Answer. Under this proposal, FAS will concentrate available resources on the highest priority activities in order to maximize the benefits of increased international agricultural cooperation and development.

Question. Please identify the highest priority activities to maximize the benefits of increased international agricultural cooperation and development.

Answer. The Cochran Fellowship program, our efforts in international collaborative research, especially in support of SPS initiatives, and our work on food security issues are the highest priority activities in international agricultural cooperation and development at the current time.

Question. Please provide for the record a table providing a separate breakdown of the funding and staffing reductions proposed for fiscal year 1999, by activity: (1) to offset increased resources proposed for the “overseas buying power maintenance

account”, and (2) for “support of USDA’s international crop estimates and production intelligence capabilities.”

Answer. I will provide a table providing a separate breakdown of the funding and staffing reductions proposed for fiscal year 1999 in order to offset the costs of those two components of our budget request.

[The information follows:]

REDUCTIONS BY BUDGET ACTIVITY

[Dollars in thousands]

	Overseas account		Crop est. and produc- tion intelligence		Total	
	Amount	SY	Amount	SY	Amount	SY
Market access	\$173	2	\$1,115	13	\$1,288	15

Total	779	9	4,587	53	5,366	62

PUBLIC LAW 480 PROGRAM

Question. The fiscal year 1999 budget proposes to maintain the fiscal year 1998 Public Law 480 Titles II and III program levels in fiscal year 1999, but to decrease the Title I program level by \$124.7 million, from the fiscal year 1998 level of \$226.9 million to \$102.2 million. What is the reason for the significant reduction proposed for fiscal year 1999 in the Public Law 480 Title I program?

Answer. This reduction supports compliance with discretionary spending targets which have been established in conjunction with efforts to balance the Federal budget. Program resources will be targeted towards the most promising market development opportunities which have been identified by the Foreign Agricultural Service in its resource allocation processes.

Question. What impact will this reduction have on commodity shipments? Which commodities are likely to be impacted?

Answer. The proposed program level for fiscal year 1999 will provide estimated commodity shipments of 0.547 million metric tons grain equivalent (MMTGE) as compared to 1.249 MMTGE estimated for fiscal year 1998. Wheat and wheat flour, rice, and vegetable oil are the commodities most affected by the reduced Public Law 480 program level. The estimated shipment of wheat and wheat flour will be reduced from 1.099 MMTGE in fiscal year 1998 to 0.386 MMTGE in fiscal year 1999. The estimated shipment of rice will be reduced from 0.072 to 0.016 MMTGE and the estimated shipment of vegetable oil will be reduced from 0.021 to 0.005 MMTGE.

Question. What appropriations would be required for fiscal year 1999 (for the subsidy costs of Title I agreements, and for ocean freight differential grants) to maintain the fiscal year 1998 level for the Public Law 480 Title I program?

Answer. To maintain a \$226.9 million program level for Public Law 480 Title I for fiscal year 1999, we estimate that a Title I appropriation of \$196.9 million would be needed to cover the subsidy costs in the program account. In addition, \$20.9 million would be required for estimated OFD costs.

Question. Please provide for the record the Public Law 480 funding allocations, by Title, for each of fiscal years 1996 and 1997, and for fiscal year 1998 to date.

Answer. I will provide for the record the Public Law 480 funding allocations, by Title, for each of fiscal years 1996 and 1997, and for fiscal year 1998 to date.

TITLE III PROGRAM BUDGET—Continued

[In millions of dollars]

Program	Fiscal year—		
	Actual 1996	Actual 1997	Estimated 1998
Appropriation	50.0	29.5	30.0

Question. Last year the Department indicated that Public Law 480 Title I funds carried over from one fiscal year to the next were increasing: \$4.4 million was carried into fiscal year 1993, \$4.7 million into fiscal year 1994, \$16.9 million into fiscal year 1995, \$24.7 million into fiscal year 1996; and \$32.9 million into fiscal year 1997. What is the carryover from fiscal year 1997 into fiscal year 1998? What is the estimated carryover from fiscal year 1998 to fiscal year 1999?

Answer. The carryover from fiscal year 1997 to fiscal year 1998 is \$62.9 million. As of March 24, 1998, the estimated carryover from fiscal year 1998 to fiscal year 1999 is expected to be \$17.0 million.

Question. Why have the carryover balances for the Title I program been growing from year to year?

Answer. The carryover balances for the Title I program have increased in recent years because country allocations were withdrawn for unresolved issues related to the recipient country's prior year Title I agreements, civil wars within the recipient country, or for internal issues within the country which led them to change their purchase decisions. In addition, in some instances countries did not purchase the full amount of their allocation.

Question. What is being done to increase the focus of the Public Law 480, Title I program on the private sector?

Answer. Senior level teams have traveled overseas and domestically to explain the program to potentially interested private sector groups. Overseas they met in Pakistan and Bangladesh with cotton importers. Domestically, we have met with USDA cooperators including U.S. Wheat Associates and the American Soybean Association to review possible projects in southern Africa and Russia. We are presently pursuing a regulatory change that would allow USDA to enter into Public Law 480 agreements directly with foreign, private sector entities without a U.S. partner. This change is expected to increase program flexibility and private sector use.

OVERSEAS OFFICES

Question. Please provide for the record a list of FAS overseas counselor/attache and trade offices and the amount of funding and full-time equivalent staffing levels provided for each in fiscal year 1997 and 1998 and proposed for fiscal year 1999.

Answer. A list of FAS overseas counselor/attache and trade offices and the amount of funding and staffing is provided.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. FAS' program activities are essentially restated as unique strategic objectives with key operating strategies and performance goals. Each FAS objective, in turn, is directly associated with FAS' strategic goals and mission. FAS' two strategic goals are directly linked to the department's objectives and goals.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Prior to the 1998 budget, FAS had developed its Long-Term Agricultural Trade Strategy (LATS) report which identified five key drivers of long-term success. In the 1998 budget submission, FAS revised its program activities to correspond to these key drivers. As FAS began developing and refining its Strategic and Annual Performance plans, and following consultations with Senate Agriculture Committee staffers on its initial draft strategic plan, FAS identified that it had two goals: (1) expand export opportunities for U.S. agricultural, fish, and forest products; and (2) promote world food security. FAS recognized that with a few modifications, its five program activities were actually objectives that support the achievement of FAS' two goals. The first four program activities (market access, market development etc., market intelligence, and financial assistance) all support FAS' goal to expand export opportunities. The last program activity (long term market and infrastructure development) supports FAS' goal to promote world food security.

Like other agencies across the Federal Government, FAS learned that in order to implement GPRA, planning needs to drive the budget. The five program activities in the fiscal year 1999 budget submission reflect slight modifications in the five program activities in the fiscal year 1998 budget. These modifications are a result of FAS' realization that it needed to re-align its budget activities to its goals and objectives. As FAS learns more about institutionalizing performance-based management processes, it anticipates that there will be further changes required to continually adjust the budget to accommodate changes in legislation, international trade, and technology.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, performance measures contained in the agency's Performance Plan are linked to each FAS budget activity and are displayed in FAS' Annual Performance Plan.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Little difference exists between FAS' performance planning structure and account and activity structure. Objectives identified under Goal 1 of the Annual Performance Plan are identical to the first four budget program activities. The objectives for Goal 2 of the Annual Performance Plan are grouped in the account and activity structure of the budget under "Long-term Market and Infrastructure Development" for budget presentation purposes.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. FAS currently has no plans to change its account structure for fiscal year 2000. However, as FAS institutionalizes its performance-based management processes and as Federal Government agencies transition to a cost accounting system, FAS may propose changes in its account structure to facilitate aligning performance goals with all operating costs and appropriated/non-appropriated program activities.

Question. How were performance measures chosen?

Answer. FAS believes that leadership starts at the top but performance comes from the front line. Following this principle, FAS' senior management created a draft strategic plan with objectives and the Strategic Operations Staff of the Office of the Administrator facilitated a series of one-day workshops for nearly every division in the agency. The purpose of these workshops was three-fold: (1) to begin the education process of all employees and supervisors on GPRA and performance management; (2) to validate and improve the draft strategic plan prepared by senior management; and (3) to assist the divisions in preparing division-level performance plans which identified performance measures that are aligned to the agency's strategic goals and objectives. Following these workshops, FAS senior management participated in the validation of the revised draft strategic plan and the performance measures identified by the divisions prior to their submission to OMB and Congress.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The process of making GPRA a reality in FAS is hardly one year old and still ongoing. However, FAS believes that its approach of ensuring that all employees recognize how his/her activities relate to and contribute to the overall mission and performance goals of the agency will pay off in superior planning and performance in future years. By the end of fiscal year 2000, a track record of learning and evaluation regarding both realistic and verifiable performance measures and the associated costs will be available.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No, FAS will be conducting GPRA workshops this April through June with every division (approximately 23) in the organization that has direct responsibility for developing and tracking the performance data necessary to meet the March 2000 performance reporting requirement. The primary purpose of these workshops is to ensure that FAS has procedures in place to verify and validate that it is capturing the right performance data.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. While all measures are important to track to understand the breadth of FAS' activities, FAS suggests that the subcommittee focus on: the number of SPS issues resolved each year; the number of research activities facilitated annually by FAS that encourage the use of sound science (i.e., Codex Alimentarius) in resolving SPS issues; the number of foreign participants trained annually in FAS-sponsored seminars on U.S. food safety; the number of potential exporters identified and contacted about FAS exporter services; the number of U.S. based companies exporting agricultural products; and the percentage use of GSM credit guarantees to countries lacking liquidity to purchase U.S. agricultural products on the commercial market.

The rationale for putting priority on SPS issues is that they are vital FAS output goals for the U.S. agricultural industry. SPS issues raised by foreign countries under the guise of sound science are artificial trade barriers which significantly limit U.S. export opportunities. Additionally, FAS provides or administers project funds for research activities specifically targeted to resolve SPS issues and trains foreign participants in U.S. food safety standards. These activities, while supporting different objectives under separate goals, are linked.

Two of the performance indicators focus on tracking progress in achieving FAS' outreach objectives; namely, increasing domestic awareness of export opportunities, USDA export programs, and overseas market intelligence. The rationale is to reach out directly to potential exporters, especially small and new-to-export agribusiness firms, so that strategic partnerships can be built with interested organizations. FAS assists in educating their members about the rewards of exporting and how USDA can assist them in developing new markets. By expanding the number of U.S. firms exporting (primarily high-value processed food products), FAS believes that the U.S. agricultural industry will benefit by increasing its global market share of high-value products.

Lastly, the GSM Export Credit Guarantee Programs will continue to support cash-strapped countries with short-term credit to finance purchases of American products. As FAS becomes more adept at deploying this financing mechanism in countries lacking liquidity to purchase U.S. agricultural products, U.S. exporters will benefit by increasing market share and/or maintaining their presence in the market—a necessary and important element in international trade.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Using independent analysis from the Economic Research Service, FAS was able to calculate the impact (i.e., outcome) of the exports supported by its program on rural communities and the national economy as a whole. Calculating impact of market development relies on procedures approved by the Trade Promotion Coordinating Committee (TPCC) and used in preparation of the annual National Export Strategy submitted to the Congress. This includes calculating the impact of FAS market development programs on exports. Estimating national and rural economic impacts involve combining the export impacts with trade multipliers associated with direct and indirect effects of agricultural exports (multiplier effect per billion dollars of agricultural exports are as follows: national economy = \$2.4 billion; rural economy = \$800 million; national employment in jobs created = 17,300). These are published by USDA's Economic Research Service using results from a 417 sector input-output model of the United States economy.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. They are beginning to develop a greater understanding of the difference. However, in order to fully institutionalize strategic planning at every level of the organization, strategic planning workshops were held over the spring and summer of 1997 for every division in the agency. FAS will be conducting workshops again in 1998 and 1999. These workshops will continue the process of linking what every employee is doing to support the organization-wide goals, introducing the concepts of verification, validation, and process improvement in the context of GPRA. Through this ongoing process of education and by instituting a quarterly reporting requirement FAS is making GPRA real.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. For internal customers, FAS will perform two separate types of surveys. The first is the Peer Evaluations of FAS' headquarters and overseas offices' performance and customer satisfaction. The second survey will be a Work-life survey in which the employees and managers will be asked to identify trends in the work place which inhibit or promote productivity and employee development.

For external customers, FAS has numerous listening sessions with various customer groups to identify areas of improvement. For instance, FAS works in partnership with the Private Voluntary Organization (PVO) community in implementing the Food for Progress program. FAS has a yearly listening session where ideas are shared and new initiatives announced. These listening sessions have helped both groups (FAS and the PVO's) to focus on reducing red tape and improving specific projects. Also, FAS has listening sessions with U.S. banks participating in the GSM Export Credit Guarantee program. Again, these sessions have identified areas of improvement and cooperation.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The measurable goals of FAS' fiscal year 1999 Annual Performance Plan and its fiscal year 1999 budget program activities were developed in tandem and are mutually supportive.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, that is true for the most part. Depending upon the size of the increase/decrease, FAS would be able to estimate changes in the associated performance goals and indicators.

Question. Do you have the technical capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. No, we are not yet able to do so. FAS is requesting in the fiscal year 1999 budget funds to build a performance tracking, evaluation, and reporting system. Once built and implemented, this system will provide the information senior managers need to determine whether FAS will meet/exceed its performance goals or whether resources need to be re-allocated.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. To some extent, we have. The traditional FAS budget activity structure was a combination of organizational linkages and functional activities which did not fit well in a performance based management system. This led to our modification of the FAS budget activity structure in fiscal year 1998.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Beginning with the fiscal year 1998 budget, the FAS budget activity structure was modified to reflect our implementation of the Government Performance and Results Act and transition to a performance-based management system. In this regard, FAS has adopted a budget activity structure that incorporates five of the policy objectives included in the FAS strategic plan. This activity structure was modified slightly in our fiscal year 1999 submission.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. Currently FAS' program activities relate directly to our mission and legislated mandates. In general, we believe the current budget activity structure is satisfactory. However, modifications could be made as our experience in implementing a performance-based management system continues to develop.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Again, we will explore further modifications as our experience in implementing a performance-based management system develops.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Yes it does. Both FAS' strategic and annual performance plans cite several external factors. These include foreign competitors' continued use of export subsidies, direct credits and credit guarantee programs, non-price export promotion, monopolistic marketing boards, and various technical assistance programs. Additional external factors outside FAS' span of control include variability in crop production due to weather conditions, both at home and abroad; effect of foreign exchange fluctuations on the price of U.S. products abroad; political instability that may undermine demand in key importing countries; and reductions in resources of other USDA and Federal agencies with whom FAS works in partnership to fulfill its mission and goals.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. FAS will continue to use the GSM program to inject liquidity into developing country markets suffering short-term liquidity crunches similar to the way it did in Asian countries during the fiscal year 1998 financial crisis. Additionally, the agency will use the Export Enhancement Program, Dairy Export Incentive Program, Market Access Program, and Foreign Market Development Cooperator program to offset foreign competitors' continued use of export subsidies, non-price export promotion, monopolistic marketing boards, and various technical assistance programs.

Question. What impact might external factors have on your resource estimates?

Answer. The impact will vary depending on the external factors. A number of the programs administered by FAS fluctuate yearly on the basis of market conditions and competitor actions, including export credit guarantees, EEP, and DEIP.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance plan identify the overlap or duplication?

Answer. Yes it does. In conjunction with other agencies within the Department dealing with SPS issues, FAS has, as a result of a General Accounting Office review of USDA's approach to resolving SPS issues, recently been given the responsibility to support the Special Assistant to the Secretary on International Affairs to coordinate USDA wide goals and objectives and facilitate the integration of USDA-wide processes to improve USDA's efficiency and effectiveness in prioritizing SPS issues and bringing them to resolution. Since this initiative has just begun, USDA is in the process of determining how all of the USDA agencies will jointly plan and coordinate this effort.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that, to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The performance measures identified in FAS' fiscal year 1999 Annual Performance Plan are focused primarily on outputs, and are not sufficiently mature to allow use in measuring program effectiveness. In recognition of this challenge, FAS requested an increase of \$500,000 in its fiscal year 1999 budget request to enlist the help of private sector experts in developing an agency-wide performance tracking and evaluation system that has meaningful and realistic measures and benchmarks of performance to help define relative success rates and measure program effectiveness.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Yes. The biggest factor is the lack of a cost-accounting system which would provide accurate data on costs related to each budgeted program activity.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No, we do not see the need for revisions within the next year.

QUESTIONS SUBMITTED BY SENATOR MCCONNELL

PUBLIC LAW 480 TITLE II

Question. It is estimated that more than 800 million individuals are chronically undernourished, yet AID failed to program more than \$20 million of Title II humanitarian funding in fiscal year 1997. Will AID use all the current year's appropriation, as well as the unspent funds carried over from last year, for commodity and processed food purchases for donation to Title II feeding programs? If not, why not?

Answer. USAID currently expects to utilize in this fiscal year all funds appropriated for fiscal year 1998 plus the carry-over from fiscal year 1997.

While current plans are that all available funds will be utilized this fiscal year, it is possible that there will be an emergency requirement at the end of the year which will make it advisable to carry over some funds to next year. In past years, the amount has always been relatively small. For example, the carry over from 1997 to 1998 was around 2.5 percent of the Title II total and 5 percent of the amount spent for emergencies. Nevertheless, USAID currently expects to expend all available funds this year.

Question. If unspent, what impact will it have on domestic farmers, processors, packagers, and other businesses who normally supply the program?

Answer. The impact on U.S. suppliers, processors and shippers would not be great. The funds carried over from one fiscal year to the next would normally be utilized in the first few months of the following fiscal year.

Question. Traditional Title II "relief" programs donated foods for the "poorest of the poor" for feeding women, children, school children, orphans, widows and the elderly, disabled, destitute, and others in the most vulnerable circumstances. AID'S fairly recent policy change has eliminated traditional "relief" programs from Title II eligibility, restricting approvals to only "developmental" programs.

Under this policy, it has been pointed out that Mother Teresa's programs, were she alive today, would not qualify for Title II humanitarian assistance. What is the basis for this AID policy?

Answer. USAID does not have a policy that eliminates feeding activities for the "poorest of the poor." Within the non-emergency programs, however, USAID does have a policy to give Title II funding priority to programs where the recipient will eventually be able to make self-sustaining progress toward food security. We have concluded this is most likely to occur with "developmental" activities which improve household nutrition or enhance agricultural productivity. Notwithstanding this policy focus for non-emergency Title II activities, USAID does support a large number of traditional "relief" programs in both its non-emergency and emergency Title II activities. In all cases, resources are focused on the neediest countries and within those countries on the most vulnerable.

With emergency Title II programs, the U.S. feeds the starving women and children we all see on CNN. Recent crises in Bosnia, Rwanda, and North Korea are examples of where Title II resources have supported traditional relief feeding activities to maintain the health of the most vulnerable groups in those societies.

In non-emergency Title II feeding programs, U.S. commodities are often used in maternal/child health activities and food-for-education activities benefiting vulnerable groups of women and children. In many cases, these traditional feeding activities have been integrated with other developmental resources to increase the likelihood of sustainable improvements in the health and nutrition of these groups. This category also finances food-for-work programs for poor farmers and landless laborers in countries like Bangladesh. The beneficiaries of these programs are also vulnerable.

USAID also allocates Title II resources to the sorts of welfare feeding programs which Mother Theresa's Missionaries of Charity manage. We will continue to do so and have told cooperating sponsors we will consider modest expansion of these activities. However, the beneficiaries of emergency programs and of non-emergency programs such as maternal/child health are also vulnerable and we believe warrant continued priority.

Question. What has been its impact on private voluntary agencies?

Answer. There has been no adverse impact on our PVO partners. The U.S. private voluntary organizations which manage Title II participated in developing the Food Aid and Food Security policy, which emphasizes the priority of addressing the underlying causes of hunger, and with which our current programs are in complete harmony. Since the PVO's are a diverse community, it is understandable that individual organizations would support some dimensions of the policy more strongly than others. On balance, there has been general support, even though it has required some adjustments by some PVO's.

For example, the policy requires Title II to focus on the most food insecure countries and within those countries on those most in need. This has meant getting out of countries like Indonesia and Philippines which, except for emergencies, are making good progress. Conversely, the policy means greater focus on Africa.

The policy, like Public Law 480, Government Performance and Results Act (GPRA), and other legislation that apply to USAID and its programs, also requires greater attention to achieving program results. This has meant more effort must be devoted to specifying objectives, such as reducing malnutrition among children, and more effort must be devoted to monitoring performance. In some cases, the PVO's have been asked to pay greater attention to the long term impact of the programs. In food-for-education activities, for example, greater attention is paid to the educational benefits of the program.

Question. Is the policy responsible for AID not using all Title II funds in fiscal year 1997, and for likely unspent Title II funds in fiscal year 1998?

Answer. No, the policy had nothing to do with the carry-over from fiscal year 1997. The carry-over resulted from management of emergency Title II funds at the end of fiscal year 1997. No carry-over is currently expected from fiscal year 1998 to fiscal year 1999.

Question. Did AID comply with the statutory processed, fortified, and bagged subminimum tonnage requirement for Title II commodities, in fiscal year 1997? If not why not?

Answer. Based on the traditional method of calculating these subminimum levels, USAID fell a bit short in fiscal year 1997. The requirement is that 75 percent of the commodities distributed for non-emergency programs be in the form of processed, fortified or bagged commodities. The actual level was 73.3 percent. In addition, not less than 50 percent of the quantity of the bagged commodities that are whole grains should be bagged in the U.S. The actual level was 48 percent.

There are two reasons these subminimum requirements were not met in 1997. First, there are commodities such as vegetable oil, soybean meal, and milled rice that require some processing but which we traditionally have not included in this calculation. While these are "processed commodities" as that term is used commercially, the legislative history, while not foreclosing on such a reading, is not explicit as to the congressional intent of the referenced mandate to include these commodities in the calculation. Nevertheless, had they been included, USAID would have met the percentage requirements stated in the legislation. Second, the levels of monetization have increased in response to requests from the private voluntary organizations that manage most Title II non-emergency activities. Monetization allows flexibility to use proceeds for improved management and to strengthen development activities. Increased monetization of Title II commodities under non-emergency activities negatively affects the processed, fortified, bagged mandate because bulk whole grains and bulk vegetable oil represent the majority of monetized commodities.

It is important to note that there are substantial amounts of processed and fortified commodities which go through the Title II supported emergency programs. For example, in North Korea in fiscal year 1997 the U.S. contributed 10,000 metric tons of nutritious corn/soya blend for child feeding.

Question. Will AID comply with the processed, fortified, and bagged subminimum requirement in fiscal year 1998? If not, why not?

Answer. Based on current plans for implementing programs, it appears likely that programs will not be in compliance with this mandate. Commodity requests from our cooperating sponsors for non-emergency activities currently require only approximately 60 percent processed, fortified, and bagged commodities. Even if USAID were to include bulk vegetable oil, soybean meal, and milled rice (that are also processed but not included in USAID's current calculation), the percentage would only increase to approximately 69 percent. Again, we believe that this shift in commodity demand is primarily due to the increased requirements for monetization activities, which is supported by its own mandate under Section 203(b) of Public Law 480. So the factors which led us to fall slightly short of the requirements in fiscal year 1997 remain in force.

As was the case last year, we expect substantial processed and fortified commodities will be shipped under emergency programs.

Question. Does AID incorporate the statutory processed, bagged, and fortified commodity subminimum requirement into PVO program plans and approvals. If not, why not?

Answer. USAID approves the commodity and bagging specifications for PVO programs and monitors progress toward meeting these subminimum requirements on a monthly basis. However, much like Cargo Preference where it would be logistically impossible to apply the 75-percent requirement to each individual shipment, USAID

does not dictate that each PVO program earmark a specific proportion of its program to meet this requirement. To do so would result in an inflexible system that would severely limit the types of activities our partners could undertake.

Although historically USAID has substantially complied with the overall 75 percent subminimum, Public Law 480 permits waiver of these subminimum requirements if the PVO programs "will not be best served by the enforcement of such requirements." USAID manages implementation of the subminimum requirements with a view to the best interests of the PVO programs and, if necessary, exercises the waiver authority to support those interests.

Question. In light of the increased number of monetization programs, is AID taking steps to insure that the processed, bagged, and fortified commodity subminimum is incorporated into these programs?

Answer. Together with our cooperating sponsor partners, we do look for opportunities to monetize processed, fortified and bagged commodities in order to help ensure compliance with these subminimum requirements. Wheat flour and tinned vegetable oil, as an example, are monetized and counted toward the achievement of the mandate. Unfortunately, there is not a ready market in developing countries for many of the other traditional processed and fortified products, such as corn soya blend and cornmeal, so in most cases the monetization of these commodities is not feasible.

QUESTIONS SUBMITTED BY SENATOR BURNS

FOREIGN MARKET DEVELOPMENT/COOPERATOR PROGRAM

Question. Mr. Schumacher, is it true that the President's budget proposes to spend more to renovate the south building than to develop markets for U.S. agricultural products through the Foreign Market Development/Cooperator Program?

Answer. The President's budget proposes a funding level of \$22.0 for the Foreign Market Development Program (FMD), a reduction of \$5.5 million from the current level of \$27.5 million. However, it is anticipated that a higher level of participant cost-sharing will minimize program disruption. It is my understanding that the budget also proposes \$23.5 million for the continued renovation of the South Building to correct health and safety hazards and provide modern facilities.

Question. How much money is needed to be appropriated for the Foreign Market Development/Cooperator Program for fiscal year 1999 to maintain marketing plans for the program at the current level?

Answer. We are hopeful that with higher participant contribution levels, marketing plan levels can continue at the current level with the \$22.0 million appropriation request set forth in the President's budget.

Question. Why, when U.S. agricultural exports are down, especially for bulk commodities that use this program, is the Department cutting the Cooperator program or farmers export program by 30 percent?

Answer. It is simply an issue of money. The FAS budget must absorb some of the costs that had previously been funded by the Commodity Credit Corporation. Those costs used to be on the mandatory side of the budget but now are proposed to be funded on the discretionary side of the budget. FAS has a very restricted discretionary budget, and we are forced to absorb these additional costs within the constraints of the budget. We are hopeful that an increase in participant cost sharing will help offset the reduced FAS contribution to this program.

Question. What does the President's Budget mean by "increasing the cost share" for the Foreign Market Development/Cooperator Program? According to my information, the cooperator contributions to the operation of the FMD/Cooperator Program has consistently exceeded 115 percent. Moreover, if a wheat farmer checks-off \$.02 a bushel on a bushel of wheat that is worth \$2.00 less than it was two years ago, his cost share has already increased. What are you trying to do here?

Answer. The budget assumes a higher level of cost-share contributions from Cooperator organizations which will help to offset the reduced Federal contribution. This effort is consistent with House Committee report language recommending that FAS seek an increase in cost sharing from participants in the Foreign Market Development Cooperator Program. For fiscal year 1998, FMD participants currently contribute \$1.90 for each \$1.00 in FAS funding.

WHEAT EXPORT STRATEGY

Question. On Wednesday, March 18, 1998, Secretary Glickman told the House Agriculture Committee that EEP would result in lower wheat prices because other countries, namely the EU, would compete against an EEP and drive prices lower.

And anyway, our competitors will eventually run out of wheat leaving the U.S. to supply the remaining import demand. Jack Hay, a wheat producer from The Dalles, Oregon responded that wheat producers would take the chance of lower wheat prices if the Department would move wheat out of the U.S. and expand U.S. market share.

At that same hearing, the Secretary noted that the GSM-102 program was the centerpiece of the U.S. farm export strategy. This is new since the Asian financial crisis. In the fall of 1997 several agricultural groups met with the Department to urge the use of the credit guarantee programs so that they would not fall victim to cuts like the EEP experienced last appropriations cycle. The question is—in the absence of a foreign economic crisis—what is the Department's export strategy? And what is the Department's strategy for dealing with a U.S. farm crisis?

Answer. While I am not prepared to speak on all actions the Department is taking to respond to low prices, what I can do is address what we are doing to promote and expand markets. USDA's export strategy is to utilize to the maximum extent possible those programs which are available and appropriate to assist in opening markets and expanding U.S. exports. USDA is currently using a wide range of programs to assist exports including the Export Credit Guarantee Program (GSM-102), Public Law 480, as well as funding for FMD and MAP. USDA continues to monitor world markets and our competitors' actions and reserves the right to use the Export Enhancement Program (EEP) if competitor actions and market conditions warrant. At the moment, however, we do not believe these conditions make EEP the appropriate tool to use.

In addition, we are working aggressively to resolve a wide range of bilateral market access issues. Such efforts have opened up the Chilean wheat market and are currently under way to address barriers in China, India, Brazil, and many other countries. We strongly believe that reducing import barriers to U.S. commodities is the best solution to long term success for U.S. farm exports, and it is an area where the U.S. Government can play a critical role. To further this cause, we are preparing for the next round of WTO negotiations and are assisting in the Administration's review of economic sanctions.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

ASIAN FINANCIAL CRISIS

Question. You mention that the level of agricultural exports in 1997 is down slightly from the previous year due, in part, to the pending financial crisis in Asia. What US commodities are most at risk due to the current financial crisis in Asia? How long do you believe this problem will continue? Do you see long term problems for US agricultural exports resulting from this problem?

Answer. USDA expects the Asian crisis will reduce overall U.S. agricultural exports by no more than 3-6 percent in fiscal year 1998 and 1999 from levels that would have otherwise prevailed. In fiscal year 1998, two-thirds of the total impact on U.S. exports is expected to fall on high value products, led by horticultural products, red meats/poultry, and processed foods as these products are more sensitive to the price and income changes brought on by the crisis. However, in fiscal year 1999, losses for grains and soybeans are expected to grow substantially as Asian economies slow further and competitors benefit from an appreciating U.S. dollar. Beginning in fiscal year 2000, the negative trade effects will likely begin to ease as Asia's currencies, economies, and import demand start their recoveries. Assuming we have seen the worst of the crisis and these countries make the needed economic reforms, USDA sees no permanent long term damage to U.S. exports to the region. The most affected countries have well-educated and highly productive work forces, flexible economies and generally well-developed infrastructure. There is no reason to believe that these economies cannot recover much of their previous economic vitality.

MARKET ACCESS PROGRAM

Question. The budget request provides for \$90 million, the fully authorized level. Please provide information on the amounts of MAP grants made available in fiscal year 1997 including the recipient commodities, companies, and targeted markets. Also, please provide any estimates available on this information for fiscal year 1998.

Answer. I will provide that information for 1997 for the record. Allocations of MAP funding for 1998 have not yet been made, so we cannot provide any information at this time.

[CLERK'S NOTE.—The information does not appear in the hearing record, but is available for review in the subcommittee's files.]

Question. You mention that European countries spend around \$400 million on market promotion of which about half comes from EU member governments. This suggests that the EU private sector spends about \$200 million annually on market promotion. How much do U.S. companies spend on agricultural market promotion on an annual basis? Aside from the \$90 million for MAP, what additional USDA program funding do you categorize as "market promotion"? What other federal spending (non-USDA) could be considered as agricultural market promotion?

Answer. It is difficult to ascertain the exact amount of funding spent by U.S. companies on agricultural market promotion. According to Dunn & Bradstreet, there are more than 150,000 food companies in the U.S., but less than 10 percent of these companies are involved in exporting. Of the 10,000 companies that are exporting product, approximately 1,000 have received assistance under the Market Access Program (MAP). Each company receiving assistance under the MAP is required to match federal funds on a one-to-one basis. In 1996, more than 500 companies participated in the MAP and contributed approximately \$22.2 million of their own funds for export promotion activities. We know that this figure does not begin to scratch the surface as there are more 9,400 additional U.S. companies involved in export promotion that are not participating in the MAP and, therefore, are not obligated to report their expenditures to the Department. However, according to a recent survey of commodity trade organizations, the U.S. industry spends in excess of \$165 million on agricultural market promotion. This figure includes over \$88 million in expenditures which are reported as contributions by participants in the MAP and/or FMD programs.

There are two USDA programs that are categorized as export promotion programs—the MAP and the Foreign Market Development Cooperator Program, funded at \$22 million in the President's 1999 budget. USDA has a number of other programs, services, and activities which are "export-related", but do not meet the definition of export promotion as defined by the Technical Working Group of the Trade Promotion Coordinating Committee. FAS overseas offices also have a small Annual Marketing Plan budget for use in conducting agricultural promotion activities in their countries of responsibility.

At this time we are not aware of any other non-USDA programs that could be considered agricultural market promotion. With its technical expertise and international market intelligence network, the Department is best equipped to develop and implement export promotion strategies for agricultural commodities and products.

TRADE BARRIERS

Question. The European Union has placed a ban on poultry imports from the U.S. because of the practice by US companies to use chlorine as an anti-microbial agent. Is FAS involved in resolving this dispute? If so, what is the status?

Answer. FAS, in conjunction with the Food Safety and Inspection Service and U.S. industry representatives, is working with the EU to resolve the issue regarding the use of anti-microbial treatments in poultry production. In the Veterinary Equivalency Agreement, the EU committed to undertake a scientific study on the use of anti-microbial treatments, including chlorine. The experts which include a person from the United States have begun their research, and we expect this study to be completed by mid-1998. If the results are positive, the Commission has agreed to submit legislation to Member States, reversing the EU policy. U.S. officials are closely monitoring the progress of the scientific study.

AQUACULTURE EXPORTS

Question. You mention that edible fish and seafood product exports did not fare as well in 1997 as previous years and had, in fact, slipped 6 percent from 1996. What portion of the U.S. edible fish and seafood product exports are farm-raised aquacultural products?

Answer. We estimate that about one percent of 1997 U.S. edible fish and seafood product exports are farm-raised aquacultural products including: farmed Atlantic salmon (\$14.4 million, 93 percent to Canada), crawfish (\$5.3 million, 99 percent to Sweden (aquaculture estimated to be half of the \$10.5 million of total crawfish exports)), trout (\$3.4 million, 71 percent to Canada and 17 percent to China) and catfish (\$.7 million, 75 percent to Germany and 10 percent to France). Exports of these particular products were up 2.9 percent over 1996 exports. Additional aquaculture products are exported but it is difficult to separate farmed versus wild harvest exports.

Question. Will long-term U.S. aquaculture exports increase at a pace equal to increased domestic production?

Answer. We expect that long-term U.S. aquaculture exports will increase at a pace equal to or greater than increased domestic production. Exports of these products grew 4.4 percent and 2.9 percent in 1996 and 1997, respectively. For 1998, farmed catfish production is forecast to grow 2-4 percent and farmed salmon production is expect to remain level; crawfish production rose 6 percent in 1997, and trout production from September 1, 1996 through August 31, 1997, grew 4 percent. Although the domestic market is the main outlet for U.S. aquaculture products, as U.S. production grows we expect exports of some aquaculture products will increase at a greater rate or to a greater number of markets. For example, the Catfish Institute is considering expanding market promotion activities beyond Germany to include Canada and other markets.

USE OF BIOTECHNOLOGY

Question. You mention that biotechnology may provide opportunities to meet world food security needs and, at the same time, reduce chemical use, provide safer food, and cut costs. What efforts are underway to make importing countries more willing to accept products modified genetically or produced with other biotechnological methods?

Answer. USDA assisted Egypt's Ministry of Agriculture develop a biotechnology research capability in the early 1990's. In July 1997, the Egyptian Ministry of Health made a decision requiring the Genetically Modified Organisms (GMO) Certification of all food and agricultural imports. FAS alerted the Ministry of Agriculture to the issue and to the relevance of its research for the issue's resolution.

The U.S. Embassy, in its briefing cable preceding Secretary Glickman's September trip to Egypt, pointed out that Minister of Agriculture Youssef Wally took control of the issue and was a major force behind the decision to "neutralize" the GMO certification requirement. The Embassy emphasized his role in keeping the GMO issue from becoming a major trade irritant between Egypt and U.S.

While in Egypt Secretary Glickman thanked Ministry Wally and solicited his support for a reasonable international consensus on the labeling of biotech (GMO) products. Other countries in the region often follow Egypt's lead with these decisions. He also acknowledged the excellent work being done in Egypt in biotechnology and pledged USDA's continuing support and collaboration with the MOA on this kind of research.

Because of the importance that biotechnology plays in new agricultural products, USDA has recently established a Department-wide working group on biotechnology that will coordinate the Department's efforts in this area. FAS, in coordination with APHIS, other U.S. regulatory agencies, USTR, and industry groups, has initiated harmonization efforts in a number of multilateral and bilateral fora.

The U.S. government holds regular bilateral discussions with the EU to encourage the EU to evaluate genetically modified products using scientifically based analysis. USDA is working closely with the developers of genetically modified products, manufacturers of processed products, and exporters to keep them informed of developments in the EU and to help ensure that there is no disruption of trade in products such as corn gluten feed. FAS is an active participant in the Transatlantic Business Dialogue Agri-food Biotechnology Initiative.

A biotechnology initiative has been undertaken in the Asia Pacific Economic Community (APEC) and was endorsed at the recent APEC Ministerial in 1997. The U.S. hosted a second workshop on risk assessment of biotechnology products in March 1998.

Bilateral harmonizations efforts continue with Japan. FAS led a delegation from U.S. regulatory agencies to speak with Japanese press and consumer groups. In addition, USDA has hosted representatives from the Government of Japan to gather information on the U.S. approach to labeling of biotechnology products. To date, Japan has approved 15 agricultural biotechnology products for importation.

In order to mitigate the potential negative effects on trade, FAS has played a prominent role in developing the U.S. position for the negotiations of a Biosafety Protocol under the Convention on Biodiversity and is represented on the U.S. delegation to these negotiations.

PUBLIC LAW 480

Question. The budget request calls for a reduction in Title I of Public Law 480. What is the reason for this reduction?

Answer. The proposed reduction in Public Law 480 Title I funding is necessary to help meet discretionary spending targets set in order to achieve a balanced budg-

et. Public Law 480 Title II and Title III funding remains unchanged from fiscal year 1998 levels. This will ensure that adequate resources are available to meet serious food assistance needs, including emergencies.

QUESTIONS SUBMITTED BY SENATOR KOHL

FOREIGN MARKET DEVELOPMENT/COOPERATOR PROGRAM

Question. How much money needs to be appropriated for the Foreign Market Development/Cooperator Program in fiscal year 1999 to maintain marketing plans for the program at the current level?

Answer. We are hopeful that with higher participant contribution levels, marketing plan levels can continue at the current level with the \$22.0 million appropriation request set forth in the President's budget.

Question. Why, when U.S. agricultural exports are down, especially for bulk commodities that use these program, is the Department cutting the Cooperators program or "farmers export program" by 30 percent?

Answer. It is simply an issue of money. The FAS budget must absorb some of the costs that had previously been funding by the Commodity Credit Corporation. FAS has a very restricted discretionary budget and we are forced to absorb these additional costs within the constraints of the budget. We are hopeful that an increase in participant cost sharing will help offset the reduced FAS contribution to this program.

Question. What does the President's budget mean by "increasing the cost-share" for the FMD/Cooperator Program? According to my information, the cooperators contribution to the operation of the FMD/Cooperator Program has consistently exceeded 115 percent. Moreover, if a wheat farmer checked off 2 cents a bushel on a bushel of wheat that is worth \$2 less than it was two years ago, his cost-share has already increased. What are you trying to do here?

Answer. The budget assumes a higher level of cost-share contributions from Cooperator organizations which will help to offset the reduced Federal contribution. This effort is consistent with House Committee report language recommending that FAS seek an increase in cost sharing from participants in the that participants in the Foreign Market Development Cooperator Program (FMD). For fiscal year 1998, FMD participants currently contribute \$1.90 for each \$1.00 in FAS funding.

AGRICULTURAL TRADE OFFICES

Question. What are the Department's plans with respect to expanding the opening of Agricultural Trade Offices? Is this a wise course of action when U.S. agricultural exports are declining?

Answer. Agricultural Trade Offices (ATO's) have been established for the purpose of developing and maintaining markets for U.S. agricultural, food, forest and fishery products. The Secretary of Agriculture has been directed by statute to establish not less than six nor more than twenty-five U.S. Agricultural Trade Offices worldwide. ATO's are the export market promotion arm of FAS operations overseas. In recent years, the establishment of ATO's has not increased the number of FAS American staff overseas. Rather, attache positions have been converted to ATO's to reflect an increased emphasis on market development and to take advantage of increased market opportunities for consumer food products in selected regions.

U.S. consumer-oriented food and agricultural product exports continue their growth, increasing 4.14 percent to \$21 billion in 1997. While there have been some recent declines due to the financial situation in Asia and lower prices for bulk commodities, the long term trend is for continued growth in exports.

Two new ATO's were established in 1997: ATO Sao Paulo and ATO Caribbean Basin. In the case of Sao Paulo, the Office of Agricultural Affairs was converted to an ATO with no net change in American or local staffing. This was done to reflect the increasing export opportunities for high-value consumer oriented products as well as increased support needed by visiting Foreign Market Development cooperators, Market Access Program participants, and other U.S. exporters with expanded programs in the region. Import liberalization has resulted in spectacular growth in consumer-oriented exports to Brazil from \$74 million in 1994 to over \$160 million in 1997, growth of 116 percent.

The Caribbean Basin ATO is responsible for market development throughout the Caribbean. The Assistant Attache position in Santo Domingo was converted to the ATO Director position in Miami. Establishment of this office was long overdue with U.S. consumer food exports to this region exceeding \$570 million in 1997, reflecting growth of 10.6 percent over 1996 exports.

The Foreign Agricultural Service believes that dedicated market development support overseas through our U.S. Agricultural Trade Offices is not only wise but essential to fulfill our mandate to develop, maintain, and coordinate market development activities in markets with excellent high-value food product export potential.

FAS OUTREACH PROGRAM

Question. Please explain the value of the FAS Outreach Program and its direct impact on agricultural exports.

Answer. Increased agricultural exports are generated by established exporters and new-to-export companies and cooperatives. As background, Dunn and Bradstreet reports there are approximately 165,000 companies in the United States producing, manufacturing, packing or marketing agricultural products, yet less than 10,000 are actually engaged in exporting. With sales to the export market growing at three times the rate of the domestic market it is very important that U.S. companies be alerted to overseas opportunities and the potential for profit. Increased exports create jobs in both urban and rural communities; provide a safety net for farm income; and contribute positively to the balance of trade. It is clearly in the best interest of the national economy that the Government engage in increasing domestic awareness of global market opportunities, consumer quality and safety expectations, and educate foreign buyers about the merits of U.S. products.

The FAS Outreach Program uses its extensive communication network and relationships with universities, export assistance centers and the State Departments of Agriculture to effectively convey to companies and cooperatives alike that real export opportunities exist, and that USDA can be a full partner with the private sector in expanding sales, developing new markets and promoting new products. The resultant increase in exports represents tangible evidence of USDA's commitment to expanding the number of exporting companies which can be linked to the efforts of FAS in partnership with State Departments of Agriculture. Targeting small, medium and new-to-export companies in addition to cooperatives to provide export assistance and trade information has led to a higher rate of export participation among these groups, and in turn increased exports of food, fiber, seafood and forest products.

QUESTIONS SUBMITTED BY SENATOR LEAHY

URUGUAY ROUND AGREEMENT

Question. I understand that we have reported to the WTO for the 1995/1996 Uruguay Round Agreement (URA) phase-in year that we intended to ship 64,000 metric tons of nonfat dry milk, and for the following year (1996/1997), that we intended to ship 67,000 metric tons of nonfat dry milk. How much of that combined amount of 131,000 metric tons—which amounts to some 290 million pounds—actually has been shipped? If it has not been shipped, what steps are you taking to ensure that the nonfat dry milk will be exported under DEIP?

Answer. Agreements under DEIP in 1995/96 and 1996/97 committed 63,693 metric tons, and 69,890 metric tons, of non-fat dry milk, respectively. Of the total tonnage committed of 133,583 metric tons for those two years, approximately 89,607 metric tons were shipped. Buyer defaults and various other factors accounted for the loss in shipments. In order to reduce the rate of DEIP non-performance, the Commodity Credit Corporation recently modified its policy concerning amendments to DEIP agreements. DEIP exporters now have more flexibility to change the buyer on DEIP contracts, renegotiate export sales prices, and extend delivery periods. In addition, we have also regionalized our DEIP allocations in order to allow for greater program flexibility.

Question. I understand that the URA technically allows countries to carry-over from one year to the next unused export tonnage. Isn't reprogramming of canceled, unshipped tonnage, which I believe does not involve carry-over, thus also permitted under the URA?

Answer. Throughout the negotiations leading to the Uruguay Round Agreement (URA), it was understood that export subsidies would be disciplined by annual tonnage and expenditure limits. The European Union apparently interprets certain language in the URA as allowing for unused tonnage to be carried forward into another year. Although we have not yet confirmed whether the EU has acted to carry or roll-over unused tonnage, the United States and many other countries continue to have concerns that such an interpretation of the URA could greatly undermine the export subsidy disciplines in place on a range of commodities.

Question. Given that reprogramming of unshipped DEIP tonnage is permissible under the URA, and given that the 1996 farm bill mandates that USDA make full use DEIP, will you ensure compliance with the farm bill by reprogramming canceled tonnage that otherwise would not be shipped?

Answer. Re-programming tonnage that was contracted, but canceled or unshipped, could adversely affect the URA. Nonetheless, we would view with great concern actions by other countries along these lines, and we would have to consider what would be the most appropriate U.S. response should this occur.

Question. USDA is estimating that it will remove about 62 million pounds of non-fat dry milk in calendar year 1998 under the milk price support program, and in fact is currently purchasing about 2 million pounds of powder per week. Isn't it cheaper for USDA to "DEIP" milk powder overseas than purchase it under price support (assuming that USDA will have to hold on to the powder it acquires under price support for a long period or give it away)? Further, aren't DEIP sales more beneficial to U.S. dairy farmers than price support acquisitions, since a product that is DEIP'ed is removed from the market forever, but price support acquisitions overhang the market and serve to weaken prices?

Answer. Under current market conditions, it is cheaper to "DEIP" nonfat dry milk than to purchase it under the price support program. Unfortunately, our entire Uruguay Round subsidy allowances are already fully dedicated under the DEIP program. Price support purchases may be cheaper under market conditions that permit short storage periods before sale back to the market or if the DEIP subsidies were more expensive. However, the dairy price support program ends at the beginning of 2000 and the DEIP program offers the opportunity to develop long-term dairy export markets.

RISK MANAGEMENT AGENCY

QUESTIONS SUBMITTED BY SENATOR COCHRAN

LEGISLATIVE PROPOSAL

Question. The Administration proposes in the fiscal year 1999 budget request to pay all administrative expense reimbursements to reinsured companies from the mandatory Federal Crop Insurance Corporation Fund. Program changes are proposed as a partial paygo offset that would take effect beginning in fiscal year 2000. These include: placing a \$100,000 limit on Catastrophic Coverage; reducing the reimbursement rate on delivery expenses; reducing the subsidy for buy-up coverage; and limiting the loss ratio to 1.06.

By reducing premium subsidies for higher levels of coverage, Mr. Ackerman you state that farmers would experience "a slight increase" in producers' out-of-pocket costs to pay premiums, about 10 cents/acre. Farmers of which individual crops would be affected by this most?

Answer. Crops with high values per acre or high premium rates will be affected more than this average change. For example, almonds will increase about \$1.40 per acre due to an average liability of nearly \$1,700 per acre. Wheat, with a liability of about \$75 per acre and relatively high rates, will increase about 10 cents per acre. Cotton, with an average liability of \$211 per acre, will increase about 46 cents per acre.

Question. By reducing the statutory loss ratio target from 1.075 to 1.060 beginning in fiscal year 2000, producers' out-of-pocket expenses for premiums rates would increase also. How much does this increase farmers' out-of-pockets expenses?

Answer. This would increase the costs for an average producer by about 1.4 percent. The national average, based on premium costs for 1997, would be 10.4 cents per acre.

Question. In the years beyond fiscal year 1999, the agency is proposing that half of the mandatory offsets would come from proposed changes in the crop insurance program and the other from USDA sources. What other USDA sources are being considered?

Answer. The following are proposed Departmental offsets outside of the crop insurance program: Create a flexible, multi-year program level authorization for the Export Enhancement Program; and reduce the expenditures in Cotton Step 2 payments.

CROP INSURANCE COMPANIES

Question. Mr. Secretary, you indicate in your opening statement that the weather in 1997 was particularly good and that the Federal Crop Insurance Program had

a very favorable loss ratio of less than .80, which is well below the statutory requirement of 1.10. Thus the insurance companies received underwriting gains based on the risk they retained. Under more normal conditions, the companies would have received far less.

How much in underwriting gains did the companies receive in 1997? In 1998?

Answer. At the 1997 Annual Settlement, the companies received underwriting gains for the 1996 reinsurance year of approximately \$248 million based on \$1.2 billion of premium retained by the companies and a loss ratio of 76.1 percent.

At the 1998 Annual Settlement, the companies received underwriting gains for the 1997 reinsurance year of approximately \$359 million based on \$1.3 billion of premium retained by the companies and a loss ratio of 50.6 percent.

LOSS RATIO

Question. You also mention a legislative proposal that would reduce the loss ratio, among other things. What will this new loss ratio be?

Answer. The Risk Management Agency (RMA) proposes to reduce the loss ratio target, contained in Section 506 [7 U.S.C. 1506] (o)(2) of the Federal Crop Insurance Act, from 1.075 to 1.06.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. RMA's performance goals were derived directly from the Agency's objectives contained in its strategic plan. RMA documented its business processes (life cycles) in line with its strategic planning efforts. These business processes contain the activities that support the achievement of RMA's performance goals. RMA is currently working to establish the capability to more directly link program activities, performance goals, and resource requirements with the strategic plan components.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. RMA worked to link performance goals directly to program activities found in the current budget structure. However, the budget activity structure does not lend itself well to the measurement of RMA's progress toward achieving its overall mission and goal. Since RMA receives a single discretionary appropriation for administrative and operating expenses, it did not report individual program activities for this account in its fiscal year 1999 budget. Although the Agency did provide activity information on its mandatory account, the Federal Crop Insurance Corporation Fund, the current structure is not easily tied to the Agency's performance goal. Therefore, the Agency decided to take the approach of establishing annual performance goals and indicators that gauge progress toward achieving the long-term general goal and objectives found in its strategic plan. RMA is considering ways to improve the linkage between its performance goals and budget.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes—RMA's Annual Performance Plan does link performance measures to its budget, however, RMA chose to focus their performance measures and indicators on the mission, goal, objectives, and management initiatives of the Agency rather than directly tying them to the program activities or accounts found in the budget. For example, performance goal #4 in RMA's annual plan, "Reduce program vulnerabilities" relates to one objective of the Agency, has funding tied to it through the discretionary A&O Account, but is not a separate program activity in the budget. RMA is currently working to establish the capability to more directly link all of these components.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. RMA's performance planning structure and the account and activity structure in its budget do differ significantly in format and structure. However, RMA's budget estimates and justifications do include some linkage to the performance goals and indicators found in the Annual Performance Plan, as well as goals and objectives found in the Agency strategic plan. This linkage can be found throughout the Agency's fiscal year 1999 Explanatory Notes package and 1999 Annual Performance Plan. In addition, it is important to note that RMA's performance plan is consistent with the Agency strategic plan and fiscal year 1999 budget request, as required. The following is a description of both the performance planning structure and program activities found in RMA's budget request:

—The performance planning structure in the annual plan outlines the performance goals and indicators that RMA would like to accomplish in the given fiscal year. This structure is very similar to that found in RMA's strategic plan which focuses on the mission, goal, and objectives of the agency.

—However, RMA's budget account and activity structures are based on program activities, and currently include two accounts, the mandatory Federal Crop Insurance Corporation Fund and the discretionary Administrative and Operating Expense Account. The FCIC Fund is further broken out by the following program activities: premium subsidy; delivery expenses; research and development reform costs; and apportionment for excess losses. For fiscal year 1999, the A&O account includes only one program activity—salaries and expenses. RMA understands the need to translate the performance goals and indicators directly to the program activities found in the budget, and is considering ways to achieve this.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. At the present time, RMA does not propose any changes to the budget account structure for fiscal year 2000. However, if modifications were made, analysis would be conducted to determine the appropriate structure for future years.

Question. How were performance measures chosen?

Answer. RMA documented the life cycles for its core business processes using a cross-functional team. The team contained a diverse representation of managers and employees from all major functional areas of the Agency.

These life cycles contained the activities, as well as specific inputs and outputs to these business processes. RMA selected the "vital few" measures that they felt would best allow RMA management to determine agency results in line with the strategic plan.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Given current budgetary constraints, RMA has found it difficult to fund the development of truly meaningful performance measures. We realize that many of the measures in our fiscal year 1999 budget measure output or workload rather than outcomes. However, several of our outcome-based measures require customer surveys which demand an investment of significant financial resources and time. RMA fully expects there to be lessons learned from the first attempt. These lessons will be used to improve the Agency's ability to conduct performance measurement in the coming years.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. RMA did not have complete baseline data to establish all performance targets for inclusion in its 1999 Annual Performance Plan. However, RMA has established an implementation plan for the institutionalization of its documented performance plan measures. This plan takes into account the March 2000 requirement. RMA's intent is to have all its performance measures and targets based on current, reliable, and/or statistically valid information.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. RMA recommends that its performance measures that are outcome based be used to determine applicable program results. RMA's output-based measures are intended to help provide additional detail to assess programs in achieving outcome targets. It should be noted that RMA's outcome and output measures may not be mature enough for effective and efficient program management. RMA intends to conduct quarterly reviews of its available measures and determine their appropriateness as management tools. RMA fully expects adjustments to be made to its performance measures as experience is gained in results-based management.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. In RMA's annual performance planning process, we strove to include outcome measures for each objective and management initiative in support of our strategic goal. The intent was to include at least one outcome measure for each objective and management initiative. RMA recognizes that work needs to be done to establish or refine these measures. As mentioned previously, funding and time constraints precluded the development of some of these measures. As RMA gains experience with performance planning, our measures will improve and the benefits that can be derived for the Agency will increase.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes—RMA established measures utilizing cross-functional subject-matter experts serving on a team, some of whom were managers. These measures (i.e., output and outcome) were presented to and accepted by the Agency's senior management. RMA understands the need to train program managers on all GPRA concepts as implementation progresses.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. RMA has created two projects that will institutionalize the development and administration of surveys to internal and external customers. RMA is currently in the definition stage working to determine: what data elements are needed; what specific questions should be asked; who should be asked; where are they; what vehicle/instrument should be used; what should be the frequency of data collection; and what the cost would be. Examples of internal customers include: employees and unions. Examples of external customers include: private reinsured companies and agricultural producers.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. Actually, the fiscal year 1999 budget process began prior to the developmental stage of RMA's Annual Performance Plan. However, throughout the budget preparation process, RMA was able to incorporate portions of our annual plan throughout the fiscal year 1999 budget request. For example, justifications in the budget request link to the annual and strategic plans and support the goals within those plans. The Purpose Statement and Status of Program sections of the fiscal year 1999 Explanatory Notes for the Agency outline the contents of the annual plan and reflect the resources required to accomplish those goals and measures. RMA feels that together, these two tools will provide clear direction to manage RMA's activities for fiscal year 1999. In addition, the annual plan and budget documents clearly define the Agency's commitment to meet its goals.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes—however, RMA is working to improve its ability to directly link its program activities and performance goals with resource and budget constraints.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes—however, RMA is working to utilize technology to improve its current capabilities of reviewing, analyzing, and adjusting priorities or business processes to ensure achievement of its performance goals. RMA recognizes the need to coordinate and assimilate this data into its programs, given that it comes from a variety of internal and external sources. RMA has established a project designed to institutionalize Agency reviews on a quarterly basis. RMA must establish its measure baselines and establish performance targets before these reviews will be of maximum benefit.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Yes—RMA has faced difficulties in linking dollars to results under the current budget structure, especially in the mandatory FCIC Fund. For example, it was very difficult to produce quantifiable and measurable performance goals for program activities such as delivery expenses paid to reinsured companies.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. It is not clear that linkages would be clearer if RMA's budget account structure were modified. However, RMA's mandatory FCIC Fund has been reviewed by Congress several times beginning in 1994 with the Crop Insurance Reform Act and most recently in the development of the Research Title. While the categories are broadly stated, the assumptions that underlie them have been analyzed closely.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. If RMA were to modify its account structure, a thorough analysis would be conducted to determine how it could be improved.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. If modifications were made, the strengthening of accountability would depend on the analysis stated above. It is assumed that modifications would more directly link RMA resources and activities (including FTE's, dollars, and business processes) with performance goals and provide the Agency with the necessary information to strengthen accountability.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Yes—in RMA's strategic plan, they identified several key external factors that could significantly affect progress in our efforts to achieve our goal.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. RMA conducted Business Process Reengineering (BPR) that allowed for the opportunity to address some of these factors. For example, in the area of improving its delivery partner relationship with the private sector, the BPR Final Report outlines recommendations and steps to improve this relationship.

Question. What impact might external factors have on your resource estimates?
 Answer. RMA external factors can have significant impacts on our resource estimates. For example, depending on the level and degree of private sector involvement in risk management functions, the possibility of significant impacts to RMA resources are extensive.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. The performance planning process itself did not identify any significant duplicative functional or procedural steps.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. RMA's measures have not been thoroughly tested and therefore proven to be the right measures allowing for proper results management of the Agency. Through time and empirical evidence, RMA will refine its measures and management processes and become more confident in its ability to manage actual performance with targeted performance.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Many of RMA's traditional measures are activity-based. RMA is in the process of institutionalizing its outcome measures, and expects that time and experience will improve the accuracy of its resource estimates.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No—RMA's fiscal year 1999 Annual Performance Plan was directly derived from its strategic plan. However, RMA expects that changes to its strategic plan in the future will result in adjustments to any following performance plans.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

PRIVATE INSURANCE COMPANY PROGRAM DELIVERY

Question. You mention that suggested crop insurance reforms might reduce private company profits by 20 percent. What level of profits have private insurance companies been making from the crop insurance programs in recent years?

Answer. The company pre-tax return on retained premium based on the reinsurance agreement terms effective during that year are as follows:

<i>Reinsurance year</i>	<i>Actual return on retained premium (percent)</i>
1992	5
1993	- 19
1994	19
1995	17
1996	21

<i>Reinsurance year</i>	<i>Actual return on retained premium (percent)</i>
1997	28
1998 (estimate)	10

Question. If private companies are realizing sizable profits from crop insurance, why does USDA need to provide an additional \$188 to \$205 million to reimburse the companies for program delivery?

Answer. The Risk Management Agency (RMA) believes that insurance gains and losses from administrative and operating expenses subsidies should be treated separately. The basic premise behind risk sharing provisions of the Standard Reinsurance Agreement (SRA) is for the companies to share in both gain and loss years. RMA is contracting for a delivery system with private sector insurance companies. The delivery of the crop insurance program directly competes with the delivery of other lines of insurance which private sector insurance companies may choose to sell. Administrative and operating subsidies are intended solely to cover delivery expense to ensure that companies do not lose money in their delivery. Taken together, risk sharing provisions and the payment of delivery expenses provide an incentive for companies to sell crop insurance.

The issue of profitability, as with a share of underwriting gains and losses, was a significant one during the negotiations for the recently agreed upon 1998 SRA. RMA intends to continue discussions with the crop insurance industry regarding profitability in the delivery of the Federal crop insurance program. RMA believes the pre-tax rate of return provided by the 1998 SRA is similar to the rate of return received from the insurance company investments in other lines of insurance and allows insurance companies to continue delivering the program.

OTHER PROGRAM REFORMS

Question. Another suggested reform to achieve savings is to place a \$100,000 cap on payments to farmers for catastrophic risk protection (CAT). Would this change be fair to producers who might raise crops with higher market values and higher production costs?

Answer. The matter of payment limitations affects many people in various circumstances differently. You have cited high value or high production costs as distinguishing characteristics. The cap would also affect small scale farmers differently from large scale farmers. The limit is consistent with those established under ad hoc disaster programs and the Noninsured Assistance Program (NAP). However, the ad hoc and NAP programs are subject to a further limitation for farmers with less than \$2,000,000 in gross income from all sources, which is not proposed under the Department's proposal. Thus, we believe the proposed limit is consistent with previous Congressional actions but is relatively more liberal to recognize that this is an insurance program, not ad hoc disaster assistance.

Question. For example, would a payment of \$100,000 to a rice farmer with high production costs be of equal "value" as a \$100,000 payment to a wheat farmer with relatively low production costs?

Answer. A wheat farmer with relatively low production costs per acre would need to farm significantly more acreage than a rice farmer to qualify for a \$100,000 payment. Hence, even though the costs per acre are lower, the total costs associated with a \$100,000 payment may not differ materially. If this is the case, the value of the payment should be roughly equivalent for the two producers.

Another proposed reform is to reduce the statutory loss ratio from 1.075 to 1.060. The immediate result of this change would be to increase crop insurance premiums.

Question. Have you determined what effect this change will have on the level of crop insurance participation? If so, what did you find?

Answer. There are no studies that unambiguously estimate what economists call the price elasticity of demand of crop insurance. The effect of this action would be to increase premiums by about 1.4 percent. A typical policyholder owed about \$1,020 of farmer-paid premium in 1997. The increase would be about \$14. This probably is not large enough to trigger widespread cancellations. Changes due to planted acres, yields, or price elections may have a greater effect on premiums than would this change.

SUBCOMMITTEE RECESS

Senator COCHRAN. Our next hearing is going to be next week in this same room. We will hear the budget proposal from the Food

and Drug Administration and the Commodity Futures Trading Commission at that time.

Until then, the subcommittee will stand in recess.

[Whereupon, at 11:33 a.m., Tuesday, March 24, the subcommittee was recessed, to reconvene at 10:04 a.m., Tuesday, March 31.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 1999**

TUESDAY, MARCH 31, 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:04 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran and Bumpers.

COMMODITY FUTURES TRADING COMMISSION

STATEMENT OF BROOKSLEY BORN, CHAIRPERSON

**ACCOMPANIED BY MADGE BOLINGER, DIRECTOR, OFFICE OF FINAN-
CIAL MANAGEMENT**

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

Today our subcommittee is continuing its review of the President's budget request for the next fiscal year. This morning we are considering specifically the request for funding of two independent agencies under the subcommittee's jurisdiction, the Commodity Futures Trading Commission and the Food and Drug Administration.

Because we have a vote that is scheduled to occur on the floor of the Senate at 10:30, I hope that we are able to complete action on the first panel which deals with the Commodity Futures Trading Commission, and then I will go over and vote. Senator Bumpers may very well be here at that time as well. We will either continue the hearing if there is a Senator here to chair it or temporarily suspend the hearing until I can return from the floor for that vote.

PREPARED STATEMENT

We have a prepared statement from Senator Bumpers which will be made part of the hearing record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

Mr. Chairman: All too often, people hurriedly refer to this subcommittee as the "Agriculture" subcommittee. Sometimes, if they are generous, they may refer to it as the "Agriculture and Rural Development" subcommittee. It is unfortunate that people generally fail to recognize that the title of this subcommittee ends with "And Related Agencies" which include the Commodity Futures Trading Commission and the Food and Drug Administration, both of whom are with us today.

Ours is also, perhaps, an unfortunate choice of a name to the extent that these two agencies are collectively considered as "Related Agencies". This term might suggest to some a relegation of importance to a level somewhere below our usual recognition of "Agriculture" or "Rural Development". Let me assure our guests and my colleagues on the Subcommittee on Agriculture, Rural Development, and Related Agencies, that the Commodity Futures Trading Commission and the Food and Drug Administration do hold responsibilities of great importance to our nation.

The CFTC may not be a household word to every American and there may be relatively few Americans who actively participate in futures trading. However, for anyone who has ever viewed (with fascination, I am sure) the complex workings of the futures pits and considered for a moment the effect of the numbers on the board to investors and financial security all around the world, the members and staff of the CFTC are not viewed as simply another agency.

The American economy is strong. Still, we hear rumblings of market instability on foreign shores and we have seen in recent years the effect market manipulation can have on a regional and global scale. As markets become ever more "global" in nature, the role of the CFTC takes on greater importance as a regulator whose mission it is to ensure protections in the marketplace for our investors and our producers.

The 1996 Farm Bill eliminated many of the traditional Farm Safety Net features that farmers had relied on for years to protect them from an unstable market place. The Risk Management Agency at USDA has the task of creating programs to reduce the farmer's risk from nature and, to an extent, from the markets. The CFTC also holds an important role in offering the farmer tools that will enable him leverage in the market place to secure a reasonable price for his products. The use of futures is complex and, to many unfamiliar with the practice, a frightening and potentially costly alternative. The CFTC has a place in working with the farmer as well as the professional trader to make certain that products on the futures exchanges are available in a manner meaningful and useful to all. To that extent, the CFTC plays a role other than as simply a "Related Agency" but with a real responsibility to "Agriculture and Rural Development".

The Food and Drug Administration is one of those agencies whose responsibilities are often unrecognized but are, in fact, of extreme importance. A loss of the protections to human health and safety afforded by this agency are uncomprehensible. No American can enter a grocery store, a pharmacy, or a hospital in which protections of the FDA are not in place. I further believe that no American could imagine the changes to his or her lifestyle that would occur if those protections were not in place.

The Food and Drug Administration has taken criticism in recent years over delays in drug approval and other items. The Food and Drug Modernization Act of 1997 may do much to correct some of those problems. Still, regardless of past criticism, I would not trade the security of our food, blood, and drug supplies in this nation for that of any other country on earth. As modern medicine advances, FDA must keep pace and it is the responsibility of this subcommittee to provide the resources to keep FDA in step with technology.

FDA, as with USDA, is going through a period of introspection, consolidation, and downsizing. Just as agencies experience growing pains during periods of growth, similar trauma occurs (usually in a more painful manner) in the event of contraction. The consolidation of the FDA regional field laboratories presents challenges but will provide a much more efficient agency with inherent cost savings. I support this consolidation and encourage the agency to move as rapidly as possible. I will do what I can on this subcommittee to provide the resources and direction necessary to effect these changes as quickly as are prudent.

Over the past several years, this subcommittee has provided consistent increases for FDA. I am sure that we will do what we can for the coming fiscal year to help FDA maintain its commitment to quality, protection, and safety. I note that the budget submission, again, proposes unauthorized user fees and we are all aware of the special problems such assumptions create. I admonish my friends in the Administration, just as I have to those in previous Administrations, that we should be presented with a budget submission that can be reasonably assumed to be enacted. If FDA truly expects to achieve a higher program level through the collection of new user fees, they should first secure those fees from the appropriate committees before suggesting a lower request for new budget authority. We want to be helpful, but we also demand cooperation.

Mr. Chairman, this is our last hearing for the fiscal year 1999 appropriations bill. As such, it is the last hearing I will attend in my capacity as a member of this subcommittee. Let me again express publicly my sincere gratitude for the opportunity to serve with you these many years and for your gracious manner in disposing your

responsibilities. You have always been honest and fair and truly a pleasure to work with. While there are some features of public life I will not miss, sharing a role on this subcommittee with you and all members, Republican and Democrat alike, is not one of them. I will miss all of you.

INTRODUCTION OF WITNESS

Senator COCHRAN. We are very pleased to have Ms. Brooksley Born who chairs the Commodity Futures Trading Commission as our first witness, and we have a copy of your written testimony which we appreciate very much. We will make that a part of the record in full and invite you to make any comments or summarize your statement in any way that you think would be helpful to the committee. We then will have an opportunity for some questions.

You may please proceed.

STATEMENT OF BROOKSLEY BORN

Ms. BORN. Thank you very much, Mr. Chairman. The Commission very much appreciates this opportunity to discuss the President's fiscal year 1999 budget request for the Commodity Futures Trading Commission.

With me today is Madge Bolinger who is the Director of the Commission's Office of Financial Management.

The Commodity Futures Trading Commission is a small agency with an important mission. It oversees the Nation's futures and option exchanges and the over-the-counter derivatives market. The Commission also supervises 64,000 commodity professionals who trade on the floor of the Nation's exchanges or represent customers. These markets have experienced explosive growth in the past decade.

The President's fiscal year 1999 budget request for the Commission is \$63.4 million, with a staffing level of 600 full-time equivalents. This request represents a \$5.3 million increase over fiscal year 1998, or approximately 9 percent. It calls for an additional 20 full-time equivalent staff-years over the fiscal year 1998 appropriation, or a 3-percent increase in staff.

Approximately \$3.9 million of the increase is required for the Commission to sustain its current level of services, and the remaining \$1.4 million would support the requested 20 additional staff-years. The staff increase would raise the Commission's staff to approximately the staff level it had in fiscal year 1992.

The Commission is responsible for ensuring the integrity of the Nation's futures and option markets, protecting customers from fraud and other trading abuses, monitoring the markets to detect and to prevent price distortions and manipulation, and encouraging the competitiveness and efficiency of the Nation's futures and option exchanges. Through effective oversight regulation, the Commission enables the commodity futures markets better to serve their vital price discovery and hedging functions in the Nation's economy.

The requested increase will be used to enhance the Commission's enforcement, market surveillance, and oversight presence in our rapidly changing and growing on- and off-exchange markets. The largest portion of the requested dollar increase will be dedicated to the Division of Enforcement, which will receive an allocation of 10

additional staff-years. The addition of these staff-years would, in effect, complete the reorganization of the division, which was begun in 1995. The division's new flexible organizational structure, which will be enhanced by the 10 additional staff-years, will allow the enforcement program to devote necessary staff to special matters such as quick strike cases and large, complex cases, including fraud and manipulation cases, without detracting from the Commission's strong enforcement presence throughout the industry.

The increase will also enhance the Commission's market surveillance program. Additional staff-years will be used to implement the Commission's new integrated market surveillance system and to maintain an effective surveillance program over the growing markets. A strong surveillance program is critical for the Commission to carry out its mission of detecting and deterring price manipulation and other major market abuses.

The requested increase will also provide the resources necessary to sustain our oversight over contract market practices and standards. The increase will provide the Commission with the resources necessary to address new product developments, new market linkages, new trading developments, and other innovations.

Overall, the increase in funding and staffing will strengthen the Commission and increase its ability to oversee the growing and vital futures and option markets that are critical to the Nation's economy.

As part of our commitment to maintaining strong futures and option markets, one of the Commission's top priorities in fiscal year 1997 and continuing into fiscal year 1998 has been to modernize and streamline its regulatory framework. The growth and change in our markets, as well as revolutionary technological developments, have necessitated a comprehensive review of the Commission's regulations. The Commission is seeking to eliminate undue regulatory burdens while continuing to provide an effective level of regulation and public protection.

Toward that end, the Commission has proposed or adopted a number of regulatory reform initiatives in the last year relating to exchange markets and commodity professionals, many of which are described in my written testimony.

An additional area of our regulatory reform efforts involves a review of our regulatory framework for over-the-counter derivatives instruments. It has been 5 years since the Commission exempted some types of OTC instruments entered into by sophisticated parties from provisions of the Commodity Exchange Act, other than prohibitions of fraud and manipulation.

Since that time, the OTC markets have grown dramatically both in size and in the diversity of the instruments offered. These developments have prompted the Commission to examine its approach to this market. The Commission plans to issue shortly a concept release which will invite comment on how best to achieve an appropriate balance between the need to ensure that U.S. entities have the opportunity to remain competitive in the global financial marketplace and the need to maintain adequate regulatory safeguards.

We look forward to the input of the industry, users of OTC derivative instruments, relevant regulatory authorities, and other interested persons, including members of this subcommittee, as we go

forward with our concept release and other regulatory reform initiatives.

We believe that the increase that the President has requested for fiscal year 1999 is essential for the Commission to fulfill its congressional mandate and to keep pace with growing complex and dynamic markets.

Thank you very much, and I will be pleased to respond to questions.

PREPARED STATEMENT

Senator COCHRAN. Thank you, Madam Chairperson. We appreciate your being here and the fact that you have always been very willing to discuss with the committee matters that relate to the Commission's budget and the activities of the Commission. We will insert your prepared statement in the hearing record.

[The statement follows:]

PREPARED STATEMENT OF BROOKSLEY BORN

Mr. Chairman and Members of the Subcommittee: I am pleased to appear before you this morning to discuss the President's fiscal year 1999 budget request for the Commodity Futures Trading Commission ("CFTC" or "Commission"). In my testimony today, I will provide the Subcommittee with an overview of the proposed budget for 1999, discuss the need for additional resources for the Commission's programs and update you on highlights of fiscal year 1997, including the Commission's efforts to streamline its rules and procedures and to relieve unnecessary regulatory burdens while maintaining important customer protections.

REQUEST FOR APPROPRIATIONS IN FISCAL YEAR 1999

The President's fiscal year 1999 budget request for the Commission is \$63.4 million. That sum represents an increase of \$5.3 million (or nine percent) over fiscal year 1998 appropriations. Approximately \$3.9 million of the increase is necessary for the Commission to maintain its current level of services and operations. The remaining \$1.4 million increase would support the addition of 20 full-time equivalent ("FTE") staff years, a three percent increase in staffing. The budget request would provide the Commission with the resources needed effectively to perform its legislative mandate under the Commodity Exchange Act ("CEA" or "Act").

OVERVIEW OF FUNDING LEVELS AND OPERATIONAL EFFECTS

The Commission has a statutory mandate to oversee the nation's futures and option markets, including on- and off-exchange transactions in futures and options. The Commission is responsible for ensuring the economic utility of these markets by guarding the integrity of the markets, protecting customers from fraud and other trading abuses, monitoring the markets to detect and to prevent price distortions and manipulation, and encouraging the competitiveness and efficiency of the nation's futures exchanges. Through effective oversight regulation, the CFTC enables the commodity futures markets better to serve their vital functions in the nation's economy, price discovery and hedging.

The Commission also oversees 64,000 commodity professionals who trade on the floor of the exchanges or represent customers. Our goal is to ensure that these firms and individuals meet standards of fitness, maintain financial integrity, use proper sales practices and provide adequate risk disclosures to their customers.

For well over a century, futures transactions have enabled producers, merchandisers and processors of agricultural commodities to protect against adverse price movements. In recent decades, market innovations have expanded to include contracts for other physical commodities such as metals and energy products. In addition, the derivatives industry has developed new on- and off-exchange futures and option products that have given financial institutions and others tools to protect against currency fluctuations, equity index variations, and interest rate changes. The proven utility of these on- and off-exchange derivative transactions has resulted in phenomenal growth in their trading volumes.

Examples of this growth and the great expansion of the Commission's oversight and regulatory responsibility include the following:

Increased exchange trading volume.—The CFTC supervises all trading of futures and option contracts on U.S. futures exchanges. The commodity futures and option markets have experienced dramatic growth. Exchange futures and option trading has increased by 100 percent in the last decade (from 275 million to 555 million contracts). In the last year alone the number of futures and option contracts traded on designated U.S. contract markets grew from 499 million in 1996 to nearly 555 million in 1997, an increase of more than 11 percent. The Commission's regulatory program has encouraged this healthy growth by assuring market participants around the world that our markets are safe, fair and transparent.

Growth of over-the-counter derivatives.—The CFTC exercises oversight of the rapidly growing and evolving over-the-counter market in derivative instruments. The CFTC works with other U.S. financial regulators and with the international regulatory community to address disclosure and market integrity issues in the global market. This enormous market, currently estimated to have a notional value well in excess of \$27 trillion world-wide, has emerged in the past decade.

Growing managed funds.—The CFTC regulates commodity pool operators ("CPO's") and commodity trading advisors ("CTA's"). Funds committed to professional management for futures trading have grown exponentially, from \$115 million in 1975 to over \$35 billion today, not counting hedge funds also registered as commodity pools. This area of financial investment includes a growing number of pension and mutual funds. The Commission has worked with industry groups and other regulators to improve and to simplify disclosure requirements which allow customers to make informed investment decisions.

Rapid innovation.—The CFTC approves all contracts traded on futures and option exchanges and all rules of such exchanges and the National Futures Association ("NFA"). Since 1986, the CFTC has approved over 450 new contracts for trading on exchanges. Many of these new, innovative contracts have brought new market users within CEA protection for the first time. The CFTC has worked closely with both the exchanges and industry representatives to assure that new contracts will create hedging opportunities and enhance price discovery and price basing of the underlying commodities.

Expanded Congressionally mandated responsibilities.—The CFTC's authority and responsibilities have grown substantially since the Commission was created in 1975. Congress passed the Futures Trading Practices Act of 1992 giving the CFTC a number of new responsibilities to ensure market integrity. Ongoing activities include enforcing the heightened audit trail standards for exchanges and improving the CFTC's own oversight and enforcement programs. In 1995 Congress reaffirmed these obligations by adopting a reauthorization of the Commission through fiscal year 2000.

Growing internationalization of the markets.—Financial and commodities markets are becoming increasingly global, further increasing the complexity of the CFTC's oversight responsibilities. The agency must respond promptly and effectively to international developments, such as the collapse of Barings Plc. and the issues surrounding Sumitomo Corporation's copper trading. The agency has ongoing responsibilities to ensure that its regulatory framework is capable of responding to the domestic implications of problems arising anywhere in the world. It has become a leader in encouraging international cooperation and improvement of regulation abroad.

Technology developments.—The exchanges, commodity professionals and users of the markets are turning to newly developed technology to cope with the huge growth in this industry. Likewise, the CFTC has had to augment its staff as well as its hardware and software to keep pace with the growth in the markets. Technology also poses regulatory challenges to the CFTC, including the need to police futures and option trading advice and sales offered illegally via the Internet.

CFTC RESOURCES

During the past four years, both the Administration and Congress have recognized the need for additional resources at the CFTC to maintain effective oversight over the growing and evolving futures and option markets. Accordingly, the CFTC has received increased appropriations to maintain current service levels from year-to-year, to provide additional resources to the Commission's Division of Enforcement and to permit investments in technology to increase the Commission's ability to conduct adequate market surveillance.

The proposed increase in funds for fiscal year 1999 is necessary to enable the Commission to keep pace with the rapid growth in volume and the profound changes resulting from novel transactions, new trading systems, new market practices, advances in technology, and the globalization of the markets. The additional

resources would be dedicated primarily to maintaining an effective enforcement, surveillance and oversight presence in these rapidly changing and growing markets. In addition, the Commission must remain responsive to technological developments, business changes, and market evolution so as not to burden innovation and financial market growth with regulatory inefficiencies and outmoded regulatory structures. The Commission began a comprehensive regulatory review and reform initiative in fiscal year 1997, which is ongoing in fiscal year 1998 and will continue into fiscal year 1999. Without the requested additional resources, the Commission would not be suitably equipped to carry out effective enforcement, market surveillance and regulatory reform.

Much of the requested increase will be dedicated to the Division of Enforcement, which will receive an allocation of ten additional FTE staff years. That allocation of resources would make the Division's employment level the strongest since fiscal year 1992. The addition of these staff years would in effect complete the reorganization of the Division, which began in 1995. The ten additional FTE's will be devoted to investigation and prosecution of matters involving fraud, quick-strike cases, and large, complex cases, including manipulation cases. The Division's new flexible organizational structure will allow the Enforcement program to devote necessary staff to respond appropriately without detracting from a strong enforcement presence across the industry.

The Commission's fiscal year 1999 budget request would also add five FTE staff years to further the Commission's market surveillance efforts. These FTE's are necessary to continue the effort started in 1997 to implement new software for the integrated market surveillance system and to maintain an effective surveillance program for a dynamic industry. One of the major enhancements of the system is the ability to obtain and analyze daily large trader option data. (Previously large trader option data was obtained on a weekly basis.) The system also has the benefit of reducing the overall reporting burden of certain commodity professionals, who will report large trader data only to the CFTC rather than to multiple exchanges. Full implementation of the new system, together with the Commission's current surveillance system, will enhance the Commission's ability to detect and deter price manipulation or other major market abuses.

The final five additional FTE staff years will be allocated to the Division of Trading and Markets. The Division of Trading and Markets has taken the lead in developing many of the regulatory reform initiatives that have been undertaken or are being considered by the Commission. A number of those initiatives are discussed in the Commission's highlights of fiscal year 1997 described below. Additional resources are needed to develop innovative regulatory approaches to address new product developments, market linkages, and trading mechanisms and to assure that clearing organizations, firms holding customer funds, and other commodity professionals operate safely and consistently with the public interest. The resources will also enhance Commission oversight of contract market standards and practices.

The requested increase in funding and staffing will strengthen the Commission and will increase its ability to oversee the growing and vital futures and option markets that are critical to our nation's economy.

HIGHLIGHTS OF FISCAL YEAR 1997

REGULATORY STREAMLINING

One of the Commission's top priorities in fiscal year 1997 and continuing into fiscal year 1998 has been to modernize and to streamline its regulatory framework. Much of the Commission's regulatory regime dates back to its early years as an agency. The explosive growth and change in our markets as well as revolutionary technological developments have necessitated a comprehensive review of the Commission's regulations. The Commission must ensure that its rules have adapted to changes in the marketplace and continue to provide an effective level of regulation and public protection. Toward that end, the Commission has proposed or adopted a number of regulatory reform initiatives in the last year, some of which I would like to highlight here today.

Fast-Track Review for Contract Designations and Rule Changes

In fiscal year 1997, the Commission implemented new "fast-track" procedures for processing certain contract designation applications and exchange rule changes. These procedures significantly streamlined the review process for most new exchange contracts and many exchange rules, permitting approval within ten days for many types of contracts and 45 days for certain other contracts.

Prior to the adoption of fast-track procedures, the Commission had already reduced its average contract approval time to about 90 days. During the seven months

of fiscal year 1997 that the fast-track rules were in place, 15 new contract designations were filed with the Commission, seven of which were eligible for fast-track treatment. The Commission approved all eligible contracts within the fast-track period. Even contracts not subject to the fast track procedures—such as stock index futures contracts, which must be submitted to the Securities and Exchange Commission (“SEC”) for comment—were approved in record time. For example, during fiscal year 1997, the Commission approved the Chicago Mercantile Exchange’s (“CME”) E-Mini S&P 500 contract and the Chicago Board of Trade’s (“CBOT”) Dow Jones Industrial Average contract within days of receiving the statutorily required SEC comment letters.

Reporting and Disclosure Requirements

The Commission also streamlined many of its reporting and disclosure requirements. The agency amended its reporting requirements to permit filing by large traders of CFTC Form 40, Statement of Reporting Trader, only when requested by the Commission rather than annually. In an important development for CFTC registrants who are also SEC registrants, the Commission adopted rule amendments to harmonize certain financial reporting requirements with the requirements of the SEC. The Commission also approved in principle two-part risk disclosure documents for commodity pool offerings, which potentially would highlight the core information required to be provided to customers.

In early September 1997, the Commission proposed amendments to its rules reducing the risk disclosure obligations of futures commission merchants (“FCM’s”) and introducing brokers (“IB’s”) as to financially sophisticated customers. The Commission approved the rules on February 20, 1998, and expects the rule amendments to speed the account opening process for the customers identified in the rule. The rule provides flexibility to FCM’s and IB’s to design their own disclosure of risk by eliminating certain mandatory risk disclosure information and procedures. This proposal responded directly to industry calls to permit different regulatory treatment of sophisticated customers where appropriate.

Electronic Media

The Commission has adopted a number of initiatives designed to take advantage of the increased efficiencies and reduced costs made possible through the use of electronic media. In June 1997, the Commission paved the way for FCM’s to use electronic media to communicate with their customers. The Commission’s Advisory permits FCM’s to deliver confirmations and account statements solely by electronic media to customers who consent to electronic transmission in lieu of receiving paper documents. Also in June, the Commission authorized CTA’s and CPO’s to provide risk disclosure documents to their customers via electronic media. The Commission’s interpretation enables CPO’s and CTA’s to provide customers with a risk disclosure summary and a hyperlink connection to the entire risk disclosure document.

The Commission also adopted measures to permit the electronic filing of documents with the Commission. In April 1997, the Commission adopted a rule allowing CTA’s and CPO’s to file their required disclosure documents with the Commission electronically. The Commission has also undertaken a program to permit FCM’s to file required financial reports with the Commission electronically. These electronic media initiatives should increase the timeliness of information flow, reduce the administrative costs of commodity professionals and allow members of the industry and their customers to reap the benefits of technological advances.

Streamlined Requirements for Commodity Professionals

The Commission’s streamlining efforts have brought significant benefits to FCM’s, CTA’s and their customers. For example, in June 1997, the Commission approved an interpretation permitting streamlined procedures for allocation of customer orders which are bunched for execution by CTA’s. The Commission provided relief to FCM’s with respect to the capital treatment of short option positions to permit more FCM’s to carry such positions for customers and to facilitate efficient use of capital without creating undue financial risk.

Delegations to the National Futures Association

To improve the efficient use of Commission resources, the Commission has focused on whether it could delegate additional functions to the NFA. The NFA is a self-regulatory organization of commodity professionals designated by the Commission under the CEA to perform certain regulatory functions. During the past year, the Commission delegated additional authority to NFA in several areas including registration decisions relating to floor brokers and floor traders with disciplinary histories, various registration and processing functions relating to non-U.S. firms, and the review of disclosure documents required to be filed by CPO’s and CTA’s.

ENFORCEMENT

During fiscal year 1997, the Commission focused enforcement efforts on matters involving allegations of fraud in a variety of contexts. For example, the Division of Enforcement pursued cases against commodity professionals which failed to register with the Commission, as required, and which violated the anti-fraud provisions of the Commodity Exchange Act. The Division filed cases alleging fraud in the offer and sale of various off-exchange instruments, including precious metals contracts and foreign currency contracts marketed to the general public. The Division also pursued cases against firms and individuals using fraudulent advertising and solicitations.

In fiscal year 1997, the Division of Enforcement also investigated allegations related to certain hedge-to-arrive contracts involving grain elevators. As a result, in fiscal year 1997 the Commission filed three separate administrative complaints alleging violations of various provisions of the CEA and Commission regulations in connection with certain of these hedge-to-arrive contracts. The Commission filed an additional complaint in fiscal year 1998. The Division of Enforcement continues to investigate other individuals and entities in connection with hedge-to-arrive contracts.

CONTRACT DESIGNATIONS

In fiscal year 1997, the Commission reviewed and approved 51 applications for new futures and option contracts. Several of these contracts reflect innovative approaches designed to meet specialized hedging needs. For example, the Commission approved contracts based on inflation-indexed debt instruments issued by the U.S. Treasury, including the CBOT inflation-indexed Treasury bond, long-term Treasury note, and medium-term Treasury note futures and option contracts. These contracts, the first based on inflation-indexed debt securities, were designed specifically to deal with the unique hedging needs of institutions exposed to risk arising from holding the inflation-indexed instruments recently issued by the U.S. Treasury.

INTERNATIONAL REGULATORY COOPERATION

The CFTC, along with British and Japanese authorities, co-sponsored an international regulators conference on physical delivery markets in London in November 1996. Regulators from 17 countries issued a Communiqué agreeing on certain basic principles of regulation of such markets. The participants also agreed on a year-long work program for the development of international "best practices" standards on contract design, market surveillance, and information sharing. Such best practices standards were agreed upon at a meeting of international regulators on October 31, 1997, in Tokyo. To date 17 regulators from 16 countries have subscribed to the standards. International best practices standards help to protect the U.S. markets from the impact of events on foreign markets due to poor market regulation abroad. They also assist in leveling the international regulatory playing field for markets and commodity professionals.

ESTABLISHMENT OF OFFICE OF INTERNATIONAL AFFAIRS

In late July 1997, the Commission created, within the Office of the Chairperson, an Office of International Affairs to enable the Commission to continue its leading role in international regulatory initiatives and to keep abreast of global changes. Over the past several years, there has been enormous growth in the international marketplace. New exchanges have been established around the world, foreign trading volume has grown, new regulatory bodies have been created abroad, and the need for cooperation and understanding among international regulators and exchanges has become paramount. The Office of International Affairs will enhance the Commission's ability: (1) to respond quickly to market crises that have global systemic implications; (2) to remain an effective supervisor in a global marketplace where no one regulator has all the information or resources to regulate its markets or its firms; and (3) to eliminate unnecessary impediments to global business while preserving core protections for markets and customers. The Office of International Affairs will play a key role in an evolving process toward international harmonization of regulations which ensure market innovation and access while maintaining needed customer and market protections.

AGRICULTURAL TRADE OPTIONS

Agricultural options—both on- and off-exchange—were traded in the United States at least from the time of the Civil War until the 1930's. However, concerns about fraudulent sales practices, failure to perform over-the-counter obligations, and

the use of exchange-traded options to manipulate the prices of agricultural commodities prompted numerous industry and government efforts to limit or eliminate trading in agricultural options. In 1936, Congress banned all sales of options on certain agricultural commodities listed in the CEA. In 1982, Congress lifted the 1936 statutory ban, allowing the Commission to permit options on certain agricultural commodities listed in the Act. The Commission permitted exchange trading in these agricultural options in 1984. However, the regulatory ban on off-exchange agricultural options remains.

In May 1997, the Commission's Division of Economic Analysis issued a White Paper on this issue. The paper analyzed: (1) the current regulatory environment; (2) recent developments in agriculture that have expanded the need for risk-shifting strategies; (3) the benefits and risks of agricultural trade options; and (4) possible ways to strike a balance between the benefits and the risks. The staff analysis identified, for the consideration of the Commission, risks and benefits of lifting the ban. The Commission sought public comment on the issue through a Federal Register notice and by holding meetings in Bloomington, Illinois and Memphis, Tennessee.

The Commission published a proposal in the November 4, 1997 Federal Register to establish a three-year pilot program that would lift the ban on certain agricultural trade options subject to regulatory protections. Under the rules as proposed, entities which handle the agricultural commodity in normal cash market channels would be able to offer to buy or sell options on that commodity with other commercial counterparties for business-related uses. These options would require physical delivery of the commodity if exercised and could not be repurchased, resold or otherwise canceled prior to the expiration or exercise of the option. Entities offering to buy or sell the options would be required to become registered as agricultural trade option merchants, to report to the Commission on their transactions, to provide their customers with disclosure statements and to safeguard their customers' premiums. As a condition of registration, such entities would be required to meet a financial requirement, successfully complete a proficiency exam and periodically attend ethics training. The Commission also proposed to exempt from the prohibition and the other proposed rules described above individuals or entities which have a net worth in excess of \$10 million. Finally, the Commission proposed to remove the prohibition on the offer and sale of agricultural options for physicals on designated exchanges. The Commission is currently considering all comments received on its proposal and expects to conclude its consideration of the matter soon.

DELIVERY SPECIFICATIONS FOR CHICAGO BOARD OF TRADE FUTURES CONTRACTS

In December 1996, the Commission voted unanimously to notify the CBOT under section 5a(a)(10) of the CEA that the delivery terms of the CBOT corn and soybean futures contracts no longer accomplish the statutory objectives of "permit[ting] the delivery of any commodity . . . at such point or points and at such quality and locational price differentials as will tend to prevent or diminish price manipulation, market congestion, or the abnormal movement of such commodity in interstate commerce." That decision was based on a substantial reduction of the delivery capacity in Chicago under the CBOT contracts.

The Commission's notification gave the CBOT until March 4, 1997, to submit proposed amendments to its corn and soybean contracts to achieve the statutory objectives. On April 15, 1997, the CBOT approved proposed contract changes. Nearly 700 comments were received by the Commission relating to the CBOT's proposed delivery amendments, many expressing objections. On September 15, 1997, the Commission published a proposed order to change and to supplement the CBOT's proposed amendments for the corn and soybean futures contracts. After providing the CBOT an opportunity to be heard, the Commission issued its final order on November 7, 1997.

Since issuance of the final order, the CBOT has submitted new terms for its corn and soybean futures contracts for the Commission to consider. The CBOT's board of directors, on February 10, 1998, approved additional revisions to its current proposal. The CBOT's full membership approved the additional revisions on March 19, 1998. The revised proposal has since been submitted to the Commission and is currently under review.

AUDIT TRAIL AND DUAL TRADING

Accurate audit trails have been an aim of the Commission since its inception. In the past year, the Commission reviewed compliance with statutory and regulatory requirements regarding audit trails and dual trading in order to assure that trade monitoring systems are in place which, to the extent practicable, enable effective detection, deterrence, and prosecution of trading abuses, as required.

During 1997 the Commission took action on all pending exchange petitions for exemption from the statutory dual trading ban provisions of the CEA, except for the New York Mercantile Exchange's ("NYMEX") petition. (NYMEX asked for a delay in Commission action in light of its recent relocation to new facilities with new audit trail systems.) The Commission issued unconditional dual trading exemptions to the Commodity Exchange, Inc. ("COMEX"), the Coffee, Sugar & Cocoa Exchange ("CSCE") and the New York Cotton Exchange ("NYCE"), each of which demonstrated that it met the statutory requirements.

On November 7, 1997, the Commission issued separate proposed orders granting the CME and the CBOT conditional dual trading exemptions in 7 and 13 affected contract markets, respectively. In addition, the Commission granted the CME an unconditional dual trading exemption for its S&P 500 futures contract market. The Commission's proposals to grant conditional exemptions for the other affected contract markets were based on the Commission's finding that the exchanges' trade monitoring systems for these markets did not meet all the requirements of the Act and Commission regulations. Specifically, neither exchange was able to demonstrate that 90 percent or more of its imputed trade times are reliable, precise, and verifiable as demonstrated by being imputed within a timing window of two minutes or less. Both the CME and the CBOT were provided opportunities to present written and oral comments to the Commission, and each has done so. The Commission expects to issue final orders for both exchanges shortly.

USE OF THE INTERNET

The Commission has taken several steps designed to make information and assistance more available to the general public. In addition to its Internet monitoring and surveillance program, commenced in fiscal year 1996, the Commission has used its home page on the World Wide Web as a means of providing the public with brief summaries of the types of abuses commonly investigated and prosecuted by the CFTC. The Commission's website also provides descriptions of recently filed cases and encourages the public to report suspected abuses by providing an electronic questionnaire that can be filled out by visitors to the website. The website also includes information about individuals and firms who are the subjects of pending enforcement actions or who have been found liable for violating federal commodities laws in an administrative or a civil action previously brought by the Commission. Similarly, the website includes the names of individuals and firms with sanctions in effect. Finally, the website provides individuals with the Commission's entire reparations complaint package.

AUTOMATION OF ADMINISTRATIVE FUNCTIONS

During fiscal year 1997, the Office of Proceedings implemented a new case tracking system. The new system tracks the progress of each case from receipt through disposition in the Office of Proceedings, appeal to the Commission and appeal to Federal court. This system not only assists case management within the agency, but allows the Office of Proceedings to provide better information on the status of cases in response to public inquiries.

The Commission took additional steps during fiscal year 1997 to make more extensive use of automation to streamline financial and fiscal processing. For example, the Commission now has the capability to transmit electronic disbursement requests to the Philadelphia Finance Center, thereby eliminating the need for magnetic tape generation and costs associated with overnight delivery. In addition, the Commission can now make disbursements directly to financial institutions for vendors and employees and has implemented an electronic travel manager system that reduces paperwork and increases productivity.

COMMISSION YEAR 2000 COMPUTER COMPLIANCE INITIATIVES

The Commission has been engaged in conducting analyses and taking corrective actions related to the so-called Year 2000 problem since 1993. The Commission's internal systems needed to be Year 2000 compliant at that time in order to process futures and option contracts with expiration and delivery dates in the year 2000. The Commission implemented modifications to our mission-critical mainframe systems to accomplish correct turn-of-the-century processing. At that same time the Commission adopted a policy that all new systems developed would be Year 2000 compliant.

In response to OMB Bulletin 96-02, our other mainframe systems are also being reengineered and converted to Year 2000 compliant client/server-based systems. That work is scheduled to be completed by September 1999. During the next 24

months, we will be reviewing, correcting and testing equipment and software so as to ensure the Commission's compliance.

The Commission is also working with the regulated industry and other regulators on Year 2000 compliance matters. Last year, the Commission contacted each of the futures exchanges about its responsibilities as a self-regulatory organization ("SRO") to ensure internal compliance, as well as the compliance of its member firms. More recently the Commission has requested that SRO's produce additional materials that will demonstrate such compliance. In addition, the Commission has sent a questionnaire to FCM's asking them to report material facts on their compliance plans.

Finally, the Commission is working with other regulators, the Futures Industry Association and the Securities Industry Association to develop stress testing for computer systems in advance of the year 2000. This cooperative effort should help determine domestic and global preparedness of the financial markets.

PENDING LEGISLATION

Last year I expressed the Commission's concerns with legislation pending before the Senate and House Agriculture Committees (S. 257 and H.R. 467, respectively) to amend the CEA. In the Commission's view the bills, if adopted, would result in pervasive deregulation of our futures and option markets, posing dangers to the public interest. While both bills remain pending before the Senate Committee on Agriculture, Nutrition, and Forestry and the House Committee on Agriculture, we understand that no action is currently scheduled. The Commission has addressed many of the issues raised in the bills and, as illustrated above, has adopted regulatory reform measures to meet many of the concerns underlying the bills.

The Commission has reconstituted its Financial Products Advisory Committee ("FPAC") to serve as a forum for industry members to discuss the Commission's regulatory reform proposals. The Commission welcomes any regulatory reform suggestions from the industry, market participants, members of Congress and other interested persons.

Separately, the CFTC has been monitoring the progress of the Financial Services Act of 1997 (H.R. 10). The Commission's review of the proposed legislation has revealed that it could create conflicts with the CEA, and the Commission has recommended that the bill should include a general savings clause making clear that the legislation is not intended to affect the provisions of the CEA or the jurisdiction of the CFTC.

CONCLUSION

The Commission appreciates this opportunity to report to the Subcommittee on its accomplishments of the past year and to reiterate its commitment to fulfilling its statutory mandate to oversee the United States' vibrant futures and option markets. As we look ahead to fiscal year 1999, the Commission seeks additional appropriations to complete its restructuring of the Division of Enforcement, to improve its market surveillance abilities, and to respond to the changes in the markets with adoption of regulatory reform initiatives. We look forward to working with Congress on these matters, and I would be happy to respond to any questions you may have. Thank you.

BIOGRAPHICAL SKETCHES

BROOKSLEY BORN

Brooksley Born was sworn in as Chairperson by Acting Chairman John E. Tull on August 26, 1996. Ms. Born was nominated by President Clinton on May 3, 1996, and confirmed by the Senate on August 2, 1996, for a term expiring in April, 1999.

Ms. Born practiced law at the Washington, D.C., firm of Arnold & Porter from 1965 until her appointment to the CFTC. As a partner in the firm, Ms. Born specialized in representing institutional and corporate clients in complex litigation, primarily in the federal courts, and in futures regulation matters.

Ms. Born is an active member of the District of Columbia Bar and the American Bar Association (ABA), having served on the Boards of Governors of both organizations. She currently serves on the Boards of the American Bar Foundation and the National Women's Law Center.

Ms. Born was in 1972-1973 an Adjunct Professor of Law at Georgetown University of Law Center and a Lecturer at Law at Columbus School of Law, Catholic University of America, in 1972-1974.

A native of San Francisco, California, Ms. Born received her A.B. degree from Stanford University in 1961 and her Juris Doctor degree from Stanford Law School in 1964, where she graduated first in her class and was President of the Stanford Law Review. She is a member of Order of the Coif. She has also been honored by the National Association of Public Interest Law, the National Legal Aid and Defender Association, and the National Women's Law Center. She received the Woman Lawyer of the Year Award from the Women's Bar Association of the District of Columbia in 1981.

MADGE A. BOLINGER

Madge A. Bolinger has served as the Director of the Office of Financial Management since 1987.

A native of Massachusetts, Ms. Bolinger began her Federal career with the Commodity Futures Trading Commission in 1976 following receipt of a Bachelor of Science degree from Miami University. Prior to her appointment as the Director, Ms. Bolinger held positions in budget and program analysis and automated data processing.

IMPACT OF TOKYO COMMUNIQUE

Senator COCHRAN. Madam Chairperson, we notice that in your statement, you referred to an international set of standards that were discussed and were the subject of a communique—the Tokyo Communique I think it is called—relating to the 16 countries that met to consider uniform standards in this regulatory area of responsibility.

What, if any, budget impact is there on the Commodity Futures Trading Commission that would flow from these standards?

Ms. BORN. I do not think that there is any budget impact from the standards, Mr. Chairman. The standards that were adopted as best practices standards by the world's regulators of leading commodity markets are already complied with by the Commission and consistent with the Commodity Exchange Act. Indeed, many of the principles in the Commodity Exchange Act have been incorporated into those guidances and are now adhered to by the other 17 countries.

LOSING BUSINESS TO OVERSEAS EXCHANGES

Senator COCHRAN. One of the problems that was brought to my attention within the last year was the concern by some of the exchanges here in the United States that we were losing business to overseas exchanges. Has that been reversed or does that continue to be a problem, or is it a problem that is serious and should have the attention of the Congress?

Ms. BORN. In fiscal year 1997, there was no further erosion of the U.S. portion of world trading in these instruments. In fact, the U.S. exchanges contract volume increased by 11 percent during fiscal year 1997, and that was approximately the level of growth abroad as well.

Senator COCHRAN. You mentioned that most of the new money that would be appropriated under this request would go to enforcement, not all, but a substantial amount in terms of the FTE's and total dollar allocation.

Is there a major problem of any kind that you are investigating now or do you foresee the need for any special enforcement activity? You mentioned market manipulation as a possible area that

could receive additional attention. Is that the only area that troubles you?

Ms. BORN. No; fraud is a pervasive problem in our jurisdiction as well. We just issued yesterday a consumer warning about prevalent fraudulent schemes relating to foreign currency markets which are being advertised over radio and through the Internet and by telemarketing which are targeting retirees and various immigrant populations, encouraging them to invest their savings in the foreign currency markets. Of course, the money disappears rapidly.

Senator COCHRAN. Do you have jurisdiction similar to the Federal Trade Commission or other Federal agencies where you can bring your resources to bear on practices like that, even though these may not be exchanges? We normally think of the Commodity Futures Trading Commission as dealing with futures traders operating out of Chicago or New York or some of the other major cities. What is the opportunity that you have or the power that you have to reach out and do something about things like that?

Ms. BORN. Well, the statute requires that futures and option contracts generally are traded on exchanges. So, we can bring enforcement actions against what we call bucket shops, that is, confidence artists who are selling off-exchange futures or option contracts illegally. We can bring actions against them on two grounds. One is fraud and the other is the fact that they are trading off exchange. There are some limitations to our over-the-counter jurisdiction, but we certainly can go against bucket shops.

Senator COCHRAN. Do you find yourself cooperating with the Department of Justice or other Federal agencies in this effort?

Ms. BORN. Very much so. We often cooperate with the Department of Justice and the U.S. Attorney's offices in the areas where we are investigating bucket shops or Ponsi schemes and proceed in cooperation with them, they bringing criminal actions which we cannot bring, and we bringing civil actions which we do have power to bring. In addition, we cooperate with State securities commissioners, with the SEC, with the banking regulators, and others as appropriate.

OVER-THE-COUNTER DERIVATIVES MARKET

Senator COCHRAN. One other over-the-counter activity that we have had brought to our attention is the possible conflict with the Securities and Exchange Commission regulations for dealers that are active in the over-the-counter derivatives market. What can you tell us about that and the plan that the CFTC has, if any, to deal with this conflict?

Ms. BORN. Well, the SEC published proposed rules at the end of the year that would regulate certain over-the-counter derivatives dealers. Based on a GAO report in 1997, the SEC has jurisdiction over approximately 1.4 percent of the instruments that are traded in the over-the-counter derivatives markets—that is, options on securities and options on securities indexes. We have jurisdiction over other instruments.

We were quite concerned with the SEC's proposal because it would extend over instruments that are within our jurisdiction and it would indeed make certain over-the-counter instruments permis-

sible for over-the-counter derivatives dealers to trade in that we have forbidden under our statute and regulations.

We did put in a comment letter to the SEC pointing out these problems and urging the need for regulatory cooperation and coordination on this matter, suggesting that each agency should act within its own jurisdiction but try to coordinate our actions.

We also at the same time announced that we are planning to release a concept release on our over-the-counter derivatives regulations. The last time we acted as a Commission in this area was in 1993 when we adopted a certain reduced regulatory regime for specified over-the-counter derivatives instruments, and we plan within the next month to issue a concept release reaching out to the market, the over-the-counter derivatives dealers, and the end users of those derivatives to ask them whether our regulations adopted 5 years ago still are appropriate for a market that has grown tremendously during that period.

NEW SYSTEM FOR MARKET SURVEILLANCE

Senator COCHRAN. One of the other areas you say you need additional funds or you plan to use the additional funds in the budget request is for market surveillance, and you talk about a software system that will require some additional FTE's to put in place and to implement. This is a new system, as I understand it.

Could you tell us a little more about what that is for and why the new system is needed?

Ms. BORN. Certainly. This was a system for which all the funds were obligated in 1996 and which is an ongoing project that will be completed in fiscal year 2000. It was designed to upgrade our market surveillance by permitting the Commission to receive not only daily reports from futures commission merchants on large futures positions of the accounts they carry, but also large options positions, so that the computer system will then be able to analyze the overall position of large traders in our markets. This is part of a very significant program in the Commission to detect market manipulation in its incipency and to try to move in quickly to deter any further price distortion or problems coming from attempted price manipulation.

Senator COCHRAN. When we mention the word "computer," I think about the fact that some agencies are doing better than others in getting ready for the year 2000 and the implications for the computer systems.

Are you spending any amount of this year's funds to prepare for that, and if not, why not?

Ms. BORN. We are indeed. Our agency identified the year 2000 problem in 1993, earlier than some agencies because we had to think about futures contracts out into the future, and realized that soon we would be faced with futures contracts expiring in the year 2000. So, we took immediate steps to get our market surveillance and contract market systems compliant with the year 2000 or to adopt plans to get them compliant. We propose to have all our systems compliant by June 1999.

We are also working very closely with the exchanges and the National Futures Association and the Futures Industry Association to

make sure that both the exchanges and the 64,000 commodity professionals are year 2000 compliant by the year 2000.

COST OF PREPARING FOR YEAR 2000 TRANSITION

Senator COCHRAN. What do you estimate—or can you estimate—the total cost of preparing for the year 2000 transition? Is there any way to do that?

Ms. BORN. For our markets and our traders, I think it will be many billions of dollars. I do not have an estimate.

Senator COCHRAN. What about the agency itself? Is there a way to identify the costs that have been sustained or that will be between now and 2000?

Ms. BORN. We could certainly attempt that. Some of the costs may be difficult to determine as they go back to 1993. In addition, some of the costs are included in the overall costs associated with our compliance with OMB's mandate to move from a mainframe computer to a client server system which has been a more or less simultaneous effort. So, it may be a little hard to pare out of the overall reorganization that part that relates just to the year 2000 computer compliance issue, but we could make an attempt.

STREAMLINING OPERATION OF THE AGENCY

Senator COCHRAN. I know that you have been trying to streamline and make more efficient the operation of the agency, and you have talked about that in your statement.

One of the things that you have done is to delegate some additional functions to the National Futures Association. I know that has been a subject of some interest for several years now. Would you judge that to have been a successful effort? Have these steps enabled the Commission to still maintain its regulatory supervision but at the same time maybe achieve some savings in the operation of the Commission?

Ms. BORN. Yes, indeed; I think it has been a great success. The NFA does a wonderful job in the functions that we have delegated to it. What we have tended over the years—and this is also true in the last year—to delegate to the NFA are those tasks under our jurisdiction which involve very staff-intensive efforts like registration of the 64,000 commodity professionals, reviewing all the disclosure documents that those professionals are required to prepare whenever there is any significant change in their operations.

By delegating those very staff-intensive activities, I think we have been able to keep our staff at a relatively small size. If we get the increase we are requesting now, we will be only at the level we were in 1992, and that, despite enormous increases in the markets we are overseeing and the number of people we are overseeing as well.

FRAUD OR ABUSE IN OFF-FLOOR TRANSACTIONS

Senator COCHRAN. I understand the Commission is considering a proposal to permit noncompetitive, off-floor transactions, that is, allowing exchanges to adopt rules for sophisticated market participants to privately negotiate the terms of large transactions and then report the transactions to the exchange.

Do you think there are systems in place to protect the exchanges and customers against fraud or abuse in these transactions?

Ms. BORN. We actually do not have any proposed rules out. What we put out, a couple of months ago, was a concept release, reaching out to the exchanges, to commodity professionals, and to big traders, asking whether they would see a benefit to our changing our rules to allow exchanges to permit this kind of activity, and if so, what kinds of protections would be necessary. The comment period is still open. I think we put it out originally for 60 days, but have gotten a request to keep it open another 30 days.

So, I cannot answer that question yet, Mr. Chairman.

Senator COCHRAN. The jury is still out.

Ms. BORN. Indeed.

Senator COCHRAN. Well, I appreciate so much your testimony this morning. It has been very helpful to our understanding the budget request and what the funds will be used for if we are able to approve them, and I hope we can. I know the work of the Commission is very important. The integrity of the exchanges is important, and the process can be very helpful to agriculture producers and consumers and our Nation's economy as well, all tied to the successful operation of this important agency.

SUBMITTED QUESTIONS

We think you have done an excellent job as chair of the agency and we commend you for that. Thank you very much for your cooperation and you are dismissed. We will submit additional questions to be answered for the record.

We will suspend the hearing temporarily while I go over and vote on this amendment to our budget resolution, and I will be back soon.

[A brief recess was taken.]

[The following questions were not asked at the hearing, but were submitted to the agency for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

REGULATORY STREAMLINING

Question. One of the efforts undertaken by the Commission was the expedited review of new contracts and exchange rule changes. How has this "fast-track" procedure for processing contract market designation applications and exchange rule amendments been received by the futures exchanges and employees of CFTC responsible for implementing the procedure?

Answer. Since its implementation, the vast majority of new contract proposals were filed, and ultimately approved, under the fast-track procedures. Since fast-track went into effect, 45 new contracts have been approved, of which 37 were deemed approved under the fast-track procedures. The seven non-fast-track approvals included five equity index contracts which were not eligible for fast-track, two currency contracts which the exchange removed from fast-track procedures, and one contract which was approved under regular procedures before the end of the fast-track period. Two of the equity index contracts were approved in 52 days, and the other two were approved in 77 days. The currency contracts were approved in 70 days. In that same period, over 100 rule changes have been submitted, of which about half were submitted under the fast-track procedures. Many of the submissions, although eligible for fast-track treatment, were made under the regular procedures of regulation 1.41(b) at the discretion of the submitting exchange. Rule changes approved to date that were submitted under fast-track were either deemed approved in 45 days, as provided by the fast-track procedures, or they were approved sooner by the Commission under its regular review procedures.

Question. What problems, if any, has reducing the approval time for new contracts and rule changes to anywhere from 10 to 45 days presented to the futures exchanges and the Commission?

Answer. The Commission's staff is reviewing the fast-track procedures to determine if any modifications are warranted. In general, the fast-track provisions appear to be working well both for the futures exchanges and the Commission. Accordingly, we would expect that any modifications would be nonsubstantive and would be designed to address primarily technical problems with the procedures.

Question. What are the eligibility requirements for fast-track treatment of a new contract or rule change?

Answer. Filings under fast-track are at the discretion of the exchange. New contract applications eligible for 10-day fast-track procedures include: (1) futures contracts using cash settlement rather than physical delivery, based on any commodity except those covered under the CFTC/SEC Accord, such as stock index and corporate bond contracts and certain enumerated agricultural commodities; (2) physical delivery futures contracts on major currencies; and (3) options on futures. New contract applications eligible for 45-day fast-track include physical delivery and cash-settled futures and option contracts based on any commodity except those covered under the CFTC/SEC Accord. Under the fast-track procedures, an exchange may list a contract for trading on the "effective date," which is the day following the end of the 10- or 45-day period, unless the date is extended or fast-track review is ended. Under fast-track, the initial 10- or 45-day effective date may be extended once for an additional 30 days. For applications not meeting fast-track requirements, or if requested by the exchange, fast-track review is ended and the regular review procedures for new contract applications apply.

Question. How, if at all, has this "fast-track" procedure improved the ability of the futures exchanges and the Commission to conduct their business?

Answer. The fast-track procedures were designed to address concerns expressed by US futures exchanges about Commission contract approval time rather than to improve the Commission's conduct of its business. The exchanges had indicated that faster contract approval times would enhance their global competitiveness by enabling them to bring innovative products to market more quickly. The fast-track procedures, therefore, should foster the domestic exchange's competitiveness.

The fast-track procedures also should provide the exchanges with more certainty about the likely approval date of contracts awaiting Commission approval. With more precise information about possible approval dates, the exchanges can better make necessary arrangements to launch the new products, such as education and marketing efforts, computer programming, as well as possible redesign of the trading floor.

Question. CFTC has adopted several initiatives to encourage the use of electronic communication of information, such as filing required disclosure documents and required financial reports with the Commission electronically, and delivering monthly statements, trade confirmations, and risk disclosure documents to consenting customers electronically. How have these efforts served to streamline regulation?

Answer. The Commission, like most federal regulators, developed many of its regulations at a time when almost all formal communication took place in a written, hard copy form. In recent years, however, technological advances that foster faster, more efficient communication have transformed business practices. Both Commission registrants and their customers have discovered the advantages of electronic communication for day-to-day business transactions. As a result, the Commission initiated a process of analyzing its regulations for unnecessary limitations on electronic communication. Where adequate measures exist to safeguard its regulatory interests, the Commission has increased the communication options available to registrants and their customers by permitting them to use electronic communication in fulfilling regulatory obligations. By moving toward a regulatory framework that is more technologically neutral, these initiatives permit registrants to respond more quickly to ongoing advances in communication technology.

Question. How many commodity trading advisors, commodity pool operators, futures commission merchants and customers have participated in these programs so far?

Answer. Two general types of communication are affected by the Commission's electronic communication initiatives: communication between registrants and their customers and communication between registrants and the Commission. The initiatives affecting the first category have been in place for less than a year, and the Commission does not have substantial data on either the number of registrants who have developed programs to communicate eligible documents to customers electronically or the number of customers who have agreed to accept electronic communications in lieu of hard copy disclosure.

The initiatives affecting communications between registrants and the Commission have been in effect for a little more than a year. During this period, approximately 18 commodity pool operators or CPO's, and 86 commodity trading advisors, or CTA's, have electronically submitted disclosure documents for Commission review. In addition, Commission staff have been communicating their comments on these draft disclosure documents electronically to the CTA's and CPO's. As a result, the overall efficiency of the review process has been materially enhanced.

As of March 31, 1998, there were 225 firms registered as futures commission merchants, or FCM's, and seven were filing financial reports electronically with the Commission as part of a testing phase. The Commission anticipates that, by the end of April 1998, approximately 54 FCM's will be filing their financial reports electronically, and more will be added during the remainder of 1998.

Question. Do you anticipate that all reporting will be done electronically within the next fiscal year?

Answer. No. The Commission's current policy is that the use of electronic communication should be voluntary, not mandatory. In the short term, it is unlikely that all eligible registrants and their customers will elect to use the electronic communication option.

In an effort to minimize development costs incidental to the Commission's initiative for electronic filing of financial reports by FCM's and introducing brokers, or IB's, the Commission is collaborating with two futures exchanges that have already developed an electronic filing system for their members. The Chicago Mercantile Exchange, or CME, and the Chicago Board of Trade, or CBT, jointly developed a software program called WinJammer that permits electronic filing of financial reports with the exchanges. The Commission is also using the WinJammer software for its electronic filing system. The National Futures Association, or NFA, an industry-wide self-regulatory organization supervised by the Commission, maintains an independent electronic filing system. Commission staff are working with NFA to adapt the data structure of its system to be compatible with the data structure of the system used by the Commission. Eventually, the Commission intends to have a single regulatory database that combines data from all FCM's into a single database for regulatory purposes.

Almost 60 percent of the FCM's who are members of CME and CBT will be capable of filing financial reports with the Commission electronically by the end of April. In the near term, the Commission plans to focus on bringing the remaining CBT and CME firms on line while working with NFA to extend the electronic filing system to registered FCM's who are not members of these exchanges. The Commission intends ultimately to expand its electronic filing system to include introducing brokers.

Question. Are there any concerns on the part of professional market participants, customers, or the CFTC that the electronic filing of documents may compromise the security or reliability of the information contained in those documents?

Answer. The electronic filing of documents raises issues relating to data security and integrity that are somewhat different from those raised by systems that rely on hard copy format. For example, the traditional method for authenticating a written submission—a signature, sometimes supported by a verification—is not easily adaptable to an electronic filing system. Moreover, due to its nature, electronic media may be easier to alter, and there is less likelihood of detecting the alteration than in hard copy media. Procedural or technological techniques must be used to reduce the risk of alteration.

Question. If so, what has been done to assure those using the electronic filing system of the security of the system?

Answer. The Commission has taken a variety of steps to address relevant security/integrity issues. For communications between Commission registrants and the Commission, required measures have varied with the nature of the information being provided. Permitting FCM's to provide important financial information electronically raises issues concerning the reliability of the information provided and the confidentiality of the communication system. The Commission has addressed these concerns by requiring firms to use Commission-issued personal identification numbers, or PIN's, in submitting financial information to the Commission. A firm's use of its PIN is deemed the equivalent of a manual signature for purposes of the Commission's attestation requirement. PIN's are issued by the Commission only after the authorized signer for the registrant has filed with the Commission a signed attestation that will be kept permanently on file. Moreover, the electronic filing system being used by the Commission provides a safeguard to minimize the likelihood of an unauthorized interception and alteration of financial data transmitted by an FCM. Financial data files are encrypted prior to transmission and unencrypted by Commission personnel prior to processing and review.

Security/integrity issues are of somewhat lesser concern in the system for electronic filing of CTA and CPO disclosure documents with the Commission because the documents at issue generally do not include confidential financial information and are subject to review and discussion prior to circulation to the public. Registrants who file electronically must use their NFA identification number to authenticate their submission and receive an electronic receipt as evidence that the Commission received the electronic submission. At the time the Commission adopted this initiative, consideration was given to requiring encryption procedures to guard against unauthorized interception of disclosure documents transmitted to the Commission electronically. The Commission determined that such a requirement was unnecessary in light of the voluntary nature of the program, but did state that Commission staff would cooperate with registrants who voluntarily adopted an encryption procedure.

For communication between Commission registrants and their customers, the Commission has placed a strong emphasis on the necessity for informed consent by customers. Because customer participation in these initiatives is voluntary, informed consent gives customers an opportunity to balance the efficiency benefits of electronic communication against the potential costs related to security/integrity concerns. For example, prior to transmitting confirmation, purchase and sale or monthly account statements to customers electronically, FCM's must generally obtain a signed, hard copy revocable consent from their customers. Similarly, CTA's and CPO's who fulfill their initial disclosure obligations by means of electronic delivery must obtain both a revocable consent and an acknowledgment of delivery of the required risk disclosure statement from their customer. While customer consent/acknowledgment may be communicated electronically, the Commission requires that CTA's and CPO's verify the authenticity of the consent/acknowledgment by using a PIN or another electronic methodology that uniquely identifies the specified person who has provided the consent/acknowledgment.

As for the reliability of information registrants communicate to the customers electronically, the Commission has required that registrants make a hard copy of the relevant information available to customers. This permits customers to monitor the reliability of the registrant's electronic communications. The Commission has also stated that FCM's should implement supervisory systems and procedures necessary to assure timely and appropriate delivery of required information and to detect and deter misconduct in connection with the delivery of such information. In addition, the Commission has noted that FCM's should take reasonable steps tailored to the particular electronic medium being used to ensure the confidentiality of personal financial information transmitted electronically. It also has directed self-regulatory organizations to enhance their audit programs to review these precautions.

ENFORCEMENT

Question. The budget justification indicates that the ten additional staff years requested would complete the reorganization of the Enforcement Division which began in 1995. How has this reorganization improved the ability of the CFTC to fulfill its enforcement responsibilities?

Answer. The reorganization of the Division of Enforcement has improved the efficiency and effectiveness of its operations, which has enhanced the CFTC's ability to fulfill its enforcement responsibilities. Prior to August 1995, the operating units of the Division were organized in three sections, each of which reported to one of three Deputy Directors in headquarters. The sections were: Western Operations, comprising the Central Regional Office in Chicago and the Western Regional Office in Los Angeles; Eastern Operations, comprising the Eastern Regional Office in New York and the Southern Regional Office in headquarters; and Manipulation and Special Operations, comprising three specialized units at headquarters—the Manipulation and Trade Practice Unit, the State/Federal Liaison Unit, and International Operations.

To enhance flexibility and responsiveness, the headquarters units were reorganized: the Manipulation and Trade Practice Unit, the State/Federal Liaison Unit, and the Southern Regional Office were replaced by four general investigation/litigation teams which are referred to as HQ1 through HQ4. International Operations was moved to the Office of Chief Counsel. Two of the deputy positions were eliminated, resulting in the four headquarters teams and the three regional offices reporting to a single Deputy Director and, ultimately, to the Director. The Deputy Director reviews and assigns all investigative referrals to Division staff and reviews all recommendations that the Division of Enforcement makes to the Commission.

The position of Counselor to the Director was established, in part, to assist with the review of recommendations through the Director's office.

As to the litigation teams themselves, each of the four headquarters teams is now headed by an Associate Director, and each regional office is headed by a Regional Counsel. The Management Analysis Officer has been given responsibility for supervising all administrative staff in Washington. This responsibility previously had been assigned to the unit within which a particular administrative employee worked.

In addition to the major structural changes described above, the Division has made organizational changes in the regional offices. Within the last six months, the Central Regional Office has been reorganized to include both attorneys and investigators in the same teams; a similar structure already existed in the Eastern Regional and Headquarters offices. Previously, investigators in Chicago reported through a separate supervisory structure. In addition, there is now a separate intake team in that office to perform preliminary investigative work. Also, the Eastern Regional Office has created the supervisory attorney positions, designed to provide more supervisory structure to investigations and litigation in that office. Finally, the Division's Office of Chief Counsel now has primary responsibility for preparing briefs in appeals to the Commission of Administrative Law Judges' initial decisions. Previously, the teams that handled the litigation before the ALJ had primary responsibility for appeal briefs.

The restructuring achieved several things. First, specialized units at headquarters were replaced by general investigation/litigation teams so that any one of the teams could respond immediately to any matter requiring investigation and legal action. The Division believes that this, in combination with the Deputy Director's handling of referrals, has evened workloads and enhanced the Division's ability to respond efficiently to new matters. The elimination of the two deputy director positions similarly was intended to streamline the review process, to enhance consistency in the policy review process, and to even workloads of the Division's seven operational units.

Second, designating the Office of Chief Counsel, in lieu of investigation/litigation teams, to handle all appeals to the Commission has left more time for the teams to pursue their investigations and cases. Just as important, centralizing this responsibility with the Office of Chief Counsel has ensured that the Division handles matters on appeal to the Commission consistently and more effectively.

Finally, shifting the responsibility of management of administrative staff to the Management Analysis Officer has reduced the amount of time investigation/litigation teams spend on administrative and personnel matters and allows more efficient utilization and oversight of support personnel. The changes in Chicago and New York are similarly designed to permit more effective management and oversight of the work of the attorneys and investigators, with the goal of performing the work and overseeing personnel more efficiently and effectively.

Question. If you receive the requested Enforcement staff-year increase, do you have a plan of action to recruit and hire the necessary employees to fill these positions in a timely manner?

Answer. The Division plans to use the additional FTE's to fill both professional and administrative positions in several different offices. If we were to receive the requested funding increase, the Division would immediately implement an active recruiting plan. With regard to professional positions, the Commission posts all vacancy announcements, including the Division's, on its CFTC website and forwards vacancy announcements to the Office of Personnel Management for inclusion on its nationwide Current Job Openings website. The Division also advertises in large, general circulation newspapers in the region where the job opening is located.

To focus more directly on qualified candidates, the Division also advertises in selected legal periodicals and—depending upon the experience required for particular openings—forwards vacancy announcements to law school placement offices. Also, each year representatives from the Division participate in a limited number of recruiting programs run by law schools. The Division's objective is to draw from the largest, most qualified, pool of candidates. For administrative staff, the efforts are similar, but do not include recruiting through educational institutions or professional periodicals.

Question. Please highlight for the Committee the cases of misconduct in connection with the hedge-to-arrive contracts and futures and options trading which were investigated by the Enforcement program of the CFTC in fiscal year 1997, and those which have been investigated so far in fiscal year 1998. How many cases were investigated? What were the outcomes of the investigations? Which provisions of the Commodity Exchange Act or CEA, and Commission regulations were violated? What

measures have been taken to protect the public and the industry from future similar violations of the rules and regulations?

Answer. In the spring of 1996, the Commission's Division of Enforcement commenced an investigation into certain grain transactions referred to as hedge-to-arrive or HTA contracts. The Commission's interest in HTA's arose from its surveillance of the grain markets during the volatile market conditions in 1995 and 1996, and the effect these conditions had on certain types of contracts entered into by grain elevators, marketers, and producers. The nationwide investigation involved discrete lines of inquiry, some of which resulted in filed cases and some of which the Division is still actively pursuing. Under the CEA and Commission's rules, these investigations must remain confidential, so I am unable to discuss them in any detail in this forum.

I can tell you, however, that the investigation has thus far resulted in the filing of four separate administrative complaints alleging violations of various provisions of the CEA and Commission regulations in connection with certain HTA's. Three were filed in November 1996, and one was filed in December 1997. All of these cases are pending before administrative law judges, and have not yet resulted in final judgments. Until there is some final adjudication of these issues, it would be inappropriate to speculate as to what violations may have occurred. Moreover, because these cases may come before the Commission on appeal, it would not be appropriate for me to discuss the merits of the matters. Accordingly, I will describe them to you generally to give you an idea of the types of violations alleged.

One complaint charges that a grain elevator offered and sold HTA contracts that constituted illegal futures contracts. This case involves alleged violations of Section 4(a) of the CEA, which prohibits offering or entering into illegal futures contracts. This matter is captioned *In re Grainland Cooperative*, CFTC Docket No. 97-1.

A second case charges a cooperative grain elevator with offering and entering into illegal futures and options contracts; an individual with acting as an unregistered commodity trading advisor or CTA, and with fraud in connection with his marketing and promotion of, and his entry into, illegal futures and options contracts; and a futures commission merchant and one of its employees with aiding and abetting the unregistered activities and trading without proper authorization. This case involves alleged violations of Section 4(a) of the CEA; Section 4c(b) and Regulation 32.2, entering into illegal agricultural options; Section 4m(1) acting as an unregistered CTA; Section 4o(1) fraud by a CTA; Section 4b fraud in connection with futures contracts; Section 4c(b) and Regulation 33.10 fraud in connection with options; Regulation 4.13(b) failure to file an exemption statement or to deliver to pool participants disclosure documents or account statements; Regulation 4.41(a) solicitation of agreements to guide clients commodity interest trading without delivering requisite disclosure documents; and Regulation 1.37(a) failure to maintain records of persons exercising control over customer accounts. This matter is captioned *In re Wright, et al.*, CFTC Docket No. 97-2.

A third complaint alleges that a cooperative grain elevator violated Section 4c(b) of the CEA and Commission Regulations 32.2 and 33.10 by selling illegal agricultural options and engaging in fraud in connection with its marketing of the illegal instruments. This matter is captioned *In re Southern Thumb Coop Inc.*, CFTC Docket No. 97-3.

Finally, a fourth complaint, captioned *In re Competitive Strategies for Agriculture, Inc., et al.*, CFTC Docket No. 98-4, alleges fraud in connection with illegal futures contracts, failure to supervise by a registered introducing broker, or IB, and failure to identify a branch office of a registered IB. The sections of the CEA and Commission regulations alleged to have been violated include Section 4(a); Section 4o(1); Section 4b(a); Regulation 166.3 failure to supervise; and Regulation 166.4 failure to properly identify a branch office to the public.

With respect to measures taken to protect the public and the industry from future similar violations of the rules and regulations, the Commission has taken a number of steps. Specifically with regard to HTA contracts, in May 1996, the Commission's Division of Economic Analysis issued two policy and guidance statements relating to HTA contracts. The first concerned the mutual decision by producers and elevators to use cash payments in unwinding, working out or terminating such contracts, and the second addressed the risk implications of particular features and practices associated with HTA contracts for the future delivery of grain. The statements were publicized by a press release, were posted and remain posted on the Commission's website, and were published in the Commerce Clearing House reporter. Similarly, the Commission has issued press releases regarding the filing of each of the enforcement cases discussed above, and the Commission's website provides access to full-text copies of each of the complaints. Also in 1996, Commission employees participated in a series of town meetings hosted by state authorities to

discuss risk management and risk associated with the use of HTA contracts. Commission staff has also fielded numerous inquiries from the public regarding these instruments and will continue to do so.

More generally, the Commission has taken a number of steps to educate the public and the industry on risk management issues. For example, as the Committee is aware, the Federal Agricultural Improvement and Reform Act of 1996 requires the US Secretary of Agriculture to provide, in consultation with the CFTC, "education in management of the financial risks inherent in production and marketing of agricultural commodities." In 1997, the Commission entered into an agreement with the USDA which established the basis for a joint risk management education effort directed at farmers and third parties who deal directly with farmers regarding tools to mitigate risks. In September 1997, the two agencies held a risk management education summit to establish the basis for a nationwide education effort.

Finally, the Commission has engaged in extensive efforts to keep the public and industry informed of its policy on agricultural trade options. The Commission recently adopted a three-year pilot plan that lifts the ban on off-exchange agricultural trade options, another possible vehicle for farmers to hedge price exposure. In connection with its adoption of the program, which was announced on April 9, 1998, the Commission has engaged the public and industry in an extended dialogue regarding these instruments. In December 1995, the Commission held a public roundtable at which commodity industry experts, regulators, academics and market users exchanged their views regarding the prohibition of agricultural trade options. In May 1997, the Commission released a staff white paper entitled "Policy Alternatives Relating to Agricultural Trade Options and Other Risk-Shifting Contracts." In June 1997, the Commission published advanced notice of proposed rulemaking in the Federal Register seeking comment on whether it should propose rules to lift the ban. It also held a series of field meetings at which members of the public had an opportunity to address the Commission and to ask questions regarding the ban.

As a result of the recommendations contained in the white paper and the comments received from the public, in November 1997 the Commission published notice of a proposed rulemaking in the Federal Register regarding the pilot plan. The proposed program provided for streamlined registration of those selling the instruments, required that customers be provided with disclosure statements and account information, provided certain financial protections, and required that options vendors file reports on their market activity. After a public comment period in which over 440 comments were received, the Commission adopted a three-year pilot program.

Question. Please provide the Committee a description of the reorganization of the Enforcement Division which has taken place since 1995, including the funding and personnel resource changes during each fiscal year.

Answer. As a result of the reorganization described earlier, since the fall of 1995, the Division has put in place an almost entirely new senior management team, including a new Director, Deputy Director, Chief Counsel, Counselor to the Director, two Associate Directors and three Regional Counsels. In terms of total numbers, since 1995, Division staff has increased from 144 in 1995, to 147 in 1996, and to 154 in 1997. Division obligations, which include all program costs, were \$12.8 million in 1995, \$13.9 million in 1996, and \$16 million in 1997. For the same time periods, the Commission's obligations were \$49 million, \$53.5 million, and \$54.7 million.

MARKET SURVEILLANCE, ANALYSIS AND RESEARCH

TRADING AND MARKETS

Question. The President's budget for fiscal year 1999 requests five additional full-time equivalent positions for the Market Surveillance, Analysis and Research Division and the Trading and Markets programs. Please explain the need for these staffing increases.

Answer. The five additional FTE's in the Division of Trading and Markets are needed to enhance the Commission's regulatory reform and streamlining efforts, address new product developments, and sustain Commission oversight over contract market practices and standards.

Two of the additional FTE's are needed to continue development of innovative regulatory approaches, to address new product developments, market linkages and trading mechanisms, and to develop rules that foster the competitiveness of clearing organizations, firms holding customer funds, and commodity professionals in dynamically evolving market conditions without loss of customer protections. The globalization of markets, the blurring of distinctions among financial institutions, and the explosive growth of technology have made it essential that the Commission's rules are appropriately adapted to market conditions.

Three additional FTE's are needed for the Contract Markets subprogram. One is needed to provide increased efficiency in reviewing new programs and to be certain that increasingly innovative linkages between US and offshore markets, as well as cash and futures markets, maintain appropriate customer and market safeguards without imposing undue burdens or adversely affecting equitable access to the marketplace. The second is needed to assist in developing new initiatives regarding appropriate regulatory standards for sophisticated market participants who trade on, or are subject to the rules of, a contract market. The third is needed to address the increasingly complex oversight of SRO practices to assure appropriate incentives to maintain effective compliance programs. The Commission is expanding the ways in which it reviews SRO programs, reviewing both individual programs and particular practices across all exchanges (horizontal reviews), and developing a compendium of 'best practices' that can provide guidance to increasingly linked markets worldwide.

The additional resources will allow the Division to be more responsive to market participants and the public by reviewing rules to determine if they should be streamlined and modernized in light of technological and market developments; providing guidance and relief to foster innovative transactions and trading systems; maintaining US leadership in setting internationally accepted standards for the regulation of markets and trading; addressing intermarket issues through the President's Working Group on Financial Markets; and encouraging technological improvements and market innovation.

ESTABLISHMENT OF OFFICE OF INTERNATIONAL AFFAIRS

Question. Chairperson Born, in your prepared testimony you state that the Office of International Affairs was created in July 1997, within the Office of the Chairperson, to "enable the Commission to continue its leading role in international regulatory initiatives and to keep abreast of global change." What funding was used to create this office? How many FTE's are being used to staff this office, and from where were they taken?

Answer. The Office of International Affairs was funded and staffed with eight positions from the Office of Trading and Markets. The reassigned staff represented the Commission's principal expertise in the international area. The reorganization was accomplished within the Commission's fiscal year 1997 FTE ceiling and budget. The Office of International Affairs reports to the Office of the Chairperson.

Question. How has the creation of this office affected other offices within the CFTC, both in dollars and FTE's?

Answer. The creation of the Office of International Affairs resulted in a transfer of approximately \$900,000 and eight FTE's from the Division of Trading and Markets to the Office of the Chairperson.

Question. What role has the Office of International Affairs had in dealing with the Asian financial crisis and its effect on the commodities and futures markets in the United States and around the world?

Answer. During the recent Asian volatility crisis, Commission staff from the Office of International Affairs, or OIA, has assisted in obtaining information from and providing information to foreign regulatory authorities as needed. For example, OIA staff successfully assisted a US futures commission merchant who initially experienced delays in receiving funds from a Malaysian broker by communicating with the Malaysian Securities agency and urging a quick resolution of the matter. In addition, OIA staff assisted in obtaining regulatory information from authorities in Japan and Hong Kong and transmitted that information to the Commission's operating divisions to assist in surveillance of our domestic markets.

Separately, OIA staff has participated in several international fora addressing these issues. For example, at the Commission's annual international regulators' conference in March of this year, organized in large part by OIA staff, Hong Kong, Brazil and Mexican authorities made presentations on the impact of Asian volatility on each of their markets, their immediate regulatory response, and their views on what their longer-term response may be.

Question. How cooperative have other countries been in sharing information and resources?

Answer. The collapse of Barings Plc., a UK firm, in 1995 resulted in a greater awareness of the need for regulators to share information and to implement emergency procedures domestically that help to minimize the spread of systemic risks resulting from defaults. Since that incident, cooperation from other countries in sharing information with the Commission generally has been good. For example, during the sell-off in world equity markets in the fall of 1997, the Commission received early information of the steps being taken by Japan to address the financial

situation and also information on the status of specified Japanese firms with some proprietary business on US derivatives markets. When the staff requested additional specificity about certain firms, the information was provided promptly. When the Japanese authorities suspended trading in a particular firm, they took care, consistent with recommendations made at the Windsor Conference, to permit the continued margining, offset and transfer of futures positions of customers. Also, in January 1998, during increased volatility in the Asian currency and equity markets, the Hong Kong Securities and Futures Commission notified the CFTC of one US-related firm with an exposure in the Hong Kong futures market which had reached a trigger level under the Declaration on Cooperation and Supervision of International Futures Markets and Clearing Organizations.

Additional examples of information sharing are the increasing number of formal arrangements entered into by the Commission with foreign regulators. Since amendments were made to the Commodity Exchange Act in 1992, the Commission has entered into 44 formal and informal arrangements for cooperative enforcement and regulatory information sharing with authorities in 21 jurisdictions. The formal arrangements include 13 Memoranda of Understanding; two Agreements; one exchange of Diplomatic Notes pursuant to a Treaty, signed by the Department of State on behalf of the Commission; and one joint communiqué. In 1997, the Commission signed two new formal arrangements for cooperative enforcement and regulatory information sharing: a Joint Communiqué on the Exchange of Information for Cooperation and Coordination signed on May 27, 1997, by the Commission and the Financial Services Board of South Africa; and an MOU between the Commission and Germany's Bundesaufsichtsamt für den Wertpapierhandel concerning cooperation and consultation in the administration and enforcement of futures laws.

A principal feature of the response to Sumitomo's losses, and an action item from the one-year work program commenced in London in 1996 and concluded in 1997 in Tokyo, was amendment of the multilateral support for exchange of large exposure information known as the Declaration on Cooperation and Supervision of International Futures Exchanges and Clearing Organizations. Those amendments were specifically designed to assure that all relevant regulatory authorities could be signatories and to clarify that disruptions related to manipulative and other abusive activities were covered and were successfully completed in November 1997 and March 1998, respectively.

The CFTC has also entered into a variety of arrangements with foreign authorities for the purpose of sharing information regarding regulatory matters. In October 1997, the CFTC concluded a new arrangement with the SEC, the Bank of England and Financial Services Authority to facilitate information sharing for prudential and risk-assessment purposes with respect to US, UK and/or third-country owned broker-dealers, FCM's or banks which conduct operations in both the United Kingdom and United States.

In addition to these formal arrangements, the Commission receives information informally through the many relationships established over the years with foreign regulators through its participation in international organizations such as IOSCO.

Question. Are there any concerns on the part of the Commission, market participants, or customers that participation in the international marketplace will compromise the security of the United States futures markets?

Answer. The recent volatility that has shaken world equity and currency markets has demonstrated more vividly than ever before that the markets are inextricably linked through common products and related market participants. Therefore, events that occur in one market can and frequently do cause global regulatory concerns. The shocks to the world financial system caused by the 1995 collapse of Barings Plc., a UK firm which traded on numerous world futures markets including Singapore, Japan, Hong Kong and the UK, and the 1996 copper losses suffered by the Sumitomo Corporation, a Japanese firm trading on the London Metal Exchange, illustrate that this is true for derivatives markets as well as securities markets.

The CFTC has played a leadership role in the international community in improving world standards for oversight mechanisms to reduce potential problems from market disruptions and for handling of defaults and protection of customer funds. The CFTC believes that more can be done to improve the integrity of global markets and is actively participating in ongoing international initiatives.

The CFTC also maintains an immediate crisis management response to global events in order to secure further the futures markets and its participants. For example, in the Barings and Sumitomo crises the CFTC promptly assessed the effects on US interests in the following areas: the extent of direct participation or trading activity by the affected firm or its affiliates in the US futures markets; whether the firm operated a US futures commission merchant, that is, a firm which carries customer positions; the extent to which other US FCM's were clearing or executing

trades through the firm on foreign markets; the extent to which US FCM's with subsidiaries that clear through exchanges in which the firm was a member could be affected by substantial losses on those exchanges as the result of clearing assessments or other loss mutualization provisions; and the potential impact on US exchange member firms if heightened volatility resulted from a firm's failure.

AGRICULTURAL TRADE OPTIONS

Question. Please provide for the Committee a description of the three-year pilot program that would lift the ban on off-exchange agricultural trade options.

Answer. Trade options are off-exchange options offered for business-related purposes to a producer, processor, merchant, or commercial user of a commodity. On April 8, 1998, the Commission removed the prohibition on off-exchange trade options on the enumerated agricultural commodities pursuant to a three-year pilot program. The interim rules for the pilot program permit only agricultural trade options which, if exercised, will result in delivery of the commodity. Also, the interim rules permit only those entities which handle the commodity in normal cash market channels to solicit, to offer to buy or sell, or to buy or sell such options.

Under the interim rules, vendors of such options would be required to become registered as agricultural trade option merchants, to report to the Commission on their transactions, to provide their customers with disclosure statements, and to safeguard their customers' premiums. The Commission is exempting from the prohibition and these interim rules individuals and entities which meet a substantial financial requirement, as it proposed. As part of the same action, the Commission also removed a longstanding prohibition on the offer or sale of exchange-traded physical options on these commodities.

The Commission promulgated interim rules because this is a pilot program and intends to reexamine the rules during and at the conclusion of the pilot program.

Question. What costs, if any, will be incurred by the Commission for this program?

Answer. The Commission will incur costs related to its oversight of trading under the pilot program. These relate to oversight of compliance with the interim rules and the cost of analyzing and studying the relative merit of the interim rules including possible surveys of market activity. The direct costs of registration and receiving required quarterly reports from agricultural trade option merchants will be borne by the National Futures Association which has been delegated these functions by the Commission.

AUDIT AND DUAL TRADING

Question. The Commission is working with USDA's Risk Management Agency on a risk management education program for agricultural producers. Can you give me an update on this initiative?

Answer. The Federal Agricultural Improvement and Reform (FAIR) Act of 1996 requires the U.S. Secretary of Agriculture to provide, in consultation with the CFTC, "such education in management of the financial risks inherent in the production and marketing of agricultural commodities as the Secretary considers appropriate." Consistent with this mandate, in 1997 the CFTC entered into a memorandum of understanding with USDA which establishes the basis for a joint risk management education effort. This effort is intended to be broad in both scope and content, focusing on integrating basic information on risk management from all relevant sectors, including crop insurance as well as futures and options. The education effort is being directed toward two audiences: third parties (such as insurance agents and commodity brokers) who deal directly with farmers on a variety of tools to mitigate risks, and the farmers themselves. To initiate the education program, the USDA held, and the CFTC participated in, a risk management education summit on September 16 and 17, 1997, which attempted to establish the basis for a consistent nationwide education effort.

Current initiatives involve development of educational materials and programs for ultimate delivery to farmers, including the February 10, 1998, issuance of an announcement of availability of grant funds and request for proposals for agricultural risk management education. In addition, a series of regional conferences, with an emphasis on more "hands on" training for third-party influences, will be held through 1998, beginning with a conference in Spokane, Washington, on March 24 and 25.

Commissioner David Spears has replaced former Commissioner Joseph Dial as the Commission's designee to the Risk Management Education Steering Committee which oversees this entire risk management education effort.

ELECTRONIC TRADING

Question. Has electronic trading become a widely used mechanism of trading in the industry? If so, which professional market participants and customers use electronic trading, and how often and under what circumstances is it used?

Answer. Currently, there are three electronic trading systems in operation at domestic futures exchanges: the Chicago Board of Trade's Project A system, the Chicago Mercantile Exchange's Globex system, and the New York Mercantile Exchange's ACCESS system. Since the inception of Globex and Project A trading in 1992 and ACCESS in 1993, the number of contracts traded and the volume of trading on these systems have continued to grow. Electronically traded volume, however, remains a very small percentage of overall futures trading. For example, volume on Project A during 1997 totaled approximately 6 million contracts, as compared to pit trading at the CBT of approximately 243 million contracts over the same time period. Therefore, electronic trading is not as widely used in the US futures industry as pit trading. Since these systems operate almost exclusively after the close of regular pit trading hours, the participants on electronic trading systems are generally institutional customers with facilities for overnight trading. These customers generally need to access these overnight markets to respond to global events that may influence their overall trading strategies.

Question. Have there been any regulatory problems in relation to the electronic trading of futures contracts, to date? If so, what measures were taken by CFTC to adjust to the regulatory demands of electronic trading? If not, do you foresee any future problems with the regulation of electronic trading?

Answer. To date, there have been no major regulatory problems with respect to electronic trading of futures contracts. Notwithstanding this, however, Commission staff have been examining electronic trading systems from a domestic and international perspective to develop facts and analysis with respect to the surveillance and compliance experiences at various exchanges. This information will be relevant to the Commission's consideration of the regulation of electronic trading systems generally, and with respect to such specific issues as the applicability of the statutory dual trading prohibition to these systems.

Question. What effect, if any, do you anticipate electronic trading will have on traditional pit trading?

Answer. At this point in the evolution of domestic electronic trading systems, it is difficult to predict what effect electronic trading systems may have on traditional pit trading. To date, domestic electronic trading systems have been developed as after-hours trading mechanisms to complement, rather than compete with, traditional open outcry pit trading. With one exception, the Chicago Mercantile Exchange's E-Mini S&P 500 contract on its Globex system, contracts in the US can be traded electronically only after the close of regular trading hours. The E-Mini contract, which began trading in September 1997, is traded concurrently both on Globex and in the pit during regular trading hours.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request? Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The agency's annual performance goals represent the estimated workload to be accomplished during the year based on the activities established in the CFTC Strategic Plan. Each performance goal is linked directly to an activity and an outcome objective. Performance goals are shown for most of the fifty activities. The activity level is the lowest of three levels set forth in the Strategic Plan. Each of the fifty activities supports one of the nine outcome objectives. Each of the nine outcome objectives supports one of the three strategic goals. This makes it possible to link a performance goal directly to an activity and an outcome objective.

Traditionally, the CFTC budget request has been displayed by program and sub-program activity only. This year, program and subprogram activities are linked to the outcome objectives and goals of the Strategic Plan. For instance, the Trading and Markets program contributes to outcome objectives in all three goals. Therefore, it is possible to review how the performance goals in the Annual Performance Plan are linked to the Strategic Plan and to the program activities in the budget request.

This cross-cutting display of budgetary resources required Commission staff to revamp the budget formulation system. One positive result is the ability to formulate the annual budget request and understand its impact by program activity as well as by goal.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, the performance indicators or measures in the annual performance plan are linked to the budget through the use of annual performance targets. The cost of reaching annual performance targets is shown in summary fashion on the annual performance plan in the table entitled, Budget Request by Program Activity. This table shows the amount of funding each program activity or account will require to accomplish each goal. There is one table for each goal. Each program activity or account has performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The performance planning structure is organized by goal while the budget justification structure is organized by program activity. There is a cross-cutting analysis in each structure. The program-based analysis of the budget request is augmented by a programmatic distribution of resources by agency goal. The goal-based analysis of the Annual Performance Plan disaggregates resources by program. Our intent in displaying information in both formats is to engender greater understanding of how the Commission's resources contribute to the accomplishment of the agency's mission.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. We do not anticipate any changes to the account structure for fiscal year 2000 at this time.

Question. How were performance measures chosen?

Answer. The performance measures were developed collaboratively by the CFTC Strategic Planning Task Force and the Commission's program managers during the development of the CFTC's strategic plan. After the Commission adopted a mission statement, three agency goals, and corresponding outcome objectives and activities, the Task Force prepared a set of corresponding performance measures, which the Commission approved.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. To date, the Commission has used existing reporting systems to collect all data. For example, data concerning the distribution of labor were collected principally through the Management Accounting Structure Code system, otherwise known as MASC. These data reflect the hours spent on various Commission activities and are provided bi-weekly by every employee concurrent with production of the payroll. These data are augmented by each division's informal systems for tracking and recording time spent on various projects and activities and the results or outcomes produced. As a result of the Commission's strategic planning experience, program managers have determined that new data may need to be tracked to produce a more complete and reliable picture of performance. To the extent possible, the Commission will seek to utilize and refine existing systems rather than develop new systems. More will be known after the first full year of tracking and analyzing data for the fiscal year 1999 Annual Performance Plan. Costs may be incurred in altering current systems and/or in developing better methods of data collection and verification. The costs will need to be weighed against the long term benefit of enhanced performance data.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Performance data are being tracked for the first time in fiscal year 1998 for some performance goals. While some data may not be available, it would be unwise to infer too much from data covering such a short period. The Commission is approaching the GPRA initiative as an iterative process to build on its positive experiences from year to year with a goal of understanding how we best accomplish our mission and at what cost.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The CFTC's recommended performance goals from its fiscal year 1999 Annual Performance Plan correspond to four broad indicators of success: markets free of disruption; registered and fit market professionals and financial intermediaries; self-regulatory organizations with sound financial practices and effective enforcement programs; and swift and aggressive investigation and prosecution of wrongdoing, with sanctions and fines levied for the maximum remedial and deterrent effect.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The process of working across professional disciplines and programs via the Strategic Planning Task Force ensured the inclusion of a significant number of performance measures. The fiscal year 1999 Annual Performance Plan includes, 12 performance goals and 46 quantitative performance indicators for Goal One; nine performance goals and 76 quantitative performance indicators for Goal Two; and nine performance goals and 80 quantitative performance indicators for Goal Three. It is our goal to assess these goals and indicators after the first year to determine their usefulness and effectiveness.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The Commission's program managers understand the concept of moving from measuring outputs to measuring outcomes. As we put together measurement tools and develop a system for tracking and reporting on the fiscal year 1999 Annual Performance Plan, we will continue to search for ways better to measure outcome. It is often difficult for regulatory agencies to demonstrate the causal relationship between efforts and stated desired outcomes. As we have expressed to the Office of Management and Budget and our Congressional oversight staff, we welcome any suggestions.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. The Commission's strategic goals are all broadly aimed at serving the broad and diverse set of customers who use the US futures and options markets. Accomplishing our goals helps to provide globally competitive US futures and option markets free of disruption and accessible to the public through registered and fit market professionals. The Commission also meets customer needs through its goal of ensuring that the self-regulatory organizations operating in the industry have sound financial practices and effective enforcement programs. Most broadly, the Commission serves all market users and the public through swift and aggressive investigation and prosecution of wrongdoing.

Beginning in fiscal year 1999, the Commission will monitor progress toward each of these customer goals through its annual performance plan.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The format of the CFTC's fiscal year 1999 budget and annual performance plan allows analysis from both a program perspective and performance planning perspective. Every staff-year can be attributed to a program and every staff-year can be attributed to one, or more, agency goals. As the agency's priorities change, so will the resources devoted to specific activities and goals. Because activities are linked to our program accounts the Commission is able to develop a budget that reflects agency priorities.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Generally, the answer is yes. The CFTC budget can be analyzed by program or by goal; any change in the budget will impact either a specific program or goal or all programs and goals depending on the nature of the change.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. The agency does not have a comprehensive technological system for measuring and reporting data. To achieve the goal of tracking performance and reporting on it regularly, we rely on the labor-hour distribution system which is a by-product of our payroll system to capture data on how the Commission staff spend their time by project. We combine this data with data from a variety of data collection systems for reporting performance. Currently we analyze performance twice a year, once with the development of the OMB Budget Estimate and later with the development of the President's Budget. The Commission's GPRA Task Force is studying the feasibility of using our existing quarterly review process to incorporate additional types of measures reportable under GPRA. It may be possible to use this process to measure the accomplishment of performance goals on a more regular process.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty? Would the linkages be clearer if your budget account structure were modified? If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. The CFTC has no plans to modify the budget account structure currently in use. CFTC financial staff devoted considerable resources in fiscal year 1997 to the reconfiguration of the Commission's budget formulation system to capture and report data by goal, outcome objective, and activity in addition to the current budget account structure which is by program and subprogram activity.

Aligning the new requirements created by GPRA to the existing budget account structure allows the Commission to report on resource requirements in both formats while ensuring that we may continue to use of the underlying financial data from the Commission's payroll and labor distribution systems without altering significantly either of those systems.

However, challenges remain as the Commission seeks to modify the current labor distribution, or Management Account Structure Code System, to better align it with the structure of the activities set forth in the strategic plan.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate, and plan for such influences? What impact might external factors have on your resource estimates?

Answer. Yes, the Strategic Plan identified ten external challenges or factors that may impact planning and goal achievement at the Commission. They are: the volume of trading in futures and commodity options; the number and sophistication of market users; the variety of markets traded; the growing use of over-the-counter derivatives; the structural changes in the financial services industry; the globalization of financial markets; the effect of federal law and policies; the advancement of technology; the standards, resources and priorities of other organizations, and; events that destabilize the commodity markets such as the 1987 stock market break, the 1995 collapse of Baring Bank and the 1996 copper market events precipitated by the Sumitomo Corporation.

The possibility exists for any number of these external factors to influence Commission priorities or to place additional demands, whether short or long-term, on the Commission staff. It is the Commission's intent to meet these challenges by using existing resources effectively, finding efficient methods—such as the Global Markets Advisory Committee—to strengthen its capacity to respond to these challenges, and seeking the appropriate level of budgetary resources each year to fulfill its legislative mandate.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. In developing the Performance Plan, the Commission did not identify overlapping functions or program duplication, although the Plan did highlight the linkages between the agency's programs. One of the positive outcomes of the process was a greater understanding of how each program contributes to the agency's goals.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that, to what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. As mentioned earlier, performance measures data are being tracked for the first time in fiscal year 1998 for some performance goals. While some data may be available, it would be imprudent to infer too much from "unseasoned" data. The Commission is approaching the GPRA initiative as an iterative process and hopes to build on its positive experiences from year-to-year. Our ultimate goal is to understand how the agency best accomplishes its mission and at what cost.

Perhaps the most challenging question facing the Commission is how to measure deterrence of wrongdoing, manipulation, and fraudulent activity at its incipency. It is very difficult to establish a measurable causal relationship between regulatory oversight that relies in large measure on deterrence and specific activities of the market and market users.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. As of this date, the CFTC has no plans for a substantive revision to the Strategic Plan released in September 1997. We will continue to evaluate the Plan internally and as we receive any further comments on it. The Commission continues to invite comments on our Plan, which can be found on the Commission website at <http://www.cftc.gov>.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

NEW PRODUCTS FOR A FARM SAFETY NET

Question. Since passage of the 1996 Farm Bill, farmers' concerns are growing about the lack of an adequate safety net to protect them from an unstable market. For years, various financial instruments under the jurisdiction of the CFTC have been considered as tools farmers could use to lock in a satisfactory price for their products. Is CFTC actively working to help develop products to help provide a farm safety net against unstable prices? If so, what are some of these products?

Answer. The CFTC has no statutory authority to develop risk management products such as futures and options. It, however, has taken actions that should facilitate the development of such products by US futures exchanges and agricultural firms and institutions.

Examples of recent Commission actions that have facilitated the development of agricultural risk management products include: adoption of a pilot program to permit the trading of agricultural trade options; lifting the ban on US exchange-traded options on physical agricultural commodities—previously, futures exchanges could list options only on agricultural futures contracts; continuing efforts to streamline its contract designation process, resulting in significantly reduced review times for new contracts and the virtual elimination of designation backlogs; and the release of a statement of guidance on hedge-to-arrive contracts and prudent risk-reduction practices.

Question. Is CFTC working with USDA's Risk Management Agency to develop useful risk management products for farmers?

Answer. As required by the statute, the CFTC consults closely with USDA's Risk Management Agency to help provide risk management education to farmers and ranchers and to provide any technical assistance required by USDA. For example, the Commission has provided technical assistance to that agency in its development of a dairy option pilot program.

FAST-TRACK PROCEDURES

Question. In fiscal year 1997, CFTC implemented new "fast track" procedures to approve certain types of contracts and to better streamline CFTC activities. What are some of the elements of this "fast-track" procedure?

Answer. In April 1997, the Commission implemented fast-track procedures for processing certain contract designation applications and rule changes to contract terms and conditions. These procedures streamlined the review process for most types of contracts so that the administrative process for approval could be completed in time periods as short as 10 or 45 days following receipt by the Commission. These procedures were intended to cut in half the average, 90-day, period during which new contracts and substantive rule changes had been pending with the Commission.

Filings under fast-track are at the discretion of the exchange. Filings must comply with the form and content requirements of the Commission's rules, and may not be amended except as requested by the Commission. Under the fast-track procedures, an exchange may list a contract for trading on the "effective date," which is the day following the end of the 10- or 45-day period, unless the date is extended or fast-track review is ended. Under the fast-track procedures, the initial 10- or 45-day effective date may be extended once for an additional 30 days if the proposed rule raises novel or complex issues which require additional time for review. For applications not meeting fast-track requirements, or if requested by the exchange, fast-track review is ended and the regular review procedures for new contract applications apply.

Question. What safeguards are in place to assure the soundness of contract approvals on an expedited basis?

Answer. The abbreviated review periods established by the Commission under the fast-track procedures have not adversely affected the soundness of the contract approval process. The Commission continues to assess the legality of exchange proposals and their impact on the public interest. Moreover, to be eligible for fast-track filing, applications must be complete upon submission. Applications that are complete can be more readily reviewed within the specified time frames. When applica-

tions are not complete or contain deficiencies, the Commission has the authority to remove them from fast-track to conduct a more extensive review.

To ensure that proposed contracts meet the approval standards and that public interest issues are addressed within the streamlined time frames, the Commission has modified certain of its internal processing procedures, including the standardization of its approval documents and streamlined review procedures. While the overall effect on Commission staffing has been neutral, the most substantive resource impact has been to change the timeline of the reviews rather than the total work. In this regard, the new procedures require that the workload be concentrated in the time periods immediately following submission of the proposals to the Commission, rather than being spread out more uniformly over a longer period of time. In addition, the Commission has encouraged informal discussions with exchange staffs about potential proposals prior to their submission so that issues may be identified and corrected by the exchanges prior to submission as well as to facilitate the Commission's reviews.

Also, the Commission's website has been enhanced to include a page showing all pending new contracts along with provisions for downloading the proposed terms and conditions and filing electronic comments or questions. The address is <http://www.cftc.gov/dea/pending/newcontr.htm>. This enhancement will enhance the public's ability to monitor pending proposals and to submit comments related to public interest or other concerns.

"SOPHISTICATED CUSTOMERS"

Question. Last month, CFTC approved rules designed to speed up the account opening process for certain customers. The rule allows flexibility for "futures commission merchants" and "introducing brokers" to design their own "disclosure of risk" procedures. You state that this rule is a response to a request by industry to provide different regulatory treatment for "sophisticated customers" where appropriate. What is your definition of "sophisticated customer?"

Answer. In February 1998, the CFTC approved rule changes that eliminated requirements that futures commission merchants and introducing brokers provide certain defined categories of customers with Commission-mandated risk disclosure statements and obtain from these customers written acknowledgment of receipt of these statements as part of the account-opening process. The customers affected by this rule change, who are carefully defined in the rule amendments, would generally be considered "sophisticated" because they are institutional investors, entities regulated by federal or state agencies, high net-worth individuals or regulated foreign entities which perform similar functions to qualifying US regulated entities. Specifically, these customers include securities broker-dealers, banks, insurance companies, and other regulated financial intermediaries; investment companies with total assets in excess of \$5 million; employee benefit plans subject to ERISA with total assets exceeding \$5 million or whose investments are managed by specified investment professionals; corporations and other entities with total assets exceeding \$10 million or having a net worth of at least \$1 million; and natural persons with assets exceeding \$10 million.

These recent rule amendments built upon other CFTC efforts to streamline registrants' disclosure obligations. For example, since 1992, the CFTC's rules have allowed commodity pool operators and commodity trading advisors to meet less onerous disclosure requirements in pool offerings and managed accounts offered to investors who satisfy certain net worth or other financial requirements. In this regard, it should be noted that the CFTC rules do not use the term sophisticated customer, nor do these rules apply a single definition for qualifying customers. Instead, the standards used to define categories of customers for whom specific relief can be claimed have been developed in each instance to assure that the overall customer protection goals of the Commodity Exchange Act are fully maintained.

Question. Are there any provisions of this rule that could result in inadequate CFTC oversight of market activities?

Answer. The CFTC does not believe that these rule changes will reduce its ability to oversee the commodity futures or options markets or in any way erode customer protections. These rule changes provide futures commission merchants and introducing brokers with relief from mandated disclosure requirements when opening accounts for certain defined categories of customers. Futures commission merchants or introducing brokers relying on this relief continue to have obligations under other CFTC rules to provide all their customers with information material to a specific transaction. Moreover, in adopting these rule amendments, the CFTC carefully considered comments made by members of the public. In fact, the CFTC removed government entities from the list of customers for whom this relief could be claimed

after the Government Finance Officers Association indicated that its members would benefit from continued receipt of the CFTC-mandated risk disclosure statements.

Question. Is this rule a precursor of deregulation of certain sectors of the futures industry?

Answer. These rule amendments are not a precursor of deregulation of certain sectors of the futures industry. They are part of an ongoing CFTC effort to reduce unnecessary regulatory burdens on registrants while assuring that customers and the futures and options markets themselves continue to receive the high levels of protection required by the Commodity Exchange Act.

CFTC AND THE SEC

Question. In the past, there has been discussion about merging the functions of CFTC with the Securities Exchange Commission. What are the views of the CFTC to that proposal?

Answer. The Commission previously has opposed specific proposals to merge the CFTC and the SEC. It has been the Commission's view that a merger would not result in appreciable cost savings or increased efficiency, nor would it result in any other clear benefits. Furthermore, it has been the Commission's view that the public interest is best served by retaining an expert and independent agency that can devote full attention to the futures and option markets. The Commission believes that a more productive approach would be to continue close communication and coordinated action between the two agencies on issues of common concern.

In creating the CFTC as an independent agency in 1974, Congress determined that the regulator for commodity futures and option risk-shifting instruments should not be part of an agency regulating the underlying cash markets, whether that agency is the Department of Agriculture, the Securities and Exchange Commission, or the Department of Energy. Congress recognized that price neutral regulation of risk-shifting activity would suffer if placed within a larger agency with different, and perhaps at times conflicting, priorities.

The existing regulatory structure also reflects a functional regulatory approach to the financial markets which the Commission supports. The jurisdiction of the CFTC and the SEC is divided based on the function of the particular financial instrument. The CFTC regulates futures and option contracts that serve a price discovery or hedging function, and the SEC regulates securities that serve a capital formation purpose. The separate regulatory framework for futures and options that has evolved over the decades reflects the different purposes that those instruments serve.

Question. What, if any, overlapping exists between the two agencies?

Answer. As I mentioned earlier, the two agencies regulate instruments and markets that serve different economic functions. We do not believe that there is any overlap between the regulatory missions of the two agencies. However, the markets for commodity futures and securities are interrelated and share common participants. Accordingly, the agencies routinely coordinate and cooperate in carrying out their separate regulatory missions.

Question. Please describe CFTC's relationship with the SEC.

Answer. Because the markets are inter-related and share common participants, the CFTC and the SEC often work together closely in an attempt to ensure a consistent regulatory approach and an effective enforcement program.

In the regulatory area, the agencies have worked together over the years to ensure that circuit breakers (e.g., price limits and trading restrictions that are triggered when the stock market and stock index futures markets move a certain number of points) operate across markets in a coordinated fashion. The agencies have also coordinated their financial reporting rules in order to avoid placing unnecessary and duplicative regulatory burdens on market professionals. These are just a few examples how the CFTC and the SEC have worked together in the regulatory area and how that coordination has benefited the markets.

In the enforcement area, the staff of the Commission's Division of Enforcement and their counterparts at the SEC routinely cooperate in their efforts to police wrongdoing in the nation's financial markets. From time to time conduct comes to the attention of the two enforcement offices that implicates both the futures and securities laws. In those circumstances, the offices join forces, often devising coordinated investigation strategies for gathering and sharing information. In this way, duplication of effort is avoided and expertise and resources are shared. Where appropriate, we also coordinate the filing and settlement of enforcement actions to ensure a consistent governmental response to misconduct.

ELECTRONIC COMMUNICATION SECURITY

Question. You mention that CFTC has adopted measures to permit the electronic filing of documents with the Commission. As more and more governmental and market transactions are handled through electronic communications such as E-mail, what is CFTC doing to help ensure that computer-based communications are reliable and not susceptible to invasion by computer "hackers" who might place at risk the integrity of market transactions?

Answer. The Commission's electronic filing and analysis systems for financial reports and disclosure documents are independent of the systems used to track market data, such as large trader and trade practice data. Accordingly, the security of the latter data is not threatened by recent Commission initiatives.

The Commission has taken a variety of steps to address relevant security/integrity issues in the course of its recent initiatives. For communications between Commission registrants and the Commission, such measures have varied with the nature of the information being provided. Permitting FCM's to provide important financial information electronically raises issues concerning the reliability of the information provided and the confidentiality of the communication system. The Commission has addressed these concerns by requiring firms to use Commission-issued personal identification numbers, PIN's, in submitting financial information to the Commission. A firm's use of its PIN is deemed the equivalent of a manual signature for purposes of the Commission's attestation requirement. Moreover, the electronic filing system being used by the Commission provides a safeguard to minimize the likelihood of an unauthorized interception and alteration of financial data transmitted by an FCM. Additionally, financial data files are encrypted prior to transmission and unencrypted by Commission personnel prior to processing and review.

Security/integrity issues are of lesser concern in the system for electronic filing of CTA and CPO disclosure documents with the Commission because the documents at issue generally do not include confidential financial information and are subject to review and discussion prior to circulation to the public. Registrants who file electronically must use their NFA identification number to authenticate their submission and receive an electronic receipt as evidence that the Commission received the electronic submission. At the time the Commission adopted this initiative, consideration was given to requiring encryption procedures to guard against unauthorized interception of disclosure documents transmitted to the Commission electronically. The Commission determined that such a requirement was unnecessary in light of the voluntary nature of the program, but did state that Commission staff would cooperate with registrants that voluntarily adopted an encryption procedure.

INTERNATIONAL MARKET STABILITY

Question. You mention your meetings in London in November of 1996 and in Tokyo last October in an effort to establish international standards for market transactions. Over the past few years, we have seen dramatic shocks to the markets originating in foreign countries that sometimes had a regional or global effect. In some cases, these incidents were direct results of improper market manipulation. Please describe the state of market stability and security from international market incidents?

Answer. The Commission's recent international initiatives have encouraged international action to address the issues of systemic risk posed by our linked markets and have encouraged the worldwide adoption of higher regulatory standards. These international initiatives are designed to enhance international supervisory cooperation and emergency procedures, to establish concrete standards of best practices that set international benchmarks for regulation of futures and derivatives markets, to encourage improved transparency in those markets, to improve the quality and timeliness of international information sharing; and to encourage jurisdictions around the world to remove any legal or practical obstacles to achieving these goals.

These structural measures can assist market authorities in dealing better with crises and in safeguarding customer funds and assets in case of defaults. In addition to such structural measures, the relationships established over the years with foreign regulators, both through formal memoranda of understanding and informal relationships, facilitate the Commission's ability to obtain critical information and to assist US firms in addressing the consequences of market events.

The Commission continues to work in these areas to improve the design of regulatory programs to withstand market shocks and to improve the execution of existing programs. I would like to submit for the record a list of recent Commission initiatives addressing systemic risk.

[The information follows:]

Barings & Windsor Conference.—Following the collapse of Barings Plc., a UK firm which traded on numerous world futures markets including those in Singapore, Japan, Hong Kong and the UK, the CFTC co-chaired a meeting in Windsor, England, with the UK Securities and Investments Board—which has since been renamed the Financial Services Authority, or FSA. That meeting, and the resulting Windsor Declaration, set in motion a series of international initiatives at both the regulatory and market level intended to enhance the resilience of the financial marketplace against shocks or stress caused by such defaults. These initiatives included:

- the development of procedures to coordinate and to respond to a market crisis once it has materialized;
- initiatives to increase transparency of market protections and procedures, including proposals for the strengthening of protections accorded customer funds deposited for investment or safekeeping; and
- initiatives to encourage the development by all markets of default procedures intended to isolate risks to the defaulting firm and to restrict potential impact on other firms or markets.

Development of Large Exposure Information Sharing Arrangement.—In an era in which exchange member firms and market participants typically trade on multiple exchanges, no one regulator or market authority will have the information necessary to evaluate the risks to its markets. For example, at Barings, a rogue trader with high exposures in Singapore claimed that his positions in the Japanese markets were risk reducing, but there was no regulatory mechanism available to any single regulator to verify this claim. A notable accomplishment resulting from the Windsor meeting was the signing in March 1996 at Boca Raton, Florida, of the Declaration on Cooperation and Supervision of International Futures Exchanges and Clearing Organizations, an arrangement under which the occurrence of certain triggering events affecting an exchange member's financial resources or exposures prompts the sharing of information among regulators. The Declaration, which has been signed by 26 regulators to date, and a companion agreement among self-regulatory organizations which has been executed by approximately 65 exchanges and clearing-houses, facilitate the identification of large exposures by firms that could have a potentially adverse effect on multiple markets.

Sumitomo & Tokyo Communiqué.—Similarly, in November 1996, following the revelations of huge losses at Sumitomo and the related adverse effects on the global copper markets, the CFTC and the UK SIB, along with the relevant Japanese authorities, the Ministry of International Trade and Industry ("MITI") and the Ministry of Agriculture, Forestry and Fisheries ("MAFF"), co-sponsored an international regulators conference in London on physical delivery markets in international commodities. The London conference focused on the special problems that physical delivery markets pose for regulators and considered how contract design, market surveillance and international information-sharing can reduce the potential for, and assist in the management of, manipulation and other market disruptions. The 17 countries participating in that meeting issued a Communiqué agreeing on certain basic principles of regulation and on a year-long work program.

That effort culminated on October 30 and 31, 1997, at a conference in Tokyo, Japan, jointly chaired by the CFTC, the Japanese MITI and MAFF and the UK FSA where representatives of regulators from 16 jurisdictions responsible for supervising commodity futures markets announced the completion of the work program contained in the London Communiqué issued in November 1996. At the end of the meeting, the regulators issued a Tokyo Communiqué which, among other things, endorsed two guidance papers, one on best practices for the design and/or review of commodity contracts and another on market surveillance and information sharing. The guidances represent the first occasion on which regulators responsible for overseeing commodity derivative markets have agreed to international standards for the supervision of these markets.

Significantly, the regulators at the Tokyo meeting agreed that they should move beyond the mere adoption of statements and expressly committed to seeking the removal of domestic legal and other barriers to ensure access to information that permits them to detect and deter abusive practices and disorderly conditions in the markets, including information on concentrations of positions and the overall composition of the market. This commitment is significant because many regulators need new or expanded powers in order to attain this goal.

Enhancements in Boca Declaration: removal of restrictive language and addition of manipulative activities to scope.—The Tokyo Communiqué also encouraged regulators to participate in, and to make use of, the arrangements for sharing large exposure information which are set out in the "Declaration on Cooperation and Supervision of International Futures Markets and Clearing Organizations." However, we recognized that restrictive language in the Declaration made it impossible for cer-

tain regulators of commodity markets to join in that arrangement. Accordingly, in 1997 the CFTC and UK FSA, as co-chairs of the Windsor Declaration, successfully led an effort to remove such restrictive language from the Declaration. We are pleased to report that the following regulators have subsequently signed the declaration: Japanese MITI and MAFF, the New Zealand Securities Commission, the Securities Commission of Argentina, the Capital Markets Board of Turkey and the Securities Commission of Taiwan.

Participants in the Tokyo Conference also determined that the utility of the Declaration could be enhanced by further amending the Declaration to clarify its application to potential manipulative or abusive practices. Again, the CFTC joined with its Japanese and UK colleagues to lead this initiative which was successfully concluded and announced at the international regulators conference in Boca Raton, Florida on March 20, 1998.

Question. In what ways will the international standards reduce the threat of spreading international market disruptions?

Answer. At the end of the meeting in Tokyo in November 1997, the participating jurisdictions issued the Tokyo Communiqué which, among other things, endorsed two guidance papers—one on best practices for the design and/or review of commodity contracts and another on market surveillance and information-sharing. The guidances represent the first occasion on which regulators responsible for overseeing commodity derivative markets have agreed to international standards for the supervision of these markets.

By creating international best practices standards, we hope to establish worldwide regulatory benchmarks which can help each regulator to assess how its standards and practices compare with the benchmarks and to consider possible regulatory improvements. We anticipate that market authorities, both regulators and markets, will refer to the standards of contract design as providing an international consensus as to the elements that should be considered in order to reduce the possibility that a commodity contract may be susceptible to manipulation or other disorderly conditions.

Contract design, however, is merely part of overall market regulation. Accordingly, the regulators issuing the Tokyo Communiqué also endorsed standards of best practices for market surveillance and information-sharing. Among other things, the guidance on market surveillance and information sharing recommends that regulators have access to information about the exchange positions of large traders. Also, they should have access to traders' related cash and over-the-counter positions so that they can assess fully the risk of such persons' positions to the markets.

Significantly, the regulators at the Tokyo meeting agreed to move beyond the mere adoption of statements and expressly committed to seeking the removal of domestic legal and other barriers to ensure access to information that permits them to detect and deter abusive practices and disorderly conditions in the markets, including information on concentrations of positions and the overall composition of the market. This commitment is significant because many regulators need new or expanded powers in order to attain this goal.

The best practices guidances adopted in Tokyo demonstrate an international consensus on how to regulate derivatives markets and a commitment on the part of regulators to enhance their regulatory effectiveness.

The CFTC also has actively participated in the ongoing project of the International Organization of Securities Commissions, or IOSCO, to articulate the basic elements of an effective regulatory regime for the supervision of securities and derivatives markets. We expect a consultative document to be released in May, setting forth thirty Principles of Securities Regulation and collating, in a user-friendly fashion, all existing IOSCO guidance on effective regulation of financial services.

Question. What additional steps, if any, should the United States take for protection against international market disruptions?

Answer. Domestically, the Commission continues to evaluate its regulations to ensure that necessary safeguards are in place to respond to market events and that its regulations are updated to address changes in the marketplace. The Commission supports various on-going international initiatives and inter-governmental dialogue to improve the transparency of market information. The Commission also supports enhanced disclosure of information about relevant rules in place in specific markets to permit end-users of markets to advise themselves adequately about specific risk. The Commission also supports improvements in the protections available worldwide to address the insolvency of financial services firms without adversely affecting the liquidity of the markets in which they transact or the ability of solvent customers of insolvent firms to manage their position risk; improvements in the capacity to share information on the whole position of market participants, including over-the-

counter, cash and futures markets positions, wherever located; better policing and oversight of markets generally; and appropriate coverage of over-the-counter risks.

These issues were identified by the Commission in the Windsor Declaration and the Tokyo Communiqué, but may require new national law, removal of national barriers or other action at an international level. While reforms are in process, the work necessary is by no means complete—nor can it be accomplished by a single jurisdiction acting alone.

The CFTC has paid close attention to addressing preparations for and containment of market risks in its domestic markets. We have updated our contingency plan, developed programs to promote readiness for Year 2000 and Euro conversion, engaged in stress testing, performed oversight audits of markets and firms, required upgrades of firm internal controls, and modified core regulations to address evolution of the market. We continue to be vigilant as markets evolve.

QUESTION SUBMITTED BY SENATOR HARKIN

Question. Has the CFTC encountered problems in having access to any kinds of information on livestock prices and markets it would need to investigate claims, should they arise, about market manipulation in the futures markets?

Answer. Reliable cash prices that accurately reflect supply and demand conditions are critical to the Commission's market surveillance program. One aspect of that program is assessing how well futures prices reflect the cash market as a futures contract approaches expiration. For physical delivery futures contracts, this entails an analysis of the basis or the difference between the futures price and the relevant cash price for the commodity. For cash-settled futures contracts, the futures price will ultimately be set at the specified cash price used for settlement. Consequently, for these markets the surveillance issue is whether the cash price is representative of the market or is susceptible to manipulation to benefit a futures position.

For domestic agricultural markets, the reliability of available cash price quotations has increasingly been of concern to Commission surveillance staff. In the cattle market, cash prices at terminal markets are of declining importance due to the prevalence of direct marketing from feedlots to packers at prices that may not be reported. Several cash-settled contracts, like live hogs, boneless beef, and the new pork belly contract, are settled on the basis of prices reported by the USDA. The staff also has some concerns about the thinness of the underlying cash prices for some of these commodities. Moreover, some USDA price reporters are concerned that, by sharing with the CFTC the confidential data price they collect, they may jeopardize the willingness of some firms to report price data to the USDA. Accordingly, the Commission would support initiatives to strengthen the USDA's ability to collect and publish reliable price data.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

FOOD AND DRUG ADMINISTRATION

STATEMENT OF MICHAEL A. FRIEDMAN, M.D., LEAD DEPUTY COMMISSIONER

ACCOMPANIED BY:

ROBERT J. BYRD, DEPUTY COMMISSIONER, MANAGEMENT AND SYSTEMS

WILLIAM B. SCHULTZ, DEPUTY COMMISSIONER, POLICY

JOSEPH A. LEVITT, DIRECTOR, CENTER FOR FOOD SAFETY

JANICE F. OLIVER, DEPUTY DIRECTOR, CENTER FOR FOOD SAFETY

MITCHELL R. ZELLER, DIRECTOR, OFFICE OF TOBACCO PROGRAMS

DENNIS P. WILLIAMS, DEPUTY ASSISTANT SECRETARY, BUDGET, DEPARTMENT OF HEALTH AND HUMAN SERVICES

INTRODUCTION OF WITNESSES

Senator COCHRAN. The subcommittee will please come to order.

We resume our hearing for the purpose of considering the annual budget request that has been submitted by the administration for funding for the Food and Drug Administration. We are very pleased to have Dr. Michael Friedman, who is the Lead Deputy Commissioner of the Food and Drug Administration, here with us with colleagues. We invite you to introduce those who are with you.

We have your written testimony which we appreciate very much. We will make that a part of the record in full and encourage you to make any summary comments or other statements that you think would be helpful to our committee in understanding the budget request. You may proceed.

STATEMENT OF MICHAEL A. FRIEDMAN

Dr. FRIEDMAN. Thank you very much, Mr. Chairman.

As the Lead Deputy Commissioner of the Food and Drug Administration, it is my privilege to be here today to present our proposed budget for fiscal year 1999.

With me are Mr. William Schultz, our Deputy Commissioner for Policy; Mr. Robert Byrd, our Deputy Commissioner for Management and Systems, both from the Food and Drug Administration. Mr. Dennis Williams accompanies us. He is the Deputy Assistant Secretary for Budget at the Department of Health and Human Services. They and others from the FDA are here to help respond to your questions.

As you recognize, sir, FDA is an agency that serves a vital and unique role in promoting and protecting the public health. The public demands are great. All Americans expect that the food they eat will be safe and wholesome, that the medical products they use,

drugs, biologicals, and devices, will be safe and effective, that children will be protected from the harmful effects of tobacco, and that information on the products regulated by FDA will be useful and understandable.

These are important public health responsibilities and we take them very, very seriously. Our commitment is an enduring one and our high level of performance in the last year demonstrates our ability to make good on that commitment.

As you know, one of our most visible activities is the review of new products before they go to market. I am proud to say that the agency has performed at historically high levels this past year. For example, FDA reviewed and approved 144 new drugs and biologicals last year, a record number, as well as 125 therapeutic supplements. We were 100 percent on time in meeting our pharmaceutical review deadlines. We conducted the reviews in a median of only 12.2 months. That is for both standard drugs and priority products. At the same time we also reviewed a record number of generic products, more than 400.

The Center for Devices and Radiological Health approved 48 major new devices, 5 more than the previous year, even as it cut review times by one-third. Eighteen of these devices presented important diagnostic or therapeutic advances such as the first surgical implant to restore partial hand movement in quadriplegics, a deep brain stimulator for helping to control tremors in people with Parkinson's disease, and the first laser system for treating tooth decay.

Overall, FDA's output, as measured by the number of annual approvals for all new products reviewed by the agency, has improved 17 percent per year for each of the last 4 years. This level of performance is even more noteworthy since in each of the last 4 years, FDA's workload, as measured by the number of all types of applications we receive, has steadily risen at the annual rate of 12 percent per year. As you recognize, our workload is doubling every 6 years, and we fully expect the number of new applications to continue to rise at this very exciting but very challenging rate.

The engine of practical scientific progress is fueled by increased support for biomedical research, at NIH now at a level of \$13.6 billion, and very substantial investments by private industry, more than \$25 billion per year. These organizations are working to turn scientific discoveries into practical, marketable therapeutics.

As a result, we foresee a medical product pipeline filled with novel and promising remedies for years to come. The very uniqueness of these products challenges FDA's own scientists to remain on the cutting edge. We must improve both our intramural scientific and research programs and foster better links with external scientific bodies in order to be able to understand and appropriately evaluate and regulate the very newest products.

In addition, FDA manages important new responsibilities, such as the expanded food safety programs and the tobacco regulation. Moreover, the agency must be prepared for the unexpected, the next outbreak of a novel foodborne pathogen such as *E. coli* O157:H7 or unexpected problems with therapeutics already on the market such as the diet drugs fenfluramine and dexfenfluramine which were recalled last year.

Last, let me say a couple of words, if I may, about the challenges presented by the FDA Modernization Act of 1997, this major piece of legislation intended to improve the regulation of medical products, foods, and cosmetics.

The timely implementation of this ambitious law will be a substantial challenge to FDA. The act directs FDA to publish 42 regulations, 23 guidances, 13 other publications in the Federal Register, as well as 25 other tasks such as postmarketing approval studies, electronic application submissions, and so forth. This will consume a considerable amount of FDA resources for which there is no specific budget allocation.

We, of course, are committed to carrying out the congressional directives delineated in the act, even though many FDA programs have not benefited from funding increases over the last several years.

To meet these expectations and to support the agency's activities, FDA requires \$1.26 billion in fiscal year 1999. The appropriation request includes \$970 million in budget authority, \$281 million in user fees, and \$13 million in other reimbursable activities.

Sir, I want to acknowledge that the proposed budget is complicated and I am sure you will have many questions that we will do our very best to answer, but before I close, I would like to thank you, sir, and the committee for your past commitment to bettering the health of our citizens.

Last year you authorized \$24 million for the President's food safety initiative. We are using that money to take several very important steps to improve the safety of the Nation's food supply. These include increasing surveillance for potential outbreaks, improving consumer education, increasing focused research aimed at detecting pathogens and eliminating them, developing strategies to prevent microbial contamination of food, developing microbial risk assessment techniques, and strengthening the coordination between Federal, State, and local authorities. These are very important steps, but the road to safer food is long and difficult.

In our fiscal year 1999 proposal, we are requesting an additional \$50 million. We plan to further enhance the foodborne illness surveillance program, as well as to expand our coverage of imported products. Research will focus on developing improved methodology for detecting microbial contaminants in food, technologies to eliminate or prevent food contamination, and enhancing our understanding of how microbial resistance to food preservation techniques and to antibiotics occur.

I also want to acknowledge the committee's support for our efforts to reduce tobacco use by youngsters. With the \$34 million the committee provided last year, we have taken important first steps to protecting the Nation's youth from tobacco products. We have established compliance programs in 10 States already, signed contracts with 3, and are negotiating with the next 15. North Carolina signed the first contract for this year, and we expect to have compliance programs in all 50 States by the end of the year.

With the budget increase proposed for the next fiscal year, FDA will expand the enforcement and outreach efforts designed to ensure that retailers do not sell tobacco products to minors.

I believe it is clear, Mr. Chairman, that the investment of each American taxpayer dollar in the Food and Drug Administration is a solid investment in promoting and protecting the public health. Americans expect their FDA to be caring, to remain vigilant, to promote their health and well-being, and to protect them from all types of health hazards. This is an important trust. It is a trust this agency will do its very best to keep.

If I may close, Mr. Chairman, with one personal comment, I on behalf of the agency want to recognize the contributions of Senator Bumpers, convey to him our best wishes as he moves on in his retirement this year. He has dealt fairly and thoughtfully with complex issues and it has always been a pleasure to work with him.

Mr. Chairman, I appreciate very much this chance to address you, to answer your questions, and we look forward to working with you. Thank you, sir.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Dr. Friedman. We have your complete statement and it will be inserted in the hearing record.

[The statement follows:]

PREPARED STATEMENT OF MICHAEL A. FRIEDMAN

Mr. Chairman, members of Congress, ladies and gentlemen, my name is Michael Friedman. I am the lead deputy commissioner for the Food and Drug Administration and it is my privilege to be here today to tell you about our plans and expectations as presented in the Administration's proposed budget for fiscal year 1999. And, of course, I am happy to answer your questions.

FDA is an agency that serves a vital role in promoting and protecting the public health. Our primary obligation is to the public—but we recognize the value of positive interaction with industry, academia and other governmental bodies. Moreover, we value a close and cooperative relationship with Congress.

But it is the public that we serve and it is the public that has high expectations about the performance of my Agency. Americans expect that the food they set on their family table will be safe and wholesome. The public expects that new medical products—drugs, biologicals and devices—will be safe and effective and available in a timely way. The nation expects that children will not use tobacco. And it expects that the information provided on the products that FDA regulates will be useful and understandable.

These are important public health responsibilities and we take them very seriously. Our commitment is an enduring one, but our practices are the subject of re-evaluation and renewal. Important progress was made with the FDA Modernization Act of 1997 toward achieving the expectations of the public and Congress.

OVERVIEW

Today, I would like to examine these public expectations, highlight the actions FDA has taken in the past year and project what we anticipate doing in the next.

Food Safety

Stimulated by recent, publicized outbreaks of food-borne illnesses, food safety has become a subject of increased attention and concern. What's more, public health experts worry that the risks of food-borne disease may be rising as Americans grow older, eat out more, and food is more widely distributed and therefore more vulnerable to contamination. In addition, we face new threats, such as the emergence of novel pathogens like *E. coli* O157:H7, the strain that led to the recent recall of more than 25 million pounds of hamburger and sickened consumers of unpasteurized apple juice on the West coast just over a year ago, and a drug-resistant strain of salmonella called DT104.

Outbreaks like these, and the President's ongoing concern about food safety, prompted him to launch the National Food Safety Initiative last year. Congress responded by allocating \$24 million to the FDA's food safety initiative for the current

fiscal year, as well as giving additional funds to other relevant federal agencies. With these resources, FDA took specific steps to improve the safety of the nation's food supply, including: increasing surveillance for potential outbreaks, improving consumer education, increasing research aimed at improving detection of pathogens, producing strategies to prevent microbial contamination of food, developing microbial risk assessment techniques and strengthening the coordination between federal, state and local governments.

In addition, we have moved rapidly on a number of fronts to improve the safety of the nation's food. At the end of last year, FDA began implementation of the HACCP rules on seafood. As you know, HACCP stands for Hazard Analysis and Critical Control Point (HACCP). It is a scientifically designed program that identifies the steps in food production where contamination is most likely to occur and then puts in place preventive measures. FDA recently announced its intention to develop HACCP regulations for fresh fruit and vegetable juices and proposed regulations to require fruit juice makers to label their products so consumers will know which are treated to prevent contamination and which are not. We also called on manufacturers to voluntarily label their products as soon as possible, even though the regulation is not yet in effect.

In July 1997, FDA hosted a public meeting on the risks of *Cyclospora*. We also convened a federal interagency meeting on food safety research and began drafting a federal plan to set research priorities. That plan should be available this spring. FDA also helped set up a public-private partnership on food safety education along with industry, consumer groups, states and other federal agencies.

In December, after a thorough scientific review, FDA approved the irradiation of meat products for controlling disease-causing microorganisms. The decision applies to fresh and frozen beef, lamb and pork. The Agency concluded that irradiation is safe and does not compromise the nutritional quality of these products. Studies show that it does reduce the number of disease-causing microbes in or on meats.

Last summer, FDA acted to prevent the contamination of feed for American beef, sheep and goats with the agent that causes bovine spongiform encephalopathy or BSE. BSE is a brain-infection by an incompletely understood infectious agent related to a degenerative disorder in humans called Creutzfeldt-Jakob disease. A cluster of Creutzfeldt-Jakob cases in England was associated with eating English beef contaminated with BSE. The resulting outcry seriously damaged the British beef industry. Although there has not been a documented case of BSE in the U.S., FDA acted to protect the safety of America's red meats by banning production practices that raised the risk of BSE transmission.

And finally, on the food front, FDA's Center for Food Safety and Nutrition (CFSAN) has worked hard to reduce the backlog of food additive petitions. By eliminating lower priority activities and through hard work and improved management, the center cut the number of pending petitions in half—from a high of 295 in 1995 to 143 in 1997—and the center continues to make decisions on more petitions than it receives. CFSAN fashioned pragmatic solutions without compromising scientific rigor.

This year, FDA is asking for an additional \$50 million for food safety in fiscal year 1999. With it, we plan to enhance food-borne illness surveillance, as well as increase coverage of imported products by expanding lab certification. Research will focus on developing improved methods of detecting microbial contaminants in foods, technologies to eliminate or prevent food contamination and understanding microbial resistance to food preservation techniques and antibiotics.

To help implement the National Food Safety Initiative, FDA made key personnel changes in January. We reassigned Joseph A. Levitt, an innovative and effective manager within FDA who has served as the Agency's acting deputy commissioner, to take the directorship of the Center for Food Safety and Nutrition. In addition, FDA hired Dr. Robert L. Buchanan, a leading authority on food microbiology and quantitative risk assessment for microbial foodborne pathogens with the USDA's Agricultural Research Service, to be a senior scientist for the National Food Safety Initiative. Other high-level recruitment is underway. This team will lead CFSAN into the next century as it implements an ambitious agenda to improve the safety of the nation's food supply.

In addition, under the President's Initiative to Ensure the Safety of Fresh Fruits and Vegetables, FDA, working with the Department of Agriculture, will develop and finalize good agricultural practice and good manufacturing practice guidances for use by the domestic and foreign produce industry. To minimize microbial contamination, FDA also will provide technical assistance and educational outreach to the domestic and foreign produce industries to promote adoption of the voluntary guidance. To support these activities, research is being accelerated to develop techniques that prevent microbial contamination of produce from the farm to the table.

