**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

THURSDAY, FEBRUARY 10, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:30 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Specter, Bond, Gorton, Burns, Stevens, Kohl, Harkin, Dorgan, Feinstein, and Durbin.

DEPARTMENT OF AGRICULTURE

OFFICE OF THE SECRETARY

STATEMENT OF DAN GLICKMAN, SECRETARY OF AGRICULTURE

ACCOMPANIED BY:

RICHARD ROMINGER, DEPUTY SECRETARY

KEITH COLLINS, CHIEF ECONOMIST

STEPHEN B. DEWHURST, BUDGET OFFICER

DOUG SHUMAKER, UNDER SECRETARY, FARM AND FOREIGN AGRICULTURE SERVICES

OPENING STATEMENT OF SENATOR THAD COCHRAN

Senator COCHRAN. The subcommittee will please come to order.

We are under some tight time constraints this morning, and I apologize immediately to the Secretary and his colleagues who are here to present the President's budget request to us for our review this morning.

We have a vote that is scheduled to commence on the floor of the Senate at 11 o'clock, and that gives us a chance, maybe, to make some opening comments and hear from the Secretary, and probably we will not have a chance for many questions before we have to go vote.

So, I am going to abbreviate my comments, and if we start on time, that may also give us a head start on those who might have arrived a little later. I know there are other Senators who are going to come over for the hearing. With everyone's cooperation and understanding, we will proceed.

Let me just make a couple of observations about the budget request as I have reviewed it. It seems to me that the things we should notice right off include the fact that the President is asking

for discretionary appropriations from this committee that will amount to a 9 percent increase over this year's spending level.

And one other thing that I noticed right away is that the budget request includes proposals for the Congress to impose user fees, which in my view, user fees are new taxes in disguise, of \$568 million. The people who are going to pay these are the producers of food and agriculture products, the processors, and the handlers. The grain inspection process will be hit, among others.

Another thing that strikes me as noteworthy as well, the budget includes \$153 million to create the New Delta Regional Authority to assist the Lower Mississippi Delta region.

This proposal includes \$30 million in new resources to create the new authority, and the definition of how the funds are going to be spent is very vague.

Now, there is a phrase that I remember from law school where something could be "void for vagueness". If there is any truth in that, it may be reflected in the description of how the funds are going to be used.

And I am suspicious, to be honest, about whether this is going to really provide the benefits that are advertised by this Administration to help lift those who are in poverty and who are having a hard time in the delta region of the United States.

I am not going to make any assumptions about who gets the money, but creating a new authority with \$30 million sounds like a lot of money to me to hire people to help others. You are going to be helped if you are hired, but if you are not hired by the new Delta Regional Authority, you are probably out of luck. That is my concern. I really hope the Administration will take a hard look at an alternative.

For example, using the resources at Delta State University, at Mississippi Valley State University, at Alcorn State University, where research is being done, where efforts are being made to educate, to try to help lead and other new initiatives that will uplift that entire region, I think the money could be better spent if it is given to those universities and those educational institutions where they have a proven track record of success, where they understand the problems of the Delta better than a Washington person who comes down there to run a program. And in my view, we would be a lot better off if that is the way that program is run.

There is another big concern that I have, and I think the Department of Agriculture is doing a better job than many other agencies of our government, and that is to break down these barriers to trade, trying to get to the bottom of the suspicions and the allegations that are being made internationally about the dangers of our seeds and our food products that are being exported all over the world because of genetic modifications, because of changes that have been made through the use of technology to protect the environment, to promote efficiency, to try to deliver to the consumer a healthier product.

All the good things that have happened because of biotechnology and many other technologies that are used today in the production and processing of food and food products is all being lost in this din of controversy and criticism and demonstrations and riots in Seattle. I think the Department of Agriculture is doing a good job in

this area, and I hope the other agencies of the government will support the initiatives of this department.

So, I know you are working hard on this, Mr. Secretary, personally, but I want to encourage you. In my judgment, those are the problems in agriculture that are going to require additional spending this year, and you recommend here \$11 billion over 3 years for new legislative costs, not new appropriations, I notice, but new laws, to provide a safety net initiative to protect producers from counter cyclical changes and the fall off of revenues and profits.

That is just a drop in the barrel as to what it is really going to cost if we are not able to overcome these misguided, uninformed, but nonetheless very real, attacks against American agriculture.

I ended up talking too long, but I feel very strong about those issues, and I hope that the other members of the committee will forgive me for those comments.

I am going to recognize senators in the order in which they came to the hearing.

