef and pork at the farm level have resulted in increased concern about concentration in the meat packing industry. Packer use of captive supplies, formula pricing, and other procurement initiatives require P&S to collect extensive data from packers for extended periods of time. Providing for the electronic submission of this data would reduce the cost to packers, improve the timeliness and increase the volume of data collection, and create a better understanding of the data on a real-time basis.

Increasing concentration, structural change, market performance, and the use of complex formula and value-based marketing systems by packers continue to raise questions of regulatory and policy significance. Additional resources will allow GIPSA to expand our capability to monitor and investigate the competitive implications of structural changes and behavioral practices in the meat packing industry, and will increase our ability to support legal actions that require complex economic and statistical analyses. Continuous, systematic collection and analysis of data along with aggressive investigative activities are required to address these issues effectively. Additional resources are critical to expanding the Agency's capability to monitor and investigate the competitive implications of structural changes and behavioral practices in the meat packing industry, and will enhance our capability to support legal actions that require complex economic and statistical analyses.

To promote competition and improve market performance and confidence in the livestock and poultry sectors, the Secretary's Advisory Committee on Agricultural Concentration recommended increased monitoring and enforcement of antitrust and regulatory policy and, specifically, increased antitrust enforcement under current regulations of the P&S Act. Since anticompetitive practices are complex and often encompass broad geographic areas, investigations involving building cases for unacceptable behavior has become more difficult and resource-intensive.

The requested increase of \$795,000 for packer competition and industry structure will allow GIPSA to conduct additional detailed investigations and analyses in selected geographic markets on a timely basis. It also will help us meet our responsibility of fostering fair and open competition, and guarding against deceptive and fraudulent practices that affect the movement and price of meat animals and meat food products.

As the industry continues to rapidly move to value-based methods of pricing, the complexity and sophistication of the packing industry's procurement and pricing methods will continue to increase. With this change also comes greater opportunity for packers to engage in unfair, unjustly discriminatory, or deceptive practices to the detriment of livestock producers. The Agency must be able to commit the necessary resources to conduct the type of complex investigations that are required to ensure the integrity of the accounting and payment to producers.

The \$750,000 increase for poultry compliance activities will allow GIPSA to better ensure that contract poultry growers are treated fairly when dealing with large, integrated poultry companies, and protect them from unfair and discriminatory practices, as recommended by the Advisory Committee on Agricultural Concentration. Specifically, the Committee recommended that the Secretary be provided the same administrative enforcement authority for poultry as currently exists for red meat to protect contract poultry growers from unfair and discriminatory practices. Additional funding for poultry compliance will allow GIPSA to operate on other than a complaint-driven basis and permit increased compliance investigations into the

poultry industry. More in-depth investigations will increase the Agency's ability to identify or address practices in the industry that may be unfair, unjustly discriminatory, or deceptive before practices escalate.

A one-time appropriation of \$3,000,000 will allow GIPSA to take the steps needed to strengthen its overall ability to investigate anticompetitive practices, and to provide greater flexibility and efficiency in enforcing all of the trade practice and payment protection provisions of the Packers and Stockyards Act. Without restructuring the field operations to provide for fewer offices with larger staffs, it will not be possible to incorporate the level of expertise needed to address the increasingly complex competitive issues facing the livestock, meat, and poultry industries.

A request is included to provide for a statutory dealer trust to require livestock inventories and accounts receivable due from the sale of livestock to be held in trust for unpaid cash sellers when a dealer fails to pay for livestock. If the request is enacted, the cost of administering this provision would be recovered through license fees.

Finally, concerning our proposal for new user fees, we realize that in the past, the Congress has not approved these requests. However, please consider this in terms of a service being provided that primarily benefits an industry or individual. Should taxpayers as a whole pay or should those who benefit? As with the current fees for inspection and weighing services, we believe that those who primarily benefit should pay.

CONCLUSION

Mr. Chairman, this concludes my statement. I appreciate the opportunity to testify on behalf of the Grain Inspection, Packers and Stockyards Administration (GIPSA). I will be happy to answer any questions the Committee may have.

BIOGRAPHICAL SKETCH

ENRIQUE E. FIGUEROA

Dr. Enrique E. Figueroa comes to USDA from Cornell University where he was an associate professor in the Department of Agricultural, Resource and Managerial Economics since November 1992. His initial appointment began in November 1986 as an assistant professor. Throughout his stay at Cornell, Dr. Figueroa's work focused on horticultural product marketing issues. Prior to that he was a post-graduate research agricultural economist and a research assistant in the Department of Agricultural Economics at the University of California at Davis.

His experience also includes work as a staff assistant to the House Committee on Agriculture for the U.S. Congress in 1982 and 1984. He spent four years with the California Conservation Corps from 1976 to 1980. He has an M.S. and Ph.D. in agricultural economics from the University of California at Davis, along with a M.S. in horticulture. His B.S. degree in agricultural education is from California State University in Fresno.

Dr. Figueroa has extensive experience in both research, extension, and teaching. He has worked on a number of projects in many parts of the world and has trained a number of graduate students.

INSPECTION CHANGES DUE TO HACCP

Senator COCHRAN. With respect to the Food Safety and Inspection Service, I know that one of the centerpiece programs now is the HACCP Program, this Hazard Analysis and Critical Control Point Program. How about that? [Laughter.]

It was designed to be based on science, to be more efficient to find things that the old way of inspecting carcass by carcass with the naked eye could not possibly detect, and to provide information to those who were processing the carcasses so that problems could be corrected and the food products be safer.

My question is, What changes, if any, can you tell us have been made in these plants with the introduction of this new procedure? What has been discarded that used to be done? What is being done under the new program?

Dr. WOTEKI. Well, there are very substantial changes that have resulted as HACCP has been implemented over this last year plus. Our implementation began last year with sanitation standard operating procedures, as well as the beginning of testing for generic E. coli. Under that first step in implementation, our plants have essentially taken the responsibilities for having and following sanitation plans themselves. Our inspectors' role changed too. Instead of mandating the sanitation, they are overseeing the companies and the implementation of their standard operating procedures for sanitation.

Then in the 300 of the largest plants that began operations in January of this year under the HACCP rule, we have also seen companies taking additional responsibilities for the ultimate safety of the product that they are producing and meeting the performance standards that are required under the rule for Salmonella.

In addition, our inspectors' role has changed very substantially. The number of tasks have been reduced and systematized, and the role that they play within the plant in overseeing the companies' implementation of their HACCP plans has been another very substantial change.

It has been a cultural change as well as a change to meet the requirements of performance standards in this science-based inspection approach.

Senator COCHRAN. If you could for the record—I know this may be too difficult to do in an oral response to my question—list the tasks that were performed by the inspectors under the old system that are no longer being performed. That would be nice to see.

Dr. WOTEKI. Yes; we can very easily submit that for the record. [The information follows:]

For the record, we are providing the Inspection System Guide contained in FSIS Directive 5400.1, which contains tasks that inspection program personnel are no longer required to perform in establishments that are subject to the HACCP system regulations. In addition, we are providing Inspection System Procedures contained in FSIS Directive 5400.5 that replace the Inspection System Guide.

FSIS DIRECTIVE 5400.5

INSPECTION SYSTEM ACTIVITIES

I. Purpose

FSIS is modernizing its approach to inspection to rely less on after-the-fact detection of problems and more on verifying the effectiveness of establishment processes and process controls. The Agency established the basic regulatory framework for this approach when it issued the Pathogen Reduction-Hazard Analysis and Critical Control Point (HACCP) Systems final rule (July 1996), which amended the regulations to require official establishments to take preventive and corrective measures at each stage of the food production process where food safety hazards occur.

A modernized approach to inspection requires changes in the performance-based inspection system (PBIS) and the activities FSIS has conducted under that system—in particular, the tasks in the Inspection System Guide (ISG). Therefore, for establishments that are subject to the HACCP system regulations, FSIS is replacing the ISG and portions of the PBIS directives with this directive and its attachments. Inspection program personnel are to follow the instructions in this directive in every establishment that is subject to the HACCP system regulations.

II. [Reserved]

III. Reason for Issuance

FSIS is issuing this directive to provide procedures, forms, and instructions that are appropriate for use in a modernized inspection system.

In an official establishment, inspection program personnel are to follow the instructions in this directive (along with its attachments) if the establishment is subject to the HACCP system regulations.

Senator COCHRAN. One of the suspicions out there, I will have to tell you, is that nothing has changed. We have got more and new things to be done under HACCP, but the old ways have not been abandoned and the activities of the inspectors are pretty much the same as they have been, except with new requirements on the part of the plan operators. That is a suspicion.

BRUCELLOSIS

On the other side of the table, let me get a status report on the brucellosis program. From what I hear, it has been a tremendous success and you have every right to be proud of the accomplishments there. Are we at a point where brucellosis is no longer a problem?

Mr. DUNN. At this time, Mr. Chairman, we have nine States yet to achieve brucellosis-free status. We intend to complete that operation by calendar year 1999.

Senator COCHRAN. Well, I congratulate you on a very successful program, and the States have been actively involved in helping make that a success too. I know in my State of Mississippi, former Commissioner of Agriculture Jim Buck Ross used to send me a letter up here every year telling me that status and where we were and what was needed in order to continue to make progress.

Mr. DUNN. Mr. Chairman, it has been a true partnership between the States, the Federal Government, but also the producers as well.

SANITARY/PHYTOSANITARY STANDARDS

Senator COCHRAN. There are a lot of inspection points now because of importing more fruits and vegetables and other food stuffs. Particularly under NAFTA, the freedom to import and export has increased the requirements for inspections and sites of inspections have increased, as I understand it.

With this added workload, how are you going to do all the things you have to do in this global economy and still assure the U.S. consumers that things that are being imported are safe, wholesome, and not contaminated?

Mr. DUNN. Mr. Chairman, we have been working very diligently with our trading partners to ensure that we can establish sanitary and phytosanitary procedures that are based on science and fact. APHIS, through its international services, has been working in country with these individual countries to ensure that we have equivalencies and verification of those equivalency programs for protection. I will ask the Administrator, Mr. Medley, to elaborate.

Mr. MEDLEY. Mr. Chairman, our 1999 budget requests increases in two areas. One is in our animal health monitoring and surveillance program. The other is in the pest detection program. These program increases are directly related to your question about the need to enhance our domestic infrastructure and to enhance our surveillance systems to certify the health status of American agricultural products.

We also conduct inspections at the first point of entry. Under our agricultural quarantine inspection program, we are increasing the number of detector dogs used to identify prohibited agricultural products. We are using more sophisticated x-ray technology in the identification process as well. We are also shifting to a more risk-based inspection approach. With the enhanced value of agricultural exports to our economy, these safeguard measures provide protection for our domestic agricultural producers from exotic pests and diseases.

SINGLE FOOD SAFETY AGENCY

Senator COCHRAN. The National Academy of Sciences, as I understand it, is coming out with a proposal that there be one agency in the Federal Government that would be the food safety agency. Now, the Food and Drug Administration has responsibilities under current law, and the Department of Agriculture has separate responsibilities under current law.

Dr. Woteki, what is your reaction to this proposal and how is the administration planning to respond to that proposal?

Dr. WOTEKI. Well, we are very interested in what the report is going to say. I think the committee is going to be holding its first meeting later this month and begin considering this question of how should the Federal Government be organized to improve the safety of the food that is made available to our public.

You may recall that the administration did consider this question early on during the National Performance Review, during the first year of that activity. They essentially came to the conclusion that we were going to better coordinate our activities. The President's food safety initiative and the budget request that we have submitted is a good example of how we have been working together to make the various parts of the Department of Health and Human Services, the EPA, as well as the various agencies within USDA that have a role to play in improving food safety, work better together.

IRRADIATION

Senator COCHRAN. One of the new technologies that some are arguing ought to be used more in the food industries to help protect the consuming public is irradiation as a way to kill bacteria and other contaminants in food.

What is the reaction of your office to this suggestion and what can be done by the administration to encourage more irradiation of foodstuffs, if this is a correct approach?

Dr. WOTEKI. Well, as you are probably well aware, the Food and Drug Administration considered the question of whether irradiation should be approved for use in red meat and decided the safety question with respect to red meat in December.

Senator COCHRAN. They decided that it was safe.

Dr. WOTEKI. That it was safe, exactly.

Our role now within the Food Safety and Inspection Service is to develop a proposed rule that we will put out for public comment later this summer about how that technology should be used and applied within meat slaughter and processing establishments and also how that product then should be labeled.

REDEPLOYMENT OF INSPECTORS

Senator COCHRAN. Let me ask you this. With the advent of the new technologies for analyzing food as it is being processed for sale in our country, is it necessary that we have the inspectors doing a carcass-by-carcass inspection any longer? Is that a waste of money?

Dr. WOTEKI. Well, we are definitely giving a lot of consideration to how, within a HACCP environment, our inspection resources should be used. We are working with industry to develop some pilot projects to consider how those inspection resources, the inspectors' time, can be better used to focus on food safety concerns and to free up their time so that it can be used and redeployed into other areas, again with the primary emphasis on improving the safety of the product.

Senator COCHRAN. As I mentioned when we started, we apologize again for the short period of time we have for oral questions. I have a number of questions that I intend to submit to you and I hope you will be able to respond to those in a timely fashion on a wide range of subjects. I do not want to leave anybody out. I hope you do not feel bad that I may not have asked you something that you wanted me to ask during this abbreviated hearing.

My good friend, the distinguished Senator from Arkansas, is here. As I pointed out, he was over in the full committee markup on the supplemental appropriation. I am going to have to leave for another commitment that I made, and I am going to do something to show you how we get along up here occasionally. I am going to turn the gavel over to a Democrat and let him ask whatever questions he wants to ask and then adjourn the hearing.

I do want to say that we will continue our hearings on the budget request for the Department of Agriculture on March 24 in this room. We will have witnesses from the Department's Farm and Foreign Agriculture Service programs.

I am going to yield the floor to my good friend and thank you again for your cooperation with our committee. Thanks very much. Senator Bumpers.

HACCP IMPLEMENTATION

Senator BUMPERS [presiding]. Thank you, Mr. Chairman. You could not have picked a worse time to turn the gavel over to me. I have been so busy with the supplemental appropriation, I really have not had a chance to prepare for this hearing, as I would like.

But there is one thing that is still a little bit of a thorn in my throat.

I wanted to ask you, Ms. Woteki, about the HACCP Program, first of all. How do you rate the effectiveness and success of that program?

Dr. WOTEKI. We have been at the full implementation of HACCP in about 300 plants just since January of this year. Our overall assessment of that first stage of implementation is good. It has gone relatively well. There have been some problems that have arisen of the type that we expected would occur with changes as large in magnitude as this is, both for the plants as well as for our inspectors.

When there have been problems that have arisen over this last month and a half, our analysis of the situation has been that plants have reacted very quickly and very positively. Our inspectors have at times required some additional clarification of their roles and responsibilities, which we have been swift in providing to them. So, I think for a change as big as this one has been, our assessment of implementation is it is going pretty well.

USER FEE PROPOSAL

Senator BUMPERS. How quickly could you start collecting these user fees that you are requesting?

Dr. WOTEKI. Well, we have included in our request approximately \$100 million that will enable us to start up that program in the first quarter.

Senator BUMPERS. In 1998?

Dr. WOTEKI. In fiscal year 1999.

Senator BUMPERS. In 1999, \$100 million?

Dr. WOTEKI. Correct.

Senator BUMPERS. And how much, say, in the year 2000?

Dr. WOTEKI. At that point the program would be in full implementation.

Senator BUMPERS. And would produce how much revenue?

Dr. WOTEKI. We anticipate that it would produce the revenue that would fully cover the cost of Federal inspection activities.

Senator BUMPERS. And how much would that be if it were in, say, 1998 or 1999?

Dr. WOTEKI. It will be approximately \$570 million.

Senator BUMPERS. Do you think the meat and poultry processors would pass that cost on to their consumers?

Dr. WOTEKI. The economists that we have consulted in the development of this proposal have told us, yes, they believe the costs will be passed on to the consumers and those costs will amount to less than a penny per pound of product.

SEAFOOD INSPECTION

Senator BUMPERS. You also have jurisdiction over fish inspection, do you not?

Dr. WOTEKI. No.

Senator BUMPERS. Who does?

Dr. WOTEKI. The Food and Drug Administration and the Commerce Department.

Senator BUMPERS. Well, I am not going to burden you with the question I was going to ask, but do you know what percentage of the domestic fish is inspected? Does anybody on this panel have any idea?

Dr. WOTEKI. Mr. Billy previously worked on this issue.

Senator BUMPERS. Mr. Billy.

Mr. BILLY. I formerly was the Director of the Office of Seafood for the Food and Drug Administration. I may be a little out of date in terms of my statistics.

The basic regulation of seafood safety falls to the Food and Drug Administration, and they operate an inspection system that is of a surveillance type. So, they spot check plants and products at a fre-

quency appropriate to the hazards that are associated with the various types of seafood products.

In addition to the mandatory system that they have, the Commerce Department operates a voluntary program similar to the programs operated by the Agricultural Marketing Service for other commodities. As I recall, about 20 percent of the seafood produced in the United States is under that voluntary program. Under that system, there are inspectors present daily and it operates more closely aligned to the way you would think meat and poultry inspection is done, although tailored to seafood.

FRUIT AND VEGETABLE INSPECTION

Senator BUMPERS. The President is now proposing to inspect all fruits and vegetables coming into the country from abroad. Is that correct?

Mr. BILLY. As I understand it, under the food safety initiative, the proposal is to strengthen the inspection activity of both domestic and imported fresh fruits and vegetables.

Senator BUMPERS. Is that also Commerce's responsibility?

Mr. BILLY. It is primarily a Food and Drug Administration responsibility, but Assistant Secretary Dunn may want to comment in terms of the role that the Agricultural Marketing Service will play.

Senator BUMPERS. I would be glad to hear it, Secretary Dunn.

Mr. DUNN. Mr. Chairman, what we have requested in our budget is \$6.3 million to begin microbiological testing for fruits and vegetables as part of the President's food safety initiative. We are going to be able to minimize that cost by putting it in with our pesticide data program that we currently have where we work through 10 different States to do testing for pesticide data residue. That will allow us to begin to have some inkling of how much microbiological problems there are in fruits and vegetables that come in, and we will have that information that we will turn over then to the Food and Drug Administration for action.

Senator BUMPERS. I want you to know I am hot for that program, and I was amazed, when the President offered that, that that was not already in effect. Most of the people in the country, when they buy—and in the winter months, you know that virtually everything you are eating is imported, and I think most people assume that it has been inspected and that there are no pesticide or herbicide residues on any of fruits and vegetables that have been imported. I would like to see that go forward, of course, and implemented at the earliest possible time.

Ms. Woteki, how many poultry and meat plants were closed down totally in 1997 under the HACCP Program? Do you know the answer to that?

PLANT CLOSURES UNDER HACCP

Dr. WOTEKI. The numbers that I have with me are for 1997 and year to date so far in 1998. It includes January, February, and March of this year.

Senator BUMPERS. Say that again. I am sorry.

Dr. WOTEKI. The numbers that I have with me that I can report to you today include calendar year 1997 as well as 3 months of calendar year 1998.

Senator BUMPERS. Fine.

Dr. WOTEKI. We have withheld inspection in 28 plants for failure to implement their sanitation standard operating procedures.

Senator BUMPERS. Let me interrupt you for just a moment. How many plants are we talking about total? How many do you inspect, meat and poultry?

Dr. WOTEKI. Over 6,000.

Senator BUMPERS. How many of those are poultry?

Dr. WOTEKI. FSIS inspects 428 plants that produce only poultry products, and 3,464 plants that produce both meat and poultry products.

Senator BUMPERS. Go ahead.

Dr. WOTEKI. There have been 50 actions to withhold inspection which include 28 plants from whom we have withheld inspection because of repetitive SSOP deficiencies, in 11 plants because of basic E. coli failures, in 10 plants because of HACCP system failures—and in this case, there are about 300 plants since January of this year that have come under HACCP-based inspection. Inspection has been withheld in one non-HACCP plant for zero tolerance failures.

IMPORT INSPECTION

Senator BUMPERS. You also inspect imported meat and poultry, do you not?

Dr. WOTEKI. Correct.

Senator BUMPERS. Do we import any poultry into this country?

Dr. WOTEKI. A small amount.

Senator BUMPERS. Pardon?

Dr. WOTEKI. A small amount.

Senator BUMPERS. What kind of inspection do you perform on imported poultry and meats? Mostly in meat I assume. A lot of it comes from South America, does it not? Argentina?

Dr. WOTEKI. Yes; we do a twofold inspection. One is that we evaluate countries that are exporting to us to determine whether they have a system that is equivalent to our own inspection system, and then as product enters the country, we do a random inspection of all of that product that comes in.

Senator BUMPERS. Are you telling me that we would not let a carcass of beef into this country that came from Argentina that was not subjected to as rigid an inspection in Argentina as it would be as if it were produced here?

Dr. WOTEKI. That is correct, sir.

Senator BUMPERS. Do you have any way of verifying that, validating that?

Dr. WOTEKI. Yes; we do.

Senator BUMPERS. How do you do it?

Dr. WOTEKI. Well, I would like Mr. Billy to give you the details on how we go about doing that.

Mr. BILLY. Only 37 countries are authorized to export to us out of all the countries that presumably could.

As Dr. Woteki described, we do a thorough evaluation of a country's inspection system to ensure that it is equivalent to ours before we will even approve them to export. That includes not only reviewing all their laws and regulations, but going on site and making sure that what they have on paper actually is being done in the plants and that their pesticide monitoring program, et cetera are being followed.

Then once we allow shipping to start, as Dr. Woteki described, we randomly pick shipments and inspect them based on past performance and the risks associated with the product in question. This is done by our inspectors at what are called inspection houses, and we keep records of the performance of plants and countries.

Then also as an additional step, we send auditors over to these countries. Our policy is to do that once a year. We review their program and we audit some percentage of the plants to make sure that they are continuing to follow the same procedures that we had reviewed previously. If they do not, we will delist the plants, have the country delist plants, or we will delist the country. We have done that on many occasions.

It is a very strict system.

Senator BUMPERS. Mr. Billy, how about canned meats?

Mr. BILLY. Same thing, same procedure.

Senator BUMPERS. You inspect the plants where the meat is canned?

Mr. BILLY. Yes, sir. Yes; we do.

Senator BUMPERS. Do you have authority on that or is that an FDA—

Mr. BILLY. No; we have specific authority in the Meat Act and the Poultry Products Act.

HUDSON FOODS RECALL

Senator BUMPERS. Dr. Woteki, let me ask you this. Hudson Foods bought beef from 15 different beef plants where the cattle were processed and the beef cut and maybe even ground. I am not sure. I think it was ground in the Hudson plant. But, for example, they took the carcass, cut all the meat off of it, transported it, 15 different packing plants, every one of them USDA inspected, FSIS inspected.

Now, when the so-called outbreak in the Hudson plant in Iowa occurred—or in Nebraska, rather. Was it Nebraska? It was, was it not?

Dr. WOTEKI. The plant was located in Nebraska. The outbreak was in Colorado.

Senator BUMPERS. Yes.

But in any event, the last I heard FSIS had reduced the possibilities of where that beef came from. It did not originate in the Hudson plant. It originated in another plant that was FSIS inspected and transported there.

Now, Hudson bore the brunt of the entire thing, and he was innocent as a newly ordained nun.

So, my question to you is, have you ever identified which of the two plants that it had been narrowed to shipped the beef to the Hudson plant?

And if I have misstated any thing of fact, do not hesitate to question it.

Dr. WOTEKI. No, sir; we have not identified the source of the original contamination.

REWORKED PRODUCT

There is one clarification, though, that I think is worthwhile bringing about. I think Hudson did have a responsibility for maintaining practices that would prevent the further contamination of product they were processing within their plant, and they did have a practice they called return or rework where product—broken patties or other product—was put into the cooler overnight and brought back the next day and put into production. So, they had the possibility for recontaminating product every day they were producing.

Senator BUMPERS. Were you able to determine that that practice in that Hudson plant caused this outbreak?

Dr. WOTEKI. We were not able to determine that that was the cause, but it does bring up the possibility of recontamination from—

Senator BUMPERS. I understand the practice might not be the ultimate practice even though this was a brand new facility, state-of-the-art, and I assume that FDA had known for a long time—the FSIS had known for a long time that this was a practice in that plant.

Dr. WOTEKI. I know that this type of practice is common within the meat industry. I believe that based on the Hudson experience, many companies have reconsidered the use of this practice and discontinued it.

Senator BUMPERS. Have you issued an order to require no plant to use this practice?

Dr. WOTEKI. No; we have not done that.

Senator BUMPERS. Why have you not?

Dr. WOTEKI. We have held a public meeting on this issue and we are in the process of developing some guidance on this issue.

Senator BUMPERS. If this was a practice that you think could possibly have been a contributor to this problem, why have you not made every processing plant discontinue the practice?

Dr. WOTEKI. I would like Mr. Billy to comment on the actions that we have undertaken to address this practice.

GUIDELINES VERSUS COMMAND AND CONTROL

Mr. BILLY. We have held two meetings with the industry, all of the industry that has concerns about this particular area, the problem being the contamination of hamburger material with E. coli O15:H7. We have made it clear that these types of practices affect the risk of the organism, if it is, in fact, present in the raw material or if it somehow is introduced into the plant. This can contaminate more than the day's production.

We have encouraged changes in the procedures that plants follow. We have drafted and will be sharing an announcement, just about to go out, guidelines that explain in very straightforward language how these different types of practices affect the exposure of the plants in terms of this organism being present in their product.

Mr. Chairman, we are trying to move away from the traditional command and control approach. HACCP is about seeing plants take responsibility for how they produce their product, to use procedures that minimize the risk to the consumer. That is why we are working on guidelines. That is why we have had meetings, but we want the plants to take responsibility and have appropriate control measures in their HACCP programs. Many plants have already done so and we are going to encourage all plants that produce this type of product to do that.

I am very concerned about falling back into the traditional approach of telling plants specifically you can do this, you cannot do that, at 11 o'clock you must make this step; the practices of the past.

I believe the industry is committed. I believe they want to produce safe products. They have certainly shown to us with their HACCP programs that we have seen so far that they are taking good, positive steps to do that, and we are going to encourage more. I think that is the prudent strategy.

We have included the public in this process. They are aware of what we are doing and how we are approaching it. I think there is a reasonable degree of comfort that this is a sound approach that will net us a safer product for the future.

IMPACT OF RECALL

Senator BUMPERS. I raise this issue because I am familiar with all of these people in my State. I watched Hudson Foods from the time I was elected Governor, maybe doing a few million dollars a year, go to \$1.7 billion. I have always thought that the people who have the greatest incentive to put out a pure product are the companies themselves.

In this particular case, I did not know quite what to think when this thing first burst on the scene, but as time went by and I found out that that contamination almost certainly originated in another USDA-inspected plant, not in a Hudson plant, and yet every press conference by the Department, every utterance by the Department placed the entire burden on Hudson Foods and made it so they had no choice but to either fold or to sell. And they sold for hundreds of millions of dollars less than that plant would have brought 1 day before this happened.

Until this very day, until this moment, you cannot—I am not being all that critical about the process. I am concerned about the public relations that occurred during that period of time. You cannot tell me with any degree of certainty that they were culpable in any way. You are telling me that the procedure they used was one that was used in virtually all these plants, and that while it might have lent itself to the possibility of Salmonella or E. coli breaking out, you cannot state at all that that is what caused this problem.

Yet, here is a family who worked themselves to death over the past 25 years to build that business and all of a sudden, they are out of business at a cost of several hundred million dollars to them.

REWORKED PRODUCT

Mr. BILLY. Mr. Chairman, we do have information that indicates product that was produced in late April or early May and associ-

ated with some of the illnesses in Colorado was subsequently put into use roughly 4 weeks later, and we can provide the specific information for the record. That introduction of the return material into that later production, in fact, may well have introduced the organism into that later day's production and caused the bulk of the outbreaks of illness in Colorado. So, to the extent we were able to glean information from the company records, we do have information to indicate that the plant took part in practices that appeared to have caused the organism to be spread from one day's production to another.

I would be happy to provide you with that information for the record.

Senator BUMPERS. Well, the information now is of not much benefit. I mean, the damage has already been done.

I have chastised myself in a way because I did not speak up in the beginning, but the reason I did not speak up is because I did not know. I thought maybe the contamination was going to be widespread. I thought that maybe Hudson was culpable in the whole thing. I had no way of knowing, and I was listening to these press conferences constantly about going from a few pounds of beef until we wound up with 25 million pounds and then the plant then shut down. It is a powerful thing.

I consider Secretary Glickman one of the best friends I have ever had. I have known him for years, long before he was Secretary, and I think he is a man of immense integrity, immense talent, and I think he does, by and large, an excellent job in the Department of Agriculture. So, I am reluctant to—I am not chastising him because none of us really knew in the beginning, but I am just saying the end result was catastrophic so far as I am concerned for innocent people.

This morning on the way to work—my chief of staff who lives in the neighborhood and I drive to work together. I was talking about a large gathering last night that I had spoken to, and I told her, I said, you know, when I started talking about how lucky we are to live in a nation where, when you eat food, you know it is pure, when you drink water, you know it is pure, and when you take a dose of medicine, you know it has been tested and tested and tested, when you are in an airplane, you feel relatively safe because you know you are on a radar that is handing you off from one to the next one, and on and on and on it goes.

But I saw two or three people in the audience. I could tell they did not like to hear that, and we were talking about that. I have been in this business a long time. I can watch an audience and I can tell who appreciates what I am saying and who does not. I could tell there was some anti-Government sentiment in that audience.

Sometimes anti-Government sentiment is irresponsible, reckless, and irrational, but I told her this morning, I said, but you have ever been on the receiving end of an autocratic bureaucrat enforcing a regulation that you are quite sure he is misinterpreting or using to abuse you, you do not ever get over that.

And that is the reason for the antipathy toward the Internal Revenue Service. They brought most of this on themselves. Now, I am not for abolishing the Internal Revenue Code or the Internal

Revenue Service. All I am saying is I understand the hostility people feel about it, and I certainly understand the Hudson family's attitude about the Federal Government, and I might say it is toward OSHA as much as it is FSIS.

But our job here is to try to make Government responsive, try to make it function. You will not ever make people like Government. You are not ever going to have a wholesale respect for Government. All I am saying is our job is to constantly day by day do the best we can and improve it as much as we possibly can.

Well, that is enough of that lecture.

I have just one other question, maybe a couple.

BOLL WEEVIL

Mr. Medley, I wanted to ask you about the boll weevil program because my State is going to get left on the starting blocks. We are just getting started on it and now you are cutting the budget by \$12 million. Does that bring the boll weevil eradication program to a halt?

Mr. MEDLEY. Senator, the cut of \$12 million in the boll weevil program budget request is the Department proposing to move out of those areas where we have been successful in eradication and also provide a way by which the producers can get the startup costs, which sometimes can be very high, through an FSA loan program.

It is an attempt to refocus our resources. Because of the success of the program and because of the high return for producers that have invested in the eradication program, we can move from providing direct support to providing technical assistance.

Senator BUMPERS. Mr. Medley, let me interrupt you just a moment. You are phasing out the grant program in favor of a loan program. Is that correct?

Mr. MEDLEY. Well, the appropriated funds in favor of a loan program; yes, sir.

Senator BUMPERS. Well, so my question is this. How about States like mine for example? This program has been going now, what, 5 or 6 years, a little longer?

Mr. MEDLEY. Yes; a very successful eradication program.

Senator BUMPERS. But everybody else had enjoyed the fruits of the grant program and now that you get down to Arkansas, you are converting it to a loan program, if I understand it. And I do not consider that fair for my cotton farmers.

Mr. MEDLEY. Senator, in the beginning, the eradication program was funded through a 70-30 cost share with 30 percent of the funding coming from the Government through appropriations. Over the last several years, there are more new eradication programs starting with growers paying more of the eradication costs because of the economic benefits. For instance, producers contribute over 85 percent for new eradication programs in Texas. As we demonstrate that the program can be successful, we have requested reduced appropriations for the eradication program. It is different from when the program first started.

Senator BUMPERS. I am enjoying this so much but we have got a vote on here. So, I will submit a few questions.

Jim, I am sorry I did not have anything for you this morning.
[Laughter.]

Mr. BAKER. It does not bother me a bit, sir. [Laughter.]

Senator BUMPERS. I thought you were rather enjoying it.

Mr. BAKER. I was.

SUBMITTED QUESTIONS

Senator BUMPERS. We have a vote on, and so I am going to have to do that. I will submit a few questions in writing and ask that you at your earliest convenience answer those questions.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

FOOD SAFETY AND INSPECTION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Question. The President's fiscal year 1999 budget proposes new language under the Food Safety Inspection Service's Salaries and Expenses account which would waive the requirement that "Federal funds for any year shall not exceed 50 per centum of the estimated total cost of the cooperative program", as required by the Federal Meat Inspection Act. What is the rationale for increasing federal support to the States for this program, especially when the Administration is requesting private funds to pay all costs for inspection of the private companies?

Answer. This waiver is needed to assist the States and ensure timely implementation of all HACCP requirements in the State inspection programs. The States will need assistance in developing infrastructure support for HACCP-based inspection in the areas of automation, laboratory pathogen testing, and inspection workforce training. This assistance will provide State programs with the same capability as FSIS in these critical areas so that State requirements will be "equal to" those at the Federal level, as required by the statutes.

The budget request will extend the current FAIM project initiative to the States, which would eliminate the need for each State to design, develop and implement automated systems that will support communication with FSIS automated systems. FSIS has already tested and proven the value of this infrastructure and the cost to FSIS would be less than paying 50 percent of the full cost for twenty-five individual State automation programs. This proposal will assist in moving toward a seamless food safety program through support of a uniform nationwide inspection system.

Question. How does the Administration propose to pay for this increase?

Answer. The Administration proposes a net appropriation of nearly \$150 million that includes \$7.8 million for this initiative.

Question. The President's budget proposes legislation to require user fees to recover the full costs of meat, poultry, and egg products inspection. How many inspectors are supported by the fiscal year 1998 budget?

Answer. The fiscal year 1998 budget supports a total of 7,628 permanent full-time inspectors and the full-time equivalent of 570 other than permanent full-time inspectors.

Question. Does the fiscal year 1999 budget propose an increase or decrease in the amount of funding for inspectors?

Answer. The fiscal year 1999 budget proposes increases totaling \$19.8 million for mandatory pay, retirement, and non-salary costs, as well as assumption of the Florida State inspection program to support a constant level of inspection staffing. FSIS will continue the process of transforming the inspection process within the same overall staffing levels in 1999 that we have in 1998.

Question. Would all inspectors be supported by the user fee collections proposed?

Answer. Yes, the proposal would cover the full cost of inspection, including the salaries and benefits of all inspection personnel.

Question. How much will the consumer have to pay under the Administration user fee proposal?

Answer. We estimate the overall impact on costs as a result of these fees will be less than one cent per pound of meat, poultry, and egg products production.

Question. Why is a \$100 million appropriation required to implement the user fees?

Answer. Under our user fee proposal, establishments will be billed on a monthly basis, with fees due by the end of the month following the billing period. Because no fees will be received in the first month of the fiscal year, start-up funding is requested to cover FSIS budget obligations that must be paid in the first month. In addition, a reserve is needed to maintain a stable Federal inspection program as the flow of user fee revenue may not match estimated costs. Of the total \$100 million request, estimated costs include \$48 million for fiscal year start-up, and \$52 million for program reserves.

Question. What start-up costs would this amount support? Please be specific.

Answer. The obligations that must be paid before the receipt of user fees are primarily for the salaries and benefits of the FSIS workforce, which is estimated at 85 percent of the total cost of the Federal inspection program.

Question. When does the Administration plan to send to the Congress the legislation authorizing user fees?

Answer. The proposed user fee legislation is presently in clearance at the Office of Management and Budget (OMB) and will be submitted to Congress very soon.

Question. Did the Administration submit its user fee proposal to the Congress last year?

Answer. Yes, on June 26, 1997, Secretary Glickman transmitted to the President of the Senate, Albert Gore, and the Speaker of the House, Newt Gingrich, a draft bill, "To authorize the Secretary of Agriculture to impose user fees for the inspection of livestock, meat, poultry, and products thereof, and egg products."

Question. Dr. Woteki, you mention in your statement that you have been tapped as the coordinator of the President's Food Safety Initiative. Among other duties, one directive is to develop and carry out a plan to ensure the safety of domestic and imported fruits and vegetables. How does the agency's fiscal year 1999 budget address the President's initiative to enhance the safety of imported and domestic fruits and vegetables?

Answer. While FSIS does not inspect fruits and vegetables, \$13 million of the \$46 million included in the USDA fiscal year 1999 budget for the President's Inter-agency Food Safety Initiative has been specifically targeted for the President's Directive on the safety of domestic and imported fruits and vegetables: \$4.0 million for the Cooperative State Research, Education, and Extension Service (CSREES) for research and producer education; \$2.7 million for the Agricultural Research Service (ARS) for research on the development of new food safety technologies aimed at reducing and controlling pathogens on fruits and vegetables; and \$6.3 million for the Agricultural Marketing Service (AMS) to establish a microbiological data program on fresh fruits and vegetables.

FLORIDA INSPECTION PROGRAM

Question. Florida terminated its funding for the Cooperative State Inspection Program on December 1, 1997. Why did the State of Florida terminate its funding for this program?

Answer. Governor Lawton Chiles informed Secretary Glickman, in his letter of July 23, 1997, that the State budget adopted by the Florida legislature for the fiscal year 1997-98 reduced funding for the State meat and poultry inspection program sufficiently to necessitate termination of the State program in December 1997 when funds would be depleted. Details were not provided for the rationale used by the legislature to prioritize funds.

Question. Does the law direct FSIS to fund these activities should a state choose not to participate in this program?

Answer. FSIS is mandated by law to assume responsibility, previously held by a State, for administering meat and poultry inspection programs with respect to operation and transactions within a State. In accordance with section 301(c)(3) of the Federal Meat Inspection Act and section 5(c)(3) of the Poultry Products Inspection Act, States that have terminated their inspection programs are designated to receive Federal inspection with respect to operations and transactions within the State.

Question. Does the FSIS anticipate any other of the participating 25 states terminating its participation in this program? If so, which ones?

Answer. FSIS has not received any notification that a State is planning to terminate its program.

Question. Should the Committee propose to not provide this needed increase, what are the consequences?

Answer. The requested increase in funding is needed to ensure full coverage of inspection assignments for which FSIS assumed responsibility when Florida terminated its program. Without this increase, FSIS will absorb the additional workload, making adjustments as needed in resource allocations based on inspection priorities.

PRESIDENT'S FOOD SAFETY INITIATIVE

Question. How much money in fiscal year 1998 did FSIS contribute to the "Fight BAC!" educational campaign?

Answer. FSIS is contributing \$75,000 in fiscal year 1998 towards the "Fight BAC!" campaign. This includes \$30,000 for printing "Fight BAC!" brochures and \$45,000 for distribution of the brochures through the Consumer Information Center in Pueblo, Colorado. Additionally, FSIS is planning a multi-year education initiative that is part of the President's Food Safety Initiative. The Agency proposes an increase of \$500,000 in the fiscal year 1999 budget request to develop new educational products and support distribution of existing products.

Question. What was FSIS' role in this campaign?

Answer. FSIS played a leading role in creating the Partnership for Food Safety Education, which brings together representatives from industry, government, public health, and consumer organizations. The Partnership developed the "Fight BAC!" campaign. FSIS is completely involved in all aspects of the Partnership, including selection of the public relations firm that created the "Fight BAC!" campaign, and review of all educational materials, the public service announcement, and Web site design and content. FSIS also played a major role in coordinating the "Fight BAC!" press conference held at USDA. FSIS continues to play an important role in recommending new promotional opportunities for the "Fight BAC!" campaign and planning the next phase of the campaign, which is to develop materials for the classroom.

Question. FSIS is planning a multi-year education initiative which is a part of the President's Food Safety Initiative. The agency proposes in the fiscal year 1999 budget request an increase of \$500,000 to develop new educational products and support distribution of existing products. Are these additional funds to continue the "Fight BAC!" educational food safety campaign?

Answer. The four key safe food handling messages contained in the "Fight BAC!" campaign will continue to be the cornerstone of new materials developed by FSIS. The Agency proposes in the fiscal year 1999 budget request an increase of \$500,000 to develop new educational products and support distribution of existing products in order to help food handlers change unsafe behaviors.

Within the President's Food Safety Initiative, there are many consumer education projects identified that require government funding. For example, FSIS is proposing to produce a safe food handling video for senior citizens at risk for developing foodborne illness. Reaching at risk audiences is one of the goals of the President's Initiative. FSIS is currently investigating how best to integrate food safety education into the school environment. Once that analysis is completed, plans will be developed and funded by the request.

Question. Do other USDA agencies develop and distribute informational products regarding food safety? If yes, which ones and how does this educational material differ from FSIS'?

Answer. There is no other agency within USDA that develops and distributes national food safety information materials to consumers. However, FSIS has worked very closely with the Cooperative State Research, Education, and Extension Service (CSREES) at the State level. FSIS believes that the programs complement each other. Most of the CSREES resource allocation is provided through grant funding to local extension offices in individual States or localities. Projects are developed on a smaller scale. FSIS conducts educational programs on a national level and provides local extension specialists with tools to expand the impact of the national programs at the grass-roots level. For example, FSIS, as a partner in the "Fight BAC!" campaign, contributed to the production of brochures, camera-ready art and action kits, which are supplied to extension specialists. FSIS is funding the brochure's distribution through the Consumer Information Center (CIC). Extension specialists can direct their constituents to that resource.

Question. The President's fiscal year 1999 budget request proposes an increase of \$3 million for risk assessment and producer education. Of this increase, \$1 million will be used to collaborate with animal production experts in identifying cost effective pathogen reduction strategies to reduce foodborne illness. The other \$2 million will be used to educate producers, marketers, and transporters of meat and poultry products and to fund up to 25 State agriculture initiatives. Would you please elaborate on how these risk assessment and educational initiatives will be used by producers to reduce pathogen contamination.

Answer. Currently, there does not exist the scientific understanding of practical ways to reliably reduce the level of pathogens in animals prior to slaughter that would result in lower contamination levels on the carcasses. The \$1 million will continue the focus of the fiscal year 1997 initiatives in risk factor analysis at the food

animal production stages for lamb, beef, poultry, and pork. The data collected from the pathogen reduction strategy pilot demonstration projects will provide information for quantitative and qualitative evaluation of production practices that producers may opt to use which have potential to lower the chemical, physical, and microbiological hazards associated with food animals presented for slaughter and processing.

The \$2 million for educational efforts will foster State level initiatives among food animal producers, practicing veterinarians, animal and public health agencies, agricultural research and extension and other stakeholders to assist producers in developing practical, cost-effective methods of managing their flocks and herds in ways which enhance food safety. As HACCP implementation causes the marketplace to encourage adoption of HACCP-compatible production practices, food animal producers, including small producers, will be aware of the changing nature of the marketplace. They will have the ability to remain viable by using the option of adopting management practices that both meet the demands of the marketplace and result in production of animals, which are the basis of safe, high quality food.

Question. Does the agency plan to mandate these practices for producers in the future?

Answer. The Agency has no plans to seek statutory authority for animal production. FSIS supports the implementation of voluntary efforts to reduce chemical, physical and microbial hazards from the farm, through markets, transportation, feedlots and during pre-slaughter preparation of food animals. The Agency believes the Pathogen Reduction/HACCP systems rule will affect food animal suppliers when they sell to slaughter plants implementing these systems. Plants will need more information about the potential hazards in/on incoming animals, including birds, in order to address those hazards appropriately in their HACCP plan. This will drive market changes that will promote HACCP-compatible practices at the production level. These practices may include record keeping, following the FDA compliance guidelines for appropriate drug use, animal or premise identification, and other Quality Assurance Program and Good Production Practices standards.

Question. The fiscal year 1999 budget provides funds to train federal and state inspectors as the Hazard Analysis and Critical Control Point (HACCP) system is implemented in all sectors of the food industry. What areas are being emphasized in these training sessions? To date and by fiscal year, how many Federal inspectors and how much funding has been used?

Answer. The 1999 budget requests a \$750,000 increase to develop and deliver HACCP training for State inspection personnel under the activity Special Assistance for State programs, which is a major part of the President's Food Safety Initiative. The proposed State training will be modeled on the Federal HACCP training already underway since fiscal year 1997. Federal HACCP training includes the following:

1. In fiscal year 1997, the first phase of the implementation of the pathogen reduction and HACCP rule took place. It dealt with Pre-HACCP requirements primarily consisting of the sanitation standard operating procedures (SSOP's), effective in all plants on January 27, 1997. Two separate training programs were delivered at the cost of \$3.5 million, as follows:

- a. 4,331 employees, including supervisors, completed a three-day training program that focused on how to (1) perform the inspection tasks for the regulatory oversight of the pre-HACCP requirements; and (2) understand and appreciate the changes being brought about by the new rule.

- b. 1,200 supervisors completed a two-day training program to equip them to lead the changes brought about by the pathogen reduction and HACCP rule.

2. In fiscal year 1998, the second phase of the implementation of the pathogen reduction and HACCP rule occurred. It dealt with the implementation of the HACCP and Salmonella requirements in large plants, effective January 26, 1998. It cost approximately \$2 million and included a training program for more than 2,000 field inspection and compliance personnel during a six-week period in December 1997 and January 1998. Preparatory to the implementation, some 112 facilitators completed a three-week Facilitator Training Program on the delivery of the HACCP Technical Training Program.

Included in the HACCP Technical Training Program was a module on Business Relations that focused on the concepts and practices that inspection personnel need to know to establish and maintain an effective business relationship with plant owners, operators and employees. It is centered on the following five relationship principles:

1. Maintain open, honest, and straightforward communications.
2. Have mutual respect.
3. Be issues-oriented, do not personalize.

4. Maintain a work environment that is absent of the fear of retaliation and intimidation.

5. Understand each other's roles and responsibilities.

On January 30, 1998, FSIS announced that Federally inspected meat and poultry plants may, upon request, implement and receive inspection under the pathogen reduction and HACCP rule prior to the mandatory implementation dates. Plants are not permitted to begin operating under the rule until FSIS has trained the assigned inspector(s). Upon receipt of a request, the HACCP Training Facilitators will schedule and deliver the training to the affected inspectors.

Question. When does the agency plan to complete all training for Federal and State inspectors, by fiscal year?

Answer. The training of Federal inspection personnel assigned to plants implementing the HACCP and Salmonella requirements will occur in subsequent fiscal years, as follows:

1. In fiscal year 1999, for employees assigned to small plants that are required to implement the HACCP rule on January 25, 1999; and

2. In fiscal year 2000, for employees assigned to very small plants that are required to implement the HACCP rule on January 25, 2000.

Training for State inspection program personnel will be developed during the first part of fiscal year 1999, with delivery of training to begin in late fiscal year 1999 and continue into fiscal year 2000 to complete mandatory HACCP implementation in all very small plants.

Question. Has the agency used any funding in providing joint training to the industry? If yes, how much?

Answer. No, the Agency has not used any funding to provide joint training to the industry. FSIS is providing information to the industry through briefings at many locations nationwide, and technical assistance for small and very small establishments. FSIS is making available to small and very small establishments various HACCP materials that should assist these establishments in conducting their hazard analyses and developing their HACCP plans. As stated in the HACCP final rule, each establishment is responsible for training its employees. FSIS training is limited to FSIS and State employees because of complex logistical and cost considerations.

Question. Dr. Woteki, you mention in your statement implementing the farm-to-table food safety strategy. What is the agency's strategy?

Answer. The consumer's risk of foodborne illness from meat or poultry is a composite of the microbial hazards introduced to the product throughout the farm to table continuum. The only way to provide the maximum reduction in risk to consumers, and to allocate the costs of ameliorating those risks fairly, is to promote, or where appropriate require, adoption of reasonable interventions at every step where a hazard is introduced.

While FSIS continues to focus much of its resources on oversight of slaughter and processing operations, the Agency is addressing other risk factors that contribute to foodborne illness and make consumers sick. FSIS officials recognize that the measures contained in the Pathogen Reduction and HACCP rule must be part of a comprehensive food safety strategy that addresses hazards at other points in the farm-to-table chain. To that end, FSIS is broadening the scope of its food safety activities beyond slaughter and processing plants, with particular emphasis on hazards that arise during production, transportation, distribution and retail sale.

Animal production food safety.—To improve food safety at the animal production and intermediate stages before the slaughter plant, FSIS is working with industry, academia, and other government agencies to develop and foster voluntary measures that can be taken on the farm and through distribution and marketing of animals to reduce food safety hazards associated with animals presented for slaughter. FSIS believes that the voluntary application of food safety assurance programs based on HACCP principles can be useful in establishing risk reduction practices on the farm and during intermediate marketing stages. The agency believes that continued public concern about foodborne pathogens and the adoption of HACCP and performance standards will increase incentives for producers to adopt food safety practices at the animal production level.

In the animal production area, the Agency strategy is two-fold. First, FSIS will continue efforts begun in fiscal year 1997 to identify and field-test production practices that will result in lower risk animals being presented for slaughter and processing. These efforts will be aimed at defining cost-effective, practical management adjustments that tend to contribute to food safety in all areas of chemical, physical, and microbial risks. They will address practices in the production of beef, lamb, poultry and pork, and the process will involve collaboration with numerous special-

ists in management, disease control, data collection, and risk analysis both inside and outside of USDA.

Second, we will promote and encourage the development at the State level of partnerships among producers, veterinarians, animal and public health agencies, marketers, transporters, and education and extension personnel. These partnerships will function to make producers aware of the food safety challenges in the production of food animals, and define locally feasible methods of addressing these challenges. Every effort will be made to encourage the blending of needed food safety practices into existing and developing industry quality assurance and total quality management programs. The food safety HACCP-compatible production practices will then be available to producers in form and language familiar to them, and as part of projects already supported by industry leaders.

Transportation, storage and distribution.—Other important links in the food safety chain are transportation, storage and distribution. In these areas, FSIS, FDA, and State and local governments share authority for oversight of food products. FSIS and FDA are working together to develop standards governing the safety of foods during transportation and storage, with particular emphasis on the importance of temperature control in minimizing the growth of pathogenic microorganisms. When raw product leaves the inspected facility, unsanitary conveyances can contaminate product and inadequate temperature controls during transportation to market can promote rapid and progressive growth of any bacteria present. For this reason, we are working with FDA and the food industry to develop procedures and practices that will ensure only clean and sanitary vehicles are used and appropriate temperature controls are maintained throughout transportation and distribution to retail.

Retail and food service.—In the retail area, FSIS and FDA are working with State officials to ensure the adoption of uniform, science-based standards and to foster the adoption of HACCP-type preventive approaches. State and local authorities have the primary responsibility for food safety oversight of retail stores and restaurants, but FSIS and FDA, working through the Conference for Food Protection, can provide expertise and leadership to support local authorities and foster the development of sound food safety standards and practices nationwide.

CDC outbreak data indicate that where a food source has been identified, mishandling of food at retail or in a food service establishment is, more often than not, cited as a contributing factor. Usually, one of the following factors is cited: (1) improper holding temperatures, (2) inadequate cooking temperatures, (3) contaminated equipment, (4) unsafe food sources, or (5) poor health or hygiene of personnel. There are about one million such establishments, employing about 12 million people. Close to half the consumer food dollar is spent on food prepared by others outside the home. These people represent not only a potential source of additional microbiological contamination, but also the last point at which interventions—such as cooking—can reduce or eliminate microbial risks. Improvements in food handling at retail promise to achieve the greatest reductions in the prevalence of foodborne illnesses.

FSIS intends to be aggressive in promoting higher food safety standards and more uniformity among State and local jurisdictions that have primary jurisdiction over these establishments and food at retail. We are joining with FDA on a number of projects to support State and local food regulatory officials. Most notably, the Food Code provides the best advice of the Federal agencies on State laws and procedures for oversight of the retail food industry. The Food Code is continuously updated in collaboration with State and local regulatory officials, industry representatives, academic experts, and consumers participating in the biannual Conference for Food Protection.

In addition, FSIS is providing training for State and local officials on meat and poultry processing, increasingly important as more and more retail establishments are processing products that, if they were produced in inspected establishments, would be subject to mandatory HACCP.

The Agency is also collaborating with FDA on other training initiatives that will promote more uniform and effective oversight by State and local food regulators. One initiative is train the trainer courses, together with training materials and ongoing support, to increase the ability of the States to reach those in subordinate jurisdictions that most need training. Another initiative involves adapting HACCP principles to the many various conditions confronted by establishments handling and preparing foods at retail.

Consumer education.—Even as progress is made in reducing contamination during these stages, it will remain critical that retail food handlers and consumers follow safe food handling practices. Proper storage, preparation, and cooking of meat, poultry, and egg products are essential to achieving the goal of reducing the risk of

foodborne illness to the maximum extent possible. FSIS intends to augment its food handler education efforts by expanding its collaboration with industry, other government agencies, consumer and public interest groups, educators and the media to foster the effective delivery of food safety education and information. FSIS is a key participant in the Public/Private Partnership consisting of industry, government and consumer groups that have developed a public education campaign, "Fight BAC!", which is focused on food handling and is a key part of our efforts to educate consumers. The campaign includes public service announcements, and highlights the need for increased safety in food preparation practices. The "Fight BAC!" campaign highlights four basic sanitation and food-handling strategies consumers should use in their homes through use of a graphic featuring these four steps to food safety. The steps are: (1) Clean: Wash hands and surfaces often, (2) Separate: Don't cross-contaminate, (3) Cook: Cook to proper temperatures, and (4) Chill: Refrigerate promptly. The graphic is designed for use in a variety of materials, including posters and refrigerator magnets. This campaign is the foundation for the multi-year food safety education initiative.

FIELD AUTOMATION AND INFORMATION MANAGEMENT

Question. The fiscal year 1999 President's budget proposes an increase of \$5.8 million for automation assistance to extend the Field Automation and Information Management (FAIM) project to the State inspection programs. How many States would be served by this proposed funding, and would the FAIM program be fully implemented in fiscal year 1999?

Answer. In January 1998, the National Association of State Meat and Food Inspection Directors polled each of the 25 States that maintain their own inspection programs. All twenty-five expressed their desire to participate in FAIM. Twelve of the States want FAIM to be implemented in fiscal year 1999; the remaining thirteen States have asked for fiscal year 2000 as an implementation date. The funding requested for fiscal year 1999 will be sufficient to implement FAIM in the twelve States requesting implementation in fiscal year 1999.

Implementing FAIM in the States will eliminate the need for each State to design, develop and implement automated systems that will support communication with FSIS automated systems. FSIS has already tested and proven the value of this infrastructure and the cost to FSIS would be less than paying 50 percent of the full cost for twenty-five individual State automation programs. This proposal will assist in moving toward a seamless food safety program through support of a uniform nationwide inspection system.

Question. Does the fiscal year 1999 budget request contain any funds earmarked for the FAIM program on the Federal level?

Answer. FAIM—for FSIS inspectors—is predicated on a phased five-year implementation. The Agency budget request includes \$8.525 million in fiscal year 1999 for the fourth year of nationwide implementation. Implementation is on schedule and will be completed in fiscal year 2000.

Question. Please provide funds made available for FAIM in each fiscal year since the program was initiated to fiscal year 1999 and indicate the amount obligated for the program in each of these years.

Answer.

[The information follows:]

Fiscal year	Funding	Obligated
1996	\$8,425,000	\$7,230,000
1997	8,525,000	9,485,000
1998	8,525,000	8,760,000
1999	8,525,000	8,525,000

Notes:

1. Nearly \$1.2 million was carried over as no-year funding from fiscal year 1996 to fiscal year 1997.
2. In fiscal year 1997, \$1.0 of the \$1.2 million carryover funds was expended.
3. Projected fiscal year 1998 obligations include the remaining \$0.2 million carryover funds.
4. Fiscal year 1999 funding and obligated data reflect the current budget proposal.

SALARIES AND EXPENSES

Question. In fiscal year 1999 the budget proposal assumes a decrease in staff years for non-inplant personnel realizing a savings in salary and operating costs. What factors influence this reduction in staff years?

Answer. The 1999 budget proposes reductions of \$1.75 million and 25 staff years in salary and benefits and operating costs. This includes \$1.0 million and 10 staff years for field office streamlining as a result of continued implementation of the FAIM project. An additional savings of \$750,000 for salaries and benefits associated with 15 staff years is projected to result from the elimination of the prior approval programs.

Question. How long does the agency expect these factors to affect staff reductions?

Answer. Implementation of the FAIM project is scheduled for completion by the end of fiscal year 2000 and the resulting field streamlining will also be completed in fiscal year 2000. Elimination of the prior approval programs will be completed by the beginning of fiscal year 2000.

HAZARD ANALYSIS AND CRITICAL CONTROL POINTS

Question. On January 26, 1998, the Hazard Analysis and Critical Control Point system (HACCP) was implemented in 312 of the largest meat and poultry plants in the nation. Some leading scientists involved in developing the model HACCP program have charged that FSIS is ignoring scientific data and forcing plants to incorporate the old organoleptic processing methods into HACCP plans. The Committee had serious concerns at the time the HACCP rule was being written about layering the new system on top of the old.

I am aware that complaints have been made that FSIS is in fact forcing plants to write regulations from the old system—such as time and temperature cooling requirements—into their HACCP plans. Mr. Billy, if this is true, how does this fulfill the commitment the department made to Congress to eliminate layering?

Answer. FSIS does have regulatory requirements that need to be updated and the Agency has acknowledged that it needs to remove its command and control requirements and replace them with performance standards, which provide the regulated industry with more flexibility. The Agency is developing a consolidated set of regulations that bring meat and poultry requirements together in a single place. We are committed to writing our regulations in plain and simple language so that they can be understood by not only the regulated industry, but also by the public, which expects that the government will hold industry accountable for meeting regulatory requirements.

However, we acknowledge it is taking us longer to meet our goals than originally intended. Until performance standards are implemented, there are a number of regulations containing command and control requirements that will continue to be enforced. One such regulation is the requirement that poultry be chilled to a specific temperature within a certain time frame, depending on the weight of the bird: 40 degrees within eight hours for turkey (9 C.F.R. 381.91). This requirement was based on the best available scientific knowledge about the lag phase for bacterial growth. FSIS would be negligent in its food safety mission if it dropped this requirement before implementing a performance standard.

Question. How does this enhance food safety?

Answer. To protect the public health, FSIS is enforcing current regulatory requirements that are based on the best science available at the time the requirements were developed. Chilling reduces the growth of bacteria.

Question. FSIS has eliminated pre-approval for equipment and blueprints. Does FSIS intend to remove any other outdated requirements that you could share with us today?

Answer. FSIS made a commitment to change its command and control regulations into performance standards as rapidly as it could, given current requirements for regulatory change.

We are providing the FSIS portion of USDA's Unified Agenda that will be published in the Federal Register in April 1998. The Agenda outlines the Agency's regulatory reform efforts, including Sanitation Requirements for Official Meat and Poultry Establishments, Rules of Practice, Performance Standards for Perishable, Ready-to-eat Products, and Elimination of Requirements for Partial Quality Control Programs.

[CLERK'S NOTE.—The information referred to does not appear in the hearing record, but can be reviewed in the April 1998 Federal Register.]

Question. Mr. Billy, in your statement you mention the proposed increase of \$2.3 million for upgraded HACCP inspection technology for the implementation of HACCP in the Egg Products Inspection program, and equipment and increased travel for distribution compliance activities.

Why hasn't the agency promulgated the final rule requiring a 45 degrees Fahrenheit ambient air temperature for the transportation and storage of eggs as the Committee required in the fiscal year 1998 Appropriations Act?

Answer. We are moving as rapidly as possible to publish the regulation mandating a 45 degree ambient air temperature requirement and will comply with the 1998 Appropriations Act.

Question. Please elaborate on the need for this proposed increase of \$2.3 million.

Answer. Under HACCP-based inspection, FSIS will redeploy inspection personnel within the plant and in distribution to implement the farm-to-table food safety strategy. While redeployment enables us to operate within existing staffing levels, increased operating support is needed to perform the new inspection tasks required to ensure the safety of meat, poultry, and egg products.

An enhanced compliance presence is needed to conduct increased inspection activity in distribution channels beyond the in-plant setting in order to ensure food safety from the farm to the table. An increase of \$0.5 million is needed to provide travel, equipment, and supplies associated with these activities. The farm-to-table strategy for inspection will entail a great deal of out-of-plant activity requiring travel to multiple destinations. Specialized equipment, such as cameras and portable telephones, and supplies for taking samples are required to support these efforts.

Additionally, FSIS expects to complete amendments to the HACCP rule that will cover Egg Products Inspection in fiscal year 1999. Implementation of HACCP provisions will require training for all inspectors, relief personnel, and supervisory staff involved with Egg Products Inspection; and sampling of egg products from the plant environment for various microorganisms to establish baseline data. FSIS is requesting an additional \$0.4 million to provide training for more than 120 inspection personnel and enable the agency to perform required baseline sampling. Prior year funding for HACCP training will not be available for this purpose as it is committed to meat and poultry inspection and will be needed for training in new slaughter inspection procedures.

Upgraded inspection technology is needed to assist inspection personnel in the fully implemented HACCP-based inspection program. The requested increase of \$1.4 million will pay for technology not currently available to inspectors as well as improvements in current technology. Some examples include stethoscopes for veterinary medical officers to make a more thorough and complete determination of the health status of incoming animals for slaughter. In addition, improved thermometers are needed to perform verification tasks required by HACCP. Neither stethoscopes nor thermometers are currently available to FSIS inspectors. These instruments will be used in the HACCP inspection models project this year and will be needed by the full inspection workforce in fiscal year 1999. They are also necessary in order for inspection results to be fully accepted as accurate. Additionally, software packages are being developed, which inspection personnel will use in determining the adequacy of critical limits and other technical information related to HACCP.

Question. What do you think about organizing an independent, scientific organization to come in and see if HACCP implementation has strayed from science-based HACCP?