FDA will move aggressively to deliver on America's expectation for a safe and wholesome food supply, and to work cooperatively with sister agencies in the federal government as well as state and local officials. Each makes a unique and valuable contribution to the safety of the food we eat.

Pharmaceuticals and Biologicals

In addition to safe food, Americans expect that they will have timely access to new pharmaceutical and biological agents that are safe and effective. Since the 1962 Kefauver-Harris Amendments to the Food, Drug and Cosmetic Act, FDA has acted as the gatekeeper, allowing new therapeutic products onto the American market after clinical studies prove their worth. This scientifically complex and time-consuming procedure of reviewing applications has sometimes bogged down in the past. Since 1992, however, FDA significantly picked up the pace of pre-market approvals for drugs and biologics after Congress authorized additional resources through the Prescription Drug User Fee Act of 1992.

Last year, FDA received a record number of new drugs and biologics for review and the Agency approved a record number of them, 144. Among these were 62 new molecular entities or NME's, a record number of these important new products, which went on the market for the first time in this country. NME's often represent hope for patients by providing new treatments or by providing significant improvements over existing therapies, either through heightened effectiveness or reduced side-effects.

And the Agency has done all this even as it reduced the time it takes—on average—to get a drug through review and onto the market from 14.8 months in calendar year 1996 to 12.2 months in calendar year 1997. That's for all types of drugs, both priority drugs and standard drugs. FDA has met the agreed to deadlines negotiated by the Agency, Congress and the industry. For the last two years, we have approached or hit 100 percent on-time performance.

With the renewal of the Prescription Drug User Fee Act last year, FDA will increase the number of reviewers and support staff under this program to 820 in fiscal year 1999, ensuring that the Agency will be able to continue to perform at its current high level.

The evidence of PDUFA's success comes not only from the performance statistics, but also from the strong support FDA received from industry for its renewal, as well as the prestigious Innovations in Government Award given for the improvements in the drug and biologics approval process. The award is sponsored by the Ford Foundation, Harvard University's John F. Kennedy School of Government in partnership with the Council in Excellence in Government.

FDA launched a number of other initiatives related to drugs and biologics in the last year. For example, FDA proposed a rule that would provide health care professionals with the information necessary to prescribe medications more safely for children. The proposed rule would assure that labeling for certain new and already marketed drug products contain information on the use of the drug in pediatric populations. In some cases, companies have been allowed to put pediatric information on the label after extrapolating from adult studies along with safety and pharmacokinetic data obtained from trials in children.

Currently, many widely used medicines are not properly labeled for use in children, forcing pediatricians to estimate the proper dose of an adult medicine for use in a child. Too often this can lead either to the side effects of an overdose or a therapeutic failure when too small a dose is given. FDA's pediatric labeling initiative is complemented by the provisions of the FDA Modernization Act of 1997 that grants a six month period of market exclusivity for studies of the pediatric use of certain drugs.

FDA moved to ensure that women are included in early clinical trials of drugs and biologics designed to treat life-threatening diseases. In the past, women have been excluded because they might be pregnant at the time that they receive the experimental therapy. The Agency's proposed rule would give it the power to suspend a clinical study if the sponsor routinely excluded men or women from the clinical study because of potential toxic risks to offspring or reproductive organs.

Under the PDUFA renewal, FDA has promised to improve its drug-review performance still more. Under the previous version of the program, FDA had 12 months to review a standard drug and six months to review priority drugs. We have been meeting those deadlines. Under the new program, FDA will gradually ratchet down approval times for standard drugs by an additional two months.

In addition to requesting the increased resources authorized in fiscal year 1999, the President's budget also requests supplemental appropriations for fiscal year 1998 of \$26 million in additional revenue for the Agency to begin, in earnest, the enhancements envisioned in the reauthorization of PDUFA. With the resources pro-

vided by this renewal, FDA expects to continue its high level of performance and provide American patients with speedy access to drugs and biologics while maintaining the Agency's customarily high scientific standards.

Medical Devices

Third, Americans expect that the medical devices used to detect and treat their illnesses—from diagnosing breast cancer to treating Parkinson's disease—will be safe and effective and that they will have access to them in a timely way. In addition, we need to be sure products include information on how and when to use them and what patients can expect when they are cleared for market. That means FDA must work closely with manufacturers throughout product development and clinical study so useful information is generated efficiently. That also helps FDA act quickly to review, independently, the data on safety and effectiveness.

Since 1994, when Congress provided the Center for Devices and Radiological Health (CDRH) with some additional resources, the center's staff has made substantial and sustained improvements in the quality and speed of its reviews. In the past year, CDRH approved a record number of pre-market applications (PMA's), eliminated all remaining backlogs and improved review times in every product category.

Forty-eight PMA's were approved in fiscal year 1997, five more than the previous year. Nearly all were for new products and 18 of them represented important diagnostic or therapeutic advances. The average time to approval decreased from 26 months in fiscal year 1996 to only 17 months in fiscal year 1997. Key device approvals last year included the first surgical implant to restore partial hand movement in quadriplegics, a deep brain stimulator to help control tremors in people with Parkinson's disease and the first a laser system for treating tooth decay. At the same time, CDRH eliminated the backlog of PMA's and PMA supplements.

The center also made substantial improvement in its 510(k) application review times, cutting almost in half the peak average review time of 194 days in fiscal year 1994. These 510(k) applications are for medical devices substantially like devices already approved for marketing.

CDRH has every hope of its ability to maintain this high performance level as it begins the complex implementation of the FDA Modernization Act of 1997. Unlike the provisions that renew the Prescription Drug User Fee Act, the legislation does not provide CDRH with additional resources, so all of the costs to implement FDAMA and meet performance expectations must come out of the device program's budget. The center's leadership is deeply concerned about the effect this will have on existing programs and resources, but they are committed to making every effort to provide American patients with speedy access to safe and effective medical devices.

Tobacco

Fourth, Americans expect that their children will be protected from the seduction of tobacco products and the addictive nicotine that they contain. In February 1997, the first provisions of FDA's final rule on tobacco went into effect, making it a violation of federal law to sell cigarettes or smokeless tobacco to anyone younger than age 18. The new rule also requires retailers to ask for photo ID from anyone younger than 27 before selling tobacco products.

To enforce the new provisions, FDA established contracts with its first 10 states—Arkansas, California, Colorado, Florida, Illinois, Massachusetts, Minnesota, Pennsylvania, Texas and Washington—to conduct enforcement surveillance. In the current fiscal year, FDA will sign contracts with the remaining states and U.S. territories that are willing to join with us so they can conduct the enforcement inspections of retail operations.

The Agency also launched an education campaign last year to inform retailers of their responsibilities under the new rule—including a nationally broadcast teleconference—and a training program for state officials.

FDA's tobacco rule was challenged in federal district court by tobacco manufacturers and others. The court upheld the Agency's jurisdiction and the age and photo ID provisions were allowed to proceed but other portions of the rule were not upheld or suspended pending appeal. FDA appealed these adverse rulings and is currently awaiting a decision by the U.S. Circuit Court of Appeals.

For fiscal year 1999, the Administration is asking for a \$100 million increase in the tobacco program for additional enforcement and evaluation activities as well as compliance outreach, including trade advertising and direct mail targeted to retailers, advertising on radio, print and billboards, public education aimed at parents, community organizations and voluntary health groups. FDA also anticipates beginning a scientifically based product regulation program, including setting up a system to review and analyze product ingredients.

When all the provisions of FDA's final tobacco rule are implemented, FDA believes that it will significantly reduce the number of young people who become addicted to tobacco and will achieve the Administration's goal of cutting by half the 3,000 teenagers who become regular smokers every day.

Information

Fifth, Americans expect that they will be able to make individual decisions and choices about their personal health and the health of family members. To do that, they expect and need to receive reliable, useful and understandable information about the products that FDA regulates.

Some 1.3 million times a year, Americans misuse their medicines and are injured, causing thousands of preventable hospitalizations resulting in estimated annual costs of \$20 to \$75 billion. To reduce the risk of medical misadventures, FDA helped launch the Medguide program last year. Under Medguide, private contractors will develop and distribute scientifically accurate and unbiased information that gives patients sufficiently specific, comprehensive and easy to understand directions on the proper use of their medications. The goal is to provide a Medguide brochure every time a patient fills a prescription.

The Agency also proposed new, easy-to-understand labeling for over-the-counter drugs. Consumers spend some \$18 billion a year on OTC drugs currently. The instructions and warnings on their labels are neither standardized nor easy to use. The new regulation is designed to give consumers the kind of information they need to make informed decisions—just like the food label—in a format that is easier to read and understand. As a result, patients will know how to use OTC products correctly and better understand their risks and benefits.

A new guidance proposed by FDA last summer will make it easier for pharmaceutical manufacturers to advertise prescription drugs directly to consumers. The guidance clarifies the requirements for advertisements on television and on radio, including information about any major risks, as well as instructions for how consumers can easily obtain more detailed information about the drug's approved uses and risks. This new guidance will help promote greater consumer awareness about prescription drugs.

To speed the flow of information between FDA and industry, the agency is rapidly moving into the age of electronic submissions of applications for marketing approval for drugs, biologics and devices. A paperless approach has the potential to increase efficiency, speed up the review process and even make it easier to retrieve information when problems arise after a drug is approved. The full impact of electronic filing has yet to be appreciated but the Agency's leaders expect it to be profound.

Information is also the engine of scientific advancement. FDA actively tries to ensure that it stays on the cutting edge through excellent intramural scientific programs and collaborations with sister agencies such as the NIH and the CDC and academia.

As a science-based organization, FDA will continue to search for the best ways to gather and digest the mountains of new information pouring out of the nation's biomedical research centers and present it to consumers in ways that are timely and useful.

Other Achievements

FDA's many accomplishments cannot be covered in a single document. There has been important progress in many centers and activities, from re-engineering the drug approval process in the Center for Veterinary Medicine to breaking ground for the new regional laboratories in Arkansas, next to FDA's National Center for Toxicological Research, and another at York College in Jamaica, N.Y.

I should specifically mention that OASIS, the Operational and Administrative System for Import Support, became fully operational in every U.S. port of entry where FDA-regulated products come into the country by sea, land and air. This computerized system electronically links all FDA inspection offices with the brokers who bring foreign products into the country. Based on the information supplied by the broker, OASIS can give automated and immediate clearance for the imports or trigger an inspection by a FDA official.

The implementation of this system comes at a critical time for FDA's Office of Regulatory Affairs, which manages the nation's imports of foods and medical products. The quantity of FDA-regulated imports has nearly doubled from 1.5 million at the beginning of the decade to more than 3 million entries or shipments today. Yet the number of FDA inspectors and analysts has increased only slightly from just under 700 in 1990 to just over 800 today. Without the OASIS system, FDA would have a difficult time monitoring the products flowing into this country and keeping out those that pose a threat to our citizens.

THE BUDGET

The President has requested \$1.26 billion for FDA's budget in fiscal year 1999. To support this program level, the appropriation request includes \$970 million in budget authority, \$281 million in user fees, and \$13 million in other reimbursable activities. This amount will allow the Agency to carry out a core of critical activities and move forward with new initiatives to protect and promote the health of the American people.

The fiscal year 1999 budget for FDA contains the first annual performance plan for the Agency. FDA priorities, goals and objectives for the year are detailed in the performance plan as well as in the budget. Moreover, the plan is closely linked to the resource levels requested in the budget.

User Fees

The budget proposal for fiscal year 1999 includes \$281 million in user fees. Nearly \$153 million in currently authorized user fees will be collected, including \$132 million under the enhanced Prescription Drug User Fee Act and \$21 million in other existing user-fee programs to support Mammography Quality Standards Act inspections, export certification and the certification of color additives.

What's more, the budget proposes \$128 million in additional proposed, but not yet authorized, user fees. These new fees, if authorized by Congress, would cover a portion of the cost of the full range of premarket and postmarket activities in most of FDA's program areas including foods, human drugs, biologics, animal drugs and medical devices.

FDA provides a vital public service by promoting health and protecting consumers from unsafe and impure regulated products. Additionally, industry derives a direct commercial benefit from consumers' confidence in FDA's review process and product surveillance, which provides a substantial guarantee of safety. Given the benefits to both the public and the industry, and given that workloads are growing far faster than government resources, FDA believes it is reasonable to share some of the cost between the taxpayer and the industry. Consumers, through tax dollars, already substantially support FDA's activities. In order to maintain necessary funding program levels in an era of fixed, disciplined resource allocation under the balanced budget agreement, the Agency is proposing user fees to help support the whole range of FDA activities.

FDA will work with Congress and the Agency's many constituencies, including the regulated industries, to further develop the proposed fees in conjunction with agreed-upon performance measures and goals that will be linked with the proposed resource levels.

CONCERNS FOR THE FUTURE

Although the Agency's performance has been steadily improving, we have concerns about the future. Our portfolio of important public health responsibilities continues to grow. New and sometimes unexpected issues, such as concerns about imported foods, safety of novel technologies and the emergence of new pathogens, arise continually.

Rising Workload

FDA will continue to face a growing workload. The number of applications for all of the types of products that FDA reviews each year has been going up at 12 percent per year for the last four years. With PDUFA funding for drugs and biologics and innovative management initiatives in all of the centers, we have kept pace with the growing workload; in fact, we have exceeded it. As measured by the number of annual approvals for all new products, our output has increased 17 percent per year Agency-wide.

We are concerned that we may not be able to continue to achieve annual improvements in performance, especially if we do not receive the level of resources included in the President's budget. If the workload continues to rise at 12 percent per year, it will be a great challenge to continue to increase performance given budget projections.

Fluctuating Staffing

FDA's staffing has not grown with increased responsibilities. Over the past five years, the Agency has steadily reduced staff in many core functions supported by appropriations alone even as it increased staff in areas supported by user fees. The overall staff levels rose slightly from the beginning of PDUFA in 1992 from a total of 8,868 FTE's to a high of 9,242 FTE's in fiscal year 1995. After that, there has been a modest decline, though an increase is expected in fiscal year 1999 as FDA expands with the renewal of PDUFA.

In addition, total FTE's will rise this year as the Agency adds staff for food safety and tobacco. These, however, are focused programs that have received specially designated appropriations. While these specialized programs continue to grow, core FDA functions have seen a steady decline in non-PDUFA FTE's from the fiscal year 1992 level of 8,868 to a low of 8,444 in the current fiscal year, a 4.8 percent drop.

The Agency leadership is concerned that the performance improvements made in the past few years may not be maintained if staffing continues to shrink and workloads continue to increase.

Increasingly Full Pipeline

There's little doubt that the workload pressures will continue to rise in the future. The National Institutes of Health, with an annual budget of \$13.6 billion, is an engine of biomedical research and medical progress. The basic research that it supports in universities and private labs across the country will lead to the development of many new medical products.

At the same time, the industry's research and development investment of some \$21 billion in drugs and nearly \$4 billion in medical devices last year continues to grow as companies try to transform the advancing medical science into new products. The payoff is a product development pipeline filled with promising new therapeutics, some of which are strikingly novel.

For society, the benefit from this investment in basic research is great. For FDA, as society's technological midwife for medical products, the burden also is great as it struggles to manage the burgeoning flow of new products to the market.

In addition, new issues arise and add to our workload. Let me give you an example:

PostMarket Surveillance

As more medical products move through the development pipeline and receive FDA approval every year, the number of therapeutics on the market has reached record proportions. Because FDA has a never-ending responsibility for every product—from the time it is first used until it becomes obsolete and is withdrawn from the market—the Agency must remain vigilant for unanticipated or rare, but serious, problems that might arise after patients begin to use it.

In recent years, much less attention has been paid to postmarketing surveillance, FDA's responsibility to understand what happens to a product after it is approved and marketed. This is a critical part of FDA's responsibility because approved drugs and devices sometimes cause unexpected consequences, such as the discovery of heart-valve damage caused by the diet drugs fenfluramine and dexfenfluramine last year. As you know, we moved quickly to take fenfluramine off the market.

Postmarketing surveillance becomes even more important for devices as the FDA Modernization Act of 1997 is implemented. The act directs the Agency to consider how postmarketing surveillance can reduce the amount of efficacy evidence required to get a device on the market.

Clearly, the need for this kind of surveillance is growing rapidly. Industry is developing more and more new products; FDA is approving them at record rates. At the same time, FDA launched MEDWATCH to get doctors to report adverse events and cross-drug reactions. The program is accumulating information so rapidly that the number of reports is going up logarithmically. We will be increasingly challenged to properly analyze those trends.

With this budget, the Agency expects to respond to the problem through increased efficiency, use of information technology—for example the computerized Adverse Event Reporting System that is being implemented for pharmaceuticals—and by partnering with health professional organizations, academia, industry and our international regulatory colleagues. If these approaches are not successful, however, unexpected adverse effects from already approved therapeutics could become a serious problem in the future.

Emergencies and Other Uncertainties

When FDA discovers that an approved therapeutic is injuring patients or a food product is contaminated with a pathogen, the Agency must react quickly and competently. The rapid removal of the diet drug Fenfluramine, the quick action of tracking down the source of *E. coli* contamination in apple juice, requires substantial Agency resources. As the technology for surveillance improves for food-borne illnesses and as more and more pharmaceuticals and medical devices reach the marketplace, FDA predicts that there will be an increasing number of these kinds of emergencies.

In addition, we know that FDA will face future uncertainty and novel problems. No one could have predicted the first drug tampering cases let alone the advent of animal—and the potential of human—cloning or avian flu spreading to humans. No

one can say what future crises will arise, but we do know they will come. And when they do, they will consume unbudgeted resources.

Consider, for example, the avian flu. FDA reacted quickly to the first reports, consulting with sister agencies such as CDC, NIH, DOD and USDA as well as international health agencies such as the World Health Organization and vaccine manufacturers. Once the critical parts of the virus were identified, FDA acquired recombinant H5 HA antigen from a biotech company and injected it into sheep to produce standardization reagents for vaccines that might have to be developed on an emergency basis. A high-security, biological containment lab at FDA is being used to safely study the virus while preventing the unintended release of the H5N1 avian flu into domestic poultry or people. FDA already is working with NIH to permit testing of experimental purified H5 HA vaccine to prevent the spread of avian flu in America.

Based on the past, the Agency knows that the unexpected lies ahead. We need to think about ways to prepare for it.

International Issues

FDA has experienced a dramatic increase in its international operations. It has been an active participant in the development of common approaches to the international approval of new medical therapeutics under the International Harmonization Conference with the European Union. It has also entered into Memoranda of Understanding and Mutual Recognition Agreements for a variety of activities including inspection of international production facilities for pharmaceuticals and medical devices as well as increased inspection responsibilities for imported foods. International activities, however, have proved to be more and more complex and resource intensive than expected.

As global trade in FDA-regulated products continues to grow exponentially, the Agency will face an increasing challenge to its ability to protect American citizens while maintaining good relationships with other countries.

Implementing FDA Modernization

Lastly, let me say a few words about the FDA Modernization Act of 1997. This major piece of legislation focused on modernizing the regulation of medical products, food and cosmetics. The act directed FDA to carry out a number of programs that will include publishing 42 regulations, 23 guidances, 13 other publications in the Federal Register as well as 25 other tasks, such as mutual recognition agreements and global harmonization, postmarketing approval studies and electronic applications and submissions, and seven reports. This will consume a considerable amount of FDA resources for which there is no specific budget allocation. We, of course, are committed to carrying out the congressional directives delineated in the act.

CONCLUSION

I believe it is clear that the investment of each American taxpayer dollar in the Food and Drug Administration is a solid investment in protecting the public health. From the programs I have described, you can see that when Congress invests its trust and resources in FDA, the Agency uses the money well and is productive.

This is an Agency staffed by professionals. We deliver on the expectations of Congress and the American public. When we have sufficient resources, we meet our goals because we are disciplined. When confronted with problems, we make the hard public health choices to ensure the greatest good for the largest number of Americans.

Because FDA is a science-based Agency, it is judicious in the problems it chooses and the way it goes about solving them. We know what's important and we invest where it will do the most good.

Americans expect their FDA to remain vigilant, to promote their health and well being and to protect them from all sorts of hazards. That is an important trust. And it is a trust this Agency will not fail to keep.

Thank you.

BIOGRAPHICAL SKETCHES

MICHAEL A. FRIEDMAN

As Lead Deputy Commissioner, Michael A. Friedman, M.D. is the senior manager for the Food and Drug Administration. He will act in this capacity until a new Commissioner of Food and Drugs is named/confirmed. In addition, he continues his duties as Deputy Commissioner for Operations, overseeing the operations of the Agency's 6 Centers and the Office of Regulatory Affairs, including all field offices. He

manages high priority scientific and public health issues both within and across Centers and participates in a broad range of public health issues sponsored by the Department of Health and Human Services. As a member of the Agency's senior management team of Center Directors and Deputy Commissioners, Dr. Friedman is involved daily in negotiations and discussions of food and drug issues with regulated industries, patient and consumer groups, congressional staff, other federal and state agencies, and representatives of foreign governments.

Dr. Friedman received a B.A. degree in English from Tulane University, New Orleans, Louisiana and an M.D. degree from the University of Texas, Southwestern Medical School, Dallas, Texas. His postgraduate medical training was at Stanford University, Stanford, California and the National Cancer Institute, Bethesda, Maryland, and he has Board Certification in Internal Medicine and Medical Oncology.

Prior to his October 1995 appointment as Deputy Commissioner for Operations, Dr. Friedman served as the Associate Director of the Cancer Therapy Evaluation Program from 1988-1995 and from 1985-1988 as Chief of the Clinical Investigation Branch within the Division of Cancer Treatment at the National Cancer Institute, National Institutes of Health. From 1975 to 1983, Dr. Friedman was a faculty member at the University of California San Francisco Medical Center serving as an Associate Professor in the Department of Medicine, and the Director of Clinical Affairs and the Interim Director of their Cancer Research Institute. Dr. Friedman's professional activities at the local and national level have included appointment to the various posts in the American Society for Clinical Oncology, as well as membership in the American Cancer Society, the American Federation for Clinical Research and the Western Society for Clinical Investigation. His scholarly activities include authorship of numerous scientific articles and book chapters as well as editorial board responsibilities for books and journals.

Dr. Friedman is a career Public Health Service Commissioned Corps member and currently holds the rank of an Assistant Surgeon General. He has received the PHS Commendation Award in 1992, the EEO Special Achievement Award in 1993, and the PHS Distinguished Service Medal in 1997. He is a member of Phi Beta Kappa and Alpha Omega Alpha honor societies.

ROBERT J. BYRD

Appointed to this position in December 1995, Mr. Byrd is responsible for Strategic Planning and Management Systems, and providing leadership and direction in all phases of management operations. Mr. Byrd is the Chief Financial Officer for FDA and the Commissioner's Chief Advisor on all aspects of managing FDA resources. Mr. Byrd is also responsible for providing cost effective, customer focussed management support for the operating programs, including financial management, human resources management, facilities management, procurement, grant and contract management, safety and security, information systems, and effective planning and assessment of Agency programmatic activities.

Prior to joining FDA in 1994 as Associate Commissioner for Management, he was recruited into the U.S. Department of Agriculture's Senior Executive Service Career Development Program as a management specialist, 1992-1994. There, he designed a model for integrating procurement management within USDA. Many of the elements of his model, which was presented to the Vice President and to the Secretary of Agriculture, were incorporated into the "Report of the National Performance Review."

He also served as Assistant Secretary, Services and Logistics in Maryland state government from 1990-1992. Prior to that, Mr. Byrd served in Maryland's Department of General Services as Director of Operations, 1986-1990; Executive Assistant to the Secretary, 1984-1986; Administrator, Special Projects, 1981-1984; Executive Director Maryland Minority Educational Fund, 1976-1981; Administrator, Architect/Engineer Selection Board, Maryland state government, 1975-1984; Accountant/Auditor, Maryland Department of Transportation and Maryland Department of General Services from 1973-1975. Mr. Byrd received a B.B.A. from Loyola College and an M.B.A. with honors from Loyola College in 1987. His awards include the Governor's Citation for Outstanding State Service, MD, 1983 and 1992; Governor, Comptroller, and Treasurer's Distinguished Service Award, MD, 1984; FDA's Award of Merit, 1996; and FDA Commissioner's Special Citation, 1997.

WILLIAM B. SCHULTZ

Mr. Schultz is the Deputy Commissioner for Policy at the Food and Drug Administration (FDA). As the Deputy Commissioner, Mr. Schultz oversees the Agency's

policy development activities and the processing of all FDA regulations. He is the principal advisor to the Commissioner on policy matters before the Agency and bears primary responsibility for coordinating FDA's policies with other government agencies and countries. He also oversees implementation of the President's Tobacco Initiative and the development of the Agency policy positions on legislative matters before Congress.

Prior to his appointment, Mr. Schultz served as Counsel to the House Subcommittee on Health and the Environment, which was chaired by Congressman Henry A. Waxman of California. Mr. Schultz was the Counsel principally responsible for the following laws: Nutrition Labeling and Education Act of 1990; Safe Medical Devices Act of 1990; the Prescription Drug User Fee Act of 1992; Generic Drug Enforcement Act of 1992; and DES Education and Research Amendments of 1992.

Prior to becoming Counsel to the Subcommittee, Mr. Schultz was a Senior Attorney at Public Citizen Litigation Group, where he litigated cases in state and federal court (at all levels) on a variety of issues, including food and drug law, automobile safety, nuclear power, voting rights and anti-trust. He also represented Public Citizen before Congress and has written a number of articles, principally on food and drug law issues.

Between 1982 and 1996, he was an Adjunct Professor at Georgetown University Law Center, where he taught Civil Litigation and Food and Drug Law.

Mr. Schultz served as a Law Clerk to United States District Judge William B. Bryant.

He received his J.D. from the University of Virginia Law School and his B.A. from Yale University.

DENNIS P. WILLIAMS

Dennis Williams has served as Deputy Assistant Secretary for Budget since 1984.

Dennis provides advice and assistance to the Assistant Secretary for Management and Budget, and the Secretary, on program policy and management issues dealing with the Department's budget. He is responsible for the formulation of the budget for HHS and its presentation to the Office of Management and Budget and to Congress.

From 1982 until 1984 he served as the Director, Division of Welfare Budget Analysis in HHS. Before that, starting in 1980 until 1982 he served as Chief, Health Care Financing Branch, Division of Health Budget Analysis.

From 1977 until 1980 Dennis was a Program Analyst in the Division of Health Budget Analysis.

Prior to his appointment at HHS, Dennis served from 1968 until 1971 as a Program Specialist with the Office of Economic Opportunity and from 1965 to 1967 with the Peace Corps in Turkey. He was awarded a doctorate in International Relations at the Johns Hopkins School of Advanced International Studies in 1976.

FOOD SAFETY INITIATIVE

Senator COCHRAN. We appreciate the cooperation that we have received from you, Dr. Friedman, in the work of this agency. I know that as an acting director, you have been called on to do an awful lot of heavy lifting. We have admired the efforts that you have made to assume responsibility for the actions of the agency and to try to provide strong leadership as the acting administrator.

The questions I have are centered primarily on the substantial increases in the budget request. Specifically, the first item is the food safety initiative. You pointed out that there had been an additional \$24 million provided for this food safety initiative for the current fiscal year. Now we see an additional \$50 million increase over that amount being requested for this initiative.

It seems like an awful lot of money and at a time when we do not anticipate an increase in allocation to this subcommittee. So, if we provide increases in funding, they have to come from other programs. We do not have the luxury of just reaching up in thin air and pulling down new money to support these increases. So, that presents us with some hard choices that we have to make.

So, we need to know what is being done in this area that justifies taking \$50 million from some other program either at FDA or from some other agency that is funded in this appropriations bill. So, it is going to be a hard sell I think.

You pointed out surveillance, education, research, imported products requirements.

Dr. FRIEDMAN. Let me do my very best to make that case to you, sir.

Senator COCHRAN. Why do you need so much more money?

Dr. FRIEDMAN. It is a very appropriate question and I want to convey to you both the reasons why we think this is a very important investment in our future and the recognition of how many worthwhile activities compete for your committee's attention and resources. I do recognize that as a very significant tension.

You recognized the background upon which all of these discussions occur. Our current assessment of the number of illnesses from foodborne infections is rather imprecise, but at a low it is a little over 6 million and at a high, perhaps 33 million individuals become ill each year in the United States from foodborne illness. The dollar figures associated with their loss of ability to work and function is significant. More critical, of course, are the perhaps 9,000 deaths that occur each year from foodborne illness.

The background upon which we are facing food threats is a very substantial one. Our population is becoming older and more sensitive to foodborne infections. The kind of foods that we eat are changing dramatically, much more imports. Our imports have virtually doubled over the past 7 years and are going up at an even more rapid rate as our consumers want to have fresh produce or other products available year-round from all over the world.

Not only that, but the micro-organisms themselves have changed. We have seen the evolution of more virulent, more deadly micro-organisms. The E. coli O157:H7 is one example but by no means the only one. There is a Salmonella subtype. There are Campylobacter microbes that are becoming more virulent and more deadly.

When you put all this together, you realize that America has a very safe food supply now, but that our citizens want this to remain safe and even safer and that the challenges that we confront in the future are going to be very substantial.

I am sorry for that long introduction. I know you recognized that but I thought it was worth just restating it.

We are working very closely and very cooperatively with our colleagues in the Centers for Disease Control and Prevention, at the U.S. Department of Agriculture, at the Environmental Protection Agency, with State and local authorities to try and have the most integrated, most powerful system for preventing infection, detecting infection, and dealing with it once we identify it.

The paradigm is that we want to control all the possible contaminations from the farm where the food is produced, until it reaches the consumer's table. It is a formidable challenge to cover that entire range, but if you think about the vast number of food types, the vast number of opportunities for infection—I do not want to seem arrogant—this is a modest request and one that we agonized over because we did not want to come to this committee asking for

an exorbitant amount. We think the programs identified here are really very sensible scientifically from a public health point of view. We do recognize how difficult it is to make these budgetary allocations, but this is what I think our citizens want as one of their primary desires and I think we can make a very strong case for it, sir.

Senator COCHRAN. There is one part of the program that we understand includes expanding the effort to inspect seafood under the new HACCP requirements. What level of funding is being allocated for the hazard analysis and critical control point requirements and the implementation of a seafood inspection program?

Dr. FRIEDMAN. This year we are committing to fully implementing the seafood HACCP program with some \$8 million to recruit an additional 80 seafood inspectors.

In addition to that, though, there are extensive activities in terms of education for State and local regulatory officials, but also educational activities for the seafood processors and the industry people as well.

This looks to be so far a very promising start. This was the pilot program which the U.S. Department of Agriculture has been watching very closely as they model their own HACCP program. It seems to be one where there is a good deal of cooperation between industry, local authorities, and Federal authorities. At this point, sir, we are enthusiastic about it. It is the pilot program in some sense. We are deeply committed to a full and vigorous implementation of the HACCP program for seafood.

We are of course, examining and will be moving to HACCP programs for juices this year as well.

Senator COCHRAN. The budget justification that has been submitted to the committee indicates that FDA intends to expand implementation of HACCP and other food safety assurance systems in the food industry. What expansions and new systems do you intend to implement?

Dr. FRIEDMAN. Our juice program is No. 1 in that regard.

Senator COCHRAN. What is that?

Dr. FRIEDMAN. Fruit juice.

Senator COCHRAN. OK. I just did not understand what you said.

Senator BUMPERS. You say you are planning to expand it to fruit juices?

Dr. FRIEDMAN. Yes, sir; that is right. That will be the next area.

I think that we want to only expand HACCP programs in those areas where there is scientific basis and where there is an expectation that such a system, as attractive as it is intellectually, will actually be practical and will in fact offer the consumer something positive.

Mr. Schultz.

Mr. SCHULTZ. If I could just comment. I think this represents a new philosophy by the FDA and really reflects the sort of Reinventing Government approach of this administration. We are moving away from what we did before, which was having inspectors go in plants. We were accused, I think sometimes justifiably, of nitpicking, and it was a very confrontational relationship with the industry.

With HACCP, we are starting with the areas where there is the greatest concern, the greatest risk. It involves FDA working with the company to develop what is called a HACCP plan, which is a plan that says how often do you clean the counters, how often do you check the temperature in the refrigerator, where do you have to have pasteurization or something equivalent in the case of juice. Then, what our inspectors do is they come in, they look at the plan, and they look at the records, not just what is happening that day, such as is the floor dirty? But looking back in time what happened when they checked the temperature, when they did this, and when they did that.

It is much more effective in terms of food safety and I think it is much more constructive. Obviously, where there are serious violations, we will bring enforcement actions, but the idea is to get away from the single day, nitpicking kind of approach, and really focus on what is important.

Senator COCHRAN. It does sound like that is the kind of thing that inspectors do in city governments or in local governments. Are there not agencies involved in going around and certifying restaurants and other food establishments where people buy food to see if the counters are clean, et cetera? Or am I missing something here? Why do we need a Federal agency doing that?

Dr. FRIEDMAN. Well, State and local inspectors inspect at the retail level. I think the value of having Federal inspectors is a couple of fold. One is in setting the principles. For example, the State of Alaska has recently come to us and so much appreciated our seafood HACCP program, the scientific basis of it, the clarity of it, the logic of it. They are incorporating it as their State program and following it there.

In terms of dealing with international suppliers who may not supply just one city or one locality but many parts, we have a very important role to play there. In terms of interstate commerce where seafood is distributed widely across parts of the country, we have a very important role to play there.

In terms of having certain authority to set the standards, I think that we have a very valuable contribution, but I must recognize the important role that State and local authorities do play in this. We work closely with them in that regard.

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. Thank you, Mr. Chairman. First, let me apologize to you for being a little late. I have a responsibility on the Energy Committee as ranking member, and they had a big—

Senator COCHRAN. Knock down, drag out?

Senator BUMPERS. Yes; exactly. [Laughter.]

Dr. FRIEDMAN. Thank you for being here, sir.

Senator BUMPERS. Like a train wreck, I did not want to miss it, but I have sat where you have sat many mornings by myself in this committee holding these hearings, and I know what that can be like.

Dr. Friedman, let me first thank you. My staff tells me that you paid a great tribute to me before I got here. I wish you would have saved it. I would like to have heard it. [Laughter.]

But I know that everything you said was true and a lot more. [Laughter.]

Dr. FRIEDMAN. I edited those remarks, sir, yes.

Senator BUMPERS. Thank you very sincerely for your kind remarks. I have had an excellent relationship with you and Dr. Kessler, all the FDA directors.

In any event, I have the highest approval rating in my State I have ever had, even when I was a young, dynamic, good looking Governor, which tells you that when you tell them you are going to exit, they all love you. [Laughter.]

Dr. Friedman, let me just ask you a few questions. I hope these have not been asked before, but do not hesitate in telling me if this question has been presented to you before.

I wanted to ask you, first, how long have you been inspecting seafood and how is that going?

Dr. FRIEDMAN. Well, I do not have the exact date of when we began inspecting seafood.

Senator BUMPERS. Let me tell you. A couple of years ago.

Dr. FRIEDMAN. Do you mean under the HACCP program?

Senator BUMPERS. Pardon?

Dr. FRIEDMAN. Under the HACCP program?

Senator BUMPERS. Yes; I am sorry. Under the HACCP program. I am sorry. I left that out.

Dr. FRIEDMAN. Mr. Levitt, who is the Director of our Center for Food Safety, may be prepared to deal with more of these.

The full implementation of HACCP only occurred this last December.

Senator BUMPERS. This past December?

Dr. FRIEDMAN. The full implementation.

Senator BUMPERS. I guess it is fair to say then, Mr. Levitt, you have not had enough experience yet to know how it is going to work, have you?

Mr. LEVITT. We are clearly in the first year of its implementation, and we consider this both a learning experience for us and the industry. One thing we are doing, I think No. 1, we have a goal of inspecting every seafood processor within the calendar year.

Senator BUMPERS. Where are you in that goal now?

Mr. LEVITT. Well, we are a quarter of the way into the year.

Senator BUMPERS. You are at 25 percent?

Mr. LEVITT. I am not positive we are at 25 percent as yet, but we have been doing it for the first quarter of the year.

What we are doing, which I think is a little unusual, is we are providing feedback letters to companies after the inspection. Again as Mr. Schultz said, the traditional mode is for FDA to have a very kind of arm's length relationship with the industry. We are trying to do this much more cooperatively and after the inspections, we are providing written feedback to companies of potential areas we think improvement could be made in their HACCP program in an effort to use this program as a way to raise the standards overall and enhance the safety of the program.

So, we consider this first phase of implementation to be both the first year that companies are expected to have a full seafood HACCP program in place, but also recognizing there is a learning curve involved. So, we are trying to provide constructive feedback on how they can make it even better.

IRRADIATION OF FOOD

Senator BUMPERS. Do you permit irradiation of seafood? Anybody?

Mr. SCHULTZ. No.

Senator BUMPERS. You do not irradiate seafood. Is there a specific FDA prohibition against irradiating seafood?

Mr. SCHULTZ. In order to irradiate food, we treat that as a food additive, so a sponsor has to come and ask permission, and I do not know that kind of request has been made for seafood.

Senator BUMPERS. But do you have an answer for them if it is made?

Mr. SCHULTZ. Well, we have to look at the data.

Senator BUMPERS. Do you have any data?

Dr. FRIEDMAN. This is Janice Oliver, Deputy Director in our Center.

Ms. OLIVER. Good morning.

Senator BUMPERS. Ms. Oliver.

Ms. OLIVER. We have some data that has been supplied to us on irradiation for seafood and we have petitions that are in-house that I cannot comment on. But we also have some additional data that the seafood industry is gathering at the present moment to supply us.

Senator BUMPERS. While you are there, Ms. Oliver, you may be the one to answer this. What percentage of the poultry in this country is irradiated? Does anybody know the answer to that?

Mr. SCHULTZ. Small.

Dr. FRIEDMAN. I believe it would be a USDA issue.

Senator BUMPERS. I know this is USDA's responsibility but I thought you might have some idea.

Dr. FRIEDMAN. My understanding is it is a small percentage but I cannot give you a quantified number on that.

Senator BUMPERS. Let me ask you this. If I wanted to start irradiating foods, for example, poultry, would I have to come to you and ask your permission?

Mr. SCHULTZ. The answer is yes, and it has been done and we gave the permission.

Senator BUMPERS. So, it is done on an individual basis. The poultry industry does not have ad hoc authority to just go ahead and start, what shall I say—

Mr. LEVITT. Irradiation is considered a food additive under the Food, Drug, and Cosmetic Act and needs prior FDA approval. Irradiation has been approved for particular products including poultry and most recently for red meat.

Dr. FRIEDMAN. Currently, there are several food commodities that can be irradiated to kill microbes, spices, poultry, red meat. It is perfectly permissible.

Senator BUMPERS. Do you have any idea what percentage of the red meat in this country is being irradiated?

Dr. FRIEDMAN. Again, sir, my understanding is that it is small. I am not sure that the labeling has been fully worked out by the U.S. Department of Agriculture. We have been working with them on that. I know they are committed to that, but they could give you a better sense of the exact status.

Senator BUMPERS. Did FDA develop this process of doing something to the chicken to eliminate all salmonella?

Dr. FRIEDMAN. It is a very interesting product, sir. The competitive exclusion, is essentially colonizing the chicks' intestines with friendly, less harmful organisms to keep the more harmful organisms from setting up colonies there. This particular product was developed by USDA researchers. They then, working with a private company, submitted that application to the Food and Drug Administration. We reviewed the application. Our Center for Veterinary Medicine in fact agreed that it did exclude some of the harmful bacteria, and as you know, that was approved recently.

There are a number of other products also under consideration for the same kind of thing. This is a very interesting microbiologic technique that has even been used in humans in some situations.

Senator BUMPERS. I do not know whether this is pervasive in the industry or not, but I am hearing from some of them that because of a new requirement—and it may be related to this—they are having to use 2 gallons of water more per bird than they have in the past. Do you know what that is about?

Dr. FRIEDMAN. I do not, sir. I think USDA may be able to provide that answer.

Senator BUMPERS. Well, I am advised that that is an FSIS thing. I am sorry.

Dr. FRIEDMAN. No, no; it is perfectly OK, sir.

Senator BUMPERS. Do you have any idea how foreigners treat irradiation, what their view of it is?

Dr. FRIEDMAN. I know that irradiated products have been available in foreign countries.

Senator BUMPERS. There is some resistance to it, is there not?

Dr. FRIEDMAN. There is a small symbol that is put on irradiated food. I have not seen specific data suggesting how many people find it an attractive treatment and how many people are worried about it. I do not know that information, sir.

MEDGUIDE PROGRAM

Senator BUMPERS. Mr. Chairman, I guess this is close to my last question. I have two questions.

Last year you launched the so-called Medguide program to give consumers better information about the drugs they were buying. Now, that works pretty well for me. I take a few medications and they always give me this little poop sheet. But I thought 2 years ago we also decided that FDA would be the final determiner of what information is given on all these different drugs that required that. Is that correct?

Mr. SCHULTZ. Maybe I could try that.

Senator BUMPERS. All right.

Mr. SCHULTZ. What was worked out with the Congress last year was a two-step program. The first step would be to let the industry and industry groups voluntarily try and do Medguides and to reach certain goals. So, we are currently in that voluntary phase where we are looking at two things. One is how often do consumers actually get a piece of paper when they get a prescription drug, and the answer today is fairly frequently.

Senator BUMPERS. Virtually all the big drug companies do that, do they not?

Mr. SCHULTZ. The drugstores do, the drug chains, yes.

Senator BUMPERS. That is what I am talking about.

Mr. SCHULTZ. The computer has just helped us immensely because there are companies that basically put out packages of the information and then the pharmacist can very easily print it out on an inexpensive printer.

The second issue, though, also very important, is what is the quality of the information. That varies quite a bit. So, I think the effort over the next few years is going to be to get that information up to a very high quality, not such that FDA is writing it, or saying exactly what the words have to be, but making sure the key elements are there. We will then do a survey in the year 2000 to see if, I believe the goal is, 75 or 80 percent of people get adequate information. If the answer is no, then the FDA could play a more active role.

Senator BUMPERS. I think all drugs have an admonition, do not drink if you take this drug, do they not?

Dr. FRIEDMAN. Not all drugs.

Senator BUMPERS. Not all of them?

Dr. FRIEDMAN. No, sir.

Senator BUMPERS. Just the ones that I buy? [Laughter.]

Dr. FRIEDMAN. I know that you are not proposing new regulations for us in that regard.

ARKANSAS REGIONAL LABORATORY

Senator BUMPERS. Finally, I talked to you, Dr. Friedman, in the office about the disappointment those of us in Arkansas experienced when we found out we were not in the budget for phase 3 of NCTR, the National Center for Toxicological Research.

Let me ask you. As you know, the consolidation of the laboratories by FDA which was designed to save money and become more efficient—as long as Arkansas was one of them, I was hot for it, of course, and we are one of them and I thank you and Dr. Kessler for that.

But I am just curious. We have got the money and we are under construction on phases 1 and 2. I forget the amounts this year. I think in 1998 we got \$14 million for phase 2. My question is, What impact will that have on the efficiency of that laboratory or its ability to do what it is supposed to do without phase 3 being built at least sometime in the immediate future?

Dr. FRIEDMAN. As you recognize, sir, the first two phases have to do with the construction of the laboratory components for our regulatory activities. The attractiveness of having our regulatory laboratories interacting directly with our applied scientific laboratories—it is an obvious opportunity that we want to take advantage of.

Phase 3 is constructing office/conference space for the staff not only for our regulatory affairs staff, but also for some of our scientists at NCTR. We will use temporary buildings. We will use other facilities to have offices for these individuals.

Our consolidation plan for our field laboratories is moving forward. We have been very successful. I have been very gratified

with how that has been handled so far. We are consolidating. We will be appreciating real savings and efficiencies.

Nonetheless, we recognize that not having phase 3 will mean that we cannot be as efficient at our Arkansas facility as we possibly could be. As you know, sir, we requested the money this year. We are planning to do so again next year. We think this is a legitimate, valid project for us to be engaged in. As you recognize, the Department recognizes, we all struggle with the competition for very important things that need resources. We will put this forward again, sir.

Senator BUMPERS. Dr. Friedman, I appreciate your remarks.

Mr. Chairman, if I may just in closing say that I have been a fairly unabashed supporter of the Food and Drug Administration. Three years ago, I believe it was, there was a mad dash in the Congress to force FDA to speed up the licensing of drugs. While that is always a highly desirable goal, it is not a goal if you are going to sacrifice any of the kinds of experiments and information you need to protect the consumers. Every time I talk about how we as Americans are so lucky because when we eat our food, we know it has been inspected, and when we take medicine, we know that the medicine has been tested and tested and tested.

Dr. Kessler was a little bit on the defensive but certainly not because of anything I said. It is very easy to sit up here when you are down there and browbeat you and demand that you do certain things more expeditiously, but I never joined that herd because if it takes longer to be sure that you are not dispensing a drug that is going to have some terrible side effect—and oftentimes those do not show up for years. So, sometimes I know that it is just a roll of the dice almost when you do license these drugs because they have not been tested long enough to know for sure that somebody is not going to have liver cancer 10 years from now and it is going to be traced back to that.

So, as I say, I have always thought you did an excellent job. Dr. Kessler's role in this tobacco brouhaha is legendary, and he was always tough-minded and deserves a lot of credit for it.

As I say, I think you do a very fine job. We have had a great relationship with you in my State at the National Center for Toxicological Research, and we appreciate that.

So, since this will be the last time I will have this bittersweet experience of having FDA before me, I just wanted to make those comments to you to assure you that I will continue to feel that way. If I were king—I have said many times I should be. [Laughter.]

I would take the space station—better still, I would just take the cost overruns of the space station. [Laughter.]

And split it between you and the National Institutes of Health. I might give NIH a lot more than I would FDA because they are actually on the cutting edge of doing the medical research in this country. You are not going to get anything out of the space station. We never have.

I mean, I am a proponent of the space program. Do not misunderstand me. But the space station is now—and I am in my "I told you so" mode this morning. For 7 years I have tried to kill that sucker without success, and now we are looking at, the first time, the admission of NASA that just the building of it, not the deploy-

ment and the operation of it, is going to cost \$6.6 billion more than we had been led to believe. That is just the opening salvo.

As I have said many times, when NIH can only approve about 27 percent of the good medical applications for good research that they get and us getting ready to spend well over \$100 billion over something that has no payback, unless you are intent on going to Mars, as I say, I would just take the cost overruns and give it to you and NIH and the Centers for Disease Control. I will add them too.

Thank you, Mr. Chairman.

IRRADIATION OF FOOD

Senator COCHRAN. Thank you very much, Senator Bumpers.

Dr. Friedman, I have one other question on this food safety issue and that relates to irradiation. I understood that FDA had issued an order, regulation finding that irradiation, when used for the purpose of killing bacteria and other things that made food harmful, was safe and it could be used in the food processing industries. Is that a correct statement?

Dr. FRIEDMAN. It is correct, sir, for a number of kinds of food. It is true for muscle meats of animals like beef and pork and sheep. It is true for poultry. It is true for certain spices. There are a number of kinds of foods where it has been approved for the killing of bacteria, yes, sir.

Senator COCHRAN. My concern is that we are spending a lot of money on visual inspections of carcasses to try to find things that are unhealthy or could cause people to get sick if they ate the food. But we are not spending anything in the food processing industries that I know anything about on irradiation, or at least it is a very small amount devoted to that right now.

You point out that one of the things that you are doing with the money in the food safety initiative is education. Why are you not spending some money educating the public that irradiation is safe so that there will not be the fear of it that exists right now?

Dr. FRIEDMAN. I think the public's perception of irradiation and the attractiveness of irradiation to the public is an important consideration, and I know that the livestock industry, meat producers are certainly focusing on this very much.

As you appreciate, sir, even if irradiation were uniformly applied to all products today, that would be very good for that particular moment, but if the consumer then did not properly handle it, did not clean the surface, did not wash his or her hands, did not store it properly, did not cook it properly, the opportunities for contamination at the home or at the retail store or at the restaurant are still very substantial. We are looking at the range of educational activities.

I think for some consumers, for some products, irradiation makes a great deal of sense, and we believe that it is safe. We believe it is appropriate, and that is why we approved it. We have said that publicly and continue to do so.

I think that how we use our scarce education dollars over the whole range of responsibilities is something that we are still looking at.

Senator COCHRAN. I may have it wrong but it just seems to me that the Federal regulations right now require a lot of things to be done in food inspection that are unnecessary or that do not really meet the problem head on. Yet, when we come up with new technological advances, the Federal Government does very little to advance the use of that and to try to help acquaint the general public with the benefits of it, the processing industries with the benefits of it, and to go to the next step. It may be because it is like I said about the food safety initiative and the additional \$50 million that you need. It is a hard sell unless we are going to get some benefits from it.

Dr. FRIEDMAN. We certainly expect to get benefits from it.

I think that the remarks that you are making are important remarks, but probably are more appropriate to be directed at USDA than ourselves in that regard since they are the ones who are developing the labeling for meat irradiation.

In addition, though, you make a very important point about how you use your inspectional resources. Just to reprise what Mr. Schultz said, one of the really attractive features about the HACCP program is that it is prevention, it is scientifically based, it uses our resources much more efficiently. We are really trying to explore this because we agree with you. To inspect every piece of seafood is not a very efficient use of our time and may not even be the very best way to do it. We believe that looking at the processes, having a scientifically validated way of doing things just makes a lot more sense. It is not only more practical but it makes a lot more sense. I think your points are very cogent in that regard.

Senator COCHRAN. Mr. Schultz, you appear to want to say something.

Mr. SCHULTZ. No, no; I cannot improve on it.

I think that there are two issues on irradiation that you are alluding to. One is, is it really safe? Nobody is going to get irradiated, but what does it do to the nutrients in the food? We looked at that, as Dr. Friedman said, for meat and poultry and are ready to look at it for other products.

Then there is this major consumer acceptance issue. Because of the word "irradiation," people are afraid of it. I think you make a very valid point, and we ought to, with USDA, look at this issue of consumer education. It is a little bit of a chicken and egg issue since nobody is using it, it is a little odd to start the education now. But I think it is something we should look at.

USER FEES

Senator COCHRAN. I hope you will. I think that would be a wise use of some of your resources.

In the budget request, there are proposals for new user fees. Could you tell us how much in user fees you are suggesting be imposed on industries, which industries, and how much do the user fees amount to?

Dr. FRIEDMAN. Our budget outlines several kinds of user fees.

Senator COCHRAN. I am referring to all of them. I want you to hang it all out. Tell us what the administration is proposing. I am tired of just stating it myself. I want you to tell what you are proposing.

Dr. FRIEDMAN. Very good. I will ask Mr. Byrd to assist me in this.

We are asking for a component for prescription drug user fees which was reauthorized in our 1997 FDA Modernization Act which I believe were \$132 million. In addition, there is approximately \$128 million of new user fees which are distributed in a way that Mr. Byrd can outline for you.

Senator COCHRAN. Mr. Byrd.

Mr. BYRD. We are distributing the \$128 million of new user fees: \$10 million for the food additive petitions, \$12 million for generic drugs, \$25 million for devices, \$10 million for animal drugs and feed, \$57 million for postmarket surveillance, and \$12 million for import reviews, a total of \$128 million in new user fees.

Senator COCHRAN. Who would pay the postmarket surveillance user fees, that \$57 or \$58 million?

Mr. BYRD. That is right. That is intended to be paid by establishments.

Senator COCHRAN. What kind of establishments?

Mr. BYRD. Well, the medical device establishments, the businesses. When we talk about establishments, we mean the businesses.

Senator COCHRAN. What businesses? I want people to know who you are going to tax or who you are going to ask to pay for these things.

Mr. BYRD. Medical device businesses, the food establishments. When I say food establishments, I mean those food—that part of industry that makes food and distributes food, processes food. Human drug establishments. Those are the pharmaceutical and biologics industries. Those are the establishments that we are referring to when we talk about postmarket surveillance.

About \$31 million of that \$57 million would come through the food establishments, about \$7 million through human drug establishments, about \$11 million for medical device establishments, about \$4.6 million for biologics establishments, and about \$4 million for animal drugs and feeds establishments.

YOUTH TOBACCO PREVENTION INITIATIVE

Senator COCHRAN. The budget also proposes a substantial increase in funding for the youth tobacco prevention initiative. In looking at the budget request, it appears that compared with this fiscal year where \$34 million was provided to the administration for this initiative, next year's request is for \$100 more million. So, a total of \$134 million is requested for that initiative. Is that correct?

Dr. FRIEDMAN. Yes, sir; that is correct.

Senator COCHRAN. Like the budget request for the additional \$50 million for the food safety initiative, there is no offset anywhere suggested, and it is unlikely that the committee is going to get an allocation any higher than it got this year. So, we are confronted with a new \$100 million request for this initiative that either has to be taken from other programs administered by the Food and Drug Administration, or from programs administered by the Department of Agriculture or the Commodity Futures Trading Commission that come under the jurisdiction of this committee because

we are not anticipating an increase in allocation under the budget resolution. There is in effect an agreement that was entered into last year called the Balanced Budget Act which imposed restraints on spending. That applies to this next fiscal year just as well as it did the current fiscal year.

Dr. FRIEDMAN. Yes, sir.

Senator COCHRAN. So, this is a part of reality that we are confronting this morning in looking at FDA's budget request.

The part I specifically want to ask about I guess is, as we try to decide what to put in the bill as we recommend it to the full Senate, we have to justify to the Senate that these are going to be funds that are well used and that are needed and that there is legal authority to use them.

As I understand it, \$24 million of the request is for tobacco product regulation. Is there legal authority for the Food and Drug Administration to spend \$24 million in product regulation?

Dr. FRIEDMAN. I will ask Mr. Schultz or Mr. Zeller if you would please help with that.

Mr. SCHULTZ. Well, I think it is straightforward. As you know, the agency has said it has jurisdiction over tobacco products, and there are some new products coming along. Now, the jurisdiction issue is in litigation. The district court upheld jurisdiction. It is on appeal to the fourth circuit. It has been argued. But, we believe we have jurisdiction and the district court upheld it. So, that would mean as new and novel products come along, the agency would have the obligation to review them.

Senator COCHRAN. The additional \$51 million over this current year's level is for enforcement and evaluation. What is to be enforced and evaluated? What do you intend to enforce?

Dr. FRIEDMAN. The enforcement activity referred to is the prohibition of selling tobacco products to underage youth. These are to be moneys distributed to States. One of the really attractive features about this program is its distributed nature, the fact that there are not a lot of FDA staff who will be working on this here in the Washington area. It is at State and local communities where this money will be distributed to check and see whether there is compliance with the restrictions on selling tobacco products to underage youth and asking for identification before such a sale is made to a young individual.

Senator COCHRAN. I am curious to know whether you are going to make decisions on allocating the funds on the basis of whether States have already settled cases with the tobacco industry and obtain funds for this purpose already on their own initiative. Will that be a factor in determining who gets the money?

Dr. FRIEDMAN. I do not believe it will be.

Mr. SCHULTZ. What we have done is we have asked the States that are interested to submit contract proposals to us. Basically, their people are going out and doing the inspections. If they find violations, then we send warning letters and can impose fines.

I do not know that the State settlements are really to enforce our 18-year-old restriction, although they obviously involve a lot of money that could be used for good purposes in terms of tobacco.

Senator COCHRAN. How many States have actually applied for these funds in the current fiscal year? You have \$24 million avail-

able for the enforcement and outreach program this year. Have you made any allocations of these funds to the States?

Dr. FRIEDMAN. I would ask Mr. Zeller who is most conversant with that to speak.

Mr. ZELLER. Last year we signed 10 contracts on a pilot basis. The total for those first 10 contracts was just under \$2 million. So far this fiscal year we have signed renewals with 4 of the first 10 States. We have signed three new contracts, North Carolina, Nevada, and Rhode Island, and we are in negotiations with another 12 to 13 States. We have yet to receive word from a single State that they definitely will not be applying for funding to help us in the enforcement this year. So, we remain confident by the end of the fiscal year, we will have signed contracts with 50 States. We even have interest from some of the territories.

Senator COCHRAN. So, you think you are going to spend all the \$24 million by giving it to the States?

Mr. ZELLER. The overwhelming majority of the \$24 million is for the States. It is not 100 percent. We are setting aside some money for followup enforcement action that we could take at the Federal level. We do not want to reveal how much of the \$24 million is for the States, but the great bulk of it is for State contracts.

Senator COCHRAN. I may have missed something, but I am not familiar with the details of the Federal laws regarding violations of the prohibitions against selling tobacco to underage people. Does the Federal Government presume to prosecute and deal with offenders, or is this something that comes under the State and local jurisdictions?

Mr. ZELLER. A violation of our final rule is pursued by FDA.

Senator COCHRAN. So, it is a rule. It is not a law then. It is not a Federal criminal law.

Mr. ZELLER. No; it is a civil violation of the rule. For a first violation, since the program is new, the retailers get a written warning from FDA, and then civil money penalties begin with a second violation. We have sent out and received our first set of civil money penalty payments. For the second violation, the fine is \$250.

Senator COCHRAN. What if these acts are also prohibited by local statutes or ordinances? Do you respect the right of local law enforcement officials to deal with that?

Mr. ZELLER. Absolutely, as long as they are coordinating with us so that we know what actions they are taking separately. There is nothing that would happen to the States by signing contracts with us to enforce the Federal regulation that would impede their ability to proceed separately under State law.

Senator COCHRAN. So, what is the policy? If someone has already been punished, in effect, or disciplined in some way for violating these rules, you do not come in and try to put a Federal penalty on them on top of the local penalty?

Mr. ZELLER. Only if we have been able to document a violation of the Federal regulation. Prior violations of the State or local ordinance have no effect on when a particular penalty would kick in under the FDA rule. We have to document individual violations of our regulation.

Senator COCHRAN. Compliance outreach is a part of the program, and in this year \$10 million was allocated for that purpose, as I

understand it. Next year you are proposing to spend \$35 million. What will you do with the additional funds in the area of compliance outreach?

Dr. FRIEDMAN. I think it is important to put in perspective both what the goal is—that is, to help educate and work with the retailers so they understand what the regulations are and understand the importance of not selling tobacco products to underage youth—and also to recognize really the vast amount of money that is spent advertising tobacco products.

This is a considerable amount of money, \$35 million, but compared to \$5 billion, which is what the tobacco industry spends on advertising products, it is a drop in the bucket. There are some States like California, for example, that have programs that are more expensive and larger than what we are proposing for the whole Nation.

The goal here is to help educate the retailers so that their sales staff, cash registers at a 7-Eleven or some other kind of store, will understand the necessity of assuring that it is an adult who is buying the product and understanding that the owner of the store may be at risk for a financial penalty should that not be properly applied.

Mr. Zeller.

Mr. ZELLER. Let me give you some detail on how we would propose to spend the increase. With the money for outreach this year, just over a month ago, the Vice President announced a national multimedia advertising campaign to the tune of about \$7 million out of the \$10 million. It is a combination of radio, newspaper, billboard, and in-store advertising. And the way it works is each time we sign an enforcement contract with the State, when the compliance checks are ready to begin, we go in and we make a media buy. It will average about \$100,000 to \$150,000 per State this year. What that means is, if it is a smaller State, we will be in two media markets. If it is a larger State, we will only be in one media market and only for about 4 weeks. So, that is basically what the \$7 million buys you.

If we can get the money that we are requesting for next year, we will take what is a very modest presence, getting the word out to retailers and, just as importantly, to the public. And we will be able to do more media next year, and we think that it is very important to bring the enforcement and the outreach together. It will enhance retailers' understanding and hopefully compliance with the rule. We have extensively researched this package. We will be researching and monitoring the effectiveness of each of the media buys as they are done over the course of the year, and we will be able to report our progress when we come back next year.

Senator COCHRAN. Is it the assumption of the agency that these activities are authorized by law now, or are you assuming that the Congress will pass legislation that will authorize the Federal Government to make these expenditures?

Mr. SCHULTZ. In this case, this particular issue was before the district court. After Judge Epstein issued his decision, he had to decide which part of the rule to let go into effect and which part to hold back on until there was a further decision. He allowed this piece, the prohibition on the sale, to go into effect.

Senator COCHRAN. I am talking about the part that we were just talking about, compliance outreach. This is advertising, as I understand it, buying 7 million dollars' worth of advertising. You have already done that.

Mr. ZELLER. We have signed the contract and then the agency that has the money will then, on a State-by-State basis, place the ads as each of the contracts are signed. We will be in the first 10 States by the end of the spring. The program started about a month ago in Little Rock, AR.

Senator COCHRAN. Has the agency ever done any advertising of this kind for any other products or any other subject matter area under its jurisdiction?

Dr. FRIEDMAN. I think in terms of public education, there are a variety of things that we have done.

Mr. SCHULTZ. I think we have done some. We do have explicit legal authority to use publicity in connection with—

Senator COCHRAN. I was just curious as to whether you have done it before.

Mr. SCHULTZ. I do not think on this scale.

Dr. FRIEDMAN. Certainly not on this scale.

Senator COCHRAN. You have not, for instance, advertised that irradiation has been found to be safe in food.

Dr. FRIEDMAN. No, sir; but we have advertised through a variety of activities, important health messages, nutritional messages, women's health messages, through written materials that we have made widely available through our website, through personal speaking activities of FDA staff. I think in the overall trend of wanting to get good information to the public about things that are important to their health, we certainly do have a track record.

BLOOD SAFETY

Senator COCHRAN. Changing the subject to blood safety, there has been a good deal of concern over whether or not the Federal Government has been doing enough or been aggressive enough to address blood safety concerns of the hemophilia community and other users of blood products. I know that FDA has taken steps to enhance inspections of blood product manufacturing facilities and to improve enforcement of better manufacturing practices.

My question is, Do you intend to spend any funds that are provided in next year's appropriations for the purpose of helping to ensure, through collaborative efforts with the Centers for Disease Control or others, surveillance or detection of problems with blood products and then doing something to help ensure their safety?

Dr. FRIEDMAN. This has been one of our areas of greatest activity this current year. There is a very distinguished physician who has joined our Center for Biologics to have as his primary activity the coordination of the blood safety program, Dr. David Feigel, who had a very distinguished career in coming up with AIDS treatments previously. He and a team that he has assembled plus the staff in our Center for Biologics, many of whom are absolutely first rate, have done a remarkable job in coming up with a plan which aggressively and ambitiously improves our blood safety system.

There are resources that are being devoted to that this year. There will be resources from our Center for Biologics and from the

Commissioner's office that will be devoted to this next year. There are, for example, inspectional resources from our field activities.

We face some difficult choices this year, and there are some areas that have had to be deemphasized in terms of having fewer inspections. I have made sure that our inspections go up, both the number of inspectors and the number of inspections, is in the blood and blood product area. This is a very deeply held commitment from our agency at this time.

Senator COCHRAN. Are there any efforts to convene a working group, as the committee directed last year, to develop a system to notify patients of adverse events in the blood supply system?

Dr. FRIEDMAN. We have reached out I think extraordinarily successfully already this year to link our Blood Safety Committee to certain communities through the chairmanship of our new Surgeon General and Assistant Secretary for Health. Dr. Satcher recently testified before House Members on lookback for hepatitis C and activities that we were going to be engaging in. FDA has a role in that. They are very important activities for education that we have been working on. If I may, let me give you one or two examples of how that has worked this past year.

There was a product for hemophiliacs that was made with a tiny amount of a protein that came from a patient who was later found to have Creutzfeldt-Jakob's disease. There was no indication that this material would spread that disease, but there is a lot we do not understand about that very subtle neurologic, degenerative disease.

What we did was to work directly with the hemophilia communities, informing them of this, advising them about it, getting their input as to how exactly we should deal with this particular product. I think there was a very fruitful exchange between those communities, who are very sensitive and very knowledgeable about these risks, the manufacturers and our own regulatory authorities.

NEW PRODUCT APPLICATIONS

Senator COCHRAN. In the area of new product applications and approvals, you talked about the fact that this is growing at a fairly substantial rate each year. I think you said 12 percent per year for the last 4 years.

Dr. FRIEDMAN. Correct, sir.

Senator COCHRAN. Applications being submitted for all types of products that FDA reviews.

To what extent does this reflect an expansion by FDA on its own of its application requirements and to what extent does it reflect a rise in the number of products companies are seeking to market that have traditionally been approved by FDA?

Dr. FRIEDMAN. It is a very good question. The vast majority of this—and I do not have the exact percentage, but I would venture to guess more than 90 percent of this represents simply the robustness of industry. As a Nation we have been investing in basic biomedical research for the past two decades. I think that has been one of the most valuable investments that we as a Nation could ever make. The fruits of that are being born now both in private industry and in our public institutions, universities, government organizations, and so forth. What we are seeing is a vast wave of new

products for things that we have traditionally been involved in, and the pressure on us is both the novelty of these products, the sheer number of these products, and the fact that we are dealing with disease areas for which there have never been treatments before in the past. It is a very remarkable time. It is a very exciting time, and we want to make sure that we make the best of possible judgments about these products and the speediest possible judgments about these products.

Senator COCHRAN. Well, there is no doubt that the Food and Drug Administration has an enormous responsibility in terms of the consequences of what you do on public health and our country in general in many respects. We appreciate the leadership you have provided, Dr. Friedman. We know it is a big job, and we have been impressed with your high level of energy that you brought to the task and your personal enthusiasm for trying to do the best possible job at that agency. And we commend you for that. I am impressed and congratulate you on the job that you have done personally.

I frankly think the agency has bitten off more than it can chew and you are taking on a lot of responsibilities that could very easily be handled by State and local authorities and other agencies of the Government, and I think you ought to take a hard look at that. I know within your own agency and in the administration and the Office of the Vice President and the President, there is a tremendous amount of political appeal about all these new ventures that you are getting into, and I will not attempt to list them all. But it seems to me that it is time to go back to the basics, take a look at the basics and what your original mandate from the Congress required of the agency. I think some of the traditional responsibilities are being short-changed.

You do not have the money to do it all. Obviously, if you look at the budget request, you are requesting way more money than you are going to get. There is just no way in the world for the agency to get all the funds that have been requested. So, it is either pie-in-the-sky time or somebody has got to wake up and realize that it is unrealistic to ask for this kind of money under the budget agreement that we have that governs the appropriation of dollars.

I assume that if you get a bill through Congress, for example, to provide a lot of new revenues from the tobacco companies, that could be a source of additional revenue if it is earmarked for the FDA. But I am not sure the Congress is going to earmark all of it for the FDA.

Anyway, I am troubled by the tendency in this administration to continue to expand the authority and the reach and the activities of the Federal Government. This is not just things that come under the jurisdiction of this budget request but so many others too. But I made that speech the other day in another appropriations subcommittee, and I do not want to hear it again. [Laughter.]

And I know nobody else wants to hear it again, so I will not make it again.

But let me thank all of you for cooperating with our subcommittee and being here to help us understand the budget request. We will do the best we can.

Dr. FRIEDMAN. Thank you, sir, very much.

SUBMITTED QUESTIONS

Senator COCHRAN. We have additional questions that we will submit to you in writing to be answered for the record.

[The following questions were not asked at the hearing, but were submitted to the agency for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD SAFETY INITIATIVE

Question. FDA's fiscal year 1999 budget includes \$74 million for the Administration's food safety initiative, a \$50 million increase over the fiscal year 1998 level of \$24 million. What is being accomplished with the \$24 million provided for this initiative and what is the justification for the significant increase requested for this initiative for fiscal year 1999?

Answer. The fiscal year 1998 Food Safety Initiative, FSI, request represented the first installment on a major government-wide effort to reduce foodborne illness through significant enhancements to food safety and public health systems that were designed in the early part of this century. The requested fiscal year 1999 FSI increase represents a second installment, and has two major objectives. One is to permit FDA to work jointly with other federal agencies, including USDA, EPA, and CDC, and the states to strengthen and expand the food safety activities underway and build on gains made with the fiscal year 1998 resources. The second objective is to increase the emphasis on ensuring the safety of domestic and imported fresh produce in response to the President's October 2, 1997, directive to ensure the safety of fresh produce.

With the requested resources, FDA and its federal and state partners will be able to respond more rapidly and effectively to a wide range of health threats posed by foodborne hazards, including emerging pathogens, natural toxins, and antimicrobial resistant pathogens. These expanded efforts are needed to permit the Nation's food safety regulatory systems to deliver on national goals related to protecting and improving the health and well-being of our citizens.

One example is in research conducted at FDA's National Center for Toxicological Research, NCTR. Part of their research focus with fiscal year 1999 funding will be in the areas of pathogen identification, antibiotic resistance, microbial risk assessment and foodborne contamination, to include exploring the prevalence of resistance determinants in microorganisms and how these determinants are affected by selective pressure from the environment. Other studies will be initiated to evaluate the bioremediation of veterinary drug residues in the environment and to develop procedures to measure pathogens in animal feeds.

Other examples of this increased effort are to enhance surveillance systems by expanding the ongoing systematic collection, analysis, and interpretation of antimicrobial susceptibility surveillance data, which will enable FDA to ensure accurate and valid information that can be used to minimize further the transmission of resistant pathogens through the food chain. FDA plans to increase the overall capacity—the number of microbial isolates in the database—of the National Antimicrobial Susceptibility Monitoring Program by 20 percent in order to ensure a high likelihood of detection of emerging resistance trends in zoonotic enteric pathogens. Educational partnership agreements with state and local agencies will be initiated and use existing mechanisms such as Cooperative Extension and professional associations to strengthen and implement programs to educate producers, veterinarians, state and local regulators about proper drug use and the incorporation of HACCP principles to reduce foodborne pathogens into industry quality assurance programs to ensure public health by minimizing the occurrence of residues in edible tissues. Improved and more standardized risk assessments would permit the ranking of food safety concerns to provide for better public health protection and more efficient utilization of resources. These initiatives will also improve the utility of confidence in risk assessment among scientists and the general public by providing for more transparent risk analysis. These initiatives will provide better risk assessments in order to set priorities, to evaluate surveillance plans, risk reduction strategies, and research programs for improving food safety.

The second objective of the fiscal year 1999 Food Safety Initiative is to increase the emphasis on ensuring the safety of domestic and imported fresh produce in response to the President's October 2, 1997, directive to ensure the safety of fresh produce. The President's Fresh Produce Initiative is designed to expand the scope and focus of the original FSI and to develop and implement strategies required to

address more effectively critical safety issues associated with fresh produce. Over the past several years, several major foodborne illness outbreaks have been associated with the consumption of fresh fruits and vegetables or fruit and vegetable products. These include outbreaks linked to *Cyclospora* contamination of raspberries imported from Guatemala and domestically-produced apple juice contaminated with *E. coli* O157:H7. Also, *Salmonella* contamination has been found on melons and other produce.

There are several important food safety issues that necessitate a special focus on hazardous microbial contamination of fresh produce. One is the low rate of monitoring provided annually for imported produce products. With existing resources, FDA examines for microbial contamination only about 0.2 percent of the approximately 430,000 import entries of fresh produce for microbial contamination. Also, it is anticipated that the per capita consumption of fresh produce will increase significantly in the future as health conscious consumers follow government dietary guidance and take advantage of the scientifically established benefits of these products. Current estimates indicate that there will be a 33 percent increase in the importation of fresh produce between now and fiscal year 2002. FDA needs resources to develop and implement science based strategies to minimize levels of contaminants that may be injurious to human health in these foods.

Under this initiative, FDA is developing with USDA and the agricultural community draft Good Manufacturing Practices—GMP's—and Good Agricultural Practices—GAP's—guidance for use by producers, domestic as well as foreign. FDA is accelerating research to develop or improve the detection and intervention/prevention techniques for pathogens, develop and implement education and technical assistance programs to promote appropriate appreciation of the guidance, and develop appropriate specific guidance on an as needed basis. The resources requested for this new initiative will promote use of voluntary GAP/GMP guidance through education and technical assistance to domestic and foreign producers; and evaluate growing, harvesting and production practices in countries that export fresh produce to the U.S. Moreover, the President directed that a legislative proposal be developed to expand FDA's authority over imported foods to be similar to that already provided to USDA for meat and poultry products. The bill permits the agency under appropriate circumstances to declare foods or specific commodities from a country to be adulterated if FDA determines that a particular facility or country's food system does not provide the same level of protection that is provided for comparable domestic products, and thus, refuse them entry into the United States.

FDA will continue to work with foreign governments and producers to take any steps necessary to help ensure that imported food products meet U.S. food safety requirements or otherwise achieve the level of protection required. If FDA determines that the steps needed to address an existing or potential risk have not been taken and that the affected products therefore will not meet U.S. food safety requirements or otherwise achieve the level of protection required, FDA is authorized to deny such products entry into the United States.

For fiscal year 1998, FDA has accomplished a significant number of activities under the Food Safety Initiative that will contribute to a safer food supply. This is due in part to the cooperation received from other entities that are involved in food safety, such as the Department of Agriculture and the Centers for Disease Control and Prevention, I would be happy to provide a listing of these accomplishments by each of the six categories.

I would first like to share a success story that was possible with the funding provided in fiscal year 1998. The National Antimicrobial Susceptibility Monitoring Program—NASMP—was initiated in 1996. It began as a collaboration among FDA, CDC, and USDA to monitor bacterial foodborne pathogens for changes in antimicrobial susceptibility, using *Salmonella* as a sentinel organism. The goals of the program are: to identify resistance as it emerges and to identify patterns of resistance, to allow timely response to changes in susceptibility through information sharing and other mechanisms, and to identify areas that require more detailed investigation. This initial effort was the precursor to the FSI Early Warning System for Foodborne Disease Surveillance related to antimicrobial resistance. The 1998 FSI monies allowed extensive expansion and augmentation of the NASMP. Isolates which are tested through this program originate from clinically ill animals and humans, healthy farm animals, and animals at slaughter. The number of isolates is increasing annually to obtain an increasing representativeness of the sample, including the incorporation of produce and animal feed isolates and new bacterial species such as *E. coli* and *Campylobacter*.

Having an established surveillance system enabled the Federal partners to identify the presence of a multi-drug resistant *Salmonella typhimurium* DT 104—StmDT104—in humans and animals. StmDT104 had been responsible for human

disease outbreaks in the United Kingdom and was recognized as widespread in distribution and increasingly prevalent in the United States. This early warning of a potential epidemic, such as that seen in the United Kingdom, was achieved through the NASMP and enabled CDC to warn state health departments of STMDT104's presence, and allowed augmented monitoring for this pathogen. As a result public health officials were prepared for the Vermont dairy farm outbreak and were in a position to take preventative steps to minimize the spread. This farm is currently part of an ongoing investigation as part of the NASMP investigational activities. Continuing work in 1998 includes international collaborations between USPHS epidemiologists and researchers in the U.K. The funding requested would allow for continued expansion of this program.

[The information follows:]

FISCAL YEAR 1998 FOOD SAFETY INITIATIVE ACCOMPLISHMENTS

Surveillance

Worked with CDC and other federal agencies to expand the FoodNet sites from five to seven (with an eighth site to come scheduled online in fiscal year 1998), and expanded the scope of data by adding two new State Health Department partnerships/FoodNet sites to the National Antimicrobial Resistance Monitoring Programs, increased Salmonella, Campylobacter, and E. coli isolates (human database).

Worked with CDC to create a national electronic network for rapid fingerprint comparison for pathogens that will link FDA, USDA and states together to allow the rapid sharing of information and permit quick determinations about whether outbreaks in different states have a common source.

Increased animal Hazard Analysis Critical Control Point, HACCP bacterial isolates (veterinary database).

Expanded the scope of data by adding three new veterinary diagnostic laboratories to further facilitate the comparison of veterinary and human resistance trends.

Expanded data in animal database by initiating Campylobacter isolates testing.

Expanded the information on resistance by initiating multi-resistant Salmonella strain testing.

Developed a plan to conduct molecular microbiological and genetic studies to clarify the role of across species transmission of resistance.

Developed a plan to evaluate antimicrobial use databases—promote prudent use of antimicrobials.

Will sponsor a public meeting related to research on antimicrobial resistance between August 31 and September 2, 1998.

Coordination

Worked with other federal agencies to form the Foodborne Outbreak Response Coordinating Group (FORCG) consisting of representatives from FDA, the Centers for Disease Control and Prevention, United States Department of Agriculture, Environmental Protection Agency, Council of State and Territorial Epidemiologists, Association of State and Territorial Public Health Laboratory Directors, Association of Food and Drug Officials, National Association of City and County Health Officials, and National Association of State Departments of Agriculture to improve responses to foodborne illness outbreaks.

The information provided will be used to develop guidance for handling future outbreaks. An actual outbreak response was evaluated to determine which of the currently used response procedures worked well and which needed improvements.

Inspections

Expanded efforts to implement HACCP systems in the seafood industry. Major accomplishments related to seafood HACCP include:

- Trained over 1,137 federal, state, and local regulators in seafood HACCP. An additional 6,861 persons, including industry officials and state and federal inspectors, were provided a three-day basic HACCP course by the Seafood HACCP Alliance in cooperation with FDA. Also, 30 partnerships were established with states to conduct seafood HACCP inspections.
- In the process of hiring 80 investigators and microbiologists for seafood HACCP implementation.
- After the HACCP regulation became effective in December 1997, initiated verification inspections to ensure that domestic seafood establishments have effective HACCP systems in place. FDA plans to complete initial verification inspections in 2,700 domestic seafood establishments this fiscal year and to date, more than 500 of these inspections have been conducted.

—Published a proposed rule to require a warning statement on fruit and vegetable juice products that have not been processed to destroy pathogens and a proposed rule to require HACCP in fresh juice production.

Published draft guidance containing criteria FDA intends to use to decide whether another country's regulatory system for food safety provides a level of protection that is equivalent to the U.S. system. We are currently reviewing the comments received.

Developed Recommended National Retail Food Program Standards that identify the components of an effective retail food regulatory program at the state and local level.

Developed a draft HACCP Principles at Retail Guide.

Education

Established the Partnership for Food Safety Education with other federal agencies, industry, state associations and consumer groups. The Partnership is a broad-based coalition committed to educating the public about safe food handling and preparation. Using the combined resources of the industry, several consumer and public health organizations, and the federal government, the Partnership will conduct a multi-year food safety education campaign to make American consumers aware of food safety problems and provide information on how these problems may be prevented.

The Partnership launched the "Fight BAC!" consumer food safety education campaign. The "Fight BAC!" campaign features colorful, 30 second television public service announcements that focus on food safety in the home. The television spot highlights four basic safe food handling steps that consumers may use to prevent food contamination. These steps include washing hands and surfaces often, preventing cross-contamination, cooking foods to proper temperatures, and refrigerating foods promptly.

Cooperated with other federal agencies on a Food Safety Education Conference, and conducted consumer research on consumer behaviors to develop effective food safety advisory and juice warning labels.

Formed the "Food Safety Training and Education Alliance for Retail, Food Service, Vending Institutions, and Regulators," (FSTEAL) to promote the use of safe food handling techniques by retail food service workers.

Risk Assessment

Established an interagency Risk Assessment Consortium with particular focus on microbiological risk assessment. The Consortium includes representation from FDA, USDA, National Institutes of Health, CDC, and EPA and operates out of the Joint Institutes for Food Safety and Applied Nutrition located at the University of Maryland. Among the goals of the Consortium are to inventory existing data research and expertise; establish a clearinghouse of risk assessment related data and models; and determine long-term research needs.

Formed a dose response workgroup that is tentatively planning a public meeting in July 1998.

Initiated a comprehensive review of available risk assessment methodologies and data.

Initiated a process to establish the clearinghouse of available methodology and data repository for use by all Consortium members.

Research

Developed DNA fingerprinting methods for a variety of pathogens to increase the ability to trace the source of foodborne disease outbreaks.

Standardized DNA fingerprinting methods for *Vibrio cholerae*, *Vibrio vulnificus*, toxigenic *Staphylococci*, Group A *Streptococci*, *Listeria*, *Salmonella* and pathogenic *E. coli*.

Published a draft GAP/GMP guidance document to help producers and processors minimize microbial hazards in fresh fruits and vegetables.

Held six grassroots and one international meeting with the agricultural communities and other interested parties to gather input for the development of GAP's/GMP's.

Developed enhanced methods for the more rapid isolation and detection of a variety of foodborne pathogens from produce and juices.

Prepared, in collaboration with other federal agencies, a multi-year research plan to accelerate research associated with improving the safety of fresh produce. This plan focuses on research to develop and improve methods for detection, prevention and control of microbial contamination in these products.

Established intramural FSI microbiological staff.

Began validation of detection procedures for all FSI research and surveillance programs.

Will begin development of detection procedures—meat, milk, eggs, animal feeds—for feces, and environmental pathogens.

Will evaluate procedures to detect salmonella in animal feeds.

Will initiate research to reduce pathogens in animal feeds.

Will initiate research to determine impact of animal feed pathogens on the food supply.

Plan to initiate research to reduce resistant pathogens from antibiotics used in food producing animals including fish.

Plan to initiate evaluation of procedures for reducing pathogen load in food producing animals including extended withdrawal periods and competitive exclusion products.

Will develop food animal management procedures to mitigate the proliferation of resistant pathogens.

Will begin evaluation of effects of multiple drugs/routes of administration/multiple exposure on resistance development and pathogen load.

Plan to initiate studies to determine the cause and factors which impact the development of resistant pathogens and the transmission of resistance between pathogens in food producing animals and the environment.

Question. What are the specific goals of the food safety initiative?

Answer. The May 1997 report to the President on the Food Safety Initiative established several major goals related to improving the safety of the Nation's food supply. These goals include decreasing foodborne illness; building a new national early-warning and surveillance system to help detect and respond to outbreaks of foodborne illnesses earlier, and give federal agencies and states the data needed to prevent future outbreaks; improving responses to foodborne illness outbreaks; improving risk assessment capability, particularly microbial risk assessment, to determine the likelihood that exposure to a hazard, such as a foodborne pathogen, will result in harm or disease in humans; developing better methods for more rapidly detecting, preventing and controlling foodborne safety hazards, especially microbial pathogens and mycotoxins; improving the safety of the food supply through more effective inspection and compliance strategies; and using innovative food safety education programs to ensure that food preparers and handlers at each point of the food chain are fully informed of food safety risks and appropriate safe handling practices.

The FSI also has a set of goals that relate to our work in the area of animal drugs and feeds, including reversing the resistance trend of animal pathogen development and reducing the transfer of resistant animal pathogens to humans; developing, through the National Antimicrobial Resistance Monitoring System, timely information upon which to base public health decisions relating to the control of resistant foodborne pathogens and to be proactive in assisting practitioners in the appropriate use of antimicrobials; developing alternative strategies to antimicrobial drug use in food-producing animals such as improved management techniques and novel drug treatments including competitive exclusion to reduce both the overall prevalence of animal-carried pathogens and specifically target animal carried resistant pathogens; and working to identify and limit animal feed contaminants from entering the human food supply.

Question. How has the food safety initiative improved the safety of the food supply since its implementation last year?

Answer. Though we are only mid-way through fiscal year 1998, FDA has still accomplished a significant number of activities under the Food Safety Initiative that will contribute to a safer food supply. This is due partially to the cooperation and interactions occurring with other entities that are involved in food safety, such as the Department of Agriculture and the Centers for Disease Control and Prevention. I would be happy to provide a listing of these activities by each of the six categories. [The information follows:]

FISCAL YEAR 1998 FOOD SAFETY INITIATIVE ACTIVITIES

Surveillance

By the end of fiscal year 1998, FoodNet sites will be operating in areas that are representative of the geographic and demographic population distribution in the U.S. Data from these sites currently allow FDA and other agencies to identify outbreaks and link outbreaks in different locations. By the year 2002, the FoodNet sites will be able to produce the volume and quality of baseline data against which federal agencies can more accurately measure declines in foodborne illnesses, the effect of intervention measures and increases in illnesses that require the need for new interventions. In addition, data produced by the sites will permit FDA and other

federal agencies to establish more realistic and measurable performance goals and targets for their food safety programs.

FDA, USDA and several states are now linked to the CDC national electronic network for rapid DNA fingerprint comparison of microbial pathogens. This new system allows data on microbial pathogens associated with outbreaks to be exchanged and compared in 10 to 30 minutes. This eliminates the necessity of mailing cultures of pathogens in order to compare isolates from patients and from incriminated foods and reduces the time for comparisons from days to minutes. This capability will allow the agencies and states to link more rapidly distant outbreaks, to identify the implicated food, and to trace it back to the source.

Coordination

The Foodborne Outbreak Response Coordinating Group (FORCG), which consists of representatives from FDA, CDC, USDA, EPA, the Council of State and Territorial Epidemiologists (CSTE), the Association of State and Territorial Public Health Laboratory Directors (ASTPHLD), the Association of Food and Drug Officials (AFDO), the National Association of City and County Health Officials (NACCHO), and the National Association of State Departments of Agriculture (NASDA), will help ensure that responses to foodborne illness outbreaks are more rapid and more effectively coordinated. This is critical since each day saved in responding to a foodborne illness incident can significantly reduce the number of illnesses that occur as well as their economic impact.

As a "test case" to evaluate a typical illness outbreak response, FORCG completed an evaluation of the response to an actual outbreak. Results of evaluation are being used in the development of SOP's for sharing information on outbreaks among agencies and with the public.

Inspections

HACCP systems are a key component of FDA's strategy for reducing the incidence of foodborne illnesses. HACCP, which places emphasis on identifying and properly controlling points in a food processing system where safety problems could occur, is designed to prevent food safety hazards. Because HACCP systems are designed to prevent food safety problems, wide spread use of these systems in the food industry will result in safer end products, help eliminate the cost and delay of end product testing, and will permit FDA to use its food safety inspection resources more efficiently and focus on the highest risks.

With the FSI resources provided in the fiscal year 1998 appropriation for the Food Safety Program, FDA is expanding efforts to verify that domestic seafood establishments have HACCP systems capable of ensuring the safety of seafood products. FDA is planning to conduct 2,700 initial verification inspections this fiscal year and the States will conduct approximately 2000 additional inspections under contract. Without the FSI funding, FDA would have taken at least 2 to 3 years to conduct these 2,700 initial seafood HACCP verification inspections.

FDA published a Notice of Intent to mandate the application of HACCP systems for fruit and vegetable juice products and require a warning statement on fruit and vegetable juice products that have not been processed to destroy pathogens. The expansion of HACCP to fresh fruits and vegetable juices will help ensure that these products do not contain hazardous contaminants that could cause foodborne infections and the warning labels will alert consumers, particularly parents, to the potential health hazard.

Education

The Partnership for Food Safety Education permits FDA and other federal agencies to leverage the resources of industry, consumer groups and professional associations to increase the effectiveness and breadth of food safety education activities. "Fight BAC!" and other education campaigns undertaken by the Partnership will help prevent foodborne illnesses by making American consumers aware of proper safe food handling practices. More than 50 national and local organizations from the public health, government, consumer and industry sectors have agreed to support the campaign and disseminate educational materials. There is also a web site where consumers, health professionals, educators and the media can obtain the latest information on preventing foodborne illness.

Consumer research conducted on consumer behaviors, and to identify barriers to safe food handling, is the basis of developing effective food safety advisories, and juice warning labels. This research helps FDA determine the most effective medium for reaching the consumer and provides information required to more effectively focus future education activities to achieve changes in unsafe food handling behaviors.

Risk Assessment

The Risk Assessment Consortium, which was established in November 1997, permits FDA and other federal agencies to work with academia to advance collectively the science of microbial risk assessment and assist federal agencies (HHS, USDA and EPA) to protect consumers more effectively from foodborne illness. Through its efforts to coordinate and guide overarching federal microbial risk assessment research, the Consortium will help eliminate duplication and increase the effectiveness of efforts to improve the speed and accuracy of techniques for assessing risks associated with microbial pathogens and other hazardous foodborne contaminants. The development of microbial risk assessment techniques, now in their infancy, will be a critical tool agencies use in targeting their food safety activities and resources on the highest public health risk.

Research

The more rapid isolation and detection methods developed for a variety of foodborne pathogens will permit the Agency to identify more accurately foodborne safety hazards and increase the ability to trace more quickly the source of foodborne disease outbreaks.

Fresh Produce Initiative

The information FDA, USDA and other federal agencies obtained through the six grassroots and one international meeting with the agricultural communities and other interested parties has been incorporated into the draft GAP/GMP guidance for fresh produce. This guidance is designed to prevent foodborne illnesses by providing producers and processors information on how they can minimize microbial contamination in fresh fruits and vegetables.

The Interagency Research Planning Document developed in conjunction with USDA and other agencies will ensure that analytical development and other research conducted on microbial pathogens and mycotoxins is properly focused and coordinated. This will help both agencies eliminate any duplications of effort and ensure that available research resources are focused where the greatest needs exist.

Question. Please explain how the "early warning" and surveillance system to detect and respond to outbreaks of food borne illness and provide the data needed to prevent future outbreaks works, how it is being enhanced through the President's food safety initiative, and what FDA's role is in this system.

Answer. This system, FoodNet, is an active surveillance program, currently functioning at seven sites located around the U.S., that will provide more accurate and comprehensive baseline data on foodborne illness in this country. The sites currently cover 20 million people or 8 percent of the U.S. population.

FoodNet has the capability to detect widely dispersed outbreaks. Local health departments have long been able to detect outbreaks of several people being made ill from a single occasion such as a banquet. Widely distributed outbreaks from commercial ice cream or bean sprouts consumed in homes were rarely discovered by the old passive surveillance system. FoodNet investigators, at the state level, contact clinical microbiology laboratories regularly to obtain information on all cases of bacterial and parasitic diseases most often associated with foodborne diarrheal illness. The sites submit regularly selected microbial isolates for DNA fingerprinting. State-of-the-art computer networks compare these isolates looking for matches that could indicate widely dispersed common source outbreaks. FoodNet staff enlist many of the cases in case-control studies to estimate probable sources of infection. When unusual patterns are noted in any of this data, special studies are begun to pinpoint the source of the problem. This newly expanded capability will mean more discovery of foodborne disease risks and more interventions to protect the public.

The FoodNet data collection technique has already demonstrated its usefulness. For example, in the 1980's, CDC surveyed for the occurrence of listeriosis over a period of years at the request of FDA. The data showed that the incidence of listeriosis decreased as a result of measures initiated by the Agency and industry. These studies were the predecessor to the FoodNet system. The data currently being generated is proving useful, despite a relatively low level of funding support. Data from the sites has contributed to investigations of foodborne outbreaks, such as a multi-state outbreak of *E. coli* O157:H7 detected in Illinois and Connecticut associated with California lettuce.

Food Safety Initiative funding will allow CDC, with support from FDA and USDA to increase the number of FoodNet sites and greatly expand the good work already underway. With the addition of an eighth site later this year, FoodNet will improve its representation of the U.S. population, both demographically and geographically. Food safety initiative funding is being used to conduct focused surveys to learn more about the occurrence of specific pathogens and foodborne illness, food sources of con-

tamination, e.g., for *Campylobacter*, based on data derived from the FoodNet system. All FoodNet sites have received increased assistance in DNA fingerprinting capabilities through the addition of FSI funds. FDA's role in this system is to provide support funding for the system, participating in the design of ancillary studies (e.g., case-control studies for hemolytic uremia syndrome), and using FoodNet data to design more effective intervention measures to reduce the risk of foodborne illness and to develop policy and regulations to enhance food safety.

With regard to animal drugs and feeds, in 1996, FDA, CDC and USDA established the National Antimicrobial Resistance Monitoring System, a nationally based program to prospectively monitor changes in antimicrobial susceptibilities of zoonotic enteric pathogens from human and animal isolates. Beginning in fiscal year 1998, the Monitoring System was moved into the Food Safety Initiative and substantially expanded and enhanced.

FoodNet has been used as the foundation for the human arm of the National Antimicrobial Resistance Monitoring Program. The FoodNet sites plus ten additional sites, consisting of state or county public health laboratories, are submitting human *Salmonella*, *E. coli*, and *Campylobacter* isolates to CDC's Foodborne Disease Laboratory for susceptibility testing to 17 antimicrobics.

Veterinary isolate testing is conducted at the United States Department of Agriculture's Russell Research Center in Athens, Georgia. Isolates are collected from three primary sources: clinical samples from the APHIS National Veterinary Services Laboratory in Ames, Iowa; on-farm studies of health animals from the APHIS National Animal Health Monitoring Surveys; and, as of January 1998, healthy animal samples collected for *Salmonella* monitoring at all large slaughter plants as part of the Food Safety and Inspection Service mandatory HACCP requirement. In addition, samples from large epidemiology studies undertaken by USDA are added to the collection. The *Salmonella* isolates are collected and serotyped by USDA as part of their mission. These isolates are then susceptibility tested in Athens under an interagency agreement with FDA. Only *Salmonella* was tested until 1998, when *Campylobacter* and *E. coli* were added.

The objectives of the Monitoring System are to provide descriptive data on the extent and temporal trends of antimicrobial resistance among enteric pathogens in human and animal populations, provide timely information to physicians and veterinarians, prolong the lifespan of approved drugs by promoting the prudent use of antibiotics, investigate areas for more detailed investigation, and guide research in the area of antibiotic resistance. The capability to investigate resistance patterns and trends identified through the Monitoring System are essential elements to facilitate timely and appropriate public health response activities.

Question. How are federal agencies coordinating with each other and with other state and local public health agencies to detect and respond to food-borne disease outbreaks?

Answer. An interagency Foodborne Outbreak Response Coordinating Group—FORCG—has been formed with representatives of FDA, CDC, USDA/FSIS, EPA, and organizations of state health and regulatory officials. This group is evaluating the current system of outbreak response at the local, state, and federal levels to determine what works well and where improvements might be made to make the response faster and more efficient. As a first step, a subgroup of FORCG conducted a retroactive analysis of an actual outbreak response to identify what worked well and where improvement was needed. Among the areas identified for improvement were: communication among the various agencies; more rapid sharing of information and data among the agencies, and providing timely, accurate information about an outbreak and implicated products to the public. FORCG is now working with state organizations to develop standard operating procedures for more rapid communication and sharing of information and data among the agencies and with the public.

Another example is the National Antimicrobial Resistance Monitoring System which was initially developed by expanding or redirecting existing programs in several federal agencies. FDA is in the planning stages to develop and conduct veterinary prescribing practices and producer antimicrobial use surveys in collaboration with USDA for feedlot cattle. The survey will begin in 1999, and will combine antimicrobial use information with on-farm sampling by nesting within the ongoing USDA National Animal Health Monitoring Survey. USDA's Agency Animal and Plant Health Inspection Service works directly with the National Agriculture Statistics Service to develop representative samples and we anticipate the quality of results will be much better than any obtainable through a contractual arrangement with a private organization. This process will also allow several agencies to share and use the data obtained from the survey.

The federal agencies have also worked closely with states in developing the Monitoring System. The sources of human isolates are the FoodNet state sites plus ten

additional state sites. As of January 1, 1998, we also established veterinary sentinel sites in the states of California, Washington, and New York. A recent collaborative effort was undertaken in response to an outbreak of salmonellosis among residents of a Vermont dairy farm. FDA, CDC, and USDA jointly initiated the investigation of this illness caused by *Salmonella* Typhimurium DT104, a multi-resistant pathogen, on the Vermont farm and surrounding area. The investigation is on-going in order to determine the status of DT104 colonization and shedding in cattle and other animal species on the farm is on-going.

Question. Please provide a breakdown of how the funds provided to FDA for fiscal year 1998 for the food safety initiative and requested for fiscal year 1999 are being allocated to: (1) surveillance, (2) coordination, (3) inspections and compliance, (4) education, (5) research, and (6) risk assessment.

Answer. I would be happy to provide a table showing this break-down as reflected in our fiscal year 1998 and fiscal year 1999 budget requests, as well as our most recent estimate for fiscal year 1998, for the record.

[The information follows:]

FOOD SAFETY INITIATIVE FUNDING

[Dolars in millions]

Category	Fiscal year—		
	1998 request	1998 estimate ¹	1999 request
Surveillance	\$3.16	\$3.18	\$2.40
Coordination	0.55	0.55	0.20
Inspections/compliance ²	7.87	8.99	27.40
Education	2.07	1.84	3.70
Research	6.40	5.96	9.20
Risk Assessment	3.95	3.48	7.10
Total	24.00	24.00	50.00

¹ Estimates as of March 30, 1998.

² Inspections/compliance estimates are about \$1 million higher than originally planned to reflect unanticipated costs associated with fiscal year 1998 activities for the Fresh Produce Initiative. This increase was derived from small reductions from some of the other food safety activities.

Question. For both fiscal year 1998 and the fiscal year 1999 request, provide a detailed list of the specific activities being funded or proposed to be funded by FDA under the above categories of the food safety initiative, including the funds and full-time equivalent positions allocated to each activity.

Answer. I would be happy to provide tables showing a detailed list of food safety activities that will be funded with both the fiscal year 1998 appropriation and the proposed fiscal year 1999 level.

FISCAL YEAR 1999 FOOD SAFETY INITIATIVE ACTIVITIES—Continued

[Dollars in millions]

Activity	FTE's	Amount
Continuation of fiscal year 1998 activities		
Multi-disciplinary risk assessment team		
Framework to identify and fully characterize potential human health risks		
Strategies to characterize the impact of animal drug use on the pathogen load and resistance patterns		
Identify data gaps regarding the ecology of on farm microbial pathogens—Salmonella, Campylobacter, and E. Coli O157		
Data and modeling techniques—understand casual relationship between antimicrobial drug use in animals and human disease		
Introduce HACCP planning in the rendering industry—emphasizing controls against BSE infective agent		
Research	44	9.20
Continuation of projects begun in fiscal year 1998		
Detection procedures—meat, milk, eggs, animal feeds, feces, and environmental pathogens		
Detection procedures for all FSI research and surveillance programs		
Evaluate procedures to detect salmonella in animal feeds		
Reduce pathogens in animal feeds		
Determine impact of animal feed pathogens on the food supply		
Reduce resistant pathogens from antibiotics used in food producing animals including fish		
Develop food animal management procedures to mitigate the proliferation of resistant pathogens		
Education	17	3.70
Educational partnerships with veterinary practitioner and producer organizations to promote good production practices		
Producer quality assurance programs to foster appropriate agricultural drug use		
Incorporate food safety into veterinary curriculum and veterinary continuing education programs		
Educational partnerships with other federal agencies, state, and local agencies		
Total	250	50.00

Question. Provide a list, in priority order, of the FDA food safety initiative activities proposed to be funded for fiscal year 1999.

Answer. The \$50 million request for fiscal year 1999 would allow FDA—as part of the intergovernmental efforts in food safety with the Department of Agriculture and the Centers for Disease Control and Prevention, among others—to continue with some of the important steps begun in fiscal year 1998 in the areas of surveillance, coordination, inspections/compliance, education, research, and risk assessment. This request would also allow the Agency to fulfill commitments made by the President to improve the safety of domestic and imported fruits and vegetables. We strongly believe in the programs outlined in our budget request, and cannot, at this time, put these initiatives in priority order. Each is essential to improving for the long term the safety of the foods available from all sources to the American consumer. If provided an amount less than the full request of \$50 million, we would be forced, after consultations with USDA and CDC, to restructure our plans and reduce coverage and efforts in certain areas.

INSPECTIONS AND COMPLIANCE

Question. FDA indicates that it is particularly concerned about the safety of produce and the potential risks associated with produce imports. The food safety initiative proposes to expand inspection and compliance efforts. How much of this money in each of fiscal years 1998 and 1999 will go towards inspections at the border?

Answer. There are no funds in the fiscal year 1998 budget for the Food Safety Initiative directed to the expansion of inspection of fresh fruits and vegetables at the border. In the proposed fiscal year 1999 budget, we have requested an additional \$2.7 million for sample analysis, some of which will be used for analysis of samples collected from entries of imported foods. Another \$5.3 million would support screening activities at the border. However, monitoring at the border has been acknowledged by FDA, GAO, and other experts as not the most efficient utilization of resources, as it is a reactive process. In addition to the efforts included in our fiscal year 1999 request, we will target resources for our monitoring activities on products that have a high potential for pathogen contamination or have a history of violations of public health significance.

Question. How much will go to increasing inspections of fresh produce?

Answer. We will refocus import activities and target resources toward more prevention activities that should be more effective in preventing entry of foods likely to be contaminated with pathogens. These activities will include foreign country evaluation, education and technical assistance and outreach activities to promote appropriate application of the GAP's/GMP's guidance, verifying use of the guidance, and inspections, but only when an outbreak has occurred.

Question. Will a risk-based selectivity system be used to determine which food products are inspected? Which foods would that involve?

Answer. Yes. One of the principles underlying effective food safety programs is that efforts should be focused on the hazards that represent the greatest risk to consumers. This is a key attribute of HACCP programs, and is why this approach to food safety is being increasingly adopted by industry and regulatory agencies. The Food Safety Initiative correctly identified our inability to measure accurately the risks associated with different microbial food safety concerns as a serious impediment to the adoption of risk-based systems such as HACCP. To that end, the initiative has called for the development of microbial risk assessment methods and databases.

Question. Will part of the food safety initiative inspection and compliance funding be used to pay for U.S. inspectors dispatched to foreign plants?

Answer. Funds are requested in the fiscal year 1999 budget for seafood HACCP implementation that may be directed towards evaluating HACCP implementation in foreign countries. In the fiscal year 1999 budget request for the Food Safety Initiative and the Produce Initiative, FDA has requested \$11.9 to support foreign country education, evaluation and technical cooperation and assistance. We will also provide further GAP/GMP guidance, as a need is indicated, for use by the fresh and minimally processed produce industry. Providing the type of expertise and assistance that results in safety mechanisms being built into food production systems will have a far more profound impact on the safety of products offered for import than merely depending on end product testing at the borders.

Question. Does FDA currently have personnel that go into other countries to inspect foreign facilities?

Answer. Yes, FDA does have personnel that go to foreign facilities to conduct two types of inspections: low-acid canned food inspections and those related to foodborne disease outbreaks from food exported to the U.S. For fiscal year 1998, FDA plans on using three fully-supported FTE for 40 foreign inspections related to the low-acid canned foods program. While we can never accurately predict the number of inspections that will be needed for foodborne disease outbreaks, for the past three years, in the foods area, we have conducted 72, 9, and 29 inspections, for fiscal years 1995 through 1997, respectively.

Question. Is the FDA budget authority request for fiscal year 1999 adequate to cover both increased domestic and foreign inspections, as well as any needed infrastructure?

Answer. The fiscal year 1999 request is part of a multi-year initiative designed to restructure various aspects of the existing food safety system in order to reduce the estimated numbers of deaths and illnesses related to foodborne pathogens. The fiscal year 1999 budget request will provide the resources necessary to carry out the initiatives proposed in that document. We would continue with the next steps for the fiscal year 1998 Food Safety Initiative, as well as expand our efforts in the area of domestic and imported fresh fruits and vegetables. This latter effort would include evaluation, not inspection, of foreign growing, harvesting, and processing systems in order to provide guidance on improving the safety of these products. The \$50 million request for fiscal year 1999, plus the initial funding of \$24 million provided in fiscal year 1998, will allow the Agency to move toward its goal of reducing the deaths and illnesses associated with foodborne outbreaks.

Question. How many new inspectors does FDA plan to hire for fiscal year 1999? How many inspectors are on board (FTE) currently (fiscal year 1998)? What was FDA's inspection staffing level for fiscal year 1997?

Answer. The fiscal year 1999 budget request includes 104 Consumer Safety Inspectors/Officers for the Foods program. The food activities performed by these positions include, but are not limited to, providing foreign technical assistance, screening and review of import entries, policy and guidance for fresh produce development, and HACCP for juices and continued implementation of seafood HACCP. These Consumer Safety Inspectors/Officers will monitor the safety of food imports by sampling and screening at the border with improved methods and targeted sampling techniques. They will also evaluate food production systems in foreign countries and provide technical assistance and education, as necessary, to improve the capability of those systems to provide safe products for export to the U.S. A large part of this work will be in the area of fresh fruits and vegetables.

FDA's Foods inspection staffing level in fiscal year 1997 was 407 total investigative positions and in fiscal year 1998, 455 total investigative positions.

Question. The justification indicates that FDA examined approximately 0.2 percent of fresh produce entering the United States in fiscal year 1996. What are your goals for expanding FDA's inspection of imported fresh produce in each of fiscal years 1998 and 1999?

Answer. FDA does not plan increase coverage for fiscal year 1998 but intends to maintain the same coverage as that in the previous years. Because the number of fresh produce imports is expected to rise, FDA will still need to increase resources to continue to match past levels. The fiscal year 1999 President's Budget includes a substantial focus on imported fresh fruits and vegetables, and specifically providing technical assistance and information, based on the fresh fruit and vegetable GAP's/GMP's, to foreign countries and the foreign produce industry that will enable them to improve the safety of produce exported to the U.S. In following years, increased coverage of imports in general will include increased monitoring of imported fresh produce.

Question. The justification indicates that the Administration is proposing legislation "to expand FDA's authority over imported foods to equal that already provided to USDA." What does this mean? What new authority is the Administration proposing to give the FDA?

Answer. This bill permits the agency, under appropriate circumstances, to declare foods or specific commodities from a country to be adulterated if FDA determines that a particular facility or country's food system does not provide the same level of protection that is provided for comparable domestic products, and thus, refuse them entry into the United States.

FDA will continue to work with foreign governments and producers to take any steps necessary to help ensure that imported food products meet U.S. food safety requirements or otherwise achieve the level of protection required. If FDA determines that the steps needed to address an existing or potential risk have not been taken and that the affected products therefore will not meet U.S. food safety requirements or otherwise achieve the level of protection required, FDA is authorized to deny such products entry into the United States.

Question. How many MOU's are in existence and with which countries? What is the substance, scope and objectives of these agreements?

Answer. FDA has 55 international agreements. This includes memorandums of understandings, memorandums of cooperation, and exchanges of letters. A manual containing all international agreements is being sent under separate cover. I would be happy to provide the information for the record.

Question. How many MOU's have been established in the past two years?

Answer. There have been nine international agreements signed since the beginning of 1996. I would be happy to provide the information for the record.

[The information follows:]

Question. How are MOU's being used to improve food safety?

Answer. FDA's overall policy for initiating, developing, and monitoring MOU's was set forth in a 1995 Compliance Policy Guide, 60 FR 31485, June 15, 1995. As stated in that document, it is FDA's policy to pursue development of MOU's that will further the Agency's public health mission.

The majority of MOU's and other arrangements currently in effect were developed to improve food safety by establishing a formal mechanism under which a foreign government can address and correct an identified non-compliance situation associated with a particular food or class of foods from the particular country. These types of MOU's are referred to as compliance MOU's. They contain provisions which delineate actions by the foreign government and industry aimed at preventing continuation of a previously identified problem and provide that the foreign government certify that specific foods offered for import will comply with the relevant United States regulations. FDA audits such foreign government certification through paper reviews and laboratory analyses to verify the performance of the foreign government and industry.

Other less formal MOU's and agreements allow FDA to use its limited inspectional resources more efficiently by cooperating with the government of the producing country to help ensure production of safe food. These arrangements normally contain provisions aimed at preventing any safety problems associated with a particular food. The arrangements accomplish this goal through well-controlled production, storage and transportation practices, and sufficient foreign government oversight and testing, which provides FDA with reasonable assurance that exports

of the particular food from that country comply consistently with applicable United States regulations. FDA oversees the arrangement through appropriate audits, but is able to redirect its limited inspectional resources toward those imported products which are not subject to such rigorous government oversight in the producing country. This type of arrangement is a fundamental step in the process of reaching equivalence between the regulatory system of the United States and that of a foreign country.

Question. Please provide the Committee with an update on the status of the implementation of the seafood Hazard Analysis Critical Control Point (HACCP) requirements.

Answer. HACCP implementation has involved four primary elements, each of which are interrelated: education and technical assistance for the industry; education of FDA and state inspectors; regulatory inspections of seafood processors; and Federal/State seafood HACCP inspection partnerships.

Under Education and Technical Assistance for the Industry, HACCP is a system of preventive controls for safety that are operated by the industry. For each processor to be able to operate its own HACCP system, the processor must understand both the food safety hazards that are reasonably likely to occur for the products being processed and the controls that are available to minimize or eliminate the hazards. On a day-to-day basis, a processor's core HACCP activities are monitoring key processing points to ensure that they are operating in a manner that produces a safe product and recording the results of that monitoring.

To help processors understand these concepts and activities, FDA participated in the development of low-cost training for industry in HACCP principles and their application to seafood. This course has been attended by several thousand individuals nationwide. The Agency also developed guidance for processors, entitled "Fish and Fishery Products Hazards and Controls Guide," which provides advice on hazards that are reasonably likely to occur in various situations and on controls that are known to exist for those hazards. This guide also includes a simple, fill-in-the-blank HACCP plan and instructions on how to complete it.

For Education for Inspectors, HACCP-based regulatory inspections involve auditing processor's HACCP systems to determine whether they are appropriate for the circumstances and are being operated properly on a day-to-day basis. Effective auditing involves expertise and judgment on the part of the inspectors and the regulatory agency. The FDA regulations do not require that processors submit their HACCP plans to FDA for approval in advance of the first HACCP-based inspection. FDA does not have the resources to conduct such reviews. Moreover, it is difficult to effectively judge a HACCP plan without actually seeing the processing operation. Thus, FDA's inspectors must be trained in how to evaluate HACCP plans and systems during routine inspections. To prepare FDA's inspectors, the Agency sent them to the course developed for industry, described above, and to an additional course that FDA designed for seafood inspectors on auditing technique. This course has also been made available to state inspectors and has been well attended.

Under Inspections, the seafood HACCP requirements became effective on December 18, 1997, after a two year grace period. FDA started conducting HACCP-based inspections shortly thereafter. The Agency's goal is to inspect all 3,800 U.S. seafood processors, other than processors of raw molluscan shellfish, which are inspected by States under a Federal-State cooperative program, within one calendar year of the effective date.

Even with the training and the guidelines, the Agency has long recognized that the development of HACCP systems in many processing plants will involve a period of trial and error. Thus, it has always been the Agency's expectation that the first round of inspections after the effective date would reveal that a significant percentage of HACCP systems need some improvement. This expectation is turning out to be the case, but it is not regarded as a special problem at this stage of implementation. As planned, FDA's inspections are focusing on evaluating HACCP systems and providing feedback to the firms. During the first round, FDA anticipates that regulatory action will be initiated when, in addition to HACCP system deficiencies, the products themselves contain contaminants or are in imminent danger of becoming contaminated.

FDA is permitting the industry to challenge the conclusions from these inspections. While FDA's inspectors will initially compare each processor's HACCP system to the advice in the guidelines described above, processors are free to choose alternative approaches so long as their HACCP systems provide a level of safety that is equivalent to that provided in the guidelines' approach. Moreover, processors are free to challenge the scientific validity of the approach taken in the guidelines. FDA is always interested in learning about better ways to ensure safety and in making improvements in its own guidelines. In developing alternatives to the guidelines or

challenging their validity, processors should be able to establish the scientific validity of their systems for the Agency to evaluate.

Under Federal-State Seafood HACCP Inspection Partnerships, the FDA seafood HACCP program provides the opportunity for the Federal government and the states to operate inspection systems that are consistent in both philosophy and detail, based on HACCP as the common element. It is possible for the first time to have a consistent, national, Federal-State cooperative program for seafood safety as well as to aggregate the results of both Federal and state inspections into a common national database. It would also enable both the Federal government and the States to leverage their resources by sharing the workload. An integrated Federal-State system would enhance consumer protection by substantially strengthening the domestic program for seafood safety.

In virtually all states that have significant seafood processing, the States conduct their own inspections, often as an offshoot of state licensure of processing establishments. Many of these states inspect their processors at least once per year, with some mandating as many as four inspections per year. Except in certain circumstances, however, FDA traditionally has not been able to fully coordinate its seafood inspection activities with those of the states because of inconsistencies between the programs and the costs associated with developing common data bases. As a result, Federal and State inspections have tended to overlap.

To take advantage of the opportunity that HACCP provides, FDA developed a model Federal-State partnership for seafood HACCP inspection; and a computerized national seafood HACCP inspection database into which both FDA and state partners could enter the results of their inspections. The Agency also set aside some funds to make available to potential state partners to upgrade their inspection capabilities through the acquisition of equipment or other means. Much of those funds have already been committed to States. FDA has also entered into seafood HACCP inspection partnerships with some states and is pursuing agreements with many others. About 30 states have entered into partnerships or are considering doing so.

Question. What level of funding is being allocated for seafood HACCP in fiscal year 1998? How much is included in the fiscal year 1999 request for this purpose?

Answer. The fiscal year 1998 President's Budget included an increase of \$8.0 million to implement seafood HACCP, the regulation for which became final in December 1997. The fiscal year 1999 request includes an additional \$3.4 million.

Question. The budget justification indicates that FDA intends to expand implementation of HACCP and other food safety assurance systems in the food industry. FDA has indicated that in addition to seafood, it intends to expand HACCP to fruit juice. What other expansions and new systems does FDA intend to implement?

Answer. In addition to fruit juices, the Agency is also evaluating the feasibility and practicality of applying HACCP to the retail food industry and to production of animal feeds. FDA has also engaged in other HACCP pilots with industry. Expanded activities will include working more closely with industry, academia, and professional and trade associations by providing technical assistance, training, and guidance to appropriate entities. In addition, FDA will continue to work with the Department of Agriculture towards the adoption of the Food Code. FDA will work with other agencies to increase the percentage of domestic produce produced consistent with the new voluntary GAP's/GMP's guidance and FDA will monitor and evaluate the effectiveness of that guidance. FDA will evaluate fresh fruit and vegetable production in areas in the U.S. and foreign countries where there is evidence that a potential public health hazard exists and GAP/GMP guidance has not been applied. FDA will evaluate ways to increase coverage of imports through such means as increased personnel, increased partnerships, and innovative partnerships with the states.

Question. The prepared statement indicates that the Operational and Administrative System for Import Support (OASIS) became fully operational in every U.S. port of entry where FDA-regulated products come into the country. What was the total cost of this system? Please provide the resources, both dollars and staff years, which FDA allocated to this system in each fiscal year since its initiation, and under which activity of the budget these funds were provided.

Answer. OASIS development was done by private contractors, to whom \$10.5 million has been paid for their system development work. FDA did not spend any staff years on system development of OASIS, since the development work was performed by private contractors. The increase in FTE utilization for OASIS in fiscal year 1996 was largely because that is when the Agency was at the height of the roll out of OASIS to FDA field offices nationwide, and were utilizing FDA personnel to get the computer equipment ready at these sites, to provide training to our field users of OASIS, and to furnish on-site support to the start up of the system. All of the budget activities, except for NCTR and Tobacco, were used to fund the development costs

of OASIS as the ORA import inspection program includes formal entries from all other budget activities. I would be happy to provide, for the record, the information requested.

[The information follows:]

[Dollars in millions]

Fiscal year	Amount	FTE's
1988-91	\$2.0	
1992	0.7	
1993	0.8	
1994	0.7	4.0
1995	3.4	2.0
1996	0.8	11.0
1997	0.9	5.0
1998	1.2	4.0
Total	10.5	26.0

Question. What is included in the fiscal year 1999 request for OASIS? Please provide dollars and staff years.

Answer. OASIS will require \$600,000 in fiscal year 1999 for system maintenance to be performed by the development contractor. These are funds that relate to the development of OASIS as have been reported in previous years.

Question. Will OASIS allow FDA to regulate imports with fewer inspectors and analysts? If yes, what is the savings in each of fiscal years 1998 and 1999?

Answer. We do not anticipate the OASIS will allow the Agency to monitor the increasing volume of FDA regulated imports with fewer inspectors or analysts. In fiscal year 1992, there were approximately 1.5 million entries of FDA regulated products. In fiscal year 1997, there were approximately 3.9 million entry lines of FDA regulated products offered for entry. This does not include those informal entries with a value less than \$1,250, which is to be raised to \$2000, effective July 2, 1998, and some formal entries, which may not be electronically processed. Entry lines is a more realistic way of determining the volume of imports which FDA must evaluate. Since each entry could contain more than one line of FDA regulated product, as on average an entry contains 1.7 lines, the number of entries underestimates the challenge posed in maintaining an effective import inspection system.

The efficiencies and economies that OASIS has brought to the processing of import entries has enabled FDA to handle this increased volume of work. However, OASIS does not affect the number of products that FDA examines in the field, or collects for laboratory examination. Nor does it affect the staffing needed to examine product in our laboratories. The benefit from OASIS in terms of examinations and analysis is to help ensure that the most meaningful entry lines are selected for examination and analysis.

FOOD SAFETY EDUCATION

Question. FDA indicates that it will invest its resources in new and innovative education and information sharing strategies for improving food handling practices of consumers and retail food service establishments. USDA has been carrying out and increasing its activities in this area as well. What is the division of labor between the FDA and other agencies, such as USDA, in food safety education and information sharing to prevent duplication of effort?

Answer. FDA and USDA have always worked together to coordinate food safety education. The Food Safety Initiative has provided ample opportunity to become even more closely coordinated. Working groups have been formed and meetings occur on a regular basis to delineate each agency's specific role and assess progress. The breakdown of education programs among the agencies is dependent upon the constituencies serviced and the products regulated. FDA is responsible for education concerning food safety issues in processing and consumer food handling of all foods except meat, poultry, and processed egg products. FDA is also responsible for education involving food handling in retail food service establishments specifically involving the retail Food Code of 1997.

USDA does food safety education on the production, processing, and consumer food handling of meat, poultry, and processed egg products. The Department is also responsible for education at congregate meat sites, gleaning and food recovery pro-

grams sites, school food service facilities, and retail stores and restaurants that have on-site meat or poultry processing. USDA and FDA are working together with industry to develop an educational outreach program for the Good Agricultural Practices/Good Manufacturing Practices guidance for fresh fruits and vegetables. This program will be a well-organized program applicable to the domestic and foreign product industry.

FDA is also pursuing cooperative programs related to veterinary education programs which will focus on proper drug use with a specific emphasis on proper use of antimicrobial drugs. These educational initiatives will be implemented in conjunction with Surveillance activities such as the practitioner prescribing surveys which will serve as the foundation for this activity. These activities will be accomplished in partnership with professional veterinary associations. Additionally, the Agency is working to develop programs dealing with food safety to be used in veterinary continuing education and incorporation into veterinary school curricula. Producer education will be done in partnership with producer associations as well as components of the U.S. Department of Agriculture, such as the Animal Production Food Safety Program, and Cooperative State Research Education and Extension Service.

Question. What areas of food safety education will FDA be responsible for? Please describe in detail the educational strategies FDA will conduct, what information will be provided, how it will be delivered, and who will be the target audience.

Answer. In terms of consumer education, FDA has joined CDC, USDA, and the Department of Education, members of industry, and consumer representatives to form a public-private Partnership for Food Safety Education and launched a nationwide public education campaign in October 1997. The campaign centers on four key food safety principles along with a "FIGHT BAC!" logo. The Partnership distributed community action kits and supermarket kits containing public education materials to support the "FIGHT BAC!" campaign in early 1998. Currently FDA is advising the Partnership on two school-based initiatives. The first is development of a "Presenter's Guide" for introducing the "FIGHT BAC!" message to children in kindergarten through third grade. The presenters, our partners at the local level, cooperative extension agents, health and consumer educators, have many opportunities to present information in a classroom setting. This program will include interactive activities to engage the children, as well as information to take home to parents. The goal is to have this program in place for September. The Partnership is also in the developmental stages of creating a science-based food safety education program for children in grades three through six. This longer-term project will meet the educational needs of children as they are just beginning to learn food preparation in the home.

Both of these projects are based on findings of a report, "Evaluating the Placement of Food Safety Education in American Schools," contracted for by FDA and USDA. Never before has an educational survey been conducted to identify what subjects at what grade levels, and to which school personnel food safety education should be directed. This report, currently under review, will serve as the foundation for developing relevant and effective education programs.

FDA will support National Food Safety Education Month, already designated by industry, by sending posters featuring "FIGHT BAC!" to elementary school food service directors for display in the school cafeteria. Work is also underway on a planning guide for use by community health educators for promoting National Food Safety Education Month that will be distributed this summer.

A video teleconference is scheduled for May that will reach state and local health and education officials concerned with the prevention of foodborne illness. Experts from government and private sector organizations will, among other things, discuss how to use community action materials from the "FIGHT BAC!" campaign along with plans for National Food Safety Education Month.

In an attempt to examine the broad range of research data and its implication on food safety education practice, a meeting of food safety education researchers is planned for this year. The purpose of the meeting will be to review the status of food safety education research, identify gaps in existing research, and identify strategies for future food safety education. One gap that has already been identified is the need for further research on the best way to communicate the key food safety principles in order to achieve behavior change. Research will take place on the barriers to safe food handling.

FDA and USDA are developing a National Food Safety Information Center. This center will build on the agencies' existing information dissemination systems by, among other things, enhancing the data base capabilities of the FDA/USDA Foodborne Illness Education Information Center at the National Agriculture Library, establishing a new food safety 800 number, developing the joint

foodsafety.gov web page, and enhancing publications distribution and electronic publications dissemination systems.

In terms of retail education, FDA has worked with USDA to make the HACCP manual for the school lunch program consistent with FDA's Food Code. FDA has also joined with government, academic, consumer, and industry representatives in establishing the "Food Safety Training and Education Alliance for Retail, Food Service, Vending, Institutions and Regulators." This group, FSTE, is working to promote training of government and industry employees in retail food service. FSTE has thus far developed an evaluation form to be used by the professional association members in evaluating training resources listed in the National Agriculture Library's Foodborne Illness Education Center database, and are developing recommended qualifications for persons who teach retail food safety training to industry employees as well as training curriculum for regulatory food inspectors.

FDA offers a considerable number of training courses for state and local retail food regulatory staff through its State Training Branch. A special four day Microbiology for Inspectors satellite course will be offered in August. A follow up course, Investigation of Foodborne Illness will be offered in September.

FDA has "Voluntary Retail Food Regulatory Program Standards" and "Managing Food Safety: A HACCP Principles Guide for Operators of Food Establishments at the Retail Level." We are conducting workshops regarding these with State officials and once the documents have been reviewed, the Agency will conduct pilot programs in the states of the program standards and the HACCP guide beginning in the fall of 1998. FDA is also conducting courses of epidemiology for State regulatory officials, and has conducted an investigator course on tracebacks of foodborne illness.

For producer education, FDA is working with USDA to develop an educational outreach program for the GAP/GMP guidance for fresh fruits and vegetables. An International Working Group consisting of representatives from the Office of U.S. Trade Representatives, the U.S. Department of State, FDA and USDA have been established to develop a system of outreach for assistance to foreign countries to meet guidelines required by the Produce Initiative. A conference will be held this summer with individuals and representatives from organizations involved in producer education to address outreach on the domestic and international levels.

FDA is also responsible for the Veterinary Practitioner education. Many initiatives already exist and more are being developed in collaboration with veterinary profession associations, such as the American Veterinary Medical Association and veterinary speciality practitioner groups. The target audience for these programs is practicing veterinarians and veterinary students. FDA is working with the veterinary academic community to develop programs dealing with food safety for use in continuing education programs and to encourage the adoption of these programs into veterinary school curricula. Further, practitioner education efforts will be conducted in conjunction with producer associations such as National Pork Producers Council, and National Cattlemen's Beef Association. The Agency will work with these associations to enhance producer quality programs and develop new quality assurance programs that will emphasize the relationship between good husbandry practices and achieving a safe food supply. FDA plans to work with producer associations, the Department of Agriculture, and the states to enhance safe food production practices.

FOOD SAFETY RESEARCH

Question. Can you be more specific as to what FDA plans to do with the research money requested as part of the food safety initiative? Please list specific research work/projects to be funded in each of fiscal years 1998 and proposed for fiscal year 1999, the cost of each project, and who will conduct the research.

Answer. An active research program is an integral component of FDA's ability to develop and implement scientifically-sound regulations and guidance designed to safeguard the U.S. food supply. The Food Safety Initiative recognized that solving the new food safety problems that will arise as we enter the next century requires a strong investment in science, the source of new solutions. This is reflected in the inclusion of two research components within the initiative, bioresearch and risk assessment, that are devoted to providing the needed food safety data, methods, and technologies.

The Food Safety Initiative, FSI, identified the following five broad goals as the focus of the initiative's research programs: Improved Detection Methods; Understanding Resistance to Traditional Preservation Technologies; Understanding Antibiotic Drug Resistance; Prevention Techniques: Pathogen Avoidance, Reduction, and Elimination; and Food Handling, Distribution, and Storage. FSI also identified the need for methods and scientific data that would enhance the ability of federal agen-

cies to assess microbial risk. This included two additional broad priority research areas that are critical for addressing this goal of the Food Safety Initiative: Develop and Validate Exposure Assessment Models Based on Probabilistic Methodology; and Develop and Validate Dose-Response Assessment Models for Use in Risk Assessment. These seven research goals, with an emphasis on microbiological problems associated with fresh or minimally processed produce, were reaffirmed under the Produce and Imported Foods Safety Initiative.

These research priorities were used by FDA to develop a three year research plan. The plan, which is in the final stages of development, details the projects that FDA is undertaking to meet the goals of the Food Safety Initiative and the regulatory mission of the Agency. I would be happy to provide, for the record, a table showing research projects, estimated FTE's associated with these projects, and whether these projects are planned intramurally and extramurally.

[The information follows:]

FOOD SAFETY INITIATIVE RESEARCH

[Dollars in thousands]

Research project	Fiscal year—				FDA-run or external
	1998 estimated FTE level	1998 cost	1999 estimated FTE level	1999 cost	
Sampling for Pathogens on Produce	11.5	\$874	14.5	\$1,157	FDA.
Molecular Characterization of Maverick Strains of Enterohemorrhagic E. Coli.	1.0	76	4.0	319	FDA.
Effects of Environmental Conditions, Pytochemicals, Modified Atmosphere Packaging and other Parameters for the Growth and Survival of Foodborne Pathogens on Produce, Particularly Sprouted Seeds.	8.2	623	10.2	813	FDA.
Molecular Mechanisms for Pathogen Emergence.	5.5	418	6.5	518	FDA.
Identification and Characterization of Virulence Determinants for Salmonella enteritidis and Vibrio vulnificus.	3.0	228	4.0	319	FDA.
Cyclospora Detection and Viability Assessment ..	2.5	190	4.5	359	FDA CDC USUHS Colleges.
Characterization of Pathogenic Aquatic Eucaryotes and their Toxins.	13.7	1,041	14.2	1,133	FDA.
Control of Viral and Bacterial Human Pathogens in Seafood.	5.5	418	6.5	518	FDA.
Assessment of Technologies for Pathogen Reduction or Elimination.	9.7	737	10.7	853	FDA DOD.
Mycotoxins	15.0	1,114	17.0	1,356	FDA.
Virulence Assessment and Molecular Pathogenesis of Salmonella typhimurium DT 104 and Shigella.	3.5	266	4.5	359	FDA.
Minimizing Biogenic Amine Formation in Seafood and Other Commodities.	2.6	1,976	4.6	367	FDA.
Quantification of Effects of processing on Foodborne Pathogens for minimally processed foods.	1.5	114	2.0	159	FDA.

Question. How much is requested for FDA food safety research for fiscal year 1999?

Answer. The total amount for food safety research included in the fiscal year 1999 budget request is \$9.2 million and 43 FTE. Of this total, \$8.5 million is for the Foods program, \$0.5 million for the National Center for Toxicological Research, and \$0.2 million for Other Activities.

Question. How will the research at FDA be different from the research that is being done and is planned by USDA?

Answer. A series of interagency meetings was conducted in the fall of 1997 to assure that the resources provided by the Food Safety Initiative for research would be utilized optimally. Similarly, one of the major goals of the risk assessment activities called for by the Food Safety Initiative was the establishment of an interagency

risk assessment consortium. One of the first activities of the consortium has been to assist in the coordination microbial risk assessment research.

For research related to our work in the area of veterinary medicine, FDA is coordinating with the Department of Agriculture to minimize the duplication of work. FDA's focus will be on those aspects of foodborne pathogens related to products regulated by the Agency; specifically the development of pathogens detection procedures for animal feeds, feces, manure, and environmental samples, the contribution of animal feeds to the pathogen load in food producing animals, and the evolution of pathogens, including resistant pathogens, in animals being fed antibiotics.

As a result of these interagency exchanges, the Agency has identified eight research program areas that were consistent with its regulatory mission and could be effectively addressed with the expertise and facilities available at FDA. In addition, priority research needs in support of specific public health issues currently facing FDA were assessed. A total of ten issues associated with three broad regulatory issues related to the control of foodborne disease were identified as requiring research support. I would be happy to provide a list of these activities for the record.

[The information follows:]

Research

Development of Sampling and Detection Methods for the Identification of Pathogens that Occur Sporadically at Low Levels on Produce

Salmonella Typhimurium DT104

Cyclospora cayetenensis

Development of New Strategies and Technologies for the Prevention or Elimination of Pathogens from Foods, Particularly Fresh Produce

Molecular Mechanisms of Microbial Evolution that Lead to the Emergence of New Foodborne Threats to Public Health

Risk Assessment

Improved Exposure Assessments Through the Development of Product/Pathogen Pathway Analysis Models

Characterization of Dose-Response Relations for Selected Foodborne Pathogens

Identification of Alternative Modeling Techniques for Enhanced Microbial Risk Assessments

Control of Pathogens in Commodities that do not Receive a Terminal Inactivating Treatment Prior to Consumption

1. Contamination of shell eggs with Salmonella.
2. Contamination of sprouted seeds with pathogenic microorganisms, such as Escherichia coli O157, Salmonella spp., and Bacillus cereus.
3. Contamination of raw molluscan shellfish with pathogenic microorganisms, including Salmonella spp., Vibrio spp., and Norwalk viruses.
4. Contamination of fresh or minimally processed produce with pathogenic microorganisms, such as Escherichia coli O157:H7, Salmonella spp., Listeria monocytogenes, and Cyclospora cayetenensis.

Adequacy of Food Processes and Implementation of HACCP

5. Validation that current guidelines for the aging of cheeses is adequate to assure the elimination of pathogenic microorganisms.
6. Control of pathogenic microorganisms in fresh fruit and vegetable juices, including Escherichia coli O157:H7, Salmonella spp., Listeria monocytogenes, and Cryptosporidium parvum.
7. Contamination of fresh seafood with marine toxins or parasites such as Anisakis simplex that can infect humans.

Assessment of Public Health Impact

8. Pfiesteria piscicida—assessment of risk to human health through consumption of contaminated seafood.
9. Contamination of grain-based products with mycotoxins, such as fumonisins, deoxynivalenol, aflatoxins, and ochratoxins.
10. Determination of levels of pathogenic microorganisms in specific commodities that would not pose a risk to specific high risk populations.

Question. What criteria are you using for what research FDA should do and what research should be conducted by USDA and other federal agencies?

Answer. FDA uses the three criteria for determining what research to conduct: (1) whether a particular issue or matter applies to FDA's regulatory mission; (2) whether the interagency committees of the Food Safety Initiative and the Produce Initiative assigned or placed responsibilities on FDA; and (3) whether current or

planned FDA personnel have the expertise to conduct research applicable to either of the two criteria stated above.

For veterinary medicine, FDA is coordinating with the Department of Agriculture to eliminate duplication of work. FDA's focus will be on those aspects of foodborne pathogens related to products regulated by the Agency, namely the development of pathogens detection procedures for animal feeds, feces, manure, and environmental samples, the contribution of animal feeds to the pathogen load in food producing animals, and the evolution of pathogens, including resistant pathogens, in animals being fed antibiotics.

Question. What criteria are you using to determine what government-funded research should be done?

Answer. The role of research within FDA is support of the Agency's regulatory mission. This includes acquiring scientific knowledge and principles needed to develop sound food safety policies and guidance, developing tools for implementing and assessing the effectiveness of its policies, and responding rapidly to newly emerging food safety threats to public health. Other criteria focus in a generic sense on the contributions of animal feeds and drugs to the development and transfer of foodborne pathogens, including resistant pathogens, in animal agriculture. An objective that is included is to minimize the contributions of animal feeds and antibiotics to the problem, recognizing the importance of both to the safety of food and health of animals.

Question. Will the requested increase for food safety research involve an increase in the scientific staff at the Center for Food Safety and Nutrition (CFSAN)?

Answer. Yes. CFSAN's scientific staff will increase to fill the deficiencies in expertise from a limited number of selected high-level scientists. In addition, some increase will be needed in support and temporary personnel to make research more cost efficient.

Question. How will the research be used once it is completed? Is all the new research planned targeted at providing the science base for better regulation and education for food safety?

Answer. The information acquired through Food Safety Initiative research projects will indeed be used to support the Agency's regulatory duties and responsibilities. These are: acquiring scientific knowledge and principles needed to develop sound food safety policies and guidance; developing tools for implementing and assessing the effectiveness of its policies; and responding rapidly to newly emerging food safety threats to public health.

The three-year research plan was developed in an incremental fashion. An inventory and review of current and planned research projects was conducted to fulfill the Fresh Produce Initiative directive to identify, accelerate, and coordinate with other food safety agencies research that will reduce microbial risks associated with fresh produce, and to prepare FDA's research program for external peer review. As this research focus developed, several additional factors were considered during the review process. Core research support functions, such as electron microscopy, mass spectrometry, flow cytometry, pulse field gel electrophoresis, ribotyping, and animal care and use, were identified. The needs to maintain and enhance specific cross-cutting scientific capabilities and expertise, to support the entire research program and the Agency's ability to respond to new food safety concerns, were strongly considered. Moreover, a balanced research program that addresses both the intermediate and long-term needs of FDA is required. Therefore, the majority of the research program is designed to address FDA's research needs during the next three to five years, but a portion of the effort is reserved for "exploratory research" that addresses potential food safety concerns that may occur during the next five to eight years.

Further, another objective of the research is to minimize the contribution of animal feeds and drugs to the development of pathogens—including antibiotic resistant—in food producing animals and the transfer of these pathogens to animal derived food. This research is expected to contribute to the reduction of pathogens in animal feeds and also food producing animals. The research is also expected to provide the basis for any changes in feed manufacturing, transportation and storage. New, fast detection methods for detecting pathogens in feeds, in animals and animal derived food are to be developed, evaluated and accepted for monitoring purposes. This research will provide the data to serve as the basis for the evaluation and monitoring of any new animal antibiotics which affect the development of foodborne pathogens in food producing animals. The research will also provide the foundation for assessing the human risk of using antibiotics in food producing animals. The ultimate goal is to reduce the occurrence foodborne pathogens in animal derived food.

TOBACCO ACTIVITIES

Question. FDA proposes that funding for its tobacco activities which received a \$29 million increase for fiscal year 1998, be increased by an additional \$100 million for fiscal year 1999. What is the justification for such a significant increase?

Answer. The proposed increase for tobacco will enable the Agency to enter into enforcement contracts with all 50 states to conduct a minimum of 500,000 inspections, fund an expanded outreach effort to include state by state advertising directed to retailers, and enable FDA to begin to implement regulatory controls for cigarettes and smokeless tobacco.

Question. FDA funding for the tobacco initiative for fiscal year 1998 and requested for fiscal year 1999 is broken into the following categories:

[In millions of dollars]

	Fiscal year—	
	1998	1999 request
Compliance outreach	10.0	35.0
Enforcement and evaluation	24.0	75.0
Product regulation		24.0
Total	34.0	134.0

For both fiscal year 1998 and the fiscal year 1999 request, provide a detailed listing of the specific activities being funded or proposed to be funded under the above categories of the tobacco initiative, including the funds and full-time equivalent staff allocated to each activity.

Answer. We are happy to provide this information for the record.
[The information follows:]

FISCAL YEAR 1998

Staffing.—Twenty-five FTE are allocated to tobacco activity for fiscal year 1998. Most of the people work on all aspects of the program, however, 2 are dedicated exclusively to Outreach and 8 are dedicated to Enforcement.

Outreach.—In fiscal year 1998, FDA is focusing most of its efforts on retailer information, continuing its provision of brochures and Question and Answer pamphlets for retailers as well as maintaining a toll-free hotline telephone number for retailers to call to request materials and a WEBSITE with similar information. Further, as each new state contracts with FDA to undertake compliance checks, the Agency sends mailing to all retailers in the state to alert them that compliance checks will soon begin in their state. The Agency has developed and has begun distribution of in-store materials to all retailers answering potential questions, and reminding them of their responsibilities under the rule, and assisting them in compliance. In addition, FDA has begun placing a modest level of advertising in a major market within states in which contracted compliance checks are being conducted.

Enforcement.—In fiscal year 1998, the Agency is attempting to establish contractual relationships with each state and territory to conduct compliance checks of retail outlets that sell tobacco products. FDA is asking each state to attempt to conduct a minimum of 375 inspections per month. The contracting process requires hours of effort by Agency staff reviewing proposals, providing technical assistance to states, and finally negotiating the final contract. FDA then trains the commissioned officials in each state and oversees the progress of the contract.

FISCAL YEAR 1999

Staffing.—Twenty-five additional FTE are sought for fiscal year 1999. This includes four scientific reviewers for product regulation; two attorneys, and six program analysts, primarily for enforcement; and seven administrative staff, three consumer safety officers, and three clerks to be involved in all the aspects of the program.

Outreach.—In fiscal year 1999, the Agency will design a multi-media advertising campaign including radio, print, and billboard advertisements and place these ads in major media markets in every state with which FDA contracts to conduct compliance checks. It will also develop a comprehensive retailer education program which includes a retailer kit containing in-store signs, tent cards, fact sheets, counter mats and other materials; a letter to retailers in each state updating them on the status

of compliance checks in their state; a series of reminder postcards that can be posted in the store for customers and clerks to see; trade advertisements in retailer publications; and a toll-free hotline that retailers can call to request additional materials and ask questions. It will continue to have exhibits at major conferences representing state and local health officials, public health organizations, and consumer and retailer organizations educating these audiences about the new tobacco rule.

Enforcement.—The Agency plans to commission state officials in all 50 states to perform unannounced inspections of over 500,000 retail establishments to determine if retailers are complying with the law. It will send warning letters to first violators and seek civil money penalties from those found violating the law multiple times. Finally, it will develop an enforcement strategy for national chains.

Product regulation.—The Agency will begin to review applications for new tobacco products that claim that they may or may not be less hazardous. In doing so, it will assess the products to determine what effects those products have on the health of current users, whether the products will create more demand by young people to initiate use, and whether the products will keep from quitting, those who might otherwise have quit. Other activities may include: classification of the product pursuant to Section 513 of the Act, establishment of quality system requirements, and review and analysis of ingredients and constituents of tobacco products.

Question. Provide a list, in priority order, of the tobacco initiative activities proposed to be funded for fiscal year 1999.

Answer. We believe it is imperative that we expand our activities in the tobacco program. All the activities we described earlier, when taken together, form a program, which if viewed as a whole, instead of as three separate parts, designed to move FDA towards its goal of reducing youth tobacco use by half.

Question. Does the FDA have the capability to spend the increased funds requested for its tobacco initiative during fiscal year 1999?

Answer. FDA does have the capability to spend the increased funds requested for the tobacco initiative during fiscal year 1999. The President's budget provides for a reasonable level of funding for each of the three programmatic areas of FDA's tobacco program. Activities in fiscal year 1997 and fiscal year 1998 have provided the institutional basis for the effective carrying out of the responsibilities planned for fiscal year 1999. A substantial amount of time, effort and planning has occurred and the Agency is in a good position to undertake the expansions envisioned for the program.

The majority of the funding for the tobacco program is dedicated to be used for contracts with the states to commission state officials to perform unannounced inspections of retail establishments.

Question. Will the \$34 million for tobacco activities be obligated by the end of fiscal year 1998? What portion of these funds have already been obligated to date?

Answer. We will be happy to provide this information for the record.

[The information follows:]

TOBACCO FUNDING FISCAL YEAR 1998

[In millions of dollars]

	Fiscal year 1998—		
	Current obligations	Anticipated obligations—	
		Last half of fiscal year	Total
Salary & Benefits8	1.1	1.9
Enforcement9	21.4	22.3
Outreach	6.8	3.0	9.8
Total	8.5	25.5	34.0

The overwhelming majority of the money anticipated to be obligated during the second half of fiscal year 1998 is for enforcement contracts. Most of those contracts are in the process of being negotiated, with the time consuming process of bidding and drafting proposals having occurred during the first half of fiscal year 1998.

Question. What reduction in youth tobacco use will be achieved with the increased funds provided for fiscal year 1998? What is your projection if the \$100 million increase requested in the fiscal year 1999 budget is provided?

Answer. The increased efforts in the arenas of outreach and enforcement activities, the proposed product regulation campaign, coordinated with the complimentary activities in the CDC, SAMHSA and NIH, will dramatically enhance the nation's ability to meet its objective of reducing young peoples use of tobacco by 50 percent over seven years. It is the combined effect of all these efforts that provides the greatest opportunity to reduce the death and disease associated with tobacco use.

Question. Why doesn't the President's budget propose that the costs of implementing and enforcing FDA's regulation of nicotine-containing tobacco products be covered by a tobacco settlement rather than be borne by the American taxpayer?

Answer. If Congress enacts comprehensive tobacco legislation, then funds will be available for the FDA program that would be generated by industry payments. The Administration is committed to working with the Congress to ensure the enactment of this important legislation.

Question. FDA is currently proceeding with the age and photo ID provisions of its final rule on tobacco since other provisions of its rule were not upheld or suspended by the federal district court. If the US Circuit Court of Appeals overturns the ruling and the FDA is able to proceed to implement all provisions of its rule, will this alter FDA's spending plans for fiscal year 1999? If so, how?

Answer. If FDA could proceed with enforcement of the entire tobacco rule, it would require the Agency to renegotiate state contracts to call for more and different enforcement tasks for state officials. In addition, enhanced outreach efforts would have to be designed and disseminated to explain the new provisions to affected industries. How much reassignment of funds would be necessary to cover these new activities is unclear, but FDA would expect to continue with its current plans to begin product regulation, to the extent possible.

Question. How much of the \$34 million provided for fiscal year 1998 is for FDA contracts with states to conduct enforcement inspections of retail operations for compliance with FDA's regulations prohibiting the sale of tobacco products to minors? How much is included in the fiscal year 1999 request for contracts with states?

Answer. At least \$20 million is allocated for FDA contracts with states for fiscal year 1998. The bulk of the \$75 million for enforcement activities in fiscal year 1999 is intended for state enforcement contracts.

Question. If states do not elect to enter into contacts with FDA, what action, if any, will FDA take?

Answer. FDA is endeavoring to contract with every state and territory. Significant amounts of time are being spent trying to address each state's individual needs and requirements so that all states can participate. However, if we should be unable to contract with a state, FDA is prepared to perform compliance checks with FDA field personnel in those states.

Question. If the \$34 million provided for fiscal year 1998 was intended to cover FDA contracts with all states and territories, why is an increase in funding for these contracts required for fiscal year 1999?

Answer. There are over 500,000 retailers in the U.S. who sell tobacco products (some estimate that it could be as high as 1,000,000). The funding provided to date will enable FDA to contract with each state to begin enforcement activities. But at current funding levels, less than half of all retailers will be inspected. With the increase funding for fiscal year 1999, FDA would anticipate being able to contract for 500,000 compliance checks.

Question. Please describe what costs and activities are covered by FDA's contracts with the states. What is the federal government paying for specifically?

Answer. The contracts are designed to obtain state assistance in the investigational coverage of retail establishments that sell tobacco products. We will be happy to provide specific objectives of these contracts, for the record.

[The information follows:]

SPECIFIC OBJECTIVES TOBACCO CONTRACTS

To enforce the Regulations, 21 CFR 897.14 (a) and (b).

To conduct a minimum of 375 unannounced investigations using children ages 15-17 in retail establishments that sell tobacco to determine compliance with the Regulations, 21 CFR 897.14 (a) and (b) (minimum age of purchase 18 and requirement that retailers request a photo identification for purchase).

To train one or more persons in the Contractor's state who in turn trains the individual commissioned officers to conduct investigations.

To document unannounced investigations and coordinate with FDA as necessary to achieve substantial compliance with the regulations, 21 CFR 897.14 (a) and (b).

The state is responsible for hiring the appropriate personnel, training the minors who will assist in the investigations, planning and conducting the investigations, fil-

ing reports with FDA of the outcome of each investigation and conducting follow-up investigations as warranted. FDA is responsible for sending out letters to each retailer informing him/her of the results of the investigation (compliance or violation). If a second or greater number of violations is reported, it is FDA's responsibility to bring legal action, specifically, to seek to impose civil money penalties.

Question. What is FDA's goal for the frequency of retailer compliance checks through State contracts?

Answer. A key influence on a retailer's decision to comply with the new legal requirement is the extent to which the individual perceives he or she is likely to be found in violation. The Agency has developed a general enforcement strategy aimed at conducting compliance checks in a significant percentage of the approximately 500,000 retail outlets that sell tobacco products. In fiscal year 1997, during the start up phase of the program, ten pilot states were asked to conduct a minimum of 300 compliance checks per month. Currently, all 50 states and several territories are being asked to submit proposals to conduct a minimum of 375 checks per month. In fiscal year 1999, FDA has committed to conducting a minimum of 500,000 unannounced compliance checks of retail establishments that sell tobacco. The goal of the program, when full implementation occurs, will be to check every facility at least once each year and to conduct follow up investigations on those found to violate the rule.

Question. Please provide a summary, by state, of each contract, including the total cost of the contract, its terms and length, etc.

Answer. All the contracts provide for the states to perform the same functions. We are happy to provide a detailed summary of each contract for the record. In addition to those contracts awarded for fiscal year 1998, we are nearing final contract award with five other states.

[The information follows:]

FISCAL YEAR 1997 TOBACCO COMPLIANCE CONTRACTS

State	Contract award date	Number of compliance checks	Total cost	Start date	End date
Florida	06/11/97	2,664	\$194,589	06/20/97	05/20/98
Washington	06/24/97	2,640	167,517	07/01/97	03/01/98

Florida	02/04/98	n/a	72,000	05/21/98	08/20/98
Total		30,200	2,079,799		

Question. Please explain the differences between state contracts, if any, and the reasons for those differences.

Answer. The main differences between FDA's contracts with the states are the cost and proposed number of checks. There could be several reasons for these and other differences. For example, some states may choose to subcontract with county and local government to conduct the unannounced investigations. The size of each state varies, therefore travel costs and the number of investigators may differ. Some states may have more experience conducting tobacco compliance checks. Other reasons may include the variance in the number of retailers in each state, and the difference in the lengths of the contracts.

Question. As I understand it, all the states had laws prohibiting the sale of tobacco products to minors at the time FDA issued its final regulation. To the extent that states were already implementing enforcement and compliance activities with respect to those laws, do the contracts include maintenance of effort requirements?

Answer. FDA's enforcement activities are not intended to supplant state enforcement, but to supplement them. Efforts are made during negotiations to ensure that state enforcement continues and that federal funds be expended only on federal enforcement.

Question. First-time funding of \$24 million is requested for fiscal year 1999 for FDA tobacco production regulation. Please explain in detail how this funding will be used and why it is required for fiscal year 1999?

Answer. The product regulation activities anticipated for fiscal year 1999 are all essential functions under the Food Drug and Cosmetics Act and provide the industry with a framework in which to properly conduct business.

The activities planned for fiscal year 1999 in this area include the review of applications for new tobacco products that may claim to be less hazardous than those currently on the market; the assessment of these products to determine what effects they may have on the health of current users; whether the products will create more demand by young people to initiate their use and whether the products will keep those who might otherwise have quit using tobacco products from doing so. Other activities may include initiation of classification of the product pursuant to Section 513 of the Act, establishment of quality system requirements, and review and analysis of the ingredients and constituents of tobacco products.

PROPOSED USER FEES

Question. Please provide the Committee with a copy of the Administration's legislative proposal to authorize the new user fees proposed in the President's fiscal year 1999 budget.

Answer. I will provide for the record a copy of the March 31, 1998, letter from Secretary Donna Shalala to Albert Gore, Jr., President of the Senate, transmitting the Administration's draft bill, the "Food and Drug Administration User Fee Act of 1998." The same letter was sent to Newt Gingrich, Speaker of the House of Representatives.

[The information follows:]

LETTER FROM DONNA E. SHALALA

THE SECRETARY OF HEALTH AND HUMAN SERVICES,
Washington, DC, March 13, 1998.

Hon. ALBERT GORE, JR.,
President of the Senate,
Washington, DC.

DEAR MR. PRESIDENT: Enclosed for the consideration of the Congress is the Administration's draft bill, the "Food and Drug Administration User Fee Act of 1998".

The bill provides authority for the assessment of user fees for regulatory activities of the Food and Drug Administration (FDA), achieving savings indicated in the Presidents Budget for fiscal year 1999.

FDA has had great success in employing user fees to finance important Agency activities, such as the review of new human drug applications and the inspection of mammography facilities. The Prescription Drug User Fee Act program, in particular, has been a model for reinventing government and has benefited both consumers and industry.

Industry derives a direct commercial benefit from consumers' confidence in FDA's review process and product surveillance, which provides a substantial guarantee of safety. Given the benefits to the industry, and given that workloads are growing far faster than government resources, FDA believes it is reasonable to share some of the cost with the industry. In order to finance specific discretionary activities in an era of fixed, disciplined resource allocation under the balanced budget agreement, the FDA is proposing user fees to help support the whole range of its activities.

Fees would be assessed for applications for marketing approval for food additives, generic human drugs, animal drugs, and medical devices, and for licensing of establishments manufacturing medicated animal feed. Fees would also be assessed for import inspections of, and issuance of export certificates for, human and animal drugs, medical devices, and foods. Finally, fees would be assessed for monitoring and inspections of establishments involved in interstate commerce in FDA-related products, including foods, human and animal drugs, devices, and cosmetics.

Fees charged under authorities added by this bill would not duplicate fees under the Prescription Drug User Fee authority; they could be waived in exceptional circumstances in the public interest. Fees could be set at up to the full amount required to recover all associated FDA costs. Fee revenues could be used only for the regulatory activity for which collected, and would remain available without fiscal year limitation (but subject to appropriation).

We recommend that the Congress give the draft bill its prompt and favorable consideration and look forward to working with Congress to secure enactment of this important proposal.

The Office of Management and Budget has advised that there is no objection to the transmittal of this draft legislation to the Congress, and that its enactment would be in accord with the program of the President.

Sincerely,

DONNA E. SHALALA.

Enclosure.

A BILL

To provide for user fees for approval, importation, and postmarket surveillance of products regulated under the Federal Food, Drug, and Cosmetic Act.

Be it enacted by the Senate and the House of Representatives of the United States of America in Congress assembled.

SECTION 1. SHORT TITLE; REFERENCES IN ACT.

(a) **SHORT TITLE.**—This Act may be cited as the “Food and Drug Administration User Fee Act of 1998”.

(b) **REFERENCES IN ACT.**—Except as otherwise specified, references in this Act to “the Act” are to the Federal Food, Drug, and Cosmetic Act, and amendments made by this Act to a section or other provision of law are amendments to such section or other provision of that Act.

SEC. 2. CONTENTS.

This Act contains the following provisions:

SEC. 1. Short title; references in Act.

SEC. 2. Contents.

PART A—USER FEES

SEC. 11. Fees related to food additive petitions.

SEC. 12. Fees related to generic drugs.

SEC. 13. Fees related to animal drugs.

SEC. 14. Fees related to medical devices.

SEC. 15. Fees related to import inspections and export certificates.

SEC. 16. Fees related to entities under FDA’s oversight.

PART B—GENERAL PROVISIONS

SEC. 21. General provisions related to user fees.

SEC. 22. Agency plan and annual reporting requirements.

PART A—USER FEES

SEC. 11. FEES RELATED TO FOOD ADDITIVE PETITIONS.

(a) **TYPES OF FEES.**—Beginning in fiscal year 1999, the Secretary shall establish, in accordance with section 21, fees to cover activities of the Food and Drug Administration in connection with:

(1) petitions for food additives submitted pursuant to section 409(b) of the Act;

(2) notifications to the Secretary for food contact substances submitted pursuant to section 409(h) of the Act;

(3) petitions for color additives submitted pursuant to section 721 of the Act;

(4) petitions, submitted pursuant to sections 201(s) and 701(a) of the Act and regulations thereunder, for affirmation that a substance that becomes, or may

reasonably be expected to become, a component of food is generally recognized as safe; and

(5) notifications to the Secretary, submitted pursuant to sections 201(s) and 701(a) of the Act and regulations thereunder asserting that a substance that becomes, or may reasonably be expected to become, a component of food is generally recognized as safe.

The fees shall be payable at the time the petition or notification is submitted to the Secretary.

(b) FEE AMOUNTS AND AVAILABILITY.—Subject to section 21(a)(1)(A), fees for the activities specified in subsection (a) shall be set for each fiscal year at amounts that the Secretary reasonably estimates to be sufficient to generate revenues totaling \$10,335,000 for each of fiscal years 1999 through 2003, and shall remain available until expended, to the extent provided in appropriations acts, for the costs of carrying out such activities.

SEC. 12. FEES RELATED TO GENERIC DRUGS.

(a) TYPES OF FEES.—Beginning in fiscal year 1999, the Secretary shall establish, in accordance with section 21, fees to cover activities of the Food and Drug Administration in connection with applications for approval for new drugs submitted pursuant to section 505(j) of the Act. The fees shall be payable at the time the application for approval is submitted to the Secretary.

(b) FEE AMOUNTS AND AVAILABILITY.—Subject to section 21(a)(1)(A), fees for the activities specified in subsection (a) shall be set for each fiscal year at amounts that the Secretary reasonably estimates to be sufficient to generate revenues totaling \$12,377,000 for each of fiscal years 1999 through 2003, and shall remain available until expended, to the extent provided in appropriations acts, for the costs of carrying out such activities.

SEC. 13. FEES RELATED TO ANIMAL DRUGS.

(a) TYPES OF FEES.—Beginning in fiscal year 1999, the Secretary shall establish, in accordance with section 21, fees to cover activities of the Food and Drug Administration in connection with:

(1) applications, including supplements, for new animal drugs submitted pursuant to section 512(b)(1) of the Act, including application and other submissions for import tolerances, as described in section 512(a)(6) of the Act;

(2) abbreviated applications, including supplements, for new animal drugs submitted pursuant to section 512(b)(2) of the Act; and

(3) applications for licenses to manufacture animal feeds bearing or containing new animal drugs, submitted pursuant to section 512(m) of the Act.

The fees shall be payable at the time the application for approval is submitted to the Secretary.

(b) FEE AMOUNTS AND AVAILABILITY.—Subject to section 21(a)(1)(A), fees for the activities specified in subsection (a) shall be set for each fiscal year at amounts that the Secretary reasonably estimates to be sufficient to generate revenues totaling \$10,100,000 for each of fiscal years 1999 through 2003, and shall remain available until expended, to the extent provided in appropriations acts, for the costs of carrying out such activities.

SEC. 14. FEES RELATED TO MEDICAL DEVICES.

(a) TYPES OF FEES.—Beginning in fiscal year 1999, the Secretary shall establish, in accordance with section 21, fees to cover activities of the Food and Drug Administration in connection with applications for—

(1) premarket approval of devices (including proposed product development protocols) submitted under section 515 of the Act,

(2) supplements to approved premarket approval applications for which clinical data are required,

(3) supplements to approved premarket approval applications for which clinical data are not required, and

(4) device premarket notification submissions under section 510(k) of the Act.

The fees shall be payable at the time the application is submitted to the Secretary.

(b) FEE AMOUNTS.—The fees required under subsection (a) shall be as follows:

(1) \$175,000 for applications described in subsection (a)(1);

(2) \$100,000 for supplements described in subsection (a)(2);

(3) \$6,000 for supplements described in subsection (a)(3);

(4) \$4,500 for submissions described in subsection (a)(4).

(c) FEE AMOUNTS AND AVAILABILITY.—Subject to section 21(a)(1)(A), fees for the activities specified in subsection (a) shall be set each fiscal year in accordance with section 21 to amounts that the Secretary reasonably estimates to be sufficient to generate revenues totaling \$25,000,000 for each of fiscal years 1999 through 2003,

and shall remain available until expended, to the extent provided in appropriations acts, for the costs of carrying out such activities.

SEC. 15. FEES RELATED TO IMPORT INSPECTIONS AND EXPORT CERTIFICATES.

(a) **TYPES OF FEES.**—Beginning in fiscal year 1999, the Secretary shall establish, in accordance with section 21, fees to cover activities of the Food and Drug Administration in connection with the review of imported human and animal drugs, medical devices, and food subject to regulation under the Act (including activities relating to admission or detention of, refusal of entry to, and the issuance of export certificates for such items). The fees shall be payable at the time of each import entry or request for export certificates for shipment of the item.

(b) **FEE AMOUNTS AND AVAILABILITY.**—Subject to section 21(a)(1)(A), fees for the activities specified in subsection (a) shall be set for each fiscal year at amounts that the Secretary reasonably estimates to be sufficient to generate revenues totaling \$12,000,000 for each of fiscal years 1999 through 2003, and shall remain available until expended, to the extent provided in appropriations acts, for the costs of carrying out such activities.

(c) **COLLECTIONS.**—The fees authorized by this section shall be collected on behalf of the Secretary by the United States Customs Service.

SEC. 16. FEES RELATED TO ENTITIES UNDER FDA'S OVERSIGHT.

(a) **TYPES OF FEES.**—Beginning in fiscal year 1999, the Secretary shall establish, in accordance with section 21, fees to cover activities of the Food and Drug Administration in connection with regulatory activities with respect to regulated products approved for marketing. The Secretary shall assess fees for monitoring establishments that are subject to regulation (including inspections conducted pursuant to section 704 of the Act, and other regulatory activities), as follows:

(1) **FOOD ESTABLISHMENTS.**—An establishment subject to inspection under section 704 of the Act because it manufactures, processes, packs, or holds food for (or after) shipment in interstate commerce, is subject to assessment of annual fees under this section. The Secretary may impose an annual registration requirement on such an establishment to facilitate assessment and collection of the fees.

(2) **DRUG AND DEVICE ESTABLISHMENTS.**—An establishment subject to the annual registration requirement under section 510 of the Act (with respect to products other than those for which such an establishment is subject to section 736 of the Act) is subject to assessment of annual fees under this section at the time of registration.

(3) **COSMETICS ESTABLISHMENTS.**—An establishment subject to inspection under section 704 of the Act because it manufactures, processes, packs, or holds cosmetics for (or after) shipment in interstate commerce is subject to assessment of annual fees under this section. The Secretary may impose an annual registration requirement on such an establishment to facilitate assessment and collection of the fees.

This section does not affect any other statutory or regulator' requirements imposed on these entities.

(b) **FEE AMOUNTS AND AVAILABILITY.**—Subject to section 21(a)(1)(A), fees for the activities specified in subsection (a) shall be set for each fiscal year at amounts that the Secretary reasonably estimates to be sufficient to generate revenues totaling \$57,905,000 for each of fiscal years 1999 through 2003, and shall remain available until expended, to the extent provided in appropriations acts, for the costs of carrying out such activities.

PART B—GENERAL PROVISIONS

SEC. 21. GENERAL PROVISIONS RELATED TO USER FEES.

(a) **ASSESSMENT OF FEES.**—

(1) **FEE AMOUNTS.**—

(A) **COLLECTIONS SUBJECT TO APPROPRIATIONS.**—The fees authorized by this Act shall be collected in each fiscal year as provided in appropriation acts for such fiscal year.

(B) **RELATION TO COSTS.**—Fees assessed and collected under part A shall not exceed amounts which the Secretary estimates to be sufficient to cover costs of the Food and Drug Administration associated with the activities for which the fees are collected (including costs of assessments and collection of the fees).

(C) VARIATION FACTORS.—The amount of fees established may vary to reflect the cost of those activities with respect to different entities or groups of entities, including the type and size of entity, volume of business, and other factors the Secretary may find appropriate.

(2) FEE DETERMINATION AND PUBLICATION.—The Secretary shall annually establish fee amounts under part A, and shall publish schedules of such fees in the Federal Register as an interim final rule. The establishment and publication of such fees shall be solely in the discretion of the Secretary and shall not be subject to the requirements of sections 553 and 801 of title 5 of the United States Code and shall not be reviewable.

(3) REDUCTION OR WAIVER OF FEES.—The Secretary may provide for reduction or waiver of the fees under part A in exceptional circumstances in the public interest.

(b) CREDITING AND AVAILABILITY OF FEES.—

(1) IN GENERAL.—Fees collected pursuant to part A shall be credited to a special fund in the Treasury for user fees collected by the Food and Drug Administration. The fees shall be available in the amounts specified in appropriations acts, for salaries and expenses necessary to carry out the responsibilities of the Food and Drug Administration in connection with the activities for which such fees were collected, including the conduct of scientific research; development of methods of analysis; purchase of chemicals, fixtures, furniture, and scientific equipment and apparatus; development and acquisition of information technology and information management systems; acquisition, maintenance, and repair of real property; and expenses of advisory committees.

(2) FEES AVAILABLE ONLY FOR THE CATEGORY OF ACTIVITY FOR WHICH ASSESSED.—Fees collected for each category of activities specified in part A shall be separately accounted for, and shall be used only to finance the costs related to carrying out responsibilities in connection with the same category of activities for which the fees were collected.

(c) COLLECTION OF UNPAID FEES.—If the Secretary does not receive payment of a fee assessed under subsection (a) within 30 days after it is due, that fee shall be treated as a claim of the United States Government subject to the provisions of subchapter II of chapter 37 of title 31 of the United States Code.

SEC. 22. AGENCY PLAN AND ANNUAL REPORTING REQUIREMENTS.

The Agency plan for the Food and Drug Administration required under section 903(f) of the Act shall include objectives with respect to the assessment, collection, and use of the fees authorized under part A, and the annual report required by section 903(g) of the Act shall describe the performance of the Secretary with respect to such objectives.

Question. The budget justification indicates that the FDA intends to work with the Congress, industry, and other affected parties to achieve the goal of collecting the total \$280 million in existing and new user fees assumed in the budget in fiscal year 1999. Has FDA discussed the new user fees it proposes with the House and Senate authorizing Committees of jurisdiction, and with affected industries and other parties? Would you please summarize the status or outcome of those discussions.

Answer. FDA, in concert with HHS and OMB, prepared user fee legislation for the new fees proposed in the fiscal year 1999 President's Budget, which was submitted to the President of the Senate and Speaker of the House on March 13, 1998. To date, there have been no hearings with the authorizing committees or with affected industries on this specific proposal. We do look forward to working with Congress to authorize the fees. In order for FDA to maintain its current level of consumers' health protection, it is important that the full program level in the President's budget be appropriated.

Question. The fiscal year 1999 budget uses the collections from unauthorized user fees to pay for FDA's regulation of foods, drugs, biologics, animal drugs, and medical devices. If the proposed user fees are not authorized, what impact would the lack of these resources have on FDA's ability to carry out its responsibilities in each of these areas?

Answer. The Administration is proposing new user fees of \$127.7 million which would support 1,183 staff years. If the proposed user fees are not authorized and the base resources replaced by these user fees are not restored, the cuts will be felt across every program area of FDA. The review times and backlogs of all FDA-regulated products would increase substantially. FDA's ability to meet its statutory deadlines and fulfill its mission of protecting and promoting the health of the American public would be seriously undermined.

Question. What is meant by "postmarket surveillance" as part of the user fee proposal?

Answer. Postmarket surveillance activities include not only traditional domestic postmarketing activities, but also emerging strategies, which include partnering with state, local, professional and industry groups, and individuals to enhance the quality and safety of products. By increasing information sharing and technical assistance, establishments can operate with stronger quality assurance systems. As a result, the Agency anticipates that less formal regulatory intervention may be required. User fees would be collected for traditional domestic postmarketing activities such as inspections, investigations, sample analyses, regulatory analytical methods development, field exams, and recall effectiveness checks.

Question. How many additives will fall under mandatory "postmarket surveillance"?

Answer. Food additive and color additive petitions are considered as part of the Agency's premarket activities, and as such, none would fall under mandatory postmarket surveillance.

Question. What mechanisms are proposed to ensure that user fees for food additives will not be used for increased inspections?

Answer. In the draft bill the "Food and Drug Administration User Fee Act of 1998" submitted to Congress by the Secretary on March 13, the Department explicitly proposes that fees collected for each category of activity be separately accounted for and be used only to fund the costs related to carrying out responsibilities in connection with that category of activities. Thus, fees related to food additive petitions could not be used to fund activities, including inspections, other than those specified in the bill.

Question. What reductions would you propose in FDA's fiscal year 1999 budget request if the \$128 million in collections from proposed new user fees are not available and the appropriations request is approved?

Answer. If the \$128 million in collections from proposed new user fees are not available and the base level of appropriations is not restored by this amount, the magnitude of the reduction would have a very serious impact on our activities. It is difficult to say what the specific reductions would be in each program area; however, I am certain that there would be adverse consequences on all of our activities, and our ability to act in a timely and complete manner would be seriously compromised.

RENTAL PAYMENTS

Question. For fiscal year 1999, FDA is requesting \$88.3 million for rental payments to the General Services Administration, an increase of \$42 million from the fiscal year 1998 level. The budget justification indicates that since 1995, there has been a widening gap between payments paid and owed by the FDA for leased space and services provided by GSA. This Committee has been appropriating the full amount requested in the President's budget for FDA rental payments to the GSA. Why hasn't the President's budget in past years reflected the full amount FDA owed to the GSA?

Answer. Competition for increases in scarce Federal funding dollars has provided higher priority to public health program improvements. Again in fiscal year 1998, the President's budget request is for an amount less than the actual GSA rent bill. If FDA's rent payments to GSA had not been limited as they have been in recent years, FDA would have had to divert further critical program resources to pay the rental charges.

Question. I understand Dr. Friedman, that you were notified by GSA last year of the arrearage in FDA's rent payments to the General Services Administration for space and services received and the need to remedy this situation. GSA indicated that it would not be able to expand space and services to the FDA as it has been doing over the past couple of years without proper reimbursement. Does the fiscal year 1999 request reflect the full rent due to GSA for all FDA occupied and planned space provided by the GSA?

Answer. Yes, based on the information FDA has currently available and that of GSA, FDA believes the fiscal year 1999 Congressional Justification reflects the full rent due to GSA for all of FDA's occupied and planned space.

Question. What will be the consequences of not appropriating the full amount requested in the budget for fiscal year 1999 for rent payments FDA owes to the GSA?

Answer. If FDA's rent payments to GSA are not fully appropriated or if rent payments to GSA are not limited as they have been recent years, FDA will have to divert further critical program resources to pay the rental charges therefore reducing resources currently applied to important public health initiatives.

Question. Of the \$88.3 million requested for fiscal year 1999 to fully finance FDA rental payments due to the GSA, the budget requests that \$5.428 million be financed from Prescription Drug User Fee Act (PDUFA) collections. PDUFA user fee collections have not been drawn on in the past to defray FDA leased space in support of the user fee portion of the process for the review of human drug applications. Does the FDA reform bill enacted into law at the end of last year authorize the use of PDUFA collections for this purpose?

Answer. The original legislation, the Prescription Drug User Fee Act of 1992, defined expenses associated with the process for the review of human drug applications to include leasing, maintenance, renovation, and repair of facilities. This section was left intact under the provisions of the FDA reform bill enacted into law at the end of last year. The FDA Modernization Act however, authorizes the transfer of fees from an account without fiscal year limitation to the appropriation account for salaries and expenses with such fiscal year limitation. The Agency has also received clarification recently from FDA attorneys that rent costs could be included in the costs financed from PDUFA collections. FDA has requested specific changes in the fiscal year 1999 appropriation language to allow the transfer of up to \$5,428,000 from fees to the Rental Payments to GSA appropriation.

Question. Please provide the provision of law which specifically authorizes the use of PDUFA collections for rental of space payments to the GSA. Please include the legal citation.

Answer. Section 735 (7)(C) of the Prescription Drug User Fee Act of 1992, Public Law 102-571 defines expenses associated with the process for the review of human drug applications to include leasing, maintenance, renovation, and repair of facilities, (See 21 USC 379g (7)(C)). The Food and Drug Administration Modernization Act of 1997, Public Law 105-115 amended Section 736 (g) of the FD&C Act to authorize the transfer of fees to an annual appropriation account. (See 21 USC 379h (g)(1)). Additional appropriations language would be necessary to transfer sums in excess of the 5 percent cap that appears on such transfers for rental payments in the fiscal year 1998 appropriation.

Question. Please tell us how the \$5.428 million was calculated as the estimated amount of the payment for space representing the user fee portion of the process for the review of human drug applications. Please indicate how many square feet of GSA-provided space, out of the total occupied by FDA, is devoted to the human drug applications' review process, and how many occupiable square feet the user fee portion of this space represents.

Answer. The calculation of \$5.428 million is based on identifying the percentage of fiscal year 1998 process FTE's times the FTE's applicable to fees (41 percent).

In fiscal year 1998 an estimated 454,000 square feet of GSA space was identified for the process and of this approximately 188,000 square feet or 41 percent of the process space was estimated to be applicable to the fee. The estimated GSA rent cost that could be chargeable to fees in fiscal year 1998 was estimated to be \$5.220 million.

The 1999 budget request of \$5.428 million for GSA rent chargeable to fees only includes an additional \$208,000 above our fiscal year 1998 estimate. The increase is to cover the costs due to anticipated inflation for our existing GSA space.

Question. How many total occupiable square feet of GSA-provided space does FDA's fiscal year 1999 request for rental payments to the GSA cover? Please provide a breakdown of this total by the following categories: (1) the amount of occupiable square feet of currently occupied, GSA-provided space; (2) the total occupiable square feet of space being undertaken by GSA on FDA's behalf; and (3) the amount of occupiable square feet of GSA-provided space projected for occupancy during fiscal year 1999.

Answer. By the end of fiscal year 1998 FDA will occupy 4.05 million occupiable square feet of space that is provided by GSA. This will reflect an increase of approximately 51,000 occupiable square feet that will have occurred during the course of 1998. The additional 51,000 occupiable square feet resulted from the occupancy of 318,761 occupiable square feet and the vacating of 268,129 occupiable square feet. GSA is undertaking these additions and the vacating of space for FDA at a number of sites. In fiscal year 1999 FDA is expecting to vacate a total of 15,000 occupiable square feet which would reduce the total FDA occupancy to 4.03 million occupiable square feet of space provided by GSA.

Question. Are the FDA estimates provided in response to the above question the same as the GSA estimates? If not, please give GSA estimates and explain the differences between the FDA and GSA estimates.

Answer. GSA has estimated that by the end of fiscal year 1998 FDA will occupy 3.98 million occupiable square feet of space that is provided by GSA. The difference between GSA's estimate and FDA's estimate is approximately 70,000 oc-

cupiable square feet. This difference can be attributed to minor discrepancies between GSA's records and FDA's. When evaluated these individual discrepancies typically affect less than 5,000 square feet of space each, but when aggregated accumulate to 70,000 occupiable square feet. This, however, represents less than two percent of FDA's total inventory of space which is dispersed in over 225 buildings. FDA is working to reconcile its records with GSA's.

This reflects an increase of approximately 53,000 occupiable square feet that will occur over the course of 1997 and 1998. There is a 2,000 occupiable square foot variation in the amount of space projected by GSA when compared to FDA's projection. This is primarily due to the fact that GSA's estimates date back to 1997 and include actions that may have already been reflected in FDA's 1998 projection.

In fiscal year 1999 GSA is expecting FDA to occupy a total of 100,000 occupiable square feet of space which would increase the GSA estimated FDA occupancy to 4.08 million occupiable square feet of space provided by GSA. GSA's estimate includes 50,000 occupiable square feet of unspecified growth in FDA's inventory and 50,000 occupiable square feet attributable to occupancy of space at the White Oak site in Maryland. At this time there is no funding available to construct space at White Oak Maryland. Therefore, FDA has not included this space in its projected 1999 occupancy. If the GSA projection is reduced by 50,000 which was assigned to the White Oak site, FDA's and GSA's projected occupancy for 1999 are identical at 4.03 million occupiable square feet.

Question. How much is included in the fiscal year 1999 request for rental payments to the GSA for operating costs associated with GSA-provided space or for the refurbishment of space? Please indicate what increases are projected for these costs for fiscal year 1999. Do the FDA estimates differ with GSA's. If yes, please explain the differences in detail.

Answer. Of the \$88.294 million for GSA rent in fiscal year 1999, \$4.9 million is expected to be for FDA's building delegation operations. This is \$0.1 million more than the estimated fiscal year 1998 amount. FDA estimates its operating cost to be \$13.4 million, a total of \$8.5 million greater than the amount proposed to be provided by GSA. The funds provided to FDA, by GSA, are a building delegation allowance for buildings that are primarily occupied for special use laboratories. However, the funds are provided at a standard level based on office operations, not the higher costs associated with the operation of a special use laboratory.

Laboratory space is delegated to FDA because it requires an increased level of operational expertise that GSA is not accustomed to providing. While GSA charges almost 77 percent more for the occupancy of laboratories than for offices they only provide an operating allowance that is adequate for office space. Office space operating costs are based on a general rule of 10 hours of operation for 5 days a week. This results in substantially less operating time than laboratories which must operate on a 24-hour basis 7 days a week due to the scientific activities that must occur within controlled environments.

Question. In addition to GSA-provided space and services, the FDA is funding additional housing costs through its salaries and expenses account. For fiscal year 1998, \$25.855 million is being allocated for these costs. For fiscal year 1999, \$27.505 million is requested, an increase of \$1.650 million. Please provide specific explanation of the expenses funded through the "rent and related activities" category of the salaries and expenses account.

Answer. We are happy to provide the Committee with information on our Rent and Rent Related Activities.

[The information follows:]

FOOD AND DRUG ADMINISTRATION—RENT AND RENT RELATED ACTIVITIES

	Fiscal year—		Increase/ decrease
	1998 current estimate	1999 request	
Other rent and rent related activities	\$25,855,000	\$27,505,000	+ \$1,650,000

Other Rent and Rent Related Activities:

EXPLANATION OF EXPENSES

FDA incurs rent and rent-related costs for facilities within the Salaries and Expenses (S&E) appropriation that are not part of the Rental Payments to GSA, which is a separate appropriation. These costs are identified in three accounts: Commercial

Rent & Related Services, GSA Rent-Related Services and GSA Building Delegation Services. Below is a description of each of the accounts within Other Rent and Rent-related Activities:

The Commercial Rent and Related Services account consists of recurring activities that FDA pays directly to non-Federal sources under the delegation of direct lease and service authority. (Note: This also includes recurring services for FDA-owned facilities.) Services include rental of space, and all recurring services for building operation; i.e., utilities; and services such as janitorial, guard, grounds maintenance; and operation and maintenance of heating, ventilation, and air-conditioning (HVAC) systems.

The GSA Rent-Related Services account includes recurring reimbursable services provided by GSA that are over and above the normal eight hours that GSA covers in its rent charges. Services included are security systems, guard services, and HVAC beyond the standard level funded by GSA.

The GSA Building Delegation account provides recurring services and one-time repairs to operate and maintain buildings delegated to FDA by GSA for management of day-to-day operations above GSA's standard level. Services include utilities and all recurring services for building operation, such as janitorial, guard, grounds maintenance, and operation and maintenance of HVAC systems.

INCREASES

Other rent and rent related costs—+ \$1.65 million

For fiscal year 1999, FDA is requesting an increase of \$1.65 million for rent related costs. The fiscal year 1998 to fiscal year 1999 increase represents a full year of rent and utilities for new space at the Christopher Columbus Center in Baltimore, MD, as well as other increased costs for full year utilities and service contracts including operation and maintenance, janitorial, guards service, and grounds maintenance of FDA facilities.

Question. Please provide a detailed listing of the specific expenses included in the \$27.505 million requested for rent and related activities for fiscal year 1999, by account (i.e., commercial rent and related services, GSA rent-related services, and GSA building delegation services), as compared to fiscal year 1998.

Answer. We are happy to provide the Committee with the information detailing the specific expenses included in the \$27.505 million for the rent and related activities for fiscal year 1999 compared to fiscal year 1998.

[The information follows:]

RENT AND RELATED SERVICES FISCAL YEARS 1998 and 1999 PLANS

[In thousands of dollars]

Account/type of service	Estimates	
	Fiscal year 1998	Fiscal year 1999

Total, GSA building delegation	6,952	7,252
Total, FDA rent and related services	25,855	27,505

¹ Space vacated during fiscal year 1997; fiscal year 1998 costs are thru the decommissioning period.

² Utilities and service contracts (i.e., O&M, grounds, guards, janitorial services).

³ Overtime, utilities, guard and cleaning services not covered in GSA lease.

⁴ Utilities and service contracts (i.e., O&M, grounds, guards, and janitorial services above GSA-funded standard level).

⁵ Includes FDA funds for Atlanta Annex II for above-standard level for three-fourths of fiscal year.

⁶ Includes FDA funds for Atlanta Annex II for above-standard level for full fiscal year.

⁷ Space will be vacated in fiscal year 1998.

FISCAL YEAR 1998 OPERATING PLAN REDUCTIONS

Question. For fiscal year 1998, FDA is reducing funding for “low priority” foods program work, including activities related to cosmetic products, applied research on the full range of potentially hazardous substances which may be found in foods, and compliance monitoring of domestic food processors and imported food products. In addition, FDA will not be able to devote additional staff to work on food and color additive petitions. What impact will the reduction in resources devoted to the chemical safety of foods have on food safety?

Answer. As stated in FDA’s fiscal year 1998 Operating Plan submitted to Congress, the Agency is reducing funding for lower priority work. Within the Foods Program, the Chemical Safety of Foods area absorbed part of the Agency’s reduction in base resources. The following three projects under Chemical Safety of Foods received those resource reductions: (1) Chemotherapeutic Agents in Domestic and Import Aquaculture Products; (2) Domestic and Import Pesticide Programs; and (3) Food and Color Additive Petition Reviews.

Chemotherapeutic Agents in Domestic and Import Aquaculture Products is a program aimed at detecting unapproved drug compounds in aquaculture or farm-raised fish. In 1994, FDA detected several samples with banned drugs but fortunately has failed to detect the drugs within the past three years. While FDA’s Center for Veterinary Medicine will continue its research on new detection methods, for the Foods Program, this activity will be reevaluated in fiscal year 1999 to determine any nega-

tive impacts from the resource reduction. As for the Domestic and Import Pesticide Program, FDA projects a 12 percent decrease in the number of pesticide samples as a result of reduced resources. For Food and Color Additive Petition Reviews, the reassignment of additional staff to work on food and color additive petition review has contributed significantly to gains made in fiscal years 1996 and 1997 to reduce the inventory of pending petitions. While the inability to continue to devote additional staff to this effort will make it harder to maintain this level of progress and it may take longer than originally planned to entirely eliminate petition backlogs, we have instituted procedures to increase efficiency and are still making gains. We have attempted to make these reductions in such a way as to minimize the impact on food safety.

Question. What will the reduction of additional staffing devoted to work on food and color additive petitions have on the progress FDA has made in reducing the backlog of work in this area? What impact will this have on the time for reviews?

Answer. The reassignment of additional staff to work on food and color additive petition review contributed significantly to the gains made in fiscal years 1996 and 1997 in reducing the inventory of pending petitions. For example, at the end of fiscal year 1997, the inventory stood at 214 versus 242 at the end of fiscal year 1996 and 295 at mid-fiscal year 1995). While the inability to continue to devote additional staff to this effort will make it harder to maintain this progress and it may take longer than originally planned to entirely eliminate petition backlogs, we have instituted procedures to increase efficiency and are still making gains. For example, in fiscal year 1999, FDA intends to meet its goal of reviewing 30 percent of its food additive petitions within one year.

Question. Slower device review times below the fiscal year 1997 baselines was one of the impacts cited by FDA to result from the reductions made in its operating plan. What are the fiscal year 1997 baseline levels, and what reductions do you anticipate will result in fiscal year 1998?

Answer. The improvements and changes resulting from the implementation of the FDA Modernization Act and ongoing reengineering efforts have significantly improved FDA's level of productivity in the device review area in fiscal year 1997. During fiscal year 1998, FDA's Device program is facing the challenge of implementing the requirements of the FDA Modernization Act with reduced program resources. We hope to maintain our productivity at the fiscal year 1997 level but we realize that some decline in performance may occur during this transition period. Our strategy is to concentrate resources on higher risk, higher impact products or work areas where they are likely to have the greatest effect on the public health. I will be happy to provide for the record the fiscal year 1997 baseline levels for 510(k) applications, PMA applications, and PMA supplements. The baseline levels for PMA's and PMA supplements are estimates since insufficient time has elapsed to calculate actual measurements.

[The information follows:]

Fiscal year 1997 baseline estimates for PMA's and PMA supplements: Complete 50 percent of PMA first actions within 180 days; and complete 78 percent of PMA supplement first actions within 180 days.

Fiscal year 1997 baseline for 510(k) applications: Complete 98 percent of 510(k) first action within 90 days; and complete 64 percent of 510(k) final action within 90 days.

BUILDINGS AND FACILITIES

Question. FDA recently reprogrammed \$10.4 million of its buildings and facilities funding from lower priority projects to complete construction of Phase II of the Arkansas Regional Laboratory. The fiscal year 1999 request does not include funds for Phase III of the project. When will this funding be required and what is the projected requirement for Phase III of the project?

Answer. \$13.35 million would be needed in fiscal year 1999 to construct Phase III and complete the Arkansas Regional Laboratory. Due to competing issues with a higher priority to the FDA mission, within both the Salaries and Expenses and the Buildings and Facilities Appropriations, the request was not included in the President's Budget. The \$13.35 million is the firm figure based on the exercise of a fixed price contract option to include Phase III in the current ARL construction contract to the current construction contractor by December 31, 1998. If this unfunded option is not exercised in fiscal year 1999, Phase III may have to be repriced which may affect the cost and may affect the schedule. It will likely escalate the price due to the contractor having to re-mobilize the appropriate crafts, or a new contractor having to mobilize altogether. If this unfunded option is exercised in fiscal year 1999, there may be the opportunity to realize some savings. In addition, Phase III could

be completed on the original schedule of December 1999, which is the same time as Phase II.

Question. What requirements of FDA's field laboratory consolidation plan have been accomplished, and what future requirements remain? Please give project, cost and year scheduled.

Answer. I would be happy to provide that information for the record.
[The information follows:]

STATUS OF ORA FIELD LABORATORY CONSOLIDATION—MARCH 1998

Location/action type	Construction cost	Year completed	Year planned
Seattle, Expansion	N/A—GSA Lease	1996
Buffalo, Lab closure	N/A	1996
Chicago, Lab closure	N/A	1996
Philadelphia, Expansion	N/A—GSA Owned	1997
WEAC, Restructure	N/A	1997
Cincinnati, Restructure	N/A	1997
New Orleans, Lab closure	N/A	1998
Atlanta, Expansion	N/A—GSA Lease	1998
San Juan, Lab renovation	\$1.6 M	1998
New York, New facility	N/A—GSA Lease	1999
Arkansas, New facility	\$37.9 M ¹	1999
Los Angeles, New facility	\$38.5 M	2000
Baltimore, Lab closure	N/A	1999
Detroit, Lab closure	N/A	2000
Dallas, Lab closure	N/A	2000
Minneapolis, Lab closure	N/A	2000
Denver, Lab closure	N/A	2010
Kansas City, Lab closure	N/A	2014
San Francisco, Lab closure	N/A	2014

Note.—Facilities provided by GSA are funded through Agency annual rent payments to GSA. The costs identified above only reflect construction expenses funded under the FDA Buildings and Facilities appropriation, and not related cost (i.e. employee and equipment transfers) which are funded via FDA's Salaries and Expenses appropriation.

¹ Phase III of the project is unfunded, estimated cost is \$13.4 M.

THE FDA MODERNIZATION ACT OF 1997

Question. Are any additional resources included in the fiscal year 1999 budget request, aside from increased PDUFA collections, to fulfill requirements the FDA Modernization Act enacted into law at the end of last year?

Answer. No additional resources have been requested in the fiscal year 1999 budget request. Currently FDA is developing more than 40 regulations and guidance documents specified in the FDA Modernization Act within our current resources. After the issuance of these documents, additional resources to implement and fulfill requirements of the FDA Modernization Act will be addressed in future budget requests.

Question. Please list the activities, and resources, both in dollars and staff years, required by FDA to carry out its new responsibilities under the FDA Modernization Act of 1997. In addition, indicate the fiscal year the Committee can expect these additional resources to be requested.

Answer. The Agency is currently preparing over 40 regulations, federal register and guidance documents which are included in the FDA Modernization Act. This effort is being undertaken within current resources and is expected to cost more than \$10 million. Several additional provisions of the FDA Modernization Act require FDA to submit reports to Congress which evaluate the costs of certain provisions. After completing the implementing regulations and federal register documents, FDA will prepare the reports and cost estimates as specified in the Act. We hope that the fiscal year 2000 budget will address any additional resources the Agency will need to undertake new responsibilities under the FDA Modernization Act.

Question. The Pre-Market Notification provisions of the FDA Modernization Act of 1997 will expedite introduction of advanced food packaging materials while assuring protection of public health. The Act conditions this new pre-market notification system on an appropriation of \$1.5 million for the six months the system will oper-

ate in fiscal year 1999 and at least \$3 million annually thereafter. Is the \$1.5 million for this system to operate included in FDA's fiscal year 1999 request? If not, why?

Answer. No increase was included in the fiscal year 1999 request, as we were still reviewing the impact of this program. We are in the process of completing our report, as required by the FDA Modernization Act, which will provide our estimate as to the costs of this program.

Question. What is the fiscal year 1998 base level of resources in dollars and staff years in each of the Human Drugs and Biologics programs required to sustain the base level of resources required for FDA to utilize PDUFA fees? What are these levels for fiscal years 1999, 2000, and 2001?

Answer. The Agency devoted resources of \$232,249,000 in fiscal year 1997 to the Process for the Review of Human Drug Applications, of which, \$84,289,000 came from fees and \$147,960,000 from appropriated dollars. The FDA Modernization Act mandates that the amount that came from appropriations in fiscal year 1997 be the base level that must come from FDA appropriations in each of the subsequent years. It does not specify how much must be spent in either the Human Drugs or Biologics programs.

The amount of base resources for the subsequent years are adjusted for inflation based on the lower of either the Consumer Price Index or the total of discretionary budget provided for programs in the domestic category. Therefore, the amounts for fiscal years' 1999, 2000, and 2001 cannot be projected at this time.

ANIMAL DRUG APPROVALS

Question. Dr. Friedman, you indicate the prepared statement you submitted to the Committee that the Center for Veterinary Medicine is "reengineering the drug approval process." Would you please explain how the process is being revised or changed.

Answer. FDA is in the process of implementing the Animal Drug Availability Act of 1996—ADAA—and policies that will enable faster approval of new animal drugs. The Center for Veterinary Medicine at FDA has been working closely with animal drug manufacturers, producers and veterinarians to design a new and more flexible animal drug approval process that reduces the time and cost necessary for meeting the requirements. Congress enacted the ADAA on October 9, 1996. The purpose of the ADAA is to facilitate the approval and marketing of new animal drugs and medicated feeds. In furtherance of this purpose, the ADAA redefined substantial evidence, i.e., the standard by which a new animal drug is determined to be effective. FDA was directed to, and has, proposed a further definition of substantial evidence (62 FR 59830). The proposed changes would give FDA greater flexibility to make case-specific determinations regarding the number and types of studies that will provide, in an efficient manner, substantial evidence that a new animal drug is effective. Additionally, in response to the President's reinventing government initiatives announced in the President's National Performance Review, "Reinventing the Regulation of Animal Drugs," May 1996, FDA announced its intent to implement policies that will enable the faster approval of new animal drugs. FDA has found that direct review of new animal drug submissions by reviewers with specialized technical expertise and phased review of technical sections of new animal drug applications enable faster approval of new animal drugs because technical sections are submitted and reviewed as they are completed rather than the sponsor waiting until all sections are completed and submitting them together. FDA has implemented policies to allow for the direct and phased review of applications and intends to modify the regulations governing investigational use new animal drugs and new animal drugs to describe direct and phased review. FDA also intends to issue a proposed regulation to describe how new animal drug applicants may request a pre-submission conference to discuss investigational or new animal drug application requirements. While the ADAA added a statutory entitlement to a pre-submission conference, FDA's Center for Veterinary Medicine had already been encouraging sponsors of NADA's to participate in conferences with FDA to discuss in detail what studies are necessary to demonstrate the safety and effectiveness of a new animal drug. In its experience with these informal conferences, FDA and industry found that, as a result of direct communication during the development and review of new animal drugs, industry conducted fewer unnecessary studies and there were fewer delays in the review process.

OFFICE OF GENERIC DRUGS

Question. In response to language included in the Statement of the Managers accompanying the Conference Report on H.R. 2160, the fiscal year 1998 Agriculture,

Rural Development, and Related Agencies Appropriations Act, the FDA operating plan includes an increase from the fiscal year 1998 level for the Office of Generic Drugs. Funding for the Office of Generic Drugs for fiscal year 1998 will be \$9,693,000, as compared to the fiscal year 1997 level of \$8,991,000, an increase of \$702,000. Is this correct?

Answer. Yes, the Office of Generic Drugs was given an increase of \$702,000 for fiscal year 1998, over the fiscal year 1997 level, as reflected in FDA's fiscal year 1998 Operating Plan.

Question. How is FDA allocating the additional funds provided for the Office of Generic Drugs for fiscal year 1998?

Answer. The Office of Generic Drugs will spend most of the fiscal year 1998 funding increase on payroll expenses for additional review activities. The remaining funds will be expended on operating expenses. These expenses include spending for things such as laboratory and computer equipment, travel, training, and day-to-day operating costs.