Senator Dorgan.

STATEMENT OF SENATOR BYRON L. DORGAN

Senator DORGAN. Mr. Chairman, thank you very much. And I will be mercifully brief, recognizing that we have an 11 o'clock vote.

Mr. Chairman, I want to welcome the Secretary and his team. They are good to work with. They have had about as tough a job as you can have in this country, administering a farm program that, in my judgment, is not a very workable farm program during periods of collapsed prices. It simply does not provide the safety net necessary to give family farmers a chance to make a living during price collapse.

Again let me say to the team that Secretary Glickman has: You are working hard and we appreciate that. We need to give you some help. We need to change the underlying farm program.

Now, one feature in this proposal, Mr. Chairman, that I think is a significant step is a proposal that says, "Let us move towards some counter cyclical help for family farmers."

It is, I think, a move, following your statement, Mr. Secretary, that we need significant changes in the farm program. I think your budget proposal is a significant step in the right direction. Is it far enough? I do not know. But is it in the right direction? Absolutely.

And that is a breath of fresh air, and you are going to find a lot of support from people here on Capitol Hill especially people like me who feel that you are moving in the right direction.

We have, in many ways, the worst of all worlds at the present time. This committee, the Appropriations Committee, has had to pass two successive emergency bills essentially to cover the deficiencies in the Farm Bill, which is not designed to help, during price collapse.

And I just want to show one chart, that in my judgment, shows the combination of the worst possible results. This chart shows that at the same time that we have had less income for family farmers, we have had more spending by the Federal Government. I mean this is a combination of the worst of all worlds, more spending by the government and more misery for family farmers.

We can certainly do better than that. And I hope that your recommendation, in this budget saying, “Let us move to a counter cyclical approach to helping family farmers during tough times,” triggers action here in Congress that says, “Yes, let us do that. Let us do it together.”

PREPARED STATEMENT

This is not about Republicans or Democrats. There is no partisan way to go broke on the family farm. And when prices collapse, we need a decent farm program to help, and your recommendation is a step in that direction.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BYRON L. DORGAN

Rural America—particularly family farmers—is facing the greatest crisis in decades, but instead of recognizing the importance of those who grow our food, we’ve all but ignored their situation. The crisis, now in its third year, is driven by many things. But at its core is the current farm policy that has failed our producers. We’ve enacted two major disaster bills to try to help as many producers as we could make it through these horrible times with no safety net. And yet, there are those who still refuse to acknowledge the failure of their policy and find something that will work.

We’ve been told that the Freedom to Farm program is fine, and family farmers can reply on Congress to pass disaster programs to prop up income. That is simply illogical. In 1998 and 1999, government payments to producers exploded and net farm income still decreased.

I’ve held the first in a series of hearings to outline the impact this failed policy has had in rural America. These hearings are necessary for a variety of reasons, but foremost among them is the continued refusal of the Senate Agriculture Committee to schedule hearings. The Chairman of the House Agriculture Committee acknowledges there are serious problems with the program and has scheduled such hearings. Family farmers certainly know it has failed. And now, the President, speaking through the Secretary of Agriculture, has acknowledged that the program has failed and must be re-written.

In response, I plan to soon offer a farm proposal that will act as a counter-cyclical safety net. The administration has offered a similar and immediate response.

In its elemental form, any successful plan must target family farmers through counter-cyclical methods to help them in times of low prices. Conservation programs must be addressed and crop insurance must be improved to eliminate abuse and fully compensate producers for losses. Finally, a plan must include tools for rural communities to succeed and reap the benefits of our rolling economy. The Administration’s plan includes these elements, and though it must be expanded to be truly beneficial and successful, the plan is a good start.

This initiative recognizes that Freedom to Farm has failed and underlines the need to provide immediate replacement. The Administration lays out a framework for assistance. Now we need to match it with a substantive plan.

PREPARED STATEMENT

Senator COCHRAN. Senator Burns.

Senator BURNS. Mr. Chairman, I have a prepared statement, but in the essence of time, may I submit my statement, and as well include my comments in the question and answer?

Senator COCHRAN. Without objection, your statement will be printed in the record. Thank you very much.

[The statement follows:]

PREPARED STATEMENT OF SENATOR CONRAD BURNS

Mr. Chairman, thank you for holding the hearing today in such a timely manner. It is only February 10 and you have started the ag appropriations process rolling. I commend you for starting the process early. I know that Montanans are anxious to see what we can do to help agriculture this year. I would also like to thank the Secretary and other witnesses for coming to appear before us today.