Answer. FSIS appreciates the importance of an independent, scientific evaluation of HACCP implementation. The Agency's evaluation strategy for HACCP is two-fold: conduct formative evaluations to gain information at each phase to facilitate the overall implementation of HACCP; and obtain scientific evaluation expertise from beyond the Agency to conduct a summative evaluation that will assess the impact of the final rule on inspection, industry, consumers, and foodborne illness.

The first formative evaluation effort, Results of the SSOP Implementation Follow-Up Study, has been completed. Six months after the initial implementation date of sanitation standard operating procedures (SSOP's), this study was conducted to determine the extent to which the new system was implemented and where additional effort was needed to assure that the new system would continue to work as intended.

The second formative evaluation, Evaluation of Inspection Activities During Phase One of HACCP Implementation is just starting. This in-house evaluation of FSIS inspection activities during HACCP implementation in large plants is designed to identify areas that might need modification before small plants begin implementation in January 1999. The plan is to design the study, collect the data, analyze it and write the final report by July 1998. This tight timeline will enable FSIS Field Operations to review the findings and as necessary modify aspects of its delivery of inspection in time for small plant implementation in January 1999. Evaluation efforts of this type are planned at each phase of HACCP implementation.

Concurrent with these evaluation efforts, the Agency is already planning an evaluation of the HACCP final rule. This evaluation will require expertise from beyond the Agency. The study is expected to address whether or not HACCP process control systems: (1) control production safety hazards, (2) reduce foodborne illness, (3) make

inspection more effective, (4) increase consumer confidence, and (5) provide an opportunity for increased productivity.

Question. When do you suggest this should be carried out?

Answer. Based on the tentative timeline, the evaluation reports will be due in fiscal year 2000, fiscal year 2001 and fiscal year 2002. This would allow adequate time to fully assess the implementation of HACCP in all meat and poultry plants.

Question. Please provide the Committee with the multi-year HAACP plan for staffing levels in the plant (in-plant inspections and others).

Answer. Under HACCP implementation, FSIS is currently designing pilot projects to determine the best ways of conducting inspection of establishments and areas of in-distribution. FSIS has the opportunity to focus its inspection staffing resources on food safety both in plants and in distribution to achieve its Strategic Goal of enhanced public health. These projects will help the Agency determine what are optimum staffing levels and configurations to ensure the safety of meat, poultry, and egg products along the food safety continuum.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The mission of FSIS is to ensure that meat, poultry, and egg products moving in interstate commerce or exported to other countries are safe, wholesome, and accurately labeled. In 1996, FSIS issued the HACCP final rule, which serves as a blueprint for changes in meat, poultry, and egg products' inspection for the future.

The FSIS Strategic Plan goes beyond HACCP to develop the Agency's strategy for achieving enhanced public health. The Plan contains one goal: to enhance the public health by minimizing foodborne illness from meat, poultry, and egg products, which is supported by six corresponding strategic objectives that are necessary to accomplish the goal.

The Strategic Plan and the Annual Performance Plan are closely linked in that the annual performance goals are based on the strategic objectives. All of the program activities in the 1999 budget request support the Agency's strategic goal. The "Means and Strategies" section under each performance goal identifies specific budget initiatives that will enable FSIS to achieve its annual performance goals.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The Agency recognized the importance early on of linking the performance goals and the budget activities through the Agency mission. The goals represent our mission objectives, while the budget activities represent our mission activities. On a preliminary basis, the Agency evaluated the relationship between the budget activities and the performance goals to determine whether or not changes were needed in budget activities, and found that the complementary linkage of performance goals and budget activities to the Agency mission indicated no immediate need for change.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. FSIS is undergoing a transformation in its inspection program from traditional organoleptic inspection to HACCP-based inspection. The performance goals are specific to achieving a reduction in foodborne illness through HACCP and other inspection changes, and primarily focus on new and anticipated food safety developments. The budget activities capture all costs for both the traditional inspection program and the new HACCP-based inspection system now being implemented. We learned that the linkage of performance goals and budget activities will evolve through many stages as transformation of the inspection program takes place, and we should not make further changes in our budget activities at this time.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. FSIS used both its Strategic Plan and preliminary 1999 budget information to design the Annual Performance Plan. The performance goals are specific to achieving a reduction in foodborne illness, and the measures in the Plan indicate progress in achieving these goals. The performance measures are linked to the budget activities that compose the budget as indicated by the description of the measure. For example, the first goal—to reduce pathogens on raw products by continuing implementation of the Pathogen Reduction/HACCP rule—includes as one performance measure, the percentage of large and medium meat and poultry slaughter and processing facilities in compliance with the HACCP rule. This measure is linked to Fed-

eral food inspection, the budget activity through which FSIS will obtain the data to measure the industry's compliance with the HACCP rule.

Question. Does each account have performance measures?

Answer. FSIS has one major appropriated salaries and expenses account, and the Agency designed performance measures for that account. Many of the performance measures do not apply to the Agency's Trust Fund account because voluntary inspection is not included under the HACCP final rule. FSIS has not designed separate performance measures for the Trust Fund account.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The FSIS performance planning structure is built around specific steps that must be carried out to achieve the strategic goal of minimizing foodborne illness in meat, poultry, and egg products. The account and activity structure presented in the budget justification is organized along program activity lines that capture the range of infrastructure and support activities necessary to carry out a total inspection program.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. At this point in time, it is too early to discuss with any certainty the likelihood of changes to the account structure. In the 1998 budget, FSIS proposed a new, streamlined program activity structure that would reduce the number of activities from eight to five. The new structure of Federal Food Inspection, Import/Export Inspection, Laboratory Services, FAIM, and Grants to States replaced the old structure of Slaughter Inspection, Processing Inspection, Egg Products Inspection, Import/Export Inspection, Pathogen Reduction Program, FAIM, and Grants to States. FAIM and Grants to States were preserved because of unique funding arrangements: no year funding for FAIM and earmarked funding for States. In the 1999 budget, FSIS included an additional activity, Special Assistance for State Programs, to reflect proposed enhanced Federal funding of 75 percent, rather than the authorized 50 percent matching funds. The proposed program activity structure is broad and flexible enough to permit linkage with strategic and annual performance goals, especially as these are fine-tuned or change over time.

Question. How were performance measures chosen?

Answer. As part of the performance goals, the performance measures were chosen as indicators of progress toward achieving goals. The annual performance goals are written in measurable, performance-oriented terms so that annual program evaluations can more easily gauge progress for each performance goal. Maintaining a common set of objectives and performance goals provides a strong linkage between the long-range strategic plan objectives and the more output-oriented performance goals in the Annual Performance Plan.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. When designing its performance indicators, FSIS tried to rely on information that was readily available within the Agency. Therefore, the data collected for activities contained in the Strategic Plan will be consistent and comparable with other activity data collected over time, ensuring a stream of reliable and valid performance data for the Plan's goals and objectives. Data quality should continue to be high since the Agency will rely on the same data sources (inplant records, for example) from which it has published data in the past.

With some exceptions, there should be little increased cost due to the collection of data to meet the GPRA requirements. What will be needed is a review of the methodology the Agency uses to collect and verify the data and a strengthening of record keeping technology. FSIS has also established a performance measure to track the number of automation processes improved to determine how well information technology is supporting strategic and program goals. Management is committed to institutionalizing an integrated IRM system throughout FSIS and this commitment to better data collection and evaluation will permit more accurate data available for performance measurement of activities detailed in the FSIS Strategic Plan and Annual Performance Plan.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. During the performance measure design process, FSIS created measures that would utilize information that is both available and reliable. The Agency does not anticipate performance-reporting difficulties in preparing the March 2000 report.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. FSIS recommends that the subcommittee use performance goals one, two, three, and four to track FSIS program results. They are as follows:

- Reduce pathogens on raw products by continuing the implementation of the Pathogen Reduction/HACCP rule.
- Collaborate with other public health agencies and stakeholders to implement the near term program objectives contained in the President's National Food Safety Initiative.
- Develop a comprehensive strategy for promoting food safety from farm-to-table.
- Continue the necessary cultural change to support HACCP and related food safety initiatives by training the workforce to carry out the re-defined regulatory tasks and procedures and by ensuring industry and State programs understand their new roles and responsibilities.

The Agency believes that HACCP, along with microbiological testing, will improve food safety and reduce foodborne illness. Agency management also believes that applying HACCP or HACCP-compatible procedures in both the Federal and State programs throughout the farm-to-table food safety continuum will reduce foodborne illness. The Agency's performance measures for fiscal year 1999 were specifically selected to track progress in achieving this goal.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The FSIS strategic goal is to enhance the public health by minimizing foodborne illness from meat, poultry, and egg products. The Annual Performance Plan establishes performance goals and measures to achieve the strategic goal. The long-term outcome for both the Strategic Plan and the Annual Performance Plan that FSIS is working toward is a 25 percent reduction in foodborne illnesses associated with meat, poultry, and egg products, which will be a major benefit for the consumer. Reducing pathogen contamination of these products is the major focus of FSIS initiatives.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The Agency has conducted training for its managers over the last three years in preparation for meeting the requirements of GPRÁ. Substantial progress has been made. However, continued training is needed as GPRÁ concepts and requirements are integrated into ongoing program operations.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Customer satisfaction measures will be based, in part, on feedback from stakeholders, including our own employee groups, representatives from the regulated industry, consumer groups, academia, State and local governments, and foreign governments. Stakeholders have participated in the development of the HACCP regulation for achieving greater food safety through numerous meetings that FSIS has conducted over the past several years. In addition, we expect to solicit feedback from the general public through a planned food safety consumer survey in cooperation with the Department of Health and Human Services as partners in the President's Food Safety Initiative.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The measurable goals of the fiscal year 1999 Annual Performance Plan enabled the Agency to evaluate and prioritize program needs in determining where budget initiatives were needed to help achieve performance goals.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. FSIS would be able to indicate the likely impact on program performance goals if budget numbers are changed up or down by the committee. What would be more difficult is measuring the precise impact on the FSIS strategic goal of enhancing the public health by minimizing foodborne illness from meat, poultry, and egg products, and the corresponding outcome of this goal. The Agency will be able to indicate the impact in a more definitive way after implementing the annual reporting requirement and completing a full GPRÁ cycle.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. FSIS is currently able to measure and report performance on a regular basis for its performance goals. However, in preparing for the future the Agency contracted with a consulting firm to help managers internally evaluate data collection and measurement. The Administrator has created the FSIS Process and Data Analysis Project in conjunction with the Leads Corporation to develop systematic evaluation of Agency data systems as an ongoing process. In fact, FSIS has identified evaluation as one of its six core business processes. Data evaluation will be systematized using the Integrated Computer Aided Manufacturing (ICAM) methodology and the ICAM definitional language modeling technique (IDEF). The Agency is committed to institutionalizing an integrated information resources management (IRM) system throughout FSIS and this commitment to better data collection and evaluation will produce more accurate data for performance measurement of activities in the FSIS Strategic Plan and Annual Performance Plan.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Many of the FSIS results are based on outcomes related to HACCP implementation, which will be completed in fiscal year 2000, while the budget account structure covers both traditional and HACCP inspection activity. Therefore, the linkage between performance results and budget activities is not complete.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. The activities included in the budget account structure are sufficiently broad to cover the use of all budgetary resources and are also specific enough to account for the Agency's use of particular resources, such as Grants-to-States and FAIM. At this time, FSIS does not think it is necessary to modify the budget account structure.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. While FSIS does not think modification is necessary at this time, the feedback received as we continue to transform the inspection program and complete the entire GPRA cycle will be evaluated to revisit this question.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. No modification is proposed at this time.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The achievement of Agency goals is largely dependent on the success of multiple partnerships FSIS has with both internal and external stakeholders. The 1999 Annual Performance Plan identifies a number of external factors that influence goal achievement, including but not limited to cooperation of other Federal agencies and State and local governments, industry compliance with regulatory requirements, and the food handling behavior of consumers.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. Recognizing the importance of partnerships, FSIS continues working proactively with our partners to identify needs, meet education/information and infrastructure needs, and invest budgetary resources to ensure we are moving toward goal achievement. In developing the HACCP regulation FSIS conducted extensive meetings with the industry to address their needs, and as a result, is providing technical assistance, especially to small businesses to assure successful implementation of regulatory requirements. The 1999 budget proposes an increase for food safety education for consumers, building on the Public/Private Partnership's "Fight BAC!" campaign to promote safer food handling by consumers. In addition, the 1999 proposed special assistance for State programs reflects the Agency's effort to ensure successful State implementation of HACCP requirements based on infrastructure needs identified in the State inspection programs.

Question. What impact might external factors have on your resource estimates?

Answer. External factors influence the allocation of existing resources and generate new resource requirements. In the 1998 budget, FSIS requested and Congress approved funding for two activities that were part of the President's Food Safety Initiative, and both activities are associated with external factors. FSIS learned from CDC that *Campylobacter* is the most common foodborne pathogen, so the Agency

requested an increase of \$0.5 million for CDC to provide baseline data on the incidence of foodborne illness resulting from this pathogen. In addition, FSIS requested \$0.6 million to provide HACCP training to State and local food regulatory officers who have jurisdiction over the packaging and processing of food in restaurants and retail establishments.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. The Agency did not identify any function or program overlap or duplication internally or with other USDA agencies while developing its performance plan. The recently implemented FSIS reorganization is based on a thorough evaluation of functions and programs that resulted in streamlining to eliminate overlap and duplication. The FSIS public health mission is broad in scope, however, and the Agency has participated with other agencies on food safety issues, such as HHS and EPA with the President's National Food Safety Initiative. Although such inter-agency activities are limited, FSIS considers them beneficial because they provide different Federal agencies with similar food safety interests an opportunity to share information and experiences in food safety protection.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The Agency's performance measures are designed to measure performance in areas where performance has never been measured before. This is clearly a learning period for the Agency and adjustments will be made as lessons are learned.

FSIS has established performance measures that it believes relate to each performance goal in question. That is, the measures used correlate directly to the targeted performance. However, the Agency believes that it needs more experience before it is able to confidently predict future budget requirements based on projected performance.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The performance goals are specific to achieving a reduction in foodborne illness and do not capture full inspection program costs at this time. The resource estimates are accurate, based on what actually took place in the prior year, and current and budget year projections. Estimates reflect employment trends and projections, as well as the estimated cost of specific budget initiatives for which funding has been requested.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No, the Agency does not foresee any need to make substantive revisions in its strategic plan submitted on September 30, 1997.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

USER FEES

Question. You state that protection of public health is your mandate. What other federal program charged with protecting public health seeks to impose user fees in order to pay for its entire inspection costs?

Answer. There is no other Federal program that imposes or seeks to impose user fees for its entire inspection costs; however, other countries that have meat inspection programs completely financed by user fees include Argentina, Australia, Canada, Denmark, Germany, Great Britain and New Zealand. All of these countries have inspection programs that FSIS has determined are equivalent to ours and all of these countries are exporting product to the U.S.

Question. Other than to achieve savings, is there any public health and safety policy reason to impose user fees?

Answer. Yes, user fees will provide the required funds to maintain a strong public health protection for meat, poultry, and egg products.

Question. If you state that your mandate is to protect public health, then why do you further state that "cost burdens must be shifted from taxpayers to those who benefit directly from the provided services?"

Answer. Both the public and industry benefit from our inspection services. However, industry is the direct beneficiary of Federal inspection, which enables businesses to engage in commerce and earn profits. Industry also directly benefits from the consumer confidence in inspected meat, poultry, and egg products.

Question. Are not the direct beneficiaries of your mission the consuming public?

Answer. Industry receives the direct benefit of Federal inspection, which is permission to operate businesses and earn profits. The consuming public also benefits by receiving strong public health protection from Federal inspection.

Question. Are not the taxpayers directly benefited from the protections you provide? If not, why mandate an inspection program at all?

Answer. Taxpayers who purchase meat, poultry, and egg products benefit from the public health protections that Federal inspection provides.

Question. Is it the Department's view that the FSIS inspection service benefits the industry more than the consumer?

Answer. Both industry and the consumer benefit from Federal inspection, but they do so in different ways. The consumer benefits by eating meat, poultry, and egg products that are safe, wholesome, and accurately labeled. Industry benefits from Federal inspection financially because inspection enables establishments to operate and helps to assure the public confidence in the safety and wholesomeness of their products. Federal inspection also benefits industry by providing the level of inspection commensurate with production so as not to limit production.

Question. If enacted, the user fee proposal would result in FSIS inspectors remaining under the direction of the agency, but their livelihood tied to the financial health of the companies. Since there would be no appropriated funds for the salaries of FSIS inspectors, the inspectors would have a direct interest in the well-being of the companies. How does USDA plan to counter the questions in consumer confidence that will result from this plan?

Answer. FSIS has and will continue to work at all levels of the Agency and with employee groups to ensure that an inspector's livelihood remains tied to his or her competence in performing regulatory inspection duties rather than the financial health of an individual company. FSIS is recommending that user fees be based on volume of production rather than an hourly inspection rate to avoid providing an opportunity for any external pressure to modify the application of inspection standards or inspection intensity. While the total number of inspection personnel is related to the overall size and growth of the industry, FSIS will perform inspection, including HACCP verification tasks, in a manner that will assure consumers and industry that the inspection program operates in accordance with regulatory requirements. Consumer confidence will grow, maintaining strong markets for industry as establishments produce product under HACCP programs that are fully compliant with regulatory requirements. Further, by basing user fees on objective, verifiable data, the Agency will be able to assure an equitable distribution of inspection costs.

To maintain consumer confidence in the inspection program, FSIS will provide public information about the impact of user fee legislation. A key element in the public information effort would be public meetings with key Department and Agency officials, similar to those conducted for the HACCP regulation, to solicit input on issues concerning the implementation of user fees.

Question. What are the views of most consumer organizations to this proposal?

Answer. We are aware that many groups—consumer and industry—have expressed concern about user fees. Rather than attempting to speak for them, you may wish to contact them directly to ensure their full views are adequately conveyed. However, as I stated earlier, we will continue to work with all of our stakeholders on this very important issue. I believe that all of these groups want inspection personnel to maintain high inspection and enforcement standards and requirements in order to maintain consumer confidence and provide strong markets for meat, poultry, and egg products.

HAZARD ANALYSIS AND CRITICAL CONTROL POINTS

Question. One of the early concerns about moving to HACCP was that the old organoleptic system would be left in place creating a "layered" system containing features of both. We had been assured that as the new HACCP program became established, the old "command and control" methods would be removed. Now that HACCP is in place in the large plants, what parts of the old system have been eliminated?

Answer. We are providing the Inspection System Guide contained in FSIS Directive 5400.1, which contains a number of tasks that inspection program personnel are no longer required to perform in establishments that are subject to the HACCP system regulations. In addition, we are providing Inspection System Procedures contained in FSIS Directive 5400.5 that replace the Inspection System Guide.

Question. What is the timetable for eliminating the remaining elements of the old system?

Answer. FSIS made a commitment to change its command and control regulations into performance standards as rapidly as it could, given current requirements for regulatory change. We believe we have made significant progress to fulfill our commitment as evidenced by the FSIS portion of USDA's Unified Agenda that will be published in the Federal Register in April 1998. The Agenda provides a timetable for the Agency's regulatory reform efforts, including Sanitation Requirements for Official Meat and Poultry Establishments, Rules of Practice, Performance Standards for Perishable, Ready-to-eat Products, and Elimination of Requirements for Partial Quality Control Programs.

[CLERK'S NOTE.—The information referred to does not appear in the hearing record, but can be reviewed in the April 1998 Federal Register.]

Question. There have been complaints that confusion on the implementation of HACCP in certain plants could have been avoided if inspectors and other personnel had received HACCP training earlier. In fact, some FSIS inspector training was conducted just prior to the implementation date in January of this year. What were the reasons for the delay in HACCP training?

Answer. You can be assured that the Agency is concerned about the way inspection personnel carry out their regulatory responsibilities. The HACCP Technical Training Program provides inspection personnel with the (1) required information and background on HACCP and its principles and (2) knowledge, understanding, and techniques to apply the inspection procedures established to determine a plant's compliance/noncompliance with Pathogen Reduction and HACCP requirements. The "just-in-time" approach allows the agency to:

1. Link the training to the four-phase implementation schedule contained in the Pathogen Reduction and HACCP rule spanning a period of 6 to 42 months;
2. Make the best use of scarce human resources;
3. Minimize the disruption of program services; and
4. Have employees immediately apply their newfound knowledge and skills thus eliminating the need to establish and maintain costly re-training or refresher programs.

Further, we have established multiple means for employees to become more familiar and comfortable with the new Pathogen Reduction and HACCP inspection procedures as follows:

1. Computer Based Training programs;
2. Issuance of a Reference Guide on the HACCP-based inspection;
3. Around the clock availability of technical assistance from the Technical Service Center through the use of e-mail and a 800 number; and
4. Day-to-day guidance, support and coaching by supervisors.

Question. It is my understanding that some meat and poultry plants have been shutdown due to HACCP violations already. How many plants have been shutdown since the implementation of HACCP?

Answer. We inspect over 6,000 plants and from the pre-HACCP implementation in January 1997 through mid-March of this year, there have been 50 actions to withhold inspection.

Question. What were the causes for the shutdowns?

Answer. Of those 50 actions, 28 plants had Federal inspection withheld because of repetitive SSOP deficiencies, 11 plants because of basic E. coli failures, 10 plants because of HACCP system failures, and one non-HACCP plant for zero tolerance failures.

Question. Is there a formal administrative appeal process a company may use to avoid a shutdown or other adverse agency action regarding a HACCP violation? If not, why?

Answer. If the Inspector-in-Charge (IIC) determines that there may be a HACCP system inadequacy because an establishment has multiple, recurring noncompliances, as specified in 9 CFR 417.6, and has failed to adequately implement immediate and further planned actions as documented on the Noncompliance Record (NR) (FSIS Form 5400-4), the IIC should discuss this developing trend at the weekly meetings held with establishment management. If the IIC subsequently determines that the trend of multiple, recurring noncompliances without successful interventions has led to a HACCP system inadequacy and that the marks of inspection should be withheld, he or she shall contact the District Office (DO) and provide all the relevant information for the DO to prepare a Notice of Intent to Suspend Inspection. The Notice shall:

1. Inform the establishment that the nature and scope of the noncompliances indicate that the HACCP system is inadequate as specified in 417.6 of the regulations;
2. State that, because of the trend, FSIS intends to withhold the marks of inspection and suspend inspection;
3. Explain the reason for the determination;

4. Reference each pertinent NR by number;
5. Inform the establishment that it is being afforded the opportunity to demonstrate why a HACCP system inadequacy determination should not be made or that it has achieved regulatory compliance; and
6. Provide the establishment three business days from the date of the letter to provide its response to the DO.

Based on the establishment's response, FSIS will determine further actions.

If at any time inspection personnel determine that adulterated product was shipped, FSIS will immediately enact enforcement actions.

Prior to appealing, the establishment may request that the program employee or IIC reconsider his or her finding or decision. The program employee or IIC who made the finding or decision should evaluate and consider any factual information the establishment provides. Program employees should encourage establishment management officials who indicate that they may appeal a decision or finding to do so as soon as possible. Timely appeals will help ensure that the relevant information is provided to subsequent decision makers promptly and that facts and observations can be verified. Timely appeals also avoid the implication that the establishment does not contest the inspection finding or decision.

FSIS regulations provide establishments with the opportunity to appeal, orally or in writing, an inspection finding or decision made by any program employee. Such appeals should be directed to the employee's immediate supervisor. The following outlines the chain-of-command for inspection decisions:

1. Program employee, including the Inspector-in-Charge (IIC), who made the determination;
 2. Circuit Supervisor;
 3. District Manager;
 4. Assistant Deputy Administrator for District Inspection Operations; and
 5. Deputy Administrator for Office of Field Operations.
- [The information (9 C.F.R. 417.6) follows:]

§ 417.6 INADEQUATE HACCP SYSTEMS

A HACCP system may be found to be inadequate if:

- (a) The HACCP plan in operation does not meet the requirements set forth in this part;
 - (b) Establishment personnel are not performing tasks specified in the HACCP plan;
 - (c) The establishment fails to take corrective actions, as required by § 417.3 of this part;
 - (d) HACCP records are not being maintained as required in § 417.5 of this part;
- or
- (e) Adulterated product is produced or shipped.

FSIS AND TRADE

Question. The U.S. poultry industry has been fighting a ruling by the European Union that product sprayed with chlorine as an anti-microbial will not be allowed in any EU country. Is the use of chlorine as an anti-microbial not an FSIS approved method to assure product safety?

Answer. Chlorine is permitted as an antimicrobial treatment in the U.S.

Question. Is there any evidence that any EU nation is using chlorine or is importing product from countries other than the U.S. that use chlorine as an anti-microbial?

Answer. It was reported that the United Kingdom was using chlorine as an anti-microbial in their poultry plants. The EU Commission indicated that they would take legal action to assure that the United Kingdom was in compliance with EU requirements.

Question. Has FSIS been involved in discussions with the EU on this subject and if so, what have they accomplished?

Answer. The use of chlorine was the most contentious issue concerning poultry during the negotiation of the U.S.-EU veterinary equivalency agreement. The end result of the talks was that the agreement calls for the EU to conduct a scientific review of the use of antimicrobial techniques regarding poultry meat.

Question. FSIS conducts inspections of meat and poultry imported into this country at 124 locations. Are there other locations that imports may cross in which there are no inspectors?

Answer. Imported product can enter the United States at other locations, but must move under Customs bond to one of the FSIS inspection locations for import inspection.

Question. How can you be certain that product is not coming into the country at undetected locations?

Answer. U.S. Customs controls all products that enter the United States. Customs refers the importer to the appropriate government agency responsible for the specific imported product. In addition, FSIS Field Operations personnel would detect uninspected meat or poultry products during their routine inspections both in Federal plants and in commerce.

Question. What safeguards can be put in place?

Answer. U.S. Customs control at the Nation's borders and the continued vigilance of FSIS inspection personnel provide the safeguards necessary to ensure that foreign product is not entering U.S. commercial distribution channels illegally.

QUESTIONS SUBMITTED BY SENATOR KOHL

Question. Some leading scientists involved in developing the model HACCP program have charged that FSIS is ignoring scientific data and forcing plants to incorporate old organoleptic processing methods into HACCP plans. If this charge is true, this is very serious. If this is happening, then how is food safety being enhanced?

Answer. To protect public health, FSIS is enforcing current regulatory requirements that are based on the best science available at the time the requirements were developed. The process of replacing command and control regulatory requirements with performance standards is not one that can be accomplished quickly; therefore, it has taken the Agency longer to meet its goals than it had originally intended. Until performance standards are implemented, there are a number of command and control requirements that will continue to be enforced in order to protect public health.

Question. When do you think would be a good time to have an independent, scientific organization to come in and see if HACCP implementation has strayed from science-based HACCP?

Answer. FSIS appreciates the importance of an independent, scientific evaluation of HACCP implementation. The Agency's evaluation strategy for HACCP is two-fold: conduct formative evaluations to gain information at each phase to facilitate the overall implementation of HACCP; and obtain scientific evaluation expertise from beyond the Agency to conduct a summative evaluation that will assess the impact of the final rule on inspection, industry, consumers, and foodborne illness.

The first formative evaluation effort, Results of the SSOP Implementation Follow-Up Study, has been completed. Six months after the initial implementation date of sanitation standard operating procedures (SSOP's), this study was conducted to determine the extent to which the new system was implemented and where additional effort was needed to assure that the new system would continue to work as intended.

The second formative evaluation, Evaluation of Inspection Activities During Phase One of HACCP Implementation is just starting. This in-house evaluation of FSIS inspection activities during HACCP implementation in large plants is designed to identify areas that might need modification before small plants begin implementation in January 1999. The plan is to design the study, collect the data, analyze it and write the final report by July 1998. This tight timeline will enable FSIS Field Operations to review the findings and as necessary modify aspects of its delivery of inspection in time for small plant implementation in January 1999. Evaluation efforts of this type are planned at each phase of HACCP implementation.

Concurrent with these evaluation efforts, the Agency is already planning an evaluation of the HACCP final rule. This evaluation will require expertise from beyond the Agency. The study is expected to address whether or not HACCP process control systems: (1) control production safety hazards, (2) reduce foodborne illness, (3) make inspection more effective, (4) increase consumer confidence, and (5) provide an opportunity for increased productivity.

Based on the tentative timeline, the evaluation reports will be due in fiscal year 2000, fiscal year 2001, and fiscal year 2002. This would allow adequate time to fully assess the implementation of HACCP in all meat and poultry plants.

Question. There have been complaints that inspectors in the field have had varying interpretations of what a HACCP plan should contain and how a HACCP plant should operate. Some feel this situation has bordered on disastrous and that it was caused by a lack of inspector training, yet we understand FSIS still believes "Just-in-Time" training is the best approach to preparing inspectors for HACCP. How can you explain your rationale?

Answer. You can be assured that the Agency is concerned about the way inspection personnel carry out their regulatory responsibilities. The HACCP Technical

Training Program provides inspection personnel with the (1) required information and background on HACCP and its principles and (2) knowledge, understanding, and techniques to apply the inspection procedures established to determine a plant's compliance/noncompliance with Pathogen Reduction and HACCP requirements. The "just-in-time" approach allows the agency to:

1. Link the training to the four-phase implementation schedule contained in the Pathogen Reduction and HACCP rule spanning a period of 6 to 42 months;
2. Make the best use of scarce human resources;
3. Minimize the disruption of program services; and
4. Have employees immediately apply their newfound knowledge and skills thus eliminating the need to establish and maintain costly re-training or refresher programs.

Further, we have established multiple means for employees to become more familiar and comfortable with the new Pathogen Reduction and HACCP inspection procedures as follows:

1. Computer Based Training programs;
2. Issuance of a Reference Guide on the HACCP-based inspection;
3. Around the clock availability of technical assistance from the Technical Service Center through the use of e-mail and a 800 number; and
4. Day-to-day guidance, support and coaching by supervisors.

Question. This subcommittee had serious concerns at the time the HACCP rule was being written about layering the new system on top of the old. To this point, FSIS has eliminated preapproval for equipment and blue prints. Is this all FSIS intends to do toward removing outdated requirements, or do you have more activities planned?

Answer. FSIS made a commitment to change its command and control regulations into performance standards as rapidly as it could, given current requirements for regulatory change.

We are providing the FSIS portion of USDA's Unified Agenda that will be published in the Federal Register in April 1998. The Agenda outlines the Agency's regulatory reform efforts, including Sanitation Requirements for Official Meat and Poultry Establishments, Rules of Practice, Performance Standards for Perishable, ready-to-eat Products, and Elimination of Requirements for Partial Quality Control Programs.

[CLERK'S NOTE.—The information referred to does not appear in the hearing record but can be reviewed in the April 1998 Federal Register]

Question. There have been complaints that FSIS is in fact forcing plants to write regulations from the old system—such as time and temperature cooling requirements—into their HACCP plans. How does this fulfill the commitment the Department made to Congress to eliminate layering?

Answer. FSIS does have regulatory requirements that need to be updated and the Agency has acknowledged that it needs to remove its command and control requirements and replace them with performance standards, which provide the regulated industry with more flexibility. The Agency is developing a consolidated set of regulations that bring meat and poultry requirements together in a single place. We are committed to writing our regulations in plain and simple language so that they can be understood by not only the regulated industry, but also by the public, which expects that the government will hold industry accountable for meeting regulatory requirements.

However, we acknowledge it is taking us longer to meet our goals than originally intended. Until performance standards are implemented, there are a number of regulations containing command and control requirements that will continue to be enforced. One such regulation is the requirement that poultry be chilled to a specific temperature within a certain time frame, depending on the weight of the bird: 40 degrees within eight hours for turkey (9 C.F.R. 381.91). This requirement was based on the best available scientific knowledge about the lag phase for bacterial growth. FSIS would be negligent in its food safety mission if it dropped this requirement before implementing a performance standard.

Question. The subcommittee understands there have been a few plant shutdowns so far. When FSIS makes a serious finding against a plant, what opportunity does the plant have to demonstrate compliance or dispute the findings before the plant is shut down? Is there a formal dispute resolution process in place? If not, why not?

Answer. If the Inspector-in-Charge (IIC) determines that there may be a HACCP system inadequacy because an establishment has multiple, recurring noncompliances, as specified in 9 C.F.R. 417.6, and has failed to adequately implement immediate and further planned actions as documented on the Noncompliance Record (NR) (FSIS Form 5400-4), the IIC should discuss this developing trend at the weekly meetings held with establishment management. If the IIC subsequently determines

that the trend of multiple, recurring noncompliances without successful interventions has led to a HACCP system inadequacy and that the marks of inspection should be withheld, he or she shall contact the District Office (DO) and provide all the relevant information for the DO to prepare a Notice of Intent to Suspend Inspection. The Notice shall:

1. Inform the establishment that the nature and scope of the noncompliances indicate that the HACCP system is inadequate as specified in 417.6 of the regulations;
2. State that, because of the trend, FSIS intends to withhold the marks of inspection and suspend inspection;
3. Explain the reason for the determination;
4. Reference each pertinent NR by number;
5. Inform the establishment that it is being afforded the opportunity to demonstrate why a HACCP system inadequacy determination should not be made or that it has achieved regulatory compliance; and
6. Provide the establishment three business days from the date of the letter to provide its response to the DO.

Based on the establishment's response, FSIS will determine further actions.

If at any time inspection personnel determine that adulterated product was shipped, FSIS will immediately enact enforcement actions.

Prior to appealing, the establishment may request that the program employee or IIC reconsider his or her finding or decision. The program employee or IIC who made the finding or decision should evaluate and consider any factual information the establishment provides. Program employees should encourage establishment management officials who indicate that they may appeal a decision or finding to do so as soon as possible. Timely appeals will help ensure that the relevant information is provided to subsequent decision makers promptly and that facts and observations can be verified. Timely appeals also avoid the implication that the establishment does not contest the inspection finding or decision.

FSIS regulations provide establishments with the opportunity to appeal, orally or in writing, an inspection finding or decision made by any program employee. Such appeals should be directed to the employee's immediate supervisor. The following outlines the chain-of-command for inspection decisions:

1. Program employee, including the Inspector-in-Charge (IIC), who made the determination;
 2. Circuit Supervisor;
 3. District Manager;
 4. Assistant Deputy Administrator for District Inspection Operations; and
 5. Deputy Administrator for Office of Field Operations.
- [The information (9 C.F.R. 417.6) follows:]

§ 417.6 INADEQUATE HACCP SYSTEMS

A HACCP system may be found to be inadequate if:

- (a) The HACCP plan in operation does not meet the requirements set forth in this part;
 - (b) Establishment personnel are not performing tasks specified in the HACCP plan;
 - (c) The establishment fails to take corrective actions, as required by § 417.3 of this part;
 - (d) HACCP records are not being maintained as required in § 417.5 of this part;
- or
- (e) Adulterated product is produced or shipped.

AGRICULTURAL MARKETING SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

MARKET NEWS REPORTING

Question. A \$320,000 increase is requested for fiscal year 1999 to expand reporting in foreign markets to include South and Central America and the Pacific Rim countries. What international markets does AMS report on currently? How do you decide which markets to cover within available resources?

Answer. AMS currently reports selected markets in Canada, Mexico, England, France, Japan, Germany, New Zealand, the Netherlands, Colombia, and Bulgaria. The markets covered are chosen on the basis of their significance or importance to United States interests either as suppliers, competitors, or markets of opportunity. Our reports only include limited data on the important markets in those countries.

Our requested increase would allow us to expand coverage in these and other markets in response to U.S. requests for information.

PESTICIDE DATA PROGRAM

Question. The fiscal year 1999 budget proposes to increase funding for the Pesticide Data Program from \$13,616,000 to \$23,730,000, an increase of \$10,114,000. Of the increase requested, \$2,480,000 is for continuation of the current Pesticide Data Program; \$1,716,000 is to create a rapid response capability to support increased EPA demands for pesticide residue data to conduct dietary risk assessments; and \$6,257,000 is to initiate a microbiological surveillance program on domestic and imported fruits and vegetables. Why is an 18.2 percent funding increase needed to maintain current Pesticide Data Program activities?

Answer. The increase of \$10,114,000 mentioned in your question is the increase request for the entire Market Protection and Promotion activity. The combined budget net increase for the Pesticide Data Program, or PDP, is \$10.453 million. The increase of \$2.48 million for current Pesticide Data Program activities is needed to maintain statistically reliable data for use by EPA and other government and private entities in their decision-making. If the requested funding is not provided, we would have to reduce sampling levels and eliminate certain types of testing.

We would also be unable to update our technical capabilities. Since 1991, a new generation of instrumentation has become available, especially in chromatography and mass spectrometry. Furthermore, the computer systems for the laboratory instrumentation purchased in the early 1990's are not year 2000 compliant. The program needs to invest in replacement instruments or upgrade present instrumentation to make them compatible with present advancements in technology and year 2000 compliant.

Question. The budget indicates that if the requested increase of \$2.48 million is not provided for current Pesticide Data Program sampling and testing, sampling in Colorado, Maryland, and Wisconsin would be eliminated, and either one other major state would be dropped or funding to the remaining participating states would be reduced by 13 percent. Why have you determined that Colorado, Maryland and Wisconsin would be dropped from the program instead of reducing funding across-the-board if the requested funding increase is not provided?

Answer. Reducing funding to the states across the board is not an option since the sampling in Colorado, Maryland and Wisconsin is at a minimum level now and those states cannot maintain viable programs if reduced further. Even with the three states leaving the program, the remaining states will still have to absorb a 13 percent decrease in funding which will mean reduced staffing and withdrawal of services in those states. Alternatively, having one of the seven remaining states leave the program would have the least impact on program effectiveness while still retaining regional balance. Ohio or Michigan would be one of the likely candidates.

Question. Which states are currently participating in the Pesticide Data Program? How many State employees in each of these states are currently being supported with federal funds through this program?

Answer. The 10 States in the 1998 Program and number of employees expressed as staff years are: California—23, Colorado—2.5, Florida—12, Maryland—3, Michigan—12, New York—17, Ohio—7.5, Texas—15, Washington—12.5, and Wisconsin—1.5. The total number of State staff years is 106.

Question. Which fruits and vegetables are currently being tested and sampled through the Pesticide Data Program in each of the participating states?

Answer.

[The information follows:]

Question. How much of the current Pesticide Data program currently supports equipment costs? Of the \$2.48 million increase requested, how much is for equipment?

Answer. The present PDP equipment budget is essentially zero. If states can realize savings through reduced indirect costs or economies in staffing, they can apply the funds toward equipment purchases. Such savings would be insufficient to maintain or implement new and more efficient technologies. Since PDP's inception in 1991 an entire new generation of instrumentation has become available, especially in the area of chromatography and mass spectrometry. Most computer systems for laboratory instrumentation are not Year 2000 compliant. However upgrades for certain instrumentation software are available to correct this situation. Of the \$2.48 million requested, a minimum of \$600,000 is needed to invest in replacement instruments or upgrades for year 2000 compliance.

Question. Please describe the \$1.7 million rapid response capability which you say you need to support increased EPA demands for pesticide residue data. What additional data does the EPA need and specifically what will this data be used for?

Answer. The EPA is required to review over 9,000 tolerances over the next ten years to meet the requirements of the Food Quality Protection Act, or FQPA. EPA's initial plan is to reevaluate tolerances for pesticides with a common mechanism of action such as organophosphates and N-methylcarbamates. Also, when factoring in EPA's Dietary Risk Assessment System criteria, more pesticides will fall under the acute rather than chronic classification. The acute pesticides will require single serving size studies in order to meet the criteria of "no health concern" for infants and children.

EPA needs data for most commodities for which a pesticide is registered in order to conduct effective dietary risk assessments under FQPA guidelines and assure compliance with the new stringent standards. The first part of PDP rapid response would conduct modified residue studies for these commodities, for example, 100 to 300 data points over a one to two year period rather than 600 samples or more over two or more years. These rapid response situations will require minimal method development investment and can be done with minimal method validation with no need to assess laboratory capability to test new pesticides. Some commodities which may be considered under this arrangement are lemons, selected berries, nectarines and so forth.

The second part of this response is single serving size studies for specific acute exceeder pesticides or group of pesticides, based on a composite sample analysis exceeding predetermined target level. Crops considered for these studies would already have been studied previously in the testing program. PDP already has experience in designing these studies. One such study was for aldicarb/potatoes in 1997, using a multi-residue method, therefore, the data were also applied to carbofuran at a later date.

Question. You are requesting a \$6.2 million increase for the Pesticide Data Program to initiate a microbiological testing program. Please tell us why this new program is needed, whether any testing of this type is done currently and who is doing it, and how this program will work.

Answer. Although the U.S. domestic food supply is unmatched in both quantity and quality, sporadic cases of microbiological and viral contamination and parasitic infestation accounted for 90 percent of the confirmed food borne disease outbreaks nationwide. Apparently, microorganisms once thought under control are adapting to their environments, developing resistance to conventional food processing operations, and are re-emerging with increased pathogenicity. The risk of contracting food borne illness may increase with questionable practices in food production, the mass preparation of meals, the trend to consume a greater proportion of meals away from home, the emphasis to increase fresh fruits and vegetables in the diet and product distribution logistics. This could be especially true where produce is imported from sources which may have less rigorous sanitation standards.

The President mandated a Food Safety Initiative and a Produce and Imported Foods Safety Initiative. Under these initiatives, FDA and USDA share the responsibility for developing a research program aimed at reducing disease caused by food borne microbes and their natural products. The President also directed FDA and USDA to issue guidance on good agricultural practices and good manufacturing practices for fruits and vegetables. It is generally agreed that there are a number of missing pieces of information in the scientific basis for reducing or eliminating pathogens in the agricultural setting. One of those missing pieces is valid statistical information on the present day level of fecal contamination and pathogenic contamination of the nation's fresh fruit and vegetable supply. Without this information, it is very difficult to determine if recommended changes in the production and handling of these commodities are effective. This program is designed to provide this

piece of the missing information. It is also hoped that once this statistical data is available to both government and the public, innovative minds in other disciplines will make use of it in research areas that have not yet been considered.

Statistically valid testing of pathogenic and fecal contamination in produce available in this country is not being performed. The current work being done by the Centers for Disease Control and Prevention, or CDC, FDA, and the States supports regulatory mandates and outbreak episodes. CDC has the primary responsibility for surveillance and tracking of both communicable and food borne illness. FDA provides support to this effort by funding surveys and notifying CDC of findings related to regulatory and laboratory investigations. CDC also relies on reports from State and local health departments to estimate the number of food borne illness cases occurring across the country. These reports are based on outbreak information from one or more individuals experiencing a similar illness, depending on the source. Local and State health departments conduct an investigation to identify the source of contamination and the specific food, if possible, before notifying CDC. Reports are limited by the ability of State and local authorities to follow up leads and report investigations to CDC. For example, outbreaks involving restaurants or institutions are more likely to be recognized than those involving foods prepared in the home or processed foods. In addition, the information reported can also differ widely by State, with some States having no surveillance staff specifically assigned to monitor for the presence of key pathogens and spoilage organisms in food and water.

The Microbiology Data Program, or MDP, would use the infrastructure of PDP. All the elements that make PDP scientifically-sound will be incorporated into MDP. The same States performing work for PDP will perform work for MDP. The same samplers that obtain samples for PDP will be trained to gather the samples for MDP. A rigorous laboratory quality control program will be initiated to ensure that the results from various laboratories are comparable. The number of samples taken at each site will be statistically determined by NASS and the electronic transfer of data from the laboratories to AMS will mirror the data transfer for PDP. The data will be analyzed for accuracy and published in an annual summary. Commodities will be chosen based on per capita consumption and seasonality, and the organisms for testing will be chosen by USDA officials with recommendations from the scientific community.

It is expected that seven staff years will be required for this program. It is anticipated that the ARS, FDA, and CDC will provide expert scientific advice and will make use of the resulting data, but will not receive any funds from the program. Some funding for statistical work will go to NASS, but at least 75 percent of the funds will go to the States performing the sampling and analysis.

Question. How will AMS work with the Agricultural Research Service, the Centers for Disease Control, the Food and Drug Administration, and participating States on the requested microbiological testing program initiative?

Answer. AMS scientists will confer with scientists in the ARS, CDC, FDA, and academia to obtain the best scientific advice on technical aspects of the program through surveys and informal consultations with experts. The ARS, CDC, and FDA would also have access to any pathogenic organisms isolated in the Microbiological Data Program, or MDP, for use in ongoing research projects. ARS is interested in examining any isolates obtained to expand their collection of organisms and to be able to correlate antibiotic resistance to areas of the country and perhaps production practices. The FDA is interested in determining the genetic relationships of pathogens isolated from various commodities from various parts of the country. This information might reveal the pathways of dissemination of pathogens. In addition, FDA would be able to use the data generated to determine whether recommended production modifications are having a positive effect on the microbial level of fresh fruits and vegetables and to determine the risk to the food supply relative to the microbial load. Using genetic fingerprinting, the CDC hopes to use the information generated in the MDP to help trace the source of food infection outbreaks. The Economic Research Service of USDA is very interested in obtaining statistically valid information for use in its projections regarding the economic impact of food borne outbreaks. Any additional data developed by these agencies that is not confidential, would be transmitted back to the MDP program for inclusion in the published data.

To implement MDP, AMS will initiate agreements with the States currently participating in PDP—California, Colorado, Florida, Maryland, Michigan, New York, Ohio, Texas, Washington, and Wisconsin. States will collect samples at terminal markets and distribution centers. Those States without adequate microbiology laboratory capability will serve as collection centers with the analyses performed in other state laboratories or in an AMS laboratory. Those States with appropriate laboratory capabilities will perform the required analyses and electronically transfer the resulting data to AMS. We estimate that the States will receive at least 75 per-

cent of the available funds. All participating State and AMS laboratories will participate in a stringent quality assurance program which will include analysis of check samples and on-site laboratory reviews. Those States currently in PDP have informally expressed interest in participating in MDP.

Question. Please prioritize the increases requested for the Pesticide Data Program.

Answer. The priority is as follows: First, \$2,480,000 for continuation of the current Pesticide Data Program. Second, \$6,257,000 to establish the Microbiology Data Program. Third, \$1,716,000 to create a rapid response capability to support increased EPA demands for pesticide residue data to conduct dietary risk assessments.

SECTION 32 COMMODITY PURCHASES

Question. Please list the commodity purchases made under the emergency surplus removal program in each of fiscal years 1996 and 1997 and in fiscal year 1998 to date, and the reason for each removal action

[The information follows:]

The emergency surplus removal program is a mechanism used to stabilize market conditions. Commodities that are determined to be in overabundant supply are acquired to accomplish the purpose of clause (2) of Section 32. The goal also is to encourage the domestic consumption of commodities by diverting them from normal channels of trade and commerce and donating them to schools, institutions, and other domestic feeding programs.

Emergency surplus removal

Fiscal year 1996

<i>Item</i>	<i>Dollars (millions)</i>
Beef roast	\$6.4
Blueberries, frozen	10.1
Date pieces	1.9
Dried figs	2.4
Fig nuggets	0.4
Orange juice, canned	13.3
Potatoes, fresh	1.5
Prunes, dried	6.4
Prunes, puree	1.6
Salmon, canned	10.0
Salmon nuggets	2.2
Total	56.2

Fiscal year 1997

Apricots, canned	\$2.1
Apricots, frozen	1.5
Beef, boneless	6.4
Beef roast	2.1
Beef, ground	19.1
Cheese	5.0
Cherries, canned	3.0
Cherries, frozen	2.8
Date pieces	1.6
Fig nuggets	1.3
Figs, dried	2.6
Grapefruit Juice	2.3
Orange juice	5.5
Peaches, canned	2.9
Peaches, frozen	0.7
Pork rib patty	8.8
Potato flakes	1.5
Potato granules	4.1
Potato oven fries	1.1
Potato rounds, frozen	3.3
Potato slices, dehydrated	6.3
Potato wedges, frozen	3.1
Potato slices, canned	4.0
Salmon, pouched	1.3

Turkey	8.5
Total	100.9

Fiscal year 1998 through 3/20/98

Salmon	\$7.1
Turkey	26.4
Navy beans	1.6
Prunes, dried	5.8
Peaches, frozen	4.5
Prune puree	0.6
Unused authorization	62.0
Total	108.0

MARKET DEVELOPMENT AND ASSISTANCE

Question. Funding of \$1 million was provided in fiscal year 1998 for AMS to assist Alaska in marketing salmon. The fiscal year 1999 budget indicates this assistance is complete. Please describe the marketing efforts supported with this funding.

Answer. Of the \$1 million provided for marketing assistance to Alaska, \$50,000 was designated for the promotion of agricultural commodities by the Alaska Division of Markets, or ADM. The Alaska Fisheries Development Foundation, Inc., or AFDF, will receive \$880,000 for marketing Arctic-Yakor-Kuskokwin salmon. Based on a review of ADM's and AFDF's marketing plans, AMS has submitted grant agreements to both groups. Funds will be distributed as soon as AMS receives the signed agreements from ADM and AFDF.

Question. What agricultural marketing problems and opportunities have been addressed through projects funded through the Federal-State Marketing Improvement Program?

Answer. Federal-State Marketing Improvement Program, or FSMIP, funds are allocated competitively among State departments of agriculture or other appropriate State agencies, for a wide range of research and service projects aimed at improving the marketing, distribution, and utilization of agricultural products. Federal grants, which must be matched by non-federal funds or in-kind resources, have averaged about \$50,000 each in recent years, resulting in approximately 25 proposals funded per year. I will provide some examples of the marketing problems and opportunities addressed for the record.

[The information follows:]

The Global Marketing Support Service at the University of Arkansas is providing information and other assistance to small- or mid-sized producers of specialty food and wood products to further their efforts to enter and compete effectively in targeted international markets.

FSMIP provided assistance to the Missouri Department of Agriculture in developing a prototype market reporting system which more accurately reflects prices paid by packers and processors for slaughter hogs by accounting for premiums and discounts associated with carcass leanness. After operating on a pilot basis in Missouri during the past year, this system now is being extended to other areas under the Federal-State Market News Service.

Funds provided to the Illinois Department of Agriculture, in cooperation with the University of Illinois, have been used to identify market opportunities for specific varieties and grades of soybeans used in food products in South Korea and other Asian markets. A second project, with the same cooperators, is aimed at improving farmers' and country elevator managers' access to information about the value of soybeans based on differences in oil and protein content as measured by Near Infra-Red technology.

Kansas University, in cooperation with the agricultural marketing division of the State Department of Commerce, is identifying consumer demand and transaction costs for locally-grown produce through alternative market channels or marketing organizations, including producer cooperatives.

ORGANIC CERTIFICATION PROGRAM

Question. An increase of \$505,000 is requested for fiscal year 1999 to continue implementation of the Organic Certification Program. What is the fiscal year 1998 level of funding for this program?

Answer. A total of \$490,000 was made available in the 1998 appropriation for the Organic Certification Program. AMS estimates that an additional \$362,000, for a

total of \$852,000 from its Marketing Services account, will be needed in fiscal year 1998. A reprogramming proposal is under review within the Department.

Question. What is the current staffing (FTE) level for the Organic Certification Program? What staffing (FTE) level is proposed for the program for fiscal year 1999?

Answer. The current staffing level for the National Organic Program is 10 staff years. AMS proposes 12 staff years for fiscal year 1999.

Question. Once the Organic Certification Program is fully established, growers and handlers and certifying agents are to be assessed fees to recover program costs. The user fees collected will be deposited in the Treasury under current law. Please provide the statutory language that would need to be included in the appropriations Act to allow these fees to be credited to the Appropriations account to cover program costs.

Answer. A technical amendment to the Organic Foods Production Act of 1990, or 7 U.S.C. 6506, was adopted by conferees as section 601 of the Agricultural Research, Extension, and Education Reform Act of 1997, S. 1150. S. 1150 is pending final action by the Congress. The language, which authorizes the retention and use of the fees, is added at the end of section 2107 of the Organic Foods Production Act of 1990.

[The language follows:]

“(d) Availability of Fees.—

“(1) Account.—Fees collected under subsection (a) (10) (including late payment penalties and interest earned from investment of the fees) shall be credited to the account that incurs the cost of the services provided under this title.

“(2) Use.—The collected fees shall be available to the Secretary, without further appropriation or fiscal year limitation, to pay the expenses of the Secretary incurred in providing accreditation services under this title.”

Question. When do you expect a final rule to be published?

Answer. The current plan is to publish a final rule by the end of calendar year 1998.

Question. When do you expect the program to be fully established and user fees to be charged?

Answer. The proposed rule lays out an 18-month implementation schedule following publication of the final rule. During the first 6 months, applicants seeking accreditation for certification status will pay an application fee and an administrative fee. Operations wishing to be certified organic will then have 12 months to be certified, and will pay fees into the program. Site visits to the certifying agents will take place during this 18-month period and will generate fees. After the 18-month period, AMS anticipates the program will be self-supporting.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. AMS' annual performance goals are directly linked to its mission and strategic goals. The agency's program activities are grouped according to the agency's two strategic goals; the performance goals are listed by program activity. I will provide a table that shows the linkage between each activity and goal.

[The information follows:]

SUMMARY OF AMS PERFORMANCE GOAL LINKAGES, FISCAL YEAR 1999

Fund	Goal 1	Goal 2
Marketing services:		
Market news, appropriation	X	
Standardization, appropriation	X	
Shell egg surveillance, appropriation		X
Federal Seed Act Program, appropriation		X
Organic Certification Program, appropriation	X	
Pesticide Recordkeeping Program, appropriation		X
Pesticide Data Program, appropriation	X	
Market development and assistance, appropriation	X	
Wholesale market development, appropriation	X	
Transportation services, appropriation	X	
Payments to States and possessions: Federal-State Marketing Improvement Program, appropriation	X	

SUMMARY OF AMS PERFORMANCE GOAL LINKAGES, FISCAL YEAR 1999—Continued

Fund	Goal 1	Goal 2
Section 32:		
Commodity purchase services, appropriation	X
Marketing agreements and orders, appropriation	X
User funded:		
Grading and certification, user funded	X
Plant Variety Protection Act Program, user funded	X
Commodity research and promotion acts, user funded	X
Perishable Agricultural Commodities Act Program, user funded	X

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. AMS developed a performance goal for each budget activity. Since we used the budget activities as the framework, we did not encounter any difficulties.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, the agency's performance plan links performance measures to budget activities. AMS budget accounts include multiple activities; each AMS activity has a performance measure.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. AMS' performance planning structure does not differ from the budget structure. The activities in the annual performance plan are the same as the activities in the budget justification. The budget justification lists AMS activities by account, whereas the performance planning structure lists the activities by goal.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. No, AMS does not plan to propose any changes in its account structure.

Question. How were performance measures chosen?

Answer. Performance measures were developed through a consensus of program personnel and agency managers. As part of its strategic plan development, AMS established committees of agency program personnel for each activity. These committees were responsible for developing performance measures for their activities based on the strategic plan. AMS also formed a Strategic Planning Action Team at the Associate Deputy Administrator level. This team monitors the performance goals in the annual plan, gathers actual performance data semiannually, and prepares a report to the Administrator.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Since we were already collecting data on a budget activity basis, there was no significant increase in costs.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. At this point, we do not believe there will be a problem, but since the performance goals are new, we cannot be sure.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. Since the AMS performance goals track the budget activities, we believe that the Subcommittee would be interested in all of them.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. We attempted, where possible, to provide outcome measures for each program area.

Question. Do you believe your program managers understand the differences between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, we believe AMS program managers understand the differences. The problem, in some instances, was that measuring outcome was not possible and we had to use surrogate measures instead.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Some examples of customer satisfaction measures for external customers include the performance goal for market news services that is based on timeliness and the measures for wholesale market development and transportation services that are based on customer satisfaction survey results. None of our measures are specifically oriented toward internal customers.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. We developed the budget based on the agency's mission and strategic plan, then adjusted the performance goals as needed.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals.

Answer. Yes, we change the goal estimates based on the budget proposals. If the proposed budget number is changed, AMS program personnel can estimate the likely impact of the change on program performance. The performance goals and indicators reflect the requested budget levels.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. AMS has systems in place to measure and report program performance on a semiannual basis for management use.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

—Have you faced such difficulty?

—Would the linkages be clearer if your budget account structure were modified?

—If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

—How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We have not faced any difficulty in linking dollars and results since we are using an activity basis under both the annual performance plan and the budget structure. Therefore, there is no need to change the budget account structure for AMS to improve the linkages.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

—If so, what steps have you identified to prepare, anticipate and plan for such influences?

—What impact might external factors have on your resource estimates?

Answer. We included a discussion of external factors in the strategic plan. The discussion of performance goals in the performance plan briefly mentions external factors that could influence goal achievement for some of the agency's activities. AMS programs try to anticipate and prepare for uncontrollable external factors such as weather, economics, production levels, and consumer preference by closely monitoring the agricultural industry and its environment.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. No, rather the plan process has helped us to understand the complementary nature of our activities with others within and outside the Department.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

—To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

—Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. We believe our performance measures are the best that are currently available to reflect the accomplishment of our mission. We have not experienced any difficulty, but we plan to periodically reassess our performance measures to assure that they effectively measure AMS performance.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No, we do not see the need for any substantive revisions.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

ORGANIC STANDARDS

Question. The Department finally published proposed rules to establish national organic standards after many years of requests by the organic farming community. However, the proposed rule appears to have raised concerns by many about various practices that may be included in the standards. You suggest the final rule may be published by early in fiscal year 1999. Given all the past problems in publishing a proposed rule and the problems that have surfaced since, do you think early fiscal year 1999 is a realistic target?

Answer. Secretary Glickman has stated that the final rule will be in place by the end of the year. We are committed to meeting that deadline. We are proposing to reprogram \$362,000 for Organic Certification in fiscal year 1998.¹ With those additional funds and the funding increase requested for fiscal year 1999, we should have the resources and personnel we need to meet our goal.

Question. When the organic movement began, many thought of it as a passing fad. What do you see as the long-term outlook for this method of production and marketing?

Answer. The size of the organic industry has risen dramatically in recent years. In 1996, total domestic retail sales of organically-grown food products reached \$3.5 billion, up from \$78 million in 1980. Sales of organically-grown food have grown at approximately 20 per cent per year since 1990. From 1992 to 1994, certified organic cropland production in the U.S. expanded from 473,000 acres to 667,000 acres, and is expected to reach 2 million acres by the year 2000.

U.S. exports of organically-grown products totaled \$203 million in 1994, or about nine percent of the organic output. Export markets may become more substantial and offer price premiums for organic products, with increased world-wide consumption of organically produced food. The organic market share in the European Union, or EU, has been projected to reach 2.5 percent of total food consumption expenditures in 1998. Austria expects its organic market share to equal one third of all food sales by the year 2000. In 1994, France and Germany combined had total retail sales of organic foods equal to that of the United States in the same year, approximately \$2 billion. Japan's retail sales for that year were estimated to be \$688 million. Other EU countries report growth rates equal to or greater than the current growth rate in the United States, which is about 20 percent per year.

Question. AMS recently completed a study on the Little Rock River Market. Can you provide an overview of the finding and recommendations of that study?

Answer. In September 1996, AMS initiated a cooperative agreement with the city of Little Rock to conduct an operational management analysis of the River Market, a public market that had recently opened in downtown Little Rock. A goal of the study was to develop a strategy for River Market to position itself as a preferred fresh food shopping destination, providing quality products built on farmer and grocery trade. A preliminary report was presented to market management and the City outlining a series of recommendations for improving operating procedures and management practices at the market.

Included among the recommendations were:

- Institute a monthly advertising fee to conduct ongoing and long-term promotional and marketing campaigns.
- Hire a committed, strong, focused, visionary manager and give that person the authority to make decisions and orchestrate the market's success.
- Reduce the number of days the market is operating to coincide with consumer shopping preferences.
- Enhance security, particularly at night, to ensure a safe environment for the market.
- Enforce terms of lease agreements, particularly as they relate to Use Clause, Stall Design, and Rental Rates. Excesses and abuses should be curtailed.
- Consider implementing a validation system that would provide free parking for shoppers.

Question. When will the study be available?

Answer. A final draft is currently being prepared which further describes market data, demographics, and structural features of the market. This draft is scheduled for completion by May, 1998.

¹ A reprogramming request is under review within the Department.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

AGRICULTURAL QUARANTINE INSPECTION

Question. The fiscal year 1999 President's budget request proposes an increase of \$12,000,000 for the agricultural quarantine inspection (AQI) user fee program. Does APHIS expect to use any of its operating reserves in fiscal year 1998? If yes, how much and for what purposes?

Answer. Yes, in fiscal year 1998 APHIS will need to access \$12 million from the AQI Reserve Account to fund the operating shortfall that exists between the \$100 million Federal Agriculture Improvement and Reform (FAIR) Act of 1996 threshold and the \$88 million in appropriated funds. The FAIR Act changed the way funding is made available for most AQI activities and provided a mechanism to meet increased demands for AQI services. The FAIR act was designed to transition the AQI User Fee program into a true demand-driven user fee program in fiscal year (FY) 2003 based on the assumption that the program would receive \$100 million in annual appropriated funds through fiscal year 2002 and finance additional costs with user fee collections that exceed \$100 million. However, if less than \$100 million is appropriated, the shortfall must be funded from the AQI Reserve Account. In both fiscal year 1997 and 1998 the AQI User Fee program was appropriated less than \$100 million, \$98 million and \$88 million, respectively. We began fiscal year 1998 with a reserve account balance of \$17.8 million on a cash accounting basis. However, after using the reserve account to finance the fiscal year 1998 appropriations shortfall, only \$5.8 million is projected to remain available in the AQI Reserve Account for fiscal year 1999. This is a critically low reserve balance for a large-scale program such as AQI. Continued annual appropriations of less than \$100 million will gravely threaten the program's ability to perform its mission. The proposed fiscal year 1999 \$12 million program increase will help APHIS avoid further depleting the AQI Reserve Account to finance user fee inspection services.