Question. What was the staffing level (FTE's) for the Office of Generic Drugs for fiscal year 1997? What will the staffing (FTE) level for the Office be for fiscal year 1998? What is the fiscal year 1999 budget request level?

Answer. The ceiling for the Office of Generic Drugs was 127 FTE's in fiscal year 1997 and is at 132 FTE's for fiscal year 1998. No decision has been made to date on the staffing level for fiscal year 1999, but the current estimate for fiscal year 1999 is the same as fiscal year 1998.

Question. How many full-time equivalent (FTE) positions would have to be added to the Office of Generic Drugs fiscal year 1998 staffing level to enable the Office to meet FDA's statutory requirement to take final action on Abbreviated New Drug Applications (ANDA's) within six months?

Answer. The Office of Generic Drugs estimates that it would need approximately 75 additional FTE to review the majority of applications within 180 days. There will always be a few applications that cannot be reviewed within 180 days due to complicated scientific issues or other barriers outside the direct control of the Office of Generic Drugs. In addition, other parts of the Food and Drug Administration that support the generic drug review program will need additional FTE, such as the Office of Regulatory Affairs and Office of Compliance. Furthermore, the Office of Generic Drugs' and possibly other supporting FDA components' budgets would need to be proportionately increased to support the extra FTE, with increases to cover costs associated with support costs such as computers and training. The projection of approximately 75 additional FTE is based on a November 1996 report entitled: "Generic Drug User Fee Proposal Questions & Answers," but updated to reflect the increase in submissions of ANDA's.

Question. What was the backlog of generic drug applications as of the end of fiscal year 1997 and as of January 1, 1998? Please provide the total number of ANDA's pending before the FDA as well as the number pending for more than six months?

Answer. At the end of fiscal year 1997, there were 515 pending ANDA's, including 106 pending for more than six months. On December 31, 1997, there were 588 pending ANDA's, including 100 pending for more than six months.

Question. What were the mean and median review times for new drug applications (NDA's), ANDA's and ANDA supplements in fiscal year 1997? What have they been in fiscal year 1998 to date?

Answer. It is important to note that review time is different from approval time. Review time is the time that the agency takes to review, that is, to take a final action on, an application. The time for approval is the sum of the time for FDA review plus the time for the sponsor to respond to any deficiencies noted in the review if the application is not approved the first time it is submitted.

Either an approval or disapproval of an ANDA is considered by FDA to be a final action. The Agency makes every attempt to meet the requirement to approve or disapprove an application within 180 days; however, for a number of reasons it is not always possible to do so. After receiving a disapproval action, manufacturers frequently resubmit applications that address the deficiencies indicated in the disapproval action.

As we mentioned earlier, approval times reflect both time with the agency reviewing applications as well as time with the sponsor or applicant responding to deficiencies noted by FDA reviewers. The time spent in FDA on an ANDA is measured by "review cycles". A cycle starts when an application is filed by FDA and ends when the agency issues an "action letter". Generally these letters communicate to the sponsor that their application is approved or not. If not approved, the sponsor is provided with the reasons why and has an opportunity to submit information needed to address these deficiencies. When this information is received a new cycle begins.

The Office of Generic Drugs does not calculate yearly review cycle times, but can provide monthly calculations. Traditionally, the month of September has been used to report review times. Regarding the NDA information we will provide, the data reported include all approvals during the fiscal year 1997 and 1998, pre-PDUFA as well as any applications submitted in a PDUFA cohort.

[The information follows:]

FISCAL YEAR 1997 REVIEW TIMES (SEPTEMBER 1997)

[Time in months]

	Mean	Median
ANDA's	5.9	5.4
ANDA supplements ¹	n/a	5.2
NDA's (124 drugs)	16.0	15.0
Fiscal Year 1998 Year to Date Review times (February 1998)		
ANDA's	6.2	6.1
ANDA supplements ¹	n/a	4.4
NDA's (55 drugs, through 2/28/98)	14.3	12.0

¹Original and major amendments to supplements.

BLOOD SAFETY

Question. How does FDA collaborate with the Centers for Disease Control (CDC) in investigating CDC-reported incidents of possible transmission of an infectious disease in its efforts to identify problems with blood products?

Answer. The FDA has extensive interactions with its sister agencies of the Public Health Service or PHS, the CDC and NIH, on blood safety issues at all levels of the agencies. The FDA collaborates with the CDC to ensure a rapid response to any possible transmission of infectious disease. The CDC participates in product investigations by conducting epidemiologic studies or assisting with scientific analysis.

Recent examples include Centeon Albuminar in which CDC provided epidemiologic assistance in determining cases of individuals affected by bacterially contaminated product. Another example concerned Alpha Factor VIII and Factor IX in which the CDC provided epidemiologic and laboratory assistance in investigating the transmission of Hepatitis A virus from these clotting factors. CDC is currently assisting the FDA in an investigation of allergic reactions associated with specially filtered (leukoreduced) blood products.

The NIH and CDC routinely share information from large scale surveillance studies on blood safety issues such as the Retroviruses Epidemiology in Donors Study (REDS), the Transfusion Safety Study (TSS), and the Transfusion Transmitted Viruses Study (TTV).

The Department has raised blood safety to the highest level. As you are aware, Dr. Satcher has been appointed as the Assistant Secretary for Health, as well as serving as the Surgeon General, and also serves as the Blood Safety Director. Coordination of the response of the PHS agencies occurs at the level of the Blood Safety Committee chaired by the Blood Safety Director and consisting of the Director of the NIH, the CDC, and the Commissioner of Food and Drugs.

The NIH, CDC and FDA also serve as ex-officio members of the Advisory Committee on Blood Safety and Availability. The Advisory Committee has considered Hepatitis C virus (HCV) lookback notification and policy related to risk of Creutzfeldt-Jakob Disease (CJD), since its first meeting in April 1997. In August 1997, the Committee issued recommendations for the implementation of HCV lookback notification. The Secretary accepted these recommendations in January 1998, and the Department is in the process of implementing HCV lookback measures.

CDC and NIH representatives now serve as voting members of the Blood Products Advisory Committee which provides scientific advice to the FDA on a variety of issues including product approvals. NIH and CDC employees also serve on the Transmissible Spongiform Encephalopathies—TSE—Advisory Committee which advises FDA on TSE issues including their possible impact on blood and blood products. NIH and CDC representatives participate in the Interagency Working Group on Blood Safety and Availability which hold monthly teleconferences to discuss issues affecting blood safety.

The CDC has also created a position of Assistant Director for Blood Safety to facilitate interactions on these issues. Together, these efforts ensure that CDC and NIH have input at the highest levels of the FDA and the Department.

Question. Does the investigation process differ if an adverse event is discovered by FDA or by CDC? Are FDA's decision steps related to product withdrawal or recall the same?

Answer. The FDA and CDC may become aware of adverse events by many different mechanisms because the FDA focuses on regulated products while CDC focuses on surveillance and epidemiological investigations. Adverse events may be reported through either the FDA's Medwatch system, the CDC surveillance systems or as reports from consumers. Once an adverse event is discovered, the FDA and CDC work together to safeguard the public by rapidly investigating the cause of the adverse event, alerting the manufacturer and the public. FDA and CDC have reciprocal arrangements regarding emergency contacts and utilize standing cooperative procedures for sharing information and managing investigations.

The FDA may initiate an investigation at both the administering facility and the manufacturer of the product. CDC may be called upon to assist the FDA in epidemiologic and scientific investigations.

FDA's decision steps related to product withdrawal or recall are the same regardless of whether the event is discovered by the FDA or by the CDC. FDA's decision steps in the classification of these types of situations is similar. The end points may, however, be different. For example, a manufacturer may voluntarily withdraw product from the market at any time. If the presence of the product in the market place represents a violation of the Federal Food, Drug, and Cosmetic Act or the Public Health Service Act and the FDA would pursue legal action (e.g. seizure), the withdrawal may be formally classified by the FDA as a "recall". If the FDA does not believe that the underlying violations or deficiencies relating to the product are actionable violations, the withdrawal action may be formally classified by the FDA as a "Market withdrawal". For recall classifications, a health hazard evaluation is performed and the recall is classified as Class I, II, or III based on the potential risks and hazards, if any, associated with use or exposure to the product.

Investigation processes for FDA and CDC differ in that FDA has a focus on regulated products and the public health associated with the use of those products while CDC is principally concerned with epidemiological investigations and surveillance relating to transmission or suspected transmission of diseases which also contribute to public health decisions. FDA and CDC work closely together when investigations focus on broad public health issues involving the potential spread of infectious agents.

Investigational processes and directions may differ based upon the source of the information concerning an adverse event. For example, if a regulated product is suspected as having caused an unexpected or serious adverse event, FDA may initiate an inspection at both the administering facility and the manufacturer of the product in question. Since CDC has extensive epidemiological investigational experience, FDA would conduct a joint review in situations where the facts surrounding a disease transmission do not clearly implicate a specific product and require an extensive epidemiological investigation.

Question. Last year, the Committee directed FDA to move forward in convening a working group to develop a system to notify patients of adverse events. As a result of this action, I understand that a voluntary patient notification system has been proposed by blood product manufacturers. What progress has been made in implementing this voluntary notification system?

Answer. The voluntary notification system came about following a PHS-sponsored meeting on notification of withdrawals and recalls that occurred in November 1996. Since that time, the FDA has met with consumer groups and industry representatives on numerous occasions to help formulate the elements of this voluntary system.

The International Plasma Products Industry Association, IPPIA, has formulated a proposal to implement a voluntary notification system, that will employ a single third-party to act as the repository and distributor of information. The IPPIA projects that the notification system will be operational in June 1998.

Question. What steps does FDA intend to take to ensure this system is appropriately implemented?

Answer. FDA is considering drafting a regulation that will require adequate record keeping and an effective mechanism to identify and notify product custodians in the event there is a potential for the exposure to a communicable disease. Delivery system participants will be required to establish and maintain mechanisms for notification of the product custodian, which in some cases, may include the patient or the patient's legal guardian.

FDA continues to support better notification of consumers about withdrawals and recalls through a number of means, including improved labeling of products. Proposed improvements include the use of lot-number tear-offs to make it easier to track lot numbers, and the printing of the third-party telephone number on the product to permit easy access to enrollment in the notification system. The FDA continues to meet with consumer groups and industry to discuss these issues.

Question. Once established, is there a mechanism for FDA oversight of the patient notification system?

Answer. FDA regards the notification system as a component of the recall plan of a manufacturer, and thus, the system would fall under FDA's regulatory purview. Any information a firm disseminates through the national notification system will be part of its recall procedures, and will be reviewed by the FDA on that basis. Importantly, while FDA does have a policy of reviewing the recall strategy of manufacturers, recalls are reviewed at different levels depending on several factors. The depth of review has resource implications, especially if multiple systems are in place. FDA prioritizes its resources by the level of health risk. Any auditing for effectiveness during a recall would be governed by FDA's existing procedures for effectiveness checks.

Question. How will manufacturers be held accountable for notifying patients of possible contamination of blood products?

Answer. FDA agrees that the voluntary national notification proposal by a third party is a good idea, but not in lieu of patient notification by the product consignees. During a recall, the FDA is also concerned with product retrieval, which is not a primary objective of the voluntary plan. The proposal addresses patient notification but not product withdrawal or retrieval. A manufacturer's participation in the voluntary patient notification system will not fulfill all of a manufacturer's responsibility regarding product recall. FDA is considering a regulation requiring a notification mechanism of a manufacturer's failure to follow the regulation which could result in regulatory action. FDA would conduct inspections to oversee the implementation of the regulation.

Question. What FDA resource commitments has FDA made to this voluntary notification system?

Answer. The voluntary notification system came about following a PHS-sponsored meeting on notification of withdrawals and recalls that occurred in November 1996. Since that time, the FDA has met with consumer groups and industry representatives on numerous occasions to help formulate the elements of this voluntary system. The FDA continues to meet with consumer groups and industry to discuss these issues. FDA continues to support better consumer notification about withdrawals and recalls through a number of means. CBER posts notices of plasma-derivative product recalls and withdrawals on its WebPage. FDA is considering publication of a proposed regulation which would require adequate record keeping and an effective mechanism to identify and notify product custodians in the event there is a potential for the exposure to a communicable disease. This proposed regulation would be disseminated for notice and comment before becoming final. Resources for these activities have been identified within a larger plan to address current concerns related to blood safety.

The International Plasma Products Industry Association (IPPIA) has formulated a proposal to implement a voluntary notification system, that will employ a single third-party to act as the repository and distributor of information. The IPPIA projects that the notification system will be operational in June 1998.

MEDICAL GLOVE PROTEIN AND/OR POWDER

Question. FDA reportedly has under consideration a rule setting a protein limit of 1200 micrograms per medical glove, and a powder limit of 120 milligrams per glove. Is there a scientific basis upon which to determine these standards? If so, what is that basis? Or, are these standards simply based on FDA's evaluation that medical glove manufacturers will be able to achieve them?

Answer. These limits are based on the scientific principle of dose-response, i.e., less protein and less powder will reduce adverse effects, and they are also based on FDA evaluation that medical glove manufacturers will be able to achieve these limits.

Question. The implementation of any standard for glove protein and/or powder would seem to depend heavily on the methods used to measure protein or powder. What methods are available to measure these things, and what if anything needs to be done to improve, refine, or standardize these methods? Has the FDA worked with ASTM or other voluntary standards organization to arrive at reliable measurement techniques?

Answer. The method recommended for measuring protein levels is the American Society for Testing and Materials (ASTM) D 5712 Standard. FDA's Center for Devices and Radiological Health is currently evaluating the use of the ASTM D 6124 Standard for measuring glove powder levels.

Question. In setting protein and/or powder limits for medical gloves, what measures has FDA taken, or does it intend to take, to ensure that its regulations do not cause shortages of medical gloves?

Answer. FDA has requested ASTM to develop a standard for the maximum level of water-soluble protein on natural rubber latex medical gloves, and the maximum allowable level of glove powder on medical gloves. This effort is ongoing and FDA is actively participating. This effort in cooperation with the manufacturer members of ASTM was undertaken to ensure that the proposed regulation will not cause shortages of medical gloves.

FDA STUDY OF THE THIRD NATIONAL HEALTH AND NUTRITION EXAMINATION SURVEY
(NHANES) SAMPLES

Question. In its September 1997 Medical Glove Powder report, FDA indicated that its CDRH Epidemiology Team was conducting a study of the seroprevalence of natural latex-specific IgE antibodies among participants in the Third National Health & Nutrition Examination Survey (NHANES III). What is the status of FDA's study? Over what time period were blood samples in this study collected?

Answer. FDA's CDRH, in conjunction with FDA's Center for Biologics Evaluation and Research, CBER, sponsored testing of blood samples from the Phase II, 1991-1994, of the National Health and Nutrition Examination Survey III for seroprevalence of natural latex-specific IgE antibodies. The CDRH Epidemiology Branch is awaiting the results of this testing, which is still in progress. Upon receipt of the complete testing results, the CDRH Epidemiology Branch will analyze the data, using the demographic information and population weights supplied by the National Center for Health Statistics, the agency conducting NHANES III.

Question. In studying IgE seroprevalence among NHANES III participants, what assay(s) did the CDRH Epidemiology team use? Also, what method or cutoff level(s) did the Epidemiology Team use to classify individual results as reflecting or not reflecting latex sensitivity? (For example, did the Epidemiology Team use a result of 0.35 International Units per milliliter (0.35 IU/ml) on the AlaSTAT Latex-Specific IgE Allergen assay as a cutoff point for latex sensitivity?) And what was the reason for using this cutoff?

Answer. The AlaSTAT Assay is being used to test the NHANES III Phase II blood samples. The Epidemiology Team will receive the results expressed in International Units per milliliter (IU/ml), rather than as "positive" or "negative." Therefore, the CDRH Epidemiology Branch will be able to examine the data using a variety of cut points, and determine which, if any, correlate with other variables available in the NHANES III data set.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The Agency's annual performance goals are aligned with FDA-wide strategic goals and strategies, which in turn, support the Agency's mission. The basic elements of FDA's mission are to promote the public health by timely review of regulated products prior to marketing; protecting the public health by ensuring the safety and effectiveness of products on the market; and coordinating agency efforts with external partners and stakeholders. FDA's strategic goals and strategies directly support each element of the mission statement. Each performance goal in the Performance Plan, in turn, is tied to an Agency strategy. Those connections are identified in the descriptive material supporting the performance goal statements.

The performance goals in the plan are also organized by FDA's major program activities in the budget, for example foods, drugs, biologics, or one of the other major program areas. Within each program activity, performance goals are grouped into clusters, with program resources broken out for each cluster.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The process used to link performance goals to budget activities involved program managers, planners and budget representatives from each Agency center, their field counterparts, and non-center headquarters analysts. The process contained several steps. First, program managers and planners in each center identified clusters of performance goals that supported each major strategic direction for

the center. FDA identified resource totals for each budget activity. We are defining a budget activity as a program identified in the budget, for example human drugs, foods, and so forth. Resources associated with a program consist of the resources allocated to a product center, such as human drugs, plus the resources assigned to regulate that product area in FDA's field organization. Center officials then apportioned the resource total for each budget activity, or program, to each cluster of performance goals within the program, based on an estimate of expenditures necessary to achieve the performance goals. We then reconciled program resources identified in the budget with those identified in the performance plan.

The challenge associated with this new way of organizing resources, by strategic direction, was that it was different from the traditional "project" classification. FDA's current accounting system keeps track of resources below the program level by these projects. Thus, resources were crosswalked from an input-oriented project and accounting system to a results-oriented performance system. These crosswalks were accomplished by developing reasonable estimates rather than through empirical record-keeping.

The major lesson learned was that performance goals could still be linked to the existing budget structure while being arrayed differently for strategic and performance purposes. We are still in the process of determining the extent to which budget and performance systems should be integrated. The degree of integration depends, at least in part, on the preferences expressed by HHS, OMB, and Congress.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, the performance goals in the performance plan are directly linked to the budget. There are goals for each program area in the budget and the clusters of goals within program areas are tied to the resources requested for that program. The budget justification uses performance goals in justifying the budget request. With respect to the second part of your question, if by "account" you mean the FDA appropriation, the answer is yes. The appropriation is a more aggregate category than the program, or budget activity. Thus, performance measures for the FDA account, or appropriation, would be the sum of performance measures for all of FDA's programs.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The performance planning structure uses the same programs as the budget, for example Foods, Human Drugs, Biologics, Animal Drugs and Feeds, Devices, National Center for Toxicological Research, and Tobacco. Earlier we discussed how the performance planning and budget structure differ below the program level.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. We are currently in the process of evaluating whether to change portions of our account structure, to provide the most helpful information to the Committee. We would be happy to keep the Committee apprised of any proposed changes as they are developed.

Question. How were performance measures chosen?

Answer. First, we would like to clarify how FDA uses the term performance measure. FDA identifies a performance measure as one element of a performance goal. The performance measure is the yardstick that is used to identify levels of desired and actual performance. The performance goal is a statement that includes the performance measure plus the target level and time frame that the manager selects as an intended result, and by which he/she manages. To illustrate, "percentage of priority drugs reviewed within one year of receipt" would be a performance measure. The total performance goal would read: "Complete review on 90 percent of all high priority drugs received in fiscal year 1999, within one year of receipt."

FDA used a process to choose performance goals, which includes the selection of both measure, target level and time frame.

FDA initiated this process by issuing guidance on the development of performance goals and supporting documentation. This guidance was based on directives issued by OMB and the Department of Health and Human Services. Each line component of the Agency submitted performance goal candidates. Over 250 performance goals were submitted by the Centers. The goals were screened based on specific criteria, condensing the initial list of goals to the 64 performance goals contained in the Agency Performance Plan. We are happy to provide this criteria for the record.

[The information follows:]

FDA PERFORMANCE GOAL CRITERIA

Did the goal address a high public health priority?

Was there substantial stakeholder concern and interest—for example, the Administration, Congress, consumers, industry?

Did the goal address a specific legislative mandate—for example, the Prescription Drug User Fee Act?

Was the goal either outcome-oriented or would it position the agency to measure and produce outcomes in the future?

Was the goal associated with a program area in which substantial budget increases were being requested?

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. FDA used the primary criterion of significant potential public health risk to determine in which areas it was justifiable to expend and request resources for collection and validation of important data. Two notable illustrations are in the area of food safety and imports. Both areas are of major concern to the public. The Agency has devoted considerable resources in the import area to establish an import monitoring system, in cooperation with the U.S. Customs Service. As a result of this effort, the Agency now has in place an automated screening system which permits the rapid approval of imports from sources that historically have “clean bills of health.” This system also allows the Agency to quickly target suspected shipments for closer laboratory examination. FDA’s performance plan contains a goal that will ensure that at least 55 percent of safe import entries are released for entry within 15 minutes.

Food safety is a second illustration of a high public health priority for which large expenditures for establishing of effective data collection systems is warranted. FDA performance goals for fiscal year 1999 address the need to work cooperatively with other federal agencies in developing baseline surveillance data on food borne illnesses; and on adverse events associated with dietary supplements, infant formulas, and medical foods.

In other instances, the establishment of valid and reliable data systems in the premarket review areas has been supported by stakeholders, such as the regulated drugs and biologics industry in the form of user fees. Industry is willing to contribute funding for these systems because they are dependent upon accurate data to gauge FDA’s progress in prompt review decisions.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Our goal is to have reliable data available for all performance goals, performance measures, target levels and time frames, by March 2000. The performance goals that are at greatest risk for not having reliable data are those areas in which the Agency is partnering with other agencies and are taking new approaches to protecting the public health. For areas such as seafood HACCP, where the industry is still in the process of adapting this new hazard control approach, some time may be needed to develop baselines that are sufficiently stable to use as a basis for predicting future performance. Also, some programs will need to focus on process improvement goals. These are goals that lay the foundation for systems to collect data and/or develop appropriate measures. Once these systems are operating, then the program will have data and the appropriate metrics to measure performance that is more closely related to outcomes.

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. All of the goals in FDA’s fiscal year 1999 Performance Plan represent Agency commitments that FDA will strive for. The Committee may be particularly interested in tracking specifically identified goals that lend themselves to quantification, and are associated with program areas of particular current Congressional interest. We will be happy to provide a listing of these goals for the record.

[The information follows:]

SELECTED FDA PERFORMANCE GOALS FISCAL YEAR 1999

PDUFA (Prescription Drug User Fee Act)

Review and act on 90 percent of standard new drug applications (NDA’s) filed within 12 months after receipt (30 percent within 10 months of receipt); and priority applications within six months.

Review and act on 90 percent of complete NDA applications resubmitted following receipt of a non-approval letter, within six months after resubmission date.

Review and act upon 60 percent of fileable original generic drug applications within six months after submission date.

Review and act upon 90 percent of standard efficacy supplements within 12 months (30 percent within 10 months of receipt) and priority efficacy supplements filed within six months of receipt.

Review and act upon 90 percent of manufacturing supplements within six months and act on 30 percent of manufacturing supplements requiring prior approval within four months.

Food safety

By 12/30/99, 50 percent of the seafood industry will be operating preventive controls for safety as evidenced by functioning, appropriate HACCP systems.

By the end of fiscal year 1999, enhance the safety of the nation's food supply by achieving adoption of the Food Code by 25 percent of the states.

Tobacco

Enter into contracts with all 50 states (depending on their willingness) to conduct an average of 42,000 unannounced compliance checks each month of retail establishments that sell tobacco products.

Imports

Increase the percentage of safe imports screened within 15 minutes to 55 percent.

Mammography

Have at least 97 percent of mammography centers meet key inspection standards, with less than 3 percent of facilities with Level 1 (serious) inspection problems.

Important new medical devices

Complete 50 percent of Premarket Approval applications (PMA's) within 180 days.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. FDA used several approaches to focus on outcome-oriented performance goals. In anticipation of preparing the fiscal year 1999 Annual Performance Plan, we trained over 600 of our managers, planners and field staff in GPRA and performance management principles. FDA's GPRA training and the fiscal year 1999 Performance Plan guidance described the differences between input goals, activity goals, output goals and outcome goals. We are also encouraging the use of 'process improvement' performance goals, such as establishing important data systems, or developing appropriate partnering arrangements. These goals are important as transition mechanisms which position our agency to be more effective in both measuring and producing outcomes in cooperation with external partners. FDA is also encouraging system analyses of agency programs and their relationships with their environment to explain and predict outcomes more effectively. These analyses help to explain the relationships among components of the system. To illustrate, in the food safety area, we are examining linkages among research, surveillance efforts, educational interventions and enforcement actions. These relationships are first understood in conceptual terms. As systems understanding develops further, hopefully empirical relationships can be established among these components to aid in predicting and then committing to outcomes.

During the development of the Annual Performance Plan, FDA used its network of program liaisons to provide technical assistance and support to organizational components in developing outcome-oriented performance goals. This assistance ranged from reinforcing performance planning principles; discussing performance measurement issues; establishing rational linkages between process improvement goals, output goals and desired outcomes; and providing feedback on performance information developed. Through an iterative process, the Agency program managers and planners selected the most important and most outcome-oriented performance goals for inclusion in the Annual Performance Plan.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes. As a result of extensive GPRA training and application of performance management principles, FDA's program managers are shifting their emphasis away from managing activities and toward managing results. For example, the primary objective of the President's Food Safety Initiative is to reduce foodborne illness. FDA managers are collaborating with USDA, CDC and EPA and state and local health and agricultural agencies in this effort.

The use of the Compliance Achievement Reward System (CARS) provides another example of how the development of a performance-based personal reward system has been used to foster change toward an outcome-oriented culture in the Agency's

compliance program. This results-oriented computer data system captures efficient and effective compliance achievements that focus on impacts and outcomes. This reporting system is helping to create a change in FDA's mind set from only "policing" the industry to a willingness to openly communicate and work with those industries willing to work with FDA. Credit is given to employees who achieve compliance efficiently with regulated industry. Employees used to be rewarded for the number of enforcement and administrative actions taken. Now they are interacting with industry more through individual meetings, training, workshops, and grassroots meetings to listen to concerns.

Nevertheless, we continue to face several challenges that limit our ability to establish measurable outcome oriented performance goals. First, a major barrier to establishing outcome-oriented performance goals is that most desirable health outcomes of FDA action, reduced morbidity and mortality, results from the efforts of multiple actors, including the regulated industry, other federal agencies, health professionals and consumers. As we approach ultimate outcomes, FDA's singular influence increasingly wanes and it becomes increasingly difficult to establish a clear connection between FDA's action and some ultimate health outcomes. Moreover, we are necessarily dependent on purchasing or obtaining data from external partners who are responsible for collecting and guaranteeing the quality of health outcomes data. In many cases, outcome data are not only expensive, they are simply not available.

Second, many of our existing data systems were designed to measure activities but provide neither relevant baselines required to develop results-oriented performance goals that are within our control nor to track the progress made toward achieving such performance goals. Third, although we have addressed this issue by including process improvement goals aimed at developing the appropriate measurement systems, their development often requires a substantial investment of resources and, in some cases, performance data will not be immediately available.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. FDA is concerned about customer satisfaction for all of our varied customer groups. We recently completed a survey of customers including consumers, health professionals, state governments and industry. Survey results were analyzed and incorporated into goal setting for FDA programs. Since the Performance Plan is concise and focused externally, only a fraction of the customer service goals FDA has adopted were included in the fiscal year 1999 Performance Plan. FDA is working to incorporate more input from customers in its program management and the Agency has worked with OMB to develop a "generic" customer service survey initiative that will expedite FDA's conduct of customer surveys in the future. We are happy to provide some examples of customer-focused goals for the record.

[The information follows:]

SELECTED EXAMPLES OF FDA CUSTOMER-FOCUSED GOALS

By the end of fiscal year 1999, complete reviews of 30 percent of food and color additive petitions within 30 days.

By the end of fiscal year 1999, increase to at least 77 percent the proportion of people aged 18 and over who use food labels to make nutritious food selections.

Review and act on 90 percent of standard new drug applications and Product License Applications/Biologics License Applications filed within 12 months after receipt—30 percent within 10 months of receipt—and priority applications within six months.

FDA will continue to improve the legibility and clarity of over the counter (OTC) drug labels, and improve the consumer's ability to read and understand important warnings and usage directions.

At least 97 percent of mammography centers meet key inspection standards, with less than 3 percent of facilities with Level I serious inspection problems.

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. The Agency's measurable goals, performance goals, provided a basis for estimating resources required to fulfill the Agency's performance obligations. For example, in the area of prescription drugs, FDA negotiated performance goals with industry stakeholders. The budget was derived from the specific performance commitments negotiated. Similarly, for Seafood HACCP, a goal was set to bring the seafood industry into compliance. FDA determined the number of inspections and the technical assistance required to achieve the desired level of compliance, and these estimates served as a basis for requesting additional funds to hire new staff for the seafood inspection program.

In other instances, such as the President's Food Safety Initiative and the Tobacco Initiative, the public health rationale and pressing need for a change in strategic emphasis was sufficiently strong to result in the development of a new initiative and the appropriation of additional resources. The strategic intent of these important initiatives set the directional context that guided the development of annual performance goals.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, as we gain experience in implementing GPRA, we continue to improve our ability to evaluate the impact of changes in funding level on our programs and our ability to achieve the performance commitments outlined in the Annual Performance Plan. In some instances, changes in funding level may require an increase or decrease in program efforts and target level of performance or the development of new performance goals to fulfill new performance expectations. In other instances, reductions in funding level and performance expectations may require us to re-evaluate our priorities and program expectations.

Over the past few years, FDA has practiced several strategies for operating with reduced resources in spite of an increasing workload. These strategies, which have sometimes been used in combination, have included reducing program efforts without significantly changing the program approach, refocusing program efforts to target the highest priority health risks and to implement interventions that yield the greatest potential health benefits, and maximizing our limited resources by re-examining and redefining the role we play in protecting public health vis à vis other federal, state and local and international government agencies, third parties, industry, and other nongovernmental institutions. Some of those strategic changes have led us to modify some of our activity measures. However, changes in approach will not change the agency's desire to improve health outcomes.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes, the agency has a variety of data systems which can provide information on program performance needed by management. The agency plans to monitor performance on the fiscal year 1999 performance goals on a regular basis. As part of the required GPRA verification and validation process, the agency has initiated a system to ensure that performance data provided by its programs are accurate. This program has three basic components, (1) training workshops for program managers to learn the essential aspects of performance measurement; (2) a comprehensive checklist for verifying and validating performance information used to establish and monitor progress toward each goal; and (3) assistance in applying performance data as an effective management reporting tool. This process will ensure that the necessary data is both available and reliable to report on each fiscal year 1999 performance goal and will progressively enhance the Agency's ability to achieve and measure meaningful results.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. The present budget account structure has not made it difficult to link dollars to results. In the performance plan, we linked dollars to our major program categories and more specifically, to groups of related performance goals, which we call performance goal clusters. The program dollars required to carry out the strategic intent of our programs were linked to the goal clusters.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. We do not know the answer to your question at this time, but we are studying the situation. Specifically, we are examining ways of improving alignment of the traditional budget account structure to which Congressional Appropriations Committees are accustomed and a structure required by the Government Performance and Results Act (GPRA) that links resources with results-oriented performance goals. The first step in this process is to develop a crosswalk between our budget account structure and the results-oriented performance goal clusters. Once we better understand the linkages between these two structures, we will be in a better position to evaluate the budget account structure to determine if it should be changed to better reflect performance as required by GPRA. Whether Congress and our other stakeholders want us to eliminate the existing budget structure which is recogniz-

able remains unclear. We will continue to keep the Committee informed of any changes.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. We are currently exploring possible changes in our account structure, but are not far enough along to have a meaningful dialogue with the Committee. We fully intend to work with the Committee as we move forward in developing any proposed changes.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We are not yet sure that modification of the budget structure is the most appropriate answer to strengthening accountability for program performance. However, any mechanism which establishes a stronger link between budgeted dollars and planned performance will allow program managers and resource allocators to gain a better understanding of their return on investments. It is entirely possible that such mechanisms could be informative crosswalks between budget and performance structures. It should be noted that budget structures, performance structures, and integrating mechanisms are only as effective as the validity and reliability of the information contained in those structures. It does little good to show which dollars are 'chasing' which performance goals if a solid relationship between resources and performance hasn't yet been established.

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Our Performance Plan does briefly address some of the external factors that effect both goal achievement and the choice of strategies necessary to respond to the external factors. Prior to developing performance goals for fiscal year 1999, each program identified key environmental factors that affect their ability to carry out the strategic intent of their program. Because each of our programs are so diverse, each had to address the individual factors affecting their particular programs as they developed performance goals.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. The Foods program, for example, has identified changes in physiological microorganisms, changes in the food supply and distribution, hazardous dietary supplements as some of the external factors to which they must respond. They respond by developing appropriate strategies and leveraging resources to address these factors. One of the external factors that is common to several of FDA programs is an increased workload. This factor has led to the increased participation in Federal, state, international, and industry partnerships to develop the most efficient and effective ways to protect the public health. Partnerships in themselves are an external factor because without full and continued participation in agreements, the desired outcome of the partnership is compromised.

Question. What impact might external factors have on your resource estimates?

Answer. Unexpected shifts or developments of new factors could ultimately affect resource estimates. For example, response to emergency situations; changes in consumer consumption; and incomplete partnerships agreements would require FDA to reprogram resources to respond to meet the need.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. Through the development of the performance plan FDA has taken steps toward identifying areas of overlap and coordination with other federal agencies and nongovernmental institutions. This in turn, has led to significant coordination to avoid duplication of effort.

The Food Safety Initiatives provides a good illustration of how a total network can create synergies to produce system outcomes. We have included in the performance plans descriptions of how each of these initiatives is being implemented through partnerships and close coordination among multiple federal agencies, international, state and local governments, industry and consumer groups. FDA is working closely and cooperatively with its partners to reduce the incidence of food borne illnesses.

In developing the President's Food Safety Initiative, the functions of all the participating agencies were examined and great care was taken to avoid duplication, both among and within the participating federal agencies, and to ensure that the activities of the participating agencies were coordinated. FDA is closely coordinating with other agencies in the area of Food Safety education, research and risk assessment. For example, FDA and USDA's Agricultural Research Service have coordi-

nated their research efforts and have jointly developed research strategies. A risk assessment consortium has been formed at the Joint Institute for Food Safety and Nutrition (JIFSAN) which allows members to learn from the work of other agencies and build on each others efforts. Coordination of agency efforts in the area of food safety education is expected to encourage the communication of common messages and thus improve the ability of all cooperating agencies to achieve the shared goal of reduce the risk of microbial contamination in food and reducing the occurrence of food borne illnesses.

During the development of the fiscal year 1999 Performance Plan, we used a combination of data from FDA's Field Data System and data from USDA's National Agricultural Statistics surveys to develop a performance goal of increasing the percentage of fruit and vegetables produced using good agricultural practices guidance for reducing microbial contamination. FDA and USDA are currently collaborating in the development of follow up surveys that will allow both FDA and USDA to measure the effect of their joint efforts. FDA is engaged in similar data sharing partnerships with other agencies involved in the Food Safety Initiative, including the CDC and Food Safety Inspection Service (FSIS), and other USDA agencies.

FDA will continue to examine the relationships between its own efforts and those of cooperating organizations. The interactions among institutions is essential in order to address complex health challenges in areas such as tobacco, imported products and mammography. The current climate of outcome-oriented performance management reinforces the need to identify synergies as well as areas of overlap so that we can launch cost-effective consumer protection initiatives.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. In some cases, our performance measures are sufficiently mature for use as a basis for funding decisions. An example of a "mature" indicator is provided by the PDUFA goals that measure the timeliness of FDA application review, such as "review and act on 90 percent of standard new drug applications within 12 months of receipt." However, the fiscal year 1999 planning process revealed a need for certain new performance measures. In some of those cases, FDA is developing or refining data systems, such as the adverse event reporting system, to collect the necessary information. A goal for fiscal year 1999 is to implement the Adverse Event Reporting System for the electronic receipt and review of adverse drug event reports. FDA has a similar goal in the device adverse event reporting area. In other cases, FDA has decided to partner with other state or Federal agencies to share data. FDA is sharing data for goals such as to increase the percentage of domestic produce produced consistent with Good Agricultural Practices to reduce microbial contamination. We will be determining the baseline and using data from USDA's compliance data systems and their Fruit and Vegetable Chemical Use Surveys. In other areas, including seafood HACCP compliance, FDA coordinates its inspection efforts with states, so we must also integrate compliance data between FDA and all contracted states. FDA continues to explore potential partnerships with other institutions and creative solutions to address the issue of data compatibility.

FDA is firmly committed to developing credible data for our performance measures, not only for Congressional use, but for our own priority setting, internal management, and budgeting decisions. We are emphasizing verification and validation of performance data in our planning and budgeting activities, and managers are enforcing this focus by using performance measure data in analysis and decision making.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Several factors affect accuracy of resource estimates. First, would be lack of empirical data in areas where new strategies have been formulated. If the approach is new, no baseline exists to determine the relationship between resource expenditures and either activities or results. Another major factor is the great expense in collecting data in areas where we are trying to estimate resources necessary to achieve outcome-oriented performance goals. In many cases, outcome data bases simply don't yet exist. A third factor is the expense associated with conducting studies that will allow us to establish a valid and reliable relationship between resources and results. The Agency would have to overcome each of these barriers in order to accurately estimate resources necessary to achieve specific outcome-oriented performance goals.

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The Department submitted a department-wide strategic plan in lieu of having each operational division do so in order to meet the requirements of GPRA.

QUESTIONS SUBMITTED BY SENATOR SPECTER

Question. I understand that FDA officials recently toured mushroom growing and processing facilities in the People's Republic of China. I would appreciate a full report of the findings of this trip. Does FDA have any plans to change the automatic detention and lot-by-lot release program currently operating for mushroom products imported from China?

Answer. FDA recently completed a series of evaluation trips to the People's Republic of China (PRC). The purpose of the trips was to evaluate the progress made by the PRC mushroom industry, in conjunction with their government authorities and private consultants, in addressing the problem of Staph enterotoxin in canned mushrooms. The evaluation trips were designed to look at mushroom processing from the grower through post-processing handling.

FDA is currently in the process of reviewing the trip reports and will prepare an evaluation of the findings. FDA intends to use the findings from our recent evaluation trips to determine if the current lot-by-lot release program for canned mushrooms should be maintained as it is currently, amended or discontinued. No decision on this question has yet been made and will not be until the evaluation of the trips is completed. We will share our evaluation with your office when it is available.

Question. Please provide my office with any monthly statistics the FDA has for the past year regarding the number of lots of processed mushrooms and kilograms represented by those lots from the People's Republic of China that have requested clearance and/or been cleared for import into the United States under the lot by lot program.

Answer. The results of our record review regarding imported canned mushrooms from the People's Republic of China under the Lot-By-Lot Release Program for the past year as of March 31, 1998, are 3,527 lots and 38,837,561 kilograms. FDA did not make any seizures of mushrooms from the Chinese factories due to contamination by *Staphylococcus aureus* enterotoxin. Monthly statistics are not currently available, but we would be glad to work with you on obtaining that information.

PHARMACEUTICAL BENEFIT MANAGEMENT COMPANIES

Question. Pharmaceutical Benefit Companies are engaged by health plans to interact with pharmaceutical manufacturers and health care providers in order to find safe and effective therapies, ensure consumer safety, and coordinate information services.

What prompted the FDA to issue the January 5 draft guideline on "Medical Product Promotion by Healthcare Organizations or Pharmacy Benefit Management Companies"? What agency analyses were undertaken to prompt formal action on the issues addressed by the guidance? What were the methodologies used in those analyses?

Answer. FDA has been considering issues related to the promotion of medical products in a managed care environment since 1994. In 1994, the Agency met individually with four medical product sponsors to discuss regulatory issues in light of their newly established relationships with Pharmacy Benefit Management Companies, PBM's. Since that time, the Agency has continued its information gathering efforts. These efforts have included our participation in programs, meetings and workshops. These activities permitted FDA to work with many managed care experts to review several studies and to comment on reports from other government agencies. In addition, we have participated in meetings with many of our stakeholders, including members of the pharmaceutical industry, health professional groups and consumer organizations.

On October 19 and 20, 1995, FDA held a public hearing on "Pharmaceutical Marketing and Information Exchange in Managed Care Environments." The purpose of the hearing was to solicit information and views concerning the potential impact of changing organizational structures and information dissemination channels in the managed care setting on the Agency's responsibilities to regulate drug marketing and promotion. FDA heard testimony from 26 individuals and received an additional 38 comments to the hearing docket.

Since the hearing, the agency has continued its dialogue with representatives from the public and private sectors, including representatives from the pharmaceutical industry. The pharmaceutical industry representatives have asked that FDA maintain "a level playing field" for all medical product sponsors with respect to the regulation of their promotional activities. Since one concern that has been raised about this issue is drug switching, FDA has, in addition, sent a letter to its "MedWatch partners" asking that they disseminate a letter describing FDA's concerns about possible risks that may be associated with the switching of a patient from one product to another, usually within the same therapeutic class and asking

that reports of any adverse events be submitted to FDA. The Agency has evaluated these reports and has placed its findings in the docket for the January 5, 1998 draft guidance. In light of FDA's concern about promotional activities that may create a public health risk, and consistent with the information that had been gathered over the years, the Agency determined that the issuance of a draft guidance would be the appropriate next step.

Question. What is the role and jurisdiction of the FDA in connection with health care actors outside the realm of the drug companies it currently regulates? What is the specific jurisdiction of the FDA in issuing this guidance?

Answer. Under the Food, Drug and Cosmetic Act, FDA has responsibility for regulating the labeling and, in many cases, the advertising of medical products. FDA's determination that medical product sponsors are responsible, under certain circumstances, for promotional activities performed by health care organizations/PBM's on their behalf is consistent with long standing agency policy and finds support in the Act, regulations and legal precedent. The introductory phrase of section 301 of the Act provides that the "causing" of a prohibited act, as well as the act itself, is prohibited. In addition, 21 C.F.R. §1.1(a) provides that the provisions of regulations promulgated under the Act, "with respect to the doing of any act shall be applicable also to the causing of such act to be done." FDA is simply saying that medical product sponsors, that is, the holders of new drug applications, must be accountable for their promotional activities whether these activities are undertaken as direct marketing or indirectly through a PBM.

This broad theory of liability, which is based on FDA's responsibility to protect the public health, has been upheld in several FDA enforcement actions. Additional support is found in the law of agency, doctrine of respondent superior.

Question. Why did the FDA proceed on this issue through a guidance as opposed to a rulemaking?

Answer. FDA determined that a guidance was appropriate because the agency was not creating new requirements, but was, instead, providing an interpretation of existing statutes and regulations. Consistent with the Agency's Good Guidance Practices, this Level One guidance document was issued in draft with a request for public input.

OFFICE OF GENERIC DRUGS

Question. Last year, the Senate Appropriations Committee inserted report language making it clear that the FDA has a statutory obligation to take final agency action within 6 months in regard to generic drug approvals. In the fiscal year 1999 Budget Justification submitted to Congress in February, the FDA states "an action letter is issued for approximately 50 percent of the applications within the 180-day statutory period." Does the FDA consider an action letter final agency action?

Answer. Yes, unless the applicant requests an opportunity for a hearing on the question of whether there are grounds for denying approval of the ANDA. Generally, an action letter communicates to a sponsor that its abbreviated new drug application, ANDA, is approved or not approved. If not approved, the sponsor is provided with the reasons/deficiencies. However, the sponsor can pursue approval by responding to the deficiencies by providing the necessary information. This response is called an amendment and restarts the statutory obligation for an agency action within 180 days. The 180 day median value is calculated for original submissions and major amendments only. For "minor" deficiencies, the median review time is approximately 60 days. Many of our letters are for minor deficiencies.

Question. As you may know, last year I expressed support for increased funding for the Office of Generic Drugs. In preparation for the conference to reconcile the Senate and House fiscal year 1998 Agriculture Appropriations Bill, I wrote Senator Cochran in support of the additional \$1 million contained in the House Bill. The Conference Report (Public Law 105-86) included a fiscal year 1998 Operating Plan to Congress. The Operating Plan submitted to Congress at the start of the year provided the Office of Generic Drugs with a funding increase of at least \$400,000. Please explain why the FDA decided against allocating the Office of Generic Drugs the additional \$1 million and how the \$400,000 figure was determined.

Answer. In developing an fiscal year 1998 operating plan for the Agency, FDA took into account the direction in the Conference Report on FDA's fiscal year 1998 Appropriation, which stated "The conference agreement includes an increase for the Office of Generic Drugs". Using fiscal year 1997 operating and payroll obligations of \$8.9 million in the Office of Generic Drugs as a starting point, the full cost of the fiscal year 1998 pay raise was added along with an increase to the operating budget, for an increase of \$702,000 for the Office. The increase in funding will assist the Office of Generic Drugs' efforts towards accelerated approval times.

The Office of Generic Drugs is an integral part of the generic drug review process and represents a portion of the total resources for the generic drug program. The total obligations for the generic drug review process are shown in the Congressional Budgets on the "Distribution of Resources" table, in the Human Drugs program line "Generic Drug Evaluation," page 122 of the fiscal year 1999 Justification of Estimates for Appropriations Committees.

We will be happy to provide funding information for the total generic drug program.

[The information follows:]

GENERIC DRUG PROGRAM FUNDING LEVELS

	Fiscal year 1997 actual		Fiscal year 1998 estimate		Fiscal year 1999 estimate	
	Amount	FTE	Amount	FTE	Amount	FTE
Generic drug evaluation	\$34,183,000	351	\$34,883,000	351	\$34,883,000	351

Question. I have been contacted by a constituent who has Hereditary Angioedema, a rare blood disease. I understand that the medication C1-Inhibitor has shown promise in stopping acute attacks of this disease. What is the testing status of this drug and when is it expected to be approved for use?

Answer. The FDA may neither confirm nor deny the receipt of applications for unapproved products.

The following information is taken from a National Institute on Allergy and Infectious Diseases, NIAID, release dated September 1996. Hereditary angioedema, HAE, is caused by a defect in the gene that encodes the C1 inhibitor protein, an important regulator of a group of immune system enzymes known collectively as complement. Affected individuals produce either insufficient or dysfunctional C1 inhibitor. The resulting deregulation of complement in these individuals leads to episodes of swelling, typically in the extremities, face, larynx, and abdomen.

Many people with HAE currently use androgens, compounds derived from male sex hormones, to reduce the frequency and severity of swelling attacks. These drugs, however, are ineffective in some patients, and unsafe for children and pregnant women. More than a decade ago, researchers led by Michael M. Frank, M.D., then chief of the NIAID's Laboratory of Clinical Investigation, LCI, showed that C1 inhibitor protein extracted from donated human blood could ease patient's swelling during acute episodes of HAE. This experimental treatment, however, was associated with a risk for transmission of viral blood contaminants such as HIV and hepatitis. Other researchers subsequently showed that prolonged exposure to heat and high pressure could inactivate blood-borne viruses. In a current study, Dr. Frank and his colleagues in the LCI and at Children's Hospital in Boston used C1 inhibitor that had been sterilized through these procedures.

In the treatment study, the researchers gave either C1 inhibitor or placebo to HAE patients after episodes of swelling had begun. On average, patients receiving C1 inhibitor felt relief of their symptoms 55 minutes after infusion, more than 10 times sooner than patients in the placebo group. The treatment was particularly effective for reducing swelling of the larynx and abdomen. The researchers reported that C1 inhibitor caused no immediate or short-term harmful side effects. In addition, after four years of follow-up, no evidence of HIV or hepatitis infection was found in any of the study participants.

QUESTIONS SUBMITTED BY SENATOR BOND

ST. LOUIS FDA DRUG ANALYSIS LAB

Question. The fiscal year 1998 Agriculture appropriations bill specifically stated that "none of the funds made available to the Food and Drug Administration by this Act shall be used to close or relocate the Food and Drug Administration Division of Drug Analysis in St. Louis, Missouri."

Is the FDA following the intent of this law? How do you explain the fact that since Dr. Janet Woodcock became Director of the Center for Drug Evaluation and Research (CDER), the St. Louis lab has not been allowed to hire replacements for individuals who leave, and that if any new person is hired, he or she would be hired for the Laurel, MD laboratory?

Is the FDA circumventing the intent of the law?

Answer. Per the appropriations bill language, no fiscal year 1998 funds are being used by FDA to close or relocate the Division of Testing and Applied Analytical Development. FDA will maintain its analytical operations at the DTAAD laboratory in St. Louis.

In order to meet the challenges of budget reductions and to direct limited resources to priority objectives and goals, the FDA has reviewed its various programs to determine where streamlining is feasible. The entire Office of Testing and Research, OTR, of which the Division of Testing and Applied Analytical Development is a part, has absorbed resource reductions, both in dollars and numbers of employees, FTE, over the last several years. The reductions in FTE have limited the entire OTR's ability to replace employees, and limited dollars have dictated the need to evaluate programs further.

In addition, work demands have changed significantly with regard to testing requirements. Many requirements for testing drugs have been reduced or eliminated in the last few years. Under the Food and Drug Administration Modernization Act of 1997, FDA has reduced testing requirements for antibiotics and eliminated testing requirements for insulin. FDA is currently evaluating duplicative testing requirements in other areas. All of these resource-saving initiatives are being done in an effort to meet streamlining needs and direct FDA resources to the highest priority needs.

Question. The St. Louis FDA lab has been in St. Louis since 1909 and is the premier laboratory in CDER and is recognized world-wide for its outstanding capabilities and collaborative efforts. If the FDA continues in weakening the St. Louis lab by refusing to allow it to maintain its ability to function as a viable laboratory, isn't the FDA defiantly contradicting the fiscal year 1998 appropriations language?

Answer. It is our intent to comply not only with the letter of your direction, but with the intent. We will not use any fiscal year 1998 funds to close or relocate the Division of Testing and Applied Analytical Development. FDA will continue to maintain its analytical operations at the DTAAD laboratory in St. Louis.

Laboratory testing requirements have changed significantly in the last few years. The Food and Drug Administration Modernization Act of 1997 eliminated the requirement to test insulin and reduced antibiotic testing requirements. These changes, coupled with streamlining initiatives agency-wide, have required a redirection of our research and testing programs, wherever the location. All the resource saving initiatives are being done to support the need to streamline the Agency, while maintaining our core scientific capability.

FDA REGULATION OF HEALTH CARE ORGANIZATIONS

Question. What was the impetus for the FDA in developing a draft guidance on "Medical Product Promotion by Healthcare Organizations or Pharmacy Benefit Management Companies" which was published earlier this year?

Answer. As the health care environment has changed in recent years, there have also been changes in the marketing and promotion of drug products. On January 5, 1998, the FDA published a Federal Register notice announcing the availability of a draft guidance concerning promotional practices by pharmacy benefits management companies (PBM) and similar enterprises that are owned or influenced by the sponsors of medical products. Concerns about drug switching and other potentially harmful promotional practices have come to light as a result of several in-depth analyses of PBM involvement in medical decision making conducted by the FDA, the Health Care Finance Administration, and the Department of Health and Human Service's Office of Inspector General.

Question. Why did the agency opt to undertake this initiative as a guidance, which has no public comment period, instead of the rule making process?

Answer. FDA published a document entitled "Good Guidance Practices," which was announced in the Federal Register on February 27, 1997, in a notice entitled "The Food and Drug Administration's Development, Issuance, and Use of Guidance Documents." This document explains that the purposes of guidance documents are to first provide assistance to the regulated industry by clarifying requirements that have been imposed by Congress or issued in regulations by FDA and by explaining how industry may comply with those statutory and regulatory requirements. The second purpose of guidance documents is to provide specific review and enforcement approaches to help ensure that FDA's employees implement the agency's mandate in an effective, fair, and consistent manner. The document entitled "Guidance for Industry: Promoting Medical Products in a Changing Healthcare Environment; I. Medical Product Promotion by Healthcare Organizations or Pharmacy Benefits Management Companies, PBM's," draft was posted on the FDA website on January 5, 1998. There was a 90-day comment period on the draft guidance, which ended

on April 6, 1998. We received approximately 200 comments. We are reviewing and considering these comments carefully as we prepare to write final guidance.

QUESTIONS SUBMITTED BY SENATOR GORTON

Question. Could you expand on FDA's plan to inspect growing conditions (farms) overseas in order to further the President's Food Safety Initiative? Does the FDA expect that foreign countries would like to establish a similar program to inspect U.S. farms?

Answer. We do not anticipate regular inspections. FDA will become involved in visiting growers only when there is an identified outbreak of foodborne illness that is traced back to a specific farm.

Foreign governments, regulatory agencies, and industry currently send inspectors to the U.S. to inspect a variety of manufacturers, including many drug, device, and food processing facilities, for a variety of regulatory and trade reasons. Many other countries currently send inspectors to the U.S. to confirm compliance with fresh fruit and produce requirement involving grades, size, chemical usage, among others. With or without a U.S. program of inspection of farms in foreign countries, we expect that our trading partners may wish to, and will, visit U.S. farms and food production facilities.

Question. What does FDA intend to do with the additional \$100 million requested for the youth and tobacco project?

Answer. The \$100 million increase will be apportioned as follows—\$51 million for increased enforcement activities; \$25 million for increased outreach activities; and \$24 million for new product regulation activities.

QUESTIONS SUBMITTED BY SENATOR McCONNELL

TOBACCO

Question. The FDA has requested \$134 million for tobacco in fiscal year 1999. The money for this increased funding would come from the proposed tobacco settlement, which may not pass Congress this year. If it is not passed, where will FDA get money for tobacco? What programs within the agency will be cut to provide money for the tobacco initiative?

Answer. Reducing the availability and appeal of tobacco products to children and teenagers is an enormous undertaking with the potential for immense public health benefits. As a result, the Agency's activities in this regard are a high priority for FDA and are a central component of the Administration's Youth Tobacco Prevention Initiative. If the funds are not fully appropriated for the tobacco initiative, the Agency will have to make some difficult choices with respect to this and other important programs it administers. Funding reductions in other programs would seriously impair FDA's ability to carry out all of its significant functions.

Question. How much money do you propose be spent in FDA on tobacco-education activities? How much money will be spent in all of HHS on tobacco education activities? What will the education entail?

Answer. The overall budget for FDA's tobacco education activities for fiscal year 1999 is \$35 million. However, HHS does not separately track tobacco education activities for each of the agencies. In fiscal year 1999, the Agency will design a multi-media advertising campaign including radio, print, and billboard advertisements and place these ads in major media markets in every state with which FDA contracts to conduct compliance checks. We will also develop a comprehensive retailer education program which includes a retailer kit containing in-store signs, tent cards, fact sheets, counter mats and other materials; a letter to retailers in each state updating them on the status of compliance checks in their state; a series of reminder postcards that can be posted in the store for customers and clerks to see; trade advertisements in retailer publications; and a toll-free hotline that retailers can call to request additional materials and ask questions. FDA will continue to have exhibits at major conferences representing state and local health officials, public health organizations, and consumer and retailer organizations educating these audiences about the new tobacco rule.

Question. How much money is spent in both FDA and HHS on education activities for encouraging breast examinations and yearly pap smears?

Answer. Because FDA has responsibility for implementation of the Mammography Quality Standards Act (MQSA), our educational efforts for breast health have been mainly in promoting the use of mammography. While many of the agency outreach efforts involve educating health professionals about MQSA, FDA has conducted

some activities to encourage breast health among consumers. The agency's accomplishments are listed below.

[The information follows:]

Entered into an Interagency Agreement for \$25,000 with the Agency for Health Care Policy and Research to produce the consumer brochure "Things to Know about Quality Mammograms";

—Spent \$5,000 for buttons stating "Quality Mammography Saves Lives!";

—Spent \$129,000 to initiate and implement a hotline so that any woman in the country could find an FDA-certified mammography facility. The hotline was promoted through the media and a campaign by the First Lady to promote mammography;

—Spent \$11,000 to develop speakers kits on MQSA;

—Developed a Breast Implant Update packet for consumers; and

—Sent a letter to Ann Landers about the importance of mammography in early detection of breast cancer.

In addition to these accomplishments, FDA routinely conducts the following activities which require little funding:

—exhibit and present at meetings for consumers;

—share the database of certified facilities with the National Cancer Institute;

—conduct voluntary patient notification activities when facilities practice poor quality mammography. This involves focus testing notification letters to patients and physicians, developing patient notification packages to help facilities develop the letters, and a follow-up study to evaluate the effectiveness of the notification;

—distribute the "Mammography Matters" publication to consumers as well as health professionals;

—distribute letters to approximately 500 breast cancer advocacy and national health organizations on issues such as the consumer aspects of the final MQSA regulations; and

—develop a reprint on mammography and the final regulations which will be distributed throughout FDA and by the Consumer Information Center in Pueblo, CO.

Question. How much money is spent in both FDA and HHS on education activities for encouraging the consumption of folic acid for women in their child-bearing years?

Answer. Over the past several years, FDA has been instrumental in providing education about the association between folic acid and reduced risk of neural tube defect-affected births to the audiences most in need of up-to-date, accurate information: consumers, healthcare professionals, and industry. This is accomplished through contacts with these groups, providing educational materials, and working with professional organizations to assure that the latest science is translated into information easily used by consumers. The Agency has ongoing, direct contact with individuals from these groups to answer their questions. It routinely provides them materials such as press releases, the Backgrounder, an issue of FDA Consumer magazine featuring folic acid articles, copies of regulations, and the FDA Folate Poster. The Agency also participates in cooperative work to communicate the health message. The Agency uses an internet outreach and education program to make information more easily accessible. Other folic acid outreach and education activities are conducted through the FDA Consumer Education Staff, Public Affairs Specialists located in District Offices around the country, and both the FDA and HHS Offices of Women's Health. Those activities include presentations to consumer groups including adolescents and adults, and to health professionals and nutrition education and food safety groups. FDA, in collaboration with CDC and the March of Dimes Birth Defects Foundation held a public meeting on August 6, 1997, focused on partnering with outside groups in an effort to disseminate the folic acid health message as widely as possible. I would be happy to provide, for the record, a list of the specific activities the Agency has produced and disseminated. Because these activities have occurred over a number of years and are a part of larger day-to-day program activities, such as consumer information, or dietary supplement work, it is not possible to identify specific funding devoted to each of these education efforts.

[The information follows:]

FDA MATERIALS RELATED TO FOLIC ACID EDUCATION

—FDA Consumer magazine featuring folic acid:

Inside back cover, "Think Folate Now"

Folic acid article "How Folate can Help Prevent Birth Defects"

Birth defects article

—Article for FDA Medical Bulletin

- Article on folic acid for North American Precis—wire service to 10,000 newspapers nationwide
- Consumer group contacts: “Dear Consumer” letters and packets
- “Dear Editor” letters
- “Dear Health Professional” letters and contacts with professional associations.

Question. How much money is spent in both FDA and HHS on education activities for identifying the signs of diabetes and treating the disease?

Answer. FDA currently has no ongoing educational activities regarding diabetes. I support focusing food regulatory activities on matters of food safety. This focus, however, has the effect of placing economic and quality regulatory issues as relatively lower priorities. Nevertheless, I am concerned that if there are regulatory requirements that FDA will not enforce, then those requirements should be repealed. Otherwise, unscrupulous operators can violate those requirements with impunity to the competitive disadvantage of law abiding businesses.

I understand that there are industry self policing efforts with attempt to address these economic and quality regulatory issues in an informal manner. For example, the olive oil association has a program that identifies economic adulteration of olive oil, such as substituting other edible oils or misrepresenting the quality of the olive oil.

Question. Does FDA policy support active cooperation with industry self policing programs? Using the olive oil program, as well as other examples that you feel are appropriate, please report on apparent violations referred to you agency and what action was taken by FDA.

Answer. FDA has long encouraged industry self compliance activities that promote adherence to legal requirements. Activities such as the American Institute of Baking food labeling seminars; the container integrity program of the National Food Processors Association and the defects in spice program of the American Spice Trade Association are important programs that promote industry awareness and compliance with food safety and other requirements. FDA also has partnership agreements with industry and trade associations such as the California Dried Fruit Association.

In 1995, as part of the Administration’s “Reinventing Government” initiative, FDA conducted a page-by-page review of agency regulations. As a result, a number of regulations were revoked and proposals were made to revoke others. On August 12, 1997, a final rule was published to revoke certain regulations relating to food and cosmetic labeling.

The activities of concerned consumers, industry and associations have long been an important part of our surveillance activities. However, some of the information we received from these sources is not current and may not be suitable for regulatory consideration, i.e., analytical data may not reflect adequate sample sizes, utilize official analytical methods or the chain of custody is inadequate. Nevertheless, these reports are evaluated with appropriate follow-up assigned based on timing, strength of the evidence, available resources and competing priorities. During the past year, we have not taken regulatory action based on these sources of information. However, during the past few years we have successfully taken action against adulterated orange juice, honey and syrup products based on part on information from industry, consumer or state officials.

QUESTION SUBMITTED BY SENATOR BURNS

MEDICAL PRODUCT PROMOTION

Question. The Food and Drug Administration recently published a “Draft Guidance for Industry: Medical Product Promotion by Healthcare Organizations of Pharmacy Benefits Management Companies (PBM’s).” As I understand the draft guidance, it seeks to clarify the FDA’s position on promotional activities of pharmaceuticals by PBM’s which are subsidiaries of product sponsors or promote products on behalf of the sponsors. I certainly support the FDA’s goal of ensuring that promotional activities follow applicable laws and regulations. It has been brought to my attention, however, that the guidance could inadvertently restrict the dissemination of comparative information about pharmaceuticals to consumers in Montana. I look forward to a written response from FDA addressing this concern. I note that it is not addressed in the draft guidance notice published in the Federal Register on January 5, 1998.

Answer. Because the document is a draft and comments are still being reviewed, I cannot say what will be in the finalized guidance, but we do appreciate your concern. The final guidance will be developed after careful consideration of these com-

ments, including the concerns regarding comparative information about pharmaceuticals that were mentioned by your constituents in Montana.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

FOOD SAFETY INITIATIVE—HACCP/SOUND SCIENCE

Question. In late 1997, FDA began implementation of HACCP for seafood and you have now stated your intention to develop HACCP rules for fresh fruit and vegetable juices. In January of this year, FSIS began implementing HACCP for meat and poultry operations and already, the industry is finding parts of the HACCP rules problematic. For example, I have been recently told that an FSIS HACCP rule is going to require an additional use of two gallons of water per bird for poultry processing which will result in tremendously burdensome challenges for many rural community water discharge facilities. Since implementation of HACCP for seafood, have you encountered any special problems in working with industry? If so, what?

Answer. HACCP is a system of preventive controls for safety that involve, for each processor, developing an understanding of both the food safety hazards that are reasonably likely to occur for the products being processed and the controls that are available to the processor to minimize or eliminate the hazards. On a day-to-day basis, a processor's core HACCP activities are monitoring key processing points to ensure that they are operating in a manner that produces a safe product and recording the results of that monitoring.

To help processors understand these concepts and activities, FDA participated in the development of low-cost training for industry in HACCP principles and their application to seafood. This course has been attended by several thousand individuals nationwide. The Agency also developed guidance for processors, the "Fish and Fishery Products Hazards and Controls Guide," which provides advice on hazards that are reasonably likely to occur in various situations and on controls that are known to exist for those hazards. This Guide also includes a simple, fill-in-the-blank HACCP plan and instructions on how to complete it.

Even with the training and the guidelines, the Agency has long recognized that the development of HACCP systems in many processing plants will involve trial and error. Thus, it has always been the agency's expectation that the first round of inspections after the December, 1998, effective date of the HACCP program would uncover numerous systems in need of improvement. This is turning out to be the case, but is not regarded as a special problem at this stage of implementation. As planned, FDA's inspections are focusing on evaluating HACCP systems and providing feedback to the firms on aspects of their systems that need improvement. During the first round, regulatory action is only to be initiated when, in addition to HACCP system deficiencies, the products themselves contain contaminants or are in imminent danger of becoming contaminated. If the feedback from the first inspections does not result in significant, industry-wide improvements during the second round of inspections, FDA would likely regard such a situation as a special problem.

Question. Do you have current authority to expand HACCP to fruit and vegetable juice processing?

Answer. Yes. The legal basis for mandating HACCP systems for juice processing is the same as that for seafood. Thus, the Food and Drug Administration proposed to issue HACCP regulations for fruit and vegetable juice processing under various sections of the Federal Food, Drug and Cosmetic Act, including, most significantly, sections 402(a)(1) and (a)(4) and 701(a) of the act (21 U.S.C. 342(a)(1) and (a)(4) and 371(a)). Section 402(a)(1) of the act states that a food is adulterated if it bears or contains any poisonous or deleterious substance that may render the food injurious to health. Section 402(a)(4) states that a food is adulterated if it has been prepared, packed, or held under insanitary conditions whereby it may have been contaminated with filth, or whereby it may have been rendered injurious to health. Section 701(a) of the act authorizes the agency to adopt regulations for the efficient enforcement of the act.

As noted in the final rule mandating HACCP for fish and fishery products (60 Federal Register 65096), the Act provides a broad statutory framework for Federal regulation to ensure human food will not be injurious to health and to prevent commerce in adulterated foods. Recent outbreaks of foodborne illness as a result of consumption of contaminated juice have raised concerns about the safety of juice. Given these concerns and its responsibility under the act, FDA has determined that it is appropriate to propose to require that processors incorporate certain basic food safety control measures into juice production.

Question. Please explain in detail the manner in which FDA incorporates the best science available in developing HACCP rules?

Answer. In developing HACCP regulations, FDA relies on advice from the National Advisory Committee on Microbiological Criteria for Foods—NACMCF—as well as data and information from the food industry, FDA scientists, and scientists in other fields from academia, government and trade associations. Because HACCP rules are established through notice/comment rulemaking, all interested persons have the opportunity to submit relevant information, including high quality scientific information, to the agency in comments on the proposed rule. FDA also reviews the most up-to-date scientific documents from the peer-reviewed literature in identifying hazards, control measures, and critical limits, and uses advice from the NACMCF as the basis for developing HACCP rules.

The NACMCF, an advisory committee of peer-acknowledged leading scientists to advise on specific health-related science-based issues, has published three documents on HACCP. The latest revision provides better clarity, science, and harmonization with international HACCP guidance, and was released in August, 1997. The USDA and FDA HACCP rules are based on the seven principles of HACCP, as defined by the NACMCF, and are fundamentally the same. The proposed HACCP juice rule is also consistent with these existing HACCP regulations and the underlying science upon which HACCP is based.

In developing the proposed rule for juice, FDA held public scientific meetings to address science and health related issues relevant to the production, processing and consumption of juice. Top scientists from academia, government, the food industry and trade organizations; public health officials from the Centers for Disease Control and Prevention and states; and interested members of the public attended, providing the latest evidence, concerns, and solutions, both at the meeting and in written comments. FDA scientists used these comments, as well as comments on the HACCP ANPR from August 1994, FDA research and surveillance data, pilot program experience, and information from the peer-reviewed scientific literature, in developing the proposed rule.

Question. How does FDA resolve disagreements within the scientific community regarding the development of what is proper under HACCP?

Answer. Hazard Analysis Critical Control Point—HACCP—is a preventative system for producing safe food. FDA's HACCP regulations are not proscriptive in that they do not identify specific hazards, or require specific control measures or critical limits that industry must apply. Rather, HACCP places responsibility on industry to determine the specific hazards that apply to their products and processes, and measures to control these hazards. It is the industry's responsibility to provide scientific data and principles to substantiate a HACCP plan.

During the developmental stages of HACCP rules, the Agency works with the scientific community and the industry to jointly determine what to include in a HACCP rule, such as through the voluntary HACCP Pilot Program, and through public scientific meetings. Through the HACCP Pilot Program, for example, FDA is working cooperatively with processors, trade associations, and state regulatory agencies. Where there are disagreements, such as in the results of hazard analysis or the determination of critical control points, scientific data are presented to resolve the problem.

FDA also comments on its HACCP proposals from the scientific community and others, through the rule-making process. FDA used the comments received on the ANPR, and those received on the proposed rule for seafood to develop the final seafood HACCP rule. The same process is planned for HACCP for juice. The proposed seafood HACCP rule was available for public and scientific comment during "Town Meetings." FDA held a public forum on juice in December of 1996, that was used in developing a proposed rule.

Question. What mechanisms are in place for industry to challenge a science-based rule relating to the implementation of HACCP for seafood or any similar regulation under your jurisdiction?

Answer. FDA recognizes, and has long advised the industry, that no two HACCP systems need be identical. HACCP systems can be unique to each processing operation. FDA does not dictate in advance what a HACCP system must look like for any given processor. Individual flexibility is one of the key aspects of HACCP and is essential to the success of the overall program. That is one reason why the seafood HACCP regulations are short and relatively general. The regulations essentially require that processors establish HACCP systems that honor seven internationally recognized principles of HACCP, such as hazard analysis, developing "critical control points," and monitoring those critical control points to make sure that they are operating as they should, but leave the details to processors.

To help processors determine how to apply those principles to their situations, FDA has issued guidelines, the "Fish and Fishery Products Hazards and Controls Guide," that provide advice on hazards and controls for those hazards. Processors are advised not to follow FDA's advice blindly, however, but to determine whether that advice is appropriate for them. While FDA's inspectors will initially compare each processor's HACCP system to the advice in the guidelines, processors are free to choose alternative approaches so long as their HACCP systems provide a level of safety that is equivalent to that provided in the guidelines' approach. Moreover, processors are free to challenge the scientific validity of the approach taken in the guidelines. The appeals process for guidance is set forth in the agency Good Guidance Practices at 62 Federal Register 89 69-70, February 27, 1997. FDA is always interested in learning about better ways to ensure safety and in making improvements in its own guidelines. In developing alternatives to the guidelines or challenging their validity, processors should be able to establish the scientific validity of their systems for the agency to evaluate.

PREMARKET NOTIFICATION PROGRAM

Question. The Food and Drug Modernization Act of 1997 created a new Pre-Market Notification Program which would accelerate the approval time of certain materials such as new food-contact packaging materials that are important to firms in my state. This program is supposed to take effect April 1, 1999, and I understand it is estimated to cost \$1.5 million in fiscal year 1999 and \$3 million in subsequent years. I also understand FDA is required by the Act to report to Congress by April 1, 1998 (tomorrow) on updated estimates for this program. When can we expect to receive the report that is due tomorrow?

Answer. We have a draft document that is now being circulated within the Agency for clearance. We plan to submit this report to the Department for their review shortly. With support from the Department, we are trying to expedite the process as much as possible. However, assembling this initial report and ensuring the soundness of the estimate did take longer than anticipated. We expect that the report will be submitted shortly.

Question. Can you provide information regarding the currently estimated costs of this program?

Answer. At this time, the report is still under development. Once the report is finalized we will be able to provide our estimate of the costs of the program.

Question. Do you believe it will be operational by April 1, 1999?

Answer. The section of the Food and Drug Modernization Act that established the premarket notification program for food contact substances provides that this program will operate only if, in a given year, certain conditions are met. That is, that an appropriation equal to or exceeding a defined amount is made for carrying out the premarket notification program, and that the Secretary certifies, in essence that the amount appropriated for the Center for Food Safety and Applied Nutrition is not less than that appropriated for fiscal year 1997, exclusive of new programs.

At this time, we cannot say whether the conditions specified in the statute for operation of the premarket notification program will be met. However, only if the statutory conditions are met, would the program be operational on April 1, 1999.

Question. Have you heard from the regulated industry regarding this program and if so, what is their response to it?

Answer. Prior to enactment of the FDA Modernization Act, agency personnel discussed the premarket notification system with industry representatives who strongly favored the establishment of such a system and even supported industry-funded user fees to ensure that the program would be adequately supported. It is our understanding that the regulated industry continues to favor an adequately supported premarket notification program for food contact substances.

IRRADIATION

Question. Last December, FDA approved irradiation of meat products including fresh and frozen beef, lamb, and pork. FDA had similarly approved irradiation for poultry products in 1992. What is your view on consumer confidence relating to irradiated foods?

Answer. A survey conducted for FDA in the 1980's showed a small proportion of the population very interested in obtaining irradiated foods, a similar proportion opposed, and the majority being willing to consider such products and deciding on the merits. The only real test, however, is to see whether consumers buy such products when available. At this time, very little product has been available to consumers but, where consumers had the opportunity to purchase such foods and had received educational materials allowing an informed decision, they have been receptive. With

greater awareness of the risks from foodborne organisms, we believe many consumers would be interested in irradiated foods depending on the price, taste, and perceived benefits.

Question. What percentage of poultry products have been subjected to irradiation since 1992?

Answer. As far as we are aware, only a very small percentage. USDA's Food Safety and Inspection Service would have better information of amount based on their management of the poultry inspection program.

Question. What indications are there that the meat industries will be using irradiation as a food safety procedure in the near-term?

Answer. While we know of interest, we have no information on who, if anyone, will actually use the process. Also, at this time, there is still a need for the Food Safety and Inspection Service to amend its regulations regarding meat processing before meat may be irradiated legally. As with poultry, FSIS may be in a better position to gauge industry interest because, in such cases, a meat irradiation facility would become a meat processing facility subject to FSIS regulation.

Question. Outside the United States, how is irradiation viewed by consumers?

Answer. We have no information on that question. We know that the amount of food irradiated outside the U.S. is generally small but have no information about consumer preferences.

Question. How much, if any, irradiated food product is imported into the United States?

Answer. Essentially none. There is very little irradiated food in commerce, in the U.S. or abroad.

PROTECTIONS FOR INDUSTRY

Question. No one questions the need to move forward with reliable food safety requirements. Industry and consumers alike know that the highest levels of food safety are in the interests of them both. However, sometimes in an effort to react quickly, government overreacts in ways later found more harmful than necessary. The effect of the Alar scare several years ago to the apple industry in the Pacific Northwest and the more recent forced sale of Hudson Foods are cases in point. What steps is FDA taking to ensure that while doing everything possible to protect consumers from unsafe food, governmental overreaching does not occur in ways overly harmful to industries or individual companies?

Answer. In these days of mass media coverage of news events, there may be little FDA can do to protect industry from adverse publicity. However, FDA has issued a complete guideline for industry to follow to be prepared for emergencies such as product recall. This guideline is published at 21 CFR Part 7. Basically this guideline explains how the industry can be prudent in making such emergencies as recalls as least disruptive to the firms operations as possible. These are: (1) prepare and maintain a contingency plan for emergencies; (2) use sufficient coding of products to make possible lot identification and to facilitate effective recall of violative lots; and (3) maintain product distribution records necessary to facilitate location of the product being recalled.

Utilizing this system, the expeditious handling of a recall or other emergency can and does show to consumers that the firm takes its responsibilities to consumers seriously. This approach also allows the recall to be completed quickly and reduces media exposure.

INTERNATIONAL FOOD SAFETY

Question. Food markets have become global and various new strains of bacteria move more quickly from one region to another than ever before. In addition, the modernization of food processing itself poses special problems for food safety. Explain the role of FDA in investigating the rise in harmful bacteria, especially as it relates to food products.

Answer. FDA regulates food products except for meat, processed egg products, and poultry. FDA for many years has had a robust research and testing program geared to microbial contamination of food products, especially canned foods and seafoods. With the recent increase in reported outbreaks associated with fresh produce and other foods, FDA and USDA contacted CDC to initiate a nationwide active surveillance program, now called FoodNet, to actively collect foodborne outbreak information from physicians and hospital surveys. These FoodNet sentinel sites, which will number eight in 1998, cover nearly the entire USA and provide statistical foodborne illness information for FDA and USDA to monitor and institute intervention strategies to limit the scope of an outbreak. Likewise, FDA or USDA would then conduct traceback investigations to determine the exact food source or microorganism. FDA

and USDA have recently linked with CDC's DNA fingerprint network in order to specifically link/de-link geographically diverse outbreaks.

FDA, in cooperation with other federal and academic institutions, conducts microbial and risk assessment research on the microbial ecology, intervention strategies, method development, risk assessment models, and sampling strategies, to provide the scientific data and information necessary to successfully prevent, minimize or intervene microbial contamination. This scientific research is critically important to develop food safety systems and guidance for emerging and evolving microbial pathogens.

FDA is a leader in the scientific investigation of foodborne pathogens and this expertise proves essential in crafting sound public policy to ensuring the safety of the food supply. With ever-increasing and global food supply, we must devote greater attention and efforts, however, to new strains and new pathogen commodity combinations. Likewise, pathogens are evolving so that traditional prevention techniques across the country and around the world. This means that a single contaminated product has the potential to be distributed thousands of miles and to cause contamination. Moreover, food products may become contaminated at any point in the lengthy journey between producer and grocery.

Question. Explain your view on the influence of modernization of the food system as a contributor of food-borne illness.

Answer. The modernization of the food system influences both the development and spread of foodborne illness. Only a few years ago most food available to consumers was produced and sold locally. Today, the food industry has evolved from many, small local producers and manufacturers into a few large producers that ship products across the country and around the world. This means that a single contaminated product has the potential to be distributed thousands of miles and to cause contamination. Moreover, food products may become contaminated at any point in the lengthy journey between producer and grocery.

Consumers are demanding products with convenience and that have organoleptic properties closer to "fresh." This requires the use of minimal processing and packaging technologies and more complex processes to assure the same level of protection that traditional thermal methods, such as canning and pasteurization, deliver. Further, there are several other causes. Among these are consumer preferences for undercooked products and convenience foods, increased dining out, and more on-site food processing. Also the population particularly vulnerable to foodborne disease has been growing in size; today more than 30 million people are at high risk from foodborne infection. These include the elderly, the very young, pregnant women, and the immunocompromised by diseases such as HIV/AIDS or by drugs such as those used by organ transplant recipients and cancer patients.

The modernization of the food supply also applies to animal production practices. The use of antimicrobial agents in animal production has facilitated confinement housing and allowed higher densities of animals to be maintained. Unless properly managed, food animals being reared in crowded conditions have ample opportunities to transmit infections. The resulting poor performance or disease increases the use of therapeutic, prophylactic and growth-promotant antimicrobial agents. Even if well managed, the increased density of livestock or poultry with similar risk profiles in intensive rearing operations requires an aggressive approach to disease control, which can lead to heavy prophylactic and therapeutic antimicrobial use. If such operations are not well managed, heavy antimicrobial use may become a management crutch.

For these reasons, the use of preventive systems, such as Hazard Analysis and Critical Control Point procedures, during food production and distribution becomes imperative in reducing the risk of contaminated products reaching consumers.

Question. Describe the manner in which FDA is working with foreign countries to help ensure food safety for all consumers.

Answer. FDA has a long history of international leadership and cooperation on food safety through direct contacts with foreign governments and industry as well as through international organizations such as the World Health Organization, Panamerican Health Organization, and the Codex Alimentarius Commission, which establishes international standards.

Through these numerous avenues, FDA has promoted or established standards which are consistent with the U.S. level of protection. With the President's Food Safety Initiative we have convened an international working group comprised of the State Department, U.S. Trade Representative and USDA/Foreign Agriculture Service to map out a technical assistance program to reach foreign countries and producers. Furthermore, we have made numerous speeches and presentations at scientific, intergovernmental meetings to discuss FSI and, more specifically, the Fresh Produce Initiative goals and objectives. We established a website to further disseminate information, regulations such as HACCP, and guidelines generated to ensure im-

proved food safety. Currently, we have proposed, "Draft Guidelines to Minimize Microbial Contaminations for Fresh Fruits and Vegetables," and proposed Juice HACCP regulations. The internet is a powerful tool in sharing information and informing foreign countries and enterprises.

With the funding included in the President's fiscal year 1999 Budget request, we plan to hire additional staff to conduct foreign country visits to provide scientific and technical assistance in cooperation with our USDA/FAS and APHIS colleagues to actively promote good agricultural practices and food safety regulations.

TOBACCO

Question. In 1997, FDA's regulation on youth tobacco became effective and ten states, including Arkansas, were chosen for a pilot project to determine the level of enforcement of rules prohibiting the sale of tobacco products to anyone younger than 18 years of age. Additional funds for this purpose were included in the fiscal year 1998 appropriations bill to extend this activity to any state wishing to participate. How many states have chosen to participate?

Answer. Thus far, 28 states have submitted proposals for funding in fiscal year 1998. Of these, 4 are for extensions of the original 10 contracts signed last year. There are 7 contracts with new states that have been signed or will shortly be signed. Seventeen additional proposals are currently being negotiated.

Question. If any states declined, what were the reasons?

Answer. No states have formally declined to submit a proposal. The agency expects the remaining proposals to be submitted over the next two to three months.

Question. In what ways were these federal funds not simply replacement of state funds that would have been otherwise available for enforcement?

Answer. Funds available to the states to enforce the FDA rule cannot be used to enforce state laws. They can only be used to enforce the FDA regulation. Thus, the federal funds cannot be used to replace any existing state funds that would have otherwise been available for enforcement.

Question. The fiscal year 1999 budget request includes an increase of \$100 million for tobacco-related activities. What steps is the Administration taking to ensure that of any revenues available through a "tobacco settlement", enough will be made available to this subcommittee to fund the FDA activities related to tobacco?

Answer. The Administration will work closely with Congress to ensure the appropriate distribution of any funds that are generated from the passage of comprehensive tobacco legislation.

Question. Please provide an outline of the extent to which specific activities will be included in the \$100 million increase.

Answer. Of the requested \$100 million increase, \$51 million will be used to increase enforcement activities; \$25 million will be used to increase outreach activities; and \$24 million will be used for new product regulation activities.

Question. Since the fiscal year 1999 budget contains several proposed user fees, why were user fees not proposed to fund the FDA tobacco activities?

Answer. The Administration's budget request for fiscal year 1999 includes funding for FDA's tobacco program, and other domestic policy priorities, that would be generated from the passage of comprehensive tobacco legislation. A key element of this legislation is raising the cost of cigarettes. The revenues raised are essentially indirect user fees.

Question. A large part of the \$100 million increase is for education, media, directed mailings, and other activities designed to dissuade young Americans from using tobacco products. What levels of funding are currently being used for this purpose by other governmental entities (including state and local governments) and various non-profits such as the American Cancer Society?

Answer. The overall objective of FDA's tobacco program is to reduce the number of young people who use tobacco. Nevertheless, that is not the primary objective of the outreach activities the Agency will conduct with increased funding in fiscal year 1999. The goal of FDA's outreach efforts is to increase retailer compliance with the regulations that went into effect in February 1997 that prohibit the sale of cigarettes and smokeless tobacco products to minors. The Agency is unaware of the precise level of funding currently being used by private and public organizations to dissuade young people from using tobacco products and whether any of that funding is directed to retailer compliance.

Question. What tangible evidence exists to document the effect of educational and communication efforts in reducing teen smoking?

Answer. The following evidence exists on the effect of educational and communication efforts to help reduce teen smoking.

[The information follows:]

DHHS, "Preventing Tobacco Use Among Young People: A Report of the Surgeon General," 1994, stated, based upon a review of the evidence, that "a nationwide well-funded antismoking campaign could effectively counter the effects of cigarette advertising in its currently permitted media forms." (see also, for a similar recommendation, Institute of Medicine, "Growing Up Tobacco Free: Preventing Nicotine Addiction in Children and Youths," 1994.)

From July 1, 1967 to December 31, 1970, the Federal Communications Commission, as part of the "Fairness Doctrine," required antismoking messages on television and radio to counter industry advertising. During that time, per capita cigarette consumption declined 7 percent, from 4,280 in 1967 to 3,985 in 1970 (6.2 percent was attributable to the messages). A study of adolescents found that their smoking rates declined during that period.

In an effort to reduce cigarette consumption, the Greek government launched an antismoking campaign including television and radio counter-advertising as well as a community-based print education campaign that lasted for two years of the government's effort. During this two year period, the annual increase in smoking rates dropped to zero. When the campaign ended, the annual increase rose to 6 percent.

Researchers, in Vermont, tested the effect of mass-media and school health education programs. Students exposed to both school and media interventions were 35 percent less likely to have smoked in the past week than students exposed only to the school program, and this preventive effect persisted for at least 2 years following the completion of the intervention program. The decrease occurred even in students who were considered to be at slightly higher risk of becoming smokers because of demographic considerations.

In California, the Department of Health Services conducted a \$26 million multi-year media anti-smoking campaign. One evaluation found that the campaign directly influenced 7 percent (33,000) of Californians to quit smoking in 1990-1991, and contributed to the quitting of another 173,000. The program also resulted in high levels of awareness among young people and may have contributed to stopping the rise in teen smoking that had been occurring in California before the campaign.

MEDGUIDE

Question. Last year, FDA launched the MedGuide program as a way to give consumers better information about possible side effects of medications and other possible dangers from the misuse of medicine. Can you document any results of this program?

Answer. In 1995, the FDA proposed a regulation that was intended to encourage the development and distribution of patient-directed medication information that would be easily understood, comprehensive, specific, non-promotional in tone and content, and scientifically accurate. Following publication of this proposal, Congress directed the Secretary of DHHS to convene a committee of diverse private-sector interest groups to develop a voluntary, long-range, comprehensive action plan to fulfill the goals specified in the Congressional mandate. These goals are to ensure that useful written prescription medication information would be distributed to 75 percent of patients receiving new prescriptions by the year 2000, and 95 percent by the year 2006. The plan aimed to improve patients' understanding of the prescription drugs they take and reduce the misuse of such medications which FDA has estimated costs the public in excess of \$20 billion annually. Assisted by The Keystone Center, a nationally recognized, non-profit public policy mediating organization, a 34-member steering committee representing the pharmaceutical industry, pharmacists, physicians, consumer and patient advocacy groups, patient drug information data base companies and other interested groups participated in developing the plan. On January 14, 1997, DHHS Secretary Donna E. Shalala accepted the action plan developed by the collaborative steering committee.

Public Law 104-180 called for an evaluation of the private sector's achievement of the goals of the plan in the year 2000. In addition, the action plan itself called for the development of mechanisms for periodic evaluation of the voluntary program. We are aware of at least one segment of the private sector that is conducting small-scale evaluations of patient medication information distributed by various information vendors for certain drug classes, and one specific information vendor's evaluation of certain of its leaflets. There may be other evaluations ongoing of which we are unaware.

In 2000, FDA plans to conduct an evaluation of both the distribution and quality, that is, "usefulness," of a sample of medication information sheets given to patients with their new prescriptions. In addition, FDA intends to conduct an interim assessment of the private sector's progress toward meeting the goals to allow for any necessary adjustments in time for the critical year 2000 evaluation. FDA has obtained

funding, and is in the process of obtaining OMB clearance, for one component of this evaluation: the general distribution of patient medication information. However, this study cannot evaluate the quality or usefulness of the information as defined by the action plan. FDA is seeking funding to conduct this critical component of a full interim evaluation. FDA has not yet collected any documented results because the action plan is only in its first year of implementation.

We believe we can best aid the ongoing private sector efforts to reach the congressionally-mandated goals by providing well-documented, objective, non-partisan evaluations of progress.

FDA is in the process of finalizing a rule to require FDA-approved labeling for patients, or "Medication Guides," only for a few rare products each year that are determined to pose a serious and significant public health concern requiring immediate distribution of FDA-approved patient labeling.

Question. Has there been a reduction in hospitalizations due to accidental misuse of medications?

Answer. As we discussed earlier, Public Law 104-180 called for an evaluation of the private sector's achievement of the goals of the plan in the year 2000. The action plan also called for the development of mechanisms for periodic evaluation of the voluntary program. FDA has not yet collected any documented results because the action plan is only in its first year of implementation.

Question. To what extent is MedGuide used in the marketing of medications?

Answer. FDA has not conducted a rigorous evaluation of the use of patient medication information in the marketing of medications. However, we have observed, again in a non-rigorous manner, an increase in the number of manufacturers who are submitting draft patient labeling for various new drug approvals. We believe that there are concerns on the part of the manufacturers about liability brought on by increased consumer-directed advertising. It appears there is a desire from industry to make more extensive use of information that is more easily understood by patients or consumers to fulfill the requirement that advertisements contain information "in brief summary" concerning the risks associated with the advertised product.

Question. Is there any way to document the extent to which consumers actually read and use the information available through MedGuide?

Answer. Protocols could perhaps be designed to assess the actual use by patients of patient-directed medication information, but these would be expensive to conduct.

USER FEES

Question. Again this year, FDA is proposing unauthorized user fees (\$128 million) as part of the budget submission. As always, this puts extreme budgetary pressure on this subcommittee since authorization of user fees is not within our proper jurisdiction and can, in fact, be challenged by the House Ways and Means Committee. With limited, and often reduced, allocations to our subcommittee, the assumption of user fees serves only to place all programs under our jurisdiction at risk.

What steps has FDA or the Administration taken to work with the authorizing committees to enact these user fees?

Answer. FDA, in concert with HHS and OMB, prepared user fee legislation for the new fees proposed in the fiscal year 1999 President's Budget, which was submitted to the President of the Senate and Speaker of the House on March 13, 1998. To date, there have been no hearings with the authorizing committees or with affected industries on this specific proposal. We do look forward to working with Congress to authorize the fees. In order for FDA to maintain its current level of consumers' health protection, it is important that the full program level in the President's budget be appropriated.

Question. How soon could they be collected if enacted?

Answer. As the proposed legislation moves through Congress, the Administration will make every effort to expedite collections once enactment occur. This would include extensive negotiations with industry to ensure a palatable fee structure similar to that which occurred with PDUFA. At this time, it would be difficult to provide an exact timetable of events.

Question. If this subcommittee chose to make certain FDA activities conditioned on the authorization and collection of up to \$128 million in new user fees, which FDA activities would you suggest we postpone until these fees are collected?

Answer. The authorization and collection of the new proposed user fees is intended to support FDA's traditional activities of premarket review and postmarket assurance for foods, drugs, biologics, animal drugs, and medical devices. Delays in collecting these user fees would prolong the review process, extend approval times, and seriously impede our ability to meet statutory deadlines in these program areas.

Under the Administration's plan, user fees would be in place at the start of the fiscal year so that no disruption of activities would occur.

FDA LAB CONSOLIDATION/NCTR

Question. In fiscal year 1998, funds were provided to complete Phase II of the Arkansas Regional Lab (ARL) at Jefferson, Arkansas on the campus of NCTR. The ARL is an important component of FDA's overall lab consolidation. In fact, consolidation should now be underway with certain FDA lab function being transferred to the ARL in the near future. I note that the fiscal year 1999 budget request does not include funding for Phase III of the ARL. Phase III is the final phase of construction for the ARL and I understand it is critical for the efficient execution of FDA's lab consolidation plan. Can you explain why Phase III was not included in the budget request?

Answer. Due to competing issues with a higher priority to the FDA mission, within both the Salaries and Expenses and the Buildings and Facilities Appropriations, the request was not included in the President's Budget.

Question. Was Phase III included in the fiscal year 1999 budget recommendations of FDA to HHS or to OMB?

Answer. FDA requested funding for the construction of Phase III of the Arkansas Regional Lab (ARL) in the Preliminary Budget Submission to DHHS but this request was not included in the Justification of Budget Estimates to OMB.

Question. Please provide an update on all FDA lab consolidation activities with special detail given to the consolidation of activities at ARL.

Answer. For the record, I would be happy to provide a listing of impacted field locations, with a description of the impact on that location under the FDA field laboratory consolidation. Laboratory personnel in each closing laboratory either have been or will be offered relocation expenses to move to the new site along with their work. Under the plan, other district office functions and staff would remain in place. This includes a complement of inspectors, consumer safety officers, consumer affairs officers, and administrative staff at each location where laboratories were to be phased out. Only the laboratory staffs would be affected by the plan.

[The information follows:]

STATUS OF FDA FIELD LABORATORY CONSOLIDATIONS—MARCH 1998

Arkansas Regional Laboratory (ARL) (NCTR at Jefferson, AR)—Planned as a multi-purpose laboratory. ARL assumed many of the laboratory/analytical functions performed by the Chicago District laboratory, which closed on July 1, 1997. ORA will occupy renovated, temporary space until completion of the ARL facility in 1999. The ARL will also assume the analytical and laboratory functions and personnel from the Dallas, Minneapolis, and Detroit laboratories when these facilities close in 2000, except for Detroit's human drug functions and the Medical Devices program work from Minneapolis.

Baltimore—The laboratory closes in 1999. The Human Drug functions will go to Philadelphia and Medical Devices program in-vitro diagnostics will go to WEAC. All other programs move to the Southeast Regional Laboratory (SRL) in Atlanta, except for the present DOD shelf life work which will move to Philadelphia and San Juan.

Buffalo—The laboratory closed in October 1996. All analytical laboratory functions were transferred to the Northeast Regional Laboratory (NERL), Brooklyn, New York.

Chicago—The laboratory closed on July 1, 1997. Most analytical/laboratory work was transferred to the ARL at NCTR. The remaining work moved to Minneapolis and the Kansas City laboratory.

Cincinnati—The analytical functions were terminated on June 30, 1997. The human drug functions were assigned to Philadelphia; all other work went to the SRL in Atlanta. The National Forensic Chemistry Center (NFCC) will remain in Cincinnati and the new facility is scheduled for completion and occupancy in the summer 1998.

Dallas—The laboratory will close in 2000. All analytical /laboratory functions will be transferred to the ARL.

Denver—The laboratory is scheduled to close in 2010. Analytical resource distribution will be reassessed annually. Functions will be transferred to the ARL.

Detroit—The laboratory will close in 2000. Human drug work will move to Philadelphia; DOD shelf life functions will be split between Philadelphia and San Juan laboratories. The remaining analytical and laboratory programs will be reassigned to the ARL.

Kansas City—Planned for closure in 2014. Analytical resource distribution will be reassessed yearly. Functions will be reassigned to the ARL.

Los Angeles—Planned as a multi-purpose facility. FDA has acquired 10 acres of land on the campus of the University of California at Irvine. Architectural and engineering design efforts are underway and receipt of the final design is scheduled for July 1998. Funding for construction has not been secured and the lease for the existing lab expires in March 2000. The new facility project is comprised of three construction phases. Phase I is the core and shell at an estimated cost of \$16.5 M; the second phase is the fit-out of the laboratory at an estimated \$16.5 M and phase III consists of the fit-out of the office space which is estimated at \$5.5 M. The construction cost estimate is based on an fiscal year 1999 contract award. When the new lab is completed, Seattle's current drug functions are scheduled to move to Los Angeles and seafood functions would transfer to Seattle.

Minneapolis—The laboratory will close in 2000. All analytical functions will transfer to the ARL except for Medical Devices related work which will be transferred to WEAC.

New Orleans—The laboratory closed on February 28, 1998. The human drug program moved to the San Juan laboratory; all other analytical/laboratory programs were transferred to the SRL in Atlanta.

Northeast Regional Laboratory (NERL) (New York)—Planned as a multi-purpose laboratory. A site for replacement space for the present Northeast Region, District and Regional Laboratory has been negotiated and secured at the York College in Jamaica, Queens. A lease has been signed by GSA for FDA and construction is underway. FDA occupancy is scheduled between December 1999 and Spring 2000.

Philadelphia—Planned as a drug specialty laboratory. The current laboratory facility was renovated and expanded by 8,000 square feet to accommodate the additional drug functions inherited from other laboratories. The additional laboratory space was completed and occupied in September 1997.

San Francisco—The laboratory will close upon lease expiration in 2014. Analytical functions will be reassessed yearly.

San Juan—Planned as a drug specialty laboratory. All other analytical work has been reassigned to the SRL in Atlanta. Renovations are underway to convert the laboratory to specialty drug analysis space and are scheduled for completion by August 1998.

Seattle—One of five planned multi-purpose laboratories. FDA expanded the laboratory by 5,000 square feet in 1996. Analytical programs, including an animal facility, are now operational and Seattle will receive seafood analytical program work from Los Angeles and transfer their human drug programs when the new Los Angeles laboratory is completed.

Southeast Regional Laboratory (SRL) (Atlanta, GA)—Planned as a multi-purpose laboratory. A 42,000 net square feet laboratory expansion project was completed in December 1997 and the new space is occupied and in use.

Winchester Engineering & Analytical Center (WEAC) (Winchester, MA)—Planned as a specialty laboratory for radio nuclides/radio pharmaceuticals and engineering functions for medical devices. Human drug analytical and validation work was transferred to Philadelphia during 1997 and all other analytical functions were moved to the Northeast Regional Laboratory as of June 1997.

Question. What effect on FDA lab consolidation will the failure or delay in constructing Phase III have?

Answer. Phases I and II provide only laboratory space and offices for the analysts and management of the lab. There is no space for support personnel or functions in the first two phases. Phase III is an integral part of the Arkansas Regional Lab project. Phase III construction is comprised of finishing ARL exterior areas which will allow for a more complete integration of the ARL functions with the National Center for Toxicological Research or NCTR. The functions to be expanded and shared include such support as Financial Management, Procurement, General Administration, Computer Operations and related activities. All of the planned space for these functions is included in Phase III of the ARL project. Phase III calls for renovation of available space at NCTR to provide the administrative space necessary to support the ARL and NCTR science functions which is crucial for the maximum efficiency of the programs. If funding for Phase III is not available, makeshift space will have to be provided to accommodate the expanded service and support functions. Using makeshift space will reduce the effectiveness of the entire concept of field lab streamlining and severely hinder FDA's ability to provide adequate space to house the common support elements.

Question. What are the current cost and time estimates for completing Phase III?

Answer. The current estimated construction cost of the Phase III portion of the project is \$13.35 million. The estimated cost is based on the exercise of a fixed price contract option to include Phase III in the current ARL construction contract to the current construction contractor by December 31, 1998. Based upon this option date,

Phase III would be completed, along with Phases I & II, in December 1999. If Phase III is not awarded by December 31, 1998, Phase III will have to be repriced which will affect the cost and may affect the schedule.

QUESTIONS SUBMITTED BY SENATOR HARKIN

BIOLOGICS EVALUATION AND RESEARCH

Question. The Administration's fiscal year 1999 budget for the Food and Drug Administration includes several new and expanded initiatives. However, it is my understanding that some of the basic FDA programs, such as the Center for Biologics Evaluation and Research (CBER) have recently experienced substantial program reductions—I am told 40–50 percent. Is this correct? Does the fiscal year 1999 budget address this shortfall, and how does it do so?

Answer. The Prescription Drug User Fee Act provides that fees are to be used to finance a portion of the costs associated with the premarket review of drug applications. Fees can only be collected and made available to cover increases in the costs for the process to review human drug applications. PDUFA is designed to assure that user fees collected under the Act are indeed additional resources for FDA to expedite the review of new drug applications.

Under the Prescription Drug User Fee Act of 1992, certain regulatory research activities were supported by user-fee funding. The Agency and the industry negotiated that user-fee funding will no longer support any regulatory research activities under the Prescription Drug User Fee reauthorization. The intent is to devote user-fee resources to application review and information systems. The CBER will phase out its user-fee research FTE by the year 2000. Although user fees will no longer be available to fund research, CBER will maintain a reduced, high quality research program.

The one-third reduction is to the CBER research staff, not total Center staff. The reduction will be phased over three years. At the end of this phase out, CBER will have 79 fewer FTE devoted to research, and no research FTE will be supported by user fees. About half of those 79 FTE will be redirected to application review.

FDA's budget request to Congress for fiscal year 1998 included \$820 million for salaries and expenses for the agency's base level of activities in fiscal year 1997, as well as selected program increases. In final action on FDA's appropriations for fiscal year 1998, Congress included an allocation of \$24 million for FDA's role in the President's Food Safety Initiative and an increase of \$29 million for the Agency's initiative to reduce underage use of tobacco products. Since the final appropriation of \$857 million for FDA's salaries and expenses represented additional funding of only \$37 million for \$53 million in new program activities, it required the Agency to absorb a \$16 million reduction to base activities. FDA was required, therefore, to reevaluate the funding needs of its base programs.

FDA has conducted a thorough review of its major program areas to determine where and how reductions could be taken in the current fiscal year to fund new initiatives and pay increased salary and other increased costs. The Agency is determined to fully fund the Food Safety Initiative and the Tobacco Initiative at the program levels requested and appropriated. FDA's plans are described in the operating plan submitted to the Committee in January.

As shown in the operating plan, CBER's salaries and expenses resources for fiscal year 1998 are \$96,279,000 and 875 FTE, compared to fiscal year 1997 actuals of \$96,256,000 and 861 FTE. The CBER programs are not incurring a disproportionate share of the Agency's reductions. The impact of these reductions on CBER programs will primarily be in the following areas: FDA's work on two action steps of an adult vaccination plan focusing on the recommendations of a 1994 National Vaccine Advisory Committee Report on adult immunization and adult immunization goals and performance measures will be delayed; funding for information systems to track the progress of applications, specifically, the blood logging and tracking system will be reduced; and the review times for non-user-fee applications such as blood and source plasma applications may increase.

The fiscal year 1999 request will fund CBER activities at approximately the same level as in fiscal year 1998. It should also be noted that the fiscal year 1998 operating level reflects an increase of 10 FTE in the field biologics program for increased efforts aimed at ensuring the safety of the blood supply.

Question. Dr. Friedman, it is my understanding that some of the most exciting innovations in medical research and drug development will occur in the coming decade as we travel further into the age of molecular medicine we have now entered. I am informed that these innovative products are likely to need to be reviewed by

the Center for Biologics Evaluation and Research. What are the consequences for the future if we do not provide adequate resources to stabilize the Center for Biologics Evaluation and Research today?

Answer. In the area of biologics, examples of the vast new product types for which there is not prior history or base of knowledge to draw upon include the following: DNA vaccines, gene therapy vectors, manipulated tissues, xenotransplants, and non-red blood cell oxygen carriers. Meeting the tighter review time frames and performance benchmarks required under the Prescription Drug User Fee Act, or PDUFA, requires scientists at the cutting edge of their fields. This requirement is best achieved by having the researcher, who is currently practicing his or her specialty, directly involved in the review of product applications. Thus, there must be an environment which will attract and retain highly qualified researchers who are willing to commit some portion of their time to the regulatory process.

The ability to recognize and anticipate problems before they happen, as well as to respond quickly to crises, requires a cohort of scientists who have active laboratory programs and hands-on regulatory experience. Even with the reductions that have been necessary in fiscal year 1998 in CBER programs, we believe CBER retains a wide range of excellent scientists who can bring laboratory experience to bear on regulatory decisions.

FDA YOUTH TOBACCO INITIATIVE QUESTIONS

Question. I just want to make it clear for the record that the FDA tobacco initiative that is in the budget, the \$134 million, is separate from the tobacco settlement and from comprehensive tobacco legislation. In other words, FDA intends to carry out this initiative and can do so even if Congress does not pass an omnibus tobacco bill—provided you have the funding. Is that correct?

Answer. The budget request for FDA's tobacco program for fiscal year 1999 is based upon \$134 million being made available to FDA for these activities. These resources are needed to fully enforce the Agency's tobacco rule.

Question. There is a compelling need for a comprehensive approach to reduce teen smoking along the lines of the comprehensive regulation issued by FDA in August of 1996—to reduce both access to and demand for tobacco among youths. We do not yet have fully in place a comprehensive program: it is my understanding that FDA's advertising restrictions have not yet gone into effect. However, a crucial part of the FDA initiative is in effect—setting a national minimum age for sales of tobacco and requiring photo I.D. checks. What is the contribution to public health of expanded funding just for carrying out FDA's youth access restrictions, particularly the minimum age and photo I.D. rules?

Answer. The two access restrictions that are in place today, dealing with age and photo ID, are just one part of a comprehensive set of access and advertising provisions in FDA's final rule. It is the Administration's stated goal that a 50 percent reduction in youth smoking can be achieved when the Agency's final rule has been fully in effect for seven years. It is critical to expand the funding for enforcement of the age and photo ID provisions. In fiscal year 1998, compliance checks will be performed in less than half of the retail outlets that sell cigarettes and smokeless tobacco products in the United States. Expanded funding for these enforcement activities in fiscal year 1999 will help ensure that retailers do not sell tobacco products to minors. This is a vital first step towards accomplishing the objectives of the comprehensive program envisioned under FDA's final rule.

FDA'S ARRANGEMENTS WITH THE STATES

Question. Why is FDA entering contracts with the states instead of using its own personnel for the enforcement activities?

Answer. There are at least 500,000 tobacco retailers in the United States. FDA's limited field inspectional resources simply do not allow the Agency to enforce the tobacco rule by itself. Joint enforcement efforts with the states, using a training, commissioning, and contracting process similar to the tobacco program, have worked quite successfully for mammography, retail food, and dairy farm inspections.

Question. What type of arrangements does FDA have with the states and how is FDA working with the states?

Answer. FDA has established a close and collaborative working relationship with the states to jointly enforce the tobacco rule. For fiscal year 1998, states submit proposals to FDA to conduct compliance checks under contract to the Agency. Proposals are based upon a Statement of Work drafted by FDA and sent to each state last November. State and local officials are trained and commissioned to conduct the compliance checks after each contract is negotiated and awarded. Throughout the

entire process the FDA tobacco team works very closely with the Agency's state partners.

Question. What support does FDA provide to the states? Does enforcement of the FDA minimum age and photo I.D. check rules impose new burdens on the states?

Answer. FDA provides extensive support to its state partners. In addition to the training and commissioning that each state receives, any issue or question that arises is addressed by the tobacco team working in close contact with the state making the inquiry. There are no new burdens imposed on the states by virtue of their participation in the FDA tobacco effort because FDA reimburses the states for their expenses under the negotiated terms of the contract each state signs with the Agency.

Question. Please tell the Committee a little more about what FDA will be able to achieve with the additional funding requested for the tobacco initiative for fiscal year 1999. I assume the additional funding will allow additional compliance checks, but also more education of retailers and of the public. How many retail establishments are you expecting to reach? How many visits a year do you expect to conduct for an establishment? And what will the budget request fund in the way of education and outreach?

Answer. In fiscal year 1998, FDA is focusing most of its outreach efforts on retailer information, continuing its provision of brochures and Question and Answer pamphlets for retailers as well as maintaining a toll-free hotline telephone number for retailers to call to request materials and a WEBSITE with similar information. Further, as each new state contracts with FDA to undertake compliance checks, the Agency sends mailing to all retailers in the state to alert them that compliance checks will soon begin in their state. In addition, the Agency has developed and has begun distribution of in-store materials to all retailers answering potential questions, and reminding them of their responsibilities under the rule, and assisting them in compliance; and has begun placing a modest level of advertising in a major market within states in which contracted compliance checks are being conducted.

In fiscal year 1999, the Agency will design a multi-media advertising campaign including radio, print, and billboard advertisements and place these ads in major media markets in every state with which FDA contracts to conduct compliance checks. It will also develop a comprehensive retailer education program which includes a retailer kit containing in-store signs, tent cards, fact sheets, counter mats and other materials; a letter to retailers in each state updating them on the status of compliance checks in their state; a series of reminder postcards that can be posted in the store for customers and clerks to see; trade advertisements in retailer publications; and a toll-free hotline that retailers can call to request additional materials and ask questions. It will continue to have exhibits at major conferences representing state and local health officials, public health organizations, and consumer and retailer organizations educating these audiences about the new tobacco rule.

On the enforcement side, in fiscal year 1998, the Agency is attempting to establish contractual relationships with each state and territory to conduct compliance checks of retail outlets that sell tobacco products. FDA is asking each state to attempt to conduct a minimum of 375 inspections per month. In fiscal year 1999, the Agency plans to commission state officials in all 50 states to perform unannounced inspections of over 500,000 retail establishments to determine if retailers are complying with the law. It will send warning letters to first violators and seek civil money penalties from those found violating the law multiple times. Finally, it will develop an enforcement strategy for national chains.

Question. I want to examine more closely questions about the impacts on retailers of enforcing the minimum age and photo I.D. rules. What are you doing to help retailers comply with the requirements so they do not get sanctioned by FDA?

Answer. The Agency has created an extensive program of outreach to tobacco retailers to ensure that they comply with the new tobacco rule. We fully described the details of this effort earlier. We will provide a full set of all the materials the Agency sends to retailers under separate cover.

Question. Can you walk us through the enforcement process? What happens for successive violations? What are the levels of penalties?

Answer. A retailer that sells a tobacco product to a minor during an FDA compliance check receives a written warning from FDA for a first violation. Escalating monetary penalties are imposed starting with a second violation. The fine for a second violation is \$250; \$1,500 for a third violation; \$5,000 for a fourth violation; and \$10,000 for a fifth violation. Retailers are provided an opportunity to contest the penalties FDA seeks to impose, including the right to request a hearing before an administrative law judge.

Question. How much time between compliance checks? Could a retailer be subjected to multiple penalties without having time to correct the problem in the store, for example, through multiple compliance checks and penalties in one day?

Answer. There is no fixed period of time between compliance checks. Typically, a follow-up compliance check in an outlet that previously sold to a minor will occur within three months of the prior inspection. Multiple FDA compliance checks in the same store on the same day will not occur.

Question. Can you describe for the Committee the difference between this FDA initiative and the Synar Amendment rules relating to the Substance Abuse and Mental Health Administration block grants? How are the programs different and why is FDA's initiative needed in addition to the Synar regulations?

Answer. The FDA and Synar programs complement each other. SAMHSA administers the Synar program, which conditions the receipt of substance abuse and mental health block grants on demonstrated tobacco control activities at the state level. The Synar program requires the states to monitor retailer sales to minors. By contrast, FDA has begun to enforce a mandatory federal regulation that prohibits the sale of cigarettes and smokeless tobacco products to minors.

The FDA access restrictions are just one part of a comprehensive agency regulation which, when fully in effect, will restrict the availability and the appeal of tobacco products to minors. The key difference is that SAMHSA measures compliance with tobacco control, and FDA enforces a comprehensive regulation.

QUESTIONS SUBMITTED BY SENATOR BYRD

SAFETY OF IMPORTED FOOD ACT

Question. Chairman Cochran, Senator Bumpers, members of the Subcommittee, and Lead Deputy Commissioner, Dr. Michael A. Friedman, I am pleased to be here today to review the Food and Drug Administration's (FDA) programs. The FDA is the responsible federal agency for carrying out policy that protects the health of the nation against impure and unsafe foods, drugs, and cosmetics, as well as other potential hazards. While the FDA's mission is broad in scope, I will limit my questions to the safety of imported food, the Office of Generic Drugs, and the Food Packaging Pre-Market Notification System.

One of the rewards that this nation enjoys as a result of its prosperity is the virtual smorgasbord of foods available to every consumer. However, this smorgasbord has the potential to become the literal poison pill, with outbreaks of foodborne illnesses raising alarming questions about the safety of the U.S. food supply. Not only are Americans getting sick from eating contaminated food, but an estimated 9,000 deaths occur annually in this country as a result of foodborne illnesses.

To ensure the safety of imported fruits and vegetables, and other imported food, I cosponsored S. 1707, the Safety of Imported Food Act. S. 1707 would provide the FDA with new authority that would allow the agency to prevent the importation of foreign goods grown and processed under conditions that do not meet U.S. food safety standards. These conditions include everyday production and processing practices, where microbial contamination can occur—and where it often begins. In brief, S. 1707 would greatly enhance the FDA's ability to identify potential food safety hazards before people get sick.

Would you please provide answers to the following questions: since the FDA already has the authority to detain products offered for import, why does the FDA need the authority provided under S. 1707?

Answer. Current law provides FDA with authority to refuse entry if, after inspection or testing of imported products at the border, or as a result of other information, the Agency finds that the food appears to be unsafe or otherwise violates U.S. law. Experience has shown, however, that inspection and testing of products at the border may not be sufficient in all cases to ensure the safety of food products. In addition, it may be necessary to identify and inspect the source of potential contamination to ensure that products offered for sale in the United States meet domestic food safety requirements or otherwise achieve the level of protection required. FDA currently has such authority but only with respect to domestic production.

This new provision adds to the Federal Food, Drug, and Cosmetic Act, FD&C Act, a principle that has been reaffirmed in the World Trade Organization, WTO, agreements on food safety. This agreement recognizes the right of signatory countries to set the level of protection each country deems appropriate for the health and safety of its citizens, and to exclude imported foods that do not meet their domestic food safety requirements or otherwise achieve the appropriate level of protection. The FD&C Act currently does not explicitly include this concept.

Question. What would be the effect of S. 1707 on FDA's existing authority over imported food?

Answer. Current law provides FDA with authority to refuse entry if, after inspection or testing of imported products at the border or as a result of other information, the Agency finds that the food appears to be unsafe or otherwise violates U.S. law. S. 1707 would give FDA the authority to evaluate the food safety systems, conditions, or measures in which an imported food was prepared, packed or held; if such conditions, systems, or measures do not meet U.S. requirements or otherwise achieve the U.S. level of protection, a food may be deemed adulterated and denied entry.

This new provision adds to the Federal Food, Drug, and Cosmetic Act (FD&C Act) a principle that has been reaffirmed in the World Trade Organization, WTO, agreements on food safety. This agreement recognizes the right of signatory countries to set the level of protection each country deems appropriate for the health and safety of its citizens, and to exclude imported foods that do not meet their domestic food safety requirements or otherwise achieve the appropriate level of protection. The FD&C Act currently does not explicitly include this concept. The effect of S. 1707 would be to provide the authority needed to ensure that all imported food products meet the U.S. level of protection and also is consistent with rights and obligations under international trade agreements, and would provide FDA with another effective enforcement tool.

Question. Does this legislation conflict with U.S. obligations as a member of the World Trade Organization (WTO)?

Answer. S. 1707 is consistent and will not conflict in any way with U.S. obligations as a member of the World Trade Organization, WTO. Rather, S. 1707 is consistent with the right recognized in one of the WTO agreements, the Agreement on Sanitary and Phytogantary Measures, that each member nation has the right to maintain its appropriate level of protection. The purpose of S. 1707 is not to restrict trade but to assure that U.S. consumers are as protected from harmful imports as they are from harmful domestic products. Current law provides FDA with authority to refuse entry if, after inspection or testing of imported products at the border or as a result of other information, the Agency finds that the food appears to be unsafe or otherwise violates U.S. law. Experience has shown, however, that inspection and testing of products at the border may not be sufficient in all cases to ensure the safety of food products.

Question. I note that the President's budget proposes the inclusion of approximately \$25 million in the FDA's fiscal year 1999 budget to provide the necessary resources to implement the goals of S. 1707. If these funds are provided in the fiscal year 1999 Agriculture Appropriations Bill, what progress will the agency be able to make in implementing the authority provided under S. 1707 in fiscal year 1999?

Answer. The funding included in the fiscal year 1999 budget request would provide, among other things, better assurances that domestic and imported fresh fruits and vegetables are safe. However, this funding is not dependent upon passage of the legislation. The funding and the legislation are inter-related but not inter-dependent. Passage of the legislation would provide FDA with a powerful tool toward improving the safety of imports, but the activities planned with the proposed funding can move forward even without enactment, as the legislation is budget neutral.

OFFICE OF GENERIC DRUGS

Question. Mr. Chairman, I am also interested in the FDA's Office of Generic Drugs (OGD). The generic drug industry, including Mylan Laboratories, Inc., headquartered in West Virginia, has alerted me that consumers and all purchasers of pharmaceutical products, including the federal government, could realize substantial savings if the FDA adhered to its statutory deadline for the OGD to review generic drug applications, known as Abbreviated New Drug Applications (ANDA), within 180 days.

I understand that a backlog of pending generic drug applications continues in the OGD. Why is the FDA exceeding the statutory requirement that ANDA's receive final agency action in six months?

Answer. The agency makes every attempt to meet the 180 day generic drug application review requirement; however, for a number of reasons it is not always possible to do so.

FDA considers either an approval or disapproval be a final action on any Abbreviated New Drug Application (ANDA). After receiving a disapproval action, manufacturers frequently resubmit applications that address the deficiencies indicated in the disapproval action.

Approval times reflect both time with the agency reviewing applications as well as time with the sponsor or applicant responding to deficiencies noted by FDA reviewers. The time spent in FDA is measured by "review cycles". A cycle starts when an application is filed by FDA and ends when the agency issues an "action letter." Generally these letters communicate to the sponsor that their application is approved or not. If not approved, the sponsor is provided with the reasons why and has an opportunity to submit information needed to address these deficiencies. When this information is received a new cycle begins.

Generally, approval time is comprised of multiple "review cycles," as well as time between cycles when the applicant is responding to FDA's comments. However, there have been applications approved after the first "review cycle." However, we believe there are some primary factors that impact our ability to review ANDA's within 180 days.

First of all, the number of employees assigned to the Office of Generic Drugs has remained fairly constant while the number of original ANDA submissions has increased over 40 percent since 1994.

Secondly, the activities of the Office of Generic Drugs (OGD) are entirely funded through appropriated funds. This means that OGD receives no additional funding from industry under the Prescription Drug User Fee Act (PDUFA) to support the hiring of additional staff. Therefore, resources are based on traditional appropriations and cannot rely upon additional resources made available through PDUFA.

Lastly, included on the review clock are times that the Food and Drug Administration need to determine if the manufacturing site(s) are in compliance with current good manufacturing practices (cGMP's) and time for statistical and clinical consult.

Question. Please provide a list of ANDA's that are currently being delayed because of an outstanding scientific or regulatory bioequivalence issue.

Answer. The types of drug products that may take longer to review are non-systemically absorbed drug products that require more extensive bioequivalence testing methodology and others that raise especially complex scientific issues. Information regarding whether an ANDA is undergoing review by the agency is proprietary information, and is generally not disclosable. FDA can only disclose this information to Congress in response to an authorized request from the Committee Chairman.

Question. Please provide the names, or the types of products, as well as the mean time of the applications pending before FDA.

Answer. As mentioned earlier, we may not disclose the specifics of the pending ANDA's without an authorized request from the Committee Chair. However, the types of drug products that may take longer to review are non-systemically absorbed drug products that require more extensive bioequivalence testing methodology and others that raise especially complex scientific issues.

The Office of Generic Drugs does not routinely monitor the mean time of pending applications. However, at the end of fiscal year 1997, there were 515 pending ANDA's, including 106 pending for more than six months. Overdue applications are ANDA's that have been pending more than 180 days.

Question. How many of the outstanding issues on scientific or regulatory bioequivalence were raised by citizen petitions?

Answer. The Agency receives numerous Citizen Petitions and other challenges each year regarding scientific or regulatory bioequivalence issues. There are approximately a dozen of these Petitions and other challenges currently being evaluated by the Office of Generic Drugs (OGD). Each Petition and challenge is carefully reviewed and responded to, and any related ANDA's are carefully evaluated based on the issues raised in the Petition. However, as we discussed earlier, the Office of Generic Drugs (OGD) is not allowed to specifically discuss ANDA's pending before the Agency.

Question. The FDA reported to industry last year that a program was initiated in fiscal year 1996 to release bioequivalence protocols and protocol reviews to the public. Has this program reduced OGD's protocol workload and resulted in more time for work on reviews?

Answer. The inception of the initiative to publicly release bioequivalence protocol reviews resulted in OGD's issuance of 40 protocols to date, 34 of which were issued in fiscal year 1997. This initiative has reduced the total number of protocols received by the Office from 153 in fiscal year 1995 to 60 in fiscal year 1997. Consequently, OGD's bioequivalence reviewers and support staff now have more time to devote to the review of ANDA's.

PREMARKET NOTIFICATION SYSTEM

Question. With regard to the Premarket Notification (PMN) System, the PMN provisions of the FDA Modernization Act of 1997 are intended to expedite introduction of advance food packaging materials while assuring the protection of public health. PMN has a significant impact on the Kanawha Valley Union Carbide plant in West Virginia, and I have the following questions. The FDA reform legislation that Congress enacted last year included a streamlined regulatory process for approving food contact materials. It appears that this agreement was a substantial factor in securing passage of section 309 of the new law. Am I correct that industry and the FDA were in agreement on the basic concept of this pre-market notification plan for food contact substances?

Answer. Yes, prior to enactment of the FDA Modernization Act, agency personnel discussed the elements of a premarket notification system for food contact substances with industry representatives, and it is correct that the Agency is in agreement with the basic concept. However, FDA's agreement to the program was explicitly conditioned on its receiving adequate funding through user fees; however, that portion of the program was not enacted.

Question. The language of the new statute requires that the FDA report to Congress by April 1, 1998, on the estimated cost for carrying out the food contact substance notification program. How far along is the Agency in preparing this report?

Answer. We have a draft document that is now being circulated within the Agency for clearance. We plan to submit this report to the Department for their review shortly. With support from the Department, we are trying to expedite the process as much as possible. However, assembling this initial report and ensuring the soundness of the estimate took longer than anticipated.

Question. On the basis of this evaluation, do you believe the Agency will indeed need additional funding to implement the food-contact substances notification program as originally expected by the House and Senate Conference Committee Members for the FDA reform legislation?

Answer. No increase was included in the fiscal year 1999 request, as we were still reviewing the impact of this program. We are in the process of completing our report, as required by the FDA Modernization Act, which will provide our estimate as to the costs of this program.

This concludes my questions, Mr. Chairman, and I look forward to working with you, the Ranking Member, and other Subcommittee members in conjunction with the Lead Deputy Commissioner, on these important issues confronting the FDA.

QUESTIONS SUBMITTED BY SENATOR LEAHY

GENERIC DRUGS

Question. The Administration's fiscal year 1999 budget justification document indicates that \$34,883,000 and 351 Full Time Equivalents (FTE's) were devoted to FDA's generic drug program in fiscal year 1998. I understand that approximately \$8,500,000 and 127 FTE's were allocated specifically to the Office of Generic Drugs (OGD) for fiscal year 1998. Where do the other 224 FTE's work and how does the FDA spend the remaining \$26,383,000? Please provide the specific FDA offices outside the OGD that will receive fiscal year 1998 generic drug program monies, detailing the dollar amount and FTE number for each recipient office.

Answer. Of the 351 FTE providing support to the Generic Drugs program, 127 are located within the Office of Generic Drugs; 105 are elsewhere within the Center for Drug Evaluation; and 119 are located in the Office of Regulatory Affairs. The cost of the support provided by these offices are spent on salaries and operating expenses. We are happy to provide the breakout of support for the Generic Drugs program within the Center for Drug Evaluation for the record.

[The information follows:]

Office	FTE	Estimated costs
Office of Center Director	7	\$824,000
Office of Management	7	925,000
Office of Information Technology	8	942,000
Office of Training & Comm.	8	942,000
Office of Compliance	26	3,062,000
Office of Review Management	26	3,062,000

Office	FTE	Estimated costs
Office of Pharm. Science ¹	23	2,710,000
Total	105	12,367,000

¹ Excludes Office of Generic Drugs.
Dollars are rounded.

Since publication of the 1999 budget justification document, the Office of Generic Drugs staff has increased from 127 to 133 for fiscal year 1998. The FDA Operating Plan also estimates the funding level for the Office at \$9,693,000.

Question. I am concerned about the backlog of pending applications for Abbreviated New Drug Approvals. According to the generic drug industry, about half of all drug prescriptions are filled with generic versions of the prescribed drug, and a generic typically enters the market 30 percent below the brand price. Within a couple of years, the generic industry predicts that the generic drug price may decline to 60 to 70 percent of the brand price. Long delays in an Abbreviated New Drug Application costs consumers and the government millions of dollars. I know that FDA has been trying to reduce the backlog of Abbreviated New Drug Applications. I would like to know what steps FDA is taking to continue making progress against the backlog.

Answer. The Office of Generic Drugs (OGD) defines backlog as being all applications pending review. This includes applications that are pending less than 180 days, and application pending greater than 180 days or called "overdue" applications. At the end of fiscal year 1997, there were 515 pending ANDA's, including 106 pending for more than six months. Either approval or disapproval of an ANDA is considered by FDA to be a final action. We make every attempt to meet this requirement; however, for a number of reasons it is not always possible to do so. After receiving a disapproval action, manufacturers frequently resubmit applications that address the deficiencies indicated in the disapproval action.

Of the 515 applications pending at the end of fiscal year 1997, 106 were overdue.

FDA has specific initiatives with the goal to reduce the backlog and decrease overall time to approval.

OGD has begun sending the review comments and/or deficiencies to applicants via facsimile. Prior to communicating via facsimile, all deficiencies were sent through the U.S. mail. Communicating deficiencies by facsimile can save several days in each review cycle. Additionally, for most minor issues, applicants are able to submit their responses via facsimile. If a fax response is received from an applicant within 30 days, the reviewer will then complete review of that application. Previously, responses to minor amendments were placed in a queue and reviewed within 60 days. Based on the reason for the deficiency, a small number of minor amendments continue to be placed in a queue for review. The Office believes that this new procedure has improved communications with applicants and has helped to reduce overall time to approval.

The Office has been working with firms to facilitate the electronic submission of data (ESD) used to support bioequivalence studies. This is also referred to as the bioequivalence/bioavailability database. The ESD format contains the core information from a bioequivalence study and allows raw data to be accessed for further analysis. Reviewers can compile a review by using efficient word processing tools and query functions to expedite the review process. In addition, ESD allows reviewers to instantly check individual data without manually searching pages of hardcopy data. These functions save review time and improve the quality of reviews. Nine electronic submissions have been received to date for this program, with four during fiscal year 1997. Also, OGD has begun accepting submissions of similar chemistry, manufacturing and controls data for beta testing. It is anticipated that this electronic submission will also provide a more efficient means of review.

Also, OGD initiated a process of providing pen and ink changes to proposed labeling rather than preparation of a detailed narrative letter. This reduces the time required for drafting and finalizing letters, and provides for a faster labeling review process.

The Office continues to utilize overtime for the reviewers in an effort to help reduce cycle times and improve approval times.

The Office has hired a Medical Officer to facilitate timely review of ANDA's with bioequivalence studies with clinical endpoints. In the past, these complicated studies were consulted to Medical Officers in the Office of Review Management (ORM) for review. Responses to these consults were often delayed due to Prescription Drug

User Fee Act (PDUFA) priorities in ORM. Evaluation of these studies by an OGD Medical Officer has permitted more timely completion of the review process.

The Office also initiated a procedure to contact applicants that undergo two or more major deficiency cycles. Applicants are requested to contact OGD for discussion or clarification regarding the deficiencies. If OGD is not contacted, the Office will call the applicant within 30 days to see if any further discussion, or perhaps a meeting, is necessary. OGD is attempting to provide guidance to applicants and reduce or eliminate additional review cycle, thus moving applications to approval more quickly.

The Office issued a Manual of Policies and Procedures entitled: "Procedure for Public Release of Bioequivalence Protocols and Reviews." Firms frequently submit proposed bioequivalence protocols to OGD. Often these are duplicates of already submitted and reviewed protocols. In order to decrease the burden of reviewing several protocols for the same drug product, OGD is now making available copies of acceptable protocols and related review comments. OGD believes that by utilizing completed review comments, firms will need to submit fewer protocols, freeing time for reviewer evaluation of applications.

Since the inception of the initiative to publicly release bioequivalence protocol reviews, 40 protocols have been issued to date, 34 of which were issued in fiscal year 1997. Making these protocols publicly available reduced the total number of protocols received by the Office from 153 in fiscal year 1995 to 60 in fiscal year 1997, since multiple protocols for the same drug no longer require individual review. This initiative has also reduced the need to develop Biopharmaceutical Guidances to the same extent as before. These guidances are now developed only for drugs products with special/unique bioequivalence issues.

The Office has identified and started development of several Biopharmaceutical Guidances for drugs products with special/unique bioequivalence issues predicted to be the subject of multiple generic drug application submissions during the next few years. It is anticipated that this proactive guidance program will reduce the review time for the selected drug products, thus reducing the number of overdue applications. One revised guidance was issued in fiscal year 1997. Eleven others are being developed and are expected to be issued in fiscal year 1998.

Chemistry review branches with a significant actual or predicted backlog have been reassigning reviews in accordance with Office procedures to other branches with lower workloads in an effort to reduce the number of overdue applications and supplemental applications.

The Office implemented a policy on "Substitution of an Alternate Source of the New Drug Substance in Unapproved Abbreviated Applications." Previously, if a generic drug application was otherwise approvable with the exception of an unsatisfactory current good manufacturing practice (cGMP) inspection for the primary new drug substance (NDS) supplier used to manufacture the exhibit/bioequivalence batch, it would not be approved until those cGMP issues were resolved. In order to qualify an acceptable alternate source, a new exhibit batch based on the alternate source would be needed. Additionally, a bioequivalence study would be required, depending on dosage form to support use of the alternate source. For unapproved applications OGD now allows substitution of an alternate source of the NDS based on assurance that the specifications and test data are essentially the same as those of the original source used in the exhibit batch and bioequivalence study if required, provided that the original source would have been acceptable except for cGMP issues. Generally, a new in vivo bioequivalence study will not be required for the alternate exhibit batch, but it will be necessary to provide comparative dissolution data depending on the dosage form of the proposed product. This new policy should reduce approval times in certain situations.

In addition, to facilitate streamlining, improve review and approval times, and increase communication with applicants, OGD will continue to issue letters to the generic drug industry and hold meetings with the three generic drug trade associations: the Generic Pharmaceutical Industry Association (GPIA), the National Association of Pharmaceutical Manufacturers (NAPM), and the National Pharmaceutical Association (NPA).

We do not believe, however, that the number of pending applications is likely to be reduced substantially, due to two factors. As previously stated, OGD has established a facsimile program for communicating deficiencies to applicants. If the applicants respond to the minor deficiencies within 30 days, the OGD reviewers will then complete review of the applications rather than issuing a deficiency letter that closes the review cycle. This program has significantly contributed to the reduction in approval times, but does increase the number of pending ANDA's (including overdues) as the reviews are kept in pending status until the firms respond and the reviewers complete their reviews. Traditionally, the process just described was con-

ducted in two shorter cycles which reduced the number of overdue applications but increased the overall time to approval. The other factor is that the number of original applications submitted to OGD has increased from 300 ANDA's received in fiscal year 1991 to 462 ANDA's received in fiscal year 1997. Staffing has remained relatively constant during this period.

As we mentioned earlier, review cycles comprise FDA's portion of overall approval times. The reduction in the number of cycles has subsequently resulted in reduced overall approval times. We will provide this information for the record.

[The information follows:]

APPROVAL TIMES

[In months]

Fiscal year	Median	Mean
1995	28.2	35.3
1996	24.7	33.2
1997	19.6	25.6

The reduction in review cycles and overall approval times enabled FDA to continue the increasing yearly approval trend for abbreviated applications.

Fiscal year	Total ANDA's approved
1991	141
1992	239
1993	215
1994	255
1995	288
1996	340
1997	404

Question. How many FTE's are currently assigned to review generic drug applications?

Answer. As of April 1, 1998, 133 FTE have been assigned to OGD.

Question. How many FTE's would be needed to meet FDA's statutory requirement to approve generic drug applications within 180 days?

Answer. The statutory requirement is to review generic drug applications within 180 days. A review may result in an approval or not approval action.

However, provided there is a steady submission rate of original ANDA's, the Office estimates that it will need approximately 75 additional FTE to review the majority of applications within 180 days. There will always be a few applications that cannot be reviewed within 180 days due to complicated scientific issues or other barriers outside the direct control of OGD. In addition to these FTE, other parts of the Food and Drug Administration that support the generic drug review program will need additional FTE, such as the Office of Regulatory Affairs and the Office of Compliance.

Question. I have been informed that the report to the President on food safety showed that FDA was in "critical condition" with respect to its food safety inspection functions, and that the agency regulates 53,000 plants and has an average inspection frequency of once every 10 years. Are food plants currently required to register? If not, how does the agency know who to regulate? Would registration of food processors help the agency to conduct more frequent food safety inspections?

Answer. Food plants are not required by law to register with the FDA. The only exceptions are producers of Acidified and Low Acid Canned foods, which are required to register and file scheduled processes with the Agency, and Infant Formula producers which are required to notify the Agency prior to initial product marketing or major changes in formulation.

The Agency maintains an inventory of food processing establishments that are subject to our jurisdiction. This inventory is maintained in a variety of ways to include reviewing industry data bases, such as Booz-Allen and Hamilton directories, reviewing product labels, and following-up to industry/consumer complaints and inquiries.

Requiring food processors to register with the Agency may provide FDA with more complete and up-to-date information on firms that go out of business or begin food production. However, such a system will require the allocation of additional resources both for the maintenance of the system as well as the verification of the accuracy of data in the system. We believe that given other priorities for scarce re-

sources, the current inventory maintained by the Agency provides a reasonably accurate database of food producers in the U.S.

Question. I have been informed that the FTE's dedicated for food safety inspections average only about 17 inspections per year. Why so few? What can be done to increase the effectiveness of the inspection program?

Answer. While it is true that the number of food inspections per investigator per year, now at 17, has been steadily declining for the last few years, there are a number of factors that impact this situation. FDA Consumer Safety Officers, also called CSO's, or inspectors, are employed to engage in a variety of consumer protection and enforcement activities. While inspections and sample collections are the most frequently mentioned and easily counted output activities, investigational personnel historically do many other tasks and have taken on additional responsibilities consistent with reinvention initiatives that while they are not output measures as such, are important to the outcome goal of a safe food supply.

First, the kind of inspections conducted by FDA investigators has changed over the years. Because of changes in the food supply with more ready-to-eat foods and increased pathogens, FDA conducts fewer sanitation inspections and more microbiological inspections. These microbiological inspections take longer to conduct and, when combined with constant turnover in Consumer Safety Officers, have a negative impact on the number of inspections per CSO per year.

Moreover, CSO's conduct activities under at least 14 established categories, only one of which is factory inspections. Besides inspections, Consumer Safety Officers perform such tasks as sample collections, audit checks, recall follow-ups, and provide training and technical assistance. For example, food safety checks of establishments made after a natural disaster are not reported as inspections but rather investigations, as are epidemiological trace backs after a food borne illness outbreak, for example lettuce contaminated with E-coli. Consumer complaint follow-up, and incidents associated with food allergens also consume FDA investigator time, none of which is associated with output measures and all of which take away from time to conduct inspections. FDA Consumer Safety Officers are not assigned to inspect individual plants in a local duty station day after day as are some inspectors in other agencies. Rather, FDA investigators travel great distances to inspect a wide variety of food processing plants.

Food safety inspections are also performed by state authorities under contract to FDA and in partnership with FDA. As such, FDA investigators provide assistance, training and oversight to these food safety activities. While these activities are not output measures and not routinely reported as inspectional time, they do leverage FDA inspection resources in the foods area. In recent years, as the number of field management and support personnel has declined, more investigator time has had to be devoted to industry assistance in the form of meetings and presentations, training of industry employees, and pre-operational process reviews that provide manufacturing guidance to company officials to better enable them to comply with FDA regulations.

All of the preceding are examples of activities that FDA Consumer Safety Officers must do besides conduct inspections. While most are not output oriented, all are important in assuring consumer protection and a safe food supply. Nonetheless, we believe there are a number of areas that can be examined and modified or re-engineered to provide our investigators more time to conduct inspections and thereby increase the total number of inspections conducted in a year. For example, we plan to initiate efforts to shorten in-plant times by conducting more directed inspections of certain products or processes and increased monitoring of in-plant time by supervisors. We will also review the requirements of written inspection reports for non-violative establishment inspections, and increase our use of abbreviated inspection reports or checklists. We will also look for innovative ways to collect food samples rather than relying on our investigators.

Question. Last year, the Committee supported increased funding for FDA to implement the President's Food Safety Initiative. I have been informed that a portion of that money, \$8 million was dedicated to hiring 80 new seafood safety inspectors to help with the implementation of the new HACCP program. Why does each food safety inspector cost \$100,000?

Answer. The \$8 million of Food Safety Initiative, or FSI, funds for fiscal year 1998 are supporting more FDA field activities than just the payroll and benefits costs of 80 investigators. The average salary and benefits per inspector is estimated at \$70,000, for a total of about \$5.6 million. In addition to salaries and benefits, these funds support the costs of training and outfitting these new FTE with equipment. FSI funds also pay inspectional travel costs, the costs of purchasing products that the agency wishes to sample, packing and shipping samples to laboratories, as well as the costs for analyzing samples and identifying pathogens, if any are found. The

inspection activities supported include implementing the HACCP regulations, and applying HACCP principles to retail food service operations. These funds are also supporting Federal/State Partnerships to ensure consistency in HACCP techniques, enhanced coordination, and communication between the FDA and the State regulators.

Question. I have been informed that the FDA implemented a new program to improve the safety of seafood products last December. How is the agency enforcing the program for our trading partners?

Answer. FDA has a three-part strategy for enforcement of the seafood HACCP program. We plan to continue FDA's traditional sampling program at ports of entry; inspect importers to verify that they are meeting their obligations under the seafood HACCP program; and develop HACCP-based equivalence agreements with U.S. trading partners that are found to meet the U.S. level of protection for seafood safety.

Importers would have an obligation to take "affirmative steps" to ensure that the products they are importing meet U.S. HACCP requirements. Importers must keep records of their affirmative steps. Inspections of importers have begun. FDA has scheduled over 1,500 audits of paperworks for imported seafood products for the first year. Under the FDA seafood HACCP program, importers will be able to meet their affirmative steps obligations by importing from countries with which FDA has an equivalence agreement for seafood. FDA will never have the resources to inspect the many thousands of foreign processors that ship to the U.S. from over 135 countries. Where equivalence is determined to exist, the foreign government performs the inspections and FDA verifies that the government's regulatory system achieves the U.S. level of protection. FDA has received inquiries from over 30 countries seeking equivalence determinations. The determination process is rigorous and can take at least a year per country. FDA expects the first determinations of equivalence to occur this year.

Question. How did FDA reach the conclusion that the seafood HACCP systems could operate without any laboratory verification to ensure that the plans are operating effectively?

Answer. The seafood HACCP regulations do not mandate laboratory verification but they do list it as an option. There are several reasons for this policy. FDA's seafood HACCP program is designed to rely on preventive measures that have been scientifically determined to work. It is well established, for example, that pathogens can be destroyed by cooking at specific temperatures for specific times. If a HACCP system that involves cooking is able to consistently maintain the scientifically established temperature and time, the outcome is essentially assured. The original creators of HACCP used this concept of scientifically established preventive controls to replace expensive end-product testing as a means of determining whether a food is safe.

FDA's Fish and Fishery Products Hazards and Controls Guide is essentially a compendium of scientifically established preventive measures. Processors are free to take measures other than those recommended in the Guide, but they must be able to demonstrate that their measures are equivalent from a safety standpoint. This demonstration may well involve laboratory verification. It is worth noting that the Guide is receiving international recognition. For example, the Canadian seafood regulatory program has informally adopted it and it is being translated into other languages for use in a number of countries.

FDA was persuaded by the comments received on the seafood HACCP proposal, such as those from the American Society for Microbiology, that end-product testing has limited value in measuring the success of a HACCP system. A considerable amount of testing beyond what can reasonably be required, would be needed to verify a HACCP system with anything approaching full confidence.

Nonetheless, FDA continues to take samples as part of its overall verification strategy for seafood HACCP. It continues to take "for cause" samples as warranted, and also now takes "HACCP verification" samples under certain circumstances to determine the relationship between compliant HACCP systems and safe products. Additionally, the Seafood HACCP Regulation does require other forms of verification, including, record review, calibration of process control instruments, and periodic reassessment of the hazard analysis and HACCP plan.

Question. Does FDA have any plans to make their HACCP programs consistent with the one developed by USDA for use on meat and poultry products?

Answer. At its core, HACCP involves the application of seven internationally recognized principles that collectively provide for a system of preventive controls for food safety. Both FDA and USDA HACCP regulations require the seven principles with only minor variations. In that respect, the programs are highly consistent. Those differences in detail that do exist are essentially attributable to differences

in circumstance, such as the nature of the industry, or the nature of the inspection program.

Beyond that, there are differences in implementation and in program design outside of the basic seven principles of HACCP that are due to differences in the nature of the hazards and the controls for those hazards. For example, the majority of seafood is harvested from wild fish populations while the majority of meat and poultry is obtained from a more controlled and crowded farm environment. The regulatory strategy for seafood will inevitably be different in this regard than that for beef and poultry. These differences should not be interpreted as inconsistencies between programs. For the same reason, it should be expected that there will be differences in detail between the FDA seafood HACCP program and future FDA HACCP programs for other commodities.

Question. Has the rate of imported food products increased in the last few years?

Answer. Yes, the rate of imported food entries has doubled over the past seven years, and based on recent trends, we expect at least a 30 percent increase in imported foods by 2002. FDA focuses its examination of import entries on products that have a history of violations, or which have a high potential for pathogen contamination, or which are epidemiologically associated with illness. As international trade in food increases, and FDA's resources have been reduced, FDA's examination of imported foods has declined from an estimated 8 percent in fiscal year 1992 to less than 5 percent in fiscal year 1997. Based on FDA data, in fiscal year 1997 there were over 2.5 million "entry lines" of FDA regulated foods imported into the U.S.—an entry can contain several different "lines" of distinct products that must be evaluated separately—and processed through its automated system for imports, OASIS, or the Operational and Administrative System for Import Support. This does not include a substantial number of informal food entries valued at \$1,250, which is to be raised to \$2,000 effective July 2, 1998, or less that may not be processed through OASIS. As food entry lines have dramatically increased, and FDA resources have declined, the number of entries examined by FDA has declined substantially. It is clear that the increase in imported food products has made maintaining an effective import inspection and sampling program more difficult.

Question. What impact has this had on your import inspection program?

Answer. Prior to the development of FDA's import system, OASIS, FDA did not have an automated system for accurately determining the number of import entry lines it reviewed and relied on U.S. Census data. "Entry lines" is a more realistic way of determining the volume of imports which FDA must evaluate. Since each entry could contain more than one "line" of FDA regulated foods—on average each formal entry contains 1.7 lines—the number of entries underestimates the challenge posed in maintaining an effective import inspection system.

The increase in imported food products has had an effect in several areas on our import inspection program. For example, as international trade increases, and emerging pathogens, sometimes unique to particular environmental niches not normally found in the U.S., become associated with foods, our ability to rapidly develop effective detection methodology has been increasingly challenged. Food safety research is critically needed to develop the means to identify and characterize more rapidly and accurately foodborne hazards, to provide the tools for regulatory enforcement, and to develop effective interventions that can be used as appropriate to prevent hazards at each step from production to consumption.

The President's Food Safety Initiatives include a focus on imported products. This will address many of the deficiencies in FDA's current import program by directing resources toward the source and point of origin of foreign produce.

FDA, along with USDA, and EPA, is working directly with many foreign countries to enhance the food production system and regulatory oversight infrastructure of these countries to better ensure that exports meet U.S. standards. The U.S. provides technical assistance to help correct deficiencies in production practices or foreign monitoring and enforcement programs. In addition, the U.S. serves in leadership positions in international food safety standard-setting organizations.

In response to the increase in imported products, FDA also plans to expand the number of mutual recognition agreements, also called MRA's, with trading partners and will continue to review and evaluate ways to increase coverage of imports.

CONCLUSION OF HEARINGS

Senator COCHRAN. That concludes the hearings. The subcommittee will recess and reconvene at the call of the Chair.

[Whereupon, at 12:08 p.m., Tuesday, March 31, the hearings were concluded and the subcommittee was recessed, to reconvene subject to the call of the Chair.]

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

MATERIAL SUBMITTED BY AGENCIES NOT APPEARING FOR FORMAL HEARINGS

[CLERK'S NOTE.—The following agencies of the Department of Agriculture and one related agency did not appear before the subcommittee this year. Chairman Cochran requested these agencies to submit testimony in support of their fiscal year 1999 budget request. Those statements follow:]

DEPARTMENT OF AGRICULTURE

DEPARTMENTAL ADMINISTRATION

PREPARED STATEMENT OF PEARLIE S. REED, ACTING ASSISTANT SECRETARY FOR ADMINISTRATION

Mr. Chairman and Members of the Subcommittee, I am pleased to report on current accomplishments and present the 1999 budget request for Departmental Administration, Agriculture Buildings and Facilities, and Hazardous Waste Management. The 1999 budget request for Departmental Administration affects each of USDA's staff offices, and will provide the level of support and accountability required to ensure that all USDA employees treat co-workers and customers fairly and equitably and with dignity and respect. Over the past twelve months, we have set the stage for being able to make this assurance.

MAJOR CIVIL RIGHTS ACCOMPLISHMENTS

I will provide you with copies of the one year implementation report, "Civil Rights at the United States Department of Agriculture: One Year of Change" which outlines in detail the implementation status of the February 1997 Civil Rights Action Team (CRAT) Report. We have started to implement 90 of the recommendations. Today, I would like to note some of the highlights of this report.

Since January 1, 1997, USDA has settled or closed 224 of the 1,088 program discrimination complaints in the backlog, including some cases which dated back to the mid-1980's, and has closed another 5 cases filed since then. The current program complaint backlog will be completely eliminated in fiscal year 1998. New complaints received by the Department will be brought to the point of adjudication within 180 days of their filing.

USDA re-established the program complaints investigation unit in the Office of Civil Rights. The unit is working with the Department of Justice, the White House and the Federal Courts in an effort to resolve the class action suit filed by the Black farmers late last summer.

Of the 2,091 employee complaints that were active on January 1, 1997, nearly half—905—have been resolved, and we have closed another 10 cases filed since then.

USDA has established a new position within the Office of the General Counsel—the Associate General Counsel for Civil Rights—to provide additional legal resources

needed to assist with resolution of future program and employee complaints in accordance with civil rights laws.

Agency Heads are being rated each quarter on their civil rights accomplishments by the Assistant Secretary for Administration. All managers and employees from the Subcabinet to the field level will be held accountable for civil rights. Allegations of reprisal and abuses of power by USDA employees will be immediately investigated, and where the allegation appears meritorious, the official will be removed from managerial duties pending full investigation. Disciplinary action will be taken against any manager found guilty of reappraisals against any USDA employee or customer.

In April 1997, USDA halted all pending foreclosures of USDA farm loans until a review of each case could be made. An independent review team in Washington, D.C. reviewed 3,148 pending foreclosures. We halted actions in 116 cases, pending investigations of possible civil rights violations. USDA has now directed each state to appoint a diverse Civil Rights Independent Review group, representative of the state's population, to review each case and future cases to determine if discrimination or inequitable treatment contributed to the failure of each farming operation.

On August 22, 1997, the Office of Outreach was established to provide Department-wide leadership and coordination to assure that all eligible customers have access to USDA programs and services and to administer the Socially Disadvantaged Farmers Outreach Program. Authorized by Section 2501 of the Food, Agriculture, Conservation, and Trade Act of 1990, the program is designed to assist socially disadvantaged farmers and ranchers to participate in USDA programs and be successful in their operations by providing outreach and technical assistance. The 1999 budget proposal would provide \$10 million for this program in direct funds, an increase of \$7 million, rather than continuing to rely upon additional funding from the Fund For Rural America.

A 30-member National Commission on Small Farms has made recommendations to Secretary Glickman for a national strategy for small farms and ranches that will help ensure economic viability and address the rapid decline in the numbers of minority farmers and ranchers. The Deputy Secretary will head a task force to implement the Commission's recommendations.

USDA has instituted new human resources management hiring, retention, promotion, and training policies for employees to help prevent workplace conflicts, disputes, and problems before they occur. A new Conflict Management Unit has been designed to address conflict early and pro-actively. Managers will be held accountable for managing workplace conflict. The goal is to address workplace disputes before they become disciplinary actions, grievances or EEO complaints.

These reforms will benefit both customers and employees in reduced conflict, a more productive workplace, better morale and working relationships, more effective programs, better management, better service to customers and employees, increased productivity and more efficient operations throughout USDA.

Several legislative proposals were introduced by Congress last year to effect legislative changes needed to implement some of the CRAT Report recommendations. Most of the issues were addressed by Congresswoman Eva Clayton of North Carolina in her legislation, H.R. 2185. The Department is working on a legislative proposal for civil rights initiatives that would modernize the Farm Service Agency state and county committee system, improve access to credit, reconstitute the lease back/buy back programs, and help ensure equity in funding for minority-serving educational institutions.

SUSTAINING THE CIVIL RIGHTS CHANGES

Now, I want to tell you about our 1999 budget request. The policy, oversight, and program changes in USDA's civil rights arena cannot be sustained unless they are vigorously supported with adequate resources. The President's 1999 budget request calls for the largest increase in civil rights funding in two decades to carry out the CRAT recommendations as well as the recommendations of the National Commission on Small Farms which support our civil rights agenda. In total, USDA is requesting about \$250 million for civil rights-related activities that would increase farm ownership and operating loans; increase loans and grants to construct housing for the Nation's farm workers; support an integrated research, extension, and education competitive grants program for new technology adoption and transfer to small farms; eliminate disparities in funding and enhance the Department's efforts with institutions of higher education that are primarily devoted to the needs of minority students; and improve outreach and technical assistance to socially disadvantaged farmers and ranchers through a substantial increase in the Section 2501 outreach program.

Departmental Administration staff office activities will account for nearly \$18 million of USDA's 1999 civil rights initiative. These funds will support additional staffing to improve personnel services and assistance to USDA agencies, including ethics compliance; improve outreach to USDA customers including support for the new USDA Office of Outreach that will ensure that all customers, especially underserved populations, have full access to USDA programs and services; enhance management-employee relations that support early resolution of employee grievances and conflicts within USDA; and ensure that a backlog of new program complaints does not develop because we are doing nothing to prevent new instances of discrimination.

The increased funding will be used to improve civil rights personnel oversight, training and services to USDA agencies to correct management and program practices that resulted in the Department's past poor civil rights performance. The funds would also be used for outreach to USDA customers, institutions and businesses. They would support outreach to under-served farmers and ranchers; increase opportunities for small and disadvantaged businesses to participate in USDA contract and program activities; and accelerate outreach to 1890 and 1994 Institutions and Hispanic-serving institutions by providing the opportunity to convey excess federal property to them. A conflict prevention and resolution unit will be established to prevent management-employee relations from reaching complaint status that will negatively impact USDA services and internal operations.

OTHER 1999 BUDGET INITIATIVES

A portion of the increased funds will be used to establish a Health Unit for USDA employees at the new Beltsville complex, and to support the Secretary's breast-feeding mothers initiative for nursing mothers at Headquarters and Beltsville by providing adequate space, furnishings and medical supervision. An increase for the Office of Administrative Law Judges will be used to hire an additional law judge to meet projected workload requirements. Finally, \$1.9 million of the proposed increase is needed for ongoing Departmental Administration activities that were reduced by more than 20 percent in the 1998 appropriation. A permanent funding reduction of this magnitude cannot be absorbed without a reduction-in-force to meet the payroll, and will reduce services to a caretaker role. It is important to keep in mind that these activities provide basic support essential for the new civil rights initiatives proposed in the Departmental Administration budget.

FISCAL YEAR 1998 SUPPLEMENTAL BUDGET REQUEST

The President has proposed a \$4.8 million fiscal year 1998 supplemental to ensure that the high priority activities supporting the CRAT report's recommendations and the administrative support units which make these reforms happen can be sustained in fiscal year 1998. Of this amount, \$2.4 million will be used to accelerate by six months implementation of the Departmental Administration CRAT recommendations proposed to be fully implemented in fiscal year 1999; \$500,000 will be used to establish a no year fund for a new Civil Rights Advisory Committee; and \$1.9 million will be used to partially restore the civil rights related operating base of Departmental Administration activities which were reduced in the 1998 appropriation to fully establish the program complaints investigations unit. This supplemental request will be offset by proposed rescissions in ten USDA agencies.

AGRICULTURE BUILDINGS AND FACILITIES AND RENTAL PAYMENTS

The 1999 Budget request for Agriculture Buildings and Facilities and Rental Payments of \$155,689,000 is a net increase of \$24,711,000 above the adjusted 1998 level. This increase includes an increase of \$9,564,000 for rental payments to GSA and \$18,505,000 for the continuation of the USDA Strategic Space Plan which is based on projected reductions in staff levels. These increases are partially offset by a decrease in operations and maintenance of current facilities and by a one-time reduction in relocation expenses.

USDA STRATEGIC SPACE PLAN

I would like to thank the Congress for its past support and ask for your continued support of our efforts to reduce costs associated with housing our employees. Through the long term Strategic Space Plan, we will consolidate USDA Headquarters into two Government-owned locations which will provide modern and safe facilities and enhance USDA operations. This plan consists of two major projects—the Beltsville Office Facility and the modernization of the South Building. In fiscal year 1998, the funding level for the plan is \$5 million. In fiscal year 1999, we are

requesting an increase of \$18.5 million for a total of \$23.5 million to continue the South Building modernization including the construction of Phase 2, wing 4, and related costs for design of Phase 3. In the fiscal year 1998 request, the Administration proposed a one-time reduction from \$23.5 million to \$5.0 million to ensure that the budget and program operations were coordinated and so that program funds were requested when they were actually needed. The fiscal year 1999 request represents a restoration of funding for the strategic plan to the fiscal year 1997 level.

The Beltsville Office Facility, now substantially completed, is located on Government-owned land at the Beltsville Agricultural Research Center in Maryland. This facility has been designed as a low-rise campus of four buildings with 350,000 gross square feet capable of housing up to 1,500 employees. Construction of the Beltsville Office Facility was begun in June 1996 by Tompkins Construction. As of January 1998, the buildings are being occupied. Work is continuing to fit out and occupy the new space. The agencies selected to house some of their staff in the facility include the Office of the Inspector General, the Agricultural Research Service, the Food Safety and Inspection Service, the Natural Resources Conservation Service and some Departmental Administration staff.

The 61 year old Agriculture South Building, which is eligible for listing on the National Register of Historic Places, is in dire need of repair and renovation to make it safe, efficient and functional. The required renovation work includes fire protection systems; abatement of hazardous materials such as asbestos, PCB light fixtures and lead paint; replacement of old, inefficient heating ventilation and air-conditioning systems; improved accommodations for disabled persons; and accommodation of modern office telecommunications systems. The current plan is to modernize the building in eight primary phases and to consolidate USDA agencies into the modernized areas as each construction phase is completed.

We are now making great progress on the modernization of the South Building. The first phase, which includes reconstruction of Wing 3, is about to begin. The design for Phase 2 is underway, and a construction contract is planned to be awarded in fiscal year 1999 if our fiscal year 1999 budget is approved. By the end of the South Building modernization project, USDA Headquarters offices will be consolidated into two government-owned locations, the Beltsville facility and the downtown Headquarters Complex. This will reduce our reliance on leased space, which will result in considerable savings.

BUILDINGS OPERATIONS AND MAINTENANCE

We are requesting a net decrease of \$658,000 for Buildings Operations and Maintenance in fiscal year 1999. The request includes an increase of \$667,000 and three full-time staff and associated costs to provide operations at the new Beltsville Office Facility for a full year; an increase of \$450,000 to fund contract price increases determined by the Department of Labor, the Fair Labor Standards Act and the Service Contracts Act; and an increase of \$216,000 for pay cost and related retirement costs. These increases are offset by decreases of \$1,000,000 for one-time security upgrades identified in the Department of Justice assessment of vulnerability in U.S. Federal office buildings and funded in 1998, and \$991,000 for operating reductions.

HAZARDOUS WASTE MANAGEMENT

The safe disposal of hazardous waste is a challenge we must meet. We are now paying the cost of cleanups associated with environmental problems caused by past disposal at our facilities including primarily the activities of others on lands under the jurisdiction, custody, or control of USDA. Of some 38,000 abandoned and inactive mines, mainly on Forest Service lands, we currently estimate 1,700 could require environmental cleanup. Up to 120 inactive or abandoned landfills are closing or are undergoing evaluation for cleanup. In addition, there are USDA Commodity Credit Corporation leased grain storage facilities in communities throughout the mid-west where fumigants may have contaminated the ground water. USDA is investigating drinking water wells in these communities to determine whether actions need to be taken to ensure safe drinking water supplies. Kansas and Nebraska, the U.S. Environmental Protection Agency, and the Commodity Credit Corporation are currently working on 42 sites, and have identified an additional 30 sites that may need cleanup. The Department requests \$15,700,000 for the central Hazardous Waste Management Program under the Comprehensive Environmental Response Compensation and Liability Act and the Resource Conservation and Recovery Act. Funding from this appropriation is allocated to agencies based on priority needs and made available until expended. The funds will facilitate the cleanup of abandoned mines and landfills, identify and clean up drinking water sources, and support other

1141

agency cleanup efforts throughout the Department on a small fraction of sites needing action.

CONCLUSION

This concludes my statement, Mr. Chairman.

FARM CREDIT ADMINISTRATION

PREPARED STATEMENT OF MARSHA PYLE MARTIN, CHAIRMAN AND CHIEF EXECUTIVE OFFICER

Mr. Chairman, Members of the Subcommittee, I am Marsha Martin, Chairman of the Board and Chief Executive Officer of the Farm Credit Administration (FCA/Agency). I will highlight FCA's accomplishments during the past year, report briefly on the condition of the Farm Credit System, and present our fiscal year 1999 budget request.

MISSION OF THE FARM CREDIT ADMINISTRATION

The FCA is charged with a highly challenging, increasingly complex mission: to promote a safe and sound, competitive Farm Credit System (System) by creating an environment that enables System institutions to serve rural America as a dependable source of credit and financial services within the authorities established by Congress. We take this mission seriously, and it is one we take great pride in fulfilling. In support of this mission, we operate under a dynamic, and recently revitalized, strategic plan which focuses our efforts at accomplishing two major goals.

Our first major goal is to supervise risk in the System for the benefit of stakeholders.

Our second major goal is to maximize opportunities for the System to provide competitive and dependable services to agriculture and rural America.

Within our strategic plan we have developed several comprehensive objectives and specific actions, each crafted, and continuously refined, to ensure these goals are met. Embedded throughout our plan is our commitment to improve customer service, effect clear and candid communication, produce quality products, and ensure sound financial institutions thrive to better serve agriculture. This commitment is the foundation of my operating philosophy for the Agency, and, I hope, Mr. Chairman, our commitment comes through loud and clearly today in this proposal to fund the critically important job FCA performs in regulating the Farm Credit System.

FISCAL YEAR 1997 ACCOMPLISHMENTS

During fiscal year 1997, FCA continued to reduce costs, streamline operations, improve communication, and lessen regulatory burden. These successes reflect our efforts to improve operational efficiency and strengthen communication with our constituencies. I believe we continued to clearly demonstrate our commitment to effectiveness and cost efficiency this past year as we reduced Agency full-time equivalents (FTE's) from 361 to 319, established a new organizational structure and leadership team, reorganized several offices to better fulfill our mission, reduced a level of management by eliminating the regional offices within the Office of Examination (OE), and closed two field offices. We also continued to exercise effective controls over Agency spending, as our overall obligations were \$2.5 million less than budgeted for in fiscal year 1997.

I particularly am proud of the fact that we were able to accomplish significant improvement without compromising our ability to oversee the safety and soundness of System institutions. Meeting the needs of our customers, without compromising safety and soundness, will always be our central focus and our greatest challenge. This delicate balance requires regulatory approaches which we have become quite adept at accomplishing.

Mr. Chairman, if I may, let me briefly share with you some more specifics on our accomplishments during fiscal year 1997.

EXAMINATION PROCESS IMPROVEMENTS

We place a high priority on developing increasingly efficient and innovative examination programs that not only ensure our evaluation requirements are met, but also result in minimal disruption to the vital business activities of our customers. Our examinations are conducted according to risk-based examination principles

whereby we deploy resources based on the level of risk present in an institution's operation. This risk is continuously evaluated and proactively addressed. When appropriate, off-site examinations are conducted on lower risk institutions. Also, beginning with fiscal year 1997, we implemented an 18-month examination cycle for institutions that meet specific thresholds for asset size, operations and performance. Combined, off-site examinations and the 18-month examination cycle allow us to efficiently use Agency resources and concentrate our examination presence in higher risk institutions.

During fiscal year 1997, we further enhanced our electronic access to System information systems and developed a standard method to electronically warehouse critical examination and System information. These accomplishments resulted in greater efficiencies through the use of improved electronic workflow methods. Presently, we are developing a uniform methodology to identify and respond to deteriorating performance trends in System institutions. While we are confident we have accurately identified current risk, we must remain vigilant so we can respond vigorously, with timely and appropriate action, to any warning clouds looming on the horizon that could mushroom into a systemic problem.

ENHANCED COMMUNICATION

In an effort to further improve communication with our constituencies, the FCA Board continued to hold annual information meetings with board chairmen and chief executive officers of System institutions. These highly productive meetings provide an opportunity for essential two-way communication on important topics ranging from the Agency's internal operations to current regulatory issues. FCA Board members and executives also visited System institutions and other agricultural organizations to keep in touch with grass roots level issues. These contacts provide us additional insight into how to direct our operations in a more responsive, customer-oriented manner. Also last year, the Agency revised and reissued one of its widely utilized publications, *The Director's Role: Farm Credit System Institutions*. This publication is used by many System institutions as the cornerstone for their director training programs.

ANNUAL PERFORMANCE PLAN COMPLETED

Another major accomplishment this year was development of our first Annual Performance Plan in accordance with good business practices and the Government Performance and Results Act of 1993. Our plan depicts how the FCA will implement initiatives detailed in the strategic plan and includes specific performance criteria that communicate clearly what we intend to do and how we will measure the effectiveness of our performance. The plan identifies the following four key outcomes from Agency operations:

- Effective Risk Identification and Corrective Action;
- Effective Regulation and Public Policy;
- Effective and Efficient Agency Administration; and
- Effective External Relationships.

These outcomes link directly to the FCA's mission, functions, and strategic goals and provide a thorough and balanced system of performance measures to assess the Agency's ultimate effectiveness in ensuring the safe and sound operation of the System. The performance measurement system incorporates individual criteria for each FCA office that rolls up to support the overall Agency-level measures. This will ensure that the Agency as a whole is pulling together toward the same goals.

YEAR 2000 PREPAREDNESS

The most pervasive technological change that will take place over the next several years will involve the efforts of FCA and Farm Credit institutions to ensure computer systems correctly interpret dates associated with the Year 2000. While the parameters of the problem can be stated simply, its scope is vast, and fixing it may be enormously time consuming. Problems associated with Year 2000 preparations pose potentially serious safety and soundness concerns because there is zero tolerance for late delivery or project failure.

The Agency views Year 2000 preparations with great seriousness, and we have placed a high priority on remediation of the problem by requiring each System institution to develop an action plan that will ensure business continuity for critical systems when the next millennium begins. Presently, we are analyzing each System institution to accurately assess what degree of exposure exists as a result of the millennium date change. This assessment will enable us to identify high risk System institutions early enough so that appropriate corrective action can be implemented.

In respect to our internal operations, the FCA Board last month approved a plan that details how the Agency will assess Year 2000 potential problems, including a comprehensive process to become Year 2000 compliant. Over the past three years, we completed implementation of a network operating system that is warranted as Year 2000 compliant. Throughout the process, our programmers have taken the required steps to accommodate the millennium change for the custom applications that run on the new system. This year we will run the final tests needed to assure ourselves and others that systems and applications will transition to the next century without adverse impact on their availability, integrity, or confidentiality. We are confident that all our systems will pass the testing process.

CLIENT/SERVER MIGRATION IMPLEMENTED

We have moved aggressively toward full implementation of a client/server computer architecture as the foundation for applying technology to improve Agency operations. This technology permits easier access to, and use of, information needed to accomplish our mission. It will enable us to streamline the examination process, enhance efficiency and effectiveness, and share information more quickly among headquarters and field staff.

REGULATORY BURDEN MINIMIZED

The FCA Board has legal authority to establish policy and interpret the Farm Credit Act to ensure System institutions comply with the law and operate in a safe and sound manner. Our objective is to promulgate only those regulations needed to implement the law or achieve safety and soundness goals while minimizing regulatory burden on the institutions we regulate. Fiscal year 1997 was an active regulatory year for the Agency in which we clarified safety and soundness requirements in several areas. We also eliminated, or proposed for elimination, several Agency prior-approval requirements and deleted several obsolete regulatory provisions identified through public comment or internal Agency review. On a continuing basis, staff provide recommendations to address unnecessary policies, regulations, booklets, and other forms of guidance.

Currently, we are clarifying Agency requirements and expectations in the System's young, beginning, and small (YBS) farmer program. Available data indicates that the System provided nearly \$6 billion of credit to almost 113,000 farmers categorized as young, beginning, and small during 1996. This is about 13 percent of total System loan volume and about 19 percent of their total number of loans. While the numbers are impressive, as the complexities of farming multiply and the capital requirements to enter farming escalate, the Agency must ensure the System's commitment to fund the next generation of farmers does not falter. Presently, Agency staff are drafting a FCA Board policy statement on providing service to YBS farmers to enhance existing System programs and safely ensure credit is available. Additionally, we are reviewing the continued appropriateness of current definitions and will revise reporting requirements for the YBS farmer program to ensure reporting is consistent with how other financial entities report their data.

LAWSUIT DISMISSED

Recently, the Independent Bankers Association of America and the American Bankers Association lawsuit challenging the authority of the FCA Board to revise the 25-year-old rules under which System institutions make loans to eligible borrowers was dismissed by the United States District Court for the District of Columbia (Court). In dismissing the suit, the Court noted that the Agency had adopted the new customer regulations in a thoughtful, reasoned manner, taking care to consider the concerns of the affected parties during the notice and comment period. The customer rule, coupled with new capital standards we established for System institutions, may be our most significant accomplishments of the decade. Together, they ensure strong financial standards and a continuing, competitive source of credit for agriculture and rural America.

We are extremely disappointed that the bankers' associations decided to appeal the Court's ruling. We consider it unfortunate they have chosen to expend more resources to challenge such a strongly stated Court opinion on this matter.

CONDITION OF THE FARM CREDIT SYSTEM

FCA activities ensure System institutions exercise safe and sound banking practices and that they comply with the law and regulations. We are proud of our performance in carrying out the Agency's activities, and we are satisfied with the con-

tinued progress the System has made in strengthening its financial condition and improving its operational practices.

Mr. Chairman, I am pleased to report that the Farm Credit System continues to operate on a safe and sound basis with further improvement noted in all key financial and operational areas. During 1997, its earnings reached \$1.3 billion, a slight improvement above 1996 results. System capital increased to \$11.6 billion at the end of 1997 and represented 14.8 percent of total assets. Total capital was 14.1 percent of total assets at yearend 1996. The quality of System assets also continued to improve. Nonperforming assets decreased by \$115 million during the year and comprised only 1.4 percent of total loans and other property owned at the end of 1997. Overall loan volume climbed by \$2.3 billion during the year.

The strengthened financial condition of the System is further reflected by improved CAMEL ratings—the Agency's evaluation of an institution's capital, asset quality, management, earnings, and liquidity. With a number 1 being the best rating, the percentage of System institutions rated 3, 4, or 5 dropped from 26 percent at the end of 1993 to only 2 percent on December 31, 1997. The number of System institutions under enforcement action also declined substantially, from 49 at yearend 1993, to 5 at yearend 1997. These 5 institutions accounted for less than 4 percent of the System's total assets, as compared with nearly 40 percent of the System's total assets at yearend 1993.

FEDERAL AGRICULTURAL MORTGAGE CORPORATION

FCA has oversight responsibility for the Federal Agricultural Mortgage Corporation (Farmer Mac). After becoming profitable for the first time in 1996, Farmer Mac recorded a net profit of \$4.6 million for the year ended 1997. Farmer Mac also had a successful stock subscription, increasing its capital to nearly double the \$25 million required by law. Although these are encouraging signs, we recognize that additional growth in Farmer Mac's core business is needed for it to become a key factor in agricultural finance.

During 1997, FCA implemented provisions of the Farm Credit System Reform Act of 1996 (Reform Act) by approving final regulations to govern a Farmer Mac conservatorship or receivership and began work on risk-based capital standards, as required by the Reform Act. Also, in coordination with the Treasury Department, FCA monitors the operations and the financial condition of Farmer Mac and provides periodic and timely reports to Congress.

FISCAL YEAR 1999 BUDGET REQUEST

Mr. Chairman, we are very proud of our accomplishments as the safety and soundness regulator of the Farm Credit System and of our ability to contain costs while fulfilling our mission. I assure you, Mr. Chairman, during fiscal year 1999 we will continue with our commitment to effectiveness and cost-efficiency, and we will regularly review how further progress can be made in meeting this objective.

Mr. Chairman, before I present the budget request, I respectfully bring to the Committee's attention that FCA's administrative expenses are paid for by the Farm Credit System institutions FCA regulates. FCA does not receive a Federal appropriation, but instead is funded through annual assessments of System institutions. I would also point out that FCA has not requested a budget increase in the prior four years. In fiscal year 1995, our budget request remained the same as it was for 1994. In the three fiscal years following 1995, our budget request averaged a 5 percent reduction from each previous year for a total reduction of nearly 15 percent since 1995.

For fiscal year 1999, I propose a budget of \$35.8 million. This is a \$1.4 million increase, or about 4 percent, above the \$34.4 million requested for fiscal year 1998 operations. Most of the increase is for salary and benefits for the FCA staff. In addition, our plan calls for 7 additional examiners in the field.

Our fiscal year 1999 budget request supports a staffing level of 318 FTE's. This proposed staffing level will maintain a ratio of 4.3 staff per billion dollars of System average earning assets and give FCA the right mix of positions and skills to implement our strategic plan and accomplish the Agency's mission. Please note, Mr. Chairman, the proposed FTE level remains substantially below the Office of Management and Budget's established target of 408 FTE's by fiscal year 1999 for FCA, and represents nearly a 30 percent reduction from the 450 FTE's we were authorized for fiscal year 1993.

Mr. Chairman, we welcome any questions the Subcommittee might have.

NATIONAL APPEALS DIVISION

PREPARED STATEMENT OF NORMAN G. COOPER, DIRECTOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you to discuss the fiscal year 1999 budget request for the National Appeals Division.

INTRODUCTION

The National Appeals Division (NAD) was established by the Secretary's reorganization Act of 1994. The Act consolidated the appellate functions and staffs of several USDA agencies to provide for hearings of appeals from adverse agency decisions, and review of appeal determinations by a director. NAD appeals currently involve program decisions of the Farm Service Agency, Risk Management Agency, Natural Resources Conservation Service, Rural Business-Cooperative Service, Rural Housing Service, and Rural Utilities Service. NAD is headquartered in Alexandria, Virginia, and has regional offices located in Indianapolis, Indiana; Memphis, Tennessee; and Lakewood, Colorado. NAD's staff of 130 includes over seventy hearing officers nation-wide.

MISSION

Our mission is to correctly determine appeals arising from the program operations of assigned agencies. That is, our mission is to issue timely and accurate determinations that recognize the rights of program participants and promote the lawful operations of agency programs. Our mission supports the USDA Strategic Plan Goals 1.1, Enhance the economic safety net for farmers and ranchers, 1.3; Provide access to capital and credit to enhance the ability of rural communities to develop, grow, and invest in projects to expand economic opportunities and improve the quality of life for farm and rural residents; and 3.1, Promote sustainable production of food and fiber products while maintaining a quality environment and strong natural resource base.

FISCAL YEAR 1999 BUDGET REQUEST

NAD is requesting \$13,297,000 in direct appropriations for fiscal year 1999. This request represents an increase of \$1,579,000 over the fiscal year 1998 appropriation. The increase is comprised of \$271,000 for pay costs, \$24,000 for an increase in Agency contributions for employees covered under the Civil Retirement system, and the remainder for two initiatives. The first initiative is completing the development and implementation of a nationwide Management Information System (MIS) (\$695,000), which conforms to Year 2000 requirements and replaces a system which only supported the former FmHA National Appeals Staff operations. During fiscal year 1998, NAD began work on phase one of the MIS, which is the development and implementation of a case tracking system. This system is designed to provide information on all case activity such as the number of requests for a hearing, the type of case being adjudicated, length of time being adjudicated, and the disposition of appeal determinations on review. It is critical to NAD to be able to track an appeal as it proceeds because of legislative time frames. This one-time increase will provide the necessary funding for system development and training to complete phase two of the MIS, which is an administrative system. The administrative system is designed to provide information to aid management in accomplishing the goals and objectives stated within our Strategic and Annual Performance plans, and to enhance the delivery of NAD services to program participants. Reliable information on appeal rights, as well as public access to historical records of prior NAD decisions are service enhancements we intend to accomplish. The enhancements specifically impact farming communities, agribusiness, and the general public. The purpose of this initiative is to capture relevant financial and non-financial information for use in analyzing the efficiency, effectiveness, and results of NAD operations, and to disseminate information to the public regarding NAD's appeal process and how to participate in it.

The second initiative is for training (\$589,000). The operating environment for NAD is dynamic because of the wide range of programs subject to NAD adjudication, and the changes in such programs which give rise to new and complex issues. NAD hearing officers issue decisions arising from agency programs that include; administrative off-sets pursuant to the debt collection laws; drought and disaster assistance; farm ownership loans; home ownership; conservation reserve programs; emergency loans; environmental programs under the "swampbuster" law; production flexibility contracts; rural rental housing loans; and multi-family housing projects among others. In order to make fair and equitable determinations, NAD hearing and review officers must possess not only a broad, in-depth knowledge of many program areas, but be aware of USDA policies, administration, ethics, and civil rights. It is critical that NAD maintains a well trained work force because the decisions NAD issues directly affect the quality of life for farm communities and other rural areas as well as the nation's environment, and directly impact the operation of agency programs. Decisions that are factually accurate and complete, legally correct, and rendered in a timely manner provide results that enable appellants to fully and fairly participate in agricultural programs which are efficiently and effectively managed. Continuous training and development is essential to providing the public competent and fair service which recognizes the rights of program participants and promotes the lawful operation of USDA programs. We expect these initiatives to improve the quality of service provided to rural and farm communities throughout the United States, as well as our customers within the federal government from Congress, to agencies within USDA.

CONCLUSION

Our mission is statutorily specific, but it is filled with complex challenges arising out of changing laws and policies. The opportunity that NAD makes available to the public is an opportunity for a review of an adverse decision made by a USDA agency, before an impartial hearing officer, and if requested, the opportunity for a review of the hearing officer's decision. Simply put, if a participant in one of USDA's programs is denied benefits by a USDA agency, that person has the right to have the denial reviewed by an impartial hearing officer. Further, there is a right to have the hearing officer's decision reviewed by the Director of NAD. The appeals process in NAD is a cost effective service for program participants to have their adverse decision adjudicated in a timely manner without incurring a lengthy, costly judicial proceeding. The initiatives in NAD's fiscal year 1999 budget will ensure that NAD meets its mission requirements in a more efficient and effective manner. They provide the necessary groundwork for accomplishing USDA strategic goals as well as the goals and objectives outlined in NAD's strategic and annual performance plan. More importantly, these initiatives provide farmers, ranchers, cooperatives, agencies, and other groups with an avenue to a fair and equitable adjudicative process. More detailed information regarding these budget initiatives is contained within our Explanatory Statement. That concludes my statement, and I am looking forward to working with the Committee on the 1999 National Appeals Division budget.

OFFICE OF THE CHIEF ECONOMIST

PREPARED STATEMENT OF KEITH COLLINS, CHIEF ECONOMIST

This statement discusses the functions and fiscal year 1999 budget request of the Office of the Chief Economist.

OCE is a small staff of analysts located in Washington, D.C., although a weather office staffed by one person will begin operation during 1998 in Mississippi. OCE reports directly to the Secretary of Agriculture and has three primary missions: (1) provide economic analysis to executive branch and Congressional policy officials on alternative policies, programs and regulations; (2) serve as a focal point for the collection and reporting of economic and weather data, forecasts and projections related to agricultural commodities, and the performance of the agricultural economy; and (3) conduct statutory review and oversight responsibilities related to risk assessment and cost-benefit analysis of major USDA regulations. OCE also coordinates several activities that cut across USDA mission areas, including sustainable development and agricultural labor.

OCE has three functional units: the Immediate Office, the World Agricultural Outlook Board—WAOB, and the Office of Risk Assessment and Cost-Benefit Analysis—ORACBA. Recent activities and accomplishments in each of these three areas are briefly discussed.

IMMEDIATE OFFICE OF THE CHIEF ECONOMIST

The immediate office, with a staff of nine, directs a wide range of analysis related to policy, program and legislative proposals, and regulations. The focus is on only the most substantial, complex and controversial issues, usually at the request of the Secretary, other Administration officials, or members of Congress. The most important products are briefings, and briefing and analysis papers prepared on tight deadlines. These analyses generally focus on short- to medium-term effects, involve staff from other agencies, and apply the results of existing, basic economic research to specific policy issues. The immediate office staff is also responsible for regulatory review. A key role of the staff is to coordinate analyses among USDA agencies. Examples of key activities during the past year are:

Supporting agency program and policy decisions.—OCE works with other agencies to assess program options and guide effective Departmental decisionmaking with respect to key program provisions. For example, OCE participated in a task force convened by the Secretary to develop the rules and selection procedures for the Conservation Reserve Program as authorized by the 1996 Farm Bill. OCE has participated in the process to determine maximum permitted rental rates, evaluate bids, and assess the impacts of accepted acreage on commodity markets.

OCE has been deeply involved in coordinating analysis of a variety of dairy issues. OCE led USDA's monitoring effort on the Northeast Interstate Dairy Compact. OCE also chaired USDA's Interagency Dairy Analysis Team which coordinated the analysis of the Agricultural Marketing Service's proposed rule for Federal Milk Marketing Order consolidation and reform. This analysis led to significant changes in the options presented for public comment.

OCE continues to assist the Animal and Plant Health Inspection Service—APHIS—in verifying compensation claims for producers, handlers and others adversely affected by the Federal quarantine established for the eradication of Karnal Bunt.

OCE developed and analyzed models of the Standard Reinsurance Agreement (SRA) to assist the Risk Management Agency—RMA—in their 1998 SRA negotiations with the crop insurance industry. The models were used to analyze the budget implications and industry rates of return of various reinsurance proposals, including reinsurance for catastrophic and revenue products.

OCE coordinated Departmental analysis of the proposed settlement between tobacco companies and State Attorneys' General. The analysis examined the effects of the settlement on tobacco leaf production and producer income.

OCE continued to play a major role in the Department's efforts to understand and address structural issues. Follow-up activities continued with respect to the Secretary's Advisory Committee on Concentration in Agriculture, with a series of programmatic changes developed and expected to be announced during the first half of 1998. OCE participated in the advisory team that assisted the Grain Inspection, Packers and Stockyards Administration in its efforts to reorganize in order to more effectively conduct market review and investigations on uncompetitive practices and the effects of market structural changes.

Agricultural Market Analyses.—The 1997/98 marketing years for commodities have witnessed a continuing adjustment to the record and near-record prices for many commodities during the prior year. OCE briefed the Secretary many times on the market developments, including the large increase in meat supplies, low pork prices and lower-than-expected beef prices; the initial decline and then recovery in milk prices during 1997; and the large 1997-crop production increases and reduced prices, particularly for wheat.

OCE helped organize a Departmental team to assess the effects on agriculture and rural areas of the currency devaluations occurring during 1997 in southeast Asia and in South Korea. These analyses were used to keep the Secretary up to date and support USDA forecasts for total agricultural exports and commodity forecasts reported in the World Agricultural Supply and Demand Estimates report.

Testimony and Congressional Analyses.—During the past year, the staff responded to many Congressional requests for information or analysis. During fiscal year 1996 and early fiscal year 1997, OCE testified before Congress as the principal USDA hearing witness on the consequences of estate and capital gains taxes for producers and on price and income variability facing producers under the new farm bill. In late 1997, OCE also testified on economic outlook for agriculture. In addition, the Chief Economist frequently appeared before Congress with the Secretary, Deputy Secretary or others on issues ranging from the USDA budget, dairy issues, trade and climate change.

Special Studies.—OCE has coordinated a number of special studies bringing together analysts from various USDA agencies to ensure the best expertise addresses the issue. For example, since late 1997, OCE has increasingly coordinated the Department's response to requested information on the effects of global climate change. OCE represented the Department in the development of the National Ambient Air Quality Standards issues during 1997. OCE chairs the Capper-Volstead Committee which responds to requests related to permissible activities of cooperatives. OCE responded to many requests for rapid analysis of issues such as the effects of El Niño; the rail mergers and performance of the rail industry; monitoring of the Northeast Dairy Compact; and the dairy options pilot program.

OCE participates in the USDA working group on the 1999 World Trade Organization agricultural negotiations including preparation of analysis of U.S. objectives and approaches. OCE also represents the Department on the United Nations Methyl Bromide Task Force. OCE also participated in the proposal reviews for the Fund for Rural America and provides staff support to the Secretary's Special Assistant for Trade.

Regulatory Review and Clearance.—The immediate office staff reviews and clears regulatory impact analyses of USDA regulations. During fiscal year 1997, OCE reviewed and cleared approximately 40 significant or economically significant regulations. This process often involves assisting the regulating agency with identification of feasible alternatives and planning the economic analysis. Examples of rulemaking efforts this past year ranged from the Federal milk marketing order reform to organic certification, Argentine beef imports, the livestock disaster program, peanuts, tobacco, Karnal bunt and the WIC program.

Agricultural Labor.—OCE fulfills the statutory mandate to consult with the Attorney General and the Department of Labor—DOL—with respect to the H-2A temporary agricultural worker program. OCE also consults with DOL, the Environmental Protection Agency, and the Immigration and Naturalization Service on other issues affecting agricultural workers. OCE staff was active with the agricultural worker issues of USDA's Civil Rights Implementation Team and has been assisting a consortium of California organizations in developing a Welfare-To-Farm work initiative.

Sustainable Development.—OCE coordinates sustainable development activities within USDA. This is done chiefly through USDA's Council on Sustainable Development, chaired by the Director of Sustainable Development, which develops, coordinates, and integrates the principles of sustainable development into policies and programs across all mission areas of the Department. During the past year, the Council has focused on removing credit and crop insurance obstacles hindering use of sustainable development practices and identifying sustainable development re-

search needs. The Director advises the State Department, Foreign Agricultural Service—FAS—and others on sustainable development issues for negotiations, treaty formulation and implementation, and trade discussions. The Director led the USDA delegation to the meetings of the United Nations' Commission on Sustainable Development, which is now focusing on irrigated land resources for the year 2000 meetings. The Director participated with FAS in preparing for meetings on sustainability for the Summit of the Americas and development of the U.S. Action Plan on Food Security, the follow-up to the World Food Summit. The Director serves as liaison to the President's Council on Sustainable Development (PCSD) and helped organize the September 1997 meeting with the city of Tulsa, Oklahoma and the Kerr Center for Sustainable Agriculture, which dealt with water quality in the Tulsa watershed. The Director also serves with the PCSD's Metropolitan and Rural Strategies Task Force.

WORLD AGRICULTURAL OUTLOOK BOARD—WAOB

The WAOB prepares world agricultural and weather assessments and coordinates USDA's work related to agricultural outlook, projections, weather, and remote sensing. The Board, with a staff of twenty-five, issues a monthly publication known as the World Agricultural Supply and Demand Estimates report and oversees long-term USDA forecasts required for preparation of the Federal budget. The Board also operates and manages the Joint Agricultural Weather Facility—JAWF—in cooperation with the National Oceanic and Atmospheric Administration—NOAA, and is home to the Department's Chief Meteorologist. In addition, it provides technical assistance and coordination for USDA's remote sensing activities.

Coordinating USDA Economic Forecasts.—The WAOB plays a critical role in assuring that the Department's commodity information system responds to today's rapidly changing world. The Board's mission is to ensure that USDA's intelligence on domestic and foreign agricultural developments is timely, accurate, and objective, and to speed the flow of that information to producers, consumers, and policy makers.

One of WAOB's primary functions is to coordinate and review all USDA forecasts and analyses of foreign and domestic commodity supply and demand conditions. USDA's Interagency Commodity Estimates Committees are chaired by staff of the WAOB. The purpose of these committees is to assure that sound information from domestic and international sources is fully integrated into the analytical process and that USDA's economic forecasts are objective, thorough, and consistent. The committees, with representatives from the Economic Research Service, Farm Service Agency, Foreign Agricultural Service, Agricultural Marketing Service, and WAOB, are responsible for developing official estimates of supply, utilization, and prices and reviewing economic reports issued by USDA agencies. In fiscal year 1997, the Board reviewed and approved for release approximately 200 such reports.

Each month, the WAOB publishes the World Agricultural Supply and Demand Estimates (WASDE) report, which forecasts production, trade, utilization, prices, and stocks. Coverage includes U.S. and world grains, oilseeds, and cotton and U.S. livestock and poultry products and sugar. Release is simultaneous with the U.S. Crop Production report. WASDE is internationally viewed as a benchmark for agriculture and provides timely knowledge of world commodity markets that is increasingly critical to our export-led farm economy. Equally important, the WASDE report gives early warning of changing crop production and supply prospects in the United States and in other countries.

Oversight of Long-Term USDA Commodity Projections.—WAOB chairs the Department's Interagency Agricultural Projections Committee that oversees preparation of long-term projections for farm commodities, the U.S. agricultural economy, and world agricultural trade. The Economic Research Service has the lead role in preparation of the projections. WAOB's role is to ensure a strong multi-agency effort and sound analytical procedures for the projections. The projections are used for a variety of analytic and mandated functions of the Department, such as preparing the USDA portion of the President's budget. These "baseline" projections provide an objective, rigorous, and thorough view of the likely path of the farm sector over the long term.

The most recent set, Agricultural Baseline Projections to 2007, was publicly released in February 1998 at the Department's annual Agricultural Outlook Forum. The projections indicate that the economic crisis in Asia will have a limited negative impact on the longer term positive trends in world food consumption and agricultural trade. The projections also point to favorable long-term trends in U.S. farm prices and income.

The annual USDA Agricultural Outlook Forum, conducted under OCE's leadership, is a public meeting on farm, food, and trade prospects. To provide a stronger programmatic foundation for the Forum, the Chief Economist invited the Agricultural Marketing Service, Animal and Plant Health Inspection Service, Grain Inspection, Packers and Stockyards Administration, Natural Resources Conservation Service, and Risk Management Agency to participate as co-sponsors in 1998. Per-agency participation costs were reduced and the event is now enriched with expertise on risk management, marketing, grain inspection, plant and animal health, and soil and water conservation.

Outlook Forum 1998, the seventy-fourth annual meeting, took place in late February 1998. Attendance, topping 1,000, was the highest in recent years. The program featured a spectrum of issues affecting the future of agriculture, discussed from many vantage points. In addition to near-term and long-range agricultural prospects, topics ranged from new organic food standards to the impacts of biotechnology and environmental regulation. Speakers were drawn from farming, agribusiness, environmental groups, government, and academia. Extensive media coverage and posting of speeches on the Internet shortly after the Forum ensured the timely dissemination of information presented.

Monitoring Weather Impacts on Agriculture.—USDA places a high priority on incorporating weather-based assessments into all analyses. The focal point for this activity is the Joint Agricultural Weather Facility (JAWF). JAWF staff continually monitor global weather and assess its probable impact on agricultural output. JAWF briefings, reports, and special alerts are key inputs to the development of USDA crop yield estimates for both competitor and customer countries. JAWF weather assessments are made available to the public through the Weekly Weather and Crop Bulletin, the WAOB home page, and the news media.

During the 1996/97 winter and early spring months, unusually heavy snow cover raised concerns about U.S. spring planting conditions. JAWF staff cautioned that such conditions would not necessarily cause long planting delays by showing that 1969, an analog year, experienced a similar pre-season weather but turned out "normal." During the winter, high precipitation and flood potential in the Pacific Northwest and California were closely tracked. To assess the probable impact of a freeze episode which occurred in Mid-January, JAWF analysts assembled data from sources along the Gulf Coast and in southern Florida. These alternate sources were needed because of data losses associated with budget cuts at the National Weather Service.

The Chief Meteorologist and the JAWF staff briefed government officials and media on the agricultural impacts of spring floods in the upper Mississippi River basin. WAOB's Remote Sensing Coordinator obtained imagery of spring flooding along the Red River in North Dakota and Minnesota and along the Ohio and Mississippi River. Through an arrangement with the National Imagery and Mapping Agency and Radarsat, WAOB enabled the Natural Resources Conservation Service, Agricultural Research Service, Foreign Agricultural Service, Forest Service and National Agricultural Statistics Service to obtain a complete set of flood imagery for free, a substantial cost savings to the Department.

Disseminating USDA Numbers to the Public.—As commodity prices are affected less by Government programs and more by market forces, the need for objective and current market information is becoming especially critical. The WAOB recognizes the need for rapid information dissemination and strives to place the WASDE report Weekly Weather and Crop Bulletin in the hands of farmers and other users as quickly as possible. The goal is to provide simultaneous access at a minimum cost to all market participants.

During fiscal year 1997, WAOB began posting the market-sensitive World Agricultural Supply and Demand Estimates on its home page within minutes of release, replacing the Department's expiring Computerized Information Dissemination System (CIDS) as the locus of first release. Most of the Weekly Weather and Crop Bulletin also is posted each week.

WAOB continues to be a key participant in the management of the USDA Economics and Statistics System, a website for periodicals and data bases maintained by Cornell University. In 1997, this site was selected as a "Best Library-Related Web Site" by Library Hi Tech magazine. Free e-mail subscriptions to crop reports are a popular feature of the site. The number of e-mail subscriptions to the WASDE report continued to increase in fiscal year 1997. WAOB and other partner agencies met with Cornell University staff in December 1997 to plan future enhancements to the site.

Technical Cooperation with China.—As part of an agreement between China's State Statistical Bureau and USDA's Foreign Agricultural Service, WAOB took part in technical exchanges that are yielding important analytical benefits. China re-

quested USDA's assistance as the country prepared to execute a comprehensive agricultural census during 1997. A USDA team visited Beijing under leadership of the WAOB Chairperson to explain the Department's agricultural sampling techniques and present seminars on near-term and long-term agricultural prospects. In two return visits, Chinese analysts shared their first commodity balance sheets for rice and cotton, prepared with help from the WAOB. The balance sheets provided critical new data for evaluating USDA's estimates for China.