I have some real concerns with this budget. In another year of projected bad prices for agriculture, I am concerned that this budget was put together without any input from Congress, or from producers. There is an obvious failure to implement many of the focus areas that farm-state senators have been consistently pushing for. There are cuts to export programs, to Rural Utilities, to APHIS and to ARS. These programs have been a focus for funding to assist agriculture for many years.

First of all I don't understand why this administration is asking for less money than last year. It is abundantly clear that prices are not going to be better for farmers this year. Emergency spending was a major portion of the expenditures last year. It is time to take a close look at where the markets are, and decide what we are going to do to actually help the producers who are faced with low commodity prices.

I also have some major concerns with the new Farm Safety Net USDA is proposing. I'm glad the president has come to the table with a proposal but a \$30,000 cap on payments is ridiculous. How can producers support their families and stay in business on \$30,000? The answer is: they can't. 18 percent of producers in this nation account for 85 percent of production. I find it hard to believe that this proposal won't hurt more producers than is currently anticipated.

\$1.3 billion for conservation in the farm safety plan is a fairly large increase over last year's budget. I am hopeful that this is not a move to lock more land out-of-production or to promote an environmental agenda that is not in the best interest of the agricultural community. The Administration's budget includes \$236 million as part of the Land's Legacy Initiative. Of that, \$130 million will be used to acquire lands for recreation, wildlife habitat, & watershed protection. A portion will be used to establish & expand community forests and open spaces. The "A" in USDA stands for "agriculture"—not "acquisition of lands". Setting aside such sums of money for purchasing land for wildlife habitat is not my idea of assisting our producers.

To add to that, these new programs increase the need for FSA staff. Without a significant price upswing during the upcoming 12 months we will again see a high level of activity in FSA's LDP and price support programs. Also, as part of the farm safety net initiative, CRP acres will be increased from 36.5 million acres to 45 million acres, meaning there will be more contracts to administer. What's more, this administration is also proposing a farm facility loan program. These programs will accomplish nothing with the current staff levels USDA has estimated.

Nearly every export program was cut. The Public Law 480 program was cut drastically as was the Section 416 program. The export subsidy program shows a decrease in funds of \$154 million. At a time when we are fighting for a place in the world market why are we cutting funds for important export programs?

Farm-states like Montana depend on export programs for their agricultural economy. My farmers and ranchers need to have these markets open. They have been virtually cut off from over 10 percent of the world market, due to sanctions and under-funded and under-utilized market development programs. The disregard by this administration to use these programs allows our competitors an open door to those markets.

In times like these our producers need every available marketing option open to them. We cannot afford lost market share. The Market Development Program (MDP) and the Export Enhancement Program (EEP) especially, provide much-needed help to farmers and ranchers to create new product markets. Let's use the tools we have.

Wildlife Service funding was decreased again this year. I have been trying consistently to get more funding for predator control. Year after year, this administration takes it away. The re-introduction of the wolf has caused severe predator problems in Montana. Yet, I had to include line-item funding in the budget last year to take care of my livestock producers because the USDA won't fund the clean-up for the mess they made. I am more than a little frustrated to see that this administration continues to disregard the well-being of agricultural producers for predator control. Not to mention, that to fund this program would improve wildlife habitat considerably. The coyotes and wolves continue to kill not only sheep and calves but deer and other wildlife as well. We don't need more conservation programs to save wildlife. We need to fund predator control.

I have been a major proponent of bringing telecommunications to rural areas. Bringing Internet access to Montana farmers and ranchers increases market opportunities. It provides valuable information on agricultural research. A vast amount of information is made available to better their farm operations and improve their bottom line. The Internet is becoming an increasingly valuable tool for agricultural producers and Rural Utilities Service (RUS) funding is an important part of that. Farmers and ranchers cannot afford to take the prices given them. They must utilize new avenues of marketing and expand their horizons. Telecommunications provides that service. Let's help them use it, not take it away from them with a cut in RUS funding.

ARS is this year trying to cut the funding I was able to include for the Northern Plains Research Lab in Sidney, MT. This funding is to be used for by three new scientists on plant pathology, irrigation and value-added crops. This funding is vital for innovation in agriculture. As I stated earlier, producers need new avenues and new methods to market their products. USDA, who is supposed to be a proponent for agriculture, surely doesn't want to take that away.

On that same note, the Economic Research Service (ERS) budget was also decreased. ERS provides important market information to agricultural producers. Many Montana producers rely on reports issued by ERS for cattle numbers and market reports. Again, the USDA is not giving producers a fighting chance to make their own way in the global market.