PEST AND DISEASE EXCLUSION ACTIVITIES

Question. A recent General Accounting Office (GAO) report advised APHIS to improve its point-of-entry inspection program. What actions are being taken by APHIS to address this report? How much money has been earmarked in the proposed fiscal year 1999 budget request to address these concerns?

Answer. APHIS proposes to address these concerns by providing additional inspectors at new ports of entry; expanding facilities at the Mexican and Canadian borders, and Hawaii; and further expanding the detector dog program along the Mexican border. An increase of \$2.6 million is included in the fiscal year 1999 budget to fund these improvements.

Question. To address the GAO report, APHIS has stated that it will hire additional staff for inspections in Hawaii, Canada, and Mexico. How many additional staff will be devoted to conduct predeparture inspections in Hawaii, and preclearance inspections in Canada and Mexico? How many staff does Hawaii need to be considered fully staffed for all AQI programs?

Answer. The fiscal year 1999 increase of \$2.6 million for AQI appropriated activities supports nineteen additional staff years for predeparture inspections in Hawaii; 3 additional staff years for preclearance inspections in Canada; and 18 additional staff years for preclearance inspections along the U.S./Mexican border. Two additional inspectors above the increase level would provide optimal AQI staffing in Hawaii.

Question. With the increase in world trade and global competitiveness, many responsibilities have been created to comply with the new World Trade Organization (WTO) obligations. Which responsibilities fall under the responsibility of APHIS?

Answer. APHIS personnel have made and continue to make major contributions in resolving issues related to the World Trade Organization (WTO) Agreement on the Application of Sanitary and Phytosanitary (SPS) Measures. Several USDA agencies, including FAS, ARS, FSIS and all three Marketing and Regulatory Programs mission area agencies (AMS, APHIS, and GIPSA), spend considerable time and resources in resolving the many animal and plant health issues that arise due to increasing world trade and global competitiveness. In fiscal year 1996, APHIS and USDA SPS accomplishments included the resolution of 38 trade barrier issues worth nearly \$7 billion in exports of U.S. agricultural commodities, representing about 12 percent of the \$60 billion in U.S. agricultural exports that year. In 1997, SPS accomplishments included the resolution of over 70 issues worth over \$1 billion.

APHIS provides critical technical input for protecting American agriculture while facilitating trade. APHIS must maintain monitoring and surveillance activities in countries that have a trade relationship with the United States while, at the same time, ensuring that domestic agricultural products have access to emerging markets.

Question. How does the proposed fiscal year 1999 budget request address the financial obligations placed on the agency?

Answer. The demands facing APHIS have shifted substantially as a result of agricultural trade liberalization achieved during the GATT Uruguay round. The workload associated with regulating imports and certifying exports is increasing. As traditional barriers such as tariffs and quotas are eliminated under the WTO and other trade agreements, the temptation has increased for countries to adopt health-related requirements as disguised trade barriers.

This reality increases the need for APHIS to assertively execute its role as a leader in the SPS area. First, APHIS conducts risk analyses to monitor epidemiological pest and disease trends and conduct or participate in risk analysis for specific plant and animal commodities and pathways of introduction. Second, APHIS is continuing to assess and make regulatory decisions on an increasing number of import requests. These regulatory decisions must be in accordance with WTO rules which require greater documentation, scientific analysis, and transparency than in the past. Third, an increasing portion of our resources is being used to support U.S. agricultural exporters who encounter foreign technical trade barriers. Our scientific staffs play a critical role in the negotiation and resolution of these SPS issues. Fourth, APHIS spends an increasing amount of time and resources working with its foreign regulatory counterparts to develop international standards and address a variety of pest and disease issues which affect trade. Increasingly, APHIS must also gather technical information in foreign countries on surveillance and monitoring procedures and certify these systems. These international activities and relationships are becoming increasingly vital for promoting harmonized regulatory approaches which allow U.S. products to compete on a level playing field.

This expanding function presents certain challenges for APHIS as it seeks to reassess priorities and existing processes for managing sanitary and phytosanitary issues. APHIS is realigning its work processes to fit these changing needs, but increasing demands place a strain on current resources and the ability to update the skills of the workforce. Accordingly, we have requested increases in several line items to help us address sanitary and phytosanitary issues. Specifically, we request increases of \$4.6 million for our animal health monitoring and surveillance program and \$374,000 for our pest detection program. These program increases would enhance our domestic infrastructure and surveillance systems to certify the health status of American agricultural products. To specifically address SPS issues, we request an additional \$694,000 for international programs, \$173,000 for import/export inspection, and \$2.6 million for our agricultural quarantine inspection appropriated program.

Question. Under the import/export program, does APHIS' workload address the President's Food Safety Initiative? If yes, where and how much does the fiscal year 1999 proposed budget request contain?

Answer. Because APHIS is not directly involved in the President's Food Safety Initiative, the fiscal year 1999 workload projections for the import/export program do not address the initiative. However, APHIS has technical expertise in the area related to animal and plant health and is well-suited to advise the Food and Drug Administration and other participating agencies within the USDA as they address the Food Safety Initiative.

KARNAL BUNT

Question. How much does the agency plan to spend on Karnal Bunt in fiscal years 1998 and 1999?

Answer. In fiscal year 1998, we plan to spend approximately \$4.3 million on operating costs, which will fund surveys, testing, regulatory, and laboratory work. We expect the funding need for these activities to decrease by fiscal year 1999. However, we will not have an accurate cost estimate for fiscal year 1999 until at least July 1, 1998. At that point, enough fields will have been harvested to give us some indication of the level of activities needed for fiscal year 1999. So far through our Karnal Bunt (KB) Emergency Program, we have been able to prevent the presence of KB in the United States from crippling the \$5.9 billion wheat export market. Preserving this market is highly dependent on our successful continuation of the regulatory program and ongoing national survey to document that major wheat-producing areas of the U.S. are free of KB.

Question. Has the private sector agreed to finance this program?

Answer. There is no consensus among the private sector about financing this program. Although industry groups within the major wheat-producing areas of the country are generally supportive of the KB National Survey, grain handlers in some regions are resistant. By fiscal year 1999, there will be a decreasing need for extensive survey. This is because our intensive National Survey of 1996-97 has provided ample evidence that KB is not present at detectable levels in unregulated U.S. wheat production regions and is not a production or quality problem in our system.

Currently, we know that at least some of the sample collection element could be transferred if industry is willing to accept such a transfer. We believe we could also effectively transfer parts of the sample analysis element to private laboratories under accreditation processes. Also, we are working with the private sector to determine how parts of the data analysis and data management elements of the National Survey could be transferred. As long as our trade partners regard KB as a phytosanitary issue, the private grain sector should be willing to accept such a transfer and should want to take whatever measures may be necessary to assure trade partners that U.S. wheat meets import requirements. However, private sector acceptance of this transfer will depend on our ability to ensure that the private sector system would yield an official sample to meet WT Organization requirements.

SILVERLEAF WHITEFLY PROGRAM

Question. In the fiscal year 1999 President's budget, APHIS proposes to incorporate all components of the silverleaf whitefly program into the Biocontrol line item at the fiscal year 1998 funding level. Why is the agency proposing this?

Answer. Although we are proposing to incorporate the silverleaf whitefly (SLW) program into the Biocontrol line item, we plan to continue SLW activities in fiscal year 1999 at approximately the same level as in fiscal year 1997 and 1998. However, this transfer could provide greater flexibility in future years in allocating resources related to biological control methods for the SLW.

Question. Does the agency know if the industry agrees with this transfer?

Answer. The industry is concerned about this transfer. They believe that it may signal decreased funding for SLW activities in fiscal year 1999, but this is not the case. We plan to spend the same amount for SLW activities from the biocontrol line item in fiscal year 1999 as in fiscal years 1997 and 1998.

BOLL WEEVIL ERADICATION PROGRAM AND LOAN

Question. In your statement, Mr. Secretary, you indicated that a redirection of \$12 million from the Animal and Plant Health Inspection Service (APHIS) appropriations to the boll weevil loan program has been proposed. However, the budget shows the loan program level would decline from \$40 million in fiscal year 1997 to \$30 million in fiscal year 1999. Why is this?

Answer. The boll weevil program, stays in the same areas for a few years, then rapidly expands into new zones. We understand that program leaders in Texas are considering a loan request of as much as \$78 million. We also have indications of requests that will be made from other States. At the time the budget was developed, our assessment of the need for loans was \$30 million. We have not had an opportunity to review the current thinking behind the requests and cannot determine at this time, whether there will be a need for funding of the magnitude indicated.

Question. APHIS plans to discontinue all cost-sharing program activities where the boll weevil no longer exists in the fiscal year 1999 budget. In which areas does the boll weevil no longer exist?

Answer. The boll weevil no longer exists in Virginia, North Carolina, South Carolina, Georgia, Florida, California, Arizona, most of Alabama, middle Tennessee, and northwestern Mexico.

Question. The boll weevil loan program was created to enhance the appropriated funds for the boll weevil eradication program. The fiscal year 1999 President's budget proposes to decrease the eradication program by \$12.2 million. Last fiscal year, the President's budget proposed to decrease the program by \$9.8 million.

Why does the agency continue to propose reductions in this program even though it knows the loan program is not capable of covering the costs of the program? Please explain how USDA proposes to utilize the \$4 million proposed for the Boll Weevil Program in fiscal year 1999? How much of the APHIS funds go directly to the field and how much are attributed to administrative overhead? Since the program is continuing to expand, please provide the Committee with an analysis of whether the program can succeed without significant funding for federal cost sharing and for the FSA loan program—particularly while cotton prices are low and acreage is in decline.

Answer. Since boll weevil eradication has proven to be successful and profitable for cotton growers, program beneficiaries will assume a greater financial responsibility for program costs. Additionally, growers had expressed a desire to have primary control over the daily operations of their program.

In an effort to mitigate the impact of reduced Federal grants to the boll weevil eradication foundations, the USDA provided a loan program with very favorable terms which supplements funds raised through grower assessments and eases cashflow problems. In fact, the FSA loan program makes more total funds available for boll weevil program expansion than have been available under the traditional appropriations and grants approach. Because of the tremendous benefits cotton growers can gain from boll weevil eradication, we believe that they will choose to take advantage of the loan program. It provides a reasonable alternative that is cost beneficial.

The Agency proposes to use approximately \$2 million to fund direct and indirect costs for the ten technical coordinators APHIS has placed throughout the active eradication area. The remaining \$2 million would be allocated as cost-sharing funds among the active program areas.

Approximately 86.1 percent of APHIS' funding is allocated to the field for program delivery costs while 13.9 percent is allocated for agency and program-level support costs.

We believe the boll weevil eradication program can succeed with fewer federal cost-share funds and a flexible loan program. Cotton acreage has fluctuated significantly over the last two years, largely due to recent changes in farm legislation. These swings in acreage make it more difficult to provide the cash flow for the eradication program in each new area. High acreage during the expensive few years of eradication will result in high overall program costs. If acreage then declines in the post-eradication phase as loans are being repaid, grower assessments may not be sufficient to retire existing debt on schedule. Loans, therefore, must be flexible and the acreage accurately reported each year through FSA.

Question. What is the status of the memorandum of understanding (MOU) between APHIS and FSA which would provide for collection and sharing of crop acreage data in Boll Weevil Eradication zones which would facilitate administration of the program and collection of producer assessments? Is this consistent with report language which accompanied the fiscal year 1997 appropriations bill?

Answer. Both agencies agree that an MOU is not needed. Coordination of data is proceeding adequately to facilitate administration of the program and collection of producer assessments.

Yes, I believe that the Department is administering the program consistent with the Committee recommendations contained in Senate Report on the 1997 Act. In particular, we have developed working relationships with the foundations that actually carry out the boll weevil eradication program. Efforts by both FSA staff responsible for the loan program and APHIS staff responsible for the USDA's eradication program are closely coordinated, and we are making every effort possible to ensure that loan terms and conditions meet the needs of borrowers.

Question. Please provide the Committee with an explanation of how the Department is currently collecting crop acreage data. Is there concern about gaps and inaccuracies in crop acreage data figures under the Department's new collection procedures?

Answer. In most areas involved in eradication, FSA offices are involved, to varying degree, in collecting acreage information from producers. This information is provided by growers in accordance with State boll weevil eradication laws. It is critical that grower Foundations involved in the eradication program receive accurate and timely acreage reports from FSA. This information is used to bill growers for the assessments they voted to pay when they joined the program. Some States are very aggressive in enforcing their laws, while others are not.

Question. Does USDA have authority to allow producers to report their planted acreage? Does USDA have authority to share planted acreage data with private organizations who need such data?

Answer. Yes, the statutory authority to collect information such as reports on planted acreage is contained in Section 374 of the Agricultural Adjustment Act of 1938. No, the Department does not have authority to share the data with private organizations. Planted acreage reports are subject to a Privacy Act system of records and are exempt from Freedom of Information Act requests for sharing with private organizations.

YELLOWSTONE BISON

In fiscal year 1998, the Committee appropriated \$1 million to plan, design, and construct a quarantine facility in Montana to hold and test bison leaving the confines of the Yellowstone National Park.

Question. What is the status of this project?

Answer. Discussions with the State of Montana are currently taking place to determine the best location for this facility and the roles and responsibilities of both APHIS and the State. Although a location has not been determined, APHIS has consulted with an engineering firm to put together a preliminary generic plan for construction. Upon selection of a site, a specific design plan for the facility will be developed. Once the design phase is complete, construction will begin. Due to the mild winter thus far in Montana, the need for such a facility has not been critical. APHIS expects that the facility will be operational by the winter of 1999/2000.

Question. How has the project contributed to the agency's strides in reaching a long-term solution?

Answer. The facility, when completed, will be consistent with the long-term solution to manage brucellosis in the Yellowstone bison population announced in June 1997 by State and Federal officials. The long-term solution includes capturing animals and sending them to quarantine facilities; providing the disease free animals to Native American Indian tribes; hunting bison in certain situations; and vaccinating the bison when a vaccine is approved.

Question. Has the agency spent any of the fiscal year 1998 appropriation of \$1 million?

Answer. To date, APHIS has not spent any of the \$1 million appropriated in fiscal year 1998 for this project.

Question. What is the next phase of this project and how much money will be needed in fiscal year 1999? Is this amount included in your fiscal year 1999 request? If not, why?

Answer. Upon completion of the construction phase, the operational phase of the facility will begin. Presently, discussions are taking place to identify the roles and responsibilities of APHIS and the State of Montana. Funds were not included in the fiscal year 1999 budget for this activity because at the time the budget was developed, funds had not yet been included in the fiscal year 1998 Appropriations Act to construct the facility. For this reason, APHIS did not anticipate a need for operating and maintenance funds in fiscal year 1999.

GOLDEN NEMATODE

Question. In 1997, APHIS, the National Plant Board, the potato growers' industry, and the Agricultural Research Service conducted an extensive review of the golden nematode program. Why has the plan not been implemented?

Answer. After a panel representing these groups conducted the review, they made several recommendations concerning the golden nematode program. In fiscal year 1997, we established an implementation team to review this panel's report, to determine which of the recommendations could be implemented, to establish a timetable for implementation, and to address the operational details associated with implementation. This implementation team consists of representatives from APHIS, ARS, New York State, Cornell University, New York State potato grower groups, the National Potato Council, and the American Association of Nurserymen. The recommendations and the actions we have taken on each follow:

(1) that the feasibility of eradication be tested in accordance with the parameters presented by the Panel, and that the USDA, the New York State Department of Agriculture (NYSDA), and Cornell University continue to conduct a joint golden nematode (GN) management program.

Since total eradication is not possible, the team advocated that some type of GN program must continue to prevent the pest from becoming more widely distributed.

(2) that the program should explore the possibility of developing other effective control methodologies.

We developed a steam heat treatment for farm equipment that we hope can replace methyl bromide by 2000. Also, we developed the "hatching factor," which uses a chemical that would cause GN to hatch prematurely. In addition, the team supported the idea that biotechnology may have some application in the long term to accelerate the development of new GN-resistant potato varieties.

(3) that the USDA or the New York State Department of Agriculture (NYSDA) work with potato growers to obtain a special local needs or general registration for Basamid.

The team advocated the registration of Basamid, although it would probably require a third-party registrant. The availability of Basamid would not significantly affect program operations.

(4) that the national GN detection surveys now in progress be completed.

The team favored the continuation of the golden nematode program and Federal quarantine. Also, it advocated the need for additional national surveys that would enable the program to identify and regulate infested properties in time to prevent further spread.

(5) that the program continue to intensively manage the GN in New York State.

The team will be appointing a subcommittee to determine to what extent Long Island should be regulated. Currently, only individual properties are regulated on Long Island. Also in New York State, we initiated and implemented GN-resistant potato variety crop rotation on exposed lands (those that are at risk of becoming infested) which will control GN populations and prevent further spread. This would reduce workload because we would not need to survey the lands that are in rotation as often or as intensively as other lands.

(6) that the GN management program be restructured to reduce workload.

The program could be restructured and workload reduced if New York State would be willing take a greater role in activities concerning the intrastate movement of farm equipment.

(7) that the federal-domestic quarantine be revised and the NYSDA evaluate the New York State parallel quarantine.

The team supported the idea that the Federal quarantine not be revised until it is determined what type of program funding would allow. Also, the team believes that the current quarantine is an effective mechanism for preventing GN spread.

(8) that ARS and Cornell University continue research and development efforts, that funds now provided to these efforts from APHIS and NYSDA be redirected to the regulatory and management program, and that federal funding for regulatory and management activities continue.

ARS and Cornell University will continue research and development efforts to develop GN-resistant potato varieties and a heat treatment technique for farm equipment since the availability of new resistant varieties is essential to the program's success. But most of the team favored ARS and/or Cornell University funding this work. In fiscal year 1997, APHIS funded these activities at \$50,000.

Also, the team endorsed the idea that APHIS conduct a cost-benefit analysis of the GN program in an attempt to justify requests for additional funding.

(9) that potato commissions be consulted in developing research to identify other detection and control methods.

The National Potato Council and the American Association of Nurserymen were represented at the most recent implementation team meeting in February.

Question. Have other areas of the country become infested by the golden nematode?

Answer. No, there are no areas outside of New York State that are infested with GN.

Question. Under the circumstances, why is the fiscal year 1999 President's budget request proposing a decrease of \$36,000?

Answer. We can achieve savings through the closing of our golden nematode facility in West Hampton Beach, Long Island, without impacting program operations. The employee now working in that office would be re-located to another office, but would still conduct most of the activities she is currently conducting. These activities include maintaining compliance agreements with growers and treating used farm equipment. The savings would be realized primarily through utility and maintenance costs.

WILDLIFE SERVICE OPERATIONS

Question. The agency has proposed changes to the Wildlife Services Operations program to reduce the disparities between the States cooperators who are receiving assistance from the Federal Government. Please provide the Committee with a list of all States participating in the program currently, the amounts the States contribute currently, and those States identified which would be affected by these proposed changes.

Answer. The following table contains the amount of net Federal appropriated funds and cooperator contributed funds by State for fiscal year 1997. Federal funds used for Congressional Directives, human health and safety work, protection of endangered species, migratory bird work, and basic program infrastructure costs are excluded from the Federal amounts listed. The balance reflects the Federal amounts which are directly contributed toward cooperative agreement activities.

[The information follows:]

State	Fiscal year 1997—	
	Appropriated	Cooperative
Alabama		\$142,116
Alaska		347,407
Arizona	\$306,793	323,608
Arkansas	18,890	
California	338,453	2,513,179
Colorado	534,997	236,519
Connecticut		1,392
Delaware		
District of Columbia		
Florida		88,710
Georgia		118,343
Hawaii		640,938
Idaho	672,186	488,089
Illinois		280,275
Indiana		20,703
Iowa	16,325	15,475
Kansas	25,500	65,267
Kentucky		227,000
Louisiana	61,725	288,119
Maine		135,157
Maryland		50,340
Massachusetts		53,490
Michigan		31,915
Minnesota		631
Mississippi	319,072	821,463
Missouri		104,998
Montana	562,055	816,258
Nebraska	223,001	285,754
Nevada	593,659	637,232
New Hampshire	11,969	162,818
New Jersey	29,630	318,240
New Mexico	839,896	1,001,291
New York		48,494
North Carolina	61,623	691,320
North Dakota	143,625	436,229
Ohio		88,736
Oklahoma	551,429	1,099,536
Oregon	735,311	897,095
Pennsylvania		13,993
Rhode Island		2,075
South Carolina	28,312	311,024
South Dakota	231,458	1,032,867
Tennessee	19,952	404,848
Texas	1,574,520	5,383,783
Utah	853,825	1,035,008
Vermont	9,594	36,105
Virginia	30,700	258,917
Washington/Guam	95,031	2,929,073
West Virginia		209,938
Wisconsin	357,540	1,036,177
Wyoming	701,924	571,845
Total	9,948,995	26,703,790

The following chart shows disparity amounts by state, based on the same formula used in developing the fiscal year 1999 budget proposal, but is based on fiscal year

1997 rather than fiscal year 1996 data. The formula used for determining disparity amounts involves totaling both Federal and cooperative funding, and then determining the amount below 50 percent of the total, which is then the disparity amount. [The information follows:]

State	Fiscal year 1997—		Total program	Disparity
	Appropriation	Cooperator		
Arkansas	\$18,890	\$18,890	\$9,445
Colorado	534,997	\$236,519	771,516	149,239
Idaho	672,186	488,089	1,160,275	92,048
Iowa	16,325	15,475	31,800	425
Wyoming	701,924	571,845	1,273,769	65,039
Total	1,944,322	1,311,928	3,256,250	316,196

Mr. Medley, you mention in your testimony that a survey was done of catfish farmers and that "68 percent of the respondents indicated they had spent some effort to avoid wildlife caused losses to their catfish crops."

Question. What does "spent some effort" mean?

Answer. In January 1997, the National Agricultural Statistics Service conducted a survey of catfish farmers regarding wildlife-caused losses in 1996. The results of the survey indicated that 69 percent of aquacultural producers suffered some type of damage from wildlife. Wildlife cost catfish producers about \$17 million in 1996. Preventative measures most frequently cited by producers included shooting, vehicle patrol, scare tactics, and roost dispersal.

Question. What is the agency doing to avoid these losses?

Answer. Assistance is provided nationwide, with intense efforts concentrated in Alabama, Florida, and Mississippi, where three wildlife biologists are stationed. Wildlife biologists conduct onsite evaluations to assess damage and identify the species of bird or mammal causing the damage, and make control equipment available to producers. If exclusionary and scaring techniques fail to reduce losses, producers may now take a limited number of birds by lethal means, as a result of a cormorant depredation order recently issued by the U.S. Fish and Wildlife Services (FWS). In addition, APHIS' field research station in Starkville, Mississippi, conducts research and field studies to improve current control methods, and to develop new ones.

In addition, APHIS cooperates with the FWS in the development and implementation of a management plan to control damage caused by fish-eating birds to aquaculture resources in the mid-south. APHIS is also continuing to work with FWS to study the ecology, behavior, food habits, and migratory patterns of various fish-eating birds.

Question. How does the fiscal year 1999 budget request address the agency's preventive actions?

Answer. Funding to continue all current aquacultural assistance and research activities would continue at the current level, if cooperators increased contribution levels as proposed in the fiscal year 1999 request.

Question. Through the agency's actions in fiscal year 1997 and 1998, oral vaccines for the canine strain of rabies have been successful in stopping the spread of disease in Texas. Does the fiscal year 1999 budget request propose any spending for continued actions in Texas? If yes, how much?

Answer. The fiscal year 1999 request does not propose any funding for support of the Oral Rabies Vaccination Project in Texas. However, APHIS will support the Texas program with in-kind services totaling about \$25,000.

Question. Oral rabies vaccine bait distributions, monitoring and surveillance activities in Vermont, Ohio and New York have helped to stop the spread of the Mid-Atlantic strain of rabies in the raccoon population in those States. How much money is requested for the continuation of these activities in the fiscal year 1999 budget request?

Answer. The fiscal year 1999 request includes approximately \$30,000 to provide continued support of a Rabies Hotline which is maintained in the APHIS Wildlife Services Vermont office. No funds are included for oral rabies vaccination program activities in New York, Ohio, or Vermont.

Question. During 1997 APHIS was able to reduce a backlog of Animal Welfare Act cases to about 25 percent. What is the current estimate of the reduction of backlog in the fiscal year 1999 budget request, and how much money is proposed to be used for these activities?

Answer. We believe this problem is close to being resolved. Where in the past there were several hundred cases open awaiting formal administrative prosecution, the number has now been reduced to fewer than 100, most of which are recent. The main factor in our success has been an emphasis on settling cases at the agency level through stipulations, where the party agrees to improve their operation and pays in most cases a nominal fine, rather than issuing a formal complaint which may necessitate a lengthy hearing and appeals process. In addition there has been an intensive effort by APHIS and the Office of the General Counsel to eliminate the backlog of cases and reduce the time it takes to formally adjudicate an Animal Welfare case.

We did not include a request for additional funds in the fiscal year 1999 budget to reduce the current backlog of cases.

Question. In the fiscal year 1998 Appropriations Act, the Committee provided funding to enforce the Commercial Transportation Equine for Slaughter Act. What actions has the agency taken to date, and has the entire amount provided in fiscal year 1998 been used for enforcement activities? How much does the fiscal year 1999 budget request contain for the continuation of these activities?

Answer. APHIS is in the process of implementing a program which focuses on regulating and educating the trucking and slaughter industries and conducting research on issues related to the humane treatment of horses from shipment to slaughter. Presently, APHIS is gathering information to draft regulations to enforce the Act. Information is being gathered from the horse industry including the American Horse Protection Association, the Humane Society of the United States, and the American Horse Council (AHC). APHIS expects to begin developing the regulations in the third quarter of fiscal year 1998. For fiscal year 1998, APHIS is funding two research studies which focus on the stress and well-being of slaughter horses during transport and examine health problems such as dehydration. The budget request includes approximately \$400,000 to continue these activities in fiscal year 1999.

PANAMA FACILITY

Question. The fiscal year 1999 budget request proposes \$1.4 million reduction for the screwworm program. Planning for the new Panama facility is to begin in fiscal year 1999 with an architectural and engineering study. How much money is ear marked in the proposed fiscal year 1999 budget for the planning of this facility?

Answer. Recent Appropriations Acts have granted APHIS authority to carry over up to 10 percent of the annual screwworm appropriation, to remain available until expended. At the beginning of fiscal year 1998, APHIS had \$5.4 million available from prior years in the screwworm program to plan and conduct an architectural and engineering study and another \$5 million available in Buildings and Facilities to update the master plan for the facility. These funds were accumulated gradually from program savings over the past 4 years. No money in the proposed fiscal year 1999 budget is ear marked for planning the Panama facility.

Question. What is the projected total cost of this building, and when does the agency plan to finish it?

Answer. We expect to begin operations at the new facility by 2002. Current projections estimate costs for the construction of the sterile screwworm facility to be up to \$80 million for three modules plus another \$8 million for an architectural and engineering study and environmental studies. APHIS has the authority to make a grant to the Commission which could then construct, lease, or make loan payments for the facility.

ANIMAL WELFARE ACT

The Animal Welfare Act is administered by APHIS and regulates groups under the Act which include "dealers" in dogs and cats. The Animal Welfare Act specifically excludes "retail pet stores" from the definition of "dealers" and regulations have excluded persons from the definition of "dealer" who sells dogs and cats at retail. I understand that APHIS is now considering to expand the definition of "dealer" to include some persons who sell dogs and cats at retail, specifically persons who sell dogs and cats at retail in their own residence.

Question. Is APHIS considering such a proposal, and if so, do you have any idea how many additional entities would be defined as "dealers" and subjected to regulation under the Animal Welfare Act as a result of this regulatory expansion?

Answer. APHIS is considering a proposed rulemaking that would require licensing and inspecting of both wholesale and retail outlets of dogs—including dogs intended for hunting, security, and breeding purpose—while still excluding true retail pet stores. The licensing determination would be based on the number of adult breeding females on the premises. Currently premises with less than four are not required

to be licensed. We will propose to modify the threshold of breeding females based on recommendations received during a comment period after publication in the Federal Register. By soliciting this input from interested parties such as animal protectionist organizations as well as current and potential licensees, we can better determine the appropriate number and expect better compliance with any new regulation.

According to my information, the number of residential breeders who sell dogs and cats at retail could number as many as 300,000 to 500,000. I have no idea how many additional persons may sell dogs and cats for breeding, hunting, or security purposes. I understand from APHIS' recent Animal Welfare Enforcement reports that the Animal Care unit currently has fewer than 8,000 licensees and registrants, and only inspects about 10,000 sites annually. That is an inspection rate of about 1.4 inspections per year. The proposal to expand regulations to retail sellers, if it is carried out, seems like it would greatly expand the number of entities regulated by APHIS' animal care unit.

Question. Will the Animal Care unit require additional funds to carry out this expansion?

Answer. The number of additional facilities to be regulated has not been determined. An Animal Care survey showed that possibly another 10,000 facilities might need to be regulated whereas, other estimates from industry has been as high as 270,000. It is estimated that to inspect an additional 10,000 facilities, 58 more inspectors and an additional \$4.8 to \$5 million would allow APHIS to service these facilities as in the past. APHIS is considering raising the current threshold of breeding females to a level where the additional facilities picked up would be offset by not inspecting those facilities below the threshold. Until the final rule is published, we will not know the full impact of this proposed regulation. Also, using a newly developed Risk-based Inspection System, APHIS will reallocate resources to those facilities most needing inspection services. Those facilities having a good history of Animal Welfare Act compliance may only be inspected once every 3 years; those facilities with a history of noncompliance may be inspected 2 to 4 times per year. However, using risk-based inspection will free up an estimated 3 to 10 percent of Animal Care resources that can be used to cover these additional facilities.

Question. Is APHIS considering a request for an increase in its appropriation to regulate residential breeders or persons who sell hunting, breeding or security dogs at retail?

Answer. In fiscal year 1999, APHIS did not request funding to carry out these activities. The Agency will consider requesting additional funds for these activities at a later time.

Question. Has APHIS made any estimates of the additional funds that would be required to carry out this expansion?

Answer. It is estimated that it will cost approximately \$4.8 to \$5 million to cover the expenses associated with inspecting an additional 10,000 facilities.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. They are directly linked. The five general goals of the APHIS strategic plan correspond to the five functional components of the agency's budget structure (Pest and Disease Exclusion, Plant and Animal Health Monitoring, Pest and Disease Management, Animal Care, and Scientific and Technical Services). Similarly, the objectives listed under each goal correspond directly to funded line programs under each functional component. In the annual performance plan, APHIS has developed a set of annual performance targets for each goal of its strategic plan.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Development of performance goals and supporting budgets in APHIS occurs through a formal process we call the Multiyear Program Planning and Budgeting process. Personnel involved in budget development receive formats requesting that they develop budgets and measures for performance goals. Each program has its own set of ongoing, or formative, evaluation activities in place to identify strengths and weaknesses, and these evaluations are used by the program managers to develop new performance goals and strategies that are tied to funding levels.

For many of our pest and disease eradication goals and objectives, the annual performance targets describe a progression leading to the long-term eradication objectives of the strategic plan. For other, more difficult-to-measure goals, further efforts

are underway to quantify performance baselines. Once the performance baselines have been established, it will be possible for us to set targets for the goals of the strategic plan and then link them more fully to the performance plans.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The annual performance plan identifies selected program performance measures to reflect progress toward achieving the general goal. Each general goal has selected annual performance measures, but not every objective in the general goal is represented in the performance plan.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The annual performance plan identifies progress toward general goals. However, it does not contain specific measures for each objective under the general goals.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. At present, there has been no decision to change our account structure for fiscal year 2000, although final agency decisions on the fiscal year 2000 proposal will not be completed until June of this year when budgets are due to the Department.

Question. How were performance measures chosen?

Answer. Performance measures were chosen as part of the Agency's cycle of long- and short-range planning, budgeting, and program evaluation. Each program has its own set of ongoing, or formative, evaluation activities in place to identify strengths and weaknesses, and these evaluations are used by the program managers to develop new performance goals and strategies. These evaluations include station reviews, port reviews, program reviews, customer and stakeholder needs assessments, and the results of public hearings, meetings, and symposia on current scientific issues. In addition, as part of its annual performance planning cycle, APHIS is developing performance monitoring systems which will be refined over the next several years, so that program managers can routinely evaluate program effectiveness.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The need for reliable and valid performance data is considered a high priority within the agency's information technology needs. Cost may affect how quickly we can reach our goal of having reliable and valid performance data for all our programs, especially given the resources devoted to the Year 2000 problem, but we are committed to eventually reaching the goal.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. There will likely be some performance measures for which reliable data will not be available in time for our first performance report in March 2000.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. We believe that none of the performance goals should be overlooked in tracking program results.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Ever since the passage of the Government Performance and Results Act, APHIS planning, budget, and program staffs have been engaged in efforts to change the mind set within the agency toward outcomes versus outputs. Initially, this work was done in small groups focusing on selected pilot line items, then broadened to encompass all of the agency's funded activities.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. We believe that most of our program managers do recognize the distinction, although there may still be a few who don't. We are making every effort to promote awareness, through a number of avenues including training sessions, redesigned data collection formats, and interaction between program, policy, and budget staffs.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. In our Wildlife Services program, we will measure "customer satisfaction with Wildlife Services livestock protection." For Horse Protection, the following

measure has been developed: "level of customer satisfaction with the Horse Protection program expressed by a random sample of customers in a mail survey." For Veterinary Biologics, we will measure "public confidence in the safety and efficacy of biological products." These are but a few of many customer satisfaction measures that have been developed.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The fiscal year 1999 budget was developed last Spring, before the fiscal year 1999 Annual Performance Plan was completed. However, each program in APHIS has its own set of ongoing, or formative, evaluation activities in place to identify strengths and weaknesses, and these evaluations are used by the program managers to develop new performance goals and strategies and prioritize activities in their budgets. In addition, as part of its annual performance planning cycle, APHIS is developing performance monitoring systems which will be refined over the next several years, so that program managers can routinely evaluate program effectiveness. We will continue to work in the coming years toward integrating these processes so that program goals can translate into resource needs.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, we would be able to estimate the likely impact.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. We have made some progress in this area, but the work is not finished. Our field and headquarters personnel are working together to develop the necessary technological capabilities to meet reporting requirements.

The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Question. Have you faced such difficulty?

Answer. We have not experienced any difficulty from the standpoint of having a compatible budget structure. The five general goals of the APHIS strategic plan correspond to the five functional components of our budget (Pest and Disease Exclusion, Plant and Animal Health Monitoring, Pest and Disease Management, Animal Care, and Scientific and Technical Services). Similarly, the objectives listed under each goal correspond directly to funded line programs under each functional component. In our annual performance plan, we developed a set of annual performance targets for each goal of the strategic plan. For many of our pest and disease eradication goals and objectives, the annual performance targets describe a progression leading to the long-term eradication objectives of the strategic plan. For other, more difficult-to-measure goals, further efforts are underway to quantify performance baselines. Once the performance baselines have been established, it will be possible for APHIS to set targets for the goals of the strategic plan and then link them more fully to the performance plans.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. We do not believe modifying the budget account structure would significantly improve our ability to measure program performance.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure? How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We do not see a need to modify the budget structure at this time.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The performance plan does not specifically mention or identify external factors that could influence goal achievement. Those factors are enumerated and discussed in the Agency's strategic plan.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. APHIS takes into account a wide range of external factors in developing its overall strategy for accomplishing its mission. As the risk of pest and disease entry increases due to emerging animal and plant health issues, increases in global trade and passenger movement, and improved transportation technologies, APHIS

is increasingly challenged to update prevention strategies, monitoring systems, and response actions that ensure effective management of those risks and preserve our markets. We must also continue to update strategies and methods to ensure that solutions are practical and environmentally sound.

Question. What impact might external factors have on your resource estimates?

Answer. External factors may have a significant impact on our resource estimates, as emergency outbreaks of fruit flies, citrus canker, and Karnal bunt have shown in recent years. Our aim, however, is to find solutions and adjust priorities so that we can accomplish our mission within resource estimates.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No, we have not.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. We have not identified overlapping functions or program duplication.

Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

Question. To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. For many of our programs we are still in the process of establishing baselines and shifting measures from outputs to outcomes. We are also working to identify those external factors which could impact on our ability to achieve our targets. However, in certain eradication programs such as brucellosis and screwworm, the performance measures are as mature as possible and may be suitable for such uses.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Both factors exist to some degree and would affect the accuracy of resource estimates. Another factor which interferes with accurate resource estimates is the occurrence of unexpected outbreaks of emerging pests and diseases.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No. We see the need for some small adjustments, but none that we would consider substantive.

BOLL WEEVIL

Question. Is it accurate that USDA and Land-Grant University analyses have concluded that the boll weevil program has generated significant economic and environmental benefits in the Southeastern states?

Answer. A report written by USDA and University of Georgia researchers entitled—Cotton Production and the Boll Weevil in Georgia: History, Cost of Control, and Benefits of Eradication—summarizes the tremendous economic and environmental benefits of boll weevil eradication in Georgia. According to the study, cotton production has increased dramatically each year since the program was completed in 1990. Average yield has increased from 482 pounds per acre in the pre-eradication period (1971 to 1986) to 733 pounds per acre in the post eradication period (1991 to 1995). Acreage has increased from an average of 288,000 to 770,000, and average gross crop revenues have increased from \$70 million to \$400 million per year. In addition, net crop revenues (gross revenues less insect pest management costs and amount of damage) have increased from \$187 to \$451 per acre.

The report also identifies environmental advantages to growers and residents of the State due to a significant decrease in insecticide use in Georgia cotton. The average number of insecticide treatments have decreased from 14.4 per acre in the pre-eradication period to 5.4 per acre in the post-eradication period. In most cases, the materials used are more specific, and the amount of active ingredient applied during each treatment has been reduced from pounds per acre to a few ounces per acre.

QUESTIONS SUBMITTED BY SENATOR BURNS

BISON QUARANTINE FACILITY

Question. Mr. Secretary, last year this committee provided the Animal Plant Health Inspection Service (APHIS) with \$1 million to construct a bison quarantine facility in the state of Montana outside the boundaries of Yellowstone National Park. Could you provide the Committee with an update on the current status of those funds?

Answer. APHIS has not yet obligated the \$1 million for the bison quarantine facility. Presently, APHIS is in discussion with the State of Montana to determine a lo-

cation for the facility and to identify roles and responsibilities for both APHIS and the State. Although a location has not been determined, APHIS has consulted with an engineering firm in Utah to put together a preliminary generic plan for construction. Upon selection of a site, a specific design plan for the facility will be developed. Once the design phase is complete, construction will begin. Due to the mild winter thus far in Montana, the need for such a facility has not been critical. APHIS expects that the facility will be operational by the winter of 1999/2000.

Question. Would you also provide the Committee a breakdown of the negotiations that have occurred between APHIS and the State of Montana on this particular facility?

Answer. Negotiations with the State of Montana are underway. Since January 1998, contacts have been made with the newly hired State Veterinarian in Montana to meet and discuss the facility. Items for discussion include operations management, authority issues, and a site location.

Question. Could you also provide us with a status report on the agency's involvement in the Environmental Impact Statement being designed to address the bison/brucellosis problems in Yellowstone National Park?

Answer. The National Park Service (NPS) is the lead Agency for the Environmental Impact Statement (EIS). APHIS is a cooperator. In our role as cooperator, APHIS has participated in the preparation, review, and evaluation of the alternatives of the EIS. APHIS has also provided assistance with assessing the economic impacts of actions on ranchers in the area. As a cooperator, APHIS is committed to providing input concerning brucellosis pathogenesis, epidemiology, and disease management methods.

BRUCELLOSIS

Question. What is the current count of herds in the United States currently infected with brucellosis?

Answer. As of February 28, 1998, there were 12 cattle herds under quarantine in the United States for brucellosis. These 12 herds were located in Texas. In addition, one privately owned bison herd in South Dakota was under quarantine.

Question. What is APHIS' assessment of the science and research currently available with respect to brucellosis in livestock, captive wildlife and free ranging wildlife?

Answer. Several research projects are ongoing and others have been conducted that provide or will provide critical information towards resolving the brucellosis problem in the Greater Yellowstone Area. These projects address disease transmission, pathogenesis, epidemiology, and vaccine safety and efficacy. However, additional information is needed including vaccine delivery systems, the effect of the vaccine on non-target animals, and management methods. Many of these studies require a statistically significant number of animals to validate study results and facilities which can handle large numbers of animals.

Question. What are the principal centers and facilities for research on disease transmission between captive and free ranging bison and wildlife?

Answer. The principal centers known to APHIS for research on transmission between captive and free ranging bison and wildlife are (1) Yellowstone National Park, (2) the Agricultural Research Service's facility in Ames, Iowa, (3) Texas A&M University, and (4) the Idaho Wildlife Laboratory/Caine Veterinary Teaching Center, Caldwell Idaho. Other facilities work on various aspects of brucella research but they do not have facilities to house bison for transmission studies.

Question. What does APHIS see as the principal scientific, health, and research issues involving captive and free ranging bison and wildlife?

Answer. APHIS feels that current brucellosis control and eradication methods are adequate to eradicate the disease from the Greater Yellowstone Area (GYA). However, implementing these standard procedures could potentially have a significant negative impact on the number of bison in the Yellowstone National Park (YNP) herd. Therefore, additional information is needed to address management procedures that could be used in YNP to eliminate infection and limit the impact on the herd populations. Issues that APHIS considers principal to implementing a brucellosis control plan in the GYA include evaluating vaccine safety and efficacy in a significant number of bison and elk; developing a variety of vaccine delivery systems that can be used in a variety of situations in YNP and surrounding elk feedgrounds; and evaluating newer vaccines with more potential for efficacy. Additional information that would be very useful includes improving elk habitats to prevent commingling on elk feedgrounds; additional studies in transmission, epidemiology, and pathogenesis in bison and elk (especially in males); and latency in bison and elk calves.

Question. The Northwest Pilot Project is not working. The Canadians set protocols so unfriendly toward feedlots in the country that at this point in time only three have signed onto the program. The United States/Montana protocols are not applicable because USDA-APHIS approved the Regionalization Docket. I have several questions here so, first what can APHIS do to get Ag Canada to address the issues of rewriting the Northwest Protocol, and to expedite the development of a Canadian Regionalization document?

Answer. The Canadian Cattlemen's Association (CCA) has already approached the Canadian Food Inspection Agency (CFIA) about adjusting the protocol. Their concerns reflect the issues that Montana producers have raised. CFIA is willing to address these issues on a scientific basis and continues to work with CCA to do so. Therefore, at this time, the process has been started. We have urged the industries on both sides of the border to cooperate with this process.

Question. The producers in Montana are not very happy about the current situation. Canada got all it was asking for and the United States, particularly those states in the northwest got almost nothing. Could you explain to me what happened here?

Answer. This project was developed over several years at the urging of both the National Cattlemen's Beef Association (NCBA) and the Canadian Cattlemen's Association (CCA). Both groups were involved with drafting the specifics of the project. Canada, which has a notice and comment regulatory procedure similar to the U.S. Federal Register process, published the proposed changes, including the requirements that feedlots must meet, for public comment. Neither the NCBA nor the CCA submitted any negative comments on this proposal. The regulatory changes were finalized and published. These changes allowed Canada to accept untested feeder cattle from any state that met the provisions.

The U.S. commitment to this project addressed brucellosis and tuberculosis testing requirements for cattle from Canada. APHIS has the authority to waive federal requirements when it is determined that a risk is not present to the domestic livestock population. Using this authority, we evaluated Canada's animal health status for these diseases and decided to waive the testing requirements. At the same time, we were in the rule-making process with our regionalization document, which proposed many changes to the United States' animal health import requirements. The agreement to waive the Canadian requirements was made with the understanding that any final changes as decided in the rulemaking process would supersede any waivers. Final changes from the regionalization regulations were made in fall 1997 and took effect in November 1997.

Question. Why didn't we ask for some sort of reciprocal regionalization document?

Answer. This pilot was an industry driven project. The industry wanted to ship untested feeder cattle into Canada. The Agency pursued this request with Canada. Canada is primarily concerned with bluetongue and anaplasmosis. Currently, there is not enough available data on the status of these diseases in Montana to support any type of a regionalization request. We are working with Montana to obtain this data.

WILDLIFE SERVICES

Question. Mr. Dunn, the Wildlife Services program is obviously important to a broad range of the American public. It is involved with livestock protection, reintroduction of the wolf, public health and keeping wildlife away from airports. In four of the past five years the Department's budget has proposed large decreases in the operational budget. Can you explain to the Committee why this is happening with a program that is so important to the public safety and to wildlife conservation?

Answer. Recently proposed decreases, including the fiscal year 1999 request, have been based upon a cost sharing proposal which constitutes an effort to reduce Federal Costs by encouraging increased cooperative contributions to the program. This approach maintains total cooperative funding and cooperative program efforts at the current level, provided cooperators meet 50 percent of total program costs. If, however, affected cooperators did not increase their contributions, the Federal amount would be reduced and program activity would be reduced accordingly.

Question. Is this a decision by the Office of Management and Budget (OMB)?

Answer. WS has maintained a policy for several years in which cooperators must provide a minimum of 50 percent of total funding in all new agreements. In addition, WS has made and continues to make every effort to increase cooperative funding in all agreements, old and new. This is evidenced by the dramatic increase in total cooperative contributions, increasing from \$13,957,909 in fiscal year 1990, to \$26,703,790 in fiscal year 1997.

Question. If so, has the Secretary done anything to point out to OMB the importance of this program?

Answer. We met with representatives of OMB to discuss the cost sharing proposal. We believe that OMB understands the importance of the program.

This Committee, in response to the public need, has restored funds in each of the years when decreases have been proposed.

Question. Can we expect that the Department's budget will continue to propose such cuts in the coming years that the Committee will have to restore?

Answer. Constantly changing program demands and budgetary circumstances may dictate a future need to propose a reduction for the program, but APHIS currently has no specific plan to request further reductions for Wildlife Services.

Question. On the east coast we hear a lot about the methods used to control wildlife and predators that are causing damage. With this type of criticism, why is the Department proposing to cut the budget for research on new methods of animal control?

Answer. In fiscal year 1996, the National Wildlife Research Center (NWRC) conducted a survey of wildlife damage management experts to determine highest priority advanced research needs. The survey resulted in the identification of priority needs for which additional emphasis is required. The new NWRC was established to meet such advanced needs and had anticipated taking advantage of new facilities to implement these expanded/enhanced priority areas in fiscal year 1999. However, the animal research building support wing and the outdoor animal holding and testing pens must be constructed before identified priority research can be fully supported. This will impact APHIS' ability to develop, improve, and maintain Environmental Protection Agency and Federal Drug Administration approved chemicals, vaccines, and drugs used for wildlife damage management.

NATIONAL WILDLIFE RESEARCH CENTER

Question. Mr. Dunn please describe for the Committee what your plans are for completing the new research facility in Fort Collins, Colorado.

Answer. On August 4, 1997, the Denver Wildlife Research Center in Lakewood, Colorado, was officially closed, and the National Wildlife Research Center (NWRC) in Fort Collins, Colorado, was opened. As of that date, all NWRC headquarters personnel began working from the NWRC Animal Research Building and GSA leased facilities in Fort Collins. Construction of the 82,000 sq ft office/laboratory/headquarters building began in late 1997, and is expected to be ready for occupancy in late 1998. At that time all NWRC headquarters personnel again will be located at one site.

The remaining unfunded components of the 43 acre Master Plan as approved in 1989, include the outdoor animal pens and several associated support buildings, including a warehouse, bulk chemical storage facility, and a garage/maintenance/shop building, collectively known as the Outdoor Pen Project. Another essential component in NWRC construction, and one which is crucial for research scientists in the development of alternative control methods is the Animal Research Building (ARB) support wing. In addition, the completion of the full complement of animal holding and testing rooms in the ARB, and associated design and bid documents for this and for a pump house, irrigation piping, landscaping/visual barriers, fencing, etc., remain to be constructed.

Additionally, a one-time investment is required for equipment and technology for the NWRC to fully utilize the new research facilities. This will allow the Center to maintain its research capabilities in terms of modern technologies, such as analytical instrumentation, computing infrastructure, information transfer capability, etc.

Question. When do you propose to have it completed?

Answer. Until funding sources are identified and secured for the remaining \$22.75 million in unfunded components of the NWRC Master Plan, a completion date for the Center cannot be projected.

Question. Why have you not requested funds to complete the facility?

Answer. Although APHIS understands the importance in completing the NWRC, because of budgetary constraints, funding for NWRC construction could not be included in the fiscal year 1999 request.

50/50 COST SHARING

Question. Mr. Dunn, I have noticed that you have once again proposed a 50/50 cost share arrangement for Wildlife Services, the same proposal rejected by Congress last year. Do you have more recent Federal/cooperative data available, and if so what is the disparity amount by State based on this data?

Answer. The following chart shows disparity amounts by state, based on the same formula used in developing the fiscal year 1999 budget proposal, but is based on fiscal year 1997 rather than fiscal year 1996 data. The formula used for determining disparity amounts involves totaling both Federal and cooperative funding, and then determining the amount below 50 percent of the total, which is then the disparity amount.

[The information follows:]

State	Fiscal year 1997—		Total program	Disparity
	Appropriation	Cooperator		
Arkansas	\$18,890	\$18,890	\$9,445
Colorado	534,997	\$236,519	771,516	149,239
Idaho	672,186	488,089	1,160,275	92,048
Iowa	16,325	15,475	31,800	425
Wyoming	701,924	571,845	1,273,769	65,039
Total	1,944,322	1,311,928	3,256,250	316,196

Question. Was this something that the Department came up with or did this possibly come from OMB?

Answer. WS has maintained a policy for several years in which cooperators must provide a minimum of 50 percent of total funding in all new agreements. In addition, WS has and continues, to make every effort to increase cooperative funding in all agreements, old and new. This is evidenced by the dramatic increase in total cooperative contributions, increasing from \$13,957,909 in fiscal year 1990, to \$26,703,790 in fiscal year 1997.

Question. Wildlife Services' operational program is funded from a single line item, and I understand that overall, the program has more cooperative than Federal funding (probably more than any other Federal agency). Why does the Administration insist on micro-managing Wildlife Services down to the state level when cooperative funding objectives are being met nationally?

Answer. A state by State analysis and subsequent cost sharing proposal was initiated not only because of States in which cooperator contributions are minimal or nonexistent, but also because of the States in which cooperative contributions far exceed Federal funding. The cost sharing proposal is made in an effort to encourage cooperators to contribute a fair share of funding toward cooperative program activity in each State. This approach greatly enhances the value of Federal funds invested. By encouraging a minimum 50 percent cooperator contribution level, the Agency can accomplish a more equitable distribution of Federal funds, can accomplish the same level of program activity with less Federal funding, and can consider future needs and new cooperative agreement proposals on a more programmatic and equal basis.

Question. You are seeking to eliminate cost sharing disparity in each state, and you are requesting a reduction in funding because of this, yet at the same time, I understand you are projecting funding shortfalls for activities such as wolf control. Efforts to increase cooperative funding and to reduce Federal costs are commendable, but shouldn't program shortfalls be addressed before requesting reduced funding?

Answer. The purpose in the fiscal year 1999 proposal was to facilitate a more equitable distribution of Federal WS funds among States, and to encourage cooperators to increase contributions for activities such as wolf control.

It is true that there is a projected shortfall of approximately \$70,000 in fiscal year 1998 for wolf management efforts in Montana, Idaho, and Wyoming, and a projected shortfall of about \$235,000 in fiscal year 1999. In Minnesota, wolf control work is currently conducted solely with APHIS funding of about \$250,000 per year with a projected shortage in fiscal year 1998 of about \$30,000, and a projected shortfall in fiscal year 1999, of \$100,000. These figures exclude inevitable wolf damage control costs relating to reintroduction of the Mexican wolf in Arizona, which will result in an additional need of about \$100,000 in fiscal year 1999. Although the Agency must seek alternative means for funding these shortages in the short term, APHIS hopes that current efforts to reduce Federal program costs where possible, may permit shifting some funds to wolf damage control efforts.

Question. Mr. Dunn, the livestock industry in Montana and other western states objected to the reintroduction of wolves. With this 50/50 cost share proposal are you proposing that they now have to share in the cost of controlling the wolves which they did not agree with in the first place?

Answer. The cost sharing proposal would only affect those States which do not currently contribute a minimum of 50 percent of total funding toward cooperative program activities. As Montana is one of those States in which cooperative contributions totaling \$816,258, far exceed Federal contributions of \$562,055, the State would not be affected by this proposal.

Question. Are there any exceptions to the cost share arrangement as it is now proposed?

Answer. The cost sharing proposal would be applied to all States equally, without exception. To do otherwise, would defeat one of the proposal's goals of eliminating inequities in the State by State distribution of Federal funds as much as possible.

WOLF CONTROL

Question. I understand that Wildlife Services is responding to an increasing number of requests for wolf control assistance in the Rocky Mountains and in Minnesota. How much of this increase is due to Fish and Wildlife Service wolf reintroduction efforts?

Answer. APHIS responded to 76 requests for assistance due to suspected wolf predation in Idaho, Montana, and Wyoming, in fiscal year 1997. Approximately two thirds of these were due to reintroduced wolves. Minnesota has no wolf reintroduction, but is experiencing a great increase in the natural wolf population.

Gray wolves began naturally moving back into northwestern Montana from Canada in the mid-1980s. This naturally occurring population of wolves is increasing and now occupies northern Idaho as well as northwestern Montana and consists of about 70 adults and yearlings and possibly 30 pups. To speed wolf recovery in the region, the U.S. Fish and Wildlife Service (FWS) captured 29 wolves in Canada in 1995, and 37 wolves in 1996 with the assistance of WS personnel. These animals were released into Yellowstone National Park and central Idaho and are increasing in number. Naturally occurring populations from Canada and the reintroduced animals in Idaho and Yellowstone National Park now total estimated 235 adult wolves with an additional 134 pups produced this year.

In August 1974, the eastern gray wolf was classified as an endangered species. At the time, the Minnesota wolf population was estimated at 500 to 1,000 animals and occupied a range of approximately 19,000 square miles. The Minnesota wolf population is increasing at an annual rate of 3 to 5 percent and expanding its range considerably. By 1996, the population had reached an estimated 2,200 to 2,300 wolves which had expanded their range to more than 39,000 square miles. APHIS verified 195 incidents of wolf predation on domestic animals in Minnesota in fiscal year 1997 and captured 226 wolves.

After the wolf was classified as endangered, livestock producers became dependent on the Federal Government for protection from wolf depredations on their livestock in Minnesota. In Idaho, Montana, and Wyoming, wolf recovery and reintroduction have caused restrictions on the use of traditional methods of control where wolves may exist. The endangered status in Minnesota and the restriction on control methods due to reintroduction in Idaho, Montana and Wyoming, in addition to increasing populations of natural and reintroduced animals, have all contributed to great increases in the number of requests for assistance.

Question. How much funding is Fish and Wildlife Services currently providing to APHIS for this work?

Answer. In fiscal year 1997, the FWS and APHIS each agreed to contribute \$100,000 to provide assistance at current wolf population levels, in dealing with wolf predation on livestock in Idaho and Montana. In Minnesota, wolf control work is accomplished solely with APHIS funding.

Question. What are these efforts costing APHIS in fiscal year 98 and projected to cost in fiscal year 99, and can you provide the same level of response with an increasing volume of work?

Answer. In addition to the total of \$200,000 provided under cooperative agreement equally from APHIS and FWS, there is a projected shortfall of approximately \$70,000 in fiscal year 1998 for wolf management efforts in Montana, Idaho, and Wyoming. APHIS is projecting costs in these States to total \$435,000 in fiscal year 1999, creating a shortfall of about \$235,000. Also, reintroduction of the Mexican wolf in Arizona, initiated in January of this year, will result in an additional need of about \$100,000 in both fiscal year 1998 and fiscal year 1999. FWS has agreed to provide \$100,000 to deal with initial wolf predation problems in Arizona in fiscal year 1998. In Minnesota, where wolf control work is conducted solely with APHIS funding of about \$250,000 per year, a \$30,000 shortage is expected in fiscal year 1998, and total costs in this State are expected to be \$380,000 in fiscal year 1999. In addition, wolf expansion into Wisconsin is projected to cost approximately

\$10,000 in fiscal year 1999. APHIS will have to adjust response levels to match available funding.

INTRODUCTION OF EXOTIC PLANT AND ANIMAL DISEASE

Question. A national news broadcast last week portrayed the risk of deadly disease originating in livestock all around the world, sometimes in a matter of days or hours. In some cases, such as the Hong Kong Chicken Flu, these diseases can be transmitted to humans.

What steps has the agency taken to provide a proper defense against unintentional or intentional introduction of exotic plant and animal diseases into this country?

Answer. APHIS delivers a number of programs that protect the health of U.S. plant and animal resources, such as preclearance inspection, permit regulations, port of entry inspection, quarantine treatment, detection survey, and pest and disease eradication. However, dramatic increases in international travel and trade, and containerization of cargo make total reliance on traditional inspection techniques and procedures impractical. Therefore, APHIS is developing a comprehensive safeguarding system to augment these activities and improve our pest and disease exclusion efforts.

The cornerstone of the safeguarding model is traditional point-of-entry inspection, but the model expands the use of foreign source intervention, increased point-of-entry inspection, smuggling intervention, exotic plant pest detection, and management of exotic pest incursions. A strong scientific base is fundamental to all parts of the system. The safeguarding model is still under development.

BOLL WEEVIL/BRUCELLOSIS ERADICATION

Question. The boll weevil eradication program has been successfully completed in some states and producers there are enjoying lower production costs, higher land values, and other benefits. Other states, such as Arkansas, are just now beginning the eradication process (pursuant to a timetable earlier agreed upon by the cotton industry) but are being told the budget is being reduced by \$12 million.

Does the Agency feel it would not harm the entire program to stop the eradication effort before it is complete?

While the FSA boll weevil loan program allows the program to accelerate, is the intention of the agency to now phase out the grant program in lieu of the loan program? If so, does that not give an unfair advantage to those regions of the country where eradication was complete before this shift in policy?

Would it not be better for all producers, the environment, and your agency mission to proceed with the eradication program as quickly as scientifically appropriate?

Answer. We believe that areas where the boll weevil no longer exists—Virginia, North Carolina, South Carolina, Georgia, Florida, California, Arizona, most of Alabama, middle Tennessee, and northwestern Mexico—as well as current active zones would suffer if the eradication program were to stop expanding and moving toward completion.

Since boll weevil eradication has proven to be successful and profitable for cotton growers, program beneficiaries will assume a greater financial responsibility for program costs. Additionally, growers had expressed a desire to have primary control over the daily operations of their program.

Earlier program areas assumed a greater degree of risk in joining the eradication effort since the efficacy of the technology was still unproven. Now that the boll weevil has been effectively eradicated from over 4 million acres, the technology is generally accepted and the risks to growers has been dramatically reduced. It is reasonable that the early "pioneers" of eradication received more significant assistance. In an effort to mitigate the impact of reduced Federal grants to the boll weevil eradication foundations, the USDA provides a loan program with very favorable terms to supplement funds raised through grower assessments and eases cash flow problems. In fact, the FSA loan program makes more total funds available for boll weevil program expansion than have been available under the traditional appropriations and grants approach. Because of the tremendous benefits cotton growers can gain from boll weevil eradication, we believe that they will choose to take advantage of the loan program. It provides a reasonable alternative that is cost beneficial.

It would be very beneficial for the entire cotton industry and the environment if the eradication program moved quickly to completion since unnecessary delays usually result in higher program costs and additional program constraints.

IMPORTED FIRE ANT

Question. The imported fire ant continues to be a growing problem all across the South affecting property, health, and safety. The budget proposal again zeros out the appropriation for the fire ant stating, in part, that since there is no real control, there is little you can do. However, you also state that the fire ant program at the University of Arkansas at Monticello along with the University of Florida has been working on the introduction of a natural enemy of the fire ant that might be a successful control tool. Would you provide an update on the University of Arkansas at Monticello program?

Answer. APHIS has a cooperative agreement with the University of Arkansas at Monticello to conduct research on imported fire ants. The three areas funded by this agreement are a self-supporting community abatement program, an economic impact assessment, and an Agricultural Research Service (ARS) biological control project.

The abatement program uses several public information tools to help area residents better manage fire ants using existing control methods. The economic assessment has concluded that pesticides alone will not provide a long-term solution to the problem and that the focus for IFA control should turn to non-pesticide strategies, such as biological controls. In the biological control project, ARS has identified three organisms for potential impact on the imported fire ant (IFA). These organisms include a microsporidium disease (*Thelohania*), a species complex of phorid flies (Phoridae), and a social parasitic ant (*Solenopsis dagarrî*). Currently, ARS scientists are studying several colonies of these agents at their quarantine facility in Gainesville, Florida. These studies, which will likely continue until 2001, are aimed at introducing these organisms into the U.S. from South America. Once they are introduced, APHIS would mass produce and distribute the biological control agents. We began field release of one Phoridae in fiscal year 1997 and will begin field release of the parasitic ant by the Fall of 1999. None of the identified organisms by themselves would be enough to eradicate IFA from the United States because the pest is so widespread. We hope, however, that some combination of these methods will eventually enable native ants to compete effectively with the IFA to reduce economic losses and public health risks associated with IFA.

Question. What efforts are you making to ensure that the ant does not further spread by interstate movement of nursery plants or other hosts of the ant?

Answer. We are working to prevent further spread of the imported fire ant (IFA) by enforcing the Federal quarantine and cooperating with infested States to regulate articles like nursery stock and soil moving equipment. Also, we will continue evaluating the efficacy of regulatory treatments for preventing further spread of the IFA and revise our regulations and procedures as necessary. Even if the IFA line item were eliminated, the States could maintain a strong regulatory program with the Federal quarantine guidelines and industry cooperation. In addition, States have, in many cases, proven themselves able to eradicate small isolated infestations outside the regulated area.