Understanding TCK Smut.—WAOB meteorologists continued to work with Agricultural Research Service scientists to develop a scientifically-based response to China's concerns that TCK smut from imported grain will spread dwarf bunt disease in China's winter wheat. USDA's position is that meteorological conditions in China will not support significant spread of the fungus.

Information Exchange with South Africa.—WAOB took part in an initiative with South Africa to share weather technologies and data. Getting better data from South Africa is important because of its role in world corn trade. A meteorologist of the WAOB's JAWF provided support at a Binational Commission ministerial meeting in Capetown. He also accompanied a team of South African scientists to observe Oklahoma's "Mesonet" weather data system, which is under consideration as an adaptable model for South Africa, and took part in a return visit to South Africa in February 1998.

Planning Assistance for Colombia.—At the invitation of the Government of Colombia and Institute for Inter-American Cooperation on Agriculture, WAOB participated in a two-day agricultural seminar in Cali, Colombia entitled, "Visions for Future and Long-Term Planning." The WAOB Chairperson presented USDA's long-term baseline projections to an audience of 250 Colombian agricultural leaders.

Restoring Farm Weather Data.—Recent termination of specialized agricultural weather services by the National Weather Service (NWS) has created a gap in weather data needed by agriculture. WAOB has been leading USDA efforts to revitalize plans for a National Agricultural Weather Information System, which was initially authorized in the 1990 Farm Bill. In fiscal year 1997, alternatives were developed to achieve cooperation with NWS and the private sector and link with existing local agricultural data collection networks.

Southeast Meteorological Position Established.—WAOB obtained approval to establish a meteorological position co-located at the Cooperative State Research, Education, and Extension Service site in Stoneville, Mississippi, recently vacated by the National Weather Service. The new position will be dedicated to collecting meteorological data in the Southeast and marks the first step in development of a USDA National Agricultural Weather Observing Network.

Interagency Initiatives.—WAOB's Chief Meteorologist represented the Department in a number of climatic activities, including liaison to the Office of the Federal Coordinator for Meteorology and the World Meteorological Organization. The Chief Meteorologist supported USDA's Deputy Secretary in his role as co-chair of the Western Drought Coordination Council, a cooperative project with the Western Governors Association. In fiscal year 1997, the Chief Meteorologist helped organize the Council's first meeting in Albuquerque, New Mexico.

The JAWF worked closely with the National Water and Climate Center of USDA's NRCS and with NOAA Regional Climate Centers on a Unified Climate Access Network to provide on-line access to weather and climate data from a variety of sources. At the request of the World Meteorological Organization, JAWF staff prepared a training course on agricultural data management procedures. Plans are afoot for JAWF staff to present the course to WMO member countries. JAWF has also begun to put updated sections of its popular handbook Major World Crop Areas and Climatic Profiles on the Internet, and is working with the U.N. Food and Agriculture Organization to develop an expanded CD-Rom version using geographic information system (GIS) technology.

Weather Data Receiver Upgraded.—The National Weather Service now requires recipients of its data, including the JAWF, to install compatible hardware and software or purchase NWS data elsewhere at substantially greater cost. The Office of the Chief Economist obtained Departmental approval to install a suitable receiving site in Kansas City, Missouri. Once operational, a customized stream of real-time meteorological data will be downloaded and made available to all USDA end-users, free of charge.

Remote Sensing Activities.—As the chair of the Department's Remote Sensing Coordination Committee (RSCC), WAOB coordinated revision of a draft Memorandum of Understanding between USDA and the National Aeronautics and Space Administration (NASA), which was signed by the Secretary in February 1998. WAOB arranged for more than 20 briefings of the RSCC on technical and space program issues. WAOB established a remote sensing web page to enable customers and cli-

ents to access all USDA remote sensing offices and selected imagery products. At present, WAOB is coordinating USDA inputs for a proposed NASA research announcement on agricultural remote sensing. Also, WAOB is coordinating a study being conducted by the Office of Science and Technology Policy to identify potential agency requirements for remote sensing data from commercial sources.

1890 Institution Partnership.—WAOB strengthened its relationship with the University of Maryland at the Eastern Shore (UMES), an 1890 institution. WAOB employed two UMES students as interns. One found permanent employment with a USDA statistical agency and the second worked on an application of GIS technology, a burgeoning field. WAOB conducted an agricultural career seminar for preregistered UMES students (high school seniors) to introduce them to the work of USDA and opportunities in agriculture.

OFFICE OF RISK ASSESSMENT AND COST-BENEFIT ANALYSES—ORACBA

The principal task of ORACBA, with a staff of five, is to promote effective and efficient USDA regulation of hazards to human health, human safety and the environment. This is accomplished by bringing science and management together in policy and regulatory development. By statute, ORACBA is required to ensure that the analysis supporting a major rule proposed by USDA includes a risk assessment and a cost-benefit analysis for mitigation measures that are performed consistently, and use reasonably obtainable and sound scientific, technical, economic, and other data. ORACBA serves as a focus in USDA for developing new methods and approaches to risk assessment for agriculture related hazards. To accomplish this, ORACBA works with USDA agencies in coordinating analyses supporting major regulations.

Supporting and Expanding USDA Risk Assessment Capabilities.—ORACBA programs for training, information resources, analytical support, and peer review are the primary means for integrating science-based risk assessment and regulatory impact analysis. For example, ORACBA sponsors two interagency work groups to coordinate these activities. One, for food safety issues, is the Interagency Food Risk Assessment Group (I-FRAG). The other, for ecological and conservation issues, is the Ecological Risk Assessment Work Group (ERAWG). Both groups are actively carrying out research on methods and application of methods to hazards managed by USDA. The groups include representatives for every pertinent USDA unit as well as members from other government agencies and industry associations.

ORACBA continues to sponsor monthly seminars, the Risk Forum, which brings in notable speakers for discussion of technical and scientific issues relating to food safety, human health and ecological risk assessment. The ORACBA Newsletter continues to provide an outlet for further discussion of risk assessment issues within USDA. Circulation for hard copies has reached 850; all newsletters available through the Internet.

ORACBA continues to support an interagency Fellowship program between USDA and FDA, sponsored through the American Association for the Advancement of Science. This expands our government ties to the research community to stimulate research in critical areas where USDA and FDA programs affect human health, safety, or the environment. Two scientists from the Agricultural Research Service work with ORACBA to assess food safety risks and examine risk assessment and management for USDA's conservation programs.

ORACBA has joined the Joint Institute for Food Safety and Nutrition (JIFSAN) in the development and establishment of a curriculum in risk analysis. The curriculum will be taught at JIFSAN as summer institutes, at University of Maryland for semester courses, and at the USDA Graduate School as short courses. Other colleges and universities will also have access to these materials, allowing them to offer courses on their own campus. Tuskegee University is working with USDA and JIFSAN in developing these course materials.

Conducting Reviews and Supporting Risk Assessments.—ORACBA has reviewed a number of risk assessments and related activities, both from within USDA and through its role in interdepartmental review. For example, ORACBA provided support and technical assistance to FSIS during the dioxin in chicken episode. ORACBA's input helped develop a policy which protected consumers while helping identify the dioxins as from a natural source. ORACBA has worked with the Animal and Plant Health Inspection Service to develop a policy for animal health regionalization regulations and will review all risk assessments for imports brought in under the rule. ORACBA has also advised on the recently proposed organic rule, the Animal Feeding Operation Strategy Working Group under the Vice President's Clean Water Action Plan, the President's Initiative on Fruit and Vegetable Safety, EPA's report to Congress on mercury in fish, and the interagency development of a plan to assess the risk of illness due to salmonella in eggs.

FISCAL YEAR 1999 BUDGET REQUEST

For fiscal year 1999, OCE is requesting \$6,173,000 in direct appropriations. This request represents a net increase of \$1,125,000 over the fiscal year 1998 adjusted base. The proposed budget includes an increase of \$131,000 for the annualization of the fiscal year 1998 pay raise and the anticipated fiscal year 1999 pay raise, an increase of \$32,000 for retirement costs, a decrease of \$38,000 to achieve the Streamlining Level in support of the President's Executive Order and \$1,000,000 are for the following items.

(1) *A net increase of \$219,000 for Modernization of Weather and Climate Data Acquisition.*—This consists of a decrease of \$525,000 included in the fiscal year 1998 budget for a one-time equipment purchase for NOAAPORT telecommunications equipment which was installed at a central USDA location to serve as a hub for interagency access to the National Weather Service (NWS) data and products. This was the first phase of a multi-year modernization initiative.

The increase items include an increase of \$410,000 and two staff years for the Modernization of Weather and Climate Data Acquisition. The expected outcome is expanded access for USDA to weather and climate data needed to accomplish USDA's administrative responsibilities and Congressional mandates related to the impact of weather and climate on agriculture and the national forests. The NWS is implementing a multi-billion dollar modernization and restructuring initiative which includes the adoption of state-of-the-art communications technologies. The collection, dissemination, and quality control of weather and climatic data will be accomplished on AWIPS/NOAAPORT equipment, which was installed during fiscal year 1998. The next phase of modernization will be to provide staffing and pre-Advanced Weather and Information Processing System (AWIPS) equipment at strategic sites. The increase will provide for the purchase of hardware and software necessary to fully implement operational sites, telecommunications and maintenance, as well as the hiring of two staff years. The staff will be tasked with managing the system, hardware and software, maintaining the integrity of the data network, and utilizing an AWIPS compatible Geographical Information System package to ensure near real time availability of the data at all operational sites. The acquisition of AWIPS technology will also provide USDA with a link to the Unified Climate Access Network (UCAN), an information delivery system which provides complete and efficient access to all weather data sources in the United States. Through UCAN, a wide variety of climate applications that are essential to USDA will become more readily accessible to weather and climate analysts in both the public and private sectors.

(2) *An increase of \$334,000 and four staff years for the National Agricultural Weather Observing Network (NAWON).*—As a result of the full implementation of NAWON, an infrastructure will be created to rapidly deliver local level weather and climate data for agricultural areas to public and private sector users. The data could then be used for a broad range of analytical purposes. NAWON will link different agricultural weather data collection networks already in existence, such as the NWS volunteer "Cooperative Observer" (COOP) network around the Nation; the State and university operated networks such as the Oklahoma Mesonet and the High Plains Automated Weather Station (AWS) Network; and the USDA operated networks such as the NRCS SNOTEL (SNOpack TELemetry) and FS RAWs (Remote Automated Weather Station) networks. Some new sites in major agricultural areas will also be established. The effort would be a full partnership between the Federal and State agencies, extension specialists, agricultural research scientists, university researchers and the private sector.

This is the second year of implementation of this initiative. The focus in fiscal year 1999 will be to reestablish access to data that has previously been collected through the COOP program and to establish new data collection sites in key agricultural areas. As part of the restructuring and modernization, NWS has announced plans to eliminate about three-fourths of the active 12,000 COOP sites. USDA staff will be placed in strategic locations around the Nation to assist state climatologists, Regional Climate Centers, and COOP observers in preserving an accurate and reliable network for agricultural weather data. Without access to basic weather and climate data for agricultural areas, the accuracy of their advisories and forecasts is compromised. In addition, both public and private sector analysis and decisions concerning agricultural commodity trade and markets, fire weather management, forest management, ecosystem conservation, assessments of crop conditions and yield potential, and responses to natural disasters affecting agriculture, all depend on the availability of this data.

(3) *An increase of \$255,000 and two staff years for support for the World Agricultural Outlook Board.*—This funding would be used to support two additional agricul-

tural economists. These analysts would be assigned lead responsibility for analyzing selected oilseeds and grains, while providing needed statistical and computer support to the senior analysts for these commodities. A primary mission of the World Agricultural Outlook Board (WAOB) is to produce the Department's highly market-sensitive World Agricultural Supply and Demand Estimates Report. The Board was designed to be a small staff, consisting of only 25 FTE's, including staff supporting all weather and climate activities. The commodity marketing analysis core of the Board is comprised of the Chairperson and six senior level agricultural economists, each of which chairs an Interagency Commodity Estimates Committee (ICEC) for a major commodity group, i.e., wheat and feed grains, rice, oilseeds, livestock, cotton, and specialty crops. The membership of each ICEC includes representatives from other USDA agencies which contribute relevant information and expertise to the analytical process. As originally conceived, the Board was to function primarily as a coordinating body with strong resident analytical capability.

As commodity expertise within the Department has eroded due to agency budget reductions and reallocations, the Board's role has gradually shifted from interagency coordination, as originally intended, to one of primary responsibility for the situation and outlook products released by the Department. Increasingly, industry requests for current market intelligence are being deflected to the Board from participating agencies. At the same time, support provided to the Board such as data collection, quality control, and data entry, have, in many cases, been withdrawn or curtailed by participating agencies. The ICEC chairpersons now have difficulties filling information voids and providing the in-depth analyses needed to generate the quality commodity situation and outlook assessments for which the Department is renowned worldwide. ICEC chairpersons are working under enormous pressure, and analytic underpinning of USDA forecasts is deteriorating. Four years ago, the Deputy Chairperson position was lost to downsizing and reorganization and the six senior level ICEC chairpersons function with no backup or in-house analytical or statistical support.

While numerous factors have caused agencies within the Department to cut support for commodity situation and outlook work, public and private sector demands for objective and unbiased analyses have increased sharply. With the passage of the 1996 Farm Bill, risks associated with agricultural enterprises have increased. Marketing alternatives to manage risk have become more, not less important. To serve its constituency, the Department must not abandon its long-standing tradition of providing the highest quality unbiased market information possible. However, at this time, the WAOB is barely able to maintain the current forecast and projection program and is not likely to be able to do so in the future without additional resources.

This initiative would help maintain OCE's capability of improving the U.S. agricultural economy by facilitating efficient price discovery in agricultural markets by coordinating the release of comprehensive, consistent, reliable, timely and objective USDA estimates, forecasts, and projections of commodity supply, demand, and prices.

(4) *An increase of \$78,000 to support a Risk Assessment Fellows Program.*—The Office of Risk Assessment and Cost-Benefit Analysis (ORACBA) undertakes a limited number of efforts to develop partnerships in agricultural risk analysis activities. Experience over the past years has proven one of the most valuable efforts to bringing outstanding young scientists to work at USDA for one year. During fiscal year 1998, ORACBA participated with the American Association for the Advancement of Science (AAAS) and the Food Safety and Inspection Service to fund a limited number of fellows who contributed importantly to food and animal risk analysis projects. During fiscal year 1999, an increase in risk analysis related to food safety and international trade in animal products is expected. The annual increase of \$78,000 would allow an additional fellow to participate in this young scientist's program and provide temporary assistance in addressing the risk analysis program needs. ORACBA would also conduct an outreach program with universities to promote risk analysis research in support of USDA program needs. This initiative supports the achievement of OCE's strategic goal to ensure regulations affecting the public are based on sound, objective and appropriate economic and risk analyses.

(5) *An increase of \$98,000 for ORACBA to support the President's Food Safety Initiative.*—The President's Food Safety Initiative cites six critical elements for a comprehensive and more effectively coordinated nationwide program to improve the safety of the food supply and, thereby reduce the possibility that consumers will suffer the adverse health and economic consequences of foodborne infections. One of these elements is the development of improved risk assessment methods for foodborne pathogens. Risk assessment methods help characterize risks to human health of foodborne hazards and help regulators make decisions to ensure effective

and efficient interventions for improving public health. This increase would fund activities in the Office of Risk Assessment and Cost Benefit Analysis to support the improvement of risk assessment methods for foodborne pathogens.

The first of these activities is Peer Review—review by independent scientists and risk assessors of key risk-based methods, programs, and activities for the purpose of making improvements. For example, a risk assessment model is currently under development in USDA through ORACBA's Interagency Food Risk Assessment Group (IFRAG) to consider microbial risks to beef products from farm to table. It is expected that this model will be widely useful in Government and industry for risk-based evaluation of procedures and processes important in beef production and processing. This model will become part of the risk assessment capability for the National Food Safety Initiative, as well as support efforts in international trade of food commodities. Another example concerns FSIS' use of risk analysis to revise the residue testing program. The program will develop a risk-based system for allocation of inspection and testing resources to assure the safety of red meat. Since the current USDA system for residue evaluation has been criticized by international trade groups, it is important that the system under development have peer review to assure adequacy of the proposed program to support domestic needs and export activities.

The increase would also be used to fund activities to develop greater expertise in risk assessment research related to food safety issues, and to assure trained and competent analysts are available to complete risk analyses, both within and outside USDA. Overall, these activities will benefit USDA food safety programs, help develop the analytical capabilities of USDA staff, and enlarge the number of trained professionals involved in food safety risk analysis. This budget initiative also supports the achievement of OCE's strategic goal to ensure regulations affecting the public are based on sound, objective, and appropriate economic and risk analyses.

(5) *An increase of \$350,000 for the Commission on 21st Century Production Agriculture.*—The Commission on 21st Century Production Agriculture authorized by the Federal Agricultural Improvement and Reform Act of 1996 (Farm Bill), was created to make farm program policy recommendations to Congress regarding future farm legislation beyond the year 2001. The Commission is comprised of three members appointed by the President and eight members appointed by the Chairmen of the Senate and House Agricultural Committees.

The Commission is to conduct a comprehensive review and assessment of the success of production flexibility contracts in supporting the viability of U.S. farming; assess the economic risks to farms delineated by size; assess the changes in farmland values as a result of the 1996 Farm Bill; assess the extent to which regulatory relief and tax relief for agricultural producers is implemented; and assess the effects of trade embargoes, international trade agreements and export programs on U.S. agriculture; assess the likely effect of transferring peanut quotas across State lines; assess the personnel and infrastructure requirements of the Department of Agriculture necessary to support the future relationship of the Federal Government with production agriculture and make specific legislative recommendations to the Congress in this regard.

OFFICE OF THE CHIEF FINANCIAL OFFICER

PREPARED STATEMENT OF SALLY THOMPSON, CHIEF FINANCIAL OFFICER

Mr. Chairman and members of the Subcommittee, it is a pleasure to appear before you today as we present the President's budget proposal for fiscal year 1999 for the Office of the Chief Financial Officer—OCFO—and the Department's Working Capital Fund. I would like to introduce Ted David, the Deputy Chief Financial Officer, Steve Dewhurst, the Department's Budget Officer, and Constance Gillam, my budget officer.

Mr. Chairman, the OCFO administers its programs and activities, as required by the CFO Act of 1990, and delegated by the Secretary of Agriculture, to provide financial management leadership and service to support program delivery in USDA. As important examples, we develop financial management systems policies that promote complete, reliable, timely and consistent information from financial systems; provide policy guidance and oversight of the Department's internal controls and management accountability programs, to ensure adequate controls over Department assets; coordinate implementation of the Government Performance and Results Act—Results Act—in USDA, including strategic planning and performance measurement; and provide budget support for Departmental Offices and the Office of the Secretary. In addition, the CFO is responsible for leadership of USDA's National Finance Center.

PROGRESS IN FINANCIAL MANAGEMENT IN USDA

I'd like to share with the Committee today the progress OCFO has made in strengthening financial management in USDA as well as our current plans for further improvements in financial management in USDA. Our plans are based on the following four major strategic goals for OCFO which have been identified in USDA's Strategic Plan:

- Ensure the provision of timely and reliable financial management information, advice, and counsel to support informed decision making by USDA policy and program personnel.
- Ensure accountability for assets and resources entrusted to the Department.
- Provide coordination, compliance, and monitoring services to USDA agencies for specified financial management and related legislation, regulations, and administration policy.
- Develop and maintain administrative and financial management information processing systems at the National Finance Center that are responsive to user and customer needs. It should be noted that this particular goal is financed through the Departmental Working Capital Fund but is under the direction and guidance of the Office the Chief Financial Officer.

We are committed to these Strategic Goals. Our Annual Performance Plan and budget request for fiscal year 1999, which are directly linked to these goals, are designed to ensure that USDA's policy and program officials have the financial information they need to deliver quality, low cost programs and services to the American public.

FINANCIAL MANAGEMENT INFORMATION ADVICE AND COUNSEL

In today's Government environment, unless policy and program officials have accurate, timely, reliable, consistent, and accessible financial information, they cannot adequately assess the effectiveness and efficiency of their programs, as required by the Government Performance and Results Act (GPRA) and by good management practice. In recognition of this need, OCFO has defined the need to provide quality information in a timely fashion as a major strategic goal and devoted significant resources toward its accomplishment.

As part of our Annual Performance Plan, we have identified four performance goals for fiscal year 1999 to achieve the strategic goal of providing financial management information and advice to policy and program officials. The first performance

goal is the continued implementation of the single integrated financial management information system to modernize financial systems through the multi-year Financial Information Systems Vision and Strategy (FISVIS) project.

We already have made significant progress in implementing FISVIS. For example, we have developed a single set of financial standards and definitions for USDA that are consistent with Governmentwide standards and requirements. This in itself is a major achievement considering several years ago there were different financial standards for each USDA agency, with a single account code having many different definitions. We are also progressing in implementing the Foundation Financial Information System (FFIS), using Commercial Off-the-Shelf software. Toward that end, we have converted the appropriation accounts of OCFO and three organizational units in the Forest Service to the FFIS system. We have also developed a tool kit that will simplify future implementations of smaller agencies to the new systems. Further, the Farm Service Agency is well on its way to implementing the new system. By fiscal year 1999, we plan to implement the remainder of the Forest Service. We will implement other USDA agencies beginning in fiscal year 2000 and plan for complete implementation by the beginning of fiscal year 2001. Of equal importance, we will ensure Year 2000 (Y2K) compliance for our financial systems long before the inevitable deadline of January 1, 2000.

While USDA has had major achievements in implementing our single integrated financial information system, our progress has not been as rapid as planned. We have encountered some of the difficulties inherent in the implementation of complex financial systems. We are working with the Chief Information Officer to assess current status and, if necessary, to modify our project approach. I believe, however, we are well on our way to implementing a new single integrated financial information system which will enable program policy and management personnel to fulfill their responsibilities.

As part of implementing the single integrated financial information system, OCFO is responsible for ensuring that other financial systems and the financial portions of the mixed systems developed by USDA agencies are in compliance with Departmental standards. We are also working with the Office of the Chief Information Officer to ensure that all financial systems in USDA will be Y2K compliant before we enter the new millennium.

Our second major performance goal is to achieve an unqualified opinion on USDA's financial statements. An unqualified opinion is required by legislation, such as the Government Management Reform Act. More importantly, an unqualified opinion on the financial statements provides assurance to our users and customers that the financial systems which underlie those financial statements are sound and generate consistent, reliable, and useful information. OCFO is continuing to make significant progress in achieving that goal. Implementation of FFIS is expected to be a key factor in our success. In addition, the Forest Service financial health project, upgrading of our credit reform accounting policies and improving the quality of information received from our State partners are all significant factors in our ability to achieve an unqualified opinion. Our strategic and performance plans call for achieving an unqualified opinion on USDA's fiscal year 1999 consolidated financial statements as verified by the OIG audit opinion which we will receive in fiscal year 2000.

A third performance goal is to fully implement cost accounting systems and methodologies in USDA. Accurate, reliable, consistent cost data at the lowest organizational level are essential for good financial management. We want to ensure that sound cost principles are applied consistently throughout USDA. With improved cost data, we can generate credible information on the cost of services, products, outputs, and outcomes as required by the Results Act as well as for day-to-day decision making. In fiscal year 1998, our consolidated financial statements will show the full costs of major USDA programs. In fiscal year 1999, cost accounting standards will be implemented at lower levels of the organization. In fiscal year 1999, USDA will meet the requirements of the CFO Act, to review all fees and other charges every 2 years for compliance with cost accounting and other standards by reviewing 50 percent of its fees, annually.

Our fourth performance goal is to provide financial management advice, counsel and technical expertise to USDA policy and program personnel. This is, perhaps, one of the most important services that we offer and one of the most difficult to measure. We have chosen to use customer satisfaction as our measure of performance. The timeliness and quality of the advice and assistance we provide will be assessed and validated by a customer service survey. The baseline will be established during fiscal year 1998. Action plans to improve performance will be implemented and incremental improvement achieved in fiscal year 1999 as validated by a follow-up survey.

ACCOUNTABILITY FOR ASSETS AND RESOURCES ENTRUSTED TO USDA

Our second strategic goal is to ensure accountability for assets and resources entrusted to USDA. The Department is responsible for approximately \$136 billion of taxpayer assets. It is critical that we demonstrate our accountability for those resources and that we are indeed good stewards of the public's funds.

Our first performance goal in demonstrating accountability is to achieve incremental progress on ensuring effective management controls throughout USDA and timely completion of corrective action plans. The adequacy of management controls is primarily determined by two processes: internal reviews by management as reported in the Federal Managers Fiscal Integrity Act (FMFIA) and audits by the Office of Inspector General. I am proud to report that for the first time in 7 years, USDA has provided reasonable assurance that, taken as a whole, the Department is in compliance with the management accountability and control provisions (Section 2) of FMFIA. We are still not able to report compliance with the financial systems provisions of the Act (Section 4); however, our current efforts to improve our financial systems will enable us to achieve such conformance.

During fiscal year 1999, we will focus on the remaining corrective actions for Section 2 material weaknesses and resolve the Section 4 nonconformances. Our performance goal is to achieve full compliance with FMFIA for fiscal year 1999.

Our second accountability performance goal is to publish an Accountability Report for fiscal year 1999. The new Accountability Report will combine into one document the FMFIA Report, the Secretary's Management Report to Congress, the consolidated financial statements, the Prompt Pay Report, and others, so that Congress may get an overall view of accountability for those assets entrusted to the Department. We plan to issue our first Accountability Report for fiscal year 1999.

In addition, as part of this strategic goal, we plan to improve the quality of the budget and related services which we provide to Working Capital Fund activities and to client agencies. These services assist client agencies in determining and justifying resource needs, allocating resources, and reporting on the utilization of those resources. In fiscal year 1999, we will continue to improve the timeliness, accuracy, responsiveness and reliability of these services, including implementation of new tools and techniques to improve the efficiency and effectiveness of our operations.

DEPARTMENTWIDE POLICY AND OVERSIGHT

OCFO's third strategic goal is to provide coordination, compliance, and monitoring services to USDA agencies for specified financial management and related legislation, regulations, and administration policy. In this role, OCFO establishes departmentwide policies, provides expert advice, coordinates systems development, and monitors agency performance to ensure that policies are implemented in accordance in Department and Governmentwide requirements. These policy and oversight services enable us to ensure compliance with the GPRA, the Debt Collection Improvement Act (DCIA), the Cash Management Improvement Act (CMIA), Prompt Pay Legislation, Credit Reform Act, and other legislation. In addition, OCFO provides similar services for other fiscal requirements, including travel policy, federal assistance, asset management, and other fiscal matters.

During fiscal year 1999, we will continue to provide expert assistance, consultation, and oversight in these areas; however, we will accord a high priority to the following activities:

Government Performance and Results Act.—Fiscal year 1999 is the first year for which Annual Performance Plans are "in effect" for all USDA agencies and the first year for which an Annual Performance Report is required. OCFO will assist agencies in identifying and developing performance information, develop the form of the Performance Report itself and prepare the Performance Report. While the Report will be for fiscal year 1999, by law it is to be submitted by March 2000. In addition, we will continue to provide technical assistance and support to USDA agencies, as they institutionalize strategic and performance planning in their organizations.

Debt Collection Improvement Act.—During fiscal year 1998, significant portions of DCIA will be implemented, including those portions relating to administrative offset and cross-servicing. During fiscal year 1999 we will continue offset and cross-servicing activities and implement the requirements for electronic funds transfer (EFT) which are to be put in place by January 1, 1999. Other aspects of the Act will be implemented based on Treasury guidance. We will also monitor agency achievement of delinquent debt reduction goals and, as with GPRA, continue to provide technical assistance to USDA agencies on overall improvement of our credit programs.

Implementation of new credit card programs.—In early fiscal 1999 the General Services Administration will put into effect new credit card programs available to USDA and other Federal agencies. These new programs provide significant flexibil-

ity to USDA to use one or more of the vendors on the approved list. We will work with USDA agencies to implement that combination of credit card programs which is most advantageous for USDA program officials.

New travel systems.—We will, with USDA agencies, begin to develop a new travel system, taking advantage of new legislation and advanced technology.

Other.—USDA agencies have identified specific goals for reduction in delinquent debts, on-time payment under the Prompt Payment Act, use of advanced methods for payments and cash collections and other operating performance indicators. We will monitor achievement of those goals as well.

Since much of the guidance, coordination, and oversight is provided through consultation with USDA officials on travel, grants, cash, debt, and other fiscal policies, we will strive to improve the quality and timeliness of our service and will measure the success of our efforts through use of customer surveys.

FISCAL YEAR 1999 BUDGET REQUEST

Our fiscal year 1999 budget request of \$4,562,000 is an increase of \$279,000 and 2 staff years over our fiscal year 1998 appropriation. The increase covers additional personnel costs of \$123,000 for pay costs and \$35,000 for the Civil Service Retirement System. The remaining \$121,000 and 2 staff years are needed to develop cost-related performance information. This increase supports two of our strategic goals financial management information, advice and counsel, and Departmentwide policy and oversight with specific focus on implementing GPRA. We will provide leadership throughout USDA to develop cost management systems and information and to identify suitable cost-related measures to be used to measure the cost of achieving mission areas' and agencies' strategic and performance goals.

WORKING CAPITAL FUND—NATIONAL FINANCE CENTER

Mr. Chairman, I would like to conclude with a brief overview of our major initiative for the largest activity financed by the Working Capital Fund the National Finance Center. While the Fund finances 22 activities, most of those are managed by the Assistant Secretary for Administration and Chief Information Officer. They can speak in greater detail about their WCF-funded activities. Since the NFC is under my administration, I will focus my comments on NFC initiatives.

During fiscal year 1998, one of the major activities at the National Finance Center is to assure that all of our systems are compliant with Year 2000 requirements. Thus, we are devoting significant effort this year to modify and test computer systems code. In the process, we are eliminating a number of computer programs which are no longer necessary and are renovating those systems which will be used in the new millennium. Our current plan is to renovate all code in fiscal year 1998 and to continue our testing throughout fiscal year 1998 and early fiscal year 1999. NFC will be Y2K compliant on or before the target date established by the Office of Management and Budget and the USDA Chief Information Officer.

We have allocated significant NFC resources to assure that we can achieve Y2K compliance, as we continue to modernize and upgrade some of our major systems in fiscal year 1998 and fiscal year 1999. The objectives of these modernization efforts are to reduce the cost of NFC services to our client agencies and to reduce the costs of administrative activities by our client agencies. These modernization efforts include:

- The implementation of the Foundation Financial Information System (FFIS) discussed previously, an integral part of the Department's ability to provide financial information to program and policy personnel.
- Modernization and enhancements to the payroll system. This will reduce the costs of NFC services and enable our client agencies to reduce their costs of processing personnel and payroll actions.
- The implementation of a new purchase card management system which will significantly reduce the costs of small purchases of our customer agencies.
- Ongoing efforts to develop a procurement management system, working closely with the Assistant Secretary for Administration and the procurement community. Continued compliance with the technical infrastructure requirements of the Chief Information Officer.
- Achievement of Level 2 of the Capability Maturity Model which will enable us to develop systems more effectively and efficiently.
- Implementation of methods to reduce the volume of paper sent to our clients so as to reduce NFC and client costs.

In addition, we are continuing to actively market NFC services to other Federal agencies. We continue to obtain new clients, particularly for the payroll/personnel

system, for example, the Capitol Police—Senate—and we anticipate that our modernized systems will result in additional cross service business.

NFC cannot achieve these ambitious goals without the participation and support of our customer agencies inside and outside USDA. That support comes with an obligation to us to reduce costs wherever the opportunity presents itself. An example will illustrate the point. As I mentioned, we are devoting significant effort to assuring that our systems are Y2K compliant. To do this, we have not asked for additional resources from our client agencies. Instead we have reallocated resources within the Center to ensure that Y2K costs are absorbed within the resources available to NFC. This means we have suspended certain of our maintenance activities and that some agency specific requests for work cannot be accommodated this year. Given the similar difficulties our agency partners are experiencing in achieving Y2K compliance, we believe that our customers understand our strategy and appreciate our efforts to hold down costs. We will continue to ensure that cost increases are fully justified and that agencies are informed of increases and involved in decisions that affect their budgets.

Mr. Chairman, the National Finance Center has become a benchmark against which other providers of financial and administrative services are measured. The initiatives identified here today will enable NFC to continue to serve as a benchmark well into the future.

I appreciate the opportunity to meet with you this afternoon and will be pleased to answer any questions the committee has.

BIOGRAPHICAL SKETCH

SALLY THOMPSON

Sally Thompson served as the State Treasurer of Kansas. First elected in 1990, Thompson won reelection in 1994. Thompson resigned as State Treasurer to become the Chief Financial Officer for the U.S. Department of Agriculture. As Treasurer, Thompson managed a staff of 54 employees with an annual budget of more than \$90 million. During her tenure as State Treasurer, Thompson initiated a complete overhaul of the agency, which consisted of a \$5 billion municipal bond portfolio and cash management services of \$11 billion annually.

Thompson's efforts to reform the State's investment laws have earned Kansas \$700 million in interest income since 1992. Thompson served on the Pooled Money Investment Board (PMIB), the entity that directs the State's investment policies. Thompson also developed the Municipal Investment Pool, an investment alternative for local governmental entities that has earned participants more than \$150 million combined in interest income since 1993. In addition, Thompson updated the State's unclaimed property laws, returning \$13 million in unclaimed property to its rightful owners. The program includes the Kansas Cash Connection, a portable computer database that contains more than 300,000 records of unclaimed property. Thompson also served as a trustee on the Kansas Public Employees Retirement System Board (KPERS) and was a member of the Surety Bonds and Insurance Committee.

Active in treasury issues at the National level, Thompson served as Secretary/Treasurer of the National Association of State Treasurers. She is a past chair of the National State Debt Management Network and served as treasurer of the Midwest Association of State Treasurers as well as a member of the Executive Committee for the Council of State Governments.

Before entering public life, Thompson spent 20 years in the private sector. Thompson served as President and Chief Operating Officer of Shawnee Federal Savings in Topeka. Prior to that position, she worked as Vice President of Business Planning and Development for the United Banks of Denver. A certified public accountant, Thompson began her career as a financial manager at Touche Ross, a multinational accounting firm.

Thompson combined her professional experiences with community involvement. She has served on the boards of the Topeka YWCA, Everywoman's Resource Center, Downtown Topeka and the Topeka Chamber of Commerce. Thompson also graduated from the Leadership Kansas, Leadership Topeka and the Council of State Governments' Toll Fellowship programs.

Thompson graduated magna cum laude from the University of Colorado, Boulder, with a bachelors degree in business, accounting and finance. A nontraditional college student, Thompson graduated at the age of 35. She has three children and three grandchildren. A longtime Topeka resident, she now resides in Arlington, Virginia.

OFFICE OF THE CHIEF INFORMATION OFFICER

PREPARED STATEMENT OF ANNE F. THOMSON REED, CHIEF INFORMATION OFFICER

INTRODUCTION

Mr. Chairman, Senator Bumpers, members of the Subcommittee: thank you for inviting me here today. I will submit my testimony for the record and also offer a few remarks.

I am honored to have been chosen by Secretary Glickman to serve as Chief Information Officer of USDA, and to lead the Department's efforts in implementing, developing and maintaining applications of new technologies which will cut waste, serve USDA's customers more efficiently, and open new opportunities for farmers, families, and rural communities.

I am proud to work for Secretary Glickman whose leadership and commitment has transformed USDA into a vibrant, vital force for the American people and their communities. With the strong bi-partisan support and cooperation of the Congress, USDA is stronger, abler, leaner and more cohesive, which will better serve our nation.

Though USDA has turned the corner on a new path of efficiency and quality program delivery, we still face many challenges, such as assuring Year 2000 compliance and in the area of implementing new technologies. We recognize that these challenges come at a time when the federal government has fewer and fewer resources. And we realize that creativity, innovation, and hard work are needed to assure that we stretch every dollar in our budget.

President Clinton has laid out a balanced budget plan that works to aid families, strengthen education, and promote the expansion of economic opportunities, which is welcomed news for all Americans. The benefits of a balanced budget will show themselves in continued economic growth and prosperity. A strong national economy is critical to a strong farm economy and critical to the mission of USDA. Secretary Glickman has worked long and hard with the White House to lay out a vision for USDA, and the President's budget seeks to fund and promote these priorities: Expanding opportunities for family farmers and rural communities; Making a major commitment to food safety and to fighting hunger in America; Providing wide stewardship of our natural resources; and Protecting the integrity of USDA programs.

Within each of these priorities lies the need for the expanded use and integration of new technological applications, whether it be faster program delivery to small farmers, new PC's and Internet access for rural grade schools, computerized testing to assure food safety, or new telecommunications vehicles and further system integration which create greater long-term savings and efficiencies for USDA. Implementing new information technology will turn these visions into reality.

USDA INFORMATION TECHNOLOGY BUDGET HIGHLIGHTS

The 1999 total budget request for information technology at the Department is \$1.2 billion. This includes the Department and all of its agencies. This total includes approximately \$327 million for acquisitions, including equipment and software; \$236 million for commercial support services for operations and maintenance; \$31 million for supplies; \$447 million for inter-governmental payments, such as grants to states and FTS 2000 services; \$280 million in personnel costs; and \$75 million in other services, including non-FTS 2000 voice and data communications. Offsetting these costs are collections from non-USDA agencies of approximately \$146 million.

By targeting our efforts to promote these priorities, it is our hope that all USDA customers and employees will benefit. I look forward to working closely with you and your staffs on this task in the days to come. Let me begin to discuss our challenges in more detail.

SYSTEMS INTEGRATION

The Department is making real headway in its efforts to integrate systems and expand the application of new technologies. Over the past year, USDA has reduced

the unnecessary paperwork burden on the public by 30 percent, exceeding the President's goal of 25 percent; more than 40 percent of USDA's 1,320 mission critical systems are already Year 2000 compliant and the remaining systems are projected to be completed by no later than March 1999; and USDA won three Government Technology Achievement Awards. This past year saw the National Resources Conservation Service's (NRCS) flood management system, Rural Housing Services' (RHS) Dedicated Loan Origination and Servicing System, and the Agricultural Research Service's (ARS) computerized irrigation system all come away with this prestigious recognition.

In addition, other USDA infrastructure investments in 1999 include an estimated \$27 million to ensure that every USDA system and application is year 2000 compliant. A proposed \$67 million for the Common Computer Environment (CCE), a USDA Service Center Implementation project, will provide a single computing platform for USDA's Service Centers, which deliver farm and housing loans, conservation assistance, and other programs in America's rural communities. Also, the Forest Service seeks to invest \$143 million in Project 615, a continuing effort which provides geographic information, telecommunications, and hardware and software infrastructure in support of program delivery throughout the country. The Animal & Plant Health Inspection Service's Integrated Systems Acquisition Project (ISAP) will provide a common electronic mail system allowing for a more efficient communications environment. ISAP implementation is underway or planned for key APHIS science centers, regional and field offices. The fiscal year 1999 planned investment is \$6.7 million.

Other USDA agency proposed technology expenditures include \$8.1 million for the Dedicated Loan Origination and Servicing System, a Rural Development program which provides centralized escrow and servicing of housing loans made by USDA in rural communities. Approximately \$14.3 million has been requested by the Food Safety & Inspection Service for information technology to facilitate the implementation of the Pathogen Reduction/Hazard Analysis and Critical Control Point System (HACCP)—a science based food safety system, and to support field restructuring.

OFFICE OF THE CHIEF INFORMATION OFFICER BUDGET REQUEST

This proposed funding for OCIO will facilitate continuing efforts to integrate USDA technological programs and services, and assure that USDA Information Technology (IT) resources are expended wisely. The fiscal year 1999 Office of the Chief Information Officer budget request totals \$7,222,000, an increase of \$1,671,000 and 6 staff-years over the 1998 level of \$5,551,000.

Within this increase, \$500,000 and 6 staff-years are requested to support Information Technology Capital Planning and Investment Control programs. The Clinger-Cohen Act of 1996 and the Office of Management and Budget Circular A-11 Part 3 require USDA to intensify its review and analysis of information technology systems as capital assets. Numerous internal (IG) and external (GAO) audits and studies in recent years have found the Department's Information Technology management and acquisition systems to be lacking, and criticized the deployment of these IT assets. There is a clear and critical need for a centralized, Departmentwide approach to capital planning and investment control for USDA's IT assets. The Secretary and I have responded with a moratorium on IT acquisitions and begun to build the decision making structures, policies, and support systems for a USDA IT Capital Planning process. An Executive Information Technology Investment Review Board (EITIRB) was established in 1996, and efforts are underway to support this Board, but much more needs to be done from both a policy and a practical aspect to provide needed information to the Board on capital planning, life-cycle cost analyses, and risk assessment for IT investments. Work has begun in this area with two efforts underway to accomplish the development of a model capital planning and investment control (CPIC) process and a case study of how a USDA agency uses the model to document and operate the process. This effort is jointly funded with the Department of Energy and the National Performance Review. After the results of the study and the model are determined, the tools developed as part of the model will be made available to the agencies.

The design and implementation of a USDA-wide capital planning and investment control program and supporting automated information system is a multi-year effort requiring an infusion of resources to OCIO for a permanent, ongoing program management staff. As the process is used across USDA, skilled staff will be needed to perform and review benefit-cost, return on investment, and other detailed analyses in order to reduce as far as practicable the risk of failure in the development, deployment, and operation of USDA information technology systems. The necessary skills are beyond those of current staff and will be of particular importance in pro-

viding support to the EITIRB. Revised management processes need to be established, training on the use of the planning and tracking tools for CPIC provided, and project management systems set up to report accurate cost, schedule and performance data. The resources requested will allow us to successfully carry out the process.

The greatest portion of the 1999 funding increase is \$1,000,000 for continued development of the USDA Technical Architecture, including technical standards, business data, and telecommunications, and for contractor expertise for the Department's Earned Value Management System to track and account for the cost, schedule, and performance of information technology projects, and to provide valid, timely audit data for management. Contractor expertise is required to assess the completeness of the USDA Information System Technical Architecture (ISTA) against accepted industry standards, which takes into account the multiple layers of an information systems architecture, including basic scope and purpose, enterprise or business model (design of the business and how its entities and processes interact), system model (the data elements and functions that represent the business entities and processes for the information system), the technology model (the adaptation of the system model to detailed technologies), and the detailed description of the system. The ISTA model will provide a framework for USDA agencies to migrate their existing technology base to the new architecture, resulting in an increased level of interoperability and data sharing. The architecture is the vehicle for applications used by one agency to interoperate with applications used by another agency. OCIO needs contractor skills and modeling capabilities to achieve this important work. It will cost less to manage and operate under this single ISTA than it will for each agency to manage their own unique component.

Development and use of an Earned Value Management System (EVMS) will improve the management of information technology projects in terms of cost, schedule, and performance. The Earned Value Management concept requires the integration of a program or project's technical, cost, and scheduling requirements into a comprehensive performance management baseline against which progress is assessed. EVMS analyzes the added, earned value that IT resource investments bring to program delivery and provides a common framework for communicating program status to managers for informed decision-making. EVMS will improve accounting for IT projects expenditures, fostering better management decision-making on the investment of the Department's IT resources and will correct a material weakness in many USDA control systems. EVMS will improve management of information technology project scheduling, prevent cost overruns and slippages, and generate performance data needed to support the CPIC process. My office needs contractor expertise to benefit from the contractor's often first hand experience with other agencies and firms' best practices. Provision of these resources will strengthen our ability and flexibility to meet USDA's IT challenges successfully and without costly failures.

CIO PLAN OF ACTION

The appropriate application of information technology is critical to the Department's ability to deliver programs and services to the public. We have invested many resources in technology to improve government accountability and to transform program delivery through the use of modern business practices. Secretary Glickman has challenged the Department to significantly strengthen our corporate management of technology so that information can be more readily shared across organizational lines, assuring that investment decisions are based on sound business principles.

This plan of action is firmly based on the requirements of the Clinger-Cohen Act coupled with the business needs of USDA to improve service to our customers. The Act has guided our actions through the capital planning and investment control process. This pathway directed our portfolio investment policies and the creation of a technology architecture over the past year. Our plans may initially appear ambitious, but they are necessary, and USDA is up to the task of applying these management principles to all IT capital investments.

Today, we are building on the foundation which we have worked arduously to create. The activities of my office are structured around five critical objectives:

- Assure that mission-critical systems are Year 2000 compliant;
- Implement a single information technology infrastructure and supporting organization for the Farm and Foreign Agricultural Services agencies, the Rural Development agencies, and the Natural Resources Conservation Service;
- Improve the Department-wide management of telecommunications;

- Develop policies and procedures for implementing the provisions of the Clinger-Cohen Act through strengthening the capital planning process, instituting an information technology program review and evaluation strategy, refining the enterprise-wide architecture, providing for business process reengineering and developing work force planning capacity; and
 - Build a strong management team and develop strategies for improving the corporate management of USDA's information infrastructure.
- These objectives support the Department's strategic plan for information technology, establish clear milestones for achievement, and identify responsible parties.

YEAR 2000 STRATEGY

The Department is taking a strong management approach to effectively respond to the challenges of Year 2000 remediation. USDA has begun implementation of a strategy to assure that the Department's systems and operations are compliant. The Department is also working to raise awareness in the communities which we serve, to assure that they do not suffer prolonged interruption in services or incur hazards to public health and safety. During the past year USDA has:

- Made OCIO, in particular the Year 2000 Program Executive and myself, responsible for planning, oversight, and evaluation of the USDA's efforts to achieve Year 2000 compliance. The Under and Assistant Secretaries and Agency Directors have been given the programmatic, budgetary, managerial, and technical responsibility for ensuring that USDA's mission-critical systems nationwide are Year 2000 compliant by March 1999 in their respective areas.
- Appointed a senior executive in each agency area to address the Year 2000 issue. For purposes of Year 2000 remediation, this designee reports directly to the Agency Administrator, and is charged with establishing a Year 2000 project team. In order to establish accountability, Year 2000 remediation is a critical element in the performance standards of the executive sponsors.
- Issued a procurement moratorium requiring CIO approval of any IT procurement over \$25,000. Under this moratorium, purchases will only be approved on an emergency basis or when the acquisition is directly related to Year 2000 remediation. I have sole signatory authority under the moratorium, which will remain in place throughout fiscal years 1998 and 1999 to assure that the Year 2000 is the Department's information technology priority.

OCIO has begun to reach out to USDA customers—corporations, farmers, nonprofits, and rural communities—to increase awareness about the need to address the integrity of their technological applications in regards to the Year 2000 problem.

- I was an active participant in agricultural industry forums that have addressed the Year 2000 issue and have discussed compliance issues with agricultural manufacturers.
- USDA initiated an effort to raise Year 2000 awareness across rural America. The OCIO, REE, FSA, and RD mission areas are increasing their contact with partners and constituents in the state and local sector, including the National Association of Counties, the National Governors Association, and the National Association of State Universities and Land Grant Colleges.
- I have actively participated in government-wide initiatives to work with the states on Year 2000 compliance.

The OCIO has identified more than 8,000 external data exchanges with states and other entities. Approximately 95 percent of the exchanges have been assessed for Year 2000 compliance with 58 percent already compliant. In addition, USDA has undertaken a comprehensive inventory of all network and telecommunications equipment and software. More than 3,700 network routers have been specifically identified, and several hundred will require software upgrades in order to be Year 2000 compliant.

The Department currently estimates the total cost of becoming Year 2000 compliant to be \$120 million. This includes costs beginning in fiscal year 1996 and continuing through the Year 2000.

ADMINISTRATIVE CONVERGENCE/SERVICE CENTER IMPLEMENTATION

Over the past several years, we have been addressing the difficult challenge of modernizing and streamlining delivery of program services at the county level. The consolidation and collocation of the county offices is nearing completion. By the end of this year, we will have reduced the number of county office locations from 3,700 to fewer than 2,600 USDA Service Centers. The Secretary's vision is that any USDA customer of the county based agencies, FSA, NRCS, RD, can go to any USDA Service Center to conduct business. Furthermore, the continued implementation of mod-

ern integrated technology will allow many customers to do some business from their homes.

The first phase of modernizing the technology infrastructure is the deployment of an integrated telecommunications system for both voice and data. This system will link these agencies within the Service Centers as well as with other offices, thereby enabling the sharing of equipment and information as we achieve a Common Computing Environment (CCE). Deployment of the telecommunications systems will be completed by the end of the year.

Interagency Business Process Reengineering initiatives are moving forward to define improved and more integrated ways of delivering USDA programs to customers. The results of these efforts provide the framework and requirements for technology improvements. We are initially testing these business and technology improvements in a laboratory environment, then moving to field pilots, beginning in April. We anticipate beginning the acquisition of parts of the technology infrastructure in late fiscal year 1998 and continuing with acquisition and deployment of the new infrastructure over the next four years.

A related initiative is the decision to consolidate administrative and information technology staffs of the county based agencies into one unit as part of the Secretary's administrative convergence strategy. These consolidations will bring about immediate efficiencies and savings that will rapidly increase as we build and deploy our integrated technology systems and dispose of our legacy systems.

My office has oversight responsibility; however, direct responsibility for managing Service Center initiatives rests with the Agency Administrators. Last year, I established an oversight unit with Senior Executive leadership to manage this responsibility. This staff works continuously with the agencies, Service Center Implementation Team, and other policy officials to facilitate and monitor progress on these initiatives. Outside, independent resources are also used regularly to identify the need for modifications and for mid-course corrections. Through these efforts, and the moratorium, USDA has dramatically changed its approach to managing modernization efforts.

TELECOMMUNICATIONS

In the last year, I have taken significant steps to change telecommunications management practices at USDA. When reviewing the process previously used to order telecommunications equipment, I learned that 300 people had procurement authority and many had not been adequately trained. Furthermore, there were not adequate mechanisms to allow for the sharing of information and resources.

Today, only 17 people have authority to order equipment. They receive training quarterly, and they have access to a database of information that allows for more efficient decision-making. Through these and a series of specific cost reduction initiatives, we have saved several million dollars over the past year.

Now, USDA is continuing to focus its efforts on establishing a telecommunications environment which optimizes improvements in mission performance while minimizing program operational costs. USDA is doing so through three major initiatives: The Telecommunications Enterprise Network, the Telecommunications Ordering, Billing and Inventory System (TOBI), and a comprehensive review and update of telecommunications and security policies. The Telecommunications Enterprise Network will eliminate further proliferation of agency private, wide-area data networks, and capitalizes immediately on savings from efficiencies. Measures are in-place today which permit USDA to stabilize its current telecommunications environment. A key example is the establishment and certification of Telecommunications Mission Area Control Officers who manage mission area and agency needs centrally while identifying and implementing planning which optimizes consolidation and cost avoidance opportunities from a broader corporate perspective. The Network plan will also allow for a national infrastructure to be constructed and managed under the authority of the USDA CIO, as a corporate enterprise asset allowing greater planning and system integration between the various USDA agencies significantly reducing costs and speeding program delivery.

The TOBI system integrates the recently reengineered administrative processes with an automated management information system, allowing for greater control and accounting of USDA telecommunications acquisitions.

The third major telecommunications initiative encompasses a comprehensive review and update of the existing telecommunications and security policies. Policy development and implementation are imperative to ensure that the Department moves in a uniform direction, standards are applied consistently, information and resource sharing opportunities are maximized, and cost reductions are realized. Policy revisions are needed to address the changing environment resulting from enactment of

the Clinger-Cohen Act, the proliferation of new technologies such as Internet and Intranets, and the increasing number of network security threats. A strong security program is our first line of defense against increased threats and vulnerabilities. My staff has greatly increased coordination on security efforts with all USDA agencies—sharing information and raising awareness at all working levels.

CLINGER-COHEN COMPLIANCE

CAPITAL PLANNING AND INVESTMENT CONTROLS

New processes have been implemented for approving capital investments in IT. USDA adopted procedures recommended in the OMB Capital Programming Guide. The Executive Information Technology Investment Review Board met to review and endorse the fiscal years 1998–99 investment portfolio. As we move forward, we will strengthen the analytical support provided to these senior policy decisions. My office established a capital planning and investment control (CPIC) process for implementing the Clinger-Cohen Act. Concurrently with this process development, we are participating in a joint development effort with the Department of Energy and the National Performance Review to implement an information system which will assist us in this management. This project is named the Information Technology Investment Portfolio System (I-TIPS). I-TIPS will provide USDA managers with ready and shared access to a variety of up-to-date information about individual IT initiatives as well as their entire IT investment portfolio. I-TIPS is a World-Wide-Web application that requires only an Internet connection and a browser to access.

I am happy to report that there is wide interest for I-TIPS in the federal community, with many agencies already committed to I-TIPS installations including: Energy, Justice, Labor, and HUD. Both the General Accounting Office and the Office of Management and Budget have reviewed I-TIPS and firmly support its use as a management tool to help agencies monitor their IT investments. USDA plans to use this system this budget year for our analysis of agency IT investment initiatives and Department level decision-making for our entire IT portfolio.

INDEPENDENT VERIFICATION AND VALIDATION EFFORTS (IV & V)

My office embarked on an independent verification and validation program in 1996. We recognize that non-partisan analyses and observations are needed at various points in the life cycle of a program to identify deficiencies before systems are built. Our IV&V program targets major information technology initiatives and has several objectives: Assess the quality of plans and management strategies; assess how well systems address customer needs; and verify that every system is well-designed and meets all USDA specifications.

Several IV&V tasks already completed include the review of the management and plans for the installation of telecommunications facilities in the field service centers, analysis of the technical alternatives and business case for the future computing environment at the service centers, an analysis of the Department's developing information technology architecture, and an analysis of the requirements of the Department-wide financial information system.

We expect to continue to employ the IV&V concept as part of our IT management strategy. Unlike in the past, we want to make sure that all future technology expansion is part of a cohesive and integrated planning process. We want to ensure that it works right the first time, and that USDA and the American taxpayer get what was paid for.

INFORMATION SYSTEMS ARCHITECTURE

A rapidly changing information intense environment demands new approaches, particularly in the way the Department deploys technology to meet its business information needs. USDA recognizes that effectiveness can be achieved and economies gained through coalescence of business activities and information technology resources. Under my leadership, USDA has developed the Information Systems Technical Architecture (ISTA) to meet these immediate and future needs. The ISTA will be one of the mechanisms used to strategically manage information and information technology resources at USDA. The ISTA will evolve through continuous assessment of USDA's business needs, modern management practices, and technology advancements.

As I indicated earlier, the USDA ISTA was reviewed by an outside contractor under the IV&V Program to evaluate the existing ISTA against an accepted architecture methodology and make recommendations regarding the integration, implementation, and management of the architecture. While the IV&V findings were generally positive regarding USDA's first effort, there are several recommendations

that we will incorporate. My office is currently examining the plan to ensure that USDA is taking a highly pragmatic and cost-effective approach to architecture design and implementation. In this regard, OCIO will leverage existing agency projects by identifying best practices in the various architectural components. We will also establish a configuration management board, standards criteria, and a program management staff. The ISTA is linked to the Capital Planning and Investment Control process and is a required input for the selection phase and for the implementation of the Information Technology Investment Portfolio System (I-TIPS).

USDA TECHNOLOGICAL WORK FORCE

As this Committee is all too aware, current Bureau of Labor Statistics' projections show a major shortage of information technology workers in the fields of computer engineering, computer sciences and computer programming. We have anecdotal evidence that this is becoming a problem at USDA. We have many talented individuals, and that is well known to the corporate sector.

To address this work force crisis, I have recently designated a staff member to oversee USDA's IT workforce planning and development efforts. I am also working within USDA and in conjunction with the CIO Council to develop recruitment and retention strategies to ensure that USDA's information technology systems are competently managed and operated in the years to come.

CIO MANAGEMENT STRATEGIES

Every successful organization has strong and effective leadership at its highest levels. With the continued support of Secretary Glickman and Deputy Secretary Rominger over the past year, great strides have been made toward building a competent management team within my office, and a credible, business-like information technology program for the Department. One of my earliest appointments was a Senior Executive to provide oversight of Service Center Implementation activities. In May 1997, a Deputy CIO was named to create a strong management focus on all USDA IT matters. The executive team includes an Associate CIO for Policy, the Director of the NITC, and a Senior Policy Advisor for Year 2000 remediation. A search will soon begin for a telecommunications executive to fill a recent vacancy. Each of these executives has demonstrated an understanding of USDA business and customer service requirements and the role of information technology in supporting these requirements. All have demonstrated their leadership, energy, communications, and technical skills.

As the team evolved, we have been unified in our vision and focus for managing USDA's information technology resources from a corporate perspective. My in-house expertise has been further leveraged through the development of strong partnerships with USDA agency Chief Information Officers and counterparts in other federal organizations. Recognizing that we face common goals of increasing performance while meeting the challenges of reduced staffs, shrinking budgets, and greater time constraints, these partnerships have demonstrated synergy in developing new approaches and solutions to shared problems.

In addition, through benchmarking and other opportunities, I have sought the advice of corporate CIO's who manage large and complex organizations. This advice has proved instrumental as we have established new IT governance strategies.

Also as part of OCIO's management strategies implementation process, we recently completed the development of our comprehensive reorganization plan, of disparate USDA IT elements, into a strong corporate program agency to meet the challenge of providing the right mix for leadership and program delivery for USDA information technology.

FISCAL YEAR 1998 MANAGEMENT INVESTMENT STRATEGY

Deputy Secretary Rominger issued the USDA IT investments moratorium on November 12, 1996. The initial purpose of the moratorium was to restrict USDA agencies from purchasing IT resources until improvements were fully implemented which control our management of IT resources. To assure that agencies focused on correcting Year 2000 issues before initiating new IT projects, the moratorium rules were revised to apply to any IT acquisitions of over \$25,000. Agencies now receive a moratorium waiver from my office only for true emergencies and Year 2000 remediation actions.

Through the moratorium, the Department has been able to ensure that USDA agencies are focusing on the Year 2000 problem and carefully evaluating their IT needs in conjunction with their partner agencies, allowing for more coordination and cooperation.

CONCLUDING REMARKS

As with most other CIO's, my top priority for the coming year is Year 2000. In addition to priorities associated with Service Center/Administrative Convergence, Clinger-Cohen implementation, and telecommunications, there are significant issues to address with legacy systems, security, inter-operability, electronic commerce, management of change, skilled labor shortages, and exploding technology. There is a growing awareness that improved corporate management of USDA's information infrastructures can only occur when leadership and the right mix of business, management, and technical skills are present. With my current team in place, I believe I am positioned at the highest level of my organization to meet current and future challenges.

The historic balanced budget which President Clinton has introduced provides a framework to meet the many technology challenges that we face, in a way that is good for USDA and good for America. Over the past year, USDA has made great strides in righting past wrongs and redirecting our technological goals. Aside from our internal systems usage, USDA has taken technology to deliver our programs to the public—quicker and more efficiently. We instituted the HACCP program to make food safer for America's families. The Electronic Bid Entry System (EBES) is creating more business opportunities for the commodities industry and our nation's businesses. The USDA telemedicine loan and grants programs are bringing the latest medical innovations into rural communities across the nation. And the Forest Service, through Project 615, is using technology to improve our stewardship of America's precious natural resources and public lands.

There is still more to accomplish—more challenges ahead of us. And we must stay focused on addressing these challenges. We must continue to take action on reconciling our internal Year 2000 problems, while at the same time reaching out to our broad constituencies in rural America and the agriculture industry to make them aware of the threat to their systems and their health and safety. We must address the IT work force shortage, to ensure that USDA will have the expertise in the future to continue to deliver services and address the needs of both the Department's staff and the public. And most importantly, we must continue to work together to prove to the American people that we can meet these challenges in a creative, competent, common-sense manner.

Over the past year, I have had the privilege of working with this sub-committee in a positive way to meet these challenges. I look forward to working with all of you in the months to come to build on this relationship and meet our mutual needs and objectives as we head into a new century. I expect to be able to report tangible results on these initiatives at next year's hearings. Thank you.

OFFICE OF COMMUNICATIONS

PREPARED STATEMENT OF TOM AMONTREE, DIRECTOR OF COMMUNICATIONS

Mr. Chairman and members of the Subcommittee, I am pleased to discuss the fiscal year 1999 request for the Department of Agriculture's Office of Communications—OC.

When in 1862, Congress wrote the law establishing what is now the U.S. Department of Agriculture, it said the Department's "general designs and duties shall be to acquire and to diffuse among the people of the United States useful information on subjects connected with agriculture in the most general and comprehensive sense of the word." The Office of Communications coordinates the implementation of that original mandate.

The Office of Communications coordinates communications with the public about USDA's programs, functions, and initiatives, providing information to the customers and constituency groups who depend on the Department's services for their well-being. It also coordinates the communications activities of USDA's seven mission areas, and provides leadership for communications within the Department to USDA's employees.

In keeping with President Clinton's balanced budget plan, this office continues to streamline its operations. For fiscal year 1999, we will have 120 staff years, 30 less than in fiscal year 1993. At the same time, we are adopting new technologies to meet the increased demands for information. Using the Internet's world wide web, radio, television and teleconference facilities, we are able to ensure that the millions of Americans whose lives are affected by USDA's programs receive the latest and most complete information.

The Office of Communications' 5-year strategic plan includes the following goals:

- Increase the general public's awareness of USDA policies, programs and initiatives, with particular attention to reaching traditionally underserved communities.
- Using the latest and most efficient communications technology, methods and standards, improve access to and distribution of USDA information to news media, constituent groups, and individual customers.
- Improve communications with USDA employees by leading and coordinating internal USDA communications.
- Continue development of an efficient and effective results-oriented, public affairs community within USDA that provides high-quality customer service.
- Foster civil rights and diversity throughout USDA's public affairs community and its communications products and services.

To accomplish these goals, we will continue to take an active part in policy and program management discussions, coordinating the public communication of USDA initiatives. We will continue to provide centralized operations for the production, review, and distribution of USDA messages to its customers and the general public, and we will monitor and evaluate the results of these communications.

The Office of Communications will continue to acquire and instruct staff in using the most effective and efficient communications technology, methods, and standards in carrying out communications plans.

The Department values its employees as good Government "ambassadors" who need to be kept informed. The Office of Communications intends to improve communications with USDA employees, especially those away from headquarters. We will help employees understand USDA's general goals and policy priorities, to become more familiar with USDA programs and services, and to understand initiatives, especially cross-cutting ones, and how they relate to each employee's specific job duties.

OC is also working hard to ensure compliance with Government Performance and Results Act. We will be working to update USDA regulations and guidelines for communications; conducting regular training sessions for USDA communications staffs about using communication technologies and processes to enhance public service; fostering accountability for communications management performance through-

out USDA; and continuing to work to create a more efficient, effective and centralized Office of Communications.

The Office of Communications will also provide equal opportunity for employment and promote an atmosphere that values individual differences. We will continue to provide equal opportunity for contracting goods and services. We will increase availability of USDA information for underserved communities and geographic areas to ensure equal opportunity in USDA's outreach efforts, and will continue to develop universally accessible information products.

FISCAL YEAR 1999 BUDGET REQUEST

The Office of Communications is requesting a budget of \$8,319,000. This is a net increase of \$181,000 over our fiscal year 1998 current estimate. The net increase covers additional personnel costs of \$195,000 for pay costs, and \$51,000 for the Civil Service Retirement System; a decrease of \$100,000 based on the approval of two buyouts; and an increase of \$35,000 for an initiative to improve communications to underserved groups. This effort is directly related to OC's Strategic Plan management initiative to improve efforts to reach groups that are working with small and limited resource producers in underserved communities and geographic areas, and to improve their understanding of USDA programs and initiatives. It would also increase awareness among USDA stakeholders and consumers about such important issues as food safety.

This concludes my statement, Mr. Chairman. I will be pleased to respond to any questions.

OFFICE OF THE GENERAL COUNSEL

PREPARED STATEMENT OF CHARLES R. RAWLS, ACTING GENERAL COUNSEL

INTRODUCTION

Mr. Chairman and members of the Subcommittee, I am pleased to have this opportunity to present our fiscal year 1999 budget request and to also provide you with an overview of our agency to include some of the current activities and issues facing the Department.

MISSION

The Office of the General Counsel (OGC) is the law office for the Department. As an independent, central agency within the Department, OGC provides all legal services necessary to support the programs and activities of USDA. OGC provides legal advice and services to the Secretary of Agriculture and other officials of the Department of Agriculture with respect to all USDA programs and activities.

ORGANIZATION

OGC's services are provided through 12 Divisions in Washington and 18 field locations. The headquarters for OGC is located in Washington, D.C. The Office is directed by a General Counsel, a Deputy General Counsel, six Associate General Counsels, and a Director for Administration and Resource Management. The attorneys located in headquarters are generally grouped in relation to the agency or agencies served. Our field structure consists of five regional offices, each headed by a Regional Attorney, and 13 branch offices. The field offices typically provide legal services to USDA officials in regional, State, or local offices.

Our full staffing levels are approximately 242 attorneys and 108 support staff, including 17 paralegals, in the Washington, D.C. headquarters and field locations. Approximately half of our personnel are located in the field.

FISCAL YEAR 1999 BUDGET REQUEST

For fiscal year 1999, OGC is requesting \$30,446,000 in direct appropriations. This request represents an increase of \$1,922,000 over the fiscal year 1998 appropriation. Of this amount, \$683,000 is for the anticipated pay raise, which is needed to maintain staff so that existing levels of mission efforts may continue. OGC is requesting \$219,000 to cover the increase in Federal agency contributions for employees covered under the Civil Service Retirement System.

OGC has made substantial improvements in the automated data processing (ADP) computing environment, upgrading both its hardware and software as well as making substantial improvements to the OGC communication network. In order to continue to implement a centralized work tracking system for correspondence, document and opinion archiving, as well as database management for a variety of OGC work items, an increase of \$100,000 is necessary.

OGC is also requesting an increase of \$250,000 to support and maintain current staffing needs because the demand for legal services by agencies within USDA has not diminished. This increase will enable OGC to meet its strategic objective of providing effective legal services in a timely and responsive manner to support USDA activities.

Also included in this request, is an increase of \$670,000, which includes a \$235,000 supplemental (\$470,000 on an annualized basis) for civil rights. In accordance with the recommendation of the USDA Civil Rights Action Team (CRAT), a separate Civil Rights Division in OGC was established, headed by an Associate General Counsel, reporting directly to me. For the Associate General Counsel for Civil Rights and CRD to be effective in effectuating their mission, additional resources are sorely needed. The additional funding requested for the Civil Rights Division will ensure that the Department can meet its civil rights reform goals without limiting OGC in other important mission areas. The new Division must expand on with

the work performed last year by the General Law Division—assisting in carrying out the CRAT recommendations, reviewing program discrimination cases, and assisting the Office of Civil Rights in processing decisions in civil rights complaints brought by USDA customers and employees. With the high priority placed by the Secretary on ensuring that the civil rights laws are vigorously enforced, the Civil Rights Division will be working side-by-side with the Office of Civil Rights, and the rest of the Department, to make sure that this key objective is met.

CURRENT ACTIVITIES AND ISSUES

There are several areas of our current work that I would like to highlight to demonstrate how OGC serves the Department. During the past year, OGC has supported the activities of the Foreign Agricultural Service (FAS) in numerous areas. Pursuit of the benefits and enforcement of the commitments of the Uruguay Round Agreements on Agriculture and on the Application of Sanitary and Phytosanitary Measures (SPS Agreement) continues to be of paramount concern to FAS and OGC.

Accordingly, OGC played a leading role in the victory of the United States in the World Trade Organization (WTO) dispute on the European Union's (EU) import ban on meat produced with the use of growth-promotant hormones. During the EU appeal of the initial panel result, OGC played an instrumental role in formulating and coordinating the United States strategy and submissions. The WTO Appellate Body ruled in favor of the United States, finding the ban not consistent with the EU's obligations under the SPS Agreement. OGC will continue active involvement in the development and application of the effort necessary to compel the EU to fulfill its international obligations.

WTO litigation is increasingly a priority area for OGC. The United States has recently invoked the dispute settlement process within the WTO in several agricultural matters, and OGC has played a leading role in all of them:

- (1) Philippines—Administration of tariff-rate quotas for pork and poultry meat. The efforts of OGC were a significant factor in the development of a Memorandum of Understanding with the Philippines that is expected to lead to significantly improved access in that market for U.S. pork and poultry meat exports;
- (2) Japan—Requirements to re-establish the efficacy of quarantine treatments for pests on a varietal basis. This issue is of particular importance to apple, nectarine, cherry, walnut, and other stone fruit exports;
- (3) Canada—Access for U.S. fluid milk and cream and Canadian export subsidies through application of milk class price-pooling; and
- (4) European Communities—Export subsidies on processed cheese manufactured under inward-processing arrangements.

In efforts to realize the benefits of the Uruguay Round Agreements other than through litigation, during the past year the United States and the EU resolved many of the difficult outstanding issues that had precluded an equivalency agreement on veterinary inspection matters. Due in large part to the efforts of OGC, the text of the agreement has now been finalized, but a few implementation issues remain. OGC will continue to be actively involved in the effort to achieve a signed agreement.

OGC also has provided valuable drafting assistance in connection with the ongoing negotiation of a veterinary biologics annex to the recently concluded Mutual Recognition Agreement between the United States and the EU. Agreement on a veterinary biologics annex would allow the United States and the EU to accept imports of veterinary biologics from one another on the basis of a mutual recognition of the efficacy of one another's regulatory systems.

After two years of negotiations in which the United States played a significant role, the United Nations Food and Agriculture Organization Conference adopted a revised text of the International Plant Protection Convention (IPPC). A primary objective of the revisions was to strengthen the ability of the IPPC members to develop phytosanitary standards as envisioned in the SPS Agreement. OGC was a principal participant in the review of iterations of draft text and other documents and also participated in the interagency group. These efforts ultimately led to United States support of adoption of the revised text.

OGC also continues its active involvement in other FAS program areas. OGC continues to provide extensive legal advice in the rejuvenated export credit guarantee program, as well as in the development of the supplier credit guarantee program, the facilities guarantee program, and the emerging markets program. During this past year, OGC has also become more actively and directly involved in efforts to reduce the necessity and enhance collection of admiralty claims arising from damaged or distressed cargo shipped in connection with title III of Public Law 83-480.

Attorneys from OGC have provided significant assistance with respect to commodity, disaster and conservation programs. Implementation of the provisions of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act) authorizing Production Flexibility Contracts (PFC) has resulted in numerous requests for OGC assistance to resolve such issues as those involving the division of program payments between landowners and tenants and the succession-in-interest by new owners and tenants to existing program contracts. In addition to routine requests for assistance, implementation of the peanut poundage quota provisions of the 1996 Act has resulted in the filing of two major lawsuits against the Government.

The administration of the revised Conservation Reserve Program (CRP) required a major devotion of OGC resources to develop new CRP regulations and contracts as a result of the enactment of the 1996 Act. These efforts included: the resolution of unintended conflicts between PFC provisions of the 1996 Act, the CRP provisions of the Food Security Act of 1985, and the tobacco and peanut program provisions of the Agricultural Act of 1938 in a manner that provided enhanced opportunities for participation in the CRP by tobacco and peanut producers without remedial legislation; development of agreements for administration of the Conservation Reserve Enhancement Program portion of CRP, including the drafting of the agreement between the State of Maryland and the Commodity Credit Corporation concerning the protection of the Chesapeake Bay; and the provision of daily assistance on CRP matters as a result of the conduct of the 15th and 16th CRP enrollments which involve several hundred thousand contracts and approximately 24 million acres.

OGC attorneys have been working with the Office of the United States Attorney for the Eastern District of North Carolina, the Farm Service Agency (FSA) and the Office of Inspector General (OIG) to bring approximately 40 criminal cases, 40 civil false claim cases, and numerous administrative cases as the result of an extensive OIG investigation of the 1990-1992 activities of more than 100 tobacco warehouse operators and dealers in North Carolina.

Working with FSA officials, OGC attorneys provided expeditious assistance in the development of the various livestock emergency feed assistance programs implemented as a result of severe winter blizzard conditions. Similarly, OGC attorneys were significantly involved in the development of program regulations for the Tree Assistance Program and the Livestock Indemnity Programs authorized by Congress in 1997.

OGC attorneys are substantially involved in providing legal services related to the continuing changes in the Department's crop insurance program, especially the review of private insurance company initiatives including crop revenue coverage; nonprocurement suspension and debarment issues; the development of new crop insurance programs and amendments to old ones. OGC has been particularly involved in the development of the risk management education initiative and the Dairy Option Pilot Program.

The enactment of welfare reform legislation in 1996 has continued to raise many legal issues. The implementation of the alien provisions and the provisions restricting the eligibility of persons convicted of trading in controlled substances generated substantial Constitutional challenges. OGC attorneys are also working closely with the Food and Nutrition Service (FNS) in connection with the implementation of the Debt Collection Act of 1996 and to enhance food stamp program efficiency and integrity through implementation of electronic benefit transfer systems. Debarment and suspension activities continue with OGC attorneys assisting FNS in taking actions to protect the federal government and the public with respect to over 200 dairy companies and individuals convicted of bid rigging on school milk contracts.

In trade practices, we are continuing to give assistance and counsel to the Secretary on issues of concentration in agriculture and the continuing response of the Department to recommendations of the Advisory Committee on Agricultural Concentration. We are continuing to pursue administrative enforcement against the nation's largest packer on allegations that the packer gave an undue or unreasonable preference to certain feedlots in the procurement of cattle, and that case is now before the Department's Judicial Officer for decision. We are working with agency personnel on a number of investigations into procurement and other trade practices in areas of production where there are high levels of concentration, and on investigations and enforcement actions involving allegations of false or misleading statements or representations in the marketing of agricultural products.

The last year has been an especially busy year for OGC as it relates to work for the food safety mission area. We dedicated substantial resources to the Food Safety and Inspection Service (FSIS) in connection with the implementation of the new requirements for standard sanitation operating procedures in all inspected establishments. We also assisted FSIS in the related redraft of its existing sanitation regulations and the promulgation of a proposed rule that would eliminate most "command

and control" rules and replace them with a streamlined set of performance standards for sanitation. Additionally, we provided daily support to FSIS as it prepared for the January 1998 implementation of the Hazard Analysis/Critical Control Points (HACCP) inspection procedures in the largest FSIS-inspected establishments. Our work on HACCP implementation and compliance issues can be expected to increase over the next two years as the "small", and then the "very small" plants are brought under the HACCP requirements.

Enforcement matters under the meat and poultry inspection laws have continued to require extensive legal support, and in the coming year, we will be working closely with FSIS to publish final rules of practice governing enforcement actions under the HACCP, microbiological testing, and pathogen reduction regulations.

Finally, we spent considerable time with FSIS on the development of a legislative proposal to enhance the Department's food safety enforcement authorities under the meat and poultry inspection laws, and a proposal involving the interstate shipment of meat and poultry from state-inspected plants.

We worked closely with the Animal and Plant Health Inspection Service (APHIS) by assisting in the implementation of our WTO obligation to regionalize our regulatory requirements governing the importation of animals and animal products. This past year, for example, regulations allowing the importation of beef from Argentina, and pork from Sonora, Mexico, were promulgated. In addition, a comprehensive policy statement and complementary rule changes were adopted establishing the regulatory structure APHIS will use to review and act on requests for regionalization, and how it will use risk assessment methodology to arrive at proposed safeguards to prevent the introduction of communicable diseases of livestock and poultry.

We have also been heavily involved in defending a lawsuit filed by five environmental groups challenging APHIS regulations governing the importation of logs, lumber, and other unmanufactured wood products. In June of 1997, the court found for the Department on most issues, but nonetheless enjoined APHIS from issuing new permits for the importation of certain temperate wood products until a supplemental environment impact statement (EIS) is prepared and regulations based on it are promulgated. We worked assiduously with APHIS to see that the draft supplemental EIS, which was published in December 1997, meets the requirements of the court's order. We anticipate that the final supplemental EIS will be published before a scheduled status conference on May 15, 1998.

In 1997, after lengthy court proceedings, we settled a \$34 million lawsuit filed by the State of Florida arising out of the 1984 to 1986 citrus canker eradication program. The settlement stipulated that the funds paid to Florida in settlement of all claims would be used exclusively in the current program to eradicate the most recent citrus canker infection in Florida. We also worked closely with APHIS on its regulatory measures to eradicate a large infestation of Mediterranean fruit flies in Florida discovered in May of 1997. We have also assisted in the development and promulgation of an array of quarantines and regulations throughout the U.S., including the refinement of the Karnal bunt (Kb) regulatory measures and the issuance of regulations providing for compensation for those affected by the Kb outbreak.

There continue to be very significant developments in connection with marketing order regulations and litigation. The issuance of two voluminous and complex regulations concerning organic food labelling, and the reform of milk marketing orders required extensive legal involvement and assistance. In the litigation arena, we provided counsel and assistance in successfully applying the Supreme Court decision in *Wileman Bros. et al. v. Glickman* to challenges under both marketing orders and free-standing research and promotion programs as well as defending the appeal of the Northeast Interstate Dairy Compact case.

In the area of animal welfare, we successfully litigated numerous significant cases, including a case involving the death of a circus elephant. The circus operator's license as an exhibitor under the Animal Welfare Act was permanently revoked and he was assessed a civil penalty of \$200,000, the highest civil penalty ever assessed in an Animal Welfare Act case. We also took actions against several research facilities to require that they provide humane care to animals used for research. We assisted in developing the strategic plan for the Horse Protection Act program. The plan will give the Tennessee walking horse industry an enhanced role in the enforcement of the Horse Protection Act through the USDA authorized inspection system.

OGC also provides legal services to agencies which manage some of America's largest lending portfolios. The ongoing implementation of centralized processing (CSC) for Rural Housing loans uses substantial legal resources. OGC continues to be heavily involved in debt collection and foreclosure work with many cases going back to the emergency loan programs of the 1970's and 1980's. Implementation of

the Debt Collection Improvement Act of 1996 and the flexibility gradually being made available under the Rural Community Advancement Program of the 1996 Act also requires substantial legal resources.

The Secretary is committed to regulatory reform. We continue to work with Department officials to implement the President's regulatory reform package. This is a significant undertaking as we work with agencies throughout USDA to reduce regulatory burdens, eliminate obsolete or unnecessary regulatory requirements, and streamline regulation, particularly in the areas of rural, farm and utility lending. This year we look for a substantial push in this area from the Rural Utilities Service (RUS), Farm Service Agency (FSA), Rural Business-Cooperative Service (RBS), and Rural Housing Service (RHS).

OGC provided considerable assistance to the Rural Utilities Service (RUS) on a range of matters related to the changing electric and telecommunications industries. In particular, the introduction of competition in the electric industry has resulted in increased demand for legal services by RUS on a number of key electric program matters. For example, OGC has provided legal services in connection with the restructuring of borrowers' power supply arrangements through mergers, alliances, and other types of reorganizations and through the renegotiation of borrowers' power supply contracts. OGC has also dedicated substantial resources to the negotiation and drafting of new security arrangements for some large power supply borrowers. These arrangements, patterned after indentures used in the private sector, will provide borrowers with more flexibility in operating in the new competitive environment while facilitating access to private market financing.

As a result of the Telecommunications Act of 1996, which introduced deregulation and competition to the telecommunications industry, the RUS telecommunications programs is facing a wide range of issues and concerns requiring legal services. These include issues of loan purposes, loan security and borrower structure as well as the impact of FCC orders implementing the Telecommunications Act on RUS borrowers and program interests. RUS for the first time made distance learning and telemedicine (DLT) loans in addition to its DLT grants. Legal assistance is required both in the promulgation of new regulations implementing the DLT program and in developing the documents for these loans and grants. One cannot underestimate the legal resources which will be required by the movement to deregulate in the rural electric and telephone area.

In the natural resources area, we have been involved in a number of extremely significant undertakings concerning national forest management and soil conservation programs. We have provided assistance nationally to the Natural Resources Conservation Service in implementing a number of conservation programs including the Environmental Quality Improvement Program (EQIP), the Wetlands Reserve Program (WRP), the Farmland Protection Program, the Conservation Farm Option and Emergency Watershed Protection.

Management of our National Forests is a subject of intense debate and litigation, with a great deal of legal work generated by the impact of new scientific information on ongoing Forest Service projects and commitments. Such legal questions include challenges regarding the nature of forest planning in the Circuit Courts of Appeal and in the Supreme Court (*Ohio Forestry Association v. Sierra Club*), the relationship of the Endangered Species Act to the forest planning process and revisions of the first generation of forest plans.

Further, we are defending against numerous timber sale claims arising from legally created delays and contract modifications to protect the habitat of endangered species. We also successfully defended challenges in several places in the West by local governments and individuals under the so called "County Supremacy" movement disputing federal ownership or jurisdiction over public lands.

We have also devoted substantial resources to other legislative and regulatory initiatives, such as land exchanges, Clean Water Act questions, water adjudications, relicensing of hydro projects, grazing reform, reauthorization of the Endangered Species Act, the Safe Drinking Water Act and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). OGC also provided the Forest Service with support in the administration of the National Forest lands as they are affected by the complex statutes related to mineral exploration.

In addition, we regularly provide advice on compliance and litigation arising under the pollution control laws. Most frequently, pollution control issues involve abandoned and inactive mines and landfills on federal lands, the use and storage of agricultural chemicals, and management of hazardous waste at agricultural research facilities. We have worked with other federal resource management agencies on implementation of executive authority under CERCLA to address cleanup of hazardous substances affecting federal resources.

As the Administration and the Congress continue their efforts to re-invent the Federal government, and as the Department takes its own initiatives to make its delivery of services more efficient, streamlined, and customer friendly, we anticipate greater demands in the general law area. These range from providing legal services regarding personnel and labor matters; increased legal services as we implement the Electronic Freedom of Information Act, debt collection initiatives, and Year 2000 compliance; and legal support for creative approaches of doing more with less through mechanisms such as partnering.

Agency implementation of new administrative offset procedures pursuant to the Debt Collection Improvement Act of 1996 have triggered numerous appeals to the National Appeals Division (NAD) and resulting legal questions regarding the intersection of the offset process and the NAD appeal process. Last year, the U.S. Court of Appeals for the Eighth Circuit held that the Administrative Procedure Act and the Equal Access to Justice Act apply to NAD proceedings, thus allowing recovery of legal fees incurred by appellants in NAD proceedings.

With regard to the procurement of property and services, the Clinger-Cohen Act of 1996 mandated many changes that address source selection procedures in negotiated procurements; the acquisition of commercial items; and the acquisition, use, and disposal of information technology by the Federal Government. In particular, the general law division will continue to devote substantial resources to assist the Chief Information Officer created by the Act in fulfilling her duties both under the Act, and under separate Secretarial mandates, to improve information technology management in the Department.

Also with regard to procurement, the most recent revision of the General Accounting Office (GAO) protest rules has resulted in the general law area, providing more and an enhanced level of legal representation of USDA agencies in protests before GAO. This includes the provision of legal representation to the Forest Service in all Forest Service GAO protests.

OGC continues to provide legal services to the Alternative Agricultural Research and Commercialization Corporation regarding the scope of authority of the Corporation, as well as issues relating to grants, cooperative agreements, loan guarantees and other financial assistance provided to entities by the Corporation for the purpose of commercializing new non-food uses for agriculture commodities.

We continue to provide legislative drafting and related assistance to the Department and Congress on major legislative activities that involve the Department. We are providing assistance in the development of legislation to reauthorize the Department's research, education, and extension activities and the Department's child nutrition activities. We are preparing legislation to improve the Department's food safety programs. In addition, we are participating in the preparation of legislation in a number of areas in support of the President's fiscal year 1999 budget requests for USDA.

Over the past year the Department has engaged in massive efforts to reform its civil rights performance. The Secretary wants to ensure that all our customers and employees are treated with dignity and respect and are afforded equal employment opportunity and equal access to all USDA programs. The Civil Rights Action Team appointed by the Secretary in December 1996, and the Civil Rights Implementation Team formed in January 1997, both concluded that an essential component to achieving the Secretary's civil rights goal is to establish a new division within OGC staffed with lawyers fully trained in, and dedicated to, civil rights compliance and enforcement.

Our first Associate General Counsel for Civil Rights has been hired. The Associate General Counsel for Civil Rights is the chief civil rights attorney for USDA and is responsible for providing advice on civil rights law to the Department and its officers. The Associate General Counsel for Civil Rights is responsible for establishing and directing the newly created Civil Rights Division (CRD). CRD will assist USDA in fashioning responses to discrimination claims and provide assistance to the Department of Justice in relation to litigation of civil rights claims.

The CRD will provide legal advice to the USDA Office of Civil Rights, which is responsible for investigating and administratively adjudicating complaints of discrimination by employees and farmers in the delivery of credit and other services by USDA. CRD will also assist the Office of Civil Rights in ensuring that investigations and decisions are conducted in accordance with the law. This effort includes assisting in the effort to resolve the significant backlog of program and employment complaints. The Secretary has requested that these complaints be resolved as quickly and fairly as possible.

CRD will ensure that every mission area and agency within USDA receives timely and accurate legal advice on issues impacting the Department's compliance with, and enforcement of, civil rights laws. Further, CRD will proactively work to identify

civil rights issues and potential problems, notify the General Counsel, the Secretary, and other appropriate Department officials of the issues and problems and possible courses of action, and work with the General Counsel, Secretary and Department officials to address the issues and problems.

OGC has requested a supplemental in fiscal year 1998 which would provide funds needed to staff the newly created Civil Rights Division. The activities of this division cannot be carried out at current OGC resource levels without substantially reducing vital legal services to other areas of the Department. Since OGC has appointed an Associate General Counsel for Civil Rights, additional resources are now required to staff and maintain this new division with attorneys who are committed to civil rights in USDA and who specialize in civil rights law.

Mr. Chairman, it is important to note that these comments only touch on the dozens of daily issues that come before the legal office of a Department with over 100,000 employees administering programs in an extremely wide range of areas.

CLOSING

That concludes my statement, Mr. Chairman. We very much appreciate the support this Subcommittee has given us in the past. Thank you.

OFFICE OF INSPECTOR GENERAL

PREPARED STATEMENT OF ROGER C. VIADERO, INSPECTOR GENERAL

INTRODUCTION AND OVERVIEW

Good afternoon, Mr. Chairman and members of the Committee. I am pleased to have this opportunity to visit with you today to discuss the activities of the Office of Inspector General (OIG) and to provide you with information on our audits and investigations of some of the major programs and operations of the U.S. Department of Agriculture (USDA).

Before I begin, I would like to introduce the members of my staff who are here with me today: James Ebbitt, Assistant Inspector General for Audit; Jon Novak, Acting Assistant Inspector General for Investigations; and Del Thornsbury, Director of our Resources Management Division.

I want to thank the Committee for its support during the nearly 3½ years since my appointment as Inspector General. We have tried to work closely with you, and I hope that we have been able to address some of your concerns.

I am proud to say that in fiscal year 1997, we continued to more than pay our own way. In the audit arena, we issued 255 audit reports and obtained management's agreement on 207 recommendations. Our audits resulted in questioned costs of approximately \$900 million. Management also agreed, as a result of our audit work, to recover \$19 million and put \$267 million to better use. Additionally, our investigative staff completed 958 investigations and obtained 703 convictions. Investigations also resulted in nearly \$83 million in fines, restitutions, and other recoveries and penalties during the year.

We continued to work closely with agency officials to address key issues and to expand our cooperation with other Federal, State, and local law enforcement and audit agencies to broaden the impact of our work. Our achievements would not have been possible without the actions of the Department's program managers who worked closely with us in carrying out our mission. Working together, our staffs identified program weaknesses and program violators. Capitalizing on the staffs' respective expertise, we created solutions for positive action.

In fiscal year 1998, we are focusing our audit efforts on the Department's financial accounting systems, farm credit programs, civil rights, the Rural Rental Housing Program, and the Food Stamp Program including its Electronic Benefits Transfer project. Our investigative priorities include the timely and thorough investigation of threats to the health and safety of the public, emergency responses, child and adult care programs, employee integrity issues, and fraud in the Department's loan, regulatory, and benefit programs.

Before I move to our special law enforcement initiative and other specific audit and investigative activities, I would like to update the Committee on our progress in implementing the requirements of the Government Performance and Results Act (GPRA) and our forfeiture authority.

We have made significant progress in implementing GPRA in OIG. We have prepared a 5-Year Strategic Plan that describes our mission and sets forth our general goals and objectives through fiscal year 2002. We have completed our first Annual Performance Plan under GPRA, which contains specific performance goals and objectives for the fiscal year. We have also developed performance measures to assess our progress in achieving these goals and objectives under the plan so that we might make adjustments to maximize our effectiveness.

On the forfeiture front, as I discussed last year, with the Committee's support we are now authorized to receive proceeds from forfeiture actions arising from our investigations. While we have seized over \$11 million in assets for possible forfeiture to the Government as a result of our investigative actions since OIG was provided the authority in November 1995, to date, OIG has received only about \$100,000 from these proposed forfeitures. We are continuing to work with the Department, the Office of Management and Budget, and the Departments of Treasury and Justice to ensure OIG receives its appropriate share of proceeds from these proposed

forfeited assets as approved by you. However, after more than 2 years, the Department of Justice has not signed a memorandum of understanding with this agency.

Special Law Enforcement Initiative

Mr. Chairman, at this time I would like to discuss our special law enforcement initiative included in our fiscal year 1999 budget request. This initiative will be a major undertaking for the agency, and we ask your support to provide the resources necessary for it. I have provided each of you a handout on the initiative, highlighting our need and what we expect to achieve from this effort.

This special law enforcement initiative is to provide funding for OIG to crack down on fraud and abuse in the Food Stamp and other nutrition programs, assistance programs such as the Rural Rental Housing Program, and disaster and health and safety programs requiring immediate response.

Health and safety of food from production to the consumer is of special concern because of such highly visible emergencies as contaminated strawberries in the School Lunch Program and tainted meat in the food distribution chain which resulted in the recall of 25 million pounds of ground beef. Also, OIG's recent pilot effort, Operation Talon, in 24 metropolitan areas around the country, has been extremely successful, resulting in the arrest of over 2,200 fugitive felons and the potential savings of millions of dollars to the U.S. Treasury. This initiative is to allow the agency to expand such efforts nationwide.

Operation Talon

The Department estimates that over \$50 million a year in food stamps go illegally to convicted felons and prison inmates, and that a sizable number of retailers who accept Food Stamps make money from them illegally. Prior to the passage of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, also known as Welfare Reform, the exchange of information between law enforcement and State social service agencies was not allowed. Welfare Reform provided many useful tools to the law enforcement community, such as making fugitives and people who are violating conditions of probation and parole ineligible for food stamps. Additionally, the legislation made it possible for State social service agencies to provide law enforcement authorities certain identifying information from their files pertaining to fugitives.

As a result of the tools provided by Welfare Reform, we initiated "Operation Talon," a law enforcement initiative led by OIG and carried out in conjunction with other law enforcement agencies and State social service agencies across the country. Under this initiative, law enforcement agencies' fugitive records are matched by social service agencies with their food stamp recipient records. Information on fugitives is then shared with OIG and other law enforcement officials who use it to locate and apprehend the fugitives. As of January 13, 1998, "Operation Talon" has resulted in 2,235 arrests of fugitive felons, the vast majority of whom were food stamp recipients or former recipients. These fugitives included numerous violent and dangerous felons who were wanted for murder, child molestation, rape, and kidnapping.

I have included a chart which identifies the offenses for which these felons were wanted.

<i>Offense</i>	<i>Total arrests</i>
Murder	9
Attempted murder	10
Child molestation	10
Rape	7
Attempted rape	2
Kidnapping	6
Assault	115
Robbery	86
Drugs	645
Other	1,345

An example of the type of individuals we arrested is a fugitive wanted for selling a large quantity of marijuana. He was arrested at a sting site in Chicago, Illinois. The individual came to the site believing he had an appointment to discuss his food stamp benefits. When he was confronted by a Cook County Sheriff's deputy, the fugitive attempted to flee, running down a small corridor where an OIG special agent and local police officer tackled and subdued him. This fugitive later threatened to burn down the Cook County detention facility and kill the police officers and special agents. On his person, and in a bag, he was carrying 8 knives, 11 assorted lengths

of steel pipe, 2 screwdrivers, 1 wrench, and materials such as glass containers, wicking material, and candles needed to make Molotov cocktails.

Operation Talon is a success story. I say this not only for OIG, but also for the State and local law enforcement agencies we helped to locate and arrest fugitive felons. Even more importantly, Operation Talon is a success for the American people who can now know that their communities are safer now that these people wanted for murder, rape, drug dealing, and other violent and dangerous crimes have been taken off their streets and that food stamp benefits go only to those who need them.

On December 18, 1997, Vice President Gore publicly announced Operation Talon during a press announcement at the White House. Also present for this announcement were 10 members of State and local law enforcement agencies with whom we worked during this operation. These participants included the Sheriff of Cook County, Illinois, where Operation Talon "bagged" 470 fugitives. Two deputies with the Pierce County, Washington, Sheriff's office, the entire fugitive squad for that office, traveled all the way across country to participate and to express their appreciation for our efforts, which they characterized to us as the "best thing that has happened." They just could not get over that, with this new information, 90 percent of the doors they knocked on produced the fugitive they were looking for. This kind of positive feedback exceeded even what we had expected.

Successful as they are, activities such as Operation Talon are not without their price. As of January 13, 1998, 116 OIG special agents had expended nearly 2,500 staff days on this operation. We can continue to recover and save money for the taxpayers only if we have the resources needed to perform our mission. Adequate funding and staffing for OIG makes good sense because we help create a Government that works better, produces positive results, and saves the taxpayers' money. We believe the success demonstrated through our pilot work in Operation Talon and the other areas of our special initiative provide outstanding examples of what can be accomplished if the necessary resources are made available to the agency to perform this critical work.

Child and Adult Care Food Program (CACFP)

Another area we are looking at in our initiative is the Child and Adult Care Food Program. The objective of CACFP is to ensure that children and adults being cared for in participating day-care homes and centers receive nutritious meals. To accomplish this, the Food and Nutrition Service (FNS) reimburses day-care providers for the meals they serve and sets nutritional requirements for the food. The program is administered by State agencies through sponsors, who are generally public or private, nonprofit organizations. Sponsors act as the link between the State agency and individual day-care providers. More than 14,000 sponsors administer the program in just over 230,000 day-care homes and centers nationwide. CACFP funding for fiscal year 1996 was \$1.5 billion.

To ensure the integrity of the program, sponsors are required to train providers in program requirements and perform onsite visits to providers' homes and centers to make sure they are fulfilling these requirements. Sponsors are also responsible for reviewing provider claims to ensure that the meals are nutritionally balanced and that the children are eligible. Sponsors are ultimately responsible for program operations in the day-care homes they oversee. In return for carrying out their responsibilities, sponsors are reimbursed for their costs of administering the program.

In a CACFP investigation in California, four executives of a non-profit child-care sponsoring organization are awaiting sentencing in March after they pled guilty to mail fraud in connection with their participation in CACFP. The organization oversaw in excess of 60 day-care centers and 175 day-care homes in the Los Angeles and Orange County areas.

Our investigation disclosed that, through various fictitious names and bogus entities, two of the executives fraudulently obtained and diverted approximately \$2.3 million in CACFP funds for personal and nonprogram-related expenses, including the purchase of a \$1.5 million residence and the payment of their children's college-related expenses. The other two executives claimed and received over \$60,000 in CACFP funds for nonexistent day-care home providers.

One of the executives was also employed by the California Department of Education (CDE), the State agency responsible for administering CACFP. In that capacity, she was specifically responsible for monitoring her own sponsoring organization's compliance with CACFP. She and her husband used various aliases to conceal their business and family affiliations from her employer. She was subsequently fired by CDE as a result of her conflict of interest involving her association with the sponsoring organization. This investigation was conducted jointly by OIG and the U.S. Postal Inspection Service.

A separate civil forfeiture action was filed against four residential properties in Southern California, owned by the subjects, and valued in excess of \$2 million. This is being handled through the U.S. Postal Inspection Service and the Civil Division of the U.S. Attorney's Office, Eastern District of California in Sacramento.

In the audit arena of CACFP, our reviews revealed a breakdown in controls at the sponsor level. In our pilot test, we have concentrated on the approximately 1,200 sponsors who primarily sponsor day-care homes. We reviewed 12 sponsors in 10 States and found 11 of them to be seriously deficient in their administration of the program—and this is only the tip of the iceberg, considering there are about 1,200 sponsors of some 195,000 day-care homes nationwide.

As part of our sponsor reviews, we conducted unannounced visits to a substantial number of day-care homes and found widespread deficiencies in their operations. Many providers did not have adequate records to support the meals they claimed or had no records at all. Claiming of unallowable meals by providers appeared to be common. Many of the children for whom the providers claimed meals were not present when we visited, and we questioned whether they were actually in care. We also questioned whether some providers were eligible to claim the meals they served to their own children. At some homes, we found unsafe or unsanitary conditions and licensing violations, and we reported these conditions to the local health or licensing authorities.

Based on the large numbers of problems we found at the homes, we concluded that the sponsors' training and monitoring efforts were generally ineffective. Sponsors did not provide all required training and did not conduct all required reviews. Reviews that were performed were often ineffective. Sponsor visits were usually scheduled in advance, were brief, in many cases, only 5 or 10 minutes in length, and very seldom disclosed any problems. Some of the extensive problems our unannounced home visits found included the following.

- Conditions were unsafe or unsanitary at 10 providers of an Illinois sponsor. At one home, the only sources of heat, in the month of February, were the gas and oven burners on the kitchen stove. Several homes were seriously over capacity, with only 1 adult caring for up to 25 children, versus State licensing provisions which allow 1 adult to care for not more than 8 children.
- One Oregon sponsor did not adequately monitor or train its providers, claimed unallowable administrative expenses, and failed to accurately report administrative costs on its monthly claims for reimbursement. The sponsor also may have been conducting unrelated outside business activities and charging their costs to the program. Based in part on our audit report, the State agency terminated this sponsor from the program.
- Nearly one-third of a New Mexico sponsor's providers we attempted to visit were not home, yet they later claimed meals which were purportedly served at these times.
- One-sixth of the reimbursements claimed by one Alabama sponsor's providers were improper. Numerous providers claimed reimbursement for meals not served or for ineligible meals. We recommended recovery of the \$3,000 paid for ineligible meals and meals not served.

Because of the serious deficiencies, FNS has terminated the participation of 5 of the 12 sponsors. Four of the five sponsors are being investigated for fraud-related activities.

Due to the significant problems found, we have included this work in our national initiative to expand our efforts to identify abusive sponsors. These efforts will include "sweeps"—unannounced, targeted visits—of sponsors and providers conducted jointly by OIG auditors and investigators with the assistance of FNS and State agency personnel. Because the "sweeps" place a large cadre of reviewers at selected onsite locations simultaneously and without warning, they will provide an authentic snapshot of CACFP operations in the targeted areas. Those sponsors found to be abusing the program will be removed from sponsorship; ineligible payments recovered; and, if warranted, prosecuted.

Electronic Benefits Transfer (EBT)

Another area we plan to emphasize in our initiative is monitoring of EBT systems that deliver program benefits. OIG remains the lead agency, under agreement with the President's Council on Integrity and Efficiency (PCIE), to review EBT systems that deliver State-administered programs. For USDA, the State-administered programs are the Food Stamp Program (FSP) and the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). Also included as State-administered programs are the Temporary Assistance for Needy Families (TANF), funded by the U.S. Department of Health and Human Services (HHS), and States' general assistance programs.

While the majority of FSP benefits are still distributed in the form of paper coupons, electronic distribution of benefits is growing rapidly and currently sends about 27 percent of local food stamp benefits. Currently, 26 States have operational online food stamp EBT systems with 8 of the States operating statewide systems. Two States have operational off-line systems using the smart cards with one of these States using its system for the WIC Program. Many of the remaining States have selected EBT vendors and are at various stages of awarding contracts. The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 mandates EBT for all States by 2002.

EBT has an impressive impact in identifying individuals and retailers who are committing fraud in the program. While trafficking of benefits has not been eliminated by EBT, we believe the number of individuals involved in street trafficking has been reduced. EBT benefits are less negotiable "on the street" and, thus, less likely to be used as a "second currency." We have not found, to any significant extent, the exchange of EBT benefits for illegal drugs, a not too uncommon occurrence with coupons. Instead, the individuals now exchanging cash and non-food items with recipients are generally retailers or those working with them.

In addition, information available under EBT is now used to identify and prosecute those who engage in illegal transactions. While paper food coupons are generally not traceable to individual recipients, under EBT, details of all transactions are recorded. The system records the date, time, amount, recipient and store involved in all benefit transactions. This information is used to identify and prosecute both the retailers and the recipients involved in trafficking. FNS has also used EBT data to disqualify violating retailers, and State authorities are using information obtained from EBT records to disqualify recipients who have sold their benefits.

An example of a significant EBT investigation was completed recently in Baltimore, Maryland. Maryland was the first State to implement EBT statewide. In this case, eight people pled guilty in Federal court to a variety of money laundering, conspiracy, and food stamp trafficking charges for their roles in a conspiracy that defrauded the program of \$2.4 million.

The group used eight stores, both authorized and unauthorized, to purchase and then redeem EBT benefits. In the unauthorized stores, ring members obtained the account and personal identifier numbers from recipients and then relayed the information over the telephone to members in authorized stores. The authorized stores had EBT machines which were used to access the recipients' accounts and remove the benefits. The recipient was then paid a reduced amount of cash. In addition, other ring members purchased benefits "on the street" and used mobile telephones to call in recipient information.

The ring leader was sentenced to 48 months in Federal prison, while five others received prison terms ranging from 4 to 21 months. Additional subjects are pending prosecution and sentencing.

This case is also useful in demonstrating how EBT data can identify traffickers. During analysis of EBT data during another trafficking investigation in Baltimore, our agents identified the above-mentioned conspiracy. We used the system to follow recipients with suspicious transactions to a second group of stores. We also followed recipients from the second set of stores to yet another trafficking operation in Baltimore. Members of all three trafficking operations were prosecuted.

As mentioned earlier, EBT has also been used by State authorities to disqualify recipients who have sold their benefits. This has been occurring on a large scale in Maryland. For the past 3 years, we have provided lists of recipients who used their EBT benefits in stores which we found to be buying benefits, along with transaction information, to the Maryland Department of Human Resources (MDHR) Baltimore City Food Stamp Trafficking Unit. This information was compiled from data developed during OIG investigations of 14 stores.

As an unfortunate indication of the extent of food stamp fraud and abuse, to date, over 5,200 heads of households in Baltimore, or 8.3 percent of all Baltimore households receiving benefits, have been disqualified from FSP based upon the EBT data. These disqualifications have thus far resulted in a savings of over \$3 million in suspended benefits. Additionally, another 11,604 Baltimore households—18.2 percent of the total households receiving benefits in the city—are in various stages of administrative action by MDHR.

We would like to take this opportunity to commend MDHR, especially its Baltimore City staff, and the prosecutors with the Office of the State's Attorney for Baltimore City for their efforts in addressing the problem of recipient fraud trafficking. Their aggressive administrative disqualifications and prosecutions of recipients have saved the taxpayers millions of dollars and should serve as an excellent deterrent to others who might consider abusing this valuable program.

During the course of another OIG investigation into suspicious EBT transactions in Essex and Hudson counties in New Jersey, 10 authorized stores were identified as having engaged in food stamp fraud. Those stores redeemed an estimated \$9.5 million in food stamp benefits during the period of investigation, of which \$6 million is alleged to have been involved in fraudulent transactions. In addition, approximately 1,000 individual food stamp benefit recipients were identified as having engaged in suspect transactions larger than \$1,000. Thirteen men and three women who owned and/or operated the 10 stores pled guilty for various charges including conspiracy, food stamp fraud, and fraud in connection with electronic access devices. Seizure warrants netted \$75,000 in cash, and asset seizures of real property are pending. We worked on this investigation with the U.S. Secret Service (USSS); the Internal Revenue Service (IRS); and the East Orange, New Jersey, Police Department. The investigation was initiated after a review by FNS' Compliance Branch identified the stores as potential violators of the Food Stamp Program.

During the past year, we have performed audits of EBT systems used to issue FSP benefits in Illinois, New Mexico, North Dakota, South Dakota, and Wyoming. In Wyoming, we included the WIC Program in our review since Wyoming's EBT system delivers WIC benefits in six counties.

Overall, security policies and control processes in the States reviewed were adequate to ensure timely and accurate availability of FSP and WIC Program benefits to recipients and payments to retailers. We did identify some areas in the individual States needing improvement. For example:

- In Illinois, controls needed to be strengthened over State employee access to the EBT system, reconciliations of data transfers between the State and the EBT processor needed to be documented, and the aging of FSP accounts needed to be modified to comply with FSP regulations. Illinois also needed to address the EBT processor's timeliness in installing equipment at authorized retailers.
- New Mexico's contract with its processor expires in 1998, but New Mexico does not have a contingency plan to continue FSP benefits if it must operate without an EBT processor. Dormant accounts remained accessible to recipients beyond the 1-year authorized period.
- North Dakota and South Dakota use the same EBT processor, which agreed to provide interoperability between the two States. The EBT system did not document the full cycle of FSP activities and did not report approved FSP transactions pending retailer payment. As a result, the States cannot adequately monitor the processor's use of Federal funds or reconcile transactions to reimbursement drawdowns, which may increase the States' potential liabilities.
- Wyoming's WIC EBT system did not allow clients to purchase the full amount of their WIC food prescriptions because it rounded the weights of foods purchased. Variations in product coding sometimes prevented clients from purchasing sale items and unnecessarily increased program costs. The FSP portion of EBT had a design feature to expunge unused benefits over a year old, but it was not in use. Appropriate recommendations were made in the individual State reports to address the problems found and strengthen controls.

Emergency Response—Health and Food Safety

OIG's highest priority is the investigation of criminal activity which poses a threat to the general health and safety of the public. Because of the high-profile cases in this area during the past year and our belief that these are only examples of possible threats to the health and food safety of the public, we have included health and food safety as part of our special initiative efforts that must be enhanced. Among these crimes are violations involving the processing and sale of adulterated meat, poultry, and egg products; criminal tampering with food products consumed by the public; and product substitution, adulteration, or other misrepresentation of food products which are regulated or purchased by USDA.

OIG investigations in the health and safety area have traditionally been focused almost exclusively in the red meat industry. OIG agents traditionally investigated meat packers who clandestinely slaughtered diseased cattle and supplied the meat for public consumption, and processors who surreptitiously mixed tainted meat with wholesome meat which was sold to the public. The financial incentives for those who commit this type of crime remain so high that OIG expects to continue responding to these types of criminal activity far into the future.

While OIG continues to conduct these traditional health and safety investigations, recent investigations of health-related criminal activity involving the inspection programs and other USDA programs have identified an increasing need for OIG attention. Last spring, OIG immediately responded and took control of an investigation surrounding an outbreak of hepatitis A in Michigan which eventually sickened 190 school children and which was believed to have spread through their eating of

strawberries served through USDA's School Lunch Program. The president of a San Diego based food processing company, his company, and the former sales manager pled guilty to conspiracy in regard to substituting Mexican strawberries for U.S. domestic strawberries in this case. Sentencing for all three defendants has been scheduled for next month. The company, through three brokers, supplied 1.7 million pounds of frozen strawberries to the School Lunch Program, for which USDA paid over \$900,000. The USDA contract called for frozen strawberries that were 100 percent grown and processed in the United States. The company's president certified to USDA that all of the 1.7 million pounds of frozen strawberries were domestically produced and processed, when in fact, at least 99 percent of the product supplied to USDA was grown in Mexico. This investigation was conducted jointly with the Food and Drug Administration (FDA), with assistance from the Federal Bureau of Investigation (FBI).

Also during the past year, OIG was called upon to investigate the circumstances surrounding another life-threatening emergency, this time involving the often deadly bacteria E-coli 0157:H7. Knowing this to be the same type of outbreak which had caused fatalities in previous occurrences, OIG immediately dispatched an Emergency Response Team to the Nebraska meat-processing plant which prepared the ground beef patties identified by State Health Department officials as the source of the bacteria. While our criminal investigation into this matter continues, and it would be inappropriate for me to discuss our findings at this time, this is a perfect example of how OIG reacts to emergency situations involving USDA-regulated matters and the type of activity we plan to expand as part of our special law enforcement initiative.

Rural Rental Housing (RRH)

We also plan to place special emphasis on the Rural Rental Housing (RRH) Program as part of our initiative. A recent legislative change provided a new weapon to OIG and to the Rural Housing Service (RHS) for use in the fight against program fraud and hazardous living conditions in the Nation's 16,300 rural multifamily housing projects. With these new criminal sanctions, the agencies can take aggressive action to identify and eliminate the worst offenders—those who convert tenant rental proceeds and Federal assistance to personal use while neglecting the physical condition of deteriorating properties. Owners, agents, or managers convicted of "equity skimming," or diversion of project assets, can be fined up to \$250,000 or imprisoned for not more than 5 years, or both.

Using automated audit techniques and in consultation with RHS staff, we will identify RRH projects that have certain risk factors, such as chronically underfunded reserve accounts that may point to financial irregularities and threats to tenants' health and safety. A team comprising an auditor, an investigator, and an RHS employee will make visits to high-risk projects. We will follow up with detailed audit and investigative work where indications of fraud or unsafe living conditions are identified. To the extent necessary, local officials such as fire marshals and building inspectors may be involved to further corroborate any problems and to provide an additional impetus for improving substandard living conditions.

As an example of the type of financial abuse we expect to find, the general partner of a Pennsylvania management company pled guilty to nine counts of false statements made to RHS. The individual planned, built, and managed 32 apartment projects in Pennsylvania, New York, Maryland, Delaware, and West Virginia, all under the RRH program. The general partner established a central disbursement company to oversee the operation of the projects and their accounts. It was determined that the individual made more than \$1.3 million in unauthorized withdrawals from the tenants' security deposit and replacement reserve accounts. The money was used to support private real estate ventures that were losing money, which included housing developments and shopping malls. Sentencing is pending.

Additional Controls Over the U.S. Department of Housing and Urban Development (HUD) Section 8/515 Projects Not Fully Implemented

Under the Section 515 RRH Program, RHS approves loans to provide housing for persons with low or moderate income and for persons aged 62 or over. Rent paid by tenants of these projects can be supplemented through RHS rental assistance or Section 8 rent subsidies provided by HUD. In September 1993, we reported several situations where improvements in servicing for projects receiving Section 8 rent subsidy were needed. RHS officials agreed to implement regulations requiring RHS countersignature for reserve withdrawals. RHS also issued instructions requiring servicing officials to identify and monitor projects with excess funds and cancel unneeded interest credit or recover the unneeded interest credit by collecting over-

ages. In addition, RHS agreed to monitor lump sum retroactive rent subsidy payments from HUD.

In followup to our 1993 audit, we selected 33 projects to determine if new procedures improved the cash management practices used by Section 8/515 borrowers and achieved savings. We found some borrowers were not investing project funds, in order to avoid tax liability. We estimated that interest income could have been increased by approximately \$918,000 by investing reserve funds in accounts yielding higher interest rates. Countersignature reserve accounts were either not established or not operating effectively for approximately 48 percent of the projects reviewed. Also, \$45.2 million of reserve funds was not adequately secured for 422 projects in our universe of 895 projects. In addition, we estimated that 46 percent of the projects did not transfer approximately \$16.5 million from nonsupervised operating accounts to reserve accounts requiring the countersignature of an RHS official. In total, an estimated 258 borrowers, with interest credit agreements dated before RHS obtained regulatory authority, received \$2 million of unneeded interest credit annually. In addition, we estimated 326 borrowers, with agreements dated after RHS obtained reduction authority, received unneeded interest credit totaling \$3.4 million annually. An estimated 55 percent of projects accumulated excess funds totaling \$31.3 million. In addition, we estimated that had approximately 28 percent of projects applied excess funds to loan obligations, annual savings to the Government and borrowers totaling \$1.7 million would have resulted. We identified \$169,000 of project funds used for questionable purposes, and we projected that \$3 million had been used for questionable purposes.

We recommended RHS seek legislation to eliminate dual subsidies arising from unneeded interest credit and require project managers to deposit reserve funds in an escrow account directly under RHS control. In addition, we recommend RHS strengthen servicing and establish procedures for situations where project managers did not timely establish or maintain countersignature reserve accounts. We recommended recovery of the questioned costs.

Mr. Chairman, at this time, I would like to highlight some of our other audit and investigation activities.

ENTITLEMENT PROGRAMS

FOOD AND NUTRITION SERVICE (FNS)

Food Stamp Program (FSP)

The Food Stamp Program is our nation's primary nutritional "safety net" for those in need. Program expenditures in fiscal year 1997 were about \$21.5 billion, with benefits provided to about 23 million recipients monthly across the country. The program is administered by FNS through various State and local government entities. According to FNS, as of the end of fiscal year 1997, about 75 percent of food stamp benefits was issued using food stamp paper coupons. However, States are rapidly moving to implement EBT systems, and under welfare reform, EBT is mandated by 2002. About 187,000 retail grocery and other stores are authorized by FNS to accept food coupons or EBT benefits from recipients.

Because of the huge size of the program and its vulnerability to fraud and abuse, OIG devotes a significant portion of its total resources to audit and investigative work in FSP. Our audit work focuses on the adequacy of controls and systems used to manage program areas such as issuance operations, wage-matching requirements, bank and retail store monitoring, and quality control procedures. Our audit staff is also working closely with FNS, other Federal agencies, and the States to monitor and review EBT systems as they expand in use. Our investigative emphasis is on food stamp trafficking, which is the illegal exchange of food stamp coupons or EBT benefits for cash or for other nonfood items. During fiscal year 1997, we devoted approximately 46 percent of our investigative resources and 8 percent of our audit resources to FSP work. During the year, we conducted 598 food stamp fraud investigations, and we issued 19 audits relating to FSP. Our food stamp investigations resulted in 540 criminal convictions of individuals and businesses and over \$17 million in fines, restitutions, and other monetary penalties. For fiscal years 1995 through 1997, OIG has conducted over 1,900 investigations of food stamp fraud, which have resulted in over 1,800 convictions and \$49 million in monetary results.

Trafficking

Trafficking in food stamps has been a problem since the program began. While most food stamps are properly issued to eligible recipients and are used as they were intended to buy food in FNS-authorized stores, a significant amount of trafficking continues and remains a problem to this day. Street trafficking involves persons who purchase or barter food stamps for cash or other nonfood items. Street traffick-

ers often obtain food stamps from recipients at a substantial discount of their face value, frequently in exchange for drugs or other nonfood items. Retailer trafficking involves FNS-authorized store owners and their employees who purchase food stamps for cash at a discount of their face value and then redeem them at their banks for full face value. Retailers traffick with both individual recipients and with street traffickers. Since the FNS-authorized retailer is the key to the eventual redemption of illegally obtained food stamps, OIG's primary investigative focus is on identifying and investigating those retailers who purchase food stamps. During fiscal year 1997, about 80 percent of our food stamp investigations involved FNS-authorized stores. During the year, 326 retail stores were disqualified by FNS based upon OIG investigations. Those stores had annual redemptions of \$65 million.

FNS' Sanction Settlements Do Not Always Enhance Error Control

As an incentive to control food stamp certification error rates, States are awarded additional administrative funding for low error rates and sanctioned for excessive error rates. As outlined in our 1997 audit which covered a 14-year period ending in 1995, 48 States were sanctioned for excessive error rates. The States overissued approximately \$8.5 billion in food stamps and were liable for approximately \$1 billion for excessive errors.

Between fiscal year 1981, when the sanctioning process became effective, and fiscal year 1995, FNS had collected only \$6.2 million of the \$1 billion in liabilities. FNS may waive collection of a State's liability incurred after fiscal year 1985 on the condition that the State invests its own funds in error control activities. Through settlements with FNS, States were required to reinvest \$65.1 million in FSP, with contingency provisions for reinvestment of another \$36.7 million. Almost \$765.4 million in potential sanctions was waived by FNS as part of the settlement agreements negotiated with the States.

We reviewed the settlements that FNS had negotiated with the States, as well as the reinvestment activities the States engaged in. We found that the settlements (1) absolved States of their liabilities regardless of their error rates, (2) did not always provide incentives for States to reduce error rates, and (3) included payment of Federal matching funds for activities that should have been fully funded by the States. We also found ineligible projects and costs included in the 45 reinvestment projects we reviewed in 17 States. The States had budgeted \$70.8 million for the projects. We questioned an unduplicated \$50.2 million of the budgeted and actual costs. For example:

- We questioned the eligibility of 11 projects budgeted for \$42.3 million because most of the work performed under the projects constituted the basic activities required for program administration. Also, the States funded some of the projects by reallocating existing resources rather than budgeting new expenditures.
- The States charged ineligible costs to their reinvestment activities. We evaluated the propriety of costs charged to the 30 projects conducted by 11 of the 17 States. Of the \$40.5 million the States had charged to the projects, we questioned \$10.5 million in costs.

We recommended that FNS (1) collect sanctions from States with historically excessive error rates; (2) make any settlement agreement contingent on a State's ability to reduce its error rate below the national average; (3) ensure that reinvestment activities enhance the controls over errors, not merely meet the minimum requirements for program administration; (4) ensure that reinvestment projects are not funded by reallocation of resources; (5) review each State's reinvestment activities to evaluate its eligibility; and (6) recover the questioned costs or require the States to reinvest in error rate control activities that qualify.

FNS officials generally disagreed with our conclusions regarding the amount of questioned costs. We continue to work with them on resolution of the recommendations.

One State Overclaimed As Much As \$25 Million in Employment and Training Funds

The Employment and Training Program (ETP) provides funds to train food stamp recipients to find work. FNS approves each State's Employment and Training plan, and reimbursements are based on the size of each State's food stamp work registrant population, as a percentage of food stamp work registrants nationwide, and on actual costs that exceed those calculated by the population formula. Reimbursed costs may not include overhead costs of normal educational operations.

At the request of FNS, we evaluated Wisconsin's methodology for identifying those costs to be submitted for Federal Employment and Training matching funds, and we reviewed the State's procedure for determining the number of eligible program participants.

FNS approved Employment and Training matching funds totaling \$10.2 million in fiscal years 1995 and 1996 to which Wisconsin was not entitled. The State's calculation of work registrants included food stamp recipients who were ineligible for ETP. Wisconsin also charged for costs of operating the Wisconsin Technical College System even though neither the colleges nor the attending food stamp recipients were given any Employment and Training funds by the State. FNS was unaware of these conditions because the regional office did not recognize the large increases in the State's claim for matching funds as an indicator of possible problems.

An additional \$15.3 million in Federal matching funds was approved for the costs of continuing a U.S. Department of Health and Human Services (DHHS) jobs program whose normal allocations had run out. Reimbursement of these transferred costs could constitute a violation of appropriation laws and, thus, may need to be refunded to FNS.

We recommended that FNS collect \$10.2 million from Wisconsin for the ineligible costs of the technical college system and for the overstated number of Employment and Training participants. We also recommended that FNS' regional office obtain a legal opinion from the Office of General Counsel on whether the payment of costs allocated to a DHHS program constitutes a violation of law and whether the associated funds should be collected. Finally, we recommended that FNS strengthen its monitoring procedures to prevent future recurrences of these problems in other States.

FNS officials agreed that the State's grant and matching funds may have been overstated. They also agreed to obtain a legal opinion regarding the possible appropriations violation.

Other Food Stamp Investigations

In cooperation with the local Oregon police department, our investigation of an individual in Oregon who was illegally receiving food stamps, led to his January 30, 1998, guilty plea on two counts of Aggravated Murder. Our investigation determined that the individual, who was suspected of multiple homicides while riding railroad lines throughout the United States, had applied for and received food stamps using false identities in 12 States. Information we obtained from food stamp files around the country established a time line which tracked the individual around the country and helped place him in the locations where the homicides occurred and provided the motive for some of the murders. He admitted to using the identities of some of his homicide victims in order to receive their food stamp benefits. In Connecticut, 15 individuals were arrested in a food stamp sting operation. Owners and employees of eight authorized stores had purchased approximately \$256,000 in food stamps for \$118,450 in cash, two handguns, and two vehicles. The 13 store owners and employees involved with food stamp trafficking were charged with Federal and/or State violations. The owner of one store was a city councilman, who pled guilty to State food stamp charges. During the course of the investigation, the owner of an authorized store introduced the OIG undercover agent to a Connecticut State Representative, who was also a police officer, for assistance in expediting a pistol permit. The OIG agent paid the Representative \$400 for his assistance. Even before the OIG investigation, the chief State's attorney's office had been investigating the Representative for election law violations. The OIG agent, while conducting this business, was approached by a second State Representative who was a police officer, as well. The Representative made a similar arrangement to assist in expediting the pistol permit. The OIG undercover agent paid this State Representative \$200 for his assistance. Both Representatives were arrested and charged with various State violations by the chief State's attorney's office. Subsequently, both pled guilty, resigned from their positions, and were given suspended sentences with probation. The case was worked jointly with Connecticut's chief State's attorney's office, IRS, and the U.S. Attorney's Office.

While the vast majority of our investigative time spent in the Food Stamp Program involves trafficking, we also conduct investigations of other types of criminal activity in the program, such as large-scale thefts of coupons from issuance offices and multiple issuances of benefits to the same individual, particularly if interstate fraud is involved.

One recent investigation resulted in guilty pleas from three individuals who broke into food stamp issuance centers in Georgia, Oklahoma, and Alabama and stole nearly \$500,000 in food coupons and over \$47,000 in cash. The robbers gained entry to the businesses by cutting holes in the roofs. When employees arrived at work early in the morning, two of the armed robbers—dressed in black ski masks, gloves, and coveralls—crashed through the ceiling and climbed down ropes into the businesses. Two members of this robbery ring have pled guilty to multiple Federal crimes, including food stamp violations, and were sentenced to prison for 151

months and 60 months, respectively, along with total restitution of \$142,380. The ringleader, who was wanted for numerous armed robberies in several States, was tried in Texas for a similar robbery which did not involve food stamps. He received two consecutive life sentences under the new Federal "Three Strikes and You're Out" law. The three gunmen have also been implicated in nine other armed robberies.

FARM PROGRAMS

FARM SERVICE AGENCY (FSA)

Tobacco Fraud

A North Carolina tobacco dealer, who was also affiliated with the Montana Freeman organization, and a Fredericksburg, Virginia, tobacco dealer were among the 40 tobacco dealers, warehousemen, farmers, and 1 corporation who have been convicted of felony charges for their roles in a tobacco fraud scheme that resulted in the illegal sale of more than 34 million pounds of excess tobacco valued at over \$57 million. The Freeman pled guilty to charges of conspiracy to commit mail fraud and to making false statements regarding tobacco marketed on USDA tobacco dealer cards, after he and others used dozens of persons throughout the Southeastern United States to illegally sell the excess tobacco. He was sentenced to 5 years in prison for the tobacco-related charges. Information developed by OIG during the tobacco investigation laid the groundwork for another Federal prosecution and conviction of the Freeman relating to crimes associated with the Freeman group, including conspiracy to commit bank fraud and conspiracy to intimidate a Federal officer. The sentence for that conviction was 12 years in prison. The Fredericksburg tobacco dealer was sentenced to nearly 16 years in prison following his trial and conviction. Additionally, the Government was awarded property, including the defendant's residence, a colonial era estate known as "Beauclaire Plantation," which IRS has appraised at over \$900,000, and \$3 million in cash and substitute assets. The substitute assets seized include a registered American Quarter Horse, known as "Coosa Lad," valued at nearly \$500,000, and additional real estate valued at over \$150,000. Administrative action has been initiated to collect up to \$42.5 million in tobacco marketing-quota penalties. Civil suits have also been filed against some warehouse operators under the False Claims Act.

Mohair Incentive Program

Although the Mohair Incentive Program was eliminated in 1996, OIG continues to investigate criminal violations of this once-important program. This program allowed mohair producers to receive Government subsidies approaching 400 percent of the amount of their actual mohair sales. Prior to its elimination, this Program was defrauded out of \$1.6 million by three Texas ranchers. A fourth rancher submitted additional false claims for over \$400,000 in program payments; however, the payments were not made. The producers, who were required to have actually owned the goats which produced the mohair for which they sold and received subsidy, actually purchased the mohair from other sources, resold it, and submitted bogus receipts to support their claim to USDA. All four of the defendants in this case pled guilty to charges of making false statements, and three of them have been sentenced to prison terms from 22 to 40 months and ordered to pay over \$2.5 million in restitution. Sentencing is pending for the fourth. Interestingly, the Federal District Court Judge ordered the restitution to include interest on the amount of the fraud calculated, from the date the payments were received.

Adulteration, Misgrading, and Misweighing of Grain

A multinational food company headquartered in Omaha, Nebraska, pled guilty to charges of adulteration, misgrading, and misweighing of grain by the company's grain division and paid \$8.3 million in fines and disgorgement of criminal profits. A significant part of the sum is being disbursed to more than 4,000 farmers who were cheated by the company's schemes to defraud. In addition, four former managers of the grain company pled guilty to misgrading grain. Two of the managers also pled guilty to wire fraud. One of the managers found guilty of wire fraud was sentenced to a prison term of 15 months, followed by probation of 2 years, and the other manager was fined \$3,000 and placed on 4 months' home detention. The other two managers were fined \$500 and \$200, respectively, because they cooperated in the investigation and had not led the schemes. In lieu of debarment, the company signed a compliance agreement that establishes a corporate code of ethics and conduct and provides for training in ethics, as well as grading and weighing. The agreement also ensures a prohibition against adding water to grain except for processing.

Our investigation found that the company used several schemes to defraud farmers and grain buyers and increase its grain inventories and profits. Soybeans were purposefully misgraded, allowing the company to pay less to the farmer yet sell at higher rates. The company also significantly misweighed grain it sold, thereby allowing it to ship less grain than it was paid for. In addition, water was added to grain inventories, which increased the grain's weight and the company's profits when the grain was sold. The excess moisture also caused spoilage of grain in transit, prompting international complaints. Further, the company paid gratuities to federally licensed grain samplers who worked for a Government contractor. These licensed personnel then allowed the grain company to exchange poor-quality grain samples for samples of a higher quality. The samples were used to prepare "Official Certificates," which are used throughout the grain trade to market grain. End users received poor-quality grain but paid a higher price. Investigative findings of the questionable grain-handling practices prompted lawmakers to increase the level of violations of the USDA Grain Standards Act from misdemeanors to felonies. Subsequent rulemaking severely restricted the addition of water to grain. The 4-year investigation was a joint effort with FSA and the Grain Inspection, Packers, and Stockyards Administration.

FSA Oversight of Certified State Mediation Programs Needs Strengthening

The Secretary of Agriculture has the authority to help States develop certified mediation programs. These programs make a trained, impartial person available as a mediator to facilitate communication between disputing parties to promote reconciliation, settlement, or understanding among them. At the local level, mediation programs may be administered directly by the State. Since 1988, USDA has obligated \$19.7 million for 20 State mediation programs.

Although grant agreements give USDA officials full access to mediation records, OIG was denied access by all four State agencies visited. State officials withheld all records that would identify mediation participants, as well as the final agreement resulting from the mediation. State officials considered such records confidential. As a result, we were unable to fully evaluate the use of Federal funds and the accomplishments of the States. It is important to note that mediation programs are available for a variety of USDA loan and payment programs, which total approximately \$33 billion. Since any borrower or participant in these programs can request mediation services, \$33 billion is the value of USDA funding impacted by the decision to deny OIG access to records.

Through review of the limited records that were provided, we identified \$2.1 million since 1988 in excessive or questionable reimbursements for activities that did not involve mediation. These activities included financial analysis, credit counseling, and other technical assistance for individuals not in mediation. In our opinion, mediation funds should be used to reimburse expenses associated with mediating disputes involving farmers directly affected by USDA actions.

We also reported that the average cost per mediation case for FSA-administered mediation programs was \$537 while the average cost for State-administered programs was \$3,719 per case. In addition, we noted that the total fiscal year 1996 appropriation for the mediation program was \$2 million; however, FSA obligated \$3.1 million to the States and allowed them to carry forward unused amounts to the succeeding fiscal year.

We recommended that FSA (1) withhold grant funds from the four States we visited until records are made available, (2) amend regulations to specify what costs can be claimed for reimbursement, (3) recover \$1.2 million in questionable and unsupported costs, (4) reduce the cost per case for the State mediation program, and (5) stop obligating more grant funds in a fiscal year than are appropriated by Congress. We are working with FSA officials to resolve the issues identified in the report.

Subsequent to the release of our audit report, OGC issued an opinion regarding USDA access to records. The opinion states in part:

—Section 1946.4 of 7 Code of Federal Regulations (CFR) requires that any State requesting a mediation grant comply with 7 CFR parts 3015 and 3016. Section 3015.24 of 7 CFR in turn provides, in part, that USDA and any of its authorized representatives " * * * shall have the right of access to any * * * records of the recipient which are pertinent in a specific USDA award in order to make audit, examination, excerpts, and transcripts."

OGC concluded that FSA should notify the grantees of the regulatory requirements and that continued failure to grant access in accordance with the regulations will be considered a material violation of the grant award under 7 CFR part 3015, subpart n. FSA has notified the grantees of the OGC opinion.

Currently OIG, FSA, and State-administered mediation officials have reached a compromise in our effort to complete a review of the mediation program, and the review is continuing in selected States. Our review objective, for this phase, is limited to determining whether the mediation program is effectively resolving USDA-related issues in accordance with applicable laws and USDA regulations and procedures. This phase is being limited since, in our earlier review, we made recommendations to FSA concerning matters eligible for funding with mediation grant funds. We continue to work with FSA officials to resolve these matters.

Tobacco and Peanut Marketing Penalties Not Assessed

The Omnibus Budget Reconciliation Act of 1993 requires that marketing assessments be collected on imported tobacco, while the Omnibus Budget Reconciliation Act of 1990 requires that producers and handlers remit marketing assessment fees for the sale and purchase of farmer stock peanuts.

Tobacco importers who do not remit the assessment promptly are subject to marketing penalties and late payment interest charges. Over the period 1994 to 1996, potential marketing penalties and interest charges approximating \$123 million were not timely identified and collected. FSA's failure to identify the penalties and interest could result in a material understatement of accounts receivable for the Commodity Credit Corporation (CCC).

While peanut handlers generally remitted marketing assessments timely, FSA did not assess penalties against handlers who remitted the fees, or a portion thereof, late even though the legislation required it. Of the almost 12 million tons of peanuts marketed between 1991 and 1996, assessments were remitted late on 700,000 tons, or 5.8 percent. The unassessed late payment penalties would have totaled \$46.4 million.

For tobacco, we recommended FSA (1) notify the respective importers of their liabilities and give them an opportunity for a hearing, (2) recover the net amount of marketing penalties determined due, (3) ensure that any reductions to marketing penalties are in accordance with legislated mandates, and (4) record accounts receivable in CCC's financial statements for penalties assessed. For peanuts, we recommended that penalties be assessed for late payments. FSA officials are in the process of taking corrective actions.

Improper Conservation Reserve Program (CRP) Scoring Reduces Environmental Benefits of Land Accepted

Under CRP, producers receive annual payments from FSA to take highly erodible cropland out of production and establish and maintain a vegetative cover on it. Last year, FSA opened the program to the fifteenth signup. During signup, producers designated tracts of land that were determined environmentally sensitive, and personnel from the Natural Resources Conservation Service (NRCS) reviewed the tracts and scored them according to values on the Environmental Benefits Index (EBI). One subpart of the index identifies the environmental benefits of the land, such as providing cover beneficial to wildlife, and specifies what numerical scores may be given for the different kinds of conservation practices—planting mixed grasses, legumes, etc.—that the producer established to enhance each benefit. Tracts that have been awarded higher scores are regarded as more worthy of conserving and qualify for CRP consideration ahead of tracts with lower scores. Tracts that fall below a minimum score are excluded from the program.

Our audit disclosed significant inconsistencies in the methodologies used by States when they assigned scores for various conservation factors. Specifically, producers in some States received high scores for preserving cover beneficial to wildlife or for protecting threatened and endangered species even though the required cover or the endangered species were not present on the tracts of land. Such inconsistencies in scoring can result in greater CRP consideration for cropland in one State even though its environmental benefits are no greater than those of its neighboring States.

Our review focused on two environmental benefits of land tracts offered to CRP—providing cover beneficial to wildlife and providing habitat for threatened and endangered species. Additional work was conducted in Kansas because of a complaint about that State's EBI scoring methods. Kansas, like most other States, provided little monitoring of county signups by State NRCS representatives to prevent counties from misapplying EBI criteria.

Nationwide, we reviewed CRP land offers in 55 counties in 17 States. Scoring errors and inconsistencies occurred on 47 percent of the CRP worksheets we verified. Inconsistencies occurred because States unilaterally modified EBI values, awarding 10 points, for example, for a category that allows either 15 points or no points. Errors occurred because some States developed EBI scoring software that was not al-

ways accurate and because some States entered improper values on CRP worksheets.

We recommended that FSA and NRCS (1) provide additional guidance on criteria for assigning points for the environmental benefits we found improperly scored and (2) require field offices to review and correct EBI scoring, based on the additional guidance, before the CRP contracts are signed. We also recommended that software developed for future signups be field-tested for accuracy prior to use. Specifically, in Kansas, we recommended that CRP contracts not be finalized until the offers were reviewed and corrected.

Based on a management alert we issued during our audit, FSA officials issued clarifying information and instituted a second-party review of CRP worksheets for the six counties with the largest number of land offers in each State that had CRP activity. NRCS management also issued a guidance document that addressed some scoring problems noted in our review. USDA also allowed 1 year of payment to producers whose offers were incorrectly accepted due to errors made determining EBI scoring. Due to the large error rate in the fifteenth signup, we have expanded our audit coverage into the sixteenth signup.

Borrowers With Delinquent Farm Loans Received Full Benefit From Other FSA Programs in the Past, but Offsets Are Scheduled

Farm loan borrowers whose accounts were delinquent have continued to get full Government payments from other FSA programs—for example, the Acreage Reduction Program or the Conservation Reserve Program—regardless of their delinquent debt to FSA. FSA did not offset the program payments to reduce the delinquent amounts because it did not have an automated system that could identify delinquent borrowers who were scheduled to receive other program payments. The offsetting was further complicated by procedures—inherited from the former Farmers Home Administration, that allow FSA to apply the offset only after it has “accelerated” the delinquent account—started formal foreclosure proceedings against the borrower.

During 1995 and 1996, FSA made \$72.1 million in program payments to over 4,000 borrowers whose total indebtedness was over \$885 million and who were at least 180 days delinquent on these debts. It had accelerated the delinquent accounts of those who received \$9.7 million of this amount, and it offset only \$3.1 million in payments to those borrowers with the accelerated accounts.

FSA’s procedures regarding offsets were incompatible with departmental procedures. The Department does not require agencies to accelerate delinquent accounts before applying any offsets, and it gives agencies 10 years from the date the debt arose to collect the debt through the offset. FSA procedures required the acceleration and limited FSA to 6 years to collect the debt through the offset.

In response to our management alerts, FSA issued interim regulations on August 1, 1997, authorizing the agency to offset program payments to delinquent borrowers without accelerating the loan accounts and by expanding the collection period to 10 years. We concluded that, with timely implementation of the new rules prior to the final 1997 farm program payments, \$34 million in program payments could be offset from borrowers whose accounts are more than 180 days delinquent.

We recommended that FSA expedite the release of all procedures to implement the new regulation and that necessary actions be taken, manually if necessary, to offset 1997 payments due delinquent borrowers. We also recommended that FSA ensure that its automated administrative offset system will (1) identify delinquent borrowers who are also receiving program payments, (2) provide for an offset of those program payments, and (3) apply the offset to the delinquent account. The agency agreed with the findings and recommendations and initiated corrective actions.

Disaster Overpayments Result from Improper Reporting and Weak Oversight

As part of our nationwide review of FSA’s noninsured crop assistance program (NAP), we reviewed producers’ applications in two counties in California and one county in Alabama. Producers in a designated area are eligible for payments if a natural disaster reduces their crop yields below 50 percent of the expected yield.

In California, we questioned payments in the 2 counties, totaling about \$1.6 million, because 48 of 136 producers we reviewed had overstated their losses. In one of the counties, we also found that the Agriculture Credit Office made loans of \$569,000 to two producers based on possible false certifications which underreported their production. In other cases, FSA made errors which resulted in overpayments of \$88,000 and underpayment of \$8,300.

In the one Alabama county, the county office improperly used State-assigned yields to calculate benefits rather than the producers’ actual production histories. Twenty-six of the 53 producers who applied had received disaster payments from

FSA in 1 or more of the previous 4 years and had production histories on file. Using these histories, we determined the 26 producers were eligible for only about \$23,000 of the \$126,000 determined by FSA.

Since we found that assigning yields, rather than using actual yields, was a State-wide practice in Alabama and also occurred in other States, we recommended to FSA's national office that it base yields on actual production histories. As a result, Alabama halted payments to producers, pending national office instructions. In California, we recommended that FSA broaden the definition of "misrepresentation" to include inaccurate producer reporting that benefits the producer and that measures be taken to strengthen program controls. In all cases, we recommended recovery of overpayments and corrections of underpayment.

FSA Reacts Quickly to Needs of Endangered Livestock in Upper Great Plains

In response to severe winter storms in early January 1997, FSA implemented the Emergency Feed Grain Donation Program to provide immediate assistance to livestock producers in North Dakota, South Dakota, and Minnesota. It also implemented the Foundation Livestock Relief Payment for producers in the three States and other bordering States who needed feed to enhance the diet of foundation livestock weakened by the winter weather. FSA provided about \$25 million in assistance through both programs.

We worked closely with FSA officials during the programs' implementation and provided suggestions on how to address control weaknesses and abuses often associated with emergency programs. Based on our field work in selected locations, FSA issued notices to clarify provisions on producer eligibility and the duration of available assistance.

In June 1997, Congress created the Livestock Indemnity Program to provide about \$50 million in assistance for livestock and poultry losses that occurred between October 1, 1996, and June 12, 1997. We reviewed the program during the sign-up period and found that third-party verification statements were being accepted as evidence of losses instead of documented evidence. We also noted one State's interpretation of eligible loss conditions was inconsistent with national office guidance and noted inconsistencies in program administration between States. We made recommendations to FSA to address these issues. We are making further reviews of eligibility determinations, payment calculations, and spot-checks of livestock and poultry operations.

NATURAL RESOURCES AND ENVIRONMENT

Forest Service (FS)

A former FS employee and a self-employed aircraft broker were recently found guilty at trial of conspiring to steal 28 Government-owned airplanes—22 C-130A cargo planes and 6 P-3A submarine attack planes—valued at up to \$28 million.

The Federal Property Management Regulations administered by the General Services Administration (GSA) allow excess Federal property to be transferred from one agency to another. However, under this program, title to the excess property must remain with the United States Government. Historically, the Air Force has provided used military aircraft to FS, which uses them to fight fires.

Our investigation disclosed that five airtanker-operating companies signed exchange agreements with FS in which they exchanged alleged historic aircraft for either C-130A or P-3A aircraft owned by the United States Government. The C-130A and P-3A aircraft had originally been transferred to FS from the Air Force and the Navy as excess aircraft through the GSA exchange program. Both defendants assisted the airtanker operators in facilitating the aircraft exchanges. Also, both defendants made misrepresentations to officials of GSA, the Air Force, the Navy, and other Federal agencies to accomplish these exchanges. One of the airtanker operators, who received six C-130A aircraft from FS, transferred two of the planes back to the aircraft broker. The broker then transferred these two planes back to the same airtanker operator and received \$450,000. Another airtanker operator, who also received six C-130A aircraft, transferred two of them back to the broker. The broker then transferred title of the two planes to a third airtanker operator in exchange for cash payments and other benefits with a value of \$600,000. Sentencing for both defendants is scheduled next month.

FS Cooperative and Reimbursable Agreements Neither Safeguard Funds Nor Identify Conflicts of Interest

FS is authorized to cooperate and share scientific information and technology with other Government agencies, colleges and universities, businesses, and private landowners. During fiscal years 1994 and 1995, FS awarded \$70.3 million in research grants and agreements to colleges and universities.

We reviewed 33 grants and agreements awarded to 23 recipients by 7 FS research stations in fiscal year 1994. More than one-third of the recipients in our sample did not always comply with Federal assistance regulations, Federal cost principles, or the terms of specific grants and agreements. Noncompliance included not providing sufficient resources to meet the agreement, failing to satisfy cost-share requirements, not obtaining FS prior approval for large purchases of equipment, and not maintaining adequate records to support claims.

We recommended that FS (1) perform periodic national reviews of research grants and agreements and (2) require research stations to periodically review a sample of reimbursement claims from cooperators. FS officials have generally agreed with our findings and recommendations and are developing an acceptable corrective action plan.

Controls Over USDA Environmental Hazardous Cleanup, Abatement, and Prevention Efforts Need Further Assurance Against Liabilities From Land Acquisitions

The Hazardous Waste Management Program was established as a separate USDA appropriation to bring its agencies' past and current actions into compliance with Federal, State, and local environmental standards. Departmental policy provides for the initiation of agricultural and forestry programs that abate, control, and prevent pollution. OIG has assisted the agencies' efforts toward achieving environmental compliance for the facilities they own and operate by reviewing the adequacy of the individual policies, procedures, and actions they have adopted for meeting these standards and requirements.

Over the past 6 years, OIG has reviewed the progress being made in USDA's management and disposal of hazardous chemical, biological, and radioactive materials and provided recommendations to make these efforts more effective and efficient. Eleven USDA agencies are involved in the purchase, exchange, assumption, or sale of lands and perform hundreds of transactions per year. Our immediate concern is to help these agencies avoid the accumulation of further environmental liabilities in the acquisition, management, and disposal of properties under their stewardship.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

Water Quality Incentive Projects (WQIP) Need Clearer Focus

The goal of WQIP is to provide incentive payments to reduce agricultural pollutants through environmentally and economically sound management practices. We found that funding of State and locally identified priority areas did not always increase conservation benefits on the most vulnerable lands. In addition, inconsistencies existed in the methodologies followed by States and local areas to identify and rank prospective projects and to prioritize requests to enroll land. Practice components were not always adequately planned or the most effective for improving water quality because plans did not always address all water quality problems identified, and incentive payments were approved for practices previously implemented or required to comply with the highly-erodible-land provisions.

We recommended that NRCS coordinate with other conservation partners in developing the focus for the Environmental Quality Incentives Program (EQIP) and establish whether EQIP should address all existing resource concerns. EQIP, which was established by law in 1996, consolidated WQIP and three other USDA conservation programs into one program. We also recommended that NRCS develop policy and guidance for EQIP to promote total resource management planning and to prohibit payment for practices that were previously implemented or required to comply with highly-erodible-land provisions. NRCS officials agreed to implement our recommendations.

CONSUMER PROTECTION

FOOD SAFETY AND INSPECTION SERVICE (FSIS)

FSIS User Fees Did Not Fully Cover Cost of Export Inspections

In addition to the basic meat and poultry inspections performed by FSIS, products for export are reinspected to ensure they comply with meat and poultry regulations and specific requirements of the importing country. FSIS performs an estimated 450,000 reinspections of products to be exported which were previously inspected under the normal inspection process. FSIS does not collect user fees for these reinspections.

FSIS could offset the Government's costs of providing export inspection services by collecting additional user fees. For certain services, such as export reinspection and preparation of certain export certificates, FSIS would need congressional au-

thorization to collect user fees. If FSIS were to obtain this authority, some export inspection functions could become self-sufficient, thereby making an estimated \$13.7 million of appropriated funds available annually for other inspection activities. In other areas where user fees are currently authorized and charged, FSIS did not charge for the full cost of the services provided. We estimated that FSIS could collect an additional \$921,000 annually if such fees were adjusted to reflect all associated FSIS costs.

We recommended that FSIS (1) seek statutory authority to assess, collect, and retain user fees for all export inspections/reinspections and for the preparation of the export certificates where such authority does not currently exist and (2) increase the user fees currently authorized and charged for products to be exported to cover the full costs of the services provided. FSIS management agreed with the reported findings and is taking corrective actions.

FSIS Needs To Strengthen Policies and Procedures Over the Progressive Enforcement Action System

FSIS developed the Progressive Enforcement Action system as a tool to monitor meat and poultry plants with continuing food safety problems and bring them back into compliance. However, the current system does not permit FSIS to suspend or withdraw inspection when contaminated products or conditions that may compromise food safety are first detected, even though such authority is provided for in the law and FSIS regulations. The Progressive Enforcement Action system requires inspectors to develop supporting documentation proving noncompliance before they can suspend or move to withdraw inspection. The four plants we reviewed produced 212 million pounds of products under conditions that could have caused contamination. Products included full carcasses of beef and poultry, and poultry for slaughter. FSIS neither took action to suspend inspections of the plants we reviewed nor established specific timeframes during which plants must complete corrective actions. Currently, plants are allowed to remain under progressive enforcement for extended time periods while continuing to produce products under conditions which do not meet food safety standards.

Further, the current system places the responsibility for ensuring plant compliance on FSIS inspectors rather than on plant owners/managers. To comply with requirements contained in the Progressive Enforcement Action guidelines, inspectors must spend an inordinate amount of their time performing inspections and documenting the results. Plant management is required to provide an action plan but is not primarily responsible for ensuring compliance. FSIS' present grant of inspection does not provide for specific performance expectations or standards and does not establish the consequences or penalties for noncompliance.

We recommended that FSIS improve progressive enforcement by developing and implementing procedures to ensure that (1) inspectors refuse or withdraw inspection when conditions that may lead to adulterated products are first detected and (2) specific timeframes are developed for plant management to complete corrective actions in noncomplying plants. We further recommended that FSIS revise (1) its progressive enforcement policies to require plant owners/managers to assume primary responsibility for establishing permanent corrective actions and (2) the grants of inspection to make plant owners/managers responsible for quality of plant operations and compliance with regulations by specifying expected plant performance levels and repercussions for noncompliance.

FSIS management generally agreed with the reported findings and pointed out that publication of the Pathogen Reduction and Hazard Analysis and Critical Control Point (HACCP) final rule has changed FSIS enforcement strategies. FSIS now has specific regulatory requirements for plant-developed and -operated systems for process control and sanitation to prevent direct contamination or adulteration, and these preventive measures are a condition of receiving inspection. Compliance with procedures contained in the Pathogen Reduction and HACCP final rule should address the type of problems we identified.

GRAIN INSPECTION, PACKERS, AND STOCKYARDS ADMINISTRATION (GIPSA)

Investigative Techniques Lacking Against Anticompetitive Practices in Meat Packing Industry

The Packers and Stockyards (P&S) division of GIPSA is responsible for enforcing Federal laws against anticompetitive practices in the meat packing industry. Recent changes in the meat packing industry have resulted in fewer companies controlling an ever-increasing share of the market. This has raised concern among livestock owners and others who depend on the sale of cattle to meat packers at open-market prices. In 1995, the price livestock owners received for cattle decreased sharply

while the major meat packers earned record profits. The perception among livestock owners was that the meat packers were manipulating the price of cattle. The Secretary of Agriculture requested that we assess GIPSA's efforts to monitor and investigate anticompetitive practices.

P&S has performed few investigations of anticompetitive practices in the last few years which have been litigated successfully by OGC. This occurred partly because of the type of evidence available and partly because P&S has not kept pace with the techniques needed to monitor an industry that has changed. The evidence collected through traditional investigative methods is no longer sufficient, by itself, in litigating anticompetitive cases. Additional evidence from economic analysis is now needed, but P&S does not deploy sufficient economic resources in anticompetitive investigations to provide this evidence.

P&S needs to deploy its economists better and obtain additional economic and statistical resources to prepare complex economic models that can demonstrate the adverse effects, if any, of industry activities on open and free competition in the marketplace. P&S also needs to integrate legal expertise into its investigations and consult with departmental attorneys at the beginning of an investigation to ensure that the evidence necessary to litigate a case is collected. Other Federal agencies use teams of attorneys and economists to investigate antitrust violations.

We concluded that P&S needs to restructure its organization, both to place more of its resources in the regions and to redirect staff efforts toward monitoring of the meat packing industry. P&S has several economists on staff but has placed only one econometrician at the full disposal of its investigative staff. P&S' economists should be located at the regional offices, where investigations of anticompetitive practices are performed and where market data is more readily available.

We presented a number of options to P&S to strengthen its operations: (1) reorganize its national and regional offices; (2) integrate its economics staff into the investigations of anticompetitive practices; (3) assess staff qualifications and obtain additional staff with economic, statistical, and legal backgrounds; (4) transfer its economic research activities to another USDA agency; (5) develop procedures to consult with OGC before initiating and during anticompetitive practice investigations; and (6) retain the services of a manager with expertise in all areas of directing anticompetitive investigations or request the U.S. Department of Justice (DOJ) and/or the Federal Trade Commission to provide a manager, on detail, to assist in the reorganization of P&S' functions related to anticompetitive practice investigations.

Since it will take several, if not all, of the above options for P&S to develop an effective investigative staff, the Department may want to consider requesting legislative action to transfer USDA's responsibilities for performing anticompetitive practice investigations to another Federal agency.

Another example of our activity in the health and food safety arena includes:

—In Oklahoma and Texas, OIG and Food and Drug Administration agents are currently conducting investigations involving the adulteration of milk. To date, 12 dairymen and milk truck drivers have been convicted for conspiring to add water and salt to raw milk. It was also found that one driver pumped water directly out of a 55-gallon barrel, which was exposed to insects, bird droppings, and other outdoor elements, into his milk container truck. By adding salt to the water, these individuals evaded quality control detection and defrauded the Associated Milk Producers Incorporated (AMPI), AMPI cooperative members, and the general public. Criminal charges are pending against other identified drivers, and additional investigations involving several other dairymen and drivers are ongoing.

AGRICULTURAL MARKETING SERVICE (AMS)

More Measures Needed To Ensure Dairy Processing Plants Meet Sanitation Standards

AMS has improved its operations by implementing additional monitoring, training, supervising, and reporting measures related to sanitation in dairy-processing plants. However, improvement is still needed to ensure that regulatory agencies are notified of sanitation deficiencies, and increasingly stiffer penalties are needed for dairy processing plants with repeated sanitation deficiencies.

AMS neither reported serious sanitation deficiencies to FDA if the conditions could be corrected quickly nor reported plants which were denied participation in the inspection program because the initial inspection disclosed serious unsanitary conditions. AMS' policy was to notify FDA only when it had withdrawn inspection services from a plant because of serious unsanitary conditions.

We identified three instances where plants were repeatedly ineligible because of unsanitary conditions and appeared to implement only temporary fixes in order to

obtain an approved status. Although the deficiencies were corrected sufficiently during inspections, the corrections were apparently only temporary. Though relatively few plants have this problem, for those that do, AMS needs to implement a system whereby plants are sanctioned for repeatedly failing to maintain acceptable standards or develop procedures to notify regulatory agencies of plants with repeated violations.

We recommended that AMS report all significant sanitary deficiencies identified during plant inspections, regardless of a plant's status, to FDA. We further recommended that AMS develop procedures to notify regulatory agencies when plants have repeated sanitary deficiencies.

AMS officials supported our conclusions and agreed to report all significant unsanitary conditions to FDA, State regulator agencies, and industry trade associations. They also agreed to develop procedures to notify regulatory agencies when plants have repeated sanitary deficiencies.

INSURANCE

RISK MANAGEMENT AGENCY (RMA)

New Initiatives Under the Federal Agriculture Improvement and Reform (FAIR) Act

The FAIR Act authorizes new revenue insurance programs. In 1995, the Federal Crop Insurance Corporation (FCIC) had already approved, for two crops in two States, the Crop Revenue Coverage (CRC) program, a privately developed insurance program that offered alternative coverage to FCIC's multitiered crop insurance. The FAIR Act also provided for phasing in of a single delivery system for catastrophic risk (CAT) coverage. In 1997, this involved transferring over 108,000 CAT policies to 15 private insurance companies in 14 States. In May 1997, the Secretary approved the transfer of all remaining policies. For both programs, FCIC reinsured companies that would service the policies. Through various interim reports, we provided RMA with recommendations to strengthen controls over these new activities. Regarding CRC implementation, we recommended that RMA develop regulations for administering privately developed programs. We also recommended that FCIC amend or establish new reinsurance agreements with the companies to shift additional risk to the private sector and reduce administrative expense reimbursements for CRC in line with other FCIC policies.

Our reviews of the transfer of CAT policies in the first 14 States found a lack of interest by local agents in servicing policies and an unawareness of special provisions to forgo the \$50-per-crop fee for producers with limited resources. For future transfers, we recommended that RMA determine the availability of agents in "local" areas and whether this is adequate. It should also measure the effectiveness of the transfer process in the first 14 States. We also recommended that RMA require reinsured companies to provide information to limited-resource producers on fee-waiver requirements. RMA agreed with our recommendations.

Crop Insurance for Florida Fresh Market Tomatoes Was Not Properly Managed

We audited the 1996 Dollar Plan Fresh Market Tomato Crop Insurance program in Florida and concluded that RMA should take sanctions against reinsured companies in Florida because their servicing of claims filed under the program was poorly managed. All seven indemnity payments we reviewed were improperly made, resulting in questionable indemnity payments of almost \$1.5 million. The companies paid indemnities even though the insureds had (1) abandoned their crops because of low market prices, (2) claimed against losses that occurred after the reinsurance coverage period had ended, (3) planted crops on converted wetlands they had promised to restore to their natural state, and (4) failed to report all production.

We found that the practices and procedures used in administering the insurance program for fresh market tomatoes allow indemnities to be paid to producers who did not experience a loss of commodity but, instead, suffered financial losses due to low market prices. We met with OGC officials and discussed the legality of paying indemnities based on low market prices and no loss of commodity. OGC officials verbally advised us that, to qualify for an indemnity, the insured must suffer a quantity or quality loss of a commodity caused by an insurable peril. We requested a formal, written opinion.

We also found two reinsured companies' sales agents were employed by the policyholders to whom they sold policies that resulted in claims. The agents involved in the conflict of interest received almost \$400,000 in commissions, and one of the policyholders received over \$2.4 million in indemnities on his claims.

We recommended that RMA officials develop a plan of action to ensure that reinsured companies comply with program regulations in their management of the Fresh Market Tomato Crop Insurance Program. In addition, we recommended that

RMA obtain data on all cases where indemnities were paid on fresh market tomato claims where there was no commodity loss and, based on the results of OGC's formal opinion, recover any indemnities that should not have been paid. Other recommendations included one in which we asked RMA to determine what sanctions should be taken against the reinsured companies and the sales agents involved in the conflicts of interest. RMA management generally agreed with the reported findings and is addressing the recommendations.

Errors in Establishing Yields and Adjusting Claims Resulted in Incorrect Indemnity Payments

Our review of 12 California crop insurance claims for 1995 and 1996 identified errors in the calculation of indemnity payments for 8 of the 12 claims. Sales agents, loss adjusters, insured producers, and FSA personnel misstated historical yields, miscalculated appraised production, and inconsistently established insurable acreage and production-to-count. It is to the producer's advantage to overstate historical yields and understate production during a loss year; an overstated historical yield will increase the amount of actual production that can still qualify for indemnities. Of the eight claims we found in error, indemnities for seven were overpaid by approximately \$125,000, and the indemnity for one was underpaid by approximately \$9,500.

We also reviewed the 1995 claims of one cotton producer in Mississippi. The audit identified errors made by the reinsured company in calculating indemnity payments and premiums. In adjusting the loss claim, insurance company officials (1) overstated the number of acres affected by the disaster by 60 acres and (2) understated the producer's prior yield by 157 pounds per acre. The errors resulted in overpaid indemnities of approximately \$32,000; underpaid indemnities of \$4,400; and overpaid premiums of just over \$1,000.

In these two audits, we recommended that RMA recover overpaid indemnities totaling approximately \$152,000; pay \$14,000 to the underpaid producers; and require the reinsured company to credit the insured's account for the \$1,000 premium overpayment. RMA should also ensure that proper adjustments are made to historical yields for policies where errors were identified by our review. RMA management agreed with the reported findings and is implementing corrective actions.

MARKET DEVELOPMENT

FOREIGN AGRICULTURAL SERVICE (FAS)

During this past year, as a result of an OIG investigation, the Government concluded a global settlement with a prominent international grain company in New York and its foreign affiliate. As agreed to by the parties, the grain company paid \$25 million to the United States Government in settlement of any potential civil claims, and its affiliate paid a \$10 million fine after pleading guilty to a criminal charge of conspiracy. In addition, three associated entities agreed to permanent debarment from participation in any Federal programs.

This settlement represented the culmination of a series of investigations conducted by OIG special agents since 1989 into fraud related to USDA's General Sales Manager 102 and 103 Export Credit Guarantee Programs, which were administered by FAS on behalf of CCC.

In 1989, two employees of the Banca Nazionale del Lavoro (BNL), Atlanta, Georgia, branch disclosed to the U.S. Attorney's Office that BNL branch management issued unauthorized loans to foreign governments and exporters. Repayment of some of those loans was guaranteed by CCC under Export Credit Guarantee Programs. The guarantees enabled foreign entities that otherwise could not obtain credit to purchase U.S. farm commodities and products. If the foreign entity defaulted on its loan, CCC paid the holder of the guarantee 98 percent of the unpaid principal and interest.

OIG initiated an investigation after inquiry with FAS revealed that BNL held CCC loan repayment guarantees exceeding \$1.6 billion. The USDA investigators were joined by agents from the U.S. Customs Service, FBI, and IRS, and examiners from the Federal Reserve. The team included Assistant U.S. Attorneys in the Northern Judicial District of Georgia, and various divisions of DOJ's national office, who worked closely with the agents.

In 1991, a Federal grand jury in Atlanta had handed down a 347-count indictment. Named in the indictment were a Turkish-owned corporation, its manager, a bank owned by the Iraqi Government, four Iraqi Government officials, and two former officers and an employee of the BNL Atlanta branch. The indictment alleged that officials of the BNL Atlanta branch, without authority and in disregard of BNL internal policies and procedures, issued more than \$4 billion in loans and credit ex-

tensions to the Government of Iraq. Approximately one-half of those loans involved USDA programs. The ten defendants were charged with conspiracy, mail and wire fraud, money laundering, false statements to USDA, falsification of documents presented to USDA, and other counts.

The Turkish company named in the indictment pled guilty to 20 counts of the indictment, paid \$5 million in restitution to BNL and a \$1 million fine to the U.S. Treasury, and agreed to voluntary permanent debarment from participation in all U.S. Government-funded programs. The three BNL employees named in the indictment pled guilty to various charges. Three additional BNL employees, not named in the indictment, also pled guilty to various charges. The Turkish company's manager and the four Iraqi Government officials remain fugitives, with an unconfirmed report that one of the Iraqi officials has died.

The BNL investigation resulted in numerous spinoff investigations. One of those spinoff cases investigated by the USDA agents resulted in a U.S.-based trading company pleading guilty to charges that it conspired to make false statements to CCC. The trading company paid over \$8 million in restitution to CCC and a maximum fine of \$10,000. The responsible division of the company and three employees agreed to debarment from U.S. programs for periods up to 3 years.

The USDA portion of these investigations resulted in \$38 million of restitution and over \$11 million in fines. These investigations also developed sufficient evidence to allow FAS to cancel \$500 million in additional CCC guarantees requested by Iraq for 1990, saved the American taxpayers even more losses, and led to the debarment of seven parties from participation in USDA and U.S. governmentwide programs.

Changes Are Needed To Improve Delivery and Effectiveness of Humanitarian Aid

FAS and CCC provided \$81 million to the Russian Federation and the Kyrgyz Republic to establish joint commissions. We found that the joint commissions did not operate efficiently and impacted embassy workloads adversely, and funds were misspent. As recommended, the U.S. Department of State issued a protest to the Government of the Russian Federation resulting in the return of over \$6 million to the joint commission from the Russian tax authorities, and the Government of the Kyrgyz Republic agreed to use the funds owed to support the activities outlined in the original agreement. The joint commissions are being terminated.

Commodities Donated to Russia Mismanaged

A U.S. private voluntary organization that was sponsoring the distribution of donated USDA commodities under the Section 416(b) Program was negligent in its sponsorship. It provided little or no management oversight of overseas operations, essentially abdicating its responsibilities to its Russian agent and the Salvation Army.

We found the sponsor's Russian agent misappropriated commodities valued at \$1.5 million. Another \$653,000 in commodities could not be accounted for, and \$2 million in commodities would have ended up "in the streets" of Moscow if the Salvation Army had not paid \$55,000 of its own money to secure storage space. Also, contrary to its agreement, the sponsor did not use half of the approximately \$3.6 million from commodity sales to support humanitarian projects in Russia.

FSA officials were unaware of the problems because the sponsor did not provide adequate logistical reports nor did the sponsor fully comply with its plan of operation and its project proposal. We concluded the sponsor was negligent in its management of the sale and distribution of \$19.6 million in USDA commodities and that it should be debarred from further participation.

FAS officials agreed to require the sponsor to make a full accounting of all commodities and repay USDA for any misappropriated and unaccounted-for commodities. Although they would not debar the sponsor, they agreed to keep the sponsor out of any new programs until all issues raised in the audit are fully resolved.

RURAL DEVELOPMENT

RURAL BUSINESS-COOPERATIVE SERVICE (RBS)

Intermediary Relending Program (IRP) Borrowers Used Loans for Ineligible Purposes

RBS provides IRP loans at 1 percent interest for up to 30 years to intermediary relenders, who reloan the funds at low interest rates to ultimate recipients in rural areas—those areas with populations less than 25,000. Relenders use the income from the recipient loan repayments to cover operating expenses, make loan payments to RBS, and make additional loans. Loan repayments from the recipients are known as second generation funds.

We questioned loans to 21 recipients, totaling almost \$2 million, because (1) relenders made ineligible loans and loans in cities with populations of 25,000 or more, (2) relenders used second generation funds for purposes not in the loan agreement or work plan and for relending in urban areas, and (3) conflicts of interest existed between relenders and ultimate recipients. In addition to the loans we questioned, we reviewed the relenders' annual reports and identified other possibly ineligible or inappropriate loans, totaling \$1.6 million.

Relenders requested and received IRP advance funds from RBS far exceeding the amount necessary to cover a 30-day period. As a result, advance funds were held for periods ranging from 4 months to almost 2 years before being used. Also, relender IRP loan accounts often exceeded the federally insured amount of \$100,000.

In addition, relenders held excessive amounts of IRP funds and were not loaning them timely. Fifteen relenders had rural business loans, totaling \$17.7 million which closed in 1993 and 1994 but had requested advances of only \$1 million or 6 percent. Seven of the 15 relenders, with loans of \$7.7 million, had made no drawdowns of loan funds to reloan to ultimate recipients.

We recommended that RBS (1) recover the funds used for ineligible purposes, (2) revise IRP regulations to state clearly that second generation funds are for rural development and for purposes that meet the eligibility requirements for initial loans, (3) clarify regulations to provide detailed guidelines for making conflict-of-interest determinations, (4) improve procedures for more efficient use of program funds, and (5) improve reporting and monitoring procedures.

RESEARCH, EDUCATION, AND ECONOMICS

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES)

Schedule A Extension Appointees' Rights Need Clarification

There are approximately 8,000 CSREES Schedule A appointees working nationwide in the State Cooperative Extension System (CES). The appointees receive Federal benefits including participation in the Federal Health Benefits program and Civil Service retirement plan. Our review of adverse actions taken against two of these appointees by one State university CES director disclosed that the universities are not always aware that protection, such as counseling and appeals procedures, apply. In this case, the university offered no protection and stated its own policy allowed CES to dismiss the appointees without taking any such actions. OGC provided CSREES with an opinion that these positions fall within the due process requirements of the Merit Protection System. The Merit Systems Protection Board is currently reviewing an appeal by the individuals. OIG continues to support action by CSREES that will inform all CES offices of the appointees' current status and direct them to seek the agency's advice before taking actions that would invalidate these appointments.

EMPLOYEE INTEGRITY

Investigation of serious misconduct by USDA employees remains a high priority for OIG. During fiscal year 1997, OIG issued 82 reports of investigation concerning serious breaches of employee integrity by USDA employees. Our investigations resulted in 21 convictions of current and former USDA employees and 67 personnel actions, including reprimands, suspensions, removals, resignations, and alternative discipline. For example:

—In Kentucky, 12 people, including the FSA County Executive Director (CED), a program assistant, and the FSA building landlord, pled guilty to defrauding three FSA programs of approximately \$850,000 over a 9-year period. All 12 defendants were sentenced to terms ranging from probation to 57 months in jail and were ordered to pay fines and restitution totaling approximately \$607,000. Forfeiture of \$246,350 was ordered against the CED and the building landlord, and both of the FSA employees have been dismissed. The investigation also prevented an additional \$15,500 in funds from being issued by FSA. The multifaceted scheme involved the Feed Grain, Disaster, and Tobacco Programs. The two FSA employees falsified documents, enabling the coconspirators to receive payments they were not entitled to, and, in return, approximately half the proceeds were given to the CED. The numerous checks were made payable in the names of the various coconspirators and to fictitious names. Of the 12 who pled guilty, only 1 was a farmer. In addition, the CED and the building landlord conspired to steal Burley Tobacco Marketing Cards and tobacco poundage quotas from various farms. The proceeds were laundered through a business account belonging to the building landlord. We were assisted in this investigation by the FBI.

—A Texas FSA program assistant who was charged with theft and embezzlement of more than \$945,500, confessed and pled guilty, and was suspended without pay pending conclusion of the criminal action. The employee had created numerous false loans, altered several CCC checks to bear her name, forged the signatures of two FSA county supervisors on the CCC checks, and deposited several CCC loan and program payment checks into her personal bank account. Our investigation determined the employee used some of the fraudulent loans to pay off other fraudulent loans in order to keep the scheme active. The actual dollar loss to the Government was approximately \$286,400. Sentencing is pending.

ADMINISTRATION

The Department's Backlog of Discrimination Complaints Has Increased; Greater Technical Assistance is Needed for Loanmaking and Loan-Servicing

As requested by the Secretary, we reviewed the backlog of complaints made by disadvantaged and minority farmers. We issued a report in February 1997 that detailed the staffing problems, obsolete procedures, and lack of direction from management that resulted in a backlog of 530 civil rights complaints within the Department. During the second phase of our work, we found that the backlog had increased from 530 to 984, as of August 1997. In FSA alone, the backlog nearly doubled, increasing from 241 to 474.

Although an ad hoc team was formed in April 1997 with the goal of eliminating the backlog by June 1997, the Office of Civil Rights (OCR) found that the complaints had never been properly investigated. As a result, the ad hoc team was disbanded without accomplishing its goal. We believe additional efforts are needed by ad hoc teams, under the direction and control of OCR, to help address the backlog of complaints. Further, we think the task of performing preliminary inquiries on FSA complaints should be performed by OCR investigators, who can be more objective and independent than FSA employees in performing the task.

The Secretary also asked us to review a broad range of issues concerning program participation by minorities. For this review, we selected 11 States and 33 counties to determine if FSA provided sufficient technical assistance to help minority farmers apply for and receive farm credit loans and if FSA processed minority farm loan applications and serviced minority accounts in the same manner as for nonminorities. Our review disclosed the following.

—FSA needs to provide greater technical assistance during the loanmaking and loan-servicing processes. One of the greatest frustrations to applicants is the extent of the information needed to complete the multiple documents for financial assistance. Statewide data for the 11 States reviewed showed that it took minorities and nonminorities about the same number of days, on average, to get their applications processed from receipt to loan closing. However, in certain locations, it took minorities longer than nonminorities to complete an approved application from receipt to completion status. At certain locations, disparities were noted in the number of multiple servicing decisions provided to nonminority farmers compared to the number provided to minority farmers. In those locations, the percentage of accounts that were delinquent was higher for minorities than for nonminorities.

—FSA could improve its relations with the minority community by better targeting its outreach efforts, upgrading the status of its minority advisors, and increasing its work force diversity at the local level. The field offices visited used traditional means to reach out to minority farmers, relied on 1890 Land Grant colleges to promote their programs for them, or were satisfied with the status quo and awaited guidance from headquarters.

County officials told us that outreach has been a pointless exercise in recent years because funding for loans has been unavailable. However, we found that during fiscal years 1992 through 1996, \$557 million in available loan funds nationwide was allowed to expire and was never obligated. Most of these funds, approximately \$542 million, were available in fiscal years 1992 and 1993.

—Concerning FSA's fund allocating decisions, the agency needs a recordkeeping system to account for its unspent direct operating loan funds which are redistributed to States from a national reserve account. FSA's current practice of "pooling" and redistributing its unspent direct operating loan funds does not always follow the normal "first-come, first-served" procedure. We also believe that socially disadvantaged applicant (SDA) direct operating loan funds should be "pooled" along with non-SDA funds that are sent to the national reserve account for redistribution. Pooling of SDA funds, however, will require a legislative change.

The Secretary also asked us to determine the degree of participation in farm credit programs by minority farmers. We attempted to make direct correlations between FSA's direct loan portfolio and Government census data but were unable to make any meaningful correlations. Neither the general population census or the agricultural census identified the number of individuals in the business of farming. Further, the FSA portfolio itself may contain borrowers who are still indebted to FSA but are no longer farming.

We did compare the applications received and approved from minority and non-minority farmers for the sites visited. We found that, during fiscal year 1996, the loan service centers that serviced the 33 targeted counties received 1,416 applications for direct loans; 317, or 22 percent, were submitted by minority applicants and 1,099, or 78 percent, were submitted by nonminority applicants. A total of 190, or 60 percent, of the minority applications were approved, whereas 729, or 66 percent, of the nonminority applications were approved.

We recommended that the Secretary seek changes to legislation which will allow FSA to "pool" SDA direct operating loan funds and allocate the funds to States instead of allowing them to expire. We also recommended that the Secretary (1) convene ad hoc teams to help address the backlog of civil rights complaints in the Department and (2) revoke the delegation of authority that granted FSA responsibility to conduct preliminary inquiries and return this authority to OCR.

We also recommended that the Secretary direct FSA to provide greater technical assistance to farmers for the entire application process and throughout loan-servicing, establish effective methods of outreach, and develop standards and benchmarks by which to evaluate outreach performance.

The Secretary has requested the Acting Assistant Secretary for Administration to work closely with OIG to ensure that the recommendations are promptly implemented.

ACCOUNTING, FINANCIAL, AND INFORMATION MANAGEMENT

Financial Statement Audits

As required by the Chief Financial Officers Act of 1990 and the Government Management Reform Act, we completed seven financial statement audits. We issued unqualified (clean) opinions on the fiscal year 1996 financial statements of the Federal Crop Insurance Corporation and the Rural Telephone Bank. Audits of the Rural Development mission area and FNS resulted in qualified opinions. Rural Development received a qualified opinion because we were unable to assess the reasonableness of its estimated loan subsidy costs for loans obligated after fiscal year 1991. FNS received a qualified opinion because we were unable to assess the reasonableness of its gross, non-Federal accounts receivable for the Food Stamp Program and the related account balances, and notes to the financial statements. We issued a disclaimer of opinion on FS, CCC, and USDA consolidated statements for fiscal year 1996.

FS received a disclaimer because it was not able to produce auditable financial statements in a timely manner for the year. We are working with FS in a coordinated effort towards correcting weaknesses addressed by our prior audit reports. Corrective action plans have been developed, and significant progress has been achieved in cleaning up invalid accounting data. Through consulting services and monitoring reviews, we continue to help FS personnel implement applicable accounting standards and improve accountability.

CCC received a disclaimer of opinion due to a scope limitation resulting from restrictions imposed on our access to necessary records. Our initial review of FSA's mediation program indicated a variety of program abuses. When we attempted to determine the scope and materiality of irregularities and expand our review to three additional State-administered programs, officials in the States denied us access to the mediation records needed for our assessment. FSA's management asserted that the records available for our review in its State offices were sufficient when, in fact, they were not and did not aggressively assist us in resolving the encumbrance. Because management within FSA has a significant role in CCC's internal control structure, the actions taken to deny our access to records needed to assess compliance with applicable laws and regulations caused us to question the representations by CCC's management.

The USDA consolidated statements received a disclaimer of opinion because the Department could not provide assurance that its consolidated statements were presented in accordance with applicable accounting principles. This lack of assurance was primarily due to (1) FS' inability to provide the Department with complete, auditable financial statements and (2) the Department's inability to provide assur-

ance that, as a whole, its internal control and financial management systems comply with requirements under the Federal Manager's Financial and Integrity Act.

INFORMATION RESOURCES MANAGEMENT

Department Progressing with "Year 2000" Conversion

The "Year 2000" date conversion crisis poses a significant challenge to all users of affected information technology. Every organization, whether Federal or private, must ensure that its information systems are fully Year 2000 compliant well before December 31, 1999, or risk catastrophic failure of those systems. The Office of the Chief Information Officer (OCIO) serves as the Department's focal point for addressing Year 2000 issues.

We initiated a review to assess the readiness of USDA agencies and service centers to achieve Year 2000 computer compliance. This review will encompass a determination as to whether agencies have (1) established an overall strategy; (2) prioritized the conversion or replacement of certain systems and/or hardware, including system interfaces; (3) a strategy to convert, replace, or eliminate certain hardware and software, including operating systems software and application software; (4) a strategy to test, verify, and validate converted or replaced systems; (5) devoted sufficient resources to accomplish the plan and prioritized critical systems and activities; and (6) a contingency plan for critical systems and activities.

Generally, we have found the agencies we have examined thus far have initiated actions to address their individual Year 2000 conversion projects. We have, however, found areas for improvement at four USDA agencies visited and have reported those matters to them. For example, USDA agencies, under a departmentwide contract, purchased a large number of personal computers which were found to be Year 2000 incompatible. The particular vendor sold various types and configurations of computers, totaling approximately \$31.6 million, to 10 USDA agencies. These findings and others have been provided to the affected agencies in interim reports, and the agencies have responded to our recommendations. Our audit of the Year 2000 issue continues, and we will issue a report early in 1998.

On a personal note, I am pleased to report that OIG is Year 2000 compliant.

CONCLUSION

This concludes my statement, Mr. Chairman. As you can see, the work of OIG is far-reaching and expansive. I appreciate the opportunity to appear today and present this information, and I hope that my comments have been helpful to you and the Committee. I will be pleased to respond to any questions you may have at this time.

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

NONDEPARTMENTAL WITNESSES

The following testimonies were received by the Subcommittee on Agriculture, Rural Development, and Related Agencies for inclusion in the record. The submitted materials relate to the fiscal year 1999 budget request for programs within the subcommittee's jurisdiction.

PREPARED STATEMENT OF THE AD HOC COALITION

Mr. Chairman, Members of the Subcommittee, this statement is respectfully submitted for the hearing record on behalf of the ad hoc coalition¹ supporting fiscal year 1999 appropriations of not less than \$244.5 million for title I of Public Law 480, the same level as provided in the current fiscal year.

The ad hoc coalition also strongly supports the administration's request that \$109 million of CCC funds be used to support Food for Progress in fiscal year 1999, and that the program level for Public Law 480, title III, be maintained at \$30 million for the fiscal year. The coalition also supports full funding for title II at the level requested by the Administration. Using carryover funds, title I programs can be increased by maintaining appropriations of budget authority at fiscal year 1998 levels.

In its fiscal year 1999 budget, the Administration without explanation recommends a title I program level of only \$112 million, a drastic decline to less than one-half of that established for the current fiscal year. While acknowledging the importance of title I in promoting long-term markets for U.S. agriculture, the Administration fails to recommend the resources required to do the job. At a time when U.S. agricultural exports are declining, the Department should increase its efforts, with strong Congressional support, to alleviate hardships in friendly countries and promote new markets for our farmers.

LONG-TERM SIGNIFICANCE OF PUBLIC LAW 480

Mr. Chairman, the title I program has an illustrious history. From enactment in 1954 until the mid-1960's, title I shipments accounted for about 20 percent of the annual value of all agricultural exports. Until foreign sales dramatically increased in the 1970's, title I shipments continued to represent more than five percent of all agricultural exports. As recently as fiscal year 1990, moreover, title I export values regularly exceeded \$700 million. Only in recent years has the U.S. commitment to this program eroded substantially, to a low of \$202 million in title I credit sales in fiscal year 1997.

Under the leadership of the Agriculture Appropriations Subcommittees of the Congress, funding for title I was modestly increased in fiscal year 1998, and the Ad-

¹The ad hoc coalition is composed of the USA Rice Federation, the National Association of Wheat Growers, the National Council of Farmer Cooperatives, the American Soybean Association, the American Maritime Congress, the Maritime Institute for Research and Industrial Development, the Transportation Institute, Gulfoast Transit Company, and Liberty Maritime Corporation.

ministration's estimated program level for this fiscal year currently stands at \$245 million. This funding will permit the shipment in fiscal year 1998 of 1.2 million metric tons of grain equivalent, up from a low of 900,000 metric tons in fiscal year 1997.

Mr. Chairman, the export subsidy reduction commitments established in conjunction with the Uruguay Round Agreement on Agriculture severely restrict U.S. flexibility in agriculture export market development. Those commitments curtail the use of the Export Enhancement Program and similar strategies that might be implemented in the future. But Food for Peace is exempt from the Uruguay Round restrictions: Public Law 480 remains one of the principal programs for penetrating new overseas markets, for establishing trading relationships that will surely become essential to the economic survival of our agricultural sector.

In the two decades following World War II, Food for Peace was instrumental in securing long-term, stable markets for American food and fiber. In fiscal year 1996, U.S. agricultural exports reached a record value of \$59.8 billion, representing more than 25 percent of total farm cash receipts for crops and livestock. In that year, the U.S. share of the global agricultural export market reached 23 percent, an increase of more than one-third in a single decade. But the record level achieved in fiscal year 1996 was no more than a snapshot of conditions at a given moment in time. The current picture is troubling: pessimistic forecasts for agricultural trade in fiscal year 1998 require enhanced effort, a renewed dedication to the principles of market development.

FISCAL YEAR 1998 OUTLOOK FOR U.S. AGRICULTURAL TRADE

Mr. Chairman, the Foreign Agricultural Service on February 27, 1998, reported that fiscal year 1998 agricultural exports are forecast to decline by \$1.3 billion from fiscal year 1997 levels, and that exports will fall \$3.8 billion below the record established in fiscal year 1996. The reasons for the falloff in U.S. foreign sales are increased competition in corn markets, weaker prices for grains and soybeans, and reduced Asian demand due to the current financial crisis.

Agricultural export volume is forecast to reach 149.2 million metric tons in fiscal 1998, up 1.9 million tons from 1997 but about 20 million tons below the record established in 1995. In terms of bulk commodity sales, the value of U.S. exports in fiscal year 1998 is expected to fall \$1.6 billion to \$22.5 billion, largely due to lower prices and export volumes for corn, and lower wheat and soybean prices. According to FAS, increased export competition from China and Eastern Europe is reducing U.S. corn sales, while South American competition is being felt in the world soybean market.

In the former Soviet Union and other emerging market economies, important new opportunities for sales of U.S. agricultural commodities will emerge in coming years: The United States must compete aggressively for these markets. For the duration of the current economic crisis in East Asia, America must maintain export volumes and market share.

The Foreign Agricultural Service of the U.S. Department of Agriculture, in administering Food for Peace, will be instrumental in protecting existing markets and developing potential new markets. Through sustained title I funding, Congress must give the Department the tools it needs to do the job.

USDA SHOULD BE DIRECTED TO USE TITLE I RESOURCES

Mr. Chairman, the ad hoc coalition strongly recommends a fiscal year 1999 appropriation for title I of Public Law 480 of not less than \$244.5 million, the level provided in fiscal year 1998. Using carryover funding from prior fiscal years, increased program levels can be achieved without diverting resources from other worthwhile programs of the Department.

On February 26, 1998, the Foreign Agriculture Service announced its revised Second Quarter country allocations for title I funded programs in the amount of \$227.8 million. This is substantially below the Department's established program level of \$245 million for the current fiscal year. The newly independent states of the former Soviet Union, together with a number of Eastern European countries, are prime candidates for increased concessional credit sales under title I of Public Law 480. The Department of Agriculture should be encouraged to promote this program throughout the world, both for humanitarian reasons today and for the development of foreign markets in future years.

Mr. Chairman, the ad hoc coalition respectfully requests report language accompanying the fiscal year 1999 funding bills which would direct the Department of Agriculture to increase title I country allocations and make full use of the resources available for this worthwhile program. Working closely with the representatives of

recipient countries, we are confident that USDA can restore title I program levels to those most recently achieved in fiscal 1996.

CONCLUSION

Mr. Chairman, the administration has long acknowledged the importance of title I of Food for Peace as a program to promote long-term markets for U.S. commodities, and to alleviate hardship in friendly countries. But the administration suggests a title I program level for fiscal year 1999 of only \$112 million, a drastic decline to less than half that established for the current fiscal year.

With enactment of the 1996 farm bill, Government price supports and producer payments are being phased down. As a result, agricultural producers have become increasingly dependent on export markets to sustain a healthy economy. The title I, Public Law 480 program, coupled with the other export programs, have become of even greater significance than ever before in meeting this objective, sustaining the many allied industries dependent upon a healthy agricultural economy, as well as providing valuable humanitarian assistance to developing countries.

The members of the ad hoc coalition respectfully request an appropriation of not less than \$244.5 million for the title I program and committee report language directing the Department of Agriculture to establish a program level for the title I program that makes full use of this appropriation and the carryover funds. The need is there. We also request that the Agriculture Appropriations Subcommittees of Congress closely monitor the performance of the Department in fulfilling this objective over the course of the fiscal year.

Our farmers and the U.S. maritime transport system depend upon Congress to set the standard, and upon the Department to meet that standard, as we enter an era of uncertainty and volatility in trading relationships. The title I program of Food for Peace must be preserved and effectively employed to promote American interests in an environment of uncertain markets and increasing global competition.

PREPARED STATEMENT OF THE AMERICAN ASSOCIATION OF RETIRED PERSONS

The American Association of Retired Persons appreciates this opportunity to comment on appropriations next year for various programs which benefit the low income elderly in rural America. Initiatives such as Section 515 Rural Housing Loans and Section 504 Very Low Income Home Repair Grants and Loans make a real difference in the quality of life for many elderly Americans.

AARP's recommendations may be summarized as follows:

- Provide at least current funding for Section 504 Very Low Income Home Repair Grants and Loans;
- Maintain Section 515 Rural Housing Loans at current level;
- Provide the Administration's recommended increase for Section 521 Rental Assistance; and
- Provide sufficient resources for Food Stamp outreach activities.

POVERTY AMONG RURAL OLDER PEOPLE

Some of the nation's most persistent economic, housing, and health problems are concentrated in rural areas among older people. In 1996, older people living in nonmetropolitan areas had a poverty rate over 13 percent, compared with approximately 9 percent for those living in other areas. Poverty increases with age, rising to a rate of more than 25 percent for rural Americans who are 85 and above.

Economic problems are particularly severe among older minorities and among rural women living alone. When these factors are combined, poverty is nearly universal. According to the 1995 American Housing Survey, 36 percent of all nonmetropolitan households consisted of older women living alone. Especially hard hit are older minorities living in areas where poverty is highly concentrated. Among rural Americans age 65 and older, the poverty rate in 1996 was 34 percent for Hispanics and nearly 40 percent for those of African descent. Poverty rates are higher among elderly households in the southern U.S.—23 percent—compared with approximately 17 percent in other parts of the country.

The Association urges special attention to the plight of older migrant and seasonal farmworkers. Working and living conditions, which are generally bad for farmworkers of all ages, are abysmal for older workers. Earnings for those over age 65 continue to be far below the poverty threshold, and many receive no Social Security or other benefits. Not surprisingly, farmworkers often experience problems characteristic of the elderly before reaching their fiftieth birthday. Disability levels are

disproportionately high. Unfortunately, access to needed services has often been blocked by prejudice, language barriers, and a lack of outreach activities.

RURAL HOUSING

One result of high rates of rural impoverishment is a striking concentration of housing problems among rural older people. Data from the 1995 American Housing Survey indicate that 39 percent of older households living in moderately or severely inadequate housing reside in rural areas, though only 28 percent of all older households live in rural areas. To address the needs of these older households and other vulnerable populations, it is critical that federal housing programs targeted to rural America be continued and strengthened.

For Section 515 Rural Housing Loans, AARP urges at least a freeze next year at the existing \$150 million loan level. We also support the Administration's recommended increase in Section 515's companion program: Section 521 Rental Assistance (from \$541.3 million to \$583.3 million). Loans made under the Section 515 program have decreased substantially over the past few years—down from more than \$500 million in fiscal year 1994 to the current \$150 million. Demand for both new construction and rehabilitation far exceeds available resources.

The Administration's recommended \$50 million cut next year for Section 515 would push funding to the bare minimum required to continue a national program. Trade-offs will be necessary between badly needed new construction and rehabilitation loans to maintain current stock. Section 515 is the only federal program to target funds directly to rural areas for rental housing production. Half of these loans have historically gone to provide housing for the elderly poor and disabled tenants of all ages. More than half of older renters living in rural areas spend at least 30 percent of their income on housing. Given the extreme poverty which exists in many rural areas, the availability of such housing is vital for many families.

AARP recommends that more emphasis be placed on the development of congregate facilities and on the retrofitting of existing Section 515 projects. Because of the scarcity of social services in many rural communities, congregate housing projects which provide nonmedical assistance such as meals, housekeeping and transportation can be especially crucial to the independence of frail older residents.

AARP further recommends that greater attention be given to initiatives which provide affordable housing to remote rural areas and areas with large concentrations of underserved populations such as older and disabled farmworkers. We also support funding for the program for migrant workers and rural homeless people. Migrant workers tend to be older than other farmworkers and are more likely to be minorities with extremely low incomes. Farmworker housing very often has no heat or running water, creating barely tolerable living conditions for most families and a health-threatening situation for older persons.

The Association appreciates the Subcommittee's continued support of the Section 504 Very Low Income Home Repair Program. Funds are used to remove safety and health hazards for the elderly poor or to install basic necessities such as indoor plumbing. We support the \$25 million assumed in the Administration's budget for Section 504 grants, contingent upon congressional approval of the funding request for Rural Housing Assistance. We recommend that Section 504's loan component be maintained at the existing \$30 million. The Administration recommends a \$5 million reduction. The Very Low Income Home Repair Program makes a tangible difference in the quality of life for elderly Americans. Cuts made here really do hurt those most in need.

FOOD STAMP OUTREACH ACTIVITIES

Many older people in rural areas also suffer from nutrition-related health problems because they are economically unable to maintain a good diet. All too often, these individuals are forced to limit food purchases in order to manage the increasing costs of other necessities such as medical care, housing, and energy.

Food Stamp benefits can be a lifeline for such families but participation rates remain low due to a lack of information about the program or distance from Food Stamp offices. The social and physical isolation of rural older people makes outreach activities difficult but all the more critical. We urge the Subcommittee to provide sufficient resources for outreach activities next year.

Thank you again for the opportunity to present our views on rural housing and food stamps. We look forward to working with the Subcommittee to improve the lives of rural Americans of all ages.

PREPARED STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION

FARM BILL IMPLEMENTATION

Farm Bureau supports continuation of the principles of the Federal Agriculture Improvement and Reform Act (FAIR).

Full implementation of the FAIR Act should not be compromised. As you know, the FAIR Act set agriculture on a seven-year course that reduces income supports by establishing a hard cap on total spending regardless of prices or the volume of production. Agriculture's support for the FAIR Act was based upon the promise and assurance given that it was a seven-year contract between the federal government and agricultural producers. Accordingly, any change in current policies and programs would represent a violation of that agreement.

Farm Bureau believes in free and open movement of markets and prices. We oppose the Administration's program to extend non-recourse crop loans for an additional six months. While an extension would be budget neutral when market prices are well above loan rates, the potential for high costs exists if producers store their crops under loan for an extended period of time causing burdensome supplies to depress market prices.

We support the Commission on 21st Century Production Agriculture and urge sufficient funding to ensure that the Commission will be able to conduct a thorough evaluation of the effectiveness of the FAIR Act and potential agricultural policy alternatives. In just four years, Congress will again need to address agricultural policy and the recommendation of the Commission will be important to that activity.

RISK MANAGEMENT

Farm Bureau places a high priority on the development of risk management tools to supplement or provide an alternative to traditional crop insurance.

The expansion of risk management programs is of importance to farmers and ranchers. Farm and ranch income is increasingly at risk due to the phase-out of traditional price and income support programs. New and innovative tools to manage risk are needed by farmers everywhere.

We support the continued expansion of new risk management tools that may be offered by private companies and reinsured by the federal government. To the extent that those programs are actuarially sound, we believe they should be expanded to cover as many crops as is feasible.

CONSERVATION PROGRAMS

Farm Bureau places a high priority on funding for voluntary incentive-based conservation programs.

Conservation funding is an integral component of the nation's overriding food and natural resource policy. Farmers and ranchers respond to positive incentives that enable them to: improve soil, water and air quality; reduce erosion; provide additional wildlife habitat; and increase green space. Because conservation projects can be very costly to implement, priority should be given to initiatives that provide education, technical assistance, training and financial assistance to accomplish the nation's farm and resource policy objectives.