The Administration's budget suggests that there is strong support for USDA Civil Rights activities. Unfortunately, I find that very difficult to believe. The USDA has not proved their commitment to the civil rights issue. In Montana, we have cases that have been languishing at the Office of Civil Rights for years. These cases must be solved and they must resolved quickly. I am failing to see the action if this is indeed a high priority for the USDA.

Thank you again Mr. Chairman, I look forward to hearing some answers from the USDA, and more importantly to working with you in the coming year to improve the economic situation for the American farmer and rancher.

STATEMENT OF SENATOR ARLEN SPECTER

Senator COCHRAN. Senator Specter.

Senator SPECTER. Thank you very much, Mr. Chairman. I have just a very few brief comments.

And first, let me welcome my long-standing friend, Dan Glickman, we hale from Wichita, Kansas together. Our tenure in Wichita did not overlap. I left in 1942, and he arrived there——

Secretary GLICKMAN. In 1944.

Senator SPECTER [continuing]. In 1944 at the Saint Francis Hospital.

Secretary GLICKMAN. Wesley.

Senator SPECTER. Wesley Hospital.

Secretary GLICKMAN. Frederick County was blessed——

Senator SPECTER. I am not sure if they were blessed.

Secretary GLICKMAN [continuing]. Not by Arlen leaving, but by my coming.

Senator SPECTER. He has always been quick on the uptake. He beat me to the punch there again.

Two areas that I want to mention very briefly, and as usual, it is a very heavy morning. Secretary Slatter is testifying on Transportation, and Judiciary has some important matters on the agenda, and we have the early vote.

But I want to comment about the problems of milk pricing in my State, Pennsylvania, where the price per hundred weight is down now under \$10. A year ago it was \$17, in December of 1998. It was \$9 plus in December of 1999, and those variations just make it impossible.

We have lost 300 to 500 farms in Pennsylvania a year in the time period of 1993 to 1998. We do not want to see America with

solely agricorps. We have a big regional battle between Wisconsin, Minnesota on one hand and area compacts. We worked out a compact for the northeast, but as a matter of fairness, it ought to extend to states like Pennsylvania. And we really need to find some way to deal with these cataclysmic variations in pricing.

The other comment I want to make is about the disaster matter. The Mid-Atlantic States suffered \$2.5 billion in disaster last year. Pennsylvania had \$700 million. While we had a farm bill of \$8.3 billion in emergency disaster assistance, only \$1.2 billion went for disasters, which included Hurricane Floyd and flooding in the Midwest, losses to livestock and fishery. And that again is an issue which we have to address.

I know that you are doing an excellent job, Mr. Secretary. Herculean efforts against so many, many problems, but I wanted to focus on those two problems which are really not just Pennsylvania problems, but national problems.

Thank you very much, Mr. Chairman.
 Senator COCHRAN. Thank you, Senator.
 Senator Gorton.

STATEMENT OF SENATOR SLADE GORTON

Senator GORTON. Thank you, Mr. Chairman. I join with you in welcoming the Secretary of Agriculture whom I believe is not only highly competent, but energetic and caring. It is, therefore, with deep regret that I express my extreme disappointment in the budget that the Administration has submitted for the Department of Agriculture.

It seems to me to accelerate a trend which has already been too evident in turning the Department of Agriculture from a department interested in the producers and the produce of farms of the United States into another welfare department. We have significant increases in expansions in this bill for things like food stamps.

We have disguised the methodology of accepting the protocols through monies spent by the Department of Agriculture. We have empowerment zones. But what we do not have is a promotion that oversees the sale of our commodities.

You know, we, in the Pacific Northwest, have lost a substantial portion of our market in Pakistan for our wheat when the Foreign Agriculture Service told Pakistan it was not available when it was stacked up everywhere. We have a budget that continues to ignore foreign market development.

With respect to the farm safety net plan which has some positive qualities, it ignores minor crops. You helped these to a certain extent last year with that, but we have gotten no cooperation from the Department of Agriculture on it at all. And I am just increasingly frustrated that what we have is a Department of Agriculture that seems to be interested in almost everything other than agriculture itself, and hope that we can reverse that direction.

Again, the Administration has presented you with a great difficulty on university and locally oriented research, something you have always supported very strongly, and that the Department of Agriculture wants to centralize, if to do it at all.