EL NIÑO AND OTHER WEATHER PHENOMENA

Question. The El Niño and similar events are credited with erratic weather patterns this year. Notably, the Mid-Atlantic region has had a very mild winter that suggests there may have been little winter-kill of insect pests. The storms in the Dakotas last year were predicted to cause an increase in grasshopper problems. It appears shifting weather patterns all across the nation are likely to have some affect on insect and other life.

Has APHIS made or is APHIS aware of any forecasts of unusual insect or pest problems this year resulting from erratic weather or other conditions?

Answer. We expect higher than normal boll weevil numbers in all weevil-infested areas this spring due to the unusually mild winter experienced across much of the Cotton Belt. In addition, we expect to lose some ground in the leafy spurge program since the mild winter eliminated the insulating effect of snow causing an increase in the mortality of flea beetles. The Agency anticipates high grasshopper populations this summer if, as in the past, a drought follows the end of the El Niño weather pattern.

WILDLIFE SERVICES AND FISH EATING BIRDS

Question. For years, the growing aquaculture industry in the Mid South has been plagued by fish-eating birds, most notably, the Double Crested Cormorant. I understand agreements have recently been reached with the U.S. Fish and Wildlife Serv-

ice which has issued a depredation order to reduce the economic losses to this industry?

Answer. A double-crested cormorant depredation order was published in the Federal Register on March 4, 1998. This allows aquaculture producers to take action against cormorants without applying for individual permits from the U.S. Fish and Wildlife Service (FWS).

Question. What effect will this order have on your program?

Answer. With the publication of this order, APHIS has begun assisting producers in implementing the certification and reporting criteria required by the FWS in the depredation order. The depredation order requires APHIS to "certify" that an aquaculture facility has a cormorant depredation problem and has implemented non-lethal actions to reduce cormorant impacts before the producer can take depredating cormorants by lethal means. The order also requires producers to keep a record of numbers taken so that the FWS can assess the impact of these "takes" and evaluate the success of the depredation order. APHIS is currently developing policies to assist producers in implementing consistent certification and reporting procedures. With the elimination of the Federal permit requirement, the number of producers requesting technical assistance from APHIS for the control of cormorants is expected to increase.

Question. Please provide an update on your activities to control fish-eating birds.

Answer. Assistance is provided nationwide, with intense efforts concentrated in Alabama, Florida, and Mississippi, where three wildlife biologists are stationed. Wildlife biologists conduct onsite evaluations to assess damage and identify the species of bird or mammal causing the damage, and make control equipment available to producers. If exclusionary and scaring techniques fail to reduce losses, producers may now take a limited number of birds by lethal means, as a result of a cormorant depredation order recently issued by the U.S. Fish and Wildlife Services (FWS). In addition, APHIS' field research station in Starkville, Mississippi conducts research and field studies to improve current control methods, and to develop new ones.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR COCHRAN

PACKERS AND STOCKYARDS OFFICE RESTRUCTURING

Question. The fiscal year 1999 budget requests a one-time increase of \$3 million to enable the Packers and Stockyards to reorganize its National and regional offices in response to an Office of Inspector General report recommending an office restructuring to improve the Agency's ability to monitor and investigate anticompetitive practices.

Can this office restructuring be completed in fiscal year 1999? When do you plan to begin the consolidations of offices if the requested funding is provided?

Answer. If funding is provided, GIPSA plans to complete its restructuring during fiscal year 1999. The Agency is currently moving forward with restructuring its headquarters operations by consolidating two operating divisions and six branches into one division and three branches. The requested funding will be used to consolidate Packers and Stockyards' 11 field offices into 3 regional offices located in Denver, Colorado; Des Moines, Iowa; and Atlanta, Georgia, to provide significantly larger staffs located in regions with concentrations of beef, pork, and poultry. In order to assure that basic services are maintained across the Nation, the reorganization plan also includes resident agents who will work out of their homes or one of three suboffices located in Sacramento, California; Fort Worth, Texas; and Lancaster, Pennsylvania. This restructuring is vital to meeting the Department's responsibility, and industry's concerns, relating to competitive behavior in the livestock, meat and poultry industries.

Question. What savings will be realized as a result of this plan to consolidate and maintain fewer office?

Answer. The purpose of the restructuring plan is to strengthen Packers and Stockyards' ability to investigate anticompetitive practices while providing greater flexibility and efficiency in the Agency's operations by creating larger staffs with a broader mix of investigative skills. Except for the one time cost, consolidating the offices is not expected to result in either an increase or decrease in cost. However, the budget request does include additional resources to address concerns about competition in livestock procurement and poultry contract growing arrangements.

Question. Will this reorganization result in a staffing reduction as well?

Answer. The reorganization will not result in a staff reduction, however, it will substantially increase GIPSA's capacity to assemble investigative teams possessing the appropriate mix of economic, legal, and industry expertise required to conduct complex investigations in a timely manner.

PROPOSED NEW USER FEES

Question. The fiscal year 1999 appropriations request assumes a net reduction of \$17.3 million resulting from proposed new user fees: \$2.819 million from new methods development fees, \$3.598 million in new fees for standardization activities; and a net reduction of \$10.859 million in Packers and Stockyards license fees and a dealer trust. Please describe the proposed new user fees assumed in the President's fiscal year 1999 budget.

Answer. The proposed new user fees are consistent with the overall effort to balance the budget and with the Administration's efforts to shift funding for programs which benefit identifiable groups.

GIPSA develops, reviews, and maintains official U.S. grain standards that describe the grain characteristics in terms of physical, sanitary, and intrinsic value at the time of inspection. GIPSA also conducts applied research or tests that produce new or improved techniques for measuring grain quality. Because these standards and methods directly benefit and are used almost solely by the grain trading industry, and because they facilitate the orderly marketing of grain products, we believe that it is industry, rather than the general public, that should bear the costs.

As for the Packers and Stockyards license fees, this proposal would impose a license fee on an estimated 23,000 subject firms to fund the cost of administering the Packers and Stockyards Act (Act). The principal purpose of the Act is to assure the integrity of the livestock, meat, and poultry markets for the benefit of producers. This includes fostering fair and open competition, guarding against deceptive and fraudulent practices and providing financial protection for livestock and live poultry sellers and contract poultry growers.

The dealer trust proposal would amend the Act to create a dealer trust and require livestock inventories and accounts receivable due from the sale of livestock to be held in trust for unpaid cash sellers when a dealer fails to pay for livestock. Dealer failures represent a significant amount of unrecovered losses in the livestock marketing chain. A dealer trust would minimize the losses suffered by producers because of dealers failing to pay.

Question. Is new legislative authority required for all new user fees proposed assumed in the budget? Has the Administration submitted its legislative proposals for these fees to the Congress for consideration?

Answer. Yes, new legislative authority is required for all of these proposed user fees. The GIPSA legislative proposals will be sent to Congress as part of a total USDA legislative proposal package in the near future.

Question. Most of these user fee proposals have been proposed by the President in previous-year budgets but have not been acted upon by the Congress. Is there any indication that these fee proposals will have greater success in gaining the approval of the Congress and being enacted into law this year?

Answer. No. We have had no prior indications of Congress' intent regarding the user fee proposals.

Question. What impact will approval of the President's appropriations request for the agency have if the proposed user fees are not adopted?

Answer. Approval of the President's appropriations request will significantly impact the Agency's standardization and methods development activities, as well as its Packers and Stockyards program.

AGRICULTURAL CONCENTRATION

Question. The President's fiscal year 1999 budget requested increased resources to continue to implement the recommendations of the Secretary's Advisory Committee on Agricultural Concentration. The fiscal year 1999 budget requests an additional \$505,000 for the Agricultural Marketing Service (AMS) to expand reporting of livestock and poultry markets. For the Grain Inspection, Packers and Stockyards Administration, an additional \$795,000 and 15 staff years is requested for packer competition and industry structure investigations and analyses, and an additional \$750,000 and 10 staff years is requested for poultry compliance investigations.

Please address the need for the additional resources requested for fiscal year 1999 to address livestock and poultry competition and industry structure.

Answer. The additional funds and personnel are needed for GIPSA to more aggressively pursue anticompetitive practices related to industry concentration. We have increased the breadth and depth of anticompetitive practice investigations dur-

ing the past 3 years. Due to our limited staff resources, however, the added focus on anticompetitive practice investigations has come at the direct expense of programs designed to protect individual producers from unfair practices and provide financial protection.

The additional funds will be used to recruit and integrate five additional economists, three lawyers, and two computer programmers into investigative units that will conduct investigations involving anticompetitive practices. Such expertise will allow for more effective monitoring and enforcement of potential anticompetitive practices in the increasingly concentrated meat packing industry while also ensuring that fair and competitive practices continue to grow and develop as the industry progresses. The funds will be used in fiscal year 1999 to continue conducting major investigations of potential anticompetitive practices and detailed analyses in the slaughter steer and heifer, slaughter hog, slaughter cow, and slaughter lamb industries. Detailed evidence will be developed if, and where incidences of anticompetitive practices are disclosed. Additional personnel with economic, statistical, and legal expertise will be critical to completing the necessary analyses that are essential for a full and complete investigation.

The additional \$750,000 requested for poultry compliance is necessary for GIPSA to perform the in-depth compliance investigations necessary to ascertain if the firms are engaging in activities that may be unfair or unjustly discriminatory to the growers. These additional funds would permit GIPSA to be proactive in initiating and expanding the scope of our compliance investigations, and at the same time continue to timely investigate the large number of complaints being received from poultry growers. The funds will be used to place additional investigators in the field to conduct industry-wide investigations and address specific grower complaints on a more timely and thorough basis. This will enable us to examine the effect of practices that impact grower performance and pay on a broader scale.

Question. What progress has been made to date in implementing the recommendations of the Secretary's Advisory Committee on Agricultural Concentration with the increased resources that have been provided for this purpose?

Answer. USDA has taken several steps to implement the recommendations of the Secretary's Advisory Committee on Agricultural Concentration. USDA reviewed surveillance, investigation, and enforcement practices under the Packers and Stockyards Act and developed a restructuring plan to increase flexibility and efficiency in enforcing the trade practice and payment protection provisions of the Packers and Stockyards Act, and strengthened enforcement against anticompetitive practices.

GIPSA is currently recruiting and integrating economists into investigative units that will conduct investigations involving anticompetitive practices. Major investigations of fed steer and heifer procurement in the Texas Panhandle, slaughter hog procurement in the central United States, and slaughter lamb procurement in the western United States are currently under way. The investigations will examine statistical relationships between livestock prices and various formula and other contract purchase arrangements.

USDA has taken several actions to improve the market and price discovery information available to the livestock industry.

- Producer pork reporting—USDA is expanding the Missouri pork producer price reporting pilot project. Officials from USDA have met with the National Pork Producers Council to explore expanding Missouri hog price reporting to three additional States—Illinois, Iowa and Wisconsin.
- Expanded boxed beef reporting—Beginning September 1996, USDA extended its coverage of boxed beef sale commitments to cover the upcoming 15 business days, rather than the previous 10 business days. Approximately 45 percent of volume traded is now reported, compared with 30–40 percent previously reported.
- Value-based reporting—In October 1996, USDA initiated a weekly report of premiums and discounts being offered for cattle in the upcoming week by meat packers. All major packers are participating and feedlots can verify information through the report.
- Livestock produced or traded under contract—Beginning with the December 1996, Hogs and Pigs Report, USDA is reporting the number of hogs produced under contract by large hog producing operations. Starting in October 1996, USDA also began issuing a weekly report indicating the number of cattle being produced under contract for delivery in future months. For those contracts calling for settlement relative to a futures market price, the basis difference from a futures market contract is also reported.
- Regional beef quality and yield report—In February 1997, USDA initiated a report of beef grading results on a regional basis, for four regions of the country,

that will provide better geographic detail than contained in the current national report.

USDA will examine the relationship between prices reported to AMS and prices that GIPSA obtains during its investigations of competitive issues to evaluate whether USDA's publicly reported Market News prices accurately reflect packer procurement transactions.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. There is a direct correlation between the agency's mission, strategic goals, performance goals, and budget activities. Each of the agency's budget activities—the Packers and Stockyards program and the Grain Inspection program—is directly linked to a strategic goal and supporting performance measures. The Packers and Stockyards program is represented in Goal 1 of the Agency's strategic plan, and the Grain Inspection program is represented in Goal 2. Both goals support the Agency's mission and have supporting performance measures.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. We developed our strategic plan around our core business practices which parallel our existing budget activities. The end result is that there is a one-to-one correlation between budget activities and strategic goals and supporting performance goals.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, each budget account is aligned with a strategic goal and supporting performance measures. Several performance measures are still under development as we strive to efficiently and effectively measure outcomes.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. There are no differences.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. The Agency is evaluating the benefits of consolidating two budget activities, Standardization and Methods Development.

Question. How were performance measures chosen?

Answer. The Agency focused on measurements requested by our customers—cost efficiency, timeliness of service, and accuracy of results. To date, the Agency has developed measures of timeliness (e.g., percentage of violations corrected within one year of investigation's starting date) and cost efficiency (e.g., cost of the official grain inspection and weighing service per metric ton using constant 1992 dollars indexed on the Gross Domestic Product). The Agency will develop measurements of accuracy to coincide with the beginning of the fiscal year 2000 budgeting cycle.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. For some of the Agency's performance measures, such as cost per metric ton, the data was already available and resulted in no extra cost to the Agency. In other instances, the agency is still struggling with developing meaningful outcome measures and identifying the necessary data sources.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No, at this time, the Agency does not anticipate having performance measures for which reliable data are not available in time for the first performance report.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. Each of the Agency's five performance goals align with the Agency's five budget line items and, as a result, it would be difficult to assign greater importance to any one goal. As given in the fiscal year 1999 Annual Performance Plan, the Agency's five performance goals and affiliated budget line items are: (1) Monitor, investigate, and analyze the livestock, meat and poultry industries; identify and correct unfair, deceptive, or discriminatory trade practices; and provide financial protections to livestock and poultry producers, all with the intent of ensuring a fair, open, and competitive marketing environment for livestock, meat, and poultry

(Packers and Stockyards); (2) Increase the efficiency of U.S. grain marketing by harnessing technology to streamline grain inspection and weighing processes and providing objective measures of grain quality, quantity, and end-use value (Methods Development); (3) Enhance the uniformity of grain quantity and quality measurements to promote a more standardized framework for trade in the U.S. grain marketing system (Standardization); (4) Provide all segments of American agriculture with cost-effective and responsive official inspection and weighing services (Inspection and Weighing); and (5) Protect the integrity of U.S. grain marketing by regulating grain weighing and handling practices, and regulating the providers of official grain inspection and weighing services (Compliance).

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The Agency worked with its customers and employees to determine program expectations and then developed measurements to best determine whether those expectations are met. GIPSA anticipates refining some of its current performance goals and measures prior to the fiscal year 2000 budgeting cycle.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Although managers understand the difference, the Agency, at large, is still having difficulty in identifying meaningful outcome measures. For example, standardization of grain quality and quantity measurement improves market efficiency. Likewise, the use of grades and standards improves market efficiency if the grades and standards communicate the quality characteristics relevant to the market. GIPSA directly controls the standardization of the official inspection system and influences the standardization of the commercial market. Measuring the use of grades and standards by the commercial market is impractical, since nearly all those buying or selling grain use the grades and standards to one degree or another. As a result, GIPSA is attempting to develop surrogate measures that track the efficiency of the official inspection system and the adequacy of grades and standards.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers?

Answer. In late 1996, GIPSA conducted a mail-out survey of external customers of the official inspection and weighing system. Results from the survey have allowed the official system to quantitatively assess customer satisfaction in terms of the factors that have been identified by customers as being critical to the official system's success: timeliness, accuracy and consistency, cost-effectiveness, responsiveness, and professionalism. Results from the survey will also serve as benchmarks against which further progress will be measured. The Agency plans to conduct another customer survey in fiscal year 1999.

In 1994 and 1997, GIPSA also conducted surveys of employees of the grain program. The Agency's managers and employees have used, and will continue to use, the survey results to identify the Agency's strengths and weaknesses and to take actions to improve both.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. We aligned the Agency's strategic goals and supporting performance goals and measures with the Agency's two budget accounts, the Packers and Stockyards program and the Grain Inspection program.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. While not directly apparent, it is possible that a shift in funding sources for the Grain Inspection program would affect the cost of the official grain inspection and weighing service per metric ton.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes. With the exception of one measure, GIPSA will rely on internal agency procedures to track performance. More specifically, the Agency will rely upon existing systems, such as the agency's quality assurance/quality control and information management collection systems, to measure and report on program performance. By the start of the fiscal year 2000 budgeting cycle, GIPSA will have the capability of regularly assessing program progress.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

—Have you faced such difficulty?

Answer. Since GIPSA's program activities set forth in the budget and the Agency's strategic and performance goals are aligned, the Agency has not encountered such difficulty.

—Would the linkages be clearer if your budget account structure were modified?

Answer. No, the linkages are currently clear.

—If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. The Agency does not consider modification to be necessary at this time.

—How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. The Agency does not consider modification to be necessary at this time.

Question. Does your fiscal year 1999 Performance Plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The Agency's strategic plan, rather than its performance plan, identifies key external factors that could influence goal achievement.

—If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. GIPSA must effectively respond to the fluid and dynamic business environments in which the grain and livestock industries operate. Like many segments of American agriculture, these industries are experiencing rapid changes such as mergers, acquisitions, vertical integration, and increasingly automated operations. The changes are shaping how GIPSA operates. For example, GIPSA has developed a field office consolidation plan which will allow more resources to be located in regions where beef, pork, and poultry production and processing are concentrated. Furthermore, the field offices will be strengthened with additional expertise in economic, statistical, and legal issues to more effectively conduct investigations of alleged anticompetitive practices and financial and trade practice violations.

—What impact might external factors have on your resource estimates?

Answer. Changing external factors may require the Agency's Packers and Stockyards program to shift from one area of focus to another. In the grain arena, increases or decreases in U.S. grain exports may affect the cost per metric ton of the grain inspection and weighing service.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. GIPSA has not identified any overlapping functions or program duplication. GIPSA does, however, coordinate its program activities with a number of government entities. Within USDA, GIPSA works with the Animal and Plant Health Inspection Service and the Agricultural Marketing Service on marketing issues; the Foreign Agricultural Service on international trade issues and programs; the Agricultural Research Service and the Economic Research Service for research support; and the Office of the Inspector General on investigative matters. Further, GIPSA cooperates with various non-USDA entities, including the Food and Drug Administration on food safety issues; the Environmental Protection Agency on pesticide residue programs; and the Department of Justice and the Commodity Futures Trading Commission on investigative matters. GIPSA's strategic plan, rather than its performance plan, addresses the coordination of efforts.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

—To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Given that the Agency's current performance goals and measures are relatively immature, the Agency is in the process of reviewing and refining its current goals and measures and developing some new measures in time for the beginning of the fiscal year 2000 budgeting cycle.

—Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The Agency has not encountered any such factors at this time.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issues on September 30, 1997?

Answer. GIPSA does not foresee any need for substantive revisions in the Agency's strategic plan at this time.

QUESTIONS SUBMITTED BY SENATOR BURNS

PRICE REPORTING

Question. What does the Department plan in terms of price reporting action?

Answer. The Department plans to implement or enhance the following:

(a) Increased reporting on the terms of contract sales, or captive supply transactions. While AMS has been able to report captive supply volumes, reporting of contract terms and transactions has been more difficult. This information will assist the industry as they move toward a value based marketing system.

(b) Expanded reporting that includes value-based pricing indicators. A matrix report for value based marketing has been requested by the cattle industry. The report will provide the economic indicators to help guide producers in supplying products to meet consumer demands.

(c) Reporting share of slaughter by grade and yield. This report will provide industry with the consist and distribution of cattle that provides a barometer of available supplies that meet certain criteria for the trade.

(d) Reporting daily live cattle and hog crossings from Canada and Mexico. These reports provide the industry with information on volume and prices of animals being exported and imported at U.S. borders. Knowledge of movements and price levels provide industry a more level trading platform to assess their marketing plans.

(e) Increasing the reported volumes of forward sales of boxed beef. Increased volumes and broader coverage of prices provide market information that is important to the industry in negotiating forward sales of products and enhances competition.

(f) reporting packer premiums and discounts for beef carcass value differences. Information on packer premiums and discounts will assist industry in improving their products to meet stated premiums and therefore move more efficiently to meet consumer demands.

(g) Expanding producer reported hog marketing information. This will provide vital cross checks in the marketing of hogs. The recent changes that have occurred in the marketing of hogs, primarily of marketing on a carcass value-based concept, has necessitated the need for more producer input of data relative to marketing specifics.

(h) Reporting regional and national marketing of the direct feeder pig trade. There currently is no market report in place to assist producers in determining the fair market value of segregated early weaned and other weaned pigs. These reports will assist in this area.

Question. What options does the Department have to implement some sort of mandatory price reporting system for fat cattle?

Answer. Options include:

Continue with voluntary reporting of market information.

Pros:

- (1) Most economical for the government and industry.
- (2) Analysis and reporting volumes are sufficient to adequately establish trading levels and assist in the price discovery process.
- (3) Information collected and reported does not divulge proprietary information.
- (4) Places a minimum amount of burden on the industry.
- (5) Contacts who currently provide information play large or significant roles in the market. Collection from a large number of small participants may have little or no effect on the price discovery process.

Cons:

- (1) As the industry becomes more concentrated it is more difficult to obtain voluntary information.
- (2) Some commodity products have very limited open market sales and if these sales are not obtained, the price discovery process hindered.
- (3) There is the appearance of hidden sales.

Mandatory reporting of transactions only when asked by a reporter.

Pros:

- (1) Would provide industry with a large amount of sales transaction marketing data.
- (2) Remove the appearance of hidden sales information.
- (3) Would limit the financial and personnel requirements that would be required under 100 percent reporting.

Cons:

- (1) Promote the absence of available industry contacts to avoid reporting.
- (2) Place a large financial burden on the government.

(3) Monitoring and enforcing mandatory reporting would require additional government financial and personnel resources.

(4) Industry members may be unwilling to cooperate with private and industry information systems if reporting to the government is mandated.

(5) Divulging information that could be used by a domestic or international competitor could be detrimental to the industry.

Question. Is the voluntary price reporting system working?

Answer. Yes, the system is working, however due diligence must be practiced. Market reporters develop reliable contacts to discuss market conditions and obtain information about sales or purchases. Voluntary participants are more likely to provide information of a confidential nature that affect market conditions to aid reporters in their market analysis. Voluntary collection of information is the most economical for the government and places a minimum amount of burden on the industry.

Question. What is USDA doing to insure that there is a competitive environment in the live cattle market?

Answer. GIPSA will restructure its Packers and Stockyards Programs (P&S) to strengthen enforcement against alleged anticompetitive practices and provide greater flexibility and efficiency in enforcing the trade practice and payment protection provisions of the P&S Act. GIPSA will restructure the headquarters offices of P&S, consolidate field offices, and add staff with economic, statistical and legal expertise to work on investigations of anticompetitive practices. P&S' Denver, Colorado, regional field office will handle all major competition and industry issues in the United States relating to cattle and sheep, as well as all trade practice and financial protection issues in its region. The Denver office will continue to conduct investigations of anticompetitive behavior in the cattle industry following reorganization.

GIPSA is conducting a broad investigation of fed steer and heifer procurement in the Texas Panhandle. Preliminary descriptive and graphical analysis have been completed and portions reported to the industry. Purchase and slaughter patterns have been examined to identify potential occurrences of aberrant or unusual procurement practices. Assessment has begun of whether the Department's publicly reported Market News prices accurately reflect packer procurement transactions. Econometric and statistical analysis of the data is underway to identify relationships between spot market prices and nonspot purchases, and to reveal relationships that may not be otherwise apparent. Portions of the econometric analysis will be conducted under cooperative agreement with researchers at Iowa State University and the University of Nebraska. The completion date depends on the results of the econometric and statistical analysis.

SUBCOMMITTEE RECESS

Senator BUMPERS. We will stand in recess subject to the call of the chair. Thank you very much.

[Whereupon, at 12:18 p.m., Tuesday, March 17, the subcommittee was recessed, to reconvene at 10:06 a.m., Tuesday, March 24.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

TUESDAY, MARCH 24, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:06 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Burns, Bumpers, Kohl, and Leahy.

DEPARTMENT OF AGRICULTURE

**STATEMENT OF AUGUST SCHUMACHER, JR., UNDER SECRETARY,
FARM AND FOREIGN AGRICULTURAL SERVICES
ACCOMPANIED BY DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF
BUDGET AND PROGRAM ANALYSIS**

STATEMENT OF LON HATAMIYA, ADMINISTRATOR

RISK MANAGEMENT AGENCY

STATEMENT OF KENNETH D. ACKERMAN, ADMINISTRATOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

Today our subcommittee continues its hearings reviewing the President's budget request for the next fiscal year for the Department of Agriculture and related agencies. This morning we are specifically considering the budget request for programs and activities of the Department's Farm and Foreign Agricultural Services agencies. Our witnesses this morning include a panel led by the Under Secretary for Farm and Foreign Agricultural Services, Mr. August Schumacher, Jr.

Mr. Secretary, we appreciate your attendance and that of the others who are with you this morning. We invite you to introduce

them and proceed with your statement and any other statements by the panel that you think would be helpful to the subcommittee. We have copies of the prepared testimony, which we will print in the record in full. We are interested in hearing what your proposal is for appropriations for these activities, and thank you for being here today.

I am going to yield now for any comments or opening statements from other members of the subcommittee. Senator Bumpers.

STATEMENT OF SENATOR BUMPERS

Senator BUMPERS. Mr. Chairman, today's panel is going to be the last panel we will hear from regarding the President's budget. I would just like to make a few comments, and I will insert my formal opening statement for the record.

During my tenure in the Senate, I have seen many changes in farm programs and the relationship of the Department to the farming community. I have seen agricultural production go from huge surpluses to shrinking supplies. I have seen farm prices soar and I have seen them collapse. I have seen crops prosper and I have seen untold natural disasters that have destroyed countless acres of farmland and farmers' livelihoods along with them.

Two years ago, Congress enacted, without my support, legislation that dramatically changed the relationship of farmers and the Federal Government. Prices were good then, better than they are now. The phaseout of farm programs seemed a distant problem, especially when sweetened with additional cash from Uncle Sam.

We are already beginning to hear the faint cries of hard times ahead. Legislation is being discussed to extend crop loan periods and other farm safety net mechanisms seen only as an amendment away. I do not hold out false promises. We fought the hard fight and my side lost.

Still, in all my years of public service, one thing always rings true: The Government, Congress especially, will never forget its farmers. Not only has the Department changed its relationship with farmers, it has changed its relationship with itself. The USDA of 5 years ago is not the USDA of today. Names have changed, but changes have gone beyond the purely cosmetic.

The Farm Service Agency now exists where two agencies were before, ASCS and the Farmers Home Administration. To further complicate matters, the new agency houses more than two former agency missions. It houses two separate classes of USDA employees. The old Farmers Home Administration offices were staffed with regular Federal Civil Service employees, while ASCS offices were staffed with employees hired under a different authority, tied to the county committee system, and were considered non-Federal employees. Still, they were and are USDA employees, all with the same commitment to farmers and the delivery of Federal farm programs.

I make this distinction because the two classes of employees are not treated alike. Earlier this year, the Farm Service Agency conducted a RIF of 152 employees. Because of their status as non-Federal employees, the USDA employees from the old ASCS offices were the only ones to lose their jobs, regardless of years of service, experience, or other relevant factors. With all the attention to civil

rights problems at the Department, this inherently unfair situation is one that should not be overlooked.

PREPARED STATEMENT

Mr. Chairman, I will forgo the rest of my statement and ask a couple of questions on the point I just made later. I ask unanimous consent that my full statement be inserted in the record.

Senator COCHRAN. Without objection, it is so ordered. Thank you, Senator.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

Mr. Chairman: It is a pleasure to welcome Secretary Schumacher and the other USDA officials to this morning's hearing. Today's panel will be the last from USDA we will hear regarding the President's budget request for fiscal year 1999. It is somehow appropriate that this final USDA hearing will focus on those agencies which are most closely associated with farmers, in the traditional context, and with expanding export markets, which many believe will be the focus of U.S. agriculture's future.

During my tenure in the United States Senate, I have seen many changes in farm programs and the relationship of USDA to the farming community. I have seen agricultural production go from huge surpluses to shrinking supplies. I have seen farm prices soar and collapse. I have seen crops prosper and I have seen untold natural disasters that have destroyed countless acres of farmland and farmers' livelihoods along with them.

Two years ago, Congress enacted, without my support, legislation that dramatically changed the relationship of farmers and the Federal Government. Prices then were good, better than they are now, and the phaseout of farm programs seemed a distant problem, especially when sweetened with additional cash from Uncle Sam. We are already beginning to hear the faint cries of hard times ahead. Legislation is being discussed to extend crop loan periods, and other "farm safety net" mechanisms seem only an amendment away. I don't hold out false promise. We fought the hard fight and we lost. Still, in all my years of public service one thing I have learned: the Government, Congress especially, will never forget its farmers.

Not only has USDA changed its relationship with farmers, it has changed its relationship with itself. The USDA of five years ago is not the USDA of today. Names have changed, but changes have gone beyond the purely cosmetic. The Farm Service Agency now exists where two agencies were before, the Agricultural Stabilization and Conservation Service (ASCS) and the Farmers Home Administration (FmHA). To further complicate matters, this new agency houses more than two former agency missions, it houses two separate classes of USDA employees. The old FmHA offices were staffed with regular federal civil service employees while ASCS offices were staffed with employees hired under a different authority tied to the county committee system and were considered non-federal employees. Still, they were, and are, USDA employees all with the same commitment to farmers and the delivery of federal farm programs.

I highlight this distinction because the two classes of employees are not treated alike. Earlier this year, the Farm Service Agency conducted a RIF of 152 employees. Because of their status as "non-federal" employees the USDA employees from the old ASCS offices were the only ones to lose their jobs, regardless of years of service, experience, or other relevant factors. With all the attention to civil rights problems at the Department, this inherently unfair situation is one that should not be overlooked.

Another major change at USDA has been the manner in which federal assistance is administered to help farmers recover from natural disasters. In place of the ad hoc programs of the past is a series of risk management programs designed to cover a wide variety of disaster scenarios. Some of these programs even cover losses in market price. Still, there is much to do to make these programs truly fair. The natural disasters that now have the attention of Congress speak to this point. Some producers, dairy for example, are not covered at all for losses in production. Maple producers are covered for production losses but in a way that doesn't precisely fit the facts of the recent ice storms in the Northeast. Clearly, it is hard to prepare for every contingency, but it should be our goal to treat producers as fairly and consistently as possible. Otherwise, we will be urged to head back down the path of ad

hoc programs that can only escalate to a multitude of changing and contrary programs that we could not easily justify on either policy or budgetary grounds.

Finally, let me mention the role of the American farmer in world markets. When Thomas Jefferson spoke of America as a nation of yeoman farmers, his vision of agricultural markets did not see beyond the demands of a growing and expanding domestic population. In the course of two hundred years, Jefferson's view has been dramatically altered.

Today, financial crisis in Asia will affect thousands of metric tons of U.S. farm production that may find no way to market. Phytosanitary requirements in Europe may close down U.S. poultry plants and cost American jobs. Famine in Africa may compel the U.S. to ship food stores through the Public Law 480 programs, thereby boosting grain prices to farmers in mid-America. More and more, the nations and regions of the world are tied together in ways not imagined even a few short years ago.

I have spoken many times before about my concern for world food security and our ability to keep pace with an ever growing population. American farmers remain the best in the world and our natural resource base can keep them there if we manage it properly. We must keep our access to the markets and the people of the world wide open. Our farmers can produce, but they're never quite sure which markets will be open.

This is the last year I will review the policies and priorities of USDA in an official capacity as a member of the subcommittee. I want to stress in this, my last hearing with USDA agencies, the importance of supporting the American farmer. He is more than the simple romantic notion contained in political speeches. The American farmer is an integral and very important part of our economy. He contributes to our balance of trade. He protects our natural resources which, unlike most of us who see them as recreation, are the basis of his livelihood.

There is also something to that old romantic notion that is more than mere fiction. From the early days of America, philosophies tied to work ethic became the very fabric of this nation and that work ethic was largely based on that of the farmer. The America of today was not built from the foundation of a shopping mall or office complex. Neither the empires of finance nor the network of telecommunications serve as the model for who we are as Americans. If there is any single part of the American family that can remind us all of who we once were, it is the American farmer. The New York bond dealer, the Dallas oilman, and the California computer tycoon may never admit it publicly, but all our roots are on the farm.

STATEMENT OF SENATOR BURNS

Senator COCHRAN. Senator Burns.

Senator BURNS. Thank you very much, Mr. Chairman.

For the first time, I want to welcome Keith Kelly to the table this morning. Keith was raised up in the Red Lodge, MT, country and his father was an outstanding sheepman and they lost him a year ago. They are just fine people. I want to welcome Keith here. We have had a great working relationship for a long time.

I want to sort of associate myself with the words of Senator Bumpers. I think we have changed the direction of the USDA. It seems like we are getting away from the support. Of course, Mr. Kaplan has heard this speech so many times that he is getting sick of it and wants to go out and throw up. But we are changing our emphasis from the grassroots producer.

The more I explore this and we take a look—and we have a crisis on the farm. I do not care how you turn it. We have a crisis and it is an income crisis. A guy says there is nothing wrong on the farm except in the price, what we get at the gate.

The more I am kicking this around, the more I think it is in the area of the transparency in the market. We just do not get reports from our processors and our purveyors as it compares to the prices we receive at the gate, and I think there has to be some way that we get some transparency in the market. And it is just not in our grains. It boils down to the problem with all of the commodities.

Now we have packers that do not want to report what they gave for fat cattle going into their plants, and I think that is wrong because the free market—I will say right now that the auction markets right now are the only ones that are really engaged in price discovery. And I think we have to look at price discovery in order to gain transparency. That is our problem with the Canadian grain situation is transparency in the market. And I go back to the old Wheaties thing again, and I hate to keep beating on that, but if there is transparency in the market, then it seems as though good things happen and money does get filtered back down to the farm.

But we do not know what a crisis is until this next year as far as on the farm because we have got farmers that will not—we cannot produce our commodities for the same price, especially in the grains, as we produced in 1948, 50 years ago, and now that same combine is costing \$180,000, that same tractor is costing over \$100,000. And we are still paying taxes, and we pay the highest taxes. The Government does not choose to pay taxes on their land that they own in our counties to the rate of the private taxpayer.

So, we are in a bind, folks, and I am very much concerned. But I think it boils down to transparency in the market.

PREPARED STATEMENT

I will put the rest of my statement in the record. I got another commitment, Mr. Chairman, and I must leave, but that still concerns me.

Thank you very much.

Senator COCHRAN. Thank you, Senator. Your statement will be printed in the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman.

I appreciate you calling this hearing this morning. As we look at the budget for the Department of Agriculture I see this as one of the more important hearings on the calendar. I believe that both of these agencies have a great impact on the farmer on the ground in Montana as well as the rest of the nation.

I would like to welcome Mr. Keith Kelly to this hearing. Mr. Kelly and I go back a ways in Montana agriculture. While I was broadcasting agriculture radio shows, Keith was the Director of Agriculture for the state of Montana. Keith is a good Montana native and we are pleased to see him in his position today.

As with most of the agencies which we have seen come before this committee, I am again concerned with the way that these agencies are budgeting for the coming fiscal year. I have to admit that I am again concerned with the lack of work that I feel is being done for the producer on the ground. This group has as much to do with lack of concern as any we have had testify before us.

As I look upon this budget for this year, I am concerned with the way the funds have once more been directed by the Department of Agriculture. I see funding cuts in areas where we have restored funds in past years. I also see programs continually proposed which this committee and Congress have told the Department that they are not inclined to agree with the Administration.

I will continue to stress the need I see for a sound and committed agriculture trade policy which will assist our producers in the world market. About a month ago I attended a farm forum in Cut Bank, Montana, where I was able to spend time with the people on the ground who are trying to make a living today, but who face terrible odds in doing so. Partially because of what they, and I, see as a faulty trade policy. When my farmers in Montana cannot sell their bushels of wheat for the equivalent price of a one pound box of Wheaties. Yet they continue to see hundreds of thousands of bushels of wheat crossing the border from Canada. Well, Mr. Chairman, it does not take a genius to understand how and why these men and women feel the way they do.

The man and woman in the field are very concerned about what they see happening on the world market. The rest of the world seems to be trading with each other and we sit by and watch them move their grain, while our Department of Agriculture does nothing. My producers are asking that this Department do something, other than sitting on their hands.

My producers in Montana, and those I have talked with across the country are very puzzled by what they are seeing in Washington today. They see reactive and not proactive trade arrangements being made. They feel as though, like I do, that this Administration and this Department do not care about them. Instead of actively moving in the market we hear that the Secretary is waiting until the rest of the world depletes their supplies of grain. Well I wonder how many farmers out there will still be there when something finally occurs.

Last week before the House, Secretary Glickman told the Agriculture Committee that he felt that using the Export Enhancement Program (EEP) would drive wheat prices lower. The countries we compete with would in turn lower their prices. He followed up by stating that sooner or later our competitors will run out of grain anyway and we will have the market to ourselves. Well I have some very serious concerns about those statements, and I will have questions to follow up with those remarks.

The one thing I have to say here is that the Secretary finally gave us some sense of a reason for not using the EEP funding. The real problem here lies in the way that all the funds for export marketing in the Department of Agriculture are being used. This is the basic root of why the producer in the field is losing sleep over and confidence in this Department.

We see other programs like the Foreign Market Development funds not being totally expended, resulting in carryover which the Department claims is a success. Instead where we have a program that they are using, they are not using it to its fullest degree. Programs where the dollars are cost shared by the producer are being carried over for use in the coming years.

Now I understand that the Department and the Foreign Ag Service is not excited about the fact that I got an amendment in the last farm program bill to create a line item for this account. And it has been stated that this line item ties their hands, but I like the people in the field, have little confidence in what would have been done if there was not a line item for this account. I believe I have heard it stated that they would have put more money in there, well I find that difficult to believe considering the amounts that they have placed in the budget in the past couple of years.

I could go on and on about the lack of confidence that the general agriculture producer has in this Administration when it comes to trade policy, but well unfortunately I don't see where it will do a lot of good. This Administration and Department have their minds set on not doing enough to assist the producers in the field. I will have some follow up questions to bring before the Committee to see if I can get some answers on later.

Last year we had some problems with the way that the signups for lands to be placed into the Conservation Reserve Program were being completed. The people on the land were left in a state of confusion and unfortunately now, in a state of distrust in the Department of Agriculture. The confusion in the way the program was being administered has hurt both the program and the producer.

The results of this confusion led to some of the best producing land in the state of Montana being placed in CRP. Excluding those marginal lands which the program was originally designed to protect. It was my understanding that the Conservation Reserve Program was a plan developed to take marginal, environmentally sensitive lands out of production and allow them to be reseeded in grasses. This then would serve to protect those lands, the environment and enhance wildlife opportunities in areas of a sensitive nature.

Instead in Montana what has occurred, by the development of the indexes used to judge the fields, was the exact opposite of what the program was intended to do. We have large sections of good solid producing land coming out of production, and those areas with highly sensitive land will continue to see the plowshare breaking the soil. This just does not make sense to me or to the people trying to protect the lands on which they plant.

Furthermore, during the signup periods, people were provided with certain sets of rules and standards by which their land was judged for suitability for inclusion in the program. Only to find out afterwards, that during the process the rules and standards had changed. So ultimately they found that the standards for which they were planning were no longer the same standards by which they could plant their cover seed for this land.

In a large operation it might be possible to overcome this type of realignment of seed purchase for cover forage, but on many of the smaller operations who count on this land for stable income, well it completely wipes out their cash reserve for the coming planting season. Making nearly impossible to either continue their enrollment in the program or plan for planting costs for the upcoming year.

These people are having a difficult enough time this year, with grain prices at horribly low levels. Brought on, in part at least, by the unwillingness of this Administration and the Secretary to use all the marketing tools at their disposal to make gains on the world market stage. American agriculture is always one of the first issues taken off the table at trade negotiations, in favor of the hi tech industry for which the United States is famous. Forsaking our ability to continue to produce our own supply of safe, reliable and cost effective food and fiber.

Mr. Chairman, I am concerned about the future of Agriculture in these United States. It seems we are headed down the wrong path. Life in Washington, DC, is so easy compared to the nightmares that the producer faces daily in the fields of our states. I pledge my time and energy to working with you to find ways we can assist the producer. I know you and the ranking member have a great deal of work before you, but I will be there to help in anyway I can to make sure that the producer on the ground in either Montana, Mississippi or Arkansas has a chance to make something of their futures, despite all the efforts of the Department of Agriculture.

STATEMENT OF SENATOR LEAHY

Senator COCHRAN. Senator Leahy.

Senator LEAHY. Mr. Chairman, I will put mine also in the record.

I am glad to see, of course, Gus Schumacher here. I have worked with him for so long. And Ken Ackerman who was a valued member of the Senate Agricultural Committee staff. He not only advised me on that, but perhaps as importantly has given me great advice on scuba diving. [Laughter.]

He is one of the best there is in that area.

I just want to thank you, Mr. Chairman, and Senator Bumpers for your help in approving the amendment for the emergency supplemental for maple farmers. I understand from Mr. Schumacher, he is looking carefully how to help there, and I will have questions that I will submit for the record on that area.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Senator. We will insert your prepared statement in the hearing record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR LEAHY

Good morning Under Secretary Schumacher. I would like to take a moment to mention a problem that I raised once before with Secretary Glickman, but which I think is important to discuss again today. Earlier this year a devastating ice storm paralyzed communities from Northern New York to the tip of Maine.

Just a few days after the storm, I visited the hardest hit areas of Vermont. The storm's damage was the worst I have ever seen. The damage to Vermont's maple groves was especially severe. The cost of downed taps and tubing in Vermont alone totaled over \$4 million. In some cases, sugarmakers will have to wait for several years to allow regrowth before tapping can resume. And yet none of those costs were covered through the disaster assistance programs.

Last week the Appropriations Committee corrected that problem by including \$4.48 million in the emergency supplemental to assist farmers to replace taps and tubing in maple groves throughout the Northeast which were affected by the storm. I appreciate the help Senator Cochran and Senator Bumpers gave in approving that amendment. However, getting this money out to those farmers will require an emergency designation by the President. I hope you will support that request and that the Farm Service Agency will help farmers in Vermont and throughout the Northeast make use of this funding to bring their maple groves back into production.

One other area also needs to be mentioned. I was hopeful that you, Mr. Under Secretary, could work out some new arrangements with Canada that would permit us to export milk to Canada. This is potentially a huge dairy market for Vermont—yet tariffs can be as high as 300 percent. I would like to see something done about this problem as soon as possible.

On a similar front, I am very concerned about other countries using sanitary standards as an excuse to keep out American products. And third, I am very concerned about the quality and safety of our imports.

STATEMENT OF AUGUST SCHUMACHER, JR.

Senator COCHRAN. Mr. Secretary, please proceed.

Mr. SCHUMACHER. Thank you, Mr. Chairman, and thank you, Mr. Burns, Mr. Bumpers, and Mr. Leahy.

I have a very fine panel this morning. Ken Ackerman is with us. Keith Kelly not only worked in Montana, but he and I worked together as commissioners, and we enjoyed each other working different ends of the country. Lon Hatamiya is our new FAS Administrator, but not new to USDA. He has done a fine job at AMS, and is doing a great job right off the get-go on Asia in FAS. Chris Goldthwait and Dennis Kaplan are here as well. Chris is working closely on Asia with Lon. Dennis has been here almost every meeting.

I would like to submit my formal statement for the record, Mr. Chairman, and then have a very brief opening comment, if that would be permissible.

Senator COCHRAN. That certainly will be. Your statement will be printed in the record.

Mr. SCHUMACHER. Mr. Chairman, our mission—and I always consider this the most important area of USDA—is to secure long-term vitality, global competitiveness, and profitability for the American family farmer and rancher. As American agriculture continues to adjust to the new Federal policies that the committee has outlined, these expose producers more directly to risks and market fluctuations, as has been noted. The goal of the President and the Secretary remains to improve farm income and to provide an adequate safety net for American family farmers and ranchers. The President's budget we feel will permit us to accomplish this goal.

Today I am going to talk a fair bit about this in my opening statement and then, of course, take questions on the crucial safety net for our farmers and ranchers.

This safety net has several critical elements, including assistance in managing risks inherent in agricultural production, assistance in obtaining credit necessary for agricultural production, assistance to producers and ranchers in times of crisis, emergency, and some of the new weather patterns we are seeing, and assistance in marketing our agricultural products in the strong global marketplace. We feel this budget supports and strengthens this safety net.

Today's hearing is very timely, Mr. Chairman, because it is being held while Congress is considering support for critical elements of the safety net in the context of the President's supplemental appropriations request for fiscal year 1998, and the research bill, as well as the present budget debate that is currently ongoing.

We certainly appreciate the support the Senate has shown in supporting additional funding to provide emergency assistance to farmers and ranchers who recently sustained losses due to natural

disasters, which is well documented, and to finance farm ownership and operating loans targeted to small, beginning, and socially disadvantaged farmers through supplemental appropriations.

Absent enactment of the supplemental budget, funds available for direct loan programs during 1998 will be used up by this spring. They will end, and farm ownership guaranteed loans will be exhausted by the end of June.

We also appreciate the healthy debate that is taking place in the context of the research bill and other bills regarding permanent funding for the vitally important crop insurance program.

We appreciate the opportunity to work with you and your committee to provide permanent funding for these critically important programs without jeopardizing funding for other priorities outlined in the President's budget.

Mr. Chairman, Secretary Glickman is concerned the safety net does need to be strengthened in three respects: credit, insurance, and the international side. I will be brief on all three.

Mr. Chairman, the Secretary believes that several aspects of our credit programs need to be strengthened. In order to be successful and profitable in farming, America's farmers and ranchers need access to adequate, affordable credit. For that reason, the budget provides almost \$3 billion in funding for farm loan and loan guarantee programs for farm families who would be unable to obtain credit otherwise, and is consistent with recommendations of the Department's Civil Rights Action Team and the National Commission on Small Farms.

Carolyn Cooksie, who is here today, oversees lending for 110,000 farmers on direct loans and an additional 50,000, I believe, on guaranteed. So, roughly 160,000 farmers are working with Carolyn on credit, a very important issue.

We have submitted legislation that would amend the "one strike and you are out" clause that prohibits family farmers and ranchers, 73,000 since 1989, who have ever had a wipe-down, for whatever reason, from ever coming to USDA for another loan. We believe this is too harsh, too restrictive, and we hope Congress will support this legislation.

Further, the Secretary has placed high priority on providing credit to small, socially disadvantaged, and beginning farmers and ranchers. The budget proposal we have submitted reflects this commitment.

We also believe more funds are needed for the direct loan programs. We have 7,400 direct operating loan applications on hand. Nearly 4,000 of these will go unfunded unless we provide some additional funds. This is similar to what happened last year. Loans are made on a first-come-first-served basis, and when funds are gone, they are gone.

As I said earlier, we appreciate your support in the Senate—strong support—for these programs through the supplemental appropriations bill that is underway, and we look forward to working with you and your colleagues in the House to put this funding in place.

We are reviewing several other aspects of our credit programs. We will be proposing regulatory streamlining changes to make these programs more user friendly, both for the borrowers and also

for the banks that provide the important guarantee. We are moving very hard on low documentation and we will continue to brief you and your committee on those improvements.

Let me just touch briefly on crop insurance, and then I will end with the international side.

This is under great discussion as we speak, in fact, yesterday, today, and tomorrow. I was with Mr. Stenholm in Texas yesterday, and he has been in close touch with the Congress on these very important issues.

We believe that America's family farmers and ranchers deserve to know that crop insurance, the backbone of the farm safety net, is on a sound financial footing. Crop insurance provided \$24 billion in protection to more than 600,000 producers last year.

Ken Ackerman's group expects that next year 63 percent—63 percent—of our total insurable acres will be covered by our crop insurance risk management program. Twenty-two percent of this acreage is expected to be covered at the CAT level, which is 50 percent of the approved yield covered at 55 percent of the expected market price, with the Federal Government paying 100 percent of that premium. Forty-one percent of the insurable acres is expected to be covered at higher levels, the buy-up, up to 75 percent of the approved yield level, covered at 100 percent of the expected market price, and for this buy-up, of course, producers pay a premium.

Since passage of crop insurance reform in 1994, total expenditures have averaged about \$1.2 billion. In 1999, these expenditures are expected to rise, depending on the appropriation, to \$1.8 billion. The budget proposal provides for full funding of this amount, and proposes to shift all delivery expenses from discretionary to mandatory. This shift would consolidate all spending for the program other than salary related and operating costs into a single account, a mandatory account, and eliminate the possibility of the program being restricted by a limited appropriation of discretionary funds.

We look forward to working with your committee, Mr. Chairman, to provide offsets without diminishing funding for the program to the extent that it would be put at risk or for other priorities in the President's budget.

Our crop insurance program has changed dramatically over these past 5 years and is, we feel, much improved. Participation is more than double the levels of the early 1990's. Farmers have more choices of insurance, and our delivery system has been solid. At the same time, we also recognize that expectations for crop insurance and the complementary risk management tools, as we are looking at a number of issues like dairy options and others, will have grown dramatically as well. And it is very important that in addition we move beyond crop insurance and look at related risk management tools that Ken Ackerman and his team are ably developing, in accordance with the farm bill.

As other programs have receded under the farm bill, farmers more and more depend on crop insurance and related risk management tools as the principal safety net, along with Lon Hatamiya's group on the international side.

As a result, while maintaining the program's basic financial soundness, we must continue to expand Federal crop insurance to cover as many producers as practical, correct program flaws when

we find them, and respond to customer needs with a growing menu of services and tools. It is a great challenge, Mr. Chairman. We will need to work closely with you as we work to make the necessary improvements.

Let me then conclude on the international side. I have been before you in the past as Lon's predecessor. I continue to spend a fair bit of my time on the international side because export markets are so critical—so critical—to America's family farmers.

The budget provides a number of tools which we believe are needed to help expand U.S. agricultural exports. The key is to ensure that markets are open and ranchers and farmers have the opportunity to compete and ensure that we remain a reliable supplier of safe, affordable, high-quality food and farm products to our customers.

Again, our budget will allow us to continue our market reporting. Senator Burns has mentioned the very important need for transparency in market reporting and intelligence gathering activities overseas. Our budget will also continue our trade policy negotiating work going into the next round. We have been very active, Mr. Chairman, in trying to make sure that as we get information internationally, we get it out promptly to all segments of American agriculture, particularly using the radio, so that farmers have equal access to this information that comes in from overseas so they can make prompt decisions on their crop sales and planning ideas.

Access to this information is one of the keys to success in this marketplace. The budget provides full funding for the MAP program, the Market Access Program, the Dairy Export Incentive Program, and the GSM Export Credit Guarantee Programs, as well as some innovative multiyear funding for the Export Enhancement Program.

It also includes \$3 million for the very successful Cochran Fellowship Program, unchanged from 1998 levels.

We believe we need to use all these tools to respond to changes in market condition. We have been very aggressive this year, Mr. Chairman, in using the GSM program in Asia. Chris and Lon have been to Asia twice and they can respond to any questions. We feel, because of liquidity problems there, this is the right tool for the right job. We have been criticized for this by certain countries.

There continues to be a need, however, for liquidity in Asia as they continue to work through a very difficult situation. There is a tremendous demand for our products—meats, cotton, soybean meal, hides and skins, and corn and soybeans.

But the Asian currency situation and the banking crisis have made it difficult, particularly in December, January, and February, to finance transactions through Lon's and Chris' program, the GSM, which provides commercial guarantees on letters of credit at commercial rates to allow this trade to take place and to help resolve some of the ongoing liquidity problems in certain key countries. GSM is the right tool for managing this crisis.

The facts speak for themselves. Since Secretary Glickman announced the program in Korea, we have registered nearly \$700 million in sales under the program. This includes \$87 million in beef, \$13 million in pork, \$125 million in cotton, and \$100 million in

hides and skins. And certainly it is having an impact on the bottom line.

One of the mistakes made when Chris, Lon, and I were negotiating this is that we did not include hides and skins in the original negotiation with Korea. Once we realized the importance of hides and skins, the Secretary, Lon, and I worked to get the Korean Government another \$100 million, to bump it up to \$1.1 billion.

This had an immediate effect. The price of hides a hundred-weight fell in January to \$57 because Korea takes something like 35 percent of all the hides produced in the United States, and as soon as that was announced, the price went up \$10 to \$67, and that put between \$5 and \$10 back into the hands of America's 900,000 producers of cows and calves. Again, a very useful tool and we were able to operate it very quickly.

Certainly also with cotton, the GSM has had an important role to play throughout Asia as it has been used to stabilize contracts and keep those markets open for American cotton exporters.

Mr. Chairman, in closing, we are using all of these tools that Congress has made available—credit, crop insurance, emergency assistance, and export expansion measures—as strategically targeted as possible, to accomplish our mission to keep family farming and ranching profitable in this country.

We do not have all the tools we would like to have, and we have put forward a series of proposals within the framework of a balanced budget to strengthen the farm safety net.

I look forward to working with you and other members of the committee as Congress considers our proposals for the upcoming year.

That concludes my remarks, Mr. Chairman. I would be very pleased to take your questions.

PREPARED STATEMENTS

Senator COCHRAN. Thank you very much, Mr. Secretary. We will insert your prepared statement in the hearing record along with the statements of Mr. Kelly, Mr. Hatamiya, and Mr. Ackerman.

[The statements follow:]

PREPARED STATEMENT OF AUGUST SCHUMACHER, JR.

Mr. Chairman and Members of the Committee, I am pleased to appear before you this morning to discuss the fiscal year 1999 budget and program proposals for the Farm and Foreign Agricultural Services (FFAS) mission area of the Department of Agriculture (USDA). With me today are the Administrators of the three agencies within our mission area: Kenneth D. Ackerman, Administrator of the Risk Management Agency; Keith Kelly, Administrator of the Farm Service Agency; and Lon S. Hatamiya, Administrator of the Foreign Agricultural Service. I am also pleased to be accompanied by Christopher Goldthwait, the Department's General Sales Manager, and Dennis Kaplan from the Department's Office of Budget and Program Analysis.

Statements by the Administrators, providing details on their agencies' budget and program proposals for 1999, have been submitted to the Committee. My statement will summarize the proposals, after which we will be pleased to respond to your questions.

Mr. Chairman, the mission of FFAS is to secure the long-term vitality and global competitiveness of American agriculture. As American agriculture continues to adjust to new Federal policies that expose producers more directly to risks and market fluctuations, the goal of President Clinton and Secretary Glickman remains to improve farm income and provide an adequate safety net for American family farmers and ranchers. The President's budget proposals allow us to accomplish this goal.

While we have moved away from the traditional supply management and price support farm programs, USDA still provides a crucial safety net for American producers. This safety net has several critical elements, including assistance in managing risks inherent in agricultural production, assistance in obtaining credit necessary for agricultural production, assistance for producers in times of emergency, and assistance in marketing American agricultural products in the global marketplace. The budget supports and strengthens this safety net.

Further, Secretary Glickman has placed a very high priority on providing credit to small, socially disadvantaged, and beginning farmers and ranchers. The President's budget proposals reflect that commitment.

FARM SERVICE AGENCY

The Farm Service Agency (FSA) is the agency that family farmers and ranchers interact with most frequently. Producers come to FSA to participate in farm programs, for farm ownership, operational, and commodity loans, for disaster assistance, and to participate in the Conservation Reserve Program. The FSA network is a tremendous resource. We can all be proud of the dedicated FSA staff who serve America's family farmers and ranchers.

The consolidation of staffs and county offices, establishment of a common computing environment, and the convergence of administrative services at all levels of the county-based agencies continue to be the focus of USDA streamlining efforts. As part of the Department's continuing reorganization, we are implementing a field office streamlining plan which co-locates the county-based agencies in one-stop USDA Service Centers. At this point, the county offices have been consolidated into about 2,700 Service Centers. An additional streamlining initiative will consolidate administrative support functions for the county-based agencies.

We are also developing a common computing environment for these agencies to optimize the use of data and equipment and improve the flow of information across the agencies. Also, the Department has entered into a contract with an independent consultant who is examining what further steps, if any, can be taken to improve the efficiency of our farm and rural program delivery system. That study is scheduled to be completed by the end of this fiscal year. Collectively, these efforts represent a substantial retooling of our service delivery system and a vital investment in rural America that is important to family farmers and ranchers.

Our budget proposals provide \$976 million for salaries and expenses for FSA in 1999 for the administration of its programs. This is comprised of appropriated funding of \$953 million, a proposal for the collection of user fees for the sale of information to the public of \$10 million, and estimated carryover funds of \$13 million. The total includes \$21 million for increased pay costs and \$30 million in increased funding for the common computing environment. The 1999 request represents a \$13 million increase over our current estimate for 1998; however, the funding requested will support about 1,100 fewer staff years than in 1998.

Commodity Credit Corporation

Before I turn to the programs administered by FSA, I would like to address the budget request for the Commodity Credit Corporation (CCC), a government entity for which FSA provides operating personnel. Domestic farm commodity price and income support programs are administered by FSA and financed through CCC. CCC is also the source of funding for a number of the conservation programs administered by USDA, and it funds a portion of the export programs administered by the Foreign Agricultural Service. Funds are borrowed by the Corporation from the Treasury to finance CCC programs. Changes over the last decade in commodity, disaster, and conservation programs have substantially modified the level, mix, and variability of CCC outlays. Since the mid-1980s, commodity program spending has declined dramatically, spending for ad hoc crop disaster programs has been virtually eliminated, and spending for conservation programs has increased and become a major portion of CCC's outlays. A great deal of volatility associated with CCC outlays has been removed due to provisions of the 1996 Farm Bill.

The 1999 budget reflects a need for \$8.4 billion to reimburse CCC for its actual fiscal year 1997 realized losses, an increase of \$7.7 billion from the 1998 reimbursement of \$784 million. In prior years, the request for appropriations to reimburse CCC for net realized losses has been based on an estimate of losses incurred one year earlier which have not been previously reimbursed. The estimate could exceed or fall short of the actual amount of loss. Beginning in the 1998 budget, the request for appropriations to reimburse CCC for net realized losses covered the actual amount of the unreimbursed losses incurred 2 years earlier. The appropriation request for 1999 would fully reimburse CCC for the balance of actual 1997 net realized losses of \$8.4 billion. Appropriations to reimburse CCC for actual net realized

losses to be incurred in 1998, currently estimated to total \$8.5 billion, will be requested in the President's budget for fiscal year 2000.

Commodity Price and Income Support Programs

Commodity price and income support program outlays account for about two-thirds of total CCC outlays in 1999. The President's budget includes \$5.94 billion in funding for commodity price and income support programs in 1999, down from the current estimate of \$6.25 billion in 1998.

The commodity price and income support programs administered by FSA were changed dramatically by provisions of the 1996 Farm Bill. The 1996 Farm Bill replaced deficiency payments with fixed production flexibility contract payments that are no longer tied to market price. Nonrecourse loan programs for contract commodities and oilseeds have been retained. These programs continue to provide producers with some protection against sharp declines in market prices, but the changes in the support programs have diminished the traditional role of the farm programs as a buffer against fluctuations in production and commodity prices.

The 1996 Farm Bill also modified price support provisions for dairy, sugar, and peanuts. Dairy price supports are being phased out, and Secretary Glickman recently announced major reforms of milk marketing orders. The peanut program was made a no-net-cost program, the minimum national peanut poundage quota was eliminated, and the quota rate level was reduced. With respect to sugar, sugar loan rates were effectively reduced with the imposition of loan forfeiture fees, marketing assessments were increased, and marketing allotments were suspended.

The Administration continues to place a high priority on helping farmers to manage risk. These changes underscore the importance of crop insurance programs that help farmers manage production risk. For the crop insurance program administered by the Risk Management Agency, legislation will be proposed with the 1999 budget to provide mandatory funding for administrative expense reimbursements to reinsured companies previously funded through the discretionary account. Offsets required for the proposal are included in the budget. For producers of crops for which crop insurance is unavailable, the Noninsured Crop Disaster Assistance Program, administered by FSA and funded through CCC, provides coverage against catastrophic losses where area-wide crop losses exceed 35 percent of normal yields.

Conservation

Conservation program outlays account for almost one-fourth of the CCC expenditures in 1999. The 1996 Act authorized CCC funding for the Conservation Reserve Program (CRP) administered by FSA and several new conservation programs administered by the Natural Resources Conservation Service (NRCS). In 1998, outlays for CRP will total an estimated \$1.9 billion, including \$63 million in NRCS and Forest Service technical assistance costs paid for with appropriated funds and \$1.8 billion from CCC for rental costs and for sharing the cost of establishing permanent cover on replacement acres. For 1999, outlays for CRP will total approximately \$1.72 billion, including \$24 million in appropriated funds for technical assistance and \$1.7 billion from CCC.

CRP provides landowners annual payments and half the cost of establishing a conserving cover in exchange for retiring environmentally sensitive land from production for 10 to 15 years. The 1996 Act authorized the program through 2002 and set maximum enrollment in the program at 36.4 million acres. Current enrollment totaled about 28 million acres at the end of calendar year 1997. After a successful 16th CRP regular signup, the budget assumes acreage enrollments under the CRP of about 32 million acres in 1998, 34 million acres in 1999, with an eventual enrollment of 36.4 million acres by 2001.

A number of other conservation programs administered by USDA, such as the Wetlands Reserve Program, the Environmental Quality Incentives Program (EQIP), the Conservation Farm Option Pilot Program, and the Wildlife Habitat Incentive Program are also funded by CCC. These programs are administered primarily by NRCS, and funding for these programs will be discussed in detail when NRCS appears before the Committee.