We oppose all user fees for conservation programs. Conservation programs are often costly to implement and benefit everyone, not just farmers and ranchers. Public policy should encourage farmers and ranchers to increase conservation efforts, not place additional impediments to their efforts.

We are concerned that while the Administration has proposed increasing the National Resource Conservation Service (NRCS) budget, the net effect may be a decrease in NRCS staff that work directly with farmers and ranchers because the Administration budget does not provide funding for increased NRCS workload and administrative costs. Congress should appropriate funds so that programs which benefit farmers and ranchers and the environment are maintained and expanded.

The Environmental Quality Incentive Program (EQIP) is an important program that strives to improve water quality. The program should be available to all producers, regardless of size of operation. We support increased funding for EQIP, but it should not come at the expense of other agricultural programs or through user fees, including user fees for NRCS technical assistance.

Farm Bureau continues to be a strong supporter of the Conservation Reserve Program (CRP). We are concerned that increased emphasis on the Conservation Reserve Enhancement Program will detract from the traditional CRP program and its goals. The focus of the program should not be broadened to the point that it loses its effectiveness in meeting soil conservation and water quality goals.

We support continued funding for the Forestry Incentive Program (FIP) at \$6 million. Private forestry is an important part of American agriculture and makes a strong economic contribution to the nation's economy. FIP has played an important role in reforestation efforts and is strongly supported by the agricultural community and maintains strong congressional support.

Farm Bureau continues to support the goals of the Grazing Lands Conservation Initiative. The program allows farmers and ranchers to accomplish further conservation and environmental gains without compromising net farm income by providing technical assistance.

FOOD SAFETY AND INSPECTION

Farm Bureau supports the modernization of food safety and inspection programs.

No group is more concerned about food safety than farmers and ranchers. USDA programs that keep food safe as it moves from farm to market and those that monitor the safety of consumer ready products are very important.

Meat and poultry inspection is a public health function mandated by public law which should be paid from the general fund. We oppose user fees to finance federally-mandated meat and poultry inspection. In general, user fees are not passed onto the consumer, but rather are passed downward to producers in the form of lower prices paid for livestock. If the fees are passed onto consumers, they would be a food safety tax.

Farm Bureau supports adequate funding to implement Hazard Analysis Critical Control Point (HAACP) meat and poultry inspection reforms. We are concerned about the impact on smaller processors and ask that an unreasonable burden not be placed on these plants.

Farm Bureau supports USDA funding for the Pesticide Data Program (PDP). PDP provides valuable pesticide residue information to the Environmental Protection Agency so that chemical registration decisions can be made on actual pesticide residues rather than on presumed maximum possible residue levels. This program should remain within USDA because it has the scientific expertise and working agreements with state agencies to effectively administer this program.

Improper implementation of the Food Quality Protection Act may force the unnecessary and unwarranted cancellation of essential crop protection products. The USDA Office of Pesticide programs should provide advocacy for farmers' continued access to safe and effective crop protection products, and must be adequately funded to perform this important task.

Key functions of the office must include assisting EPA in establishing accurate data for risk assessments where current data is inaccurate or incomplete. USDA must be a full partner with EPA in all key implementation policy decisions. To reduce disruption of U.S. agricultural producers, USDA should conduct an economic impact analysis of proposed EPA implementation strategies, including EPA's proposals relating to risk assessments for organophosphate and carbamate.

Also important is funding for USDA to update its database on human food consumption patterns. The Food Quality Protection Act requires EPA to evaluate the total risk associated with pesticide use. To do this, accurate information on human diets is needed. Funding to keep this information current should be a priority.

The Food Animal Residue Avoidance Database (FARAD) has been an invaluable tool for veterinarians and producers in assuring the proper use of animal health products. It is an important cog in our overall food safety assurance effort. Funding is needed to allow it to continue to operate.

AGRICULTURAL RESEARCH

Farm Bureau places a high priority on funding for research which is focused on food and production agriculture.

Agricultural research, education and extension activities should be focused on improving the performance of the food and agriculture sector. The benefits of this research will accrue not just to agricultural producers, but also to the general public. The food and fiber needs of a growing world population can be met only if there is a sharp focus on securing answers to questions challenging production agriculture.

Innovative research depends upon the availability of modern facilities. Many of the major Agricultural Research Service facilities were constructed prior to 1960 and are now functionally obsolete and in need of major modernization to bring them up to current health and safety code requirements. A total of \$35.9 million is needed in fiscal year 1999 to update and modernize numerous facilities nationwide.

Increased funding for the National Research Initiative Competitive Grants Program and the Food Genome initiative are important.

Farm Bureau supports allowing the Agriculture Research Service to regain ownership of the National Swine Research Center. This center will conduct essential research to resolve the odor and water quality issues facing the pork industry and will integrate production issues with nutrient management.

Increased funding for the National Research Initiative Competitive Grants Program and the Food Genome initiative are important.

INTERNATIONAL MARKET DEVELOPMENT

Farm Bureau supports programs to maintain and expand foreign markets for agricultural products.

Farm Bureau places a high priority on export promotion programs, especially given the current Asian economic crisis. Foreign sales continue to provide a market for 30 percent of U.S. agricultural production. Passage of the 1996 farm bill has increased the significance of overseas markets to farm and ranch profitability as farmers and ranchers become more dependent on exports to expand their incomes.

The Market Access Program (MAP) supports the development, maintenance and expansion of commercial agricultural export markets by partially reimbursing participating organizations for the costs of carrying out foreign market development activities in designated countries. This program is more important than ever because the FAIR Act phase out of commodity programs increases the importance of export markets and because new markets must be found to make up for export markets lost due to the Asian financial crisis.

Maximum funding for the Market Access Program (MAP), the Foreign Market Development Program, the Export Enhancement Program (EEP) and Dairy Export Incentive Program (DEIP) are critical to maintaining and expanding foreign export markets. Funding provided for EEP and DEIP should be \$320 million and \$82 million, the maximum allowed. Stable funding for MAP, at \$90 million, will allow that program to continue to expand markets.

Farm Bureau also supports stable funding for Public Law 480 programs which finances sales of agricultural commodities to developing countries for dollars on credit terms or for local currencies. The needed appropriation for Public Law 480 grants I and II is estimated at \$949 million for fiscal year 1999.

The Overseas Private Investment Corporation (OPIC) should be funded at no less than last year's levels to guarantee access and investment in developing countries and territories. Because OPIC targets emerging markets for American products, the program provides access to markets with the greatest potential for growth.

We support the flexibility to maximize the use of available resources by allowing funds not utilized for direct export subsidies to be made available for other GATT-allowed or "Green Box" programs (including market development, research and promotion).

Last year's appropriations bill prohibited the use of MAP funds for promotion of mink in international markets. We believe that no agricultural commodity should be discriminated against in allocation of MAP funding. The only criteria should be the potential to increase sales of agricultural products and the availability of funds.

ANIMAL AND PLANT HEALTH

Farm Bureau places a priority on programs that protect plant and animal health.

The Animal and Plant Health Inspection Service (APHIS) must be adequately funded to meet the high demands of protecting the nation's agriculture industry and its role in maintaining consumer confidence in the safety of the U.S. food supply.

APHIS must have state-of-the-art diagnostic and processing procedures to ensure plant and animal health and to guarantee the safety of agricultural imports and exports. Funding for diagnostic tests, vaccine development, disease surveillance and emergency preparedness must be increased as we increase international trade. Important to this effort is funding for such programs as Animal Health Monitoring and Surveillance.

Farm Bureau continues to support eradication of the boll weevil and requests full funding to provide a 30 percent match with producer funding. USDA should continue to work with the Boll Weevil Eradication Program to collect funds from farmers, certify cotton acreage, assist in conducting referendums and make maps available. We also ask for increased availability of low interest revolving loan funds to facilitate expansion of the program.

The President's operating budget for APHIS Wildlife Services is \$26.1 million, a reduction of \$2.5 million from fiscal year 1998. These cuts would reduce levels of animal damage control funding in 28 states. We recommend funding at the fiscal year 1998 level of \$28.6 million.

The President's budget for Wildlife Services Methods Development (Research) is \$9.7 million, a reduction of \$855,000 from fiscal year 1998. If this level of funding were adopted, one of the casualties would be the National Trap Testing Program which tests trap types to determine the most humane design while maintaining efficiency. Funding should remain at the level of fiscal year 1998 of \$10.2 million.

Congress authorized the construction of a \$37.7 million Wildlife Services Wildlife Research Center in Fort Collins, Colorado. A appropriation of \$20.5 million should be provided to complete this project.

The present Wildlife Services Management Information Reporting System is outdated, uses obsolete hardware and is limited in the amount of data it collects. Funding of \$700,000 should be provided to for implementation of a new system.

With the expansion of wolf numbers and areas where they are dispersing, the Wildlife Services wolf management budget should provide \$275,000 in new funding for the increased workload.

The Berryman Institute for Wildlife Damage Management at Utah State University is the nation's premier academic institution in this field. The institute needs to improve its capabilities in social science research, expand continuing education programs and begin publishing a quality journal on wildlife damage management. We recommend an increase in Wildlife Service funding of \$236,000 for the Berryman Institute.

The President's budget would require states and other cooperators to pay at least 50 percent of the Wildlife Services program costs in each state. Animal damage problems don't lend themselves to a "one-size-fits-all" approach and instead should include flexibility for cost-sharing mechanisms.

AGRICULTURAL CREDIT

Providing farmers and ranchers with a variety of credit at the lowest possible interest rates is important to Farm Bureau.

For the past 10 years, Farm Bureau has supported the shift away from direct USDA operating and farm ownership loans to loans provided by private lenders and guaranteed by USDA. This is consistent with making maximum use of limited USDA funds and ensuring that the loans will be creditworthy over the long term. We oppose the Administration proposal to increase funding for direct operating and farm ownership loans.

USDA ADMINISTRATION

Farm Bureau believes that USDA should monitor domestic and international agriculture affairs and provide an accurate source of agricultural data.

We support funding for Packers and Stockyards Administration programs. Expenditures to enable electronic submission of industry data, to increase poultry compliance activities, to monitor and analyze packer market competition and implications of structural change and behavioral practices in the meat packing industry are important.

The Administration's budget includes \$500,000 for the first-ever census for the aquaculture industry. It would survey all farms that report in the 1997 agricultural census at least \$1,000 of aquaculture sales. Aquaculture is a billion-dollar industry, but information on the industry is very incomplete and a census would be of great value.

PREPARED STATEMENT OF RUTH GOLDSTEIN, FEDERAL POLICY PROGRAM MANAGER,
AMERICAN FARM TRUST

Dear Mr. Chairman: I write regarding the fiscal year 1999 appropriations for USDA natural resource conservation and research programs under NRCS, CSREES, and ARS. I'd like to request that this letter be made a part of the record.

American Farmland Trust is a 30,000 member, private, non-profit organization founded in 1980 to protect our nation's farmland. AFT works to stop the loss of productive farmland and to promote farming practices that lead to a healthy environment.

Land protection and natural resource conservation must go hand in hand. USDA must be able to protect our nation's farmland through the Farmland Protection Program; ensure a vital natural resource base through conservation technical assistance and voluntary programs such as WRP, CRP, WHIP and EQIP; and identify ways to produce safer, healthier food and maintain America's working landscapes through the Sustainable Agriculture Research and Education programs. USDA conservation and research programs have the potential to work together to address the

long-term sustainability of our natural resource base and the availability of this base for agricultural production.

NATURAL RESOURCES CONSERVATION SERVICE

Farmland Protection Program.—We strongly support funding of the Farmland Protection Program at \$50 million per year through fiscal year 2002. Every minute of every day America loses two acres of farmland to sprawling development. This is the land that produces three-quarters of our fruits and vegetables and more than half our dairy.

States have taken the lead in addressing this national problem through voluntary purchase of development rights (PDR) programs, which are so popular with landowners that there is typically a six-year waiting list. Eighteen states and dozens of local governments have spent \$900 million to protect more than a six hundred thousand acres of important farmland.

The FAIR Act directed USDA to implement a new \$35 million Farmland Protection Program to support these state and local farmland protection efforts. The FPP has thus far helped protect nearly 82,000 acres of farmland on more than 230 farms. Moreover, it has generated a substantial amount of new farmland protection activity at the state and local level.

The last of the \$35 million will be disbursed by the end of fiscal year 1998. We urge the subcommittee to request \$50 million for fiscal year 1999 to continue the Farmland Protection Program and continue its success.

America's Private Land Conservation (Conservation Technical Assistance).—The America's Private Land Conservation account (formerly Conservation Technical Assistance) allows NRCS to provide basic technical conservation services to private agricultural landowners across the country. NRCS employees work with producers to create farm-wide conservation plans; design and build grassed waterways, sediment retention ponds, and stream-side buffers; collect and analyze soil quality data for nutrient management and erosion control; and design and establish wildlife habitat or manure management systems. NRCS works with communities and conservation districts to share information about conservation opportunities and technologies. These services are critical both to all producers regardless of whether they participate in cost-share programs like EQIP, WHIP, CFO, WRP and FPP.

The Administration's fiscal year 1999 request for the APLC account will limit the availability of general technical assistance services. Limitations on EQIP's technical assistance funds means the agency will have to supplement EQIP funding with \$27 million from the America's Private Land Conservation account. (Technical assistance funding under EQIP is limited to 10 percent of the total instead of over 19 percent needed by NRCS to effectively carry out the program.) In addition, over \$43 million of the APLC account is earmarked for specific activities. This reduces the availability of funds for general technical assistance activities discussed above.

We support funding for the APLC at \$616.110 million (an increase of \$27 million over the Administration's fiscal year 1999 request of \$589.110) to meet the conservation needs of producers across the country.

Conservation Farm Option.—The Conservation Farm Option provides a voluntary approach to implementing full-farm conservation. Six regional pilot programs, authorized by section 335 of the 1996 FAIR Act, will be conducted for the purpose of soil and water conservation; water quality protection or improvement; wetland restoration, protection and creation; wildlife habitat development or protection, or other similar conservation purposes. CFO provides an opportunity to achieve multiple, targeted conservation benefits on farmland. AFT supports the Administration's fiscal year 1999 request of \$25 million for the Conservation Farm Option.

Wetlands Reserve Program.—The Wetlands Reserve Program, authorized by the 1990 FACT Act, is an example of the kind of incentive driven approach to wetlands protection and restoration that should be a centerpiece of national agricultural policy. AFT supports the Administration's \$127.741 million request for fiscal year 1999.

Environmental Quality Incentives Program.—EQIP provides technical and financial assistance to landowners for changes in cropping and grazing systems, and manure, nutrient and pest management. Land management practices such as installing riparian buffer strips, are eligible for assistance. AFT supports the Administration's fiscal year 1999 request for \$300 million to help farmers voluntarily address water quality, soil erosion, and wildlife habitat needs.

Wildlife Habitat Incentives Program.—WHIP is a positive step towards helping landowners continue to sustain healthy wildlife populations on private agricultural land. We support the Administration's request for \$20 million for the WHIP program.

AGRICULTURE RESEARCH SERVICE

Healthy, well-managed grazing lands can be instrumental in maintaining healthy watersheds across the country. ARS soil, water, plant and animal sciences strengthens our understanding of how grazing systems impact water quality and provides tools for reducing impacts on watersheds. We support the Administration fiscal year 1999 budget request for a \$7.5 million increase for Environmental Quality and Natural Resources research.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

Sustainable Agriculture, Research and Education.—Sustainable Agriculture, Research and Education (SARE) funds high quality, farmer involved research and education on economic, agronomic, and environmental aspects of sustainable agriculture farming systems. Professional Development Grants (Chapter 3) fund outreach and education workshops for natural resource professionals, soil and water conservation districts, RC&D's, NRCS, and extension personnel on community development, whole farm planning, and farmland protection. We support the Administration's fiscal year 1999 request for \$10 million for SARE and \$3.3 million for SARE Chapter 3 Professional Development Grants.

Renewable Resources Extension Act.—American Farmland Trust is pleased to see the Administration has requested renewed funding for the Renewable Resources Extension Act program (RREA), and we applaud the action of this subcommittee in restoring that program in spite of the Administration's request to eliminate it last year. American Farmland Trust supports this program which helps to train natural resource professionals regarding the impacts of increasing suburbanization on ranch and forestlands. We support the Administration's fiscal year 1999 request for \$3.4 million dollars for the RREA program.

Thank you for the opportunity to share the views of American Farmland Trust.

PREPARED STATEMENT OF KIM M. WARDENSKY, AMERICAN FEDERATION OF STATE, COUNTY, AND MUNICIPAL EMPLOYEES AND STEVEN M. HOLLIS, AMERICAN FEDERATION OF GOVERNMENT EMPLOYEES

I. SOME OF PRESIDENT'S BUDGET REQUESTS SHOULD BE SUPPORTED, AS FOLLOWS

We urge Members of Congress to support, or increase, the following items in the President's fiscal year 1999 Budget:

Farm Operating Loans, Direct, \$500 Million Program Level

This increased funding level for the direct operating loan program was recommended by the Civil Rights Action Team and the Small Farms Commission. It is projected to support operating loans to approximately 11,580 farmers, with at least 12 percent targeted to socially disadvantaged farmers. The share of direct loans made at the reduced interest rate for limited resource borrowers would be continued at current levels, approximately 40 percent.

Farm Ownership Loans, Direct, \$85 Million Program Level

This increase was also recommended by the Civil Rights Action Team and Small Farms Commission. It is projected to support about 1,000 small farmers to either acquire their own farm or to save an existing one—nearly 500 more than in 1998. Roughly 60 percent of these loans are provided to limited resource borrowers, with at least 18 percent targeted to socially disadvantaged farmers.

Rural Housing Loans, Single-Family, Direct, \$1 Billion Program Level

The single family housing direct loan program provides subsidized loans for the purchase of modest housing in rural areas. Nationally, the average income of a direct loan borrower is about \$17,000, which is about 55 percent of area median income.

*Water and Waste Disposal Loans, \$839 Million Program Level**Water and Waste Disposal Grants, \$500 Million Program Level*

Continuation of the program at these levels is consistent with the President's Water 2000 Initiative which was designed to help ensure that all rural households have access to clean running water by the year 2000.

*Farm Labor Housing Loans, \$32 Million Program Level**Farm Labor Housing Grants, \$13 Million Program Level*

These increases were also recommended by the Civil Rights Action Team. They would provide for the construction of 658 new units and rehabilitation of 199 existing units of housing for farm workers.

Rural Development Salaries and Expenses, \$527 Million Program Level

This increase of \$18 million over the fiscal year 1998 levels is absolutely imperative. Unless Congress supports this request from the President's Budget proposal, there will be RIF's in Rural Development within the next few months. Congress must support the increase in Salaries & Expenses for Rural Development for the following reasons:

(a) The ill-housed rural poor, and the small rural community infrastructure needs, must not be expected to continue to bear a disproportionate share of the sacrifice necessary to achieve a balanced budget. These programs are crucial to rural America and provide an invaluable service to minorities and socially disadvantaged citizens.

(b) The President's budget proposal would reduce overall USDA staff by 14.3 percent during the period from 1993 through 2002, but proposes to reduce the Rural Housing staff by 33 percent over this same period. It will be impossible for Rural Development to perform its mission if these additional disproportionate cuts are allowed to stand.

Section 2501 Socially Disadvantaged Farmers Outreach Program, \$1 Million

The Outreach and Technical Assistance program is the most effective tool developed to carry out the mission of USDA as the technical provider for small farmers. For a very small investment, the program has significant multiplier effects in the small and poor communities where there exist few other possibilities for sustainable economic development. It also serves as a small token of relief for the many deficiencies in the service provided to these farmers by the Department

II. ONE OF PRESIDENT'S BUDGET REQUESTS MUST BE INCREASED, AS FOLLOWS

We urge Members of Congress to increase the funding for the Section 515 Rural Rental and Cooperative Housing program by at least \$50 million over the President's Fiscal Year 1999 Budget request, to at least maintain the Program Level at the 1998 level of \$150 million.

The President's proposal to reduce funding below the 1998 level of \$150 million would end this program as a national program. We would not be able to fund even one project in each State. Rural Development area offices have a backlog of applications on hand that need funding. Multi-Family Housing helps senior citizens and others on fixed low incomes with many medical expenses.

We urge the Committee to direct USDA to place a priority, in the use of these limited funds, on rehabilitation of existing units rather than new construction. Unless this is done, the Rural Housing Service will become known as the nation's largest slum landlord.

III. SOME OF PRESIDENT'S BUDGET REQUESTS SHOULD BE DECREASED TO OFFSET THE INCREASE NEEDED IN THE SECTION 515 RURAL RENTAL AND COOPERATIVE HOUSING, AS FOLLOWS

Export Enhancement Program: Fiscal Year 1997, \$0; Fiscal Year 1998, \$150 Million; Fiscal Year 1999, \$320 Million

The Export Enhancement Program subsidizes American grain companies to enable them to dump wheat, corn, and other grains into international markets at below market prices.

This undermines self-sufficient farming in these other counties and provides direct payments to such corporations as Cargill, Continental Grain, Louis Dreyfus, Bunge Corporation, and others. There are better uses for our tax dollars.

IV. USDA REORGANIZATION AND STREAMLINING INITIATIVES

Our labor unions appreciate the recognition by the leadership of this Subcommittee that we can only create a USDA that "works better and costs less" if we make sure the proposed changes, in their implementation, will enhance, rather than harm, the ability of the front-line workers to serve the public in the most effective and efficient manner. Unfortunately, we must report to Congress that the Department has failed to adopt this common sense approach.

ADMINISTRATIVE CONVERGENCE—READY, SHOOT! AIM?

AFSCME and AFGE urge Members of Congress to block implementation of Secretary Glickman's proposal for "Administrative Convergence", still scheduled for October 1, 1998, until the following problems are worked out:

1. Information Technology (IT) and Financial Management (FM) Workload Has Increased, yet Secretary Glickman proposes to decrease IT and FM Staff?

(a) Attachment 1 shows, for rural Development, that the Information Technology workload, measured in terms of lines of code, has increased from 4 million to 11 million since 1993, while IT staffing for Rural Development in St. Louis, Missouri, and Washington, D.C., has already been reduced by over 30 percent since 1993! Attachment 2 documents where administrative staffing reductions have been accomplished since 1993. The Rural Development staff in St. Louis, Missouri, and Washington, D.C., has already been cut to the bone. Further cuts would jeopardize program viability. For example, Rural Development's ability to make all its software Year 2000 compliant would be placed in great jeopardy. NRCS and FSA (Kansas City and Washington) have done much less streamlining.

(b) The Congress and the Administration have actually increased the Information Technology (IT) and Financial Management (FM) workloads, in Rural Development and in the Ag Credit/Farm Loan Programs, by placing greater controls over fraud, abuse, the integrity of loan making, etc. If IT and FM staffing is reduced too much, or too soon, the very management controls which have been placed on these programs to improve accountability will not be implemented in a proper, timely, manner.

(c) To accomplish the "business reengineering" proposed by the Service Center Implementation concept—a Common Computing Environment and better business and financial practices and supporting computer systems—also means more work, not less, for IT and FM support employees.

To proceed with further staff reductions before there is a reduction in work requirements can only lead to greater problems with the integrity and effectiveness of program delivery.

2. Contracting Out Will Cost More and Produce Lower Quality Results.

In 1993, the House Agriculture Committee nearly passed to the USDA Reorganization Bill that would have required the Department to do such cost comparisons of current and future service contracts. The amendment was withdrawn based on the Department's promise to establish such an in-house procedure. This has not been done. Attachment 3 documents, from USDA's own figures, the continuing overreliance on commercial support contracts for Information Technology.

We urge the Appropriations Committee to require the Department to conduct cost comparisons on all current and future commercial service contracts. This includes instructing USDA to abandon FTE controls and "fee for service" proposals which require, or even allow, the hiring of contractors to do the work that can be more cost effectively performed by Federal employees. No more Federal employees should be laid off so long as contractors are working for the Department performing work that Federal employees could perform at better quality and less cost.

3. Streamlining the middle management bureaucracy.

There should be an upfront requirement that supervisory ratios within the proposed Support Service Bureau will be less than 1:15, as mandated by the National Performance Review. We are not opposed to consolidating multiple administrative support and IT organizations into a Departmentwide organization, but only if the unnecessary management bureaucracy is dramatically reduced.

4. County Office Administrative Functions Must Be Included.

The GAO/RCED-97-214 Report emphasizes that about two (2) staff years of effort per County Office is being devoted to the activities associated with keeping the offices open and functioning. These duties include obtaining and managing office space, paying utilities, computer administration, and processing payroll. It is not possible to honestly and successfully streamlining administrative functions unless all administrative activities are included in the streamlining effort.

5. Damage to Civil Rights and Work Force Diversity.

Current plans for Administrative Convergence would cut 1,800 jobs in Washington, St. Louis, and Kansas City—where the percentage of minority participation in the work force is greatest. In response to the obvious Civil Rights implication of this proposal, FFAS representatives have indicated they will find some way to transfer minority employees to the State level, presumably bumping out current non-minority employees. Do Members of Congress want to deal with these constituent complaints?

6. Damage to Servicing of USDA Loan Programs.

Secretary Glickman's plan for Administrative Convergence would cut many of the centralized loan servicing staff supporting RD and FSA loan portfolios by lumping them into the "administrative" Financial Management category. These program servicing positions must be excluded from Administrative Convergence.

USDA should build on the widely heralded Rural Housing Centralized Servicing Center and DLOS initiative in St. Louis. It makes no sense to provide centralized servicing and debt collection for Rural Housing in St. Louis, and then to duplicate those functions, in Kansas City or the Field, for the farm loan programs and farm loan debt.

7. Compliance With the Intent of Congress.

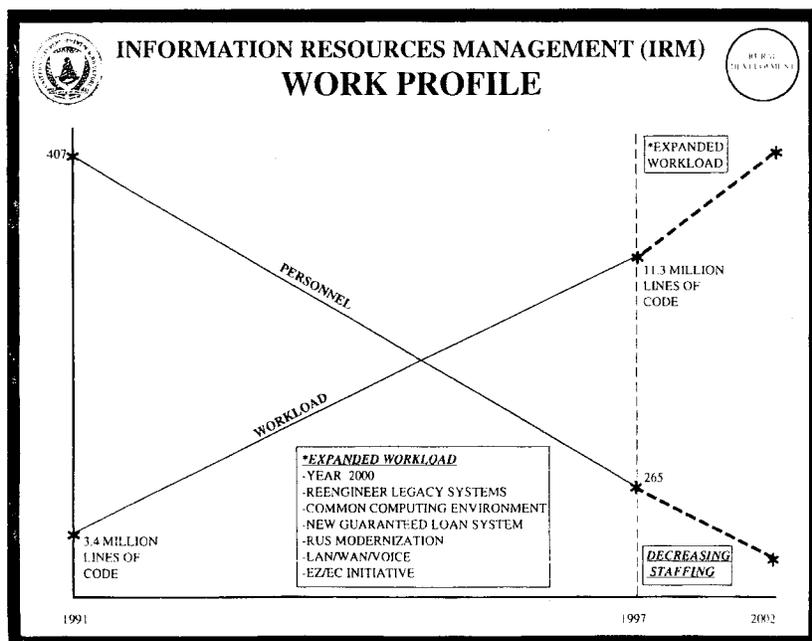

Administrative Convergence should comply with the intent of the Congress before it is implemented. In 1994, the House Agriculture Committee included the following report to Section 105 of the House bill, which became Section 216 of Public Law 103-354 (7 USC 6916), Improvement of Information Sharing:

The Committee intends that the Department fully retrain and use the employees who are currently responsible for developing and implementing its program delivery, accounting, and administrative computer systems to update and improve the Department's computer systems, and to provide support for the new systems * * * the Committee intends that the Department maintain and enhance the current automation, accounting, and administrative support centers in St. Louis, Kansas City, Washington, and Ft. Collins as "centers of excellence" in support of multiple programs and agencies. In particular, (FmHA) service center in St. Louis should continue to provide automation and accounting support for the farm credit programs that are being transferred to the ASA, as well as for the programs of the Rural Community and Economic Development mission area.

In the House Report on the Fiscal Year 1997 Agriculture Appropriations Act, your Committee reaffirmed this direction that the Department maintain Farm Service Agency automation and accounting support for the farm loan programs in St. Louis, Missouri. We urge the Appropriations Committee to enforce the previously stated intent of the Congress, as contained in these authorizing and appropriations reports.

IN SUMMARY

We urge the Committee to strengthen the oversight role of the Committee which was envisioned in Section 727 of the Fiscal Year 1998 Agriculture Appropriations Act by adopting language in this year's act as recommended in Attachment 4.

ADMINISTRATIVE STAFFING REDUCTIONS, 1993-98

Administrative staffing (IRM, FM, PM, HRM)	SL	KC	DC	Other	Total agency staff years (For comparison purposes)	
					Federal	Non-Federal
Fiscal year 1993:						
Farm Service Agency	147	953	600	(1)	7,490	14,953
Rural Development	690		402	(1)	9,347	
Natural Resource and Conservation Service			(2)	1,444	13,280	
Fiscal year 1998 (Current):						
Farm Service Agency	110	860	491	(1)	5,877	11,229
Rural Development	492		277	(1)	7,360	
Natural Resource and Conservation Service			(2)	1,204	12,048	
Percent reduction (1993-98):						
Farm Service Agency	-25	-10	-18		-22	-25
Rural Development	-29		-31		-21	
Natural Resource and Conservation Service				-17	-9	

¹ There are also hundreds of administrative (IRM, FM, PM, HRM) positions in the State and county offices in FSA and RD.
² Some of NRCS administrative staff is located in Washington, DC, some in Ft. Collins, some in Ft. Worth, and most of it in Regional Offices, to the best of our information. The detailed breakdown is unclear to us.

Summary: Rural Development Operations and Management staff (St. Louis and Washington) has already been cut to the bone. Further cuts would jeopardize program viability. NRCS and FSA (Kansas City and Washington) have done much less streamlining.

[ATTACHMENT 3]

USDA OVER-RELIANCE ON COMMERCIAL SUPPORT CONTRACTS FOR INFORMATION TECHNOLOGY

The real point about balancing the budget should be taxpayer dollars, not Federal employee jobs. We need to ensure that Administrative Convergence does not just lead to replacing Federal employees with more expensive contractors who can't do as good a job. AFGE is very concerned about this, because in DOD and other agencies, the Administration has consolidated administrative functions—and then tried to contract them out. The following numbers come from the Agencies' A-11 submissions to OMB, reporting on "Obligations for Information Systems."

[In thousands of dollars]

	Commercial support services	Personnel
Fiscal year 1993:		
ASCS	39,029	27,657
FAS	4,366	3,033
OICD	183	245
FCIC	8,572	3,627
FmHA/RDA	40,627	36,181
REA	618	1,506
SCS	17,419	38,131
Fiscal year 1998:		
FSA	90,894	44,898
FAS	7,252
RMA	8,597	4,206
RD	26,148	15,048
NRCS	23,223	25,516
Percent change (1993-98):		
FSA/FAS/RMA ¹	+ 51	+ 30
RD	- 36	- 60
NRCS	+ 25	- 33

¹ Some amount of the Rural Development decrease, and the FSA increase, from fiscal year 1993 to fiscal year 1998, consisted of the transfer of Farm Credit functions from FmHA/RD to FSA.

The ACAT Team 1 Draft Report (11/3/97) proposed two IT staffing options under Administrative Convergence Option 2 (50 percent decrease of Federal FTE's from fiscal year 1993) would require the Department to replace 397 Federal employees with contractors as compared to Option 1 (30 percent decrease of Federal FTE's from fiscal year 1993). "The Standard Costs for a government ITS employee FTE is \$69,250. The average costs for a contractor FTE is \$109,000. The option 1 mix of governmental and contractor ITS personnel will save USDA \$15.8 million per year over the option 2 mix of ITS FTE's."

Summary: Contractors cost more than Federal employees. USDA already spends more on IT contractors than on employees, and this will continue to increase total IT costs more than would reducing contractors and retaining employees.

[ATTACHMENT 4]

PROPOSED LANGUAGE FOR THE FISCAL YEAR 1999 AGRICULTURE APPROPRIATIONS ACT

None of the funds provided by this Act, or provided by previous Appropriations Acts, to the agencies funded by this Act, or provided from any accounts in the Treasury of the United States derived by the collection of fees available to the agencies funded by this Act, shall be used to implement Administrative Convergence, or any other initiative to reduce Federal staff performing Information Technology, Financial Management, Management Services, Civil Rights, Human Resources, or other administrative functions in support of the county-based agencies, Farm Service Agency, Natural Resources and Conservation Service, or Rural Development, until a plan for such convergence and streamlining has been presented to, and approved by, the Appropriations Committees of both House of Congress. Such plan shall include, at a minimum, the following:

(1) the number of additional County Offices to be closed, along with criteria for determining which offices will be closed, and a timetable for the closures;

(2) a detailed statement of the Information Technology, Financial Management, Management Services, Civil rights, Human Resources (including Training), or other activities considered to be administrative in purpose as distinct from program delivery, identifying such workload which will be eliminated or reduced through convergence and where each activity is proposed to be performed (i.e., County Offices, State Offices, Regional Offices, or National Support Centers such as Washington, DC, St. Louis, MO, Kansas City, MO, New Orleans, LA, Ft. Worth, TX, Ft. Collins, CO, etc.);

(3) a detailed statement of the program delivery activities which may be centralized for the purpose of improving consistency and achieving efficiencies as has been accomplished with the Section 502 Rural Housing program;

(4) a statement as to whether the Department intends to maintain two personnel systems within the Farm Service Agency, or whether the Department intends to phase out the County Office Committee personnel system;

(5) the projected impact (with locations and timetables) on Federal, non-Federal, and Contractor staff and associated costs; and

(6) a detailed statement of the Civil Rights impact on both employees and customers of the proposed changes.

Justification:

The 1996 Farm Bill (Public Law 104-127, April 4, 1996) dramatically reduced the Federal Government's role in supporting agriculture and, therefore, the county office workload. The Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994 (Public Law 103-354, October 13, 1994) also directed the Secretary of Agriculture to streamline departmental operations by consolidating county offices and merging various agencies. Yet, both non-Federal and Federal employees report that USDA workload has not decreased as a result of these changes. The GAO/RCED-97-214 also reports that it is not possible to determine the impact of the 1996 act on the workload of the Farm Service Agency's county offices. GAO also emphasizes that about two (2) staff years of effort per office is being devoted to the activities associated with keeping the offices open and functioning. These duties include obtaining and managing office space, paying utilities, computer administration, and processing payroll. The Department has entered into a contract with an outside consulting firm to conduct a study of the farm and rural program delivery system of these county-based agencies, FSA, NRCS, and RD, to be completed by September 1, 1998. Among other things, the study will clearly identify the purposes agency operations are intended to achieve, an independent assessment of agency workload estimates, identify criteria for determining the highest value use of office staff, evaluate county office efficiencies gained so far, etc. That study should serve as the basis for any plan to converge the administrative support functions of these agencies.

PREPARED STATEMENT OF PAUL BROUHA, EXECUTIVE DIRECTOR, AMERICAN FISHERIES SOCIETY

The American Fisheries Society (AFS) appreciates the opportunity to present written comments concerning the proposed fiscal year 1999 budget of the USDA Cooperative State Research, Education, and Extension Service (CSREES). We ask that this letter be included in the official record of the agency's appropriation hearings.

The Society is an international organization of more than 9,000 fisheries and aquatic science professionals. Chartered in 1870, the Society is the world's oldest and largest scientific body dedicated to the advancement of fisheries science and the conservation of renewable aquatic resources.

The American Fisheries Society (AFS) recognizes that the research and educational programs of the CSREES and its Land Grant Partners effect relevant, positive changes in attitudes and implementation of new technologies by private landowners, managers, community decisionmakers, and the public. This results in significant benefits to individuals and to the Nation through building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture. Since over two-thirds of our lands, approximately 1.35 billion acres, are controlled by over 10 million private landowners and managers, it is most appropriate that the CSREES-Land Grant System, with its grass roots credibility and delivery system, be adequately funded to translate and deliver research-based educational programs and new technologies to help the Nation's private landowners and managers move towards a more sustainable society. However, in the President's fis-

cal year 1999 budget, we see very little emphasis on natural resources research and education directed toward helping these clientele.

The American Fisheries Society recommends that the fiscal year 1999 budget for CSREES should redirect funding to accomplish the following goals:

AFS recommends that the Renewable Resources Extension Act be funded at a minimum level of \$9.5 million in fiscal year 1999. The RREA funds, which are apportioned to State Extension Services, effectively leverage cooperating partnerships at an average of about four to one, with a focus on the development and dissemination of useful and practical educational programs to private landowners (rural and urban) and continuing education of professionals. The increase to \$9.5 million would enable the Extension System to accomplish the goals and objectives outlined in the 1991–1995 Report to Congress. The need for RREA educational programs is greater today than ever because of the fragmentation of ownerships, the diversity of landowners needing assistance, and the increasing environmental concerns of society about land use. It is important to note that RREA has been reauthorized through 2002. It was originally authorized at \$15 million annually; however, even though it has been proven to be effective in leveraging cooperative state and local funding, it has never been funded at a level beyond \$3.4 million. An increase to \$9.5 million would enable the Extension Service to expand its capability to assist over 500,000 private landowners annually to improve decisionmaking and management on an additional 35 million acres while increasing productivity and revenue by \$200 million.

AFS recommends that Smith-Lever 3(b)&(c) base program funding be increased by 9.0 percent to a level of \$280,950,770 with an appropriate portion of this increase targeted to Extension's Natural Resource and Environmental Management programs (NREM). The President's fiscal year 1999 budget requests a reduction of \$10,740,000 funding for Smith-Lever 3(b)&(c) funds from the fiscal year 1998 level. AFS appreciates that Smith-Lever 3(b)&(c) base programs provide "Block Grant" type funds for land grant universities to provide essential educational outreach based on local needs assessment. This will enable NREM programs to develop the critical mass of expertise at the state and local levels to redirect and leverage limited funding to address critical existing and emerging natural resource and environmental issues that are directly affecting small landowners and farmers in both rural and urban communities nationwide.

Expanding Extension programs in natural resource public issues education on important issues such as forest health, wetlands, endangered species, and human/wildlife interactions, as well as to strengthen its programs in urban and community forestry and environmental education as called for in the 1990 FACT Act is essential to address natural resource issues that are relevant to the sustainability of these critical resources. Such an increase targeted appropriately would help producers better understand and implement the changes in the 1995 Farm Bill Conservation Provisions. Moreover, we are concerned that appropriate positions in the Natural Resources and Environment Unit have not been retained to provide needed national leadership for critical interdisciplinary resources such as range management.

AFS encourages continuation of close cooperation between State CES's and their State Fish and Wildlife agencies, as well as other appropriate state and federal agencies and conservation organizations. Extension 4–H Youth natural resource programs and projects continue to increase with over 1,350,000 youngsters presently enrolled from both urban and rural communities across the Nation. Increased Smith-Lever funds targeted appropriately will enable CSREES to carry out its environmental education and NREM National Strategic Plan obligations nationwide.

AFS recommends restoration of the Rangeland Research Grants \$500,000 budget for fiscal year 1999. The Society is disappointed that the practical and applied problems addressed by the Rangeland Research Grants (RRG) program were zeroed out in the President's 1998 budget and totally ignored in this fiscal year 1999 budget. Over one half of the land area of the United States is rangeland; and elimination of the only federal competitive grants program for rangelands has serious implications for wildlife, watersheds, and other natural resources. Modest appropriations for RRG in the past have supported some of the most important rangeland research conducted over the past decade, and wildlife issues on rangelands will present some of the more critical rangeland research problems over the next decade. This would help increase the interdisciplinary capacity of research and educational programs to help landowners improve the adoption of forests and rangelands ecosystem management and the conservation of biodiversity on an ecoregion level.

AFS recommends that an appropriate portion of the total increased appropriation for Pest Management should be dedicated to educational programs for prevention and control of vertebrate pests in urban and rural communities and to address invasive exotic species and noxious weed problems on rangelands for restoring, managing, and sustaining the biological integrity of the Nation's natural resource base

upon which the agricultural and natural resource economies depend. AFS notes that a combined total increase of almost \$15.5 million has been recommended in the President's budget for Pest Management and related research and extension programs over and above increases received in fiscal year 1998. Vertebrate pests and invasive species have been identified in many states as posing the most significant problems, now and in the future, that agricultural and related crop producers and private landowners face. This targeting of Pest Management funds for research and educational programs would advance the knowledge and capability of landowners to reduce significant losses to vertebrate pests and invasive species.

AFS recommends that the Hatch and McIntire-Stennis funds be restored to fiscal year 1998 levels and, if necessary, redirected from the substantial \$32,800,000 proposed increase in NRI funding. AFS is pleased that the Administration proposes a 9.5 million increase in basic research identified under the National Research Initiative (NRI) as Natural Resources and the Environment; however, what is proposed under this "Area of Specials Emphasis" clearly does not address critical natural resource research needs that the Natural Resource Community and the public are vitally concerned about. The Society is alarmed at the significant reduction in both the Hatch Act and McIntire-Stennis research programs of over \$15.5 million. Both of these research programs, conducted by land grant university partners and other educational institutions, are crucial to addressing natural resource and environmental issues critical to agriculture and natural resource sustainability now and in the future.

SUMMARY

The American Fisheries Society, based on the above considerations, recommends the following for the fiscal year 1999 budget of CSREES:

- (a) The RREA budget be increased to \$9.5 million;
- (b) Smith-Lever 3(b)&(c) base program funding be increased by 9.0 percent;
- (c) Rangeland Research grants be restored at \$500,000 level;
- (d) A portion of the Pest Management and related increase be targeted to provide increased research and education programs to address vertebrate pest prevention and control needs and invasive species and exotic weed problems; and
- (e) McIntire-Stennis and Hatch Act funding be restored to fiscal year 1998 levels.

Thank you for the opportunity to comment on the USDA Cooperative State Research, Education, and Extension Service programs. If there is any way we can be of further assistance, please let us know.

PREPARED STATEMENT OF RICHARD ADEE, PRESIDENT, AMERICAN HONEY PRODUCERS ASSOCIATION, INC.

My name is Richard Adee. I am President of the American Honey Producers Association, Inc. and I am submitting this statement in its behalf. The American Honey Producers Association, Inc. is a national organization of commercial beekeepers with activities in most of the States in this country.

The Association is seeking the inclusion of sufficient funds in the appropriation for the Agricultural Research Service of the Department of Agriculture to meet with the critical needs of the industry. Specifically, the Association is seeking the restoration of \$500,000 in the baseline funding for the bee laboratory at Weslaco, Texas, and an increase of \$500,000 in the level of funding for the ARS honey bee breeding, genetics, and physiology laboratory at Baton Rouge, Louisiana.

Honey bees pollinate over 90 cultivated crops whose estimated value exceeds \$9.3 billion and produce an average of 227 million pounds of honey annually. Since 1984, the survival of the honey bee has been threatened principally by a number of problems for which beekeepers are depending upon research for the answers. Unfortunately, there is no simple solution to these problems. The honey bee industry is too small to support the cost of the needed research, and there are no funds, facilities, or personnel elsewhere available in the private sector for this purpose. Accordingly, the beekeeping industry is dependent on research from public sources for the scientific answers. As you know, there are no longer any federal subsidies on honey, there is no longer a honey price support program in effect. The key to the survival of the honey industry lies with the honey bee research program conducted by the Agricultural Research Service.

Parasitic mites, primarily the varroa mite, are causing a crisis for the U.S. beekeeping and pollination industry. Hundreds of thousands of domestic honey bee colonies are being lost annually to varroa mites, and wild bee colonies are being devastated. The only chemical now registered for varroa mite control has been rendered ineffective by the development of resistant mite populations. Moreover, chemical

pesticides for mite control can adversely affect the bees, as well as being a food safety concern.

The USDA-ARS honey bee research facility at Weslaco has been working hard in trying to find alternative chemicals to deal with the varroa mite. It is responsible for finding new and improved methods for control of parasitic mites and other pathogenic organisms on honey bees, solving beekeeping problems that interfere with honey production and effective crop pollination, and determining the impact and spread of Africanized honey bees. Until the appropriation for fiscal year 1998, it has not been possible to fully operate the facility with full-time permanent scientists and cover the necessary overhead expenses. The uncertainty of continued funding is halting the efforts of the Weslaco laboratory in implementing its plans for making full use of the fiscal year 1998 appropriation. A reduction of \$500,000 in the base line appropriation for the Weslaco facility will disrupt its operations and make it more difficult to achieve its research objectives. These funds need to be restored.

The ARS laboratory at Baton Rouge, Louisiana, is the only laboratory world wide focusing on the development of long-term, genetics-based solutions to the varroa mite. After multiple matings, scientists at this laboratory have found a few colonies of honey bees that show possible resistance to the varroa mite. These types require intensive evaluation to assure that the resistance holds up under a wide range of environmental and beekeeping conditions. Attributes such as vigor, pollination, and honey production must be evaluated. There is an immediate need to propagate the resistant queen bees in large numbers for wide scale distribution to beekeepers so that this evaluation can be accomplished. The work is slow and tedious. It is also costly. We are seeking an increase of \$500,000 in permanent funding for the Baton Rouge, Louisiana, laboratory to accelerate the research, development, and transfer of queen bee stock resistant to varroa mites to U.S. beekeepers.

We wish to thank you for your support of honey bee research in the past and would appreciate your continued support by approving an appropriation for the ARS bee research laboratories at Weslaco, Texas, and Baton Rouge, Louisiana, that includes an additional \$500,000 for each of those laboratories above the level recommended in the Administration's budget. Only through research can we achieve and maintain profitability in U.S. beekeeping and continue to provide stable and affordable supplies of bee pollinated crops which make up fully one-third of the U.S. diet.

PREPARED STATEMENT OF THE AMERICAN INDIAN HIGHER EDUCATION CONSORTIUM

INTRODUCTION

Mr. Chairman and Members of the Subcommittee, on behalf of the American Indian Higher Education Consortium (AIHEC) and the 29 Tribal Colleges that comprise the AIHEC land-grant institutions, we thank you for this opportunity to share our funding requests for fiscal year 1999. On behalf of the Tribal Colleges, we respectfully request full funding of our four land-grant programs, along with funding under the Agriculture Research Reauthorization. These include: \$4.6 million for the Tribal College endowment; \$1.45 million for the equity grant program; \$5 million for the extension program; \$1.7 million for institution capacity building grants; and \$10 million for research.

This statement will cover three key points: first, it will provide a brief background on the Tribal Colleges and our long-awaited inclusion in this nation's land-grant system; second, it lays out Tribal Colleges' ambitious efforts through extension services to fulfill the agricultural potential of American Indian communities and to ensure that American Indians have the skills needed to maximize the economic development potential of our resources; and third, it describes our additional program requests for fiscal year 1999.

BACKGROUND ON TRIBAL COLLEGES

Today, 130 years after enactment of the first land-grant legislation, Tribal Colleges, more so than any other institutions, truly exemplify the original intent of the land-grant legislation. The first Morrill Act was enacted in 1862 specifically to bring education to the people and to serve their fundamental needs. Mr. Chairman, this is the definition and mission of the Tribal Colleges. We truly are institutions by, of, and for our people.

The dismal statistics concerning the American Indian experience in education brought tribal leaders to the realization that only through local, culturally-based education could many American Indians succeed in higher education and help bring desperately needed economic development to the reservations. In the late 1960's and

early 1970's, the first Tribal Colleges were chartered on remote reservations by their respective tribal governments, to be governed by boards of local tribal people. In 1972, the first six tribally-controlled institutions came together to form the American Indian Higher Education Consortium. Today, AIHEC is a cooperatively sponsored effort on the part of 31 member institutions in the United States and Canada, 29 of which are the 1994 land-grant institutions.

Tribal Colleges now serve 26,500 students each year, offering primarily two-year degrees, with some colleges offering four-year and graduate degrees. Since their inception, the Tribal Colleges have helped address the problems and challenges of our welfare system. Tribal Colleges provide GED and other college preparatory courses, probably more than any other community colleges in this country. We have done this because our mission requires us to help move American Indians toward self-sufficiency and help make American Indians productive, tax-paying members of our society. Fulfilling this obligation will become even more difficult over the next several years as Tribal Colleges feel the impact of welfare reform legislation—already, our colleges are seeing increasing numbers of welfare recipients turn to the colleges for training and employment opportunities. Tribal Colleges serve as community centers, providing libraries, tribal archives, career centers, economic development centers, public meeting places, and child care centers.

Despite our many obligations, functions, and notable achievements, Tribal Colleges are the most poorly funded institutions of higher education in this country. Historically, states do not have an obligation to American Indian lands because our reservations are trust lands under federal jurisdiction. Unlike mainstream land-grant institutions, we cannot depend on state and local governments to match or surpass the federal investment. Our core funding under the Tribally-Controlled Community Colleges Assistance Act of 1978 remains grossly inadequate; and total funding for the agriculture programs authorized for all 29 of the 1994 institutions combined equals approximately the amount the Department of Agriculture gives to just one state land-grant institution each year.

The members of AIHEC enjoy strong support from the U.S. Department of Agriculture, as witnessed by the Memorandum of Understanding between the Department and the Tribal Colleges, signed by Secretary Dan Glickman on February 3, 1998. The MOU, which was mandated in the 1996 Farm Bill, is targeted at achieving full integration of the Tribal Colleges into the land-grant system and ensure their full participation in the USDA's land-grant programs. Objectives were established covering four key areas: (1) student programs; (2) employment and program opportunities; (3) capacity building; and (4) full access to grant and excess property programs. We are heartened by the Department's apparent commitment to the Tribal Colleges, and we look forward to joining with the Department and other land-grant institutions in continuing this important work.

EXTENSION SERVICES—AMBITIOUS EFFORTS TO REACH ECONOMIC DEVELOPMENT POTENTIAL

Although current land-grant programs at the Tribal Colleges are modest, our 1994 authorizing legislation is vitally important to us because of the nature of our land base. Of the 54.5 million acres that comprise American Indian reservations, 75 percent are agricultural lands and 15 percent are forestry holdings. In fact, Indian agricultural production has been valued at nine times the production potential of oil and gas resources.

Tragically, due to lack of expertise and training, millions of acres lie fallow, under-used, or are developed through methods that render the resources non-renewable. The Educational Equity in Land-Grant Status Act of 1994 is our hope for turning this situation around. It is absolutely critical that American Indians learn more about new and evolving technologies for managing our lands. We are committed to becoming, as we were when your forefathers came to this land centuries ago, productive contributors to this nation's—and the world's—agricultural base.

This year witnessed impressive efforts to address economic development through land use, as Tribal Colleges entered into partnerships with 1862 land-grant institutions through extension services. This program, which is administered and coordinated through the 1862 institutions, represents an ideal combination of federal resources and Tribal College-state institution expertise, with the overall impact being far greater than the sum of the parts. Some examples of the innovative programs that are funded under extension services include:

- Fond du Lac Tribal and Community College and the University of Minnesota Extension Service are partnering in a project to develop, conduct, and distribute an environmental analysis of the St. Louis River ecosystem. This project will

- introduce students from the college and the university to scientific research and interpretation, and promote thoughtful management and use of water resources.
- Salish Kootenai College, through a partnership with Montana State University, developed a native plant/ecosystem restoration program, that will create a tribal center for native plants and horticulture to serve the Confederated Salish and Kootenai Tribes. As part of this project, the college will conduct a market feasibility study for tribally grown native plant materials and encourage, support, and coordinate native plant knowledge on the Flathead Reservation.
 - Sitting Bull College and North Dakota State University will focus on providing training and support services to ranchers in the area of bison production and management. This project will generate a database of producers and offer training sessions on-site at tribal ranches covering topics like marketing, processing, herd management, life cycle and grazing patterns.

Additional funding to support such efforts is needed because extension services provided by the states on our reservations are woefully inadequate, and the Tribal Colleges need to fill that void. It is important to note that this program is not duplicative of ongoing extension activities, and that it will complement and build on the existing Indian Reservation Extension Agent program.

In fiscal 1997 and fiscal 1998, the 1994 institutions were awarded \$2 million for extension services. In fiscal 1999, we are requesting that Congress build on the modest funding increase of \$1.5 million proposed in the President's budget, and raise funding to \$5 million, the fully authorized level for this program. The increase recommended in the President's request emanates from the strong relationship we have with USDA and is evidence of our successes in this program.

OTHER FUNDING REQUESTS FOR TRIBAL COLLEGE PROGRAMS

The twenty-nine 1994 Institutions' appropriations request for fiscal year 1999 are extremely modest when compared with the annual appropriations to each existing land-grant institution. Along with our request of \$5 million for the joint 1862-1994 institution extension program, we are seeking the following amounts for the three other authorized programs for 1994 institutions: \$4.6 million for the Tribal College endowment; \$1.45 million for the equity grant program; and \$1.7 million for institution capacity building grants; and \$10 million for research. It is important to remember, as stated earlier, total funding for the programs authorized for all 29 of the 1994 institutions combined equals approximately the amount the Department of Agriculture gives to just one state land-grant institution each year.

The Tribal Colleges are grateful for the Subcommittee's support in the past for funding of three of our programs. These small programs catalyzed the 1994 Institutions' crucial first steps in initiating and strengthening agriculture and natural resource programs in our communities. However, it is critical that we build on the momentum we have gained. Justification for our requested funding levels follows.

1. *\$1.7 million Institutional Capacity Building Grant Program.*—This competitive grant program, which requires a non-federal match, would provide the 1994 institutions with the investment necessary to allow us to strengthen and more fully develop our educational infrastructure. Facilities maintenance and improvement are urgently needed at many of the Tribal Colleges, which are currently operating in abandoned, condemned, or donated buildings. Hazards include leaking roofs, asbestos insulation, exposed wiring, and crumbling foundations. In a recent needs assessment, nine of the Tribal Colleges identified facility maintenance and renovation as a high priority, at an estimated cost of \$8.3 million. Many of these facility improvements are needed to provide American Indian students with the education necessary to fully compete in the modern agricultural world.

2. *\$4.6 million Endowment Fund for 1994 Land-Grant Institutions.*—This endowment installment remains with the U.S. Treasury, and only the interest is distributed to the 1994 institutions. Just as other land-grant institutions historically received large grants of land or endowments in lieu of land, this sum assists the 1994 institutions in establishing and strengthening our academic programs in the areas of curricula development, faculty preparation, instruction delivery systems, equipment and instrumentation for teaching, experiential learning, and student recruitment and retention in the food and agricultural sciences. As the endowment increases over time, it will provide each 1994 institution with significant income. The second year interest payment totaled nearly \$116,000, which was distributed to the 29 land-grant institutions on a formula basis.

3. *\$1.45 million Tribal College Educational Equity Grant Program.*—Closely linked with the endowment fund, this program provides \$50,000 per 1994 Institution to assist in academic programs. The 1994 institutions are in their second year of funding under this program. Through the funding made available in fiscal year

1996, the Tribal Colleges were able to begin to support vital courses and planning activities specifically targeted to meet the unique needs of our respective reservations. Examples of programs include:

- Fort Belknap College in Harlem, Montana, will build on its fiscal year 1996 project, which established a Global Positioning System/Geographic Information System (GPS/GIS), using the GPS/GIS to research, document and inventory the location of important cultural and ethno-botanical sites on the reservation. Faculty and students from natural resources courses will work with traditional leaders and elders from the Fort Belknap community to complete this project.
- Sinte Gleska University in Rosebud, South Dakota, will use the equity grant to support its development of a community-based forestry project that will involve the full life cycle of trees. The project will document tribal stories and teachings about trees and their related environment and the acquired knowledge will form the foundation for an ecological and cultural understanding of native trees that will be incorporated into the University's courses and practices.

Other Tribal Colleges have started natural resource management courses; nutrition and dietetic programs; environmental sciences curricula; comprehensive horticulture programs; and courses on sustainable development, forestry, and buffalo production and management.

Funding for Research.—In addition to these authorized programs for the 1994 institutions, we are requesting funding for a new research program, which has been proposed in an amendment to the Agriculture Research, Extension, and Education Reform Act of 1997 (currently in conference). This amendment proposes that the 1994 land-grant colleges receive the same agriculture research authority granted to 1862 and 1890 land-grant institutions, through a competitive program authorized at \$10 million.

This authority, and its corresponding appropriation, is vital to ensuring that Tribal Colleges finally have the opportunity to become full partners in this nation's land-grant system of colleges and universities. Many of our institutions are currently conducting applied agriculture-based research, yet they struggle to finance this research and meet their community's other research needs. Some of the research in progress includes soil and water quality research; amphibian propagation; pesticide and wildlife research; range cattle species enhancement; and native plant preservation, for medicinal and economic purposes. We urge the committee to fully fund this program's pending authority, as we expect this amendment to be approved in the near future.

Funding for the Rural Development Trust Fund.—The Tribal Colleges also support the administration's request for the Rural Development Trust Fund, which includes a 3-percent transfer dedicated for rural development programs conducted by federally-recognized tribes.

CONCLUSION

The 1994 institutions are efficient and effective tools for bringing education to American Indians. The modest federal investment in the Tribal Colleges has paid great dividends in terms of employment, education, and economic development, and continuation of this investment makes sound moral and fiscal sense. No communities are in greater need of land-grant programs than American Indian reservations, and no institutions better exemplify the original intent of land-grant institutions than the Tribal Colleges.

Mr. Chairman, we appreciate your long-standing support of the Tribal Colleges, and we are grateful for your commitment to our efforts to bring self-sufficiency to our communities. We look forward to continuing a partnership with you, the Members of your Subcommittee, the U.S. Department of Agriculture, and the mainstream land-grant system—a partnership that will bring equal educational, agricultural, and economic opportunities to Native America.

Thank you.

PREPARED STATEMENT OF THE AMERICAN NURSERY & LANDSCAPE ASSOCIATION

Mr. Chairman, the American Nursery & Landscape Association (ANLA) welcomes this opportunity to present the nursery industry's views regarding the U.S. Department of Agriculture's (USDA) budget for the 1999 fiscal year.

ANLA is the national trade association for the nursery and landscape industry. ANLA represents 2,500 production nurseries, landscape firms, retail garden centers and horticultural distribution centers, and the 16,000 additional family farm and

small business members of the state and regional nursery and landscape associations.

ECONOMIC SIGNIFICANCE OF THE NURSERY INDUSTRY

According to USDA's Economic Research Service (ERS), the nursery and greenhouse industry remains the fastest growing agricultural sector in cash receipts. An estimated 18,000 farms (or one percent of all farms) were engaged in producing at least some nursery and greenhouse crops in 1969. By 1992, an estimated 47,425 farms were included in this sector—an increase of 163 percent. Nursery and greenhouse crops in 1996 totaled an estimated \$10.9 billion in farm-gate value, representing nearly 11 percent of the total cash receipts for all U.S. farm crops.

In 1996, nursery and greenhouse crops ranked 7th in total grower cash receipts among all agricultural commodities. It is the third largest plant crop—behind corn and soybeans, yet ahead of wheat, cotton, and tobacco. Nursery and greenhouse crop production now ranks among the top five agricultural commodities in 24 states, and among the top 10 in 40 states. According to USDA, growers produce thousands of varieties of cultivated nursery, bedding, foliage and potted flowering plants in a wide array of different forms and sizes on 390,200 acres of open ground and 678 million square feet under the protective cover of permanent or temporary greenhouses.

USDA data from 1990 also show that nursery and greenhouse farms had the highest average net farm income of all agricultural commodity groups at \$53,589. This was four times higher than the average American net farm income in 1990 of \$13,458. Although nursery farms can be profitable, they are often more capital intensive than other agricultural operations, and are very labor intensive given the thousands of different plant species and the wide-ranging sizes in which they are grown.

AGRICULTURAL RESEARCH SERVICE (ARS)

Reinstatement of Nursery/Greenhouse Research Funding

Noting the increasing economic significance of the nursery and greenhouse industry, ANLA is very grateful and pleased that Congress provided \$200,000 to ARS in fiscal year 1998 specifically to address the important research needs of the nursery and greenhouse industry. Nevertheless ANLA is deeply disturbed that the Administration has once again failed to provide for a continuation of these research dollars in fiscal year 1999. ANLA respectfully urges Congress to restore in fiscal year 1999 the \$200,000 funding which serves as a foundation and springboard for the joint research initiative that the nursery and floral industry has developed (see below).

Although recognition of the economic significance of the nursery industry is indeed increasing, very few federal dollars are dedicated directly to the nursery and greenhouse industry. In fact, only about 0.02 percent of all federal agricultural research dollars are currently so dedicated. This underscores why last year's provision of \$200,000 was so important. Current competitive grant programs and other public funding mechanisms are unable to meet the industry's research needs. In fact, the nursery industry has been largely excluded from funding under the National Research Initiative (NRI) competitive grants simply because it does not grow food or fiber crops. The only rare NRI exceptions are when a horticultural crop has been utilized solely by reason of its rapid production. The nursery and greenhouse industry has an exemplary record of supporting its own research needs as industry-funded research grants annually total several million dollars.

The industry will continue to support research efforts through its own privately funded research foundations, including ANLA's very own research division (the Horticultural Research Institute) which is providing \$350,000 in research grants this year alone. The federal government must play a research role more appropriate to its scope. It must retain the lead in developing the basic building blocks of plant science, in contrast to the industry's applications of those blocks to build solutions to its particular challenges. For instance, ANLA supports the federal funding of biotechnology as ARS fulfills its role as the international leader of such fundamental research. Biotechnology is a crucial tool for use in dealing with a wide spectrum of challenges to environmental horticulture, as well as other important agricultural sectors. The federal role in research is: (1) longer term; (2) cuts across multiple disciplines; (3) calls for extensive coordination among scientists and institutions; and, (4) involves higher risk than can be undertaken by any one industry. Only the federal government can fulfill this essential role.

Joint Nursery/Floral Industry Research Initiative

ANLA and the Society of American Florists (SAF) have jointly developed a detailed \$21 million proposal establishing a coordinated research initiative for the environmental horticulture (nursery and floral) industry. Its goals are to:

- Protect the environment, including human health and safety through research leading to reduced use of chemicals and a reduction in runoff and other wastes.
- Enhance environmental remediation and cleanup efforts on wetlands, post-industrial sites, air quality and other environmental areas through research on the ability of plants to reverse and mitigate environmental pollution.
- Improve the ability to prevent the spread of plant pests and diseases in international trade.
- Strengthen rural and suburban economies across the U.S. by providing improved crop production systems and technologies to nursery and greenhouse crop growers and helping them to increase production efficiency.
- Contribute to the U.S. agricultural economy and increase international competitiveness by conducting research leading to improved nursery and greenhouse products and production strategies, and by improving technology transfer of research results to benefit other U.S. agricultural sectors.
- Maintain biodiversity through germplasm preservation enabling useful botanic traits to be transmitted to future generations.
- Enhance Americans' quality of life by increasing the availability and diversity of plants and flowers for the consumers' purchase and enjoyment.

The joint nursery and floral industry research initiative shall accomplish these goals by focusing on three essential research areas: (1) Improved environmental and resource management; (2) improved pest management; and, (3) improved production system practices and strategies.

ANLA respectfully requests an increase of \$8.0 million in fiscal year 1999 to begin to reach the funding balance envisioned by this research initiative for the nursery and floriculture industry representing nearly 11 percent of all U.S. farm crop cash receipts. ANLA urges Congress to allocate the requested \$8.0 million as follows: (a) \$4.5 million to ARS centers including the U.S. National Arboretum; (b) \$500,000 to Ohio State University to establish an ornamental Plant Germplasm Center in conjunction with USDA's National Plant Germplasm System; and, (c) \$3.0 million to multi-state, multi-location cooperative agreements between ARS and appropriate university researchers.

Methyl Bromide

As a widely used fumigant, methyl bromide is a critical input to many nursery crop management and quarantine systems. However, the U.S. Environmental Protection Agency has listed methyl bromide as a Class I ozone-depleting substance under the Clean Air Act and will ban its use by January 1, 2001. Research and development of effective methyl bromide alternatives for soil fumigation and quarantine treatments are absolutely critical to the nursery industry. Effective alternatives to methyl bromide must be identified. Therefore, ANLA supports the proposed \$2 million in fiscal year 1999 for extramural research on methyl bromide alternatives. ANLA urges that such research be funded based on a priority-setting awards process that encourages grower input. 3

U.S. National Arboretum

When it was founded in 1927, Congress had the foresight to designate research and education as the mission of the U.S. National Arboretum. Since its founding, the U.S. National Arboretum has introduced over 200 important new cultivars, including azaleas, New Guinea impatiens, crepe myrtles, hollies, magnolias, and disease resistant elms. ANLA and the nursery industry have immense respect for this highly successful federal institution. ANLA is proud to support the Friends of the National Arboretum (FONA)—the non-profit, private sector organization whose mission is to garner additional resources to advance the quality and scope of the U.S. National Arboretum's important research and education activities. ANLA supports full fiscal year 1999 funding for the U.S. National Arboretum.

Northwest Nursery Crops Research Center (OR, WA, ID)

ANLA appreciates the \$500,000 in fiscal year 1998 funding for the Northwest Nursery Crops Research Center. This collaborative research center is supported by the American, Oregon, Idaho and Washington nursery associations, Oregon State University, Washington State University, the University of Idaho, and the related extension services. Nursery crop growers in the Pacific Northwest play a pivotal role in supplying nursery stock—not only to the retail and landscape segments of the industry. They provide plants and trees to growers in other areas of the nation for

further cultivation and development. ANLA urges Congress to continue funding the Northwest Nursery Crops Research Center in fiscal year 1999 at the current level of \$500,000.

Nursery Crops Research Station (Tennessee State University)

ANLA appreciates the prior federal funding which helped lead to the establishment and construction of the Nursery Crops Research Station at Tennessee State University. Nursery crop growers in the South continue to face myriad serious plant pest problems. At the same time, implementation of the 1996 Food Quality Protection Act (FQPA) could drive the loss of many pesticide uses critical to nursery growers in the South and throughout the nation. ARS recently established research positions at the Nursery Crops Research Station at Tennessee State University. ANLA urges Congress to provide \$515,000 in fiscal year 1999 for such positions to conduct the critical research to address pest management and other nursery crop production issues.

Endorsement of Minor Crop Farmer Alliance's Testimony

ANLA endorses the appropriations testimony of the Minor Crop Farmer Alliance regarding the following USDA programs: Agricultural Research Service (ARS)—Food Consumption Survey; National Agricultural Statistics Service (NASS)—Pesticide Use Surveys and the National Agricultural Pesticide Impact Assessment Program; and, Agricultural Marketing Service (AMS)—Pesticide Data Program.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

International and interstate trade in nursery crops is governed by inspection and quarantine regulations designed to prevent or slow the artificial spread of hazardous agricultural pests. APHIS works in cooperation with state departments of agriculture to promulgate and enforce such regulations. ANLA strongly supports APHIS' request for adequate program funds for safeguarding plant resources from exotic pests and diseases. The continued growth and success of the nursery industry, and all of American agriculture, depend on these vital APHIS programs.

Agricultural Quarantine Inspection (AQI)

Port-of-arrival inspections and first-class mail inspection under the AQI program are the first line of defense against damaging pest introductions. About 80 percent of the funding for this important program comes from user fees levied broadly across international travel and commerce.

APHIS does not currently collect user fees associated with commerce and travel from Canada to the U.S. Given the risks demonstrated in recent years of movement of such pests as exotic fruit flies into the U.S. from Canada, APHIS might consider whether collection of user fees on goods moving from Canada would allow for enhanced pest exclusion efforts along the U.S./Canada border.

Pest and Disease Management

The Administration's budget seeks about \$80 million for pest and disease management programs in fiscal year 1999. ANLA supports the proposed modest increase for Pest Detection to \$6.685 million in fiscal year 1999. This increase represents sound public policy as evidenced by several recent pest outbreaks. For example, detections of Asian longhorned beetle in New York and Mediterranean fruit fly in Florida have precipitated expensive quarantine and eradication efforts. These outbreaks underscore the need for enhanced pest detection programs. The earlier infestations of damaging exotic pests can be detected, the better the chances of achieving containment or eradication at reasonable expense. We are reminded of the wise adage: "Pay a little now or pay a lot later."

Imported Fire Ant

ANLA notes that the Administration proposes to discontinue funding for the imported fire ant quarantine. The fiscal year 1998 funding level of \$1 million represented only 27 percent of the funding level four years ago, yet the workload associated with the quarantine has increased as the pest has continued to spread. ANLA respectfully urges Congress to direct APHIS to maintain imported fire ant funding in fiscal year 1999 at the fiscal year 1998 funding level of \$1 million.

The small federal funding share is used to carry out cooperative efforts with infested states in the South and Southeast. Continued federal involvement strengthens the level of protection enjoyed by uninfested states wishing to remain free from the agricultural and public health burdens posed by imported fire ants. The federal quarantine ensures a fair, consistent framework for domestic commerce for nurseries located in the 11 affected states from North Carolina through Florida and west to Texas. In exchange for those benefits, nurseries in infested states incur substan-

tial quarantine compliance costs—often in excess of \$100,000 in a single nursery—for a pest that does not cause significant harm to nursery crops. Given the great environmental and public health benefits to society resulting from a successful quarantine effort, ANLA strongly believes that a modest federal expenditure of \$1 million in fiscal year 1999 is justified.

Golden Nematode

In 1995, a science panel was jointly appointed by the National Plant Board and USDA to review, evaluate and make recommendations regarding the golden nematode program. This action was in part necessitated by federal and state reductions in funding and support that jeopardize the very integrity of the federal domestic quarantine. Federal/state cooperative efforts to control and contain the spread of this serious pest have been successful and economically beneficial.

In its report, *The Golden Nematode: Future Strategies for Quarantine and Management* (May 15, 1996), the science panel found the golden nematode to be of continued quarantine importance and regulatory significance. Furthermore, the current quarantine program was deemed biologically sound. However, federal funding shortfalls truly jeopardize the continued long-term viability of the golden nematode management effort. Erosion of this management effort will negatively impact the entire U.S. potato industry from both production and international trade viewpoints, and it may also have disruptive impacts on the nursery industry.

Funding for this program dropped from almost \$900,000 in fiscal year 1992 to \$444,000 in fiscal year 1997, and to \$435,000 in fiscal year 1998. ANLA strongly urges that at least the fiscal year 1997 funding level of \$444,000 be provided in fiscal year 1999 for the necessary survey and regulatory enforcement activities. Optimally, a future appropriation of \$862,000 will maintain the integrity of the quarantine by providing for the necessary supporting research and regulatory activities.

Chrysanthemum White Rust

Chrysanthemums are an important nursery and greenhouse crop. Annual farm-gate value of the U. S. chrysanthemum crop is about \$160 million. Chrysanthemum white rust (CWR), a serious disease of chrysanthemums not known to be established in the United States, has been detected in recent years in California, Oregon, Washington, New York and New Jersey. During fiscal year 1995–98, APHIS and state cooperators engaged in CWR detection survey, control and regulatory activities with these states. Yet, this level of funding has been inadequate to yield a comprehensive understanding as to whether eradication efforts have succeeded. Future regulatory decisions must be based on sound, comprehensive information. ANLA urges Congress to direct APHIS to cooperatively fund completion of thorough CWR detection surveys, and evaluate the success of the eradication program based on the survey results.

Plant Pest Emergency Fund

In recent years, emergencies have been declared as a result of discovery of such devastating pests as Karnal bunt of wheat, Asian gypsy moth, and Mediterranean fruit fly. The long-term benefits of successful eradication efforts far outweigh the short-term costs of emergency programs to eradicate such pests. However, such efforts require rapid response and adequate resources. ANLA supports the establishment of a “no-year” emergency agricultural pest fund that could be accessed at the sole discretion of the Secretary of Agriculture in the event of pest emergencies. Such a fund should be adequate to deal with multiple emergencies, and should be replenished as needed.

FOREST SERVICE

Gypsy Moth Slow-the-Spread (STS)

ANLA recognizes that jurisdiction for U.S. Forest Service funding rests with another appropriations subcommittee. Nonetheless, ANLA believes that the gypsy moth issue is so important that it needs to be brought to this subcommittee's attention as well.

Gypsy moth is a devastating forest and landscape pest that was introduced into the U.S. in 1869. It has since spread to all or part of 17 states and the District of Columbia. However, this area represents only 25 percent of the total area susceptible to gypsy moth outbreaks.

A recent Forest Service pilot program demonstrated that the rate of gypsy moth spread could be slowed by at least 60 percent through the application of modern survey and management practices. National implementation of “Slow-the-Spread” (STS) would cost-effectively reduce the new territory invaded by gypsy moth along a 1,200

mile "frontier" stretching from Wisconsin to North Carolina. STS would protect environmental resources and reduce the burden of quarantines on the nursery industry.

ANLA urges that the \$3.5 million in Forest Service funds provided for the annual pilot program in recent years be dedicated to the STS program. ANLA also urges Congress and the Forest Service to vigorously pursue full STS funding of \$8 million by the year 2000.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

Pesticide Clearance

ANLA strongly supports the Administration's fiscal year 1999 budget proposal of \$10.7 million for the JR-4 program under the USDA-CSREES Special Research Grants Program. Further increases may be needed and justified in view of the new requirements of the 1996 Food Quality Protection Act—(FQPA). FQPA requires the reassessment of virtually all pesticide dietary tolerances over the next 10 years—an enormous task that will require comprehensive JR-4 support. Together with USDA-ARS funding, this would increase JR-4 funding to \$12.8 million for fiscal year 1999.

The JR-4 program has achieved unparalleled success in facilitating the registration of minor-use crop protection tools, including big-pesticides and other reduced-risk pesticides. While most JR-4 projects focus on minor-use food crops, the program to date has generated crucial data supporting uses of most products registered for nursery and greenhouse use. Private industry resources are also leveraging the program's successes. For example, ANLA led a successful effort in 1996 to raise \$20,000 to fund a high level workshop where key nursery and floral researchers prioritized production problems and critical pesticide registration needs. ANLA's research division, the Horticultural Research Institute, as well as the American Floral Endowment and the Society of American Florists supported this effort.

NATIONAL AGRICULTURAL STATISTICS SERVICE (NASS)

ANLA thanks Congress for funding the very practical and efficient Census of Agriculture now under the auspices of the National Agricultural Statistics Service (NASS). Not only does the Census of Agriculture and related surveys provide environmental horticulture statistics unavailable from any other source, these critical surveys reduce both government duplication and respondent burdens.

ANLA supports the proposed \$1.4 million in fiscal year 1999 to expand the current pesticide use surveys to include the burgeoning environmental horticulture industry. ANLA believes strongly that regulations need to be science-based, real world solutions to protect the environment, valued workers and nursery families. ANLA is concerned that in the absence of actual use data, regulators employ overly conservative default assumptions to determine pesticide risks and application rates.

ANLA strongly supports expansion of the labor statistics gathering of NASS as part of the Horticultural Specialties survey. As the industry's single greatest production expense, labor is key to the ability to move into the future, while attracting, training and retaining employees.

ECONOMIC RESEARCH SERVICE (ERS)

The nursery industry relies heavily upon the agricultural economic analyses produced by the Economic Research Service (ERS). In fact, ERS is this nation's sole source of such comprehensive nursery industry analyses. ANLA deeply appreciates the past support provided by Congress for the continued support of economic analyses of the nursery and greenhouse industry. Despite this congressional support, ANLA remains concerned that ERS may ignore both the congressional support and the nursery industry's demonstrated need for continuation of these economic analyses. Therefore, ANLA urges Congress to earmark \$240,000 in USDA's fiscal year 1999 funds and direct ERS to continue conducting its on-going economic analyses of the size and scope of the nursery and greenhouse industry. ANLA respectfully requests Congress to direct ERS to analyze interstate and international trade flows of the nursery industry.

CONCLUSION

In closing, Mr. Chairman, ANLA is mindful of the budget constraints faced by this Committee. Yet, we believe that federal funding of the kinds of activities supported in our testimony is not only justified, but necessary, if the nursery industry is to continue to prosper and play its increasingly significant role in this nation's economic strength. As in past years, ANLA genuinely appreciates this opportunity to present the nursery industry's views regarding USDA's agricultural research pro-

grams and the Department's annual proposed budget. Thank you for your consideration, and we look forward to continuing to work with you, Committee members and your staff.

PREPARED STATEMENT OF THE AMERICAN SEED TRADE ASSOCIATION (ASTA), CORN
AND SORGHUM BASIC RESEARCH COMMITTEE

STRENGTHENING THE GERmplasm BASE OF USA HYBRIDS BY ENHANCING CORN
GERmplasm

SUMMARY

We are requesting \$500,000 be appropriated annually for enhancing corn germplasm.

1. Corn is a key resource providing food, industrial uses, livestock feed, and export.

2. Corn production in the U.S. is based on less than 5 percent of corn germplasm available in the world. Broadening the germplasm base would provide genes to improve yields and protect against new disease, insect and environmental stresses. Exotic germplasm would also be a source for changes in grain quality being demanded by export markets, industrial processors, and other end users.

3. Most exotic germplasm is unadapted to growing conditions in the U.S. This proposal is a joint USDA/ARS, university, and industry effort to adapt this material, so that it can be used by commercial breeders in the development of new hybrids to meet the demands of the American consumer and our foreign markets.

4. We greatly appreciate the \$500,000 previously appropriated for this research, beginning in the 1995 federal budget. This funding is supporting the two main USDA/ARS locations involved in this research (Iowa and North Carolina), as well as USDA/ARS and university locations in Delaware, Georgia, Illinois, Iowa, Mississippi, Missouri, New York, Tennessee, and Wisconsin. Industry is providing \$450,000 in-kind support annually for this effort.

5. The additional appropriation of \$500,000 annually would enable the Iowa and North Carolina locations to purchase equipment and add staff necessary for carrying out this research. It would also provide funding for the increased germplasm evaluation and breeding necessary to test and enhance the exotic materials available.

BACKGROUND

Corn is the major crop on the cultivated land of the USA where approximately 75 million acres are planted each year. U.S. corn production, accounting for about half of the world's annual production, adds over \$16 billion of value to the American economy as a raw material. About 20 percent (\$3.2 billion) of this production is exported each year, thereby providing a positive contribution to the nation's trade balance. Approximately 17 percent of the yearly corn crop is industrially refined. A portion of refined products is exported resulting in an additional \$1.4 billion in export. Through feeding livestock, the rest of the crop is processed into meat and dairy products that affect everyone in our society. Corn is a key resource within our country.

CONCERNS

All of this production is based on using less than 5 percent of the corn germplasm available in the world. Less than 1 percent of our commercial corn is of exotic (foreign) origin, and tropical exotic germplasm is only a fraction of that. This situation exists because private sector corn breeders have generally concentrated on genetically narrow based, or elite by elite, sources for their breeding efforts, since their use results in getting hybrids to the marketplace faster.

Traditionally, corn has been treated as a commodity. In recent years corn grain users and processors have become more interested in the quality characteristics of the grain itself and how this affects their business. Since much of the exotic germplasm has undergone selection for many indigenous uses (foods, beverages, etc.) by various cultures, it seems likely that new grain quality characteristics will be found in exotic rather than the narrow-based germplasm now used. A small increase in value to the grain, such as 10 cents per bushel, would increase its annual value by \$800 million for an eight billion bushel harvest.¹

¹ Salhuana, Pollask, Tiffany 1994. Public/Private Collaboration Proposed to Strengthen Quality and Production of U.S. Corn through Maize Germplasm Enhancement, Diversity Vol. 9, no. 4, 1993/Vol. 10, no. 1, 1994.

Breeders must still be concerned with breeding for higher yields so that U.S. corn farmers can remain competitive. Tapping into the broader germplasm pool could provide new sources of genes for higher yield and other performance traits, such as disease and insect tolerance or improved stalk and root strength.

A further concern with a narrow genetic base is the potential for widespread disease or insect damage due to new diseases or insect species spreading into U.S. corn growing areas. It is more likely that resistance to these dangers would be found in genetically diverse exotic germplasm sources than in our breeding material. One major benefit would be reduced pesticide use. In addition to protection against diseases and insects, these exotic materials provide insurance for unforeseen climatic or environmental problems.

A great deal of excitement has been generated over the new techniques of biotechnology, especially over the potential value to the corn industry of gene transformation using genetic engineering. Research conducted on exotic germplasm could yield many beneficial genes that genetic engineers could quickly transfer to commercial hybrids.

LAMP PROJECT

What would be the source of this exotic germplasm? Over the years, collections of corn have been made from farmers' fields and other sources all over the world, and are stored in various germplasm banks. In 1987, the Latin American Maize Project (LAMP) was initiated to evaluate these corn collections (accessions). It was a cooperative effort among 12 countries to identify accessions that might provide valuable source material for further improvement in hybrid and open-pollinated cultivars in the U.S.A. and other areas. Pioneer Hi-Bred International gave USDA/ARS \$1.5 million to fund the LAMP research.

Nearly 12,000 maize (corn) germplasm accessions were evaluated. In successive stages, the project identified the top 268 accessions. The environmental areas of adaptation for these 268 "elite" populations range from temperate to tropical, and are prime candidates for enhancing the U.S.A. corn germplasm base.

GERMPLASM ENHANCEMENT

Most of this germplasm is unadapted to growing conditions in the U.S. and requires genetic enhancement to make it adapted, or able to grow and mature in our environmental conditions. Enhancement basically means that these exotic materials will be bred with U.S. adapted materials and breeders will select progeny that carry the desired exotic traits and are also adapted to U.S. growing conditions. This will require a concerted long-term breeding approach by corn breeders at numerous locations (environments) throughout the U.S. Only after this process of enhancement will these exotic materials be ready to enter commercial corn breeding channels and be effectively utilized by a broad cross-section of the industry in the development of new hybrids for farmers and corn users.

The total process of enhancement is too large and long-term for public institutions and/or seed companies to accomplish individually. An ambitious task of this nature can only be completed through a coordinated and cooperative effort between the USDA/ARS, land-grant universities, and industry.

The Corn and Sorghum Basic Research Committee of the American Seed Trade Association has been concerned that enhancement of this exotic germplasm would proceed. The Committee consists of representatives from about 30 companies actively involved in the corn and sorghum seed industry, and at the committee's request, Dr. Linda Pollak, Research Geneticist, USDA-ARS, et al., developed a proposal for enhancing exotic germplasm starting with materials which will include the elite LAMP accessions as noted above. This proposal has developed into the U.S. GEM (Germplasm Enhancement of Maize) Project.

U.S. GEM PROJECT OUTLINE

Since this project serves a national need, the primary effort and direction has come from the USDA/ARS. Two permanent USDA/ARS locations are being used as primary sites for enhancement breeding and coordination. One is at Ames, Iowa, where the USDA/ARS currently conducts corn evaluation and enhancement efforts. Dr. Linda Pollak, Research Geneticist, is located there. Dr. Pollak was the Principal Investigator of the U.S.A. for LAMP, and is the lead scientist for this project.

The other permanent site is the USDA/ARS location in North Carolina. This site has responsibility for initial evaluation and conversion of the tropical materials. Tropical corn populations normally will not reach maturity in the Corn Belt, but will produce seed in North Carolina. After initial enhancement of the tropical mate-

rials in the South, they will be sent to Ames for further enhancement and testing in Corn Belt conditions. Dr. Marty Carson is in charge of this program.

A number of corn researchers at various land-grant universities and other ARS locations are also taking part in the enhancement and evaluation of this exotic germplasm. This cooperative effort is very important and serves not only as a source of improved germplasm but also provides excellent training for future plant scientists.

Industry is also involved. A total of 21 companies have pledged research nursery and yield trial plots to be used in this breeding effort. This in-kind support is valued at \$450,00 per year.

An important component of the project is an annual meeting of all cooperators to evaluate progress and plan strategies. An information network has been established to keep everyone up-to-date. A U.S. GEM Technical Steering Group consisting of members from USDA/ARS, University, and Industry has been formed for guidance and administration of this cooperative effort.

This germplasm enhancement project is public and is open to all public sector institutions as well as private seed companies. Information will be freely available and publicly developed materials will remain in the public domain, accessible to all.

ACCOMPLISHMENTS IN 1996-97

Following is a description of accomplishments and research conducted at various locations using 1996-7 funding.

Ames, Iowa.—Priorities for the corn enhancement work at this location are overall project coordination, data analysis and management, management and release of enhanced germplasm, analysis of materials for value-added traits, and as one of the many breeding sites. In cooperation with Iowa State University, a postdoctoral food technologist is working on the utility of unique oils obtained from GEM accessions and a graduate student is studying environmental effects on starch quality measurements.

The laboratory is continuing to evaluate oil, starch, and protein in the exotic accessions and in the breeding populations made up of exotic materials crossed to proprietary corn belt inbreds. In results from 1996, a line from one breeding cross measured total protein of 16 percent (corn belt germplasm has 10 percent) and total oil level of 6 percent (corn belt is 4 percent). It is extremely unique to find increased levels for both of these traits in the same line, and it is potentially very useful for food and feed applications. In 1997, lines were identified with unique starch characteristics, which may be beneficial for human food products.

GEM's World Wide Web site opened on July 15, 1996. From this site cooperators can obtain the latest data from yield tests, disease and insect screening, and value-added trait research, as well as news and upcoming events.

Raleigh, North Carolina.—The focus of this location is twofold. One priority is to develop enhanced material adapted to the Southern U.S. corn growing conditions. The second is to be a stepping stone for adapting tropical material to Midwest conditions.

Breeding populations were tested for resistance to various leaf diseases and stalk rots. Selections were made for improved material with resistance to these diseases as well as for improved yield, standability, and adaptation to North Carolina conditions. For example, in 1997 significant resistance to *Fusarium* ear rot was found in 4 GEM breeding populations. Resistance to *Aspergillus* ear rot was also found in 2 of these same 4 populations. Hybrids of about 130 advanced breeding lines developed from tropical x elite breeding populations outyielded the mean of commercial check hybrids.

Other public cooperators conducted evaluations in 1997 as follows: Drought resistance in Delaware. Yield data accumulation in Georgia. Grain yield, disease resistance and starch content in Illinois. Corn rootworm and *Fusarium* ear rot resistance in Iowa. Grain physical properties, wet milling properties, starch functionality, and other value added grain traits in Iowa. Resistance to aflatoxin in Mississippi. Resistance to corn rootworm and corn borer in Missouri. Resistance to anthracnose stalk rot in New York. Grain yield tests in Tennessee. Evaluation of silage quality in Wisconsin.

Demonstration nurseries were planted at Iowa and North Carolina for viewing by cooperators. Fall field days were held at Iowa and Wisconsin.

In 1997, private cooperators continued the breeding and adaption of about 15 accessions following the protocol developed by the GEM Technical Steering Group. Companies increased their nursery and yield trial in-kind support by approximately 25 percent in 1996.

RESEARCH IN 1998

Research will continue at the various USDA/ARS, university, and company locations similar to 1997.

EFFECTS OF INCREASED FUNDING BEGINNING IN 1999

Appropriation of the additional \$500,000 annually would provide funds to increase research in the following ways:

Ames, Iowa.—The corn genome is being mapped by researchers in the corn genome project. This DNA information is only useful if it is associated with traits of interest. Many unique traits of interest, such as value-added traits, are being discovered in the GEM materials. Additional funding will add personnel and resources to speed up the discovery of value-added traits and help tie these two areas of research together. The increase in winter nursery funding would allow the Ames location to support the public breeding activities and allow public materials to reach commercial breeding programs in half the time. A small amount of money would be available to help public cooperators to attend the annual meeting and field day.

Raleigh, North Carolina.—This location has a number of equipment needs, such as a seed storage unit, because current facilities are filled to capacity. A technician would be added to handle the expanded field work. Current resources restrict testing and development work to relatively few breeding populations. With the increased funding, the number of breeding crosses could be increased, greatly speeding up the introduction of adapted GEM material into private and public breeding programs. Additional funding would provide for yield trial testing at more locations and more extensive disease and insect resistance screening, greatly increasing the precision in selecting materials that are high yielding and have high levels of pest resistance.

Other Public Cooperators.—The increase in funding for public cooperators (to \$202,000 per year in the third fiscal year) would allow for full evaluation and development of new breeding materials improved for productivity as well as disease and insect resistance and value-added traits. It would also provide for the use of biotechnology tools in this development work. Most public cooperators are willing to participate, but cannot unless they have at least partial funding. There are approximately 30 public cooperators now, and as the project develops we are likely to have more.

CONCLUSION

Corn hybrids in the U.S. have a very narrow genetic base, utilizing only a small percentage of all available corn germplasm. This greatly increases vulnerability to unforeseen pest problems, and may lead to an eventual yield cap. Exotic corn germplasm could provide genes for resistance to pest problems and for increased yields. These exotic materials may also contain quality traits to meet new market demands. This will help ensure the U.S. maintains its world leadership in providing the best raw materials to meet the demand for the production of meat, eggs, milk, and many other food and industrial uses.

LAMP project identified the top 268 corn accessions from among 12,000 populations evaluated. The present proposal represents a joint USDA/ARS, land-grant university, and industry effort to enhance these and other exotic accessions so that they can enter commercial corn breeding programs. The result of this cooperation will be an increase in the productivity, quality, and marketability of hybrid corn in the U.S. and for export, benefiting the farmer, the feed and processing industries, and the consumer.

Therefore, the ASTA Corn and Sorghum Basic Research Committee hereby requests the 106th Congress of the United States to add funding of \$500,000 (in addition to the \$500,000 appropriated initially in 1997, for a total of \$1,000,000) annually for this corn germplasm enhancement project beginning with the 1999 federal budget.

BUDGET SUMMARY

This is a summary of the operational and capital budgets for 1998, 1999, and 2000; 2000 will only be operational. The budget is divided into the Corn Belt Location and corresponds to Ames, Iowa (USDA-ARS) and the cooperators in the Corn Belt area. The Southern Location corresponds with Raleigh, North Carolina (USDA-ARS) and the cooperators in the states in the South. For a complete copy of the budget, please contact Dr. David Harper, Holden's Foundation Seeds LLC, Box 839, Williamsburg, IA 52361 or 319-668-1100.

Items	1998	1999	2000
Corn Belt location:			
Board reductions	\$18,500	\$19,100	\$19,800
Personnel	143,500	252,200	262,600
Office/field	43,600	91,000	91,000
Capital equipment	34,400	68,700	57,600
Specific agreements for public cooperators ¹	60,000	169,000	169,000
Total for Corn Belt location	300,000	600,000	600,000
Southern location:			
Personnel	90,000	123,000	126,000
Office/field	25,100	53,500	54,000
Capital equipment	4,900	68,000	68,000
Specific agreements for public cooperators ¹	30,000	55,500	52,000
Total for Southern location	150,000	300,000	300,000
Summary:			
Corn States location	300,000	600,000	600,000
Southern location	150,000	300,000	300,000
USDA/ARS overhead	50,000	100,000	100,000
Grand total	500,000	1,000,000	1,000,000

¹ Specific Agreements for Public Cooperators: Agreements for public cooperation can be made with universities and ARS scientists in many locations which could include the following states: Delaware, Ohio, Pennsylvania, Indiana, Illinois, Wisconsin, Kentucky, Missouri, New York, Iowa, Michigan, Minnesota, North Dakota, South Dakota, Nebraska, North Carolina, Mississippi, Georgia, Louisiana, Texas and Tennessee. Research at these locations would include selection for disease and insect resistance, evaluation for value added traits, and yield trials.

**PREPARED STATEMENT OF LORIN MOENCH, JR., PRESIDENT, AMERICAN SHEEP
INDUSTRY ASSOCIATION**

The American Sheep Industry Association (ASI) is a federation of state member associations representing the nearly 80,000 sheep producers in the United States. The sheep industry views numerous agencies and programs of the U.S. Department of Agriculture as important to lamb and wool production. Sheep industry priorities include rebuilding and strengthening our infrastructure, critical predator control activities, maintaining and expanding research capabilities and animal health efforts.

The rapid changes that have occurred in the domestic sheep industry and continue to take place put further emphasis on the importance of adequately funding the U.S. Department of Agriculture programs important to lamb and wool producers.

We appreciate this opportunity to comment on those portions of the USDA fiscal year 1999 budget.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The mission of APHIS, "to protect U.S. animal and plant resources from diseases and pests," is very important to the sheep industry of the nation.

Wildlife Services

The Wildlife Services (WS) program of USDA-APHIS is vital to the economic survival of the sheep industry. The value of sheep and lambs lost to predators and predator control expenses are second only to feed in sheep production costs. Costs associated with predation now exceed our industry's veterinary costs, labor, and transportation costs.

The sheep industry adamantly disagrees with the Administration's budget proposal to reduce the Wildlife Services operations budget \$3.4 million and to decrease methods development funding \$829,000. The proposed \$4.3 million funding cut for programs and research will not only severely impact tens of thousands of agricultural producers, but will endanger the health and safety of millions of Americans, jeopardize a number of endangered species and other wildlife programs, and carry negative international implications.

The Agricultural Statistics Service estimates that two-thirds of the nation's farms suffer some form of wildlife damage each year. Most recent loss surveys found that over 520,000 head of sheep, 117,000 head of cattle and 35.4 million bushels of corn were lost to wildlife damage. The president's budget reduction will not only reduce or eliminate efforts to control livestock losses in a number of states, but also threatens efforts to control aquaculture losses to migratory birds in Arkansas, Alabama and Pennsylvania, rice losses in Louisiana, sunflower, corn and other small grains losses in North Dakota and Iowa. Losses of federal cooperative dollars is also expected to result in corresponding reductions in state and local cooperative dollars, further reducing the effectiveness of Wildlife Services.

Agriculture is not the only sector of the public affected by the proposed Wildlife Services budget cut. Urban America makes as many requests on WS for protection of private property and human health and safety as agriculture. With over 2,000 commercial jets hitting wildlife each year, airport safety is also heavily dependent on WS. The president's budget needlessly threatens to reduce efforts to protect airlines and passenger safety in states such as Florida, Pennsylvania, Iowa, Kansas and Utah. The president's budget recommendations to eliminate \$800,000 in rabies control funding for New York, Vermont, Ohio and Texas also places needless risk on human health and safety.

Due to its cooperative nature, the Wildlife Services program continues to be the most cost effective and efficient program within the U.S. Department of Agriculture in managing the public's wildlife for purposes of reducing wildlife damage to private property and protecting human health and safety. Wildlife Services is one of the few federal programs that has been consistently at or above the 50-50 federal to cooperative funding ratios. The president's recommendation that a 50-50 ratio of cooperator funding be applied at the states and local level has no justification in statute, regulation or policy. Efforts by the administration to micromanage this successful cooperative program will only serve to take away needed flexibility of WS managers and will inhibit Wildlife Service's ability to accomplish its mission as mandated by the Animal Damage Control Act, NEPA and the Government Performance and Results Act.

Although the funding for Wildlife Services has seen slight increases in the past, most increases have been Congressional Directives aimed at specific projects. Inflation has slowly eaten away at funds used to support general operations programs. The sheep industry strongly supports the funding for fiscal year 1999 Wildlife Services operations be set at \$33,997,600, an increase of \$5,511,600 over the fiscal year 1998 level.

Aerial hunting is one of Wildlife Service's most efficient and cost effective core programs. Past appropriations have not kept pace with inflationary effects which have almost double the cost of flying since 1980. As the budget availability for aerial hunting has decreased, Wildlife Service's ability to oversee safety inspections and to conduct annual certifications on all contract aircraft's has also decreased. A total of \$3,182,500 is needed to offset inflationary effects on the aerial program and to provide better safety, training and inspection for Wildlife Service pilots.

The United States Fish and Wildlife Service continues to place increased budgetary demands on Wildlife Services in terms of endangered species protection and management. With record numbers of wolves in Minnesota this past year, also came record numbers of farms where livestock were verified killed by wolves. Wolf predation on livestock in Montana, Wyoming and Idaho doubled in 1997 vs. 1996. An additional \$285,000 over fiscal year 1998 levels of funding is needed to manage rapidly expanding wolf populations.

A total of \$700,000 is needed to continue implementing the new Management Information Reporting system. Implementation is expected to cost \$6 to \$8 million over a five year period and is necessary to replace Wildlife Service' outdated system which is to obsolete to handle current amounts of information. The new system is necessary for NEPA compliance and to provide trend information and information on resources protected, etc. as required by the Government Performance and Results Act.

As stated in the president's budget, the National Wildlife Research Center (NWRC) is the only research facility in the world devoted exclusively to studying and developing socially acceptable methods on managing wildlife damage and related human health and safety issues. The president's budget, however, is inaccurate in its statements that the NWRC cannot accommodate much of the specialized requirements of its methods development programs within current facilities and therefore requests a \$479,000 decrease. These monies are being fully utilized for research in areas of airport safety, human health and safety, predator management and the protection of aquaculture, small grains and forests. Facilities in Olympia, Washington; Starkville, Mississippi; Gainesville, Florida; Logan, Utah and others are fully

capable of conducting this research until the Ft. Collins, Colorado facility is complete. The \$479,000 proposed budget cut by the president will only serve to cripple or close existing facilities.

The sheep industry urges Congress to provide the necessary \$20.5 million needed to complete the state-of-the-art facilities and Ft. Collins, Colorado. Future improvement of humane and effective wildlife damage management programs depends on identification and development of more effective control methods.

The president's budget also carries negative international implications. After five years of negotiation, the United States has reached agreement with the European Union (EU) to test and develop scientific information in relationship to safe and humane trapping standards. Not providing the necessary funding to conduct this research will cause the United States to renege on its international promises to the EU. The sheep industry urges Congress to add \$450,000 to the budget for this very critical wildlife management, economic and trade issue.

Scrapie

Adequate funding of the Voluntary Scrapie Flock Certification Program and other scrapie control measures through USDA-APHIS is of critical importance to the sheep industry, as well as all segments of the livestock industries. ASI appreciates this Subcommittee's efforts in recognizing the seriousness of this devastating disease and the real need for control and eradication. ASI and others have urged APHIS to step up its efforts in scrapie control/eradication through a more aggressive regulatory approach. We request that the scrapie control/eradication program be funded more adequately in fiscal year 1999 as requested by the administration.

No country has, to date, conducted an active surveillance study of scrapie. ASI has requested that APHIS conduct a national surveillance study of scrapie since our industry's ability to compete in the market place is encumbered by both existence of scrapie in our flock and the lack of quantitative data about the disease. ASI has committed to investing producer funds to help cover laboratory costs associated with the study. Additional appropriations up to \$600,000 are supported by the industry to insure completion of this critical surveillance effort.

AGRICULTURAL MARKETING SERVICE

Lamb Market Information and Price Discovery Systems

The sheep industry strongly supports the fiscal year 1999 budget of \$22,166,00 for Market News of USDA-Agricultural Marketing Service. The increased appropriations of \$820,000 is critical for the agency to conduct the increased international market reporting and activities associated with the concentration in the livestock industry. The sheep industry has requested a review and update to the lamb and lamb meat market reporting system in the U.S. and inclusion of imported lamb product prices in the market news which brings added importance to increasing funds for the Foreign Agricultural Service (FAS).

The sheep industry participates in FAS programs such as the Market Access Program (MAP) and the Foreign Market Development Program. ASI strongly supports continued appropriations at the fiscal year 1998 level for these critical Foreign Agricultural Service programs. ASI is the cooperator for American wool and sheep genetics and has achieved remarkable success in increasing exports of domestic wool, breeding sheep and semen. Wool exports have increased 170 percent over the last five years with the aid of this funding. American lamb sales also benefit from the Foreign Market Development Program through increased international efforts.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

ASI urges increased appropriations for the range programs of the Soil Conservation Service to benefit the private range and pasture lands of the United States with conservation assistance. We support the budget item and recommend an increased level for the Grazing Lands Conservation Initiative which ASI has worked with, along with other livestock and range management organizations, to address this important effort for rangelands in the U.S.

RESEARCH, EDUCATION AND ECONOMICS

The sheep industry recognizes that it must be globally competitive, profitable and sustainable as a user of and contributor to our natural resource base; that production and processing practices must be environmentally sound, socially acceptable and must contribute to the goals and overall well-being of families and communities. It is therefore essential that an integrated systems approach be used, focusing on problem-oriented programs utilizing interdisciplinary team efforts. These efforts should be applied both to plan and to conduct research on complex problems as well

as to apply problem-solving technologies on farms and ranches through quality educational programs. We are disappointed in the small increases requested by the administration for agricultural research and education funding. In order for U.S. Agriculture to be globally competitive and environmentally sound in the future we must invest in the discovery of new technologies for producing, processing, and marketing food. We urge the subcommittee to give send a strong message supporting agricultural research and education increases.

Agricultural Research Service

ASI recommends the continued support and expansion of the scrapie/BSE and other TSE research initiatives at Pullman, Washington and Ames, Iowa as requested by the administration. The collaborative research that is ongoing at these locations is recognized world wide and will be key in finding solutions to these disease problems. We believe regulatory initiatives to prevent, control, and eradicate TSE's in our livestock populations will work when based on sound research information. We also strongly support the administration's request of \$6 million for emerging diseases and we urge significant appropriations for the animal component of this line item.

COOPERATIVE STATE RESEARCH EDUCATION AND EXTENSION SERVICE (CSREES)

We strongly support the National Research Initiative (NRI) and we appreciate the Administration's request of \$130 million. The competitive grants awarded under its program are for the highest quality research addressing the goals and objectives of FAIR 1995.

The ongoing research in wool is critically important to the sheep industry. ASI supports continued funding of \$212,000 for fiscal year 1998 through the special grants program of the CSREES.

We urge the subcommittee to appropriate both intramural and extramural funding for research to measure the well being of livestock. Animal well being is an emotional issue; in order to consider new management strategies for the enhancement of animals, we need improved methods of measurement.

The industry greatly appreciates this opportunity to discuss these programs and appropriations important to the sheep industry.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR NUTRITIONAL SCIENCES
(ASNS)

The American Society for Nutritional Sciences (ASNS) is the principal professional organization of nutrition research scientists in the United States representing 3,500 members whose purpose is to develop and extend the knowledge and application of nutrition science. Our members include scientists involved in human as well as animal nutrition research. Our members hold positions in virtually every land grant and private institution engaged in nutrition-related research in the United States as well as industrial enterprises conducting nutrition and food related research.

THE NEED FOR NUTRITION-RELATED RESEARCH

The need for nutrition science and research is critical within the USDA. Nutrition and agricultural research are areas that impact the constituents of every congressional district in the nation. New technologies are demanded to reduce the likelihood of pathogen transmission by food, to improve the quality of processed foods, and to deliver greater nutritional value in foods. Additionally the economic impact on society in healthcare costs produced by advances in nutrition research is significant in the number of dollars saved by the American taxpayer. As health costs continue to rise, it is imperative that our medical practices take a preventive approach. This requires a thorough understanding of the role of nutrients in foods in preventing chronic illnesses such as heart disease, cancer and diabetes.

Research in the areas of food safety and human nutrition has paid-off with considerable benefits to society. The USDA has a unique role in the area of nutrition research, particularly as it applies to human nutrition. For example, although there is a serious and obvious commitment to the funding of disease-related research within the National Institutes of Health, issues important to the basic mechanisms of nutrient function and the safety of the food supply have traditionally been the purview of USDA funded research. Most of the recent work on nutrient content and availability in various foods has come from USDA-NRI supported research. From a consumer perspective, it is this type of information that is often the most useful. It is clearly an important extension of the commodity-oriented research carried out

by our land grant universities. And from the perspective of nutrition, the goal of this research often achieves optimal health in the context of using given commodities as part of our diets.

ASNS is aware that nutrition research is among those areas of public policy that has received bipartisan support, and we hope that support will continue. Nutrition scientists are grateful to those members of both parties who have supported scientific research. This investment increases knowledge that ensures a healthy and productive society.

We need to continue to invest in research as greater challenges face us in the 21st century. Increasing populations, international economic competitiveness, improving the environment and minimizing healthcare costs through disease prevention are all areas that will continue to demand solutions for the future. These solutions might include advances in the understanding of the genetic basis of disease and the genetic basis of nutrient requirements for optimal health, which will require greater understanding of how nutrition and dietary information can be used for disease prevention in at-risk populations. In recent years nutrition research has led to nutritionally improved school lunches, implemented changes in safety requirements, and increased awareness for pregnant women, children and the elderly.

SIGNIFICANT NUTRITION-RELATED RESEARCH ACCOMPLISHMENTS

Zinc Intake Important to Maintaining Good Health

National surveys have shown that in the U.S. half of the adults have inadequate intakes of zinc. Inadequate intakes of zinc can make one more susceptible to infection, poor wound healing and skin lesions. It is not known how much zinc is needed to maintain good health. In a study funded by USDA's NRI, investigators developed a model of zinc kinetics which shows the relationship between endogenous excretion, absorption, pool sizes and dietary zinc intakes. They were able to show that the size and turnover rates of rapidly equilibrating zinc pools are specific indicators of zinc status and can be used to assess the prevalence of low zinc in a population. Future studies will entail developing zinc status tests that can be used in field settings.

Dietary Energy Requirements in Children and Obesity

Data from National health surveys have shown that pediatric obesity is increasing in the U.S. This is a critical health concern because obesity in childhood increases the risk for obesity in adulthood and the many diseases associated with obesity. It has been shown that 26–41 percent of obese preschool children are obese as adults. Diet is considered to be an important variable, especially dietary fat intake. In a study supported by USDA's NRI, investigators showed that maternal obesity influences dietary fat intake in children and in boys there was a correlation between their fat intake and amount of body fat. Researchers have been able to show that physical activity (hrs/day) is more related to body fatness than to energy expenditure (kcal/day). Total energy expenditure is influenced by season and geographic location independent of differences in body composition. Gender influences energy expenditure through its effect on resting energy expenditure and this effect is consistent among several ethnic groups tested. They have been able to provide and validate new tools for assessment of diet, energy expenditure and body composition in growing children, which can be used in the development of new guidelines for dietary energy needs in children.

Vitamin B-6 Kinetics in Women

Vitamin B-6 is required for numerous metabolic functions. Lower serum levels of vitamin B-6 have been found in pregnant women. It is still unclear what is a good method for assessing vitamin B-6 status in people, especially in women during pregnancy and lactation, a time of stress. Pyridoxal, pyridoxamine and pyridoxine are the forms of vitamin B-6 found in the body and these metabolites provide critical information about vitamin B-6 status. In a study supported by USDA NRI, investigators examined the appearance of a stable isotope given to women in pyridoxic acid (important vitamin B-6 metabolite) in urine and in pyridoxal in milk of lactating women. They have shown that lactation may have a greater influence on vitamin B-6 metabolism than pregnancy. The researchers have also shown that using standard clinical assays for alkaline phosphatase and phosphorus may be used to estimate pyridoxine phosphate phosphatase activity in undiluted plasma, an indicator of vitamin B-6 status.

Vitamin A Critical to Embryonic Development

Numerous studies have shown that adequate vitamin A is critical for normal embryonic and fetal development in humans. Maternal insufficiency of vitamin A during pregnancy results in several abnormalities and death of the fetus. In a study

supported by USDA's NRI, the investigators used an avian model to look at the physiological function of vitamin A in early development. In vitamin A-deficient embryos no retinoic acid (metabolite of vitamin A) was found. However, normal early embryos were shown to be capable of processing vitamin A. Using molecular biology techniques, developmental patterns between normal and vitamin A-deficient embryos were compared. These studies showed a role for vitamin A in heart, central nervous system and vascular system development. In addition, the researchers were able to identify a valuable marker (retinoic acid receptor beta), which is vitamin A status dependent, for vitamin A-dependent developmental events. It is widely accepted that very early developmental events are similar across species, thus the finding of this research is relevant to human embryonic development, which could lead to a scientific basis for evaluating vitamin A nutrition in humans.

RESEARCH FUNDING MECHANISMS AND ISSUES

Competitive Grants

A competitive system for allocating government research funds is the most effective and efficient mechanism for focusing efforts on cutting edge research aimed at improving the health of the American people. Competitive grants provides the most effective, efficient and economic return to the public. ASNS strongly supports the competitive grants process as reflected in the National Research Initiative and believes that an open, merit and peer review process, applied as extensively as possible throughout the research system, is the preferred way to distribute research funds among qualified scientists and to support the most meritorious new concepts.

Special Grants

ASNS strongly believes that the best research results come from research that is peer reviewed. That is why researchers funded by federal agencies, such as the NIH and the NSF, that award grants on merit have made such great progress. There is a danger that special grants and earmarked research funds from USDA may be awarded on the basis of politics rather than merit, priority or research need. Therefore, the integrity of the research system and agricultural science may be eroded. Last year special grants were appropriated at \$66 million even though the Administration's request for this year was just over half of that figure. We recognize that there is pressure to maintain these special grants. Special grants, however, do not always make for the best science or good use of scientific expertise. While special grants have their place to address emergency needs of national priority such as food safety, they may also be used to address research that is not deemed of the highest priority or merit. Thus, the proportion of special grants in comparison to the total research budget at USDA should be decreased.

INITIATIVE FOR FUTURE AGRICULTURE AND FOOD SYSTEMS IN THE RESEARCH, EXTENSION, AND EDUCATION REAUTHORIZATION BILL

The Agricultural Research, Extension, and Education Reform Act, which has been agreed upon in conference, and still pending in the Senate (4/29/98) includes an Initiative that would create new mandatory spending that provides \$600 million for funding competitively-awarded research programs at USDA over a five year period. Priority mission areas to be addressed in the first year are food genome, food safety, food technology and human nutrition; new and alternative uses and production of agricultural commodities and products; agricultural biotechnology; and natural resource management. The Initiative also includes provisions that allow merit/peer review and lets those who benefit from agricultural research provide input about the priority setting process. ASNS supports this Initiative and urges members of this subcommittee to support the bill when it comes to the Senate floor.

ANIMAL WELFARE ACT

Research using animals has been crucial to virtually every advance in medicine in the past century. Agents for control of high blood pressure and the management of diabetes, vaccines for the control of poliomyelitis and mumps, development of artificial joints and heart-lung machines, and many more medical advances have depended on animal research.

USDA's Animal and Plant Health Inspection Service (APHIS) is charged by Congress to enforce the Animal Welfare Act (AWA). Under the AWA, USDA licenses dealers to buy and sell random-source animals to research facilities that are unable to obtain them from municipal pounds and shelters. This provides access to a critical supply of animals since animals bred specifically for research often lack characteristics needed by researchers studying health-related problems. Much of their work relies on older, larger, and genetically diverse animals.

ASNS recommends that Congress provide APHIS with adequate funding for enforcement of the Animal Welfare Act in fiscal year 1999 so that it can continue to ensure compliance with the AWA.

CLOSING REMARKS

Agriculture has been and will continue to be important to human health in terms of food that provides proper nutrition for healthier people. As the future challenges us with more complicated diseases, research is forced to expand outside the traditional disciplines and approaches, such as the work that is being done in plant and animal genomics. Transgenic plants and animals offer potential for new developments never before thought possible. New approaches must be implemented to address new societal concerns. For example, despite our hard efforts to plan healthy diets for school children much of this food is being wasted. Nutritionists are constantly challenged to develop nutrient-balanced meals that will encourage our children to choose more healthful foods. New demands to fit busy lifestyles is another example. Issues such as product convenience, uniformity of products, ease of preparation, "automatic" nutrient balancing, and packaging are all areas scientists must address. Research in areas of how our food is produced, pesticide usage, animal care and food handling issues also present demands to our scientists. These demands and opportunities must be answered in a way that sustains or enhances our quality of life. Although greater challenges lie ahead, agricultural research funding continues to be stagnant.

It is for these reasons that ASNS recommends to the Committee an increase in funding for USDA's National Research Initiative Competitive Grants Program from \$97 million to \$130 million. This amount reflects our view that the increase requested for the competitive grants program is an investment which will lead to a more balanced and productive research system that is vital to our national interest.

PREPARED STATEMENT OF CAROLYN CHENEY, CHAIRMAN, AMERICAN SUGAR ALLIANCE

Thank you for the opportunity to submit testimony for this important hearing. I am Carolyn Cheney, Washington Representative for the Sugar Cane Growers Cooperative of Florida. I also serve as chairman of the American Sugar Alliance, of which my cooperative is a member. The ASA is a national coalition of growers, processors, and refiners of sugarbeets, sugarcane, and corn for sweetener. I am proud to present the views not only of the Sugar Cane Growers Cooperative of Florida, but also of the American Sugar Alliance.

SUMMARY

The U.S. sugar industry has long endorsed the goal of global free trade because we are efficient by world standards and would welcome the opportunity to compete on a genuine level playing field. Until we achieve that free trade goal, however, we must retain at least the minimal, transitional sugar policy now in place to prevent foreign subsidized, dump market sugar from unfairly displacing efficient American producers. This policy was substantially modified by Congress in the 1996 Farm Bill, but remains highly beneficial to American taxpayers and consumers.

Despite its free trade goal, however, the sugar industry has some serious concerns about the structure of future multilateral or regional trade agreements.

Multilaterally, we are concerned that, while U.S. agriculture unilaterally far surpassed its Uruguay Round commitments through huge government cutbacks in the 1996 Farm Bill, many foreign countries have yet to even minimally comply with their Uruguay Round commitments.

Regionally, we are facing serious problems with both Canada and Mexico. Canada is exploiting a loophole to circumvent the U.S. tariff-rate quota for sugar and threaten the no-cost operation of U.S. sugar policy. Mexico, three years after the NAFTA went into effect, is calling into question the validity of special sugar provisions to which it agreed before the NAFTA was voted upon and approved.

American sugar farmers want free trade. But we have trouble moving further in that direction when past free trade agreements are being ignored, or circumvented, by our trading partners, to the possible detriment of our farmers.

I would like to provide some background on the United States' role and standing in the world sugar economy and on U.S. sugar policy's effect on American consumers and taxpayers and discuss the U.S. sugar industry's trade policy goal, concerns, and recommendations, with special focus on the next round of World Trade Organization (WTO) talks.

BACKGROUND ON U.S. SUGAR INDUSTRY, POLICY

Size and Competitiveness.—Sugar is grown and processed in 17 states and 420,000 American jobs, in 40 states, are dependent, directly or indirectly, on the production of sugar and corn sweeteners. The United States is the world's fourth largest sugar producer, trailing only Brazil, India, and China. The European Union (EU), taken collectively, is by far the world's largest producing region. It benefits from massive production and export subsidy programs.

Despite some of the world's highest government-imposed costs for labor and environmental protections, U.S. sugar producers are among the world's most efficient. According to a study released in 1997 by LMC International, of Oxford, England, American sugar producers rank 19th lowest in cost among 96 producing countries, most of which are developing countries. According to LMC, fully two-thirds of the world's sugar is produced at a higher cost per pound than in the United States.

Because of our efficiency, American sugar farmers would welcome the opportunity to compete against foreign farmers on a level playing field, free of government subsidies.

Unfortunately, the extreme distortion of the world sugar market makes any such free trade competition impossible today.

World Dump Market.—More than 100 countries produce sugar and the governments of all these countries intervene in their sugar markets in some way. The most egregious, and most trade distorting, example is the EU. The Europeans are higher cost sugar producers than we are but they enjoy price supports that are 40 percent higher—high enough to generate huge surpluses that are dumped on the world sugar market, for whatever price they will bring, through an elaborate system of export subsidies.

World trade in sugar has always been riddled with unfair trading practices. These practices have led to the distortion in the so-called "world market" for sugar. These distortions have led to a disconnect between the cost of production and prices on the world sugar market, more aptly called a "dump market". Indeed, for the period of 1984/85 through 1994/95, the most recent period for which cost of production data are available, the world dump market price averaged just a little more than 9 cents per pound raw value, barely half the world average production cost of production of over 18 cents.

Furthermore, its dump nature makes sugar the world's most volatile commodity market. Just in the past two decades, world sugar prices have soared above 60 cents per pound and plummeted below 3 cents per pound. Because it is a relatively thinly traded market, small shifts in supply or demand can cause huge changes in price.

As long as foreign subsidies drive prices on the world market well below the global cost of production, the United States must retain some border control. This is our only response to the foreign predatory pricing practices that threaten the more efficient sugar farmers.

The reformed sugar policy of the 1996 Farm Bill does retain the Secretary of Agriculture's ability to limit imports, and also provides a price support mechanism, though only when imports exceed 1.5 million short tons. We are currently only 240,000 tons above that critical trigger level.

Sugar Reforms.—The 1996 Farm Bill drastically changed U.S. sugar policy, as it did other commodity programs. All American farmers, including sugar farmers, now face a less certain future, with less government intervention, higher risk, and the prospect of lower prices.

There were six major reforms to U.S. sugar policy in the 1996 Farm Bill:

1. *Marketing allotments eliminated.*—With no production controls, we now have a domestic free market for sugar. Less efficient producers are more likely to go out of business; more efficient producers are free to expand. Just two months ago, the only sugarbeet processing company in Texas announced it is closing, ending sugarbeet production in that state, because of low returns.

2. *Guaranteed minimum price eliminated.*—Sugar is the only program crop that has lost the guarantee of non-recourse loans and a minimum grower price. Sugar producers will have access to non-recourse loans only when imports exceed 1.5 million short tons.

3. *Minimum imports effectively raised.*—Under the Uruguay Round of the GATT, the U.S. was required to import no less than 1.256 million tons of sugar per year. The non-recourse loan trigger of 1.5 million tons effectively raises our import minimum to that level, a unilateral increase of 20 percent.

4. *Marketing tax raised.*—The special marketing assessment, or tax, sugar producers must pay to the government was raised by 25 percent, to 1.375 percent of the loan rate on every pound of sugar produced. This added burden on sugar farmers

will generate about \$40 million per year for the U.S. Treasury, with all this money earmarked for federal budget deficit reduction.

5. *Forfeiture penalty initiated.*—To discourage forfeiture of loans to the government when non-recourse loans are in effect, and to raise even more money for the U.S. Treasury, a 1-cent per pound forfeiture penalty was initiated.

6. *Commitment to further reductions.*—A provision called “GATT Plus” requires that the U.S. will reduce its sugar supports further if, and when, foreign countries surpass their Uruguay Round commitments, as the U.S. has done.

Effect on Consumers.—American consumers and food and candy manufacturers benefit from high-quality, dependable, reasonably priced supply of sugar. Consumer prices in the United States are fully 32 percent below the developed-country average, according to a world survey by LMC International. Compared with consumers worldwide, and taking varying income levels into account, LMC found that in terms of minutes to purchase one pound of sugar, American consumers are the second lowest in the world, trailing only the tiny country of Singapore.

Consumer Cost Myths.—The food manufacturer critics of U.S. sugar policy repeatedly point to a severely flawed 1993 General Accounting Office study that estimated a consumer cost of U.S. sugar policy at \$1.4 billion per year. Experts at the U.S. Department of Agriculture have twice vilified this flawed report, as have noted academicians. More recently critics are citing a Public Voice “update,” which mimicked the faulty methodology of the GAO report and dropped this supposed cost to \$1.2 billion.

Both of these absurd studies assumed that: (1) All U.S. sugar needs could be supplied from the world dump market at a price well below the world average cost of production; (2) We could fulfill our needs from this thinly traded, highly volatile world market without that price increasing at all; and (3) Every penny of the food manufacturers’ and retailers’ savings from the lower dump market sugar prices would be passed along to consumers.

For reasons I have already outlined, it is clear that if the United States destroyed its sugar industry and shifted all its demand for sugar to the thinly traded world dump market—which would increase demand on that market by about 50 percent—the price would skyrocket, as it has in the past with far smaller surges in offtake.

To address the third and most outrageous of these assumptions, one need only examine price behavior of the past year, or the past decade. History shows absolutely no passthrough.

No Passthrough to Consumers.—Since Farm Bill reforms went into effect in October 1996, both raw cane and wholesale refined beet sugar prices to producers have dropped dramatically, wholesale refined prices by a whopping 12 percent. But at the retail level, not even the price of sugar on the grocery shelf has dropped at all. And prices for sweetened products, such as candy, cereal, ice cream, cakes, and cookies have all risen by 1–5 percent. Looking back to price changes since 1990, the story remains the same: producer prices down, by 6–10 percent, but consumer prices for sugar and products up, with product prices rising 18–26 percent.

The disconnect between producer and consumer prices is even more pronounced with regard to beverages. Over the past year high fructose corn syrup producers have suffered a catastrophic 50 percent drop in the price for their product, the principal sweetener used in American soft drinks. Have cola consumers seen any benefit? Not a bit. Carbonated drink prices are up, by almost 1 percent, over the same period.

Effect on Taxpayers.—Not only has U.S. sugar policy been run at no cost to the government since 1985, but since 1991 it has been a revenue raiser. The marketing assessment burden on sugar farmers will generate an estimated \$288 million for federal budget deficit reduction over the seven years of the 1996 Farm Bill.

U.S. SUGAR INDUSTRY’S FREE TRADE GOAL

Because of our competitiveness, with costs of production well below the world average, the U.S. sugar industry supports the goal of genuine, global free trade in sugar. We cannot compete with foreign governments, but we are perfectly willing to compete with foreign farmers in a truly free trade environment.

We were the first U.S. commodity group to endorse the goal of completely eliminating government barriers to trade at the outset of the Uruguay Round, in 1986. We understand we are the first group to endorse this same goal prior to the start of the 1999 multilateral trade round. We described our goals and concerns to the Administration in a letter last May to Trade Representative Barshefsky and Agriculture Secretary Glickman.

The U.S. sugar industry does not endorse the notion of free trade at any cost. The movement toward free trade must be made deliberately and rationally, to ensure

fairness and to ensure that those of us who have a global comparative advantage in sugar production are not disadvantaged by allowing distortions, exemptions, or delays for our foreign competitors.

To achieve a free trade transition process that is rational and fair, we offer the following thoughts on past agreements, and our concerns and recommendations regarding future negotiations.

SUGAR AND THE URUGUAY ROUND

Little Effect on World Sugar Policies.—More than 100 countries produce sugar and all have some forms of government intervention. Unfortunately, these policies were not significantly changed in the Uruguay Round Agreement (URA) of the GATT.

- The agreement failed to reduce the European Union's lavish price support level and requires only a tiny potential drop in their massive export subsidies.
 - Developing countries, which dominate world sugar trade, have little or no labor and environmental standards for sugar farmers, have no minimum import access requirements, and often have high import tariffs. Nonetheless, developing countries were put on a much slower track for reductions, or were exempted altogether.
 - Important sugar-producing and importing countries such as China and the former Soviet republics are not GATT members, and need to do nothing.
 - State trading enterprises (STE's) that are prevalent in sugar-producing countries such as Australia, Brazil, China, Cuba, and India were ignored.
- Furthermore, some countries have not yet even complied with their URA commitments.

U.S. Sugar Surpasses URA Requirements.—The United States is one of only about 25 countries that guarantees a portion of its sugar market to foreign producers and it has far surpassed its URA commitment on import access. The URA required a minimum access of 3–5 percent of domestic consumption. The United States accepted a sugar-import minimum that amounts to about 12 percent of consumption. In practice, U.S. imports the past two years have averaged 24 percent—double the promise we made in the GATT, and about six times the global GATT minimum.

All this sugar imported from 41 countries under the tariff-rate quota enters the United States at the U.S. price, and not at the world dump price. Virtually all this sugar enters duty free. Just five countries (Argentina, Australia, Brazil, Gabon, and Taiwan) that lack Generalized System of Preferences (GSP) status pay a duty, and that is quite small, about 0.6 cents per pound.

The United States calculated its above-quota tariff rate in the manner dictated by the URA. These tariff levels are totally GATT consistent, and are dropping by 15 percent over the 6-year transition period, as we promised they would in the Uruguay Round.

SUGAR AND THE NAFTA

Canada.—Sugar trade between the United States and Canada, which imports about 90 percent of its sugar needs, was essentially excluded from the NAFTA. U.S.-Canadian sugar trade is governed mainly by the U.S.-Canada Free Trade Agreement and by the WTO.

Currently, Canada is threatening the integrity of U.S. sugar policy by circumventing the quota with a new product referred to in the trade as “stuffed molasses”—a high-sugar product not currently included in U.S. sugar TRQ classifications. USDA has estimated imports of this product could add 125,000 tons of non-quota sugar to the U.S. market this year. That amount could grow if this loophole is not closed.

Mexico.—Mexico had been a net importer of sugar for a number of years prior to the inception of the NAFTA. Nonetheless, the NAFTA provided Mexico with more than three times its traditional access to the U.S. sugar market during the first six years, 35 times its traditional access in years 7–14, and virtually unlimited access thereafter.

These provisions were negotiated by the U.S. and Mexican governments and contained in President Clinton's NAFTA submission to the U.S. Congress, which Congress approved in November 1993. Nonetheless, Mexico is now undermining the integrity of the NAFTA by claiming the sugar provisions are somehow invalid.

CONCERNS REGARDING THE 1999 TRADE ROUND

Export Subsidies.—The most distorting practice in world agricultural trade is export subsidies. In the world sugar market, subsidized exports by the EU alone amount to about a fifth of all the sugar traded each year.

Export subsidies provide countries the mechanism to dispose of surpluses generated by high internal production subsidies. In the absence of export subsidies as a surplus-removal vehicle, countries would have to reduce their production supports.

The Uruguay Round did not significantly reduce the amount of sugar sold globally with export subsidies.

State Trading Enterprises (STE's).—STE's are quasi-governmental, or government-tolerated organizations that support domestic producers through a variety of monopolistic buyer or seller arrangements, marketing quotas, dual-pricing arrangements, and other strategies. These practices were ignored in the Uruguay Round, but are, unfortunately, common in the world sugar industry. Major producers such as Australia, Brazil, China, Cuba, and India have sugar STE's, but were not required to make any changes in the Uruguay Round.

Compliance with Past Agreements.—While the United States has far surpassed its Uruguay Round commitments, many other countries have yet to even minimally comply. Numerous examples exist where export subsidies, internal supports, and import tariffs for many crops are not in compliance with GATT. A key example in sugar is the Philippines' failure to lower its import tariffs.

In the NAFTA, Mexican sugar producers are casting doubts on the validity of the sugar provisions, three years after the agreement's inception, and have slammed the door on imports of U.S. corn sweeteners with duties as high as 100 percent.

Widely Varying Levels of Support.—Unilateral reforms to U.S. agriculture policy in the 1996 Farm Bill far exceeded U.S. commitments made the year before in the Uruguay Round. Furthermore, developing countries, which dominate world agricultural trade and particularly sugar trade, were subject to a slower pace of reductions, if any.

As a result, the United States is way out in front of the rest of the world in removing its government from agriculture and has placed its farmers in a domestic free market situation. This gap makes American farmers uniquely vulnerable to continued subsidies by foreign competitors.

In sugar, two examples come to mind: (1) The EU sugar support price is approximately 40 percent higher than the stand-by U.S. support price. The Uruguay Round's formula-driven percentage reductions in support levels do not reduce the gap between the EU and the U.S. at all. (2) Actual U.S. sugar imports the past two years have been nearly double the 1.26-million-ton minimum import commitment the U.S. made in the Uruguay Round and about six times the URA global minimum.

It is key that American farmers not be penalized for attempting to lead the rest of the world toward free agricultural trade. American farmers must be given credit for the reforms they have endured.

Labor and Environmental Standards.—The gap in government standards—and resulting producer costs—between developed and developing countries is well documented and immense. In sugar, the gap is particularly pronounced because, while the EU and the U.S. are major players, production and exports are highly dominated by developing countries, especially in the cane sector.

For example, the LMC International survey of global production costs revealed labor costs—per worker, per day—in Malawi, ostensibly one of the world's lowest cost producers, to be a mere one-hundredth of the average wages paid to sugarcane workers in Hawaii.

Sugar producers in Florida, and every sugar-producing state in America, comply with the world's highest standards for environmental protection—at a price. For example, the Everglades Forever Act (EFA) mandates that Florida farmers pay at least \$232 million in taxes for Everglades preservation activities—on top of the many costs borne by farmers to monitor and clean water leaving farm areas. In Hawaii, extremely high environmental compliance costs have been a factor in driving two-thirds of the state's sugar growers out of business in the past 10 years. In many developing countries, by contrast, sugar mills face no restrictions, or no enforcement of restrictions, on the quality of water or air emissions.

American sugar farmers are proud to raise sugar with the highest possible regard for workers and the environment. But we should not be penalized in multilateral trade negotiations for providing these costly protections. And foreign countries that do not provide such protections should not be rewarded.

If we are attempting to globalize our economy, we should also globalize our food safety and worker and environmental protection responsibilities.

Formula Driven Trade Strategy.—For the many reasons I have outlined, the rigid, formula-driven, or "one-size-fits-all," approach for trade concessions does not work for agriculture in general, or for sugar in particular. Pursuing this approach would:

—Fail to reduce the gap in supports between countries—lowering the playing field, but not leveling it;

—Again give developing countries a free ride;

—Further diminish our negotiating leverage, which was severely reduced through our unilateral concessions in the 1996 Farm Bill.

To date, we have led the world in trade barrier reductions and we are disadvantaged as long as the rest of the world fails to follow our example.

We can turn our unilateral concessions to our advantage only if we follow a request/offer strategy. Essentially, we provide foreign countries the incentive to reduce their government programs by promising to reduce ours further when, and only when, they have reduced their export subsidies, internal support, import tariffs, and STE or similar practices to our levels.

RECOMMENDATIONS FOR THE 1999 TRADE ROUND

To address these concerns, we would like to make four recommendations for U.S. negotiators in the next trade round.

1. Elimination of export subsidies, the most trade distorting of all practices, and of state trading enterprises, which were ignored previously, must be given top priority in the next trade round.

2. The United States should not reduce its government programs any further until other countries have complied with their Uruguay Round commitments and have reduced their programs to our level.

3. The wide gap in labor and environmental standards between developed and developing countries must be taken into account in the next trade round, and addressed in a manner that ensures global standards rise to developed-country levels, rather than fall to developing-country levels.

4. We can address the huge disparities in supports among nations and turn the United States' unilateral concessions to our advantage only if we follow a flexible, request/offer type of strategy in the next trade round.

CONCLUSION

In conclusion, Mr. Chairman, thank you for convening this timely and important hearing. U.S. agriculture is extremely vulnerable as we approach the next trade round. If we negotiate carefully and rationally, however, there is enormous potential for responsible American producers to compete and prosper in a genuine free trade environment, free from the need for government intervention. Thank you for the opportunity to participate.

PREPARED STATEMENT OF BERNARD H. BERNE, M.D., PH.D.

APPROPRIATION FOR FDA CONSOLIDATION

I am a resident of Arlington, Virginia. I serve the Food and Drug Administration (FDA) as a Medical Officer and as a reviewer medical device approval applications. I am testifying as a private individual. I ask your Subcommittee to appropriate \$4,000,000 for FDA to study the feasibility of consolidating its facilities at the Southeast Federal Center or at another site that is within half a mile of a Metro Station in the Washington Metropolitan Area.

The FDA Revitalization Act (Public Law 101-635, Nov. 28, 1990) (104 Stat. 4583 et seq.) authorizes the Secretary of Health and Human Services (the Secretary), in consultation with the Administrator of the General Services Administration (GSA), to "enter into contracts for the design, construction, and operation of a consolidated Food and Drug Administration administrative and laboratory facility." It is therefore the responsibility of your Subcommittee to initiate the appropriations of funds to permit the Secretary to develop this single facility.

In the past, Treasury, Postal Services, and General Government Appropriations Acts have appropriated funds to GSA to construct separate consolidated FDA facilities in Montgomery and Prince George's Counties, Maryland. Public Law 101-635 did not authorize these appropriations, since this law only authorized a single facility and only authorized the GSA Administrator to consult with the Secretary regarding this project.

Further, because of a 1995 rescission (Public Law 104-19, July 17, 1995) and the lack of proper authorization for later appropriations, there are presently no funds available to GSA or to FDA to design, construct, or operate the consolidated facilities.

GSA is presently making plans to develop the two new separate consolidated facilities for FDA. These facilities would be located far from each other in College Park in Prince George's County and in White Oak in Montgomery County. If supported by appropriations, GSA's plans would negate the goal of Public Law 101-635, which authorizes only a single consolidated facility.

There does not appear be any benefit to the government for FDA to consolidate in two locations, rather than in one. This is a wasteful type of consolidation that is not cost-effective to the government or to the public.

In 1991, a Conference Committee of the Treasury, Postal Services, and General Government Subcommittees (Treasury Subcommittees) of the House and Senate Committees on Appropriations created this double "consolidation" so that the two facilities would serve the political jurisdictions represented by certain members of the Treasury Subcommittees (House Report 102-234 (Oct. 3, 1991)). This so-called "consolidation" would benefit neither FDA, the federal government, the general public, the federal taxpayer, nor the Washington Metropolitan Area.

The Congressional division of the single consolidated facility and the forced suburban locations of the resultant FDA buildings contradicted both Public Law 101-635 and an existing Executive Order that is designed to strengthen the Nation's central cities. The location of the facilities also contravened a long-standing National Capital Region Planning Commission goal of retaining and increasing federal employment in the District of Columbia. It is difficult to find a worse example of "pork-barrel" legislation.

It is therefore necessary for your Subcommittee to review this situation and to appropriate funds to the Secretary of Health and Human Services (not to the GSA Administrator) to design and construct a single consolidated FDA headquarters facility. Your Subcommittee also needs to encourage the Secretary to locate the facility at a site that conforms with existing Executive Orders and Presidential policies that direct the placement of federal facilities in urban areas and in the National Capital Region. Previous appropriations acts relating to the FDA consolidation have disregarded these Orders and policies.

Former President Jimmy Carter's Executive Order 12072 (August 19, 1978, 43 F.R. 36869 (Federal Space Management)) states in Section 1-1 (Space Acquisition), Subsection 101: "Federal facilities and Federal use of space in urban areas shall serve to strengthen the nation's cities and to make them attractive places to live and work. Such Federal space shall conserve existing urban resources and encourage the development and redevelopment of cities."

Section 1-1, Subsection 1-103 of the Executive Order states: "Except where such selection is otherwise prohibited, the process for meeting Federal space needs in urban areas shall give first consideration to a centralized community business area and adjacent areas of similar character, including other specific areas which may be recommended by local officials." Section 1-3, Subsection 1-301 of the Executive Order states: "The heads of Executive agencies shall . . . economize on their use of space."

President William J. Clinton has reaffirmed the Administration's commitment to Executive Order 12072 in his Executive Order 13006, May 21, 1996 (61 F.R. 26071). Section 1 (Statement of Policy) states: "Through the Administration's community empowerment initiatives, the Federal Government has undertaken various efforts to revitalize our central cities, which have historically served as the centers for growth and commerce in our metropolitan areas. Accordingly, the Administration hereby reaffirms the commitment set forth in Executive Order No. 12072 to strengthen our nation's cities by encouraging the location of Federal facilities in our central cities."

In March, 1997, President Clinton ordered his Cabinet Secretaries to assure that federal agencies do not leave the District of Columbia. The President considers this action to be an important element in his plan to revitalize the District.

Despite all of the above Executive policies and orders, GSA and FDA are presently planning to locate the major consolidated facility on a sprawling 130-acre site at White Oak, Maryland. According to GSA's 1996 Draft Environmental Impact Statement for the project, no building on this campus-like site would exceed six stories in height. The campus' site plan is clearly not intended to economize on the use of space.

White Oak is located about a mile outside of the Capital Beltway in a suburban area of Montgomery County that is far from any centralized business area, is not in any city, and is three miles from the nearest Metrorail station. The highways and roads near White Oak are among the most congested and dangerous of all traffic arteries in the Washington Metropolitan Area.

If implemented as GSA intends, the Prince George's and Montgomery Counties consolidations would relocate about 1000 FDA employees out of D.C. and would encourage associated development to occur in the District's suburbs, rather than in the District itself. The White Oak facility's decentralized location would discourage FDA's visitors and employees from using Metrorail and would force nearly all employees to drive to work. FDA's consolidations would therefore serve to weaken a central city, rather than to strengthen it.

Your Subcommittee needs to take control of the FDA consolidation process and to stop this wasteful type of planning. Appropriations legislation should encourage the Secretary to consolidate FDA in a compact facility that can fit into the District of Columbia's central business area and is convenient to Metrorail.

It is not difficult to achieve such an economy of space. FDA's major headquarters presently occupy an 18-story building (the Parklawn Building in Rockville, MD). Further, the National Institutes of Health constructed in 1980 a 13-story building at its Clinical Center in Bethesda, MD, to house many of its clinical research laboratories. The FDA consolidated facility can thus be entirely accommodated in several high-rise buildings located close to each other in Washington, D.C.

GSA controls a large amount of underutilized federal space at the Southeast Federal Center. This space is located next to the Navy Yard Metrorail station in downtown Washington, D.C.

The Southeast Federal Center is only a mile from Capitol Building and from the headquarters of the Department of Health and Human Services in the Hubert H. Humphrey Building. It is thus an ideal site for the FDA consolidation.

The Southeast Federal Center can easily accommodate the FDA consolidation. GSA's plans for the Federal Center show that there is more developable space available at the site than FDA requires for its entire consolidation. No appropriated funds are presently available to construct any federal facilities at this location, which is largely vacant or occupied by obsolescent facilities.

In the National Capital Planning Commission's March, 1996, Plan for Washington's Monumental Core, a proposal in the category of "Economic Development" states: "Assist the transformation of the Southeast Federal Center and adjacent Navy Yard into a lively urban waterfront of offices, restaurants, shops and marinas."

An FDA office and laboratory facility at the Southeast Federal Center would be fully consistent with this goal. The facility would further help to compensate for the relocations of thousands of federal employees from the District of Columbia to suburban sites in Maryland and Virginia that have taken place in recent years. During the last two decades, these relocations have contradicted Executive Order 12072 and have greatly contributed to the decline of the District's economy.

Because of budgetary constraints and of FDA's uncertain future, your Subcommittee should not appropriate a large amount of funding to the Secretary for the FDA consolidation at this time. However, a small appropriation is needed to encourage FDA and GSA to begin to plan for a consolidation at the Southeast Federal Center or at another location in the District of Columbia.

I therefore request that your Subcommittee initiate a fiscal year 1999 appropriation of \$4,000,000 to FDA for the specific purpose of studying the feasibility of constructing a single consolidated FDA administrative and laboratory headquarters facility within half a mile of a Metrorail station in the Washington Metropolitan Area. Legislative or Committee Report language can direct or request the Secretary to give first consideration to the Southeast Federal Center in Washington, D.C., as the site for the consolidation.

Thank you.

PREPARED STATEMENTS OF MICHAEL P. KENNY, EXECUTIVE OFFICER, CALIFORNIA AIR RESOURCES BOARD; BARBARA PATRICK, MEMBER, BOARD SUPERVISORS OF KERN COUNTY AND MEMBER, CALIFORNIA AIR RESOURCES BOARD; MANUEL CUNHA, JR., PRESIDENT, NISEI FARMERS LEAGUE; LES CLARK, VICE PRESIDENT, INDEPENDENT OIL PRODUCERS' ASSOCIATION; AND CATHERINE H. REHEIS, MANAGING COORDINATOR, WESTERN STATES PETROLEUM ASSOCIATION, ON BEHALF OF THE CALIFORNIA INDUSTRY AND GOVERNMENT COALITION ON PM-10/PM-2.5

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry and Government Coalition on PM-10/PM-2.5, we are pleased to submit this statement for the record in support of our fiscal year 1999 funding request of \$436,500 (one-half of the historical baseline split between California and Washington) from CSREES, for the California Regional PM-10/PM-2.5 Air Quality Study.

The San Joaquin Valley of California and surrounding regions exceed both state and federal clean air standards for small particulate matter, designated PM-10/PM-2.5. The 1990 federal Clean Air Act Amendments require these areas to attain federal PM-10/PM-2.5 standards by December 31, 2001. Attainment of these standards requires effective and equitable distribution of pollution controls that cannot be determined without a major study of this issue.

According to EPA and the California Air Resources Board, existing research data show that air quality caused by the PM-10/PM-2.5 problem has the potential to

threaten the health of more than 3 million people living in the region, reduce visibility, and impact negatively on the quality of life. Unless the causes, effects and problems associated with PM-10/PM-2.5 are better addressed and understood, many industries will suffer due to production and transportation problems, diminishing natural resources, and increasing costs of fighting a problem that begs for a soundly researched solution.

PM-10/PM-2.5 problems stem from a variety of industry and other sources, and they are a significant problem in the areas that are characteristic of much of California. Typical PM-10/PM-2.5 sources are dust stirred up by vehicles on unpaved roads, and dirt loosened and carried by wind during cultivation of agricultural land. Soil erosion through wind and other agents also leads to aggravation of PM-10/PM-2.5 air pollution problems.

The agriculture portion of this study will be developing specific types of information, tools and techniques needed to develop an inventory and the management practices that will most likely be part of the control strategies. They are: (1) validate method or methods for accurately measuring fugitive PM-10/PM-2.5 emission rates from an individual site or operation; (2) a method to easily and quickly estimate PM-10/PM-2.5 emissions; (3) an accurate inventory of fugitive PM-10/PM-2.5 dust sources by individual farming operations; (4) validated (field tested) best management practices; (5) a clear understanding of significant factors that effect PM-10/PM-2.5 emissions; and (6) a workable, validated model or models for predicting PM-10/PM-2.5 emission, based on operational parameters.

The primary focus of the short term objectives is on those soils, practices, and conditions presumed to have the highest PM-10/PM-2.5 emissions. Priority for this work will be focused on the following situations, practices, and crops within the study area.

Almond, Walnut and Fig Harvest: Preparation for harvest; Shaking trees; Windrowing; Picking up nuts; and Ambient conditions before and after.

Cotton Harvest: Harvesting—1st and 2nd picking; Shredding of stalks; Stalk incorporation; and Ambient conditions before and after.

Dairy Industry: Dairy Lagoons and Livestock Corrals.

Fall/Spring Land Preparation: Deep tillage; Discing; Land planning; Bed formation; Ambient conditions before and after.

Feedlots: Feedlot activities.

Grain Harvesting: Harvesting; Stubble incorporation; Discing; Burning.

Land Leveling: Appropriate practices.

The importance of this study on PM-10/PM-2.5 is underscored by the need for more information on how the federal Clean Air Act Amendments standards can be met effectively by the business community, as well as by agencies of federal, state and local government whose activities contribute to the problem, and who are subject to the requirements of Title V of the Clean Air Act. There is a void in our current understanding of the amount and impact each source of PM-10/PM-2.5 actually contributes to the overall problem. Without a better understanding and more information—which this study would provide—industry and government will be unable to develop an effective attainment plan and control measures.

Agriculture wants to be a part of the effort to solve this major problem, but to do so, we need federal assistance to support research and efforts to deal effectively with what is essentially an unfunded federal mandate.

Agriculture and industry, in concert with the State of California and local government entities, are attempting to do our part, and we come to the appropriations process to request assistance in obtaining a fair federal share of financial support for this important research effort. In 1990, our Coalition joined forces to undertake a study essential to the development of an effective attainment plan and effective control measures for the San Joaquin Valley of California. This unique cooperative partnership involving federal, state and local government, as well as private industry, has raised more than \$19 million to date to fund research and planning for a comprehensive PM-10/PM-2.5 air quality study. Our cooperative effort on this issue continues, and our hope is that private industry and federal, state and local governments will be able to raise an additional \$8 million over the next two years to fund this important study.

To date, this study project has benefited from federal funding provided through USDA's, DOT's, DOD's, EPA's, and Interior's budgets—a total of \$10.6 million in federal funding, including \$436,500 from USDA (one-half of CSREES amount provided for California and Washington) in the last three fiscal years. State and industry funding has matched this amount virtually dollar for dollar.

The UC Davis research into the contribution of agriculture to airborne PM-10 in the San Joaquin Valley has produced a number of interim results. Some of these results have already been incorporated into the San Joaquin Valley Unified Air Pol-

lution Control District's planning, and additional research efforts have been planned in consultation with district personnel.

The agricultural emissions research is critical to the district's efforts to understand and control PM-10 in the valley. The San Joaquin Valley is a serious non-attainment area for PM-10 and also experiences high concentrations of PM-2.5. The district's strategies toward PM-10 emissions from agriculture focus on research to identify activities that significantly contribute to the PM-10 problem, and then to develop feasible methods of controlling emissions from those sources. Without this information, the district could be demanded to control agricultural sources in ways that may or may not be effective at reducing PM-10. Effective control plans are those that actually reduce PM-10 concentrations, so that there is some assurance that the cost of implementing them is well-laced.

UC Davis research has produced much better emission factors for the harvesting of cotton than were previously available, and has produced the only available emission factors to date for harvesting almonds. These emission factors were obtained under actual harvest conditions, so should be representative of agricultural operations in the San Joaquin Valley. UC Davis research has also investigated the emissions generated from harvesting figs and walnuts, and the burning of raisin trays. For raisin trays, the results indicate that the emissions are not significant. For fig and walnut harvesting, the results also show that the emissions are not highly significant. Moreover, actions taken to reduce almond harvest emissions will be effective at controlling emissions from fig and walnut harvesting, as these crops use the same harvesting equipment.

UC Davis has initiated research into the emission of ammonia from livestock facilities in the San Joaquin Valley, primarily dairies and feedlots. Approximately half of all ammonia emissions in the San Joaquin Valley is thought to come from animals. This research is significant because ammonia combines with NO in the atmosphere to produce fine particles in the PM-2.5 size range. Further, the ammonia emissions are not well characterized for the livestock management practices prevalent in the San Joaquin Valley, so new information is needed. Some preliminary results have been obtained, but they need to be confirmed with additional measurements.

The currently available fugitive dust emission factors approved for use by the U.S. EPA rely on the dry silt content of the soil, defined as the fraction that passes through a 75 PM sieve. The emission factors were developed empirically, and there is scientific disagreement over their utility as a predictive tool. UC Davis research is exploring other methods of defining the potential of a soil to emit PM-10 and has developed laboratory procedures to measure an index of PM-10 emission potential in a repeatable manner. Additional research is ongoing to develop this as a useful tool.

The fugitive dust emissions UC Davis has measured from agricultural operations so far has relied on physically collecting the dust from the plumes on filters. UC Davis has developed a remote sensing lidar (light detection and ranging) instrument to characterize the extent of a dust plume from afar. This instrument has been used successfully in the field to collect information on the size and shape of dust plumes. Additional research is ongoing to calibrate it and use it to quantitatively measure the dust concentrations. The device will be particularly useful under conditions when it is not possible to collect a valid sample on filters.

During the coming year, UC Davis will focus on the following research areas:

- Fugitive dust emission from land preparation activities. Land preparation is common to nearly all agricultural crops in the valley, but the emission factors from this activity is very poorly defined in the current methods. There is tremendous value in developing better emission factors from this activity.
- Controlled testing of almond harvesting. Almond harvesting is one of the dustiest activities examined to date. This summer, UC Davis plans to test several different harvesters on the same orchard, including the latest harvester from each of the two companies that produce them, as well as the most commonly used harvester of each manufacturer.
- Initiate emissions testing of garlic harvesting. This crop is expanding in the San Joaquin Valley, and is potentially very dusty. A few pilot tests will provide information on how much further this crop should be examined.
- Emissions from livestock management. UC Davis has conducted preliminary testing of dust and ammonia emissions from dairies and feedlots; additional research is needed to acquire a valid database for analysis.

The support of the Department of Agriculture has been indispensable to the completion of the work performed to date. Continued support for this research is essential to assure that decisions made on behalf of improved air quality are based on

scientifically valid information, and that the interests of agriculture are considered in the process.

For fiscal year 1999, our Coalition is seeking federal funding once again through the U.S. Department of Agriculture to support continuation of this vital study in California. In the budget for the Cooperative State Research, Education, and Extension Service (CSREES), we request \$436,500, representing one-half of the \$873,000 historical baseline split between California and Washington in the past three budget cycles.

The California Regional PM-10/PM-2.5 study will not only provide vital information for a region identified as having particularly acute PM-10/PM-2.5 problems, it will also serve as a model for other regions of the country that are experiencing similar problems. The results of this study will provide improved methods and tools for air quality monitoring, emission estimations, and effective control strategies nationwide. Consequently, the beneficial results of this research will contribute to national policy as well.

The Coalition appreciates the Subcommittee's consideration of this request for a fiscal year 1999 appropriation of \$436,500 for U.S.D.A. to support the California Regional Region PM-10/PM-2.5 Air Quality Study.

PREPARED STATEMENT OF DAVID P. HOLVECK, PRESIDENT AND CHIEF EXECUTIVE OFFICER, CENTOCOR, INC.

Mr. Chairman and Members of the Subcommittee, I am David P. Holveck, President and Chief Executive Officer of Centocor, Inc., a biotechnology company located in Malvern, Pennsylvania. Like other biotech companies, most of our products are or will be regulated as biological products by FDA's Center for Biologics Evaluation and Research (CBER). CBER—and our emerging industry—face a crisis in research funding. Action by this Committee can resolve this potential crisis and insure informed regulation of biotechnology products, to the benefit of the United States biotechnology industry, and to patient care.

BACKGROUND

Mr. Chairman, as you know, late last year Congress enacted FDA reform legislation¹ that updated antiquated laws and practices applicable to biologics, drugs and medical devices. An integral part of this law was the renewal of the Prescription Drug User Fee Act (PDUFA)² under which the pharmaceutical and biotechnology industries pay user fees with most applications submitted to FDA. These fees are paid in exchange for increased numbers of scientific review staff and FDA's agreement to meet specified performance goals in the drug review and approval process.

The FDA reform law reauthorized the PDUFA program, with increased performance goals. Under the first five years of PDUFA, the FDA used a fraction of user fee funds to support research activities related to the drug review process. However, as part of the five year extension of PDUFA, use of user fee monies was restricted to information management, personnel for faster reviews and meetings on investigational new drug applications (as well as review activities themselves). User fee monies may no longer be used to support CBER research activities, even though these activities are an integral part of product regulation. Compounding the problem is the fact that the overall CBER research budget has declined significantly since fiscal year 1994. For the reasons set forth below, many of us in the biotechnology community fear that unless this Subcommittee takes action, a depleted research capability will impede the agency's review and approval process and threaten its mission to protect the public health.

While the Subcommittee has never specified appropriations that may be spent by CBER for research, our best estimates are, that for the fiscal year 1994, CBER's research budget was \$18.4 million. This amount declined to \$6.9 million for fiscal year 1998. Reductions in user fee monies for research activities of CBER will be \$3.5 million in 1999 and CBER's fiscal year 1999 research budget will decline to \$4.5 million—a little more than one-quarter of the fiscal year 1994 amount. Without action by this Subcommittee the result will be "reassignment" of 79 full-time equivalent research positions, or approximately 154 biologics center physicians and laboratory scientists, over the next three years to other Federal agencies. CBER's research capability will be severely impacted.

¹ Food and Drug Administration Modernization Act of 1997 (Public Law 105-115).

² Prescription Drug User Fee Act of 1992 (Public Law 102-571).

HISTORY OF CBER AND ITS RESEARCH ACTIVITIES

Historically, CBER has recognized the link between the conduct of original research and appropriate regulation of biological products. Until the early 1970's, what is now CBER was part of the National Institutes of Health—indeed, CBER's headquarters remain on the NIH campus. Since the turn of the century, CBER and its predecessors have been involved in assuring the safety, purity and potency of biological products such as vaccines and blood products. Research was an indispensable component of these responsibilities, since often standards for biological products could only be developed after gaining an understanding of the products themselves. For over 90 years, CBER has maintained a tradition that combines scientific research with product review.

Mr. Chairman, today CBER also regulates products derived from new, emerging technologies. CBER regulates AIDS drugs, gene therapy, monoclonal antibodies and other products resulting from the genius of biotechnology. In many cases, regulatory issues related to new and emerging technologies are not initially well understood. Thus, the agency must conduct research in biomedical areas to develop the expertise necessary to address new technologies and issues, develop and validate testing methodologies, and establish standards for new biological products. Research is required to assess risks of new therapies so that the agency, in concert with industry, can, reduce and control such risks. Appropriate regulation of the biotechnology industry, consistent with the FDA reform law, demands state of the art knowledge of the science employed to develop our products.

CBER's research team includes both scientists who perform primarily review of products and those who perform both research and review ("researcher/reviewers"). Unlike other health-related agencies, such as NIH or CDC, where the majority of the professional researchers exclusively conduct research, in CBER all researchers are fully integrated into the regulatory process. CBER's researchers/reviewers participate in development of regulatory policy and the establishment of methods and standards to which products can be compared. They review investigational new drug applications (IND's) and biologics license applications (BLA's), attend pre-IND, IND and BLA meetings with investigators and manufacturers, carry out pre-license inspections, and evaluate adverse drug reaction and risk assessment issues. In short, they contribute their knowledge of complex scientific matters gained by intramural research to the regulation of increasingly complex biological and biotechnology products.

SCIENCE BOARD REVIEW OF FDA'S INTRAMURAL RESEARCH PROGRAM

Mr. Chairman, on two recent occasions, subcommittees of FDA's outside Science Board have reviewed the fiscal status of FDA's research budget, and expressed strong support for its strengthening, in order to ensure informed regulation.

Subcommittee on FDA Research.—At the recommendation of FDA's Deputy Commissioner of Operations in 1996, a Science Board Subcommittee on FDA Research was convened and Chaired by David Korn, M.D., former Dean of Stanford Medical School and currently Senior Vice President of the Association of American Medical Colleges. The Subcommittee was charged with determining how the FDA could ensure that the agency's regulatory review and decision-making processes would continue, in an era of extraordinary rapid scientific advancements, to be informed by the very best and most current scientific information available.

The Subcommittee undertook a high-level review of the state of intramural science in the FDA, including organization of the scientific programs, their interactions with the extramural scientific community, and the policies, procedures and standards that governed their conduct.

As part of its recommendations, the Subcommittee stated that:

. . . robust, high-quality programs of intramural research are essential components of the FDA's science base and are critical for supporting, in a scientifically sound and rigorous fashion, the review and regulatory decisions made by the agency in discharging its mission to promote and protect the public health. The intimate proximity and interaction of cutting-edge scientific research with review and regulatory activities is more important today than ever before given the extraordinary rapid pace of advancements in . . . biomedicine, materials science, micro-electronics, information technology, and others. . . . A strong and well managed intramural research program provides the foundation for creating a climate of science and scientific communication within the FDA that enhances the ability of the agency to recruit and retain high quality scientific staff [and] to address existing regulatory issues and anticipate future problem. . . .

The majority of the Subcommittee rejected the arguments that the scientific research needs of the FDA can be obtained from outside sources in a more cost-effective manner that would meet criteria of timeliness, competence and freedom from conflict of interest. Likewise the Subcommittee rejected the notion that a strong program of intramural scientific research is not necessary for the recruitment and retention of high quality scientific staff. The Subcommittee found that "starving the agency's base of intramural scientific expertise must inevitably compromise the quality of review and regulatory activities."

Subcommittee on CBER Review.—Last month, the Science Board's Subcommittee on CBER Review, comprised of distinguished scientists from academic centers, major pharmaceutical companies, the biotechnology industry, research foundations and the NIH expressed great concern over declines in research funding at CBER.³ The Committee determined that

. . . inadequate funding for CBER, particularly the inadequate funding for laboratory research within CBER, would risk potential damage to the health of the population of the United States, but also the health of our economy, by affecting an industry that will expand in the 21st Century.

The Subcommittee conducted an exhaustive review of the research capabilities of the various divisions and units within CBER. It pointed out that historically, because of their nature, biological products have been associated with adventitious (accidentally arising from an external source) contaminants that have led to adverse reactions and death. It stated that "a credible emergency response by CBER to adventitious agent problems associated with marketed biological products, including blood and blood products, requires immediate availability of a laboratory-based team of experts who understand both the potential adventitious agents involved in the scientific, manufacturing, control, and clinical aspects of the product." (p. 4)

The Subcommittee concluded as follows:

Thorough and timely review of the safety, efficacy, and quality of a biological/product license application (BLA/PLA) requires experts with appropriate experience at CBER, including relevant laboratory techniques required to perform characterization, manufacturing, and control of the product. In a field of biotechnology, virtually every IND or BLA application raises new policy issues which are identified and addressed as part of the review process. It is incumbent upon the CBER reviewer to assess the potential merits of new technologies, to identify new risks or potential risks associated with these technologies and to develop methods for evaluating and controlling these risks."

RELATIONSHIP BETWEEN CBER RESEARCH AND EFFECTIVE REGULATION

Intramural research has shortened development time of biological products and served as the basis for product approval. Examples of the importance of CBER's research to product development are numerous:

For many years, the whole cell pertussis (whooping cough) vaccine was used to prevent pertussis in infants and young children in the United States. While this vaccine was effective in preventing pertussis in the U.S., it was associated with a number of adverse reactions. While the most severe reactions were never positively linked to vaccination with the whole cell pertussis vaccine, scores of lawsuits were filed and it became clear that a safer pertussis vaccine was desirable. Clinical trials to test the safety and efficacy of a new generation of pertussis vaccines, known as acellular pertussis vaccines, were completed last year. In July of this year, the first acellular pertussis vaccine was licensed in the U.S. for infant use. Research conducted at CBER shortened the development time for the acellular pertussis vaccines, sped approval time, and resulted in improved products.

Expedient approval of recombinant Factor VIII (which promotes blood coagulation) was facilitated by CBER research that provided a well-calibrated reference preparation to measure the potency of these materials, and that established the conditions for potency assays that allowed comparison with plasma-derived products. CBER directed the preparation and calibration of large amounts of a Factor VIII reference standard that has received international recognition for its long-term stability and quality. CBER also recently developed a Factor IX standard that will speed approval of a recombinant Factor IX currently under development. CBER recruited large donations of potential source material from industry, assessed the biochemical and assay characteristics of these materials in the CBER laboratory, and

³Science Board Subcommittee for the Center for Biologics Evaluation and Research Review, Report to the Science Board to the Food and Drug Administration, May 19, 1998.

selected one for further evaluation in an international collaborative study. This study led to the acceptance of the FDA material by the European Pharmacopoeia and WHO as the new international reference preparation and working standard.

CBER research will lead to expeditious approval of safe and effective DNA vaccines. These agents, which are based on new and untested technology, are now being developed for preventing viral, bacterial, and parasitic infections, as well as for treatments of hepatic, colon and cervical cancer.

One of the ways that FDA has sped approval of breakthrough drugs is through the development of clinical endpoints—laboratory measurements that are reasonably likely to predict clinical benefit. Use of these endpoints has resulted in early approval of several AIDS drugs—more quickly in this country than in Europe or England. CBER research led to development of the surrogate endpoint for protease inhibitors. In collaboration with the developer of the drug, CBER's research was crucial to the development of quantitative polymerase chain reaction, which became the means by which the drug's contribution to a patient's viral load is determined. The viral load was used as a surrogate endpoint, rather than multi-year clinical trials to evaluate long-term survival, to determine efficacy of this important class of AIDS drug.

Each year the Food and Drug Administration determines the type, or strains, of the influenza virus most likely to enter the United States in the coming year. This determination is based on worldwide surveillance of influenza isolates conducted by the Center for Disease Control (CDC) in collaboration with the World Health Organization (WHO). After the strains are chosen each year, CBER works closely with influenza manufacturers to provide high growth reassortant influenza viruses for use by vaccine manufacturers so that adequate vaccine supplies can be made each year. This involves basic laboratory research by molecular biologists and virologists at CBER. They also must provide new reagents each year for standardization of strains used in the vaccines produced by various manufacturers which supply the U.S. market. CBER's research on high growth reassortants and standardization of manufactured vaccines is critical for assuring that safe and effective vaccines for adults and children are available in the fall of each year. Without the support of basic science at CBER, the quality and quantity of influenza vaccines would decrease with resultant excess mortality from influenza each year.

Mr. Chairman, these examples—and scores of others—demonstrate the fact that the CBER research program is an integral component of biological product regulation. CBER research leads to establishment of standards for biological products. It shortens development time for products under investigation. It serves as a basis for FDA decisionmaking on the safety and efficacy of biological products. And—perhaps most importantly—CBER research protects the public health.

ACTION REQUESTED

Mr. Chairman, we want to emphasize that we do not disagree with the decision of Congress that PDUFA fees may no longer be used for research related activities. Indeed it is entirely proper that PDUFA fees should be dedicated to their original purpose—speeding the review of product-specific submissions. However, we are concerned that the message that research activities are essential to the broader statutory mission of CBER and FDA to protect the public health may have fallen from view in our collective interests to assure full and proper allocation of PDUFA funds. Although FDA's research efforts are not devoted to the product of a specific company, they are nevertheless critical to assuring speedy access of safe and effective products to the market.

Mr. Chairman, in terms of appropriations action, we recommend that the Committee specify amounts from appropriated funds that should be dedicated to CBER research activities. These amounts should be no less than the fiscal year 1998 amount plus inflation. We thus recommend that a minimum of \$7 million be specified for CBER research for fiscal year 1999. This will require an increase in the FDA budget of \$2.5 million.

Beyond this immediate request are concerns about the need to assure adequate funding for future research at CBER. In our view, the best way to assure that any program received adequate funding is to clearly and convincingly illustrate the value that the program delivers. When it comes to research efforts at CBER, neither CBER staff nor we in industry have made our best efforts to assure that the value of CBER's research programs are documented and communicated. To that end, we urge this committee consider requiring CBER to develop guidance for the process by which research programs at CBER are authorized. CBER supported research should be clearly distinct from academic or basic research efforts in that it should be conducted in support of specific, statutory, regulatory or mission-related pur-

poses. In our view, it is not the role of CBER to conduct research intended solely to contribute to the general knowledge or the advancement of a specific field of science. The research should be consistent with CBER's statutory responsibilities, authority and with its mission. It is Centocor's position that CBER's research activities should fit within one or more of the following criteria in order for it to be authorized:

1. It should fulfill a specific need identified in support of specific functions and responsibilities of the Center.

2. It should relate directly to a product category or technology for which CBER has responsibility.

3. It should identify whether it relates specifically to issues of safety, effectiveness or both. For example, many of the products under CBER's jurisdiction raise unique issues related to the impact of viruses and other adventitious agents on product safety. Also, some materials regulated by CBER are not synthesized but are the product of complex or undefined physiological processes. Process control and validation may be of greater importance for these products than for traditional synthetic drug products.

4. CBER should justify why the research must come from original, laboratory-based research conducted by CBER staff. For example, CBER should document the findings which support the conclusion that the specific type of research is not already being done elsewhere within the federal government or the public or private sectors or that the results of such research would not be readily available or useful to CBER.

Beyond these points, all research should be subject to active management and oversight by CBER and FDA staff as well as open to comment from regulated industry, academia and the general public. We anticipate that this or another appropriate form of cataloging CBER's important research activities will help CBER and the biotechnology industry better communicate the value and importance of the research work of CBER's scientific staff.

Once this action is taken, the committee will be able to evaluate specific amounts that should be allocated for CBER research and whether the recent recommendation of the Science Board Subcommittee that the budget be restored to the fiscal year 1994 level is realistic.

Thank you for your attention to the important issue of appropriate funding of CBER research. We are anxious to work with this Subcommittee in a mutual effort to halt the decimation of CBER's research program, while assuring that CBER research activities are relevant to its statutory mission of reviewing and approving life-giving biotechnology products.

PREPARED STATEMENT OF DENNIS BIER, M.D., DIRECTOR, CHILDREN'S NUTRITION RESEARCH CENTER

Mr. Chairman and members of the Subcommittee, thank you for your continuing commitment to nutrition research, and most especially for the much-needed funding increase which you provided to the Children's Nutrition Research Center (CNRC) last year. Your foresight in funding this program is more widely recognized each year as the importance of nutrition research grows and the trend of scientific discoveries continues to underscore the fact that good nutrition information is vital to our hopes of controlling a large number of very serious, and very expensive, diseases. As a physician, my own personal clinical nutrition interest relates to the management of diabetes, and I initially came into nutrition research because of its critical importance to our efforts to control the complications of this serious malady.

The CNRC was established in 1978 and operates under a cooperative agreement between the Agricultural Research Service (ARS), Baylor College of Medicine, and Texas Children's Hospital, a unique public/private partnership between the ARS and two of the nation's leading pediatric research institutions which also draws on the resources of the world's largest medical center.

The CNRC has been, and continues to be, a world leader in nutrition research. Since the Center is the best-equipped pediatric facility of its kind in the world, we can undertake many research projects that no other children's research laboratory can do. This is particularly valuable in light of our rapidly-growing knowledge of the intimate relationships linking an individual's genetic constitution (genotype), lifestyle, and diet to that individual's ultimate health. We now know that whether a person leads a long and productive life or is more likely to suffer early disability or death from chronic disease is determined in very large part by the interplay between that individual's heredity, lifestyle choices, and what he or she chooses to eat.

At least five of the ten leading causes of death—heart disease, cancer, stroke, diabetes, and atherosclerosis—are diet-related, and there is strong evidence that the contributions to the overall outcome of these diseases begin in childhood. Dealing with these diseases by preventing or delaying them through early dietary changes is a major goal of our research. The potential cost savings to the government through Medicare and Medicaid are enormous, not to mention the need both to see to the nutritional adequacy and to provide the basic scientific evidence for the USDA feeding programs which account for a considerable part of your Subcommittee's budget allocation each year.

Through advances in genetics and molecular biology, we now have the tools to aggressively investigate prevention of diet-related problems such as obesity, high cholesterol, and certain types of cancer. If we can identify a specific individual's risk factors in childhood, we could then target our efforts to those at-risk individuals alone and not expend scarce funds on persons who are not at risk. Thus, identifying the specific individuals at risk and preventing the exposure to these risks in childhood will pay health dividends to society for many decades while reducing costs in two major ways: first, by not spending money needlessly on individuals without risk and, secondly, by preventing disease, which is invariably cheaper than treating the consequences of already established ailments in adulthood. Similarly, non-monetary benefits are enhanced in two ways: first, by allowing individuals not at risk to live a less restricted and, presumably, less worrisome lifestyle and, secondly, by providing at-risk individuals with a health maintenance environment whose benefits are invariably greater and last longer than the shorter and more limited benefits of treating already established adult diseases. These goals are a major priority for our research program, and we are using the additional funding which you provided last year to expand our research program in this area of nutrient-gene interactions, specifically to allow us to identify the genetic factors which place a person at risk of nutritional diseases.

CNRC NATIONAL RESEARCH AWARDS

The Children's Nutrition Research Center is dedicated to investigating the food needs that ensure health in pregnant and nursing women, and in children from conception through adolescence. The success of your decision to support the CNRC over the years, and the quality of research being done at the CNRC, is evidenced by the fact that CNRC researchers won a total of five top national research honors during this last year.

Dr. Buford Nichols, who is our Director Emeritus, was awarded the 1997 Nutrition Award from the American Academy of Pediatrics. The Academy has always been a champion and forceful advocate of the nutritional health of America's children and their Nutrition Award is their single, highest honor in children's nutrition. Dr. Nichols has made major strides in the last few years in advancing our understanding of the gastrointestinal genes regulating carbohydrate digestion in malnourished children. In some malnourished children, the body essentially turns off certain digestive enzymes. As a result, the children are unable to utilize food properly and they die even if, during treatment, they are provided with what should be adequate food. Dr. Nichols' lifelong work in this important area was the foundation for the American Academy of Pediatrics Nutrition Award and, last year, Dr. Nichols made important strides by describing for the first time the complete gene structure of the principal human gastrointestinal enzyme responsible for the digestion of starches in our diet.

Dr. Teresa Davis was chosen as the winner of the E.L.R. Stockstad Award by the American Society for Nutritional Sciences, the nation's largest scientific nutrition society. The award is given for outstanding fundamental research in nutrition. Dr. Davis' research focuses on determining the mechanisms by which nutrients, hormones, and growth factors regulate the high rate of body protein accretion that occurs during early postnatal life and is both necessary and responsible for the rapid growth rate observed in healthy infants.

Dr. Peter Reeds has been awarded the 1998 Osborne and Mendel Award from the American Society for Nutritional Sciences. Dr. Reeds was given the award for his innovative applications of non-radioactive isotope techniques to an inherently complex area of nutrient metabolism, specifically, the intestinal and liver metabolism of amino acids liberated during the consumption of dietary protein. In this work, Dr. Reeds demonstrated the important role of dietary amino acids, particularly the amino acid glutamate, in providing the metabolic fuel source for gut energy metabolism and for the synthesis of glutathione, the critical gut compound providing defense against oxidative stress damage in the intestine. Oxidative stress reactions are

important contributors to the development of diseases such as cancer and are also an underlying cause of aging.

And, if I may toot my own horn for a moment, I was elected to membership in the Institute of Medicine of the National Academy of Sciences, an award which is bestowed on only a select number of the nation's scientists and physicians. I was selected for contributions to the fields of nutrition and metabolism, and for my role in developing the field of the study of human metabolism using stable, non-radioactive isotopes. In addition, I won the National Institutes of Health Excellence in Clinical Research Award for my lifelong career work in clinical nutritional metabolism studies in NIH-funded General Clinical Research Centers (GCRC), first as Associate Program Director the GCRC at the University of California, San Francisco, then as Program Director of the GCRC at St. Louis Children's Hospital, Washington University School of Medicine, and currently as Program Director of the GCRC at Texas Children's Hospital, Baylor College of Medicine.

I want to thank the members of this Subcommittee for your support for the CNRC over the years. You have made it possible for us to do the research which has won these distinguished awards, and we want to share with you the credit for these accomplishments.

EXAMPLES OF CNRC RESEARCH

The CNRC is continuing to be a leader in the field of pediatric nutrition. Some of the studies now underway include:

A study which is looking at the possible relationship between attention-deficit/hyperactivity disorder (AD/HD) in children and DHA (docosahexanoic acid), a fatty acid found in breast milk. DHA is concentrated in the brain, is essential for normal brain growth, has effects on brain cell membrane function, and is believed necessary for overall proper functioning of the central nervous system. Some studies have shown that children with AD/HD have lower levels of DHA in their blood. We are conducting a study in which we are giving dietary supplements of DHA, which is also found in fish oil, to determine its impact on AD/HD behavior.

The potential benefits to society are enormous. Many children with AD/MD continue to have problems in adulthood with employment, family relationships, and anti-social behavior, and society ends up paying a high price for these problems. If this simple dietary intervention has an effect, then the benefits to society could be significant.

We are studying a possible link between fetal development and coronary heart disease in adult life. We have found evidence that poor fetal growth permanently alters cholesterol metabolism. As part of our ongoing collaborative research and training efforts internationally, our scientists studied the levels of HDL apolipoprotein A1, an independent predictor of coronary heart disease, in 16 Jamaican children whose mothers were not properly nourished during pregnancy. HDL apolipoprotein A1 transports cholesterol from the peripheral tissues back to the liver for excretion. High levels of HDL apolipoprotein A1 usually means that a person has a good cholesterol level. We found that the lower the birth weight, the lower the HDL apolipoprotein A1 levels in these children. The fact that they have low levels of HDL means their ability to transport cholesterol back to the liver for excretion is impaired. This study was accepted by and appeared in the prestigious international scientific journal, *The Lancet*, and, when confirmed by additional expanded studies, we believe this finding will enable pediatricians to use HDL apolipoprotein A1 as a screening tool to determine those children who are at greater risk of coronary heart disease later in life and allow parents to begin feeding their vulnerable children a low cholesterol diet early on.

Our researchers have developed a new experimental approach that will, for the first time, help directly measure beta-carotene absorption from vegetables and determine the extent to which it is converted to vitamin A in humans. Thanks to our greenhouse and stable isotope facilities, we were able to grow spinach hydroponically in order to label the beta carotene with stable isotopes. This technique will allow us to assess beta-carotene absorption and metabolism from individual plant foods and identify whether some foods are better sources of vitamin A. This method will also give us the opportunity to identify other factors that could improve beta carotene absorption, such as processing, cooking techniques, or the amounts of oils that are consumed with the food. We are cooperating with the USDA/ARS Human Nutrition Research Center at Tufts University in Boston to do the first human feeding studies.

This new method will provide useful information for intervention and education programs that deal with vitamin A deficiency, which is a major nutritional problem

in the developing world, especially in areas where a persons diet consists mainly of plant-derived foods.

Also, beta carotene is one of nature's most important natural anti-oxidant compounds. Oxidative stress reactions are important contributors to the development of cancer and heart disease, as well as an underlying cause of aging. We believe that the CNRC plant scientists' new approach, which promises to allow direct study of beta carotene metabolism in humans, will play a significant role in research toward a more comprehensive understanding of cancer, heart disease and aging.

SUMMARY

The CNRC is a truly unique, world-class research program in a field that is increasingly being recognized as critical to health maintenance and to food production. Top-quality basic nutrition research is of increasing importance, and the multi-disciplinary ARS human nutrition research centers are uniquely well-suited to this task. Thanks to the foresight of the Congress, the ARS human nutrition research program as a whole is strategically well-placed to tackle today's critical research issues. Congress expanded this network in the 1970's and has provided needed research funding since then. Last year, to enhance our research efforts, the ARS Human Nutrition Research Program presented you with a unified, coordinated initiative for new areas of necessary scientific investigation. You were kind enough to provide us with additional funding, and we thank you for that.

These new directions are no less important this year. To accomplish our aims, we need a significant budget increase, and you would get a very good return on that investment if you choose to make it. I urge the Subcommittee to make every effort to provide a substantially greater level of funding for these ARS Human Nutrition Research Centers this year. The research opportunities are great, and there are huge potential rewards both in cost savings and in good health in this critical area of research.

I would invite you, Mr. Chairman, and any members of your Subcommittee to come and visit the CNRC. Our visitors can testify that the program is much more impressive in person than I can make it in my description. Thank you for the opportunity to submit this statement, and thank you for your support.

PREPARED STATEMENT DR. MELVIN C. RAY, MISSISSIPPI STATE UNIVERSITY, CHAIR, MISSISSIPPI EPSCoR COMMITTEE, ON BEHALF OF THE COALITION OF EPSCoR STATES

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to submit this testimony on behalf of the Coalition of EPSCoR States¹ regarding the U.S. Department of Agriculture Experimental Program to Stimulate Competitive Research (USDA EPSCoR). USDA EPSCoR is extremely important to the state of Mississippi and to our nation. I appreciate the opportunity to testify.

Mr. Chairman, let me begin by thanking you for your strong and unwavering support of USDA EPSCoR. Your support has been absolutely crucial in establishing and maintaining this important program. As you know, Mr. Chairman, USDA EPSCoR is having a significant impact in Mississippi, and those of us committed to improving Mississippi's research and development capability deeply appreciate your continued efforts. Thank you for all of your fine work representing Mississippi in the United States Senate.

EPSCoR is a research and development program that was first established in the National Science Foundation. EPSCoR works to improve our country's science and technology capability by funding research activities of talented researchers in states that have historically not received significant federal R&D funding. USDA EPSCoR was established in fiscal year 1992 with a goal of increasing the amount of agricultural research at academic institutions within states that have had limited success obtaining competitive funds from USDA.

Mr. Chairman, USDA EPSCoR is helping to improve the quality and competitiveness of agriculture research in Mississippi. The amount of USDA research funds received by Mississippi increased by more than 500 percent between 1990 and 1996, a clear indication that Mississippi researchers are becoming more effective. The bulk of Mississippi's funding increase since 1990 has been in the non-EPSCoR Standard Research Grants program.

Important examples of Mississippi's research include such varied studies as kenaf processing, which is a potential economic opportunity for rural states; rapid detec-

¹Alabama, Arkansas, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, North Dakota, Oklahoma, Puerto Rico, South Carolina, South Dakota, Vermont, West Virginia, and Wyoming.

tion of E coli, an important safety issue that has been in the news recently; and disease mechanisms in channel catfish, impacting a significant cash crop across the southern part of the country. These projects and those they represent address important issues not only to rural states, but to the rest of the nation. Because of this important program, EPSCoR researchers are able to contribute to our economy and our knowledge base.

USDA EPSCoR states are those whose funding ranks no higher than the 38th percentile of all states, based on a three year rolling average of funding. For fiscal year 1998, the following states are eligible for USDA EPSCoR: Alaska, Arkansas, Connecticut, Delaware, Hawaii, Idaho, Maine, Mississippi, Montana, Nevada, New Hampshire, New Mexico, North Dakota, Rhode Island, South Carolina, South Dakota, Utah, Vermont, West Virginia, Wyoming, and the Commonwealth of Puerto Rico. Let me stress that EPSCoR relies on rigorous merit review in order to ensure high-quality research.

USDA makes four types of competitive awards through USDA EPSCoR: Research Career Enhancement Awards, Equipment Grants, Seed Grants, and Strengthening Standard Research Project Awards. Proposals must be related to the program priorities of the National Research Initiative Competitive Grants Program, which address critical issues facing agriculture today.

- Research Career Enhancement Awards help faculty enhance their research capabilities by funding sabbatical leaves. Applicants may not have received a NRICGP competitive research grant within the past five years.
- Equipment Grants strengthen the research capacity of institutions in USDA EPSCoR states. The principal investigator for this grant is responsible for securing non-Federal matching funds.
- Seed Grants enable researchers to collect preliminary data in preparation for applying for a standard research grant. Seed Grant awards are limited to a total cost of \$50,000 and are non-renewable. Applicants must indicate how the research will enhance future competitiveness in applying for standard research grants.
- Strengthening Standard Research Project Awards fund standard research projects of investigators who have not received a NRICGP grant within the past five years.

USDA EPSCoR allows Mississippi and the other USDA EPSCoR States to contribute more effectively to our nation's science and technology capability, and provides our country with needed, high-quality, peer-reviewed research. It allows all regions of the country to contribute to our nation's science and technology capability while allowing flexibility to meet regional research needs. Because EPSCoR awards are matched with state funds, it is a sound investment of taxpayer dollars.

Mr. Chairman, this Subcommittee has for the past several years directed USDA to set aside 10 percent of USDA NRICGP funds for USDA EPSCoR. Those funds have provided significant opportunity and very real success in Mississippi and in the other EPSCoR states. I request that, as it has done in previous years, the Subcommittee direct USDA to set aside 10 percent of its NRI competitive grant funds in fiscal year 1999 for an EPSCoR program. These funds will allow the EPSCoR states to continue providing for the agricultural research needs of rural America and of our nation.

I thank the subcommittee for the opportunity to submit this testimony.

PREPARED STATEMENT OF DR. ROBERT G. ZIMBELMAN, CHAIR, COALITION ON
FUNDING AGRICULTURAL RESEARCH MISSIONS

Mr. Chairman: The Coalition for Agricultural Research Missions (CoFARM) consists of 20 professional scientific societies united in a commitment to support fundamental and applied agricultural research. CoFARM advocates agricultural investments in the USDA research budget that will enhance the health and well being of all Americans and increase U.S. competitiveness in expanding world markets.

Contributions of USDA-supported research to the biotechnology revolution in this age of biology is leading to extraordinary new advances in the plant, animal, microbial and nutritional sciences. Basic studies in plant genetics and plant growth and development have led to the ability of industry to regenerate transformed plant tissues. This has enabled industry to develop transgenic plants containing agronomically important genes. The plant biotechnology industry in the U.S. has flourished with the help of basic plant research in this area supported by the National Research Initiative.

Leaner meats and more nutritious plant-produced foods are resulting from USDA-supported plant and animal research. More effective protections from food-borne ill-

nesses are being found through microbial and food safety research supported by the Department. Economic studies assist the Department in implementing more efficient practices.

With predictions of substantial increases in demand for safe and nutritious food worldwide and the limitation of available land to farm, the nation and world must rely on agricultural research to increase food production on existing farmland. Support of this committee for agricultural research sponsored by the NRI, Agricultural Research Service, formula funds and Economic Research Service has been key to assisting American farmers lead the world in agricultural production.

Stagnant research budget for agriculture exposes the nation and its people to loss of leadership in agriculture—this dynamic sector that contributes to national and world security; healthier lives and higher disposable incomes for all Americans; a substantial, revenue-producing surplus in trade of agricultural products; and gainful employment for 22 million Americans. We urge the Committee to increase support for the NRI to \$130 million as recommended by the President and encourage increases of 7 percent for the Agricultural Research Service and for the other areas of the fiscal year 1999 research budget for the Department of Agriculture. Enclosed is the most recent annual brochure of CoFARM with more information on the benefits of agricultural research supported by the Department of Agriculture.

Thank you, Mr. Chairman.

PREPARED STATEMENT OF THE COALITION TO PROMOTE U.S. AGRICULTURAL EXPORTS

As members of the Coalition to Promote U.S. Agricultural Exports, we commend the Chairman and members of the Subcommittee for their interest and support of U.S. agriculture and express our appreciation for this opportunity to share our views.

The Coalition to Promote U.S. Agricultural Exports is an ad hoc coalition of over 80 organizations, representing farmers and ranchers, cooperatives, small businesses, regional trade organizations and the State Departments of Agriculture. We believe the U.S. must continue to have in place policies and programs that help maintain the ability of American agriculture to compete effectively in a global marketplace still characterized by subsidized foreign competition.

This is especially true under the new Federal Agriculture Improvement and Reform Act of 1996 (FAIR Act), which resulted in the most sweeping reforms in farm policy in over 60 years. While achieving significant budget savings, it reduces income support to producers over 7 years; eliminates acreage reduction programs; and provides increased planting flexibility. More than ever, farm income and the economic well being of American agriculture are now dependent on continued access to foreign markets and maintaining and strengthening U.S. agricultural exports.

Accordingly, we strongly urge that USDA's export programs be fully funded and aggressively implemented. This includes maintaining funding for USDA's Market Access Program (MAP) at \$90 million as recommended in the President's fiscal year 1999 budget; providing \$30 million for the Foreign Market Development (FMD) Co-operator Program; and ensuring adequate funding for USDA's Foreign Agricultural Service (FAS) to help meet critical export goals and objectives. Such action is essential to America's overall trade strategy and economic interest.

Agriculture is our nation's most export dependent industry with exports accounting for one third of U.S. production. In 1998, U.S. agricultural exports are projected to reach \$58.5 billion, strengthening farm income, generating billions more in related economic activity, broadening the tax base, and providing jobs for over one million Americans. U.S. agricultural exports this past year also led to an agricultural trade surplus of approximately \$22 billion. Without such exports, our nation's trade deficit would have been even worse.

American agriculture and American workers, however, continue to be threatened by subsidized foreign competition. Recent trade agreements, including NAFTA and the Uruguay Round Agreement on GATT, did not eliminate the use of export subsidies or other forms of export assistance. The European Union (EU), which maintains a huge advantage over the U.S. in terms of export subsidies, last year announced a major initiative to promote EU exports of meat, dairy, fruit, vegetables, and wine into Japan—a significant U.S. market.

U.S. agricultural exports to Japan last year amounted to nearly \$11 billion (down about \$1 billion from the previous year), accounting for 19 percent of total U.S. agricultural exports. As many as 200,000 American jobs depend on continued exports to Japan. Clearly, any further loss with regard to the Japanese market would have an adverse impact on American agriculture and American workers.

This is but one example of the competition facing American agriculture. Other countries are pursuing similar strategies. Again, this underscores the importance of USDA's export programs, including the Market Access Program (MAP) and FMD Cooperator Program. American agriculture is the most competitive industry in the world, but it can not and should not be expected to compete alone against the treasuries of foreign governments.

Funding for USDA's Market Access Program (MAP) has already been reduced by two thirds from its original authorized level. It now represents only a fraction of what our competitors are spending. To further reduce or eliminate funding for MAP in the face of increasing subsidized foreign competition would put U.S. agriculture at a substantial competitive disadvantage.

Further, it is important to note; USDA's Market Access Program has been substantially reformed. The FAIR Act, for example, made permanent the reforms contained in previous appropriations bills by specifically targeting direct assistance to small businesses, farmer cooperatives, and trade associations. In addition, the Act (1) continues the requirement that the program be administered on a cost share basis; (2) requires that funds be used only to promote American grown and produced agricultural commodities and related products; (3) prohibits assistance to foreign firms relating to foreign products; (4) maintains ongoing review and certification of use of funds; and (5) provides for program graduation.

By any measure, USDA's Market Access Program has been a tremendous success and extremely cost effective. It demonstrates what can be accomplished as a result of a true public private partnership. Since the program began, U.S. agricultural exports have more than doubled and value added exports have tripled. The number of jobs that depend on U.S. agricultural exports has also more than doubled making it one of the most successful job creating programs ever established.

For all these reasons, we again urge that USDA's export programs be fully funded and aggressively implemented. As a nation, we can work to export our products, or we can export our jobs. USDA's export programs are a key part of an overall trade strategy that is pro growth, pro trade and pro job.

PREPARED STATEMENT OF JACK A. BARNETT, EXECUTIVE DIRECTOR, COLORADO RIVER BASIN SALINITY CONTROL FORUM

The Congress concluded that the Colorado River Basin Salinity Control Program should be implemented in the most cost-effective way and realizing that agricultural on-farm strategies were some of the most cost-effective strategies authorized a program for the Department of Agriculture. With the enactment of the Federal Agriculture Improvement and Reform Act of 1996 (FAIRA), the Congress concluded that the Salinity Control Program could be most effectively implemented as one of the components of the EQIP program. Since the enactment of FAIRA, the Salinity Control Program has not been funded at a level adequate to ensure that water quality standards in the Colorado River, with respect to total dissolved solids (salinity), can be honored, nor is the funding sufficient to prevent salt loading from irrigated farms from impacting the quality of water delivered to Mexico under a minute of the International Boundary and Water Commission, the United States and Mexico.

The problem rests with the Department of Agriculture concluding that it should not designate any area of the county as a national priority area at this time. The Salinity Control Program has been subsumed into the EQIP program without giving recognition to the requirement in the Colorado River Basin Salinity Control Act that the Secretary of Agriculture carry out salinity control measures in the Colorado River Basin. Further, the Administration has concluded that the expenditure of EQIP funds shall be determined by initiatives developed at the grassroots level. Under USDA directives, this means that Upper Basin agricultural communities advance salinity control proposals for the salinity control efforts. The efforts must be implemented in the Upper Basin, as that is where the salt loading is occurring. Water users hundreds of miles downstream are the beneficiaries of this water quality improvement program. Agriculturalists in the Upper Basin, however, see local benefits as well as downstream benefits and have submitted cost-effective proposals to the State Conservationists in Utah, Wyoming and Colorado. The ranking criteria, however, prohibit the identification of downstream benefits as a benefit that can be credited when proposals are being evaluated.

If the Department of Agriculture believes that it is directed by the Congress to implement the Salinity Control Program, then it is incomprehensible that the program that is designed to provide downstream benefits cannot receive credit in ranking criteria for the accomplishment of the downstream benefits. The solution to the problem is simple. Grassroots in the Colorado River Basin means at the state level

and at the seven Colorado River Basin states level. The states, organized as the Salinity Control Forum, have adopted a program approved by EPA. The Colorado River Basin Salinity Control Forum should be recognized as the grassroots level for the Salinity Control Program and the Forum should serve as the Technical Advisory Committee (local work group) to Administration officials as to the need for and the expenditure of funds for the Salinity Control Program. The Colorado River Basin is covered by two NRCS regions and the program must be coordinated at a high administration level. Numerous requests have gone to the Department of Agriculture to make this designation, and the response has been that there are not adequate funds in the EQIP program to go beyond the initially adopted "grassroots" effort. Therefore, the Forum is pleased with the Administration's statement that it intends to spend \$300,000,000 in fiscal year 1999 on the EQIP program.

The Basin states have cost sharing dollars available to participate in on-farm salinity control efforts in the cost-sharing fashion provided for by the Congress. The agricultural producers in the Upper Basin are standing in line waiting for their applications to be considered so that they might also cost share in the program. When all of the cost sharing is tabulated, the federal cost of the program is less than 50 percent. However, because of the structure of the EQIP program and the associated authorized cost sharing, these funds cannot be expended in this co-operative effort until federal funds are made available.

The Forum urges that this committee support the statement of the President when he indicated he intends to borrow \$300,000,000 from the Commodity Credit Corporation (CCC) in fiscal year 1999 for the EQIP program. The Forum also requests that this Committee advise the Administration that it would be most important if \$12,000,000 of these funds were designated for the Colorado River Basin Salinity Control Program.

OVERVIEW

The Colorado River Basin Salinity Control Program was authorized by Congress in 1974. The Title I portion of the Colorado River Basin Salinity Control Act responded to commitments that the United States had made, through a minute of the International Boundary and Water Commission, the United States and Mexico, with Mexico with respect to the quality of water being delivered to Mexico below Imperial Dam. Title II of the Act established a program to respond to salinity control needs of Colorado River water users in the United States and to comply with the mandates of the then newly legislated Clean Water Act. Initially, the Secretary of the Interior and the Bureau of Reclamation were given the lead federal role by the Congress. This testimony is in support of funding for the Title II program.

After a decade of investigative and implementation efforts, the Basin states concluded that the Salinity Control Act needed to be amended. Congress revised the Act in 1984. That revision, while keeping the Secretary of the Interior as lead coordinator for Colorado River Basin salinity control efforts, also gave new salinity control responsibilities to the Department of Agriculture, and to a sister agency of the Bureau of Reclamation—the Bureau of Land Management. Congress has charged the Administration with implementing the most cost-effective program practicable (measured in dollars per ton of salt removed). The Basin states are strongly supportive of that concept as the Basin states consider cost sharing 30 percent of federal expenditures up-front for the salinity control program, in addition to proceeding to implement their own salinity control efforts in the Colorado River Basin.

Since the Congressional mandates of nearly two decades ago, much has been learned about the impact of salts in the Colorado River system. The Bureau of Reclamation has recently completed studies on the economic impact of these salts. Reclamation recognizes that the damages to United States' water users alone may soon be approaching \$1 billion per year.