Farm Loans

In order to be successful in farming, America's family farmers and ranchers need access to adequate credit. For that reason, the budget provides almost \$3 billion in funding for farm loan and loan guarantee programs for farm families who would be unable to obtain credit otherwise and is consistent with recommendations of the Department's Civil Rights Action Team and the National Commission on Small Farms. It includes \$85 million for direct farm ownership loans and \$425 million for guarantees for farm ownership loans, compared to 1998 levels of \$46 million and \$400 million, respectively. The funding requested would allow USDA to help 3,458 beginning

and small farmers to either acquire their own farm or to save an existing one, with about 1,000 of those served receiving direct loans.

The budget also includes \$2.4 billion in direct and guaranteed farm operating loans, nearly the same funding level as 1998. This funding level will allow FSA to serve an estimated 28,000 beginning and small farmers, about 12,000 of whom will receive direct loans. The budget also provides \$25 million in emergency loans for qualifying losses which occur in areas covered by a Presidential or Secretarial disaster declaration. In addition, the budget provides \$1 million for Indian tribe land acquisition loans, \$25 million for credit sales of property acquired by FSA, and \$30 million for the boll weevil eradication program.

Credit is one element of the farm safety net which needs strengthening. For this reason, the Administration has proposed emergency legislation to modify the 1996 Act prohibition on loans to borrowers who received debt forgiveness. The "one strike and you're out" provision in current law is more restrictive than U.S. bankruptcy laws which allow individuals to reestablish credit. Our proposal would correct this inequity by providing borrowers a second chance.

Other FSA Programs

The budget proposes to double funding for State mediation grants from \$2 million in 1998 to \$4 million in 1999. Mediation gives family farmers, including many low income and socially disadvantaged farmers, the opportunity to remain on the farm by resolving credit and other issues through alternative dispute resolution. The increased funding will support mediation programs in the 21 States currently certified in 1998, as well as any additional States that become certified by 1999, and will allow States to expand programs to include mediation of other agricultural issues in addition to credit disputes.

FSA also administers the Emergency Conservation Program (ECP). Under this program, USDA shares the cost of rehabilitating farmland damaged by natural disasters. Supplemental appropriations provided a total of \$95 million for the ECP in 1997. As of March 12, 1998, approximately \$9.7 million of that total remains unallocated. No funds have been appropriated to date for the program in 1998, although a request for supplemental funding is now pending before Congress. The budget proposes no funding for the program in 1999.

Requested 1998 Supplemental Funding

The President recently submitted several supplemental funding requests to Congress to provide emergency assistance to farmers and ranchers who recently sustained losses caused by natural disasters, and to finance farm ownership and operating loans targeted to beginning and socially disadvantaged family farmers.

For those whose lands were damaged by ice storms in the Northeastern United States, rains and mudslides in California, tornadoes in Florida, and other recent natural disasters, we are requesting a contingency of \$20 million for the Emergency Conservation Program. The Administration is also asking for \$4 million for losses sustained by dairy and livestock producers. Emergency funding is also requested to provide \$25 million in additional emergency loans (\$6 million in budget authority) and a contingency of \$62 million in emergency loans (\$15 million in budget authority).

In addition, we are requesting approval to redirect \$6.7 million in budget authority from guaranteed farm operating loans to finance \$39 million in direct farm ownership loans, \$25 million in farm ownership guaranteed loans, and \$10 million in farm operating direct loans. Absent enactment of the supplemental, funds available for direct loan programs during 1998 will be used up by this Spring, and farm ownership guaranteed loans will be exhausted by the end of June. These programs are targeted to beginning and socially disadvantaged family farmers and were recommended for increased funding in the Civil Rights Action Team Report to the Secretary.

RISK MANAGEMENT AGENCY

The virtual elimination of ad hoc crop disaster aid and subsequent passage of the 1996 Farm Bill expanded the role of the Risk Management Agency (RMA), giving it primary responsibility for providing an agricultural safety net. It is doing so in several ways. RMA administers the Federal crop insurance program on behalf of the Federal Crop Insurance Corporation (FCIC), offering farmers protection against income losses due to production failures and in some cases, market price declines. It is aggressively providing risk management education to make farmers aware of risk management strategies and actions to cover those risks. And, it is pursuing innovative tools, such as the Dairy Options Pilot Program, to give farmers more risk management alternatives.

From 1987 to 1994, disaster assistance payments averaged roughly \$1.2 billion a year, while annual crop insurance outlays averaged roughly \$800 million over the same period. Combined, the total Federal expenditure was roughly \$2 billion annually. Since the Federal Crop Insurance Reform Act of 1994 (1994 Act), total expenditures for the crop insurance program have averaged \$1.2 billion annually. For 1999, expenditures will total about \$1.8 billion; the budget provides for full funding of this amount.

In 1997, crop insurance provided \$24.3 billion in protection to more than 600,000 producers, holding slightly more than 1.3 million policies on 181.4 million acres. For 1998 and 1999, we expect to maintain approximately the same level of participation and that producers will select higher levels of coverage. Further, Crop Revenue Coverage (CRC) is now available on almost 90 percent of the corn, wheat, cotton, soybean, and grain sorghum acres in the United States. CRC helps protect producers from losses in yield, price, or combinations of both factors.

By 1999, RMA expects that roughly 63 percent of the country's insurable acres will be covered by the crop insurance program. Twenty-two percent of insurable acreage is expected to be covered at the catastrophic coverage level (50 percent of the approved yield covered at 55 percent of the expected market price) with the Federal government subsidizing 100 percent of the premium, and 41 percent of the insurable acreage is expected to be covered at higher levels of coverage (up to 75 percent of the approved yield covered at 100 percent of the expected market price) for which producers pay a premium, a portion of which is also subsidized by the Federal government.

With our private sector partners, including farmer organizations, crop insurance agents, trade associations, and educational institutions, we are continuing to work with agricultural leaders nationwide to increase producers' awareness of risk management strategies and impress upon them the importance of taking active steps to protect their investments from fluctuating prices and weather-related disasters. Our budget proposals include \$5 million to carry out these educational initiatives.

We are also exploring new programs that will allow us to offer coverages that better meet the needs of family-sized farm operations. We intend to launch a Dairy Options Pilot Program this year, and our budget proposal includes \$10 million for this program in both 1998 and 1999.

The budget includes a proposal to shift all reimbursements for delivery expenses incurred by reinsured companies from discretionary to mandatory spending. This shift would consolidate all spending for the program other than salary-related and operating costs into a single account and eliminate the possibility of the program being restricted by a limited appropriation of discretionary funds.

The proposal results in an increase of \$185 million in outlays from the mandatory account in 1999, associated with \$205 million in budget authority for reimbursement of delivery expenses. This will require corresponding mandatory offsets. Of the \$1.1 billion in offsets needed through 2002, USDA will propose that about half come from the crop insurance program, with producers and insurance providers sharing the reductions. Beginning in 2000, savings within the crop insurance program are achieved by: limiting payment eligibility under the catastrophic risk protection (CAT) insurance program to \$100,000 per person; reducing administrative subsidies for insurance providers from 27 percent to 25 percent of premiums for buy-up coverage; reducing premium subsidies for higher levels of coverage; and reducing the statutory loss ratio target from 1.075 to 1.060 beginning in 2000.

For 1999, necessary offsets have been identified, including savings from the Cotton Step 2 Payments and from the Export Enhancement Program.

FOREIGN AGRICULTURAL SERVICE

One of USDA's primary goals is to expand economic and trade opportunities for agricultural producers and other rural residents. The opening and expansion of foreign agricultural markets has never been more important. Recent changes in Federal farm policy, including those adopted in the 1996 Farm Bill, have made it clear that new and growing markets are critical to future income growth for our farmers and ranchers.

We have made some notable progress in achieving our export expansion goal in recent years. U.S. agricultural exports reached \$57.3 billion in fiscal year 1997, the second highest level on record. Last year also marked the third consecutive year that exports topped \$54 billion. The agricultural trade surplus ended the year at \$21.5 billion. Four of 1997's top 10 markets for U.S. agricultural exports rose to new highs. Records were set to both U.S. neighbors, Canada and Mexico. Together, our NAFTA partners accounted for \$11.7 billion in U.S. exports this past year, 20 percent of our total agricultural exports worldwide and greater than our sales to Japan.

Records were also set to Hong Kong and Russia. However, we also experienced declines in other top markets with value declines to three key Asian markets—Japan, Taiwan, South Korea—ranging from 10 to 12 percent.

The Foreign Agricultural Service (FAS) plays a critical role in our efforts to achieve the Department's goal of expanding overseas markets. Working with the Office of the United States Trade Representative, FAS is involved in agricultural trade policy, monitoring and enforcing trade agreements, and working to reduce trade barriers and increase market access for U.S. agricultural products. Through its network of 81 Counselor/Attaché offices and Agricultural Trade Offices, FAS provides market intelligence information to U.S. producers and exporters, enabling them to compete for market opportunities abroad. FAS administers a variety of foreign food assistance, market development and export promotion programs which are designed to bolster U.S. competitiveness in international markets and build long-term trading relationships with other countries. FAS also carries out exporter outreach and assistance programs which are designed to increase domestic awareness of export opportunities, help companies become export ready, and link export-ready and new-to-export companies to foreign buyers overseas. And, FAS coordinates international activities throughout USDA, bringing to bear all of the resources of the Department to address issues as they arise.

The budget provides a total program level of \$190 million for FAS for 1999. This includes \$146 million of appropriated funding, an increase of \$6 million over the 1998 enacted level.

The budget proposal includes \$4 million for overseas administrative services provided by the Department of State in support of the International Cooperative Administrative Support Services (ICASS) program, and includes \$2 million to establish a buying power maintenance fund to assist FAS in managing unanticipated changes in the costs of its overseas operations which can result from exchange rate losses or gains. This proposal responds to a request of the Conference Committee on the 1998 Agriculture Appropriations Bill.

The budget also includes an increase of \$500,000 for FAS to re-engineer its program performance measurement and evaluation tools, which are a critical element in meeting requirements of the Government Performance and Results Act.

The budget proposes to shift funding for FAS information technology infrastructure and related expenses to the FAS appropriated account. At present, these costs are funded through a reimbursable agreement with CCC. FAS will meet these costs, which are estimated to be \$12 million in 1999, through staff-year and associated cost reductions and through increased cost-share contributions to the Foreign Market Development Program.

Export Credit Guarantee Programs

Under the export credit guarantee programs, CCC provides payment guarantees for the commercial financing of U.S. agricultural exports. These programs facilitate exports to buyers in countries where credit is necessary to maintain or increase U.S. sales, but where financing may not be available without CCC guarantees.

The budget proposes a new approach to presenting the estimates for export credit guarantee programs. Program levels, budget authority and outlays will reflect the level of sales expected to be registered rather than the authorized level. This provides more realistic estimates of the costs of the guarantee programs and improves the accuracy of CCC budget estimates. This change will not restrict program use; the authorized levels remain available for use as determined by program demand and changing market conditions.

Following this new approach, the budget projects an aggregate program level of \$5.0 billion for export credit guarantees in 1998 and \$4.6 billion in 1999. These program levels are significantly higher than in recent years, reflecting large increases in programming in Southeast Asia and South Korea this year that are expected to continue into 1999. The 1999 program level includes \$4.3 billion for GSM-102 short-term export guarantees and \$100 million for GSM-103 intermediate-term guarantees. Additionally, the budget includes \$150 million for supplier credit guarantees and \$50 million for facilities financing guarantees.

Export Subsidies

The budget proposes a flexible, multi-year program level authorization for the Export Enhancement Program (EEP), which is one of two export subsidy programs administered by FAS. The proposal provides total funding level of just under \$1.2 billion for EEP during the 1999 to 2003 period and provides administrative discretion to the Department to determine the level of funding for individual years. The proposal will generate approximately \$1.4 billion in savings during this period, which will help offset increased funding included in the budget for crop insurance and

other mandatory spending proposals. There has been limited activity under EEP during the past two years due to world supply and demand conditions. However, the program remains in place and USDA is prepared to resume awarding EEP bonuses should market conditions warrant. Annual program levels will continue to be subject to the export subsidy reduction commitments established in conjunction with the Uruguay Round Agreement on Agriculture.

FAS also administers the Dairy Export Incentive Program (DEIP), which helps exporters of U.S. dairy products become price competitive and thereby make sales in targeted overseas markets where competitor countries are making subsidized sales. For DEIP, the budget assumes a somewhat lower level of program activity in 1999 due primarily to a projected tighter domestic market situation. However, the actual level of DEIP programming will be determined by market conditions in 1999, subject only to the Uruguay Round Agreement subsidy reduction commitments. Thus, the actual level of DEIP programming could exceed what is assumed in the budget should supply and demand conditions not be as tight as currently projected.

Public Law 480

Public Law 480 programs are the primary means by which the United States provides foreign food assistance. FAS administers Title I of Public Law 480, which provides for sales of U.S. agricultural commodities to developing countries and private entities through concessional financing. Titles II and III of Public Law 480 are administered by the Agency for International Development. Under Title II, the United States provides humanitarian food assistance to needy people in foreign countries in response to malnutrition, famine, and other extraordinary relief requirements. Title III provides food assistance on a grant basis to least developed countries to support programs of economic development.

The budget provides a total program level for Public Law 480 food assistance of \$979 million. This is expected to provide approximately 2.8 million metric tons of commodity assistance, approximately 700,000 metric tons less than the current estimate for 1998. The budget reduces funding for Title I from \$245 million in 1998 to \$112 million in 1999.

Funding for Titles II and III remains the same for 1998 and 1999 at \$837 million and \$30 million, respectively.

In addition, the budget assumes that approximately \$109 million of CCC funds will be used to support the Food for Progress program. Under Food for Progress, U.S. agricultural commodities are provided to developing countries and emerging democracies which have made commitments to introduce and expand free enterprise in their agricultural economies. Commodities are provided on either long-term credit or grant terms to foreign governments, private voluntary agencies, nonprofit agricultural organizations, cooperatives, or intergovernmental organizations.

Market Access Program

The President's budget fully funds the Market Access Program (MAP) at \$90 million. FAS administers MAP to support the development, maintenance, and expansion of commercial export markets for U.S. agricultural commodities and products. Under the program, CCC funds are used to provide cost-share assistance to participating organizations including nonprofit agricultural trade organizations, State regional trade groups, and private companies, for carrying out foreign market development activities in designated countries. Only small businesses are permitted to receive direct assistance under MAP.

YEAR 2000 COMPLIANCE

Finally, I would like to provide an update on Year 2000 compliance efforts. FAS, FSA, and RMA are on target for meeting required conversions and retrofitting computer hardware, software, and other systems to ensure Year 2000 compliance.

FSA is the lead agency providing information technology support for the agencies within our mission area. In August 1996, FSA established a target of September 30, 1998, for completion of conversion, well ahead of OMB's recently announced target of March 1999. FSA has reported and tracked the status of all Year 2000 efforts since October 1996. All FSA systems that have not been canceled or replaced are regarded as mission critical systems. As of January 28, 1998, FSA has completed 42 percent of its Information Technology (software application) systems. For all Year 2000 projects, both application and non-application projects, FSA has completed over 27 percent. Within the next 3 to 6 months, the percentage of completion will increase significantly as ongoing field office projects are completed.

FAS has also established September 30, 1998, as the target date for completion of all conversion projects. From the beginning, FAS took the approach that Year 2000 compliance would be incorporated into the overall re-engineering efforts for the

FAS applications systems. The process to re-engineer all of FAS's mission critical applications into a client/server environment began in 1994. FAS identified 14 applications as being mission-critical. Eight of those 14 applications are Year 2000 compliant; the remaining 6 systems will be compliant by September of this year.

RMA is also making steady progress to meet Year 2000 compliance. The Agency has identified 48 mission-critical application systems which must be Year 2000 compliant. Of these, 19 are compliant, 10 will be replaced, one is being repaired, and 18 will be retired. All of RMA's transaction data is compliant now. Historical data is still being migrated into Year 2000 compliant systems. Most of the work will be done by September 1998, and RMA is on track to have all systems Year 2000 compliant by the March 1999 deadline.

The planned early completion date for FSA and FAS will allow those agencies to use the remaining time for actual production processing with the systems to ensure compliance and will provide time to eliminate any errors.

In closing, I would like to add that I believe the Department of Agriculture has an important role to play in helping American farmers and ranchers succeed. The FFAS mission area plays a crucial role in the Department's efforts to improve farm income and provide an adequate safety net for America's family farmers and ranchers. Our programs don't operate in a vacuum, but in partnership with State and local governments, commodity organizations, private insurance companies, colleges and universities, and most importantly, with individual producers. These are our customers, and these are the people we are all here to serve. Although many challenges are ahead of us, FSA, FAS, and RMA are committed to the prospect of using all the tools available to us to serve our customers in a farmer-friendly way. With the continued support of this Committee, we will continue to do so.

This concludes my statement, Mr. Chairman. We will be pleased to answer any questions you and other Members of the Committee may have.

PREPARED STATEMENT OF KEITH KELLY

Mr. Chairman and Members of the Subcommittee, this is my first opportunity to offer a statement to this Subcommittee, and I am pleased to present the fiscal year 1999 budget for the Farm Service Agency (FSA). While our budget estimates conform with Government Performance and Results Act (GPRA) requirements regarding strategic and annual performance plans, I will discuss in a traditional format the budget estimates for the programs that serve as our tools for meeting GPRA goals—price and income support and related programs of the Commodity Credit Corporation, conservation programs funded by the Commodity Credit Corporation, the farm loan programs of the Agricultural Credit Insurance Fund, and a number of others. To conclude my statement, I will summarize our request for administrative support.

Before presenting our budget requests, however, I would like to emphasize the importance of strategic planning. The formal plans that we have submitted so far are a first step in a comprehensive process of examining the role of this agency and its appropriate level of resources now and years into the future. Accordingly, I have established a Strategic Planning, Policy, and Operations Staff within FSA to spearhead the necessary analysis.

I would also like to take a moment, before I discuss 1999, to mention some proposed changes to 1998 funding. The President has transmitted to Congress a number of supplemental requests as well as a rescission proposal. To respond to natural disaster conditions afflicting various parts of the nation, we are requesting \$20 million for the Emergency Conservation Program; \$4 million to indemnify producers for milk and livestock lost due to disaster; and \$21 million in appropriated subsidy, of which \$15 million would be available on a contingency basis, to provide up to \$87 million in emergency disaster loans. We are also requesting approval to redirect \$6.7 million from the current appropriation for guaranteed farm operating loans to provide increases in direct farm ownership and operating loans as well as guaranteed farm ownership loans, all of which are expected to be depleted in coming months. This redistribution would help increase opportunities for beginning and socially disadvantaged farmers. Finally, the Administration is proposing a rescission of \$1.08 million from the FSA Salaries and Expenses account to help offset a supplemental funding request for the USDA civil rights initiative.

COMMODITY CREDIT CORPORATION

Domestic farm commodity price and income support programs are administered by the Farm Service Agency and financed through the Commodity Credit Corporation (CCC), a government entity for which FSA provides operating personnel. The

CCC is also the source of funding for most of the conservation programs administered by FSA and the Natural Resources Conservation Service (NRCS), and it funds a portion of the export programs administered by the Foreign Agricultural Service (FAS). Funds are borrowed by the Corporation from the Treasury to finance CCC programs. Commodity support operations, handled primarily through loans, payment programs and some limited purchase programs, currently include those for wheat, corn, soybeans, minor oilseed crops, cotton (upland and extra long staple), rice, tobacco, milk and milk products, barley, oats, sorghum, peanuts and sugar.

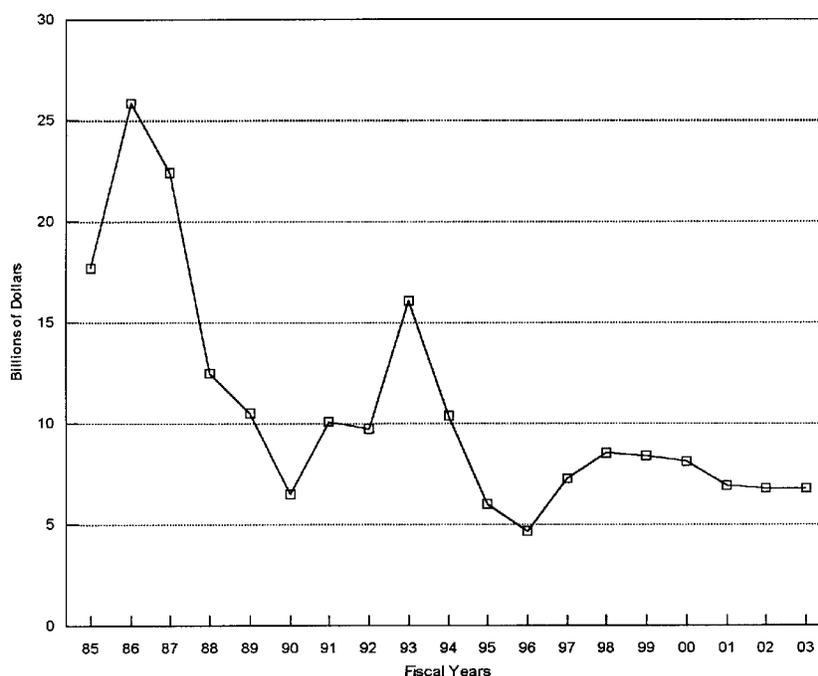

Program Outlays

The current 1999 budget estimates largely reflect estimated supply and demand conditions for the 1998 crop. However, a great deal of the volatility associated with forecasting commodity program outlays has been removed due to the provisions of the 1996 Farm Bill. The price and income support programs funded by CCC for the 1996 crops and beyond are determined by that legislation, which has fundamentally restructured income support programs and discontinued supply management programs for producers of feed grains, wheat, upland cotton, and rice.

The budget includes proposed legislation that would limit cotton user marketing certificates to no more than \$140 million in 1999 for savings of about \$110 million. The proposed spending level of \$140 million in 1999 is in line with the history of spending for this program. Since the marketing certificate program was first implemented in 1991, we have spent about \$750 million on these payments—a little over \$125 million per year, on average. To help meet critical water quality goals and to address the recommendations of the Civil Rights Action Team (CRAT), legislation is proposed to increase CCC funding for the Environmental Quality Incentives Program (EQIP) by \$100 million in 1999 and by a total of \$350 million for the period 1999 to 2003. The Department also proposes legislation to provide a flexible, multi-year program level authorization for the Export Enhancement Program (EEP), providing total funding of just under \$1.2 billion for the 1999 to 2003 period, with a funding limitation of \$320 million in 1999. This proposal provides the Department the discretion to determine the annual funding levels, where funding not used one year will remain available for use in subsequent years. This proposal would generate estimated savings of \$230 million in 1999 and a total of \$1.4 billion during 1999 to 2003.

Changes over the last decade in commodity, disaster, and conservation programs have substantially modified the level, mix, and variability of CCC outlays. Since the mid-1980's, commodity program spending has declined, and will continue to decline as annual fixed production flexibility contract payments are reduced. Spending for ad hoc disaster programs has been virtually eliminated, and CCC spending for conservation programs has increased from negligible amounts prior to the 1996 Farm Bill to over \$2 billion in 1999, becoming a major portion of CCC's outlays. Including conservation programs and other programs for which CCC funding was authorized by the 1996 Farm Bill, CCC outlays are projected to total \$8.6 billion in fiscal year 1998 and \$8.4 billion in fiscal year 1999, and are expected to decline to about \$7.0 billion by fiscal year 2003. This outlay trend is shown on the graph that follows.

CCC OUTLAYS
FISCAL YEARS 1985 THROUGH 2003

Total net outlays for fiscal year 1999, including the impact of proposed legislative savings, are expected to decrease by \$200 million to \$8.4 billion.

ADP Expenses and other Section 11 Activities

Section 161 of the 1996 Farm Bill significantly limits the use of CCC funds for certain operating expenses. CCC spending for equipment or services relating to automated data processing (ADP), information technologies or related items (including telecommunications equipment and computer hardware and software, but excluding reimbursable agreements), was limited by the 1996 Act to \$275 million for the six-year period including fiscal years 1997 through 2002, unless additional amounts for such contracts and agreements are provided in advance in appropriation acts. The amount actually obligated for ADP-related expenses in fiscal year 1997 was \$36.1 million. The 1999 budget assumes that expenditures for computer and telecommunications equipment subject to the cap will total \$107 million in fiscal year 1998 and \$76 million in fiscal year 1999. Start-up funding for the Common Computing Environment (CCE) is included in both years, and will supplement other agencies' funds to begin USDA Service Center CCE implementation activities.

Section 161 of the 1996 Act also amended Section 11 of the CCC Charter Act to limit the uses of CCC funds for reimbursable agreements and transfers and allotments of funds to State and Federal agencies. Starting in fiscal year 1997, the total of CCC fund uses under that section in a fiscal year, including agreements for ADP or information resource management activities, may not exceed the total of such allotments and transfers in fiscal year 1995. CCC obligations for Section 11 activities in fiscal year 1995 were \$46.2 million, obligations in fiscal year 1996 were \$51.2 million, and obligations in fiscal year 1997 were \$39.3 million. The budget projects obligations under the cap for reimbursable agreements will total \$44.9 million in fiscal year 1998 and \$46.1 million in fiscal year 1999.

Reimbursement for Realized Losses

Mr. Chairman, the 1999 budget reflects a need for \$8.439 billion to reimburse CCC for its fiscal year 1997 realized losses, an increase of \$7.7 billion from the fiscal year 1998 reimbursement of \$784 million. In prior years, the request for appropriations to reimburse the CCC for net realized losses has been based on an estimate of losses incurred one year earlier which have not been previously reimbursed. The estimate could exceed or fall short of the actual amount of loss. Last year, in response to OIG recommendations, the request for appropriations to reimburse CCC for net realized losses covered the actual amount of the unreimbursed losses incurred 2 years earlier. In this manner, realized losses are not requested for reimbursement until actually recorded on the books of CCC. The appropriation request for fiscal year 1999 would fully reimburse CCC the balance of actual fiscal year 1997 realized losses of \$8.439 billion. Appropriations to reimburse CCC for actual net realized losses to be incurred in 1998, currently estimated to total \$8.5 billion, will be requested in the fiscal year 2000 budget.

Appropriation Language Change

One CCC appropriation language change is proposed in the budget. Language pertaining to a minimum level of export credit guarantees is proposed for deletion. This language is not required in the appropriations act because the export credit authorizations are permanent authority. Moreover, the 1999 budget adopts a new approach for presenting more realistic annual program levels for the export credit guarantee programs. The estimates for the annual level of programming will reflect the actual level of sales expected to be registered under the export credit guarantee programs, to be determined by program demand, market conditions, and other relevant factors.

CCC-FUNDED CONSERVATION PROGRAMS

Conservation Reserve Program

The 1996 Farm Bill reauthorized the Conservation Reserve Program, established maximum enrollment at 36.4 million acres, and changed the program's financing from direct appropriation to CCC funding. The legislation also redefined the program, changing its primary focus from highly erodible land conservation and supply management to environmental protection, with wildlife habitat and water quality joining soil erosion reduction as primary program objectives.

Continuous signup has been available for certain high priority practices involving small acreages, such as filter strips and shelterbelts. As of December 1997, over 500 thousand acres have been signed up under this provision. The 16th signup for CRP regular enrollment began on October 14, 1997, and ended on November 14, 1997, with 9.5 million acres offered for enrollment at FSA offices. The 1999 budget assumes acreage enrolled under the 15th and 16th signups, in combination with the continuous signup, will bring CRP enrollment to about 32 million acres in fiscal year 1998, to 34 million acres in fiscal year 1999, and to an eventual enrollment of 36.4 million acres by fiscal year 2001.

In 1998, CCC is making payments of approximately \$1.603 billion for rental costs of acres that were enrolled for fiscal year 1997. About \$195 million is being used for sharing the cost of permanent cover on acres enrolled during the 15th and 16th signups and under continuous signup provisions. Fiscal year 1998 CRP technical assistance costs of \$63 million for NRCS and FS are funded by unobligated balances of CRP funds appropriated prior to enactment of the 1996 Farm Bill. For 1999, CCC program costs are expected to total approximately \$1.694 billion, consisting of: \$1.497 billion for rental payments on acres enrolled for fiscal year 1998, including those approved during the 15th, 16th, and continuous signups; and about \$197 million for cost-sharing of permanent cover on enrolled acres. Fiscal year 1999 CRP technical assistance costs of \$24 million for NRCS and FS are also funded by unobligated balances of CRP appropriated funds.

Other CCC-Funded Conservation Programs

The 1996 Farm Bill restructured many of USDA's conservation programs and, as with the CRP, changed the financing to CCC funding. With the exception of the Flood Risk Reduction Program, the CCC-funded conservation programs are administered under the lead of NRCS. NRCS will discuss these programs with you in detail, and I will just mention them briefly.

The Wetlands Reserve Program was reauthorized by the 1996 Farm Bill, and funding of \$123.7 million is included in the CCC budget. The new Environmental Quality Incentives Program encompasses the objectives of four previous conservation programs: the Agricultural Conservation Program, the Water Quality Incentives Program, the Great Plains Conservation Program, and the Colorado River

Basin Salinity Control Program. The CCC budget reflects \$300 million for the EQIP in 1999, including the proposed legislation to increase the program by \$100 million in 1999 and by a total of \$350 million for 1999 to 2003. The Conservation Farm Option is a pilot program which allows an eligible producer to receive a single payment totaling what he or she would have received separately under the CRP, WRP, and EQIP. For 1999, \$25 million is included for the CFO in the CCC budget. CCC funding of \$20 million will be transferred to NRCS to be used in 1999 for the Wildlife Habitat Incentive Program, which shares the cost of developing habitat for upland wildlife, wetland wildlife, threatened and endangered species, fish, and other types of wildlife.

FARM LOAN PROGRAMS

The programs of the Agricultural Credit Insurance Fund (ACIF) provide a variety of loans and loan guarantees to farm families who would be unable to obtain credit otherwise. The 1999 budget provides for a total program level of almost \$3.0 billion in ACIF direct loans and guarantees, up approximately \$83 million from the current estimate for 1998. The largest segment of FSA lending is carried out in partnership with private lenders through the guarantee programs, which are most cost-efficient for the taxpayer because of their low subsidy cost. This budget continues strong support for guaranteed loans, with a proposed program level of over \$2.3 billion. Moreover, in accordance with the recommendations of the Secretary's Civil Rights Action Team (CRAT) report of February 1997, we are seeking additional funding for direct loans, which provide affordable, supervised credit, a portion of which is targeted to beginning farmers and members of socially disadvantaged groups.

For direct farm ownership loans we are requesting a loan level of \$85 million, at least 18 percent of which would be targeted to socially disadvantaged farmers. This program level, an increase of over \$39 million from fiscal year 1998, would enable FSA to extend credit to more than 1,000 small and beginning farmers to purchase or save a family farm, nearly double the number estimated for the current fiscal year. For direct farm operating loans we are requesting a modest increase for a program level of \$500 million, up about \$10 million from 1998, to provide about 11,580 loans to family farmers. At least 12 percent of this funding would be targeted to socially disadvantaged farmers. Both of these direct loan requests represent the levels recommended by the CRAT report.

For guaranteed farm ownership loans in fiscal year 1999, we are requesting a loan level of \$425 million, an increase of \$25 million. For guaranteed farm operating loans we propose to hold the 1999 program level at the current level of \$1.9 billion.

Other Loan Programs.—The Budget requests a loan level of \$25 million for credit sales of acquired property, unchanged from 1998. This program assists qualified applicants to purchase property in FSA inventory.

The Budget also proposes a program level of \$25 million in emergency disaster loans in fiscal year 1999. In addition, our budget proposes to offer just over \$1 million in Indian tribe land acquisition loans and \$30 million for boll weevil eradication.

We have noted the recommendations of the Secretary's National Commission on Small Farms and are studying ways to use them. Our farm loan programs are already essentially directed at small farms since only family-size farms meet our loan eligibility requirements. Our average farm operating loan is about \$45,000. In response to a recommendation made by both the Commission and the CRAT, USDA is proposing legislation to amend the 1996 Farm Bill prohibition on loans to borrowers who have been granted debt forgiveness. This change is designed to provide a second chance to borrowers who might be denied credit as a result of losses that occurred long ago.

OTHER APPROPRIATED PROGRAMS

State Mediation Grants

Since 1987, State Mediation Grants have enabled a number of States to develop programs to deal with conflicts involving distressed agricultural loans. The Department of Agriculture Reorganization Act of 1994 expanded the program from farm credit cases only, to include disputes concerning wetland determinations, conservation compliance, pesticides, and other agricultural issues. Operated primarily by State universities or departments of agriculture, the program provides neutral mediators to assist producers, primarily small farmers, in resolving disputes before they culminate in litigation or bankruptcy. Moreover, this program supports the Vice President's initiative to achieve savings through alternative means of dispute resolution since mediation, at \$200 to \$250 per case, offers significant savings over national level administrative hearings, which cost about \$3,000 to \$4,000 per case.

Participating States certify their programs with FSA annually. Currently, 21 States have programs that qualify for grants. At least one additional State is expected to be certified for fiscal year 1999, and additional States are in the process of developing programs. For fiscal year 1999 the Budget requests \$4 million, an increase of \$2 million over fiscal year 1998, to meet the rising demand expected as a result of the program's broadened scope and to accommodate newly participating States. This level would allow us to provide grants which cover the full 70 percent of program costs authorized by law, eliminating the need to prorate available funds among States as we have done at the current appropriated level.

A proposed rule for this program is in final stages of clearance within the Department and will soon be published for public comment. The regulations provide a uniform set of requirements for all States participating in the program and address the issue of confidentiality of records in mediation cases.

Emergency Conservation Program

The Emergency Conservation Program assists producers in rehabilitating farmland damaged by natural disasters and in carrying out emergency water conservation measures during periods of severe drought. The program shares the cost of practices to restore the land to its productive capacity as it existed prior to the disaster. As might be expected, funding needs for this program vary widely from year to year, depending upon the occurrence of natural disasters.

The President's Budget requests no ECP funding for fiscal year 1999. No funding was provided in the fiscal year 1998 Appropriations Act, but carryover unallocated balances remain available from supplemental funding of \$95 million in fiscal year 1997. As of March 12, approximately \$9.7 million is available for allocation. Allocations of about \$14.3 million have been issued so far in fiscal year 1998 for some of the Northeast States hit by ice storms, several States damaged by floods, and a number of other States affected by other disasters. Additional requests are anticipated from the Northeast as well as flood-damaged regions of California, and others. We anticipate that all funds remaining from 1997 will be allocated before the end of the fiscal year. Accordingly, as I mentioned earlier, the Administration has transmitted a request for \$20 million in supplemental funding that would be contingent upon usage of available funds and subject to a budget request from the President.

Dairy Indemnity Program

The Dairy Indemnity Program compensates dairy farmers and manufacturers who, through no fault of their own, suffer income losses on milk or milk products removed from commercial markets due to residues of certain chemicals or other toxic substances. Payees are required to reimburse the Government if they recover their losses through other sources such as litigation. The 1999 appropriation request of \$450 thousand would cover a higher than normal but not catastrophic level of claims.

ADMINISTRATIVE SUPPORT

The costs of administering all FSA programs are funded by a consolidated Salaries and Expenses account. The account is comprised of direct appropriation, transfers from program loan accounts under credit reform procedures, user fees, and advances and reimbursements from various sources. The Budget proposes to increase direct funding by \$40.7 million, of which \$17.8 million is included under the Agricultural Credit Insurance Fund program account in order to offset serious staff shortages in administering farm loan programs. These resources would help achieve reduced direct loan losses by providing enhanced supervised credit, and would also allow reduced processing time for direct and guaranteed loan requests. We also plan to lower delinquency rates by increasing our loan servicing capability. Our proposal for \$952.7 million in direct funding reflects increases for the Common Computing Environment (\$30 million) and pay costs (\$20.8 million), partly offset by salary savings from reductions in staffing financed by direct funds (-\$11 million). Considerable county office staffing reductions occur because of a \$37.8 million reduction in available carryover funds in 1999, and because of continuing workload impacts of the 1996 Farm Bill.

The increase of \$30 million for the Common Computing Environment (CCE) will be used, along with funding from the Natural Resources Conservation Service and Rural Development, to implement the CCE for USDA Service Centers. A CCE will provide a common technical architecture supporting both the program delivery and administrative support of participating agencies. Implementation is based on a thorough analysis and reengineering of business practices and involves pretesting, procurement, deployment, installation, and training associated with equipment and software such as standard network servers, desktop or laptop computers, standard-

ized peripherals, and commercial off-the-shelf software. Achievement of a CCE will enhance customer service and optimize the opportunities for sharing of resources among the USDA Service Center partner agencies.

In the meantime I am happy to report that FSA is making good progress in conversion and retrofitting of existing computer systems to ensure Year 2000 compliance. In August of 1996, we established a target of September 30, 1998, for completion of conversion, well ahead of the Office of Management and Budget's recently announced target of March 1999. We have reported and tracked the status of all Year 2000 efforts since October 1996. All FSA systems that have not been cancelled or replaced are regarded as mission critical. As of January 28, 1998, we have completed 42 percent of our Information Technology (software application) systems. For all Year 2000 projects, both application and non-application projects, we have completed over 27 percent. Within the next 3 to 6 months, the percentage of completion will increase significantly as ongoing field office projects are finished. Our planned early completion target will allow us time for testing and correction of any problems.

Staffing

From fiscal year 1993 through the current fiscal year 1998, FSA will have reduced total staffing by 25.8 percent. These reductions reflect an overall 22.5 percent reduction in Federal staff years and a 27.5 percent reduction in non-Federal county office staff years. The fiscal year 1999 Budget proposes a further reduction of 1,118 staff years for fiscal year 1999, of which 263 are Federal staff years and 855 are non-Federal county office staff years.

As you know, Mr. Chairman, we have proceeded with the closure of FSA county offices according to the 1994 plan. However, the staffing reductions we are proposing for fiscal year 1999 require a reexamination of our county office structure. Because there is a point at which an office can be too small to function effectively, it may become necessary to consolidate offices where staffing reductions take place. I will consider any closure decisions in light of cost effectiveness and quality of service to the producer, and I will keep the Committee apprised of any prospective closures.

As you also are aware, the Secretary favors converting FSA non-Federal county committee employees, with their career tenure, to Federal civil service status. Conversion of these FSA non-Federal employees to Federal civil service status would eliminate the challenges FSA currently faces in operating two different personnel systems for employees in county offices. These challenges include the fact that non-Federal FSA employees cannot compete for FSA Federal vacancies on an equal footing with Federal employees, non-Federal employees who are RIFed are not entitled to assistance and priority placement under the Career Transition Assistance Program, and FSA is required by law to establish separate supervisory reporting lines for non-Federal and Federal employees located in the same county office.

Legislative Proposal

In closing, I would like to point out that the President's Budget includes a proposal to provide \$10 million of FSA's 1999 funding through charging a fee for information requested by insurance companies, appraisers, consultants, attorneys, and others. This proposal is in keeping with the Administration's user fee initiative intended to shift costs from the general taxpayer to the parties that benefit directly from the information.

Mr. Chairman, this concludes my statement. I will be happy to answer your questions and those of the other Subcommittee Members at any time.

PREPARED STATEMENT OF LON HATAMIYA

Mr. Chairman, members of the Subcommittee, I appreciate the opportunity to review the work of the Foreign Agricultural Service (FAS) and to present the President's budget request for fiscal year 1999.

Although I have been administrator of FAS for a short time, I am familiar with the Agency and its accomplishments, both through my work as administrator of the Agricultural Marketing Service and through work on my family's farm in California. During my four years as AMS administrator, FAS and AMS worked together on a regular basis, particularly in our efforts to implement the North American Free Trade Agreement (NAFTA). As a farmer from the No. 1 exporting state, I can fully appreciate the role of FAS in assisting agricultural exporters and the increasing importance that exports will play in the future for American farmers.

AGRICULTURAL EXPORTS REACH SECOND HIGHEST LEVEL EVER

In fiscal year 1997, U.S. agricultural exports reached \$57.3 billion, the second highest level on record. Last year also marked the third consecutive year that exports topped \$50 billion.

Exports of intermediate products (such as soybean meal and planting seeds) set a record at \$12.3 billion. Consumer-oriented products also reached a record level of \$20.8 billion, with poultry and fresh fruit leading the way. Exports of bulk products were down 16 percent because reduced wheat, corn, and cotton sales offset record soybean and tobacco sales.

Four of 1997's top 10 markets for U.S. agricultural exports rose to new highs. Records were set to both U.S. neighbors, Canada and Mexico. Together, our NAFTA partners accounted for \$11.7 billion in U.S. exports this past year, 20 percent of our total agricultural exports worldwide and greater than our sales to Japan. Records were also set to Hong Kong and Russia. However, we also experienced declines in other top markets with value declines to three key Asian markets—Japan, Taiwan, South Korea—ranging from 10 to 12 percent.

The Latin American market continues to grow in importance for U.S. agriculture. U.S. exports to Latin America reached \$10 billion in 1997, exceeding the total for all of Western Europe.

As usual, agriculture made a healthy contribution to the U.S. merchandise trade balance in fiscal 1997. The agricultural trade surplus (exports minus imports) ended the year at \$21.5 billion. With this latest figure, agriculture has now registered trade surpluses in each of the last 37 years.

More so than agricultural products, U.S. wood and fishery products faced a mixed trade picture in fiscal 1997. It was good news for wood product exports, which reached a record \$7.5 billion—up 5 percent from the previous year. Edible fish and seafood products did not fare as well. Export value slipped 6 percent to \$2.7 billion. Weak world salmon prices, a shortage of U.S. crab and crabmeat, increased competition, and sluggish demand all contributed to this drop.

Combined U.S. exports of agricultural, wood, and fish products in 1997 were \$67.4 billion. This was down 3 percent from 1996's record-breaking \$69.8 billion, but well above earlier levels. In fiscal 1990, agricultural, wood, and fish exports totaled only \$49.4 billion.

For fiscal 1998, our February estimate forecasts U.S. exports at \$56 billion. With imports projected at \$38.0 billion, the current estimates set the agricultural trade surplus at \$18 billion this year. The decline in exports forecast for this year is due largely to the unsettled financial situation in Asia, strong competition from other exporting nations, and the strong dollar.

Mr. Chairman, one of USDA's primary goals is to expand economic and trade opportunities for agricultural producers and other rural residents. The modest annual growth projected in domestic demand for U.S. agricultural products makes the export market one of the most viable sources of increases in U.S. farm income.

FAS MISSION, ACCOMPLISHMENTS AND FUTURE CHALLENGES

Before I present our budget request, I would like to briefly share my thoughts on our mission highlighted in our 5-year strategic plan, and briefly review the strategies we will use to successfully accomplish our goals. My staff at FAS has created a highly focused strategic plan to guide us in accomplishing our mission and turning future challenges into opportunities for U.S. agriculture. As stated in our strategic plan, FAS' mission is to serve U.S. agriculture's international interests by expanding export opportunities for U.S. agricultural, fish, and forest products and promoting world food security.

FAS identified two goals and a number of strategies in its strategic and annual performance plans that I believe will help us help American agriculture tap into export opportunities. The first goal is to expand export opportunities. We will accomplish this goal by:

- aggressively pursuing reductions in trade barriers and trade-distorting practices of key trading partners;
- identifying constraints to U.S. exports and implementing strategies for overcoming them;
- defending U.S. agricultural interests by promoting U.S. policy views before the international community;
- strengthening the export knowledge and skills of producers, exporters, and new-to-export small agribusiness firms so they can compete more effectively in the international marketplace;
- educating foreign buyers on the merits of U.S. products;

- targeting market development and promotion activities to leverage the entrepreneurial spirit of America's small business owners in expanding agricultural exports;
- assuring accurate and timely dissemination of market intelligence that serves a broad domestic customer base through the effective application of technologies such as the Internet;
- effectively applying our GSM export credit guarantee programs in developing country markets where liquidity is a limiting factor to U.S. exports; and
- using the Dairy Export Incentive Program (DEIP) up to GATT-allowable limits. Our second goal is to promote world food security, which we will accomplish by:
 - ensuring the U.S. research community has accurate and up-to-date information about areas of emerging trends in scientific research and technical activities that will benefit U.S. farmers through improving farming technologies;
 - supporting economic development efforts, especially in emerging markets and developing countries;
 - continuing to use the Public Law 480, Title I program, increasing its focus on the private sector; and
 - continuing the successful work under the Food for Progress program with private voluntary organizations.

Through these aggressive strategies, we are helping our farmers and ranchers meet the competitive challenges both now and in the future. FAS conducts a wide range of programs and activities to successfully implement these strategies, as we work to achieve our mission and goals. Some accomplishments in 1997 include:

Trade policy accomplishments.—In 1997, the United States won a major victory in the first case brought to the World Trade Organization (WTO) under the new Sanitary and Phytosanitary (SPS) Agreement. In August, the WTO upheld the claims of the United States and Canada that the European Union's (EU) import ban on meat from hormone-treated animals was inconsistent with the EU's commitments under the WTO SPS Agreement. The decision was affirmed just last month by the WTO's Appellate Body. This ban, initiated in 1989, stopped over \$100 million in U.S. beef exports annually. We are ready to work with EU officials toward resuming normal trade as soon as possible.

Other accomplishments included the first commercial shipment of U.S. tomatoes to Japan, the lifting of Egypt's ban on imported poultry, gaining market access for sweet cherries in Mexico, preserving the market for U.S. petfood exports to Switzerland, implementing a project to expedite shipments of live cattle from Montana and Washington to Canada, and working with Chile to re-open its market to U.S. wheat.

Enforcing Trade Agreements.—FAS aggressively monitored foreign countries' compliance with Uruguay Round Agreement commitments during 1997, the second year of the agreement's implementation. FAS efforts helped safeguard negotiated trade benefits, including working with Costa Rica to open its poultry tariff rate quotas, which had been delayed by domestic legal challenges. That action set a precedent for other countries to implement their agreement commitments. FAS efforts also resulted in the Philippines taking major steps to fully open its market for U.S. pork and poultry exports. FAS work contributed to the opening of formal dispute settlement proceedings by the U.S. government that will challenge the EU's cheese export subsidies and Canada's milk price pooling scheme—practices that may constrain U.S. dairy exports. We have used the NAFTA committee process to gain new access for sweet cherries and address restrictions that would have impeded exports for grain, livestock, fruit and milk to Mexico.

Expanding and Improving Export Assistance Programs.—Export programs and services were refined and expanded to meet changing demands of the international marketplace and keep pace with the competition. In 1997, funding offered under the Foreign Market Development Program (FMD) for the first time was provided to export organizations through a competitive process. Under the 1997 Market Access Program (MAP), 84 percent of the brand promotion funds assisted small-sized companies and cooperatives. Funding has been cut significantly for large companies and will be eliminated entirely in the 1998 allocation process.

In 1997, U.S. exporters reported the first sales under the Supplier Credit Guarantee Program. In addition, a new Facilities Credit Guarantee Program was launched. The program provides payment guarantees to help finance exports of U.S. goods and services for agricultural facilities in emerging markets.

Through a variety of training experiences throughout the United States, the Cochran Fellowship Program provided 707 participants from 45 countries exposure to U.S. economic policies, business practices and products. New programs were initiated in Kenya, Namibia and Brazil. In Ukraine, USDA, through the Commercial Agriculture Development Project, provided technical assistance and training to develop a system of grades and standards to facilitate domestic and international commerce.

Reaching Out to New Exporters.—FAS continued its outreach efforts to educate American farmers and exporters about foreign sales opportunities. In 1997, efforts continued to target cooperatives and small, disadvantaged, and minority firms. New partnerships were formed with vocational agriculture teachers, 4-H and FFA representatives to inform more of the public, particularly young farmers, of the dynamics of agricultural exports and the need to get more producers and companies exporting. In addition, FAS has worked with the FFA and United Negro College Fund to organize an international intern program providing interested students an opportunity to gain international experience by working in select FAS overseas offices.

Providing Scientific and Policy Leadership on Biotechnology.—In 1997, FAS and other USDA agencies took a leadership role to ensure that farmers and consumers around the world have access to approved products resulting from biotechnology. FAS worked tirelessly in EU countries to convince policy makers of the need for food safety decisions to be based on sound science. Two biotech products were cleared for importation by most European countries. FAS worked with Egyptian officials to continue to keep the Egyptian market open to approved agricultural biotechnology products. USDA worked to assure Brazilian officials of the safety of approved biotechnology products, and Brazilian officials approved the importation of 1.5 million metric tons of soybeans, including those derived from biotechnology. The establishment of the U.S.-Indonesia Food and Agricultural Forum insured continued dialog among senior public and private sector officials of both countries on issues related to food safety, genetically engineered products and trade. This is envisioned as a model to engage the leadership of other countries in a continuing discussion of these important issues. The United States also is a key proponent of a biotech initiative under the Asian Pacific Economic Cooperation (APEC) forum. We are sponsoring educational workshops aimed at harmonizing regulatory approaches to biotech products among APEC members.

Working to Ensure Food Security Around the World.—In 1997, USDA worked vigorously to continue the momentum created by the 1996 World Food Summit. At the Summit, 186 countries adopted a Plan of Action that endorses trade liberalization, free markets, private sector initiative, sustainable development, and self-reliance rather than self-sufficiency. USDA is coordinating U.S. follow-up by the government, which emphasizes strengthening the U.S. contribution to alleviating hunger and malnutrition at home and abroad. Central to that effort is the development of a U.S. Action Plan on Food Security to serve as a blueprint for future U.S. policies and programs. The plan is being developed in full collaboration with non-government organizations, the private sector and academia. Intended to be not just a government plan, but one for the country as a whole, its completion will hopefully also be an incentive for other countries to meet their commitments made at the Summit.

Promoting Scientific Cooperation.—USDA scientific cooperation with foreign countries continues to pay off in practical ways for U.S. agriculture. USDA uses science to help solve critical problems such as trade barriers and phytosanitary issues, food safety, and exotic diseases and pests. Postharvest technology scientists have worked with Malaysian counterparts to develop quarantine treatments to hasten the elimination of trade barriers to commodities susceptible to fruit fly. A Chinese team visited the United States to exchange information on viral diseases of animals, laying the groundwork for the exportation of U.S. Shorthorn cattle and diagnostic equipment to China.

Scientists are also promoting new industrial uses for U.S. agricultural products overseas. Initiatives include collaboration with Hungary on biodegradable plastics from corn starch, Argentina on hypoallergenic latex from guayule, and Mexico on pulp and paper products from crop wastes. Such projects help open new markets for U.S. products and diversify the U.S. export portfolio.

An important component of global food security is food safety. USDA has ongoing efforts to transfer existing technologies and develop new technologies in food safety. An example of successful technology transfer is a project that allowed USDA to provide relevant information to the Bulgarian government concerning health risks of rice grown in a region contaminated with arsenic. Subsequent efforts have focused on developing new phytoremediation techniques using plants to detoxify contaminated soils.

Challenges for 1998

Mr. Chairman, we just need to look at the front page of nearly any newspaper in America to see the issues confronting American farmers and producers. From Asian currency problems to biotechnology to food safety concerns, American farmers face challenges that were unthinkable just a few years ago. Today's global trading environment means that the actions taken by governments and businesses far from U.S. shores can and do have an impact on U.S. farmers. The enactment of the land-

mark 1996 farm bill makes the role of exports and, in turn, the role of FAS even more prominent in increasing the economic opportunities for America's farmers and ranchers. I would like to take a few moments to outline some of the issues we will be focusing on in the coming year.

Impact of Asian Financial Problems.—USDA's latest export forecast shows plainly the impact the events in Asia are having on our exports to those markets. I just recently returned from Japan and Korea to learn first hand the problems and the issues that continue to face those countries and U.S. exporters. Earlier this year, I also visited several Asian nations and the information I gathered on my most recent trip will help us determine whether our initial efforts are meeting with success.

We intend to use all the programs at our disposal to diminish the impact on U.S. agricultural exports. We have announced the availability of \$1.1 billion in export credit guarantees to South Korea, and have increased the availability of export credit guarantees to the Philippines, Indonesia, Malaysia, Thailand, and Singapore to more than \$1 billion. We have sent a technical team to the region and a follow-up team will visit this spring to ensure the smooth operation of these programs. We also will continue to constantly review the situations in these markets to ensure that U.S. exporters have all the necessary tools available to them.

Competitive Pressures.—The outlook for U.S. agricultural exports is heavily influenced by competitive pressures that differ by commodity and can affect price and/or quantity of sales. One of the primary sources of this pressure is the rising value of the U.S. dollar, especially against the currencies of our major competitors. This has the effect of making U.S. exports more expensive to our customers, relative to those of our competitors. Unfortunately, the dollar has been rising against the currencies of all our competitors. Given the strength of the American economy, this situation is likely to continue for the foreseeable future, putting downward pressure on the U.S. share of world trade.

There are commodity-specific competitive pressures that pose challenges to U.S. exports as well. Record production of soybeans in South America will continue to pressure prices in 1998 and these pressures will continue in future years. We expect South American production of grains and oilseeds to expand significantly in the years ahead, offering increased competition to U.S. suppliers in third country markets, and pressuring prices in the process. Likewise, Chinese corn and East European corn and feed wheat available for export have been putting downward pressure on U.S. corn prices so far this year. While the threat from Chinese corn appears to have abated as supplies have diminished, East European products will continue to pressure U.S. corn prices.

In addition, we will continue to face stiff competition in markets around the globe. Our annual review of the export promotion activities of the 22 countries that account for our major competition found that just like the United States, many of our competitors have ambitious export goals. The EU and other countries assist their producers and small business to develop foreign markets through activities similar to our Market Access Program and Foreign Market Development Program. Market promotion by EU countries is estimated at \$400 million in 1995/96, with about one-half of that amount provided by EU-member governments. The rest of the funds comes from producer-funded organizations and other fees. Australia, Canada, and New Zealand have strong national government promotion agencies and rely heavily on their statutory marketing boards to carry out market development activities for producers of specific agricultural products.

In addition to market promotion activities, the EU also carries out an extensive subsidy program. Of the \$7.2 billion budgeted by the EU in 1997 for export subsidies, over 85 percent was for exports of high-value products such as fresh and processed fruits and vegetables, wine, dairy products, and meat and meat products.

Fast-track Authority.—We were obviously disappointed that the President's traditional trade negotiating authority was not renewed in 1997. Like his predecessors since Gerald Ford, the President and his negotiators need this authority to gain further market access overseas, extract significant concessions from our trading partners, and play a leadership role in shaping new trade agreements. But it isn't over. The Administration is conferring with key members of Congress to secure this authority. Our preference would be for broad fast track authority, incorporating the specific goals for agriculture that were spelled out in the President's last bill.

Next Round of Multilateral Trade Negotiations.—As important as the Uruguay Round was for initiating the process of liberalizing world trade in agricultural products, a lot of work remains to be done. WTO members agreed to begin negotiations on the next phase of agricultural trade liberalization at the end of 1999. These negotiations are the best chance U.S. agriculture has for further reducing tariffs, opening new markets, and addressing unfair trade practices on a global scale. Fast track authority was critical in concluding the Uruguay Round, and renewed authority is

viewed as essential for U.S. negotiating credibility and success in future WTO negotiations. Several key issues stand out:

- Substantial further reductions in tariffs are needed.
- Tariff-rate quotas (TRQ's) should be substantially increased or effectively eliminated by cutting the out-of-quota duty.
- Export subsidies should be further cut or eliminated.
- Rigorous disciplines should be imposed on the activities of state trading enterprises.
- Tighter disciplines are needed to prevent countries from circumventing their trade commitments through disguised subsidies and nontariff measures.
- Rules on sanitary and phytosanitary measures should be tightened so countries cannot disguise protectionist intentions or pander to irrational concerns regarding public health.

Refining Our Export Assistance Efforts.—Today's competitive environment for exporters coupled with budget realities means that the Federal government must continue its efforts to do more with less. At FAS we are using the Government Performance and Results Act (GPRA) strategic planning framework to rethink our export assistance efforts from top to bottom. We continue to emphasize customer service and search for ways we can improve program delivery. This year, we will begin moving toward a one-stop application process for both our MAP and FMD programs to better coordinate our export efforts across programs, as well as simplify and reduce the paperwork burden on potential program participants. This is one example of our efforts to implement GPRA principles to guide us in allocating our export promotion resources.

In our credit guarantee programs, we will continue to expand our outreach activities to educate both potential exporters and importers about how the programs can benefit them. We will also continue to work to increase the number of U.S. firms participating in the export market through our efforts with state departments of agriculture and state legislators as well as groups such as FFA.

World Food Security.—Improving world food security continues to be a top priority. This year, we will continue to work with the public and private sectors to develop a U.S. Action Plan on Food Security that will serve as a blueprint for future U.S. policies and programs. Our food aid programs are also under review as we evaluate the changes that were made as a result of the 1996 farm bill.

Another area of emphasis is our effort to ensure that farmers and consumers around the world have access to approved products resulting from biotechnology. Properly used and regulated, biotechnology offers one of the most promising tools for meeting future demand for an abundant, affordable, nutritious, and safe global food supply. It holds the potential for reducing the use of crop chemicals and fossil fuels, adapting plant varieties that can be grown in harsh conditions, reducing losses to plant pests and diseases, increasing the shelf life and the nutritional content of foods.

Equal Employment Opportunity.—I am firmly committed to ensuring that FAS supports the civil rights of all our employees. As you can see, the challenges facing us are many, and we can only begin to accomplish these goals by effectively working together. Under the direction of Secretary Glickman, we are committed to ensuring equal opportunity; respecting the civil rights of all employees, clients, and customers; and creating a work environment that is free of discrimination and harassment, while accommodating the needs of persons with disabilities. As an Asian American, I have experienced prejudice and stereotypical assumptions solely based on my heritage. As FAS administrator, I will carefully monitor the implementation of our agency's EEO commitment and will hold each employee at every level personally accountable for his or her conduct and performance, as a public servant, in equal opportunity and civil rights.

FAS BUDGET REQUEST

Mr. Chairman, today's budget realities mean that government must be leaner and more efficient, but the era of a responsive and responsible government is not over. While there are things that government can't or shouldn't do, there are many legitimate public needs that only government can meet. Whether it's working to resolve trade disputes, supporting the American private sector as it battles in export markets against foreign competitors flush with funds from their national treasuries, or educating potential exporters, FAS has a vital role to play.

The fiscal 1999 FAS budget proposes a funding level of \$145.6 million and 819 staff-years. This represents an increase of \$5.6 million above fiscal 1998 funding levels but a reduction of 62 staff-years from 1998 levels. The budget proposes several initiatives that I would like to briefly review with you.

The 1999 budget proposes that the costs of operating the CCC Computer Facility, and other related FAS Information Resources Management (IRM) costs shall be funded through the FAS appropriation. The Facility serves as the Department's collection point for international production intelligence and crop estimates. Currently, these activities are funded through a reimbursable agreement with CCC. This change will shift funding for these activities from mandatory to the more appropriate category of discretionary spending. Additionally, with this shift, funding for these activities will no longer be subject to the annual limitation on CCC reimbursable agreements established by provisions of the 1996 Farm Bill.

The funding support for the CCC Computer Facility and other IRM costs is estimated at \$12.0 million in fiscal 1999. The budget proposes to finance this activity primarily by reducing employment, associated administrative cost reductions, and a reduction in the FAS contribution to the Foreign Market Development (FMD) Co-operator Program from \$27.5 million to \$22.0 million. It is anticipated that increased cost-share contributions by participants in the FMD Program will offset reduced FAS contribution levels.

Year 2000 Efforts.—I am pleased to report that all computer hardware and application software systems will be Year 2000 compliant by the end of calendar 1998. Of the 14 FAS mission-critical systems, eight are already compliant, and the remaining systems will be re-engineered or modified during calendar 1998. Independent Verification and Validation (IV&V) of FAS systems will be performed during the latter part of calendar 1998.

The budget proposes \$2.0 million to establish an overseas buying power maintenance account to assist FAS in managing unanticipated changes in the costs of overseas operations associated with exchange rate losses. This proposal responds to fiscal year 1998 conference report language that directs the Department to develop a plan for establishing an account to manage overseas currency fluctuations. Under this proposal, funds appropriated for this purpose in 1999 will be transferred to a revolving fund where they will remain until expended. Funds could be withdrawn from the account after exchange rate losses are verified. Exchange rate gains that may accrue will be deposited into the account.

The budget provides an increase of \$2.0 million for pay costs and higher agency contribution levels for employees under the Civil Service Retirement System and includes \$4 million for overseas administrative services provided by the Department of State in support of the International Cooperative Administrative Support Services (ICASS) program. In 1998, \$4.4 million has been transferred from the Department of State for this purpose.

The budget includes an increase of \$500,000 to develop a more effective FAS Government Performance and Results Act (GPRA) performance measurement and evaluation system and to re-engineer market intelligence gathering processes. FAS will enlist the help of private sector experts to develop a cross-agency performance tracking and evaluation system to determine success rates in attaining goals and objectives outlined in the FAS Strategic Plan. FAS also will evaluate and re-engineer its crop and market intelligence gathering activities, interagency partnering, and evaluation and dissemination processes to make them more efficient in terms of resource utilization and more responsive to internal and external customer needs.

For fiscal 1999, the budget includes \$3.0 million for the Cochran Fellowship Program, unchanged from 1998 levels.

Export Programs

Mr. Chairman, the export promotion, food assistance and foreign market development programs administered by FAS are key to expanding global market opportunities for U.S. agricultural producers. Our program proposals provide the tools to meet these new sales opportunities, tempered by the need to reduce Federal spending.

Export Credit Guarantee Programs.—The budget proposes a new approach to presenting the estimates for the CCC export credit guarantee programs. Program levels, budget authority and outlays will reflect the level of sales expected to be registered rather than the authorized levels. This provides more realistic estimates of the costs of the guarantee programs and improves the accuracy of CCC budget estimates. This change will not restrict program use; the authorized levels remain available for use as determined by program demand and changing market conditions.

Following this new approach, the budget projects an aggregate program level of \$5.0 billion for export credit guarantees in fiscal 1998 and \$4.6 billion for 1999. These program levels are significantly higher than in recent years, reflecting large increases in programming in Southeast Asia and South Korea during 1998 that are expected to continue into 1999.

The 1999 program level includes \$4.3 billion for the GSM-102 program and \$100 million for the GSM-103 program. Additionally, the budget includes \$150 million for supplier credit guarantees and \$50 million for facilities financing guarantees.

Public Law 480.—The 1999 budget provides a total program level of \$979 million for Public Law 480 foreign food assistance, a reduction of \$133 million from 1998 levels. At this program level, 2.8 million metric tons of commodity assistance will be provided, 700,000 metric tons below the current estimate for 1998. The reduction in Public Law 480 funding proposed for 1999 will occur in the Title I program; funding for Titles II and III will remain unchanged from 1998 enacted levels. This will ensure the availability of adequate resources to meet the most serious food assistance needs.

Market Access Program.—For the Market Access Program, the 1999 budget proposes to continue the program level at \$90.0 million, the maximum annual program level authorized in the 1996 Farm Bill.

Export Enhancement Program.—For the Export Enhancement Program (EEP), the budget proposes a program level of up to \$320 million for fiscal 1999. While world market conditions have limited the use of EEP over the past two years, we believe it is extremely important that we maintain a strong position in order to protect U.S. agricultural trade interests. Additionally, the budget proposed a flexible multi-year program level for EEP of \$1.2 billion for the fiscal years 1999 through 2003. This proposal will provide the Department with the administrative discretion to determine the annual funding level for EEP, subject to the \$320 million limitation in 1999. Amounts not used in one year will remain available for use in subsequent years, subject to the export subsidy reduction commitments made in conjunction with the Uruguay Round Agreement on Agriculture. It is anticipated that this proposal will generate some \$1.4 billion in savings over the five-year period that will be used to finance crop insurance sales commissions, increased EQIP funds, and other increases requested for mandatory programs in the budget.

Dairy Export Incentive Program.—For the Dairy Export Incentive Program (DEIP), the budget includes a program level of \$82.3 million, somewhat below the current level due to projected tighter domestic market situation. As is the case with EEP, actual 1999 program levels for DEIP will be determined by market conditions subject to the export subsidy reduction commitments made in the Uruguay Round Agreement on Agriculture.

This concludes my statement, Mr. Chairman. I will be glad to answer any questions.

PREPARED STATEMENT OF KENNETH D. ACKERMAN

Mr. Chairman and members of the Subcommittee, I am pleased to present the fiscal year 1999 budget for the Risk Management Agency (RMA). It is my privilege to appear before you as Administrator of RMA, and I would like to express my personal gratitude to the members of this Subcommittee who have shown a continuing interest and commitment to RMA programs.

The virtual elimination of ad hoc disaster aid and subsequent passage of the 1996 Farm Bill positioned the RMA to be the primary provider of the agricultural safety net. In order to assure that American agriculture remains solid, solvent, and globally competitive into the 21st century, RMA has committed itself to transforming the crop insurance program into a broad-based safety net for producers. That is our vision. We have worked to assure a broad-based safety net consisting of many public and private alternatives, all of which are intended to improve the economic stability of agriculture. Today, I want to discuss with you an important budget issue which must be addressed in order to continue our work establishing, maintaining, and delivering this safety net for producers. However, before I do that, I would like to emphasize our mandate which has taken RMA into many new areas beyond traditional crop insurance, including the development of innovative products based on proposals from the private sector spanning the breadth of the farm risk management community. I would also like to highlight some of RMA's key accomplishments for 1997.

PROGRAM PARTICIPATION

Participation in the crop insurance program remains at a significantly high level despite elimination of the requirement that producers obtain crop insurance to participate in other major Department of Agriculture (USDA) programs. In 1997, crop insurance provided \$24.3 billion in protection to more than 600,000 policyholders holding slightly more than 1.3 million policies on 181.4 million acres. We expect to have about the same level of participation in 1998 and 1999. In 1997, RMA expanded coverage on 29 insured crops to 343 additional counties in 26 States. In

1998, coverage will be expanded on 25 crops to 144 additional counties in 16 States. Further, Crop Revenue Coverage (CRC) is now available on almost 90 percent of the corn, wheat, cotton, soybean, and grain sorghum acres in the U.S. CRC helps protect producers from losses in yield, price, or combinations of both factors.

PREPARING FOR THE FUTURE

We are continuing to work with agricultural leaders nationwide to increase producers' awareness of risk management strategies and impress upon them the importance of taking active steps to protect their investments from fluctuating prices and weather disasters. Private sector participation is key to the success of this initiative. Without the active efforts of our private sector partners, our ability to help growers manage risk would be lessened. Our Risk Management Education effort is backed by a \$5 million apportionment of the Federal Crop Insurance Corporation Fund, on which we will draw in the coming months to carry out educational initiatives and competitively award education proposals submitted by our private sector partners, including farmer organizations, trade associations, and educational institutions. In its role as facilitator of the education effort, RMA will work to ensure that all producers are fully aware of not only the production risks but also the economic risks facing them in today's environment and of what tools are available to them to manage these risks. This initiative directly supports our strategic goal to strengthen the safety net for agricultural producers through sound risk management programs and education, as well as our objective to increase the agricultural community's awareness and effective utilization of risk management alternatives.

As part of our continuing efforts to develop programs for a range of agricultural commodities, we announced a new program for dairy farmers on January 6, 1998. The Dairy Options Pilot Program will provide minimum pricing guarantees for dairy farmers through a cost-sharing agreement with USDA. This program offers eligible producers a financial safety net by allowing them to purchase options on the price of their milk. Under this program, when milk prices fall, producers will be able to offset losses based on projected future earnings, in effect insuring the price of their milk. The pilot program, scheduled to begin this spring, is limited to six counties in six States that RMA will select on the basis of concentration of production and other factors. Funding for this program will be provided by the Commodity Credit Corporation.

In addition, we, along with our private sector partners, are exploring other opportunities to develop additional risk management tools, including insurance for many new crops and some exciting new products.

RMA recognizes changes and new challenges in its mandate and organizational environment and is currently underway with a Business Process Reengineering project which began in November, 1997. The project will produce a blueprint for re-engineering the risk management tools and compliance investigations lifecycles. Throughout this process, RMA will be responding to such factors as tightening budget and staff resources, as well as growing program demands from Congress, the Department, and key customers and partners. This process will help us achieve the goal and objectives I mentioned earlier, as well as our objective to improve program integrity and protect taxpayers funds.

STRENGTHENING THE PARTNERSHIP

After spirited negotiations, RMA and the insurance companies agreed on terms for a new Standard Reinsurance Agreement for the 1998 crop year. The new agreement reduced annual administrative costs by \$30 million and average annual underwriting profits by an estimated 20 percent. Timely completion of this agreement ensured that producers will continue to receive the high level of service they have come to expect, and that taxpayers will receive good value for their investment in American agriculture.

PRESERVING THE SAFETY NET

From 1987 to 1994, disaster assistance payments averaged roughly \$1.2 billion a year, while annual crop insurance outlays averaged roughly \$800 million over the same period. Combined, the total Federal expenditure was roughly \$2 billion annually. Since the Federal Crop Insurance Reform Act of 1994 (1994 Act), total expenditures for the crop insurance program have averaged \$1.2 billion annually. Compared to historical expenditures, the reform has saved between \$700 and \$800 million annually, net of Noninsured Assistance Program (NAP) payments, while providing most farmers affordable risk protection. While much of these savings are due to favorable weather, crop insurance reform has produced budgetary savings that have greatly exceeded expectations. For 1999, the crop insurance program is expected to

cost \$1.785 billion, which is still below the historic cost of disaster assistance payments.

To follow-up on my earlier remarks, I would now like to address the budget issue facing RMA for fiscal year 1999. The 1994 reform legislation did not fully fund the enhanced crop insurance program. Rather, about half of the amount needed to fund the administrative and operating (A&O) subsidy to participating private insurance providers—about \$188 million in fiscal year 1998—became subject to an annual appropriation of discretionary spending beginning in 1998.

We are prepared to resolve this dilemma and place the crop insurance program on a firm financial foundation. USDA has drafted legislation to shift the payment for A&O subsidy from discretionary to mandatory spending, a process that requires corresponding mandatory offsets. In fiscal year 1999, USDA will provide the offsets for this funding shift from sources outside the crop insurance program. Of the \$1.1 billion in offsets needed through fiscal year 2003, USDA will propose that about half come from the crop insurance program, with producers and insurance providers sharing the reductions. The balance will come from other USDA sources.

USDA is prepared to spend the time and energy necessary to craft a solution which is fair and flexible for those with an interest in the crop insurance program. By solving this funding dilemma, we will benefit producers by assuring year-in, year-out stability to the crop insurance delivery system and predictability for the program. Accordingly, we have proposed the following strategy in developing a package to accomplish the needed offsets beginning in fiscal year 2000:

- Limit payment eligibility under the catastrophic risk protection (CAT) insurance program to \$100,000 per person.*—The savings attributed to this action will be \$50 million in crop year 2000, increasing to \$56 million in 2003 under the baseline projections. In crop year 1997, about 9,500 producers had insurance coverage under CAT that exceeded \$100,000 for all insured crops. While maintaining the essential “safety net” for producers, the proposed limitation responds to criticisms of a “free” CAT program providing potentially millions of dollars of coverage to certain large operators.
- Reduce administrative subsidies for insurance providers from 27 percent to 25 percent of premiums for the standard plans of insurance.*—This action, combined with the reduced premium due to the limitation on CAT coverage, reduces costs by an estimated \$35–40 million per year.
- Reduce premium subsidies for higher levels of coverage.*—The smallest program cuts were made in this area in order to continue protecting farmers and encourage producers to take advantage of higher crop insurance coverage levels. Currently, the premium risk subsidy for each producer is calculated as if the per-person premium had been purchased at a 50 percent coverage of yield and 75 percent of the price election (50/75). A reduction to 50/72.5 will cause only a slight increase in producers’ out-of-pocket costs to pay premiums, approximately 10 cents per acre.
- Reduce the statutory loss ratio target from 1.075 to 1.060 beginning in fiscal year 2000.*—The savings attributed to this action are about \$30 million total during fiscal year 2000–2003. To achieve this savings, premium rates would be increased, thus increasing out-of-pocket costs for producers.

The proposed changes will have the following effect on participants. In annual dollar terms, large CAT-insured producers take the largest share of the reductions (\$58 million or a reduction of 15.7 percent from \$370 million), followed by providers (\$37 million or 6 percent from \$612 million), and then by producers who elect additional coverage (\$33 million or 4.3 percent from \$772 million).

The time is right for moving forward with this legislative proposal. If we fail to act, there will be a \$205 million shortfall in company payments as no discretionary funds have been requested to pay for these expenses. This would result in severe disruption to the Federal crop insurance delivery system and an unacceptable erosion of program effectiveness.

In proposing this legislation, our goal is to ensure that cuts are fair and that they are achieved with minimal disruption for both program participants and insurance providers. We look forward to working with you and your colleagues in the coming months on this proposal, which will protect the interests of agricultural producers and ensure the stability of the crop insurance program.

YEAR 2000

RMA is making steady progress to prepare for the technological challenges associated with the Year 2000. We have identified 48 mission critical software application systems for Year 2000 compliance. Of these, 19 are compliant, 10 will be replaced,

one is being repaired, and 18 will be retired. We are projecting that the total cost of bringing RMA into compliance will be \$1.69 million.

ADMINISTRATIVE AND OPERATING EXPENSES

Discretionary account expenses are estimated to increase by \$2.0 million from the fiscal year (FY) 1998 level of \$64 million. This increase includes: \$1,064,000 for pay costs, of which \$266,000 is for annualization of the fiscal year 1998 pay raise and \$798,000 for the anticipated fiscal year 1999 pay raise; \$277,000 to fund increased CSRS contributions; and \$659,000 for costs associated with the completion of Year 2000 conversion requirements in order to comply with Departmental mandates, Civil Rights activities, and administrative costs in support of the Risk Management Education initiative. These costs all directly support the goal and objectives of the Agency.

Mr. Chairman, this concludes my testimony. I appreciate the opportunity to address this Subcommittee on behalf of the Risk Management Agency, and I will be glad to answer any questions that you or other members of the Subcommittee may have.

BIOGRAPHICAL SKETCHES

AUGUST SCHUMACHER, JR.

August Schumacher is the Under Secretary for Farm and Foreign Agricultural Services in the Office of the Secretary of Agriculture. He provides leadership in the area of Farm and Foreign Agricultural programs and more specifically exercises general direction of programs administered by the Farm Service Agency (Commodity Credit Corporation), the Risk Management Agency (Federal Crop Insurance Corporation), and the Foreign Agricultural service.

Prior to his appointment to this position, Mr. Schumacher was Administrator of the U.S. Department of Agriculture's (USDA) Foreign Agricultural Service. As Administrator, Schumacher was a strong advocate for the interests of America's farmers both at home and abroad. He oversaw the administration of programs to foster exports of American agricultural, fish and forest products. FAS reports on international agricultural production and trade, handles USDA's responsibilities in international trade agreements and negotiations, administers the Export Enhancement, Foreign Market Development and Market Promotion Programs, coordinates USDA's role in international food aid programs and provides linkages to worldwide resources and technologies that can benefit U.S. agriculture.

Before coming to USDA, Schumacher worked for the World Bank's agricultural lending group on a series of projects on agriculture sector policy adjustment, forestry and biodiversity protection in Central Europe, Belarus and Ukraine. In addition, he has worked in China, Latin America, the Middle East and Africa.

Schumacher also served as Commissioner of Food and Agriculture for the Commonwealth of Massachusetts during 1985-90. During his tenure as Commissioner of Food and Agriculture in Massachusetts, Schumacher was heavily involved in the joint efforts of USDA and the National Association of State Departments of Agriculture (NASDA) to promote agricultural trade. He hosted the 1990 NASDA Food Expo in Boston and participated in several agri-trade missions to Europe and Japan. As Commissioner, he also fostered several state market development initiatives including the Women, Infants, and Children (WIC) farmers' market coupon program.

Schumacher is from a farm family in Lexington, Mass. He attended Harvard College and the London School of Economics. He was also a research associate with the Agribusiness Department of the Harvard Business School.

KEITH KELLY

Keith Kelly, a native of Red Lodge, Montana, is the Administrator of USDA's Farm Service Agency (FSA). As Administrator, Mr. Kelly reports to the Under Secretary of Agriculture for Farm and Foreign Agricultural Services, and is responsible for the administration of farm commodity programs, agricultural credit programs, and certain disaster and Federal crop insurance programs.

In 1990, Mr. Kelly served as the first Director of the newly-created Arizona Department of Agriculture. He was appointed by Governor Rose Mofford and was reappointed by Governor Fife Symington in 1991. Under the direction of the Arizona State Legislature, he consolidated four autonomous state agencies into a unified,

cabinet-level department with 450 employees and an appropriated budget of approximately \$13 million. Mr. Kelly was instrumental in the adoption of a bilateral, livestock health agreement with the state of Sonora, Mexico, and he has actively promoted the North American Free Trade Agreement as a member of the Arizona-Mexico Commission. He negotiated the first official boxed-beef agreement for Arizona processors in the Mexican states of Sonora and Sinaloa in 1996-97. He was appointed by Secretary Glickman and U.S. Trade Representative Mickey Kantor to the Agricultural Policy Advisory Committee in 1995. Following in the footsteps of his grandfather (Commissioner of Agriculture, 1939-1941), Mr. Kelly served as Director of Montana's Department of Agriculture (1983-1988), after serving two years as deputy director. From 1976 to 1980, he served as Administrative Assistant for Agriculture and Natural Resources for Montana's Governor's Office. He is past chairman of the National Governors Association Staff Advisory Council for Agriculture.

From 1972 to 1974, as a marketing specialist for the Montana Wheat Commission, he developed the first toll-free Grain Market News Service in the United States; and from 1974 to 1976, he was assistant director of Western Wheat Associates, based in Washington, D.C., where he developed marketing plans for U.S. wheat producers.

Mr. Kelly was raised on his parents' sheep and cattle ranch in Red Lodge. He attended Montana State University where he received a B.S. degree in Agricultural Business in 1968 and an M.S. degree in Economics/Agricultural Economics in 1973. He served in the U.S. Army Infantry, 101st Airborne Division, in Vietnam and was awarded the Bronze Star.

Mr. Kelly and his wife, the former Norma Jean Walsh of Butte, Montana, are the parents of four children.

LON S. HATAMIYA

Lon Hatamiya is the Administrator of the Foreign Agricultural Service (FAS) of the United States Department of Agriculture (USDA), where he oversees various programs that foster exports of American agricultural, fish, and forest products. FAS is responsible for USDA's obligations in international trade agreements and negotiations along with coordinating the Department's role in international food aid programs. This agency also reports on international agricultural production and trade, administers various export assistance programs, and provides linkages to worldwide resources and technologies that can benefit U.S. agriculture.

Prior to his appointment to FAS in October of 1997, Lon was the Administrator of the Agricultural Marketing Service (AMS) of USDA from 1993 to 1997, where he was responsible for over 50 federal programs. During his tenure, AMS received two "Hammer Awards" from the National Performance Review in recognition of increased efficiency and cost savings within a federal government program.

Lon was born and raised in Marysville, California, where his family has been farming for the past 90 years. He graduated with honors from Harvard University, with a B.A. in Economics. He received his M.B.A. in Entrepreneurial Studies and International Business from the Anderson Graduate School of Management at the University of California, Los Angeles (UCLA), and his J.D. from the UCLA School of Law. He is admitted to practice law in California.

Lon has worked in the private sector in various capacities over the last fifteen years. As a purchasing manager with the Proctor and Gamble Company in Cincinnati, Ohio, he assisted in the development of material acquisition and allocation strategies for their production facilities around the world. Lon has also served as a consultant to the Sony Corporation in Japan, developing a marketing strategy for broadcast equipment in Western Europe; and to the Port of Long Beach, developing a long-term intermodal transportation plan. In addition, Lon was an attorney with the national firm of Orrick, Herrington & Sutcliffe, in the practice of public finance, corporate, and political law. In the vast third Assembly District in Northern California, Lon was the Democratic nominee and the first Japanese American to run for the California State Legislature in the last decade.

Lon, before his appointment by President Clinton to USDA in September 1993, was involved in the general management of his family's farming business, H.B. Orchards Company, Inc., in Marysville, California, which grows 1,200 acres of prunes, peaches, walnuts, and almonds. He was also founder and President of BHP Associates, Inc., an economic development, education, and agribusiness consulting firm in Sacramento, California.

In 1991, Lon was selected for the California Agricultural Leadership Program of the California Agricultural Education Foundation, comprising top leaders of California agriculture. He was appointed by the California State Assembly in 1992 to serve

on the Rural Economic Development Infrastructure Panel. He also served on the Boards of Directors of Planned Parenthood of the Sacramento Valley and the Marysville Chapter of the Japanese American Citizens League (JACL); as President of the Sacramento Chapter of the JACL, he was recognized for his longtime work on obtaining reparations for Japanese Americans interned during World War II.

Lon currently serves as a member of the National Advisory Council of Minorities in Agriculture, Natural Resources, and Related Sciences (MANNRS); as a member of the Board of Governors of the Japanese American National Museum; and served on the USDA/Hispanic Association of Colleges and Universities (HACU) Leadership Council.

Lon and his wife Nancy are the parents of two sons, Jon and George.

DAIRY OPTIONS PILOT PROGRAM

Senator COCHRAN. Before proceeding with my questions, I am going to yield to the distinguished Senator from Wisconsin, Senator Kohl, for any comments, statement, or questions that he might have. Senator.

Senator KOHL. Well, that is very kind of you, Senator Cochran. I do appreciate it. I have three questions which I would like to address to the panel with respect to the dairy issue.

USDA's Risk Management Agency is finalizing the dairy option pilot project rule, as you know. The Extension Service in Wisconsin and dairy farmers in Wisconsin are quite anxious to begin using this new marketing tool. The success of the program will be determined by how many dairy farmers actually adopt this new marketing tool after the pilot project expires.

I want to see to it that throughout Wisconsin this pilot project is maximized in terms of its exposure to Wisconsin dairy farmers. My concern is that it may be used in as little as six counties, I understand, and it may be used for as few as 6 months, and then it may move on. You know the dairy industry in Wisconsin, as well as other places, but in Wisconsin, because we are so important to the dairy industry in the country and it is such an important industry in our State, as you know. And it is in dire straights, as you also know. We want them very much to use new methods to market their products like the options program.

I would like to feel that you are going to give Wisconsin more of an opportunity to participate in it than what I fear may be the case. Could I get hopefully a favorable response from you right now?

Mr. ACKERMAN. Thank you, Senator. I appreciate the support that you and many others have given to this program. We think it is a very important one.

At this point, as you note, the comment period on the rule for the dairy options pilot program is closed. We are reviewing the comments right now. At an appropriate point, once the comments are reviewed, we will be making decisions on where the first set of States and counties will be that will be initiating the program. We are hoping that will be done in an expeditious way. We have gotten quite a lot of interest around the country in the program and we take that as a very healthy development.

As you note, the dairy options pilot program is designed to start small. We intend in the first 6 months—in the first round of it—to start in six States, six counties per State. The reason for this is that it is a brandnew program. We have never done this before and are not sure that it works. We want to make sure that it

works, and once we have gained a little bit of experience, then we will be able to enlarge it. But as you note, on the first round, we will be limited in size to six States and six counties per State.

Also, it is designed as a temporary program. Any individual farmer would be in the program for 6 months, and the reason again is to teach the farmer how to use exchange traded options and futures contracts. This is very new to dairy producers. Dairy futures have only existed for a couple of years. Once farmers have been through it, we hope that this will enable them to use the markets on a permanent basis with the education and experience they have gained.

Senator KOHL. I do appreciate that and I appreciate the program and its potential value to dairy farmers, and I am hopeful that I can work with you to see to it that Wisconsin dairy farmers get the maximum exposure as the program unfolds. It is intended to be a 3-year program.

Mr. ACKERMAN. That is correct.

Senator KOHL. With a 6-month kind of a startup phase, and hopefully then to go on for another 2½ years. So, my hope is that we can work to maximize Wisconsin dairy farmers' exposure, and I am sure that you would be more than happy to do that.

Mr. ACKERMAN. That is correct, and we would be happy to do that with you.

DAIRY EXPORT INCENTIVE PROGRAM

Senator KOHL. Thank you.

Now, the second question. In the first 2 years, middle of 1995 through the middle of 1997, of the GATT implementation period, the United States notified WTO that about 141,000 metric tons of nonfat dry milk had been exported through the dairy export incentive program [DEIP]. It is my understanding that the U.S. Government approved contracts totaling that amount, but only some 91,000 metric tons were actually exported; 141,000 were reported. The difference is approximately 50,000 metric tons was reported as exported, but apparently never left the United States.

The question I am asking is when will the Department re-announce this tonnage so that the product can actually be exported.

Mr. SCHUMACHER. Senator, this is a very, very important question, one that we are working on a great deal. That is, the amount that was registered and then canceled. I am going to ask Lon or Chris where are we in terms of getting announcements on those tonnages out.

Mr. GOLDTHWAIT. We have met with the representatives of the dairy industry a number of times on this question. We have told them that for any tonnages that were canceled within this same GATT counting period, there is no problem. That tonnage will be reannounced probably around the beginning of May.

With respect to tonnage from prior years, we have this issue under study. We are looking very carefully at whether there is a way to reannounce that tonnage which would not be inconsistent with our GATT commitments. That review is still ongoing and we hope to conclude it rather shortly. Obviously we would like to do something about this quickly.

The other thing we have undertaken to do—in fact, already done—is to make certain flexibilities available to the exporters with respect to their sales under the DEIP program so that fewer contracts will be canceled in the future. Such flexibilities may involve changing, for example, the buyer in the purchasing destination if the first buyer is unable to fulfill those contracts.

So, we have this question very much under study and we certainly appreciate the importance of the DEIP program, its benefit to America's dairy farmers.

Senator KOHL. Thank you. I would like to stay in touch with you as you move ahead with that.

Mr. SCHUMACHER. Absolutely.

Senator KOHL. Hopefully we can maximize the exports.

Mr. SCHUMACHER. We are using the full funding. I think Chris and Lon's people are working very hard on that issue under some criticism from a certain number of our competitors, but I think it is vitally important. I think we are approaching \$1 billion in dairy exports, and that then does help a little bit on the price.

STATE TRADING ENTERPRISES

Senator KOHL. All right. I thank you so much.

Last question, gentlemen. Users of State trading enterprises are the most vocal in calling for the total elimination of, quote, traditional export subsidies. What measures does USDA suggest to ensure that State trading enterprises like the New Zealand Dairy Board, that their anticompetitive advantages, which they have and use, are also addressed and hopefully eliminated?

Mr. SCHUMACHER. That is a very vital issue—not only the single desk trading of the New Zealanders but also the Australia Wheat Board and the Canadian Wheat Board. It is something that we are working on in terms of the next round. It is one of our two or three top priorities, Senator.

I am going to ask Lon to address this specific issue. It is one that our friends in Canada, Australia, and New Zealand—they are all friends—but they still have these State trading organizations or single desk trading and it is a very difficult issue because it does give them a competitive advantage.

Mr. HATAMIYA. Mr. Kohl, let me answer that briefly, if I could.

Under the WTO Agriculture Committee, we continue to bring up State trading enterprises as a major focus of discussion. It is a target for us to take a look at. We are looking for transparency in the marketplace. STE's do not provide that. We proposed a questionnaire form of approaching STE's. They are among a number of the highest priorities we are going to be looking at for our future negotiations in the WTO leading into the 1999 and 2000 round. So, not only are STE's important, but tariff reductions, tariff rate quotas, export subsidies, as well as other issues are major points of contention that we will continue to address at that appropriate level.

Mr. SCHUMACHER. There is one additional issue, and that is, as I mentioned in my opening remarks, we have been aggressively using the liquidity stabilization provided by our GSM. In the situation of Asia across the board, liquidity is the problem right now, and State trading has not been as effective in the sense that they are having some problems on that side.

So, I think the ability to fully use the authorities that Congress has provided to us in the GSM is certainly helping American farmers maintain market share, and it is a tool that we continue to use firmly around the world. Certainly there has been some strong criticism from some of our good friends for our timely use of that, and there are certainly interesting statements from some of their capitals.

Senator KOHL. Well, I thank you and I thank you for your cooperative attitude and your willingness to work together. Thanks a lot.

Thank you very much, Mr. Chairman.

PREPARED STATEMENT

Senator COCHRAN. Thank you, Senator. We will insert your prepared statement in the hearing record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR KOHL

Mr. Under Secretary, we appreciate your willingness to testify before the subcommittee today regarding the Farm and Foreign Agriculture Service Agency's proposed budget.

My constituents have kept me abreast of the difficulties the new farm program has caused in your attempts to deliver new farm and conservation programs and risk management products to farmers. Your task is further complicated, by the reduction of USDA's work force by 22,000 employees over the past few years.

I am particularly interested in your plans and goals for expanding the U.S. market share for dairy products like cheese. Currently, the world prices for dairy products are 30 to 40 percent under the U.S. price. If the U.S. is going to be a major exporter then either the U.S. price must drop to the world market or the world market must go up. I expect probably a combination of the two will happen. If this is the case, the dairy industry is in for additional stress over the next five to ten years. Your leadership and expertise will play a very important role during this period.

A tremendous number of challenges, such as reining in state trading enterprises, transfer pricing issues, World Trade Organization strategy for the next round of discussions, and expanding exports need to be addressed if the industry is to become a successful player in the international market. I will be particularly interested in hearing today how we can make trade agreements work better for farmers in rural Wisconsin.

NEEDS FOR DISASTER ASSISTANCE

Senator COCHRAN. Mr. Secretary, let me ask a couple of general questions about the budget request and then get to some specifics with the other members of the panel who are here with you today.

The supplemental request, for example, is under consideration by the Senate on the floor today, and we hope to complete action on it by the end of the day. Since the request was submitted by the administration, there have been some additional disasters that have occurred in Georgia particularly and elsewhere in the country.

I hope that you will help us try to assess the needs for disaster assistance that we should try to fund in this supplemental. We will still have an opportunity to negotiate in conference with the House and work out differences between the two bills that are passed by the two bodies. But I hope that we can have up-to-date information from the administration to work with and your assistance in that regard could be very helpful to us.

CUTBACK IN FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

In connection with our foreign agriculture activities, I noticed that in the budget request, there is a cutback in funds for the Cooperator Program, where the Government makes available money that is matched with private sector money through trade associations, like the U.S. Wheat and American Soybean associations and other groups like that, to try to help open up new markets and expand our market share around the world.

With the cutback proposed by the administration in these funds, what will the impact be insofar as our total commitment to market development around the world? Is this going to have a negative consequence at a time when we need to be doing more maybe rather than less?

Mr. SCHUMACHER. First, Senator, on the first question, on the Georgia and other disasters, we will get back to you. I visited Gainesville with Commissioner Ervin a year or so ago. It is the home of the original poultry industry and I was very sad to see a number of the poultry houses knocked down. So, we are going to work carefully and we will get back to you very quickly on the impact of recent disasters.

On the Cooperator Program, the cooperators and I work very closely. That program has been going since 1954. They have done an absolutely outstanding job of increasing our market share—particularly value-added products—and also maintaining our market share on bulk commodities. Our exports would be down, I believe, without the strong support and the cost sharing of the Cooperator Program. They simply do an outstanding job here and particularly overseas.

The budget provides \$22.0 million for the Cooperator Program. MAP is fully funded and the Emerging Markets Program is fully funded. We are putting a complete package together and making that a bit more efficient so we can look at all the funds that the cooperators will have access to.

We are hoping to get a bit more cost sharing from the cooperators. There was report language in last year asking for that.

So, we would like to work with you very closely. We think that should be sufficient, but there may be differences of opinion on that.

FISCAL YEAR 1998 MAP ALLOCATION

Senator COCHRAN. For the Market Access Program, \$90 million is requested in the budget, which is the amount mandated by law to be spent on the program. The program is not a discretionary program that we fund. We simply go along with the direct funding that the law makes available for the program.

But my question is, are those funds being used? In this fiscal year, for example, there has been a holding back on the allocation of funds and making those funds available for the purpose for which they are to be spent.

Can you tell us how much of the \$90 million in this fiscal year has been spent and are there any intentional delays in the process to try to keep from spending that money?

Mr. SCHUMACHER. Well, I know the cooperators very well and the MAP participants. I think they are pretty aggressive on using this program. I would like to defer to Lon to discuss the fiscal year 1998 MAP allocation process.

It is one of the most important programs that we have. We have fought very hard to maintain the funding at the \$90 million level. We have made a lot of changes in the program to benefit small businesses and cooperatives. There have been legislative changes made. So, I will defer to Lon.

Mr. HATAMIYA. Mr. Chairman, let me agree with Under Secretary Schumacher. To the contrary, we are being as active as possible with the use of all tools, as he has mentioned. The MAP program is now under a new uniform export strategy application process that may have delayed slightly the allocation of those funds but for the long term will make more efficient use of all of the tools provided, not only the Cooperator Program, but the MAP funds, as well as the Emerging Markets Program. We are trying to coordinate each one of these, in addition to the Cochran program, to ensure that all of the available funds are most efficiently used.

As Mr. Schumacher has said, we are actively pursuing every avenue of export development. On Friday, I returned from a trip to Asia, the second in 3 months, to ensure that we are an active exporter in that very important market. I led a delegation of agricultural leaders to Japan and Korea to ensure that our presence was felt. Many of those are participants within the MAP and Cooperator Program. I think they expressed their general positive impressions as to the use of these funds.

Again, we are trying to streamline and make most efficient this process, and I think that is working quite well.

REASONS FOR DECLINES IN ASIAN EXPORTS

Senator COCHRAN. Thank you. That is very reassuring. We will continue to follow the use of those funds and hope that there will not be any delays or backing away from the commitment to be aggressive in the use of those moneys.

In looking at the statements that were submitted about our export situation, I noticed that even last year, we saw declines in our export sales in the Asian marketplace. While we were increasing our exports in other places in the world, we were ahead of the downward trend in agriculture exports. It seemed like nobody else was talking about financial problems in Asia until just a few months ago, but the agriculture exporters could already tell that something was wrong.

What were the reasons for the declines that agriculture exporters had in the Asian markets? Given all the tools that you have and the growing economies that seemed to be doing well a year ago, why were they not buying more of the U.S.-produced commodities?

Mr. SCHUMACHER. I will defer to Lon, but I think we began to see a strengthened dollar, for example in Japan—the yen I think has strengthened from 80 to, what, 130, Lon? And that started about 18 months ago and that has certainly affected our high value products. The inability to stabilize and grow is having a softening effect on our high-value product exports, especially the meats and some of the horticulture.

Mr. HATAMIYA. I think in addition to that, the strength of the dollar in the Asian marketplace, not only in Japan but also throughout the region. We have seen a nearly 50 to 70 percent reduction in the currencies of many of the countries in that region. That led to the decline and softening of agricultural exports in the United States into that market in the latter part of last year.

Also, China had a bumper crop in a lot of the grains. They are also becoming much more competitive in some of the higher value products as well. With decreased values in the currency, it makes American products less competitive.

We are trying, as you mentioned, to utilize every tool we have available. We are trying to minimize the impacts that it might have in 1998 with use of GSM-102, with the use of other tools that the Congress has provided us, and so we are hoping to, again, minimize the decrease in exports into that very important market region.

CHINESE IMPORT RESTRICTIONS

Senator COCHRAN. A couple of months ago, I read in the paper where China had suspended the importation of some of the commodities from the United States. I think cotton was one of them. They just shut down the ports to U.S.-grown cotton.

Has that changed now? Have they changed their mind and let those goods flow into the country, or are we still under some kind of embargo there that is commodity-specific from China?

Mr. SCHUMACHER. Lon, do you have any information on that? Chris?

Mr. GOLDTHWAIT. I believe, Senator Cochran, the situation was as follows. The Chinese woke up one morning and suddenly decided that they had cotton stocks in the interior regions of China that they had not counted before. What they actually did was not place an embargo or stop deliveries that were on the water, but they simply ceased purchasing. So, we have seen much less purchasing in the past 2 to 3 months from China.

At the same time, however, we have seen increased sales of cotton both to Latin American destinations and into some other markets like Turkey. So, all in all, our cotton exports, if not exactly where we would like them to be, are doing I think relatively better than, for example, some of the grains.

Senator COCHRAN. Thank you very much.

I have some other questions, but at this time I am going to yield to my good friend from Arkansas for any questions he has.

REDUCTIONS IN FSA STAFF-YEARS

Senator BUMPERS. Mr. Chairman, thank you very much.

I want to take this opportunity to accede to a request by Senator Byrd because it touches on a question that I had also. Secretary Schumacher, without going through the details of the RIF, the proposed fiscal year 1999 budget assumes an additional reduction of 855 non-Federal county committee employees. That is almost a 10-percent reduction. It assumes an additional reduction of 263 Federal employees, about a 4-percent reduction.

Can you tell me the percentage of reductions nationwide of the non-Federal county committee employees as compared with the

percentage of Federal staff reductions since the reorganization took place on October 1, 1995?

Mr. SCHUMACHER. Yes; I will get the exact number from Keith, but there have been more county employees laid off than Federal employees, and this is a problem.

What I want to do is—and it is something I am particularly looking at—to be fair to all of our employees. To minimize further difficulties and protect farm programs and delivery of services, we are doing three things, Senator.

First, we are looking at ways we can make cuts in administrative overhead at the headquarters, regional, and State levels so that we have less need to reduce county employees to meet our budget targets. This is very important, and we are working very hard. This initiative is called administrative convergence. The Secretary has charged us with getting on with it and getting it done by October so that we not cut county people who actually deliver programs.

Second is collocation. We are really trying to work very hard to collocate all our offices and make further savings and cut administrative costs so we can minimize further cuts in county office employment.

Then the third is responding to budget realities that will require some cuts. What we are trying to do is be fair, to be equitable, and to look at workload efficiency.

On the exact numbers, Keith, do you have the precise numbers for the Senator?

Senator BUMPERS. Mr. Kelly?

Mr. KELLY. Yes; Senator Bumpers, compared to the 1993 ceiling, prior to reorganization, the cuts will be in the aggregate about 33 percent for county employees and slightly under 26 percent for the Federal employees by fiscal year 1999.

Senator BUMPERS. What was the latter figure?

Mr. SCHUMACHER. Twenty-six percent.

Senator BUMPERS. What was the latter figure?

Mr. KELLY. Thirty-three percent for county employees and 26 percent for Federal employees. The primary reason the cuts fall heavier on the county employee side is that the 1996 farm bill brought about significant workload decreases in certain activities there. The non-Federal county work force was reduced by 14.9 percent in response to workload changes as compared to 5.8 percent for Federal employees because of the farm bill impact. The non-Federal county employees had a lesser workload. That is where the cuts fell the heaviest.

Senator BUMPERS. Senator Byrd also asked for those same statistics in West Virginia, the percentages.

Mr. KELLY. I will get that. I do not have them at hand for the 5-year period, but I will get them for you.

Senator BUMPERS. I will submit this question and other questions by Senator Byrd, with the chairman's permission, for the record and you can respond directly to him. OK?

Mr. KELLY. OK.

Senator BUMPERS. I had a question along the same line. I am not sure it is true, but staff indicates to me that despite—let us see. Your 1999 budget would make 1,100 additional staff-year reductions, and earlier this year there was a RIF of 152 employees, all

of which were non-Federal county employees. In spite of these RIF's, both at the county and Department level, apparently FSA is hiring new personnel. Is that true?

Mr. KELLY. That is correct. We have been hiring for agricultural credit positions.

Senator BUMPERS. How do you rationalize that?

Mr. KELLY. Because of changing workload, Senator. Again, going back to the farm bill, the workload is decreased on some of the traditional farm programs that we had. However, on the credit side, we have seen the work increase to cover servicing of our agricultural credit portfolio to ensure that we reduce the delinquencies.

So, we added, I believe, 150 Federal county employees or hires this last year on the agricultural credit side. We advertised the jobs to all sources, which meant that non-Federal county employees could apply for them, and our hope and desire was to hire those county employees that were being RIF'd, if they were qualified.

Senator BUMPERS. Well, needless to say, Senator Byrd and I are both hearing from our people back home about what they consider to be the unfairness of these RIF's.

SINGLE FSA PERSONNEL SYSTEM

Mr. KELLY. Senator, that is why we would be very supportive of one personnel system, as the Secretary has recommended—a Federal personnel system—because there are some inequities between the two personnel systems. Having one system would certainly solve the problem, because the RIF's and/or the reallocation of employment would be all within the same pot of people. Now it is not the case. We have separate ceilings for non-Federal county staffing and Federal staffing, including Federal county employees.

Senator BUMPERS. Mr. Kelly, it would be helpful to me and I think to Senator Byrd both if you would address a letter to us explaining these RIF's and why they were necessary and the percentages and so on. Obviously we have a parochial interest in our States, so if you could include the RIF's in our States. We want to be sure that, even if we agree with the RIF, for example, Arkansas and West Virginia are not being discriminated against on the numbers.

Mr. KELLY. Senator, I will be glad to provide that. I want to re-emphasize what the Under Secretary said. We want a fair and equitable treatment for all employees, and we are working internally within our administrative capability to try and make the two different systems look and behave as one within the limits on what we can do administratively.

[CLERK'S NOTE.—See questions Senator Byrd submitted for the record.]

FLOOD RISK REDUCTION PROGRAM

Senator BUMPERS. Secretary Schumacher, what is the status of the flood risk reduction program?

Mr. SCHUMACHER. Let me just consult here.

Senator BUMPERS. Do you have somebody else to defer to on that?

Mr. SCHUMACHER. Yes; Dennis, are you aware of where we are on that one?

Mr. KAPLAN. No.

Mr. SCHUMACHER. I better come back to you on that one, Senator, rather than taking time here.

Senator BUMPERS. OK.

Mr. SCHUMACHER. Randy mentioned we are still working on that one, but we will certainly get back to you with a note on that, Senator.

MARKET ACCESS PROGRAM

Senator BUMPERS. The what is now apparently called the Market Access Program used to be the Market Promotion Program. Is that correct?

Mr. SCHUMACHER. That is correct.

Senator BUMPERS. I would like you, if you would, to provide me with the number of grants and the amounts of the grants made under that program in 1997. Can you supply that for me?

Mr. SCHUMACHER. Yes; we will. We have made a lot of changes in this program. Of course, a lot of guidance has come from you and members of your committee and the Congress that has radically changed this program over the last few years and I think it is working pretty well.

[The information follows:]

Market Access Program Allocations, Fiscal Year 1997

<i>Trade organizations</i>	<i>Allocation</i>
Alaska Seafood Marketing Institute	\$2,965,056
American Brandy Association—Export	36,294
American Forest and Paper Association	6,280,192
American Jojoba Association	176,324
American Seafood Institute/Rhode Island Seafood Council	592,923
American Sheep Industry Association	95,141
American Soybean Association	2,203,929
Asparagus U.S.A	162,938
Blue Diamond Growers	1,412,689
California Agricultural Export Council	525,178

Washington Apple Commission	2,470,410
Western United States Agricultural Trade Association	4,481,370
Wine Institute	3,051,004
Total	90,000,000

Senator BUMPERS. I am well aware of that.

I have a figure here that shows that the European countries spend \$400 million on market promotion and about one-half of that comes from their members. Presumably the other one-half comes from the exporter or the exporters. Is that correct?

Mr. SCHUMACHER. I think that probably is correct.

Senator BUMPERS. In other words, one-half is coming from the EU members, the other one-half must be coming from the exporters.

Mr. GOLDTHWAIT. That is correct. The same situation pertains to the Market Access Program where the participants put up funding of their own to match what we are providing.

MARKET PROMOTION SPENDING BY AMERICAN PRODUCERS

Senator BUMPERS. Mr. Goldthwait, since you are the guru on this subject, do you have any way of knowing how much American agricultural interests spend on market promotion, export market promotion?

Mr. GOLDTHWAIT. Including what is not covered under the program?

Senator BUMPERS. Well, I am trying to figure out for comparative purposes. Apparently in Europe half of the expenditures for export promotions is paid for by the companies who do the exporting or the agricultural interests who do the exporting. I would like to have a comparative figure of what American companies pay for that.

For example, in my State we have Riceland Foods who do a lot of exporting, and there are hundreds of other similar companies. I would just like to know if you have a figure or if you can get a fig-

ure on how much the private companies in this country spend to promote agricultural exports. I am sure ADM spends a lot.

Mr. GOLDTHWAIT. We can provide you with an estimate of the total farm market promotion expenditures of the private sector. Under the Market Access Program, whereas in fiscal year 1996 our outlays—I am including a little carryover from the previous year—were \$92 million, the private sector participants contributed roughly \$115 million.

Senator BUMPERS. \$115 million?

Mr. GOLDTHWAIT. Yes; so, they more than matched what the Government provided.

Senator BUMPERS. Now, is that the Market Access Program?

Mr. GOLDTHWAIT. Yes.

Mr. SCHUMACHER. Yes; one of the concerns we have, Senator, is export restitutions, for example, on a lot of the high-value products such as beef, wine, and all the other high-value products that is creating a lot of problems for us in Europe. I think as we move into the next round, we have to really work at eliminating those export subsidies, particularly on high-value products that are putting our industry at a competitive disadvantage in addition to market promotion.

EEP EXPENDITURES

Senator BUMPERS. How much did we spend last year on the EEP program?

Mr. SCHUMACHER. On just the EEP itself, we did not spend any.

Senator BUMPERS. I know it is a mandatory program, but you spent a lot of money on it, did we not?

Mr. SCHUMACHER. We allocated the funds. We did not use the program last year.

Senator BUMPERS. You did not?

Mr. SCHUMACHER. Did not. We did for the Dairy Export Incentive Program, but we did not use the money for the Export Enhancement Program last year.

REDUCTION IN PUBLIC LAW 480

Senator BUMPERS. The budget request calls for a reduction in title I of Public Law 480. What is the purpose of that?

Mr. SCHUMACHER. The administration has proposed a reduction in the title I program of \$133 million from last year's amount. We have fully funded titles II and III, but because of the need to balance the budget, the administration felt that this was an area for which less funds would be proposed.

Senator BUMPERS. Mr. Chairman, I have a few other questions that I will submit for the record and give our panel sufficient time to answer those questions.

IMF SUPPLEMENTAL

Senator COCHRAN. Thank you very much, Senator Bumpers.

On the subject of the Asian market again, we are including in a supplemental bill funds for the IMF at \$18 billion at the request of the administration. Our committee approved that and we will be taking that up and trying to work with the House to get some level

of funding so that we can continue to participate in helping to stabilize market conditions and encourage reforms in some of those areas so that our trade opportunities will continue to be available.

How strongly do you feel that we need those funds approved by this Congress? When we go to the floor and try to answer questions from opponents of the funding, what are some of the arguments that you think are most effective to persuade the general public and Senators to vote for that?

Mr. SCHUMACHER. Mr. Chairman, when Lon and Chris and I were working over the Christmas holidays to make this program operational, particularly with Korea and then the additional funds for other countries, we could not make it operational without an IMF program in place because of the creditworthiness score. These are funds Congress provides from the taxpayers, and we simply cannot in good faith, to Congress and particularly the taxpayers, make the allocations and make it operational without a sound IMF program in place. So, the IMF had to come first.

As I said in my opening statement, the improvement we made in the hides and skins to help cattle or the stability and the sanctity of the contracts on cotton could not have been done unless the IMF was there first, a very important issue.

Initially the IMF was very helpful because they looked at some of the problems in the number of countries that affected agricultural trade, in Korea on transparency, on port procedures, and consistency with WTO and phytosanitary issues, and Indonesia on some of the monopoly practices. They require the tariffs on food to drop from 20 to 40 down to 5. They noted yesterday that soybeans now is at zero tariff. That contributed heavily by the IMF negotiators as they made those funds available.

So, two points. First we cannot operationalize the GSM without the IMF standby in place, and second, the IMF has strategically made a number of requirements which will help trade in agriculture.

Senator BUMPERS. Mr. Chairman, would you yield for just an observation?

Senator COCHRAN. Senator Bumpers.

REASONS FOR DECLINES IN ASIAN EXPORTS

Senator BUMPERS. I was just curious. Are you seeing a measurable decline in exports to the Asian markets?

Mr. SCHUMACHER. Yes.

Senator BUMPERS. At this moment?

Mr. SCHUMACHER. Yes.

Senator BUMPERS. How significant is it?

Mr. SCHUMACHER. We are monitoring it pretty carefully. Certainly in Korea—meat was down substantially. In Indonesia—last year, Senator Bumpers, we exported \$776 million to Indonesia. Probably that will be cut in half this year, affecting particularly high-value products. We are working very hard to maintain our important cotton market in Indonesia, and I think GSM is operating for cotton in Indonesia as we speak. It is a major market for cotton. We want to keep that market open. We will also be providing some Public Law 480 assistance that is now being negotiated with Indonesia which will hopefully include rice, wheat, and soybeans.

Senator BUMPERS. Thank you, Mr. Chairman.

GOAL FOR NEXT ROUND OF TRADE NEGOTIATIONS

Senator COCHRAN. You have mentioned a couple of times the WTO, the World Trade Organization, and the next round and the negotiations that you are preparing for leading up to the next round. What specifically are the administration's goals for the next round, and do you have the funds included in this budget request to staff and support the effort that we will need to make in order to achieve success?

Mr. SCHUMACHER. That is a very, very good question. I am going to ask Mr. Hatamiya to briefly outline the four or five key goals and then the issue of the budget on our trade policy side.

Mr. HATAMIYA. Mr. Chairman, I think I previously mentioned in an answer to Senator Kohl about some of the highest priorities of what we hope to achieve in the next round of the WTO negotiations, one being the State trading enterprises, seeing some reforms there, also looking at tariffs and tariff reductions, reductions in tariff rate quotas, and also reforms in that round.

Reforms to export subsidies is another important factor, as well as bringing some rationality to sanitary/phytosanitary measures. Many of those are false trade barriers that are placed in front of us, and we think it is necessary to address those so that there is a common international standard that is utilized.

We are using the avenue of the WTO Agricultural Committee to continue those discussions, but those are the highest priorities we are looking at the current time. We think it is necessary to make changes there because it is important. The United States has the most open and freest market in the world. We would hope that other trading partners do the same.

Senator COCHRAN. I had a letter the other day from the president of the American Farm Bureau Federation suggesting that I go to Geneva. Is that where the WTO—

Mr. SCHUMACHER. In May there will be a followup to Singapore in Geneva in preparation for the next round. That is correct, sir.

CONGRESSIONAL PARTICIPATION IN WTO NEGOTIATIONS

Senator COCHRAN. I have not discussed that with anyone, but I am curious to know whether you think it would be helpful in the process of preparing for or observing the negotiations in Geneva, if representatives of this committee or our Agriculture Committee would go to Geneva and participate in that process?

Mr. SCHUMACHER. We would be honored.

Senator COCHRAN. How long will it take? [Laughter.]

Mr. SCHUMACHER. I think the meetings are for 4 or 5 days. In Singapore, when Deputy Secretary Rominger went, there were 47 representative agricultural groups that attended and that was quite a long distance from the United States. So, there is tremendous interest in the next round by the agricultural community. We are working very closely with all the representatives and a representative of this committee. We would be very honored to have you attend.

Senator COCHRAN. What are the dates of the scheduled negotiations in May?

Mr. HATAMIYA. I think it is the 18th through the 20th.

FSA REORGANIZATION

Senator COCHRAN. Thank you very much.

Senator Bumpers mentioned the layoffs, the RIF's, that were occurring in the organization of the Farm Service Agency. Mr. Kelly, you spoke to that some and so did Mr. Schumacher. There seems to be a good deal of concern out in the States—I hear this from my own State—about whether or not the reorganization of the Department's agencies in the States is complete or what other changes are expected to be made or planned, the absence of any clear indication from Washington as to what is going on, or when will the next shoe fall. It has everybody sort of anxious and concerned, and it has had a negative effect on morale. That is my assessment of the situation.

What can you tell us about the plans for the continued reorganization of the States and county offices?

Mr. SCHUMACHER. Well, I will defer to Keith, but I think there are two themes, Senator, that the Secretary and I and Keith are operating under. One is administrative convergence, which will start to take place during this calendar year, and which has created some uncertainty, particularly among the administrative staffs at the Washington level, the regional level, and the State office level. But we feel we can make savings on the administrative side, so we avoid layoffs at the county level where programs are actually working directly with farmers.

The other one is the service centers and the collocation, a very important issue. We feel that we should be all under the same roof—Keith's shop, Rural Development, and the NRCS—to better service farmers and to make continued efficiencies. We do not need three Xerox machines or two carpools or whatever. There should be one. Again, those savings could then be used keeping county-level employees employed to service farmers.

There is some uncertainty and we will try and minimize that. We welcome any comments from your State and other States where there are particular questions. We will try and address them so we can provide good information to those people who feel unsure as these changes approach.

Keith?

Mr. KELLY. Yes, Senator; those are the two themes, as the Under Secretary mentioned. On service center collocation, we are about 60 percent completed. The idea again is to achieve cost savings by creating service centers for "one-stop shopping" with the objective of customer service for farmers and ranchers in the communities.

The other one, probably what you had in mind when you referred to the other shoe falling, is administrative convergence. The goal there is to streamline administrative costs, which probably fall heaviest on the headquarters. We have too many people buying pencils and papers when we can all do it one and the same way and more efficiently if we combine administrative staffs of our Natural Resources Conservation Service, Rural Development, and the FSA.

Policymaking and program operation still stay with the individual agencies. So, for example, the Farm Service Agency will continue setting policy and implementing its agricultural credit and

other programs. It is just the administrative services that are going to be merged. I believe that we are targeting October 1 for that to take place and be phased in.

Again, Under Secretary Schumacher said it correctly. It does create uncertainty out there, and it is probably in part because it is following a significant reorganization over the last several years. As was mentioned earlier I believe by Senator Bumpers, the agricultural credit programs of the old Farmers Home Administration and various programs of the old ASCS were consolidated. I am not sure we had completely worked all of the bugs out of that reorganization. Now we are starting on administrative convergence. But I think what the farmers and ranchers will get is a much more streamlined, cost effective, and efficient delivery of services for the programs available out there.

Senator COCHRAN. Well, I think that is the emphasis we want to make, and that is to be sure that we not forget the farmer in the process and the landowner who has to come to the service center or the Farm Service Agency office, whatever you want to call it, and get information and file farm plans and deal with the requirements of the Federal farm programs. So, I know that you will try to ensure that that is kept in mind by the administrators up and down the line.

But the employees are important too, the employees of the service centers. We hear from them. They are constituents too. They are people too. I hope that they are all treated fairly and you will ensure that that is the case.

Mr. SCHUMACHER. Absolutely.

Mr. KELLY. Senator Cochran, it would certainly support fairness if we were all under the Federal employment system. It would be much more fair to the employees if they all had equal chances and options. Right now it is a challenge to manage the two different systems.

Senator COCHRAN. I was glad to hear something about your background. I notice that your grandfather was the commissioner of agriculture, whatever the name of it is, in Montana. You have a long heritage of doing this kind of work.

Where is Red Lodge exactly in Montana?

Mr. KELLY. Senator, Red Lodge is 30 miles north, as the crow flies, from Yellowstone National Park on the northeast corner.

Senator COCHRAN. That is pretty country up there.

We share a constituent named Steven Ambrose who spends one-half of his time in Mississippi and the other one-half in Montana. He is the fellow who wrote that book about the Lewis and Clark expedition out there. "Undaunted Courage" is the name of the book. It is quite a masterpiece. You ought to read it if you have not read it.

Is Red Lodge very far from where the Lewis and Clark expedition traveled through Montana?

Mr. KELLY. Senator, it is not too far because they did travel up 15 miles from Red Lodge. There is the Clark Fork River that drains into the Yellowstone River, and that was named for George Rogers Clark.

I would hazard a guess that your Mr. Ambrose probably spends his summer months in Montana and the winter months in Mississippi. [Laughter.]

PROPOSED RISK MANAGEMENT TOOLS

Senator COCHRAN. You are absolutely right.

One other issue that has been touched on and I wanted to ask some more about is the crop insurance program. The statement that you filed with the committee has some interesting suggestions for reform, additional legislative provisions. Mr. Ackerman makes some specific recommendations for changes in the law. These are all very interesting, and I hope they will be carefully considered by the Congress, the legislative committee. We cannot make these legislative changes, though, and we have to kind of deal with the law as it is.

We notice you talk about other risk management tools besides crop insurance. Specifically what are these tools that you are talking about and are there requests for funding that we need to consider in this next budget cycle?

Mr. ACKERMAN. Thank you, Mr. Chairman. A very specific example is the one that Senator Kohl raised earlier in the hearing, the dairy options pilot program. This is a new tool for us. It is different from the options pilot program that existed within FSA a number of years ago. It is a noninsurance tool. It is a way for dairy farmers to ensure price with a subsidized tool based on options traded on the organized futures exchanges. It is a new idea and one that we very much want to test because we think there is a demand for it.

Other examples of tools that we are looking at are new types of insurance policies based not on a crop-by-crop premise but on a whole-farm premise. We have had a number of ideas suggested to us by the private sector along those lines.

There are a number of others, just to give you a sense of the range of ideas that are percolating out in the country. We have one idea that we have been looking at that has been recommended by a number of the farm groups. It is based on a Canadian program, the NISA, which is basically a risk management savings account where farmers would put part of their income every year into an account that would grow over time and provide a nest egg, a safety net, for them if they had a loss. It is a tool that would potentially require legislative changes to implement in this country, but one that has gained some popularity in Canada where it has been in effect and which is gaining a fair amount of recognition here among many of the farm groups. So, there is a range of ideas like that that we are considering.

GAO REPORT ON EXPENSE REIMBURSEMENT TO PRIVATE COMPANIES

Senator COCHRAN. There is a recent GAO report, dated March 20, 1998, on the subject of crop insurance, increases in insured crop prices and premium rates, and the administrative expense reimbursement paid to companies. There are some interesting findings that we have come across here.

Has this been made available to you, or do you have any information about this GAO report? Of course, that is done at the request of the Congress. It is not your investigation.

Mr. ACKERMAN. Senator, I have seen a draft of it, but we have not yet examined it in detail.

Senator COCHRAN. I was curious. You have probably been provided a draft and asked for comments or reactions.

Mr. ACKERMAN. That is correct.

Senator COCHRAN. One thing that we noticed here talking about the expenses, and that is relevant to this appropriations process that we are going through, it says that higher insured crop prices and higher premium rates led to a 13-percent overall increase in premiums. That is a disincentive to buy the insurance if the farmer gets hit with that kind of an increase.

The report noted, we concluded that FCIC could reduce the reimbursement rate another 3 percentage points below the 27 percent level we found to be justified in 1994 and 1995 to a level of 24 percent of premiums and still adequately reimburse the companies for their administrative expenses.

What is your reaction to that? Is that a fair assessment of the situation?

Mr. ACKERMAN. Well, Senator, without getting into the details of the report because, as I say, we have not analyzed it in detail yet—we did go through a process with the industry last year. We renegotiated the standard reinsurance agreement, and as part of that process, made a significant reduction in the expense reimbursement to companies. It fell from approximately 29 percent of net book premium the prior year to 27 percent of net book premium, plus the elimination of what is called excess loss adjustment. All totaled, that is about \$40 million a year and that was coupled with a significant additional underwriting risk that we put on them last year.

Certainly this is something we are monitoring very closely. In our legislative proposal, to close the gap on mandatory spending, we do propose an additional reduction beginning in the year 2000. We are trying to be cautious in the way that we do this, however. The delivery system is very important to this program. We rely on the companies to deal face to face with farmers, and generally our experience with agents and companies around the country has been very favorable. They do a good job. We want to make sure that, while we are tightening our belt and finding savings, we do it in a way that is moderate and nondisruptive. That is why, for instance, in our proposal we did propose going down to a 25-percent reimbursement rate, but we began it in the year 2000 so that companies can plan for it, build it into their business plans, and be able to absorb it.

Senator COCHRAN. As you know, we are in conference right now in the legislative committee with the House trying to work out the ratio of mandatory spending to other creative devices for coming up with the money to support this program. It is quite a challenge dealing with the constraints the administration has put on us, with insistence that so much of the money be allocated to Food Stamp Program activities, and Budget Committee provisions which restrict us in the leeway that we have within which to negotiate. But we are working hard to try to come up with a funding mechanism for the crop insurance program, and we will continue to work with both the legislative committee and the Budget Committee and the

administration to try to resolve it so that we save the program, that we have a risk management program in place that the farmers can rely upon and not just take a chance on the ad hoc responses to these disaster situations which we are trying to deal with right now with the supplemental.

But we appreciate your bringing your best efforts to bear on the process and we thank you for your cooperation with our committee.

FSA DATA COLLECTION

Let me ask a couple of questions about the acreage determinations. There is a memorandum of understanding between APHIS and FSA which would provide collection insuring of crop acreage data in boll weevil eradication zones for the purpose of administering that program. We had report language in the appropriations bill last year and we are curious to get the response of the administration to what language, if any, we need to include in this year's appropriations bill to help make sure that there is an accurate process and a fair process for collecting crop acreage data information.

The Department has the new collection procedures. We are curious to know whether they are working. Do we have the funds in the budget to support the program? I need your reaction to that.

Mr. SCHUMACHER. Do you have a comment on that?

Mr. KELLY. Senator, I will get back in detail with you. With regard to the acreage report collection, that is an agreement that we work out with the APHIS boll weevil eradication program staff, to collect the acreage report data that is necessary to ensure that the proper mapping is done out there in the States.

Right now most acreage reporting is voluntary, and support for it is included in the user fee proposal in the budget. If this proposal is adopted through the appropriation process, then the funding for acreage reporting would depend upon actual collection of user fees from private individuals and companies.

BOLL WEEVIL ERADICATION

Senator COCHRAN. One other concern that I have heard expressed is the decline in support from the FSA for loans to help pay the costs of boll weevil eradication expenses. There is a request in here that is substantially less than last year. The budget shows the loan program level would decline from \$40 million in fiscal year 1997 to \$30 million in fiscal year 1999.

We are curious to know what the explanation is, if any, for \$4 million which is for the APHIS Federal cost share of the boll weevil eradication program, why the program level is declining like that. We have farm income being pressured with low prices at market for cotton and people are planting less cotton now than they did before because of the drop in prices and the continued increases in costs of production. Now it looks like the available loan support to help pay the costs of the boll weevil eradication program is going to drop as well.

Is it realistic to expect farmers are going to continue to participate in the program if they have a hard time getting help from the Government?

Mr. KELLY. Senator, I acknowledge that because of the need to meet budget targets the request is down somewhat from last year. It is hoped that it would come close to meeting the demands of the various States to carry out the boll weevil eradication program. I will acknowledge that it is somewhat short.

Senator COCHRAN. Well, we are concerned about that and hope that you will be responsive to requests to help make sure that we have a program that works.

I note that APHIS is really the lead agency for this program, but what is your impression of the status of the program and the need for funds to achieve complete boll weevil eradication? Is this something that your agency is actively involved in trying to support?

Mr. KELLY. Senator, we work closely with APHIS on the boll weevil eradication program, and we are actively supporting it. It is the old adage, an ounce of prevention is worth a pound of cure. Having come from Arizona as a State director of agriculture, the boll weevil eradication program was very successful in reducing costs to cotton farmers. Thus the whole pesticide issue and ground water contamination was significantly reduced because of a very concentrated eradication program. So, personally, given where I came from, I support it.

I stand corrected on my answer to the previous question. Our loan level is about \$21 million in 1998 compared to \$40 million in 1997, and our request is going up to \$30 million in 1999. So, there is support and a commitment within our agency for the boll weevil eradication program.

Senator COCHRAN. We appreciate that and we appreciate your continuing attention to that problem and support for the goals of the eradication program.

RESOURCES FOR THE COCHRAN FELLOWSHIP PROGRAM

I notice there were a couple of mentions of the Cochran Fellowship Program and there is a budget request for \$3 million. We had in the past some additional funds made available from the AID Program and from the emerging markets program. What are the other resources that the Administrator has to work with in making these program benefits available throughout the world? What are the prospects next year in this next budget cycle for additional funds that can be used for the Cochran Fellowship Program?