The Colorado River Basin Salinity Control Forum (Forum) is composed of gubernatorial appointees from Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming. The Forum has become the seven-state coordinating body for interfacing with federal agencies and Congress to support the implementation of a program necessary to control the salinity of the river system. In close cooperation with the Environmental Protection Agency (EPA) and under requirements of the Clean Water Act, every three years the Forum prepares a formal report analyzing the salinity of the Colorado River, anticipated future salinity, and the program necessary to keep the salinities at or below the levels measured in the river system in 1972.

In setting water quality standards for the Colorado River system, the salinity levels measured at Imperial, and below Parker, and Hoover Dams in 1972 have been identified as the numeric criteria. The plan necessary for controlling salinity has been captioned the "plan of implementation." The 1996 Review of water quality

standards includes an updated plan of implementation. The level of appropriation requested in this testimony is in keeping with the agreed to plan. If adequate funds are not appropriated, state and federal agencies involved are in agreement that the numeric criteria will be exceeded and damage from the high salt levels in the water will be widespread and very significant.

ADDITIONAL FUNDING NEEDS

The authorized cost sharing by the Basin states was at first difficult to implement as attorneys for USDA concluded that the Basin states were authorized by FAIRA to cost share in the effort, but the Congress had not given USDA authority to receive the Basin states' funds. After almost a year of exploring every possible solution as to how the cost sharing was to occur, the states, in agreement with the Bureau of Reclamation, with state officials in Utah, Colorado and Wyoming and with NRCS State Conservationists in Utah, Colorado and Wyoming, agreed upon a parallel program wherein the states' cost sharing funds will be used. We are now in the second year of that program and, at this moment in time, this solution to how cost sharing can be implemented appears to be a good one.

With respect to the states' cost sharing funds, the Basin states felt that it was most essential that a portion of the program be associated with technical assistance and education activities in the field. Without this necessary support, there is no advanced planning, proposals are not well thought out, allegations in the proposals cannot be verified, implementation of contracts cannot be observed, and the most valuable partnering and education efforts cannot occur. Recognizing these values, the parallel state cost sharing program spends 40 percent of the funds available on these support activities. Initially, it was acknowledged that the federal portion of the salinity control program funded through EQIP was starved with respect to needed technical assistance and education support. The Forum is encouraged with the Administration's recent determination that 19 percent of the EQIP funds will be used for technical assistance. The Forum urges this Committee to encourage or direct the Department of Agriculture and the NRCS to spend an adequate portion of the EQIP funds on technical assistance and education. The Forum believes, however, that it would be better for Congress to appropriate adequate funds for these support activities rather than to have NRCS borrow these needed funds from the CCC.

PREPARED STATEMENT OF GERALD R. ZIMMERMAN, EXECUTIVE DIRECTOR, COLORADO RIVER BOARD OF CALIFORNIA

Your support and leadership are needed in securing adequate fiscal year 1999 funding for the U.S. Department of Agriculture (USDA) with respect to its salinity on-farm program. This program in the past had been carried out through the Colorado River Basin Salinity Control Act, which was initially enacted by Congress in 1974, Section 303(c) of the Clean Water Act of 1977, and now with the enactment of the Federal Agricultural Improvement and Reform Act (FAIRA) in 1996, it is being implemented through the Environmental Quality Incentive Program (EQIP) as one of its program components. With the enactment of the FAIRA, Congress concluded that the Salinity Control Program could be more effectively implemented as one of the components of the EQIP program. However, since its enactment, the Salinity Control Program has not been funded at the levels adequate to ensure that water quality standards in the Colorado River, with regards to salinity can be honored, nor is the funding sufficient to prevent salt loading from irrigated farms from impacting the quality of water consumed by water users along the River and delivered to the Republic of Mexico as provided for in the treaty with Mexico. It has been estimated through previous federal studies that the Lower Basin States (Arizona, California, and Nevada) Colorado River water users are presently suffering economic damages estimated to be in excess of \$750 million per year due to the salts in the River system. Most of that damage is occurring in California. The potential impact of failing to maintain the plan of implementation for salinity control in a timely manner would be to permit these damages in the Lower Basin to exceed an estimated \$1 billion annually by the year 2015.

The Colorado River Board of California (Colorado River Board) is the state agency charged with protecting California's interests and rights in the water and power resources of the Colorado River System. In this capacity, California along with the other Basin States through the Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin States' salinity control efforts, established, in June 1975, numeric criteria for salinity levels in the River to lessen the damages in the Lower Basin States as well as meet the

United States' treaty obligations to the Republic of Mexico. The goal of the Colorado River salinity control program is to maintain the flow-weighted average salinity at or below the River's 1972 levels. To maintain these levels, the salinity control program must remove 1.48 million tons of salt loading annually from the River by year 2015. To date, only 621,000 tons of salt load reduction has been achieved. In the Forum's last report entitled 1996 Review, Water Quality Standards for Salinity, Colorado River System released in June 1996, it found that additional salinity control measures were necessary beginning in 1994 to meet the implementation plan that had been adopted by the seven Colorado River Basin States and approved by the Environmental Protection Agency. For the last three years, federal appropriations for the USDA have not equaled the Forum's identified funding levels for the USDA's portion of the program the Federal Government has the responsibility to implement. In the Forum's report, it identified a "backlog" of salinity control measures of over 418,000 tons annually. This is in addition to future controls designed to lower the River's salt loading by 437,000 tons per year over the next twenty years in order to meet the established salinity standards. Very simply, there is a need for 45,000 tons of new salinity control measures to be implemented each year until 2015. The Forum has presented testimony to Congress recommending that the salinity control efforts through EQIP be accelerated to continue to meet the numeric criteria through 2015.

The President's proposed budget for fiscal year 1999 contains funding of \$300 million for implementation of EQIP, up \$100 million from the \$200 million that has been offered the first two years of the program. The Colorado River Board is pleased with the Administration's statement that it intends to spend \$300 million in fiscal year 1999 on the EQIP program. In fact, the Colorado River Basin Salinity Control Forum, at its meeting in Tucson, Arizona, during October 1997, recommended a funding level for the USDA of \$12.0 million for fiscal year 1999 in order to maintain water quality consistent with the established standards. The Colorado River Board supports that action by the Forum. The salinity control program has proven to be a very cost effective approach to help mitigate the impacts of higher salinity. Continued federal funding of the program is essential.

In addition, the Colorado River Board recognizes that the federal government has made significant commitments to the Republic of Mexico and to the seven Colorado River Basin States with regard to the delivery of quality water to Mexico. In order for those commitments to be honored, it is essential that in fiscal year 1999 and in future fiscal years, the Congress provide funds to the USDA to allow it to continue providing technical support in the Basin for salinity control.

The Colorado River is, and will continue to be, a major and vital water resource to the 17 million residents of southern California as well as throughout the Lower Colorado River Basin. As stated earlier, preservation of its quality through an effective salinity control program will avoid the additional economic damages to users of Colorado River water in California.

The Colorado River Board greatly appreciates your support of the federal/state Colorado River Basin Salinity Control Program and again asks for your assistance and leadership in securing adequate funding for this program.

PREPARED STATEMENT OF DR. MICHAEL CROW, VICE PROVOST, COLUMBIA UNIVERSITY

Mr. Chairman, and Members of the Subcommittee, thank you for the opportunity to submit a statement for inclusion in the hearing volume for outside witnesses. My statement concerns USDA funding for accessing and interacting with long range forecasting and modeling efforts in the area of climate change. Specifically, I propose that USDA utilize existing climate forecasting and predictive modeling expertise for:

- (1) yield calculations (using seasonal-to-interannual temperature and precipitation forecasts) in the world and domestic (U.S.) supply and demand estimates; and
- (2) stewardship of natural resources, in programs managed by USDA that involve soil and water conservation and forestry management.

The value to the agricultural community of this approach has been estimated at \$4.5 billion in preventable losses. The fiscal year 1999 project costs for this initiative are \$750,000.

THE INTERNATIONAL RESEARCH INSTITUTE FOR CLIMATE PREDICTION (IRI)

Columbia University's Lamont-Doherty Earth Observatory (LDEO), in conjunction with The Scripps Institution of Oceanography (SIO) of the University of California at San Diego, has entered into a Cooperative Agreement with NOAA to establish

and manage the International Research Institute for Climate Prediction (IRI). The IRI's mission is to provide experimental climate forecast guidance on seasonal-to-interannual time scales for use by affected communities around the world. Working with an extensive network of domestic and international research and applications centers worldwide, the IRI will provide the necessary scientific institutional focus for a multi-national "end-to-end" prediction program. This "end-to-end" prediction program supports the development and production of forecasts of changing physical conditions (temperature and precipitation) on year-to-year time scales, assessments of the regional consequences of those variations, and the application of this information to support practical decision making in critical sectors such as agriculture, water resources, fisheries, emergency preparedness, and public health and safety.

FISCAL YEAR 1998 ACTIVITIES

During the current fiscal year, the IRI will continue to develop improved seasonal to interannual climate forecasts in partnership with NOAA and other research elements of the Climate and Global Change effort. Recently, NOAA issued an evaluation on the ENSO Rapid Response Project, which compared the IRI net assessment precipitation forecasts to actual observed precipitation. A copy was provided to this Subcommittee's staff. Termed a "Validation of October-November-December Net Assessment Precipitation Forecasts", NOAA compared the graphics of the predictive models with the graphics of actual precipitation for the following regions: Africa; Asia; Australia and Indonesia; Europe; North America; and South America. The assessment showed that in the ten models that were used for comparison to actual events, the forecasts were accurate for nine of those models. The models accurately predicted the following:

- Eastern Africa: normal precipitation;
- Southern Africa: below normal precipitation;
- Northeastern China: below normal precipitation;
- Southeastern China: above normal precipitation;
- Indonesia: below normal precipitation;
- Europe: above normal precipitation;
- North America; West Coast, Southwest, Southeast: above normal precipitation;
- South America; Ecuador/Peru: above normal precipitation;
- South America; Argentina, Uruguay, Southeastern Brazil: above normal rainfall;
- South America; Northern Continent: below normal rainfall.

The only model that failed to predict accurate forecasts occurred for Queensland, Australia. The model failed to predict the rainfall delivered by tropical storms and cyclones, which are extremely rare in this region. In evaluating the model, IRI scientists attribute the failure of the prediction to the fact that tropical storms and cyclones cannot be resolved by the climate models currently used operationally. We are eager to see the results from the next validation assessment. We will transmit to you the NOAA evaluation as soon as it becomes available, as we did with this evaluation.

The development of regional applications of climate modeling by other institutions, currently in process as a function of fiscal year 1998 funding, will bring new data sources to the efforts of the IRI when they become operational.

FISCAL YEAR 1999 ACTIVITIES

The fiscal year 1999 program level for the IRI (through Department of Commerce funding) remains at the \$5 million level we are receiving in fiscal year 1998. IRI activities in fiscal year 1999, as planned within the budget request, involve continued refinement of end-to-end modeling and the incorporation of additional regional data and modeling. The periodic evaluations of three month predictions versus actual events provide near time feedback on the accuracy of IRI models and permit corrections and adjustments to ongoing modeling efforts.

Since the IRI was initially funded by NOAA, Columbia and Scripps have invested heavily in capital and research efforts. The ratio of private to public investment has been on the order of 3 to 1. The Fiscal Year 1998 Appropriations Act was the first year in which the Congress fully funded NOAA's request for IRI funding. We realize that the funding occurred concurrently with the biggest El Niño event in over one hundred years.

POTENTIAL BENEFITS OF IMPROVED FORECASTING AND MODELING

The more we are able to conduct improved modeling and forecasting experiments, the better prepared we will be when the next big event occurs. Studies have shown

that with improved forecasting and advanced warning, billions of dollars in savings can be achieved in several economic sectors:

- Agriculture, fisheries and forestry: Annual losses, \$15 billion. Preventable losses, 30 percent, or \$4.5 billion.
- Mining and manufacturing: annual losses, \$1.5 billion. Preventable losses, 5 percent or \$75 million.
- Transportation: Annual losses, \$1.2 billion. Preventable losses, 40 percent or \$40 million.
- Communications: Annual losses, \$334 million. Preventable losses, 8 percent or \$26 million.
- Financial, insurance and real estate: Annual losses (above premiums), \$5.4 billion. Preventable losses, 40 percent or \$2.16 billion.
- Other (including wholesale and retail trade, services, farm and non-farm residences, and government fixed capital): Annual losses, \$6.9 billion. Preventable losses, 40 percent or \$2.6 billion.
- Total annual losses: \$30.53 billion. Preventable losses, \$10.01 billion.

Avoidance of losses in the \$10 billion range, not to mention reduced fatalities and injuries due to hazards from storms and floods, dangers along the coast, and conditions of poor air quality, can be achieved.

PROJECT PROPOSAL

USDA's Budget Request includes \$410,000 for two staff years for Modernization of Weather and Climate Data Acquisition. In reviewing the detail of the request, and the responsibilities of the Chief Economist for production of the monthly World Agricultural Supply and Demand Estimates (WASDE), we know that current IRI predictive modeling would greatly enhance USDA's efforts. On page 8g-4 of the Fiscal Year 1999 Budget Justifications for the World Agricultural Outlook board, the following statement appears:

"Despite inadequate data from the National Weather Service, JAWF analysts assembled data from alternate sources along the Gulf Coast and in Southern Florida to assess the probable impact of a freeze episode which occurred in mid-January."

This type of analysis, forecasting for temperature and precipitation, is what the IRI was designed to produce. The products of the IRI, noted in the NOAA evaluation earlier in this statement, are developed to assist governments and private concerns in the planning decisions they make that are affected by climate related events.

In another context, USDA management of the Forest Service, though not funded in this Bill, come directly from the secretary's Office. the Secretary Of USDA relies on the weather and climate assessments of the Chief Economists office in determining many of the activities that might be affected by extreme or unusual climate phenomena.

Following the above rationale, coupled with the IRI's current capability and the potential for growth in the natural resource assessment sector, we recommend that USDA contract with the IRI for the development of refined models that will produce long range and near term climate for use in USDA's supply and demand estimates and in the management decisions related to natural resource stewardship.

The development costs related to this refined modeling will total \$750,000 in the first year. The project is estimated for a three year effort, which involves model development, assessment and validation, and real-time experimental testing. At the end of the first year, USDA would be provided predictive model information and forecasts that could be used in conjunction with traditional, less sophisticated methods. The potential benefit to the economy, local farmers and the environment far outweighs the modest investment of \$750,000.

The IRI is prepared and eager to embark on exactly this kind of project with USDA. The Budget Justifications certainly speak to the need for such expertise, and that expertise is available through the IRI.

OVERARCHING IRI GOALS

We are seeking to gain more quickly the capability for avoiding losses similar to those listed on an earlier page. The IRI's core function is prepared to move to a more mature stage. We could employ more of an engineering approach to forecast system development. The characteristics of this approach include more quantitative testing, more precise figures of merit, and particularly a much more controlled environment.

The IRI would develop the analog of a state-of-the-art wind tunnel to aerodynamically design models with physical properties. The infrastructure of this advanced approach involves computation: software environment and computing power. The IRI seeks to develop and test improved coupled ocean-atmosphere climate fore-

cast system for El Niño and La Niña events, thereby enhancing the ability to understand and predict climate impacts on a higher resolution at the national scale in the near-term future.

CONCLUSION

Mr. Chairman, I recommend that the Committee provide \$750,000 in fiscal year 1999 for climate modeling and forecasting development through the IRI for the purposes of (1) improved USDA capability and accuracy in producing the World Agricultural Supply and Demand Estimates; and (2) improved information for making decisions related to management and stewardship of our nation's natural resources.

Thank you for the opportunity to present this statement for the Committee's consideration in funding decisions you will make for the fiscal year 1999 Agriculture Appropriations Act.

PREPARED STATEMENT OF SUSAN G. SCHRAM, PH.D., FOOD AND AGRICULTURE PROGRAM COORDINATOR, DEPUTY DIRECTOR, WASHINGTON OPERATIONS, CONSORTIUM FOR INTERNATIONAL EARTH SCIENCE INFORMATION NETWORK (CIESIN)

Mr. Chairman, thank you for the opportunity to submit testimony to the Subcommittee. I would like to thank you and the Subcommittee for your support for The USDA/CIESIN Global Change Data Assessment and Integration Project, funded through the Agricultural Research Service (ARS). I am pleased to have the opportunity to report the accomplishments of the project over the past year, highlight the importance of the continuation of the project, and, inform the Subcommittee of some changes that will be taking place at CIESIN in 1998.

Mr. Chairman, it has been another successful year for the USDA/CIESIN project. As you know, the focus of our work is to increase the taxpayer's return on investment in years of agricultural research and data collection. CIESIN's work in global environmental change related to agriculture has provided the opportunity to document, rescue and use more efficiently, the vast long-term data resources of the USDA and its related field offices across the United States.

Specifically, the major objectives of our work are to:

(1) rescue and put to use valuable long-term scientific agricultural and natural resources data that taxpayers have paid millions of dollars to collect and that are at risk of being lost;

(2) provide state-of-the-art technical tools so that concerned farmers, ranchers, and citizens can visualize alternatives and participate in decision-making about the uses of our natural resources;

(3) provide cross-agency access to documentation on USDA's data resources related to agriculture and global environmental change; and

(4) bring the latest developments in electronic information technology to bear on challenges faced by USDA agencies.

Over the course of the project our work has helped address long-term agricultural and natural resource issues in: New Mexico, Michigan, Arizona, Colorado, Texas, Oregon, Alaska, Hawaii, Oklahoma and Idaho. Through the support of the subcommittee and in cooperation with the Agricultural Research Service, we have also been able to disseminate our new technologies to assist other USDA agencies such as the Forest Service and the Natural Resources Conservation Service.

Mr. Chairman, an important aspect of harnessing our scientific data resources for improved use by the research community and the public is to determine the location and condition of our long-term agricultural and natural resource data assets needed for analysis of global environmental change over time. We must assure that previous public investments in scientific data collection are not squandered due to retirement of veteran scientists, poor storage conditions, inadequate documentation, or existence of the data in single, hard copy format.

CIESIN has continued its collaboration with the Physical Sciences Lab (PSL) at New Mexico State University (NMSU) to address data rescue needs. Our efforts have been devoted to salvaging data related to two of the most valuable resources of the western United States—water and grazinglands.

In previous years we have been able to complete data rescue projects at the ARS Jornada Experimental Range and the Cibola National Forest in New Mexico, and the Santa Rita Experimental Range in Arizona. These projects transformed single hard copy data into digital data that are now being put to use by researchers. Rescued data have been incorporated with other digital data to provide an historic picture of long-term changes in grazingland vegetation and to permit analysis of the relationship between grazingland vegetation and climate variation.

This past year, data rescue efforts focused on rescuing hard-copy animal weight and forage density data at the ARS Southern Plains Experimental Range in Woodward, Oklahoma, and on digitizing aerial snow cover photographs at the ARS Northwest Watershed Research Center in Boise, Idaho. Following is a capsule summary of each of these projects:

Southern Plains Experimental Range.—Twenty years of steer and cow/calf monthly weights and forage density data were transcribed from ledgers to data sheets and keypunched into a data base format. These data were then combined with climate data to provide a means of performing statistical analysis over a twenty year period in the southwestern United States (including the massive drought of the 1950's).

Northwest Watershed Research Center.—Snow cover information is vital to the development of snow melt and runoff calculation used to predict water availability in the high desert country of Idaho. This information is presently contained in twelve years of individual 8 by 10 hard copy aerial photographs of snow cover on the Reynolds Creek Watershed. Snow cover percentage is currently estimated by visual examination of the photographs. During the 1997–1998 contract year CIESIN will digitize these photographs. Digitizing will not only provide the information in electronic format, but will also allow image processing and pattern recognition software to be employed to give a more accurate estimate of snow cover.

Looking forward to future data rescue projects, CIESIN is presently working with the ARS Southwest Watershed Research Center in Tucson, Arizona to evaluate the feasibility of extracting valuable long-term precipitation, runoff, and sedimentation data from old magnetic tapes, and applying these data to decision support systems to assist ranchers, farmers, and municipalities in southern Arizona and New Mexico.

Since the beginning of the USDA/CIESIN Global Change Data Assessment and Integration Project, CIESIN has been concerned with improving the ways in which data and information are presented to scientists, policymakers, and the public at large to facilitate decision making about agricultural resources. CIESIN has performed continuous research to stay abreast of the latest advances in data and information visualization techniques and applications. Research conducted in the past year focused on cutting edge visualization techniques and agricultural applications.

CIESIN continues to advance knowledge in the area of giving a spatial context to agricultural decision making. In the past year, the Agricultural Research Service has been particularly excited about CIESIN's work with the ARS Great Plains Systems Research Unit in Fort Collins, Colorado to develop a means of displaying the results of the Great Plains Framework for Agricultural Resource Management (GPFARM) model.

CIESIN work provides GPFARM with geographic capabilities—we provide a way for the farmer to see the model output (which is usually displayed in numbers) in a much more easily understood map format. Presently we are working with ARS scientists to implement the Farm Spatial Data Management System (FSDMS). FSDMS will provide a geographic interface for farm and/or ranch record keeping and trend analysis.

The FSDMS is a three level system, with each level providing additional capability for spatial analysis and modeling. The three levels are: Level 1—Farm Layout and Record Keeping; Level 2—Farm Analysis; and Level 3—Farm Research.

Level 1 helps the farmer "sketch" farm layouts and fields, import digital images such as scanned quad maps and aerial farm photos, supplement field sketches with commentary data and photos, record weed and pest infestation data with direct reference to the farm layout, and analyze trends in weed and pest records through interactive query.

Level 2 assists the farmer in translating farm sketches to precise geographic coordinates. This permits direct integration with Global Positioning Systems yield monitors, soil sampling, and precision chemical application. In addition, this allows the farmer to begin to take advantage of federal data resources such as NRCS digital soils maps, digital weather maps, and terrain maps. Level 2 provides the interface to GPFARM and other farm simulation models, allowing for direct benefit from federally funded research programs and model development.

FSDMS Level 3 will provide a spatial interface for agricultural research scientists to evaluate new models, develop enhanced simulation techniques, and investigate prescriptive farm assistance through artificial intelligence procedures. A detailed design for both Level 1 and Level 2 of the FSDMS system have been developed, as well as a conceptual design for Level 3. In addition, a functional Level 1 prototype has been developed and has been distributed to local farm consultants for review and feedback.

This year, CIESIN continued its work in global environmental change data documentation across USDA agencies. CIESIN has developed new metadata about global

environmental change-related data sets across the major USDA research agencies and continuously updated metadata collected in previous years. This information is made accessible to USDA and other researchers through the World Wide Web. The USDA/CIESIN World Wide Web "home page" (<http://www.ciesin.colostate.edu/USDA>), provides an integrated view of 750 USDA global change data sets, 160 models, and 173 GIS applications with electronic connections to a full spectrum of information related to environmental change research topics. Information about all of CIESIN's project deliverables to date may also be found on the home page. Between September, 1997 and January, 1998, there were over 14,000 "hits" on the USDA/CIESIN home page.

The home page now connects USDA researchers, land-grant university and other users with over 520 additional sources of agriculture and natural resource data worldwide. CIESIN also serves as the official provider of agricultural data entries, formatted appropriately, for inclusion in the electronically-accessible NASA Global Change Master Directory.

Finally, Mr. Chairman, I would like to inform you of some pending changes at CIESIN. CIESIN is in the final stages of negotiating an agreement to move its headquarters staff and operations to Columbia University in New York. Under the proposed arrangement, CIESIN would become a Center of the Columbia Earth Institute and be located at the Lamont Doherty Earth Observatory campus in Palisades, NY. This new arrangement will provide CIESIN with many new opportunities for scientific and technical collaboration, and reduce its overall current indirect cost structure, freeing more USDA/CIESIN project dollars for research.

The transition and relocation are scheduled to occur on June 30, 1998. Plans call for me to remain in the CIESIN Washington office to conduct project work and to perform federal liaison functions and for the CIESIN Ft. Collins office to continue to be co-located with ARS.

Mr. Chairman, this project is an important part of the work of USDA in preserving previous taxpayer investment in scientific data collection, providing state of the art tools for sound agriculture and natural resource decision making, and making scientific data and information more readily available and more useful for the research community, for federal, state and local policy makers and the public. We are grateful for the opportunity to provide Subcommittee members with an update on our activities and respectfully request your continued support of this program.

PREPARED STATEMENT OF E. EDWARD KAVANAUGH, PRESIDENT, COSMETIC, TOILETRY, AND FRAGRANCE ASSOCIATION

INTRODUCTION

The Cosmetic, Toiletry, and Fragrance Association (CTFA) respectfully urges you to direct \$5 million in increased appropriations to the Food and Drug Administration's regulatory program for cosmetics in the Center for Food Safety and Applied Nutrition (CFSAN) Office of Cosmetics and Colors. This additional funding is essential to ensure continuing confidence in the safety of personal care products.

We believe that this funding should be provided through increased appropriations rather than through reallocation of existing resources or through user fees. Although we feel very strongly about this, we understand the difficult budget decisions facing the Subcommittee. If an increase in appropriations is not possible at this time, we ask you instead to earmark \$5 million specifically for the regulatory program for cosmetics within the CFSAN Office of Cosmetics and Colors.

ADDITIONAL APPROPRIATIONS ARE DESPERATELY NEEDED

Without this funding, we firmly believe that the FDA will be hard pressed to maintain a credible cosmetic regulatory program. In recent months, the FDA's cosmetic regulatory program has sustained crippling cuts:

- In January 1998, the agency announced that all 12 of its field personnel assigned to cosmetics had been reassigned to food programs. This necessitated the immediate cancellation of the FDA's compliance programs for domestic and imported cosmetics.
- In March 1998, the remaining staff assigned to the program was reduced from 27 to 15 full-time equivalents. These cuts resulted in the suspension of the FDA Voluntary Cosmetic Reporting Program, which for more than 25 years had provided the agency and our industry with valuable information about the ingredients used in cosmetic and personal care products. The FDA has also indicated that, because of these cuts, it will limit the number of cosmetic-related tele-

phone inquiries it takes from the public and the industry. Additionally, laboratory studies of cosmetics will be significantly reduced or suspended.

During discussions with the cosmetic industry about these devastating program cutbacks, the agency raised the possibility of further weakening the regulatory program for cosmetics by moving it from CFSAN to the Center for Drug Evaluation and Research (CDER). We believe that such a shift would be disruptive and counterproductive. It is absolutely imperative that the program remain in CFSAN, where it has functioned effectively for almost 30 years and where the expertise exists.

With finite resources and a long list of responsibilities, the FDA faces daunting budget decisions. Cosmetic products have a stellar safety record and, according to FDA commissioners spanning more than two decades, are the safest products the agency regulates. Therefore, when the agency needs resources for other products or issues that present a critical and immediate problem, such as food safety, there is an understandable temptation to draw those resources away from the regulatory program for cosmetics. We must not allow this to happen.

This "rob Peter to pay Paul" approach is, at best, a short-term solution. It fails to recognize that by downgrading the cosmetic regulatory program, the agency is sowing the seeds for future problems. For one thing, it could unwittingly encourage unwarranted attacks on the agency's ability to police the industry. In addition, it could encourage entry into the market of product manufacturers that do not maintain the current high standards of the industry. We know that cosmetics are by far the least of the problems facing the agency today; we want to keep it that way. To do that, we must have a strong FDA regulatory program to stand behind the industry's commitment to maintain its high standards of safety.

A STRONG COSMETIC PROGRAM IS CRUCIAL TO OUR INDUSTRY AND THE PUBLIC

An exhaustive discussion of the importance of a healthy FDA cosmetic regulatory program is beyond the scope of this statement. We must point out, however, that the American people rely on the FDA and have every right to expect that the Congress will provide the agency with the resources it needs to ensure the safety of the products it regulates, including cosmetics.

CTFA members provide consumers with a wide choice of safe cosmetic products, including such things as makeup preparations, shampoos, deodorants, toothpastes, mouthwashes, perfumes, shaving creams, and skin lotions. These products promote personal hygiene. They help people look and feel their best, thereby increasing self assurance and self esteem. Virtually every man, woman, and child in the United States uses cosmetics every day. Due to the historic effectiveness of the FDA and the voluntary safety programs undertaken by the cosmetic industry—often with the agency's cooperation and participation—they do so safely and with confidence. Failure to fund adequately the agency's regulatory program for cosmetics will undercut a vital component of a safety system that has served consumers well for decades.

Moreover, the continued economic well-being of the \$25 billion cosmetic industry depends on a strong FDA regulatory program. Our industry relies on the FDA compliance function. Without compliance, unscrupulous competitors can not only defraud the public, but undermine legitimate industry as well. The cosmetic industry needs a level playing field. We need to know what regulatory requirements apply. We want to be certain that the FDA law and regulations will be enforced consistently against all marketed products, whether imported or produced domestically.

A strong FDA Office of Cosmetics and Colors exerts national leadership, maintains appropriate standards to assure the safety and proper labeling of cosmetics throughout the nation, and ensures that Americans can enjoy a nationwide marketing system with adequate public protection and uniform enforcement in every part of the country. If the FDA's cosmetic program is diminished, the states may be encouraged to ignore the agency and establish their own, potentially conflicting, regulatory requirements for cosmetics. Such a patchwork of state mandates could only confuse consumers and wreak havoc on our industry's ability to operate in interstate commerce.

The FDA is currently recognized as the preeminent international body in the field of cosmetic regulation. A visible and vigorous CFSAN Office of Cosmetics and Colors is necessary to maintain this international leadership and to move even more quickly toward the goal of international harmonization, which the Congress established as an FDA priority for cosmetics and other regulated products under Section 410 of the FDA Modernization Act of 1997.

THE COSMETIC REGULATORY PROGRAM MUST REMAIN IN CFSAN

The cosmetic industry believes that it is imperative for the FDA's regulatory program for cosmetics to remain in CFSAN. Therefore, we are asking the Subcommit-

tee to ensure that any funding it provides to the agency's regulatory program for cosmetics is specifically directed—and firmly tied—to the CFSAN Office of Colors and Cosmetics. There is simply no budgetary, policy, or management reason to move the program from CFSAN to CDER.

No savings would result from transferring the cosmetic program. At least the same levels of staffing and funding would be needed to establish and maintain an effective cosmetic program at CDER as at CFSAN. In fact, since the present CDER personnel are not knowledgeable or experienced in cosmetics, even greater levels might be required were the program shifted.

Moreover, maximum efficiency and effectiveness demand that the cosmetic program be in a scientifically compatible environment. Cosmetics and food share many more common scientific characteristics than do cosmetics and drugs. Unlike drug ingredients, for example, food and cosmetic ingredients are largely inert, are not intended to produce a pharmacologic effect, are not the subject of therapeutic claims, and are not investigated for their clinical benefit.

More than 3,400 functional cosmetic ingredients are also regulated by the FDA's CFSAN as food additives or GRAS food substances. Food flavors and cosmetic fragrances share the same natural sources and have many substances in common. Color additives—which are a significant component of most cosmetics—and food additives have been regulated by the same scientists in CFSAN since enactment of the Color Additive Amendments of 1960. Safety decisions regarding food ingredients and cosmetic ingredients rely on the same scientific disciplines, which differ from those regarding drug ingredients.

Some personal care products, such as deodorant/antiperspirants, antidandruff shampoos, and dentifrice/fluoride toothpastes, do fall into both the drug and cosmetic definitions of the Federal Food, Drug, and Cosmetic Act. They are currently and appropriately handled by CDER, in cooperation with CFSAN, as over-the-counter drugs. These products, however, represent a small portion of cosmetic products and provide no justification for transferring the vast bulk of cosmetics, which have no pharmacologic properties, from CFSAN to CDER.

We are also convinced that the regulatory program for cosmetics must remain at the Office level within CFSAN. A reduced program, buried in the bowels of the FDA, would be unable to attract leaders or staff with strong qualifications and national stature. Moreover, such a reduction would send the unmistakable signal that the FDA is abandoning this area and would virtually preclude a position of leadership either nationally or internationally.

FUNDING THE REGULATORY PROGRAM FOR COSMETICS

We are seeking \$5 million for the regulatory program for cosmetics in the CFSAN Office of Cosmetics and Colors. Although it is difficult to pinpoint an exact figure, we believe that this approximates the amount that the FDA has been allocating annually to its regulatory program for cosmetics. In this era of budgetary constraints, we are not asking for new programs. We are merely asking for a level of stable funding that will ensure the restoration and maintenance of a program similar to the one that existed prior to the debilitating cuts recently instituted by the agency.

CTFA believes it is essential to secure the \$5 million through additional appropriations rather than by drawing resources from other FDA programs or by imposing user fees. If that is impossible, however, we ask the Subcommittee instead to allocate \$5 million to ensure that there is a strong regulatory program for cosmetics in CFSAN.

We favor additional appropriations because we know that the FDA has many important responsibilities, of which cosmetics is only one. We believe that the agency needs appropriate levels of funding to do the kind of job that the American people expect and deserve. Furthermore, we believe that it is the responsibility of the Congress to ensure that the FDA has the necessary resources to regulate cosmetics adequately.

We appreciate the fact that the Congress and this Subcommittee in particular have consistently, and we believe correctly, rejected the imposition of user fees to fund general government operations. Such fees, in effect, would be a regressive tax on the products manufactured by our industry.

Prescription drug user fees are used to speed up a specific company's new drug applications. They are not used for general FDA administrative or enforcement purposes. Having the cosmetic industry pay user fees to finance the FDA's inspection and enforcement activities is an entirely different matter. Instead of directly resulting in faster approval of new prescription drug products for a company that pays the user fee, the user fees here would be used to fund the agency's broad public

health responsibilities for the entire cosmetic industry. This would raise serious public policy concerns.

SUMMARY

The cosmetic industry urges the members of the Subcommittee to provide \$5 million in increased appropriations for the FDA regulatory program for cosmetics in the CFSAN Office of Cosmetics and Colors. If increased appropriations are not possible, we ask that you instead reallocate and expressly earmark \$5 million for the regulatory program for cosmetics in the CFSAN Office of Cosmetics and Colors.

We are grateful for this opportunity to express our views on the vital importance of adequate funding for this program. Thank you for your consideration.

PREPARED STATEMENT OF SAMUEL F. MINOR, CHAIRMAN, COUNCIL FOR AGRICULTURE RESEARCH, EXTENSION, AND TEACHING (CARET)

Thank you Mr. Chairman. I appreciate the opportunity to provide testimony today in support of the Land-Grant System.

My name is Sam Minor, Chairman of the Council for Agricultural Research, Extension, and Teaching, commonly called CARET. CARET is a national focal group of lay support persons formed a number of years ago for the expressed purpose of enhancing national support and understanding of the important role played by the land-grant colleges in the food and agriculture systems as well as their role in enhancing the quality of life for all citizens of the nation.

I take part in this activity with a great amount of pride and commitment, because I know first hand of the important role played by our land-grant institutions.

As a dairy farmer, retail market, and on the farm restaurant owner/operator I have experienced the beneficial results of agricultural research and extension in our own business enterprise. This was particularly true when we, some 22 years ago, started our business from scratch on a hillside farm located some 25 miles south of Pittsburgh, Pennsylvania with nothing more than a good wife, five small children, and a few saved dollars.

I do know first hand of the value of our Land-Grant Colleges such as Penn State to the individual farm family. Nearly everything that has transpired on this farm from the cropping program, to the calf raising, to the artificial breeding, to the milking and business management has been substantially based on the research and extension work from our land-grant university. This same statement can be said about many or the hundreds of thousands of farm families across this country. Agricultural research and education has been the basis of much of the development and growth that has allowed American agriculture to be the envy of the world.

As a retailer of milk and other dairy products and farm fresh produce in our retail market and as a restaurant operator, we also have a great appreciation of the importance of food quality and food safety. The research and educational work that is being done in these two areas is also greatly recognized for the importance that this plays in our operation.

As Secretary of Agriculture, Dan Glickman, recently said, "Seventy-five percent of the progress that has been made in agriculture productivity and competitiveness since the second World War has been a direct result of the public contribution to agriculture research." Now is not the time to allow other countries to assume this lead in agricultural productivity and development.

It has been the federally supported programs of research, extension, and teaching that have provided the scientific basis to allow 1.8 million U. S. farms, such as ours in southwestern Pennsylvania, to produce a record in excess of \$200 billion of food and fiber. A record of nearly \$60 billion of this productivity in 1996 went to the export market, allowing for a nearly \$30 billion of positive contribution to the balance of trade. Although agriculture exports were down some this past year, they still had a very positive influence on narrowing the U. S. trade margin while contributing significantly to feeding and clothing a growing world wide population.

This is an important time to talk about agriculture research and education. We are increasingly aware of the fiscal restraints and the changing role of the federal government in the conduct of our agriculture businesses. Agriculture has demonstrated that it will rely less upon the commodity support programs but will compete even more effectively in the world wide marketplace. Agriculture research and the implementation of these research findings has been a major factor in preparing for this transition. As a result of these past efforts, we will have an agriculture system that is even more competitive in the global economy.

As a result of this research and education work, we will continue to have an agriculture industry that is the envy of the world. This is an industry that combines

food and agriculture and their related industries to provide almost 20 percent of the jobs in this country and accounts for 16 percent of our gross national product. Yet, the consuming public spends less of their disposal income, just over 10 percent, for their food needs than any other country in the entire world. These are numbers that are familiar to all of us. Yet they are just as significant today.

Now, as we enter a new era in agriculture and the role that government plays in agriculture, we believe that the need for an agriculture that is based on research and science is greater than it has ever been before.

We are, for many reasons, in a very rapidly changing agriculture. Some call it an industrialization of agriculture. We are seeing a consolidation of our agriculture enterprises. We are seeing a rapid implementation of new emerging technologies. Information, of all kinds, that enhances the ability to make more rapid and more correct decisions is increasingly available. New plant and animal species, varieties, and characteristics are emerging from the rapid advancement of the biotechnological sciences. These changes and this advancement has come about, to a great extent, because of the past investment in agriculture research and education, much of it from public sources.

As we consider this transition in the framework of new work that is now being done and the new scientific advancements that are just on the threshold of disclosure, one has to think that our opportunities are greater today than they have ever been in the past. It will, however, take dollars to bring these opportunities to fruition. It will be a continuation and expansion of the federal, state, local, and private partnership that can best provide these dollars critically needed for this work. Your decisions in the coming months to increase the federal outlay for agricultural research can provide some much needed leadership for this effort. The federal funds are the heart of this partnership.

Specifically, the federally-supported programs in cooperation with our state land-grant colleges and universities are crucial for us to retain and expand the U. S. competitive edge in the world wide marketplace. Specifically federal funding for agriculture research requires a balanced portfolio of base funds, special grants and competitive grants.

This testimony is principally to request support for the fiscal year 1999 budget recommendation of the NASULGC Board on Agriculture of \$910.3 million, an increase of 8.4 percent over the current year appropriation. This request is for the federal portion of the funding for research, extension, and higher education and federal administration that is, in turn, leveraged up to five times at the individual state and local level. While this is large amount of money, it is truly quite moderate in relation to the total federal appropriation to research or even in relation to the total agriculture appropriations.

Mr. Chairman, I especially want to emphasize the importance of the request for the small increase in the amount appropriated for the base programs for research and extension. This highly successful state/federal base program partnership has provided critically needed stable on-going research. These funds are essential for leveraging external resources. As you are aware, these base fund levels have been eroding for a number of years. It is very critical that this trend be reversed. Base program funding is unmatched as a vehicle to foster multi-year programs essential to the science of agriculture. Measured rates of return on this investment range from 30 to 50 percent, depending on location and commodity. Again, I sincerely request that you begin to restore these very critical base program funds.

As I am finalizing this prepared testimony, I am aware that Congress is right now preparing to finalize the reauthorization of the Research and Science portion (Title VIII) of the Farm Bill. We in CARET and the entire land-grant system are appreciative of the opportunity to have participated in this process. We are especially glad to know of the recognition that has been given to the addition of substantial new funding for agricultural research. We trust that everything possible will be done to assure that these new research monies will be included in the final form of the Title VIII reauthorization. We also trust the House and Senate appropriators will join in supporting this newly-authorized Congressional support for agricultural research, if enacted into law, without penalizing agricultural research through discretionary funding.

The Council on Agricultural Research, Extension, and Teaching is very pleased to speak on behalf of the land-grant university system. This land-grant partnership, these seventy-five universities working in close cooperation with the USDA Cooperative State Research, Education, and Extension Service, is a very important and very strong relationship. This is a partnership that undergirds successful agriculture in the United States and is the envy of the entire world. This is a partnership that our CARET organization believes should be financially supported to the fullest pos-

sible extent at both the federal and at the state levels. We ask that you give this request your fullest possible consideration this year.

As an individual farmer and a member of the agriculture community, I am very proud of what this federal, state, and local partnership has provided to us. At the same time, agriculture research and education must be an important part of our long-term agricultural policy. We must strengthen our financial commitment to assure that these basic programs of the land-grant system will be prepared to meet the emerging need of the food and fiber sector. We in agriculture and the country as a whole want to be prepared to take full advantage of the further opening of global markets, greater deregulation of the commodity programs, and the promise of scientific breakthroughs. We also want to be prepared to address important environmental and food safety issues. These all provide unprecedented opportunity to put science and education to work in support of mankind.

Thank you for the opportunity to provide this testimony.

PREPARED STATEMENT OF SARA AMUNDSON, DORIS DAY ANIMAL LEAGUE

INTRODUCTION

The Doris Day Animal League, on behalf of its 370,000 members and supporters, is a national, animal protection organization. We appreciate this opportunity to submit testimony supporting our respectful request for a specific appropriation for the Office of Cosmetics and Colors in the Center for Food Safety and Applied Nutrition at the Food and Drug Administration.

BACKGROUND

The Office of Colors and Cosmetics (OCC) is the primary department with regulatory authority for administering the cosmetics program at the FDA. Due to increased responsibility for regulation of food at the Agency, funding for the OCC has been shifted to meet new mandates. A significant portion of the estimated \$5 million annual appropriation for the OCC is being absorbed, leaving the least regulated product under FDA open to safety concerns for consumers. The lack of commitment to the OCC has manifested itself in the following ways:

- Staff for the OCC was cut by 50 percent, from 27 to 15 full-time employees in March 1998.
- The Voluntary Cosmetic Reporting Program, a resource for consumers and industry, has been discontinued. This program provided information on the ingredients used in cosmetics and other personal care products for many years.
- All assessments of in vitro, or non-animal test methods, to substantiate the safety of products have been discontinued. The FDA's authority on this issue of great concern to many Americans will be seriously undermined, as Europe progresses towards its legislative mandate to end animal tests for safety studies of cosmetics.

Under Section 410 of the FDA Modernization Act of 1997, the Agency was charged with actively pursuing international harmonization of regulations for the products under their purview. The European Union has already passed a Directive to replace animal tests for safety assessments of cosmetics with non-animal alternative methods. In order to comply with the European Union when the full Directive is implemented, it is crucial that the OCC continue to move toward harmonization of United States regulations with Europe.

With members of industry backing changes in testing methods that can be more accurate, faster and ultimately less expensive, it is important to meet the current mandate to internationally harmonize regulations. The FDA must ensure all of industry and consumers benefit by consideration of these testing methods.

The FDA, in an era of budget cuts and shifting priorities, has striven to meet other mandates by absorbing a significant portion of the OCC's budget into other programs. However, by further cuts in a program already compromised by previous budget constraints the consumers may be negatively-impacted.

The Doris Day Animal League urges an additional appropriation of \$5 million for the OCC, as a stable level of funding for this existing program, to ensure uninterrupted cosmetics regulation. If the additional appropriation is not possible, we ask that Senate Agriculture Appropriations earmark \$5 million from the existing FDA budget.

Thank you for this opportunity for the Doris Day Animal League to express the concerns of our constituents. We appreciate your consideration of our request.

PREPARED STATEMENT OF WILLIAM K. CRISPIN, EXECUTIVE DIRECTOR, EVERGLADES RESTORATION OVERSIGHT GROUP

We should most deeply appreciate your thoughtful consideration of this testimony that we are submitting on behalf of the Everglades Restoration Oversight Group (EROG). I have attached a curriculum vitae and a statement of disclosure concerning federal grants.

EROG, and its organizations respectively, thank the Senate Appropriations Committee for its leadership in appropriating funds to enable the Agricultural Research Service, USDA, to establish one hydrologist at the Subtropical Horticulture Research Station in Miami, Florida. The ARS has recruited an excellent hydrologist, Dr. Reza Savabi, to establish this program. Dr. Savabi will focus on developing a farm-scale model of the movement of water under and over agricultural fields in relation to water levels in the canal system. These water levels are being raised as part of the effort to restore the functioning of natural ecosystems in the national parks and in coastal waters. There is great concern that ecosystem restoration must be carried out in a manner that maintains or enhances the existing water supply and flood control features of the Central and South Florida Project (C&SF).

It is very clear that the science base has not been established to adequately guide the restoration program. Thus we are alarmed that the US Army Corps of Engineers and the US Department of Interior have placed the South Florida Restoration effort on a very fast track.

In the southernmost part of the Florida peninsula, the restoration effort is being implemented through the C-111 Basin Project and the Modified Water Deliveries Project. There is great concern that these Projects will have a negative impact on agriculture and on rural communities. We believe that the long-term objectives of the Ecosystem Restoration thrust can be met only if: the water management scheme is placed on a solid scientific footing; and, sustainable agricultural practices are developed in a way that facilitates the economic viability of agriculture, as well as good land and water stewardship.

Unfortunately, the focus of hydrological study to date has been within the boundaries of Everglades National Park. The Park employs more than a dozen hydrologists for this work. By contrast, until the ARS recently stationed Dr. Savabi in south Miami, only very limited hydrological studies were conducted that pertain to the agricultural areas and rural communities. Nevertheless, the University of Florida established an Hydrological Task Force which issued a report in 1997 titled "Water Management Issues Affecting the C-111 Basin, Dade County, Florida". This report found that the documents produced by the US Army Corps of Engineers and the South Florida Water Management District concerning studies relevant to ecosystem restoration in south Florida to be "inconsistent, both internally and with other published reports". Moreover, the University found many deficiencies both in the models which serve as the basis for planning and in the operating guidelines of the canal system.

In addition, in 1996 the University of Florida developed a Comprehensive 5-Year Crop Research and Extension Plan of Work that addresses technologies, which need to be developed, to make agriculture more robust and economically sustainable, and to make agriculture a better partner in ecosystem restoration. The University of Florida is addressing these needs, but the University is not able to assign additional faculty to accelerate this vitally important effort. Therefore, the University's efforts need to be augmented by a strongly-focused effort by the Agricultural Research Service.

We recommend that the Congress provide the support needed by the ARS USDA to develop a strong Everglades Agro-Hydrology Research Laboratory in south Miami, Florida. This Laboratory would address needs from Lake Okeechobee to the Florida Keys. The Laboratory would establish a coordinated multidisciplinary team of scientists to conduct cooperative research on water management issues and on sustainable agricultural production systems for this region. At least three additional scientist positions must be added. The positions should be as follows:

(1) *Research Hydrologist*. This position has been established recently. It will integrate the science information bases in a systematic manner to produce hydrologic models for planning and practical water management.

(2) *Research Soil Physicist/Engineer* to produce the hydraulics science base that characterizes the physical systems of soil, surface and subsurface water flow and transport of agricultural chemicals, salts, etc.

(3) *Research Soil Chemist* to develop the agrochemical science base needed to enable growers to provide sufficient crop fertility while guarding against environmental risks.

(4) *Research Horticulturist* to provide leadership in developing Best Management practices and in creating improved production technologies.

We request that the Congress appropriate an additional \$900,000 per year to the Agricultural Research Service for a cooperative research program on agrohydrology and sustainable agriculture in south Florida.

PREPARED STATEMENT OF GARY JACKSON, DIRECTOR, AND RICHARD CASTELNUOVO,
ATTORNEY, NATIONAL FARM**A**SYST/HOME**A**SYST OFFICE

Thank you for the opportunity to submit a written statement to the Subcommittee on the issue of appropriations for agricultural research, education and economics. From our perspective as part of a national office coordinating a network of state Farm**A**Syst/Home**A**Syst programs, we are in a unique position to provide valuable information on the benefits of an action-oriented approach to education that results in voluntary actions that effectively respond to water quality concerns. At the outset, we would like to acknowledge the support of the National Association of State Universities and Land Grant Colleges and in particular the Cooperative Extension Services in Michigan, New Mexico, New York and Wisconsin.

Through increased support for programs such as Farm**A**Syst/Home**A**Syst, the federal government can effectively address important environmental concerns in ways acceptable to farmers, ranchers and other landowners. Few dispute the growing importance of these groups in tackling significant environmental issues such as non-point source pollution and safe drinking water. The disagreement comes when the discussion turns to issues of cost and approach. Too often government responds to the environmental problem of the moment by creating a new initiative. Rarely is this approach more cost-effective than making better use of programs that are proven performers. Nor does it necessarily result in programs that fit the needs of targeted audiences. In the case of Farm**A**Syst/Home**A**Syst, an incremental investment in this unique voluntary program would generate considerable benefits, building on a program awarded a 1997 USDA Group Honor Award for Excellence "for outstanding leadership in building cooperative, interagency partnerships that encourage farmers, ranchers, and home owners to take voluntary action to prevent or reduce environmental pollution."

Farm**A**Syst/Home**A**Syst is not another federally-directed program. It is locally-controlled by individual state teams who draw strength and focus from national coordination and unprecedented levels of cooperation among government agencies, universities and the private sector. This special arrangement is vital to building a broad-based commitment to voluntary action while providing familiar sources of support that enable individual landowners to improve management of their property. At the federal level, CSREES has joined NRCS and U.S. EPA to support a national office that provides assistance and guidance to a network of Farm**A**Syst programs in nearly every state (including Alaska, Arkansas, Iowa, Kentucky, Mississippi, Missouri, Montana, Pennsylvania, Vermont, Washington, West Virginia, and Wisconsin) and newly-developed Home**A**Syst programs in 30 states. National coordination enables these state programs to respond as a system to pollution concerns and provides structure to conduct program evaluations that demonstrate impacts. Nonetheless, this framework is sufficiently flexible to permit states to tailor Farm**A**Syst/Home**A**Syst programs so they effectively address local concerns.

State endorsements of Farm**A**Syst/Home**A**Syst reveal how states take advantage of this flexibility. Dr. Jimmy Bonner, Mississippi Extension Farm**A**Syst Program Coordinator, explains how the program creates opportunities to work with the private sector:

The Delta Council, an organization of Mississippi Delta farmers, was looking for a way that its members could show they were doing the right thing environmentally. In Farm**A**Syst, the group saw a program that suited its needs. The Council wants to adapt Farm**A**Syst to address specific environmental concerns in the heavily row-cropped Mississippi Delta. We are ready to help with modification to develop materials emphasizing soil and water conservation, pesticide management, wildlife management, solid waste management and other areas to complement the existing Farm**A**Syst model. If all goes as planned, farmers will start using the materials this year.

Meg Burgett, Alaska Cooperative Extension, knows firsthand the value and impact of the program:

We are working closely with the Alaska Department of Environmental Conservation (ADEC) to integrate this program with their statewide Wellhead Protection and Groundwater Protection Programs to achieve maximum use of the materials. Alaska has approximately 85,000 households that get their drinking water from privately owned water wells. In addition, there are approximately 1700 Class A and B community water systems, most of which have privately-owned land in close proximity. Although ADEC is charged with the protection of drinking water for Alaskans, their role is not to regulate these private holdings. Educational outreach to the private landowners is the most effective method of reducing the risk of pollution to our drinking water supplies. Use of the Home*A*Syst materials developed for Alaska will enable landowners to assess pollution problems and risks on their property and empower them to take voluntary actions to prevent pollution using the best available scientifically-based recommendations.

Bob Broz, Missouri State Coordinator observes, "Like a lot of states, Missouri can benefit from pollution prevention. Agriculture is often overlooked in this effort. Farm*A*Syst offers an action-oriented approach that farmers feel comfortable using to take voluntary action to prevent pollution on their property."

Karen M. Blyler, Coordinator for Washington Home*A*Syst (a comprehensive program that reaches farmers as well as homeowners), provides insights concerning the tremendous growth of the state program:

In a little over four years, Washington's highly successful Home*A*Syst program has been used in over 17 counties and in a wide array of educational projects. Initially proposed as a "Wellhead Assessment and Protection Pilot" for farmers, ranchers and rural residents, Home*A*Syst has evolved to meet other water quality needs, including source water protection and safeguarding private drinking wells. In many areas, Home*A*Syst has become the educational tool of choice because it is both voluntary and confidential.

KY*A*Syst State Coordinator, Roger Rhodes, points to the program's value in satisfying an "innovative piece of legislation" that requires all Kentucky agricultural landowners of 10 acres or more to complete a water quality plan that covers 59 best management practices: "KY*A*Syst is the most effective way to accurately assess farmstead pollution risks related to petroleum tanks, septic systems, and pesticide storage. It will result in more complete and thorough state water quality plans."

State Coordinator Les Lanyon believes that Pennsylvania Farm*A*Syst enables farmers to take a positive approach to protect shared resources through pollution prevention:

I tend to work with small dairy farmers (40-50 cow operations) who are under intense economic pressure. Farm*A*Syst is a voluntary program that can focus on the positive. It lets folks who are doing a good job know that they are on the right track. Also it reveals opportunities for improvement on individual farms.

These experiences have been replicated in state after state. To develop and deliver the program, each state has assembled teams that have successfully linked agency officials at different levels of government, agricultural and environmental regulators, and educators and technicians in cooperative enterprises to address common environmental concerns. In states such as Washington and Arkansas, for example, local staff from CSREES and NRCS are actively involved as agency partners, together with officials from U.S. EPA and Soil and Water Conservation Districts.

These partnerships improve the effectiveness of programs such as NRCS's Environmental Quality Incentives Program (EQIP) by providing action-oriented education. Funded by an educational grant under EQIP, a Wisconsin team of Extension agents and others plan to use Farm*A*Syst with small dairy farmers, contractors and milk machine installation technicians in Outagamie, Shawano and Waupaca Counties to improve milkhouse waste treatment systems. On the western edge of the state, in Buffalo and Grant Counties, interagency teams are using EQIP funds to deliver Farm*A*Syst in two watersheds to reduce soil erosion and other environmental problems related to agriculture. Through the EQIP program in Missouri, producers will be eligible to receive a \$100 payment for conducting Farm*A*Syst assessments and adopting management practices to reduce pollution risks.

Dr. Jimmy Bonner provides this example of partnerships from Mississippi:

A Farm*A*Syst pilot project involving dairy farmers in Mississippi's Tangipahoa Watershed developed into a two-state, multi-agency initiative,

including NRCS, RC& D, Farm Services Agency, Mississippi Soil and Water Conservation Commission, Mississippi State Health Department and the Mississippi Department of Environmental Quality, as well as Louisiana agencies. With a strong partnership between agriculture, the environment and local producers, there were many opportunities to help producers test their drinking water, install and renovate animal waste lagoons and improve animal waste management practices. In addition, a special waste pesticides collection was held in the watershed resulting in the proper disposal of more than 6,000 pounds of waste pesticides. This special effort was part of a larger state-wide collection of over 600,000 pounds of waste from 1994–1997.

Ties to the private sector have strengthened state teams. Tyson Foods has turned to Farm*A*Syst to improve management of its animal production operations in Arkansas. According to John Gunsaulis, Nutrient and Land Manager for Tyson Foods, "Farm*A*Syst is a tool that allows farmers to identify any potential area of environmental concern and plan actions that need to be taken." In eight out of the 29 states where Farm*A*Syst/Home*A*Syst is in the advanced stages of development, state Farm Bureaus are actively involved. WaterSafe (West Virginia's version of Farm*A*Syst) is extending its outreach capacity by using an 800 number provided by the state Farm Bureau. The Iowa State Farm Bureau is assuming a leadership role in launching a major initiative to refine Farm*A*Syst materials for Iowa and deliver the program in a priority watershed. Missouri has pioneered a successful training effort that introduces real estate brokers to Farm*A*Syst and Home*A*Syst and has started sharing this model with other states such as Washington. Through mini-grants, Montana will enable about 10 counties to explore "something different" in their delivery of Home*A*Syst, according to state coordinator Mike Vogel. This will create new opportunities to work with insurance agents, home inspectors, local health departments, bankers, home builder associations and Welcome Wagon in their efforts to deliver the program.

Farm Cooperatives were a vital link in a Wisconsin project working with petroleum marketers to reach new audiences with Farm*A*Syst and other pollution prevention materials relating to petroleum storage. "The materials were professionally done; very well put together," according to Dean Hanley, energy department manager, Danco Prairie FS Co-op. In the words of Tom Van Arsdall, Vice President of Environment, National Council of Farmer Cooperatives:

[N]ow farmers are turning increasingly to cooperatives for assistance in the face of growing environmental pressures. That's why we are excited about the Farm*A*Syst program. It provides an opportunity for the agricultural community to pull together and help farmers pursue voluntary, cost-effective solutions when responding to environmental challenges.

States are applying Farm*A*Syst/Home*A*Syst to tackle their toughest environmental problems through voluntary action. Since every state needs help protecting private drinking water wells, Farm*A*Syst/Home*A*Syst stands out as the only national program that provides information and technical assistance that can help 23 million private well owners protect the quality of their drinking water. In Sevier County, Arkansas, Farm*A*Syst assessments were the first step in detecting and closing abandoned wells, a major pathway for pollution that threatens drinking water. County officials mobilized highway crews to close nearly 70 wells, saving an estimated \$250 per closed well. In Whatcom County, Washington, Extension teamed with the state department of health and local agencies to train operators of small water supply systems in the delivery of the program. By working with private landowners to assess pollution risks, these operators were able to minimize contamination threats to recharge zones for public drinking water wells, while helping rural landowners protect their private wells.

State programs have the potential to involve and motivate a wide range of audiences. In addition to state-specific materials developed for farmers and ranchers, they have access to specialized education tools to reach under-served groups with practical information about pollution prevention. They can build on successful pilot projects that tested simplified assessment materials with Native Americans in Washington and Wisconsin, Spanish-language materials with landowners in two states and newly-developed Home*A*Syst materials with non-farm homeowners in Alaska, Montana, Washington and other states.

Increased funding can substantially improve state and local capacity to provide pollution prevention assistance to individual landowners, as the performance of Michigan Farm*A*Syst/Home*A*Syst shows. With a boost in funding, this state program was able to conduct more than 6,500 Farm*A*Syst assessments; more than

150 Field*A*Syst assessments; and more than 12,500 Home*A*Syst assessments. Reaching more people is important but changing behavior is the test of effectiveness.

Farm*A*Syst/Home*A*Syst results in voluntary actions to prevent pollution. Clearly, a key element in this process is landowners' acceptance and use of the program, as information provided by Karen Blyler illustrates. But this alone cannot explain improvements in management. Changes result from a system of education, self-assessment and action planning in which landowners are active partners in making improvements. Easy-to-use worksheets provide a simple and inexpensive way for individual landowners to evaluate pollution risks on their property and serve as the essential first step in formulating plans to prevent pollution. Farm*A*Syst worksheets initially covered farmstead pollution risks, such as well condition, petroleum tanks, chemical storage and animal waste, but have been expanded to include field activities such as nutrient and pest management. These materials are effective and useful because they organize complex regulatory requirements, technical information and recommended management practices into a system that non-experts can apply to their property to prevent pollution.

Using the process of self-assessment, landowners learn firsthand the consequences of pollution to their home. They are motivated to improve management to safeguard the health of their land and families, avoid environmental liability and cleanups and satisfy the concerns of lenders and property buyers. Based on state surveys, it is estimated that two of every three participants make or intend to make low-cost changes immediately, with higher-cost actions planned for the future.

According to a detailed benefit-cost study of 134 Louisiana farmers, Farm*A*Syst/Home*A*Syst is an extremely cost-effective program with long-reaching economic and non-economic (educational) benefits. Drawing on the results of this two-year study, Farm*A*Syst produces benefits-over-costs ranging from at least \$2.4 million to more than \$15 million. This range is calculated using three methodological approaches (averting expenditures, avoided costs, contingent valuation) and is based on an estimated 10-year implementation period.

Nearly one in three Louisiana participating farmers had made—or planned to make—66 individual changes in their farming practices “due to information provided by the Farm*A*Syst materials,” changes that should prevent pollution to groundwater. These farmers voluntarily invested a total of \$91,437 (approximately \$682 per farmer) to make these changes. While these actions included low or no-cost changes in management, 18 percent of the changes involved construction costs over \$500, 12 percent involved the plugging of old wells and the drilling of new wells and 12 percent involved the removal or replacement of underground petroleum storage tanks. Since petroleum storage and well water contamination were two of the most frequently reported high risks on Louisiana farms, these changes will have direct and significant impact in preventing pollution. In addition, the study revealed multiple non-economic benefits including positive changes in knowledge, attitude, perception and awareness of the pollution risks associated with farming practices.

Results from less comprehensive studies in Alabama, Arkansas, Kentucky, Maine, Missouri and Washington state confirm the findings in Louisiana. In an Arkansas “Emphasis” project involving four counties (Sevier, Benton, Howard and Washington), 85 percent of the 330 participants responded to a follow-up survey by saying they had taken more than 190 voluntary actions. In Washington, 500 evaluations revealed that participation helped 75 percent of the respondents identify a high-risk activity or practice and motivated over 75 percent to make at least one change in 1–3 years to reduce pollution risks. In addition, these surveys consistently reveal user satisfaction with Farm*A*Syst. Users overwhelmingly report that the program is useful, informative, and easy to understand.

From these specific study results, it is not difficult to draw important conclusions about the nationwide impact of the program. There are many states that should have greater benefits than Louisiana since more people have participated in the program. As previously noted, Michigan alone has reached 19,000 landowners. Using conservative estimates, it is safe to assume that 80,000 assessments have been conducted nationwide. Based on the findings in the Louisiana study, it is estimated that Farm*A*Syst/Home*A*Syst activities have generated more than \$50 million in pollution prevention investments.

The value of Farm*A*Syst/Home*A*Syst cannot be measured simply in end results. The program demonstrates how Land Grant Colleges and CSREES can play leading roles in pollution prevention for farmers, ranchers and homeowners. In the tradition of Extension programs with strong links to research, Farm*A*Syst/Home*A*Syst can stimulate relevant inter-disciplinary research related to pollution prevention and organize research findings into educational programming that directly benefits landowners. During July 1997 hearings of the House Subcommittee

on Forestry, Resource Conservation, and Research, Dr. Bob Robinson, CSREES Administrator, singled out Farm*A*Syst/Home*A*Syst as one of two efforts that bridged the gap between research and applied programs, "Another notable example of a decision aid to help farmers is Farm*A*Syst, which is used to assess farms and farmsteads for potential pollution problems." This is a model for environmental programming that enables landowners to take voluntary action based on research-based recommendations. For farmers and ranchers, it offers an acceptable approach to responsibly manage their land without losing their competitive edge in the marketplace. For non-farmers, it offers a way to make significant contributions to protecting drinking water and preventing non-point source pollution.

DISCLOSURE OF FEDERAL FUNDING FOR NATIONAL FARM*A*SYST/HOME*A*SYST OFFICE (FISCAL YEARS 1998 AND 1997)

Fiscal year 1998	Funds received	Other	Forthcoming
USDA/CSREES	\$209,017
U.S. EPA	25,000	\$100,000
USDA/NRCS	80,000	\$84,450
Total	498,467

Fiscal year 1997	Funds received	Other
USDA/CSREES	\$197,977
U.S. EPA	50,000
U.S. EPA Pesticide Environmental Stewardship Program	29,910
USDA/NRCS	80,000	\$84,450
Total	442,337

PREPARED STATEMENT OF RALPH G. YOUNT, PH.D., PRESIDENT, FEDERATION OF AMERICAN SOCIETIES FOR EXPERIMENTAL BIOLOGY (FASEB)

I am Ralph Yount, professor of biochemistry at Washington State University. I am a basic scientist who works on the mechanism of muscle contraction. I serve this year as the President of the Federation of American Societies for Experimental Biology, usually referred to as FASEB. Founded in 1912, FASEB is the largest organization of life scientists in the United States with a combined membership of more than 52,000 researchers. Our members include scientists involved in human as well as animal nutrition research. These scientists hold positions in virtually every public and private institution engaged in nutrition-related research in the United States, as well as in industrial and biotechnology enterprises conducting nutrition and food related research.

FASEB believes, as we believe this committee does, that research sponsored by the Department of Agriculture conducted at universities throughout the United States generates new knowledge that ensures an affordable, abundant and wholesome supply of food and fiber, and promotes the competitive position of U.S. agriculture in the global marketplace. The growth of our global population and the threat of food-borne pathogens require improvements in agriculture and food safety, as well as advances in nutrition and reduction of environmental pollution.

As the leading agency in support of research on human nutrition and food safety, plant pathogenesis and control, and on plant genomic projects benefiting mankind, the USDA is the primary support of basic and applied research through its Research, Education, Extension budget. This budget supports the Cooperative State Research, Education, and Extension Service (CSREES) whose mission is to advance research, extension, and higher education in food and agricultural sciences and in related fields.

The National Research Initiative Competitive Grants Program, a CSREES program, funds competitive extramural research projects at public and private universities and colleges. Research proposals are merit-reviewed by panels of experts, and those attaining the best scores are funded. The NRICGP is the largest national competitive research grant program in the USDA.

FASEB's recommendations for the USDA focus principally on the NRICGP. Some examples of the program's recent accomplishments are:

- Calcium homeostasis and bone turnover in adult women.*—Studies show that healthy adult women consuming either low- or high-protein diets exhibited calcium and bone metabolism abnormalities, not observed in those on a medium-protein diet. Impaired intestinal calcium absorption combined with reduced bone turnover may result in diminished calcium incorporated into bone. These abnormalities could lead to decreased bone mass and/or increased risk of fracture. The studies suggest that in evaluating the recommended daily allowances (RDA's) for protein, the impact on calcium homeostasis and bone turnover be considered.
- Enterohemorrhagic Escherichia coli (E. coli).*—Strains of *E. coli* are associated with disease in humans and animals. *E. coli* O157:H7 is the predominant strain associated with food-borne human infection and death. Most infectious outbreaks of this form of *E. coli* have been associated with eating beef products; studies have shown that diets fed to cattle and sheep influence the shedding of *E. coli* O157:H7 from the gastrointestinal tract. Further research demonstrates that *E. coli* O157:H7 can survive in fecal matter in the environment for up to a year. Outbreaks of this strain have also been associated with drinking contaminated apple cider, and studies are underway to develop processes to eliminate it from cider without compromising the flavor.
- Anti-shattering gene in grain.*—Scientists have identified a gene that eliminates "shattering," or seed loss, of mature grain crops. Cloning this gene will contribute directly to long-range improvement in U.S. agriculture by reducing seed losses during grain harvests. It will also help to accelerate commercialization of new crops, providing a wider range of options to agricultural producers by reducing both genetic and environmental vulnerability of the U.S. food production system.

These are but three samples of agricultural research that mark the high quality productivity and achievement found in the competitive and merit-reviewed research programs of the NRICGP. As you can see, these research projects affect our basic health, our food supply and our reliance on the safety of the food supply. Many other significant achievements of NRICGP are not widely known to, or appreciated by, the public that finances them. It is important that the USDA continue to expand its efforts in publicizing research accomplishments and to remind investigators to acknowledge USDA support when reporting their findings to Congress and the public.

RECOMMENDATIONS

NRICGP.—The NRICGP's competitive and highly productive merit-reviewed research program is vital to the future of U.S. agriculture. Unfortunately, only 24 percent of applications submitted under this program can currently be funded. It is in my role as President of FASEB that I write in support of an increase in funding for USDA's National Research Initiative Competitive Grants Program from \$97 million to \$130 million. This is the same level requested in the President's budget.

National Needs Initiatives (NNI).—The NNI, the Graduate Fellowship Program of the Higher Education Office, and other USDA programs contribute to the USDA's training mission. The NNI is crucial for the recruitment, preparation, and training of the next generation of scientists. Therefore, FASEB specifically recommends that NNI funding be increased to \$4 million in fiscal year 1999. FASEB also believes that an external review of the NNI would provide useful program guidance and ensure effective use of the funds in providing graduate training.

Expanding USDA Office of Competitive Grants.—FASEB endorses efforts to expand the use of outside review to improve the research programs at USDA, and further recommends that new funding initiatives be administered by the USDA Competitive Grants and Awards Management Unit of CSREES. This would establish a solid, consistent merit-review process for these programs.

Animal Welfare Act.—Reasonable safeguards on the sale of animals protect the public and allow the legitimate use of animals in research. USDA's Animal and Plant Health Inspection Service (APHIS) is charged by Congress with enforcement of the Animal Welfare Act (AWA). We recommend that Congress provide the APHIS with adequate funding for enforcement of the Animal Welfare Act in fiscal year 1999 so that it can continue to ensure compliance with the AWA.

Mr. Chairman, these are FASEB's recommendations as you and the Committee begin the task of deciding how best to allocate funding for the Department of Agriculture, including the research programs of the NRICGP. We have also made other policy recommendations in our formal report of the Funding Consensus Conference

for fiscal year 1999, distributed earlier to members of this subcommittee, which we hope you will review carefully.

In conclusion Mr. Chairman, we believe this is an opportunity to expand our country's historic effort to improve America's health through nutrition using all the tools of research scientists. Agricultural research is the key to the improvements in agriculture required to feed the world, reduce environmental pollution, increase food safety and improve nutrition.

PREPARED STATEMENT OF THE CITY OF GAINESVILLE, FL

SWEETWATER BRANCH/PAYNES PRAIRIE STORMWATER PROJECT

On behalf of the City of Gainesville, Florida I appreciate the opportunity to present this written testimony to you today. The City of Gainesville is seeking federal funds in the fiscal year 1999 Agriculture Appropriations bill, in order to assist our efforts to protect the Floridian aquifer from stormwater runoff. In particular, we are hopeful that the Subcommittee will provide the City with \$2 million through the Fund for Rural America.

In Gainesville, the Sweetwater Branch basin contains approximately 1,710 acres and is located in the southeast central portion of the City. The outfall from this basin discharges into Paynes Prairie, a state owned preserve and park system, which eventually flows into the Alachua Sink, a natural sink hole that drains directly into the Floridian Aquifer. This Aquifer provides the majority of drinking water to Florida's residents and has a direct impact on Florida Everglades.

The Sweetwater Branch drainage basin contains urban, commercial, industrial, and residential area stormwater runoff. Because the branch runs through some of the oldest portions of Gainesville, most stormwater runoff is directly discharged into the Branch with very little flooding attenuation or pollution loading reduction. The runoff has the potential to affect threatened and endangered wildlife such as the Bald Eagle, the Woodstork, the Florida Sandhill Crane, and the Southeastern American Kestrel. In addition, many domestic water wells are used to obtain water from surficial and intermediate aquifers in the area. In summary, the situation has created a concern amongst environmentalists, business leaders, and concerned citizens throughout the region that Paynes Prairie and Floridian aquifer are being compromised.

With this in mind, the City of Gainesville, Alachua County, St. Johns River Water Management District, Florida Department of Environmental Protection and local citizens are all seeking a comprehensive ecosystem management solution to the problem of stormwater runoff from downtown entering Sweetwater Branch, Paynes Prairie, and the Alachua Sink. The project devised by these groups would reduce or eliminate the sediment, debris, nutrients and general pollutants currently being discharged. Current projections are that the project would consist of the following three components:

- the purchase of undeveloped property in the vicinity of State Road 331 and Sweetwater Branch;
- the construction of maintainable sediment and debris removal systems; and
- the construction of maintainable nutrient removal systems.

An in-depth engineering analysis of the creek system, property topography, associated wetlands, and other pertinent factors is needed to determine the optimum and appropriate scope of property purchase and facilities construction. The City is prepared to pay some of the cost for this analysis, but we are simply unable to bear the entire burden. As a result, we request that the Subcommittee appropriate \$2 million to assist their efforts. Once the project construction is complete, Gainesville Stormwater Management Utility, a public utility, would provide the required annual maintenance for the facility and no federal maintenance funds would be needed.

This is a critical and much needed project for the City of Gainesville, as well as the entire State of Florida, and we respectfully ask the Subcommittee for its consideration of the Sweetwater Branch/Paynes Prairie Stormwater Project.

PREPARED STATEMENT OF JOHN DEMOTT, PRESIDENT, DADE CHAPTER, FLORIDA NURSERYMEN AND GROWERS ASSOCIATION

We should most deeply appreciate your thoughtful consideration of this testimony which we are submitting on behalf of the Tropical Fruit Growers of South Florida, Inc. and the Miami-Dade County Chapter of the Florida Nurserymen & Growers Association, Inc. Each of us has attached a curriculum vitae and a statement of disclosure concerning federal grants.

We request that the House Committee on Appropriations effectively address two very important issues, namely (1) to re-establish a program to introduce tropical plant material, to improve this germplasm and to disseminate it throughout the United States as appropriate, and (2) establish a R&D program to combat harmful exotic organisms (initially focusing on Diaprepes) that threaten both agriculture and natural ecosystems in south Florida.

RE-ESTABLISH PROGRAM TO INTRODUCE, IMPROVE AND DISSEMINATE TROPICAL PLANT MATERIALS

The introduction of tropical plant material began with the establishment of the Spanish and English colonies on this continent. In 1790 Thomas Jefferson wrote: "The greatest service that can be rendered to any country is to add a useful plant to its culture". In order to provide effective institutional leadership for this vital activity the Congress assigned responsibility for it to the U.S. Department of Agriculture through the Organic Act of 1862 that created the Department. In order to implement this mandate on the mainland the USDA established a number of plant introduction stations. However only one of these plant introduction stations is essentially frost-free and suitable for conducting the needed R&D on tropical plants, i.e. the Subtropical Horticulture Research Station, Miami, Florida.

We are very grateful that the Congress prevented the Agricultural Research Service from closing the Subtropical Horticulture Research Station. Unfortunately the ARS no longer employs any of the horticulturists who previously had introduced tropical plant material from abroad, and improved and disseminated it. The corresponding resources were redirected by ARS during the attempted close-out process to other programs. Thus there is a need for an annually recurring appropriation of \$900,000 to assemble a team of three scientists plus technicians, field laborers, etc. needed to re-establish the program of introducing, improving and disseminating ornamental, tropical fruit and vegetable materials.

The production of horticultural crops in the southern United States is under severe pressure from NAFTA. Additional developments are in the offing that will increase such pressures including the development of additional free-trade agreements with Latin America and other tropical and subtropical countries and the inevitable democratization of Cuba. Thus American producers can remain competitive only if they employ superior technology including better quality and higher yielding varieties of tropical fruit, vegetable and ornamental crops.

The proposed budget increase request would restore three scientist years of horticultural research effort. This effort would be focused on the introduction of frost-sensitive plant material, its improvement and its dissemination to other US scientists and industry associations. This along with the plant molecular geneticist would provide a core of four scientist years of effort devoted to the development of sorely needed improved tropical fruit, vegetable and ornamental crops. At \$300,000 per scientist year of effort, the total annually recurring request is \$900,000.

The Positions would be as follows:

1. Field Research Leader (Research Horticulturist), one full time technician (BS or MS), two field hands and one secretary. The Research Leader would plan and carry out plant explorations and exchanges, establish plantings, make appropriate crosses and selections, and oversee the work of the entire Unit.

2. Research Horticulturist/Outreach Specialist, one full time technician (BS or MS) and 2 field hands. This specialist would undertake crop improvement research, develop methods of culturing new plants, organize and conduct field days and other educational events, propagate and disseminate improved plant materials to research institutions and to industry associations.

3. Research Horticulturist/Curator of Living Collections, one full time technician (BS or MS) and two field hands and one clerk typist. This horticulturist would be responsible for assembling core collections of living plants, developing methods of cryopreservation and other methods of storage of living materials, development of traditional and in vitro methods of propagation, and the preparation and maintenance of herbarium specimens of significant plant materials. Also this individual would work cooperatively with the Research Geneticist to "finger-print" plant materials, and to develop pathogen-free materials for dissemination.

We request that the Congress appropriate \$900,000 recurring annually to the Agricultural Research Service to re-establish the above program on tropical plant material.

ESTABLISH A R&D PROGRAM TO COMBAT HARMFUL EXOTIC ORGANISMS THAT THREATEN BOTH AGRICULTURE AND NATURAL ECOSYSTEMS IN SOUTH FLORIDA WITH INITIAL EMPHASIS ON DIAPREPES

With the great increase in travel, trade and influx of refugees into south Florida in the last three decades the frequency of introduction of harmful exotic organisms has increased to an alarming level. This is of great national concern because many of these pests, diseases, weeds, snails, fish, etc. threaten the fundamental character of National Parks and Preserves, spread to other parts of the United States and impose an enormous burden on agricultural production and marketing in the affected States.

In recent years south Florida served as the gateway to the entry of the devastating whitefly (*Bemisia argentifolli*), the insidious melon thrips, Thrips palm), sixteen whitefly-transmitted gemini viruses, which cause Bean Golden Mosaic disease, the most recent being the tomato yellow leaf curl virus. The latter appeared in Homestead in July 1997, has spread to the major tomato growing areas, and is causing severe losses. Also several scale insects and mealybugs have arrived recently, and they are extremely damaging to the nursery trade and to homeowners.

In past decades a number of very harmful organisms penetrated our quarantines. One of these is the West Indian Sugarcane Rootstock Borer Weevil, *Diaprepes abbreviatus*. This insect, a native of the Caribbean and Latin America, has been found in central Florida for several decades. Losses in citrus production by this exotic pest are estimated at cat \$72 million per year. In 1996 this pest was found in Miami-Dade County, and it is causing damage to fruit, vegetable and ornamentals crops which already exceed \$1 million per year.

Not surprisingly conditions for the pest are considerably more favorable in southern Florida than in Central Florida. In south Florida the subtropical climate allows this pest to reproduce and develop year round, and its native host plants occur in abundance.

Florida Division of Plant Industry and University of Florida scientists have collated the pests host records. These show that *Diaprepes* attacks 270 species of plants belonging to 157 genera in 59 plant families. Plants that have been shown to support the entire life cycle from egg through adult to egg include Citrus sp., peanut, sorghum, guinea corn, corn, Surinam cherry, dragon tree, sweet potato and sugarcane. Larvae have been shown to feed on 40 plant species in 20 plant families. Host plant associations of concern to Miami-Dade County residents include mango, Brazilian pepper, Dahoon holly, Chinese holly, Burford holly, Scheffiera, silver trumpet tree (*Tabebuia aurea*), Geiger tree, gumbo limbo, black olive, silver buttonwood, black sapote, persimmon, live oak, avocado, acacia, orchid tree, Royal poinciana, Lima bean, bush beans, tamarind, *Dracaena rainbow*, day-lily crepe-myrtle, cotton, okra, neem, mahogany, banana, Simpson's stopper, guava, Areca palm, Phoenix palms, passion fruit, mangrove, loquat, citrus, carrotwood, longan, caimito, sapodilla, tobacco, eggplant, potato and *lignum-vitae*.

Host suitability seems to vary with locality. In Miami-Dade County carrotwood appears to be a preferred host, but near Vero Beach carrotwood tends to escape infestation. In Puerto Rico *Diaprepes* attacks sweetpotato but ignores it in Florida.

As you know, for about 20 years the Congress has appropriated about \$400,000 per year to the Agricultural Research Service. These funds support research in central Florida that is conducted by the Agricultural Research Service and by the University of Florida.

However no funds are ever provided by ARS for research on this problem in south Florida. The Miami-Dade Chapter of the Florida Nursery and Growers Association has been providing \$20,000 per year to the University of Florida to conduct research on this problem as it affects the ornamentals industry in Miami-Dade County. However this level of funding is not sufficient to mount an effort that is in any way commensurate to the magnitude and urgency of the need. As you may know, only limited amounts of the technologies developed against this pest in central Florida have proven to be suitable for use in southern Florida.

We request that the Congress appropriate \$300,000 per year to the Agricultural Research Service for a cooperative research program on *Diaprepes* in south Florida. Only after satisfactory means are available to cope with this pest should any of the funds be diverted to research and development on other pest problems affecting southern Florida.

PREPARED STATEMENT OF DR. RAYMOND E. BYE, JR., ASSOCIATE VICE PRESIDENT
FOR RESEARCH, FLORIDA STATE UNIVERSITY

Thank you, Mr. Chairman, and the Members of the Subcommittee, for this opportunity to submit testimony. I would like to take a moment to acquaint you with Florida State University. Located in the state capital of Tallahassee, we have been a university since 1947; prior to that, we had a long and proud history as a seminary, a college, and a women's college. While widely known for our athletics teams, we have a rapidly emerging reputation as one of the Nation's top public universities. Having been designated as a Carnegie Research I University several years ago, Florida State University currently exceeds \$100 million per year in research expenditures. With no agricultural or medical school, few institutions can boast of that kind of success. We are strong in both the sciences and the arts. We have high quality students; we rank in the top 25 among U.S. colleges and universities in attracting National Merit Scholars. Our scientists and engineers do excellent research, and they work closely with industry to commercialize those results. Florida State ranks seventh this year among all U.S. universities in royalties collected from its patents and licenses. In short, Florida State University is an exciting and rapidly changing institution.

The Florida State University appreciates the support this Committee has provided for agricultural research in the past, and asks for your support for the President's budget proposals to increase funding for research, particularly for basic research performed at universities. A strong national research enterprise requires a balanced portfolio across the many scientific and engineering disciplines. We have seen, time and again, how research developments in one field can revolutionize work in others. Breakthroughs in biotechnology can lead to new and improved crops and higher crop yields. There are many examples of research investments paying very practical dividends to all of our citizens.

Mr. Chairman, let me describe an important project that we are continuing this year involving agriculture and new ways to look at climate prediction. It is a major collaborative program, which focuses on climate variability in the State of Florida and the Southeast (SE) United States. Objectives include developing new applications and usage for climate data. The consortium draws upon the expertise of scientists at FSU (climate analyses and coupled ocean-atmosphere prediction models), the University of Miami (climate analyses and economic value of forecasts), and the University of Florida (agriculture) to quantify climate variability (e.g., the El Niño phenomena) for the SE and to explore the potential value and practical application of climate forecasts in agricultural decisions. Based upon these analyses, farmers will be able to make better-informed planting decisions well in advance of each season.

During the initial phase of this effort, the FSU team described qualitatively the impact of El Niño (and the other extreme, La Niña) on temperature and precipitation patterns across the SE. Additionally, they found a geographic shift in tornadic activity associated with El Niño events. A new climate forecast system was created to provide predictions of seasonal temperatures and precipitation with longer lead times and improved skill in the testing phase. Improvements are due partly to the linking of ocean and atmosphere data in the forecast system. Our colleagues at the University of Florida have identified several crops in Florida which are vulnerable to shifts in weather patterns associated with El Niño and La Niña. Such information will be economically valuable in farming decisions.

Continuing this collaborative work, we hope to estimate the economic advantages that can be achieved by incorporating climate forecast information into farming management systems and eventually work with sector representatives in developing guidance products for the agricultural community.

We are seeking funding for this effort through USDA's Fund for Rural America. To make truly worthwhile breakthroughs in improving efficiencies and allowing for better and more economical decisions, farmers must have the best thinking and access to the newest approaches available. This utilization of climate data for agricultural purposes should be an example of supporting the best ideas through the Fund for Rural America. Our request of \$600,000 for two years will pay substantial returns to the American farmer and to the public. Thank you for your support.

PREPARED STATEMENT OF THE FRIENDS OF AGRICULTURAL RESEARCH—BELTSVILLE,
INC.

Mr. Chairman, and Members of the Subcommittee, thank you for the opportunity to present this statement in support of funding for agricultural research. We are re-

questing your support for programs of the Agricultural Research Service (ARS) and its world renowned Beltsville Agricultural Research Center (BARC) in Maryland.

The Friends of Agricultural Research—Beltsville (FAR-B) is a private non-profit corporation dedicated to supporting and promoting agricultural research, especially the ARS research programs at Beltsville. FAR-B provides supplementary private funds for both research and education programs. The Friends co-sponsor symposia and conferences on topics of current scientific interest. Funds are provided to co-host important international scientists who visit Beltsville each year in order to discuss cooperative programs and exchange scientific information. This public/private partnership promotes excellence, helps to ensure that useful new BARC technology is put into practice, and is supportive of the mission of the Agency.

The agricultural enterprise with asset of over \$900 billion is one of the major sectors of the U.S. economy. Employment in the food and fiber sector generates 23 million jobs, representing about 18 percent of the civilian jobs in the U.S. economy. The demand for food and fiber products annually generates almost \$1 trillion in Gross Domestic Product, about 16 percent of the Nation's GDP. U.S. exports of agricultural products rose to \$60 billion in 1996. Of the 11 major U.S. industrial sectors, agriculture generated the largest trade surplus of \$27.5 billion in 1996.

The outstanding performance of the agricultural industry and the unprecedented gains in agricultural productivity over this century can be attributed in large measure to the dynamic research and development system in this Nation. Agricultural scientists and engineers have contributed a continuing stream of new knowledge, technological innovations, and new products to undergird the U.S. agricultural enterprise. Public investments in agricultural research have been critical to these gains. Economic studies show that such investments yield substantial returns on the order of 30 to 40 percent. These are sound investments. Future support for agricultural research will be critical to the economic prosperity of our Nation and the well-being of society.

The Agricultural Research Service is the principal inhouse research agency of the U.S. Department of Agriculture. It has a lead role in solving high-priority problems of broad national significance. The Beltsville Agricultural Research Center is one of the major research facilities within ARS; it is among the largest and most diversified agricultural research complexes in the world.

BELTSVILLE

The Beltsville Agricultural Research Center was established in Maryland in 1910. It has a long and distinguished history of outstanding contributions to scientific discovery. Although it is most popularly known for developing the Small White Beltsville turkey which graces consumers' tables each Thanksgiving, BARC's contributions are much more extensive and profound. Beltsville scientists identified and supplied plant breeding centers around the world with disease-resistant wheat that ultimately led to the Green Revolution. Genetic concepts that became the foundation for modern plant and animal breeding were developed at BARC. Beltsville discovered the photoreceptor that regulates the growth and development of plants. A BARC scientist discovered an entirely new class of viruslike pathogens—viroids—which opened new avenues to understanding and controlling diseases of plants, animals, and humans. The first naturally occurring beneficial fungus approved by the Environmental Protection Agency for the biocontrol of plant diseases was developed at Beltsville. Chemists and entomologists have pioneered the discovery and synthesis of a number of attractants (pheromones) essential for trapping and surveying insect populations for integrated pest management programs. Human nutrition scientists at Beltsville demonstrated that decreasing animal fat and increasing the proportion of fat from vegetable sources significantly reduces blood pressure, thus reducing the risk of cardiovascular disease.

Beltsville is a comprehensive research center with a wide variety of disciplines addressing diverse programs of great breadth and scope. The ARS staff at Beltsville totals about 1,500, including over 300 scientists. Programs are designed to systematically address the highest priority concerns of the Department, including food safety and human nutrition, natural resources and environmental quality, emerging diseases and exotic pests, genetic resources, climate change, integrated pest management, and sustainable farming systems. Research ranges from very basic experiments in plant and animal molecular genetics, physiology and chemistry to applied research in new instrumentation, germplasm databases and integrated systems.

The Beltsville complex is the repository for a number of unique national scientific assets. Among these are important research collections: the National Fungus Collection, the National Parasite Collection, the USDA Nematode Collection, and other outstanding collections of insects, seeds, nitrogen-fixing bacteria, and plants. These

collections are essential in identifying and assigning names to specimens and organisms, a crucial first step to reliable research and to effective control measures, especially for alien pests. The Beltsville Human Nutrition Center is home to the National Nutrient Data Bank, i.e., the database of the nutrient content of foods which is the foundation for food consumption tables throughout the world. The Center also has a staff responsible for the National Food Consumption Survey and the Continuing Survey of Food Intakes by Individuals, unique in understanding long-term dietary trends in the U.S. population. The world renowned National Agricultural Library is also located on the grounds of BARC.

MODERNIZATION OF FACILITIES

A General Accounting Office Report a few years ago found widespread problems with aging Federal research facilities around the country. The findings indicated that a massive overhaul of these facilities, especially those built over 50 years ago, was needed.

Modernization of the facilities at Beltsville began in 1988. A systematic plan was developed to guide the modernization. USDA, the Office of Management and Budget, this Committee, and the Congress have been generous in providing annual support to upgrade and modernize BARC. House of Representatives Report No. 99-211 included the following language: "The Committee will expect to be kept fully advised as the Department works to restore and upgrade the Beltsville Agricultural Research Center." (p. 31)

Significant progress has been made in improving the facilities at Beltsville. Six major buildings have been modernized; a greenhouse complex has been renovated; a new dairy facility and composting research facility have been completed; and a new waste water treatment plant is now in operation. The infrastructure, including water lines and electrical service have been significantly upgraded.

The highest priority at Beltsville is funding to upgrade the facilities for the Beltsville Human Nutrition Research Center (BHNRC). Human nutrition research is a high priority within ARS and the Department. The link between diet and health is intriguing. Important breakthroughs have been made during this century. Many debilitating diseases such as pellagra, pernicious anemia, rickets, and scurvy have been eliminated as a result of research in human nutrition. The focus now has shifted from prevention of nutrient deficiencies to health maintenance and reduced risks of chronic illnesses, such as coronary heart disease, cancer, and diabetes.

The Beltsville Human Nutrition Research Center is the first of six such centers established in ARS. BHNRC programs focus on nutrient composition, nutritional quality, nutritional requirements, nutrient interactions, energy metabolism, and dietary strategies to delay the onset of nutrition-related chronic diseases. The National Food Consumption Survey also is an essential part of this program. For over 30 years, BHNRC scientists have had an uninterrupted input into the establishment of the Federal government's Recommended Daily Allowance (RDA) for dietary intake by the U.S. population. The broad indepth scientific knowledge base at Beltsville plays a vital role in the creation of these highly regarded guidelines for enhanced public health. The Beltsville staff has close associations with the National Institutes of Health, especially the National Heart, Lung, and Blood Institute, and the National Cancer Institute.

The ARS budget proposes a number of thrusts that would complement the BHNRC projects. Among these are proposals to upgrade the National Nutrient Data Bank that is so important to understanding the food choices necessary for a healthy diet. Also, support for research on nutrient-gene interactions, with special emphasis on the role of phytonutrients, is proposed.

The human nutrition research facilities at Beltsville are among the oldest in the Department and are, thus, in the greatest need of overhaul. This Committee provided funding for the planning and design of new BHNRC facilities. The design is underway; funding is needed to complete construction in a timely manner. Costs for the new facility in fiscal year 1999 are estimated at \$17 million for construction.

The proposed budget includes funding in the amount of \$2.5 million, primarily for a new poultry production facility. The purpose of this facility is to brood and grow turkey toms and hens, and provide breeder space for different strains of turkeys with a view toward healthier and more efficient production of a commodity destined for human consumption. This proposal is consistent with the long-range plan for upgrading the Beltsville complex.

OTHER CURRENT AND EMERGING ISSUES

A wide range of important issues confronts American agriculture and is of concern to the public. Two are of particular interest.

Pfisteria outbreaks in the Mid-Atlantic coastal tributaries and estuaries have become a major issue. Recent incidents in the Chesapeake Bay tributaries have focused public attention on the potential role of agricultural nutrients in the degradation of the waters. ARS scientists at Beltsville are working with colleagues at the Federal and State levels to develop management practices that farmers could adopt to reduce the movement of nutrients and pathogens to surface and ground water. A nitrogen soil test has been developed to help minimize excessive applications of nitrogen. New sustainable cropping systems which reduce nutrient and pesticide leaching and surface loss by runoff are being evaluated. Improved methods for handling, composting, and disposing of manure from farms are being developed. And, remote sensing technology is being investigated as a cost-effective way of monitoring changes in the natural ecosystems over time and across large geographic areas. Approval of the fiscal year 1999 budget proposals would allow a stronger research program in this critical area.

Food safety and quality are of paramount importance to the public. Despite the fact that the U.S. food supply is the safest in the world, thousands of Americans are stricken annually by illnesses caused by the food they consume. Consumers need to be assured of the safety of their food supply to prevent disruptions of normal healthy eating patterns. Beltsville scientists are widely involved in food safety research. New and improved analytical procedures for detecting antibiotic residues in meat and milk were developed at BARC. Industry, the Food and Drug Administration, and USDA's Food Safety and Inspection Service are now using these methods. BARC engineers are developing sensors and imaging technology for rapid inspection of poultry carcasses online during processing. Diagnostic tests and fundamental information on livestock parasites of human health significance are being researched, especially zoonotic diseases such as trichinosis, toxoplasmosis, and cryptosporidiosis. In recent years, increased attention is being given to the safety of fresh fruits and vegetables, which are so essential to a healthy diet. The Beltsville Symposium in Agricultural Research in May 1998 will bring together leading world experts to review the most recent advances in the science related to the safety and quality of fresh fruits and vegetables. The proposed budget would give a boost to this initiative.

Mr. Chairman, FAR-B thanks you and the Committee for your interest, leadership, and generous support of ARS and the Beltsville Agricultural Research Center. We recognize that finding funds for Federal agricultural research programs and facilities is a difficult challenge no matter how important the work is to the health, safety, prosperity, and well being of the Nation. This Committee has met that challenge over the years, and we encourage your continued efforts. We look forward to working with you in any way you may desire to serve the interests of American agriculture.

PREPARED STATEMENT OF LARRY BOHLEN, D.C. ISSUES COORDINATOR, FRIENDS OF THE EARTH

SUPPORT FOR FDA CONSOLIDATION AT AN URBAN, METRO ACCESSIBLE SITE

Friends of the Earth is taking an increasing interest in protecting the urban core and inner suburbs of cities across America. Existing communities are worthy of protection. In addition, making sure that existing communities are safe and economically viable places to live is one of the surest ways to protect undeveloped farms and forests from falling to haphazard sprawl development.

Moves of Federal jobs outside the D.C. beltway are detrimental to the health of the District and the inner suburbs of D.C. A currently proposed move of the Food and Drug Administration to White Oak, Maryland would threaten the economic viability of areas inside the Beltway.

To address these issues, we propose that you:

(1) Initiate a study of consolidating the FDA within a half mile of a Metro-accessible site, such as the Southeast Federal Center in the District of Columbia. We suggest that at least \$4 million be appropriated in fiscal year 1999 to conduct such a study.

(2) Observe federal Executive Order 13006 directing the location of federal facilities in urban centers.

Consolidation of the FDA at the Southeast Federal Center has several advantages:

- it is adjacent to the Navy Yard Metro;
- it is only one mile from the Dept. Of Health and Human Services, FDA's parent agency;

- it is owned by the federal government and controlled by GSA;
 - it has more than adequate floor space for FDA's site plan and is currently underutilized;
 - the Southeast Federal Center site has no funds appropriated for its redevelopment; and
 - it is in an area of D.C. urgently in need of revitalization.
- In comparison, siting of the FDA in White Oak, Maryland, as proposed, has several disadvantages:
- it is 3 miles from the nearest Metro station and has very limited bus service;
 - it is in a low-density sprawling neighborhood outside the Washington beltway, not in an urban center as directed by Executive Order 13006;
 - it is 10 miles from other FDA facilities that would not consolidate in White Oak, raising the question of just what kind of benefits is consolidation bringing; and
 - it would involve development of undeveloped wooded areas near a stream on the White Oak site whereas the Southeast Federal Center is already paved.
- Your consideration of this matter is greatly appreciated.

PREPARED STATEMENT OF R. LAWRENCE COUGHLIN, PRESIDENT, FRIENDS OF THE NATIONAL ARBORETUM

Mr. Chairman and Members of the Subcommittee, as President of Friends of the U.S. National Arboretum (FONA), I am grateful for this opportunity to present testimony in support of FONA's request for additional funding of \$300,000 in fiscal year 1999 for the Gardens Unit of your U.S. National Arboretum.

This funding is urgently needed to strengthen the Gardens Unit in anticipation of the new master plan for the National Arboretum which is being prepared under contract with the renowned landscape architectural firm of Environmental Planning & Design.

The Gardens Unit is presently the most understaffed of all of the National Arboretum's Units. Yet it is central to the purpose of the National Arboretum. There has been a continued loss of permanent staff positions in the Gardens Unit and an increase in temporary staff in order to conform to imposed budget limitations. At the same time, new facilities have been added with public and private support including The National Bonsai and Penjing Museum and the National Grove of State Trees, educational outreach has been increased and greater levels of public visitation have occurred.

An addition of \$300,000 to the Gardens Unit in fiscal year 1999 would provide four urgently needed new staff positions and, most important, allow stabilization of the staffing base in the Unit. It is currently experiencing a high turnover level because it cannot offer permanent positions to technically qualified and trained people. Attached as Exhibit I is a more detailed description requested by FONA and prepared by National Arboretum staff.

Mr. Chairman, FONA has been working with your National Arboretum staff, the Agricultural Research Service and the Department of Agriculture on a new Master Plan for the National Arboretum. FONA's objective has been to modernize the Arboretum into the millennium, to adapt it to 21st century technology and to make it a horticultural educational attraction in accordance with its Congressional mandate and worthy of the term "National Arboretum."

In its initial review, Environmental Planning and Design found that the National Arboretum was an outstanding pure research facility but was not very user friendly. Visitors sought more plant and gardening information. In short, from a visitor standpoint the National Arboretum is more a very nice park than an arboretum, and it is not adequately fulfilling its Congressionally mandated mission as a premier facility for horticultural education.

The new Master Plan is moving forward and will address such current practical needs as a new entrance, improved traffic flow and better facilities for visitor parking. Hopefully the vision will also identify educational needs such as an orientation center, automated train tours, and interactive exhibits in the display gardens. Your National Arboretum should be a horticultural education attraction in Washington that excites interest in earth sciences.

Mr. Chairman, the \$100,000 provided to the Arboretum in fiscal year 1998 for the Integrated Pest Management Program (IPM) has added a permanent technician and a second non-permanent technician to the Arboretum's highly successful IPM program. This stabilization of staff has allowed the National Arboretum to increase research and transfer knowledge to the landscape industry and the public as well as create partnerships with Federal, local and private institutions.

Your Subcommittee should be proud that thanks to your support the National Arboretum is serving as a model for IPM in the urban landscape. It is also part of a major effort to reduce nutrient loading in the Anacostia River and the Chesapeake Bay.

The National Arboretum's request for \$300,000 for the Gardens Unit in fiscal year 1999 is also consistent with last year's unfunded request to expand germplasm acquisition and maintenance. The Gardens Unit is responsible for the maintenance of extensive germplasm of species and cultivars of trees and shrubs from throughout the world. Expanding the germplasm collection improves the overall care of existing plants.

Mr. Chairman, FONA is most appreciative of your efforts and those of your Subcommittee on behalf of your National Arboretum. As always, FONA looks forward to working with you on behalf of horticultural research and education.

[EXHIBIT I]

GARDENS UNIT PROGRAM CONCERNS

The work of the Gardens Unit is very labor intensive and highly visible. The Unit staff are responsible for maintaining the display gardens, collections, and natural areas on the U.S. National Arboretum's 444-acre District of Columbia campus. With visitation increasing each year, greater numbers of customers are reaping benefits from the display gardens and collections. While the Gardens Unit welcomes this increased interest, it must be recognized that this escalates the pressure on the Unit to not only maintain the current level of quality and service, but also to meet ever higher standard for garden display and information retrieval.

GARDENS UNIT STAFFING PRIORITIES

Priority 1

The responsibility of running the horticultural activities at the greenhouse area is currently shared among the curators, gardeners, researchers, and facilities managers. The effort could become more efficient if a single person was added to the staff to assume responsibility for the day-to-day operations of the greenhouse complex. Efforts are currently underway to document the needs for the daily running of the facility. This adjustment was recommended by the team of outside reviewers who undertook a 5-year review of the Gardens Unit Program in February 1997. (\$50,000)

Priority 2

The Arboretum possesses a distinctive collection of Asian plant material which is an important source of germplasm for research and an integral part of the USNA's educational programming. Though the collection was once under the jurisdiction of a single curator, monetary constraints compelled the Unit to reassign this area to a curator with many other responsibilities. If the Asian area is to remain an integral and viable part of the Arboretum's research and educational programs, it is essential that additional funds be obtained for a full-time curator to oversee this significant collection. Preliminary data from the ongoing USNA Visitor Study indicates that the Asian Collections is the third most visited display area on the grounds (after the Bonsai Museum and the Herb Garden.) This is significant because the collection is located at the furthest point on the grounds from where visitors obtain information when entering the USNA. This action was recommended by the team of outside reviewers who undertook a 5-year review of the Gardens Unit Program in February 1997. (\$60,000)

Priority 3

The expansion of the Bonsai Museum provides an opportunity to generate a range of new programs for both occasional visitors as well as the serious bonsai scholar. The Education and Visitors Services Unit is doing all that it can to meet this need. Still, it is imperative that a museum specialist with expertise in the garden art of Bonsai be hired to develop and implement programming in this unique facility. The priceless value of this collection requires that the Museum be staffed seven days a week, which requires additional staff to cover the weekend hours, which also coincide with the highest levels of visitation. Preliminary data from the ongoing USNA Visitor Study indicates that the Museum is the most frequently visited area on the grounds. (\$50,000)

Priority 4

The Plant Record Office, while funded by the Gardens Unit, serves all Units of the Arboretum. The Office provides leadership in the implementation, operation, and expansion of the accessioning, labeling, mapping, and documentation activities of the living plant collections. It also develops and maintains the Arboretum's computerized database of plant holdings. Concerted effort is being made to input the backlog of record data in the database. An increased effort would enable the generation of computerized reports which would serve as tools to the managers of the living collections. In addition, mapping of the gardens and collections is an essential aspect of the Gardens Unit mission, yet this cannot be done with current staff. (\$35,000)

Priority 5

The stabilization of the staffing base is a great concern of the Gardens Unit. At present time, six of the nine gardener positions (Agricultural Science Research Technicians) are held by temporary employees. Regular turnover of personnel severely limits the effectiveness of garden and collection care and curtails program development from year to year. It diverts curatorial attention from legitimate collection concerns to personnel matters as an inordinate amount of time is spent in the recruiting/hiring process and in retraining new gardeners. At a minimum, each garden and program area should have at least one permanent gardener position to assure continuity of care in the collections. This would require providing additional base funding to convert five of the six temporary positions to permanent positions. (\$25,000)

Additionally, the Gardens Unit's need for administrative and facilities programmatic support services (i.e., computer support and engineering and construction support services) have exceeded the Unit's available funding. An additional \$50,000 is required to fund these needs. Finally, all programmatic increases are assessed to fund Agency administrative and support initiatives. This amounts to \$30,000.

Summary of Funding Needs

Greenhouse Manager	\$50,000
Asian Curator	60,000
Bonsai Museum Assistant	50,000
Plant Records Assistant	35,000
Permanent Gardeners	25,000
Subtotal	220,000
Garden Unit Support Services	50,000
Agency Support Services	30,000
Total	300,000

Total is based on projected personnel costs over the next 5 years.

PREPARED STATEMENT OF FATHER WILLIAM L. GEORGE, S.J. AND FATHER T. BYRON COLLINS, S.J., ASSISTANTS TO THE PRESIDENT, GEORGETOWN UNIVERSITY

Mr. Chairman and Members of the Committee: We are Father William L. George, S.J. and Father T. Byron Collins, S.J., Assistants to the President of Georgetown University, the Reverend Leo J. O'Donovan, S.J. We appreciate the opportunity to submit this testimony to the Subcommittee on the development of the Natural Medications Research Consortium Program.

NATURAL MEDICATIONS RESEARCH CONSORTIUM (NMRC)

The Senate Committee on Agriculture, Nutrition and Forestry and the Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies have expressed interest in the development of new farm products to improve the health of the citizens of the United States. We are requesting an appropriation of \$6 million for fiscal year 1999 for a consortium of the University of Mississippi, Georgetown University and the McKennan Health Systems in Sioux Falls, SD.

For centuries humans have utilized the products of nature to maintain health and treat disease. Many of the earliest known herbal remedies and other natural products are still used today and are becoming an ever more important part of the treatment of patients with illnesses. It is estimated that for these products today, Americans spend over \$14 billion, and it is a rapidly increasing portion of the \$60 billion spent on all medications. Until recently, none of these treatments had been evalu-

ated using rigorous modern testing methods to determine their safety or efficacy. Basic questions of stability and reproducibility of the content of the various formulations have made it difficult to assess the potential medical value of these products. The lack of patent protection for these products has been a disincentive for the pharmaceutical industry to assume a leadership role in this potentially valuable field of research. Although the National Institutes of Health has established an Institute for Alternative Medicines, it has only been able to support a few clinical trials. Concern about the safety of these products is appropriate considering the previous deaths and serious side effects observed with products such as ma huang, which contains the cardiac stimulant ephedrine, comfrey tea, which causes liver damage, and tryptophan, which had a contaminant that caused serious muscle damage and deaths.

In order to protect and serve the public, there is a critical need for the creation of a consortium with the resources and expertise in three major areas represented by the members of the consortium. They are; cultivating the herbs and plants that contain potential remedies by the University of Mississippi, analysis, evaluation and clinical testing by Georgetown University, and the optimal clinical resources necessary to evaluate these products in humans offered by McKennan Health System in South Dakota.

An important component of such an evaluation is the ready access to enroll patient populations that have the biologic, racial and ethnic diversity truly representative of the American population. Georgetown University and the University of Mississippi have expertise required to perform the needed product formulation and testing of these natural products. McKennan Health Systems in Sioux Falls, SD has the expertise in Native American natural product remedies and a clinical program essential for access to the diversity of populations needed for such clinical trials. The results would be made available to the Department of Agriculture to assist in the development of new crops and the public for more informed use of these natural products. We are requesting appropriation of \$6 million for fiscal year 1999 to conduct a demonstration program for the testing and scientific evaluation of treatments from natural products.

PREPARED STATEMENT OF THE GROCERY MANUFACTURERS OF AMERICA

GMA appreciates the opportunity to submit testimony on the President's fiscal year 1999 budget with regards to proposed food user fees and the food safety initiative. GMA is the world's largest association of food, beverage and consumer brand companies. With U.S. sales of more than \$430 billion, GMA members employ more than 2.5 million workers in all 50 states. The organization applies legal, scientific and political expertise from its member companies to vital food and public policy issues affecting the industry. Led by a board of 44 Chief Executive Officers, GMA speaks for food and consumer brand manufacturers at the state, federal and international levels on legislative and regulatory issues. The association also leads efforts to increase productivity and efficiency in the food industry.

USER FEES

GMA opposes the President's fiscal year 1999 user fee proposals on the food industry for the following reasons:

1. User fees imposed on the food industry are bad public policy. User fees, by definition, are intended to reimburse agencies for specific private benefits they provide to identifiable companies. The availability of a safe, plentiful, and affordable food supply, however, benefits the public generally. Consequently, regulatory activities such as post-market surveillance and inspection should be paid by public funds and not user fees. As Congress itself has repeatedly pointed out in previous years, these regulatory activities are designed to protect the public health and should not be funded by new taxes on the regulated industries.

2. User fees are essentially a regressive tax on food products. Imposition of user fees, in effect, would constitute an inappropriate tax on products essential to the health and well-being of the American public. Although user fees would be paid by food companies, the ultimate cost would be born by consumers.

3. FDA principally regulates food by taking regulatory action against adulterated and misbranded products, and is largely dedicated to enforcement activities which benefit the public at large. These activities are properly funded out of general revenues.

4. Unlike new drugs, food manufacturers may change product formulas frequently, thus creating "new" products all the time. A user fee for food products would therefore be a virtual impossibility.

5. The only type of food product for which any form of FDA premarket approval is required is for individual food additives. An average of one petition is filed every year for a new direct food additive.

BACKGROUND

In 1947, Congress actually enacted a user fee for meat inspection, which was subsequently repealed the following year because of public outcry that government programs should be funded by public dollars. In 1971, the General Accounting Office published a report recommending that fees be imposed for new drug applications. FDA opposed user fees at that time, on the grounds that regulation benefits the entire public and not just individual companies. Although Congress and FDA subsequently have debated the merits of user fees, the notion of imposing user fees to finance FDA regulation of food products had never been proposed by the Administration until only a few years ago.

GMA has always supported a strong, focused and effective FDA. In the last few years, Congress has enacted legislation giving FDA new authority in areas such as nutrition labeling, prescription drugs, medical devices and generic drugs, adding to the agency's already broad mandate. Unfortunately, additional adequate resources have not been provided.

Shifting the costs of these programs to the regulated industry, however, is not in the public interest and would constitute an inappropriate and regressive tax on the food industry ultimately borne by consumers. In practical effect, these user fees proposed in the fiscal year 1999 budget would constitute a federal sales tax on food products, which would ultimately be passed on to the consumer.

User fees by definition are intended to reimburse agencies for the particular benefits they provide to regulated companies. The courts have already determined the definition of a user fee. More than two decades ago, the Supreme Court held that the imposition of user fees on regulated companies for benefits enjoyed by the general public is nothing more than a tax on industry (*National Cable Television Association v. United States*, 415 U.S. 336, 340-341 (1974)).

THE PRESIDENT'S FOOD SAFETY INITIATIVE

GMA applauds the Clinton Administration's efforts to enhance the nation's food safety system. We have always supported adequate funding for FDA, USDA and other food safety agencies. We are pleased to see an emphasis on food safety education, risk assessment and research. Without proper research behind inspections, there is a risk that regulators won't be able to keep pace with the science involved in food safety decisions for today's food manufacturing processes. An effective and credible science-based standards and inspection system combined with food manufacturers' own safety assessment programs, will provide consumers with the greatest assurance that their food is safe. Unfortunately, the fiscal year 1999's proposed user fees will only leave vital FDA functions starved for resources.

CONCLUSION

In conclusion, GMA opposes any efforts to extend the user fee concept to the food industry. As we've written in letters to Members of this Committee, GMA remains committed to a strong FDA and USDA. Congress should, however, provide funding to meet its statutory commitments to protect the public health. Although GMA appreciates the efforts of the Administration to provide targeted funding for food safety efforts, food safety is a fundamental regulatory/enforcement mission of FDA and it benefits the public at large, not individual food manufacturers. Congress has repeatedly rejected the idea of new taxes disguised as user fees and we ask them to do so again.

PREPARED STATEMENT OF THE HEALTH INDUSTRY MANUFACTURERS ASSOCIATION

INTRODUCTION AND SUMMARY

This testimony is submitted on behalf of the Health Industry Manufacturers Association (HIMA) and the more than 800 manufacturers we represent. HIMA is the largest medical technology trade association in the world. Our members manufacture nearly 90 percent of the \$55 billion of health care technology products purchased annually in the United States and more than 50 percent of the \$130 billion purchased annually around the world. We welcome the opportunity to comment on issues surrounding FDA's funding for the next fiscal year.

We wish to highlight several key issues:

- Enactment of landmark legislation—the “Food and Drug Modernization Act of 1997” (the “Act”)—has created opportunities as well as challenges affecting resources for the Agency.
- Implementation of the Act will be a key priority for both the Agency and the industry this year and next. Additional activities necessitated by implementation may strain Agency resources.
- We continue to advocate stable funding for the Agency. We believe that all Agency programs should be held harmless from any funding reductions. New important initiatives such as tobacco regulation and food safety should carry with them additional funding appropriate to carry out the intent of Congress and not dilute other important functions of the Agency.
- We applaud the efforts of the Subcommittee to hold FDA to a greater standard of accountability for allocation of resources within the Agency. We urge continuation of efforts to ensure that taxpayer dollars are spent wisely and fairly.
- Finally, we believe the Administration’s user fee proposal for the medical device program masks dangerous cuts in FDA’s budget authority that could undermine the efforts of Agency personnel to perform their essential functions of protecting and promoting the public health. We strongly oppose user fees for the medical device industry.

FDA PERFORMANCE AND THE “MODERNIZATION ACT OF 1997”

Last fall, the Congress achieved a remarkable milestone in the history of regulation of the device industry: it enacted the “Food and Drug Modernization Act of 1997.” An enormous amount of bipartisan effort went into passage of this legislation, much of which was presaged by activities encouraged by members of this Subcommittee for years. Without the leadership exercised by this Subcommittee in conjunction with the Senate Labor and Human Resources Committee, this legislation may have never seen the light of day. We thank you for your efforts.

The victory ultimately rests with those patients who stand to benefit from the wonders of modern medical technology. The efforts of this Congress have helped to assure a promising future for continued innovation directly targeted to improving patient health and saving lives. As the new law makes explicitly clear, FDA’s mission is to “promote the public health by promptly and efficiently reviewing clinical research and taking appropriate action on the marketing of regulated products in a timely manner.” (Public Law 105–115, Section 406)

In enacting the new law, Congress recognized that the Agency was simply taking too much time to review products. Overwhelming evidence was presented that painted a bleak picture of patients being deprived of access to life-saving, life-enhancing medical products, Americans traveling overseas for medical procedures, U.S. companies relocating their research and development and clinical trial arms outside of the country, and the threat of increasing losses of our scientific infrastructure. With the new legislation, Congress has signaled the beginning of a new era in the regulation of medical devices—one marked by (1) reduced regulatory burden, (2) increased efficiency, and (3) greater focus on the patient.

We know too well, however, that simply enacting a law does not translate into an immediate fix. Implementation of the new law will not happen overnight; nor will it happen without the expenditure of Agency staff time and resources to carry out the intent of Congress. And, our concern is that all the gains we achieved with enactment of this new legislation will be for naught without thoughtful implementation by the Agency, informed by industry where appropriate, and overseen by the Congress that created the law.

From an appropriations perspective, the new law contains both resource-saving and resource-consuming provisions. The former include concepts such as exempting lower risk devices from the product clearance process (510(k)) and relying more heavily on the use of national and international consensus standards to provide a more uniform and predictable review process. The latter include new requirements for interactive meetings between industry and the FDA to enable earlier agreements on what is needed to get a product onto the market; another involves the review, analysis, and the potential recognition of a portion of approximately 30,000 national and international consensus standards applicable to the medical device industry. If FDA is to become a standards-based organization, as it has avowed, it must devote resources to this initiative.

While we expect the Agency to expend resources to prepare guidance documents, internal operating procedures, regulations, and other implementing documents, we are also concerned that resources may be redirected away from primary review functions thus resulting in increased review times, negating all of our hard-fought gains.

That being said, however, we have been pleased with the recent enhanced performance of the Center for Devices and Radiological Health. Even before the enactment of FDAMA, the center aggressively sought to dig itself out of the mounds of backlogged 510(k)'s and PMA's of several years ago through a series of effective management initiatives. Their efforts have paid off. The time to review 510(k)'s has substantially improved, and PMA's are being reviewed in a more timely manner as well. One indicator that the climate for innovation has improved is that the number of PMA's filed has increased from 39 in fiscal year 1995 to 63 in fiscal year 1997.

The leadership and management initiatives so apparent at the center today are reflections of what the manufacturing sector of our economy has undergone in order to regain America's competitive edge and make us the most productive country in the world. It is only fitting that our government should embrace the same disciplines so key to successful companies. As we said in our testimony last year, "We believe the record shows that entrepreneurial thinking and innovative management are the commodities the Agency needs and that improvement in performance are more a question of intent than of increased appropriations."

Consequently, for the past several years, we have supported level funding for the Agency on the basis that Agency management improvements can substitute for increased staff and resources. However, now the center is faced with a potentially devastating reduction in funding—one that we strongly oppose.

At this point, let me state how difficult it is to sort out the labyrinthian budget documents to ascertain actual levels of funding, particularly for the review functions of the center. We applaud your efforts to hold the Food and Drug Administration to higher standards of accountability for the allocation within the Agency of taxpayer dollars. The directive in last year's conference report requiring "a detailed operating plan for fiscal year 1998 . . . no later than 30 days after enactment of this Appropriations Act" was an important step in making sense out of the financial management of this key government function.

We were dismayed by the FDA operating plan for fiscal year 1998. It was untimely and hardly responsive to the level of detail required by the appropriators. We support your continued efforts to spur greater accountability and responsiveness from FDA.

Our understanding of the President's budget documents is that the level of direct appropriations (not inclusive of user fees) for "Device and radiological products" was \$147 million in fiscal year 1997, is estimated at \$142 million in fiscal year 1998, and is proposed to be \$103 million in fiscal year 1999. In addition, the fiscal year 1999 budget proposes \$39 million in "non-additive" user fees—user fees intended to substitute for, not add to, Agency appropriations (unlike the Prescription Drug User Fee Program which was structured to collect fees on top of appropriations in order to enhance Agency performance).

We are very concerned about this situation. While the fiscal year 1998 reduction appears arbitrary and unnecessary, the fiscal year 1999 proposed budget level could devastate the device program at FDA. This is at least the fourth year the Administration has proposed user fees for the device industry. We urge you, as you have in the past, to rule out user fees for the device industry.

It is important to note that the Administration's proposal to reduce the level of funding to \$142 million for fiscal year 1998 from the fiscal year 1997 level of \$147 million represents a reduction of 3.4 percent. The \$103 million level proposed for fiscal year 1999 represents a reduction of 26.5 percent from fiscal year 1997 funding. In CDRH, where the bulk of the budget is for salaries, reductions of the type being proposed necessarily mean sizable reductions in staff positions.

While we have every confidence that the leadership of CDRH will continue to find ways to work smarter and more efficiently—especially with the new tools provided in FDAMA, there is a limit to how many staff positions can be reduced without consequences. Core functions required to be performed by law within specific statutory time frames and in accordance with clear Congressional intent may not be doable with a "skeleton" staff. Such a result would be especially ironic considering that one of the main "drivers" of FDAMA was a desire on the part of legislators to reduce review times to speed up the delivery of important new technology to patients.

If we look at the recent appropriations levels for the entire FDA, the amount of taxpayer dollars funding salaries and expenses for the Agency—without user fees—is as follows: Fiscal year 1997—\$819,971,000; fiscal year 1998—\$857,501,000. The fiscal year 1998 direct appropriation level represents a 4.57 percent increase over the fiscal year 1997 level. During that same time, the device program suffered a reduction of 3.4 percent. While we understand Congressional interest in funding new initiatives such as tobacco and food safety, we also believe it is important for there to be sufficient appropriations to ensure the performance of statutorily mandated functions. If tobacco regulation and food safety are priorities, Congress should pro-

vide separate funding for those initiatives, not require the Agency to reduce funding for functions that are required by law.

Accordingly, we urge the Subcommittee to enact an appropriations level for fiscal year 1999 that will provide device program funding at the fiscal year 1997 level of \$147 million.

SUMMARY OF FUNDING RECOMMENDATIONS

This Subcommittee has done an excellent job over the years in encouraging the Agency to adopt administrative reforms. And, your support was key to the enactment of FDAMA last year. But we cannot rest on our laurels. In the spirit of continuing improvements to this key federal regulatory program—so important to the public health—we offer the following specific suggestions for funding levels and report language as you consider the details of the Administration's fiscal year 1999 budget.

Soundly reject the Administration's medical device user fee proposal and send a strong signal that deep cuts in the Agency's budget authority for medical devices are unacceptable

We also urge the Subcommittee to include language in its report expressing concern over the continued efforts of the Administration to include user fees in its budget proposals year after year.

Ensure level funding for the medical device program in fiscal year 1999 so that it has adequate resources to do the important functions mandated by law.

We are concerned that the device program is shouldering disproportionate cuts vis a vis the rest of the Agency. While "belt-tightening" is appropriate across the board, singling out the device program for more than its fair share is unfair and could negatively affect patient health. The size of the reduction being proposed by the Administration translates into drastic staffing cuts and a concomitant increase in review times. We do not believe anyone wants to see the devastating scene of several years ago repeat itself. Patients will suffer if funding is not kept level for the device program. Accordingly, we request that funding for the device program be level-funded at the fiscal year 1997 level of \$147 million.

Ensure that any reductions in FDA funding are not made in activities central to the Agency's primary mission—such as device reviews and activities to protect patient safety

In this age of smaller government and balanced budgets, it is important that the Agency focus on core activities mandated by statute and not spend precious resources on activities that may be interesting and helpful but not essential to the requirements of the law. Redeployment of resources—especially from the educational, scientific, and research arenas—should be encouraged by the Subcommittee. We recommend report language that urges the Agency to examine the allocation of resources and ensure that appropriate staff are assigned to product reviews and activities to protect patient safety. Goals to be achieved should include retaining the performance levels in the 510(k) product review area and improving review times for PMA's. In addition, sufficient staff should be allocated to implementation of FDAMA.

Urge the Agency to implement FDAMA in a timely manner consistent with Congressional intent and continue its "re-engineering" initiatives

The Agency has demonstrated a remarkable capacity to creatively step in new directions to improve the product review process. With re-engineering initiatives such as revival of the Product Development Protocol and the "New 510(k) Paradigm" together with the significant new tools provided in FDAMA, the Agency is indeed being "modernized." Thus far, CDRH has produced timely documents to implement the new law and has given the device industry every indication that it fully intends to continue effective implementation. Such efforts should be recognized and encouraged.

We also wish to point out that, recently, the Agency has decided to diminish its collaborative efforts with industry to address FDAMA and other policy issues. This is an unfortunate decision. As the Agency develops documents that affect industry, it should be informed throughout the process by practical considerations that only industry is in a position to present. Constructive collaboration with industry, with the Agency—of course—retaining final authority, is always a more efficient, less time-consuming model that generally results in a better product. We urge the Subcommittee to encourage such a model.

The consistent message from this Subcommittee—which has been heeded by the Agency—is to focus its efforts, use management tools, reassess core functions—in order to improve performance. This message should continue to be reinforced with FDA and expanded to include a message to work with industry to develop appropriate guidance and other documents.

Continue efforts to ensure that FDA's operating plan is consistent with Congressional intent and improve the financial accountability of the Agency to Congress

As mentioned earlier, we applaud the efforts of this Subcommittee to mandate greater accountability to Congress for allocation and use of taxpayer funds. The recent experience with the request for and submission of the fiscal year 1998 operating plan lays the groundwork for further review and analysis of Agency allocation of resources. We support your efforts and urge that they continue into the next fiscal year.

CONCLUSION

In conclusion, Mr. Chairman, we believe the Agency is poised at the brink of a new era—one marked by increased efficiency, reduced regulatory burden, creative initiatives—with the ultimate winners being the patients that benefit from medical device technology. Success can only be achieved, however, with continued attention from you and your Subcommittee to ensure that (1) an appropriate level of funding—preferably level funding based on the fiscal year 1997 amount—is provided for the medical device program, and (2) those funds are intelligently spent to carry out the health protection and promotion purposes of the Federal Food, Drug, and Cosmetic Act—as most recently amended so wisely by the Food and Drug Modernization Act of 1997.

Thank you for the opportunity to present our views.

PREPARED STATEMENT OF THE HUMANE SOCIETY OF THE UNITED STATES (HSUS)

SUSTAINABLE AGRICULTURE PROGRAMS

Public interest in sustainable agriculture farming systems continues to grow. The HSUS supports these cost-effective yet environment-friendly systems which also improve the welfare of animals. We join the Campaign for Sustainable Agriculture in requesting funding for the Sustainable Agriculture Research and Education (SARE) program. SARE is a competitive grants program that funds high-quality, farmer-involved research and education on economic, agronomic, and environmental aspects of sustainable agriculture farming systems. We join the Campaign in requesting an increase of \$2 million for fiscal year 1999 to \$10 million for the SARE program.

AGRICULTURAL TECHNOLOGY AND TRANSFER FOR RURAL AREAS (ATTRA)

The HSUS strongly supports funding for ATTRA at the level of \$2 million for fiscal year 1999. Since 1989, the caseload has more than tripled but has received the same level funding for years. It serves the entire nation with specialists who provide farmers and others with sustainable agriculture information, research results, and information based on practical experience. There is no other source of readily available information covering such a wide scope of sustainable agriculture topics. The funding level requested for fiscal year 1999, an increase of \$700,000 over fiscal year 1998, will allow ATTRA to continue to perform this important function.

ORGANIC FOOD PRODUCTION ACT

For the seventh year in a row, the organic industry has continually grown in sales, with reasons for purchase ranging from environmental and health concerns to that of enhanced animal health and well-being. Adopting consistent national standards for organic products is very important, and now is a crucial time for the national organic program to begin full implementation. This program is on the verge of becoming extremely beneficial to consumers and producers alike. More staff hours are needed to manage comments on the proposed rule, to get the final rule out, enable implementation of the program and facilitate dissemination of program information. The HSUS requests funding of \$1 million with at least \$250,000 going to offset the cost of the first round of accreditation.

ANIMAL WELFARE INFORMATION CENTER

The Animal Welfare Information Center (AWIC) of the National Agricultural Library (NAL) was started as a Congressional mandate in the 1985 Farm Bill. By law,

AWIC's main missions are to provide information that can be used for: (1) training researchers about more humane animal care and use and (2) improving methods of animal experimentation that can reduce or replace animal use or minimize pain or distress to animals.

As part of the NAL, AWIC also provides information to the public. There are several thousand users of its services, including researchers, technicians, veterinarians, IACUC members, exhibitors, dealers, Federal agencies, educators, students, and others. Due to the great success of the AWIC program in the U.S., it is being duplicated in other countries, with farm animal welfare information included in those services.

AWIC is currently operating on a staff of only 4 full-time and 2 part-time individuals. Since its inception, AWIC has never received an increase in their funding. We support the USDA's request to expand the mission of AWIC to include a comprehensive collection of information on the well-being of farm animals and to develop an inventory of and disseminate fact sheets and other materials on farm animal well-being issues. It is imperative that AWIC's funding be increased to accomplish these important functions recommended by the USDA.

PACKERS AND STOCKYARDS ADMINISTRATION

We support the USDA's fiscal year 1999 request for an increase of \$1,600,000 to focus on packer competition and industry structure. This funding will support the Secretary's Advisory Committee on Agricultural Concentration recommendations that include appropriating sufficient resources to aggressively enforce the Packers and Stockyards Act.

The HSUS also supports an increase of \$0.8 million for poultry compliance requested by the Secretary's Advisory Committee on Agricultural Concentration. We are concerned that contract poultry growers have the ability to bargain with integrators and be protected from unfair and discriminatory practices and that the Secretary be provided the same administrative enforcement authority over poultry that currently exists for red meat.

The HSUS also supports an increase of \$0.8 million for monitoring and analyzing packer competitive practices and the implications of structural changes and behavioral practices in the meat packing industry. GIPSA expects to increase their investigations of livestock markets from 1,800 in 1998 to 1,950 in 1999. The requested increase will enable GIPSA to adhere to the recommendations of the Secretary's Advisory Committee on Agricultural Concentration.

ANIMAL WELL-BEING RESEARCH

Living conditions for farm animals which provide for their health and well-being are increasingly recognized as an important component of food quality, and are also of increasing concern to the public. Research into understanding what is required to provide for the well-being of these animals is needed to help address these concerns. However, funding of such research is virtually nonexistent in the U.S. We request that \$29.5 million be appropriated to the Animals division of NRI with at least 50 percent of the funding allocated specifically for well-being research, thereby achieving a greatly needed balance between animal health and animal well-being research.

WILDLIFE SERVICES

Wildlife Services continues to be one of the most controversial programs in the Department of Agriculture. Its Western region in particular remains focused on killing wildlife, rather than solving the damage wildlife sometimes causes.

Most of the federal WS appropriations are allocated to the Western region, where the vast majority is spent killing coyotes. Although the results of scientific research have shown that control of coyote populations, as opposed to individual offending animals, is futile and even counterproductive in stopping damage, this remains the primary approach used by WS employees. By way of example, WS still relies heavily on preventive aerial gunning, in which a coyote population in an area to be used for livestock grazing is targeted, and all animals destroyed, before livestock are even moved to the area. This is precisely the kind of non-selective and unnecessary destruction of wildlife that has earned WS its nefarious reputation.

The HSUS believes that WS must change its Western program to one that helps livestock producers, rather than one that just kills wildlife. By teaching livestock producers and property managers how to prevent or reduce wildlife-caused problems themselves, the cost of this program would be substantially reduced, while its effectiveness would markedly increase. Only when initial efforts to prevent or reduce the

problem fail would lethal control, under this approach, be conducted by the government with federal funding.

A similar program of shared responsibility has very effectively reduced wildlife-caused damage in Kansas, Missouri and other states for a fraction of the federal share of WS' budget in most Western states. The HSUS recommends, therefore, that the Subcommittee direct APHIS/WS to undertake a shift in focus from direct control services to education/self-help. Lethal control would be provided by the government only as a last resort. With such a change, operational funding needs would be reduced by \$10 million. We strongly urge the Subcommittee to reduce the fiscal year 1999 budget of WS in this manner.

In addition, we urge that WS be directed to spend 90 percent of fiscal year 1999 funds allocated to WS research on the identification and development of non-lethal, non-injurious control methods.

ANIMAL WELFARE ACT

The HSUS requests a significant increase in funding for the enforcement of the Animal Welfare Act (AWA). For more than 30 years, the AWA has failed to provide protection to animals in breeding facilities for the commercial pet trade, or to animals amassed by Class B "random source" dealers for sale to research facilities. The lack of sufficient funding in this area—which has hovered at about \$9 million for years—has exacerbated the gross inadequacies that characterize AWA enforcement.

Facilities that house animals covered under the AWA are not inspected to a sufficiently frequent and random degree. Currently there are 71 inspectors covering 10,366 sites of licensed facilities, including 2,506 registered research facilities that house laboratory animals. Violations documented by inspectors must be swiftly responded to and acted upon in a definitive manner, in order to encourage compliance by all facilities in the field. The load placed upon the current inspection staff does not allow such response and action. Increased funding for additional inspectors and an expanded inspection program would therefore improve overall conditions of all facilities.

The HSUS also suggests modifications to the operation of Animal Care that could increase government revenues. These suggestions include:

- An increase in the fees for dealers, since fees for dealers have remained stagnant for many years.
- The elimination of "random source" Class B dealers, whom APHIS regulatory staff spends a significant portion of their time trying to monitor and investigate. Although these dealers are a small percentage of the total number of licensees, a disproportionate amount of time must be spent dealing with this group of chronic AWA violators.
- The imposition of strict penalties and collection of fines for all documented violations of the Act, including failure to be present or to allow for the inspection of facilities. Frequently, fines go uncollected or inspectors are denied access to facilities to verify whether licensees have complied with the AWA. Repeated unsuccessful visits and uncollected fines cost the USDA/APHIS hundreds of thousands of dollars.

The HSUS supports current efforts to strengthen USDA regulations covering large-scale commercial breeding facilities. The commercial pet breeding trade is plagued by chronic, serious violations of the AWA, and USDA-licensed facilities must be brought into compliance immediately or eliminated if compliance with the Act cannot be achieved.

MARKET ACCESS PROGRAM

The HSUS request that no monies under this program be allotted to the Mink Export Development Council or any other mink industry cooperative. From 1989 to 1995, more than \$13 million in federal funds were handed over to the Mink Export Development Council. Despite this large commitment of funds, which were used primarily for fashion shows overseas, the value of mink exports declined by 33 percent and U.S. production dropped by more than half (Source: Fur Age Weekly). In addition, mink fur is purely a luxury item for which animals are subjected to extreme cruelty. In the last Congress, an overwhelming majority of the Congress agreed that the mink industry should not receive a government subsidy under this program. In light of these facts, we urge that the Congress continue to bar funding to the Mink Export Development Council.

THE HORSE PROTECTION ACT

The HSUS supports the full appropriation of funds as authorized by law under the Horse Protection Act. The authorization limit for the enforcement of the Act has

been frozen at \$500,000 since the enactment of the law in 1970. In addition to the devaluing effects of inflation, the actual appropriation has been drastically cut in recent years. USDA only received \$353,000 for the Horse Protection Act program in fiscal year 1998, and only about \$260,000 of that money was available for enforcement purposes.

The HSUS requests that \$500,000 be appropriated for the next budget year. This amount represents the absolute minimum expenditure necessary to carry out the provisions of the Act. It is essential to insure the proper training of USDA enforcement personnel in the use of thermovision and other diagnostic techniques employed to detect the illegal soring of gaited horses. It will also support some needed research. The full appropriation will enable USDA staff to attend a representative number of target horse shows (approximately 10 percent) and it will help to improve the training and oversight of non-governmental enforcement personnel (known as Designated Qualified Persons or DQP's.)

The HSUS also wishes to go on record as stating that the Tennessee Walking Horse industry has demonstrated that they are clearly incapable of effective self-regulation as envisioned by the 1976 amendments to the Act. Industry inspectors consistently report fewer than half the number of violations cited when USDA personnel are in attendance. Also, an increasing number of walking horse shows have no inspection programs whatsoever. We urge prompt and full implementation of the strategic plan.

COMMERCIAL TRANSPORTATION OF EQUINES FOR SLAUGHTER

The promulgation of regulations concerning the humane and safe transport and treatment of horses shipped to slaughter within the U.S. are provided for under a provision of the farm bill passed in 1996. We support full development and implementation of thorough regulations to remedy the mistreatment and inhumane conditions horses transported to slaughter currently endure.

Our two year investigation and subsequent research confirmed that there are several areas of serious concern regarding how these horses are treated and transported on these long distance trips to one of the eight slaughter plants. These areas include, but are not limited to, the shipment of seriously injured, late-term pregnant mares, foals, and ill or incapacitated horses. In addition there are serious deficiencies regarding the duration of deprivation of water, food and rest during transport, the inappropriate interior height, design, and use of many livestock vehicles, the lack of segregation of horses by size, and the lack of segregation of fractious horses and stallions from others, as well as adequate protection from the elements. We are also concerned about the lack of any record keeping by which to establish ownership or track these animals. We urge full funding be appropriated for implementation of these regulations and specifically request \$425,000, which is close to the amount requested by USDA. We urge that the money allocated include adequate funding for USDA FSIS inspectors to enforce these regulations.

PREPARED STATEMENT OF R. MAX PETERSON, EXECUTIVE VICE PRESIDENT, INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

The International Association of Fish and Wildlife Agencies was founded in 1902 as a quasi-governmental organization of public agencies charged with the protection and management of North America's fish and wildlife resources. The Association's governmental members include the fish and wildlife agencies of the states, provinces, and federal governments of the U.S., Canada, and Mexico. All 50 states are members. The Association has been a key organization in promoting sound resource management and strengthening federal, state, and private cooperation in protecting and managing fish and wildlife and their habitats in the public interest.

NATURAL RESOURCE CONSERVATION SERVICE (NRCS)

The Natural Resource Conservation Service has immense responsibilities for implementing the conservation provisions of the 1985 Food Security Act (FSA), the 1990 Food, Agriculture, Conservation and Trade (FACT) Act, and the Federal Agricultural Improvement and Reform (FAIR) Act of 1996.

Technical assistance

The USDA publication "Geography of Hope" identifies that the need for general conservation technical assistance for America's private landowner will continue to increase to 2002 and beyond. The Association supports the \$38 million increase in conservation operations. This will be used for: updating and refining the NRI; pro-

viding incentive payments to state NRCS offices that leverage local funds; and hiring non-federal watershed coordinators.

The Association supports the President's fiscal year 1999 request for an additional \$1.9 million for updating and digitizing soil surveys and training field staff to improve technical assistance to users of soil survey data. These items are included in the Conservation Operations budget request and the Association strongly supports a \$752 million budget for this program.

In addition to increasing general (non-programmatic) technical assistance, increased technical assistance funds are needed to implement increasingly popular provisions of the 1996 FAIR Act. The budget for the Wetlands Reserve Program (WRP), the Conservation Farm Option (CFO), Wildlife Habitat Incentives Program (WHIP), and the Farmland Protection Program (FPP) all include the customary 19 percent to 20 percent for technical assistance. The Association strongly supports this level of funding provided to ensure maximum agriculture and natural resource benefits will accrue from these programs. Notably absent from the list of programs providing adequate levels of technical assistance is the Environmental Quality Incentives Program (EQIP). The 1998 budget provides the customary 19 percent level for technical assistance while the proposed 1999 budget raises EQIP from \$200 million to \$300 million which the Association applauds. It lowers however the percentage for technical assistance to 10 percent, a net loss of \$8 million but a functional loss of \$27 million since EQIP is increased from \$200 million to \$300 million. Some Programs (CRP, WRP, CFO and FPP) have a technical assistance cap set by Section 11 of the CCC Charter Act at the 1995 spending level. No such constraint exists on EQIP. The Association therefore strongly urges the restoration of the customary 19 percent for technical assistance on EQIP.

State Technical Committees (STC).—The 1990 FACT Act required that State Technical Committees (STC) be established to facilitate interagency cooperation and coordination of technical guidelines for the conservation programs. Further, the USDA 1995 Reorganization Act specifically exempted the STC from the Federal Advisory Committee Act (FACA). The 1996 FAIR Act further added additional members to the STC. Federal-State coordination is an ongoing normal function which is required with or without a formal State Technical Committee. We commend the strong efforts of NRCS that has ensured the establishment of the State Technical Committees in each State with representation from the respective State fish and wildlife agency.

Wetland Determination.—We believe the need for wetland determination, certification, and mapping is great and urge NRCS to proceed as soon as possible, under the guidance of the FAIR Act of 1996. The Association urges expeditious completion of the wetland determinations required to implement the Swampbuster provisions of the 1985 FSA, 1990 FACT Act, and the 1996 FAIR Act as well as the FAIR Act directed interagency cooperation, whereby NRCS assumed responsibility for wetland designation for Section 404 (Clean Water Act) purposes on farmland, including tree farms, rangelands, native pasture, and other private lands used to produce or support the production of livestock. The Association and individual states wish to continue to work with NRCS to help achieve these goals.

Public Law 566.—The Association generally supports the \$49 million request for small watershed (Public Law 566) projects. That support is based upon continued emphasis on updated watershed planning and management. Such efforts could utilize and expand upon existing Public Law 566 plans examined in light of present day issues of wetland protection, water quality enhancement and fish and wildlife habitat. The greatest potential for these programs is for land treatment measures that retain the water on the land, improve infiltration, improve water quantity and quality, and provide fish and wildlife habitat. Structural and non-structural land treatment activities require state and local matching funds and are therefore leveraged to provide greater conservation benefits for each federal dollar spent while promoting valuable partnerships among states, local agencies, and other organizations.

National Buffer Initiative.—NRCS has implemented the initiative in cooperation with industry and other partners. The Association is pleased to be a sponsor of this innovative approach. The National Academy of Sciences has found that buffer strips can reduce off-field pollution by 70 percent, thus also contributing to meeting non-point source remediation goals under the Clean Water Act. NRCS has committed special emphasis and a major effort to use the strip practices covered by the continuous CRP sign-up in a more targeted fashion. Unlike the large or whole field CRP retirements, buffer strips will require extensive outreach plus the much more attractive rental rate now available. The Association supports the allocation of increased funds specifically for outreach to increase participation in the various buffer strip practices.

Forest Incentive Program (FIP).—The Forest Incentive Programs (FIP) has multiple resource values for fish, forests, wildlife, clean water and erosion control. The Association opposes the NRCS proposed intention to drop FIP funding and strongly recommends that the fiscal year 1998 level of \$6.325 million be continued.

Capped Program.—The Wetlands Reserve Program (WRP), Wildlife Habitat Incentives Program (WHIP), Farmland Protection Program and the Conservation Farm Option (CFO) have all reached or are near authorized acreage or appropriation caps. The Association continues to recognize and support the benefits to our natural resources from these programs. We believe that due to the over-whelming success, customer's acceptance and public benefits of this program, they should be re-authorized and funded at least at the 1998 level through 2002.

FARM SERVICE AGENCY (FSA)

An adequately funded budget for the FSA is essential to implement those conservation related programs and provisions under FSA administration and/or in cooperation with NRCS as a result of passage of the Federal Agricultural Improvement and Reform (FAIR) Act of 1996. The Association strongly advocates that the budget include sufficient personnel funding to service a very active program.

FSA programs have tremendous quantifiable impacts on natural resources, and yield substantial public as well as private benefits. Building on the provisions of the 1985 FSA, the 1990 FACT Act, and the 1996 FAIR Act, the Association wants to ensure that each program accomplishes the broadest possible range of natural resource objectives, and encourages close cooperation between FSA, NRCS and the State Technical Committees in implementing the 1996 FAIR Act.

Flood Risk Reduction Program.—We believe this program has great potential to mesh with the Army Corp of Engineers Rivers Ecosystem Restoration and Flood Hazard Mitigation Project which is a part of the President's Clean Water Initiative. We urge FSA to prepare regulations and budget for implementation and make every effort to ensure that language used in its easements and agreements provide a streamlined basis for appropriate administration and are user-friendly.

Conservation Reserve Program.—The continued administration of CRP under the guidelines of the 1996 FAIR Act is a very significant and valuable commitment of USDA and the FSA. The Association applauds FSA efforts to fund and extend CRP contracts for the multiple benefits that accrue to the public as well as the landowner. The Association is especially pleased to note the commitment to reach as soon as practical and maintain the authorized 36 million acres in CRP. The Association provides special thanks to FSA for the continuous CRP sign-up of high value environmental practices and urges a special effort to advertise and increase landowner participation.

The commitment of FSA to provide high wildlife benefits in CRP contracts was most obvious in the 15th and 16th sign-up. The Association applauds FSA in those efforts with their special emphasis on native grass species and enlightened pine planting and management strategies for maximum wildlife benefits.

WILDLIFE SERVICES, ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The President's budget for the APHIS Wildlife Services (WS) Operations is \$26.05 million, a net reduction of \$2.436 million from fiscal year 1998. For Methods Development, the proposed amount is \$9.681 million, a \$543,000 decrease from fiscal year 1998. The Association is discouraged that the Administration continues to overlook the importance of the leadership role the WS program has in the area of wildlife damage management and recommends that Congress restore these funds.

WS, a unit of APHIS, has the federal responsibility for controlling wildlife damage to agriculture, aquaculture, forest, range and other natural resources; controlling damage to property, and for protecting public health and safety through control of wildlife-borne diseases and wildlife hazards at airports. Its control activities are based on the principles of wildlife management and integrated damage management and are carried out cooperatively with state fish and wildlife agencies. Most APHIS operational work is cost shared between the federal WS program, state and county governments, agricultural producers, and other cooperators.

The cooperation and support of the agricultural community are essential to maintaining wildlife populations because much of the Nation's wildlife exists on private, agricultural lands. A progressive wildlife damage control program which reduces the adverse impact of wildlife populations is necessary to maintain the support of the agricultural community and to counter increasing pressures for indemnity due to wildlife damage.

The Association works closely with WS on numerous issues critical to the state fish and wildlife agencies such as the recent agreement between the United States

and the European Community to identify and develop more humane traps for taking furbearing animals. The Association is disappointed that \$450,000 was not included in the President's fiscal year 1999 budget for the important work of developing and testing more humane traps. Without necessary funding for trap testing, the United States will not be able to keep its agreement with the European Community. The Association strongly urges Congress to add \$450,000 in the US budget for this very critical wildlife management, economic and trade issue.

The Association recommends that Congress make \$700,000 available in fiscal year 1999 to allow WS to continue implementation of their new Management Information Reporting system. The implementation will occur over a 5-year period at a total cost of between \$6-8 million. The current system is outdated, uses obsolete hardware, and is limited in the amount of data collected. The new system will allow WS to provide specific information on resources protected, damage levels, trend information, cooperators employed methods, and data on measurements and outcomes now required by the Government Performance and Results Act.

The President's budget also directs implementation of a cost-share arrangement requiring states and other cooperators to pay at least 50 percent of the program cost in each state. Problems involving wildlife damage are unpredictable and extremely varied. The Association strongly objects to such a rigid cost-share arrangement and urges Congress to maintain maximum flexibility for cost sharing.

With the success of the recent wolf reintroductions in Yellowstone and the resulting expansion of their range, the reintroduction of the Mexican wolf in Arizona, and the natural dispersion of wolves into new areas in Minnesota, Wisconsin, and Michigan, the agency's present funding level to deal with wolf problems is inadequate. As wolf populations continue to increase, so do wolf conflicts and requests from the public for assistance. The Association recommends that Congress provide an additional \$275,000 to WS for fiscal year 1999 to deal with the increasing workload related to resolving wolf conflicts in order to facilitate this important recovery effort.

A significant problem exists with regard to brucellosis which affects domestic livestock and other animals and is present in elk and bison in the Greater Yellowstone area. ASPHIS has a key role in working to resolve issues related to this problem. We strongly urge that funding be included in the Service's budget to meet the needs in veterinary services, research, and operational funding for the quarantine facility to allow the Service to meet its responsibilities in resolving this issue.

We commend Congress for recognizing the need to relocate the WS research facility from Denver to Ft. Collins, Colorado. However, the Association urges the Congress to finish what it has begun and provide the necessary \$20.5 million to complete this \$37.7 million state-of-the-art facility. The future of an effective wildlife damage management program depends on the identification and development of more effective and socially acceptable control methods. The only source of new methods is through research.

The Association is pleased with the accomplishments of the Berryman Institute at Utah State University in Logan, Utah. However, the activities have seemed to reach a plateau, and we would like to see the Institute enhance its capabilities to conduct social science research, expand continuing education programs, and start a new high-quality scientific journal for wildlife damage management that would be patterned after other established journals. To reach these new goals, the Association supports an increase of the funding to the Berryman Institute by an additional \$236,000.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE (CSREES)

The Association recognizes that the research and educational programs of the CSREES and its Land Grant Partners effect relevant positive changes in attitudes and implementation of new technologies by private landowners, managers, community decisionmakers, and the public. This results in significant benefits to individuals and to the Nation through building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture. Since over two-thirds of our lands, approximately 1.35 billion acres, are controlled by over 10 million private landowners and managers, it is most appropriate that the CSREES Land Grant System, with its grass roots credibility and delivery system, be adequately funded to translate and deliver research-based educational programs and new technologies to help the Nation's private landowners and managers move towards a more sustainable society. However, we are disappointed that the President's fiscal year 1999 budget reflects very little emphasis on natural resources research and education directed toward helping these clientele.

The Association recommends that the fiscal year 1999 budget for CSREES should be redirected to accomplish the following goals:

The Association recommends that the Renewable Resources Extension Act be funded at a minimum level of \$9.5 million in fiscal year 1999. The RREA funds, which are apportioned to State Extension Services, effectively leverage cooperating partnerships at an average of about four to one, with a focus on the development and dissemination of useful and practical educational programs to private landowners (rural and urban) and continuing education of professionals. The increase to \$9.5 million would enable the Extension System to accomplish the goals and objectives outlined in the 1991–1995 Report to Congress. The need for RREA educational programs is greater today than ever because of the fragmentation of ownerships, the resultant increase in small farm numbers, the diversity of landowners needing assistance, and the increasing environmental concerns of society about land use. It is important to note that RREA has been reauthorized through 2002. It was originally authorized at \$15 million annually; however, even though it has been proven to be effective in leveraging cooperative state and local funding, it has never been funded at that level. An increase to \$9.5 million would enable the Extension Service to expand its capability to assist over 500,000 private landowners annually to improve decision-making and management on an additional 35 million acres while increasing productivity and revenue by \$200 million.

The Association recommends that Smith-Lever 3(b)&(c) base program funding be increased by 9 percent to a level of \$280,950,770 with an appropriate portion of this increase targeted to Extension's Natural Resource and Environmental Management programs (NREM). The President's fiscal year 1999 budget requests a reduction of \$10,740,000 funding for Smith-Lever 3(b)&(c) funds from the fiscal year 1998 level. The Association appreciates that Smith-Lever 3(b)&(c) base programs provide "Block Grant" type funds for land grant universities to provide essential educational outreach based on local needs assessment. This will enable NREM programs to develop the critical mass of expertise at the state and local levels to redirect and leverage limited funding to address critical existing and emerging natural resource and environmental issues that are directly affecting small landowners and farmers in both rural and urban communities nationwide. The nation is rapidly becoming a suburban society and these new landowners are ripe for education at the urban and rural interface. Expanding Extension programs in natural resource education on such issues as forest health, wetlands, endangered species, and human/wildlife interactions, as well as to strengthen its programs in urban and community forestry and environmental education is essential to address natural resource issues that are relevant to the sustainability of these critical resources. Such an increase, targeted appropriately, would help producers better understand and implement the changes in the 1996 Farm Bill Conservation Provisions. Moreover, we are concerned that appropriate positions in the Natural Resources and Environment Unit have not been retained to provide needed national leadership for critical interdisciplinary resources such as range management.

The Association encourages continued close cooperation between State CES and the State Fish and Wildlife agencies, as well as other appropriate state and federal agencies and conservation organizations. Extension 4-H Youth natural resource programs and projects continue to increase with over 1,350,000 youngsters presently enrolled from both urban and rural communities across the Nation. Increased Smith-Lever funds targeted appropriately will enable CSREES to carry out its environmental education and NREM National Strategic Plan obligations nationwide.

The Association recommends restoration of the Rangeland Research Grants \$500,000 budget for fiscal year 1999. The Association is disappointed that the practical and applied problems addressed by the Rangeland Research Grants (RRG) program were zeroed out in the President's 1998 budget and totally ignored in this fiscal year 1999 budget. The elimination of the only federal competitive grants program for rangelands has serious implications for wildlife, watersheds, and other natural resources. Modest appropriations for RRG in the past have supported some of the most important rangeland research conducted over the past decade, and wildlife issues on rangelands will present some of the more critical rangeland research problems over the next decade. This would help increase the interdisciplinary capacity of research and educational programs to help landowners better manage their land.

The Association recommends that an appropriate portion of the Pest Management budget should be dedicated to educational programs for prevention and control of vertebrate pests in urban and rural communities and to address invasive exotic species and noxious weed problems on rangelands. The Association notes that a combined total increase of almost \$15.5 million has been recommended in the President's budget for Pest Management and related research and extension programs over and above increases received in fiscal year 1998. The Association strongly supports this increased commitment of funds. Vertebrate pests and invasive species have been identified in many states as posing the most significant problems, now

and in the future, that agricultural and related crop producers and private landowners face. This targeting of Pest Management funds for research and educational programs would advance the knowledge and capability of landowners to reduce significant losses to vertebrate pests and invasive species.

The Association recommends that the Hatch and McIntire-Stennis funds be restored to fiscal year 1998 levels and, if necessary, redirected from the substantial \$32,800,000 proposed increase in NRI funding. The Association is pleased that the Administration proposes a \$9.5 million increase in basic research identified under the National Research Initiative as Natural Resources and the Environment; however, what is proposed under this "Area of Special Emphasis" clearly does not address critical natural resource research needs that the Natural Resource Community and the public are vitally concerned about. The Association is alarmed at the significant reduction in both the Hatch Act and McIntire-Stennis research programs of over \$15.5 million. Both of these research programs, conducted by Land Grant University partners and other educational institutions, are crucial to addressing natural resource and environmental issues critical to agriculture and natural resource sustainability now and in the future.

PREPARED STATEMENT OF LUIE FASS, INTERNATIONAL SEAFOOD

Mr. Chairman, I appreciate the opportunity to submit this statement for the record.

I am submitting this statement to you to request the Committee's assistance on a legislative matter that will assist the commercial fishing and seafood industry in Virginia and other portions of the Atlantic coast. The issue involves the inclusion of seafood products within the current export credit assistance programs administered by the Foreign Agricultural Service (FAS) of USDA.

Senator Ted Stevens authored an amendment in 1990 that authorized seafood as a commodity that could be financed through USDA's GSM (General Sales Manager) credit programs. Seafood has been financed infrequently in recent years through this mechanism. I understand that it is a discretionary decision on which commodities to include in each year's program.

The Asian financial troubles have caused a tremendous reduction in seafood exports, which for some U.S. commercial fishermen is their main source of revenue. As you may know, the Department of Commerce has imposed restrictive quotas on popular fishery species to the extent that the industry will expire without the export market. The exported seafood consists of species (skate) and products (shark fins and tails) for which there is no domestic demand, but for which there is a viable and strong Asian market.

I represent a number of commercial fishermen and seafood processors and exporters who are in the same position: We are no longer able to export seafood products to Asia because the Asian importers cannot obtain credit to finance their operations. If the FAS program were to include seafood as a product on the approved list for this year, the U.S. export of seafood could resume.

We ask that in your fiscal year 1999 Appropriations action you instruct the Department of Agriculture to include seafood and seafood products on the approved list for the FAS-GSM export financing programs.

Thank you again for the opportunity to present this statement for the record.

PREPARED STATEMENT OF THE INTERTRIBAL AGRICULTURE COUNCIL

The Intertribal Agriculture Council (IAC) is an organization of dues paying member Tribes who together control over 80 percent of the 54 million acres held in trust by the United States for Indian people. Founded by 84 tribes in 1987 to promote improvement in Native American and Alaskan Native agriculture, IAC is governed by a Board of Directors elected by the Tribes from each of the twelve regions of Indian Country reflecting the diverse character of Indian agriculture. We appreciate the opportunity to provide written testimony on the Department of the Agriculture budget request for fiscal year 1999.

For the past eight years, the IAC has repeatedly submitted written comments and oral testimony which attacked the USDA budget request and pointed out areas where we felt there were significant deficiencies reflecting poor priorities for existing budget dollars. We have repeatedly sought increased funding for the Extension Indian Reservation Program authorized at \$8 million but funded at only \$1.6 million. We have sought to increase direct farm lending in Farm Service Agency (formerly Farmers Home Administration) as critically necessary to our people who are unable to obtain bank loans due to jurisdictional and land ownership issues. We have

sought improved participation in the new conservation programs collectively lumped under the Environmental Quality Incentives Program, and we have sought improved prioritization of the elements of the 1990 Fact Act collectively called Title 2501.

In this year we have the uncommon pleasure of not attacking the Department's budget request but applauding the revised priorities for existing budget dollars. The recent USDA undertakings in both civil rights and small farms issues have included direct participation by the actual targeted users of USDA programs. USDA should be commended for listening and making adjustments in priorities as reflected in this budget request.

The areas of primary budget concern for the membership of the Intertribal Agriculture Council are listed below.

COOPERATIVE EXTENSION SERVICE

Cooperative Extension Service Agents serve in the critical role of community liaison to all USDA and Land Grant University Agriculture Programs, supervise youth activities such as 4-H, and coordinate education and training programs. Until 1990, Indian reservations were excluded from this service. For the past several years the Intertribal Agriculture Council has worked with the Department of Agriculture to enhance Indian participation in Extension Service programs as a cornerstone to improving USDA/Indian relations.

The Extension Indian Reservation Program (EIRP) is authorized in Section 1677 of the 1990 FACT Act, and spearheads the IAC efforts at improving USDA involvement with American Indian communities. We in the IAC are proud of our participation in the effort to establish this critical Reservation Extension Agent program and are thankful that the department recommends increasing funding for this successful and cost effective program. The program started with the authorization and an appropriation of one million dollars in the 1991 budget. As a result of that authorization and appropriation, the Cooperative Extension Service, working in concert with Indian Tribes and State Extension Directors, implemented a program which in its first year resulted in the establishment of 13 fully operational Reservation Extension Projects with a total staff of 34, half of which were American Indians. In addition, each dollar of Federal seed money attracted \$0.37 in Tribal Government support, and \$0.41 in State Government support. States and Tribes hired nine individuals, in addition to the extension personnel, to assist in these projects. In that first year, during the start-up phase of this new program, the Extension Service received more than 75 proposals submitted jointly by cooperating States and Tribes to provide Extension services to the Indian communities. These cooperative proposals totaled more than 16 million dollars, for which only 1 million was available.

Congress recognized the value of this program and increased its funding by \$500,000 in fiscal year 1992, and another \$250,000 in fiscal year 1993. Since then, and despite great support among the Department, Congress and Indian leaders, the budget situation has prevented continuing expansion toward the full performance goal estimated at \$8 million. Increasing costs, CSREES overhead costs and budget rescissions have caused the already tiny program to cut back repeatedly in recent years, with the cuts resulting in fewer programs and smaller budgets for the remaining Extension Agents. Since 1994 the program has had to reduce from a high point of 34 on-reservation projects to the current level of only 26 programs. Even so, and without a national program leader or other oversight, 26 extension programs are providing valuable and formerly unavailable services to Indian Communities in 20 states from Florida to Alaska, including especially the valuable 4-H programs for our next generation.

Funding requested by the Tribes and States for continuing the existing 26 projects at minimum levels was \$1,872,600 in 1998. Only \$1.6 million was available, resulting in an average shortfall of \$11,000 for each on-site project, a reduction of over 17 percent below established need levels. The proposed funding level of \$5 million in fiscal year 1999 will provide adequate funding to meet the needs of the existing projects and expansion to include another 26 or so reservations in this valuable Federal/State/Tribal cooperative effort. Although below full-performance levels, the proposed increase is a reasoned approach to build upon past success without overburdening the system within fiscal year constraints. We strongly support this initiative of the USDA.

FARM SERVICE AGENCY, FARM LOAN PROGRAMS

The decision of the USDA to ask for budget levels which reflect the full authorized level of Direct Farm Ownership Loans at \$85 million and Direct Farm Operating Loans at \$500 million will be of great service to millions of American farmers and

ranchers who, for a number of reasons, are unable to obtain direct bank financing. This is especially important for American Indian farmers and ranchers on Indian reservation lands because private sector commercial banks are frequently unwilling or unable to make loans using Indian trust property as collateral. However, these issues are not a factor in direct federal lending programs.

It has taken great courage for the Farm Service Agency to seek the full appropriation, in part because the published past performance of FmHA Direct Loans has been poor. However, it must be pointed out that the reported deficiencies cannot be compared directly with similar data for commercial banks or other lenders. There are two reasons for this discrepancy. First, the reported delinquency rate is cumulative, including all delinquent loans dating from the origination of the program, while excluding all past loans which performed fully and were paid off—a commercial financial institution would dispose of non-performing loans on a yearly basis, reporting at most the three current years. Second, the direct loan program was used in the late 1970's and early 1980's as an instrument of federal efforts to mitigate the high inflation and recession affecting the country during that period. Fully three quarters of the direct loan deficiencies are "Economic Emergency" loans made during this period to provide an infusion of federal dollars to rural communities through increased lending to farmers. These loans have not been made since 1984, so 75 percent of the delinquencies are more than 15 years old and result from federally-sponsored emergency efforts at economic recovery, not from poor borrower or agency performance.

Given the strength and historical contribution of the direct lending programs to America's agriculture base, we strongly support the USDA's request to fully fund these critical programs.

INDIAN LAND ACQUISITION PROGRAM

The Indian Land Acquisition Program is listed under Farm Service Agency, Farm Loan Programs. It was created by Congress as a first effort at finding solutions to the jurisdictional and managerial crises facing Indian reservations which result from fractionated land-heirship and checker-boarded land-ownership patterns. This program has provided Tribes with the ability to purchase allotted lands within their jurisdictional area to consolidate ownership and management functions.

Congress raised the authorization for the Indian Land Acquisition program from \$2 million to \$8 million in the 1990 FACT Act. In recent years, the Department has funded this program at one million dollars, and reports limited activity. However, we are told by our member Tribes that FSA State officials have repeatedly turned away Tribal applicants by stating that no funds are available. Actually, the funding level has been so low that in many years a single loan to a single Tribe has taken the entire appropriation. Turning away potential applicants and operating a program in which a single loan may require the entire appropriation explains the low activity level.

The proposed 1999 budget again requests less than \$0.5 million in budget authority for this important source of land consolidation assistance. We are requesting that Congress direct the Department to utilize the full authorization of \$8 million for the purpose for which it was intended, the solution of long-standing land-ownership problems on Indian reservations. Since the Farm Service Agency has resources extending well into the billions of dollars we are not requesting an additional appropriation. We are requesting that the Committee and the Congress mandate that \$8 million of the total budget in Farm Loan Programs be earmarked specifically for the Indian Land Acquisition Program as authorized in the 1990 FACT Act.

OUTREACH FOR SOCIALLY DISADVANTAGED FARMERS AND RANCHERS

A widely based coalition of minority, rural and American Indian organizations sought the support of Congress for the development of an improved outreach and service delivery system for disadvantaged agricultural producers. Section 2501 of the FACT Act is the result. This section contains specific direction in developing the program and lists Tribally Controlled Community Colleges among organizations eligible to participate in USDA education and outreach programs.

Improved education of our people has long been the over-riding priority for our Tribes. This relatively simple and straight forward section of the FACT Act finally recognizes this priority. For the first time since the passage of that authorizing legislation, the Department has included a full authorization budget request to implement this important outreach program for Americans everywhere. We strongly support this move by the Department to finally implement this Congressionally-mandated program.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

The combination of the various conservation programs previously administered by the USDA into the newly created Environmental Quality Incentives Program (EQIP) through the 1996 FAIR ACT has required some adjustment at the local and regional level during the implementation phase. Initially, most reservation lands were excluded from the special emphasis areas, largely due to a lack of Indian participation on the various state committees which set-up the original implementation plans. However, in several states with large Indian landownership and populations, including Arizona, Colorado, Montana and Nevada, the NRCS has placed special emphasis on the historically unmet needs of Indian reservation lands. Coupled with national office adjustments to include Indian lands, NRCS is making major progress in bringing its important conservation programs and expertise to previously underserved populations.

The response of the agriculture and landowner community to the opportunities presented to improve long term conservation through the EQIP program has stretched the ability of this program to accomplish its identified task. For this reason, and in specific response to the inclusion of Indian owned lands in the EQIP programs, we strongly support the USDA's request to expand the program by \$100 million, nationwide.

The Board of Directors of the Intertribal Agriculture Council, on behalf of our member Tribal governments, are grateful for the opportunity to submit written comments on these issues of importance to the Indian Agriculture community. We believe the USDA's decision to request reprioritizing its existing appropriation levels through the budget process is an excellent example of a federal agency which listened and acted upon its own special task force recommendations. The proposed budget will more directly meet the actual needs of America's farmers and ranchers than any budget in recent years, and will help solve serious problems affecting rural communities throughout America.

PREPARED STATEMENT OF DR. KENNETH E. QUICKEL, JR., PRESIDENT, JOSLIN DIABETES CENTER

Mr. Chairman and Members of the Subcommittee, we at the Joslin Diabetes Center in Boston appreciate the opportunity to provide a statement for the record about an innovative and cost-effective project of potential benefit to rural Americans throughout the country.

DIABETES

The facts about diabetes among Americans are these:

- Sixteen million people have diabetes;
- Diabetes is much more prevalent among some growing minority populations;
- The prevalence of diabetes is increasing 7 percent each year;
- Diabetes is the leading cause of blindness among working-aged Americans;
- Diabetes and complications from diabetes are among the five leading causes of death in the United States; and
- Half of those who have diabetes are not yet aware they have diabetes, which may first become known only when serious complications arise.

JOSLIN DIABETES CENTER

Joslin Diabetes Center, since 1898, has been the world's leader in the study of diabetes and in providing care for individuals with diabetes. With a staff of over 400 and an annual budget of \$41 million, Joslin's clinical arm handled 65,000 patient visits in 1997. Joslin investigators contributed 108 original papers to the scientific literature in 1996. Joslin is affiliated with the Harvard Medical School and has trained over 900 diabetes specialists now practicing medicine and conducting research in 40 countries around the world.

Joslin has established thirteen Affiliated Centers across the U.S. in which Joslin physicians and staff train medical personnel in hospitals and clinics in the techniques Joslin employs for diabetes detection, prevention, and care. These thirteen Centers handled an additional 85,000 patient visits in 1997.

PROJECT PROPOSAL

We propose a two-state demonstration project that will institute pilot programs of diabetes detection, prevention and care at a very modest cost. The objectives involve a training and technology transfer exercise of Joslin's expertise utilizing prov-

en Telemedicine technologies, and an education and information program that utilizes the existing Extension Service system. We believe that the project should be at least two years in duration in order to place the equipment and train the personnel and access a sufficient proportion of the population to develop a viable model for application in other locations. The initial year of the project, fiscal year 1999, will cost an estimated \$950,000. Second-year funding will be considerably less.

The two objectives of the project are (1) Screening for diabetes and diabetic eye disease among rural patient populations in Washington and Hawaii, using an innovative technology and low light camera; and (2) providing existing, extensive information on diabetes prevention and care for dissemination in the states of Washington and Hawaii.

We have begun a similar project with the Departments of Defense and Veterans Affairs for the current fiscal year. We are linked with TATRC, the Telemedicine & Advanced Technology Research Center at Fort Detrick, Maryland. We have learned a great deal about providing training and technology to Federal agencies, and feel confident that the proposal we are advancing in this testimony can be accomplished by non-medically trained personnel.

The proposal involves two components that we have worked years to develop, refine, and operationalize through our research and clinical applications: The Joslin Vision Network (JVN) and the Information and Education component.

JOSLIN VISION NETWORK (JVN)

JVN provides the technology platform for accessing all diabetic patients into a program of high quality eye and diabetes care. The JVN utilizes a low light, non-invasive imaging of the retina. A technician, not medically trained, can be trained to use the camera to acquire retinal images in less than 30 minutes. The camera—it can be carried by one person and transported by automobile—can transmit the readings by telephone or satellite communications to a distant reading center to be interpreted by experts. The resulting retinal images are transmitted to regional centers of excellence for diagnosis and treatment plans. The process provides rural residents who may have or be prone to the development of diabetes access to diagnostic techniques and sophisticated equipment normally found only in urban settings where patient volume and traffic demand and can afford such highly specialized technology.

INFORMATION AND EDUCATION COMPONENT

Joslin has developed a comprehensive and extensive body of educational, informational and self-training (for those with diabetes) materials that are used with patients and those who have been found to be at risk for diabetes. These materials can be distributed to the population at large to educate and inform citizens of the warning signs and symptoms of diabetes. Many of the research findings that have practical, everyday applications to the sixteen million Americans who have diabetes are not known simply because the educational infrastructure is not in place. This brings me to why we are proposing this project for application within the Department of Agriculture. The Extension Service, the educational arm of USDA, provides millions of Americans valuable information that extends far beyond farming and soil conservation practices. The Extension Service has always been an active component of community life through such programs as the 4-H clubs and Home Economics activities. The Expanded Food and Nutrition Education Program seeks to improve nutritional intake through better educated consumers. Joslin's information and educational materials are the next step in the Extension Service mission of improved nutrition and better health. Joslin proposes to make available to the Extension Service in Washington and Hawaii materials that can be disseminated through Extension Service mailings, public awareness campaigns and other community activities that will result in a better educated public on the nature of and dangers of diabetes.

COSTS

We have prepared a preliminary budget to carry out this project in the two states of Hawaii and Washington. We selected these two states because Joslin has Affiliated Centers in each: Straub Clinic and Hospital in Honolulu and Swedish Hospital in Seattle. This will help keep costs at a moderate level and allow sufficient on-site monitoring on a regular basis.

We have estimated the costs to be \$950,000 for the first year: \$475,000 per state. The per state costs are comprised of the following: \$260,000 for equipment and \$215,000 for Joslin costs associated with travel, training, and monitoring for each state in the first year. The equipment costs are one-time, nonrecurring expenditures

that will result in lower second year costs. The equipment and the right to use the equipment become USDA's for continued use in these two states, or they can opt for a regional use of the equipment as the positive results of the project become proven.

Mr. Chairman, that concludes my brief statement. Thank you for this opportunity to place Joslin's statement in the hearing record for consideration by Members of the Subcommittee.

PREPARED STATEMENT OF QUON Y. KWAN, D. CRIM.

APPROPRIATION FOR THE STUDY OF FDA CONSOLIDATION

I am a resident of Rockville, Maryland. Although I am Secretary and Transportation Chairman for the Manor Lake Civic Association, I am writing as a private individual. I am currently employed as a senior environmental scientist for Energetics, Inc., a contractor for the U.S. Department of Energy, Assistant Secretary for Environment, Safety and Health. Neither my company nor I have received or will be receiving any contracts or grants from the Food and Drug Administration (FDA).

My interest in the FDA consolidation stems from my involvement as Vice-President for Action Committee for Transit (Montgomery County) for the past and current years. Again, my views do not represent the official position of Action Committee for Transit. I was opposed to the siting of the consolidated FDA campus at exurban Clarksburg primarily because of the lack of supporting infrastructure (especially, access to transit) and the commuting hardship posed on low-income and minority workers. My other reasons for opposing the Clarksburg site included the adverse impact in furthering sprawl development and the further deterioration on the inner city and urban areas. As you are well aware, the FDA abandoned Clarksburg as a potential site due to public outcry.

The FDA now seems to be focusing on the former Naval Surface Weapons Center at White Oak as a site for its consolidated campus. White Oak is also a poor choice for a number of similar reasons. My primary objection is the inadequacy of public transportation serving the White Oak site. Although it has bus service, workers would be using Metrobus service (route K6) and Ride-On service (route 22) to/from White Oak in the counterflow direction (AM northbound and PM southbound on New Hampshire Avenue). The frequency of counterflow bus service (on either route) is every 30 minutes even during rush hours. In my comments on the draft and final environmental impact statement for the proposed FDA consolidation at White Oak, I noted that such frequency of bus service is wholly inadequate to accommodate even 10 percent of the 6697 employees that would work at the site. The FDA misled the public by listing 19 bus routes and 4 rail lines that serve the study area, when in fact only the two aforementioned bus routes were within reasonable walking distance (1/4 mile of the site. The closest rail station is the Silver Spring stations for the Metrorail Red Line and MARC Brunswick Line, which is three miles away. I noted that the no-action alternative (i.e., to keep the FDA at its existing locations) was better because the dispersed FDA sites are located near Metrorail stations and have far better access to public transportation than White Oak.

My second primary objection to the White Oak site is its location in the residential suburbs. The FDA consolidated campus does not belong in a residential suburb but in the inner city or central business district. President Jimmy Carter signed an Executive Order 12072, "Strengthening the Nation's Cities," which is codified by the General Service Administration into the Federal Property Management Regulations at 41 CFR 101-19.002. This Order calls for Federal agencies to site their facilities and utilize space in such a way as to strengthen the nation's cities. This Order has been upheld in Federal courts (cf *City of Reading, PA v. Austin* [816 F.Supp. 351 (E.D. Pa. 1993)]). Why does this Order make good sense? Abandoning the inner city for the suburbs causes deterioration of the inner city and exacerbates sprawl development in the suburbs. This in turn has the unintended adverse effect of furthering division between socio-economic classes and between races, with of course, the low-income and minorities—the less mobile—remaining in the inner city and the more affluent and majority white—the more mobile—fleeing to the suburbs. When Federal agencies as well as private sector businesses take flight from the inner city to the suburbs, they create a prodigious redistribution of wealth. The inner city loses its tax base and becomes enveloped in a downward spiraling cycle of decreasing job growth and abandoned buildings accompanied by increasing alienation, poverty, and crime. On the other hand, the suburbs grow in their tax base and become enveloped in an upward spiraling cycle of increasing job growth and construction but accom-

panied by cookie-cutter gated communities and sterile industrial parks that exclude "undesirables" and oppose diversity. We need cities because we need identifiable, physical centers of commerce and culture. We need cities because they provide diversity; places that thrive with diversity breed new ideas for exchange, growth, and prosperity. Cities—not suburbs—are where the poor can rub elbows with the rich, the blacks with the whites, the humble with the powerful, and the public with the government. These are the places where Federal agencies belong—inner cities and central business districts—not in the exurbs or suburbs. Cities are vital for democracy. The Federal government should set the example and take the lead in strengthening the inner cities.

As an alternative to the White Oak site, the FDA should be consolidated at a site in the city, Washington, D.C. (consistent with Executive Order 12072), and preferably near a Metrorail station. There are several sites that would fit this criterion. One is at the Southeast Federal Center, which is adjacent to the Navy Yard Metrorail Station and is no more than about a mile from the Hubert H. Humphrey building, headquarters of the Department of Health and Human Services, the department to which FDA belongs. The other advantages of the Southeast Federal Center are that it is already owned by the Federal government (General Services Administration) and it has adequate floor space to meet FDA's needs. Furthermore, the Southeast Federal Center is located in an economically depressed area of the District of Columbia that is in urgent need of revitalization. As you are quite aware, D.C. has lost many employers, including Federal agencies, and the President has directed his cabinet secretaries in March 1997 to not contribute to the economic decline of D.C. by not allowing any more Federal agencies to abandon D.C. Moreover, the National Capital Planning Commission's Plan for Washington's Monumental Core (March 1996) under the subject of economic development proposes that the Southeast Federal Center and adjacent Navy Yard be transformed into a lively urban water front of offices, restaurants, shops, and marinas.

In conclusion, it would behoove the Subcommittee to appropriate an amount of approximately \$5 million for studying the feasibility of consolidating the FDA administrative and laboratory facilities at the Southeast Federal Center site.

PREPARED STATEMENT OF HELEN HOOPER, DIRECTOR OF PUBLIC POLICY, LAND TRUST ALLIANCE

On behalf of the more than 1,100 land trusts across the country, the Land Trust Alliance (LTA) would like to submit this statement as testimony for the record on the fiscal year 1999 appropriations for the conservation programs of the U.S. Department of Agriculture.

Land trusts are independent grassroots organizations dedicated to protecting land and the quality of life in their communities through private, voluntary action. Working within a cooperative, incentive-based strategy, these groups have helped save more than 4 million acres of wetlands and wildlife habitat, productive farm and forest lands, and other significant resources.

FUNDING REQUESTS

- (1) Support the President's fiscal year 1999 request for the following programs that help interested private landowners conserve their farmland:
 - Environmental Quality Improvement Program (EQIP)
 - Wildlife Habitat Improvement Program (WHIP)
 - Wetlands Reserve Program (WRP)
 - Conservation Reserve Program (CRP)
 - Conservation Farm Option Program (CFO)
- (2) Include funding for the National Natural Resources Conservation Foundation created under the 1996 Farm Bill.
- (3) Support the reauthorization of the Farmland Protection Program.

ENVIRONMENTAL QUALITY IMPROVEMENT PROGRAM (EQIP)

LTA supports the administration's request of \$300 million for EQIP from the Commodity Credit Corporation. This voluntary conservation program provides technical, financial, and educational assistance to farmers and ranchers for environmental land management measures that address serious threats to soil, waters, and other natural resources. EQIP promotes locally-led conservation by encouraging interested citizens to determine program focus in their communities. EQIP has generated a great deal of support among farmers, ranchers, local conservation officials, and other residents.

WILDLIFE HABITAT IMPROVEMENT PROGRAM (WHIP)

LTA supports the administration's request of \$20 million for WHIP from the Commodity Credit Corporation. This voluntary program provides technical and financial assistance to farmers to improve wildlife habitat on their land. WHIP funds often complement the activities of other USDA programs such as the Conservation Reserve Program or the Wetlands Reserve Program, increasing the overall effectiveness of the USDA's conservation efforts.

WETLANDS RESERVE PROGRAM (WRP)

LTA supports the administration's estimated request of \$123.7 million for WRP from the Commodity Credit Corporation and urges the committee to not institute any new acreage caps or restrictions in fiscal year 1999. The administration's estimate would be used to enroll 164,214 new acres in the program. WRP is a program with a proven track record of successfully restoring farmed, converted, or other degraded wetlands on current or former agricultural land. LTA would like to stress the importance of permanent WRP conservation easements. A perpetual agreement is the best way to ensure that the efforts of the USDA and the landowner, as well as the taxpayers' investment, are not wasted by future actions that may degrade the wetland area that was restored with WRP funds.

CONSERVATION RESERVE PROGRAM (CRP)

LTA supports the administration's estimated request of \$1.694 billion for CRP from the Commodity Credit Corporation and urges the committee to not institute any new acreage caps or restrictions in fiscal year 1999. CRP conserves precious top soil and promotes water quality by paying farmers to retire highly erodible lands from crop production for 10 to 15 years and providing cost-share funds to convert these areas to perennial vegetation. The program enjoys a tremendous level of support among the farmers it is tailored to, as demonstrated by the overwhelming response to the USDA's latest sign-up period.

CONSERVATION FARM OPTION PROGRAM (CFO)

LTA supports the administration's request of \$25 million for CFO program from the Commodity Credit Corporation. This voluntary pilot program provides producers of wheat, feed grains, cotton, and rice with a one-time consolidated payment if they agree to implement farm management plans that address the conservation of soil, water, and related resources, water quality, wetlands, and wildlife habitat on their farmland.

NATIONAL NATURAL RESOURCES CONSERVATION FOUNDATION

LTA strongly supports including \$1 million in fiscal year 1999 for start-up funds for the Foundation as authorized under the 1996 Farm Bill. Congress authorized this foundation to serve a role for the USDA's Natural Resources Conservation Service similar to that served by the National Fish and Wildlife Foundation for the U.S. Fish and Wildlife Service. This nongovernmental, charitable non-profit organization would raise private funds and accept gifts of real property to promote public-private partnerships, conduct educational and demonstration projects, and encourage innovative solutions to the conservation of natural resources on private agricultural lands. Unfortunately, to date no funds have been appropriated to the Foundation.

FARMLAND PROTECTION PROGRAM (FPP)

LTA supports the reauthorization of the Farmland Protection Program. This program, created under the 1996 Farm Bill, helps farmers keep their land in agricultural production by supporting the acquisition of conservation easements or other interests in farmland that is subject to substantial development pressure. In the program's first full year of operation it successfully conserved over 9,000 acres of threatened farmland in 10 states across the country. A much greater volume of farmland is expected to be enrolled in fiscal year 1998. After fiscal year 1998, all authorized FPP funding will have been consumed, but the need for the program will continue to increase. We ask that you support legislation to reauthorize this valuable program that helps keep threatened farmland in production.

We greatly appreciate your past and future support of USDA's conservation programs. We hope that you will keep in mind the views of LTA and the 1,100 volunteer citizen conservation organizations that make up the nation's private land trust movement as you make your funding decisions for the coming fiscal year.

PREPARED STATEMENT OF GARY A. GLENN, PRESIDENT, MASSACHUSETTS FOUNDATION
FOR EXCELLENCE IN MARINE AND POLYMER SCIENCES

Mr. Chairman, and Members of the Subcommittee, thank you for the opportunity to submit a statement for inclusion in outside witness hearings. My statement concerns USDA funding for research on new biological methods for treatment of liquid wastes in rural America. On behalf of research partners in Mississippi, Alaska, and Hawaii, I request that USDA fund construction and testing of "living machines" in fiscal year 1999 at a level of \$3.15 million.

LIVING MACHINES

Living machines are ecologically engineered systems for treating various kinds of wastes, especially waters. Living machines have been tested and proven effective in urban and industrial settings, and in particular locations. Living machines are ideal for small and localized applications such as are found in rural areas.

There is a need to test living machines in real-world settings. Data from specific rural demonstration sites will be collected and distributed so that large numbers of applications can take place. This data will enable local officials to confidently decide on adoption of living machine use for wastewater and other treatments, including reuse of waters.

NEED FOR GEOGRAPHICAL DIVERSITY

Living machines rely on plants and animals to purify wastewater; most of the plants used in a particular living machine are locally obtained. Living machine systems are therefore geographically and climatically specific. There is an urgent need to test and demonstrate living machines under regional conditions, where multiple applications exist. Specific locations in the United States where living machines have never before been tested or demonstrated include the following: rural Deep South, northern coastal, and sub-tropical.

SELECTION OF DEMONSTRATION SITES

In response to recommendations from program designers and ecological scientists, the following sites appear to be ideal for demonstration purposes:

Northern Coastal.—The region around Kodiak, Alaska is climatically similar to thousands of miles of sparsely populated coastline in California, Oregon, Washington and Alaska. It is planned that a demonstration living machine will be installed in Kodiak, which will show how ecological technology can be adapted to rural areas in Alaska and elsewhere.

Southern.—Rural Mississippi, especially in the northern and eastern parts of the state, offers excellent opportunities for demonstration of living machine technology for rural areas, in part because of current economic transformations in the region, and in part because of new public concerns over appropriate levels of wastewater treatment and regulation. This location can serve as a central geographical demonstration site for many applications throughout the South.

Sub-tropical.—A living machine application is needed for sub-tropical and island areas, so a living machine will be constructed and operated in Hawaii as a demonstration for the state of Hawaii as well as for many other applications in United States territories such as Guam, Samoa, and Puerto Rico, and for Pacific Island usages such as the Northern Marianas.

CONSTRUCTION AND OPERATION OF LIVING MACHINES

So that data collected from the demonstration sites identified in this description can conform to accepted standards of scientific and engineering specifications, the design and construction engineering tasks will be carried out under the management of the organization that has previously funded and supervised living machine research, the Foundation for Excellence in Marine and Polymer Sciences. This Foundation has more than 10 years experience with living machine technology, and has previously managed urban area applications. The Foundation will work directly with host institutions in each of the geographical locations identified in this testimony, who will actually carry out the research needed to confirm the parameters for living machine utilization.

FINANCIAL CONSIDERATIONS

A total of \$3.15 million is requested for fiscal year 1999, which will cover design, construction and operations costs for living machines in Alaska, Mississippi, and Hawaii.

PREPARED STATEMENT OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

The Metropolitan Water District of Southern California (MWD) appreciates the opportunity to submit testimony regarding the U.S. Department of Agriculture's (USDA) fiscal year 1999 budget, for the Hearing on Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations. MWD is a public agency created in 1928 to meet supplemental water demands of those people living in what is now portions of a six-county region of southern California. Today, the region served by MWD includes nearly 16 million people living on the coastal plain between Ventura and the Mexican border. It is an area larger than the State of Connecticut and, if it were a separate nation, would rank in the top ten economies of the world.

Included in our region are more than 225 cities and unincorporated areas in the counties of Los Angeles, Orange, San Diego, Riverside, San Bernardino, and Ventura. We provide more than half the water consumed in our 5,200-square-mile service area. MWD's water supplies come from the Colorado River via the district's Colorado River Aqueduct and from northern California via the State Water Project's California Aqueduct.

INTRODUCTION

MWD continues to favor USDA implementation of conservation programs, and is especially encouraged by the new actions identified in the recently released Clean Water Action Plan. The Clean Water Action Plan fosters integration of efforts by USDA, the U.S. Environmental Agency, and other Federal agencies to improve water quality. MWD firmly believes that inter-agency coordination along with cooperative conservation programs, that are incentive-based and facilitate the development of partnerships are critical to addressing natural resources concerns, such as water quality degradation, wetlands loss and wildlife habitat destruction. It is vital that Congress provide USDA with the funding necessary to successfully carry out its commitment to natural resources conservation.

Our testimony focuses on USDA's conservation programs that are of major importance to MWD. In particular, MWD urges your full support for funding for USDA's Environmental Quality Incentives Program (EQIP). Full funding for this program is essential for achieving Colorado River Basin salinity control objectives through the implementation of salinity control measures as part of EQIP. In addition, MWD requests your full support for the Wildlife Habitat Incentives Program, Conservation Reserve Program, Wetlands Reserve Program, Integrated Pest Management and related programs, and the Water and Waste Disposal Loans and Grants program. Sufficient federal funding for these USDA programs is necessary to achieve wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and in California's Sacramento/San Joaquin Bay-Delta (Bay-Delta) estuary.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

The Environmental Quality Incentives Program provides cost-sharing and incentive payments, technical assistance and educational assistance to farmers and ranchers for the implementation of structural practices (e.g., animal waste management facilities, filterstrips) and land management practices (e.g., nutrient management, grazing management) that address the most serious threats to soil, water and related natural resources. EQIP is to be carried out in a manner that maximizes environmental benefits per dollar expended. This assistance is focused in conservation priority areas identified by the Natural Resources Conservation Service's State Conservationists, in conjunction with state technical committees and Farm Service Agency personnel. MWD does have some concern with respect to this aspect of EQIP. Beginning with the first full year of EQIP funding in 1997, USDA's participation in the Salinity Control Program has significantly diminished. The mechanism by which funding has been allocated by USDA to date inherently overlooks projects for which benefits are interstate and international in nature. Clearly, Colorado River salinity control has benefits that are not merely local in nature, but continue downstream and EQIP as it is currently administered by USDA does not address national priorities. MWD supports the recommendation of the Colorado River Basin Salinity Control Forum as a way to remedy this situation. In Public Law 104-127, Congress amended the Colorado River Basin Salinity Control Act to direct the Secretary of Agriculture to carry out salinity control measures in the Colorado River Basin as part of EQIP. Sufficient federal funding for implementation of EQIP is critical in order to achieve Colorado River Basin salinity control objectives as well as

source water quality protection and ecosystem restoration objectives in the Bay-Delta estuary and watersheds tributary to the Bay-Delta.

The Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin states' salinity control efforts, issued its 1996 Review, Water Quality Standards for Salinity, Colorado River System (1996 Review) in June of 1996. The 1996 Review found that additional salinity control was necessary with normal water supply conditions beginning in 1994 to meet the numeric criteria in the water quality standards adopted by the seven Colorado River Basin states and the U.S. Environmental Protection Agency. For the last four years (1994-97), funding for USDA's salinity control program has not equaled the Forum-identified funding need for the portion of the program the Federal Government has the responsibility to implement. It is essential that implementation of Colorado River Basin salinity control efforts through EQIP be accelerated to permit the numeric criteria to be met again under average annual long-term water supply conditions, making up the shortfall. The Basin states and farmers stand ready to pay their share of the implementation costs of EQIP.

The President's proposed fiscal year 1999 budget contains funding of \$300 million for implementation of EQIP. MWD supports this level of EQIP funding which is also consistent with the USDA actions called for under the Clean Water Action Plan. The Forum has determined that allocation of \$12 million in EQIP funds in fiscal year 1999 is needed for on-farm measures to control Colorado River salinity. This level of funding is necessary to meet the salinity control activities schedule to maintain the state adopted and federally approved water quality standards. MWD urges you and your Subcommittee to support full funding for EQIP as requested in the President's fiscal year 1999 budget for USDA, with the specific allocation to the Salinity Control Program. MWD also recommends that the Colorado River Basin be designated as a national priority area for salinity control.

WILDLIFE HABITAT INCENTIVES PROGRAM

Wildlife Habitat Incentives Program (WHIP) is a voluntary program, providing technical assistance and cost-sharing, to help landowners develop habitat on their properties that will support wetland wildlife, upland wildlife, threatened and endangered species, fisheries, and other types of wildlife. WHIP offers an opportunity to encourage development of improved wildlife habitat on eligible lands by providing assistance to landowners who wish to integrate wildlife considerations into the overall management of their operations.

WHIP cost-sharing assistance could be utilized to support ongoing interim conservation efforts both in the Bay-Delta estuary and for the Lower Colorado River Multi-Species Conservation Program. The CALFED Bay-Delta Program is a cooperative effort among state and federal agencies and the public to develop a long-term, comprehensive solution to ecosystem and water supply problems in the Bay-Delta. One of the main objectives of the CALFED Bay-Delta Program is to improve and increase aquatic, wetland and riparian habitats so that they can support sustainable populations of wildlife species, by implementing a system-wide ecosystem restoration approach. WHIP could benefit this program by providing cost-share assistance for the development of wildlife habitat on private lands in the Bay-Delta watershed.

The Lower Colorado River Multi-Species Conservation Program (LCR MSCP) is a broad-based partnership of state, federal and private entities in Arizona, California, and Nevada. Participants include water, hydroelectric power and wildlife resource management agencies, Tribal governments, and environmental organizations with interests in the Lower Colorado River. The LCR MSCP is focusing on the conservation of over 100 threatened, endangered and sensitive species and their habitats. WHIP would allow the combination of federal cost-sharing dollars and voluntary agricultural land-use practices to enhance habitat for listed and sensitive species of interest in the Lower Colorado River. This could be a valuable vehicle for gaining further agricultural support for conservation efforts and the goals of the LCR MSCP.

The President's budget requests \$20 million for WHIP for fiscal year 1999. MWD recommends that you and your Subcommittee support WHIP at the level requested in the President's fiscal year 1999 budget for USDA.

CONSERVATION RESERVE PROGRAM

Continued support for the Conservation Reserve Program (CRP) is necessary in order to build on the past successes of this USDA conservation program. Under the CRP, incentive payments are provided to producers to remove highly erodible and other environmentally sensitive land from production. This program helps protect the quality of drinking water supplies and facilitates ecosystem restoration efforts

by reducing soil erosion, improving water quality, protecting wildlife habitats, and achieving other natural resource conservation measures. The National Buffer Initiative program will further maximize environmental benefits per dollar expended, and we are supportive of this effort.

Enrollment of eligible agricultural lands that are located in the Bay-Delta estuary and tributary watersheds in the CRP, could provide water quality improvement benefits for this important source of drinking water. We note, however, that the method which determines the rental rate for CRP enrollments effectively precludes the enrollment of much irrigated agriculture land and land with high value crops. As a result, states in the arid west do not benefit from the CRP in proportion to their contribution to agricultural production. While MWD urges you and your Subcommittee to support the President's budget request for the CRP of \$1.718 billion for fiscal year 1999, we also strongly request that you review the method for rental rate determination. We understand that one of the key actions under the Clean Water Action Plan is to review and increase, where appropriate, the incentives available for conservation buffers. Such review should also be undertaken for the CRP overall.

WETLANDS RESERVE PROGRAM

The Wetlands Reserve Program (WRP), first authorized in 1990, is a voluntary program providing incentives to landowners for the restoration and protection of wetlands with long-term or permanent easements. Wetlands restoration provides important water quality improvement and wildlife habitat restoration benefits that are important to the Bay-Delta estuary. MWD urges you and your Subcommittee to support appropriation of \$124 million for the WRP in fiscal year 1999, as requested in the President's budget. Full support for the WRP is necessary to achieve the Administration's goal of enrolling an additional 164,000 acres into the program currently, for a cumulative enrollment of approximately 825,000 acres by the end of 1999 and 975,000 acres by the end of calendar year 2000.