Mr. SCHUMACHER. I think you are correct, Mr. Chairman, funds were allocated from the Emerging Markets Program and I think some from the USAID. I think, Lon, do you have some of the details?

Mr. HATAMIYA. Yes; I do. Mr. Chairman, for fiscal year 1998, in addition to the \$3 million you mentioned in appropriated funds, we are expecting to receive \$1 million from the Emerging Markets Program and an additional \$2.3 million from USAID, for a total of \$6.3 million for this program, which I believe is the most ever. We are anticipating the number of participants in the program, an estimated 760, to be well above where participation has been in the past.

Again, let me repeat, this has been a tremendous program. We see the benefits worldwide in terms of increased exports sales. When we bring Cochran fellows into the United States, they gain

an increased knowledge as to markets in the United States, our export capability, the reliability of U.S. producers, and that continues to benefit American agriculture not only currently but hopefully into the future.

Senator COCHRAN. We appreciate having that information. If we could have a report for the record showing the countries that had participants selected and how many there were and where they went, what they did when they were here, some kind of capsule report of the program for our hearing record, that would be helpful.

Mr. HATAMIYA. Mr. Chairman, we can do that for you. No problem.

[The information follows:]

COCHRAN FELLOWSHIP PROGRAM

In fiscal year 1997, a total of 707 participants from 45 countries received training under the Cochran Fellowship Program. The following provides the fiscal year 1997 participant levels by region and by country:

- Asia: 154 participants from seven countries: Korea (20 participants), Malaysia (21), China (35), Thailand (17), Indonesia (18), Philippines (26), and Vietnam (17).
- Eastern Europe: 182 participants from 13 countries: Turkey (19), Poland (56), Hungary (9), Czech Republic (10), Slovakia (11), Albania (6), Bulgaria (11), Slovenia (12), Croatia (10), Latvia (8), Estonia (9), Lithuania (7), and Rumania (14).
- Latin America: 87 participants from seven North, Central, and South American countries: Mexico (37), Venezuela (13), Trinidad and Tobago (9), Barbados and Other West Indies (3), Panama (6), Colombia (14), and Chile (5).
- Africa: 61 participants from African countries: Cote d' Ivoire (9), Tunisia (10), South Africa (30), Namibia (2), Kenya (5), Uganda (2), and Senegal (3).
- New Independent States: 223 participants from the New Independent States of the Former Soviet Union: Russia (53), Ukraine (45), Kazakstan (23), Kyrgyzstan (8), Uzbekistan (27), Turkmenistan (8), Tajikistan (5), Armenia (16), Moldova (21), Georgia (10), and Azerbaijan (7).

In fiscal year 1998, the Cochran Fellowship Program will continue work in the above mentioned countries. In addition, pilot programs will be started in Brazil, Bosnia, Costa Rica, Guatemala, and Tanzania, and the program will be expanded in size (increase in the number of participants) in Kenya, Uganda, and Senegal.

We expected to provide training to about 760 participants in fiscal year 1998. Delay in receipt of U.S. AID and EMP until May, 1998, however, will most likely reduce the number of participants from countries in the NIS and Eastern Europe during fiscal year 1998.

The benefits of 1997 the Cochran Fellowship Program to U.S. agriculture can be categorized under the following topics:

I. *Sales of U.S. Agricultural Commodities.*—An immediate benefit of the Cochran Program is the sale of U.S. agricultural commodities or products that come about from information gained and/or direct contacts provided by participant training. Each year we receive information from past participants, from U.S. companies and associations, and from various agricultural offices about sales of products or commodities that are directly and indirectly related to Cochran Program training activities. The following provide examples of some of our most recent sales information:

FAS/Fish and Forestry Products Division reports that a Cochran trip to U.S. lumber mills for Polish furniture manufacturers was very effective in promoting U.S. exports of hardwood lumber. The trip: (i) created personal relationships that resulted in each participant making orders for U.S. hardwood lumber, (ii) cleared up misunderstandings about contract specifications, and (iii) may result in future exports of U.S. hardwood totaling \$25 million.

Another report from Poland states that a 1997 participant purchased over 300 metric tons (about \$500,000) of U.S. prunes and several tons of U.S. almonds and sunflower seeds. Another participant started imports of U.S. shelled peanuts, his first order in June, 1997, amounting to \$25,000.

A 1995 Polish participant reports that he gained ideas on how to use U.S. popcorn. Today he imports over 100 containers/year of U.S. popcorn (30 containers by June 1997) for use in caramel corn and other popcorn snacks.

The Agricultural Office in Sweden reported that Latvian and Estonian importers contracted for \$300,000 per month of U.S. consumer and confectionery products after their program at the Food Expo in Chicago.

A 1996 Slovenian feed mill team returned from their Cochran Program and ordered 20,000 MT of soybean meal—the first of many purchases.

A 1997 Colombian participant has finalized arrangements to be a distributor of a line of U.S. consumer ready products and expects to import 14 containers (@\$400,000) by the end of the calendar year.

Almost immediately after a 1997 joint Cochran/CoBank/National Cattlemen and Beef Association (NCBA) program for Mexican bankers on the GSM-103 Livestock Program, there were five livestock sales registered with USDA (about \$2.2 million), and two other sales were reportedly in the works (\$3 and \$4 million respectively).

The New Jersey Department of Agriculture reports that New Jersey seafood exports to China have doubled since a Cochran Seafood Buyers program in September 1995. Exports now exceed \$1 million per year.

The Agricultural Office in Malaysia states that “the Cochran NASDA/FMI program has proven to be very effective in generating sales of U.S. high value products as the participants are importers and supermarket managers. Although specific figures are lacking, the FAS office has received feedback from FMI exhibitors/suppliers who indicated that they had received trade leads from the participants and are very positive in establishing business ties.”

A Vietnamese participant stated recently that his company has been importing 2–3 containers per month of U.S. pistachios since June, 1997. Another Vietnamese supermarket owner has imported 3 containers of consumer ready products to test the market for U.S. products. Sales thus far are encouraging.

A 1997 Armenian supermarket owner reports that he has widened his U.S. product lines to include deli meats, fish, baby food and cookies after participation in his Cochran Consumer Foods Program.

II. *Constraints to Imports of U.S. Agricultural Commodities and Products.*—Many constraints to the export of U.S. agricultural products can be categorized as sanitary and phytosanitary (SPS) restrictions to trade or market access barriers. Cochran training through agencies such as the Food Safety Inspection Service (FSIS); Grain Inspection, Packers & Stockyards Administration (GIPSA); Animal and Plant Health Inspection Service (APHIS), State Departments of Agriculture, Food and Drug Administration (FDA) and the Environmental Protection Agency (EPA), and with private agribusinesses, provide technical information to country counterpart agencies and help to improve the opportunities to export U.S. products into countries.

During 1997, 59 Cochran fellows from 18 countries participated in 24 programs directly related to providing information on the safety of the U.S. food and fiber system as well as providing direct contact with U.S. counterparts.

The Agricultural Office in Stockholm reports that the meat inspection program for two Latvian veterinarians has been used to help establish new sanitary border inspection procedures. He states that “such education is essential support to the already growing import and transit markets for a widening array of meat and meat products.”

The Tunisian Agricultural Office reports that the Veterinary Team “is in the process of developing with APHIS a live cattle and bovine embryo protocol for U.S. imports in Tunisia, as well as a memorandum of agreement with Texas A&M University for promoting the exchange of faculty and qualified students in areas of mutual interest, such as infections and parasitic diseases of food animals and nutrition.”

The Agricultural Office in Indonesia states that the participant “has used his food safety training to develop a draft regulation on Food Security as well as input into drafts of the Indonesian Food Law Regulations.”

The Agricultural Office in Vienna writes: “The new Chief Veterinary Officer in Slovenia is a Cochran alumnus, which bodes well for relations between his office and FSIS as well as this office as we work toward agreement on sanitary inspection certificates to allow U.S. red meat into Slovenia.”

The Agricultural Office in Korea states: “The Cochran Program provides the resources to address food safety issues, perhaps the largest, singularly most restrictive barrier for U.S. products in the Korean market.”

III. *Foster Business to Business Contacts.*—One of the major objectives of Cochran training is to put the international participant in direct contact with U.S. agribusiness. Even if immediate sales do not result, follow-up contact with participants in their home country may lead to future international opportunities for U.S. business.

Cochran fellows make contact with thousands of U.S. agribusinesses through product or commodity tours, technical discussions, or via participation at trade

shows. Participation in commodity- or topic-specific trade shows or association meetings allow participants first-hand contact with a wide-range of U.S. agribusinesses. Several of the trade shows that were attended in 1997 by Cochran fellows include the Food Marketing Institute/National Association of State Department of Agriculture (FMI/NASDA) Food Expo, Produce Marketing Association (PMA) Show, Institute of Food Technologists, World Dairy Expo, World Beef Expo, San Francisco Seafood Show, International Poultry Expo, International Baking Industry Expo, American Seed Trade Conference, National Building Products Expo, Woodworking and Furniture Supply, High Point Furniture Show, National Homebuilders Association Expo, Wine Spectator Showcase, National Restaurant Show, National Barrow Show, World Pork Expo, American Feed Industry Association Show, All Candy Exposition, and the Fancy Food Show.

The Agricultural Trade Office (ATO) in Guangzhou writes that the Chinese Supermarket Program “. . . is beneficial to American agricultural products because (the team) were so impressed with the high quality and diversity of U.S. products that some of them are considering carrying more products in their stores. As a result, the largest supermarket chain in China is scheduled to host an American Food Promotion in December 1997 at 11 major stores.”

The Director of the Appalachian Hardwood Manufacturers writes about a Polish team: “We hope that our members were able to make good contacts with these companies and begin a business relationship. These were new companies to our exporters who were interested in exporting to Poland. This service allows American companies to have access to new business and contacts that would be difficult to establish on their own.”

“During the last visit of the U.S. Meat Export Federation representative to Poland, we had a chance to meet with several former participants. Most, who traveled to the 1995 International Meat Industry Convention and Expo in Chicago, started to import pork and offal from U.S. suppliers. ELKOPOL company became a major player on the Polish market, importing large quantities of U.S. tripe and pork offal. All claimed that as a result of their Cochran trip, they build their first contacts with U.S. suppliers of meat and meat products.” (Agricultural Office, Warsaw)

A Russian textile company employee wrote: “The Memphis Cotton School offered excellent coverage of all facets of textile production contract buying. They also provided us with prospects for increased cotton purchases from the U.S. in the future.”

IV. *FAS Agricultural Affairs Offices*.—The primary contact for Cochran activities in each country is FAS's Agricultural Affairs Office and Agricultural Trade Offices (ATO). FAS staff describe the benefits of Cochran training programs to their offices in terms of initiating and maintaining contacts with public- and private-sector decision makers, opening lines of communication that are useful for the resolution of trade issues, building good relations with international governments, influencing trade policy issues, and using former Cochran private sector businesses as contacts for U.S. exporters.

“Among the South China Supermarket Executives, (the training) planted the seed of goodwill and friendship without which business relationships can hardly be established and sustained.” (ATO/Guangzhou)

The FAS Office of Agricultural Affairs (OAA) in Seoul, Korea, stated: “As noted by predecessors, the Cochran Fellowship Program is perhaps the single most important tool available to OAA for achieving desired dual objectives of development of domestic agricultural systems and enhancement of U.S. agricultural interests in Korea.”

The FAS Agricultural Attache in Vietnam states: “FAS/Hanoi is extremely pleased with the development of the Cochran Program in Vietnam. The program has served to expand our contacts and increase our knowledge and understanding of the agricultural sector. The implementation phase of the program will help develop the linkages necessary to expand the market for U.S. agricultural products here in Vietnam.”

The Agricultural Officer in South Africa writes, “From our perspective on what the program has done to promote both U.S. agricultural interests and USG policy objectives to support the new multi-racial democracy in South Africa, the Cochran Program has been one of the key ingredients of our program activities in this country and the region.”

SUBMITTED QUESTIONS

Senator COCHRAN. Thank you.

I do not have any other questions at this time. We do have a few that we will submit for the record so that we will understand the

budget request as we have to before we make a decision on the committee print. But we thank you very much for your cooperation and your assistance to the committee.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

FARM SERVICE AGENCY

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Question. Mr. Schumacher, in your testimony you mention that the Department has entered into a contract with an independent consultant who is examining further steps, if any, can be taken to improve the efficiency of our farm and rural program delivery system. Is this the same study that was proposed last year to see if FSA and NRCS should be merged together into one agency?

Answer. The study currently being conducted by Coopers and Lybrand is the same study that was proposed last year.

DISASTER SUPPLEMENTAL

Question. Supplemental appropriations provided a total of \$95 million for the Emergency Conservation Program (ECP) in 1997. At the end of fiscal year 1997, \$79 million was the unobligated balance. As of March 12, 1998, approximately \$9.7 million of that total still remains unallocated. How much of the remaining balance of \$79 million has been used for disasters occurring in 1997?

Answer. Because of the nature of this program it is not unusual for the ECP to have a large unobligated balance at the end of the fiscal year. For fiscal year 1997, the unobligated balance reflected funding that was allocated to States but not obligated before the end of the fiscal year. Therefore, although it may appear that the funding is available for use, the majority of it had been allocated to the States. Also, the large unobligated but allocated balance was due to the timing of receiving supplemental appropriations during the fiscal year.

The beginning unobligated balance for fiscal year 1998 was \$79 million, of which \$57 million had been allocated to States during fiscal year 1997 and the remaining \$22 million is available for new allocations starting in fiscal year 1998.

As of December 31, 1997, a total of \$3.1 million had been allocated to several States for damages caused by natural disasters, such as droughts, flooding, Hurricane Norma, and tornadoes.

Question. Has any of the unobligated funds of \$79 million been used for the recent disasters occurring in 1998? If so, how much?

Answer. As of March 24, 1998, a total of \$11.3 million has been allocated to several States for damages caused by recent natural disasters, such as flooding, ice storms, tornadoes, and typhoons.

Question. Is the \$9.7 million of unallocated money available to meet disaster needs in fiscal year 1998?

Answer. Yes it is. We expect to get additional requests for ECP funds because of the high level of damage caused by recent natural disasters. It is very likely that all of this funding will be allocated well before the end of the fiscal year.

Question. Please list all items and activities which are covered under the ECP program, i.e. irrigations systems, fences, etc.

Answer. Items and activities covered under ECP practices are:

EMERGENCY CONSERVATION PRACTICES

Practice EC1, Removing Debris from Farmland. This practice provides assistance to remove debris from farmland damaged by natural disasters and return that farmland to productive agricultural use.

Practice EC2, Grading, Shaping, Releveling, or Similar Measures. This practice provides assistance to grade, shape, and relevel farmland damaged by natural disasters and return the land to agricultural use.

Practice EC3, Restoring Permanent Fences. This practice provides assistance to restore or replace farmland or ranch land fencing damaged by natural disasters.

Practice EC4, Restoring Structures and Other Installations. This practice provides assistance to restore structures and installations such as dams, terraces, and waterways damaged by natural disasters.

Practice EC5, Emergency Wind Erosion Control Measures. This practice provides assistance to apply emergency wind erosion control measures such as contour or

cross slope chiseling, or deep plowing on similar measures, to farmland damaged by natural disasters.

Practice EC6, Drought Emergency Measures. This practice provides assistance to provide water conservation and enhancement measures to permit grazing of range or pasture, emergency water for livestock, or emergency water supply for existing irrigation systems for orchards and vineyards, on land suffering from severe drought.

Practice EC7, Other Emergency Conservation Measures. This practice is to allow other emergency conservation practices not covered above.

Question. Please explain how initial ECP needs and estimates are collected. If these estimates/needs turn out to be incorrect, what is the procedure to reallocate this money among other States?

Answer. Initial estimates on the amount of ECP funds needed are obtained from the local county FSA office where the damage has occurred and communicated through the State office to the National level. ECP funds, if available, are then allocated based on these estimates. If ECP funds are not available, these estimates serve as the basis for allocations should funding become available. If initial estimates exceed the funds actually needed, the funds are returned to the National level and made available as needed for disasters in other States provided the appropriations act making those funds available did not restrict the use of these funds. If initial estimates are less than the funding needed, additional funds are provided, if available.

Question. How does the Agency distinguish between unobligated and allocated funds?

Answer. Allocated ECP funds are funds made available to States to cover estimated needs as reviewed at the National level. Obligated ECP funds are those which have been officially approved for disbursement to pay for completed emergency conservation work; unobligated funds are all funds that have not been officially obligated. All allocated funds are potentially obligated funds, but because there is a time lag between allocation and obligation, a snapshot of the program's unobligated funds at any given time includes both allocated funds that have not yet been obligated and funds at the National level that have not been allocated, if any.

In instances where a State's allocation exceeds the amount actually needed for obligations to cover completed emergency measures, the allocated but unobligated funds are, as noted above, returned to the National level and may be reallocated to another State as needed.

USER FEES

Question. The fiscal year 1999 President's budget proposes user fees to cover the costs of collecting and processing information of interest to private individuals and companies. Please explain this user fee proposal more fully. Which groups of people would be affected by this?

Answer. In 1999, FSA proposes to begin to charge fees to cover the costs of collecting and processing information of interest to private individuals and companies, such as crop insurance companies, appraisers, agricultural consultants, other agencies, etc. Information products developed from these collections shall be priced at the full costs of processing and dissemination. In FSA county offices, the information would include acreage and production reports, Highly Erodible Land Conservation and Wetland Conservation certifications, CRP/WRP data, and other miscellaneous requests for producer and crop data which are requested throughout the year by private and public individuals and companies. These requests may range from one report to all of these sources of data and can be area specific because of different farming practices, farmland values, conservation and water rights issues, pesticide and herbicide regulation issues, landlord and tenants rights disputes, real estate appraisals, and other types of land development issues. An estimated \$10 million would be collected through fees from these businesses and other agencies, which would be available for salaries and expense obligations.

Question. Is this collection of user fees supplementing existing appropriations for these activities?

Answer. The collection of user fees is substituting for, not supplementing, existing appropriations. If fees are not realized, up to 223 non-Federal county office staff years could not be funded. Potential constraints on realizing significant revenue are that FSA cannot provide any information that would violate the Privacy Act without specific permission from the applicable program participant, and the volume of fee waivers could also impact revenue.

Question. What level of appropriations will be spent on these activities in each of fiscal year 1998 and 1999 without the implementation of user fees?

Answer. User fee collections are a proposed source of funding and would finance payroll in order to save budget authority of \$10 million. It has been estimated that these additional fees could generate \$10 million to fund FSA salaries and expenses, but these estimates are tentative. To date, there has been no determination of how customers would be charged or what the actual charge per request would be. FSA does not have any data to indicate the current level of expense for these activities.

SALARIES AND EXPENSES

Question. The net fiscal year 1999 program level, not including the Common Computing Environment (CCE) earmark of \$30 million, totals \$946 million. This is \$17 million less than the fiscal year 1998 program level of \$963 million. The fiscal year 1999 budget request proposes an increase of \$17.8 million in transfers for administrative expenses. The increase will support an increase of 200 full time equivalents (FTE's) at the county level, updated computer systems, systems development and support. What will be the result of an even further decrease in Federal staff years and non-Federal county staff years?

Answer. FSA has several sources of funds to support staffing levels, including funds carried forward from the prior year under authority of a general provision in annual appropriation acts. Although total S&E available funds have decreased by \$36.5 million, the fiscal year 1999 ACIF account proposes a requested level of \$227.673 million, an increase of \$17.8 million to provide an adequate level of personnel qualified to perform farm loan activities. The fiscal year 1999 Budget proposes a net reduction of 1,118 staff years for fiscal year 1999, of which 263 are Federal staff years and 855 are non-Federal county office staff years. This is composed of a staff-year decrease of 1,060 FTE's required by lower funds carried forward from the prior year and the direct appropriation, partly offset by an increase of 205 FTE's funded through reimbursements and user fees. While lower available funds necessitate lower staffing, the decrease is also attributable to somewhat lower workload (except for farm loan workload) under the 1996 Act. The staffing reductions we are proposing for fiscal year 1999 may require a reexamination of our county office structure. Any closure decisions will be made in light of cost effectiveness and quality of service to the producer.

Question. Will additional county offices be closed?

Answer. Under the 1994 plan, a total of 373 FSA county offices were scheduled to be closed by the end of fiscal year 1997. Five county offices were closed at the beginning of this fiscal year to achieve this closure plan goal. As of January 1998, there have been no additional closures in fiscal year 1998. We expect to be able to use the results of the outside contractor study in guiding our actions to achieve any required office closures through a solid independent workload analysis of the county-based agencies.

Question. What will the decrease be in Federal staff years and non-Federal county staff years from fiscal year 1998 to fiscal year 1999 if the new user fee collections are not realized?

Answer. The anticipated collection of \$10 million would fund 223 county staff years, and the total county staffing reduction would be 855 versus 1,078 FTE's. If the fiscal year 1999 proposed user fee legislation is not enacted, the Agency would need an increase of \$10 million in direct appropriation to fund 223 county office staff years. The user fee collections would not impact Federal staff years.

Question. The fiscal year 1999 budget request proposes a decrease of \$10.9 million for a 263 reduction of Federal staff years. The total reduction for staff years for fiscal year 1999 is 1,118, with the remaining reduction resulting in 855 non-Federal county office staff years. Was this reduction of staff years included in the total 2000 FTE's that were to be eliminated as proposed last year or an additional reduction of staff years?

Answer. Yes, the reduction of staff years was included in the original total of 2,119 FTE's that were to be eliminated as proposed in last year's budget for fiscal year 1998. This fiscal year, FSA is using \$50.8 million in carryover funding from fiscal year 1997, in lieu of appropriations which were reduced by Congress in 1998, for salaries and expenses to fund non-Federal staff years. Consequently, a more modest reduction of Federal and non-Federal staff years was necessary in fiscal year 1998 because of the use of available carryover funds. This allowed the Agency to operate consistent with its anticipated fiscal year 1998 workload. The remaining reductions were achieved through buyouts, a reduction-in-force, the offering of early outs without voluntary incentive payments, and normal attrition.

Question. Due to the proposed staffing reductions, closure of FSA county offices will have to be reexamined. Does the Agency have preliminary estimates as to how many and the location of these offices that may be consolidated or closed?

Answer. Once the Agency has an opportunity to analyze the impact of the results of the independent study which will assess Agency workload estimates and identify criteria for determining the most efficient use of office staffing and to consider the prospective impact of administrative convergence on county office operations, FSA will be in a better position to identify the number of offices and the specific locations of consolidations and closures, where necessary.

Question. Mr. Kelly, you state that you will keep the Committee apprised of any prospective closures. How do you plan to keep the Committee apprised?

Answer. We intend to continue providing periodic status reports on possible office closures, consistent with guidance from the Secretary, to ensure that you and other interested Members of Congress are apprised of our plans in this area.

Question. For the Service Center Implementation/Common Computing Environment, the fiscal year 1999 budget request proposes an increase of \$30 million for FSA's salaries and expenses. Natural Resources Conservation Service and Rural Development will also contribute funds to this project. How much have these agencies proposed to contribute?

Answer. The Natural Resources Conservation Service and Rural Development will contribute \$15 million and \$7 million, respectively, during fiscal year 1999 towards the Common Computing Environment.

Question. Will the CCE project being completed in fiscal year 1999 require any more financing?

Answer. Hardware and software acquisitions for the Common Computing Environment will be procured in three phases over several years. Phase I will take place in late fiscal year 1998 and throughout 1999 at a cost of about \$100 million. Phases II and III will take place in fiscal years 2000 and 2001 at a cost of about \$250 million. This would complete the hardware and software acquisition for the Service Centers. Funding sources for the Common Computing Environment beyond fiscal year 1999 have not been identified.

Question. Why does this require an earmark as proposed by the Agency?

Answer. The \$30 million requested under FSA Salaries and Expenses (S&E) will be combined with funds from the Commodity Credit Corporation, the Natural Resources Conservation Service, and the Rural Development agencies to start the USDA Service Center Common Computing Environment. The appropriations language we are proposing merely denotes that \$30 million of the FSA S&E request is for the CCE and is not available for any other purpose, including staffing.

Question. Does the Agency or the Secretary of Agriculture have a proposal to convert FSA non-Federal county committee employees, with their career tenure, to Federal civil service status? If not, what has been proposed by the Secretary?

Answer. The Secretary of Agriculture is on record as supporting pending legislation introduced by Congresswoman Eva Clayton favoring converting FSA non-Federal county committee employees, with their career tenure, to Federal civil service status. Conversion of these FSA non-Federal employees to Federal civil service status would greatly improve our program delivery and would eliminate the challenges FSA currently faces in operating two different personnel systems for employees in county offices.

Question. Carryover funds used in fiscal year 1997 for staffing expenses will not be available for fiscal year 1998 resulting in a decrease of \$37.8 million. Due to the lack of these carryover balances, non-Federal county office staff years will result in a proposed net decrease of 855 FTE's from fiscal year 1998 to 1999. Were these numbers included in the target reduction number of 2,500 FTE's that you announced last year?

Answer. Yes, the reduction of staff years was included in the original total of 2,119 FTE's that were to be eliminated as proposed in last year's budget for fiscal year 1998. For fiscal year 1998, FSA is using \$50.8 million of the available fiscal year 1997 carryover balance of \$63.8 million to finance fiscal year 1998 staffing and related costs, leaving an unused balance of \$13 million. In fiscal year 1999, FSA will use the remaining \$13 million to help finance staffing costs. Because of the use of fiscal year 1997 carryover funds, a more modest reduction of Federal and non-Federal staff years was necessary in fiscal year 1998. These lower reductions were achieved through buyouts, a reduction-in-force, the offering of early outs without voluntary incentive payment, and normal attrition.

Question. Wasn't the Agency aware of these unavailable funds last fiscal year?

Answer. Yes, the Agency was aware of the funding situation last fiscal year and took action to notify the Department. The carryover balances, which resulted largely from States not filling funded vacancies in 1997 in anticipation of the large budgeted reductions for 1998, were taken into account by Congress in appropriating lower than requested salaries and expenses funding for 1998. The total available funds for non-Federal county office activities in fiscal year 1998 included funds car-

ried forward from the prior year. For fiscal year 1998, FSA is using \$50.8 million of the available fiscal year 1997 carryover balance of \$63.8 million to finance fiscal year 1998 staffing and related costs, leaving a balance of \$13 million. In fiscal year 1999, FSA will use the remaining \$13 million to help finance staffing costs.

Question. There is much frustration in the State FSA field offices under the current environment at USDA. State Directors feel that they do not know what is expected of them nor do they know what human resources will be available from year to year. Without clear goals and a strategic short term and long term plan of operation the field offices are left to make inadequate management decisions. Does USDA know how FSA will proceed in the future with the structuring of their field offices and does a strategic plan of operation exist? If yes, has this been communicated to all State Directors?

Answer. A strategic plan has been developed for the Agency which is included in the USDA strategic plan. FSA is committed to implementing the concepts in the Blair House Papers giving more responsibility and accountability to State Directors. An FSA SED conference is being held March 24 through 27, 1998, in Arlington, Virginia. This conference has been scheduled to discuss such issues as administrative convergence, outreach/civil rights, farm loan programs, farm programs, management issues and strategic planning. A notice will also be released this week delegating the responsibility for insuring budget and personnel ceiling constraints to SED's. A task force has reviewed the current delivery system, but no final decision has been made on the structure of field offices.

Question. Have State Directors been given the criteria used to determine their staff ceilings and their budget so they can make management decisions necessary to stay within the budget? If not, why?

Answer. In an August 22, 1997 memo, State Directors were issued personnel ceilings for Federal and non-Federal employees for fiscal year 1998. After the FSA 1999 appropriations are passed, State Directors will be issued ceilings for fiscal year 1999. The analysis for determining the allocation of ceilings to each State has not been determined at this time. Plans are currently being implemented to delegate to State Directors the authority to manage budgets, ceilings and personnel within their respective States.

Question. What is the Agency's plan to respond to and address discrimination complaints?

Answer. FSA is currently staffed with nine EEO counselors located in various FSA State offices. The counselors are available to FSA employees in the pre-complaint process. By the end of April 1998, FSA will be fully staffed with 11 full-time counselors. FSA has established 15 Fact Finder positions in Montgomery, Alabama, to perform fact finding inquiries into program complaints FSA-wide. This staff will report to the Director, Civil Rights and Small Business Utilization Staff. Within the next four to six months, FSA will be implementing a mediation program in the pre-complaint process. This program is intended to reduce the number of formal EEO complaints, speed up the complaint process, and preserve ongoing working relationships. Prior to implementation of this mediation program, all counselors will receive mediation training which will give them the necessary skills to act as intermediaries.

Question. USDA created the service center concept during reorganization. Service centers are used to provide "one stop shopping," thus the Agency's customers can perform all of their business transactions at one place rather than traveling to several places. Has the service center concept been integrated in all State field offices?

Answer. The Service Center concept is still in the process of being implemented in all State field offices. The office closure/opening/collocation and the LAN/WAN/VOICE installation phases of this initiative will be completed by December 1998. These two initiatives provide the foundation for business process reengineering and subsequent information technology investment. Integration of business processes is under evaluation, with pilot testing currently underway. When the pilot testing is completed and the new business processes are identified, these processes will be implemented in all Service Centers and the Service Center concept fully implemented.

Question. Why does the administration call a USDA office a "service center" when in many cases only one Agency (FSA, NRCS, or RD) is housed in the office?

Answer. The National Food and Agriculture Council (FAC), at the request of the Secretary, is reengineering, modernizing, and streamlining the processes of county-based Service Centers. The National FAC established the Service Center Implementation Team (SCIT) to design and implement the changes required to achieve an integrated Service Center environment that will provide customers with "one stop service." Under the service center concept, customers will be provided services by trained and knowledgeable USDA employees who are willing and able to accommodate customer requests, regardless of a particular Agency's presence in a Service

Center. While there are many specific benefits for both customers and the partner agencies, the primary benefit is that of achieving the Secretary's vision of a more efficient delivery of USDA programs to rural America.

Question. USDA is planning to undergo administrative convergence, using one administrative support staff for all field offices. Has the USDA thoroughly studied all options for administrative convergence?

Answer. The Secretary of Agriculture announced administrative convergence plans in July 1997 to consolidate the administrative support functions of the USDA county-based agencies to reduce costs and streamline offices. Phase one created the Administrative Convergence Action Team (ACAT), comprised of nearly 200 USDA employees, representing each of the impacted agencies and every aspect of operations. The ACAT was successful in developing the initial report that included a thoughtful series of options which set a solid foundation for the success of this critically important project. In phase two, Deputy Secretary Rominger and members of the Subcabinet developed the proposed framework for administrative convergence. Based on this proposed framework, the Secretary initiated the implementation phase of administrative convergence on March 16, 1998.

Question. Have plans for implementation been determined and have State field offices been notified?

Answer. Following the Secretary's initial review of the proposed framework, USDA's State leaders were given the opportunity to comment before the final decision was made. A number of thoughtful and important questions were raised and can only be answered during the next phase leading up to implementation, which is projected to occur by October 1, 1998.

Question. Will this convergence be considered as the Agency undergoes the service center implementation/common computing environment?

Answer. Yes, the Secretary is committed to the continued re-invention of basic business processes and the successful establishment of a common computing environment.

Question. The proposed fiscal year 1999 budget assumes a reduction in non-Federal county employees and a reduction in Federal employees as well. What is the rationale for proposing a major reduction while at the same time the Department has hired Coopers & Lybrand to study the workload requirements of the field delivery system?

Answer. The net reduction in staffing is driven by further declines in expected workload stemming from the 1996 Farm Bill and the need to make hard choices to balance the Budget. The Department entered into a contract with Coopers & Lybrand to conduct a study of the farm and rural program delivery system of the county-based agencies, FSA, NRCS, and RD, to be completed by September 1, 1998. The study will clearly identify the purposes Agency operations are intended to achieve, provide an independent assessment of Agency workload estimates, consider the prospective impact of administrative convergence on county office operations, identify criteria for determining the highest value use of office staff, evaluate office operations efficiencies gained so far, and assemble a profile of the USDA customer base as defined by eligibility for program benefits. Finally, the study will identify alternative decision systems or organizational structures for matching USDA resources with customer needs and preferences. We expect to be able to use the results of the Coopers & Lybrand independent workload analysis of the county-based workload study in guiding our actions to determine the most effective use of office staff which may result in office closures or additional consolidations. At the time of completion of the study, all recommendations will be analyzed to see what further steps, if any, can be implemented to improve the National, State, and county-based delivery systems.

Question. Does the Secretary support the conversion of county employees to Federal status?

Answer. Yes, the Secretary supports converting FSA non-Federal county committee employees, with their career tenure, to Federal civil service status. Conversion of FSA non-Federal employees to Federal civil service status would eliminate the difficulties FSA currently has in operating two different personnel systems for employees in county offices. These difficulties include the fact that non-Federal FSA employees cannot compete for FSA Federal vacancies on an equal footing with Federal employees, non-Federal employees who are RIF'd are not entitled to assistance and priority placement under the Career Transition Assistance Program, and FSA is required by law to establish separate supervisory reporting lines for non-Federal and Federal employees located in the same county office.

Question. Why has the Department made the decision to fill ACO positions, Federal only?

Answer. The Secretary favors Federal control of Farm Loan Programs (FLP) to maintain uniform management and accountability. The Office of General Counsel has advised that if non-civil service (county committee) employees are involved in loan making or loan servicing decisions, the 90-day finality rule would apply to those decisions which would create additional liability for the Department.

FSA has established Agricultural Credit Officer (ACO) training type positions in county offices to perform loan making and servicing according to supervised credit principles when there are not enough fully trained and experienced credit officers to provide supervised credit in the manner needed by FSA. Delegating farm loan making authority and some servicing authorities exclusively to Federal employees facilitates the effective delivery of FLP in county offices by having all ACO's under the same personnel system, supervisors, and guidelines. It promotes Federal control of FLP by ensuring that direct line authority extends from the Secretary to Federal employees in local county offices and eliminates FLP liability from the 90-day finality rule.

Question. The county committee system is the backbone for the field delivery system. Retaining county committee authority in decision making is very important to the farming community. Under what authority did the Department remove from the county committees the eligibility determination to apply for guaranteed loans?

Answer. The Department of Agriculture Reorganization Act of 1994, §227(a), says in part that the Secretary shall use the services of committees in carrying out the agricultural credit programs under the Consolidated Farm and Rural Development Act. The statute does not dictate to what extent the county committees will be used nor is committee action to determine eligibility required. The degree of committee involvement in FSA farm loan programs is discretionary. The Secretary determined that allowing credit officials to determine eligibility for loan guarantees would reduce application processing time and streamline the approval process. The removal of county committees from the loan eligibility process is consistent with recommendations from USDA's Civil Rights Action Team and has the full support of lenders using the guarantee program.

We agree that county committee input is very important to the farming community and the success of FSA programs. The grass roots knowledge that county committees have and the advice that they give is very valuable to making decisions regarding farm loan programs, and we continue to capitalize on that knowledge and rely on their advice. It is not, however, essential for the county committee to be involved in determining eligibility on every loan guarantee application, nor is it an effective use of the committees' time.

Question. Reports have surfaced that the Department has developed a task force report on the field delivery system. Is this the case?

Answer. A task force was appointed to address the interim and long-term needs of FSA's delivery system. This is still in the developmental stage for the Agency. The Secretary has also contracted with Coopers and Lybrand to provide alternative approaches to organizing and staffing USDA's county-based operations in delivering services that are clearly linked to Federal policy and program priorities and that can be managed to meet Federal budget targets. The study will (1) identify the purposes Agency operations are intended to achieve, (2) provide an independent assessment of Agency workload estimates, (3) consider the prospective impact of administrative convergence on county office operations, (4) identify criteria for determining the highest value use of office staff, (5) evaluate office operations efficiencies gained so far, and (6) assemble a profile of the USDA customer base as defined by eligibility for program benefits.

ACREAGE STATISTICS

Question. Does USDA have authority to allow producers to report their planted acreage? Does USDA have authority to share planted acreage data with private organizations who need such data?

Answer. Section 374(a) of the Agricultural Adjustment Act of 1938 (1938 Act) provides broad authority for collecting land and crop information in support of programs administered by USDA. The statute states that "The Secretary shall provide for ascertaining, by measurement or otherwise, the acreage of any agricultural commodity or land use on farms for which the ascertainment of such acreage is necessary to determine compliance under any program administered by the Secretary." In addition, the 1938 Act and the Federal Agriculture Improvement and Reform Act require the collection of acreage information for all quota tobacco and quota peanuts and as a condition of eligibility for the Noninsured Crop Disaster Assistance Program, respectively.

However, information collections are subject to approval by OMB under the Paperwork Reduction Act of 1995. USDA's approval for these collections has lapsed as the result of OMB concerns about the practical utility of the information being collected. USDA continues to accept reports during negotiations with OMB for re-approval.

Information sharing with private organizations is limited by the Privacy Act, 5 U.S.C. 552a, which prohibits disclosure of information regarding farm operations without written consent of the individuals to whom the records pertain. One exemption authorizes disclosure under the Freedom of Information Act (FOIA), 5 U.S.C. 552(a)(b)(2). However, FOIA restricts disclosure of information including, but not limited to, Social Security Number, farm number, yields, crop bases, tillable acres, and acreage information related to USDA-administered conservation programs.

Question. Have other groups, organizations or agencies expressed interest in working with FSA to obtain accurate crop acreage data?

Answer. Within USDA, interest in access to detailed or summary-level information has been asserted by the Animal and Plant Health Inspection Service; Cooperative State Research, Education and Extension Service; Economic Research Service; National Agricultural Statistics Service; Natural Resources Conservation Service; Risk Management Agency; and World Outlook Board. USDA's Office of the Inspector General classifies FSA's collection of this information as a key internal control for \$11 billion in annual program disbursements.

Beyond USDA, many State governments and local entities use the FSA-collected land and crop information in support of State and local programs, such as pesticide and fertilizer control programs and local crop forecasts and analysis. Private crop insurance agents, reinsured by USDA, also use and rely on FSA-collected information to verify crop data reported by producers for crop insurance.

Appeals for continued collection and sharing of the information have been received from the American Farm Bureau Federation, American Sugar Cane League, National Cotton Council, National Farmers Union, and a variety of rural land interests, such as the American Society of Farm Managers and Appraisers.

Question. What is the status of any cooperative efforts between USDA and NASA which decides the use of NASA facilities, personnel and/or equipment to collect data using remote sensing, satellite or other advanced technology?

Answer. USDA and NASA are in the final stages of establishing a Memorandum of Understanding (MOU) on Cooperation and Coordination in Science and Technology Research, Development, Transfer, Utilization and Commercialization. The purpose of the MOU is to provide a framework for the continued cooperation and coordination in the area of remote sensing.

Both parties view this agreement as important for improving the capability to collect data needed to improve precision agriculture technologies, global crop-condition assessments, and natural resource management. The Secretary signed the proposed MOU for USDA on February 27 and has forwarded the document to the NASA Administrator for his signature.

FSA COMBINATION LEASES

Question. During 1997 FSA proposed classifying all combination leases, those with a share and cash provision, as share leases. Based on concerns expressed by landlords and tenants who participate in such leases, FSA delayed implementation of the proposed procedure. Since these leases are utilized in areas where low prices for cotton and other commodities are causing production financing difficulties and since the change would generate minimal savings, if any, would the Agency consider allowing those who have historically utilized combination leases continue to do so thereby making the change apply only to new leases or to those combination leases where both parties agree to the new determination?

Answer. The reclassification of combinations leases does not mean that producers are prohibited by FSA from continuing to use such leases. Audits conducted by the Office of the Inspector General (OIG) confirmed that the majority of combination leases actually result in share leases unless a disaster affects the crop. This meant that even though the terms of the lease resulted in a crop share, FSA was recognizing the lease as a cash lease in most cases. This resulted in AMTA payments going to the operator when a portion should have gone to the owner. OIG views combination leases that are considered cash leases as a tool for allowing landlords to evade payment limitations. The change corrects this inequity. The final regulation will be issued in the near future and will address the issue of which leases/producers will be subject to its requirements.

BOLL WEEVIL ERADICATION PROGRAM AND LOANS

Question. Since the program is continuing to expand, please provide the Committee with an analysis of whether the program can succeed without significant funding for Federal cost sharing and for the FSA loan program—particularly while prices are low and acreage is in decline.

Answer. We believe the boll weevil eradication program can succeed with fewer Federal cost-share funds and a flexible loan program. Cotton acreage has fluctuated significantly over the last two years, largely due to recent changes in farm legislation. These swings in acreage make it more difficult to provide the cash flow for the eradication program in each new area. High acreage during the expensive few years of eradication will result in high overall program costs. If acreage then declines in the post-eradication phase as loans are being repaid, grower assessments may not be sufficient to retire existing debt on schedule.

Question. Is it accurate that USDA and Land-Grant University analyses have concluded that the boll weevil program has generated significant economic and environmental benefits in the Southeastern States?

Answer. A report written by USDA and University of Georgia researchers summarized the tremendous economic and environmental benefits of boll weevil eradication in Georgia. According to the study, cotton production has increased dramatically each year since the program was completed in 1990. Average yield has increased from 482 pounds per acre in the pre-eradication period (1971 to 1986) to 733 pounds per acre in the post-eradication period (1991 to 1995). Acreage has increased from an average of 288,000 to 770,000, and average gross crop revenues have increased from \$70 million to \$400 million per year. In addition, net crop revenues (gross revenues less insect pest management costs and amount of damage) have increased from \$187 to \$451 per acre.

The report also identifies environmental advantages to growers and residents of the State due to a significant decrease in insecticide use in Georgia cotton. The average number of insecticide treatments has decreased from 14.4 per acre in the pre-eradication period to 5.4 per acre in the post-eradication period. In most cases, the materials used are more specific, and the amount of active ingredient applied during each treatment has been reduced from pounds per acre to a few ounces per acre.

Question. How much of the APHIS funds go directly to the field and how much are attributed to administrative overhead?

Answer. Approximately 86.1 percent of APHIS' funding is allocated to the field for program delivery costs while 13.9 percent is allocated for Agency and program-level support costs.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the Agency's annual performance goals linked to the Agency's mission, strategic goals, and program activities in its budget request?

Answer. The annual performance goals measure incremental achievement of the Agency's strategic goals and, ultimately, the Agency's mission. As such, many of the annual performance goals in the Annual Performance Plans are similar to the strategic goals encompassed in FSA's strategic plan. Furthermore, the Annual Performance Plan reflects the program activities in the Agency's budget request, summarized on a GPRA basis, including FTE staffing and funding associated with achievement of annual performance goals.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. As a part of the budget process this year, a fiscal year 1999 Annual Performance Plan was developed and submitted which contained performance goals relating to the Agency's strategic plan. The Annual Performance Plan encompasses all program activities included in the Agency's budget, and reflects the program activities associated with identified performance goals. Both the Annual Performance Plan and the fiscal year 1999 budget discuss the need for resources relative to achieving program performance goals. This linkage also enables decision-makers to assess the FTE's and funding requirements of the strategic plan goal encompassing the program activities associated with achieving annual performance goals.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Difficulties associated with establishing this linkage included developing outcome measures for each of the program activities encompassed in the budget, while maintaining an Annual Performance Plan that is informative and concise and establishing quantitative performance goals for program activities to show a definite cause and effect relationship between the funding requested for program activities and the expected outcome. There were also some timing problems associated with

linking available funding (e.g., receipt or establishment of budgetary allowances) with related performance goals.

Question. Does the Agency's Performance Plan link performance measures to its budget?

Answer. As part of the budget process discussed previously, regarding linking performance goals to budget activities, performance measures were incorporated in budget material to indicate expected performance to be achieved, based on available funding.

Question. Does each account have performance measures?

Answer. Performance measures were developed for each FSA budget account. Performance measures were developed for the strategic goals and annual performance goals and then linked to budget accounts. Budget accounts were aggregated where appropriate to tie in with strategic goals.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The performance planning structure was aligned with the structure reflected in the Strategic Plan. As such, annual performance goals, measures, indicators, and baselines were developed for each strategic goal and management initiative. The budget account structure, however, differs from the performance planning structure. The budget account structure encompasses program and salaries and expenses funding requirements but does not separately address certain administrative and support functions, such as outreach, equal employment opportunity, and information technology initiatives. Instead, these functions are aggregated and reflected in the Agency's salaries and expense accounts by goal. Also, the performance plan will report whether or not annual performance goals were achieved with available funding for those activities. The budget justification is not currently developed to justify these types of resources primarily on a performance budget basis.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. Presently, there are no plans to change the FSA account structure for fiscal year 2000, since there is linkage between the account and activity structure in the budget and GPRA program activities.

Question. How were performance measures chosen?

Answer. Performance measures were developed by Agency representatives within their respective areas of responsibilities. The FSA Corporate Affairs Group worked closely with Agency representatives from program and administrative areas to ensure performance measures captured significant, vital operations. This ongoing interaction continues as the Agency strives to develop a greater number of outcome measures reflecting results, or impacts, of Agency programs.

Question. How did the Agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. In many instances data collection systems and verification methods were already established prior to the development of performance measures. As such, managers were able to utilize existing technology, processes, and resources to collect and evaluate data. Instances in which data collection systems and/or verification methods were not available required consideration of several factors to evaluate the cost versus the benefit of data collection and verification methods. Factors considered included actual/anticipated policy or organizational changes within program and administrative operations, available technology and funding, internal and external risk factors, and the degree to which FSA operations influence performance results.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. As reflected in the Annual Performance Plan, some performance measures exist for which resulting data may not be available for inclusion in the fiscal year 1999 Annual Performance Report, which is due in March 2000. Instances in which data is not available will be reflected in the Annual Performance Report accompanied by an explanation supporting the reason data is unavailable and anticipated timeframes to obtain the data. However, prior to preparation of the fiscal year 1999 Annual Performance Plan Report, FSA will diligently strive to develop systems facilitating the collection and evaluation of all required data.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The Agency was diligent in ensuring that the most critical performance goals were included in the FSA Annual Performance Plan. Lower-level, less critical performance goals were evaluated for inclusion in Division and Branch level plans.

As such, we recommend that the subcommittee track all of the annual performance goals in the 1999 Annual Performance Plan.

Question. In developing your Annual Performance Plan, what efforts did your Agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. During the development of the 1999 Annual Performance Plan, Agency managers were apprised of the distinction between output and outcome measures and were encouraged, to the extent possible, to develop outcome measures in their area of responsibility. We also worked with OMB and USDA staff offices to assist in this effort. Currently, the majority of the performance measures in the Annual Performance Plan are outputs rather than outcomes. Furthermore, output measures are often most appropriate for evaluating achievement of annual performance goals, for often outcomes will take multiple years to be achieved and evaluated. The Corporate Affairs Group, however, will continue working with program managers to develop outcome measures, where applicable.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Agency program managers understand the distinction between output and outcome measures. However, developing outcome measures is often not feasible for interim timeframes, such as the short-term timeframes encompassed in Annual Performance Plans.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Management initiative number 3 in the Annual Performance Plan focuses strictly on customer satisfaction. Specifically, performance measures have been developed to evaluate customer satisfaction with each of FSA's major programs. The management initiative also includes a discussion regarding the strategies that will be implemented to achieve greater customer satisfaction, including electronic warehouse receipts, paperwork reduction, and various automation techniques to issue payments in a more timely manner. In the recent past, the Agency has also used national customer (producer) satisfaction surveys.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The Agency's Strategic Plan was completed in September 1997, at which time development of the Annual Performance Plan commenced. However, budget timeframes required submission of preliminary budget documents in July 1997. As such, the budget and Annual Performance Plan were prepared to accommodate the timeframes associated with each of these initiatives. However, for fiscal year 2000, the Annual Performance Plan will be prepared prior to the start of the budget process. As such, the annual performance goals included in the fiscal year 2000 Annual Performance Plan will be a primary influence in budget development.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. The ability to assess the impact of proposed budget changes on targeted performance will vary among program areas depending on the extent and nature of proposed funding changes. For instance, the ability to effectively administer farm loan programs is dependent on adequate funding levels. As such, farm loan program personnel can immediately assess the impact on performance and the achievement of various goals, such as delinquency rates that are related to loan servicing, if proposed budget numbers are changed, up or down.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the Agency can be properly managed to achieve the desired results?

Answer. In most instances, FSA will be able to measure and evaluate program performance throughout the year. However, data will not be available for all measures included in the 1999 Annual Performance Plan until new software and/or systems are in place.

Question. The Government Performance and Results Act requires that your Agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. No, we have not faced that difficulty. The program activities in the Annual Performance Plan are linked and crosswalked to the budget account structure.

As a result, performance goals have been developed for each program activity in the Annual Performance Plan that define the level of expected performance.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Since there is linkage between the budget and the activities in the Annual Performance Plan, we believe, at this time, there is no need to modify the budget account structure. However, until we have had time to evaluate data reported on the achievement of performance goals, we cannot speculate on whether modifying our budget account structure would make linkage to the budget clearer.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your Agency and to this committee than the present structure?

Answer. We do not propose to modify the budget structure because linkage exists between the Annual Performance Plan and program activities in the budget.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. At the present time, we do not think modifying the budget account structure would necessarily strengthen accountability for program performance.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The discussion of external factors is primarily reflected in FSA's Strategic Plan. The measures in the Annual Performance Plan are linked to the goals, objectives, and measures in the Strategic Plan. Therefore, the same external factors identified in the Strategic Plan will influence achievement of annual performance goals. Including external factors in the annual performance plan would be a repetitious presentation of information and would compromise our efforts to make the plan as concise as possible.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. Management assesses risk in the administration of their daily operations and determines the impact on resource estimates and achieving targeted levels of performance. This discussion was not included in the Annual Performance Plan, for a variety of alternatives are utilized to manage risk, and including this discussion would result in a voluminous document.

Question. What impact might external factors have on your resource estimates?

Answer. That depends on the extent and type of external factors. For example, with unfavorable weather conditions, it may become impossible to achieve performance goals established for Agency program activities, such as for the Non-Insured Disaster Assistance Program (NAP), with available or requested resources. Another possible impact might be increased difficulty in determining the appropriate level of resources needed to achieve a desired program outcome.

Question. Through the development of the Performance Plan, has the Agency identified overlapping functions or program duplication?

Answer. The discussion of partnerships and coordination in the FSA Strategic Plan reflects government and private entities with whom FSA administers complementary program functions. The same partnerships and coordination also apply to the program activities included in the Annual Performance Plan.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. The Performance Plan does not identify overlap or duplication of functions or programs. However, the Agency is involved in several cross-cutting issues to streamline and consolidate duplicative and overlapping functions. For example, the USDA Service Center initiative will collocate the county-based agencies (FSA, NRCS and RD). Another major initiative underway is the administrative convergence of the NRCS, FFAS, and RD mission areas.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that, to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The Agency has established measures enabling FSA to compare targeted to actual performance. However, the Agency is continuing efforts to develop measures which will better reflect program performance. As such, newly developed performance measures will need sufficient time to mature to facilitate a comparison between actual and targeted levels of performance.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Agency managers develop estimates in view of their existing knowledge of program operations and anticipated political and economic environment. Changes

in these estimates, and the resulting impact on resource estimates, require a coordinated effort between Agency program managers and budget representatives.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The Agency has identified a need to revise the September 1997 Strategic Plan. However, the Annual Performance Plan was not the primary influence in the decision to revise the Strategic Plan. Instead, other factors, such as administrative convergence and the change in Agency leadership, are the primary factors influencing the need to revise the Strategic Plan.

QUESTIONS SUBMITTED BY SENATOR BURNS

CONSERVATION RESERVE PROGRAM

Question. Mr. Kelly, what is the process whereby contracts are being presented for acreage in the Conservation Reserve Program?

Answer. Producers may offer land for the Conservation Reserve Program (CRP) through three different methods. One method is through the CRP general signup where offers are submitted at the local FSA office during a specified signup period. The local FSA and Natural Resources Conservation Service (NRCS) make eligibility determinations and collect environmental benefits data. All offers are evaluated based on the environmental benefits index (EBI) and ranked using the EBI. After offers are determined acceptable, NRCS, in conjunction with the producer and conservation district, develops a conservation plan to implement the offered conservation practices. After the conservation plan is approved, the CRP contract is approved by the local county FSA committee.

The second method to participate is through the CRP continuous signup. Continuous signup allows producers to enroll at any time during the year for certain highly desirable environmental conservation practices such as filter strips, riparian buffers, contour grass strips, and grass waterways. Producers apply for enrollment in the continuous signup at the county FSA office. This is a non-competitive process because of the relatively small acreages of these practices and extraordinarily high level of environmental benefits to be obtained. All other land and producer eligibility requirements apply.

The third way to participate is through the Conservation Reserve Enhancement Program (CREP) where Federal and State resources are combined to target areas of environmental importance to the State and nation. States are expected to contribute significant resources toward the enhancement program such as additional funding for longer-term (beyond the CRP contract) producer obligations. All CREP agreements are subject to all CRP land and producer eligibility requirements. CREP agreements have been signed with the Governors of Illinois, Maryland, and Minnesota.

Question. Last year there was a great deal of concern about the way the program was being administered. Can we foresee these same problems in the coming year?

Answer. We are very pleased with the results of signup 16 and have noted that only a few concerns have been raised. We agree that some questioned whether USDA could implement signup 15 under the aggressive schedule we announced. However, the FSA and NRCS employees conducted the largest CRP signup ever and announced the acceptability of contracts using the least amount of time that has ever been used. After signup 15, FSA and NRCS convened a group of employees from all levels of the Agencies to identify policies and processes that could be modified to improve and streamline the program. As a result, there have been no major issues raised under signup 16. Although there are isolated areas where concerns have been raised, we believe that these issues can be resolved administratively.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

FSA STAFF REDUCTIONS

Question. You have stated that "The Farm Service Agency is the agency that family farmers and ranchers interact with most frequently." Still, in spite of this agency's importance to family farmers, the fiscal year 1999 budget would make 1,100 additional staff year reductions. Earlier this year, the agency conducted a RIF of 152 employees, all of which were non-Federal county employees. Is it true that in spite of this year's RIF, FSA is hiring new personnel?

Answer. Yes. Although the Agency is going through an overall downsizing, we did identify a need to shift staff resources from the farm programs to the farm loan pro-

grams. To accomplish this, a training type Agricultural Credit Officer (ACO) position was created to develop staff as credit officers. Initially, these new positions were being advertised internally to FSA, both under the county committee (non-civil service) and through merit promotion for FSA Federal employees. The position descriptions and qualifications were almost identical and the State Executive Director and/or State Committee selected the person who was considered best qualified for the job. Since FSA has separate ceilings for the county committee (non-civil service) and Federal positions and is in a downsizing mode, the employee selected remained in whatever system (Federal or non-civil service), they came from, allowing what was, in effect, a transfer of staff resources from one program to another and meeting what we believe was the spirit of the interchangeability provision of the reorganization act. Unfortunately, based upon opinions from the Office of the General Counsel, we learned that loans approved and servicing actions taken by county committee employees (non-civil service employees) would be subject to the 90-day finality rule which could have an adverse effect on the farm loan program. In addition there were issues raised concerning possible conflicts of interest since the non-civil service employees are actually employed by the farmer-elected committees. Given these issues, the Agency in consultation with the Secretary's office determined that a change in policy was appropriate and that these ACO positions would be filled solely as Federal positions. They were, however, advertised as "all sources" which allowed non-civil service county committee employees to apply. However, in some cases, non-civil service employees may be disadvantaged when applying for a Federal vacancy through being blocked for consideration by a veteran or a displaced Federal employee with Career Transition Assistance Program (CTAP) reemployment rights. As of March 27, 1998, 125 of these positions had been filled; 48 were formerly FSA non-civil service employees, 53 were FSA Federal employees, and 24 were from outside FSA.

Question. If so, what is barring RIF'd employees from filling the open positions before you open the announcements to public applicants?

Answer. Non-civil service county committee employees do not have Federal civil service status and for this reason cannot be considered as internal candidates for Federal positions. Therefore, in order to consider non-civil service county committee employees for Federal vacancies, the vacancy announcement must be open to members of the general public. Non-civil service county committee employees who are RIF'd do not have reemployment priority rights to any Federal civil service vacancies, as Federal employees who have been separated under the Career Transition Assistance Program do.

Question. In regard to RIF's, do you think non-Federal employees are being treated fairly?

Answer. FSA extends re-employment priority rights to non-civil service employees for comparable non-civil service vacancies. Because Federal Career Transition Assistance Program (CTAP) provisions apply only to Federal civil service employees, displaced non-Federal county committee employees do not receive any priority consideration for Federal vacancies. FSA believes this is an inequity and would have no objection to extension of CTAP coverage to FSA non-civil service employees so that they have priority for USDA vacancies, consistent with the CTAP coverage that Federal FSA employees receive.

Question. If not, what steps can be taken to make the situation more equitable?

Answer. Because of statutory distinctions between non-civil service county employees and Federal employees, action by Congress to convert all of our non-civil service county committee employees, with status, to Federal positions would eliminate the inequities that now exist and would provide us with additional flexibility in carrying out required reductions and in shifting staff resources between programs. Absent this, exemption of the farm loan programs from the 90-day rule would allow us to revisit the issue of utilizing non-civil service employees fully in the farm loan programs with some additional changes in our current handbooks and regulations. In addition, extension of Career Transition Assistance Program coverage, as indicated in the above answer, would also help to alleviate some of the inequities that now exist.

Question. You mention that "the Secretary favors converting FSA non-Federal county committee employees, with their career tenure, to Federal civil service status." What specific steps are being taken to execute this intention?

Answer. The Secretary of Agriculture is on record as supporting pending legislation introduced by Congresswoman Clayton, as contained in H.R. 2185, favoring converting FSA non-Federal county committee employees, with their career tenure, to Federal civil service status. Conversion of these FSA non-Federal employees to Federal civil service status would eliminate the challenges FSA currently faces in operating two different personnel systems for employees in county offices.

Question. What problems are stopping this process?

Answer. There are other aspects of the bill which have created concerns. Specifically, we have technical concerns regarding language that provides funding for farm ownership and operating loan programs. We also have some concerns with Section 201 of the bill which modifies restrictions on FSA lending to farmers if they have received debt forgiveness on a prior loan or if they are delinquent on an existing loan.

COMBINATION LEASES

Question. In 1997, FSA proposed a change to classify farm leases that contained elements of both "cash" and "share" leases (so-called "combination" leases) as share leases. This change would limit the ability of landowners to participate in the Agricultural Market Transition Assistance program (Freedom to Farm). Because of the timing of the proposed change, it was delayed until this year to avoid the need to redraft leases for the 1997 crop year that had already been executed. I have heard from producers in my State that they still feel the proposed change is unnecessary and unfair. Has the Farm Service Agency taken into consideration the effect of the combination lease ruling on the Agency's farm credit portfolio?

Answer. On the contrary, this change means that landowners who may have been previously considered as cash leasing their land can earn AMTA payments. The change will have some impact on the Agency's farm credit borrowers because borrowers who are land owners will receive more money and the operators will receive less money. However, nationwide, there are very few combination leases. The combination ruling has no effect on the agency's farm credit portfolio. The 1996 Act took away the authority to lease FSA inventory land. There are fewer than 447 leases on inventory land, including non-farm property, currently in effect. None of these leases are combination leases.

Question. What policy objectives will be realized by the combination lease ruling?

Answer. It is our opinion that treating all combination leases as share leases will result in more consistent administration of program provisions by county committees and will be more equitable to all producers. Additionally, treating all combination leases as share leases will eliminate their use as a means to circumvent payment limitation provisions.

Question. If the objectives include savings, what level of savings will be achieved?

Answer. The payments earned by the farm will not change; only the distribution of payment between producers on the farm will change. We recognize that there will be some savings if an affected producer reaches the payment limitation. This would be verification that fewer producers will be circumventing that provision as a result of this new policy. However, as previously indicated, the change was made to treat producers consistently and equitably and to ensure the integrity of the payment limitation provisions, not to achieve savings.

Question. Will this change not result in landlords amending their leases to totally "cash" leases and, therefore, have a detrimental effect on tenants?

Answer. Both totally cash and totally share leases are normal leases used throughout the country. We do not believe that cash leases are detrimental to producers. The type of lease negotiated is dictated by various factors, including provisions of the 1996 Act.

Question. Why do you believe this change does not refute the claim that the Freedom to Farm provisions were to provide farmers with "certainty" of Federal assistance?

Answer. This change does not impact the "certainty" of Federal assistance since the amount of payment earned by the participating farm does not change and is not tied to market prices. As previously indicated, the purpose of the change is to treat all producers consistently and equitably, and to stop the circumvention of payment limitation rules. The Statement of Managers that accompanied the 1996 Act directed USDA to ensure that production flexibility contract payment shares could be changed annually to reflect the changes in leasing arrangements on a farm.

NON-INSURED ASSISTANCE PROGRAM (NAP)

Question. The Crop Insurance Reform legislation of 1994 created the NAP program to assist farmers whose production losses are not covered by crop insurance. Congress is now considering an emergency supplemental appropriations bill to assist dairy, maple, and other producers who have suffered from recent storms. Still, as in the case of maple or dairy, the NAP does either not cover these losses or does so in a way that does not reflect actual losses. Is there any way to amend these programs to ensure all farmers are treated fairly and consistently?

Answer. The 1996 Act Sec. 196 (a)(2)(A) specifically excludes livestock (and by inference, livestock products) in the NAP definition of eligible crops: “. . . the term ‘eligible crop’ means each commercial crop or other agricultural commodity (except livestock)”.

NAP covers maple sap production losses, on a yield per-tap basis, which are directly related to a natural disaster. Future year production losses are not covered.

Sec. 196 (a)(2)(B) specifically includes otherwise ineligible crops under the food or fiber restriction. The crops specifically included are: floriculture, ornamental nursery and Christmas tree crops, turfgrass sod, seed crops, aquaculture (including ornamental fish), and industrial crops.

Except for Christmas trees and some woody ornamental nursery crops, NAP does not cover losses to trees, including maple trees or wood lots.

Under NAP, Christmas trees do not have to be intended for harvest in the year of disaster or loss. The value of the Christmas tree at the time of loss is considered when assessing damage.

Regarding the assertion that NAP needs to be made more fair for all producers, it is FSA's position that NAP is equally available to all producers of crops determined eligible. To allow payments on crops currently not eligible for NAP benefits would require a change to the statute.

EFFECT OF USER FEES

Question. During last week's hearing, when asked who would bear the brunt of proposed FSIS user fees, Secretary Woteki responded by saying that “economists” have determined that meat and poultry consumers would pay those costs at the supermarket. We know that you could lay all the economists in the world end to end and they still wouldn't reach a conclusion. Rather than an answer based on economic theory, perhaps the answer to my question last week lay with economic common sense. Do you think the meat and poultry companies are more competitive in the retail markets or with their suppliers?

Answer. We know that the meat packing industry has become quite concentrated. For example, the four largest packers accounted for 82 percent of steer and heifer slaughter in 1994, versus 72 percent in 1990 and 36 percent in 1980. Although a concentrated industry, USDA studies and ongoing monitoring of the market find competition exists. The number of meat packers bidding for supplies varies by region. The poultry industry is characterized by vertical integration with poultry growers producing birds under contract with large integrators. It is not unusual to find slaughter plants engaged in some further processing.

Meat packers and poultry firms sell to processors, wholesalers/distributors, and directly to large retail food chains and restaurants. They face a large number of buyers who can and do procure from multiple sources.

Question. Which of these two groups is more “captive” to the companies?

Answer. The Department would not use the word “captive” to describe the relationship of meat and poultry companies to any other market sector. However, given the level of concentration in the meat and poultry slaughter and processing industries, these industries are most likely able to exert some influence on both the price they pay for live animals and birds and the price they receive from wholesale or retail customers. The overall industry is structured so that a relatively few packers and processors purchase most of the live animals and birds from a relatively large number of producers and then sell their products to a relatively large number of wholesale and retail buyers.

Economic studies have consistently found that consumer demand for meat and poultry products is relatively inelastic. This means that the quantity demanded by consumers is relatively insensitive to price changes. In markets where demand is inelastic, consumers will bear most of a cost increase. This is what we expect will happen with user fees. Because user fees would be small compared to the base price of meat and poultry, the quantity purchased by consumers would show little change. Producers are unlikely to see an appreciable change in either the price they receive or the quantity they can sell to meat packers and poultry integrators.

Question. How many beef cattle or poultry producers have loans with the Farm Service Agency?

Answer. FSA does not track loans by type of producer.

Question. Did FSIS consult with you about the effect of proposed user fees on agricultural producers?

Answer. No, FSIS did not consult with FSA about any possible effects of user fees on producers.

FLOOD RISK REDUCTION PROGRAM

Question. What is the status of this program?

Answer. The 1996 Act authorizes the Secretary to offer flood risk reduction contracts to producers on farms that are frequently flooded and that have contract acreage under the production flexibility program. Producers can receive in advance up to 95 percent of the projected production flexibility contract payments the producer would otherwise have received from the time of enrollment in the Flood Risk Reduction Program through September 30, 2002. In return, producers must terminate their production flexibility contract with respect to the enrolled acreage, comply with swampbuster and conservation compliance provisions, and forgo future disaster payments, crop insurance payments, conservation program payments, and loans for contract commodities, oilseeds, and extra long staple cotton. There has been no activity to date, and the fiscal year 1999 Budget reflects no proposal for program implementation.

BOLL WEEVIL ERADICATION LOAN PROGRAM

Question. What is the identified need for this program?

Answer. This loan program is an important component of USDA's overall boll weevil eradication strategy. Already regions of this country are benefiting from complete boll weevil eradication. The benefits of this program include reduced chemical applications, higher net farm income, increased land values, and other attributes important to the vitality of rural America. This program benefits not only farmers, but everyone interested in a clean environment and economic prosperity.

These loans are used to enhance the funding of the Boll Weevil Eradication Program and are made to participating States' individual boll weevil eradication foundations. There are still large regions of the country where the Boll Weevil Eradication Program is either in the very early stages or has not yet begun. With this in mind, it is very important that we continue assisting affected regions to help protect the environment and to help sustain rural economies.

QUESTIONS SUBMITTED BY SENATOR BYRD

Question. Chairman Cochran, Senator Bumpers, members of the Subcommittee, and Undersecretary Schumacher, I am pleased to be here today to review the U.S. Department of Agriculture's (USDA) Farm Service Agency (FSA) programs. As result of the USDA Reorganization Act of 1994 and the 1996 Farm Bill, FSA staff reductions are occurring nationwide and the traditional cornerstone of the FSA's mission has been significantly altered. I have been contacted by FSA employees in my State of West Virginia who are concerned about further staff reductions. These employees are also concerned about the equity of treatment between Federal and non-Federal county committee FSA staff when separated from their jobs. I have several questions regarding the FSA in this regard. The proposed fiscal year 1999 budget assumes an additional reduction of 1,078 non-Federal county committee employees—a 9.9 percent reduction. It also assumes an additional reduction of 223 Federal employees—a 3.8 percent reduction. Can you tell me the percentage of reductions nationwide of the non-Federal county committee employees as compared with the percentage of the Federal staff reductions since the reorganization took place on October 1, 1995?

Answer. The percentage of reductions nationwide of employees from the 1993 baseline streamlining plan to the fiscal year 1999 budget is a decrease of 25.9 percent at the Federal office level and 33.3 percent at the non-Federal county level, a total FSA reduction of 30.8 percent. Headquarters employees were reduced 34.9 percent over this same period.

Question. In West Virginia?

Answer. Due to reduced funding levels, the fiscal year 1999 staffing reductions proposed in the fiscal year 1999 Budget would reduce non-Federal county office staffing by 855 staff years and Federal office staffing by 263 staff years. I cannot provide any specific details on any reductions that may take place in West Virginia in fiscal year 1999 because specific Agency or USDA plans for reducing employees or numbers of offices, by State, have not been finalized as Congress has yet to act on the President's proposals.

Question. The Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994 explicitly stated that Federal employees who were transferred to the FSA from the former Farmers Home Administration's farm credit program and the non-Federal county committee FSA employees who were transferred from the former Agricultural Stabilization and Conservation Service, would be used

interchangeably to carry out the programs of the new FSA. However, I understand that a decision was made several months ago by the FSA that the non-Federal county committee employees would be excluded from carrying out certain aspects of the farm credit program. Specifically, I understand that non-Federal county committee employees are not eligible to approve loans or to fully participate in the Agricultural Credit Officer training program that the FSA recently implemented. Please explain how this restriction on non-Federal county committee employees is not in conflict with Congress' intent that all FSA employees be used interchangeably.

Answer. FSA is fully supportive of using non-Federal county committee employees and Federal civil service employees interchangeably to implement FSA programs in local county offices. In fact, the Secretary has gone on record as supporting Congresswoman Clayton's bill to convert non-Federal county committee employees to Federal civil service status. Because of statutory distinctions between non-Federal employees and Federal employees in such areas as supervisory/employee reporting relationships, applying for civil service jobs, Career Transition Assistance Program (CTAP) entitlements, leave transfer, etc., we feel that legislation converting non-Federal employees is necessary to make these positions truly interchangeable.

FSA has been using both non-civil service county committee employees and Federal civil service employees in comparable positions interchangeably. It is true that after the reorganization that established FSA, county level trainee type positions were established so employees could learn the intricacies of the farm loan program and become credit officers. These new positions are Agricultural Credit Officers (ACO's) and are different from the Credit Specialists and Loan Technicians transferred from FmHA and the County Executive Director and Program Assistant positions transferred from ASCS. Initially, these new positions were being advertised internally to FSA, both under the county committee (non-civil service) and through merit promotion for FSA Federal employees. The position descriptions and qualifications were almost identical and the State Executive Director and/or State Committee selected the person who was considered best qualified for the job. Since FSA has separate ceilings for the county committee (non-civil service) and Federal positions and is in a downsizing mode, the employee selected remained in whatever system (Federal or non-civil service), they came from, allowing what was, in effect, a transfer of staff resources from one program to another and meeting what we believe was the spirit of the interchangeability provision of the reorganization act.

Unfortunately, based upon opinions from the Office of the General Counsel, we learned that loans approved and servicing actions taken by county committee employees (non-civil service) would be subject to the 90-day finality rule which could have an adverse effect on the farm loan program. In addition, there were issues raised concerning possible conflicts of interest since the non-civil service are actually employed by the farmer elected committees. Given these issues, the Agency in consultation with the Secretary's office determined that a change in policy was appropriate and that these ACO positions would be filled solely as Federal positions. They were, however, advertised as "all sources" which allowed non-Federal county committee employees to apply.

Question. Given the ongoing restructuring within the Agency, does this restriction disadvantage non-Federal county committee employees in pursuing new staff positions required for the Agency's evolving mission?

Answer. As mentioned above, we have advertised the ACO positions so that non-Federal county committee employees can apply and be considered. As of March 27, 1998, FSA has filled 125 ACO positions, of which 48 were formerly FSA non-Federal employees, 53 were formerly FSA Federal employees, and 24 were from outside FSA. In some cases, non-Federal county committee employees may be disadvantaged when applying for a Federal vacancy through being blocked for consideration by a veteran or a displaced Federal employee with Career Transition Assistance Program reemployment rights. In addition, it does not allow us to truly use our existing employees interchangeably.

Question. Does FSA plan to repeal the restriction? If not, why?

Answer. We are in the process of finalizing revisions in the handbook that deals with conflicts of interest and ethics which will make all FSA employees, Federal and non-civil service, subject to the same rules. (Non-civil service county committee employees are not always covered by conflict of interest or ethics statutes; however, the Agency has and will continue to make them subject to these statutes through regulation.) We are also looking at ways to ensure that the farmer-elected county committee cannot, or is not perceived as being able to, unduly influence the decision of a non-civil service employee involved in the farm loan program. However, even with these changes, we will still be faced with the 90-day finality rule and the additional liabilities created in the farm loan program if non-civil service county committee employees are fully involved in the program. We are hopeful that there will be

some movement in Congress to convert to Federal status our non-civil service employees, with status and credit for their years of service in the county committee system. If this does not happen, we may, in consultation with the Secretary's office, need to reassess the policy of filling the Agriculture Credit Officer positions as only Federal. We do recognize the Senator's concern that we fully comply with the interchangeability requirement of the reorganization act and the need to be fair to all of our employees.

Question. I am particularly interested in the effect that the FSA's policy excluding non-Federal county committee employees from carrying out certain aspects of the farm credit program had on the Agency's recruitment of Federal Credit Officer positions, classified as trainee level. I understand that while the FSA was conducting the reduction in force (RIF) of 150 non-Federal county committee employees, the Agency was simultaneously hiring persons from outside the FSA for the new trainee level Credit Officer positions. Given the experience and knowledge of the Agency's mission and clientele possessed by the RIF'd employees—who in my State have a minimum of 8 years with FSA—why did FSA not initiate opportunities for qualified non-Federal county committee employees to fill these new positions?

Answer. As mentioned in the previous response, FSA was initially filling these new type positions in a way that allowed all employees (non-civil service and Federal) to apply within their respective personnel systems and allowed us to stay within our separate county committee non-civil service and Federal ceilings. For the reasons cited, this policy was changed; however, FSA did announce the ACO positions with an area of consideration that permitted non-civil service employees to apply. As noted above, 48 non-civil service employees were selected among the 125 ACO vacancies. Although our county committee non-civil service employees are paid with Federal funds, carry out what is considered Federal work and work under a personnel system which we have made very similar to the Federal system, they are supervised by non-Federal farmer-elected county committees and are not, therefore, considered Federal. We are, therefore, not able to non-competitively reassign RIF'd non-civil service employees to these ACO positions.

Question. For employees who have likely served USDA and farmers well over the years, would such an approach help mitigate the emotional and economical impact of downsizing on those RIF'd?

Answer. FSA encouraged non-Federal employees to apply for the Federal ACO positions. Of the 125 ACO positions filled as of March 27, 48 (38.4 percent) were filled with non-Federal employees. Action by Congress to convert all of our non-civil service county committee employees, with status, to Federal positions would alleviate the problems outlined in your question. This would also provide us with additional flexibility in carrying out required reductions and in shifting staff resources between programs. Absent this, an exemption in the 90-day finality rule for farm loan programs would alleviate one concern and would allow us to revisit the issue of using all employees interchangeably.

Question. Would such an approach comply with Congress' intent that all FSA employees be used interchangeably?

Answer. FSA has extensively cross-trained county employees and is using non-civil service and Federal employees in comparable positions interchangeably. Conversion of non-civil service employees to Federal status with credit for their years of service under the county committee system would allow us to use all employees interchangeably. Absent this type of action by Congress we will continue to face challenges in truly being able to treat employees under the two systems identically as far as career advancement and opportunities for various positions within FSA. We will, however, continue to do all we can, within the constraints of the various statutes, to be as fair as possible to all our employees (non-civil service and Federal), and to utilize these employees as effectively and efficiently as possible so we can continue to provide quality service to farmers and ranchers.

Question. I understand that there is yet another component complicating the downsizing—that is, that the non-Federal county committee employees who have been RIF'd might not be on equal competitive footing with their FSA Federal employee counterparts for vacancies or new job openings, due to the Federal Career Transition Assistance Program. I would like to hear your views on this matter and, if this situation is inequitable, the Agency's options on implementing a downsizing plan that is equitable and fair for all affected FSA employees. This concludes my questions, Mr. Chairman, and I look forward to working with you, the Ranking Member, and other Subcommittee members in conjunction with the Undersecretary, on these important issues confronting the Farm Service Agency.

Answer. Non-Federal county committee employees who are RIF'd do not have re-employment priority rights to any Federal civil service vacancies, as Federal employees who have been separated do under the Career Transition Assistance Pro-

gram (CTAP). FSA believes that this is an inequity and would have no objection to extension of CTAP coverage to FSA non-civil service employees so that they have priority for USDA vacancies, consistent with the CTAP coverage that Federal FSA USDA employees receive.

QUESTION SUBMITTED BY SENATOR LEAHY

Question. Mr. Under Secretary, one thing that became very clear in the wake of the January ice storm is that there are some significant gaps in FEMA and Department of Agriculture programs. As I visited farms hit by the ice storm, I was struck by the fact that most of these farmers did not expect to get Federal assistance because of the type of damage the storm inflicted and the nature of their crops. The greatest agricultural damage in Vermont was suffered by maple sugarers and dairy farmers, neither of which fits neatly into existing assistance programs. The result of these gaps was a great deal of confusion about who to turn to for help and what kind of help could be provided. FEMA came out with a report not long ago which helps to lay out some of the holes in our Federal disaster safety net. In particular, the report urges the Small Business Administration and the Department of Agriculture to work together to identify their legislative authorities and clarify how each can better serve farmers in future disasters. Is the Department working with FEMA and the Small Business Administration to identify and fill these gaps in disaster assistance? I hope that one result of this FEMA report will be a document that clearly lays out for farmers of all types of crops the kind of assistance they are eligible for in the event of a natural disaster.

Answer. Representatives of FSA, the Small Business Administration (SBA), and the Office of Management and Budget (OMB) met on March 20 to discuss gaps in the Federal disaster safety net. These gaps surfaced in a report prepared by the Federal Emergency Management Agency (FEMA) following the New England ice storms.

Both FSA and the SBA are taking a hard look at their respective statutory and regulatory authorities to determine exactly where the gaps exist. A list of unmet needs will be established. Once specific unmet needs are identified, FSA, SBA, OMB, and FEMA will meet again and work together to determine what can reasonably be done to meet these needs.

FOREIGN AGRICULTURAL SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

EXPORT SUBSIDY PROGRAMS

Question. Please provide the total amount of bonus awards to U.S. exporters under the Export Enhancement Program and the Dairy Export Incentive Program in fiscal year 1997 and estimated for fiscal year 1998.

Answer. The Export Enhancement Program (EEP) was not operational during fiscal year 1997. For fiscal year 1998, the CCC budget baseline has an estimate of \$150 million for EEP, but the program is currently not being operated. For fiscal year 1997, Dairy Export Incentive Program (DEIP) bonus awards totaled \$121.5 million. It is difficult to estimate fiscal year end 1998 awards as bonus levels fluctuate significantly with changes in market conditions. However, the fiscal year 1998 estimate for DEIP bonuses in the CCC budget baseline is \$98.7 million.

Question. You indicate that the fiscal year 1999 budget includes a \$82.3 million program level for the DEIP. What is the fiscal year 1999 maximum GATT-allowable limit for this program?

Answer. The fiscal year 1999 maximum subsidies under the Uruguay Round Agreement are as follows:

Non-fat dry milk	\$97,926,000
Other dairy products (whole milk powder)	5,762,000
Cheese	4,317,000
Butterfat	36,215,000
Total	144,220,000

COCHRAN FELLOWSHIP PROGRAM

Question. The fiscal year 1999 budget maintains the \$3.0 million fiscal year 1998 level of funding for the Cochran Fellowship Program. Is additional funding still

being provided by USAID and through the emerging markets program to supplement the direct appropriations for this program? How much is being provided for fiscal year 1998? What additional funding is expected for fiscal year 1999?

Answer. In fiscal year 1998, the Cochran Fellowship Program requested \$2.3 million from USAID for the program in the New Independent States (NIS), and \$1.12 million from the Emerging Markets Program (EMP) for implementation of the program in Vietnam, the NIS, and in Eastern Europe. Agreements with both U.S. AID and EMP are still pending, but we believe funding will be forthcoming by at least May, 1998. We are expecting \$1.8 million from USAID and \$1.12 million from EMP

In fiscal year 1999, we are requesting \$2.5 million from USAID for the NIS, and about \$1 million from the EMP for continuation of our programs in South Africa, Brazil, and Eastern Europe. The NIS Coordinator at the State Department has indicated his support for the Cochran Program in 1999. We also have preliminary support from EMP for our program in South Africa. We do not at this point have specific agreements or amounts in place.

Question. Please provide the fiscal year 1997 and 1998 program participant levels by country and region.

Answer. In fiscal year 1997, a total of 707 participants from 45 countries received training under the Cochran Fellowship Program.

The following provides the fiscal year 1997 participant levels by region and by country:

Asia.—154 participants from seven countries: Korea (20 participants), Malaysia (21), China (35), Thailand (17), Indonesia (18), Philippines (26), and Vietnam (17).

Eastern Europe.—182 participants from 13 countries: Turkey (19), Poland (56), Hungary (9), Czech Republic (10), Slovakia (11), Albania (6), Bulgaria (11), Slovenia (12), Croatia (10), Latvia (8), Estonia (9), Lithuania (7), and Romania (14).

Latin America.—87 participants from seven countries: Mexico (37), Venezuela (13), Trinidad & Tobago (9), Barbados & Other West Indies (3), Panama (6), Colombia (14), and Chile (5).

Africa.—61 participants from seven countries: Cote d' Ivoire (9), Tunisia (10), South Africa (30), Namibia (2), Kenya (5), Uganda (2), and Senegal (3).

New Independent States.—223 participants from 11 countries: Russia (53), Ukraine (45), Kazakstan (23), Kyrgyzstan (8), Uzbekistan (27), Turkmenistan (8), Tajikistan (5), Armenia (16), Moldova (21), Georgia (10), and Azerbaijan (7).

In fiscal year 1998, the Cochran Fellowship Program will continue work in the above mentioned countries. In addition, pilot programs will be started in Brazil, Bosnia, Costa Rica, Guatemala, and Tanzania, and the program will be expanded in size (increase in the number of participants) in Kenya, Uganda, and Senegal.

We expected to provide training to about 760 participants in fiscal year 1998. Delay in receipt of U.S. AID and EMP funding until May, 1998, however, will most likely reduce the number of participants from countries in the NIS and Eastern Europe during fiscal year 1998.

Question. Please provide examples of success of the 1997 Cochran Fellowship Program.

Answer. The benefits of 1997 the Cochran Fellowship Program to U.S. agriculture can be categorized under the following topics:

I. *Sales of U.S. Agricultural Commodities.*—An immediate benefit of the Cochran Program is the sale of U.S. agricultural commodities or products that come about from information gained and/or direct contacts provided by participant training. Each year, we receive information from past participants, from U.S. companies and associations, and from various agricultural offices about sales of products or commodities that are directly and indirectly related to Cochran Program training activities. The following provide examples of some of our most recent sales information:

—FAS/Fish & Forestry Products Division reports that a Cochran trip to U.S. lumber mills for Polish furniture manufacturers was very effective in promoting U.S. exports of hardwood lumber. The trip: (i) created personal relationships that resulted in each participant making orders for U.S. hardwood lumber, (ii) cleared up misunderstandings about contract specifications, and (iii) may result in future exports of U.S. hardwood totaling \$25 million.

—Another report from Poland states that a 1997 participant purchased over 300 metric tons (about \$500,000) of U.S. prunes and several tons of U.S. almonds and sunflower seeds. Another participant started imports of U.S. shelled peanuts, his first order in June, 1997, amounting to \$25,000.

—A 1995 Polish participant reports that he gained ideas on how to use U.S. popcorn. Today he imports of over 100 containers/year of U.S. popcorn (30 containers by June 1997) for use in caramel corn and other popcorn snacks.

- The Agricultural Office in Sweden reported that Latvian and Estonian importers contracted for \$300,000 per month of U.S. consumer and confectionery products after their program at the Food Expo in Chicago.
- A 1996 Slovenian feed mill team returned from their Cochran Program and ordered 20,000 metric tons of soybean meal—the first of many purchases.
- The Agricultural Office in Cote d' Ivoire reports that a 1997 participant bought 5,000 metric tons (@ \$500,000) of U.S. corn on a commercial basis upon his return. He also purchased poultry equipment (\$32,000) and day old chicks.
- A 1997 Colombian participant has finalized arrangements to be a distributor of a line of U.S. consumer ready products and expects to import 14 containers (@ \$400,000) by the end of the calendar year.
- Almost immediately after a 1997 joint Cochran/CoBank/National Cattlemen & Beef Association (NCBA) program for Mexican bankers on the GSM-103 Live-stock Program, there were five livestock sales registered with USDA (about \$2.2 million), and two other sales were reportedly in the works (\$3 and \$4 million respectively).
- The Agricultural Office in Vladivostok, Russia reports that three Russian participants signed sales contracts for U.S. fruit and vegetables at the Produce Marketing Association (PMA) exhibition in October 1997.
- The Agricultural Office in South Africa reports that after training, a South African company interested in U.S. soybeans for food began working to purchase a large volume of U.S. soybeans.
- The New Jersey Department of Agriculture reports that New Jersey seafood exports to China have doubled since a Cochran Seafood Buyers program in September 1995. Exports now exceed \$1 million per year.
- The Agricultural Office in Beijing states: "As a result of the fiscal year 1996 Supermarket Team, an upscale grocery home delivery service is now purchasing two containers a month of mixed grocery products."
- The Agricultural Office in Malaysia states that "the Cochran NASDA/FMI program has proven to be very effective in generating sales of U.S. high value products as the participants are importers and supermarket managers. Although specific figures are lacking, the FAS office has received feedback from FMI exhibitors/suppliers who indicated that they had received trade leads from the participants and are very positive in establishing business ties."
- A Vietnamese participant stated recently that his company has been importing 2-3 containers per month of U.S. pistachios since June, 1997. Another Vietnamese supermarket owner has imported 3 containers of consumer ready products to test the market for U.S. products. Sales thus far are encouraging.
- A 1997 Armenian supermarket owner reports that he has widened his U.S. product lines to include deli meats, fish, baby food and cookies after participation in his Cochran Consumer Foods Program.

II. *Constraints to Imports of U.S. Agricultural Commodities and Products.*—Many constraints to the export of U.S. agricultural products can be categorized as sanitary and phytosanitary (SPS) restrictions to trade or market access barriers. Cochran training through agencies such as the Food Safety Inspection Service (FSIS); Grain Inspection, Packers & Stockyards Administration (GIPSA); Animal and Plant Health Inspection Service (APHIS), State Departments of Agriculture, Food and Drug Administration (FDA) and the Environmental Protection Agency (EPA), and with private agribusinesses, provide technical information to country counterpart agencies and help to improve the opportunities to export U.S. products into countries.

During 1997, 59 Cochran fellows from 18 countries participated in 24 programs directly related to providing information on the safety of the U.S. food and fiber system as well as providing direct contact with U.S. counterparts.

- The Agricultural Office in Stockholm reports that the meat inspection program for two Latvian veterinarians has been used to help establish new sanitary border inspection procedures. He states that "such education is essential support to the already growing import and transit markets for a widening array of meat and meat products."
- The Tunisian Agricultural Office reports that the Veterinary Team "is in the process of developing with APHIS a live cattle and bovine embryo protocol for U.S. imports in Tunisia, as well as a memorandum of agreement with Texas A&M University for promoting the exchange of faculty and qualified students in areas of mutual interest, such as infections and parasitic diseases of food animals and nutrition."
- The Agricultural Office in Indonesia states that the participant "has used his food safety training to develop a draft regulation on Food Security as well as input into drafts of the Indonesian Food Law Regulations."

—The Agricultural Office in Vienna writes: “The new Chief Veterinary Officer in Slovenia is a Cochran alumnus, which bodes well for relations between his office and FSIS as well as this office as we work toward agreement on sanitary inspection certificates to allow U.S. red meat into Slovenia.”

—The Agricultural Office in Korea states: “The Cochran Program provides the resources to address food safety issues, perhaps the largest, singularly most restrictive barrier for U.S. products in the Korean market.”

III. *Foster Business to Business Contacts.*—One of the major objectives of Cochran training is to put the international participant in direct contact with U.S. agribusiness. Even if immediate sales do not result, follow-up contact with participants in their home country may lead to future international opportunities for U.S. business.

Cochran fellows make contact with thousands of U.S. agribusinesses through product or commodity tours, technical discussions, or via participation at trade shows. Participation in commodity- or topic-specific trade shows or association meetings allow participants first-hand contact with a wide-range of U.S. agribusinesses. Several of the trade shows that were attended in 1997 by Cochran fellows include the Food Marketing Institute/National Association of State Department of Agriculture (FMI/NASDA) Food Expo, Produce Marketing Association (PMA) Show, Institute of Food Technologists, World Dairy Expo, World Beef Expo, San Francisco Seafood Show, International Poultry Expo, International Baking Industry Expo, American Seed Trade Conference, National Building Products Expo, Woodworking & Furniture Supply, High Point Furniture Show, National Homebuilders Association Expo, Wine Spectator Showcase, National Restaurant Show, National Barrow Show, World Pork Expo, American Feed Industry Association Show, All Candy Exposition, and the Fancy Food Show.

—The Agricultural Trade Office (ATO) in Guangzhou writes that the Chinese Supermarket Program “. . . is beneficial to American agricultural products because (the team) were so impressed with the high quality and diversity of U.S. products that some of them are considering carrying more products in their stores. As a result, the largest supermarket chain in China is scheduled to host an American Food Promotion in December 1997 at 11 major stores.”

—The Director of the Appalachian Hardwood Manufacturers writes about a Polish team: “We hope that our members were able to make good contacts with these companies and begin a business relationship. These were new companies to our exporters who were interested in exporting to Poland. This service allows American companies to have access to new business and contacts that would be difficult to establish on their own.”

—“Thanks for introducing the group to us. This is good old fashioned teamwork between the private business sector, entrepreneurial business persons in the developing countries, and the American government. It can be a win-win for all.” (Chairman, McClane Group, Temple, TX)

—“During the last visit of the U.S. Meat Export Federation representative to Poland, we had a chance to meet with several former participants. Most who traveled to the 1995 International Meat Industry Convention and Expo in Chicago started to import pork and offal from U.S. suppliers. ELKOPOL company became a major player on the Polish market, importing large quantities of U.S. tripe and pork offal. All claimed that as a result of their Cochran trip, they build their first contacts with U.S. suppliers of meat and meat products.” (Agricultural Office, Warsaw)

—A Russian textile company employee wrote: “The Memphis Cotton School offered excellent coverage of all facets of textile production contract buying. They also provided us with prospects for increased cotton purchases from the U.S. in the future.”

IV. *FAS Agricultural Affairs Offices.*—The primary contact for Cochran activities in each country is FAS’s Agricultural Affairs Office and Agricultural Trade Offices (ATO). FAS staff describe the benefits of Cochran training programs to their offices in terms of initiating and maintaining contacts with public- and private-sector decision makers, opening lines of communication that are useful for the resolution of trade issues, building good relations with international governments, influencing trade policy issues, and using former Cochran private sector businesses as contacts for U.S. exporters.

—“Among the South China Supermarket Executives, (the training) planted the seed of goodwill and friendship without which business relationships can hardly be established and sustained.” (ATO/Guangzhou)

—The Cochran Fellowship Program is an important tool for promotion of a broad array of U.S. agricultural interests in the central European region, particularly

in the spheres of market development and combating technical barriers to trade. (Agricultural Affairs Office/Vienna)

- “Post has built upon the Cochran Program relationships and expects those ties to enable us to further obtain marketing and regulatory information and influence policy discussions.” (Agricultural Affairs Office/Nairobi)
- The FAS Office of Agricultural Affairs (OAA) in Seoul, Korea, stated: “As noted by predecessors, the Cochran Fellowship Program is perhaps the single most important tool available to OAA for achieving desired dual objectives of development of domestic agricultural systems and enhancement of U.S. agricultural interests in Korea.”
- The FAS Agricultural Attache in Vietnam states: “FAS/Hanoi is extremely pleased with the development of the Cochran Program in Vietnam. The program has served to expand our contacts and increase our knowledge and understanding of the agricultural sector. The implementation phase of the program will help develop the linkages necessary to expand the market for U.S. agricultural products here in Vietnam.”
- The Agricultural Officer in South Africa writes, “From our perspective on what the program has done to promote both U.S. agricultural interests and USG policy objectives to support the new multi-racial democracy in South Africa, the Cochran Program has been one of the key ingredients of our program activities in this country and the region.”

Question. Are available resources sufficient to extend fellowships to all countries seeking to participate in the Program? If not, what additional funding would be required to meet these requests?

Answer. Currently, the Cochran Program is funded by three sources of funds: appropriations, USAID, and EMP. Of the 707 participants in the Cochran Fellowship Program in 1997, 375 participants (53 percent of the total) were funded by appropriations, 161 participants (23 percent of the total) were funded by EMP, and 171 participants (24 percent of the total) were funded by USAID.

Funding from USAID and the emerging markets office is extremely important to maintaining the Cochran Program at its present level of involvement around the world. USAID funding is essential to implementation of Cochran Program activities in the New Independent States, and EMP funding provides for essentially all Cochran Program activities in South Africa and Namibia, Brazil, Vietnam, and for about 50 percent of our participants in 13 Eastern European countries.

The demand for the Cochran Fellowship Program is expanding every year. The 1998 increase in appropriations has enabled us to initiate pilot programs and expand the size of our programs in several African and Latin American countries. In most current countries, the demand for fellowships far exceeds the available funding, but we have been able to prioritize our programs to achieve most of our objectives.

FAS Agricultural Offices in Nigeria, Ghana, Pakistan, and several Middle Eastern countries requested the initiation of the Cochran Program in 1998. We were unable to meet these requests because of funding.

We have been working with several Cochran countries on follow-up to participant training, and on evaluation of the results of the training. Formal Cochran alumni groups have been formed in Poland and Ukraine and they are requesting assistance, mostly in terms of information and contacts with U.S. industry. We currently have a data base of over 4,000 Cochran fellows and would like to initiate a more sustained system of follow-up and evaluation, using Internet as well as distance learning technology. This type of follow-up would keep us in regular contact with former fellows and continue to track the results of the program.

MARKET ACCESS PROGRAM

Question. I note that the availability of funds for the fiscal year 1998 Market Access Program was not announced until February 17, 1998. Why is there a delay in the announcement of funds for this program—nearly 5 months into the fiscal year?

Answer. Last fall, the Foreign Agricultural Service (FAS) began a new initiative—known as the Unified Export Strategy (UES)—to more effectively coordinate strategic planning and resource allocation processes across the various agricultural export assistance programs administered by FAS. The UES was developed to streamline the application process for these programs and facilitate better use of complementary marketing tools and resources. Through the submission of a single proposal, organizations may apply for assistance under the Market Access Program, the Foreign Market Development Cooperator Program, the Emerging Markets Program, Section 108, and make recommendations for trade policy initiatives, Cochran Fellowships, or Export Credit Guarantee programs.

The UES was more difficult to implement than originally anticipated because FAS needed to accommodate a wide range of commodity strategies without unduly limiting flexibility and imposing new information requirements. As a result, the program announcement was delayed until mid-February. FAS established an April 20 deadline for receipt of applications in order to give applicants sufficient time to prepare their proposals under the new UES system.

Question. When do you expect fiscal year 1998 MAP allocations to be made?

Answer. FAS intends to announce 1998 MAP allocations on June 1, 1998.

Question. The Secretary indicated to this Committee that the Department has taken steps to make the Market Access Program more targeted and friendly to small businesses. What specific steps have been taken in this regard?

Answer. Within the MAP's brand program, FAS continues to give priority assistance to cooperatives and small-sized entities. The Commodity Credit Corporation reimburses up to one-half of the eligible costs MAP brand participants incur to promote their brands in targeted markets. In fiscal year 1997, 84 percent of all brand promotion funds were allocated to cooperatives and small companies. In addition, cooperatives and small entities continue to benefit from generic activities, including participation in subsidized trade shows and retail promotions organized and coordinated by nonprofit trade organizations and state regional trade groups—SRTC's.

On February 25, 1998, CCC issued a proposed rule which would make several changes to the MAP to make it more friendly to small businesses. These changes include incorporating into the MAP allocation process the level of export contributions made by U.S. industry participants; authorizing reimbursement of certain travel expenses for brand participants and certain necessary packaging and labeling design expenses; extending the activity payment deadline following the end of an activity plan year; and permitting reimbursement to participants based upon issuance of a credit memo as an alternative to a transfer of funds. CCC has received public comments and intends to publish a final rule prior to the start of the 1998 MAP.

Question. The explanatory notes on the fiscal year 1999 request indicate that \$250,000 in Commodity Credit Corporation funds will be available in each of fiscal years 1998 and 1999 for Market Access Program evaluations. Can you please tell us specifically what program evaluations are being funded or are planned in each of these years?

Answer. During fiscal year 1998 the FAS Compliance Review Staff (CRS) anticipates performing financial and compliance reviews of the export promotion activities for 49 of the 64 participants under the Market Access Program (MAP). The fiscal year 1999 CRS MAP review schedule will not be known until September, 1998. However, we currently anticipate the number of reviews will be comparable to our fiscal year 1998 review coverage.

Question. Please provide the allocations made under the fiscal year 1997 Market Access Program.

Answer. Fiscal year 1997 Market Access Program allocations are provided for the record.

[The information follows:]

Market Access Program allocations, fiscal year 1997

<i>Trade organization</i>	<i>1997 MAP allocation</i>
Alaska Seafood Marketing Institute	\$2,965,056
American Brandy Association—Export	36,294
American Forest & Paper Association	6,280,192
American Jojoba Association	176,324
American Seafood Institute/Rhode Island Seafood Council	592,923
American Sheep Industry Association	95,141
American Soybean Association	2,203,929
Asparagus USA	162,938
Blue Diamond Growers	1,412,689
California Agricultural Export Council	525,178
California Cling Peach Growers Advisory Board	727,009
California Kiwi Fruit Commission	66,095
California Pistachio Commission	815,018
California Prune Board	2,538,590
California Strawberry Commission	471,614
California Table Grape Commission	1,987,929
California Tree Fruit Agreement	704,566
California Walnut Commission	2,566,006
Cherry Marketing Institute	154,361

<i>Trade organization</i>	<i>1997 MAP allocation</i>
Chocolate Manufacturers Association	721,310
Cotton Council International	9,261,438
Eastern U.S. Agricultural and Food Export Council	799,696
Florida Department of Citrus	4,247,525
Hop Growers of America	103,000
Kentucky Distillers Association	499,401
Mid-America International Agri-Trade Council	190,833
Mohair Council of America	75,000
National Association of State Departments of Agriculture	564,788
National Dry Bean Council	306,760
National Grape Cooperative	664,261
National Honey Board	132,953
National Peanut Council	837,544
National Potato Research & Promotion Board	1,290,688
National Renderers Association	301,885
National Sunflower Association	821,958
New York Wine and Grape Foundation	165,673
North American Blueberry Council	92,952
North American Export Grain Association	94,225
Northwest Wine Promotion Coalition	119,287
Ocean Spray International, Inc	319,848
Oregon Seed Council	180,540
Oregon-Washington-California Pear Bureau	974,151
Pet Food Institute	596,075
Raisin Administrative Committee	2,444,619
Southern United States Trade Association	3,097,777
Sunkist Growers, Inc	2,064,157
Texas Produce Export Association	42,222
The Catfish Institute	304,905
The Popcorn Institute	500,000
United Fresh Fruit and Vegetable Association	177,093
USA Dry Pea & Lentil Council	550,918
USA Fresh Sweet Cherry Promotion	840,401
USA Poultry and Egg Export Council	2,290,770
USA Rice Federation	2,911,598
USA Tomato	481,772
U.S. Apple Association	438,707
U.S. Dairy Export Council	1,881,135
U.S. Feed Grains Council	2,865,352
U.S. Livestock Genetics Export, Inc	739,981
U.S. Meat Export Federation	8,498,273
U.S. Wheat Associates	2,023,893
Washington Apple Commission	2,470,410
Western United States Agricultural Trade Association	4,481,370
Wine Institute	3,051,004
Total	90,000,000

OFFICE OF THE INSPECTOR GENERAL (OIG) RECOMMENDATIONS

Question. The Office of the Inspector General has recommended that FAS (1) streamline functions of the Market Access Program and the Foreign Market Development Cooperator Program by requiring firms to submit a single strategic plan and by consolidating their program and financial data into a single accounting system, (2) issue regulations for the Foreign Market Development Cooperator Program, and (3) establish a process to validate the size of companies participating in the Market Access brand promotion program. Is the agency responding to these recommendations? What is being done?

Answer. FAS has developed and implemented a new resource allocation process whereby organizations have the opportunity to combine their FMD and MAP applications and strategic plans into a single submission called the Unified Export Strategy (UES). For the fiscal year 1998 MAP and fiscal year 1999 FMD programs, each applicant will submit a single, strategically coordinated proposal for various USDA market development programs including not only the MAP and FMD programs, but also requests for assistance under the Emerging Markets Program, Cochran Fellowships, Section 108, and several Export Credit Guarantee programs. The new UES application will make FAS programs more cost effective by facilitating better coordi-

nated export strategies, improving accountability for results, streamlining application procedures, and eliminating duplicative information requirements.

Beginning with the fiscal year 1999 FMD program, FAS will track, monitor, and control resources expended under the FMD program with the financial management system currently used for the MAP. Also in fiscal year 1999, FAS will make available an electronic venue for submitting reimbursement claims under the FMD via the Internet. The electronic submittal of reimbursement claims is currently available and operational under the MAP. This new feature will reduce the paperwork burden on program participants and FAS, decrease financial errors and discrepancies, and expedite the payment process to program recipients.

FAS is in the process of drafting a proposed regulation and intends to issue a final rule governing the FMD program by January 1999.

FAS currently requires the State Regional Trade Groups (SRTG's) and other non-profit trade associations participating in the MAP to review and validate the size of companies participating in brand promotions. The FAS Compliance Review Staff audits the effectiveness of this control during their reviews of MAP participants. Beginning with the 1998 MAP, FAS will require a size certification statement for all companies applying for brand funds through an SRTG or any other non-profit trade association.

INTERNATIONAL COOPERATIVE ADMINISTRATIVE SUPPORT SERVICES PROGRAM

The prepared testimony indicates that the fiscal year 1999 FAS budget request includes \$4 million for overseas administrative services provided by the Department of State in support of the International Cooperative Administrative Support Services (ICASS) program, and that, in fiscal year 1998, \$4.4 million has been transferred from the Department of State for this purpose.

Question. What is the International Cooperative Administrative Support Service program?

Answer. ICASS program was developed in response to National Performance Review (NPR) initiatives that introduce a more entrepreneurial spirit and a greater sense of teamwork among foreign affairs agencies in managing their overseas administrative responsibilities. Under ICASS, the Department of State continues to be the main administrative service provider overseas. However, FAS and other foreign affairs agencies have increased input into administrative policy decisions, service standards, and encouraging innovation at post. At post and in Washington, the ICASS Council and the ICASS Working Group have generally served to build a team approach to management while also increasing the transparency of decision-making. Under ICASS, administrative support costs are more equitably spread which reflects how the benefits of services are distributed; therefore, non-State agencies will incur an increased share of administrative costs.

Question. Why has the State Department transferred funds to the FAS to support the program this year?

Answer. In fiscal year 1998, the Department of State transferred \$4,408,000 to FAS to fund the costs of administrative services previously funded by the Department of State, but are now the funding responsibility of FAS. FAS is only one of many Federal agencies with overseas offices and personnel which received transfers from the State Department budget.

Question. Where is the \$4 million increase for this program reflected in the fiscal year 1999 FAS budget request?

Answer. The budget transfer associated with the implementation of ICASS took place in fiscal year 1998 and is incorporated into the fiscal year 1998 budget base of \$140.0 million. Accordingly there is no increase requested for ICASS in the fiscal year 1999 budget request

BUDGET ACTIVITY STRUCTURE

Question. The explanatory notes indicate that based on an agency-wide survey measuring the allocation of staff time and including program costs, the distribution of Foreign Agricultural Service resources by activity is as follows:

	<i>Percent</i>
Market Access	24.0
Market Development, Promotion and Outreach	22.2
Market Intelligence	24.4
Financial Marketing Assistance	18.4
Long-Term Market and Infrastructure Development	11.0

The notes indicate that changes proposed for fiscal year 1999 not associated with a specific program will continue to be pro-rated among budget activities based on

this distribution. How have you reached your conclusion that this is an appropriate distribution of the agency's resources?

Answer. The activity structure of the fiscal year 1999 FAS budget reflects implementation of the Government Performance and Results Act and transition to a performance-based management system. In this regard, FAS has adopted a budget activity structure that incorporates five of the policy objectives included in the FAS strategic plan. In developing an allocation model, costs that are directly associated with a specific policy objective are assigned to that objective. Agency costs that are not specifically associated with a single objective are pro-rated into each objective based on a distribution formula. This formula, which is re-evaluated annually, reflects the percentage of time FAS staff devote to each policy objective based on an agency-wide survey. We believe this process best displays the costs associated with individual policy objectives.

OVERSEAS CURRENCY FLUCTUATIONS FUND

Question. In response to the conference report on the Fiscal Year 1998 Agriculture Appropriations Act, the fiscal year 1999 budget includes a request to earmark \$2 million to establish a revolving fund account to enable the Foreign Agricultural Service to manage overseas currency fluctuations. Exchange rate losses would be offset from this account and exchange rate gains would be deposited into the account. Would you please tell us how exchange rate losses and gains will be verified; how often this will be done; and how and when funds will be withdrawn from the fund.

Answer. Gains and losses will be verified through ongoing quarterly reviews of individual FAS Counselor, Attache and Trade Office operating budgets. These reviews will consider the implications of current exchange rates with those rates used at the time the post operating budgets were developed. While the timing of fund withdrawals remains under review, it would most likely occur following the completion of the third quarter review. Any exchange rate gains would be transferred into the fund following completion of the fourth quarter post operating budget review in late September.

Question. What notifications do you plan to provide this Committee? (i.e., will you notify the Committee when exchange rate losses and gains are verified and when funds are deposited and withdrawn from the fund?)

Answer. We would anticipate notifying the Committee in writing of the results of our reviews of FAS post operating budgets at least on an annual basis. Additionally, we would be pleased to meet personally with Committee staff to discuss the results of our quarterly reviews with respect to exchange rate gains or losses.

PERFORMANCE MEASURE TRACKING SYSTEM

Question. The fiscal year 1999 budget requests an increase of \$500,000 to enable FAS to develop a cross-agency performance tracking and evaluation system to determine success rates in implementing goals and objectives in the agency strategic plan, and for FAS to "re-engineer" its market intelligence performance measurement and evaluation tools. Is this request a one-time increase?

Answer. It is not certain at this point whether additional funds will be necessary beyond fiscal year 1999 to implement the fundamental changes necessary to transition FAS to a performance-based management system, as required by the Government Performance and Results Act. However, the increase is definitely temporary in nature, and will be used solely to effect full implementation of the Act as a management tool at FAS.

Question. Please explain more specifically what costs this additional \$500,000 will cover and why additional funds are required for FAS to evaluate its performance.

Answer. FAS is seeking the help of private sector experts to develop an agency-wide performance tracking and evaluation system to verify and validate success rates in attaining goals and objectives outlined in its strategic plan. The additional funds also will permit FAS to evaluate and re-engineer its market intelligence process. This is necessary for three reasons. First, recent management audits by GAO and a recent study completed by USDA's Economic Research Service question the efficiency of USDA's market information delivery system. Second, by taking maximum advantage of enabling technologies, cost savings in human, information, and program resources from re-engineering the market intelligence process can be shifted to other FAS program activities where there is a greater return on investment, e.g. market access, market promotion, and outreach activities. Third, it will help focus our market intelligence gathering activities to better serve the needs of our external and internal customers.

Question. How will the additional funds requested allow FAS to determine success rates in implementing its strategic plan goals and objectives? Please be specific.

Answer. The Government Performance and Results Act requires Federal agencies to develop and implement results-oriented performance measurement and evaluation systems to assess the public value of various program activities relative to investment costs. The additional funds will be used to enlist the services of private sector experts in developing a meaningful and realistic agency-wide performance measurement and evaluation system. This system that will help FAS define its level of success in achieving its strategic goals and objectives, and provide benchmarks for making appropriate adjustments in strategic goals and objectives when needed to achieve the maximum public good for dollars invested.

FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

Question. The explanatory notes indicate that a competitive allocation process has been implemented in the Foreign Market Development (FMD) Cooperator Program to ensure available resources are directed to the most cost effective market development activities. Please describe in detail the competitive allocation process which has been implemented for the Foreign Market Development (FMD) Cooperator Program. What criteria are being used to determine the "most cost-effective" market development activities?

Answer. In determining which proposals to approve for funding, FAS considers a number of factors including the organization's administrative capability, the conditions or constraints impeding U.S. exports, and the likely success of the strategic plan. The strategic plan must identify a clear long-term agricultural trade strategy and a program effectiveness time line against which results can be measured at specific intervals using quantifiable product or country goals. Meritorious applications then compete for funds on the basis of the following criteria: participant contribution levels, past export performance, past demand expansion performance, and future demand expansion goals. This competitive allocation process promotes FAS's strategic plan goals and objectives, as required by the GPRA, by disbursing appropriate levels of funds to those applicants that provide the greatest levels of cost-share (contributions) and can document the best performance.

FAS has adopted a results-oriented management (ROM) system based on performance measurements to determine the "most cost-effective" market development activities. In keeping with the philosophy of the GPRA, FMD funding allocations will be based in part on the effectiveness of Cooperators in meeting their goals and objectives. The criteria, or goals and objectives, vary between organizations depending on products, markets, constraints, and market development programs; however, each organization's objectives will be clearly identified in its marketing plan. FAS and its industry partners have already participated in three seminars on ROM—seminars tailor-made to assist FAS and the industry in identifying appropriate performance measures, objectives, goals, and the processes for managing our programs based on measurable results. We also intend to contract with a proven, experienced entity to work with us to further develop and refine this effort over the next several program cycles.

Question. The explanatory notes indicate that a \$5.5 million reduction is being proposed in Foreign Agricultural Service (FAS) activities funded through the Foreign Market Development Cooperator Program. This reduction is to partially offset the proposed shift in computer facility operating costs from the Commodity Credit Corporation to the FAS. The budget indicates that the proposed \$5.5 million reduction in FAS support for the Cooperator Program will be partially offset by increasing the cost-share factor for program participants. What is the current cost-share factor and what increase is being proposed? How much will this save?

Answer. I am pleased to report that participants in the Foreign Market Development Cooperator Program currently contribute \$1.90 for each \$1.00 in FAS funding. This represents an increase in participant cost sharing of over 40 percent since fiscal year 1994 levels. To fully offset the reduction of \$5.5 million in FAS funding, participant cost sharing would have to increase to \$2.54 for every \$1.00 of FAS funding.

Question. As you know, U.S. exporters who utilize the GSM-102 credit guarantee program pay a fee. I believe the fee goes to the General Fund of the Treasury. I also believe the total fees paid can range up to \$20 million per year depending on the volume of 102 credit guarantees utilized. Would it be possible to redirect the fees to the FMD program?

Answer. Under Credit Reform Act of 1990, fees associated with the GSM-102 program are used in the subsidy calculation which determines the level of budget authority and outlays for the program. Further, these fees are deposited to the loan

financing account for the export credit guarantee program, not to the General Fund of the Treasury, to be used to help offset claims. To use these fees for some other purpose would require a modification to current credit reform law and would result in a higher subsidy calculation for the GSM-102 program.

Question. Please provide a table which shows the total amount of funding available for the FMD Cooperator Program in each of fiscal years 1994 through 1998 and the amount proposed for fiscal year 1999. For each of these fiscal years, please show FAS funding for the program; the amount of nonfederal funds provided by program participants; and the program carryover balance, both for federal and nonfederal funds, from one fiscal year to the next.

Answer. I will provide a table which shows the total amount of funding available for the FMD Cooperator Program in each of fiscal years 1994 through 1998 and the amount proposed for fiscal year 1999.

[The information follows:]

COOPERATOR PROGRAM FUNDING FISCAL YEARS, 1994-1998

[In thousands of dollars]

	1994	1995	1996	1997	1998	1999 ³
FAS funding ¹	31,410	20,800	24,279	27,500	27,500	22,000
Non-Federal funds ²	27,594	30,655	31,325	39,862	47,719	53,219
Federal carryover balance	26,200	16,000	11,200	9,200	6,700

¹ Appropriated funding.

² Cooperator contributions.

³ Estimate.

Note: No information available on carryover of non-Federal funds.

Question. Please provide a breakdown of how the funds for the FMD Cooperator Program were allocated in each of the fiscal years 1997 and 1998.

Answer. I will provide for the record a breakdown of how FAS funds for the FMD Cooperator Program were allocated in each of the fiscal years 1997 and 1998.

[The information follows:]

COOPERATOR FUND ALLOCATIONS

	1997	1998
American Forest & Paper Association	\$2,555,000	\$1,538,553
American Seafood Institute	129,272
American Seed Trade Association	220,824	174,178
American Sheep Industry Association	138,353	102,905
American Soybean Association	5,249,108	5,292,821
Cotton Council International	949,000	2,297,114
EUSAFEC	134,893
Leather Industries of America	173,722	161,220
MIATCO	159,840
Millers National Federation	7,100	8,717
Mohair Council of America	20,000	5,523
NASDA	334,966
National Cottonseed Products Association	124,936	153,551
National Dry Bean Council	71,865	45,841
National Hay Association	48,250	50,203
National Peanut Council	467,934	498,151
National Renderers Association	926,000	598,164
National Sunflower Association	173,000	258,994
Protein Grain Products International	11,000	17,539
SUSTA	160,511
U.S. Beef Breed Council	73,000	25,097
U.S. Dairy Export Council	269,630	224,730
U.S. Feed Grains Council	5,551,057	4,341,047
U.S. Hide, Skin & Leather Association	48,500	52,294
U.S. Livestock Genetics Exports	385,000	657,891

COOPERATOR FUND ALLOCATIONS—Continued

	1997	1998
U.S. Meat Export Federation	1,515,000	966,206
U.S. Wheat Associates	4,767,500	6,208,474
USA Dry Pea & Lentil Council	197,379	67,095
USA Poultry & Egg Export Council	1,220,000	1,115,597
USA Rice Council	1,340,000	1,558,393
Western Growers Association	10,000	430
WUSATA	196,632
Unallocated Funds ¹	950,000
Cooperator total	27,500,000	27,500,000

¹ Due to the low carryover balances (which are expected to reach \$0 in 1999) and the uncertainty of actual expenditure rates by the Cooperators, FAS has set aside \$950,000 for future obligation in fiscal year 1998. FAS is monitoring monthly expenditures for each Cooperator and will obligate the remaining funds as appropriate to ensure adequate funding for marketing plan budgets.

SUPPLIER AND FACILITIES CREDIT GUARANTEE PROGRAMS

Question. Please explain the reason for the new approach proposed in the budget to present the estimates for the Commodity Credit Corporation (CCC) export credit guarantee programs to reflect level of sales expected to be registered rather than the authorized levels. What is the budgetary impact of this proposed change?

Answer. The new approach proposed in the budget for the CCC export credit guarantee programs will result in more realistic estimates of the costs of the programs since the estimates will be based on the actual level of sales expected to be registered rather than the higher authorized levels. In the past, when the higher authorized levels were included in the budget, these costs tended to be overstated significantly. Actual sales registrations usually turned out to be far below the level estimated in the budget. The accuracy of the CCC budget estimates will improve by using these more realistic estimates.

It is important to note that the level of guarantees to be issued by CCC during the course of the year will not be limited by the budget estimates, but instead will be determined by market conditions and program demand. This brings the budget treatment of the guarantee programs into line with that used for other CCC-funded programs.

Question. Using the new scoring, you indicate that the budget projects an aggregate program level of \$5.0 billion for export credit guarantees in fiscal year 1998 and \$4.6 billion for fiscal year 1999. What is the reason for the reduction in fiscal year 1999 from the fiscal year 1998 level?

Answer. The projected program levels for the CCC export credit guarantee programs of \$5.0 billion in 1998 and \$4.6 billion in 1999 are substantially higher than the \$2.9 billion of sales registered under the guarantee programs in 1997. The higher projected program levels for 1998 and 1999 reflect an increase in guarantee programming in response to the financial turmoil in Southeast Asia and the Republic of Korea. The reduction in fiscal year 1999 can be primarily attributed to the reduced programming level projected for Southeast Asia and Korea in fiscal year 1999. In fiscal year 1998, over \$2 billion of CCC export credit guarantees have already been made available for Southeast Asia and Korea. For fiscal year 1999, a reduced amount of \$1.3 billion in export credit guarantee commitments has been estimated in the fiscal year 1999 President's Budget for Korea and the Southeast Asian region.

Question. Please provide specific examples of how the supplier and facilities credit guarantee programs are being used to help finance U.S. exports.

Answer. These relatively new programs are just beginning to help finance U.S. exports. For fiscal year 1997, registrations under the Supplier Credit Guarantee Program (SCGP) totaled \$3.74 million for sales to Guatemala, Indonesia, and Mexico. For fiscal year 1998, registrations as of March 20 total \$2.23 million. USDA has been aggressively promoting these programs through both domestic and foreign outreach efforts, and we expect increased program use particularly for sales to Asian markets. As of March 20, USDA has authorized SCGP allocations for fiscal year 1998 totaling \$323 million to 14 countries or regions compared to \$160 million for 9 countries or regions for fiscal year 1997. Facility Guarantee Program (FGP) interim regulations became effective August 8, 1997. USDA has authorized FGP allocations for fiscal year 1998 totaling \$155 million for 13 countries. There is considerable interest in using this program to help finance projects in Asia.

PROPOSED STAFF REDUCTIONS

Question. What impact will the proposed reduction of 15 staff years have on FAS market access activities and how will this proposed staffing reduction be applied?

Answer. Under this proposal, FAS will concentrate available resources on the highest priority trade policy issues, including preparation for the next round of multilateral trade negotiations under the auspices of the World Trade Organization, regional free trade agreement negotiations (Free Trade Area of the Americas and Asian Pacific Economic Cooperation forum), and resolution of sanitary and phytosanitary issues. FAS will also work to use improved computer and other technical capabilities to assure the continued effectiveness and integrity of these activities.

We anticipate achieving staff reductions through attrition. While the budget proposes a pro-rata distribution of staff reductions among budget activities, the actual impact would likely be determined by where attrition occurs and the degree to which shifts in staff resources may be required to meet priority agency objectives.

Question. What impact will the proposed decrease of 15 staff years have on FAS market intelligence activities and how will this staffing reduction be applied?

Answer. Under this proposal, FAS will concentrate available resources on overseas reporting that focuses on the most promising market opportunities for U.S. agriculture, as well as the activities of competitor exporting countries. FAS will also work to use improved computer and other technical capabilities to ensure the continued effectiveness and integrity of this function.

Question. The explanatory notes indicate that the proposed market intelligence staff year decreases will force FAS to focus on the most promising market opportunities for U.S. agriculture, as well as the activities of competitor exporting countries. What are the most promising market opportunities for U.S. agriculture? What competitor country exporting activities are of greatest concern?

Answer. The Asian financial crisis notwithstanding, the most promising market opportunities over the next ten years are in Asia and, to a lesser extent, Latin America. While there are promising market opportunities in many parts of the world, these two regions are largely responsible for much of the export growth we have experienced over the past decade and will likely experience over the next decade. At the heart of this growth has been strong economic growth, economic and trade liberalization, and rapid expansion of their middle classes. Japan, China/Hong Kong, Korea, Taiwan, and Southeast Asia lead the "best prospect list" in Asia. In Latin America, Mexico and Brazil are the leading prospects. However, the nations of Central America and the Caribbean offer excellent prospects with both expected to reach new record highs in fiscal year 1998.

Competitor country exporting activities of greatest concern include export subsidies provided by the European Union and Canada, as well as export monopolies operated by marketing boards in Canada, Australia and New Zealand. These countries are major competitors for grains, meat, fruit and value added products. In addition, it is important to track developments in competitor countries such as Argentina and Brazil which export substantial quantities of wheat, corn, soybeans, meat and citrus, and China, which is a major exporter of fruits and vegetables and other value added products as well as some grains. Finally, recent developments in currency markets bear close attention as the devalued currencies in several competitor countries may have a negative impact on U.S. agricultural export opportunities.

Question. What impact will the proposed decrease of 12 staff years have on FAS financial marketing assistance activities and how will this staffing reduction be implemented?

Answer. Increasing the liquidity of foreign importers to buy U.S. agricultural products is the primary goal of this activity. Under this proposal, FAS will improve its analytical process to focus appropriate financial assistance activities on market development needs identified as priorities in its resource allocation strategy. FAS will also concentrate available resources on the continued development of new approaches to expanding liquidity in potential markets using the export credit programs, and on finding ways to use these programs to better complement each other and other FAS programs in order to ensure maximum benefits to U.S. agriculture. FAS will work to use improved computer and other technical capabilities to assure the continued effectiveness and integrity of these financial assistance activities.

Question. The explanatory notes indicate that increasing the liquidity of foreign importers to buy U.S. agricultural products is the primary goal of the financial marketing assistance activities supported by the FAS. How have we been successful to date in this area and what new approaches have been identified to expand liquidity in potential markets?

Answer. Under GSM-102, GSM-103, and Supplier Credit Guarantee programs more than \$5.0 billion of export credit guarantees have been made available to date in fiscal 1998. Recipients have used about 40 percent of these allocations during the first half of fiscal 1998, and the programs have played a critical role in softening the effect of the Asian crisis on the U.S. agricultural sector. Asian nations have used more than \$800 million of the approximately \$2.0 billion of GSM guarantees allocated to the region. These guarantees have maintained or restored agricultural trade relationships following the collapse in trade during late 1997. FAS continues to expand export credit liquidity through the guarantee programs to Mexico, Pakistan, and other emerging markets. New approaches to expand liquidity include making more financing instruments eligible for coverage under GSM-102 and conducting educational seminars to promote the Supplier Credit Guarantee program. FAS has implemented a new program to support the U.S. agricultural sector—the Facilities Guarantee Program. This program will provide credit guarantees to U.S. participants in projects to build or improve facilities in emerging markets. These guarantees could support projects such as refrigeration, grain handling, and storage facilities that would increase the capacity to purchase U.S. agricultural products.

Question. What market development needs are identified as priorities in the FAS resource allocation strategy?

Answer. One of the primary objectives identified in the FAS Strategic Plan for 1997–2002 is to, “Focus and expand foreign market development, promotion, and outreach activities to U.S. exporters and foreign buyers.” In meeting this objective, FAS strategic priorities include: increasing the share of overseas activities carried out in markets identified as priorities through the MAP and FMD planning processes; focusing on emerging markets while protecting market share in mature markets; increasing domestic awareness of export opportunities, programs and market intelligence, with emphasis on small and new-to-export firms; and introducing new international buyers to U.S. products and exporters through U.S. and overseas training, marketing seminars, and missions.

Over the past year, FAS has developed new processes and procedures for use in allocating its market development resources. These efforts effectively support the strategic decision-making initiatives of the Government Performance and Results Act. For example, beginning February 1998, Market Access Program (MAP) and Foreign Market Development (FMD) program applicants are required to combine their applications in a Unified Export Strategy (UES). This UES process and format will for the first time ever result in the submission of a unified package including not only MAP and FMD applications but also requests for assistance under virtually all FAS administered marketing, financial assistance, and market access programs. For example, in the UES submission, MAP/FMD applicants are asked to also specify their requests for funding assistance under the Cochran, Emerging Markets, and Section 108 programs. The UES also accommodates applicant recommendations for financial and trade policy assistance for consideration by FAS in allocating guarantee availabilities and staff resources under the GSM-102/103 and Supplier’s Credit programs and in prioritizing its efforts to open or expand access to overseas markets.

This UES process for our industry partners complements and mirrors the Country Promotion Planning process recently completed by FAS’s overseas offices and the Product Promotion Planning process which is now underway in FAS Commodity Divisions. Together these three initiatives undertaken by industry, FAS country, and FAS commodity experts will provide FAS decision-makers with the necessary information base to make sound decisions regarding how limited staff and program resources should be allocated to achieve our market expansion and food security goals as outlined in the Agency’s strategic plan.

Question. What impact will the proposed decrease of 7 staff years have on FAS long-term market and infrastructure development efforts and how will this staffing reduction be implemented?