INTEGRATED PEST MANAGEMENT AND RELATED PROGRAMS

The USDA's Integrated Pest Management (IPM) Initiative provides for the research and development of IPM practices and the coordinated implementation of IPM programs at the local level. The development and application of proven IPM practices offers the potential to reduce reliance on chemical pest controls and minimize the adverse water quality effects of pesticide use. Implementation of IPM programs could provide source water quality protection benefits in both the Bay-Delta estuary and the Colorado River Basin. The President's fiscal year 1998 budget includes funding for a variety of research and assistance programs contributing to the overall objectives of the IPM Initiative. MWD urges your full support for the \$267 million included in the President's fiscal year 1999 budget for IPM and related programs.

WATER AND WASTE DISPOSAL LOANS AND GRANTS

The President's fiscal year 1999 budget includes funding for a number of USDA programs that provide loan, grant and technical assistance to rural communities. Of particular interest to MWD is the Water and Waste Disposal Program. This program provides loans and grants to small rural communities for water infrastructure projects, in order to assist those communities with drinking water quality and supply problems and help them achieve compliance with federal drinking water standards. MWD requests you and your Subcommittee to support the President's request of \$1.339 billion for fiscal year 1999 for water and waste disposal loans and grants.

CONCLUSION

Thank you for your consideration of our testimony. We believe our comments emphasize the importance of continued funding for USDA's agricultural conservation programs. The USDA's conservation programs are critical for achieving Colorado River Basin salinity control objectives, as well as broader wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and the Bay-Delta estuary.

PREPARED STATEMENT OF RUDY K. RICE, PRESIDENT, NATIONAL ASSOCIATION OF
CONSERVATION DISTRICTS

The National Association of Conservation Districts is a nonprofit, nongovernment organization that represents the nation's 2,950 conservation districts and more than 16,000 men and women who serve on their governing boards. Established under

state law, conservation districts are local units of state government charged with carrying out programs for the protection and management of natural resources at the local level. Conservation districts work with nearly two-and-half million cooperating landowners and operators each year and provide assistance in managing and protecting nearly 70 percent of the private land in the contiguous United States.

For more than sixty years, conservation districts and state conservation agencies have worked in close partnership with U.S. Department of Agriculture agencies to provide technical and financial assistance to help farmers, ranchers and other landowners and operators protect and enhance our land and water resources. This partnership has been carried out primarily with the Natural Resources Conservation Service (NRCS), but has also involved other agencies such as the Farm Service Agency, the Forest Service and the Extension Service. The partnership bonds NRCS with local conservation districts and state conservation agencies and is recognized as an efficient and effective system for delivering conservation assistance to the nation's private landowners and operators.

The "Federal Agriculture Improvement and Reform Act of 1996" (the Farm Bill) strengthened USDA's conservation mission by expanding existing conservation programs and creating several new initiatives that significantly broaden the scope of the department's natural resource management responsibilities. It also reinforced Congress' commitment to building voluntary, locally driven conservation partnerships among private landowners and operators and the local, state and federal agencies that serve them. The Farm Bill programs, along with other USDA conservation programs, operate in tandem with myriad state and local conservation programs to address the nation's most serious natural resource problems.

NRCS's Conservation Technical Assistance Program, delivered through local conservation districts to cooperators and other land users, is the nation's foremost private lands pollution prevention program. It provides landowners and operators with much needed help in planning and applying conservation treatments to control erosion and improve the quantity and quality of soil resources; improve and conserve water; enhance fish and wildlife habitat; conserve energy; improve woodland, pasture and range conditions; and protect and enhance wetlands. Many federal and state agencies also rely upon the technical expertise unique to NRCS to carry out other conservation programs that complement the NRCS effort not only in the agricultural areas, but in rural, suburban and urban communities as well.

Conservation districts believe that the federal government must provide a base level of technical assistance funding to maintain its commitment to support locally led conservation initiatives that complement federal efforts to ensure a safe and productive environment. A federal technical presence such as NRCS is vital to ensuring that sound technical standards are maintained in our nation's conservation programs. It is also critical in the actual implementation of needed conservation practices.

This NRCS technical presence, along with federal cost-share programs, leverages a tremendous investment in conservation by state and local governments. State and local governments contribute nearly \$1 billion in personnel and cost-share funding each year to support conservation programs carried out by the partnership. This is roughly equal to NRCS's annual budget and does not include the volunteer time of district officials. Many states are also working to increase this support, but depend on the federal government to provide its fair share.

In developing funding recommendations for specific agencies and programs, we recognize our own responsibilities to contribute a fair share of resources. Our recommendations on federal funding are based on information from our members, discussions with program managers and estimates based on workloads mandated by federal, state and local program authorities. Our recommendations are stated, in part as responses to selected items in the President's proposed budget for NRCS, as well as recommendations for selected other agency programs.

The Clinton Administration's fiscal year 1999 budget proposal includes \$742.231 million for NRCS Conservation Operations (CO). It also includes several proposals that would make fundamental changes in the way NRCS delivers conservation services through conservation districts and state conservation agencies.

The President proposes \$579.110 Million for America's Private Land Conservation (APLC), the Administration's new designation for Conservation Technical Assistance. Conservation technical assistance is the cornerstone of most NRCS programs, supporting activities such as the Farm Bill, as well as other programs to address state and local program priorities. The highest priority of the conservation partnership remains that of meeting the planning and technical assistance needs of farmers, ranchers and other land managers. Conservation districts recommend \$580 million for Conservation Technical Assistance for fiscal 1999.

The President's proposal includes \$20 million for "Competitive Partnership Grants" to locally based institutions, including watershed councils, cooperatives, etc., to enhance institutional capacity. In particular, it advocates hiring non-federal watershed coordinators (350) to develop watershed partnerships. It makes no mention of conservation districts, which are the legal entities established under state law for the specific purpose of coordinating and carrying out natural resource management programs. Every district in the nation has a Mutual Agreement with the Secretary of Agriculture that documents its unique working relationship with USDA. Further, each district also has a Cooperative Working Agreement with NRCS that outlines how conservation assistance will be delivered cooperatively to local landowners and operators.

This partnership delivery system should continue to be used for delivering conservation technical assistance on private lands. We strongly recommend that any such grants be channeled through conservation districts rather than putting in place an unneeded new delivery mechanism that would duplicate the current conservation district program delivery system.

The President's proposal also includes \$20 million for "Incentives to States" to encourage them to increase their contributions to conservation programs. Of this amount, \$10 million would be awarded to states to use for geographic information system and digital photo purchases. Conservation districts support the "Incentives to States" concept, but it should not result in a decrease in funding for NRCS technical assistance.

Under the President's proposal, NRCS would collect \$10 million in user fees for providing certain technical assistance and data services to its clients. While we could support such fees for services and products provided to other federal agencies, conservation districts oppose NRCS's charging user fees for assistance and services provided to the agency's traditional clients and non-federal partners. We believe the imposition of fees for services would discourage landowners from seeking assistance and decrease the application of needed conservation practices. It is important to point out that this \$10 million is embedded in the President's proposal as an offset and should be restored when funding the CO account.

The budget proposes \$70.983 million for a new "Water Resources Assistance" line item and would decrease the Watershed Protection and Flood Prevention account by \$52 million from the fiscal year 1998 appropriated level. This would effectively transfer the technical assistance funding from the watershed program account to the new line item under CO. Conservation districts oppose shifting technical assistance out of the Watershed and Flood Prevention Operations account. We believe that action would be the first step toward dismantling this important program and that Public Law 566 funds would likely disappear in future budget proposals.

We believe it is critical for NRCS to continue providing technical assistance for the more than 500 watershed projects established under Public Law 566, the authorizing legislation for the Watershed and Flood Prevention Operations program. Many of the projects, which have created an \$8.5 billion infrastructure, are nearing the end of their evaluated lives. Approximately 5,000 of the floodwater retarding structures are 30 years old and many are in need of repair, rehabilitation, replacement or decommissioning. Project sponsors need design and construction assistance, as well as technical assistance for rehabilitating, upgrading or decommissioning aging structures. In order to address these needs, NACD recommends funding Watershed & Flood Prevention Operations at \$120 million in fiscal year 1999, with at least \$60 million of that amount directed to technical assistance.

Conservation districts are concerned over references in the President's proposal to focus NRCS activities on setting standards and providing certification, rather than directly implementing most activities. We believe this would exacerbate the trend toward targeting NRCS assistance to federal priorities while shifting more natural resource management responsibilities to state and local governments without providing adequate resources to address non-federal priorities. Conservation districts oppose this shift since conservation programs provide significant public benefits with responsibility shared at all levels of government.

The President's proposal requests no funding for the Forestry Incentives Program (FIP) because it "promotes timber production on private lands and is incompatible with the agency (NRCS) strategic plan, which is focused on water quality and habitat goals." Congress transferred FIP from the Farm Service Agency to NRCS as part of a major program restructuring in the Federal Agricultural Improvement and Reform Act of 1996 in recognition of NRCS as the Department's private lands management agency. Its technical assistance is used primarily to assist America's farmers in production agriculture as are other USDA cost-share programs. USDA recognizes private lands forestry as a farming activity, and the Internal Revenue Service treats

forestry cost-share payments as such. Conservation districts urge Congress to fund the Forestry Incentives Program at \$10 million for fiscal year 1999.

Through the Resource Conservation and Development Program (RC&D), NRCS provides needed assistance to rural communities. Resource management and rural development initiatives undertaken by local RC&D's help revitalize economically disadvantaged rural areas. The President's budget proposes funding the RC&D Program at \$34.377 million, the same level as for fiscal year 1998. Conservation districts support increasing RC&D funding to \$40 million in fiscal year 1999 to fulfill outstanding applications for new RC&D areas. New funding should be directed towards expansion of the current RC&D program to meet locally identified needs.

The President's budget proposes enrolling 165,000 acres in the WRP during fiscal year 1999, to be funded through the Commodity Credit Corporation (CCC). Of the \$127 million, roughly \$11 million would be available for technical assistance. Conservation districts recommend funding the WRP at \$163.597 million in 1999, which would allow for enrolling approximately 220,000 acres. At least \$24 million of this amount should be available for technical assistance.

The Environmental Quality Incentives Program (EQIP), which replaced most existing USDA conservation cost-share programs in 1996, is a broad, multi-purpose national conservation financial incentives program. It is premised on local leadership and a voluntary, incentive-based approach. Conservation districts support using the locally led conservation paradigm, with leadership by conservation districts, as the model for carrying out EQIP and all USDA natural resource conservation programs.

The President's budget requests an additional \$100 million per year (\$300 million total per year) to support implementation of the recently unveiled Clean Water Action Plan: Restoring and Protecting America's Waters. This increase was also cited in the USDA CRAT report for outreach to socially disadvantaged producers. Conservation districts strongly support increasing EQIP funding to \$300 million for fiscal year 1999. We also urge Congress to direct that, of this amount, at least \$57 million must be used to provide adequate technical assistance to implement the program. Our long-range target is to increase EQIP funding to \$500 million per year by 2004.

The President's proposed budget seeks \$1.7 billion for CRP in fiscal year 1999 to bring enrollment up to 34 million acres—the current level is 28 million acres. In order to build upon the environmental investment and benefits from the CRP, conservation districts support achieving and maintaining full enrollment of 36.4 million acres in the CRP.

OTHER RECOMMENDATIONS NOT INCLUDED IN THE PRESIDENT'S BUDGET

Grants to Districts

The buying power of federal budgets has declined dramatically during the past ten years resulting in a decline in the number of NRCS employees at the field level. In addition to the decline in numbers, the federal work force has been redirected to focus efforts at targeted areas at the expense of local problems that affect national conservation priorities. Many conservation districts have offset this part of this decline by adding district employees financed with state and local funds. Much of the state and local funding is being diverted to help implement federal natural resource programs, often at the expense of local conservation priorities.

To help meet these ever-increasing demands being placed on the conservation partnership, NACD recommends that \$100 million be budgeted through the NRCS Conservation Operations account for direct grants to conservation districts. This is one of conservation districts' highest legislative priorities in 1998. This action would help NRCS offset some of the costs of carrying out federal conservation programs and enhance conservation districts' ability to address national conservation concerns and priorities at the community level. We fully expect that state and local governments will step in and provide matching funds under grants program.

Private Grazing Lands

The capacity of the nation's rangeland to satisfy values and produce commodities is threatened or, in some cases, may have been lost nearly 60 percent of the nation's rangeland because of one or more resource problems such as brush, weeds and water or wind erosion. The amount of rangeland in a deteriorating trend increased from 15 to 22 percent since 1992 and nearly half of our permanent pastureland needs treatment to sustain or enhance resource values and production. In many cases, technical assistance to help landowners and land managers develop and implement improved grazing management is all that is needed to solve resource problems and improve or maintain grazing land health. Preventing degradation before

it occurs is extremely important on grazing lands because, once damaged, the cost of restoring these lands can exceed its economic value.

Section 386 of the 1996 Farm Bill authorized the Secretary of Agriculture to establish a voluntary program to provide technical, educational, and related assistance to owners and managers of private grazing land. The program, to be carried out through local conservation districts, will help landowners address resource problems that cannot be solved easily by individual efforts without technical and financial assistance. To help meet this need, NACD recommends that the Conservation of Private Grazing Lands Program be funded at \$20 million as a new line item in the NRCS budget.

FUNDING FOR COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

Several Extension programs represent critical components are significant in USDA's natural resource management delivery system. For example, the Renewable Resources Extension Act provides educational assistance to help private landowners manage their lands to meet commodity demands and needs. At the same time it provides many public values associated with the forests and rangelands of our nation.

Research also remains one of the keys to the continued vitality of agriculture and effective management of the nation's resource base. U.S. competitiveness in world markets is contingent an aggressive research and development program for agricultural conservation and production techniques. We also recognize that conservation, environmental quality and production research needs vary across the United States. America's conservation districts support maintaining strong research programs in NRCS, the Agricultural Research Service, the Cooperative State Research, Education and Extension Service and other agencies as needed.

Attached to this statement is NACD's fiscal year 1999 Agriculture Appropriations Funding Resolution for Selected Programs Funded by the House and Senate Agriculture Appropriations Subcommittees. Conservation districts' fiscal year 1999 funding proposals will begin to build a deeper commitment to land and water stewardship in America. We have also cast an eye toward the future by forecasting the investment we will need to make five years from now to protect our resource base. Recognizing that currently we spend less than two percent of the federal budget on resource protection, we recommend doubling the overall funding for NRCS conservation programs by the year 2004.

We appreciate the opportunity to share our recommendations with the subcommittee.

PREPARED STATEMENT OF MARY CARLSON, PRESIDENT, NATIONAL ASSOCIATION OF FARMERS' MARKET NUTRITION PROGRAMS

On behalf of the 30-state membership of the NAFMNP, I am writing to urge your support for an appropriation of \$15 million to permit continued expansion of the WIC Farmers' Market Nutrition Program (FMNP) in fiscal year 1999. We greatly appreciate the leadership you have provided in the past on behalf of this small but valuable program, and we can assure you that strong interest exists across the country for its further growth.

Thirty-five states and Indian Tribal Organizations (ITO's) have met the challenge of the Subcommittee's endorsement of a substantially increased funding level for the FMNP in fiscal year 1998—a 73 percent increase from \$6.75 million to \$12 million. Collectively, FMNP participating states and ITO's, including five new states—Alaska, Arkansas, Florida, Georgia, and Mississippi—requested over \$12.2 million in federal funds for this year's program.

However, even with the higher funding level and broadened participation by WIC recipients and farmers, only an estimated 15 percent of the nation's nearly 7.5 million WIC participants and less than 50 percent of its farmers' markets will be able to participate in the FMNP in 1998. The Administration's proposed funding goal of \$15 million, we believe, will allow for a reasonable and measured expansion toward the goal of making the program available nationwide.

The Administration's budget request would also shift the source of FMNP funding from the WIC Program account to the Commodity Assistance Program account. We believe this is a positive step that would provide fiscal security for the FMNP and allow funds to flow to state agriculture, health, and other FMNP agencies in a more timely fashion to assure proper program planning and operations. Under current appropriations language, funds can be made available for the FMNP only if USDA certifies they are "not needed to maintain current WIC caseload levels." This has resulted in chronic uncertainty on the part of farmers, farmers' markets, WIC families, and state and local agencies regarding the FMNP's year-to-year existence.

Moreover, the program's contingent status can delay USDA's FMNP funding decisions until late Spring—as occurred in 1997—making it difficult for participating states to effectively plan their programs and fully utilize their allocation requests. Because the proposed decoupling of WIC and FMNP funding streams would be mutually advantageous for the FMNP and for WIC, we ask that you support it.

The FMNP is of critical importance to over 8,000 small farmers, who redeemed more than \$9 million in FMNP coupons in fiscal year 1996, for the more than 1,200 participating farmers' markets, many in disadvantaged urban and rural communities, and for the nearly 1.1 million low-income women and children participants who now have increased access to high quality, locally grown fresh fruits and vegetables. As a result of the FMNP, 88 percent of the participating farmers increased their sales of fresh produce and 43 percent increased their production. In addition, 71 percent of the WIC participants increased fruit and vegetable consumption due to the FMNP, with 82 percent indicating they plan to eat more fresh produce year-round as well. These are surely impressive results from a small program with an annual federal benefit level of no more than \$20 per WIC participant!

Thank you again for your past support of the FMNP. We hope you will support our request to expand and secure the FMNP so that its success in improving maternal and child nutrition—and fostering agricultural and rural economic development—can be broadened again in 1999.

PREPARED STATEMENT OF DR. ALBERT VOGT, PRESIDENT, NATIONAL ASSOCIATION OF PROFESSIONAL FORESTRY SCHOOLS AND COLLEGES (NAPFSC)

The National Association of Professional Forestry Schools and Colleges (NAPFSC) represents the 67 universities that conduct the Nation's research, teaching, and extension programs in forestry and related areas of environmental and natural resource management. We appreciate this opportunity to comment on the three programs administered by CSREES which greatly enhance the abilities of our member institutions to effectively address forest and natural resource issues facing our nation: the McIntire-Stennis Cooperative Forestry Research Program (McIntire-Stennis), the Renewable Resources Extension Act (RREA), and the National Research Initiative (NRI). All three of these programs have stimulated the development of vital partnerships involving universities, federal agencies, non-governmental organizations and private industry.

NAPFSC submits the observation to the Committee that we are rapidly approaching a crisis situation in the nation in terms of the need for more university forestry research and extension.

THE CASE FOR ENHANCED FORESTRY RESEARCH FUNDING

The forests and other renewal natural resources of this country are primary contributors to the economic health of the nation; are reservoirs of biodiversity important to the well-being of our citizens; are significant to the maintenance of environmental quality of our atmosphere, water, and soil resources and provide diverse recreational and spiritual renewal opportunities for a growing population.

Tremendous strains are being placed upon the nation's private forest lands by the combination of increasing demands for forest products coupled with dramatic changes in timber policies concerning our national forests. Because of the changes in federal forest policy, private forest lands in the United States are now being harvested at rates not seen since the beginning of the 20th century.

Non-industrial private forest (NIPF) landowners provide a large array of goods and services throughout the country. Their contribution to market goods may actually be proportionately the largest in the West, where the public lands already provide great amounts of public recreation and amenity values. In the East, NIPF's are projected to increase their timber harvests almost 30 percent from the 1986 levels until 2010. Hardwood timber harvests on NIPF lands in the South are actually projected to increase more than 60 percent from 1986 to 2010. These spectacular increases will require large investments, higher prices, enhanced public educational programs—and hopefully much more regeneration and intensive timber management—at a scale never before realized on NIPF lands in the U.S.

The country's nine million private timberland owners control nearly two-thirds of all timberland in the country. And it has been to the universities, with strong support from CSREES, that landowners traditionally look for new information about managing their lands. The combination of research conducted by the forestry schools, combined with the dissemination of that research through the cooperative extension network, has never been more essential.

Until recently, wood and wood fiber demands have been met in significant part from federal lands. The changes in federal forest timber harvesting policy means the bulk of supply requirements has shifted to privately owned forest lands. To meet this challenge, research priorities must be adjusted to better address the needs of private landowners, and to specifically enhance the productivity of such lands through economically efficient and environmentally sound means. Increased fiber imports are not a viable option as the Nation cannot afford the trade imbalance, loss of jobs, or the importing of potentially serious plant, animal, and human diseases and pests. These challenges, however, can be met by the university community through the building of integrated research and extension programs assisted by McIntire-Stennis, RREA, and NRI.

The non-industrial private landowners are not prepared to practice sustained forest management so critical to the health of our environment and economy. Enhanced forestry research and extension activities at the nation's universities are needed now! Although the McIntire-Stennis, RREA, NRI and Fund for Rural America programs address these concerns, there is need to increase funding for these programs within CSREES.

NAPFSC is very concerned about the three percent reduction proposed in President Clinton's fiscal year 1999 budget for the McIntire-Stennis forestry program. That is the wrong direction in light of the important challenges requiring enhanced forest resource research and extension. While much of the President's budget calls for increases in federal research and development funding, agriculture and forestry research were targeted for decreases. We believe that reducing the McIntire-Stennis program to the proposed level of \$19,882,000 is unwise and short-sighted. The National Association of State Universities and Land-Grant Colleges (NASULGC) has recommended a McIntire-Stennis funding level of \$21,665,000. We also support funding at least at this level.

For more than 25 years, McIntire-Stennis funds have been a critical part of University-based forestry research. McIntire-Stennis funds leverage significant additional state and private support and assure long-term forest resource research, graduate training, and outreach across the country. Each dollar in federal appropriations has been leveraged by a factor of nearly five in non-federal dollars in support of research programs having state, regional, and national significance.

IMPORTANCE OF FORESTRY RESEARCH AND EXTENSION

Research has improved the understanding of (1) the biology of forest organisms; (2) the structure and function of forest ecosystems; (3) human-forest interactions; (4) wood as a renewable raw material; (5) economics, environmental policy, and business management related to the forest industry; and (6) international trade, competition, and cooperation. McIntire-Stennis programs have advanced our knowledge of the forest ecosystem including the basic chemical, physical, and biological forces that influence forest health and productivity. At the same time, they have expanded the marketing horizons for environmentally friendly and renewable wood and fiber-based products. Very recent work has examined the economic and ecological benefits of combining agricultural and forestry practices into integrated land-use systems termed "agroforestry." Furthermore, these programs have significantly aided the development of new forest management systems for multiple-uses including timber, water, wildlife, grazing, recreation, and aesthetic purposes. The following two projects are recent examples of the benefits of McIntire-Stennis funding:

- Agroforestry—the practice of grazing cattle, growing agronomic crops and growing trees on the same land can help landowners earn a higher return per acre from their land while seeing environmental benefits (such as less erosion). One Coastal Plain study showed returns per acre from grazing were approximately \$9 per acre, but when trees were added to the land, timber profits were more than \$80 per acre. To make the most out of alley cropping (where cattle can graze in and around the trees) producers need legumes and grasses that perform well under shade. University of Missouri scientists have identified appropriate species.
- North Carolina State University's Forest Nutrition Cooperative discovered that present levels of pine productivity are more than 50 percent below the biologic and economic potential in the southeastern United States, that poor nutrition and not water is the principal factor that limits pine production, defined nutrient requirements for a desired level of production, and developed silvicultural systems that include fertilization. Thanks to these research results, fertilization of loblolly pine plantations has increased from 100,000 acres in 1989 to over a million acres in 1997. The increased wood production due to fertilization in 1997 alone will exceed four million cords over the next eight years.

The Renewable Resources Extension Act (RREA) provides funds for technology transfer and technical assistance to ensure that the benefits of forestry research are made available to private timberland owners and forest industries through CSREES. NASULGC has recommended funding RREA at a level of \$4 million for fiscal year 1999. President Clinton recommended a funding level of \$3,192,000 in his fiscal year 1999 budget. We urge the Committee to support the NASULGC request.

RREA funds have created programs and provided expertise that benefit private timberland owners and the timber industry throughout the country. For example:

- In Arkansas, over \$5 million has been estimated to have been earned or saved by timberland owners and the forest products industry because of RREA educational programs.
- In Virginia, 98 percent of the 341 landowners who participated in ecosystem management field days indicated that they would use ecosystem management practices to improve their own land. Those landowners collectively own 68,000 acres.

Similar stories can be found in all 50 states. It is vital that Congress continue proper funding for this important program for distributing the knowledge gained through our research institutions to the private landowners.

Lastly, we urge your support of the Competitive Grants Program administered under the National Research Initiative of the USDA. Peer competition for grants is at the heart of the university system and this program has become very important to natural resource scientists working within NAPFSC institutions. Research funds from NRI enable NAPFSC institutions to build upon the base provided by McIntire-Stennis. President Clinton's budget calls for a funding level of \$130 million for fiscal year 1999, a level also recommended by NASULGC, and we urge your Subcommittee to fund the program at the requested level.

The House and Senate Agriculture Committees recently completed work on the reauthorization of the Research Title of the Farm Bill. Both committees called for increased programs and activities for forestry research to address the increasing challenges facing the non-industrial private forests. The Senate bill encourages the Forest Service to allocate a greater share of its future research budget for collaborative research conducted by the land-grant universities, and urges the development of new cooperative programs between CSREES, the Forest Service and the land-grant universities. The House bill also directs the USDA to focus more attention and resources on efforts to increase the productivity of non-industrial private forest lands.

We are delighted that the authorizing committees have recognized the importance of expanding forestry research. However, the current and proposed levels of McIntire-Stennis and RREA funding are well below their authorized levels of one-half the Forest Service research budget (McIntire-Stennis) and \$15 million (RREA) respectively. Congressional action to increase these two important sources of federal support to universities toward their authorized levels would enable universities to address the expanded research and educational needs for privately owned forest lands.

WHO BENEFITS?

Forestry research provides many direct and indirect benefits to society by increasing forest productivity, improving forest health, and providing diverse employment opportunities—all while enhancing environmental quality and improving environmental protection. Forests contribute substantially to the economic well-being of the United States. Forestry related employment constitutes a large sector of our work force, including manufacturing, research, and recreation. Forest product companies alone employed 1,580,000 people in 1988, representing 8.5 percent of the Nation's manufacturing work force. Many of these benefits accrue in rural areas of the United States where economic and social viability remain a widespread concern. Private timber landowners depend on the generation of critical forestry research information and its accessibility through extension to support and improve the wide range of public and private benefits arising from their investments. Society as a whole benefits from the improved recreational opportunities and amenity values provided by healthy forests. By increasing our understanding of forest ecosystems, the forestry research-extension partnership also improves our ability to protect the environmental amenities associated with forest lands, including the protection of biodiversity and the improvement of water and air quality.

The past, present, and future success of forestry research and extension activities arising from the NAPFSC member institutions results from a unique partnership involving federal, state, and private cooperators. Much of the funding of forestry and

forest products research comes from the private industrial sector. However, such funding is commonly allocated for research within the companies themselves and is typically focused on near-product development where the benefits of investments are readily captured. Federal agencies have concentrated on large-scale national issues while state funding has emphasized applied problems and state-specific opportunities. University research in contrast, with the assistance of federal, state and private support, has been able to address a broad array of applied problems related to technology development and fundamental biophysical and socioeconomic issues and problems that cross ownership, state, region, and national boundaries. Schools and colleges with programs in forestry, forest products, and natural resources have the expertise in-house to address a broad range of problems and opportunities related to the forest resource and its utilization.

We encourage continued federal participation in this partnership with NAPFSC institutions through McIntire-Stennis, RREA, and NRI. We respectfully urge you to fund the McIntire-Stennis Cooperative Forestry Research Program, the Renewable Resources Extension Act, and the National Research Initiative at the levels requested by NASULGC for fiscal year 1999 and respectfully suggest increasing McIntire-Stennis and RREA to their maximum authorized funding levels.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF STATE FORESTERS

Thank you for the opportunity to present this testimony regarding the Agriculture Appropriations bill. We thank the Subcommittee for their support of our priorities in recent years, and we will need your help this year to correct yet another serious mistake on the part of the Administration in requesting the elimination of the Forestry Incentives Program. We are also supporting several other programs which are designed to ensure future timber supplies and improve the management of the Nation's non-Federal Forests.

As you know, these forests make up over 70 percent of the country's forested land base, and non-industrial private forests account for well over half of the Nation's timber supply. As you are also no doubt aware, the level of harvest from Federal lands has dropped precipitously in recent years, while demand for wood fiber has not. Several programs within this bill are critical to ensuring that the shift of demand to these non-industrial private lands doesn't impair their ability to produce forest resources sustainably over the long-term.

Most critically, programs such as the Forestry Incentives Program (FIP) are needed more now than ever. With its clear focus on reforestation, it is capable of helping keep large acreages of land in continuous forest cover, ensuring long-term timber supplies while protecting soil productivity and enhancing water quality. We strongly oppose the Administration's request to eliminate the Forestry Incentives Program and reject their rationale that the program is not compatible with the Natural Resources Conservation Service's strategic plan. Keeping lands forested, and assisting landowners in overcoming these serious obstacles to reforestation, most certainly will help NRCS meet its objectives of protecting watersheds and soils. We also note that Congress specifically reauthorized FIP during the 1996 Farm Bill, and the NRCS has a statutory responsibility to carry out the program.

We also note a great deal of concern amongst State Foresters over the NRCS administration of the FIP program. While the State Forestry delivery mechanism remains fundamentally sound, we are concerned that NRCS is not committed to making the program a success. We would encourage the USDA to re-evaluate the transfer of this program from the Farm Services Agency to NRCS, and to consider either returning the program to the FSA or transferring it to the Forest Service.

In fiscal year 1997, FIP helped plant trees on over 141,000 acres, and performed timber stand improvement on more than 22,000 acres. The program has been underfunded at around \$6 million for the past several fiscal years. NASF opposes the Administration's request to eliminate the program and urges you to fund it at \$10 million, its historic level.

We are happy to see that the Administration has requested renewed funding for the Renewable Resources Extension Act program (RREA), and we applaud the action of this subcommittee in restoring that program in spite of the Administration's request to eliminate it last year. NASF strongly supports this program, which we believe can help reach landowners, loggers, and foresters with sound advice that can help improve the productivity and management of the Nation's non-Federal Forests.

A particularly important function of this program is funding the Logger Education to Advance Professionalism (LEAP) program. While professional resource managers are involved in only a relatively small percentage of timber sales, loggers are involved in every timber sale, and it is critical that we reach as many of them as pos-

sible to ensure that these sales are conducted in an environmentally sensitive manner.

NASF is pleased that the Administration has included funding for this program in their fiscal year 1999 request. However, we urge the Subcommittee to fund the program at its full authorization level of \$7 million, above the continuing level suggested by the Administration.

NASF is also pleased to offer support for the Resource Conservation and Development program at slightly higher than the continuing level proposed by the Administration. This program has enormous potential to help develop sustainable business opportunities that can take advantage of underutilized forest resources.

NASF would also like to submit the following recommendations for forestry-related research programs that are funded through this appropriations bill:

Cooperative Forestry (McIntire-Stennis) Research.—This program supports forestry and wood fiber related research conducted by the Nation's public universities. University-based research is an important and growing part of the collaborative research effort involving Federal, State, and industry scientists. It is critical to the creation of new technologies that will increase the efficiency and productivity of forest management on all forest ownerships. McIntire-Stennis Research funds are granted directly to public colleges and universities on a matching basis. This program has provided an important foundation of funding for research that has not been supported through other means. NASF recommends increasing McIntire-Stennis Research to \$25 million, to reflect the high priority we place on forest research that will help us meet fiber demands in a sustainable fashion.

National Research Initiative.—This competitive grants program funds research on key problems of national and regional importance in biological and environmental sciences. The NRI awards grants on a matching basis to university researchers using modern biological, environmental, and engineering sciences to address critical problems in agriculture and forestry. NASF strongly supports at least 20 percent of the NRI funds being dedicated to natural and renewable resources research.

Figures for NASF's Budget Recommendations are listed below. Thank you for considering our requests.

	Fiscal year—		
	1998 enacted	1999 admin.	1999 NASF
NRCS Conservation Programs:			
Forestry incentives	6.000		10.000
RC&D Program	34.377	34.377	35.000
CSREES Forestry Related Programs:			
RREA	3.400	3.400	7.000
Mc-Stennis Coop. Res	21.000	20.000	25.000
NRI	105.700	130.000	115.000

PREPARED STATEMENT OF CHARLES G. SCALET, PRESIDENT, NATIONAL ASSOCIATION OF UNIVERSITY FISHERIES AND WILDLIFE PROGRAMS, SOUTH DAKOTA STATE UNIVERSITY

The National Association of University Fisheries and Wildlife Programs (NAUFWP) submits this statement on the proposed fiscal year 1999 budget for the Cooperative State Research, Education, and Extension Service (CSREES), U.S. Department of Agriculture.

Members of NAUFWP include 53 Universities. We seek to enhance public understanding of the needs for improving natural resource management and to advance the science and practice of sustainable uses and management of the resource base. Our efforts focus on cooperative work with partners and customers to advance research, education, and extension to benefit people and communities throughout the country. This service and outreach are among the most time-tested, successful, community-based conservation efforts in the U.S.

These proven research, educational, and extension programs of the CSREES and its Land Grant University partners initiate relevant, positive changes in attitudes, and stimulate constructive actions to implement new technologies and sound approaches and practices by private landowners, resource managers, community decision-makers, and other members of the public. Accumulated experiences show that investments of funds and time yield significant benefits to individuals and to the

states and nation by building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture industry.

The pressing challenge is to have the CSREES/Land Grant University System, with its grass roots credibility and delivery system, reach more of the approximately 10 million private landowners and managers who control more than two-thirds of the U.S. lands, or approximately 1.35 billion acres. Regrettably, the proposed fiscal year 1999 budget for CSREES is far less than adequate to help private landowners and managers move forward in achieving sustainable uses of the resource base. More emphasis on proper uses of natural resources is needed to achieve a more sustainable society, thereby avoiding costly restoration efforts.

In view of these shortcomings, NAUFWP strongly recommends that the following five adjustments be made in the proposed fiscal year 1999 budget.

1. That the Renewable Resources Extension Act (RREA) be funded at a minimum of \$9.5 million in fiscal year 1999. This level of funding (1) is less than the \$15 million authorized level, and (2) is essential to enable the Cooperative Extension Service system to accomplish the goals and objectives set forth in the mid-1990's Report To Congress. Needs for RREA educational programs continue to mount as land holdings become more fragmented, more landowners need information, and concerns of society grow for managing natural resources on a sound basis to enhance water quality, fisheries, wildlife, and human health, while sustaining the productive capacity of the resource base. Among the resource management needs is outreach of information to ensure continuation of the flow of goods and services from the 490 million acres of nonfederal forests owned by millions of nonindustrial private forestland owners. Responses to these accumulating needs are supported by state and local partners who contribute an average of \$4.00 to each RREA \$1.00.

Making \$9.5 million available would permit the Cooperative Extension Service to expand its outreach services to assist more than 500,000 private owners to improve their decisions and management on an additional 35 million acres, while increasing productivity and revenue by an estimated \$200 million.

2. That Smith-Lever 3(b)&(c) base program funds be increased to \$280,950,770 (+9 percent), with at least one-third of this increase targeted to Extension's Natural Resource and Environmental Management (NREM) programs. This adjustment in the proposed fiscal year 1999 budget is needed to provide more adequate "block grant" funds for Land Grant Universities to extend essential educational outreach based on assessments of local needs. An increase in these funds is required to develop the critical level of NREM staff services at state and local levels to focus and leverage limited funds to address critical natural resources situations that involve farmers and small landowners in both rural and urban communities nationwide.

Among pressing needs for Extension's attention and services are a host of natural resource management challenges and public issues, including forest health, wetlands maintenance and restoration, water quality, endangered species, and people/wildlife interactions. More adequate Extension responses to these topics and others have been called for in the 1990 FACT Act, as well as in various Farm Acts.

Continued close cooperation among the State Cooperative Extension Service, State Fish and Wildlife Agencies, and other appropriate state and federal agencies, conservation organizations, and local people is critical to build responses to pressing needs in managing natural resources on a sustainable basis. One cooperative effort, the Extension 4-H Youth Natural Resources program and its many projects, continues to attract participants, with more than 1,350,000 young people from both urban and rural communities presently enrolled. Additional Smith-Lever funds targeted appropriately would enable CSREES to respond to more of its goals and responsibilities, especially those in the NREM National Strategic Plan.

3. That \$500,000 be restored to the fiscal year 1999 budget for Rangeland Research Grants. Elimination of the only federal competitive grants program for rangelands, as proposed in the fiscal year 1999 budget, has serious adverse implications for watersheds, water quality, fisheries, wildlife, and other natural resources. Restoration of funds, as recommended, is necessary to focus some needed practical attention on the more than half of the U.S. land area in rangeland. Modest appropriations for Rangeland Research Grants prior to fiscal year 1998 supported some of the most important rangeland studies and services carried out in the past decade. Many additional situations requiring evaluation and technical services deserve immediate attention.

4. That at least 25 percent of the total increase in funds for Pest Management be directed to technical services and educational outreach programs to prevent damages and control vertebrates, such as deer and other animals, in urban and rural communities, and to address invasive exotic species and noxious weed problems on rangelands and elsewhere. This focus on vertebrates and invasive species in pest situations has been identified by private landowners, including agricultural producers.

Merely increasing funds for pest management would provide no assurance that the most pressing problems are addressed. Targeting a percentage of the Pest Management funds for vertebrate and invasive species would help ensure that research and educational programs advance the knowledge and capability of landowners and managers to prevent and reduce losses in situations involving these species. These programs require strengthening to restore, manage, and sustain the biological integrity of the U.S. natural resource base upon which our agricultural and natural resource economies depend.

5. That the Hatch and McIntire-Stennis funds be restored to at least fiscal year 1998 levels by adding \$15,677,000 to the proposed fiscal year 1999 budget. Both of these research programs, conducted through Land Grant University partners and other educational institutions, are essential to address natural resource situations and issues important in achieving sustainability in agriculture and other uses of the resource base.

We are pleased that the Administration has proposed a \$9.5 million increase for natural resources and the environment studies through the National Research Initiative (NRI) Competitive Grants. However, what is proposed to be done under this "Area of Special Emphasis" does not address critical natural resource research needs of deep concern to the natural resource community and the public. In view of this mismatch, and if necessary, redirect funds from the total increase for NRI to fund the Hatch and McIntire-Stennis programs at fiscal year 1998 levels.

SUMMARY

Based on considerations outlined above and to strengthen community-based conservation and management of natural resources, the National Association of University Fisheries and Wildlife Programs recommends the following for the CSREES fiscal year 1999 budget.

1. Fund the Renewable Resources Extension Act at least at \$9.5 million;
2. Increase funding for the Smith-Lever 3(b) and (c) base program by 9 percent (\$23,197,770);
3. Restore \$500,000 for Rangeland Research Grants;
4. Designate at least 25 percent of the total increase in funds for Pest Management for prevention and control of damages by vertebrates and invasive species; and
5. Restore Hatch and McIntire-Stennis funds at least to fiscal year 1998 levels.

These funding levels would help in responding to current public needs and legal responsibilities, and assist in carrying out programs more effectively. NAUFWP respectfully requests that the Appropriations Committee approve these adjusted figures.

PREPARED STATEMENTS OF THE ASSOCIATION OF AMERICAN VETERINARY MEDICAL COLLEGES AND THE NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND GRANT COLLEGES

This testimony represents the concerns of both the Association of American Veterinary Medical Colleges (AAVMC) and the NASULGC Board on Veterinary Medicine.

The AAVMC coordinates the affairs of the 27 U.S. veterinary medical colleges, the four Canadian colleges of veterinary medicine, departments of veterinary science and comparative medicine and the animal medical centers. In addition, the Association fosters the membership's teaching, research and service missions both nationally and internationally. The principal goal of the AAVMC is improving the quality of life for both humans and animals. The AAVMC realizes this goal by addressing the needs of both consumers and the producers of food and fiber, as well as the needs of all animal owners.

The Board on Veterinary Medicine is a component of the Commission on Food, Agriculture, and Renewable Resources within the National Association of State Universities and Land Grant Colleges. Membership on the Board on Veterinary Medicine is comprised of colleges of veterinary medicine located at land-grant institutions. This includes 25 of the 27 United States Colleges of Veterinary Medicine. Heads of departments of veterinary science, comparative medicine, or pathobiology in NASULGC member institutions also are members of the Board on Veterinary Medicine. The purpose of this board is to address the concerns of animal health and disease, animal welfare, public health and regulatory medicine, zoonotic diseases, environmental issues, public policy related to the use of animals and products for the benefit of animals, public policy related to funding of higher education, and other issues as identified by any of veterinary medicine's diverse constituencies.

Within the AAVMC and the Board on Veterinary Medicine, we believe that these comments will highlight and support priorities set forth by the advisory board, particularly those dealing with environmental stewardship, emerging animal issues, national agricultural genome research, food safety research, and education and outreach. We also believe that many of the implied goals of the priorities can be met through a number of initiatives that will be discussed later.

Food safety is an issue of paramount importance, not because it is currently a popular political topic, but because it affects each and every person in this room and in this nation. In terms of food safety, everyone is a stakeholder, the grower, the producer, the packer and finally the consumer. While in many cases food safety concerns are traced to improper handling by the consumer, we can and should do more to assist farmers and ranchers produce food that minimizes food borne illness at the consumer level. We need to develop a body of knowledge from applied on-farm research that will prepare producers, extension specialists, and veterinarians to be better "applied practitioners" of food safety for on-farm interventions. These on-farm interventions are important to all stakeholders and especially to veterinarians, extension specialists, and the producer themselves.

Another major theme that should be considered is the development of integrated solutions to problems of air and water quality. Solutions can come from multidisciplinary research in Veterinary Medicine, Animal Science, and Environmental Science. The integration of these fields will allow for many types of possible breakthroughs that will benefit all agricultural stakeholders, both producers and consumers. This type of research program should include species specific issues allowing a focusing on the uniqueness of production and pathogens to that individual species.

At this time we will briefly mention four proposals by the AAVMC and the BOVM that will address the priorities of major importance to us.

First, a major new programmatic thrust is needed in animal health and disease, under section 1433 contained within Title VIII of the Federal Agriculture Improvement and Reform Act of 1996. This new programmatic effort, will be to insure the production of healthy animals for a healthy food supply. We are calling this initiative animal health to healthy humans. Due to the increasing realization that biological systems are ultimately linked in some form or fashion, it is timely to approach problems in a multi-disciplinary manner. The causes of and the methods to control food borne illness have become perspicuous examples of this fact. The agricultural industry is going to increasingly be asked to step up and shoulder responsibility for the food safety aspects of public health. Therefore a national commitment by Congress, funded through the Department of Agriculture, dedicated to the continual goal of identification, control, and elimination of food borne illness is a moral if not an economic must for those involved in production agriculture. The establishment of a new animal health to healthy humans initiative that is continuously funded under animal health and disease research base funding is indicated. The described new initiative should be established with the addition of five million in new funding awarded to Section 1433, which is the continuing Animal Health and Disease Research Program, with yearly increases over a three year period up to a sustained 15 million dollar level.

Base funding that supports ongoing research efforts into the ecosystem of infectious agents, such as Salmonella and E. coli O157:H7, that pose a serious hazard to human health via contamination of food stocks, is needed. In addition, improvement of on-farm and environmental knowledge of these known pathogens and understanding the methodologies to control these food borne pathogens will become increasingly important to protect U.S. export markets. The increase funding initiative for Animal Health and Disease will facilitate the gaining of an improved understanding of microbial ecology as it relates to the contamination of food supplies. With the information derived from this newly focused animal health to healthy human research effort, a foundation of knowledge will be in place to support new training programs, both at the professional and graduate levels, so that adequate numbers of people with backgrounds working with HACCP systems, ISO-9000 standards, and Sanitary/Phytosanitary Standards. The fundamental knowledge as well as the programs creating experts in food safety intervention methodologies are in high demand and sorely needed for U.S. agriculture. The creation of a new animal health initiative in the form of ongoing national core funding is warranted considering the global marketplace.

Our second proposal is to develop on-farm pre-harvest food safety systems for each of the five major animal product commodities, including eggs, poultry, dairy, beef, and swine. We recommend that this initiative be funded by a \$25 million-dollar increase in the National Research Initiative (NRI), on a sustained basis, split between the two mission areas of animal systems and natural resources and the environment. This new emphasis in the NRI should dedicate at least \$2 million for

work in each described animal commodity area. Collaborative studies need to be carried out with a variety of experts and disciplines studying on-farm systems to develop strategies for understanding the ecology of pathogens and avoiding contamination of animals and animal products before they leave the farm gate. Information gained in the study of microbial ecology will assist in the development of HACCP procedures or other on farm intervention procedures that result in risk identification and assessment, and risk management of pathogens in each commodity area. This type of collaborative research that encompasses multi-disciplinary approaches to problem solving is increasingly necessary. It is important to realize the problem solving capabilities that can be derived from integrative biology approaches. Therefore, funds are needed to support ecosystem studies by veterinarians, animal scientists, and environmental scientists. Development of sustainable systems for intensive food animal production that result in minimal impact on the quality of air and water and result in a safe food supply are the goals. We are concerned that the draft research priorities do not adequately address the need for on-farm, pre-harvest research and application of knowledge at this stage of animal production.

Thirdly, we recommend that we protect our domestic food supply and prevent non-tariff trade barriers to our export markets by using knowledge generated by research on foreign animal diseases and new and reemerging diseases. Funds required for this type of research could flow intramurally as well as extramurally through ARS and CSREES. Considering the global economy and increasing recognition that foreign animal diseases may not be so foreign, it is paramount that we ready ourselves for challenges that may threaten entire domestic animal agricultural sectors, whether they be a real epidemiological problem or just politically based. On the export side, the General Accounting Office (GAO) has recently cited a USDA survey estimating up to \$5 billion in legitimate US agricultural exports have been prohibited because of non-tariff trade barriers.¹ One of the best ways to prepare ourselves for issues of a sanitary or phytosanitary nature, whether they be import or export, is via knowledge. This nation's research mission can and should advance this knowledge. An increased awareness represented by specific funding of research into foreign animal disease, as well as those diseases that qualify as new and reemerging, is fundamental in order to protect markets and maintain a favorable balance of trade for this nation's agriculture. Our medical colleagues that work only on one species, the physicians, have recognized for years there is no such thing as exotic or foreign disease in human medicine. All human ailments fall on to a single list with various levels of concern attached to them because anyone of those ailments can end up in the middle of this country with one airplane ride. This is becoming the case for our animal agriculturists. Remember, the days of our animal agriculture isolation are quickly disappearing. Therefore research funding directed toward understanding and preparation for new and emerging animal disease threats is not only warranted, it is a proper use of public funds and should be considered a form of national defense.

Proposal number four is a recommendation to determine the food safety impact of various animal production management strategies so that sustainable practices with the lowest possible risk to consumers will be widely used. The Fund for Rural America would be a logical avenue of funding for this type of applied learning research. Research is needed that fairly evaluates various production techniques for effects on human health, such as animal feeding of low level antimicrobial agents and the development of antimicrobial resistance. Furthermore, research that may elucidate the need for cultural and management modifications to traditional animal production systems will potentially be more widely accepted if publicly funded on a national level. We include under this proposal those genomic studies that would enable rapid identification of microbes through molecular fingerprinting. This is an example of collaborative efforts at the applied level. Development of molecular fingerprinting strategies for microbe identification would be an essential element to management systems for livestock, and natural resources and the environment. This type of knowledge is paramount if pathogenic organisms, including Salmonella and E. coli O157:H7, are to be controlled or even eliminated in the human food supply.

In conclusion, we would like to thank the Subcommittee for giving the AAVMC and the BOVM this opportunity to discuss stakeholder issues in this forum. We hope that our comments will be helpful to you in prioritizing research initiatives within the USDA.

¹ GAO Report/NSIAD-98-32, Agricultural Exports, January 1998. pp. 9.

PREPARED STATEMENT OF DR. JAMES H. MORTENSEN, ASSOCIATE DEAN, RESIDENT INSTRUCTION, PENNSYLVANIA STATE UNIVERSITY, ON BEHALF OF THE ACADEMIC PROGRAMS COMMITTEE ON ORGANIZATION AND POLICY (ACOP)

Mr. Chairman, members and staff of the subcommittee, I appreciate the opportunity to address the important issue of science education in the United States and the 1999 budget for USDA. Few issues are of more importance to the well being of our country and the future of our food and agriculture system.

Over the last several years, three White House reports and three presidential administrations have called for more emphasis by federal agencies on undergraduate education and K-through-twelve science education. In 1992, the Federal Coordinating Council for Science, Engineering, and Technology (FCCSET) recommended that federal agencies should examine the impact of federal research support on university undergraduate and graduate education and identify strategies to ensure against unintentional degradation of the educational mission and excellence of the research-intensive universities. In the same year, the President's Council of Advisors on Science and Technology (PCAST) recommended that federal agencies should ensure that their programs encourage universities to reemphasize education rather than discourage them. President Clinton called for increased emphasis on education at all levels in his 1997 State of the Union message and placed even greater emphasis on education in his 1998 State of the Union address.

Federal agency involvement with higher education is especially critical to American agriculture. The great size of the American food and agricultural system and its very favorable competitive position in the world economy is due in large measure to our ability to substitute scientific knowledge for natural resources and labor. Theodore Schultz, using agriculture as his model, won the Nobel Prize in economics for demonstrating that the return on human capital was much higher than the return on physical capital.

The Board on Agriculture Budget Committee of the National Association of State Universities and Land-Grant Colleges carefully constructed a list of priorities for funding of USDA programs in research, education and extension. Preeminent again in this list is the Higher Education Challenge Grants Program administered by the Science and Education Resources Development unit of the Cooperative State Research, Education, and Extension Service.

- This program is a matching program, generating dollar-for-dollar non-federal funds, thereby doubling the federal investment.
- It is a highly competitive program, assuring only the most appropriate, highest quality projects will receive funding.
- It supports innovative and model projects that can and are transferred to other campuses throughout the system.
- It promotes partnerships among universities and colleges as well as with private industry.
- It promotes faculty development in order to be better able to serve student educational needs in the biological and social science area.
- The program allows us to enrich curricula to meet needs of potential scientists, technicians, and future informed non-science citizens.

A multitude of outstanding examples of successful Challenge Grants can be cited, however, noting but two illustrates the innovative nature and important role these grants play in our agriculture and natural resource system.

New Mexico State University.—Improving Undergraduate Science Education in Horticulture and Agriculture Education.

Iowa State University.—Web-Based Education: Creating Authentic Learning Environments in Agriculture.

Present funding for this Higher Education Challenge Grants Program is \$4.35 million. The Academic Programs Section and the Board on Agriculture Budget Committee of NASULGC recommend funding for fiscal year 1999 of \$7.0 million. This increase will allow the agency to award more and larger grants which will encourage cooperative grant proposals from participating schools. The percentage of submitted proposals funded in the life of this program is about 20 percent. This year, the number of proposals submitted has increased from 117 to 171, indicating the tremendous need for the increased funding.

The Challenge Grants Program is the cornerstone of the higher education effort of the USDA. This program complements and enhances the successful efforts of the 1890 Capacity Building Program and the new programs for the 1994 land-grant institutions.

The very successful Institution Capacity Building Grants Program for 1890 Institutions strengthens the linkages among historically minority institutions and other colleges and universities, the U. S. Department of Agriculture, and private industry.

This program is presently funded at \$9.2 million. The Academic Programs Section and the Board on Agriculture Budget Committee recommended fiscal year 1999 funding at \$10 million. Building and enhancing the capacity of the 1890 institutions to educate undergraduates in agriculture and natural resources provides a sound base from which these institutions can enrich their programs through the Higher Education Challenge Grants Program. Similarly, the 1994 land-grant institutions are building and enlarging their capacity to educate Native American students in agriculture and natural resources, primarily through the 1994 Education Equity Grants Program and the interest from the Native American Endowment Fund. In addition, the 1994 land-grant institutions have authorization for a \$1.7 million Capacity Building Grants Program to further develop their educational capacity and encourage cooperation with 1862 and 1890 institutions. These programs, aimed at substantially improving educational efforts of the 1994 institutions, many of which are only 20 years old and all with a scarce resource base, complement perfectly the Higher Education Challenge Grants Program. The Higher Education Challenge Grants build upon the educational foundation provided by the 1994 Education Equity Program, Endowment, and Capacity Building Programs. The Academic Programs Section and the Board on Agriculture 1998 Budget Committee recommends full funding for all of these necessary programs.

The Hispanic Education Partnership Grants Program is a highly competitive program that helps bring educational opportunity and innovation to institutions and is heartily endorsed by the Academic Programs Section. Projects such as that funded at Miami Dade Community College to create a Food and Beverage Export curriculum in conjunction with the Caribbean Basin Agriculture Trade Association, the World Trade Center, the Miami Free Zone and other partners is an example of the liaisons created to serve our students. The partnership between Rancho Santiago College, California Polytechnic State University, and the United Agribusiness League to promote diversity in Food Systems Education is also an example of public/private cooperation to better serve students in agriculture. The Academic Programs Section and the Board on Agriculture Budget Committee recommends funding at \$2.5 million.

Another cornerstone of this educational effort is the Multicultural Scholars Program. This program allows institutions to encourage a variety of educationally outstanding minority students to enter the field of agriculture and natural resources. Again, it further extends the cooperation between 1862, 1890, and 1994 land-grant institutions. Presently, the program is funded at \$1 million, with funds carried over to allow for a \$2 million program every other year. We recommend continued funding for this important program.

The Graduate Training Fellowships is the only federal program targeted specifically to the recruitment and education of pre-doctoral students for critical food and agricultural science positions in areas identified as having a shortage of expertise. The Academic Programs Section and the Board on Agriculture Budget Committee recommend funding at \$4 million.

The above-mentioned programs have been extensively reviewed by the USDA-land-grant partnership members and have received a high priority ranking by both the Academic Programs Section and the Board on Agriculture of the National Association of State Universities and Land-Grant Colleges.

We appreciate the opportunity to submit this testimony and encourage your positive response to these prioritized requests.

PREPARED STATEMENT OF DR. JAMES J. ZUICHES, CHAIR, NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND GRANT COLLEGES

Mr. Chairman, I am James J. Zuiches, Dean of the College of Agriculture and Home Economics at Washington State University, and Chair of the National Association of State Universities and Land-Grant Colleges' fiscal year 1999 Budget Committee. I represent the 75 universities that work in close cooperation and partnership with the USDA Cooperative State Research, Education, and Extension Service. These universities comprise the State Agricultural Experiment Stations, Cooperative Extension, and Academic Programs of the land-grant universities, representing the 1862, 1890, Tribal Colleges, and Hispanic-serving institutions. We employ over 24,000 professional staff who directly affect over 40 million Americans annually through our Cooperative Extension Service, educate more than 100,000 students in colleges of agriculture and life sciences, and conduct research projects central to the Nation's interests in food, agriculture, natural resources, and the environment.

My colleagues and I appreciate the support that the land-grant university system has received from this Subcommittee in the past; and I expect that the continued

investment in agricultural research, extension, and education programs will continue to benefit both farmers and consumers.

Our programs are designed, in cooperation with USDA and the constituencies who support our programs from the state, county, and private sector.

Our goal is to maintain a strong American agriculture. Through research and education, we support the U.S. food, fiber, and environmental system.

Unfortunately, the research and development funding for agriculture has eroded in the last decade. The funding for Agricultural Research and Extension programs, the lifeblood of our food supply system has shrunk by 8 percent in constant dollars. The President's proposal for USDA for fiscal year 1999 continues this deterioration of funding for agricultural research and extension. Comparatively, the research and development for space exploration, the environment, basic science research, and health research has increased in constant dollars from 23 to 58 percent over the last ten years.

NASULGC is requesting an 8 percent overall increase in support of research and education for the food system.

BASE FUNDS—FORMULA FUNDS: THE CORE SUPPORT OF THE SYSTEM

Federal funds, appropriated as Hatch, McIntire-Stennis, Animal Health, Smith-Lever (3b and c), Evans-Allen (1890) and 1890 Colleges and Tuskegee Extension are critical base funding of the partnership. These funds leverage state, county, and grant funds, and support the faculty and staff to address urgent problems facing agriculture and consumers.

NASULGC is specifically requesting a 5.7 percent increase in base funds to invest in long-term food security, global competitiveness, and environmental quality. Our request contrasts sharply with the President's budget request for fiscal year 1999. Unfortunately, the President's request proposed reductions in Hatch, Smith-Lever, and McIntire-Stennis, and no increases in other areas. These base funds have eroded by 16 percent in the last decade. Secretary Glickman's recent analysis confirms this erosion. Yet, these are the funds that leverage over \$4.00 of state, county, and private sector money for every dollar of federal funds. Without this critical funding to conduct research on everything from pest management to controlled atmosphere storage, we are putting the world's most abundant and safe food supply at risk to new diseases, new pests, and less efficient storage and handling techniques. We are also putting at risk our competitiveness in international markets.

The investment in agricultural research and extension through these mechanisms, has resulted in the cheapest and safest food supply on the planet. When compared with our discretionary income, Americans spend only 11 percent of our disposable income on food. This is the result of research and extension for a food system which enables the consumer dollar and the welfare families' food stamps to purchase inexpensive, safe, and nutritious food. This is a food system that creates jobs, competes worldwide and conserves its natural resource base.

ACCOMPLISHMENTS OF AGRICULTURAL RESEARCH AND EXTENSION

The scientists and educators involved in agricultural research and extension have contributed to the expansion of food exports and the creation of new jobs, both on- and off-farm. Specific examples include the opening of the Japanese market for U.S. beef and apples. In Brazil, imported apples are now accepted from the United States. Seed crops are sold worldwide because the United States farmers' ability to meet seed health standards of countries.

Every year, millions of individuals are affected by food-borne diseases. The research conducted at land-grant universities has contributed to the development of the Hazard Analysis and Critical Control Point System (HACCP). Recent federal regulations require meat and seafood processors to use HACCP to identify processing points where bacterial contamination is likely to occur and can be prevented. Land-grant university faculty are helping food processors, producers, and handlers to implement HACCP programs.

A specific example of food contamination that was solved by Washington State University occurred in 1997 when over 90 cases of salmonella thypharium DT-104 were experienced in Yakima Valley. The median age of cases was 4 years old and 91 percent of the illness occurred in the Hispanic community. We discovered the cause was homemade soft cheese made from unpasteurized milk. Developing an alternative recipe and communicating it to the Hispanic community through volunteers resulted in a 90 percent reduction in salmonella infections. Support from federal Smith-Lever and EFNEP funds, state and county funds, and the private sector made this food safety success story possible.

The challenge to agriculture is also to reduce and eliminate waste and protect the air, soil, and water quality on which agriculture depends. Collecting and disposing properly of unwanted pesticides and their containers, managing wood waste, composting, and wastes of agricultural by-products, as well as bio-solids, have all contributed to reduced costs to cities, consumers, and farmers. These efforts have also helped protect the environment from improper disposal of wastes.

These success stories are a result of the ongoing research funded through the base programs.

NATIONAL RESEARCH INITIATIVE COMPETITIVE GRANTS (NRI)

NASULGC supports the continued and expanded funding for the NRI. Special emphasis will be given to plant, animal, and microbial genomics and food safety in support of the President's initiatives and consumer demands. The food genomics effort, or agricultural genomics more generally, would complement funding by the National Science Foundation, NIH, and the Department of Energy. This food genomics program would focus on understanding the genes responsible for economically important traits in plants, animals, and microbes that are essential to agriculture. The program would also support preservation of diverse germplasm necessary to meet changing environmental and market needs while insuring biodiversity. Our specific request is to raise the NRI from \$97.2 million to \$130 million by expanding the funding for each of the program areas and adding the agriculture (food) genomics program.

Priorities for Higher Education in USDA.—Funding science education in food, agriculture, and natural resources is essential to attracting students from diverse backgrounds. These programs in higher education, in particular the institutional challenge grants, build the curriculum and local instructional capacity. Other programs provide student scholarships. We are requesting an increase for priorities for higher education to \$27.65 million. I have attached the specific budget requests for each program area.

The NASULGC community supports the President's budget request to address the USDA Civil Rights action team recommendations. These programs strengthen research, education, and extension assistance to minority and limited resource populations.

Targeted priority areas.—Major national priorities in food safety, pest management, water quality, and sustainable agriculture are joint research and extension efforts. Research investigates and discovers ways to improve the food production system and protect agriculture's natural resource base. Extension programs increase consumer awareness and understanding of national priorities. Other areas that deserve continued support include farm safety education to reduce farm accidents and deaths; managing risk issues in a changing agriculture; studying global change and soil quality; supporting rural development and economic development; and assisting children, youth, and families at risk.

The crux of successful agriculture is going to be the management of pests, whether diseases, weeds, or insects. Increased support for integrated pest management (IPM) and pesticide clearance (IR-4) is essential. The pest control strategies will also support the re-registration process for use of pesticides on minor crops and the registration of safer and more environmentally compatible pesticides. The successful re-registration or registration of new pesticides are necessary to meet the requirements of the Food Quality Protection Act. The pest management alternatives and expert IPM decision support systems programs continue to identify lists of crops/pests/control combinations where only one or limited number of controlled options are available. Finally, the pesticide applicator training program educates growers, commercial applicators, and home owners about IPM practices.

Other on-going programs.—USDA's research and extension efforts on rangeland issues, aquaculture, renewable resources, supplemental and alternative crops, tropical and subtropical agriculture reflect the diversity of agriculture in the United States. Communicating these programs also requires support from the agricultural telecommunication system, called A*DEC at \$900,000. The Expanded Food and Nutrition Education Program (EFNEP) is essential nutrition education program used in all 56 states and territories. EFNEP continues to be a vital and necessary way to teach low-income families about diet, nutrition, and financial decisions concerning food and health.

Finally, the federal administration category includes development of a new management information system to increase accountability and assessment efforts.

I have submitted the detailed request for fiscal year 1999 in each of these areas for your consideration.

The leaders of agricultural research and extension are extremely proud of the role that we have played in keeping agriculture competitive worldwide, in protecting the environment, and in combating food-borne illnesses. As I indicated in my opening comments, the USDA and Agricultural Research and Extension system, in partnership with the land-grant universities, is the heart of the U.S. food system. Our budget request recognizes the continued concerns of the public and agriculture to remain competitive and successful. Base funding, competitive funding, and targeted programs represent multiple vehicles to achieve the goals of a successful agriculture that keeps our nation's food system productive, safe, and competitive.

Thank you for this opportunity to communicate our concerns and needs. Thank you for your consideration of our request.

PREPARED STATEMENT OF DR. THOMAS L. PAYNE, DIRECTOR, AGRICULTURAL RESEARCH AND DEVELOPMENT CENTER, OHIO STATE UNIVERSITY, ON BEHALF OF THE EXPERIMENT STATION COMMITTEE ON ORGANIZATION AND POLICY (ESCOPE)

Mr. Chairman, members of the committee, we, The State Agricultural Experiment Station System, representing fifty-nine State and Territorial Experiment Stations, sixty-three Schools and Colleges of Forestry, seventeen 1890 Land-Grant Institutions and Tuskegee University, twenty-seven Colleges of Veterinary Medicine and forty-two Schools and Colleges of Home Economics, need your help! Our research programs are vital to our nation's agriculture, and yet federal support of those programs has declined 16 percent in real dollars over the past decade. Now, in the Executive Budget for fiscal year 1999, our base programs are slated for more reduction. I can't understand this. Our research programs are one of the best investment money can buy. Estimates range from \$1.30 to \$1.60 in return benefits for every dollar invested in our research. We need your help to re-instate the reductions and provide needed increases. (Please refer to research budget details in the NASULGC fiscal year 1999 Budget included in the testimony of Dr. James Zuiches, Chair, Board on Agriculture Budget Committee).

Our fiscal year 1999 budget request was developed through a partnership with our stakeholders, federal research partners and our Extension partners. The budget focuses on our responsibilities as the state partners to assist and support the food and fiber systems of our nation. These systems face challenges unparalleled in our nation's history. The realities of NAFTA and GATT coupled with proposed changes in farm programs are creating an environment of revolutionary, not evolutionary, change in American agriculture. The products of research, including new and innovative technologies, are needed more than ever before. These research products must reduce economic and environmental risks, improve competitiveness in the international marketplace, develop ways to add value to raw agricultural products, maintain and enhance a safe and nutritious food supply, and increase that food supply to meet the demands of our ever-increasing human population around the world.

The fiscal year 1999 request for research focuses on the following critical areas targeted for increases:

- Base Programs;
- National Research Initiative;
- Food Safety;
- Pest Management Control Strategies: Pest Management Alternatives (IPM)/Biological Control, Minor Crop Pest Mgt.-IR-4;
- Soil Quality Initiative;
- Water Quality Initiative;
- Sustainable Agriculture; and
- Small Farms Initiative.

Base Programs.—Our budget request includes a 5.7 percent increase in base programs. It is our number one priority! Base programs form the foundation on which all of our research efforts are built. The base programs, by analogy, are the fire departments and trucks of research standing ready for immediate response to agricultural needs at the state, regional and national levels. We support the need for competitive grants programs, but such programs do not provide support for immediate response. We are able to respond quickly to the crises of disease and pest threats to our crops, for example, because of the infrastructure available through base program funding. The crops would be gone if before we could respond if our scientists had to write a grant proposal, wait for the review and eventual funding. These programs are very important!

This priority has broad-based support from the customers of the system, and the research conducted under these programs undergoes review by scientists and ad-

ministrators. And very importantly, the research priorities are determined based on input from customers at the local, state and national level.

National Research Initiative.—Our budget shows a significant increase for the National Research Initiative. It continues to be a high priority as we ask for your support in reaching the authorization level of funding. The program is the vital competitive of federal research support for agriculture. Included in the program is the new initiative for Agriculture (Food Genomics). The Food Genome program will support research to identify and develop a functional understanding of genes responsible for economically important traits in plants, animals, and microbes of importance to agriculture. Knowledge of genome organization and gene function is critical to ensuring future genetic improvement of agriculturally important genes. The program also will support preservation of diverse germplasm important to meeting the changing environment and market needs while ensuring biodiversity. It is essential for this to be funded if our nation is to continue to maintain its lead and global competitiveness in the development of biotechnology in agriculture.

Food Safety Initiative.—Our budget request reflects the need for increased research on food safety. Research shows that 90 to 95 percent of foodborne illnesses can be prevented by proper food handling and preparation. Yet each year in the United States, food-borne illnesses affect some 33 million people. Most susceptible are the young, and the old and people with compromised immune systems. The cost of health care associated with these illnesses ranges from \$2.9 billion to \$6.7 billion. The USDA/Land-Grant partnership is providing a holistic, “field-to-fork” approach to reducing food-borne illness.

Pest Management Control.—We request increases in the Pest Management Control Strategies categories to support the USDA IPM initiative that has as its goal farmer implemented IPM methods on 75 percent of total crop acreage by the year 2000. These programs identify the Land-Grant university system, both research and extension, as major entities in the development and implementation of this program. IPM places emphasis at the regional and local levels with major involvement of producers and private industry to set the priorities for research and technology transfer.

Soil Quality Initiative.—We request support for a new research initiative on Soil Quality. This initiative is proposed in support of efforts toward whole farm and ecosystem level planning. Understanding of the role of soil in forest, range, and pasture, crop and wetland ecosystems is critical in the development of management plans on these lands. Currently, resources are not available to conduct the needed research.

Water Quality Initiative.—This national initiative addresses the major research and educational concerns relating to water quality and management. Sufficient high-quality water is often taken for granted, yet recent threats to its stability profoundly affect the future of agriculture, the economy, and the health of our population. Research programs examine the roles of forestry and agriculture as suppliers, users, polluters, and recyclers of both surface and ground water. Scientists are developing methods to restore contaminated aquifers and prevent additional contamination. Using research information, extension specialists provide educational programs and demonstrations on water quality and management options for soils, pesticides, nutrients, and animal wastes that will provide safe drinking water supplies. Resources are used to increase Extension’s educational programs in 74 hydrologic zones and 16 demonstration sites in a coordinated multi-agency effort at the state and national level.

Sustainable Agriculture Initiative.—This program relates to and complements food safety, integrated pest management, water quality and other environmentally-related activities, and rural development. Sustainable agriculture is a systems framework of technologies, practices, and procedures that provides for continuing productivity. Sustainable agriculture systems are site-specific and require skillful management. Sustainable practices that are effective will be based on all factors that affect a specific site, such as soil type and fertility, cropping history, microclimate conditions, surrounding vegetation and pest pressures. The goal for sustainable agriculture is to develop systems that are economically sound, socially acceptable, and environmentally benign.

Small Farms Initiative.—Also in our budget is a request for funding to initiate an integrated small farm research and education program to address the resource constraints experienced by small farm producers and those of diverse ethnic and racial origin. The new program is designed to help these producers to operate their farms more efficiently and in an environmentally sound manner.

Our budget was developed with our USDA partners and reflects recommendations of a system-wide joint planning effort. The research planning process, leading to the development of the research budget, involved more than 200 “Customer Input

Groups" including commodity and farm organizations, professional and scientific societies, institutes, foundations and councils (both public and private), and policy makers. Research partners included USDA/Cooperative State Research, Extension, and Education Service, USDA/Agricultural Research Service, and Schools and Colleges of Veterinary Medicine, Forestry, and Home Economics.

The Federal/State partnership through the combination of research programs in this budget proposal, when coupled with state and non-federal support, continues to provide the flexibility to address a wide array of issues and has resulted in the high rate of return on public investment in agricultural research ranging from 30 to 65 percent. These data are based on independent studies of return on investment in agricultural research and development. Research programs of the Agricultural Experiment Station System perform approximately 68 percent of all public funded agricultural research in support of the \$600 billion agricultural industry. The federal investment represented in this budget is leveraged by approximately \$1.5 billion in state and non-federal funds.

Thank you for the opportunity to provide this testimony on behalf of the Board on Agriculture of the National Association of State Universities and Land-Grant Colleges. The 109 year partnership of state and federal research, along with the support of Congress, will continue to meet the challenges of the future and create opportunities for agriculture. I strongly encourage you to consider and adopt this budget recommendation. Your continued support is appreciated and we are committed to continue playing a major role in sustaining a strong agriculture for the benefit of all citizens of this country and people of the world.

PREPARED STATEMENT OF RICHARD D. WOOTTON, ASSOCIATE DEAN AND ASSOCIATE DIRECTOR, COOPERATIVE EXTENSION SERVICE AT KANSAS STATE UNIVERSITY, ON BEHALF OF THE EXTENSION COMMITTEE ON ORGANIZATION AND POLICY (ECOP)

Mr. Chairman, I am Richard D. Wootton, associate dean and director of the Cooperative Extension Service at Kansas State University. I present this statement as the chair of the fiscal year 1999 Budget Committee of Cooperative Extension System and its leadership throughout our Nation.

The Cooperative Extension System has a rather extensive and intensive process for program priority setting; the budget represented in this statement has been through this same scrutiny. Our budget development committee is comprised of representatives from all regions of the country, as well as representation from our citizen advisory committee, the Council on Agricultural Research, Extension and Teaching (CARET). Each line item in this budget was carefully examined. We have focused on issues which require a solid research base and applied education. We have strengthened our resolve and commitment not only to agriculture, but to the entire food and fiber system while maintaining strong programs in family, youth and community issues.

Considering the fiscal climate in which we make this budget presentation, we have limited our requests for increases to a few key critical areas. However, based on the fiscal problems in many states, reductions in the Extension budget at the federal level are not apt to be offset by state, county or private funding partners. These partners now provide over seventy percent of the Extension System's annual budget across the nation. Thus, each federal dollar is very important because it leverages several more dollars from state, local, and private sources and serves as the "glue" of this unique partnership.

BASE PROGRAMS

Smith-Lever 3(b)(c).—The highest priority for the Cooperative Extension System is a 5.7 percent increase in the funding for base programs. We are requesting a funding level of \$283.8 million or \$15.3 over fiscal year 1998. Base program funds, along with matching state and local funds, provide the nucleus for maintaining the scientific and community-based network which is critical to the implementation of the base programs and the national initiatives. This increase will help to maintain a strong base for Extension programming across the country and provide the important funding to undergird the national initiatives, such as Integrated Pest Management, Food Safety and Quality, and Youth and Families at Risk.

The network of faculty and staff of 74 land-grant universities represents an intellectual resource unmatched by any other country of the world. No other national education system has the capabilities of reaching citizens in some 3,150 counties in the United States. In addition, nearly three million trained volunteers work with the Cooperative Extension System in areas such as health, nutrition, gardening, financial planning and youth development.

1890 Colleges and Tuskegee University.—The requested 5.7 percent increase in base funding for these institutions is also a top priority. These institutions maintain base programs geared to the needs of culturally diverse audiences, especially those limited in resources. Funds provided these institutions have helped them prioritize highly essential educational initiatives focused on families, community leadership, small scale farms and youth programs. These programs are designed to address new directions for what has become a large audience of people at risk and generally out of the mainstream of society. This 5.7 percent increase for the 1890's would enhance programming capabilities in key areas.

NATIONAL PRIORITY INITIATIVES

Significant increases are requested for three currently funded national priority initiative programs: Water Quality, Food Safety and Quality, and Integrated Pesticide Management.

Water Quality.—We are requesting a \$2.0 million increase for the Water Quality initiative to focus specifically on assisting farmers, ranchers and homeowners identifying environmental risks and taking voluntary action to prevent pollution. The increased funding would be used to expand a proven program called Farm*A*Syst/Home*A*Syst that helps people conduct pollution prevention assessments on their property and take appropriate voluntary action. These assessments involve well water protection, agricultural compliance assistance, livestock waste management, and related factors that can impact environmental surroundings. This program is conducted in coordination with a number of other state and federal agencies with responsibilities for water quality and other environmental issues.

Integrated Pest Management.—We request that funding be increased for Integrated Pest Management (IPM) from \$10.783 million to \$15.0 million. Pesticide use in agriculture, as well as in urban America, continues to be a major public issue. IPM programs set the stage for innovative crop protection programs that meet economic and environmental needs. Additional resources are needed if the goal of establishing effective IPM practices on 75 percent of the crop land is to be achieved by the year 2000. The increase will address this concern and supports the Department of Agriculture's initiative.

Food Safety.—A safe food supply is of utmost importance to consumers as well as food producers, processors and distributors. Public concern about food contamination has escalated during the last decade. Even so, information about the causes and prevention of food-borne illnesses is still very limited. Furthermore, much of the current knowledge is inadequately applied and practiced. Extension education programs focus on protecting the safety of food from production to consumption. These programs assist food producers and processors, food service establishments and consumers in understanding safe production, handling and preparation practices. The HACCP (Hazard Analysis Critical Control Point) model is used as the primary basis for these educational programs. We are proposing \$7.365 million for fiscal year 1999; the fiscal year 1998 appropriation was \$2.365 million.

Reservation Extension Agents.—The support of Congress to assist with the placement of Extension agents on the Indian Reservations as a collaborative effort between the Tribal Councils and the State Cooperative Extension Services is going very well. The limiting factor is the number of agents does not meet the tremendous demand for this expertise on each of the Reservations. Thus, in accord with a plan jointly developed by representatives of the Tribal Councils and State Extension Services it was determined an appropriation of \$5.0 million, which is \$3.0 million more than the current appropriated amount, was a realistic fiscal need. These monies are awarded on a competitive basis.

Extension Services at the 1994 Institution.—This program is in its second year of operations and progressing well. The initial appropriation of \$2.0 million in fiscal year 1998 has been allocated and being put to use in a very high need education arena. The 29 Native American Institutions of higher education are targeting agriculture, forestry, human nutrition and health, and economic development. A \$1.5 million increase is requested for fiscal year 1999 to build on the base Extension staffing at these 29 Native American Institutions, which is being done in full collaboration with the State Cooperative Extension Services.

Other National Priority Programs we are requesting a very modest increases are:
Children, Youth and Families at Risk.—The Extension System uses preventive educational programs to help youth and families become healthy, productive, financially secure, and responsible members of their community. Extension has built linkages and networks with many agencies that provide services to children and families. Currently, 49 states and six territories conduct Youth-at-Risk programs. The federal Youth-at-Risk appropriation of \$9.55 million leverages an additional \$40

million and captures the support of nearly 37,000 volunteers for its programs. We request that the \$9.55 million appropriation be increased to \$10.0 million, so this important work of salvaging and rebuilding human capital may reach more youth and families.

1890 Facilities.—The annual amount of funding for this facilities program has been level or declining each of the past several years. The facility needs at the 1890 institutions still needs considerable attention for renovation and new construction to fully capitalize on the partnership between the USDA and these Historically Black Colleges and Universities. Thus, an increase of about \$4.5 million above the fiscal year 1998 appropriation is requested.

Renewable Resources.—We request that the Renewable Resources Extension Act funding be increased from the current level of \$3.214 million to \$3.3 million. Public forests and rangelands now emphasize production of non-commodity values and commodity production has decreased. Concurrently, federal requirements for environmental protection on private lands have increased (Endangered Species Act, Wetlands Protection). Private landowners are, therefore, challenged to provide both increased commodity output to meet the nation's needs and increased environmental protection. Intensive management of non-industrial private forests for greater profitability, commodity resource output and environmental protection will be enhanced by this expanded educational effort. The impact on currently declining rural communities will be positive.

NEW PROGRAM INITIATIVES

Funding is requested for two new program initiatives: Pesticide Application Training and Managing Change in Agriculture:

Pesticide Applicator Training.—The funding for this program is a collaborative effort between the Department of Agriculture and the Environmental Protection Agency. Each is requesting \$1.5 million to support, in part, the training the users of restricted use pesticides so they can be certified users. This is a very demanding program because of the number of people that require training each to become certified or recertified. The participants needing this training are growers, commercial applicators and homeowners. The total cost of operating this program exceeds \$9.0 million a year. Thus, other state and local public funds and private funds are heavily committed.

Managing Change in Agriculture.—This program addresses how the Cooperative Extension System can assist the U.S. agricultural sector in managing in a dramatically changing global and domestic economic and environmental policy environment. These changes include public concerns and expectations for production and processing of safe food at reasonable prices, while protecting the environment; rapid technological advances; accelerated industrialization of agriculture; globalization of markets; and declining governmental "safety nets."

Within the agricultural sector, the forces of change are causing significant shifts in how business is done. These include: structural integration of input suppliers, producers and processors through increased use of contracts, alliances and other linkages; more product specificity driven by consumer tastes and preferences, and technological advances in the distribution and retailing of food and fiber products; and the rise of a new class of entrepreneurs who focus on the assembly and distribution of inputs and products without being centrally involved in the production processes.

The Cooperative Extension System, in concert with the agricultural private sector, will provide the leadership for the initiative. Funding will be sought from three sources; \$2.0 million through your committee, Mr. Chairman, with matching funds from the state government and private sector. This will leverage the initiative into a \$6.0 million plus program.

SPECIFIED PROGRAMS

We are recommending level funding at the fiscal year 1998 level for the following budget items:

Sustainable Agriculture	\$2,365,000
EFNEP	58,695,000
Rural Development Centers	908,000
Pesticide Impact Assessment	3,313,000
Farm Safety/Agribility	2,855,000
Agricultural Telecommunications	900,000

Mr. Chairman and Members of the Committee, the Cooperative Extension System is mindful of the significant economic, technological, and societal changes happening

in our nation. Thus, we have redirected programs to better serve the needs of agriculture and rural America, to address directly the growing needs of children and families facing difficult situations, and to help communities work for a better future. We are focused on issues of national importance, identified at the grass roots level. We very much appreciate your past support and urge your continued support to keep our base programs strong and to continue to invest in initiatives of national importance.

We thank you for the opportunity to present this statement about our fiscal year 1999 budget needs.

PREPARED STATEMENT OF DR. RICHARD L. GUTHRIE, ASSOCIATE DEAN AND DIRECTOR, INTERNATIONAL PROGRAMS IN AGRICULTURE, AUBURN UNIVERSITY, ON BEHALF OF THE INTERNATIONAL COMMITTEE ON ORGANIZATION AND POLICY (ICOP)

I am the Associate Dean and Director of International Programs in Agriculture at Auburn University. I am also the current chair of the International Committee on Organization and Policy. I testify here in support of the fiscal year 1999 Agriculture Appropriations. Our committee is particularly interested in several programs, including the Markets, Trade & Rural Development program under the National Research Initiative (NRI) and the National Needs Competitive Grants program under Higher Education.

These programs will contribute significantly to an increased U.S. capacity to compete in the global economy. The GATT, NAFTA and other international free trade agreements are designed to increase trade and investment flows between nations. I submit that they provide a compelling rationale for these programs.

As we all know, the world has witnessed radical transformations in recent decades. Mass communication technologies, transportation networks and the disappearance of major ideological cleavages in the world have led to greater interdependence in the world economy. The globalization of markets for agricultural products has been a major consequence of them.

The failure of centrally planned economies has increased the significance of market economies of the West. These economies, including ours, now form a global system through which agricultural products are increasingly moving. Furthermore, the nature of these products is rapidly changing from raw materials to value added products.

We currently export over thirty percent of our agricultural output. This represents a very significant contribution to the U.S. balance of payments. Furthermore, our agribusiness interests consider these markets to be critical to their future. The health of the U.S. food system, including the farm sector, will depend in large measure on how well we compete in overseas markets. Alabama farmers, food industries and consumers are increasingly aware of the significance of these trends. They are increasingly asking our universities to respond to the challenges represented by them. They are demanding from us the knowledge base and training that will help make them better participants. Our College of Agriculture at Auburn University has made globalization of its programs a priority objective.

Free trade agreements imply that production efficiencies, adding value to export products, and increasing the ability of our agribusinesses to participate effectively in international markets will be major determinants of successful competition. We need to strengthen science and technology and human capital development in ways which strengthen these factors. These investments must be part and parcel of the research, extension and higher education agenda.

Land grant universities, as partners with the U.S. Department of Agriculture, have been major contributors to the incredible success of our food system. Teaching, research and outreach products have ensured a steady flow of quality human capital and technology to this sector. However, the genius of the land grant university system, namely its focus on state constituencies, has greatly limited its scope of activity to their immediate, everyday concerns. Media and transportation dimensions of the technological revolution experienced by us now require that we give greater attention to broadening its focus to global markets.

The National Research Initiative and the National Needs Competitive Grants programs are designed to help us expand our capacity to increase production and marketing efficiencies, and to extend them to users in the food system. The Globalizing Agricultural Science and Education Program for America (GASEPA) agenda, which is sponsored by our Committee, focuses specifically on how to harness available land grant university resources, including those to be provided through the NRI and the National Needs Competitive Grants, to increase our capacity to compete in these

global markets. I would like to end my formal presentation by briefly reviewing the major components of the GASEPA agenda.

Under the GASEPA agenda, U.S. land grant universities will work with various agencies of the U.S. Department of Agriculture to jointly internationalize our staff and programs. We will seek ways to use existing program funds to promote these outcomes.

The GASEPA agenda also proposes to provide sustainable, core funding to initiate and to strengthen globally relevant and useful agricultural teaching, research and outreach programs at land-grant and other qualifying institutions. Specific objectives are:

- Enhancing global competitiveness of U.S. agriculture through human resource development;
- Development and dissemination of information about market, trade and business opportunities;
- Mutually beneficial collaborative global partnerships;
- Promoting trade through global economic development; and
- Promoting global environmental quality and stewardship of natural resources.

Access to these funds will be through a competitive grants framework, administered by an agency of the U.S. Department of Agriculture. This framework will ensure that quality standards are maintained and that program activities are integrated with those of other related initiatives.

Examples of types of activities that will be supported under the GASEPA agenda are those which will: increase the international content of teaching programs; provide university faculty and staff with cross-cultural, professional experiences in areas related to their expertise; increase the ability of faculty and staff to adapt agricultural technologies developed overseas for use in the U.S.; increase faculty, staff and student ability to support the marketing of U.S. agricultural products and services overseas; help U.S. agribusinesses identify overseas opportunities; and provide students in agriculture and related fields with study and work experiences related to international competitiveness.

The GASEPA agenda will enable U.S. land-grant colleges to extend instructional, technology and marketing outputs to clientele, including students and agribusinesses, in ways which will increase the competitiveness of U.S. agribusinesses in global markets. We are eager to serve our public. We are eager to address global issues that will become increasingly important to our future national prosperity.

Thank you.

PREPARED STATEMENT OF DR. MCARTHUR FLOYD, RESEARCH DIRECTOR, ALABAMA A&M UNIVERSITY, ON BEHALF OF THE 1890 RESEARCH DIRECTORS

Senator Thad Cochran, Chairman, and distinguished members of the Committee, The Association of Research Directors (ARD) strongly supports the budget recommendations for fiscal year 1999 submitted by the Budget Committee, Board on Agriculture, NASULGC. The top priorities recommended by the NASULGC for fiscal year 1999 are to strengthen the base programs for research, extension and higher education, and to sustain current high-priority initiatives and to mount a few new programs in much needed critical research areas. A modest increase of 5.4 percent in base funds for research is being requested. These programs represent the long-term commitment of Land-Grant Universities to maintain a stable research base including personnel and facilities in the food and fiber and agricultural and environmental sciences, and natural resources.

1890 Evans-Allen Research Program (\$29,316,000)

We strongly support the recommendation for an increase of 5.4 percent in base funds for the Evans-Allen Program for the 1890 institutions in fiscal year 1999. These funds provide the primary and principal support to conduct basic and applied research to ensure a safe, economical and adequate food supply, promote a sustainable environment, conserve the natural resource base, and contribute to the improvement of the socio-economic well being and overall quality of life of diverse rural and urban populations. These funds also contribute to the development of professional expertise (especially, minority persons) in the food and agricultural sciences through focused programs.

1890 Capacity Building Grants Program (\$10,000,000)

We strongly support the recommendations for funding the 1890 Capacity Building Grants Program at \$10,000,000 in fiscal year 1999. This program is critical in enhancing teaching and research programs at the 1890 Land-Grant Colleges and Universities and in advancing partnerships with industry, USDA agencies and other in-

stitutions of higher education. This is a highly competitive program which helps to build greater capacity in research and teaching in food and agricultural sciences at these Institutions.

1890 Research and Extension Facilities Grants Programs (\$12,000,000)

We strongly support the 1890 Extension and Research Facilities Grants Program at a funding level of \$12,000,000. The facilities program enables the 1890 Institutions to develop state-of-the-art facilities and acquire needed equipment for scientific research and outreach for training of students.

Rural Economic and Social Development—1890 (\$2,000,000)

We also strongly support the initiative for 1890 Institutions on Rural Economic and Social Development at \$2,000,000 in fiscal year 1999 which is included in the Small Farm initiative for \$4,000,000. Over 55 percent of the rural poor 97 percent of the rural black poor live in the South. Targeted research is needed that will specifically address the disadvantaged and underserved communities and families in the following areas: barriers to family and community development; incentives for new linkages and partnerships; infrastructure needs; business and job opportunities; enhanced development of human capital and leadership; use of natural resources for community development; and new markets for agricultural products.

Mr. Chairman, on behalf of the ARD, I wish to express our thanks to you and the distinguished members of the Committee for this opportunity to submit this testimony.

PREPARED STATEMENT OF TERESA MAURER, PROJECT MANAGER, NATIONAL CENTER FOR APPROPRIATE TECHNOLOGY (NCAT)

Summary: I am offering testimony today in support of USDA's proposed \$2 million appropriation for the ATTRA program.

Full text of testimony: Farmers, ranchers, agricultural information providers and other members of the agricultural community continue to seek greater and more convenient access to information on sustainable agriculture production and marketing practices. Since its inception as a unique public-private partnership in 1987, the ATTRA (Appropriate Technology Transfer for Rural Areas) program has responded to more than 118,000 requests for information from callers across the U.S. The program is funded through Rural Business-Cooperative Service (RBS) and is operated by the National Center for Appropriate Technology (NCAT). NCAT is a private, non-profit organization, which provides information and technical assistance in the areas of sustainable agriculture, energy conservation, and resource-efficient housing. The USDA budget requests \$2 million for the ATTRA program for fiscal year 1999, which we urge you to support.

Through a national toll-free telephone line, ATTRA receives requests and then provides written or electronic delivery of unique combinations of diverse sustainable agriculture resources. In answer to questions posed by a variety of farmers, ranchers, information providers, extensionists, state and federal agency staff and others, ATTRA synthesizes and summarizes innovative practices and research results. User requests cover a wide range of topics, including crop, livestock and horticultural practices, and may include aspects of production, soil fertility, pest management, enterprise additions, etc.

In addition to preparing materials on frequently requested topics, staff also research specialized questions from producers. Responses draw from studies, publications and experiences spanning the spectrum of hundreds of sources including: (a) individual, innovative farmers, extensionists and researchers from a national network that we have developed (b) grassroots organizations (c) specialized sustainable agriculture publications (d) electronic communications (e) funded research and education from a variety of agencies and programs inside and outside USDA. Much of this information is not readily available from a single source, so ATTRA helps link and provide keys to this information in a timely way. ATTRA also seeks to extend the reach of SARE, NAL, Integrated Farming Systems and Cooperative Extension, who often refer their clients to the ATTRA program.

ATTRA was initially authorized in the 1985 Farm Bill and was first funded in 1987. Compared with request levels around 4,000 per year (fiscal year 1989), program staff now respond to 18,000–22,000 requests annually. ATTRA has been level funded at \$1.3 million for the last 7 years. We have seen increased interest particularly in: marketing methods for sustainably produced crops and animals (including organic production), pest management options, and farmer-generated, experience-based information. Our callers are more frequently seeking electronic or other round the clock access to ATTRA's resources and training materials.

Improved efficiency in request handling helped to meet a portion of the demand, but request volume continues to outstrip the gains made. While a Website was opened in fall, 1997, and increases some of ATTRA's capabilities, it also requires specialized skills to maintain, reformat or develop suitable new materials for that outreach method. Because many rural callers, and especially small and minority farmers, still have limited electronic access, ATTRA will remain committed to providing information on paper to caller's mailboxes or by using other technologies or outreach which does not require the caller to have expensive equipment or specialized computer knowledge. The recent report of the USDA National Commission on Small Farms (A Time to Act, January, 1998): (1) recognized the special value and accessibility of the ATTRA program, and (2) recommended a role for ATTRA in providing feedback to USDA on research and education needs of small farmers, and (3) recommended an annual funding level of \$3 million.

However, at the present time, we ask support for the proposed USDA funding level of \$2 million. It is the minimum required to meet demand for additional diversity and access for ATTRA's services. It would support a very modest staffing increase which we project would give us the capability to respond more effectively to an increased variety of topics and service requests. The Website has already enhanced exposure to ATTRA's work, with thousands of visits in the few months since it opened in September, 1997. However it will also clearly require more specialized attention to respond effectively to the requests and feedback that the Website is generating, both in calls and electronic responses. The program has also been severely understaffed for the last 4 years in the areas of: agronomy, pest management, marketing, general technical writing, and computer and information management support services. Questions that we receive now, compared to early years of the program, include more sophisticated questions from farmers and require a greater range and depth of expertise.

A small portion of the proposed increase would allow completion of upgrading in phone, addition of voice mail, and computer hardware and software. This would result in more diverse access for callers varying from those with no computer resources to educators and extensionists who may have both the computer access and ability to multiply ATTRA's information. It would also allow better organization and access to thousands of materials (include many collected nowhere else nationally) in ATTRA's resource center and response archives.

The program offers callers from across the US a unique, cost-free, 1-stop access point to information about ways to farm with innovative techniques and technologies that combine environmental and economic benefits. With recent changes in farm legislation, farmers want information on more diverse options for what they produce, how they produce it, and how they can add value and market their products. Farmers also continue to look for practices that help them keep more of their farming income by reducing production costs. The written materials provided by ATTRA's 25 staff members meet those informational needs and bring choices right to the mailbox or computer, which can help them make their own important farming and economic decisions.

We are convinced that ATTRA provides a national service that is very valuable to broadening the acceptance of more sustainable and profitable approaches to agriculture. We appreciate the past support that Congress has provided, which enables this unique service to continue to provide information that helps farmers with the many choices they face. We urge you to continue to support this work at the USDA proposed level of \$2 million, and we pledge to continue to improve the efficiency of the program, as well as the quality and usefulness of information we offer to farmers.

PREPARED STATEMENT OF MARGARET S. MAIZEL, PRINCIPAL INVESTIGATOR, NATIONAL CENTER FOR RESOURCE INNOVATIONS

As ever, we appreciate this opportunity to provide testimony to the Senate Appropriations Subcommittee on Agriculture and Related Agencies.

The National Center for Resource Innovations (NCRI) was established in 1990 through a joint private/federal initiative in an appropriation to USDA's Cooperative State Research, Extension and Education Service (CSREES). The consortium now includes seven sites (including one added this year at the Southwest Indian Polytechnic Institute, Albuquerque, NM) and an administrative office in Rosslyn, Virginia. Each site in the consortium contributes unique expertise to this national program. NCRI capabilities include integration of large data sets in a Geographic Information Systems (GIS) framework from the national level down to the farm field as

well as weather analysis, land use planning, resource management at state and local levels, and support for public and private policy development.

THE MISSION OF NCRI

The mission of NCRI is to provide collaborative and innovative transfer of geographic information systems technologies to support local government and other public policy development and decision making.

NCRI FUNDING HISTORY, MATCHING FUNDS AND COST EFFECTIVENESS

In the past, NCRI has consistently requested \$1.8 million annually for minimum program operations. Grants have been awarded from funds appropriated as follows: Fiscal year 1990, \$494,000; fiscal year 1991, \$747,000; fiscal years 1992 and 1993, \$1,000,000; fiscal year 1994, \$1,011,000; fiscal year 1995, \$877,000; fiscal year 1996, \$939,000; fiscal years 1997 and 1998, \$844,000.

NCRI has matched federal funds or had to reduce program objectives. The total non-federal support generated for fiscal years 1990 to 1998 was in excess of \$5,500,000. The total federal appropriated amounts for the same period were \$8,600,000. In fiscal year 1997, NCRI prepared at the request of Congressman Joe Skeen, a cost-benefit study. Results showed that for every federal dollar invested, \$7.40 in benefits through innovative projects was realized.

NCRI SITE EXPERTISE AND ACCOMPLISHMENTS

The advantage of the consortium of seven regional centers that makes up NCRI is that each site has unique expertise and shares technical support with other sites. In this way, projects are strengthened through shared resources and the experience needed to build complex and comprehensive information systems. Site-to-site technology transfer and networking build NCRI's overall capabilities, aids in problem solving and facilitates consistency.

JOINT ACTIVITIES (SEVEN SITES)

All of the NCRI sites plan to engage in two major activities this year: a Distance Learning Program at the Southwest Indian Polytechnic Institute site April, 7th and a Resources Technology Fair on Capitol Hill on April 21 in the House Science Committee Room. Congressmen and Senators are being invited to act as sponsors for the fair, which will include exhibits by the seven NCRI sites as well as by federal agencies and private sector companies who have been partners in technology implementation with NCRI sites.

NCRI-Great Lakes, University of Wisconsin-Madison, Madison, Wisconsin

The NCRI-Great Lakes project site is located at the Land Information and Computer Graphics Facility (LICGF) in the College of Agriculture at the University of Wisconsin. The Facility was instituted in 1993 to function as a research, teaching, and outreach resource in land and geographic information systems (LIS/GIS). Researchers at LICGF explore uses of LIS/GIS for local and regional land and resource planning to support social, economic, and environmental decision making processes. During 1998 and 1999, NCRI-Great Lakes has established the following objectives:

- Conduct seminars for the Wisconsin Land Council to develop citizen-based land use planning and the use of Land Information Systems to facilitate such efforts.
- Work with rural governments to develop reliable and cost-effective access to LIS/GIS technology to address locally defined land-use and watershed management problems.
- Accelerate the use of GIS technology by governments with coastal zone jurisdictions.
- Update existing data to prepare the state of Wisconsin for the 2000 Census and subsequent redistricting.

NCRI-Chesapeake, Inc., Rosslyn, Virginia

NCRI-Chesapeake builds cooperative integrated information systems "from the nation to the neighborhood" with federal and state agencies, universities and others to provide new information for better decision-making. These systems focus first, on the farm, productivity and the farmers in their own very specific neighborhoods as related to natural systems and their socio-economic position in the landscape. NCRI-Chesapeake has established the following goals for 1998-1999:

- Conduct continuing research in the Northeast States, and in the Delmarva Peninsula in particular, of impacts of animal manure on water quality, evaluation of agro-ecoindices, and assessment of watershed priorities.

- Conduct expanded studies in North Carolina, the Washington-Baltimore metropolitan area, and other urban areas of the country regarding the impact of urban sprawl on ecosystems.
- Determine the effects of future land use planning on economic and agricultural resources, potential impacts on other natural resources.

NCRI-Northwest Central, Washington University, Ellensburg, Washington

NCRI-NW continues to concentrate on the local and regional resource issues of the Yakima Valley and eastern Washington. These issues include irrigation of agricultural lands, county planning needs, Native American interests, and the management of inter-mixed public and private lands. The site works in close cooperation with the faculty and staff of Central Washington University as well as the GIS lab.

NCRI-NW plans for 1998–1999 include:

- Work with the Natural Resources Conservation Service to speed the delivery of digital soils maps to GIS users, precision farmers, and others.
- Cooperate with USGS to complete digital hypsography (contour lines) for the state.
- Continued assistance to the Kittitas Reclamation District for data development and data exchange.

NCRI-South West, University of Arkansas, Fayetteville, Arkansas

NCRI-SW has been based at the University of Arkansas at Fayetteville since its inception in May of 1990. Through university support and hardware and software grants, the program has a fully equipped research, training, and outreach facility capable of demonstrating a wide range of software for geographic information systems, remote sensing, spatial statistics, and database management. In the fall of 1994, expansion of Center facilities was completed to include five state-of-the-art teaching and research laboratories, ten offices, and a library/reading room. A variety of advanced computer equipment now facilitates the center's teaching, outreach, and cooperative project capabilities. NCRI-SW continues to focus on technology transfer through training, the development of statewide GIS databases and representative projects demonstrating the cost benefits and efficiency of GIS technology.

NCRI-South West has proposed the following objectives among those to be achieved in 1998–1999:

- Provide technical support to the Arkansas Land Records Modernization Board as well as serving as a member of the Board.
- Participate with a consortium of private and public sector partners to initiate the Seamless Warehouse of Arkansas Geodata (SWAG) so that users will be able to access any selected area of the state with the data provided over the net in OGC Simple Features Format.
- In conjunction with the Natural Resources Conservation Service, develop a web accessible "County Soil Survey" that will provide information comparable to the traditional county soils survey publication.

NCRI-North Central, University of North Dakota, Grand Forks, North Dakota

NCRI-NC's interdisciplinary research and technology transfer programs are located and supported at the University of North Dakota Regional Weather Information Center. From this facility, NCRI-NC is linked to the UND Aerospace Scientific Computing Center which houses a CRAY 190. The resource issues in the region are related to the enhancement and protection of farming and ranching, which are principal contributors to the region's economy. The work performed by NCRI-NC and the Regional Weather Information Center has resulted in their being recognized by the Ford Foundation as a semifinalist in the 1995 Innovations in American Government Awards Program.

During 1998 and 1999, NCRI-NC has set the following objectives:

- Provide decision support to precision agriculture and other forms of farm management by providing GPS data and implementing a farm specific rainfall model derived from Doppler radar.
- Participate in flood recovery of the city of Grand Forks by providing technical assistance in the development of the combined Grand Forks City GIS system.
- Participate in the North Dakota Weather Network program.

NCRI-South East, South Georgia Regional Development Center, Valdosta, Georgia

NCRI-SE's program is an integral component of the South Georgia Regional Development Center—a regional agency that supports local governments across ten counties. NCRI-SE's primary objective is to encourage the use of geographic information for ecologically responsible decisionmaking in this primarily rural region. "Real world" presentations by NCRI-SE using actual local geographic data have proven to be an effective method of demonstrating the value of GIS. This, coupled

with the experience gained by NCRI-SE personnel from implementing GIS for local governments, has proven invaluable to government managers in the South East region. NCRI-SE also provides direct technical and Hands on. advice and training for any regional entities working in the GIS realm.

NCRI-SE's goals include:

- Demonstrate the value of GIS to local governments using information that applies directly to their own situations, using the existing regional database and GIS applications built by NCRI-SE.
- Provide leadership in the GIS development process by promoting local government cooperative agreements in order to increase involvement and defray costs, and to promote standards that allow simple transfer of GIS data among state, local and federal agencies.
- Continue to refine data and databases for regional wetlands.

NCRI-Native Americans, Southwest Indian Polytechnic Institute, Albuquerque, New Mexico

NCRI-SIPI is the newest of the NCRI sites, having been added in 1997. SIPI is a National Indian Community College, funded by the federal government. Nearly 50 percent of all American Indians live within a 500-mile radius of the school. SIPI's overall objective is to provide technology transfer through distance education in conjunction with the development of precision farming on the SIPI campus and on Indian reservation lands in New Mexico and southern Colorado.

For fiscal year 1999, SIPI has the following objectives:

- Undertake a pilot project to develop GIS curricula with the Southern Ute Tribe using distance learning telecommunications.
- Develop and begin the implementation of a precision farming demonstration project to be used as part of the GIS/GPS-Precision Agriculture technology transfer curriculum.
- Offer GIS and GPS training/short courses locally for tribal personnel.

CONCLUSION

The current level of funding for NCRI (fiscal year 1998) is \$844,000. We request that the level of funding through USDA/CSREES be restored to \$1.2 million for fiscal year 1999. This provides uniform funding levels for all seven NCRI sites, and allows NCRI-Native Americans American (SIPI) to join the NCRI consortium as a fully funded project site.

The NCRI Consortium appreciates this opportunity to provide testimony to the Senate Appropriations Subcommittee on Agriculture, Forestry, Nutrition and Related Agencies.

PREPARED STATEMENT OF GORDON MILLER, PRESIDENT, NATIONAL COMMODITY SUPPLEMENTAL FOOD PROGRAM (CSFP) ASSOCIATION

Mr. Chairman and Subcommittee members, I am Gordon Miller, President of the National Commodity Supplemental Food Program (CSFP) Association. The Association of State and Local CSFP operators has worked diligently with the Department of Agriculture Food and Consumer Service to insure a quality supplemental nutrition assistance commodity food package program for mothers, infants, children and elderly men and women. The program, which was authorized in 1969, serves 400,000 individuals monthly in 19 states and the District of Columbia.

During fiscal year 1997 there were two significant steps forward:

- Revision of the food package to provide more nutrients and cheese with a budget-neutral effect on funding.
- A new Regulation for a combined caseload for Mothers, Children and Seniors which will give local and state agencies a better opportunity to fully use assigned caseload.

The President's budget for fiscal year 1999 requests \$96 Million for CSFP. We ask that your subcommittee recommend \$105 Million so that the CSFP may provide for:

- New states who already have approved state plans but no funds.
- Additional mothers, children and seniors on waiting lists in existing programs.

Again, Mr. Chairman and Subcommittee members, the National CSFP Association wants to thank the Subcommittee for its past support. It is our signal you recognize that CSFP is the most cost-efficient, nutritionally designed food package program of the food and Nutrition Service. The program uses foods purchased with wholesale dollars or donated foods, requires low administrative funds stretched by many volunteer labor hours and facilities, and reaches the most vulnerable mothers, children and seniors who otherwise would not receive nutrition assistance.

PREPARED STATEMENT OF W. RON ALLEN, PRESIDENT, NATIONAL CONGRESS OF
AMERICAN INDIANS

INTRODUCTION

Good morning Chairman Cochran, Vice-Chairman Bumpers and distinguished members of the Appropriations Subcommittee on Agriculture. Thank you for the opportunity to present testimony regarding the President's budget request for fiscal year 1999 Indian programs and services. My name is W. Ron Allen. I am President of the National Congress of American Indians ("NCAI"), the oldest, largest and most representative Indian advocacy organization in the nation, and Chairman of the Jamestown S'Klallam Tribe located in Washington State. The National Congress of American Indians was organized in 1944 in response to termination and assimilation policies and legislation promulgated by the federal government which proved to be devastating to Indian Nations and Indian people throughout the country. NCAI remains dedicated to advocating aggressively on behalf of the interests of our 230 member tribes on a myriad of issues including the critical issue of adequate funding for Indian programs.

THE PRESIDENT'S FISCAL YEAR 1999 BUDGET REQUEST

Department of Agriculture

In 1996, Congress passed and the President signed into law the Federal Agriculture Improvement and Reform Act of 1996 (FAIR) (Public Law 104-127). This law provides new mandates for the Department of Agriculture's Rural Development Mission on infrastructure, housing, and business needs in remote areas. FAIR also recognizes the needs of tribal governments for capital and infrastructure and authorizes a 3 percent set-aside for tribal infrastructure, housing, and related rural development projects.

Mr. Chairman, as you well know, Indian country is very poor with the great majority of tribal communities characterized by severe unemployment, high poverty rates, ill-health, poor nutrition, and sub-standard housing. The availability and condition of reservation physical infrastructure is similarly lagging behind non-Indian communities. Indian communities lack roads and highways, electricity, potable water and other utilities, and most other physical infrastructure and this, in turn, serves as a strong disincentive to employers and investors who demand basic infrastructure prior to making investment commitments.

As a direct result, Indian people are suffering because they lack these basic necessities and also because the lack of infrastructure keeps reservations economies mired in poverty and hopelessness. The tribal set-aside in the FAIR Act could unlock critical resources to being the long-term rebuilding of sustainable tribal homelands.

In fiscal year 1999, the Administration proposes to give tribes more flexibility in how they use Department of Agriculture's rural development grants and loans for business and critical infrastructure businesses, a proposal NCAI fully supports. The fiscal year 1999 budget proposes \$715 million for the Rural Community Advancement Program from which the set-aside to tribes is approximately \$21.45 million. Securing adequate appropriations for these programs is the key to their success in Indian country. NCAI urges this subcommittee to ensure that these funds are appropriated.

CONCLUSION

Mr. Chairman, we urge the Congress to fulfill its fiduciary duty to American Indians and Alaska Native people and to uphold the trust responsibility as well as preserve the Government-to-Government relationship, which includes the fulfillment of health, education and welfare needs of all Indian tribes in the United States. This responsibility should never be compromised or diminished because of any Congressional agenda or party platform promises. Tribes throughout the nation relinquished their lands as well as their rights to liberty and property in exchange for these ongoing services as well as this trust responsibility. The President's fiscal year 1999 budget is a positive step towards acknowledging the fiduciary duty owed to tribes.

We ask that the Congress consider the funding levels in the President's budget as the minimum funding levels required by Congress to maintain these services and the federal trust responsibility. The consensus of Indian country is that the federal government's budgetary process has failed to provide for effective services and minimum to raise the living standards of Indian communities consistent with non-Indian communities. In order for federal government to reasonably expect tribal government to truly achieve the self-determination, self-governance and self-sufficiency

goals mutually identified by the federal government and the tribal governments will not be achieved unless meaningful increases are provided for Indian programs and services.

Mr. Chairman, this concludes my statement. Thank you for allowing me to present for the record, on behalf of our member tribes, the National Congress of American Indians' initial comments regarding the President's fiscal year 1999 budget.

PREPARED STATEMENT OF RUSSELL C. NOTAR, PRESIDENT AND CEO, NATIONAL
COOPERATIVE BUSINESS ASSOCIATION

Mr. Chairman, members of the committee, we appreciate the opportunity to present testimony as you prepare to consider appropriations for the Department of Agriculture for fiscal year 1999. I would like to discuss the Grants for Rural Cooperative Development program and the centers for cooperative development that receive funding from that program; and I intend to offer some strong arguments for increasing funding for the Grants program.

The National Cooperative Business Association (NCBA) is proud of its role in assisting the creation of a network of rural cooperative development centers across the country. We know that Congress is equally as proud of its role in fostering a cooperative development support network throughout rural America. Congress and this Administration recognize the vital role that cooperatives play in providing economic opportunity to rural Americans.

The program I am referring to was originally authorized by section 2347 of the 1990 farm bill as a program of Grants for Technology Transfer and Cooperative Development. In fiscal year 1993, this committee began to provide funding for the program, and report language over the years has indicated your strong support for the concept of using this funding for the purpose of creating a network of centers for rural cooperative development.

NCBA's members, along with other supporters of cooperatives around the nation, joined together as the National Rural Cooperative Development Task Force to advocate for support for a national network of centers and to develop the linkages among the centers and between the centers and local partners to sustain the network's development. NCBA also launched the CLUSA Institute for Cooperative Development to coordinate our development efforts and focus resources on cooperative economic development. The CLUSA Institute is now working with ten regional centers providing vital technical assistance and support for the development of cooperative enterprises in rural America. The CLUSA Institute also signed a partnership agreement last year with USDA's Cooperative Services program to coordinate strategies to assist rural cooperative development.

In 1996, Congress demonstrated its strong commitment to the centers approach when it passed the FAIR Act, also known as the 1996 farm bill. The program is now called Grants for Rural Cooperative Development in section 747(c)(4) of Public Law 104-127. The program focuses on supporting "nonprofit institutions for the purpose of enabling the institutions to establish and operate centers for rural cooperative development." It is authorized to provide funding at \$50 million per year. The new statutory language defines the goals of these centers as "facilitat[ing] the creation of jobs in rural areas through the development of new rural cooperatives, value added processing, and rural businesses."

With the support of funding received from the program over the past few years, the rural cooperative development centers we work with have demonstrated quantifiable results. Centers in different regions of the country have given crucial help to the formation of farmer cooperatives building value added processing facilities, community development credit unions, partnerships among cooperative financial institutions, flexible manufacturing networks, and cooperatives providing housing and child care for impoverished farmworkers.

This coming year, centers will be involved in replicating successes they have achieved and breaking new ground in areas where cooperative development is needed. The electricity industry is rapidly being deregulated in every part of the country. Consumer-owned rural electric cooperatives have provided reliable and affordable electricity to rural Americans since the rural electrification program began directing federal resources for them in the 1930's. Once again, a small federal investment can provide essential assistance to develop consumer-owned energy purchasing cooperatives so that Americans are able to provide themselves with access to electricity. Centers are providing the opportunity for people to own and control these cooperative businesses.

Other cooperative development projects include the formation of new value-added agricultural cooperatives, new child care cooperatives, and cooperative housing projects. Value-added agricultural cooperatives give farmers more of the consumer dollar. Child care cooperatives provide former welfare recipients and other low-income people the opportunity to reduce the cost of child care and give them control over how their child care facilities are operated. Cooperative housing gives seniors and others in rural areas the chance to save money on their housing and live in safe communities.

The President's budget request has proposed allocating \$1.7 million to this program. This would represent four straight years of level funding at a very low level indeed. In fiscal year 1996, 87 proposals submitted for program funding qualified for approval under USDA's selection criteria. The total amount of funding requested for these meritorious applications was \$13 million. Last year, fewer applications were submitted because of an unusually short application period. However, a Cooperative Value-added Program within the Fund for Rural America drew 104 applications totalling \$19.4 million. Only \$1.1 million could be distributed to 18 of those worthy projects.

USDA's National Commission on Small Farms recently recommended that this program "be increased by \$10 million annually up to \$20 million." The Commission's report calls the program "one of the few that supports rural cooperative development at the grassroots level." The program is authorized to be funded at \$50 million annually.

We urge this committee to do what over 100 organizations are urging Congress and the Administration to do: increase funding for this valuable program. Mr. Chairman, I ask that the letter signed by those organizations be included in the record of this hearing along with my testimony.

NCBA is a national cross-industry membership and trade association representing cooperatives—over 100 million Americans and 47,000 businesses ranging in size from small buying clubs to businesses included in the Fortune 500. Founded in 1916 and known for many years as the Cooperative League of the USA (CLUSA), NCBA's membership includes cooperatives in the fields of housing, health care, finance, insurance, child care, agricultural marketing and supply, rural utilities and consumer goods and services, as well as associations of cooperatives. NCBA's mission is to develop, advance, and protect cooperative enterprise.

PREPARED STATEMENT OF THE NATIONAL CORN GROWERS ASSOCIATION

We appreciate this opportunity to provide the Subcommittee with our views on the fiscal year 1999 agricultural appropriations bill. The National Corn Growers Association (NCGA) represents 30,000 corn growers in 47 states. For the fiscal year 1999 agricultural appropriations bill, the NCGA supports the Administration's budget request for increased funding for plant and animal genomics, especially the request for \$10 million for the creation of a new, Food Genome, competitive grants program. The NCGA, also, supports the Administration's request for increased funding for ARS genomics research and increased funding for genomics under the National Research Initiative (NRI) competitive grants program. The plant component of these funds will be used for USDA's participation in the multi-agency National Plant Genome Initiative.

While many Federal agricultural programs are important to the Nation's corn growers, the National Corn Growers Association believes that the future of the corn industry is written in corn's genetic code. The NCGA believes that the most important appropriations issue for fiscal year 1999 is funding for coordinated, plant genomics research. Genomics consists of mapping, sequencing, and analyzing genomes to determine the function of genes. The complete genetic makeup of any organism is known as its genome.

In January 1998, the National Science and Technology Council issued an Interagency Working Group report on the National Plant Genome Initiative. The report stated that the time was right for the implementation of a comprehensive, five-year National Plant Genome Initiative to meet the major challenges that will face mankind in the 21st Century. In the transmittal letter accompanying the report, the President's science advisor, Dr. John H. Gibbons, stated the following:

The timing of this initiative is critical, since our international private sector partners are moving forward aggressively. A significant public sector program . . . carried out in partnership with industry will ensure plant genome data and materials are openly accessible to all scientists. It is a critical step toward promoting future scientific breakthroughs in plant biology and their practical application.

To accomplish the short-term goals of the National Plant Genome Initiative that focus on building plant genome research infrastructure, the Interagency Working Group on Plant Genomes estimated that \$400 million in funding was needed, over five years, to meet the anticipated needs of the Initiative. The Administration's budget request for increased funding for USDA plant and animal genomics will help to ensure that the short-term and long-term goals of the National Plant Genome Initiative are met.

The National Plant Genome Initiative will help scientists, geneticists, and plant breeders identify and utilize genes from corn and other economically significant crops that control important traits, such as nutritional value, stress tolerance, and resistance to pests. The far-reaching benefits of this Initiative include:

- Protection of U.S. interests and access to important biotechnology and gene patents;
- Revitalization of rural America due to a more robust agricultural sector;
- Expansion of plant-based renewable resources for energy and raw materials;
- Significant reductions in crop losses and reliance on pesticides through improved biological methods to control and alleviate serious industrial threats and targeted pests;
- Improved yields and reduced crop losses caused by adverse environmental conditions such as heat, drought, and salt;
- Improved nitrogen-use efficiency, thereby, limiting the potential for nitrates in the water supply;
- Reduced environmental problems confronted by livestock producers, such as modifying the digestibility of phosphorous in feed corn to reduce the amount of phosphorous that enters our ground water;
- Improved animal nutrition leading to healthier meat and increased meat productivity;
- Reductions in the occurrence of mycotoxin contamination by significantly improving resistance to fungal infection;
- Development of tailored hybrids with valuable specialty starches, oils, and protein content; and
- Reduced worldwide malnutrition due to higher yielding and more nutritious crops.

The National Plant Genome Initiative is critical to the long-term viability of U.S. agriculture. To compete in the global market, the U.S. must continually strive to efficiently and economically improve production capabilities—to maximize yield and combat serious threats from disease, pests, and climate changes—without harming the environment. Genomics research holds the key to achieving this goal.

The National Corn Growers Association urges you to provide increased funding for plant and animal genomics research at USDA to ensure that our growers have the tools to meet the challenges and demands of the 21st century.

We appreciate the opportunity to present our views and look forward to working with you.

PREPARED STATEMENT OF THE NATIONAL COTTON COUNCIL OF AMERICA

COTTON INDUSTRY FUNDING—BRIEF BACKGROUND ON REQUEST FOR FISCAL YEAR 1999

Boll Weevil.—The industry requests fiscal year 1999 funding which would allow APHIS to provide up to 30 percent federal cost share for the operation of the eradication program. The industry also requests sufficient funds so USDA's Farm Service Agency can provide up to \$50 million in loans for boll weevil eradication activities in fiscal year 1999. We also request funding be made available on a no-year basis. The industry's request for funding and loan authority will fill needs resulting from operation and continued expansion of the highly successful boll weevil eradication program. The industry also renews its request that the Committee instruct USDA to collect and make available statistics on acreage planted to cotton to ensure producer assessments can be collected fairly and efficiently.

The accelerated plan for eradication of the boll weevil was initiated in fiscal year 1995. The plan calls for cost-share programs to be operated simultaneously in the Southeast, Mid-South and Texas-Oklahoma-New Mexico regions. In addition, the plan provides for completion of the eradication effort in Alabama/Middle Tennessee and Texas' Southern Rolling Plains zone.

Funding for fiscal year 1997 was reduced from \$18.084 million to \$16.209 million in part because of the discontinuation of the program in east Mississippi and the Lower Rio Grande Valley. Funding for fiscal year 1998 was maintained at \$16.209 million. For fiscal year 1999, the industry requests sufficient funding be provided

to restore the federal cost share to as close to 30 percent as possible. The fiscal year 1998 appropriation allowed APHIS to contribute an average of approximately 10 percent cost share, however some areas did not receive any cost share. With declining prices and narrow margins, growers are struggling to finance the program. The 30 percent federal/70 percent grower cost share arrangement was critical to the timely completion and lasting success of the program in the Southeastern states and Arizona. Since 1997 producers have approved referenda to restart the program in east Mississippi, to initiate the program in two additional regions of Mississippi and Southwest Tennessee, to initiate the program in the Red River Valley of Louisiana along with Southwest Arkansas, to initiate the programs in South Texas/Wintergarden and Texas' Rolling Plains Central zone. New Mexico and Oklahoma have passed referenda and plan to begin programs in the Fall of 1998. Arkansas producers in all but 4 northeast counties have passed a vote to begin eradication with Mississippi's Delta and north Louisiana. Referenda covering additional areas of Mississippi's delta and Louisiana narrowly missed achieving the necessary 2/3's approval and will be reviewed for possible revotes in the future.

To succeed, the program requires a highly coordinated program supplied with equipment and trained personnel. USDA/APHIS/PPQ, the federal action agency with unique expertise for conducting such programs, has been invaluable ever since the 1978 eradication trial in Virginia and North Carolina by providing leadership, experience, and direction to the Boll Weevil Eradication Program. Their involvement now is more important than ever as multiple overlapping programs are initiated.

Elimination of the boll weevil places U.S. cotton producers in position to be cost competitive with any other cotton producing country. A strong cotton economy means strong state and local economies with more jobs and an increased tax base. The program is credited with generating \$12 in economic activity for every \$1 expended. It has also been documented to significantly reduce the cost of production and improve producer income. The environmental benefit has been documented in the Southeast by reduction of insecticide use by 40–85 percent. With the introduction of worm resistant Bt cotton, elimination of the boll weevil takes on added significance—particularly in the Delta regions of Mississippi, Louisiana and Arkansas and in Texas.

Thanks to cooperation between regional Boll Weevil Eradication Foundations who coordinate program operations, and with APHIS, limited funds have been invested as effectively as possible. While the loan program initiated in 1997 to supplement the short fall in direct Federal cost share contributions has been helpful and is needed again in fiscal year 1999, some areas are under severe stress. In fact, some eradication zones are operating with little or no Federal cost share and minimal loan funds. Virtually all programs are operating with significantly less than the 30 percent Federal cost-share which was available to earlier program areas. According to calculations, the current average Federal share is approximately 10 percent.

There has been excellent cooperation from FSA in initiating and operating the loan program. It would be extremely helpful if the loan program could be available on a no year basis so that any unused authority will not be lost. We also request that the Committee increase the available loan authority for fiscal year 1999 since expanded operations in Tennessee, Louisiana, Arkansas, Texas and New Mexico are expected to begin in Fall of 1998.

The Committee included language in the fiscal year 1997 appropriations measure urging USDA to assist with collection of acreage data so collections of boll weevil assessments could be made effectively, fairly and at the least possible cost. As of March 1998, USDA has not advised the Foundations that it would assist with the collection of acreage data. The Foundations lack the necessary facilities and resources to carry-out this function and ask the Committee to renew its instructions to USDA to provide assistance to the Foundations in collecting data critical to the administration and collection of assessments.

Pink Bollworm Programs.—The pink bollworm is a serious economic pest in West Texas, New Mexico, Arizona and the southern desert valleys of California. California growers for more than two decades have joined USDA/APHIS in a cost share partnership known as the cooperative pink bollworm containment program. Through comprehensive cultural and biological controls, pink bollworm infestation has successfully been prevented in the San Joaquin Valley. Sterile moth releases are an essential component of this program. Use of bio-rational methods includes sterile adult moths, pheromone traps and cultural methods which allow control of the pink bollworm without use of pesticides. Over 6 million moths are reared and sterilized each day in Phoenix facilities owned by California producers. Equipment, methods and partial support for rearing and operations are furnished by APHIS.

Investments in new rearing capacity will provide opportunities for USDA/APHIS/ARS, state organizations, and producers to demonstrate area-wide management of

pink bollworm infested areas by integrating genetically engineered Bt cotton, cultural controls, making disruption with pheromones and sterile moth releases. Eradication is feasible using this technology in a highly coordinated, area-wide basis. The Council's Pink Bollworm Action Committee has endorsed the area-wide approach, and is currently developing an action plan to be used to communicate to producers about the proposed area wide pink bollworm management program.

Funding for USDA/APHIS/PPQ pink bollworm programs has been cut by over 50 percent compared to fiscal year 1994 levels resulting in delays in completing area-wide demonstration programs in southern California. Demonstration of wide area control technology is essential before producers can consider expansion of the program into other infested areas in the U.S. Area wide management of the pink bollworm with maximum suppression, possibly eradication, is becoming a reality. The goal of reduced pesticide use, optimum use in Integrated Pest Management (IPM), and reduced production costs are within reach if the partnership between states, the Federal government and producers can be continued. California producers in the lower Colorado River Basin area will, in cooperation with USDA APHIS, California Department of Food and Agriculture, and California Cotton Pest Control Board, conduct a trial pink bollworm maximum suppression program including Bt cotton, cultural controls, pheromone treatments, and sterile moth releases during this growing season. Producers in other areas will carefully observe the results from this trial.

The industry requests that fiscal year 1999 base funding be maintained at fiscal year 1998 level of \$1.069 million. If producers continue to request assistance for conduct, supervision and cost sharing for areawide pink bollworm programs, the industry will request an increase in funding likely beginning in fiscal year 2000.

Silverleaf Whitefly.—The whitefly is a cotton pest of significant importance, particularly in Arizona, California and Texas, causing yield, disease, grade and contamination losses for growers. Sticky cotton, caused by whitefly honeydew is a serious problem for textile mills who at the least impose price discounts and in some cases will refuse cotton originating in areas with whitefly infestation. The Council strongly supports funding the continuation and extension of USDA's Whitefly Research, Action and Technology Transfer Plan which calls for a multi-disciplinary approach consisting of basic research, biological controls, integrated pest management, plant breeding for resistance, and insecticide controls with expedited technology transfer.

Market Access Program (MAP) and Foreign Market Development (FMD).—The cotton industry has consistently employed a long-term export market development strategy. Cotton Council International, the overseas promotion arm of the U.S. cotton industry, is a participant in the Market Access Program (MAP) and Foreign Market Development Program (FMD). Activities carried-out under MAP and FMD have been responsible for increased export sales of raw cotton and cotton products including cotton textiles. The U.S. cotton promotions have not only increased sales, they have generated more than \$2.50 in matching contributions for every \$1 spent. In operating programs under MAP, the industry insists on the following: (1) purchases of U.S. cotton and textile products must be documented, (2) sales impact must be well-documented, (3) no funds are provided to foreign or domestic firms, (4) matching contributions must be documented, and (5) no funds may be used to promote exports to the United States.

Raw cotton exports now average over 8 million bales annually and approach \$4 billion in value. Exports of value-added cotton products have quadrupled and add another \$4 billion to the value of overall cotton exports—creating thousands of jobs. The cotton industry urges that \$90 million be made available for MAP for fiscal year 1999. We also urge that FAS be provided sufficient funds so the FMD program can be operated at the same level in fiscal year 1999 as in fiscal year 1998. The FMD program is an important long-term component of a successful market development effort for U.S. agriculture. CCI utilizes FMD funds to conduct education activities which help build long term relations with potential customers for U.S. cotton and cotton products. The industry also strongly supports adequate funding so cover activities of FAS personnel who carry-out important export enhancement functions at headquarters and abroad.

Export Credit Guarantee Programs.—Congressional foresight in authorizing use of \$5.9 billion for GSM-102 export credit guarantees and USDA's timely employment of that program has allowed U.S. exporters to preserve sales to Asia. Cancellation of these sales would have had a devastating effect on exporters and farmers. For fiscal year 1999, GSM-102 will again play a critical role in facilitating U.S. export sales.

Valued Added/Quality Cotton Textile Research.—The competitiveness of agriculture depends not only on efficient production, but value added processes as well.

ARS labs have been forced to sharply reduce support staff, equipment purchases, and scientist positions due to rising costs and shrinking budgets. The industry urges continuation of value-added quality oriented research at the SRRRC in New Orleans and at Clemson University.

Germplasm Enhancement.—The United States cotton germplasm collection is maintained at the ARS Southern Crops Research Laboratory in College Station, Texas. This collection serves public and private researchers nationwide as they attempt to meet increasingly serious challenges for yields, quality and solutions to environmental problems.

The ARS has developed a long-range comprehensive plan for revitalizing the germplasm enhancement program at College Station. While we fully support the overall ARS plan, the most urgent need is for support of the germplasm enhancement and evaluation program for winter increases.

To meet crucial short term operational needs for the germplasm program, ARS has temporarily shifted funds for other high priority research projects.

Oilseed Processing and Quality Research.—The USDA ARS Southern Regional Research Center (SRRRC) in New Orleans has a long history of research for adding value to commodities including improvements in processing and utilization of cottonseed and its products. In addition to its fiber research, the ARS has developed, in cooperation with the crushing industry, a set of goals for improving process efficiency, maintaining product quality and enhancing food safety.

Specifically, research at the SRRRC is working in three areas important to cotton and other oil seeds. First, is research to remove gossypol, a naturally occurring component of cotton seeds which is toxic at high levels to some animals. Removing gossypol from cotton seed and its products is technologically feasible, however research is needed to determine optimum processes of removal. The ability to market a high quality protein product for animal consumption is a key ingredient to enhancing markets of U.S. cotton products at home and abroad.

Aflatoxin control is also an important part of the SRRRC research goals. Eliminating food and feed risks of the mold which produces aflatoxin is a high priority for cotton, peanuts, corn, tree nuts and other crops. Pioneering research conducted by researchers in New Orleans is leading the way to solving this multi-million dollar problem of U.S. agriculture.

Finally, work to enhance processing efficiency while assuring environmental responsibility is the third component of the SRRRC mission in oilseed utilization research. Developing new and novel approaches for extraction of oil while meeting new environmental objectives is important for cotton and other oil seed commodities.

We request that Congress continue to recognize the USDA/ARS work at the Southern Regional Research Center for its contribution to agriculture and ask that the unit continue to be funded at least the current level.

Plant Science Research.—Agricultural Research conducted by the in-house program of USDA's ARS and the State Agricultural Experiment Stations with CSREES support is essential for the long term viability of agriculture. While we are strongly supportive of the ARS and CSREES we also recognize the benefits of the basic research—sometimes at the molecular level—made possible by the National Research Initiative (NRI). The NRI is a key component of the USDA's research portfolio and complements other programs in the ARS and CSREES.

We appreciate your strong record of support for vital plant science research made possible through the NRI, the ARS and CSREES.

PM-10.—A variety of studies allege that agriculture is a major source of PM-10 emissions. The cotton ginning industry is already making significant investments to reduce emissions and develop air quality compliance plans. The research conducted by USDA is critically important to assist Sinners and producers in making cost effective decisions. We urge funding for CSREES' PM-10 programs be continued at not less than fiscal year 1998 levels.

CRP, WRP, EQIP.—The new farm bill extends authority for the operation of the CRP and WRP. It also authorizes a new program, EQIP, to provide assistance for projects designed to protect water, soil and related resources. We urge funding be made available at levels necessary to operate these important programs without threatening other important cotton specific programs.

FSA Offices.—The industry is concerned that the ability of FSA to deliver critical services could be impaired by further office closures and personnel reductions. USDA has already implemented a significant re-organization as a result of 1994 legislation. The cotton industry urges the Secretary to consult with all affected parties to ensure that further consolidation, closures and personnel reductions do not jeopardize the agency's ability to deliver services to farmers.

Ginning Labs (ARS).—The industry requests the Committee to urge ARS officials to provide sufficient funds to the ginning labs at Stoneville, Mesilla Park and Lub-

bock so the important work at these facilities can be continued and enhanced. Each lab conducts research which is important to gins and producers. Each lab has unique capabilities and care has been taken to ensure there is no duplication of effort. The fiscal year 1998 appropriations measure provided funds specifically to improve research capabilities at the Lubbock lab. We ask that language be included in the fiscal year 1999 legislation to ensure ARS continues to make these funds available to the Lubbock facility.

Office of Pest Management Programs.—NCC supported the role USDA was given when the new Food Quality Protection Act was passed. We were encouraged that the Department announced the creation of the Office of Pest Management Policy, but continue to be concerned that responsibilities under FQPA are not being met expeditiously enough to assure cotton producers do not lose access to important crop protection tools (such as the organophosphate insecticides) unnecessarily. The OPMP should be funded at the \$2.6 requested and to assure the greatest efficiency all requirements, including the Integrated Pest Management Coordinators, should be coordinated through that office.

PREPARED STATEMENT OF THE NATIONAL DRY BEAN COUNCIL

NDBC EXECUTIVE SUMMARY

Phaseolus beans are a unique short season, high value food crop that niche will into shorter production seasons of the northern and intermountain states, providing vital alternatives to growers where crop options are limited. Dry beans are grown on 2M acres with an annual production of 32M hundred weight in 1991 valued at \$650M. Snap beans, both processed and fresh market, are produced on 300,000 acres with an estimated value of \$200M.

Beans offer the consumer a healthy, tasty inexpensive food choice as either dry bean seed or green bean pods (snap beans). Dry beans are a protein rich source of complex carbohydrates and fiber, available in a variety of canned and dry products differing in color, size, shape, and flavor. Snap beans are rich in vitamins and minerals but low in fat and calories. Clinical studies have documented that the soluble fiber of dry bean seed can reduce serum cholesterol, and the National Research Council suggests that beans will be the fiber food of the 1990's. Beans are currently endorsed by the American Heart Association, the American Cancer Society, and the American Diabetes Association. Sixty percent of the U.S. dry bean crop is processed as canned baked beans with a value of \$900M. Currently 40 percent of U.S. production is exported, with certain commercial classes grown exclusively for export. Their value as an acceptable protein staple in famine relief is being recognized.

The research to improve beans is achieved through a highly integrated system involving state, federal, and industry scientists. Currently states furnish 24 scientist years (SY's) and the federal Agricultural Research Service (ARS) furnishes 5 SY's. Industry contributes very significantly to snap bean research, but it is also actively involved in dry bean improvement.

Beans need to be improved in three primary research areas: pathology, quality genetics, and biotechnology, if they are to remain a viable crop alternative and industry in the 20 production states. The research must remain multidisciplinary, occur across geographic areas, and continue to foster collaboration among states, ARS, and industry. Three critical USDA-ARS positions involved in two of the primary research areas; bacteriology (E. Lansing, MI), culinary and canning quality genetics (E. Lansing, MI), and fungal pathology (Beltsville, MD); need additional funding. A new ARS position, located in the Plains states, focusing on molecular technology for bean improvement would address the third research area.

To achieve these critical research goals, the National Bean Research Task Force recommends:

1. No further reduction in current level of ARS support to bean research.
2. Maintain the current ARS bean vial pathology position at Prosser, WA.
3. Appropriate an additional \$80,000 in fiscal year 1999 for the under funded ARS bean fungal pathology position at Beltsville, MD.
4. Appropriate an additional \$300,000 in fiscal year 1999 for the ARS Sugar Beet and Bean Research Unit, Michigan State University, East Lansing, MI.

Implementation of these recommendations would be a positive commitment to the future of bean research and the bean industry in the U.S. It would create more cooperation between federal, state, and private sections in their goal towards bean production improvement and utilization. The ultimate beneficiaries would be the American consumer with a reliable economic and nutritional food source and the American taxpayer with positive returns on balance of trade.

STRATEGIC PLAN FOR U.S. BEAN RESEARCH

Dry & Snap bean (*Phaseolus vulgaris* L.) are versatile short season, high value food crops that niche well into shorter production seasons of the northern and intermountain states, providing vital alternatives to growers where crop options are limited. Beans offer the consumer a healthy, tasty and inexpensive food choice as either low fat, low calories vitamin/mineral rich green bean pods or as a protein rich source of complex carbohydrates and fiber in a variety of canned and dry bean products differing in color, size, shape, and flavor. Clinical studies have documented that the soluble fiber or pectin content of dry bean seed has potent effects in the prevention and treatment of chronic medical conditions such as cardiovascular disease, diabetes mellitus, and obesity, hypertension, cancer and diseases of the digestive tract. Beans are currently endorsed by the American Heart Association, the American Cancer Society, and the American Diabetes Association. The beans are touted by these Agencies as the fiber food of the 1990's. The canning and freezing industry for both seed and pod types is diverse and located across the country offering employment outside the 20 major production states. The same processing industry which cans over half the dry bean crop as beans in either clear brine, sauce with pork, or chili has seen an increase in production in the last 10 years of 10 million cases. This volume represents an increase of \$160 million to a current value in excess of \$900 million.

Production:

Phaseolus dry edible beans are planted on approximately 1.5 million acres (1.1–2.6) in the U.S. Production fluctuates around 26.7 million hundred weight (cwt) annually, ranging from 19 million cwt in 1988 to over 32 million cwt in 1990, 1991, and 1995. On-farm value of this crop ranges from \$350 to \$700 million, depending on the season and price. The major production states ranked in order of acreage are: ND, MI, CO, NE, CA, ID, MN, WY, WA, NY, and KS. Ten dry bean commercial classes are produced in the U.S. and these are differentiated by color, size and shape of the bean.

In addition to production of *phaseolus* dry beans, green bean, or snap bean production occurs in several regions of the U.S. (approximately 220,000 acres), with an estimated value of \$110M annually. States leading in snap bean production for processing are WI, OR, IL, MI, NY and ID. Snap beans for fresh market are grown primarily in FL, with smaller acreage in NJ, AR, and TN. Snap beans for fresh market are grown on approximately 80,000 acres nationwide with an additional value of \$80 million annually.

Utilization and Exportation:

Approximately 60 percent of the total U.S. dry bean production is consumed nationally. Over 90 percent of the navy bean crop is processed as canned baked beans, while only 20 percent of the pinto bean market class is processed as a canned food. Dry bean consumption has increased from 5.7 to 7.2 lbs since 1984. This represents a 26 percent increase which is largely due to the recognition of the food and health value of beans.

A large share of the U.S. dry bean production is now targeted at export markets. Exports peaked in the early 1980's at over 12 million cwt. Currently, 40 percent of the U.S. production is exported with certain commercial classes grown exclusively for export. Cultural preferences in certain export markets for specific commercial classes of dry bean allows for diversification of U.S. dry bean agricultural production. Bean exports have played an important role in reducing the balance of payment deficit the U.S. suffers in world trade. Bean exports are becoming increasingly important because they are an indispensable protein source in Latin America and many developing countries particularly those in East Africa. Their value in famine relief in these countries is vital. The array of seed types currently grown in the U.S. makes beans an important choice to meet the energy and protein needs of estimated 21 million people at risk of death from starvation and disease in Central Africa.

CURRENT SCOPE OF U.S. BEAN RESEARCH

A major strength of the U.S. economy is its agricultural production. Stable U.S. agriculture production helps maintain a vibrant economy because food costs to consumers can be kept low yet still profitable to the producer. In addition, agricultural exports contribute substantially to reduce trade deficits. Continued U.S. dominance in agriculture will require major efforts to improve both crop productivity and quality while stabilizing or improving the physical environment. This process will allow U.S. agriculture to supply both domestic and world markets with affordable, high quality products and preserve precious natural resources for future generations.

These efforts can only be accomplished by investing in strong agricultural research technologies. Beans can only continue to be a vital part of the U.S. agricultural economy if research to keep them competitive with other commodities continues.

The number of state and federal scientist years (SY's) devoted to bean research in the U.S. in all disciplines is approximately 27 (20 SY's—dry beans, 7 SY's—snap beans). The specific locations of the larger programs are shown on the attached table, along with the agencies involved, SY's, and primary research emphasis at each location. A network of federally-supported USDA positions were established through the Agricultural Research Service (ARS) in the 1920's to support both public and private programs dedicated to dry bean and snap bean research. The ARS research mission for beans is to solve specific high priority problems of a national scope. A national research mission cannot be addressed by any single Agricultural Experiment Station. Moreover, since the bean industry is regionalized, ARS is in a better position to develop the necessary research teams to address problems that extend far and beyond state and regional boundaries. The national leadership extended by ARS scientists in areas of pathology, germplasm maintenance and enhancement and food quality genetics has strengthened the entire bean industry nationally. The present national bean research effort is operating at a minimal level but is effective because of the unique collaboration among state, federal and industry partners, fostered in part by the Western Regional W-150 project and nurseries and the Phaseolus Crop Advisory Committee.

A National Bean Research Task Force (NBRTF) has been formed to identify needs and concerns within the research community and to make recommendations to correct the deficiencies. The task force recognizes and appreciates the continued federal support for the ARS bean research positions at Prosser, WA; Beltsville, MD; and Mayaguez, PR, and for the increase in funding for the ARS food quality genetics position at E. Lansing, MI, but NBRTF is concerned by the lack of critical research areas of bean pathology. New and more virulent strains of bean pathogens have made a major onslaught in several bean production areas. There is critical need for research to characterize the new pathogens and develop strategies for resistance in the plant.

The NBRTF requests that the National Dry Bean Council (NDBC) lobby for support for federally supported research programs which are currently under funded and for the creation of a new position to solve critical problems caused by foliar, bacterial and fungal pathogens.

USDA-AGRICULTURAL RESEARCH SERVICE BEAN RESEARCH WORKERS AND FACILITIES

Goals and Recommendations for fiscal year 1999:

The National Dry Bean Council (NDBC) is urging Congress to approve funding in fiscal year 1999 for the USDA Agricultural Research Service (ARS) Plant Science Program that increases funding from fiscal year 1998 levels to the \$300,000 required by ARS to fund a CRIS project. This will enable the ARS to provide adequate support for these bean scientists.

Specifically, the NDBC is recommending Congress address the following priority needs in bean research.

Operations Budget:

1. Maintain the current ARS bean viral pathology position at Prosser, WA with the \$300,000 level of funding required by ARS to maintain a viable CRIS project. This position will enable ARS to effectively conduct research on common bean virus problems and resistance breeding and expand activities on bean root rots and allow ARS to address critical needs pertaining to disease resistance in the major bean seed production area in the U.S.

2. Appropriate an additional \$80,000 in fiscal year 1999 for the under funded ARS bean fungal pathology position at Beltsville, MD. The appropriation will bring the funding of this position up to the \$300,000 level required by ARS to maintain a viable CRIS project and enable the scientist to effectively conduct his research on bean rust pathology and genetics and expand activities on bean golden mosaic virus recently introduced into the U.S. and allow the ARS to successfully refill the position upon the retirement of the scientist.

3. Appropriate an additional \$300,000 in fiscal year 1999 for the ARS Sugar Beet and Bean Research Unit, Michigan State University, East Lansing, MI to correct a critical federal need in bean pathology, particularly in the area of foliar bacterial and fungal pathogens namely common blight, halo blight, bacterial brown spot, anthracnose, and white mold disease pathogens. The appropriation will enable the hiring of a bean bacteriologist/microbiologist to conduct the needed work pursued

formerly by the late Dr. Saettler in the area of bean pathology. This critical position has been vacant for several years.

Background:

A well-balanced approach to the nations's bean research needs requires the maintenance of a team of ARS bean research workers in diverse disciplines including genetics, germplasm enhancement, germplasm evaluation, pathology, quality, and molecular biology. In order to maintain an adequate team of ARS bean research workers, it is important that ARS research workers presently engaged in bean research not be redirected to other crops and that vacancies created by retirements and deaths be filled and these programs maintained for bean research.

During the period from 1970 to 1990, the number as USDA-ARS bean research workers declined substantially, from 13.0 to 5.0 positions, a decrease of 56 percent. This decline severely hampered the ability of ARS to meet national bean research needs, and the SAES to meet state bean research needs.

The total ARS budget increased by 67 percent from fiscal year 1980 to fiscal year 1990 while the bean appropriation remained constant at just under \$1.6M. Total bean appropriations as a percent of total ARS budget in fiscal year 1980 was 0.43 percent which dropped to 0.25 percent by fiscal year 1990.

Unfortunately, the number of ARS bean researchers is again on the decline, due to the untimely death of Dr. Saettler in East Lansing, MI and the impending retirements of incumbents at the USDA, Prosser, WA and Beltsville, MD facilities. Action by Congress is needed to restore the national ARS bean research team to a level that can meet the nation's bean research needs.

In a real sense, the bean industry (dry and snap beans), although vitally important in specific other geographic regions, does not have the resources of the major crops to establish pathological or basic mission oriented expertise in every region where beans are grown. The USDA can mend this void by maintaining the vital network of scientists currently working and dealing with important regional pathogens, problems and opportunities which are of a national importance.

USDA/ARS BEAN PATHOLOGY RESEARCH POSITION, PROSSER, WASHINGTON

The ARS BEAN Project at Prosser, Washington has been long standing with a presence under the legacies of D.W. Burke and M.J. Silbernagel. Under the leadership of these scientists, programs were developed to study the pathogenic variability of common bean mosaic virus (BCMV) and the introgression of diverse resistance genes into snap and dry bean germplasm, and the development of screening techniques for germplasm enhancement of root rot complex pathogens. The ARS Prosser, WA bean project has released over 10 snap bean lines and 18 dry bean lines in six distinct market classes. A number of the dry bean lines have become successful dry bean varieties in the West and Intermountain states (CO, ID, and WA) and the upper-Midwest (ND). The dry bean varieties developed by ARS, Prosser, WA have generated about \$1 billion in income to farmers in the Pacific NW over the past 20 years. Othello pinto bean is grown on about 50 percent of the pinto acreage in the west and intermountain region and has generate \$68 million revenue in the state of Idaho in the last 5 years. The ARS Prosser, WA bean project is currently under the leadership of Dr. Phillip Miklas who in addition to screening for root rot and introgressing genes form diverse germplasm, is conducting basic genetic studies on the resistance to different strains of BCMV, bacterial blight, rust and white mold. Mr. Miklas has developed effective cooperative research efforts with ARS and SAES scientists at several locations in the U.S. and Puerto Rico, and commercial plant breeders in CA and ID. Over 90 percent of the foundation and certified bean seed (dry and garden) is produced in California, Washington and Idaho. The ARS bean project at Prosser, WA has saved the Western bean seed industry considerable sums of money that could have been lost to disease epidemics. Over the years the facilities at Prosser, Washington have evolved to a point where there is an excellent infrastructure in which dry bean disease and germplasm enhancement research is conducted productively, efficiently, and has garnered a wide customer base. A rapport has been established with this customer base that is extremely supportive of ARS research efforts. In addition, nurseries have been established that facilitate long term research on the complex of bean root rot organisms and curly top virus.

Recommendation:

In order to meet the President's budget requirements for ARS in fiscal year 1998, the Vegetable & Forage Crops production Research unit has been slated for closure. Under this plan, there is talk of moving bean research to Pullman, WA. The NDBC calls on ARS to maintain bean research at Prosser, WA and fund this project at \$300,000, the ARS guideline for programs. Prosser is near the bean production area

and several long term nurseries have been established at or near Prosser to conduct bean pathology research. Many of the facilities at the Prosser Station have been developed to conduct bean research and are highly suitable to conduct the "cutting-edge" research that is fundamental to Dr. Mikias' CRIS. There are sufficient greenhouses to conduct the genetic introgression work and disease screening efforts.

The NDBC thinks its at a "water shed" in regards to federal support for bean research. Over the years ARS bean research positions have eroded to the point the NDBC wonders whether a critical mass of federal scientific expertise exists in the USA to conduct the type of research vitally needed to keep our industry healthy.

The NDBC urges Congress to maintain this vital ARS position and insure funding at \$300,000 in fiscal year 1999 for this position.

USDA/ARS BEAN FUNGAL PATHOLOGY RESEARCH POSITION, BELTSVILLE, MARYLAND

Dr. J.R. Stavely, full-time ARS Research Plant Pathologist at Beltsville, devotes 100 percent of his research effort to the study of fungal pathogens attacking beans. Historically, Dr. Stavely has studied the foliar fungal pathogen causing rust disease in dry and snap beans. Dr. Stavely has developed important technologies for introgressing rust resistant genes into adapted and useful germplasm. He is also studying the new viral disease, Bean Golden Mosaic Virus, introduced in 1993 in South Florida. This disease has the potential to "wipe-out" the snap bean industry in Florida.

This highly productive ARS project has released 43 processing and 15 fresh market snap beans and 24 dry bean germplasm lines in three market classes. Research has focused on the introgression and pyramiding of resistance genes into both snap and dry beans as the most effective control of the variable rust pathogen. This long-term germplasm enhancement project involves identification of novel sources of resistance present in the USDA Plant Introduction collection, incorporation of these resistance genes, both individually and as groups, into snap bean and several dry bean market classes, and field evaluation of elite material in major production areas. In addition, basic plant pathological studies on the epidemiology and genetics of the rust fungus are conducted. The current project leader cooperates effectively with other USDA scientists, SAES researchers in at least nine states, and commercial plant breeders. This position serves the national needs for bean research in the area of fungal pathogens attacking beans and provides leadership to SAES and industry and snap bean breeding efforts.

Dr. Stavely's position is currently under funded, with a major portion of the funding utilized for salaries and greenhouse rental, leaving very little for research operating costs. An increase appropriation of \$80,000 is needed to enable Dr. Stavely to effectively conduct his research, by bringing his CRIS into line with the \$300,000 level of funding required by USDA.

Recommendation:

The NDBC calls on ARS to maintain the program in bean rust pathology germplasm enhancement research at Beltsville, MD and expand the program into anthracnose disease pathology and study the bean golden mosaic virus disease. Increased funding to current ARS level of \$300,000 per year would allow this project to perform at optimum efficiency to develop improved rust, anthracnose, and bean golden mosaic resistant germplasm lines. An increased emphasis on the genetics of pathogen virulence will offer insights on the development of strategies needed to obtain stable rust and broad based genetic resistance to variable fungal and viral pathogens.

The NDBC urges Congress to appropriate an additional \$80,000 in fiscal year 1999 for this position to bring the funding level to the \$300,000 required by ARS to maintain a CRIS.

USDA/ARS BEAN PATHOLOGY RESEARCH POSITION, EAST LANSING, MICHIGAN

There is a urgent need to create a new position in bean pathology at E. Lansing, MI recognizing that an increase in bacterial diseases is negatively affecting bean production in the Midwest and intermountain areas. An ARS Plant Pathology position addressing national problems caused by foliar bacterial pathogens was closed-out in 1992 due to the untimely death of then incumbent (Dr. A.W. Saettler). There are no funds to "backfill" this position. Dr. Saettler worked to determine the molecular and genetic basis of host and non-host resistance to the bean common bacterial blight pathogen, *Xanthomonas campestris* pv. *phaseoli*, develop molecular and immunological diagnostics to determine the epidemiology and population biology of common and halo bacterial blights, and design alternative control strategies, includ-

ing biological, chemical, and cultural practices that will complement the move toward sustainable agricultural practices.

Dr. Saettler was an international expert on foliar bacterial pathogens of beans. he was the only bean pathologist in the USA (either SAES or Federal) that had an active and comprehensive research program on foliar bacterial pathogens of beans. Dr. Saettler's research contributed positively and significantly to several of today's highest national priorities as established by the National Research Council. In that position at E. Lansing, Dr. Saettler contributed to the development of 17 dry bean cultivars in five major market classes and he actively cooperated with other state and private bean research programs. The bean research community needs a pathologist working full time on foliar bacterial pathogens. The work could best be done by ARS because of the national scope of the problem. This position must be funded at the \$300,000 level to meet ARS guidelines for CRIS positions.

Recommendation:

The NDBC calls on ARS to create a new position in bean pathology at East Lansing, MI, at the level of funding commensurate with ARS guidelines. A qualified scientist should be recruited to fill the bean bacteriology position as soon as possible.

The NDBC urges Congress to appropriate an additional \$300,000 in fiscal year 1999 for the creation of the new position.

LOCATION OF DRY AND SNAP BEAN PROGRAMS, SCIENTIST YEARS (SY) INVOLVED, AND KEY WORDS FOR MAJOR RESEARCH AREAS

Location	Agency	SY	Major research areas
Dry Beans:

PREPARED STATEMENT OF THE NATIONAL EASTER SEAL SOCIETY

EASTER SEAL RECOMMENDATIONS FOR USDA AGRABILITY PROGRAM FISCAL YEAR 1999
APPROPRIATIONS

The National Easter Seal Society appreciates the opportunity to report on the notable accomplishments of the USDA Cooperative State Research, Education, and Extension Service (CSREES) AgrAbility Program and recommend that funding for the AgrAbility Program be increased to \$4.6 million in fiscal year 1999.

The AgrAbility Program is an essential, unduplicated, hands-on resource for farmers, ranchers, and farmworkers with disabilities. It is the only USDA program dedicated exclusively to helping disabled agricultural producers. It demonstrates the value of public-private partnership by securing donations of funds, talent, and materials to magnify the impact of a modest federal investment. Small, but damaging, reductions in funding over the past two years resulted in a fiscal year 1998 appropriation of \$1.91 million, down from \$2.0 million in 1995.

Your colleagues on the Agriculture Committee expressed strong bipartisan support for this important program in the "Agricultural Research, Extension, and Education Reform Act of 1997" that is currently in conference. The Committee included language, that while strongly supportive of the work of AgrAbility, expressed dismay at the increased waiting lists, strain on staff members, and unserved states that still seek funding every year and are unable to offer AgrAbility services due to funding limitations. In the 1990 Farm Bill, a funding floor of \$150,000 per state was set to assure that the state programs were successfully implemented. However, because funding has not approached the \$6 million authorized level, state projects have been funded at only \$85,000 per state. In the reauthorization, the Committee reaffirmed a commitment to that \$150,000 per state floor, and Easter Seals strongly supports the need to fully fund state programs to assure that they continue to be effective for farmers with disabilities. Without a concurrent increase in appropriations, fully funding state projects at \$150,000 per state would result of a loss of almost half of the existing AgrAbility projects. The fiscal year 1999 request of \$4.6 million would bring all current states up to the \$150,000 level and would allow seven currently unserved states to implement AgrAbility programs.

DISABILITY & AGRICULTURE

Agricultural production is one of the nation's most hazardous occupations. Each year, approximately 200,000 people working in agriculture experience injuries that limit their ability to perform essential farm tasks. Tens of thousands more become disabled as a result of non-farm injuries, illnesses, other health conditions, and the aging process. Nationwide, approximately 500,000 agricultural workers have physical disabilities that prevent them from performing one or more essential farm tasks.

For many of these individuals, the presence of a disability jeopardizes their rural and agricultural futures. Rural isolation, a tradition of self-reliance, and gaps in rural service delivery systems frequently prevent agricultural workers with disabilities from taking advantage of growing expertise in modifying farm operations, adapting equipment, promoting farmstead accessibility, and using assistive technologies to safely accommodate disability in agricultural and rural settings. Yet, with some assistance, the majority of disabled agricultural workers can continue to earn their livelihoods in agriculture and participate fully in rural community life.

AGRABILITY'S ROLE AND RECORD OF SUCCESS

The AgrAbility Program was established under the 1990 Farm Bill in response to the needs of farmers with disabilities. The Farm Bill authorizes the Secretary of Agriculture to make grants to Extension Services for conducting collaborative education and assistance programs for farmers with disabilities through state demonstration projects and related national training, technical assistance, and information dissemination. Easter Seals is proud to be a partner with Purdue University's Breaking New Ground Program in providing the national training and technical assistance portion of AgrAbility. Thousands of people in states with and without state AgrAbility projects are aided through this initiative. For example, in New Mexico, 38 farmers and agricultural and disability professionals have received direct assistance and information on farming and disability in 1997 from the national project.

AgrAbility combines the know-how of Extension Service and national disability organizations to provide people with disabilities working in agriculture the specialized services that they need to safely accommodate their disabilities in everyday farm operations. AgrAbility received strong bipartisan support during the 1996 Farm Bill reauthorization, and was extended through fiscal year 1997. The \$6 million author-

ization level for AgrAbility was continued and is expected to be included in the current reauthorization of the USDA-CSREES.

Under the statute, state and multi-state AgrAbility projects engage Extension Service agents, disability experts, rural professionals, and volunteers in offering an array of services, including: identifying and referring farmers with disabilities; providing on-the-farm technical assistance for agricultural workers on adapting and using farm equipment, buildings, and tools; restructuring farm operations; providing agriculture-based education to prevent further injury and disability; and, upgrading the skills of Extension Service agents and other rural professionals to better promote success in agricultural production for people disabilities.

In 1997, USDA received an allocation of \$1.91 million to support eighteen projects in nineteen states: Idaho, Illinois, Indiana, Iowa, Kentucky, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Jersey, New York, North Carolina, North Dakota, Ohio, Pennsylvania, South Dakota, Tennessee, and Wisconsin. The 1998-1999 grant cycle is nearly complete and USDA will be announcing the list of funded states for this year within the next two weeks. Easter Seals understands that the USDA received applications from twenty states for the fourteen available AgrAbility project slots in the 1998 grant cycle.

AgrAbility provides customized assistance to farmers, ranchers, and farmworkers with disabilities and their families. The nature and degree of assistance depends on the individual's disability needs and agricultural operation. For example:

Kenneth Stennett, a 45-year-old poultry and beef farmer from Waynesboro, Mississippi, has paraplegia due to a spinal cord injury two years ago. He was unable to use many of his farm buildings and equipment. The Mississippi Department of Rehabilitation Services referred Kenneth to the newly formed Mississippi AgrAbility project. Project staff are now providing support to help make his farm accessible. A major problem for Kenneth was his inability to use his workbench or hand tools to perform general maintenance activities. AgrAbility staff organized a community workday with the Cattleman's Association to recruit volunteer carpenters who lowered his workbench and made other changes to make his shop accessible. AgrAbility staff also referred him to the T.K. Martin Assistive Technology Center to get information on modifications for his hand tools. AgrAbility staff are also working with local limestone dealers to fill areas of the farm terrain with crushed limestone to enable Kenneth to maneuver his wheelchair more easily and safely. Finally, AgrAbility worked with Kenneth to locate a padded seat with armrests and a seat belt for his tractor so that he would be more stable while driving it, and to prevent pressure sores. Kenneth is paying for many of these modifications himself, so AgrAbility staff helped him develop a comprehensive list of needs and prioritize these needs and modifications to make the best use of his resources.

A third generation farmer, Don Wolford of Franklin County, Iowa, farms about 1,100 acres, raises 40 head of beef cows, finishes 560 head of hogs, and maintains a 24-stall farrowing building. In 1992, he had surgery to remove a tumor along his spine, which left him with paraplegia. AgrAbility staff first met with him in the hospital and showed him videos of farmers with disabilities using modifications, and advised him of modifications that he could make to his operation. After he returned home, AgrAbility staff wrote a proposal that helped get funding for Don to purchase an all-terrain vehicle that was adapted for him using a kit from the manufacturer. This vehicle allows him to move equipment and supplies on his farm. A friend designed hand brakes for his tractors and pick-ups. AgrAbility provided him with plans for installing a lift on his tractor. Local welders were then able to use the plans to install the lift. Since his injury, Don has been elected president of the Franklin County Farm Bureau and named 1997 Franklin County Master Pork Producer. He also volunteers his time as an AgrAbility peer counselor to other farmers with disabilities in similar situations.

Dave Kemper, a dairy farmer from Huntington County, Pennsylvania, thought he would not be able to remain in farming after a car accident left him with a severe neck injury and degenerative bone disease. His doctors referred him to an AgrAbility for Pennsylvanians workshop, where Dave saw that it was possible for him to continue farming. AgrAbility staff assessed Dave's farm and educated him about possible modifications to his buildings and equipment that would allow him to tend his dairy herd. AgrAbility then worked with the state Department of Vocational Rehabilitation to obtain an overhead milking system that reduces his need to bend or carry heavy milk containers, and other equipment that minimizes heavy lifting.

Since 1991, twenty-eight states have been served by AgrAbility projects. In the aggregate, AgrAbility is estimated to have:

- Provided direct on-farm assistance to more than 5,000 farmers, ranchers, and farmworkers with disabilities and their families.

- Provided information and advice to 10,000 persons with disabilities employed in agriculture and related occupations.
- Educated more than 100,000 agricultural, rehabilitation, and rural health professionals on safely accommodating disability in agriculture.
- Recruited and trained more than 1,000 volunteers to assist agricultural producers with disabilities and their families.
- Reached approximately 6.1 million people through 3,200 exhibits, displays, and demonstrations to increase awareness of the challenges affecting and resources available to people with disabilities who work in agriculture.

IMPACT OF CURRENT FUNDING LEVELS

For too long, AgrAbility projects have been underfunded relative to need and objective. At \$85,000 per state, only a few staff can be hired to provide state-wide education and assistance to disabled farmers, educate rural professionals, recruit volunteers, and work with rural businesses on disability-related issues. Rising demand for services and the great distances that must be traveled to reach farmers and ranchers severely strains even the most dedicated of AgrAbility's outstanding staff. Easter Seals fears that failure to invest wisely in this worthwhile program will ultimately cause it to falter.

One of the consequences of limited funding is that in every grant cycle, some states that have existing AgrAbility programs, and can demonstrate a legitimate need for services, are not renewed and forced to discontinue services to farmers with disabilities in that state and often have difficulty getting the access to the limited state and private funding sources that the federal seed money granted them. More than a dozen states have sought AgrAbility funding without success. Other states, including Colorado, Louisiana, Michigan, New Hampshire, South Carolina, and Vermont, had USDA-funded AgrAbility projects in the past and seek to re-establish their programs. Each of these states can demonstrate significant unmet needs among farm and ranch families affected by disability that AgrAbility could potentially address. Beginning with the 1998–1999 grant cycle that commences April 1, it is Easter Seals' understanding that projects in Ohio, New York, Idaho/Montana, and New Jersey will cease to receive federal support. This loss will greatly affect farmers with disabilities in these states for whom AgrAbility is the primary resource through which they seek information and assistance on farming with a disability. For example:

David Biehl has spent his life working the family wheat and barley farm near Helena, Montana. When a spinal infection, six years ago, left him with paraplegia, weakness in his hands, and low vision, he started searching for a way to remain in farming. His case management nurse referred him to the Montana/Idaho AgrAbility project. AgrAbility staff member Tom Scott, helped David remodel his home for wheelchair accessibility, modify his farm equipment, and find equipment to make it possible for him to drive the family truck. Together, David and the AgrAbility staff developed creative solutions to obstacles facing him. For instance, instead of purchasing an expensive mechanical lift for his tractor, David learned to use the leg braces he had unsuccessfully tried to walk in during his rehabilitation, to safely board his tractor. David expresses the importance of AgrAbility when he says, "It was very important for me not to give up. Tom understood how I felt and was able to help me find ways to be part of things." Unfortunately, the Montana/Idaho program was not successful in the USDA competition for renewal of funding in fiscal year 1998. Effective April 1, 1998, the project is no longer a resource to David and other farmers with disabilities in Montana and Idaho.

The need for AgrAbility services has never been greater, and its accomplishments to date are remarkable by any standard. The National Easter Seal Society is proud to contribute to the ongoing success of the USDA-CSREES AgrAbility Program. Please support the allocation of at least \$4.6 million for AgrAbility in fiscal year 1999 to ensure that this valuable public-private partnership continues to serve rural Americans with disabilities and their families. Thank you for considering Easter Seals' views and recommendations.

PREPARED STATEMENT OF THE NATIONAL PHARMACEUTICAL ALLIANCE AND THE GENERIC PHARMACEUTICAL INDUSTRY ASSOCIATION

Mr. Chairman and Members of the Subcommittee, the National Pharmaceutical Alliance and the Generic Pharmaceutical Industry Association are pleased to have the opportunity to present these comments on the fiscal year 1999 budget requests for the Food and Drug Administration, on behalf of their members. Medicines developed, manufactured, and marketed by the approximately 200 members of both orga-

nizations account for more than 75 percent of all generic prescriptions dispensed annually in the U.S.

COST BENEFITS ARE PROVIDED BY THE GENERIC PHARMACEUTICAL INDUSTRY

Generic drugs represent one of the most cost-effective means of controlling U.S. healthcare costs. For example, consumers, insurance carriers, and the U.S. government spent an estimated \$81.17 billion on approximately 2.5 billion drug prescriptions in 1997 alone.¹ About half of those prescriptions were filled with generic versions of the prescribed drug,² which typically enter the market at 30 percent below the brand price, and within two years decline to 60–70 percent of the brand price.³ Moreover, brand drug retail prices rose an average of 4.3 percent in 1997, while generic prices declined by approximately 7.6 percent in the same period.⁴ In addition to the price discount obtained when compared to the brand product, competition within the generic pharmaceutical industry results in declining prices that create a substantial savings to taxpayers, insurance providers, and consumers—especially senior citizens, the 40 million Americans without health insurance, and the under-insured.

While cost-effective generic pharmaceuticals have reduced health care costs in this country, these savings could be even greater if FDA took final action on generic applications within the statutorily required six months.⁵ Due in large part to the leadership of the Appropriations Committee, OGD has been able to take the first steps in augmenting its resources to meet its statutory requirements. While the fiscal year 1998 Operating Plan has not been completely implemented, it is our understanding that the plan will include between \$400,000 and \$700,000 in additional funds for OGD.⁶ These funds will give OGD the opportunity to begin a modest expansion of its resources.

The additional fiscal year 1998 funding for OGD is a watershed event. Instead of a continual focus on retaining its already inadequate resources, OGD will be able to direct its attention to speeding generic drug approvals. Yet, the foundation for a properly funded OGD must be continued with additional funding in fiscal year 1999, in order to substantially improve OGD's system of generic drug approvals.

NPA AND GPIA RECOMMEND AN INCREASE IN FUNDING FOR OGD

We recommend that the Appropriations Committee build on the fiscal year 1998 initiative and provide additional funds that will allow OGD to continue its progress toward compliance with the six month statutory period for final agency action on generic drug applications. Specifically, NPA requests that the Subcommittee take the following actions:

1. Appropriate \$3 million directly for the Office of Generic Drugs, in addition to its fiscal year 1998 funding level;
2. In the alternative, re-allocate \$3 million to OGD from FDA Administrative Offices that usually do not direct programs with statutorily required deadlines;
3. At a minimum, ensure that OGD and its programs maintain fiscal year 1998 funding levels in fiscal year 1999, despite the Administration's fiscal year 1999 budget request.
4. In addition, continue to insist that FDA provide detailed information about agency expenditures for, and by OGD.

In addition, we would like to highlight several challenges confronting OGD that could be addressed with the appropriations recommended above. We believe that additional funding in fiscal year 1999 could be used productively to:

- increase the number of reviewers to help OGD meet its statutory requirements;

⁴ See The Plymouth Group/IMS America, Ltd., "Brand vs. Generic Price Changes, Prescription Pharmaceuticals, 1997."

⁵ Under the law, FDA, through the Office of Generic Drugs, must review generic applications within 180 days. 21 U.S.C. §355(j)(4). In 1997, the median time to approval for ANDA's was 19.6 months—more than three times the length mandated by statute. See NDA/PLA Approvals on First Review Increase to 44 percent. The Pink Sheet, Dec. 15, 1997, at 7 (citing Janet Woodcock, M.D., Director of FDA's Center for Drug Evaluation and Research).

⁶ See FDA Budget Would Keep Generics Staff Level, Generic Line, Jan. 14, 1998, at 1.

- add scientific and legal personnel to address the issues related to the use of the citizen petition process to delay generic drug approvals; and
- provide funding to assist OGD in educating consumers, health care providers, and state legislative and regulatory officials about generic equivalence and the generic drug approval process.

APPROPRIATIONS ARE NEEDED FOR ADDITIONAL REVIEWERS TO MEET OGD'S INCREASED WORKLOAD

Among the most pressing needs at OGD is one for additional staff members to review generic applications. OGD continues to experience a steady increase in ANDA filings, which went up from 404 in 1996 to 462 in 1997.⁷ Yet, of these 1996 and 1997 filings, OGD annually approved only 340 and 404, respectively.⁸ This increase in workload, and the backlog that it creates, must be addressed by hiring reviewers.⁹ Even with the infusion of funds under the fiscal year 1998 FDA Operating Plan, however, it is unclear how many additional reviewers will be added to OGD's staff. Given the current situation, NPA maintains that increased appropriations for additional reviewers is paramount.

ADDITIONAL SCIENTIFIC AND LEGAL STAFF ARE NEEDED TO ADDRESS CITIZEN PETITIONS

In addition, OGD's priorities must be expanded to address a specific challenge to FDA's generic drug approval authority: citizen petitions. Over the past few years, brand drug firms have increased their use of citizen petitions to challenge FDA's bioequivalence determinations and other scientific decisions related to ANDA's.¹⁰ The petitions usually request that FDA refrain from approving a competing generic product until the "scientific" questions have been resolved. Unfortunately, FDA has taken, on average, 17 months to resolve the issues raised in the 40 citizen petitions that have been filed since 1990.¹¹ The addition of senior scientists and/or lawyers would assist OGD in managing these administrative challenges, most of which are ultimately denied by the agency.¹²

OGD RESOURCES SHOULD BE DIRECTED TO EDUCATING THE PUBLIC AND STATE OFFICIALS ABOUT GENERIC EQUIVALENCE

OGD also must take up a second challenge to FDA's authority; that is, the efforts of brand drug firms to undermine the agency's therapeutic equivalence decisions. They do this by arguing to state legislators, boards of pharmacy, and drug formulary committees that the substitution of generic drugs for pioneer drugs raises a patient health risk.¹³ To counter this misinformation, additional funds could be used by OGD to educate consumers and health care providers and to dispatch qualified spokespersons to the affected state entities.¹⁴ These agency spokespersons would be instrumental in presenting accurate information to the states about the scientific integrity of the ANDA review process and the fitness of FDA's therapeutic equivalence evaluations.¹⁵ In addition, OGD has worked effectively with academic

⁷ See FDA fiscal year 1999 Justification of Estimates for Appropriations Committees and Performance Plan, at 153.

⁸ See *id.*

⁹ Other resources that would help to improve ANDA review times are statistical analysts, computer professionals, and computer software and related information technology.

¹⁰ A detailed chart describing the 40 citizen petitions that NPA has catalogued from FDA's Dockets Management Branch is available on request. It is titled, "Citizen Petitions That Have Resulted In A Delay To The Approval Of Generic Drug Applications (ANDA's), 1990–Present."

¹¹ *Id.* As evidenced by NPA's chart on citizen petitions, 13 of the 40 petitions filed since 1990 were pending at the agency for over two years before receiving a final disposition. Of those 13, three petitions remained unresolved for three years, and two petitions remained unresolved for four years.

¹² *Id.*

¹³ A detailed chart describing the state lobbying initiatives that NPA has catalogued from public sources is available on request. It is titled, "Anti-Generic Challenges Before State Formularies (Other Than Coumadin®/NTI Challenges)."

¹⁴ NPA continues to advance the position that legislation is needed to amend the Federal Food, Drug, and Cosmetic Act to provide for the express preemption of state generic substitution laws and regulations that impose standards different from or in addition to FDA's generic bioequivalence and therapeutic equivalence determinations.

¹⁵ The agency has noted a need for increased communication between FDA and state entities. In response to questions posed by state formularies about the bioequivalence of generic drugs, FDA's Roger Williams replied, "We've got to do a better job of communicating [to the health care practitioners and state agencies] about how well and how hard we work together to control the quality of these [generic] products." Narrow Therapeutics Need to be Identified in Phase II, The Pink Sheet, Mar. 23, 1998, at 20–21.

experts and the industry in forums such as the Product Quality Research Initiative to solve difficult scientific issues. Expanding FDA's participation in PQRI would be a constructive use of additional appropriations. Regardless of the use(s) to which additional appropriations are put, it is imperative that this Subcommittee continue its support of the generic drug approval process by allocating necessary funds.

INCREASED EFFICIENCIES ARE NOT SUFFICIENT TO ACCELERATE APPROVAL TIMES

With limited resources, OGD has made Herculean efforts to speed up its review times, through a combination of diligent effort and increased efficiency. Specifically, generic drug median approval times have improved from 28.2 months in 1995 to 19.6 months in 1997.¹⁶ System advances also were made, despite a reduced budget and staff, including the streamlining of OGD's approval process and a reduction in the number of review cycles.¹⁷ Program improvements, some of which were industry recommendations, have included implementing electronic data filing, publishing bio-equivalence protocol reviews, and establishing efficient labeling procedures.

Nevertheless, improvements in generic approval times cannot be sustained with tireless staff efforts and streamlining initiatives. OGD continues to fall short of its statutory responsibility to take final action on generic drug applications within six months. Our position has not changed: this delay is unacceptable. While NPA and GPIA will continue to cooperate with OGD to implement additional program improvements, our members maintain that further efficiency measures will not significantly impact approval times. Although the fiscal year 1998 FDA Operating Plan funding for OGD is a good beginning, OGD requires additional funding and staffing to function effectively.

SUMMARY: A RATIONALE FOR APPROPRIATING ADDITIONAL FUNDS FOR OGD

We maintain that Congress must continue to guide FDA's priorities by appropriating and allocating resources directly to OGD. Only Congressional mandates can ensure that FDA will continue to invest the resources necessary to ensure timely generic approvals. Once again, the Administration has incorporated as-yet unauthorized user fees into its fiscal year 1999 budget request to cover OGD's responsibilities. Specifically, the Administration has proposed \$12.4 million in generic drug user fees. Yet, according to FDA, this \$12.4 million in user fees will enable OGD to review and act upon only 60 percent of generic applications within the six months required by statute.¹⁸ Regardless of the generic drug industry's position on the suitability of user fees, the above request clearly establishes that current appropriations are inadequate to meet FDA's obligations with respect to generic drug approvals. In sum, the ability of safe and effective generics in reducing healthcare costs for this nation cannot be fully realized without direct OGD appropriations.

In closing, Mr. Chairman, the NPA and GPIA would like to thank you and the Subcommittee for its time and attention concerning this critical aspect of FDA's fiscal year 1999 budget requests. We look forward to continuing our work with you and members of the Subcommittee to bring safe, effective and more affordable pharmaceuticals to consumers.

PREPARED STATEMENT OF CHUCK GUNNERSON, VICE PRESIDENT, LEGISLATIVE/
GOVERNMENT AFFAIRS, NATIONAL POTATO COUNCIL

My name is Chuck Gunnerson. I am a potato farmer from Minnesota and current Vice President Legislative/Government Affairs for the National Potato Council (the Council). On behalf of the Council, we thank you for your attention to the needs of our potato growers.

The Council is the only trade association representing commercial growers in 50 states. Our growers produce both seed potatoes and potatoes for consumption in a variety of forms. Annual production in 1996 was 498,600,000 cwt with a farm value of \$2.4 billion. Total value is substantially increased through processing. The potato crop clearly has a positive impact on the U.S. economy.

The potato is the most popular of all vegetables grown and consumed in the United States and one of the most popular in the world. Annual per capita con-

¹⁶ See FDA fiscal year 1999 Justification of Estimates for Appropriations Committees and Performance Plan, at 154.

¹⁷ FDA reports that, "[a]s a result of OGD's initiative to contact applicants that undergo two or more major deficiency cycles, the Office has seen a drop in the number of review cycles needed to approve abbreviated applications," from 4.0 cycles in fiscal year 1995 to 2.9 cycles in fiscal year 1997. *Id.* at 153.

¹⁸ See *id.* at 56.

sumption was 143 pounds in 1996 up from 107 pounds in 1962 and is increasing due to the advent of new products and heightened public awareness of the potato's excellent nutritional value. Potatoes are considered a stable consumer commodity and an integral, delicious component of the American diet.

THE COUNCIL PRIORITIES FOR FISCAL 1999 APPROPRIATIONS

The National Potato Council strongly urges that the Congress: (1) support Agricultural Research Service (ARS) base funding for potatoes at fiscal year 1998 levels, with the addition of \$150,000 for the replacement of Dr. Joe Pavék, retiring plant breeder, at Aberdeen, Idaho, continue to include report language urging that the ARS work with the National Potato Council in determining priorities, and oppose the USDA budget proposal to close ARS facilities at Prosser, Washington, and Orono, Maine. Much of the USDA research at Prosser has focused on reducing pesticide use through the development of pest resistant plants with genetic engineering. Eliminating USDA research at Prosser would appear to conflict with President Clinton's goal of helping minor crop producers find new ways to control pests while reducing pesticide use. The ARS lab in Orono is the only one in the northeast that approximates Maine's unique soil types and climatic conditions which are different from most other potato-producing areas. Maine is a humid area rather than arid with less than 10 percent of its production under irrigation. Closure of this facility would be disruptive to current research and marketing activities of the northeast. Considering current budget constraints, it is critical that the ARS, working with potato growers, be able to adjust current research to meet agreed upon priorities. This would allow for better program streamlining and effectiveness; (2) appropriate additional funds for a special grant under the Cooperative State Research Education and Extension Service (CSREES) to accelerate national efforts in breeding and varietal development to among other things eradicate or manage late blight disease. We urge that the CSREES Special Grant Program be increased from \$1.2 to \$1.4 million. We also support the Administration's budget request for the continuation of the USDA-IPM initiative and funds to meet the data requirements of the new Food Quality Protection Act; (3) appropriate at least fiscal year 1997 level of \$444,000 in funds to the Animal and Plant Health Inspection Service (APHIS) to continue the Golden Nematode quarantine program, without which the industry would be subjected to probable export trade restrictions by importing nations; and (4) not restrict funding for the Market Access Program.

AGRICULTURAL RESEARCH SERVICE (ARS) FUNDING

For fiscal year 1999, in order to maintain the current level of research, the National Potato Council seeks at least the 1998 base level of funding for all programs, the addition of \$150,000 to maintain a breeder position in Aberdeen, Idaho, and flexibility by ARS for potato research priority projects which would include more research on late blight. The Council specifically urges that the Appropriations Committee report also include language directing ARS to continue to work with the National Potato Council in determining priorities. We also hope that you will encourage the ARS, as potato base research funds come up for review, to direct more of such base funds into agreed upon higher priority research projects.

As you recall, the National Potato Research Proposal was the result of an intensive effort begun in 1984 between the Council and the ARS to identify national priority research issues of concern to the potato industry. Based on these identifiable research needs, the National Potato Research Proposal received initial funding from the Congress for ring rot diseases; early dying disease; marketing; aphids; potato beetle and varietal development.

The monies provided to the ARS have been greatly appreciated and the potato growers definitely see results from this research program. As a result of ARS research, potato varieties have been developed that are resistant to aphids which carry the potato leafroll virus. This virus limits potato yields and marketability by causing spotting and discoloration inside potatoes. The development of these resistant varieties should translate into reduced use of crop protection chemicals to control aphids on potatoes. We are getting feedback on research results back to the producer by having researchers speak at seminars and by making available to the potato industry a written summary of all research underway.

Potato growers recognize that, in order to remain a viable and competitive industry, we must constantly strive to improve production efficiency and market quality while reducing the use of pesticides. Through carefully planned and coordinated research, we believe we can continue to offer an excellent high-value product and maintain a viable and competitive industry in the United States.

The National Potato Council has agreed to work with USDA, EPA and FDA in the Pesticide Environmental Stewardship Program (PESP). Our growers will work toward pest management practices that further reduce risk to humans and the environment. Through this program the NPC has developed a national IPM protocol so potato growers can better judge their progress in IPM. Flexibility by the ARS in allocating potato research funds will greatly facilitate this effort.

It is important to note that representatives of the Council have held annual meetings with ARS officials, the most recent in December of 1997, to discuss the distribution and use of research funds. In response to this Committee's direction, the Council has worked closely with the ARS to ensure that the research conducted is meaningful and addresses industry problems in the most thorough, expeditious, and cost effective manner. The Council looks forward to continuing its close partnership with ARS to maximize the use of these important funds as this subcommittee has directed.

CSREES SPECIAL GRANT REQUEST

The Council has also been working with CSREES on priorities for potato research and extension.

We request \$1.4 million (an increase of \$200,000 over last year) for a special grant under the CSREES and urge that the Committee report again include the following report language: "Potato research—The conferees expect the Department to ensure that funds provided to CSREES for potato research are utilized for varietal development/testing. Further, these funds are to be awarded competitively after review by the Potato Industry Working Group."

CSREES received 15 excellent proposals totaling almost \$2 million for variety development and testing in 1998, but due to funding limitations only about 8 can be funded. Although the proposals are all from different states, the Potato Industry Working Group has encouraged the various established breeding programs to move rapidly toward cooperating on a regional basis. The additional \$200,000 will assure this cooperation will go forth and many of the current state proposals will be funded within this regional approach.

The Council will continue to work closely with USDA and will report annually to the Congress on the progress of current research and, once USDA's reviews are completed, the need for new research efforts.

GOLDEN NEMATODE QUARANTINE AND SURVEY

The Animal and Plant Health Inspection Service assures that potatoes are protected from the importation of harmful pests and diseases and works with potato growers in assuring that potatoes meet phytosanitary export requirements.

The Golden Nematode is a significant pest which has been quarantined by USDA-APHIS for over 50 years, and this pest has been confined to a few locations in New York state. Its commercial hosts are potatoes, tomatoes, and eggplants. It is important to our domestic industry and to our export market that this quarantine be continued and be effective. We are informed that federal budget reductions over the past several years have raised concerns over the future of this program. Funding for this program has dropped from almost \$900,000 in fiscal year 1992 to \$444,000 in fiscal year 1997 and \$435,000 in fiscal year 1998. The fiscal year 1999 budget request would further reduce funding to \$417,000. We strongly urge that at least the 1997 level of \$444,000 be provided and used for regulation enforcement and survey work so that this program can continue in order to avoid jeopardizing domestic production and eliminating export markets.

MARKET ACCESS PROGRAM

The Foreign Agricultural Service (FAS) assists U.S. potato growers in the export market and administers funds provided to the National Potato Promotion Board under the Market Access Program (MAP). MAP and its predecessor program have been particularly successful since 1986 in helping potatoes gain greater access and product recognition in foreign markets and is legal under the new GATT agreement.

Industry research shows that there is a direct correlation between receiving MAP funds and the ability to effectively market overseas. With MAP assistance, the U.S. Potato Board has developed long-term markets for U.S. potato exports and created an outlet for surplus potatoes grown domestically, helping stabilize farm gate prices throughout the U.S. industry. As a direct result of promotional campaigns made possible by the pooling of industry monies and government MAP funds, U.S. potato exports have reached record volumes and values. Since 1986, total U.S. potato exports have increased three-fold in volume terms and almost six-fold in value, reaching an export value of over \$618 million in 1997. In fiscal year 1997, U.S. frozen

potato exports alone were valued at over \$320 million, a 12 percent increase over 1996. Exports for 1986 were valued at \$64 million. Exports account for 10 percent of U.S. production. With MAP, U.S. potato exports have expanded to new markets in Asia and South America and the industry has diversified its marketing activities to include trade advertising, trade seminars, restaurant and food service promotions, industry orientation tours, merchandising, and research and evaluation.

During the recent Farm Bill debate, the U.S. potato industry in cooperation with a coalition of agricultural commodity groups fought to preserve the current MAP program. It was our industry's position then and remains our position today that substantive changes made to the MAP program by the 1993 Omnibus Budget Reconciliation Act and the 1996 Agricultural Appropriations Bill, which our industry supported, fully addressed the concerns raised by some in the Congress and others about program efficiencies and management. Those changes imposed minimum contribution amounts for nonprofit participants, required that all participants certify that funds supplement but do not supplant industry funds, imposed a five-year limit on the use of brand MAP funds in a given country, and gave priority funding to small U.S. entities and cooperatives under the branded program. Additional changes to the program made by the 1996 Farm Bill, which preclude direct MAP funding to large corporations and to foreign entities for foreign-produced products, ensure that the real beneficiaries of the MAP program will be U.S. farmers, cooperatives, and U.S. agricultural products.

One remaining concern about the MAP program relates to annual funding levels, which have been reduced by Congress over the last several years and again last year by the 1996 Farm Bill. U.S. potato growers were discouraged that the 1996 Farm Bill reduced program funding from its previous authorized level of \$110 million to \$90 million annually, and strongly believe that funding should eventually be restored to its previously high level of \$200 million to take full advantage of the WTO-legal program.

Despite funding cuts, we nevertheless are encouraged that Congress recognized the importance of continuing this fully accountable and result-oriented program for U.S. farmers. At a time when U.S. agriculture is struggling to compete with subsidized foreign competition and foreign governments are increasing GATT/WTO-legal promotional assistance to their agricultural sectors, we encourage Congress to keep in tact and extend greater funding to the one USDA program that has truly helped U.S. agricultural products compete in the global marketplace.

This concludes our statement and we would be pleased to respond to questions or provide further information for the record.

PREPARED STATEMENT OF JOHN F. O'NEAL, GENERAL COUNSEL, NATIONAL RURAL
TELECOM ASSOCIATION

SUMMARY OF TESTIMONY REQUESTS

Project involved.—Telecommunications lending programs administered by the Rural Utilities Service of the U.S. Department of Agriculture

Actions proposed.—Supporting loan levels for fiscal year 1999 in the same amounts as those contained in the Fiscal Year 1998 Agriculture Appropriations Act (Public Law 105-86) for hardship, cost-of-money, Rural Telephone Bank and guaranteed loan programs and the associated subsidy to support hardship and Rural Telephone Bank loans at existing levels. Also supporting funding for \$150 million in loan and \$15 million grant authority designated for distance learning and telemedicine purposes as requested in the President's budget. Supporting an extension of the language removing the 7 percent interest rate ceiling on cost-of-money loans for fiscal year 1998. Supporting continuation of the restriction on retirement of Rural Telephone Bank class A stock in fiscal year 1998 at the level contained in Public Law 105-86 and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund. Opposing the proposal contained in the budget to transfer funds from the unobligated balances of the liquidating account of the Rural Telephone Bank for the bank's administrative expenses and loan subsidy costs.

Mr. Chairman, Members of the Committee: My name is John F. O'Neal. I am General Counsel of the National Rural Telecom Association. NRTA is comprised primarily of commercial telephone companies which borrow their capital needs from the Rural Utilities Service of the U.S. Department of Agriculture (RUS) to furnish and improve telephone service in rural areas. Approximately 1000, or 71 percent of the nation's local telephone systems borrow from RUS. About three-fourths of these are commercial telephone companies. RUS borrowers serve almost 6 million sub-

scribers in 46 states and employ over 30,000 people. In accepting loan funds, borrowers assume an obligation under the act to serve the widest practical number of rural users within their service area.

PROGRAM BACKGROUND

Rural telephone systems have an ongoing need for long-term, fixed rate capital at affordable interest rates. Since 1949, that capital has been provided through telecommunications lending programs administered by the Rural Utilities Service and its predecessor, the Rural Electrification Agency (REA).

RUS loans are made exclusively for capital improvements and loan funds are segregated from borrower operating revenues. Loans are not made to fund operating revenues or profits of the borrower system. There is a proscription in the Act against loans which would duplicate existing facilities providing adequate service and state authority to regulate telephone service is expressly preserved under the Rural Electrification Act.

Rural telephone systems operate at a severe geographical handicap when compared with other telephone companies. While almost 6 million rural telephone subscribers receive telephone service from RUS borrower systems, they account for only four percent of total U.S. subscribers. On the other hand, borrower service territories total 37 percent of the land area—nearly 1½ million square miles. RUS borrowers average about six subscribers per mile of telephone line and have an average of more than 1,000 route miles of lines in their systems.

Because of low-density and the inherent high cost of serving these areas, Congress made long-term, fixed rate loans available at reasonable rates of interest to assure that rural telephone subscribers, the ultimate beneficiaries of these programs, have comparable telephone service with their urban counterparts at affordable subscriber rates. This principle is especially valid today as the United States endeavors to deploy telecommunications “information superhighway” technology and as customers and regulators constantly demand improved and enhanced services.

At the same time, the underlying statutory authority which governs the current program has undergone significant change. In 1993, telecommunications lending was refocused toward facilities modernization. Most of the subsidy cost has been eliminated from the program. The subsidy that remains has been targeted to the highest cost, lowest density systems. Other loans are made at Treasury’s cost-of-money or greater.

We are proud to state once again for the record that there has never been a default in the RUS/REA telephone program! All loans have been repaid in accordance with their terms with interest. As of December 31, 1997, well over \$4 billion of principal and \$5 billion in interest had been paid by telephone borrowers.

NEED FOR RUS TELECOMMUNICATIONS LENDING CONTINUES

The need for rural telecommunications lending is great today, possibly even greater than in the past. Technological advances make it imperative that rural telephone companies upgrade their systems to keep pace with improvements and provide the latest available technology to their subscribers.

These rapid technological changes and federal policies of competition and deregulation in the telephone industry, as evidenced by passage of the “Telecommunications Act of 1996”, underscore the continuing need for targeted assistance to rural areas. The inherently higher costs to serve these areas have not abated. Regulatory trends encouraging competition among telephone systems increase pressures to shift more costs onto rural ratepayers. Interstate subscriber line charges have already shifted substantial costs to local exchange customers. Pressures to recover more and more of the higher costs of rural service from rural customers to foster urban competitive responses will further burden rural consumers. And, as rural rates rise, small telephone systems will tend to lose confidence that they can recover the investments for costly network upgrades.

1996 TELECOMMUNICATIONS ACT EFFECT ON RURAL AMERICA

Congress passed the Telecommunications Act of 1996 as the culmination of more than a decade of debating national telecommunications policy and balancing many diverse needs and interests. The 1996 Act responded to a number of rural needs and differences with a series of safeguards to ensure that rates, services and network development in rural America will be reasonably comparable to urban telecommunications opportunities.

The process of implementing the new law continues to raise troubling uncertainties and concerns about whether the FCC and the states will honor the balance Congress achieved in its policy, as regulators (a) radically revise the mechanisms for

preserving and advancing “universal service,” (b) adjust the cost recovery responsibilities and allocations of authority between federal and state regulation, (c) effectuate the Act’s somewhat different urban and rural ground rules for how new companies and incumbent universal service providers connect their networks and compensate each other and (d) peel back layers of regulation developed over a century. So far, the FCC has been overzealous in expanding the Act’s market-opening provisions to give new entrants a regulatory head start and advantage at the expense of the Act’s rural development and universal service provisions. The FCC is trying to usurp the role of competition by dictating a whole new—and wholly inadequate—way to measure the costs of modern, nationwide telecommunications access to information. Congress and the courts must carefully supervise the FCC’s implementation to achieve the rural access to information and an evolving modern public network intended by Congress, as well as the benefits of deregulation and genuine competition.

EXPANDED CONGRESSIONAL MANDATES FOR RURAL TELECOMMUNICATIONS

Considerable loan demand is being generated because of two additional mandates for enhanced rural telecommunications standards contained in the authorizing legislation enacted in 1993 by Congress in Public Law 103–129.

First, Congress expanded the definition of a “rural area” to include towns up to 5,000 population from the previous standard of 1,500 which had the effect of qualifying substantial additional geographic areas of the country for loans. Second, as a prerequisite to eligibility for insured and Rural Telephone Bank loans, RUS, has approved a telecommunications modernization plan for each state which meet certain minimum statutory objectives for the deployment of modern telecommunications technology. Implementation of these plans will generate additional loan demand as rural telephone systems strive to meet these increased service objectives in the rural areas they serve.

These two Congressional mandates coupled with the need for stable financing sources to meet the infrastructure demands envisioned for rural areas by the new telecommunications act amply demonstrate the continuing need for this important program at the levels established in the fiscal year 1998 appropriations act. They are:

5 percent Hardship Loans	\$75,000,000
Cost-of-Money Loans	300,000,000
Guaranteed Loans	120,000,000
Rural Telephone Bank Loans	175,000,000
Total	670,000,000

The President’s budget request for fiscal year 1999 for this program closely parallels fiscal year 1998 enacted loan levels with one exception: Despite substantial ongoing demand, the President proposes to reduce hardship loans \$25 million next year. The savings which would be achieved are only about \$2.5 million dollars. Based on figures supplied by RUS, at the end of the first quarter, the agency had already approved almost all of the entire authorization of \$75 million for this fiscal year and expects to carry over an additional \$79 million in completed applications into the next fiscal year. We believe that the needs of this program balanced with the minimal cost to the taxpayer argue for its continuation at enacted levels given the fact that it provides funding for the neediest borrower systems serving the highest cost areas.

SPECIFIC ADDITIONAL REQUESTS

Continue the Removal of the 7 percent Cap on Cost-of-Money Loans

Again this year we are supporting removal of the 7 percent ceiling on cost-of-money loans. This Committee included language in the fiscal year 1996 act to permit borrower interest rates on cost-of-money loans to exceed the 7 percent per year interest rate ceiling contained in the authorizing act. The language has been continued in subsequent acts. We support an extension of this provision in the fiscal year 1999 bill. Long-term Treasury interest rates might exceed 7 percent in fiscal year 1999. In that event, the cost-of-money loan program could be disrupted and loan levels not achieved since adequate subsidy would not be available to support the program at the authorized levels. For this reason, we believe it is important to incorporate this language in the bill again this year.

Continue the Restriction on Retirement of Class A Government Stock in the Rural Telephone Bank (RTB) and also Continue the Prohibition Against Transfer of RTB Funds to the General Fund

The Committee should continue the restriction on retirement of the amount of class A stock by the Rural Telephone Bank in fiscal year 1999. The Bank is currently retiring the government's stock as required under current law. We believe that this process which began in fiscal year 1996 should continue to be an orderly one as contemplated by the retirement schedule enacted two years ago and continued in last year's bill to retire no more than 5 percent of the total class A stock in one year. We also urge the Committee to continue the prohibition against the transfer of any unobligated balance in the bank's liquidating account which is in excess of current requirements to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private Class B and C stockholders of the Rural Telephone Bank have a vested ownership interest in the assets of the bank including its funds and their rights should not be abrogated.

Reject Budget Proposal to Transfer Funds from RTB Liquidating Account for Administrative and Subsidy Costs

In this same vein, we are also opposed to the proposal contained in the President's budget that the subsidy cost associated with Rural Telephone Bank loans be funded by a transfer from the unobligated balances of the bank's liquidating account rather than by a traditional appropriation from the general fund of the Treasury which has been the funding mechanism utilized for the bank since enactment of the federal credit reform act in 1990. Requiring the bank to fund the subsidy cost of its loans would dilute the interests of the bank's stockholders. By definition, the bank's unobligated balances are not federal funds but are subject to the respective ownership interests of all the stockholders of the bank. Previous appropriations acts, including the fiscal year 1997 and fiscal year 1998 acts, have recognized the ownership rights of the private class B and C stockholders of the bank by prohibiting a similar transfer of the bank's excess unobligated balances which otherwise would have been required under the federal credit reform act. This cost is more properly funded through a regular appropriation from the general fund of the Treasury.

The President's budget also proposes that the bank assume responsibility for its administrative costs also by a transfer of funds from the unobligated balances of the bank's liquidating account rather than through an appropriation from the general fund of the Treasury. This recommendation is contrary to the RTB enabling act. Under Sec. 403(b) of that act, until the ownership, control and operation of the telephone bank is converted (or privatized). . . .

in order to perform its responsibilities under this title, the telephone bank may partially or jointly utilize the facilities and the services of employees of the Rural Electrification Administration or of any other agency of the Department of Agriculture, *without cost to the telephone bank*. (emphasis supplied)

The budget language acknowledges that neither proposal would result in budgetary savings. No justification for these recommendations is contained in the budget. Both proposals would require consideration by the authorizing committees and enactment of new authorizing legislation as a prerequisite to an appropriation. As of this date, no such legislation has been transmitted by the Administration or is under consideration before the authorizing committees.

Loans and Grants for Telemedicine and Distance Learning

The President's budget requests \$150 million in loan authority for fiscal year 1999 and \$15 million in grants specifically devoted to telemedicine and distance learning purposes. Loans are made at the government's cost-of-money. The purpose is to accelerate deployment of telemedicine and distance learning technologies in rural areas through the use of telecommunications, computer networks, and related advanced technologies by students, teachers, medical professionals, and rural residents.

We believe this program specifically designated for distance learning and telemedicine purposes is particularly important. Continuing to target funds in this manner spurs deployment of this important new technology which is vital for the survival of rural schools, hospitals and the rural communities they serve. At the same time, we believe the level proposed strikes a cost effective balance for the taxpayer.

CONCLUSION

Thank you for the opportunity to present the association's views concerning this vital program. The telecommunications lending programs of RUS continue to work

effectively and accomplish the objectives established by Congress at a minimal cost to the taxpayer.

PREPARED STATEMENT OF THE NATIONAL TELEPHONE COOPERATIVE ASSOCIATION

SUMMARY

Considering the current telecommunications demands being made by the Administration, Congress, and rural Americans, it is clear that the need for the Rural Utilities Service (RUS) telecommunications lending has never been greater. In this context, the National Telephone Cooperative Association (NTCA) strongly supports the continuation of the RUS telecommunications loan program. For nearly 49 years, the RUS and its predecessor, the REA, has carried out its mission, of both providing and improving rural telephone service, with distinction. Appropriately funded, it will continue to do so well into the future. In short, RUS financing is critical to ensuring that rural Americans enjoy the benefits of the information revolution currently sweeping the nation.

INTRODUCTION

It is a pleasure to discuss the current financing needs of the rural local exchange carrier (LEC) industry. In light of all that is occurring on the telecommunications front, this discussion is urgently needed. NTCA is a national trade association representing 500 small, rural cooperative and commercial telephone systems. These locally owned and operated LEC's are situated throughout our nation. More than 80 percent of NTCA's member systems have benefited from the RUS/REA telecommunications loan program.

NTCA's members, like most of the country's independent LEC's, evolved to serve high cost rural areas of the nation. There can be no doubt regarding the high cost of providing telecommunications services to rural America. Just considering that this account for approximately 40 percent of the nation's geographic area is convincing enough. In addition, when we consider that rural subscribers account for only 4.3 percent of the nation's total population, it quickly becomes clear why rural America is so costly to serve.

Congress recognized this unique financing dilemma confronting America's rural LEC's as early as 1949. It was in that year that it amended the Rural Electrification Act (RE Act) to create the REA telephone loan program. Congress planned for the future and fully understood that rural America's telecommunications financing needs would be ongoing. It charged the REA with the responsibility for making low interest loans to both ". . . furnish and improve . . ." rural telephone service.

In keeping with its mission, Congress has periodically amended the RE Act to ensure that the original mission of the program is met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the REA was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. In 1993, the Congress established a fourth program lending facet, the REA treasury-cost fund. Most recently, the reorganization of the U.S. Department of Agriculture facilitated consolidation of the Department's utility development programs through transferring the telecommunications loan and technical assistance programs of the REA to the Rural Utilities Service (RUS).

The infrastructure being deployed by a majority of rural LEC's today is capable of providing state-of-the-art services such as two-way interactive video links and internet access. These services are changing the destiny of rural America. Through this technology, rural Americans are assured of improved education, health care access, and business and government services. The RUS's telecommunications loan program is financing a significant portion of such infrastructure enhancement.

RESPONSIBILITIES CONFRONTING THE INDUSTRY ARE SUBSTANTIAL

The success of private/public partnership represented by NTCA's members' use of the RUS telecommunications loan program is substantial. This partnership boasts infrastructure of a highly sophisticated quality. With the assistance of RUS capital and technical standards, NTCA's members are leaders in modernizing their telecommunications capabilities for their communities. This financing partnership fosters a true commitment to rural residents. Compared to their urban counterparts, rural communities are faced with higher poverty rates, lower income levels, and higher costs of delivering modern infrastructure.

These rapid changes are underscored by recent actions taken with passage of the "Telecommunications Act of 1996." As we enact federal policies of competition and deregulation, the high costs associated with providing modern telecommunications

services in rural areas will not diminish. Moreover, the mandated provisions for an evolving definition of universal service serves to emphasize the need for targeted assistance to rural areas. Two years into the implementation of the act, the FCC's interpretation of the law has held little regard for congressional intent particularly with respect to rural provisions that are vital to rural incumbent LEC's. This is evidenced by the 25 percent federal/75 percent state split in universal service funding. These important provisions include universal service language mandating a national commitment to geographic toll rate averaging and consumer access to quality services at reasonable and affordable rates; interconnection exemption, suspension and modification language to spare rural LEC's from excessive new regulatory burdens; infrastructure sharing language requiring large carriers to engage in such sharing upon request of a facilities based universal service designee that lacks resources; as well as other provisions important to the rural industry.

It is clear that without appropriate strong national safeguards, the transition to a competitive and deregulatory telecommunications environment would damage the ability of rural Americans to full participate in the information age. Today, RUS borrowers average only 6 miles per subscriber compared to 37 per mile for the larger, urban-oriented, non-RUS financed systems. This results in an average plant investment per subscriber that is 38 percent higher for RUS borrowers. Without the availability of affordable capital financing to compete and provide adequate, up-to-date services in an unfavorable environment, building adequate telecommunications infrastructure in rural communities will be untenable.

RUS: CONNECTING RURAL AMERICA TO THE FUTURE

Clearly, the RUS telecommunications loan program is helping extend benefits of the information superhighway to rural America. RUS telecommunications lending creates public-private partnerships that work to create telecommunications infrastructure. These federal resources have stimulated billions of dollars in private capital.

For example, in fiscal year 1997 a subsidy of just \$3.6 million generated \$670 million in federal loans and loan guarantees. For every dollar in government money invested, 4.5 private dollars were invested. RUS financing in 1996 involved the construction or rebuilding of an estimated 9,472 route miles of line (including fiber optic facilities) and other plant facilities to provide initial or improved service to 72,874 subscribers.

The RUS is also making a difference in our rural schools, libraries, and hospitals. Since 1993, the RUS Distance Learning and Telemedicine (DLT) Grant and Loan program has funded 192 projects in 41 states totaling over \$52 million for interactive technology in rural schools, libraries, hospitals, and health clinics. This program has provided unprecedented educational opportunities for rural students and enhanced health care for rural residents.

As a result of this program, thousands of rural students will gain access to additional classes and advanced curriculum. The RUS reports that previously unavailable courses such as calculus, physics, chemistry, and accounting are now being made to 550 rural schools in 33 states. In addition, telemedicine facilities which provide cost-effective services such as 24 hour access to trauma specialist, continuing medical education, and distance consultations for pediatrics, obstetrics, cardiology, and oncology will be made available to 438 hospitals and clinics in 23 states. Simply stated, this critical program is allowing our rural citizens to overcome the isolated nature of their rural areas through the power of modern telecommunications.

At the end of 1997, about \$4 billion in principal and \$5 billion in interest had been paid by borrowers. We are proud to claim that there has never been a loss for U.S. taxpayers through borrower default or abuse in 49 years of RUS telecommunications lending!

RECOMMENDATIONS FOR THE SUBCOMMITTEE'S CONSIDERATION

RUS Telecommunications Loan Program.—Increasing demand for expanded telecommunications services and infrastructure upgrades indicates the level of need. The RUS has indicated that as of the end of the second quarter of fiscal year 1998, all of the 5 percent Hardship loan funds have been allocated and are expecting a backlog of \$60–100 million in hardship loan requests this year. To allow for this demand to be met, NTCA recommends that the committee consider the following RUS Telecommunications loan levels for fiscal year 1999:

5 percent Hardship Loans	\$75,000,000
Treasury-rate Loans	300,000,000
FFB Loan Guarantees	120,000,000

Rural Telephone Bank Loans	175,000,000
Total	670,000,000

These loan levels are the same as the current fiscal year's funding provided by this committee and represent a genuine commitment to rural telecommunications needs.

Removal of Interest Rate Cap on Treasury-rate Loans.—We are also requesting that the committee include language removing the 7 percent interest rate cap on Treasury-rate loans. This provision was included in this year's Fiscal Year 1998 Agriculture Appropriations Act (H.R. 2160), and it prevents the potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized lending levels. It is a continuation of current policy and supports the viability of this critical loan program.

Prohibition of the Transfer of Unobligated Balances of the Rural Telephone Bank Liquidating Account.—NTCA also recommends that the subcommittee continue the prohibition against the transfer of any unobligated balances of the Rural Telephone Bank liquidating account to the general fund of the Treasury. This language was first introduced in the Fiscal Year 1997 Agriculture Appropriations Act (H.R. 3603) to protect the private Class B and C stockholders ownership rights to the assets of the bank. Restatement of this language will ensure that RTB borrowers are not stripped of the value of this required investment.

Fund the Rural Telephone Bank's Loan Subsidies and Administrative Expenses through Traditional Appropriation from General Funds of the Treasury.—The Administration's fiscal year 1999 budget proposal would fund the Rural Telephone Bank's loan subsidies and administrative expenses out of unobligated balances in the bank's liquidating account rather than out of the general fund of the Treasury as normally appropriated. NTCA urges the subcommittee to reject this proposal for three reasons.

Specifically, the proposal would require new authority in the authorizing act as a prerequisite to an appropriation. Current law under the Rural Electrification Act provides for the use of facilities and services of employees of the Department of Agriculture, without cost to the Rural Telephone Bank until the ownership, control and operation of the telephone bank is converted or privatized. Additionally, the proposal appears to be in conflict with the intent of the Federal Credit Reform Act (Public Law 101-508). The Subcommittee should also recognize that this proposal will not result in budgetary savings. Because of the aforementioned concerns, NTCA requests the subcommittee to fund the RTB's loan subsidies and administrative expenses through the general funds of the Treasury.

Rural Telephone Bank Privatization Proposal.—Under the President's fiscal year 1999 budget proposal, the Rural Telephone Bank is proposed to "become a Performance Based Organization to establish its financial and operational independence prior to its being privatized within ten years." At this time, it is difficult to support, or evaluate any privatization proposal without first obtaining an answer to the critical question of who own the assets of the bank—the federal government or the stockholders of the RTB. Without a definitive and official determination of this central issue, it is not possible to formulate an informed position regarding privatization of the bank.

NTCA believes any privatization plan should be well conceived before implementation. At the very least, privatization should proceed in an orderly fashion with a full accounting of the various financial and legal implications involved. Congress, RTB Stockholders, and the rural telecommunications industry deserve the benefit of having RTB privatization reviewed thoroughly. In addition to having a high concentration of NTCA members as stockholders of RTB stock, NTCA itself maintains a substantial interest in RTB stock. As the RTB possess nearly \$2 billion in assets, it continues to play a critical role in the modernization of rural telecommunications infrastructure throughout the United States, and its future will continue to be closely monitored by the rural telecommunications industry.

RUS Distance Learning and Telemedicine Program.—The RUS Distance Learning and Telemedicine Grant program has proven to be an indispensable tool for rural development. In this regard, NTCA urges the Committee to provide adequate funding for this critical program. NTCA supports the exciting initiative included with the enactment of the 1996 Farm Bill. The legislation authorized a \$100 million Distance Learning and Telemedicine and Grant cost-of-money loan and grant program that began in fiscal year 1996. NTCA encourages the subcommittee to continue funding for this critical program for the purpose of extending benefits of modern telecommunications to rural America.

CONCLUSION

The RUS telecommunications loan program bears a proud record and should remain in place to continue assisting the rural LEC industry to meet its service commitment to rural Americans. As changes to the nation's telecommunications policy are on the horizon, the continuation of the RUS telecommunication loan program is a critical necessity to ensure the highest standard of modern service in rural America. The rural segment of the nation's telecommunications infrastructure is critical to the national objective of universal telecommunications service. The RUS and the rural LEC industry are natural partners in linking all Americans to the "information superhighway."

As the nation faces substantial economic and technological challenges in the near future, rural areas must be equipped with the appropriate tools needed to manage those challenges. The RUS telecommunications loan program has carried out its mission for more than 49 years with distinction and unrivaled financial reliability. Congress willing, the RUS can do the job necessary to connect rural America to the future!

PREPARED STATEMENT OF DR. ROBERT C. SHEARMAN, EXECUTIVE DIRECTOR,
NATIONAL TURFGRASS EVALUATION PROGRAM

On behalf of the National Turfgrass Evaluation Program (NTEP), I appreciate this opportunity to provide the Subcommittee with the turfgrass industry's perspective in support of restoration of the \$55,000 appropriation for the National Turfgrass Evaluation Program (NTEP) deleted in the President's fiscal year 1999 budget request for the Agricultural Research Service (ARS).

The National Turfgrass Evaluation Program (NTEP) has been unique in that it provides a working partnership that links the federal government, turfgrass industry and land grant universities together in their common interest of turfgrass cultivar development, improvement, and evaluation. The National Turfgrass Evaluation Program is the primary means by which cultivated varieties of turfgrass are evaluated in this country. It provides unbiased information on turfgrass cultivar adaptations, disease and insect resistance, and environmental stress tolerance. The public and private sectors of the turfgrass industry use this information to develop cultivar recommendations for home owners, sod producers, sports turf managers and golf course superintendents.

At a time when this nation's awareness of environmental considerations is increasing, and because of the multiple benefits provided by turfgrass, as well as the advancements that are being made to further improve them through integrated pest management programs, recycling, and other means, the USDA has before it a unique opportunity to take positive action in support of the turfgrass industry, and similarly enjoy a tremendous return for what must be considered, in relative terms within USDA's budget, a minuscule investment of Department funds.

While the vast majority of the USDA's funds have been and will continue to be directed toward traditional "food and fiber" segments of U.S. agriculture, it is important to note that turfgrasses (e.g., sod production) are defined as agriculture in the Farm Bill and by many other departments and agencies. Further, it is estimated by the Economic Research Service that the turfgrass industry, in all its forms, is a \$30-\$35 billion industry. It should also be noted that the turfgrass industry is the fastest growing segment of U.S. agriculture, while it receives essentially no federal support. There are no subsidy programs for turfgrass, nor are any desired.

For the past 70 years, the USDA's support for the turfgrass industry has been modest at best. The turfgrass industry's rapid growth, importance to our urban environments, and impact on our daily lives warrant more commitment and support from the USDA. Failing to support the National Turfgrass Evaluation Program would be a tremendous oversight of a major opportunity. USDA's support of the NTEP at the \$55,000 level does not cover all cost. In fact, NTEP represents an ideal partnership of the public and private sectors in terms of program cost sharing. The NTEP relies most heavily on turfgrass industry (i.e., public sector, end-users) support. However, it is essential that the USDA maintain its financial support and work closely with NTEP. The turfgrass industry relies heavily on NTEP for unbiased findings. Discounting this support will also eliminate a highly reliable and credible level of objectivity that is associated with the NTEP program.

I respectfully request that the Subcommittee restore this vital \$55,000 appropriation for the National Turfgrass Evaluation Program (NTEP) in the fiscal year 1999 budget for the Agricultural Research Service.

Thank you very much.

PREPARED STATEMENT OF LINO DEALMEDIA, JR., PRESIDENT, NATIONAL UTILITY CONTRACTORS ASSOCIATION

Mr. Chairman and members of the subcommittee, my name is Lino DeAlmeida, Jr. I am president and chief executive officer of Consolidated Construction Management Services, Inc., in Colts Neck, New Jersey. I am pleased to submit written testimony on behalf of the National Utility Contractors Association (NUCA).

Every day my colleagues and I see firsthand the consequences of failed or non-existent water and waste disposal infrastructure. We can also attest to the positive public health, environmental, and economic benefits of infrastructure investment in rural communities. We are proud of the vital public services that we provide to rural communities across the country, whether it's the construction of a new drinking water treatment facility or upgrades to existing plant and pipework. The USDA Rural Utilities Service (RUS) has played a critical role in helping these communities finance basic water infrastructure needs.

FISCAL 1999 RECOMMENDATION

NUCA supports the Administration's fiscal 1999 request for \$629 million in budget authority to support RUS Water and Waste Loans and Grants totaling \$1.34 billion. The request represents a modest \$66 million increase over fiscal 1998. The proposed increase is well justified when you consider that RUS had \$3.7 billion worth of unfunded applications on hand as of January 1998.

RURAL INFRASTRUCTURE NEEDS

Many small, rural communities find it difficult to maintain safe and affordable drinking water supplies and provide sanitary waste disposal. Lack of access to conventional financing, inadequate technical resources, and a limited tax base are significant reasons why small communities struggle to meet basic water infrastructure needs. Federal regulatory requirements under the Clean Water and Safe Drinking Water Acts pose additional financial burdens.

Last fall, the U.S. Environmental Protection Agency (EPA) revised its assessment of publicly owned wastewater treatment needs. The survey found more than \$139 billion in wastewater collection and treatment needs over the next twenty years, including \$13.8 billion for communities with fewer than 10,000 residents. These small communities represent 11 percent of the nation's total documented need, including \$3.9 billion for secondary treatment and \$6.6 billion for sewer pipe repair, replacement, and new construction.

Drinking water infrastructure needs are equally alarming. A 1996 study by the USDA (Water 2000) estimated that as many as 8 million people have drinking water quality problems and that approximately 1.1 million people lack indoor plumbing.

A 1997 EPA drinking water infrastructure survey found that more than \$138 billion is needed over the next twenty years for transmission and distribution lines, water treatment plants, and water storage and supply facilities. Small systems serving 3,300 or fewer people reported more than \$37 billion in construction needs. As we noted in our fiscal 1998 testimony before the subcommittee, rural households represent the largest per-household need and are burdened with the highest per-household cost.

RURAL INFRASTRUCTURE INVESTMENT BENEFITS

Numerous benefits accrue when a small community builds a new drinking water treatment plant or makes repairs to leaking water and sewer pipes. Foremost, water infrastructure investment improves public health and safety, by reducing the incidence of disease and mortality and enhancing fire protection. Capital investment also yields economic benefits, such as new jobs and better labor productivity. New businesses are attracted to improved communities, and over time the local tax base grows and provides more financial stability.

CONCLUSION

The RUS Water and Waste Disposal Loans and Grants are an important source of financing for small, rural communities that have been turned down by more conventional lenders. The program has a solid track record in terms of loans repaid and maximum use of appropriated dollars. The need for continued federal investment in rural America is evident and worth every penny. We urge the subcommittee to fully support the Clinton Administration's fiscal 1999 request for the RUS water and waste disposal loans and grants.

Thank you for the opportunity to provide this recommendation.

PREPARED STATEMENT OF BEN F. BOWDEN, CHAIRMAN, NATIONAL WATERSHED
COALITION

The National Watershed Coalition (NWC) is pleased to present this testimony in support of some of the most beneficial water resource conservation programs ever developed in the United States. The Coalition recognizes full well the very difficult financial situation our nation faces. That makes the work of this Subcommittee very important. It also makes it imperative that the federal programs that are continued are those that provide real benefit to society, and are not programs that would be nice to have if funds were unlimited. We believe that the Small Watershed Program (Public Law 83-566) and the Flood Prevention Operations Program (Public Law 78-534) are examples of those rare programs that address our nation's vital natural resources which are critical to our very survival, do so in a way that provide benefits in excess of costs, and are programs that serve as models for the way all federal programs should work.

The National Watershed Coalition is an alliance of national, regional, state and local organizations that have a common interest in advocating the use of the watershed when dealing with natural resource issues. We also support the use of total resource management principles in planning. We are advocates of both the Small Watershed Program and the Flood Prevention Operations Program administered by USDA's Natural Resources Conservation Service (NRCS), formerly the Soil Conservation Service (SCS). These resource protection programs deserve much higher priority than they have had in the past. Even in difficult financial times, their revitalization would pay dividends in monetary and other benefits, and jobs! The disastrous 1993 Midwest floods should have taught us something. If one examines the Report of the Interagency Floodplain Management Review Committee that studied that event, we see that flood damages were significantly reduced in areas where Public Law 566 projects were installed. The requests for disaster assistance were also less.

The watershed as the logical unit for dealing with natural resource problems has long been recognized. Public Law 566 offers a complete watershed management approach, and should have a prominent place in our current federal policy emphasizing watersheds and total resource management based planning. Why should the federal government be involved with these watershed programs?

- They are programs whose objectives are the sustaining of our nation's precious natural resources for generations to come.
- They are not federal, but federally assisted. They do not represent the continued growth of the federal government.
- They are locally initiated and driven. Decisions are made by people affected, and respect private property rights.
- They share costs between the federal government and local people. Local sponsors pay between 30-40 percent of the total costs of Public Law 566 projects.
- They produce net benefits to society. The most recent program evaluation (1987) demonstrated the actual ratio of benefits to costs was approximately 2.2:1. The actual adjusted economic benefits exceeded the planned benefits by 34 percent. How many other federal programs do so well?
- They consider and enhance environmental values. Projects are subject to the discipline of being planned following the National Environmental Policy Act (NEPA), and the federal "Principles and Guidelines" for land and water projects. That is public scrutiny.
- They are flexible programs that can adapt to changing needs and priorities. Objectives that can be addressed are flood damage reduction, watershed protection (erosion and sediment control), water quality improvement, rural water supply, water conservation, fish and wildlife habitat improvement, recreation, irrigation and water management, etc. That is flexibility.
- They are programs that encourage all citizens to participate.
- They can address the needs of low income and minority communities.
- And best of all—they are programs the people like!

The National Watershed Coalition commends the Congress for the support given these programs over the years, and hopes that the outcome of the fiscal year 1999 appropriations process will enable this vital work to continue and expand as we seek to preserve, protect and better manage our nation's water and land resources. Every State in the United States has benefited from the Small Watershed Program.

In order to continue this high priority work in partnership with states and local governments, the Coalition recommends a fiscal year 1999 funding level of \$250 million for Watersheds and Flood Prevention Operations, Public Laws 566 and 534. The allocation between these two programs is best left to the ARCS. Of this amount, we would suggest that \$50 million be used for structural rehabilitation and replace-

ment, and \$10 million be used for wetland acquisition as authorized by the 1990 Farm Bill. We recognize that in these difficult financial times, the Congress may not find it possible to provide that amount, but we also believe that we are not doing our job of helping you recognize the true need if we continually recommend the federal share of these needed funds be less. We would hope that everyone understand these federal funds are only a part of the total that are committed to this vital purpose. The local project sponsors in these "federally assisted" endeavors have a tremendous investment also. Additionally, the Coalition supports \$10.5 million for watershed planning, \$13.0 million for River Basin Surveys and Investigations. We also suggest that the Emergency Watershed Program (EWP) be provided with \$20 million to allow the NRCS to provide rapid response in time of natural disaster.

The issue of the current condition of those improvements constructed over the last fifty years with these watershed programs is a matter of great concern. A USDA study published in 1991 estimated that in the next ten years, \$590 million would be needed to protect the installed works. That figure is likely larger today. Of that amount, \$100 million would come from local sponsors as their operation and maintenance contribution. That is the reason we are recommending starting with \$50 million for the work necessary to protect these installed structures. If we don't start to pay attention to our rural infrastructure needs, the ultimate cost to society will only increase, and project benefits will be lost. This is a serious concern. We are pleased that NRCS and some Members recognize this issue.

In addition to offering our thoughts on needed conservation program budget levels, we would like to express our great concern with the way in which the Administration's budget proposes to change the watershed program funding in fiscal year 1999. The Administration again proposes taking \$71 million from the Public Law 83-566 Small Watershed Program, and putting it in the NRCS Conservation Operations account, leaving only \$49 million for actual on the ground implementation. While the Administration's budget suggests this approach simply combines some of the NRCS's technical assistance expenses into one account, and the funds will be used for "water resource assistance," we believe this is a means to put these funds in an account where they will not be used for Public Law 83-566 Small Watershed Projects, but instead will be spread around with virtually no program accountability. In our view this represents the long time desire of some in the Administration to circumvent the will of the Congress and eliminate Small Watershed Projects. The Administration's budget also eliminates any funding for the eleven watersheds authorized by the Flood Control Act of 1944 (Public Law 78-534), which was about \$18 million in 1997, but suggests that "worthwhile Public Law 534 projects" can be continued under the Small Watershed Program, Public Law 83-566 (with no funding?). We see this as a way to again administratively eliminate a congressionally mandated program which some in the Administration don't care for, but one which has provided millions of dollars of benefits to society. Watershed project sponsors, who were encouraged to assume such responsibility by the federal government, now feel abandoned by that same federal "partner." It seems to us that the money taken from the Small Watershed Program (\$71 million put in the Conservation Operations account) would be far better used, and provide many more real benefits, if left in the Small Watershed Program where Congress intended it.

The availability of only \$49 million in the administration's budget for actual project installation presents a special problem for watershed sponsors. In addition to virtually eliminating most project construction, this lack of funding allows the NRCS to say they are "reevaluating project priorities in order to make the limited funds stretch, and be used for environmentally friendly projects." Thus reevaluation is done without the input of project sponsors, whose planned work meets every environmental regulation, and meets the criteria in the law. What in truth happens with this reevaluation, is that projects which have a flood damage reduction objective, and which might propose building a small upstream dam to reduce flooding, are eliminated from the NRCS priority listing. Those local project sponsors have made legal commitments based on the federal agreements, and they are being left out in the cold.

The Administration has also suggested that the \$49 million for project construction be transferred to the Rural Development for "loans." They are also proposing the collection of "user fees" for services that taxpayers have already paid for once, and for which no statutory authority exists. Not only is this not the intent of Congress or in the legislation, if the wealthy communities elect to use the loan option to implement their projects, it would virtually eliminate any of the poorer, limited resource communities from competition for very limited funds. This sounds like another crazy idea originating with the Office of Management and Budget (OMB). It flies in the face of those interested in the notion of "environmental justice."

A number of proposed amendments to this legislation were considered during the discussions of the 1996 Farm Bill. The NWC would urge you, whenever the time is appropriate, to take another look at those proposals, particularly the idea of expanding the objectives that the legislation can serve to include more non-structural practices, allow the provision in the law to provide assistance in developing rural water supplies (without water there is no rural development) actually be used (we understand OMB has never allowed its use), eliminate the current requirement that mandates twenty percent (20 percent) of the total project benefits be "directly related to agriculture" which has the unintended effect of penalizing projects in poor, small, rural communities, and continue to explore the idea of allowing the USDA Secretary to accept transfers from other Federal departments and agencies to carry out projects under Public Law 83-566, when it is to the advantage of all. We would also urge that as the issue of cost sharing rates is examined in the future, cost sharing rates be set for the natural resource purpose to be achieved, rather on the practices used to achieve those purposes.

The Coalition appreciates the opportunity to offer these comments regarding fiscal year 1999 funding for the water resource programs administered by the Natural Resources Conservation Service. With the "downsizing" the NRCS has experienced, we would be remiss if we did not again express some concern as to their ability to provide adequate technical support in these watershed program areas. NRCS technical staff has been significantly reduced and budget constraints have not allowed that expertise to be replaced. Traditional fields of engineering and economics are but two examples. We see many states where the capability to support their responsibilities in these program areas is seriously diminished. This is a disturbing trend that needs to be halted. This downsizing has a very serious effect on state and local conservation programs. Local Watershed and Conservation Districts and the NRCS combine to make a very effective delivery system for providing the technical assistance to local people—farmers, ranchers and rural communities—in applying needed conservation practices. Many states and local units of government also have programs that provide financial assistance to land owners and operators for installing measures that reduce erosion, improve water quality, and maintain environmental quality. The NRCS provides, through agreement with the USDA Secretary of Agriculture, "on the land" technical assistance for applying these measures. The delivery system currently is in place, and by downsizing NRCS we are eroding the most effective and efficient coordinated means of working with local people to solve environmental problems ever developed. Our system and its ability to produce food and fiber is the envy of the entire world. In our view, these programs are the most important in terms of national priorities.

The administration is also proposing millions of dollars for a new so-called "Clean Water Initiative." Why have they chosen to abandon the tried and proven conservation watershed programs which have served us so remarkably for 50 years in order to fund diner initiatives?

The Coalition pledges its full support to you as you continue your most important work. Our Executive Director/Watershed Programs Specialist Mr. John W. Peterson, who has over forty years experience in this business, is located in the Washington, DC area, and would be pleased to serve as a resource as needed. John's address is 9304 Lundy Court, Burke, VA 22015-3431, phone 703-455-6886, Fax; 703-455-6888, email; jwpeterson@theonramp.net.

Thank you for allowing the National Watershed Coalition (NWC) this opportunity.

PREPARED STATEMENT OF DR. SAM CURL, DEAN AND DIRECTOR, DIVISION OF AGRICULTURAL SCIENCES AND NATURAL RESOURCES, OKLAHOMA STATE UNIVERSITY, THE OKLAHOMA AGRICULTURAL EXPERIMENT STATION, AND THE OKLAHOMA COOPERATIVE EXTENSION SERVICE

Mr. Chairman and Members of the Subcommittee: Thank you for providing me the opportunity to submit testimony to your subcommittee today concerning agriculture research, extension, and education funding for fiscal 1999.

On behalf of Oklahoma State University, the Oklahoma Agricultural Experiment Station and the Oklahoma Cooperative Extension Service, I seek your support of funding for the following continuing special research grants, which are the priority initiatives for the Division of Agricultural Sciences and Natural Resources:

Animal Waste Management in Semiarid Agroecosystems	\$400,000
Expanded Wheat Pasture	330,000
Integrated Production Practices for Horticultural Crops	258,000
Preservation and Processing of Selected Fruits and Vegetables	258,000
Pilot Tech Transfer (Mississippi and Oklahoma)	400,000

Your support is also solicited for national agriculture research, extension, and education funding consistent with the recommendations of the National Association of State Universities and Land-Grant Colleges. Included within those recommendations is the proposal for a 5.7 percent increase in base (formula) funding for agriculture research, extension, and education that we solidly support.

ANIMAL WASTE MANAGEMENT IN SEMIARID AGROECOSYSTEMS—\$400,000

The proposed Oklahoma Panhandle Research and Education Center's research project in Animal Waste Management in Semiarid Agroecosystems is designed to develop sustainable, environmentally safe, and ecologically sound best management principles and practices for beneficial animal waste applications for "High Plains Agriculture." The project will be conducted in support of rural economic development through a federal-state-local partnership.

Emphasis is placed on the rapidly expanding hog industry in the semiarid region, but information gained will also be applicable to the beef and dairy industries. The objectives of this study are to develop informational databases for:

- (1) sustainable, environmentally safe, and ecologically sound principles and practices for beneficial animal waste management in semiarid agroecosystems;
- (2) best management practices to maximize nutrient utilization and minimize odor for land application of animal wastes in crop and grazingland production systems;
- (3) the design and operation of waste lagoons in semiarid agroecosystems to minimize odor and risk of harmful effects to ground water, air quality, and the environment;
- (4) ensuring public health; and
- (5) technology transfer systems that will benefit "High Plains Agriculture."

Research and education programs must provide a flow of timely information addressing problems faced by agricultural clientele and allied industries in the region. Climatic conditions and soils are unique to this semiarid region, and information that has been derived from other more humid regions is not applicable. This research will develop regional information regarding the prudent management of animal waste systems that is applicable to a five state, semiarid area. The multidisciplinary research activities will be conducted by the Oklahoma Agricultural Experiment Station and Oklahoma Cooperative Extension Service in cooperation with Oklahoma Panhandle State University and consultation with other land-grant universities from the four surrounding states.

Information gained will be adaptable to producers in the Texas panhandle, northeastern New Mexico, eastern Colorado, and western Kansas. Research and extension programs dealing with beneficial land applications of biosolids from well-established beef-cattle feedlots, new emerging swine lagoons, and the expanding dairy industry are underway. Nutrient loading rates for crop production and grazingland systems, design and operation of waste lagoon systems with major emphasis on odor control, and minimizing risks to surface and ground water all will receive major attention. It is essential that economical, sustainable, environmentally prudent, and ecologically sound waste management principles and practices be developed for the rapidly expanding animal industry in this semiarid region.

EXPANDED WHEAT PASTURE—\$330,000

The Expanded Wheat Pasture Project is a continuing multidisciplinary research and extension initiative at Oklahoma State University. The project is also known as, "Increasing Profitability of the Wheat/Stocker Cattle Enterprise," and its objectives are to:

- (1) increase profitability of the wheat grain/stocker-feeder cattle enterprise;
- (2) decrease production risks and income variability from the enterprise, thereby increasing growth of the industry in the southern Great Plains; and,
- (3) improve the economics of many rural communities in Oklahoma and the southern Great Plains.

This initiative permits Oklahoma State University (OSU) to help improve the profitability, global competitiveness, and sustainability of agriculture, and revitalize rural Oklahoma.

This initiative is at a pivotal stage with regard to evaluation of grazing management strategies to overcome the negative effects of increasing stocking density on grain yield, and further development of decision-support microcomputer models. The project presently focuses on evaluating different wheat varieties by cattle grazing trials, and further development of supplementation programs that will minimize variation in daily intake while achieving desired mean intakes of new technologies for growing cattle. This will maximize both biologic and economic efficiency.

This initiative compliments the new Beef Cattle Environmental Stress Research Facility at OSU. This will allow measurement of the effects of receiving health and nutrition treatments for stressed calves on subsequent performance on wheat pasture. Similarly, effects of treatments on wheat pasture on subsequent feedlot performance of the cattle can be evaluated. These studies are a prerequisite to improving the overall efficiency and decreasing costs of beef cattle production in the United States.

Differences in net return (dollars per acre) from cattle and total net return from cattle and grain have been as large as \$35 and \$63 per acre, respectively, depending on variety and stocking density. Oklahoma plants about 7.4 million acres of wheat each year.

The potential of this project for improving the economies of many rural communities in Oklahoma and the southern Great Plains is enormous. Annual income in Oklahoma could be increased by \$131,000,000 by improving the technical efficiency of production of the 1.5 million head of stocker cattle that are grown to heavier weights on wheat pasture in Oklahoma prior to being finished in feedlots. By improving the technical efficiency and increasing the number of cattle that are grazed on wheat pasture in Oklahoma, annual income in the state could potentially be increased by almost \$308,000,000. This research has similar potential impacts on the 5.5 million head of wheat pasture stocker cattle in Texas, Kansas, New Mexico, and Colorado. The opportunity for expansion (growth) of the industry has never been greater than it is today because of the changing structure of the U. S. beef cattle industry.

INTEGRATED PRODUCTION PRACTICES FOR HORTICULTURAL CROPS—\$258,000

The goals of the Integrated Production Practices for Horticulture Crops research project include evaluating and developing cropping systems that will diversify agricultural production, thus increasing profits and improving the stability of farms in the southeast region of Oklahoma. The focus of the project has been to develop alternative agricultural enterprises for the region, especially horticulture crops.

The research is conducted by a multidisciplinary team of scientists from OSU and the U.S. Department of Agriculture's Agriculture Research Service (ARS), who are co-located at the Wes Watkins Agricultural Research and Extension Center in southeast Oklahoma, as well as scientists at other universities. The mission of the facility is to aid in the agricultural development in the region.

Applied and theoretical research projects are necessary and are being conducted in support of the overall project. The project leaders have received additional peer reviewed competitive grants for supporting work. Funds from these grants have directly supported the research of scientists located at the Center, support local students as technicians working on projects, supplies, scientific equipment, and infrastructure that will support long term research efforts at the center.

Research has resulted in development of cropping systems for six different vegetable crops not currently grown extensively in the region plus a comprehensive cropping system for watermelons. The cropping systems that have been developed will allow producers to reduce risks, diversify farms, and increase profits. In addition, results will be useful for producers of traditional crops grown in the region. Future support will allow the team to develop new systems, extend the results of prior research to producers, and to optimize production in the region. Databases developed will enable producers to better understand the relationships among farm geography, climate, management practices, yield, and profit.

PRESERVATION AND PROCESSING OF SELECTED FRUITS AND VEGETABLES—\$258,000

Preservation of quality after harvest is of special importance for fresh fruits, nuts, and vegetables. The overall objectives of the Preservation and Processing of Selected Fruits and Vegetables research initiative at OSU are: to define the major limitations for maintaining quality of harvested fruits, nuts, and vegetables, and, then, to prescribe appropriate harvesting, handling, and processing protocols to extend shelf life and/or to improve value. Research activities have concentrated on factors currently limiting quality and shelf life of Oklahoma-grown produce and focuses on supporting the growth of the fruit, nut, and vegetable industry by providing technological improvements essential to meet consumer demands. This research program also addresses high priority national research topics in development of new technologies for handling and processing agricultural products.

A systems approach to harvesting, handling, and processing operations is being used to integrate specialized crop culture, harvesting, handling, and processing operations to optimize new cropping systems, and to provide technological information required for integration of new value-added processing industries for Oklahoma hor-

gricultural products. Commercial application of ongoing food products processing projects will be facilitated by activities in the newly opened Oklahoma Food and Agricultural Products Research and Technology Center. Technological improvements in fruit, nut, and vegetable harvesting, handling and processing are critically needed to supply domestic markets and to support continued U.S. participation in international commerce. This research will help Oklahoma industries compete in a global economy.

PILOT TECH TRANSFER (MISSISSIPPI AND OKLAHOMA)—\$400,000

Within the Mississippi and Oklahoma Pilot Technology transfer project, the Oklahoma funding supports an integrated extension program that provides technology transfer and associated business support for small manufacturers in southeastern Oklahoma. The team includes engineers and technology transfer specialists from the Oklahoma Cooperative Extension Service working cooperatively with specialists from Rural Enterprises, Inc., of Durant, Oklahoma. Team members cooperate with specialists in other districts of the state in programs supported by the National Institutes of Standards and Technology (NIST) through the Oklahoma Alliance for Manufacturing Excellence. The Alliance programs are focused on other areas in Oklahoma.

The focus of the program is one-on-one assistance to small manufacturers to help make their operations sustainable and more profitable. In the process, jobs are saved and created. In addition, the small manufacturers increase their technical competence and learn to access these kinds of services on their own through private service providers. They are also encouraged to become members of local and state manufacturing organizations that can help make them sustainable.

Rural Oklahoma traditionally has relied on agriculture and energy, with a scattering of small industry, for its economic base. Of the more than 5,800 manufacturing firms in Oklahoma, more than 5,200 employ fewer than 250 employees. Approximately half of these small firms are located in rural areas. Rural manufacturers are extremely important to their local economies. The loss or downsizing of these small plants can have devastating consequences for the host and surrounding communities, while the establishment or growth of a manufacturing facility can provide far-reaching and sustainable economic benefits.

The technology transfer activity supported by this program provides the only on-site, one-on-one, focused transfer of engineering and technical assistance to manufacturers in southeast Oklahoma. It is the only fully integrated program of financial, technical, and business assistance to small manufacturers in Oklahoma.

NATIONAL AGRICULTURE APPROPRIATIONS FOR RESEARCH, EXTENSION, AND EDUCATION

Agricultural science is important for improving the components of life that matter the most to the public. Agricultural science continually produces healthier, more nutritious, safer food than found anywhere else in the world. It produces fibers for American clothing and textiles. Agricultural science produces discoveries that make dramatic improvements in human health. Agricultural scientists work closely with Cooperative Extension personnel who ensure that agricultural discoveries get into the hands of those who need them, resolving problems for whole industries and single individuals.

Despite the documented successes of agricultural research, and education, federal funding for these programs has stagnated since the 1970's. Buying power has eroded 15 percent in real terms since 1985. The Clinton Administration has proposed significant budget cuts for fiscal 1999 in the base funds, which are compounded when the last five years of flat funding for the programs is taken into account. The Clinton budget base funding cuts of particular concern are:

- Hatch Act, Experiment Station—9 percent cut;
- Smith-Lever, Cooperative Extension—4 percent cut;
- McIntire-Stennis, Forestry—3 percent cut; and
- Animal Health—elimination.

Support is requested for agriculture appropriations for fiscal 1999 to: (1) increase base formula funding for agriculture research, extension, and education by 5.7 percent; and (2) fund other agricultural research, extension, and education appropriations as outlined in the recommendations of the National Association of State Universities and Land-Grant Colleges.

PREPARED STATEMENT OF THE ORGANIZATION FOR THE PROMOTION AND
ADVANCEMENT OF SMALL TELECOMMUNICATIONS COMPANIES

SUMMARY OF REQUEST

The Organization for the Promotion and Advancement of Small Telecommunications Companies (OPASTCO) seeks the Subcommittee's support for fiscal year 1999 loan levels for the telecommunications program administered by the Rural Utilities Service (RUS) in the same amounts as those contained in the fiscal year 1998 Agriculture Appropriations Act. The requested program levels are:

Telecommunications Loans Program

5 percent hardship loans	\$75,000,000
Treasury rate loans	300,000,000
Guaranteed loans	120,000,000
Rural Telephone Bank (RTB) loans	175,000,000

In addition, OPASTCO requests the Subcommittee's support for the following: (1) removal of the statutory 7 percent cap on Treasury rate loans for fiscal year 1999; (2) a prohibition against the transfer of unobligated RTB funds to the general fund of the Treasury or Federal Financing Bank; (3) continuation of funding the RTB's administrative expenses and subsidy budget authority through the general fund of the Treasury; and, (4) funding of the distance learning and telemedicine grant and loan program at sufficient levels.

OPASTCO is a national trade association of more than 500 independently owned and operated telephone companies serving rural areas of the United States. Its members, which include both commercial companies and cooperatives, together serve over 2 million customers in 40 states. Well over half of OPASTCO's members are RUS or RTB borrowers.

Perhaps at no time since the inception of the RUS (formerly the REA) has the telecommunications program been so vital to the future of rural America. The telecommunications industry is at a crossroads, both in terms of technology and public policy. Great leaps in telecommunications technology in recent years will deliver on the promise of a new "information age." The Federal Communication Commission's (FCC) implementation of the landmark Telecommunications Act of 1996, as well as fundamental statutory changes to RUS's lending program, will expedite this transformation. However, without continued RUS support, rural telephone companies will be hard pressed to build the infrastructure necessary to bring their communities into this new age, creating a bifurcated society of information "haves" and "have-nots."

Contrary to the belief of some critics, RUS's job is not finished. In fact, in a sense, it has just begun. We have entered a time when advanced services and technology—such as broadband fiber optics, digital switching equipment, custom calling features, and the Internet—are an expected and needed part of a customer's telecommunications service. In addition, the fast approaching year 2000 will require all telephone companies to upgrade their digital switches in order to avoid network disruptions and provide a seamless transition to the new millennium. Unfortunately, the inherently higher costs of upgrading rural networks has not abated. Rural telecommunications continues to be more capital intensive and involves fewer paying customers than its urban counterpart. RUS borrowers average only 6.1 subscribers per route mile versus 130 subscribers per route mile for large local exchange carriers. In order for rural telephone companies to modernize their networks and provide their customers with advanced services at reasonable rates, they must have access to reliable low-cost financing.

Furthermore, the relative isolation of rural areas increases the value of telecommunications services for these citizens. Telecommunications enables applications such as distance learning and telemedicine that can alleviate or eliminate some rural disadvantages. Telecommunications can also make rural areas attractive for some businesses and result in revitalization of the rural economy. For example, businesses such as telemarketing and tourism can thrive in rural areas, and telecommuting can become a realistic employment option.

While it has been said many times before, it bears repeating that RUS's telecommunications loans program is not a grant program. The funds loaned by RUS are used to leverage substantial private capital, creating public/private partnerships. The RUS estimates that every dollar of government money invested in telecommunications plant leverages \$4.80 in private capital. For a very small cost, the government is encouraging tremendous amounts of private investment in rural telecommunications infrastructure. Moreover, there has never been a default in the history of the lending program.

The FCC's implementation of the Telecommunications Act of 1996 will only increase rural telephone companies' need for RUS assistance in the future. The forward-looking Act defines universal service as an evolving level of telecommunications services that the FCC must establish periodically, taking into account advances in telecommunications and information technologies and services. While the competitive environment engendered by the 1996 Act may offer the means of meeting this definition in urban areas, rural and high cost areas have less potential for competitive investment.

One of the principles of universal service established in the 1996 Act is that consumers in rural areas have access to advanced telecommunications and information services that are reasonably comparable to those services provided in urban areas at reasonably comparable rates. At present, it is uncertain whether the FCC will provide a "sufficient" mechanism, as required by the Act, to achieve this urban/rural comparability goal. Long before the enactment of the 1996 Act, RUS has been the great facilitator of a dynamic universal service concept in rural areas, providing rural telephone companies with the financing to fund technological improvements. RUS now has an essential role to play in the implementation of the new law, as it will complement new funding mechanisms established by the FCC and enable rural America to move closer to achieving the federally mandated goals.

Working in tandem with the 1996 Act, the Rural Electrification Loan Restructuring Act of 1993 (RELRA) will further help to ensure the comparability of telecommunications service between urban and rural America. As a prerequisite to eligibility for insured and RTB loans, RELRA requires that every state have an RUS approved modernization plan which provides a timeline for the improvement of the state's telecommunications network and assures that the purpose of every loan is consistent with achieving the requirements of the borrower's state plan. These plans set forth the requirements for the transmission of video images and high speed data that will promote educational and health care opportunities as well as provide the necessary infrastructure for economic development. Implementation of these plans has already begun to generate additional loan demand as rural telephone systems strive to meet the increased service objectives in the rural areas they serve.

One of the most vital components of RUS's telecommunications loans program is the 5 percent hardship loan program. These loans are referred to as hardship loans for good reason: They provide below-Treasury rate financing to telephone companies serving some of the most sparsely populated, highest cost areas in the country. The commitment these companies have to providing modern telecommunications service to everyone in their communities has made our nation's policy of universal service a reality and, in many cases, would not have been possible without RUS's hardship loan program. Companies applying for hardship loans must meet a set of eligibility requirements and the projects to be financed are rated on a point system to ensure that the loans are targeted to the most needy and deserving. The RUS reports that through the second quarter of fiscal year 1998, they had already approved over \$65 million in hardship loans—or more than 86 percent of their authorization—and had an additional \$62 million in applications on hand. By year end, RUS estimates that it will have \$79 million in hardship loan applications that cannot be funded. For fiscal year 1998, the government subsidy needed to support a \$75 million loan level was under \$3 million. Given the need and demand for this essential program, it is critical that the loan level be maintained at \$75 million for fiscal year 1999.

With regard to RUS's Treasury rate loan program, OPASTCO supports the removal of the 7 percent ceiling on these loans for fiscal year 1999. This Subcommittee appropriately supported language in the fiscal year 1996 Agriculture Appropriations Act to permit Treasury rate loans to exceed the 7 percent per year ceiling contained in the authorizing act. This language was continued in fiscal year 1997 and fiscal year 1998. Were long-term interest rates to exceed 7 percent, adequate subsidy would not be available to support the Treasury rate loan program at the authorized levels. Accordingly, OPASTCO supports the continuation of this language in the fiscal year 1999 appropriations bill in order to prevent potential disruption to this important program.

OPASTCO also urges the Subcommittee to reinstate the language introduced in the fiscal year 1997 Agriculture Appropriations Act, and continued in fiscal year 1998, prohibiting the transfer of any unobligated balance of the RTB liquidating account to the Treasury or the Federal Financing Bank which is in excess of current requirements and requiring the payment of interest on these funds. As a condition of borrowing, the statutory language establishing the RTB requires telephone companies to purchase Class B stock in the bank. Once all loans are completely repaid, a borrower may then convert its Class B stock into Class C stock. Thus, all current and former borrowers maintain an ownership interest in the RTB. As with stockholders of any concern, these owners have rights which may not be abrogated. The

Subcommittee's inclusion of the aforementioned language into the fiscal year 1999 appropriations bill will ensure that RTB borrowers are not stripped of the value of this required investment.

On the other hand, the Subcommittee should reject the Administration's proposal to fund the RTB's administrative expenses and subsidy budget authority through the bank's liquidating account balances. This proposal is inappropriate on both legal and policy grounds. Statutorily, the Rural Electrification Act provides for the RTB's use of facilities and services of employees of the Department of Agriculture, without cost to the RTB, until such time as the bank is privatized. The proposal also appears inconsistent with the bifurcated structure of the RTB under the Federal Credit Reform Act of 1990 which does not permit funds in the liquidating account to finance new loans. From a public policy standpoint, unobligated balances of the liquidating account have been targeted to support the privatization of the RTB and use of these funds for other purposes would only serve to dilute the value of the bank for all stockholders. Finally, paying for the RTB's administrative expenses and subsidy through the liquidating account offers no budgetary savings. For these reasons, OPASTCO is opposed to the Administration's proposal and urges the Subcommittee to continue to fund the RTB through the general fund of the Treasury.

In addition to RUS's telecommunications loans program, OPASTCO supports adequate funding of the distance learning and telemedicine grant and loan program authorized in the Federal Agriculture Improvement and Reform Act of 1996. This sensible investment allows rural students to gain access to advanced classes which will help them prepare for college and jobs of the future. Also, rural residents will gain access to quality health care services without traveling great distances to urban hospitals. The Agriculture Act authorizes \$100 million for each of the fiscal years 1996 through 2002. Loans are made at the government's cost-of-money, which should help to meet demand for the program in the most cost effective way. In light of the Telecommunications Act's requirement that schools, health care providers, and libraries have access to advanced telecommunications services, sufficient targeted funding for this purpose is essential in fiscal year 1999.

CONCLUSION

The development of the nationwide telecommunications network into an information superhighway, as envisioned by policymakers, will help rural America survive and prosper in any market—whether local, regional, national, or global. However, without the availability of low-cost RUS funds, building the information superhighway in communities that are isolated and thinly populated will be untenable. By supporting the RUS telecommunications programs at the requested levels, the Subcommittee will be making a significant contribution to the future of rural America at a negligible cost to the taxpayer.

PREPARED STATEMENT OF ALAN F. HOLMER, PRESIDENT, PHARMACEUTICAL RESEARCH AND MANUFACTURERS OF AMERICA

Mr. Chairman and Members of the Subcommittee: On behalf of the Pharmaceutical Research and Manufacturers of America (PhRMA), I present recommendations on the fiscal year 1999 budget request submitted by the Administration for the Food and Drug Administration (FDA). PhRMA represents the country's major research-based pharmaceutical and biotechnology companies, which are leading the way in the search for new cures and treatments that will enable patients to lead longer, happier, healthier, and more productive lives.

Let me acknowledge at the outset that we appreciate the very difficult decisions the Subcommittee must make as it considers funding for the many vital agriculture, infant feeding, rural development, tobacco, and other programs with which it is concerned. Our interest is in the FDA and the critical role it plays in promoting and protecting the health and safety of our country's citizens.

Let me also acknowledge and thank the Subcommittee for its key leadership in ensuring that FDA receives the necessary funding to carry out its important functions. This was particularly true last year when the Subcommittee approved funding for fiscal year 1998 that enabled Congress to pass the FDA Modernization Act of 1997 (FDAMA), which extended the Prescription Drug User Fee Act of 1992 (PDUFA) for another five years. Under the first five years of the user-fee law, FDA cut drug-approval times in half and is making new life-saving, cost-effective medicines available to patients much more quickly.

We also thank you, Mr. Chairman, for your leadership on the pending fiscal year 1998 supplemental appropriations legislation. PhRMA supports FDA's request, as a result of FDAMA, for an increase to the current authorized appropriation level, plus

an additional amount for the FDA's increased workload of drug applications, for a total of \$25.9 million. We appreciate that your Subcommittee has pressed to provide this additional funding for the agency to allow it to utilize all of the drug user-fee revenues that will be paid this year.

PhRMA also supports the Administration's fiscal year 1999 request for budget authority for direct federal appropriations of \$878.9 million for FDA salaries and expenses—the major and essential component of FDA's resources. This represents a \$21.4 million increase over the appropriations enacted by Congress for the current fiscal year.

However, the Administration is further proposing to raise an additional \$127.7 million through the imposition of new user fees for such activities as medical device reviews, animal drug approvals, import inspections, food additive petition reviews, generic drug application reviews, and post-market surveillance of products. Unlike the prescription-drug user fee program, these user fees would substitute for regular appropriations, would not be dedicated to a specific purpose, and would not require that FDA meet performance goals.

For more than a decade, this and previous Administrations have made such proposals and Congress has repeatedly rejected them. We anticipate that this will happen again this year.

For this reason, we believe it is critical that Congress provide direct federal appropriations of \$1.007 billion for FDA salaries and expenses for fiscal year 1999—which includes the \$878.9 million requested by the Administration and the additional \$127.7 million the Administration believes is necessary but should be derived from general user-fees that Congress has consistently declined to authorize.

Without the additional \$127.7 million in appropriations, FDA will not be able to carry out all of its important public health and safety responsibilities in regulating more than \$1 trillion worth of products—one-quarter of all the money spent annually by U.S. consumers—in the areas of drugs, biologics, medical devices, food, cosmetics, radiation-emitting devices, and pet food and drugs.

In his prepared testimony for the Subcommittee's hearing on March 31, 1998, FDA Lead Deputy Commissioner Michael A. Friedman, M.D., stated that, while "focused" food safety and tobacco programs that have received "specially designated appropriations [will] continue to grow, core FDA functions have seen a steady decline in non-PDUFA FTE's from the fiscal year 1992 level of 8,868 to a low of 8,444 in the current fiscal year, a 4.8 percent drop."

Of primary concern to PhRMA, the prescription drug user-fee program—entirely different than the Administration's proposals for general new user fees—is good for FDA, industry and, above all, patients. The pharmaceutical industry and FDA are working to serve a common client—the patient. The research-based pharmaceutical industry is working to develop new and better drugs, FDA to improve the drug development and approval process. According to the agency, more than 11 million patients received an approved medicine in 1997 that would not have been available except for the prescription drug user-fee law.

PhRMA companies will spend over \$20 billion this year—almost 20 percent of sales, more than virtually any other U.S. industry—to discover and develop new medicines and vaccines to combat such diseases as AIDS, cancer, Alzheimer's, heart disease, stroke, diabetes, arthritis, asthma, and numerous other diseases. In his testimony, Dr. Friedman recognized the symbiotic relationship between industry and FDA:

The industry's research and development investment of some \$21 billion in drugs and nearly \$4 billion in medical devices last year continues to grow as companies try to transform the advancing medical science into new products. The payoff is a new product pipeline filled with promising new therapeutics, some of which are strikingly novel. For society, the benefit from this investment in basic research is great. For FDA, as society's technological midwife for medical products, the burden also is great as it struggles to manage the burgeoning flow of new products to the market.

We are concerned that FDA's baseline appropriations be maintained and that user fees not be substituted for direct federal appropriations. This is a fundamental principle underlying the agreement reached between Congress, FDA, and industry and embodied in PDUFA and FDAMA.

Under the 1992 law, industry agreed to pay \$327 million in user fees during 1993–1997, which enabled FDA to hire 600 additional reviewers and cut drug-approval times from 29.2 months in 1992 to 16.2 months in 1997. During fiscal years 1998–2002, pharmaceutical companies will pay more than \$550 million in user fees under FDAMA so FDA can continue to reduce approval times and can begin to cut development times as well. While approval times have been cut in half, total devel-

opment times have continued to rise through the 1990's to more than 15 years according to the most recent figures.

As Dr. Friedman stated in his prepared testimony, FDA will increase its number of reviewers and support staff under FDAMA by 120 FTE's over the current fiscal year to 820 in fiscal year 1999, ensuring that the agency will be able to continue to perform at its current high level.

As revised under FDAMA, general fund appropriations for FDA salaries and expenses each year must equal or exceed the fiscal year 1997 appropriation level (excluding user fees) of \$820 million, as adjusted for inflation or changes in overall domestic discretionary budget authority, beginning after fiscal year 1998, whichever is lower. We understand that the requested basic direct federal appropriations level of \$878.9 million for overall federal salaries and expenses may be adequate to meet the "waterline" requirement for "triggering" FDA authority to assess and collect user fees for prescription drugs in fiscal year 1999.

However, if FDA must absorb a shortfall of \$127.7 million that will not be derived from proposed new user fees and is required to direct existing staff resources to support new Administration domestic policy initiatives in such areas as tobacco and food safety, the agency will not be able to carry out all of its other important public-health responsibilities, as Dr. Friedman made clear.

Thus, PhRMA strongly urges that Congress appropriate \$1.007 billion in fiscal year 1999 for FDA salaries and expenses to ensure that the agency can fulfill all its vital responsibilities to promote and protect public health and safety.

PREPARED STATEMENT OF DAVID GAILLARD, FOREST PREDATOR PROTECTION
CAMPAIGN COORDINATOR, PREDATOR PROJECT

I am writing you on the 67th anniversary of the creation of the Wildlife Services program (formerly called, "Animal Damage Control"), in regards to the appropriations of federal funds to this program. I am writing on behalf of Predator Project, a non-profit conservation organization based in Bozeman, Montana. We urge you and the other members of the Appropriations Subcommittee on Agriculture to cut \$10 million from Wildlife Service's "livestock protection" program, which is almost entirely comprised of lethal predator control in the western United States.

The federal Wildlife Services program has received much public scrutiny and criticism for its livestock protection program, which primarily involves killing coyotes, mountain lions and other predators. As we explain in our attached report, the problem with the USDA's Wildlife Services program is that public money is being spent to kill publicly owned wildlife, often on public lands, for the benefit of a small percentage of private livestock producers, who are neither required to change their management practices to reduce livestock/predator conflicts nor directly pay for this government "service." Of the federal funds Congress allocates to Wildlife Services, we find that the majority goes to the western states, and the majority of that is spent on killing predators.

Our report "Wildlife Services?" identified the following problems:

- Despite a Clinton Administration policy that federal dollars should fund no more than half of Wildlife Services' state office expenditures, this is violated in 13 of the 17 western states;
- Western livestock producers, including individuals and organizations, contributed less than 14 percent in direct payments for livestock protection, and less than 26 percent when indirect payments to county governments (typically due to a "head" tax on livestock) are included;
- Livestock protection—which is almost exclusively lethal predator control—accounts for two-thirds (67 percent) of Wildlife Services' western state office expenditures, and more than two-thirds (69 percent) of its western state office expenditures of federally appropriated funds; and
- Wildlife Services' western state office expenditures to kill predators exceeds reported livestock losses to predators in those states by more than three times!

Predator Project considers the Clinton Administration's recent proposal to reduce Wildlife Services' operational budget for fiscal year 1999 by \$2.5 million a step in the right direction. However, we urge Congress to further reduce Wildlife Services' budget by \$10 million, by eliminating federal appropriations for the lethal predator control work conducted through the Wildlife Services' "livestock protection" program. For fiscal year 1996 (the most recent years for which figures are available) Wildlife Services state offices spent \$9.95 million of federally appropriated funds on livestock protection. We propose a \$10 million cut in Wildlife Services' annual federal appropriations to eliminate this aspect of the Wildlife Services program. It is important to note that this total comprises the amount spent by state offices only.

Additional federally appropriated funds are spent by the western and national Wildlife Services offices to manage lethal predator control work; these funds will be unaffected by this cut, and will therefore be available to provide technical assistance to livestock producers, targeted lethal predator control, and other Wildlife Services activities in the western 17 states. Eastern Wildlife Services activities, which largely assist landowners in managing their own wildlife problems, would be unaffected by this reduction.

Predator Project is not alone in suggesting that Congress end the wildlife control program. In January, an unusual coalition of taxpayer and environmental groups released "Green Scissors 1998—Cutting Wasteful and Environmentally Harmful Spending". Wildlife Services was one of 71 programs which the report recommended be cut, because the program is "preying on taxpayers." According to the report, not only is the program harmful and costly, it does not even work: "Livestock losses to predators have not declined despite a 71 percent inflation-adjusted increase in WS's appropriations between 1983 and 1993 and a 30 percent increase in coyotes killed in the last decade." In addition, Wildlife Services' livestock protection activities benefit western ranchers to the exclusion of most eastern ranchers. I would add to this that only a small percentage of western ranchers use Wildlife Services.

In sum, there are three good reasons for cutting Wildlife Services' budget. First, ranchers who get Wildlife Services' help are neither required to pay directly for that help, nor do they have to change their livestock management practices to try and reduce the need for Wildlife Services' predator control work. In other words, those ranchers who are asking for Wildlife Services' assistance are getting something from the federal government without having to try and meet their own needs first. Second, all wildlife is considered the property of the individual states. So, the states should retain the responsibility for managing its wildlife. This would give power back to the states. Increasingly, we are hearing that states in the West are frustrated with Wildlife Services' work. Eliminating the Wildlife Services' lethal predator control program would allow the states to manage their own wildlife, instead of having to accept the constraints of the federal government's program. Finally, the federal predator control program is outdated because it is no longer in step with the wishes of the majority of Americans. Our nation spends millions of dollars each year to aid wildlife, so the killing of wildlife by Wildlife Services is not cost-effective.

We look forward to working with you to reduce the federal government's operations and budget.

PREPARED STATEMENT OF A. LYNN LOWE, PRESIDENT, RED RIVER VALLEY ASSOCIATION

The Red River Valley Association is a voluntary group of citizens banded together to advance the economic development and future well-being of the citizens of the four state Red River Basin area in Arkansas, Louisiana, Oklahoma and Texas.

For the past 73 years, the Association has done notable work in the support and advancement of programs to develop the land and water resources of the Valley to the beneficial use of all the people. To this end, the Red River Valley Association offers its full support and assistance to the various Port Authorities, Chambers of Commerce, Economic Development Districts and other local governmental entities in developing the area along the Red River.

The Resolutions contained herein were adopted by the Association during its 73rd Annual Meeting in Shreveport, Louisiana on February 19, 1998, and represent the combined concerns of the citizens of the Red River Basin area as they pertain to the goals of the Association, specifically:

- Economic and Community Development;
- Flood Control;
- Bank Stabilization;
- Watershed Improvement;
- A Clean Water Supply for Residential, Commercial, Industrial and Agriculture Uses;
- Hydroelectric Power Generation;
- Recreation;
- Navigation; and
- Environment.

The Red River Valley Association is aware of the constraints on the federal budget, and has kept those restraints in mind as these Resolutions were adopted. Therefore, and because of the far-reaching regional and national benefits addressed by the various programs covered in these Resolutions, we urge the members of Congress

to review the materials contained herein and give serious consideration to funding at the levels requested.

Mr. Chairman and members of the Committee. I am Lynn Lowe, and I am pleased to represent the Red River Valley Association as its President. Our organization was founded in 1925 with the express purpose of uniting the citizens of Arkansas, Louisiana, Oklahoma and Texas to develop the land and water resources of the Red River Basin.

As an organization that knows the value of our precious water resources we support the most beneficial water and land conservation programs administered through the Natural Resources Conservation Service (NRCS). We understand how important a balanced budget is to our nation; however, we cannot sacrifice what has been accomplished. The NRCS programs are a model of how conservation programs should be accomplished and our testimony will address the needs of the nation as well as our region. We believe strongly that the whole, national program must be preserved.

Even though the fiscal year 1999 President's budget appears to increase NRCS funding the actual use of the funds has changed, to the detriment of the agency and our citizens. The effect is a decrease of usable funds for direct technical and financial assistance. The diversion of funds to new proposed initiatives would reduce assistance to those who need it.

We would like to address several of the programs affected by the President's fiscal year 1999 budget proposal.

1. *Watershed and Flood Prevention Operations (Public Laws 566 and 534)*.—More than 10,400 individual structures have been installed nationally. They have contributed greatly to environmental enhancement, economic development and the social well being of our communities. More than half of these structures are over 30 years old and approaching their 50 year planned life.

These programs offer a complete watershed management approach and should continue for the following reasons:

- Their objectives sustain our nation's natural resources for future generations.
- They are federally assisted and do not grow the federal government.
- Initiatives and decisions are driven by the communities.
- They are cost shared.
- They follow NEPA guidelines and enhance the environment.
- They can address the needs of low income and minority communities.
- The benefit to cost ratio of this program has been evaluated to be 2.2:1. What other federal programs can claim such success?

There is no doubt of the value of this program. The cost of losing this infrastructure exceeds the cost to reinvest in our existing watersheds. Without upgrading existing structures we will miss the opportunity to keep our communities alive and prosperous. It would be irresponsible to dismantle a program that has demonstrated such great return and is wanted by our citizens.

The present level, outlined in the budget, of \$49 million is not adequate. We strongly recommend that a funding level of \$250 million be dedicated to this program. This is more realistic and compares to the programs appropriated in the years prior to 1997. At the proposed funding level it would take over 30 years to complete just the identified projects, with no attention given to rehabilitation needs.

2. *Technical and Financial Assistance*.—The Administration wants to change the watershed program from its existing "financial assistance" policy to "loans". This is not acceptable and NOT the intent of Congress. Under a loan system there would be no financial incentive to develop these projects.

A serious issue is that the Administration has diverted the necessary "Technical Assistance" funds from the watershed program to "Conservation Operations". These funds must be put back in "Watershed Operations" to provide accountability and assure the program will continue. Once in the Conservation Operation's account these funds could be diverted to any other program.

The watershed program was mandated by Congress and this is an attempt by the Administration to eliminate the program through funding cuts. We know this is not the will of Congress.

3. *User Fees*.—It is proposed that \$10 million of the NRCS budget come from newly established user fees, which requires legislation to implement. This would be for technical assistance, sales of seeds and plants, soil and snow survey data and technical services.

This cannot be cost effective and will be a burden on the producers that are least able to afford good conservation practices. There has not been a federal fee program that has been effective. We strongly recommend that Congress NOT implement this proposal and instead fund the NRCS budget at the levels required to provide the services our nation needs.

4. *Forestry Incentives Program.*—The President's budget has no funding for this program, citing that it "promotes timber production on private lands and is incompatible with the agency (NRCS) strategic plan". In fact, Congress transferred this program to NRCS from the Farm Service Agency as a restructuring in the Federal Agricultural Improvement and Reform Act of 1996. Forestry is recognized as a farming activity. NRCS is the best agency to administer this program which assists farmers in production agriculture.

We request Congress to fund the Forestry Incentives Program at a level of \$10 million for fiscal year 1999.

5. *Environmental Quality Incentives Program (EQIP).*—Requests for assistance through the EQIP program have been overwhelming. The resulting requests far exceed the available funds and is an additional workload on NRCS's delivery system. Additionally, the Administration has failed to provide adequate funding for technical assistance to implement the program. The fiscal year 1999 budget increases the program by \$100 million but reduces the technical assistance by \$8 million from fiscal year 1998. In essence, the program, or workload, was increased by 50 percent and the technical assistance was reduced from 19 percent in 1998 to 10 percent in 1999. There is no logic in this proposal.

The \$300 million proposed for the EQIP program is an adequate budget for fiscal year 1999; however, we request that the technical assistance for this program be increased to \$57 million.

6. *NRCS Staffing.*—We are greatly concerned with the Administration's effort to "downsize" this agency. Over the past 3 years staffing has been reduced by about 2,000 staff years. Most of this has been absorbed by national Headquarters (50 percent) and the state offices (20 percent) with minimal impact to field offices. The further cuts proposed will come from the field offices, closing many. This will adversely impact technical support required for field delivery of conservation programs. The end result will be the dismantling of our nation's conservation infrastructure. The proposed budget would eliminate another 532 staff years. Can we afford this? Congress must not allow this to happen.

Additionally, we request that \$10.5 million be appropriated for "Watershed Planning", \$13 million for River Basins Surveys and Investigations and that \$20 million be allocated for the Emergency Watershed Program to provide rapid response in time of natural disaster.

A further reduction to technical assistance will jeopardize the local, state and federal partnership in conservation making it impossible to meet this nation's commitment to land stewardship in a voluntary manner. Acceptance of the proposed budget would contradict the policies set forth by Congress over the years, abandoning their commitment to the sound, conservation goals of our agricultural policy.

Over 70 percent of our land is in private ownership. This is important to understanding the need for NRCS programs and technical assistance. Their presence is vital to ensuring sound technical standards are met in our conservation programs. These programs not only address agricultural production, but sound natural resource management. Without these programs and NRCS properly staffed to implement them much of our private lands will not apply conservation measures.

The administration has proposed "new" Clean Water Initiatives, but why do they ignore the agency that has a proven record for implementing conservation watershed programs? Congress must make a decision. Will NRCS continue to provide the leadership within the communities to build upon the partnerships already established? The President does not provide for that leadership and so it is up to Congress to insure NRCS is properly funded and staffed to provide the needed help to our taxpayers for conservation programs.

All these programs apply to the citizens in the Red River Valley and we are concerned for the future. The RRVA is dedicated to work toward the programs which will benefit our citizens and provide for high quality of life standards. We therefore request that you correct the President's budget and appropriate the required funding levels within the dedicated programs to insure our nation's conservation needs are met.

I thank you for the opportunity to present this testimony on behalf of the members of the Red River Valley Association and we pledge our support to assist you in the appropriation process.

Grant Disclosure.—The Red River Valley Association has not received any federal grant, subgrant or contract during the current fiscal year or either of the two previous fiscal years.

PREPARED STATEMENT OF LESTER W. MYERS, PRESIDENT AND GENERAL MANAGER,
DELTA WESTERN, INC.

Mr. Chairman and Members of the Subcommittee, I thank you for the opportunity to provide testimony in support of the Regional Aquaculture Centers. My name is Lester Myers. I own and operate a catfish farm near Inverness, Mississippi, and am President and General Manager of Delta Western, Inc., Indianola, Mississippi, the largest catfish feed mill in the United States.

With relatively little fanfare, the aquaculture industry in the United States has developed into a significant part of domestic agriculture in the last 20 years. Production of channel catfish, the largest sector of domestic aquaculture, has increased more than 30 percent this decade—a rate of expansion matched by very few industries. Channel catfish now make up a remarkably large proportion of domestic seafood consumption and, on a value basis, catfish ranks fourth in the United States, behind only shrimp, salmon, and crabs. Further, a significant portion of the salmon consumed by Americans also derives from aquaculture. So, as we enter the next century, domestic aquaculture is well positioned to make up for the expected shortfalls in wild fisheries harvest and supply an increasing proportion of the domestic demand for seafood products.

Continued expansion and profitability of the aquaculture industry will, however, depend on development of new technology to reduce production costs and make production more competitive in the global market. For the past several years, I have been actively involved with the Southern Regional Aquaculture Center as Chairman of the Industry Advisory Council, and I feel that the Regional Aquaculture Center program is well suited to help meet the need for technology development. Already, results from the Regional Center projects are having a significant impact on domestic aquaculture. I believe this success is attributable to three characteristics that set the Regional Aquaculture Centers apart from other publicly funded programs.

First, the activities of the Regional Centers are industry-driven. The Center's activities are initiated by the Industry Advisory Council, which consists of producers, marketing personnel, bankers, and other individuals with fiscal interests in aquaculture. The Industry Advisory Council provides a forum for input from private and public sectors which is then incorporated into annual and ongoing plans for the Center. As such, the genuine needs of the industry are addressed rather than the needs as perceived by scientists or government officials.

Second, allocation of funds through the Center is a deliberate process involving input from experts and concerned industry representatives from throughout the region and the nation. This approach assures that only priority issues are addressed and that the approach used to solve the problem is efficient, thorough, and carefully developed.

Third, the Center's programs are regional in nature, rather than of local interest only. It is the policy of the Center that the issues addressed must be of regional significance and that the resulting project involves participation from institutions from at least two states within the region. In reality, most Center projects involve institutions from at least seven states within the region. This approach makes it possible for Centers to efficiently address problems that require more personnel, equipment, and facilities than are generally available at one location. It also makes better use of limited resources and a saving of funds relative to funding of independent, uncoordinated projects at many different locations. Accordingly, it is possible to bring the best scientific talent in the region to bear on priority problems in an extremely cost-effective manner.

In summary, representatives of the U.S. aquaculture industry are convinced that the Regional Center programs are highly valuable and productive. Additional new research findings will help insure future success for aquaculture production in the United States. The authorized level of funding for the five Regional Aquaculture Centers is \$7.5 million annually. The total annual appropriation for the Centers for fiscal year 1998 was \$4.0 million, or \$800,000 for each of the five Regions. Despite an enviable performance record while operating for more than 10 years at half the authorized level of funding, the President's Budget Proposal for fiscal year 1999 calls for a 3 percent reduction in funding for the Center Program. We strongly request that you rescind the proposed fiscal year 1999 reduction in funding and provide the full authorized level of \$7.5 million for the existing five Centers to support these extremely important and effective programs.

On behalf of the U.S. aquaculture industry, I thank you for the opportunity to present testimony in support of the Regional Aquaculture Centers, and express my sincere appreciation for the support you have provided in previous years. Again, I would like to emphasize that significant benefits have already been provided from

work conducted by these Centers and additional funding is urgently needed by our industry.

PREPARED STATEMENT OF DR. RICHARD SPENCER, LIMITED PARTNER, HAWAIIAN MARINE ENTERPRISES

Mr. Chairman and Members of the Subcommittee, thank you for allowing me to submit testimony on behalf of the Regional Aquaculture Centers and the Center for Tropical and Subtropical Aquaculture or CTSA. My name is Richard Spencer, and I am a limited partner in Hawaiian Marine Enterprises, a commercial aquaculture farm that raises edible seaweeds, clams and abalone. I have been a member of the CTSA Industry Advisory Council for ten years and am privileged to serve as its chairman.

I am a businessman, and I have a doctorate in oceanography. Wearing both those hats gives me a true appreciation of the Center's singular role linking the needs of industry and the expertise of science to further the development of aquaculture. The Center recognizes the necessity of integrating industry priorities and scientific research to ensure that its program directly meets the needs of commercial aquaculture producers.

Each year, the United States imports far more seafood than it exports. A high proportion of those imports come from countries that have little or no regulations regarding the safety of cultured aquatic animals or the manner in which wild stocks are harvested. The growth of the U.S. aquaculture industry ensures a reliable, safe source of high quality protein for the American diet and an alternative to the overharvesting of wild stocks, which are being rapidly depleted. In addition, the growth of aquaculture will create new jobs and generate tax revenues, thereby strengthening the economy. However, commercial aquaculture is a mere toddler in terms of its development, and, like all toddlers, requires support and nurture to develop to its full potential.

The Center for Tropical and Subtropical Aquaculture provides that support. Each year, the Center holds a meeting for commercial producers from throughout the region and asks them to define industry problems. Then the appropriate scientific experts are called upon to conduct research to solve those problems.

The routes to those solutions have varied, including education, training, technology transfer, addressing disease issues and government regulations, marketing and economics, and revitalizing or initiating aquaculture activity throughout the Pacific. Most importantly, each route was mapped out in direct response to an industry need.

Although the Center's research projects have been underway for one to ten years, commercial producers in the region and throughout the nation have already reaped enormous benefits.

As a producer of edible seaweed, I benefited directly from Center-funded projects investigating *Gracilaria* gall syndrome. The syndrome, a relatively new disease problem, attacks cultured seaweed and makes it unsuitable for sale. It nearly devastated seaweed production in Hawaii. The project titled "Disease Management for Hawaiian Aquaculture" found that continuous aeration controls the syndrome. Since that time, I have lost no crops to the syndrome.

The Center-funded "Pacific Regional Aquaculture Information Service for Education" provides easy access to the latest scientific information on aquaculture. It also ensures that individuals in the developing Pacific Island nations—where libraries may well be non-existent—also can easily access that vital information. The project provides a cost benefit of \$20 for each \$1 of Center funding.

Another project, "Ornamental Aquaculture Technology Transfer," allowed me to diversify into producing ornamental fish for the aquarium trade. In 1995, the U.S. imported \$54 million worth of ornamental fish, so this is clearly a lucrative market that U.S. farmers should tap.

Such progress in so short a time clearly illustrates that the Regional Aquaculture Centers' approach of spotlighting industry concerns is the right one, offering rapid, effective results. The investment in the Regional Aquaculture Centers has yielded high returns thus far and will continue to do so. However, I was recently informed that the future yields may well be diminished because of a planned 3 percent funding cut for fiscal 1999. I find that most unfortunate. I have continually urged that expanding the funding capabilities of the Centers would afford even greater results. Please reconsider this decision. Although that may not sound like a huge cut, it will seriously deter the Centers ability to fulfill its mission of developing a viable U.S. aquaculture industry to benefit producers, consumers and the U.S. economy.

With level funding, the Regional Aquaculture Centers funding allocation had lost much of its purchasing power. Over the years, we have found it increasingly difficult to fund the desired research at levels equivalent to the scope of the work. The cost of conducting science has increased dramatically, and the number of worthy proposals has increased as the aquaculture industry in the Pacific region has grown.

With reduced funding, the rising costs of research are eroding available funds and further reducing the amount of real dollars available for projects. This means that a project must be funded over several years to solve a problem that could possibly be solved in a shorter time span, given sufficient funds. Because the economy is doing well, now would be the perfect time to move forward decisively. I strongly urge you to take this into account and approve the authorized full funding of \$7.5 million for the Regional Aquaculture Centers program.

Thank you again for the opportunity to submit this testimony.

PREPARED STATEMENT OF DR. DAVID A. SMITH, PRESIDENT, FRESHWATER FARMS OF OHIO, INC.

This past year in Ohio, several landmark events have occurred in aquaculture. The first is that all farm-raised fish products have been brought under the new federal seafood inspection program of HMCP. The second is that fish processors along Lake Erie have turned their sights inland to the few pioneering fish farmers that have started modest production of yellow perch. Fishery harvests of wild perch stocks are at an all time low, and record prices have been maintained virtually all year. The bad news is that there is no perch aquaculture industry large enough in the whole country to satisfy the demand of just one of these major fish wholesalers in northern Ohio.

Why is this the case? If there is such demand, why don't fish farmers just produce more? There is a reason. A technological/extension bottleneck exists at the level of fingerling production. Farmers cannot produce, with today's level of understanding, a reliable and adequate number of young fish to stock out their ponds.

This is one example of problems that are directly addressed by research at the U.S.D.A. Regional Aquaculture Centers. In our own North Central Region, yellow perch research has been given the highest priority and attention. The Center's research priorities are identified by those of us in commercial aquaculture, and are geared to providing hands-on answers to these very real problems that hold back the economic potential of aquaculture in the United States. They are designed to do this through a network of university research and extension outreach that has the highest potential of economic return than any other program out there.

Please give serious consideration to supporting a higher level of funding for adequate aquaculture research through the Regional Aquaculture Centers. I would like to request on behalf of the aquaculture industry that funding be extended to the fully authorized level of \$7.5 million. If the fully authorized amount is not appropriated, then they should at least be funded at the level they have received over the last few years which is \$4.0 million.

PREPARED STATEMENT OF JOSEPH MCGONIGLE, EXECUTIVE DIRECTOR, MAINE AQUACULTURE ASSOCIATION

Mr. Chairman and members of the Subcommittee: I appreciate this opportunity to express my support for USDA's Regional Aquaculture Centers in the Northeast and in the four other regions of the country where vital research partnerships among entrepreneurs, academia and the extension service are fostering an emerging fish farming industry that is bringing economic opportunity to rural communities and the hope of food sufficiency to an increasingly crowded world.

Maine has been a leading supplier of high quality seafood for fully 400 years—since before the settlement at Jamestown and the landing at Plymouth Rock. But capture fishery harvests are stagnant or declining, no less in Maine than around the world. So today, Maine is a leader in marine aquaculture, as well, with fanned fish and sea vegetable harvests that are closing in on the state's lobster catch as our most valuable fishery.

I represent a trade association whose members grow salmon, trout, oysters, mussels, clams and nori, with commercial quantities of haddock, halibut, urchins and scallops on the immediate horizon. Twenty years ago, my association did not exist. Ten years ago, its members produced just a few hundred tons of fish. Today, Atlantic salmon is Maine's third most important farm crop, after potatoes and dairy.

Worldwide, one pound of fish in five is Ann raised, and virtually all of the growth in the world seafood harvest stems from aquaculture. In the U.S., fish fauns also

contribute to the growth to our seafood supply, but only 7 percent to the overall harvest. The difference between U.S. and world aquaculture performance is largely attributable to differences in public investments in research, demonstration and technology transfer—investments like the RAC's before you today. The farms I represent in Maine are living proof of the returns such investments can provide to the consumers and communities we all serve.

Of the ten marine species grown in Maine today, NRAC supported either the basic research or the technology transfer that launched three new crops from a standing start and provided critical management breakthroughs for four others:

- NRAC tech transfer support in 1993 helped a tiny 2-man seaweed company create America's first nori farm, which today supports 25 jobs, cross-licensing with an emerging web of biotechnology firms and a budding seaweed cooperative that could provide jobs and incomes for up to 100 displaced fishermen.
- A 1995 project allowed a small salmon farmer to diversify into halibut by supporting broodstock collection from which future generations can be spawned. A follow-up grant is supporting University research into the light- and depth-sensitive breeding behavior and the nutritional needs of these mysterious, and disappearing, beasts.
- Several dozen displaced fishermen are looking ahead this year to new careers on the water as mussel farmers, following an NRAC-supported education program that brought Canadian and European raft culture technology to the hard-fished waters of the Gulf of Maine.
- A University of Maine professor's 1997 breakthrough in groundfish nutrition will pay off this year with America's first commercially-significant haddock crop, thanks to research funded in part by NRAC.
- A 1996 graduate student in Food Science has become an entrepreneur in 1998 with a new line of sausages made from salmon scraps, based on techniques he identified with NRAC assistance.
- NRAC also supports long term fish health research with particular value to Maine's established salmon and oyster industries, including projects to identify genetic susceptibility to, and genetic probes for, Juvenile Oyster Disease, partial support for an investigatory new animal drug coordinator (INAD) at FDA, and the northeast's premier fish health workshop, now entering its 6th year.

While these examples focus on projects that have impacted Maine, in particular, a key element of the RAC approach is an emphasis on multi-state proposals or on research that has impacts beyond a single species or state. So, for example, the salmon sausage project actually has potential applications for any value-added fish product subject to oxidation and off flavors. The Maine projects, in fact, have been only a small part of NRAC's impact on the development of a fresh and marine water aquaculture industry between the Gulf of Maine and the Chesapeake Bay. And what NRAC provides in the northeast, four other RAC's offer in the south, the west and the heartland of the nation.

RAC projects have addressed waste management and effluent reduction; improved low phosphorous feeds and acoustic "seal scarers" that replace lethal taking of predators. They have led the way in demonstrating how aquaculture can be environmentally benign as well as economically beneficial—how rural and water-dependent communities can have payrolls and pickerel well into the future.

RAC-sponsored forums where industry and academic researchers sit down together to hammer out a common research agenda have evolved into efficient collaborative networks that can quickly marshal public and private resources to find solutions in a rapidly changing world. The RAC's have become a research infrastructure, a problem solving tool that, with your continued support and the full authorized allocation of \$7.5 million, can make this the generation of Americans that farms the sea, the next generation of Americans that feeds the world.

PREPARED STATEMENT OF KENNETH E. CLINE, CLINE TROUT FARMS

Mr. Chairman and Members of the Subcommittee: My name is Kenneth Cline. I am an owner of Cline Trout Farms, a family owned business established in 1946. We produce trout for recreation markets in Colorado, New Mexico, Wyoming, and surrounding states. I have served as president of the National Aquaculture Association, The United States Trout Farmers Association, and the Colorado Aquaculture Association. Currently, I chair the Colorado Fish Health Board and am a member of the Colorado Aquaculture Board. I have been a member of the Western Regional Aquaculture Center Industry Advisory Council for the past eight years.

In addition to the potential for aquaculture to provide food fish, aquaculture also provides fish and services to recreation fisheries. State and federal natural resource

management agencies are adjusting their priorities away from sport and recreation fisheries and toward endangered species, biodiversity, and native species. Private aquaculture provides fish and services for over one-third of Colorado's billion dollar recreation fishing industry.

Research is needed for the aquaculture industry to keep pace with increasing demand for its products and for the industry to respond to environmental concerns. The Regional Aquaculture Centers have been very successful in identifying research needs, coordinating research efforts, and disseminating research results to industry. In September of 1995 industry representatives from all of aquaculture met to discuss the National Aquaculture Development Plan. The Regional Aquaculture Center program was identified as the most positive government program for aquaculture in the last ten years.

The success of the Regional Aquaculture Center system lies in several strengths. First, the Regional Aquaculture Centers are industry driven. Research needs are identified and prioritized by industry, and research is monitored by industry so that industry research objectives are accomplished. Second, the Regional Aquaculture Centers are very successful in facilitating collaboration among institutions. Leveraging of resources among institutions has resulted in a very high rate of return on research dollars. Another strength is the regional structure; which, along with the strong input from fish farmers, facilitates responsiveness to the many diverse, and often local, research needs.

The Regional Aquaculture Centers have strongly demonstrated their worth to our industry and to the national economy. This program is an investment, not an expense, for the American public. It is unfortunate that the Administration has proposed a 3 percent cut in funding. I urge you to not only reinstate that 3 percent, but also to bring the appropriation for the Regional Aquaculture Centers to the fully authorized funding of \$7.5 million per year.

Thank you for this opportunity for input.

PREPARED STATEMENT OF WILLIAM H. BANZHAF, CAE, EXECUTIVE VICE PRESIDENT,
SOCIETY OF AMERICAN FORESTERS

Mr. Chairman, my name is William H. Banzhaf. I am the Executive Vice-President of the Society of American Foresters (SAF). The more than 18,000 members of the Society constitute the scientific and educational association representing the profession of forestry in the United States. SAF's primary objective is to advance the science, technology, education, and practice of professional forestry for the benefit of society. We are ethically bound to advocate and practice land management consistent with ecologically sound principles. I am especially pleased to submit comments on the President's proposed fiscal year 1999 budget for the Department of Agriculture and Related Agencies. I wish to thank the subcommittee for its continued support of professional forestry and its continued support of SAF's priorities. We will especially need your help this year to correct a mistake on the part of the Administration in requesting the elimination of the Forestry Incentives Program. I thank the Chair for the opportunity to submit testimony on the Forestry Incentives Program, the Renewable Resources Extension Act, and Department of Agriculture research programs.

The public policy activities of SAF are grounded in scientific knowledge and professional judgment. From this perspective we review proposed budgets for forestry and related natural resource programs to determine their adequacy to meet stated objectives and public needs.

FORESTRY INCENTIVES PROGRAM (FIP)

As you know, the forest-related programs funded under the Department of Agriculture largely affect the nation's 9.7 million nonindustrial private forest landowners, who own 57 percent of the nation's forestlands, which supply 48 percent of the nation's timber harvest. A recent report by the National Research Council points out that these owners are woefully underserved by both the private and the public sector. This is critically important today because, as you are aware, the level of timber harvest from federal lands has dropped significantly in recent years, an important factor resulting in increased harvests on other ownerships. Several programs within this appropriations bill are important to ensuring that the shift of timber demand to nonindustrial private lands doesn't impair their owners' willingness or ability to produce a broad array of forest resources sustainably over the long term.

Programs such as the Forestry Incentives Program (FIP) are needed now more than ever. FIP's focus on reforestation helps keep large tracts of land in continuous forest cover, helping to ensure long-term forest benefits while providing habitat for

wildlife, protecting soil productivity, and enhancing water quality. We strongly oppose the Administration's request to eliminate the Forestry Incentives Program and reject their rationale that the program is not compatible with the Natural Resources Conservation Service's (NRCS) strategic plan. Keeping lands forested most certainly helps the NRCS meet its objectives of protecting watersheds and soils. In fiscal year 1997, FIP provided funding to help plant trees on more than 141,000 acres and helped owners perform timber stand improvement on more than 22,000 acres. Congress specifically reauthorized FIP through the 1996 Farm Bill, and the NRCS has a statutory responsibility to carry out the program.

There is concern about the NRCS's administration of the FIP program. It appears to many that the NRCS is not committed to the FIP program. We encourage the USDA to reevaluate the transfer of this program from the Farm Services Agency (FSA) to NRCS and request that USDA consider either returning the program to the FSA or transferring it to the Forest Service.

FORESTRY RESEARCH

The Society of American Foresters promotes public policies that advance knowledge about the behavior and functioning of forest ecosystems and their responses to specific actions and policies. SAF believes forestry research is critical to understanding the relationship between societal expectations for diverse needs and values from the forest, and the capability of the forest to meet and sustain those expectations. We advocate continued public and private funding of research activities that address a broad variety of natural resource concerns. Such knowledge, based on sound science, is vital for resolving conflicts about forest policy and management. Two key programs funded by this appropriations bill provide important research dollars that can be used to benefit forest management across all ownerships in this country.

The first is the Cooperative Forestry (McIntire-Stennis) Research Program. This program supports research on forestry and wood fiber conducted by the nation's public universities. University-based research is an important part of the collaborative forestry research effort involving federal, state, and industry scientists. McIntire-Stennis research is critical to the development of new information and technologies that increase not only the efficiency and productivity of forest management on all forest ownerships for a wide range of forest benefits, but also provide information for developing natural resource management policy. As you know, McIntire-Stennis research funds are granted directly to public colleges and universities on a matching basis. This program has provided funding for research demands that have not been met through other programs or in the private sector.

The second research program is the National Research Initiative (NRI). This competitive grant program provides funding for research on problems of national and regional importance in biological and environmental sciences. The NRI awards grants on a matching basis to university researchers in biological, environmental, and engineering sciences to address critical problems in agriculture and forestry. The SAF strongly supports this program and believes some of the funding should be specifically directed at renewable natural resources research.

RENEWABLE RESOURCES EXTENSION ACT PROGRAM (RREA)

Finally, we are pleased that the Administration has requested funding for the Renewable Resources Extension Act program (RREA) for fiscal year 1999, and we applaud the action of this subcommittee in restoring funding for RREA in spite of the Administration's request to eliminate it in fiscal year 1998. The SAF supports this program, which we believe helps in communicating ecologically sound technical advice to landowners, foresters, and loggers. This advice improves the productivity and management of nonindustrial private forests.

ABOUT THE SOCIETY

The Society of American Foresters, with about 18,000 members, is the national organization that represents all segments of the forestry profession in the United States. It includes public and private practitioners, researchers, administrators, educators, and forestry students. The Society was established in 1900 by Gifford Pinchot and six other pioneer foresters.

The mission of the Society of American Foresters is to advance the science, education, technology, and practice of forestry; to enhance the competency of its members; to establish professional excellence; and to use the knowledge, skills, and conservation ethic of the profession to ensure the continued health and use of forest ecosystems and the present and future availability of forest resources to benefit society.

The Society is the accreditation authority for professional forestry education in the United States. The Society publishes the Journal of Forestry; the quarterlies, Forest Science, Southern Journal of Applied Forestry, Northern Journal of Applied Forestry, and Western Journal of Applied Forestry; The Forestry Source; and the annual Proceedings of the Society of American Foresters national convention.

PREPARED STATEMENT OF THE SOCIETY FOR ANIMAL PROTECTIVE LEGISLATION

We respectfully request the following appropriations and oversight to permit these programs within the U.S. Department of Agriculture to be carried out effectively.

\$12 MILLION FOR APHIS' ANIMAL CARE PROGRAM

At least \$12 million is desperately needed for enforcement of the federal Animal Welfare Act. The Act, passed in 1966 and amended in 1970, 1976, 1985 and 1990, is intended to ensure the protection of millions of animals nationwide used in exhibition, the commercial pet trade, experimentation, and during transportation.

Animal Care is responsible for enforcement of the Animal Welfare Act, but their excellent efforts are on the verge of collapse due to the failure of Congress to provide sufficient resources. The Animal Care program has always been forced to function with less than needed funds, as a result they are squeezing everything they possibly can out of what Congress provides. Given the vital protection provided to animals, it is time for Congress to provide a little support back to Animal Care through a modest increase in appropriations. Shamefully, current appropriations are below the fiscal year 1993 level:

<i>Fiscal year</i>	<i>Million</i>
1993	\$9.188
1994	9.262
1995	9.262
1996	9.185
1997	9.175

This decreased funding is impairing the ability of Animal Care to fulfill its duties, leaving the animals and the Department vulnerable.

This year circus elephants were diagnosed with tuberculosis. This serious potential health hazard to humans and elephants must be addressed by Animal Care. The plan calls for tuberculosis testing and monitoring of all elephants covered under the Animal Welfare Act. More work for the Animal Care staff!

The Animal Care field staff of 44 Veterinary Medical Officers and 30 Animal Care Inspectors must inspect to ensure compliance with the Act, including provision of food, water, housing and veterinary attention, at the more than 10,000 sites of dealers (random source suppliers, breeders, brokers and operators of auctions), exhibitors (zoos, circuses and carnivals), research facilities (hospitals, pharmaceutical companies, universities and private firms), intermediate carriers (airlines and railroads), and intermediate handlers (service between consignor and carrier).

Approximately \$800,000 in license fees currently go to USDA's general treasury; at minimum, these funds should be provided as additional funding to Animal Care. Animal Care is taking a get tough attitude towards licensees and registrants who habitually violate the Animal Welfare Act; in fiscal year 1997, violators of the Animal Welfare Act were assessed more than \$820,000 in fines. License revocations and suspensions increased substantially.

Critical additional needs of Animal Care include:

Laptops for all inspectors (to facilitate data transfer and storage)	\$350,000
Training (program implementation and computer instruction)	120,000
Addition of 15 Veterinary Medical Officers	1,243,000
Addition of 12 Animal Care Inspectors	715,000
Tuberculosis testing/monitoring in elephants	190,000

Cost savings in the existing Animal Care Program could be achieved through the elimination of Random Source (USDA licensed Class B) dealers who supply dogs and cats to research. Report language could offer support to H.R. 594, The Pet Safety and Protection Act, sponsored by Agriculture Committee Members Congressman Charles Canady and Congressman George Brown. As you can see from the attached book, The Animal Dealers: Evidence of Abuse of Animals in the Commercial Trade, 1952-1997, this legislation would greatly reduce USDA's regulatory burden, while still allowing research to continue unhindered.

\$900,000 LINE ITEM FOR THE ANIMAL WELFARE INFORMATION CENTER AT THE NATIONAL AGRICULTURAL LIBRARY

In 1985, Congress had the ingenuity and foresight to create the Animal Welfare Information Center (AWIC) to serve as a resource for all individuals involved in the care and use of animals in research (scientists, veterinarians, caretakers, administrators, members of Institutional Animal Care and Use Committees and USDA inspectors responsible for enforcing the law).

The Center provides information on: (a) appropriate care for animals including minimization of pain and distress, (b) reduction and/or replacement of the use of animals in research where possible, (c) preventing unintended duplication of experiments, (d) training for employees in the laboratory, and (e) legal requirements regarding the use of animals in research.

Its value to the research community has led to an ever-increasing demand for assistance. However, AWIC has not received an increase in appropriations during its 11 years, making it impossible to provide services as needed. The Center has had to stop use of a work study student and is facing the laying off of additional staff it will not be able to afford. AWIC staff have responded to more than 24,000 requests for specific publications and more than 2,500 request for reference services. The Center produces a newsletter, now in its eighth year. It also maintains a worldwide web site (<http://www.nal.usda.gov/awic>) which is being used an average of 860 times per day!

An increase in appropriations to \$900,000 provided as a line item with report language preventing use of these funds for other purposes is desperately needed. (The report language is necessary to stop the siphoning off of funds by the National Agricultural Library.)

\$500,000 FOR THE HORSE PROTECTION ACT

APHIS Animal Care is in need of an appropriation of \$500,000 to maintain at least a minimal level of enforcement of the Horse Protection Act (HPA). The HPA, passed in 1970 and amended in 1976, prohibits the cruel practice of "soring". According to APHIS, soring is defined as "the application of any chemical or mechanical agent used on any limb of a horse or any practice inflicted upon the horse that can be expected to cause it physical pain or distress when moving." Soring is done to give the animal an exaggerated gait. Tennessee Walking Horses are the common victims.

Due to a lack of basic funding, enforcement of the Horse Protection Act is being increasingly turned over to industry. Unfortunately, industry has demonstrated a failure to achieve the level of enforcement of the unbiased, well-trained, professional inspectors who work for Animal Care. The inspectors from industry are called "Designated Qualified Persons". The rate at which DQP's turned-down horses for soring in fiscal year 1996 was 1.09 percent, less than half the rate of government inspectors who had a turn-down rate of 2.55 percent.

Nearly 600 horse shows took place in fiscal year 1996, yet Animal Care inspectors were only able to inspect 22! Additional resources are needed to permit Animal Care inspectors to attend more shows thereby ensuring significantly stronger compliance with the HPA.

USDA possesses thermography equipment which is used to look for abnormal heat indications as a means to detect apparent soreness. Resources are needed to permit training of inspectors to maximize use of this important enforcement tool. Thermography can greatly strengthen enforcement efforts by providing an accurate, scientific determination of soreness in horses and by serving as a useful deterrent against would-be violators.

INCREASED OVERSIGHT OF WILDLIFE SERVICES

Animal Damage Control changed its name to Wildlife Services (WS) to signify a re-birth of the program with increased effectiveness and an improved consciousness. Unless key changes are made, Wildlife Dis-Services may be a more appropriate title. We, therefore, hope that Congress will provide increased oversight of both the research and field operations of Wildlife Services.

A basic principle of WS is supposed to be consideration of non-lethal methods of control prior to the conduct of any lethal control activities. Last year, WS was preparing a non-lethal report form as a means of documenting efforts at non-lethal control. We supported use of this form. However, WS announced recently that it has curtailed development and implementation of the reporting form and instead "will work with the National Agricultural Statistics Service to obtain information regarding the extent to which WS cooperators use non-lethal control methods." No reason

for this change has been offered. We strongly object to WS' abandonment of the reporting form which would have provided accountability here to fore lacking in the program.

A fundamental matter is continued use of steel jaw leghold traps by WS. 30,000 steel traps are owned by WS for use in predator control. Polls reveal that the vast majority of Americans want these traps banned, and the American Veterinary Medical Association has condemned them as "inhumane". A growing list of states are prohibiting or severely restricting their use. A switch to less cruel methods must take place if WS wants to retain the ability to manage predators when necessary.

In an international trapping agreement reached on December 11, 1997, between the U.S. and the European Union, the U.S. agreed to phase out use of "conventional steeljawed leghold restraining traps" within 6 years. WS has the responsibility of complying with the U.S. obligation by ending its use of these traps. Steps should be undertaken immediately.

Last year Congress provided \$350,000 for trap testing "to determine the most humane design while maintaining efficiency." (Senate Report language). The testing was necessary "to meet U.S. obligations under an international agreement for trap standards." (House Report language) The U.S.-E.U. agreement was reached in response to E.U. Regulation 3254/91 against the leghold trap. Under the terms of the agreement, in addition to phasing out use of leghold traps, the U.S. agreed to implement trap standards within 8 years.

Instead of conducting trap research with the funds, Wildlife Services passed the bulk of the monies received from Congress on to the International Association of Fish and Wildlife Agencies (IAFWA). The research being conducted under the auspices of the IAFWA needs careful scrutiny as we are gravely concerned that the funds are being misused.

The only traps being tested are different types of steel jaw leghold trap and the EGG trap (a painful, footholding trap used on raccoon). We were shocked to discover that the control traps for the studies are standard steel jaw traps. There is no excuse for continued use of these traps. Box traps are extremely efficient at capture of raccoon, and they cause virtually no injuries to the animals, thus we fail to understand why they are not being considered. Further, since box traps are such a successful trap both at minimizing injuries as well as at catching animals, we fail to see the need for conducting painful tests of leghold traps on approximately 800 raccoon.

Although USDA was presented with proposals for testing of footsnare on coyote and killing traps on muskrat, the Department elected to spend their money on leghold traps, that have been tested innumerable times over the years. By narrowing their testing to leghold traps, they guarantee results concluding that a leghold trap is acceptable. No further funding should be provided for trap testing while the process for determining which traps are tested and why is examined.

PREPARED STATEMENT OF PETER M.P. NORRIS, PRESIDENT, SPIN-2

Mr. Chairman, thank you for this opportunity to present a short statement for the hearing record for outside witnesses. The subject of my statement concerns the potential for improved accuracy of agricultural usage and yield estimates in USDA's food and fiber supply and demand reports.

There shortly will be a new data source available for high resolution remote sensing information. SPIN-2, which stands for "Space Information/2-meter", is a joint commercial venture with SOVINFORMSPUTNIK, the commercial division of the Russian Space Agency, utilizing Russian mapping satellites and launch vehicles. SPIN-2 is located in Washington, D.C., and is wholly owned by Aerial Images, Inc. of Raleigh, North Carolina. At two meter resolution, SPIN-2 data is 250 percent higher resolution than previously available through commercial remote sensing channels. Ten meter resolution stereographic SPIN-2 data is used to produce the most accurate digital elevation models in the world made from satellite data.

The first launch and recovery of data was highly successful. The catalog of data will be available through the Internet, utilizing Microsoft's Terraserver. The concentration of the first mission was the Southeastern United States and Southern California. However, large data sets were also gathered from the following regions: China, Brazil, Australia, the Middle East and Canada. These regions include major crop production areas. Many local, several state, and international governments have placed orders for the data. The data will be used in local planning, assessment and decision making regarding land use, natural resource assessment, and environmental change.

What does this mean to the Department of Agriculture and USDA missions? There are two answers to this question.

(1) USDA has the responsibility of producing world food and fiber supply and demand estimates. These estimates heavily influence futures prices of commodities, and also impact decision making on planting for numerous crops. The accuracy of USDA's supply and demand estimates depends on the refinement of the data from which the estimates are based. Today's estimates are derived from technology and equipment that have been eclipsed by several generations of improvement. Two meter resolution SPIN-2 data offers information not available through current methods (a) by providing refined field boundary definition, a major element in determining crop yields, and (b) crop differentiation by interpretation of feature texture on images. The accuracy of crop and growing condition estimates through the use of SPIN-2 data can be improved by 15 percent to 25 percent.

(2) USDA has the responsibility of managing vast areas of natural resources through its conservation programs and the U.S. Forest Service. While the Forest Service is not funded through this appropriations bill, USDA decisions on Forest Service programs depend heavily on input through the portions of USDA that are funded through this bill. Improved information on the environment would help provide more accurate assumptions to Department officials in program decisions that were environmentally fragile or subject to change. USDA's stewardship of natural resources would be improved through better information and a more accurate data base.

Some federal agencies are becoming aware of SPIN-2's resource base, and are exploring ways in which the new information can be applied to the better management of their programs. We think USDA should be among those who utilize this new source of information.

The key aspect of my statement relates to the timely availability of information. If USDA were to access the SPIN-2 information this year, savings could be realized in the current growing season, and subsequent marketing season, as opposed to waiting for later data that could not be used for the current growing season, both domestically and world wide. USDA's timely access to this information would, in our estimate, result in real-time savings and more accurate forecasts one year in advance of later systems.

Mr. Chairman, that concludes my brief remarks. If there are any questions regarding my testimony, we would be pleased to address them. Thank you again for this opportunity to present these views in the hearing record.

PREPARED STATEMENT OF WILLIAM K. QUARLES, VICE PRESIDENT, CORPORATE RELATIONS AND COUNSEL, SUNKIST GROWERS

Chairman Cochran, Senator Bumpers, Members of the Subcommittee, Sunkist Growers appreciates this opportunity to bring to the Subcommittee's attention several matters of great importance to Sunkist Growers and to American agriculture as you undertake the difficult task of crafting the agriculture appropriations measure for the final fiscal year of this millennium.

As you know, Sunkist Growers is a non-profit, farmer-owned marketing cooperative serving 6,500 citrus farmers in California and Arizona. For 105 years Sunkist has successfully marketed fresh citrus fruit grown by its farmer-members. Today, Sunkist Growers produce approximately 65 percent of the oranges, lemons, grapefruit and tangerines grown in Arizona and California. Eighty percent of our member's farms are fewer than 40 acres, truly small farms by U.S. standards. Our cooperative enjoys a long history of dedicated effort to create and develop markets around the world for our U.S.-grown citrus. Sunkist exports currently account for nearly 45 percent of our farmers' annual fresh fruit sales. Competition is intense with 18 countries now producing for the international market. Conditions in those markets is often inequitable and the terms of trade under which we have to compete are often unfair. For these reasons we need the continued help and partnership of our government.

MARKET ACCESS PROGRAM

Concerning the U.S. Department of Agriculture programs that assist American farmers export their products, we urge the Committee to continue to fully fund at \$90 million the very effective, essential and extensively reformed Market Access Program (MAP) which provides at least some limited help to American farmers confronted by the highly competitive and often inequitable market environments beyond our borders. The many reasons why American farmers need this vital USDA help to secure and maintain market access for American agricultural products con-

tinue to validate this program. Unfair trade barriers to U.S. products have not been eliminated. Increasingly we are having to counter bogus sanitary and phytosanitary allegations concerning U.S. agricultural products. High protectionist tariffs against American-grown fruit in key markets have not been reduced. In a direct challenge to displace American-grown commodities in markets around the world, foreign governments like the European Union have significantly increased market promotion assistance for their countries' competitor products. Unlike the U.S., many foreign governments continue to subsidize the transportation costs of our foreign competitors to help them move their products to market and be able to undercut our prices. At a time when America is once again confronted by massive trade deficits, American agriculture continues to be the one industry sector contributing a positive trade balance for our country. This effort needs to be fostered not undermined.

The bottom line is this—if American farmers didn't have to contend with this host of anti-competitive, trade-distorting, tariff-imposed, foreign government-subsidized, discriminatory practices and inequitable conditions in the global marketplace, we could deliver the very best products at the most competitive price anywhere in the world. But reality is we do have to contend with these unfair conditions and we need our government's help to do so.

We urge the Committee to continue to support full funding for the Market Access Program at USDA.

FOREIGN AGRICULTURAL SERVICE

The work of USDA's Foreign Agricultural Service (FAS) is a critical component in America's global effort to compete with our products in overseas markets. FAS, with its corps of dedicated and very able professionals, both here and abroad, provides insightful information and guidance in overcoming trade barriers, responding to the actions of foreign competitors, and intervening to address unfavorable regulatory policies of foreign governments which negatively impact American farm exports into those markets. During the past year alone, FAS actions on behalf of our industry have been critically important in Korea, Japan, China, Thailand, Mexico, Chile, Argentina and other countries. The reality of a globalized marketplace increases FAS' workload and makes their that much more significant to American agriculture. We urge the Committee to provide increased resources to the Foreign Agricultural Service to meet this challenge in the year ahead. Specifically, we strongly support USDA's request for \$145.6 million for FAS operations in fiscal year 1999. The workload and responsibilities of FAS will only increase in the days ahead as we commence in 1999 the next round of WTO negotiations on agricultural trade.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

Despite progress in the Uruguay Round of trade negotiations, those still intent upon maintaining protectionist barriers now resort to sanitary and phytosanitary claims to thwart successful importation of U.S. agricultural products like our citrus fruit. SPS issues have become increasingly significant in determining the course of international trade for agricultural products. SPS issues, including pest quarantines, have with growing regularity become the linchpin of trade negotiations in determining market access for fresh produce. For example, the U.S. citrus industry's efforts to gain market access to the huge and potentially profitable consumer market in China is dependent upon the success of USDA's Animal and Plant Health Inspection Service (APHIS) in negotiations with its Chinese counterpart agency (CAPQ) to satisfactorily address concerns about periodic outbreaks of Mediterranean fruit fly in California and Florida. Only when these technical issues are resolved will market access efforts prove successful. Similar technical and scientific SPS issues have become pivotal in various markets for a host of American commodities. As a result, the manpower and resources of agencies like APHIS and ARS are spread dangerously thin.

Concerns about proper management of production areas, assurance of swift eradication of destructive pests and diseases and mandatory certification that the fruit exported is pest free have become critical components of international trade. The surest way for us to have foreign markets slam shut their doors to our products is the advent of an exotic pest like Mediterranean fruit fly in or near our production areas. That is why USDA's Agricultural Quarantine and Inspection Service (AQI) which seeks to prevent exotic pests and diseases from entering the U.S. from abroad is vitally important to the health and well being of agriculture in California and Arizona.

Sunkist Growers urges the Committee to fully fund APHIS at the requested fiscal year 1999 amount of \$461,352,000 which includes \$237,642,000 for Plant Protection

and Quarantine (PPQ); \$30,648,00 for AQI-appropriated; \$6,685,000 for Pest Detection; and \$22,322,000 for Fruit Fly Exclusion.

Contrary to its actions in fiscal year 1997 and 1998, Congress should, we believe, appropriate the full \$100 million for the AQI-User Fee budget. The reduced appropriations by Congress in fiscal year 1997 and fiscal year 1998, totaling \$14 million, imposed a severe hardship on these inspection and enforcement programs so vital to assuring pest protection for vulnerable U.S. farming areas like California where we are already witnessing increased volumes of contraband produce surreptitiously entering the U.S. If not fully funded, further reductions in the appropriated amount will likely reduce already deficient inspection levels at ports of entry and increase significantly the risk of exotic pest and disease.

Similarly we strongly urge approval of the USDA budget request for Fruit Fly Exclusion and Detection. This program carries out all fruit fly trapping in Florida, Texas and California; the sterile fly release program to combat Medfly in California; the Mexican fruit fly program in the lower Rio Grande Valley in Texas; the Medfly programs in Mexico and Guatemala; and the sterile fruit fly rearing programs in Hawaii and Guatemala. This is preventive action needed to avoid the costly incidence of exotic pest infestation that destroys export markets because of quarantines and imposes tremendous costs of eradication both on industry and government.

ARIZONA CITRUS RESEARCH PROJECT

Last year, the Committee provided \$250,000 to the University of Arizona for research of attacking the problem of brown wood rot fungus citrus trees in southern Arizona. Nearly 40 percent of the commercial lemon groves in the region, which now includes the Coachella Valley in southern California, have been infected by the *Coniophora eremophila* fungus which is indigenous to the Sonora Desert. We ask the Committee to continue the same level of funding for this research, which will be the second of a planned three year effort.

Mr. Chairman, we appreciate the opportunity to apprise the Committee of our interests and concerns about the fiscal year 1999 agriculture appropriations legislation. Recognizing the significant reductions in funding levels imposed on agriculture programs over the last several years relative to other sectors of the federal budget, it is our fervent hope the Committee will ably defend existing programs and work to meet the needs identified as important to American farmers.

PREPARED STATEMENT OF A. ELLEN TERPSTRA, PRESIDENT AND CEO, USA RICE FEDERATION

My name is Ellen Terpstra and I serve as president and chief executive officer of the USA Rice Federation. I am submitting this statement in behalf of the Federation to recommend several items of particular concern to the organization that we would like to see included in the fiscal year 1999 appropriation bill for the Department of Agriculture (USDA). The USA Rice Federation is a trade association that consists of producers from States that are responsible for production of over 80 percent of the rice grown in the United States, as well as practically all the rice millers in the United States, wherever they may be located, and allied organizations.

I would like to preface my remarks to thank the Subcommittee for its actions in the past in behalf of U.S. agriculture. Those engaged in agricultural production, processing, and marketing of U.S. agricultural products owe much to the efforts of the Subcommittee. When the farm bill was enacted in 1996, it heralded the end of an era for government supports which are gradually being phased down over a seven-year period. Producers are adjusting to the new environment where they must depend more and more on market forces for income. Increasingly they are reliant on export markets and research to maintain their competitive edge in world and domestic markets. Accordingly, we strongly recommend that appropriations for the export programs and research programs be maintained at current levels, if not increased. They should not be reduced as has been recommended by the Administration in several instances.

1. For example, the Administration has recommended a drastic reduction in the appropriation for title 1, Public Law 480 from the current appropriated level—a reduction of more than 50 percent from \$245 million to \$112 million that would practically phase out the program completely. As the Administration has stated in its proposed budget, priority under title 1 is given to agreements which provide for the export of U.S. agricultural commodities to those developing countries which have demonstrated the potential to become commercial markets, among other things. Despite severe budgetary limitations in recent years, title 1 has remained vital and provided the stimulus to developing strong commercial markets for U.S. agricultural

commodities. This concessional program continues to be America's ticket of admission into new markets for the future. It is particularly important today as the "Asian flu" has caused a reduction of over \$2 billion in anticipated exports of U.S. agricultural commodities.

2. Another item for which we recommend additional support is the appropriation for the Foreign Agricultural Service (FAS) which provides funding for the foreign market development program. It is our understanding that to maintain this program at current levels it will be necessary to increase the appropriation for FAS slightly. In the past the FMD program has been sustained in part by funds from a reserve that is almost exhausted and will no longer be available to supplement the FAS appropriation. This program is operated on a cost share basis with cooperators and has shown success in maintaining and expanding markets abroad. This program, like the title 1, Public Law 480 program, is part of the Department of Agriculture's "arsenal" in assuring that the U.S. can remain competitive in world markets.

3. The USDA research program is another area that is of great importance to the rice industry. Construction of a National Rice Germplasm Evaluation and Enhancement Center at Stuttgart, Arkansas, is nearing completion. The work of this Center will enable the rice industry to improve efficiency and yields. The current year's appropriation bill provides an additional allocation of \$700,000 in base funding for the Center's program of work from the appropriation to the Agricultural Research Service (ARS). However, the Administration eliminated this allocation in base program funds from its recommended fiscal year 1999 appropriation bill. Therefore, this allocation of \$700,000 needs to be restored for fiscal year 1999, and an additional amount of \$800,000 in program funds should be provided to complete staffing of the Center in fiscal year 1999. We urge that this additional allocation in a total amount of \$1.5 million be provided from the appropriation to ARS to fully fund the Center's operations in the next fiscal year.

4. Finally, we wish to express support for maintaining at current levels the existing USDA program to control blackbird damage to rice producers and others. The Administration's proposed budget would reduce the appropriation for the animal damage control activities, now part of the Wildlife Services Operations. The USDA has reported that blackbirds are the most frequently reported source of wildlife damage throughout the United States causing annual damage to a variety of U.S. commodities and to livestock feedlots and aquaculture. They congregate in large roosts where they also cause health, aesthetic and nuisance problems in addition to agricultural losses. USDA is constantly conducting research and testing methods to better control blackbirds, and adequate resources are needed to continue this work.

We appreciate the opportunity to advise you of the recommendations of the USA Rice Federation and would appreciate it if you would include this statement in the record. Thank you again for the help you and the Subcommittee have provided the rice industry in the past.

PREPARED STATEMENT OF THE U.S. AGRICULTURAL EXPORT DEVELOPMENT COUNCIL

U.S. agricultural exporters want to compete on a level playing field. However, the large amount of foreign government manipulation of markets and production means U.S. agricultural exporters need Washington's support to make this happen. The record shows that U.S. agriculture is serious enough about this public-private partnership to contribute significant amounts of its own resources to the effort. Further, U.S. agriculture and the U.S. Department of Agriculture (USDA) are using strategic planning, program evaluation, quantifiable goals, and a competitive award process to ensure that taxpayer's money is being used in a way which generates the biggest returns for the U.S. economy and its 1.1 million citizens who depend on a healthy agricultural export sector for their livelihood. The U.S. Agricultural Export Development Council (USAEDC) respectfully urges this subcommittee to fully support all USDA export promotion efforts in the fiscal year 1999 budget, especially the FMD program at a level of \$30 million, and an MAP program at \$90 million. We also urge the subcommittee to support a strong USDA Foreign Agricultural Service (FAS), our partner in promoting increased U.S. agricultural exports.

First and foremost, it is important to revisit the role agricultural exports play in the health of our national economy and the well being of our citizenry. Every \$1 billion in agricultural exports supports approximately 20,000 U.S. direct and indirect jobs. With our \$57 billion in agricultural exports in 1997, this means a successful U.S. agriculture export effort was responsible for 1.1 million jobs. According to the U.S. Department of Agriculture Foreign Agricultural Service (FAS), more than ten percent of this total work force is in California (137,000 jobs). Iowa and Texas

have the second and third largest number of agricultural export related jobs at 96,000 and 77,000 respectively. Agricultural exports play an important role in every region of the country, including the South (189,000 jobs), the Pacific Northwest (67,000 jobs), and the Northeast (24,300 jobs). These jobs not only ensure family incomes, but help grow the national tax base and thus increase revenue to the Treasury, contributing to the reduction of our national debt. It is clear that without a healthy agricultural export sector, we all lose.

Ensuring the long-term vitality of U.S. agricultural exports is the reason the U.S. Agricultural Export Development Council (USAEDC) exists. We are a national, non-profit, private sector trade association funded solely by our members. Our nearly 80 members are U.S. farmer cooperatives and agricultural trade associations who in turn represent the interests of farmers and agribusinesses in every state of the Union. Our members represent producers of both bulk and high-value processed products, including grains, fruits and vegetables, cotton, livestock, dairy products, seeds, fish, wood products, wine, poultry, nuts, and rendered products among others.

Our members continually strive to ensure the United States remains one of the most active agricultural exporting countries in the world. We proudly produce among the world's highest quality products as evidenced by our ability to be one of the few sectors of the U.S. economy to consistently run a positive balance of trade. In 1997, U.S. agriculture racked up an impressive year in exports: \$57 billion in sales to more than 40 countries.

THE WORLD AGRICULTURAL PLAYING FIELD IS TILTED AGAINST U.S. EXPORTERS

Unfortunately, record exports do not tell the whole story. U.S. agriculture has done well, but international conditions are increasingly competitive. Foreign governments are bolstering agricultural production, putting the United States at a competitive disadvantage in foreign markets. With the demise of the Cold War, more and more countries have turned their attention to increasing support for agricultural production for both their domestic and export markets. Through their spending and production decisions, foreign governments have strengthened traditional, and created new, competitors for U.S. exports.

U.S. exporters are also encountering a rapid increase in the proliferation of new non-tariff barriers to agricultural products. With the Uruguay Round's move to reduce tariffs, many countries have turned to sanitary and phytosanitary requirements as barriers to market entry of U.S. agricultural products. Although said by their proponents to be objective, many of these sanitary and phytosanitary barriers are in actuality an attempt to use scientific data (or lack thereof) to establish import regimes which effectively halt or severely restrict U.S. imports. The recent EU uproar concerning U.S. genetically modified corn and soybeans is a perfect example.

A myriad of other types of non-tariff barriers exist. FAS and its overseas offices have gathered plentiful information on the numerous cases of foreign assistance for agricultural production as well as barriers to trade which prevent U.S. agriculture from reaching the exports levels of which it is capable. The National Trade Estimate of the Office of the U.S. Trade Representative catalogues this loss to U.S. agricultural exports from unfair foreign competition. Despite a significant commitment of their own resources, the U.S. private sector cannot overcome such an extensive amount of barriers alone.

A U.S. PUBLIC-PRIVATE PARTNERSHIP IS NECESSARY AND APPROPRIATE

Given the magnitude of the task, it would be impossible to expect either the U.S. private sector or the U.S. public sector to be able to remedy the unfair competition which U.S. agriculture faces overseas on their own. In the past, U.S. agriculture has worked successfully with the U.S. Government to remedy foreign unfair competition and market access barriers which have prevented U.S. exports from fulfilling their potential. To those who say there is no appropriate role for Washington in this fight, former U.S. Under Secretary of Commerce Jeffrey Garten, now dean of the Yale School of Management, sums up the situation quite well: "In the best of worlds, governments ought to get out of this business [of export promotion] altogether. But the marketplace is corrupted by the presence of government. So do you sit on the side and pontificate about Adam Smith, or do you enter the fray?"¹ Mr. Garten argues that Washington must enter into the battle or risk losing U.S. jobs.

In the fiscal year 1999 Federal Budget, USDA proposes funding a number of programs for U.S. agriculture which help the sector overcome these foreign trade barriers and market distortions. USAEDC commends the actions of this subcommittee in the past to fund these programs. We strongly support efforts by this Congress

¹ "Don't Be Salesmen", *The Economist*, Jan. 2, 1997.

and the Administration, as provided for in the fiscal year 1999 Federal Budget, to again provide a dynamic arsenal of programs to boost the efforts of U.S. agricultural producers to maintain current, and establish new, markets around the world.

The Federal Agricultural Improvement and Reform Act of 1996 (the 1996 Farm Bill) re-authorized and refocused a number of important export-related programs to help achieve the specific U.S. agricultural export goals contained in the Act itself. It is essential that the full range of USDA's export programs be fully funded and aggressively implemented this coming year, including the Foreign Market Development (FMD) program and the Market Access Program (MAP).

Nowhere is the record of success of the public-private partnership move evident than in the FMD and MAP programs. USAEDC members consider these programs the "heavy artillery" in the USDA arsenal. These complementary programs have been instrumental in our record export performance. The Foreign Market Development Program is aimed at long-term marketing efforts, i.e., making infrastructural changes to foreign markets through training and educational efforts among members of the foreign trade. Successful efforts result in a modification of the foreign market structure so that U.S. products become an available, attractive, well understood alternative to other sources of competing products. FMD activities help the foreign importer, processor, and retailer to understand not only how to properly store, handle, process, and market the U.S. product, but also to appreciate its unique characteristics, high quality, and reliability of supply.

The FMD program helps create new markets for U.S. agricultural exports. For example, as a result of FMD-funded market development efforts by the U.S. Beef Breeds Council and the American Shorthorn Association—one of their seventeen U.S. partner associations contributing their own resources to this program—150 head of U.S. breeding beef cattle departed in 1996 for China. This was the first-ever shipment of U.S. purebred cattle breeders to China. Now that an agreement has been reached between Washington and Beijing on a health regulation protocol, further purchases are expected. And, a Chinese buying team made inspections and selections for a second shipment completed within the first half of 1997. Without the FMD program, the Council does not believe they would have had the opportunity or resources to establish this new market for U.S. cattle. With the sustained effort of the U.S. cattle industry and the FMD program, China could become a multi-million dollar market for U.S. cattle exporters in the near future.

The FMD program helps expand existing markets. Last year, the American Forest & Paper Association (AF&PA) succeeded in having the Government of Japan accept U.S. grade stamps for softwood lumber, a major non-tariff barrier to U.S. value-added wood products exports to Japan. AF&PA and the Western Wood Products Association—one of AF&PA's four U.S. partner associations contributing their own resources to this program—have been able to work with the Japanese for almost ten years on this issue. As the number one export market for U.S. wood products, Japan is currently a billion dollar market for the U.S. wood products industry and is expected to expand further with this major development. Without it, U.S. exports would have been lost to the Canadian wood industry which has already had its grade marks accepted by Japan. FMD resources, combined with those of the U.S. wood products industry, made this U.S. export expansion possible.

The Market Access Program (MAP) is the complement to the FMD program. Where the FMD program is aimed at long-term market infrastructural change, MAP targets more immediate, shorter-term market opportunities. MAP funds are often used for consumer promotion efforts to create or capitalize on new trends in foreign consumption. Activities tend to be targeted at the foreign consumer, increasing their awareness and level of comfort with the imported U.S. product. Consumer promotions have taken the form of in-store promotions, contests, advertising, and cooking demonstrations to name but a few. Numerous examples of both successful FMD and MAP programs are contained in the attached pamphlet, "A Working Partnership Builds Markets Abroad, Creates U.S. Jobs," which catalogues USAEDC member successes with both programs.

Therefore, USAEDC strongly supports a fiscal year 1999 FMD funding level of \$30 million. This amount does not grow the program, but keeps it at a level U.S. agriculture feels is necessary to support meaningful export promotion. It is consistent with recent funding levels of the program following years of program budget reductions. In addition, USAEDC strongly supports a fiscal year 1999 MAP funding level of \$90 million.

It is important to realize that the program participants put up their own money to participate in these programs. As such contributions are part of the rules of both the FMD and MAP programs, no one is getting a "free ride." Program participants are required to contribute their own cash and manpower to run these programs. Thus, the program participants have just as much, if not more, impetus to conduct

responsible and effective FMD and MAP marketing programs. For example, in fiscal year 1995 (the most recent date available), USDA reports that U.S. program participants contributed over \$60 million of their own funds to match the \$92 million in MAP funds expended. Thus, U.S. agriculture contributed 65 cents for every MAP program dollar used. The FMD ratio is even higher, with U.S. agriculture contributing \$1.12 for every FMD program dollar used in fiscal year 1996. These numbers clearly illustrate the private sector's strong belief that the FMD and MAP programs are essential, and that the public-private partnership approach is effective.

U.S. agriculture is also active on other fronts to maximize opportunities for export increases, e.g., our public-private partnership with Washington extends into the trade policy arena. U.S. trade policy efforts have met with success in opening new markets to U.S. agricultural products. We are encouraged that the Administration appears set to continue this effort, as evidenced by Acting U.S. Trade Representative Charlene Barshefsky's comments to the House Appropriations Commerce, Justice, State Subcommittee March 14, 1997, indicating that increasing U.S. agricultural exports will be one of her top priorities.² However, trade policy alone is not enough. Bringing down barriers to trade is only truly effective at increasing U.S. agricultural exports when followed by intensive marketing efforts. The FMD and MAP programs help U.S. agriculture do just that.

FINE TUNING OF THE FMD AND MAP PROGRAMS HAS ENHANCED EFFECTIVENESS

USAEDC members are as concerned as anyone else in America about the federal budget deficit and the long-term fiscal health of this country. The public-private partnership in the FMD and MAP programs allows us to do something about it, namely increase U.S. agricultural exports beyond that which U.S. agricultural interests would be able to do on their own. USDA's own evaluation efforts indicate that for every federal dollar spent on agricultural export promotion, \$16 worth of exports are generated. In addition, USDA program rules require all program participants to conduct independent annual evaluations to determine the past impact and future direction of their marketing programs. This evaluation is in addition to that conducted independently by many of the associations themselves as part of their own strategic planning. Program evaluations are reviewed jointly by USDA and program participants to determine the appropriate promotional programs for particular markets in the future. These evaluations are evidence that USDA and program participants are serious about getting the best possible return on FMD and MAP funds.

Both generic and branded promotion have a place in marketing U.S. agricultural products abroad. Depending on the type of product and foreign market involved, branded promotion can be more effective than generic promotion as a way to increase U.S. farmers' exports. In fiscal year 1997, 100 percent of FMD funds and more than 70 percent of MAP funds were awarded for generic marketing efforts overseas. More than 80 percent of MAP branded marketing funds went to U.S. farmer cooperatives and small agribusinesses which met the Small Business Administration's definition of a "small business." In accordance with recent program reforms, in fiscal year 1998 only farmer cooperatives and small businesses are eligible to receive MAP branded promotion funds. Additionally, all applicants—whether large or small, non-profit or corporate, for FMD or MAP programs—must go through a rigorous competitive award process for program funds. Recent program reforms have resulted in application and allocation criteria being much more widely known and transparent for all potential applicants.

USDA has also made other changes to the FMD and MAP programs over the past several years in response to General Accounting Office and Office of Management and Budget recommendations to ensure the best possible return to the U.S. taxpayer and the U.S. Treasury. Changes also reflect public comment on various proposed changes published in the Federal Register. These changes include: per the Government Performance and Results Act, changes to evaluation procedures and demonstrations of additional sales as a result of the programs; a reduction in paperwork requirements; the addition of an appeal procedure for compliance findings; and the expediting of routine administrative issues by delegating approval authority to lower levels within FAS. FAS is to be commended for its work in implementing these changes as well as its continuing efforts to support efforts by U.S. agriculture to expand our exports. A continued strong and well-funded FAS is an important part of our successful public-private partnership.

The U.S. Agricultural Export Development Council (USAEDC) appreciates this opportunity to submit written testimony in support of an aggressive U.S. effort in

²"China Dominates Barshefsky Hearing," Annie Tin, Congressional Quarterly Daily Monitor, March 17, 1997, on-line service.

fiscal year 1999 to increase U.S. agricultural exports, specifically with an FMD program funded at \$30 million, and an MAP program funded at \$90 million.

PREPARED STATEMENT OF THE U.S. APPLE ASSOCIATION

On behalf of the U.S. apple industry, the U.S. Apple Association appreciates the opportunity to provide comments on the appropriations for the U.S. Department of Agriculture (USDA) for fiscal year 1999.

Our focus is on four agencies of the Department: the Agricultural Research Service (ARS), the Foreign Agricultural Service (FAS), the Cooperative State Research, Education, and Extension Service (CSREES) and the Agricultural Marketing Service (AMS).

The U.S. Apple Association is a non-profit national trade association representing all segments of the U.S. apple industry. Our membership includes 30 state organizations representing approximately 9,000 producers and over 450 individual firms which handle and market the bulk of the nation's apples. Apples are grown commercially in 35 states, with gross returns to growers last year totalling \$1.7 billion. Top producing states include Washington, New York, Michigan, California, Pennsylvania, Virginia, North Carolina, Oregon, Idaho and West Virginia.

FOREIGN AGRICULTURAL SERVICE—MARKET ACCESS PROGRAM (MAP)

All segments of the U.S. apple industry benefit directly from the use of the export promotion funds, which build markets and demand for our domestically produced product, and indirectly strengthen our markets in this country as well. While many FAS activities are important to the apple industry, the U.S. Apple Association believes the Market Access Program (MAP) in particular should be fully funded at its current authorized level of \$90 million. This program is consistent with new international trade rules, helps small businesses, and is effective in promoting U.S. exports.

After nearly a decade of multinational trade negotiations in the Uruguay Round, the global agricultural community is facing substantial trade liberalizing policies. One of the few areas in which government policies can still effect agriculture is export promotion. We support a strong MAP, which is permissible under the Uruguay Round international trade rules.

The U.S. apple industry faces severe competition from around the globe. Most competitors receive significant government funds for generic promotions. Both production and exports from European Union (EU) countries receive government subsidies. Foreign governments spend approximately \$500 million on export promotion and market development. With apple production increases occurring around the world, already severe competition is expected to intensify further.

Apple industry members believe in agricultural export programs and back their support of these programs with cost-sharing contributions of 30 to 75 percent of the total. According to USDA estimates, every \$1 in export promotion funds translates into \$16 in additional agricultural exports. MAP is an investment by the federal government that generates substantial returns to the Treasury and helps American business. MAP has been a sound investment in this nation's agricultural economy.

California, Colorado, Connecticut, Idaho, Maine, Massachusetts, Michigan, New Hampshire, New York, Pennsylvania, Utah, Vermont and Virginia are members of the U.S. Apple Export Council (USAEC). USAEC manages the export promotion activities of these states.

Each year export markets become increasingly important to apple businesses and related industries. U.S. apple production has steadily grown over the past decade, and these new markets provide outlets for this increased production. It is vital not only to the apple industry but agriculture as a whole to continue trade promotion efforts to help U.S. producers and exporters take full advantage of emerging and existing export markets. It is critical that assistance to small businesses is continued. The program makes export markets more accessible to smaller businesses which would otherwise be unable to individually effectively promote and market their apples around the world.

AGRICULTURAL MARKETING SERVICE—PESTICIDE DATA PROGRAM (PDP)

As requested in the President's budget, we recommend appropriation of \$12 million for the Pesticide Data Program (PDP), managed by the Agricultural Marketing Service (AMS) of USDA.

Since 1991, USDA has utilized PDP to collect reliable, scientifically-based pesticide residue data that benefit consumers, food processors, crop protection pesticide

producers, and farmers. These data accurately reflect the consumer's actual exposure to pesticides from certain dietary sources. This real-world information allows the U.S. Environmental Protection Agency (EPA) to make more accurate assessments of risk. Without the actual residue data, overly conservative theoretical assumptions of risk are used. These assumptions could lead to withdrawal of pesticide uses that pose no actual human health risk.

On August 3, 1996 the President signed into law the Food Quality Protection Act (FQPA). This landmark legislation requires extensive reevaluation of the safety of agricultural pesticides and requires extensive data to evaluate the risk associated with the exposure to pesticides. Over the next three years, EPA will reevaluate the pesticide tolerances of many of the most important pesticides used on apples. Lacking sufficient data, EPA will make conservative assumptions about the use of pesticides and the resulting exposure. The conservative assumptions could lead to unnecessary cancellations or restrictions of critically important pesticides used on apples. EPA will be able to make a more accurate assessment of the actual risk associated with pesticides using data from PDP. As a result, apple growers will benefit from the continued availability of safe and effective pesticides. It is imperative that the subcommittee support PDP.

AGRICULTURAL RESEARCH SERVICE—FOOD CONSUMPTION SURVEY

The U.S. Apple Association supports the \$2 million funding of the USDA food consumption survey as proposed in the USDA fiscal 1999 budget. The data from this survey is expected to lessen the potential that critical pesticides used on apples will be unnecessarily canceled or restricted as a result of implementation of the Food Quality Protection Act.

EPA uses food consumption data from the USDA food consumption survey to evaluate dietary pesticide exposures resulting from different food consumption patterns. EPA currently uses data which was produced from the latest survey conducted in 1978. The data from this survey are inadequate for certain demographic categories such as infants and children.

As previously noted, FQPA implementation will require accurate data to avoid the unnecessary cancellation of critical pesticides used on apples. Under FQPA, EPA must issue a finding that tolerances are safe for infants and children. Lacking sufficient data on infants and children, EPA is required by the new law to use additional margins of safety that could threaten the availability of pesticides used on apples. Data from a new consumption survey would refine EPA's risk assessments and possibly prevent unnecessary cancellations or restrictions on pesticides used on apples. It is also important that the survey is completed as quickly as possible since EPA will make many of its most critical decisions on apple pesticides within the next three years and will proceed on that schedule regardless of the availability of the data.

NATIONAL AGRICULTURAL STATISTICS SERVICE (NASS)—PESTICIDE USE SURVEYS

The U.S. Apple Association supports the \$7 million fiscal year 1999 budget request for NASS pesticide usage surveys. On an annual basis, USDA conducts statistical surveys on the use of agricultural pesticides. These surveys provide up to date information on the amount of pesticide use, the percentage of agricultural crops that are treated and other specific information on pesticide usage patterns. These data are used by the public and government agencies charged with the responsibility of tracking pesticide use and its implications. EPA currently uses the data in risk assessments that measure the theoretical health risk to the public from exposure to pesticides. Accurate information on pesticide use has never been so critical to the apple industry. Under FQPA, EPA will reassess the pesticide tolerances of some of the most important pesticides used on apples. The outcome of those assessments and the overall availability of pesticides for apple production will depend on the availability and accuracy of the pesticide usage data. A well funded USDA program that gathers pesticide use data on apples is critical to the proper implementation of the Food Quality Protection Act and to a realistic health risk assessment.

AGRICULTURAL RESEARCH SERVICE—TEMPERATE FRUIT FLY RESEARCH POSITION— YAKIMA, WASHINGTON

The U.S. Apple Association requests support for ongoing apple-specific research of \$825,000 and requests an additional \$300,000 in fiscal year 1999 for a temperate fruit fly research position at the USDA Agricultural Research Service facility in Yakima, Washington. Implementation of the food Quality Protection Act is expected to significantly reduce the number of pesticide alternatives that growers currently use to control a family of insects such as cherry fruit fly and apple maggot that are

devastating pests to tree fruit growers. Research on this family of pests is critically important because alternative pest controls are presently unavailable without the use of organophosphate pesticides. Over the next two years, EPA is expected to take regulatory action that will significantly reduce if not eliminate the use of organophosphate pesticides. This action will leave growers without a commercially viable control. The apple industry believes that research on this family of insects must be undertaken immediately if growers are to avoid a future crisis in pest management.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE (CSREES)—“SAFE-GUARDING THE SUPPLY OF SPECIALTY CROPS FOR CONSUMERS” MICHIGAN STATE UNIVERSITY

The U.S. Apple Association requests funding of \$700,000 for funding of a special grant to Michigan State University to develop alternative pest management strategies on key apple pests such as plum curculio and apple maggot. Implementation of the Food Quality Protection Act is expected to eliminate organophosphate pesticides, the primary pesticides that currently control those pests. If other pesticide alternatives are used they will destroy the ability of growers to utilize Integrated Pest Management (IPM), cause growers to use more miticides, and eventually will lead to massive pesticide resistance. Apple growers and pest management experts agree that without organophosphate pesticides, growers will not be able to control apple maggot or plum curculio in the future. Plum curculio and apple maggot feed directly on the apple causing worm holes, surface defects and misshapen fruit that is unmarketable in the fresh or processing market. This special project will investigate alternative pest management strategies that could control these pests. The research enjoys broad support among the apple industry since the research results will be applicable to many major apple growing regions outside of Michigan.

AGRICULTURAL RESEARCH SERVICE—NATIONAL AGRICULTURAL PESTICIDE IMPACT ASSESSMENT PROGRAM MINOR-USE PEST MANAGEMENT OFFICE

The U.S. Apple Association supports an increase of \$1.5 million for the National Agricultural Pesticide Impact Assessment Program (NAPIAP) in the ARS budget to support the Office of Pest Management Policy established in August 1997 to improve coordination and communication with grower associations, USDA agencies and the U.S. Environmental Protection Agency. In passing the FQPA, Congress provided for the establishment of a minor-use program within USDA. The primary purpose of this office is to provide coordination and policy oversight for specific program areas within USDA that impact minor-use pest management practices. The \$1.5 million increase will enable USDA to staff the Office of Pest Management Policy appropriately to meet the needs of minor-use industries.

Some of the areas of emphasis for the Office of Pest Management Policy would include the issue of meeting grower needs for chemical or nonchemical pest management tools, providing extension and educational services, and direct coordination with other federal agencies, primarily with the U.S. Environmental Protection Agency.

The minor-crop community believes that responsibility for this program must be placed at the highest levels of USDA. The U.S. Apple Association believes that the office should take an aggressive leadership role in providing for the needs of minor-use growers in the implementation of FQPA.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE (CSREES)—IPM RESEARCH GRANT PROGRAM

The U.S. Apple Association supports the President's fiscal year 1999 budget request of \$8 million for the CSREES IPM Research Grant Program. Apple growers in all regions of the United States are taking steps to avoid pesticide applications whenever possible. The apple industry has made tremendous progress in reducing pesticide applications and reducing the risks associated with the use of pesticides through the use of IPM. Increased IPM funding is necessary to discover improved IPM practices that will lead to even more environmentally-friendly production practices.

PREPARED STATEMENT OF DR. D. JAY GRIMES, DIRECTOR, GULF COAST RESEARCH
LABORATORY

Mr. Chairman, I am pleased to be here today and to have this opportunity to provide the Committee an overview of the activities of the U.S. Marine Shrimp Farming Program.

Mr. Chairman, the United States imports 70 percent of the marine shrimp it consumes, resulting in annual trade deficits well in excess of \$2 billion. The U.S. Marine Shrimp Farming Program, supported by this Committee since 1985, undertook the development of high tech processes, products and services designed to make U.S. shrimp farmers competitive in the world market.

The Consortium enlisted the participation of top scientists, their institutions and states, the cooperation of the fledgling industry, and participation of government scientists and administrators to undertake narrowly focused and results oriented projects, to provide a sound scientific basis for industry expansion. Its approach is based on financial accountability, and minimal bureaucratic constraint. The Program has been administered by CSREES/USDA, which provides oversight and conducts periodic review by independent scientific panels.

The obstacles to be overcome by new technologies and products, in order to underpin a competitive advantage for U.S. agriculture, were formidable. By comparison, worldwide shrimp farming practices are primitive as compared to modern animal husbandry standards. They depend on catching wild shrimp stocks, have little regard for the environmental consequences of their actions, use drugs and chemicals indiscriminately, and contribute to the spread of shrimp diseases with their products; this approach has often been referred to as "rape and run."

These practices, while low-cost in the short-run, are not sustainable environmentally or economically in the long-run. Currently, worldwide producers are experiencing increasing shrimp mortalities, lower quality product, and lower profits. These world wide problems provide a substantial opportunity for exploitation of the technologies and products developed by the Consortium.

The Consortium has made the United States a world leader in the development and use of:

- domesticated stocks of high health and genetically improved shrimp broodstock and seed. Shrimp with superior growth and disease resistance traits are made available to U.S. farmers;
- the most advanced molecular diagnostic tools for disease screening and control, including monoclonal antibodies and gene probes. Consortium scientists serve a primary role in the U.S. risk assessment of viral pathogens in imported shrimp products;
- environmentally sound, sustainable and biosecure shrimp production systems that offer protection against viral pathogens and produce virus free products; and
- advanced feeds and feeding methods in support of the domesticated stocks and biosecure production systems to maximize feed conversion and system stability, while minimizing and containing system wastes.

The accomplishments above, while very encouraging, are not yet complete. We are in the process of integrating these advances into working shrimp farming systems for demonstration purposes. The industry does not yet have the complete technology package and remains dependent upon the Consortium for critical products and services. The Consortium is the only supplier of high health and genetically improved shrimp stocks in the United States and these stocks are provided at cost. The industry is equally dependent upon the Consortium for disease diagnosis, prevention and treatment methods, and services.

Abrupt loss of Consortium support would cut the existing industry off at the knees and preclude completion of this important pioneering work. In anticipation of near term technology transfer, we are encouraging the industry to establish its own breeding program and disease control operations. The risks, however, are as yet too high to encourage the movement of investment capital. We are making substantial progress toward increasing profitability and reducing risk.

Mr. Chairman, it is envisioned that the United States, with the best animal feed grains and health care in the world, will become a nonpolluting producer and major competitor in the shrimp farming world. Superior technologies, products and services will deliver higher quality and lower cost shrimp products to the nation and to the world.

The Consortium receives substantial support and encouragement from CSREES/USDA. They have suggested that this is a model program for resolving important problems and capturing opportunities in both agriculture and aquaculture. Such

sentiments have been repeatedly expressed by independent scientific review teams in 1988, 1991 and 1995.

To complete the tasks identified, the Consortium is requesting continued support of \$3.5 million for fiscal year 1999. We deeply appreciate the Committee's support to date, and respectfully ask for favorable consideration.

PREPARED STATEMENT OF THE UNITED STATES TELEPHONE ASSOCIATION

SUMMARY OF REQUEST

Project involved.—Telephone Loan Programs Administered by the Rural Utilities Service.

Actions proposed.—Supporting RUS loan levels for the hardship, cost of money, Rural Telephone Bank and loan guarantee programs in fiscal year 1999 in the same amount as loan levels specified in the Fiscal Year 1998 Agriculture Appropriations Act (Public Law 105–86). Also supporting an extension of the language removing the 7 percent interest rate cap on cost of money loans for fiscal year 1999. Also supporting continuation of the restriction on the retirement of class A Rural Telephone Bank stock in fiscal year 1999 at the level contained in Public Law 105–86) and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund. Supporting funding for \$150 million in loan authority and \$15 million in grants designated for distance learning and telemedicine purposes.

The United States Telephone Association (USTA) represents over 1000 local telephone companies that provide over 95 percent of the access lines in the United States. USTA members range from large public held corporations to small family owned companies as well as cooperatives owned by their customers. We submit this testimony in the interests of the members of USTA and their subscribers.

USTA members firmly believe that the targeted assistance offered by a strong telephone loan program remains essential in order to maintain a healthy and growing rural telephone industry that contributes to the provision of universal telephone service. We appreciate the strong support this committee has provided for the telephone program since its inception in 1949 and look forward to a vigorous program for the future.

A CHANGING INDUSTRY

As Congress recognized through passage of the Telecommunications Act of 1996, the telephone industry is in the midst of one of the most significant changes any industry has ever undergone. Both the technological underpinnings and the regulatory atmosphere are dramatically different. Without system upgrades, rural areas will be left out of the emerging information revolution.

The need has never been greater for the technology employed by RUS borrower rural telephone companies to continue to be modernized. The demand for new switches to serve rural areas could be unprecedented in the next year. What is driving this demand? First, there are several Federal Communications Commission mandates that incumbent local companies will have to meet. Upgrades related to new rules regarding pay phone compensation, implementation of four digit Carrier Identification Codes (CIC's), and number portability are all new Commission requirements driven by the 1996 Telecommunications Act. Second, there are still some companies that are not equipped to offer equal access to competing long distance carriers. Third, the Communications Assistance for Law Enforcement Act (CALEA) imposes new requirements on all carriers to upgrade their capabilities to assist the Federal Bureau of Investigation and other law enforcement agencies. Fourth, telephone company switches, which are really just sophisticated computers, are impacted by the "year 2000" problem.

In addition to upgrading switching capability, it is important that rural areas be included in the nationwide drive for greater bandwidth capacity. In order to provide higher speed data services, such as ISDN (Integrated Services Digital Network) or even faster connections to the Internet, outside plant must be modernized in addition to new electronics being placed in switching offices. Rural areas with relatively long loops are particularly difficult to serve with these higher speed connections and require additional investment to allow modern services to be provided.

Provision of greater bandwidth and switching capabilities are crucial infrastructure elements which will allow rural businesses, schools and health care facilities to take advantage of the other programs available to them as end users. The money spent on having the most modern and sophisticated equipment available at the premises of the business, school or clinic is wasted if the local telephone company cannot afford to quickly transport and switch the large amounts of data that these

entities generate. RUS funding enhances the synergies among the FCC and RUS programs targeted at improving rural education and health care through telecommunications.

The RUS program provides needed incentives to help offset regulatory uncertainties related to universal service support and interconnection rules with a reliable source of fairly priced long term capital. After all, RUS is a voluntary program designed to incent local telephone companies to build the plant essential to economic growth. RUS endures because it is a brilliantly conceived public private partnership in which the borrowers are the conduits for benefits from the federal government to flow to rural telephone customers, the true beneficiaries of the RUS program. The government's contribution is leveraged by the equity, technical expertise and dedication of local telephone companies.

IMPACT OF CREDIT REFORM ON THE RURAL TELEPHONE BANK

Contrary to the intent of Congress, the interpretation of credit reform by the Office of Management and Budget (OMB) has significantly affected the operation of the Rural Telephone Bank (RTB). One of the most damaging impacts of OMB's interpretation of the credit reform law is to essentially cleave the RTB into two banks—a liquidating account bank which is responsible for pre-credit reform loans, and a financing account bank which is responsible for post credit reform loans. Until the Administration's current budget proposal, OMB has clung to the proposition that funds from the two banks could not be intermingled. USTA has protested this arrangement since it began, since it prevents the re-lending of borrower repayments to fund new loans in direct contravention of Sec. 409 of the Bank's enabling act. This, in turn, forces the RTB to borrow unnecessarily from the Treasury to fund new loans. It also permits funds to build up in the liquidating account that were generated by GAO documented interest rate overcharges, instead of those funds being returned through re-lending to the same universe of borrowers that initially generated them.

In this new budget proposal, the Administration proposes to take funds from the liquidating account and fund the loan subsidy for new loans as well as the RUS administrative expenses allocated to the RTB beginning in 1999. This is in direct conflict with an existing provision of law, Sec. 403(b) of the Rural Telephone Bank Act (Public Law 92-12). That provision states ". . . in order to perform its responsibilities under this title, the telephone bank may partially or jointly utilize the facilities and the services of employees of the Rural Electrification Administration or of any other agency of the Department of Agriculture, *without cost to the telephone bank*". (Emphasis added)

OMB has clearly changed its position on whether the liquidating account funds can be used for purposes other than liquidating the pre-credit reform loans. And on this point OMB is correct. However, instead of using the repayments into the liquidating account to fund the expenses of the RTB (contrary to the Rural Electrification Act) or to fund the loan subsidy, neither of which would result in any budget savings, OMB should adhere to Sec. 409 of the Rural Electrification Act and allow those repayments to be used to fund new RTB loans. It is ironic that in the same budget proposal that purports to have the RTB act more like a private bank, OMB continues to maintain the artificial split of the bank's resources which prevents it from acting as would a private bank—re-lending repayments.

RUS TELEPHONE PROGRAM PROCEDURES SHOULD BE STREAMLINED

The Government Performance and Results Act of 1993 (Public Law 103-62) was designed by Congress to establish clear goals for government programs and places a strong focus on results, service and customer satisfaction. This Act applies to all RUS lending programs. Streamlining the practices and procedures of the RUS telephone programs is an extremely meritorious notion. USTA is fully in support of less regulation and improved service delivery, within the context of the government's interest in security for these rural telecommunications infrastructure improvement loans. We have consistently requested RUS to examine and streamline its rules and procedures for the benefit of both the agency and the borrowers and their subscribers. Unfortunately nothing has been done by RUS to move in this direction. We hope that the Government Performance and Results Act provides the needed spur to encourage RUS to expeditiously accomplish this goal.

RECOMMENDATIONS

Continuation of the loan levels and necessary associated subsidy amounts for the RUS telephone loan programs that were recommended by this committee and signed

into law for fiscal year 1998 would maintain our members' ability to adequately serve the nation's telecommunications needs and to maintain universal service.

For a number of years, through the appropriations process, Congress has eliminated the seven percent "cap" placed on the insured cost-of-money loan program. The elimination of the cap should continue. If long term Treasury interest rates exceeded the 7 percent ceiling contained in the authorizing act, adequate subsidy would not be available to support the program at the authorized level. This would be extremely disruptive and hinder the program from accomplishing its statutory goals. Accordingly USTA supports continuation of the elimination of the seven percent cap on cost-of-money insured loans in fiscal year 1999.

The restriction on the retirement of the amount of class A stock by the Rural Telephone Bank, adopted in fiscal 1997, should be continued. The Bank is currently retiring Class A stock in an orderly, measured manner as current law requires. This should continue. The Committee should also continue to protect the legitimate ownership interests of the Class B and C stockholders in the Bank's assets by continuing to prohibit a "sweep" of those funds into the general fund.

Recommended Loan Levels.

USTA recommends telephone loan program loan levels for fiscal year 1999 as follows:

RUS Insured Hardship Loans (5 percent)	\$75,000,000
RUS Insured Cost-of-Money Loans	300,000,000
Rural Telephone Bank (RTB) Loans	175,000,000
Loan Guarantees	120,000,000
 Total	 670,000,000

The President's budget proposes a reduction of \$25 million in the hardship program designed for the neediest borrowers. There is strong demand for hardship loans. Rural Americans cannot wait any longer to be full participants in the Information Age. A minimum amount of subsidy authority would restore this proposed \$25 million cut in the hardship loan level. We cannot imagine a more deserving use of scarce government resources for the benefit of rural Americans.

Distance Learning and Telemedicine

USTA strongly supports the loan and grant proposal and recommends its funding for fiscal year 1999 at the levels proposed in the Administration's budget submission, that is, \$15 million for the grant program and \$150 million for the loan program. This program is a perfect complement to the traditional RUS telephone loan programs. For distance learning and telemedicine to become a reality, schools and hospitals need training and equipment. Similarly, local telephone companies need modern infrastructure to connect these facilities to the telecommunications network.

CONCLUSION

Our members take pleasure and pride in reminding the Subcommittee that the RUS telephone program continues its perfect record of no defaults in almost a half century of existence. RUS telephone borrowers take deadly seriously their obligations to their government, their nation and their subscribers. They will continue to invest in our rural communities, use government loan funds carefully and judiciously and do our best to assure the continued affordability of telecommunications services in rural America. Our members have confidence that the Subcommittee will continue to recognize the importance of assuring a strong and effective RUS Telephone Program through authorization of adequate loan levels.

PREPARED STATEMENT OF CYRUS M. JOLLIVETTE, VICE PRESIDENT FOR GOVERNMENT RELATIONS, UNIVERSITY OF MIAMI

Mr. Chairman and Members of the Subcommittee: I am pleased to submit testimony on behalf of the University of Miami and Florida State University. My colleagues in Florida are deeply appreciative of your leadership, Mr. Chairman, and the Subcommittee's confidence in our respective institutions. We recognize that you and your colleagues on the Appropriations Committee face difficult choices as you prepare for the Subcommittee's priorities for fiscal year 1999 and we know that you will continue to make the difficult choices with the best interests of the nation guiding your decisions. My colleagues and I hope that you will find it possible to fund an important initiative detailed below in the fiscal year 1999 appropriations cycle.

In the past several years, the Congress has been especially responsive to the Florida Congressional Delegation's requests concerning The Florida Consortium for Climatic Research, a project involving the University of Miami, Florida State University, the University of Florida, and the University of South Florida. We greatly appreciate your support of this critical area of research.

The importance of El Niño South Oscillation (ENSO) events as a major source of climate fluctuations, together with advances in ENSO predictability, suggest that forecasts have significant potential for benefiting agricultural productivity and economic decision-making. The Florida Consortium for Climatic Research proposes to focus on the southeastern United States geographical area, a large food producer whose productivity is significantly impacted by weather conditions generated by the ENSO phenomenon. Decisions made by well-informed participants from farm to policy level, made several months or seasons in advance, can significantly benefit productivity, an especially farmers' ability to plan ahead.

This project presents an end-to-end approach that will provide the bridge between climate and forecast producers, such as the recently-formed International Research Institute for Climate Prediction (IRICP), and agricultural decision makers. Specific objectives for the project are to: (1) adapt, develop, and evaluate a generic, flexible set of tools and methodologies for assessing regional agricultural consequences of El Niño events and for applying forecasts to improve agricultural decision-making; (2) demonstrate by successful applications of forecasts to agriculture and other sectors which would benefit best in the southeastern United States that began in 1996; and (3) assess the value of climate predictions to different agricultural sectors in these southeastern region.

The consortium's objectives include developing scientific applications for climate data. This consortium draws upon the expertise of scientists at FSU (climate analyses and coupled ocean-atmosphere prediction models), UM (climate analyses and economic value of forecasts), and the University of Florida (agriculture) to quantify climate variability (e.g., the El Niño phenomena) for the SE and to explore the potential value and practical application (there is a strong emphasis on agricultural applications) of climate forecasts.

During the initial phase of this effort, the FSU team described qualitatively the impact of El Niño (and the other extreme, La Niña) on temperature and precipitation patterns across the SE. Additionally, they found a geographic shift in tornadic activity associated with El Niño events. A new climate forecast system to provide predictions of seasonal temperatures and precipitation with longer lead times and improved skill is in the testing phase. Improvements are due partly to the coupled nature (i.e., linking the ocean and atmosphere so they respond to each other dynamically) of the forecast system. Our colleagues at the University of Florida identified several crops in Florida which are vulnerable to shifts in weather patterns associated with El Niño and La Niña, but noted further that the impact is not uniform in nature across the state.

Continuing with this collaboration, we hope to estimate the economic advantages that could be achieved by incorporating climate forecast information into farming management systems and eventually work with sector representatives in developing guidance products for the agricultural community. We believe that the Department of Agriculture is a major stakeholder in this critical area. We respectfully seek \$3 million from USDA to continue and expand this important research activity in fiscal year 1999.

PREPARED STATEMENT OF DR. SHELBY F. THAMES, PROFESSOR OF POLYMER SCIENCE,
UNIVERSITY OF SOUTHERN MISSISSIPPI

Mr. Chairman, distinguished Members of the Subcommittee, I would like to thank you for this opportunity to provide testimony to you concerning the ongoing efforts of The University of Southern Mississippi (USM) and the Mississippi Polymer Institute. I would also like to repeat my expression of gratitude to the Subcommittee for its leadership and support of the Institute and its work. This testimony will include an update on the progress of the Institute since my testimony of approximately one year ago. During the past year, our efforts have primarily focused on the commercialization of novel inventions resulting from our emulsion polymerization team and efforts to produce multi-functional additives. I am happy to report that we have secured industrial partners who wish to manufacture and sell our novel agricultural based materials into the polymer industry. Specifically, we have designed and synthesized novel monomers or polymer building blocks that allow the production of solvent-free, non-polluting, latex coatings. This is novel technology, and promises to be significant in reducing emissions of polluting materials into our atmosphere. In

yet another, invention we have developed formaldehyde-free adhesives for use in the particle board industry. The new adhesives are composed of more than 98 percent agricultural products, and are comparable in properties with traditional formaldehyde adhesives. The examples noted herein are two of several active ongoing commercializing efforts.

In 1983, the Mississippi Legislature authorized the Polymer Institute at USM to work closely with emerging industries and other existing polymer-related industries to assist with research, problem-solving, and commercializing efforts. During the past year, seventeen new polymer-related industries have located in Mississippi. The Institute provides industry and government with applied or focused research, development support, and other commercializing assistance. This effort complements existing strong ties with industry and government involving exchange of information and improved employment opportunities for USM graduates. Most importantly, through basic and applied research coupled with developmental and commercializing efforts of the Institute, the Department of Polymer Science continues to address national needs of high priority.

The focus of my work is commercialization of alternative agricultural crops in the polymer industry. This approach offers an array of opportunities for agriculture as the polymer industry is the largest segment of the chemical products industry in the world, and heretofore has been highly dependent upon petroleum utilization. However, my efforts are directed to the development of agricultural derived materials that can improve our nation's environment, and reduce our dependence on imported petroleum. As farm products meet the industrial needs of American society, rural America is the benefactor. Heretofore this movement to utilize alternative agricultural products as industrial raw materials has received some attention but much less than the opportunities warrant. Your decisions are crucial to the accomplishment of these goals as funding from this Subcommittee has enabled us to implement and maintain an active group of university-based polymer scientists whose energies are devoted to commercializing alternative crops. We are most grateful to you for this support and ask for your continued commitment.

The faculty, the University, and the State of Mississippi are strongly supportive of the Mississippi Polymer Institute and its close ties with industry. Most faculty maintain at least one industrial contract as an important part of extramural research efforts.

Polymers, which include fibers, plastics, composites, coatings, adhesives, inks, and elastomers, play a key role in the materials industry. They are used in a wide range of industries including textiles, aerospace, automotive, packaging, construction, medical prosthesis, and health care. In the aerospace and automotive applications, reduced weight and high strength make them increasingly important as fuel savers. Their non-metallic character and design potentials support their use for many national defense purposes. Moreover, select polymers are possible substitutes for so-called strategic materials, some of which come from potentially unreliable sources.

As a polymer scientist, I am intrigued by the vast opportunities offered by American agriculture. As a professor, however, I am disappointed that few of our science and business students receive training in the polymer-agricultural discipline as it offers enormous potential.

I became involved in the polymer field 34 years ago, and since that time have watched its evolution where almost each new product utilization offered the opportunity for many more. Although polymer science as a discipline has experienced expansion and a degree of public acceptance, alternative agricultural materials are an under-utilized national treasure for the polymer industry. Moreover, there is less acceptance of petroleum derived materials today than ever before and consequently the timing is ideal for agricultural materials to make significant inroads as environmentally friendly, biodegradable, and renewable raw materials. These agricultural materials have always been available for our use, yet society, for many reasons, has not recognized their potential. I would like to share with you several examples to support this tenet:

—I have described our efforts at meeting volatile organic compound (VOC) emission standards via the design and synthesis of solventless emulsion polymers.

The novel technology which allows the synthesis of solventless emulsion polymers is based on the use of an agricultural material. For instance, this natural product allows the synthesis of emulsion polymers that perform their intended uses at room temperature and without any organic solvents. Thus, we have developed a truly no VOC coating. Most coatings of this type contain approximately 400 to 1500 grams of VOC/gallon. It is expected that this monomer will be offered for sale in the first quarter of 1999.

—A waterborne, waterproofer has been designed and formulated with the help of several natural products. The material functions as a waterproofer yet is carried

in water. However, after application to the intended substrate, typically wood or cementous products, the material becomes hydrophobic and highly water resistant. We have collected two and one-half years of exposure data on this product with excellent success. It is currently being marketed via Southern Chemical Formulators of Mobile, AL.

- A new, multi-functional polymer additive has been designed, synthesized, and tested. It is currently being evaluated by the J.W. Hanson Company as a potential commercial product. It is a highly efficient, multi-faceted additive that functions as a dispersant, a defoamer, an adhesion promoter, a gloss enhancer, and corrosion inhibiting species. It is derived from an agricultural raw material and is very novel in its performance and applications.
- We continue to exploit the potential of lesquerella, a crop that produces a triglyceride similar to castor oil. Several products have been prepared and include: polyesters, stains, foams, pressure sensitive adhesives, and 100 percent solid ultraviolet (UV) coatings. This technology was highlighted at the AARC/NASDA meeting in Washington, DC.
- Novel open cell foams have been designed and prepared from lesquerella and/or castor oil. They are of high quality and can substitute for foams used extensively in industrial settings. The Union Camp Corporation has shown interest in these materials and will soon visit our facility to discuss possible application/commercialization of these foams.
- Closed cell lesquerella foams have been prepared from lesquerella derivatives and will be submitted for testing. This commercialization focus is attractive as castor foams are prepared from imported oil, i.e., at an annual \$50-\$75 million import cost. Thus, emergence of a lesquerella oil industry has the potential to reduce U.S. imports.

It is clear that commercial utilization of agricultural products is needed and that ag based products can play a viable role as industrial raw materials for the polymer industry. However, we simply must continue to devote support and effort to this rewarding undertaking.

U.S. agriculture has made the transition from the farm fields to the kitchen tables, but America's industrial community continues to be frightfully slow in adopting ag based industrial materials. Let us aggressively pursue this opportunity and in doing so:

- Intensify U.S. efforts to commercialize alternative crops.
- Reduce U.S. reliance on imported petroleum.
- Maintain a healthy and prosperous farm economy.
- Foster new cooperative opportunities between American farmers and American industry.

Mr. Chairman, your leadership and support are deeply appreciated by the entire University of Southern Mississippi community. While I can greatly appreciate the difficult financial restraints facing your Subcommittee this fiscal year, I feel confident that further support of the Mississippi Polymer Institute will continue dividends of increasing commercialization opportunities of agricultural materials in American industry. Advances in polymer research are crucial to food, transportation, housing, and defense industries. Our work has clearly established the value of ag products as industrial raw materials; however, while these are but a limited number of applications, our success confirms that it is time to move to yet another level of effort. Thus, we respectfully request \$1.2 million in federal funding to exploit the potentials of commercializing alternative agricultural materials and to continue our initiatives. Thank you Mr. Chairman and Members of the Subcommittee for your support and consideration.

PREPARED STATEMENT OF SAM J. MASELLI, EXECUTIVE VICE PRESIDENT, WESTERN RURAL TELEPHONE ASSOCIATION

SUMMARY OF REQUESTS

Program of Interest.—Telecommunications lending programs administered by the Rural Utilities Service (RUS) of the U.S. Department of Agriculture.

Recommendation.—WRTA supports loan levels for fiscal year 1998 at such amounts as they have been designated in the Agriculture Appropriations Act for Fiscal Year 1997 (Public Law 105-86) for hardship, treasury-cost, Rural Telephone Bank (RTB), and guaranteed loan programs and the associated subsidy to support hardship and RTB loans at existing levels. WRTA also supports the President's budget request for funding of the RUS's Distance Learning and Telemedicine (DLT) programs at \$15 million in grants and \$150 million in loan authority. WRTA sup-

ports a continuation of the current fiscal year's policy of language removing the 7 percent interest rate ceiling on Treasury-cost loans for fiscal year 1998. WRTA supports the continued provisions contained in Public Law 105-86 restricting retirement of RTB class A stock in fiscal year 1998 and prohibiting the transfer of RTB funds to the general fund. Finally, we are opposed to the President's budget proposal to transfer funds from the unobligated balances of the liquidating account of the RTB for the bank's administrative expenses and loan subsidy costs.

Mr. Chairman and Members of the Subcommittee: It is an honor and privilege to have the opportunity to discuss the unique infrastructure financing needs of the rural local exchange carrier (LEC) industry. My name is Sam J. Maselli, and I am the Executive Vice President of the Western Rural Telephone Association (WRTA). WRTA is a regional trade association representing nearly 150 small rural commercial and cooperative telephone systems throughout the western United States and the Pacific Rim territories.

BACKGROUND

WRTA's member systems, like most of this nation's independent LEC's, evolved to serve the high cost, low density areas in the rural western United States. Congress recognized this unique dilemma confronting America's rural LEC's as early as 1949 when it amended the Rural Electrification Act (RE Act) to create the REA telephone loan program. With the future of rural America in mind, Congress charged the REA with the responsibility for making low interest rate loans to both "furnish and improve" rural telephone service at the local exchange level.

In subsequent years, Congress has periodically acted to amend the RE Act to insure that the original mission of the program is fully met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the REA was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. And in 1993, the Congress established a fourth lending component, the Treasury-cost program, and Congress eliminated most of the subsidy costs associated with the administration of the program. The formal consolidation of the Department's utility programs through transferring the telecommunications loan and technical assistance programs of the REA to the Rural Utilities Service (RUS) in 1994 further served to enhance and update the effectiveness of the agency in promoting rural infrastructure development.

Due to the difficulty of providing service in high cost, low density areas, Congress provided for long-term, fixed rate loans available at reasonable rates to borrowers to assure that rural citizens benefited from the highest quality of telephone service and affordable subscriber rates. Through this ongoing commitment to capital financing, Congress affirmed the goal of comparable and affordable telephone service for rural Americans as their urban counterparts.

As a result of this commitment to rural telecommunications, rural America has greatly benefited from the highest quality of information technology. Through its effort, Congress has played a critical role in developing a rural telecommunications infrastructure financing program which best responds to the needs of rural America.

THE OBLIGATIONS OF THE INDUSTRY CONTINUE

The RUS telecommunications loan program represents a remarkable public/private partnership success story which continues to produce tangible results in the lives of rural citizens. With the assistance of RUS capital and technical standards, rural telephone systems are providing modern telecommunications services of a highly sophisticated quality. However, with the rapid pace of change in the development of information technology, the need for RUS telecommunications lending is greater than ever.

Due to the nature of rural areas, particularly in the rural West, the challenge of providing modern telecommunications services is formidable. Compared to their urban counterparts, rural communities are faced with higher poverty rates, lower income levels, physical isolation and higher costs associated with deploying modern infrastructure. Economic development is often frustrated by these unique rural conditions. With the United States in the midst of the "information revolution," rural areas are confronted with the dilemma of being left behind.

The implementation of the Telecommunications Reform Act of 1996 has also added to the uncertainty and collective uneasiness of the rural telecommunications industry. Despite the Act's solid rural safeguard provisions, the Federal Communications Commission (FCC) has embarked in a regulatory direction which explicitly threatens rural ratepayers, services, and infrastructure investment.

Congress must keep a vigilant watch over the FCC to ensure that implementation of the Act is consistent with congressional intent. This is particularly true of RUS

program borrowers where the federal government has a significant loan security interest at stake. Whatever the outcome of the regulatory process, the RUS telecommunications loan program will be as important as ever to rural systems attempting to modernize their networks and improve service to rural residents.

THE PROMISE OF THE RUS PROGRAM

Despite the obstacles to rural economic revitalization, information technology holds significant promise for our rural areas. As we have seen in recent years, information services can directly benefit our schools, libraries, hospitals and clinics. In addition, telecommunications services facilitate commercial opportunities such as telemarketing, insurance, and manufacturing not possible in previous years.

While the explosive nature of technological change offers our rural communities genuine opportunities for economic and social progress, special attention must be placed on providing rural areas with the appropriate tools to address their unique set of needs. In this context, the RUS telecommunications loan program is playing a critical front-line role in ensuring that rural America is linked to the Information Superhighway.

Today, RUS borrowers average only 6 subscribers per mile compared to 37 per mile for the larger, urban-oriented telephone systems. This results in an average plant investment per subscriber that is 38 percent higher for RUS borrower systems. Without the availability of affordable capital financing, enhancing telecommunications networks for rural communities would be untenable.

The RUS is providing affordable capital financing to allow its borrowers to upgrade their plant and facilities for digital switching, fiber optic cabling, emergency 911, and other enhanced features such as ISDN, SS7, and CLASS. Due to the dependability of the RUS program, borrowers provide their rural subscribers with cutting edge services.

RUS telecommunications lending also performs a pivotal function of stimulating substantial private investment. In fact, RUS borrowers invest in telecommunications plant at a rate of \$4.80 for every RUS dollar spent.

In addition, the RUS telecommunications program boasts a proud financial record probably unprecedented for federal loan programs. To date, the program has never experienced a borrower-related default in its history. At the end of 1997, \$4.5 billion in principal and \$4.5 billion in interest had been paid by RUS borrowers. For nearly 49 years, this successful public/private partnership has worked.

In 1993, this partnership agreed to a \$31 million cut in the name of debt reduction, and it agreed to a twelve year freeze in program loan levels while other programs grew by at least the rate of inflation. This partnership is committed to providing service to areas long neglected by others. Ultimately, this partnership will foster the rural information network of the 21st century.

SPECIFIC RECOMMENDATIONS FOR THE SUBCOMMITTEE'S CONSIDERATION

RUS Telecommunications Loan Program.—Increasing demands for expanded telecommunications services and infrastructure upgrades suggests that the level of need continues. Congressional mandates as a result of the Rural Electrification Restructuring Act (RELRA) of 1993 (Public Law 103-129) have placed additional obligations on RUS borrowers to upgrade their technology in order to maintain their loan eligibility. To address the persisting need, WRTA recommends that the Committee consider the following RUS Telecommunications Program loan levels for fiscal year 1999:

5 percent Hardship Loans	\$75,000,000
Treasury-cost Loans	300,000,000
FFB Loan Guarantees	120,000,000
Rural Telephone Bank Loans	175,000,000
Total	670,000,000

These loan levels are the same as the current fiscal year's funding provided by Congress and represent a genuine commitment to rural telecommunications.

Removal of Interest Rate Ceiling on Treasury-cost Loans.—WRTA supports language removing the 7 percent interest rate cap on the program's Treasury-cost loans. This provision was originally included in the Agriculture Appropriations Act for fiscal year 1996 and continued for the current fiscal year. The inclusion of this provision for fiscal year 1999 will prevent a potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized loan levels. Stated simply, it is a continuation of current policy, and it promotes the viability of the program at zero cost.

Rural Telephone Bank (RTB) Issues.—During the course of fiscal year 1996, the Rural Telephone Bank began the statutory retirement of class A, government-owned stock. WRTA supports the restriction on accelerating the privatization process as conceived beginning in fiscal year 1996 of no more than 5 percent of total class A stock retired in one year. We believe that a continuation of this policy best addresses the orderly and systematic privatization of the RTB. WRTA also urges the Committee to continue the prohibition against the transfer of bank funds to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private B and C stockholders of the RTB have an interest in the assets of the bank and the protection of all funds.

For these reasons, WRTA is also opposed to the proposal contained in the President's budget that the costs of RTB administration and loan subsidy be funded by a transfer from the unobligated balances of the bank's liquidating account rather than by appropriations consistent with the federal credit reform act. WRTA believes that this proposal would impinge upon the ownership interests of the bank's stockholders.

In addition, we believe that funding the administrative costs of the bank through a transfer of unobligated balances of the bank's liquidating account rather than through appropriation is contrary to the RTB enabling act (Public Law 92-12). Budget language suggests that these recommendations would not result in budgetary savings, and no justification for this proposal is contained in the budget. Furthermore, this proposal would require new authorizing legislation prior to an appropriation.

Distance Learning and Telemedicine (DLT) Loans and Grants.—The RUS Distance Learning and Telemedicine (DLT) program has proven to be a remarkable tool for promoting rural development. The DLT loan and grant program administered by the RUS significant promise for the deployment of modern technology for scores of our rural communities. WRTA supports the President's request for \$150 million in loans delivered at the government's cost-of-money and \$15 million in grants for DLT purposes. We believe that the proposed level adequately responds to the overwhelming demand for DLT resources since the implementation of the program by the RUS in 1993.

CONCLUSION

Rural economic and social development and access to advanced information services are an inseparable combination for the future. The RUS telecommunications program has proven to be an indispensable tool for rural America. Its existence continues to improve the nature of rural life in our nation, particularly in our isolated Western communities.

We appreciate the opportunity to comment on this critical program. Thank you for your time and consideration of this issue.

PREPARED STATEMENT OF RONALD R. HELINSKI, CONSERVATION POLICY SPECIALIST,
WILDLIFE MANAGEMENT INSTITUTE

I am Ronald R. Helinski, Conservation Policy Specialist of the Wildlife Management Institute. Established in 1911, the Institute is staffed by professional wildlife scientists and managers. Its purpose is to promote the restoration and improved management of wildlife in North America.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES)

The Wildlife Management Institute (WMI) recognizes that the research and educational programs of the CSREES and its Land Grant Partners effect relevant, positive changes in attitudes and implementation of new technologies by private landowners, managers, community decisionmakers, and the public. This results in significant benefits to individuals and to the Nation through building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture. Since over two-thirds of our lands, approximately 1.35 billion acres, are controlled by over 10 million private landowners and managers, it is most appropriate that the CSREES-Land Grant System, with its grass roots credibility and delivery system, be adequately funded to translate and deliver research-based educational programs and new technologies to help the Nation's private landowners and managers move towards a more sustainable society. However, in the President's fiscal year 1999 budget, we see very little emphasis on natural resources research and education directed toward helping these clientele.

PURPOSE

The Wildlife Management Institute recommends that the fiscal year 1999 budget for CSREES should redirect funding to accomplish the following goals:

WMI recommends that the Renewable Resources Extension Act be funded at a minimum level of \$9.5 million in fiscal year 1999. The RREA funds, which are apportioned to State Extension Services, effectively leverage cooperating partnerships at an average of about four to one, with a focus on the development and dissemination of useful and practical educational programs to private landowners (rural and urban) and continuing education of professionals. The increase to \$9.5 million would enable the Extension System to accomplish the goals and objectives outlined in the 1991-1995 Report to Congress. The need for RREA educational programs is greater today than ever because of the fragmentation of ownerships, the diversity of landowners needing assistance, and the increasing environmental concerns of society about land use. It is important to note that RREA has been reauthorized through 2002. It was originally authorized at \$15 million annually; however, even though it has been proven to be effective in leveraging cooperative state and local funding, it has never been funded at a level beyond \$3.4 million. An increase to \$9.5 million would enable the Extension Service to expand its capability to assist over 500,000 private landowners annually to improve decisionmaking and management on an additional 35 million acres while increasing productivity and revenue by \$200 million.

WMI recommends that Smith-Lever 3(b)&(c) base program funding be increased by 9.0 percent to a level of \$280,950,770 with an appropriate portion of this increase targeted to Extension's Natural Resource and Environmental Management programs (NREM). The President's fiscal year 1999 budget requests a reduction of \$10,740,000 funding for Smith-Lever 3(b)&(c) funds from the fiscal year 1998 level. WMI appreciates that Smith-Lever 3(b)&(c) base programs provide "Block Grant" type funds for land grant universities to provide essential educational outreach based on local needs assessment. This will enable NREM programs to develop the critical mass of expertise at the state and local levels to redirect and leverage limited funding to address critical existing and emerging natural resource and environmental issues that are directly affecting small landowners and farmers in both rural and urban communities nationwide. Expanding Extension programs in natural resource public issues education on such issues as forest health, wetlands, endangered species, and human/wildlife interactions, as well as to strengthen its programs in urban and community forestry and environmental education as called for in the 1990 FACT Act is essential to address natural resource issues that are relevant to the sustainability of these critical resources. Such an increase targeted appropriately would help producers better understand and implement the changes in the 1995 Farm Bill Conservation Provisions. Moreover, we are concerned that appropriate positions in the Natural Resources and Environment Unit have not been retained to provide needed national leadership for critical interdisciplinary resources such as range management.

WMI encourages continuation of close cooperation between State CES's and their State Fish and Wildlife agencies, as well as other appropriate state and federal agencies and conservation organizations. Extension 4-H Youth natural resource programs and projects continue to increase with over 1,350,000 youngsters presently enrolled from both urban and rural communities across the Nation. Increased Smith-Lever funds targeted appropriately will enable CSREES to carry out its environmental education and NREM National Strategic Plan obligations nationwide.

WMI recommends restoration of the Rangeland Research Grants \$500,000 budget for fiscal year 1999. The Institute is disappointed that the practical and applied problems addressed by the Rangeland Research Grants (RRG) program were zeroed out in the President's 1998 budget and totally ignored in this fiscal year 1999 budget. Over one-half of the land area of the United States is rangeland; and elimination of the only federal competitive grants program for rangelands has serious implications for wildlife, watersheds, and other natural resources. Modest appropriations for RRG in the past have supported some of the most important rangeland research conducted over the past decade, and wildlife issues on rangelands will present some of the more critical rangeland research problems over the next decade. This would help increase the interdisciplinary capacity of research and educational programs to help landowners improve the adoption of forests and rangelands ecosystem management and the conservation of biodiversity on an ecoregion level.

WMI recommends that an appropriate portion of the total increased appropriation for Pest Management should be dedicated to educational programs for prevention and control of vertebrate pests in urban and rural communities and to address invasive exotic species and noxious weed problems on rangelands for restoring, managing, and sustaining the biological integrity of the Nation's natural resource base

upon which the agricultural and natural resource economies depend. WMI notes that a combined total increase of almost \$15.5 million has been recommended in the President's budget for Pest Management and related research and extension programs over and above increases received in fiscal year 1998. Vertebrate pests and invasive species have been identified in many states as posing the most significant problems, now and in the future, that agricultural and related crop producers and private landowners face. This targeting of Pest Management funds for research and educational programs would advance the knowledge and capability of landowners to reduce significant losses to vertebrate pests and invasive species.

WMI recommends that the Hatch and McIntire-Stennis funds be restored to fiscal year 1998 levels and, if necessary, redirected from the substantial \$32,800,000 proposed increase in NRI funding. WMI is pleased that the Administration proposes a 9.5 million increase in basic research identified under the National Research Initiative (NRI) as Natural Resources and the Environment; however, what is proposed under this "Area of Special Emphasis" clearly does not address critical natural resource research needs that the Natural Resource Community and the public are vitally concerned about. The Institute is alarmed at the significant reduction in both the Hatch Act and McIntire-Stennis research programs of over \$15.5 million. Both of these research programs, conducted by land grant university partners and other educational institutions, are crucial to addressing natural resource and environmental issues critical to agriculture and natural resource sustainability now and in the future.

SUMMARY

The Wildlife Management institute, based on the above considerations, recommends the following for the fiscal year 1999 budget of CSREES:

- (a) The RREA budget be increased to \$9.5 million;
- (b) Smith-Lever 3(b)&(c) base program funding be increased by 9.0 percent;
- (c) Rangeland Research grants be restored at \$500,000 level;
- (d) A portion of the Pest Management and related increase be targeted to provide increased research and education programs to address vertebrate pest prevention and control needs and invasive species and exotic weed problems; and
- (e) McIntire-Stennis and Hatch Act funding be restored to fiscal year 1998 levels.

PREPARED STATEMENT OF HON. JIM GERINGER, GOVERNOR, STATE OF WYOMING

This testimony supports fiscal year 1999 funding for the Department of Agriculture in the amount of \$300,000,000 for the Environmental Quality Incentives Program (EQIP). The State of Wyoming requests that \$12,000,000 of that amount be directed for EQIP activities to continue the functions of the Colorado River Colorado River Salinity Control Program, one of the programs made a part of the EQIP by Public Law 104-127. Designation of Colorado River Basin salinity control as an EQIP national conservation priority area is requested.

This testimony supports fiscal year 1999 appropriations for the Department of Agriculture's Environmental Quality Incentives Program to carry out Colorado River Basin Salinity Control activities. You recently received testimony from the Colorado River Basin Salinity Control Forum (Forum), on behalf of the seven Colorado River Basin States. The State of Wyoming, a member state of the Forum, concurs in that testimony submitted by the Forum's Executive Director, Jack Barnett. I wish to emphasize to this Subcommittee that EQIP funding to accomplish salinity control in the Colorado River Basin is critically important to maintaining the basin-wide Water Quality Standards for Salinity in the Colorado River System.

Interpretation by the Environmental Protection Agency of Public Law 92-500, the 1972 amendments to the Federal Water Pollution Control Act, led to the adoption of basin-wide water quality standards for salinity in the Colorado River in 1975. Those standards consist of numeric criteria at three lower river stations (Hoover Dam, Parker Dam and Imperial Dam) and a plan of implementation. Jointly developed by the States and involved Federal agencies, the Plan of Implementation is reviewed and updated each three years in accordance with Section 303 of the Clean Water Act. The overall strategy is to prevent salts from dissolving and mixing with the river's flow. The USDA's CRSC Program has focused on reducing deep percolation of applied irrigation water by reducing the amount applied through conversion from flood application to sprinkler systems and other irrigation water application procedure improvements. Changing irrigation methodologies and other irrigation improvements have provided some of the most cost-effective (dollars spent per ton of salt loading reduction) means to control salinity loading into the river system available in the Colorado River Basin.

In June 1974, Congress enacted the Colorado River Basin Salinity Control Act (CRBSCA) which directed the Secretary of the Interior to proceed with a program to enhance and protect the quality of the water available in the Colorado River for use in the United States and the Republic of Mexico. Implementation of the Salinity Control Act is necessary to assure that the U.S. complies with both the quality of water delivery requirement under a 1973 amendment to the Mexican Water Treaty and the water quality standards for salinity established in the United States. The USDA was directed to establish a major voluntary on-farm cooperative salinity control program by the 1984 amendments to the Act. Since that time, a cost-effective on-farm program involving six units located in the states of Colorado, Utah and Wyoming has been initiated. Through fiscal year 1996 almost 230,000 tons of salt loading reduction per year had been put into place on these USDA Colorado River Basin Salinity Control units. Prior to its incorporation into USDA's Environmental Quality Incentives Program, the USDA's on-farm Colorado River Salinity Control (CRSC) program was working; providing the least cost means of controlling salt loading available to the basin-wide program and providing important benefits to producers installing salinity reduction practices and downstream water users for whom the salinity concentrations of Colorado River water creates severe economic damages and detriments. The Bureau of Reclamation has recently updated studies on the economic impacts of these salt concentrations in the River and estimates that damages to United States' water users may soon be approaching \$1,000,000,000 per year.

The Federal Agriculture Improvement and Reform Act of 1996 (Public Law 104-127) combined the CRSC Program and three other programs into the newly-created Environmental Quality Incentives Program (EQIP). Public Law 104-127 is explicit in stating that the functions of the CRSC Program would continue as a part of EQIP. We view the inclusion of the Salinity Control Program in EQIP as a direct recognition on the part of Congress of the Federal commitment to maintenance of the water quality standards for salinity in the Colorado River—and that the Secretary of Agriculture has a vital role in meeting that commitment. The intent and approach of the EQIP is that this agricultural program is to be "locally led and driven." We agree with that approach, but experience over the past several years has indicated that the basin-wide CRSC Program (now a part of EQIP) is not being funded at a level adequate to ensure that the water quality standards for Colorado River salinity can be maintained.

As we have observed the start-up and administration of the EQIP over that past year and a half, EQIP is not working relative to the Congressional directive to "carry out salinity control measures in the Colorado River Basin as part of the Environmental Quality Incentives Program" (Section 336.c.1 of the FAIRA, amending Section 202.c. of the CRBSCA). Locally led, locally-derived resource management priorities are both displacing and preempting salinity reduction program activities that have both international and basin-wide significance and importance. Experience is indicating, as we observe the EQIP resource allocation and funding process at work, that local working groups and state technical committees do not feel obliged to implement the above-mentioned Congressional directive with regard to salinity control. Local working groups and state technical committees are unable and perhaps should not be expected to maintain the "national perspective" (e.g., maintaining basin-wide water quality standards and a water quality commitment to the Republic of Mexico) when local priorities are competing for limited EQIP funding to accomplish very visible, local resource management goals and objectives.

For these reasons, the State of Wyoming urges this Subcommittee to direct the Department of Agriculture to establish an EQIP national conservation priority area for Colorado River Basin salinity control. Numerous requests by the Forum and its participating states for designation of the basin-wide salinity control program as an EQIP national conservation priority area have gone unheeded by the Department of Agriculture. It is our contention that the proposal for national conservation priority area designation has great merit and is urgently needed to keep the basin-wide salinity control program on track. As time passes, it is becoming clear that implementation of USDA's salinity control program is falling further behind under the present administration of the EQIP. I wish to emphasize that the USDA portion of the basin-wide salinity reduction effort is critical to the continued success of the salinity control program.

In the President's Recommended Budget, the Administration has indicated its intention to borrow \$300,000,000 from the Commodity Credit Corporation (CCC) for EQIP in fiscal year 1999. This increase of \$100,000,000 over the prior fiscal year's level will be most helpful in addressing important environmental needs across this nation. We urge the Subcommittee to remind the Secretary of Agriculture of his obligations to continue the Colorado River Salinity Control Program under EQIP and

to direct that no less than \$12,000,000 of the fiscal year 1999 EQIP funding allocation be expended for Colorado River salinity control.

Wyoming is represented on both the Colorado River Basin Salinity Control Forum and the Colorado River Basin Salinity Control Advisory Council, created within the 1974 CRBSCA. Like the Forum, the Advisory Council is composed of gubernatorial representatives of the seven Colorado River Basin states. It serves as a liaison between the seven States and the Secretaries of the Interior and Agriculture and the Administrator of the Environmental Protection Agency (EPA). The Council advises these Federal officials and the involved agencies on the progress of efforts to control the salinity of the Colorado River and annually makes funding recommendations, including the amount believed necessary to be expended by the USDA for its on-farm Colorado River Salinity Control (CRSC) Program. The Forum's testimony is in accordance with the Advisory Council's written recommendations.

During its October, 1997 meeting, the Advisory Council recommended that at least \$12,000,000 be expended by the Department of Agriculture for cost-sharing to implement salinity reduction practices (funds that are matched with individual contractor's cost-share funds) in fiscal year 1999, plus sufficient funds for administration, technical information and education activities. The Council's recommendation is based on assuring that the progress of removing salt and preventing additional salt loading into the Colorado River system stays on schedule with the Plan of Implementation. Should a lesser funding level be provided for this important basin-wide water quality program, the progress (as measured in tons of salt prevented from entering the Colorado River system) achieved by the USDA component of the multi-agency, state and federal Colorado River Basin Salinity Control Program will fall far short of meeting the rate of salinity control determined to be needed to maintain compliance with the water quality standard's numeric criteria for salinity.

Falling further behind the schedule set forth in the water quality standard's plan of implementation raises vitally important questions about whether the Basin States can be assured that the water quality numeric criteria for the Colorado River will continue to be complied with in the future. Accordingly, if less salt is removed from the Colorado River than specified in the Plan of Implementation, salinity concentration levels of Colorado River water at the three downstream stations will exceed the numeric criteria values established for those stations.

The Forum and Advisory Council have both enjoyed a good working relationship with the Department of Agriculture since the 1984 amendments to the CRBSCA mandated direct involvement and a significant role in salinity control by the Department of Agriculture. Prompt, appropriate measures to ensure the viability of USDA's salinity control efforts are needed to continue that productive relationship.

I wish to thank you for the opportunity to bring to your attention the status of the Colorado River Basin Salinity Control Program component of the Environmental Quality Incentives Program and the necessity to remind the Department of Agriculture to carry out the Congressional directive in Public Law 104-127 to continue the functions of the salinity control program. I am pleased to submit this testimony and would request, in addition to your consideration of its contents, that you make it a part of the formal hearing record concerning fiscal year 1999 appropriations for the Department of Agriculture.