So, I am afraid you and your ranking member, Mr. Chairman, have a great deal of work to do to turn this into a decent agricul-

tural budget. But I must say that my experience is that you have the competence and ability to do just that.

Senator COCHRAN. Thank you very much, Senator.
Senator Bond.

STATEMENT OF SENATOR CHRISTOPHER S. BOND

Senator BOND. Thank you very much, Mr. Chairman. I join with my colleague from Washington in expressing our confidence that we will be able, in this committee under your leadership and that of Senator Kohl, to restore and write the priorities that this committee and the departments should be pursuing.

Mr. Secretary, I appreciate your being here today, and we do have many areas of mutual interest. I think everyone here understands the farm prices are very low. Congress has responded in preceding years with significant supplemental assistance, roughly \$15 billion.

We hope conditions will improve, but I am not that much of an optimist to think they will, and we are going to have to respond again and we look forward to, and I hope to have more leadership this time, and more information from the USDA on the scope of the problem so we can craft the emergency appropriations relief in a manner that reflects the best information used and your offices can obtain.

One of the driving forces influencing market practices and market prices is trade. It was a pleasure to see you in Seattle. I know you were there. I managed to wash the pepper spray out of my face after a few minutes. I subsequently got behind Senator Burns, and I figured I would let him take the pepper spray, because he would be a better target.

Secretary GLICKMAN. I may just say he was with me the last time we were assaulted by somebody throwing bison guts on us. You do not want to stay too near him.

Senator BURNS. We draw a lot of attention.

Senator BOND. I have—Mr. Secretary, I have a very able former college wrestler, great athlete, who is my AG-LA and he was off at the store making photocopies when we got into the problems. So, we have had to train him on staying on task when we get into those situations.

But we did see there the kind of hysteria, the kind of impediments, that are being thrown in the way of trade, that are being thrown up by the Europeans to prevent competition, from better equipped, more technologically advanced American farmers. And the GMO nonsense is now being spread in the United States.

And I know, Mr. Secretary, you have spoken on behalf of the farmers, of scientists, of health professionals, and consumers of using the technology to provide these extraordinary benefits that biotechnology can provide for human, health and the environment, and we all know more sustainable production and more nutritious food, new medicines, vaccines and other energy and industrial products.

I have here a letter that I took to Seattle signed by over 500 scientists supporting biotechnology, and expressing their scientific confidence in the current regulatory scheme administered by FDA and EPA and USDA. The letter has a statement from the National

Research Council of the National Academy of Sciences saying that GM crops pose no distinct risk distinct from normal breeding.

The FDA has said the same thing in the Federal Register. FDA is not aware of information that would distinguish genetically engineered foods as a class of foods developed through other methods of plant breeding, and that the agency does not require that such food be specifically labeled to disclose the methods of development.

We have, for years, used hybridization and cross-breeding. That is an unspecific effort to achieve a favorable mutation. One could cross-breed a greyhound and a pit bull and get a dog that could not run and would not fight, but with genetic engineering, specific traits can be selected, and we can learn, we can have a certainty in advance what is being developed.

I also have a declaration here supporting biotechnology and endorsing the current methods of regulation signed by over 1,000 scientists including Nobel Prize winners James Watson and Norman Borlaug, and I have a policy statement from the American Medical Association endorsing biotechnology, urging physicians to be public spokespersons for agricultural biotechnologies.

And finally, even more interesting, an interview with Patrick Moore, a Ph.D. in ecology, admonishing that this new era where pagan beliefs and junk science are influencing public policy—he cites GM Foods as an example where policy is being influenced by arguments that have no basis in fact or logic. Dr. Moore was a founding member of Green Peace, and he has left that organization.

Nevertheless, we still see a vocal, aggressive, and in some cases, lawless group of advocacy organizations and competing businesses, as well as European protectionists who seek to discredit and eliminate biotechnology. And we have just seen that biotechnology can provide the nutrition that developing countries need through the insertion of the beta-carotene, Vitamin A gene into rice.

I am going to ask, for the record, a series of questions like, for example, “Is this a largely untested technology?” I would like your responses. I want to work with you on that.

And finally, as you may recall, I have contacted you again about the Foreign Agriculture Service office in Singapore, which is a linchpin in that country. I will be following up.

Mr. Chairman, I apologize for the length of this statement, but I want to be working very closely with the Secretary and the other regulatory agencies in this area in the years to come. Thank you.

Senator COCHRAN. Thank you, Senator.

Senator Durbin.

STATEMENT OF SENATOR RICHARD J. DURBIN

Senator DURBIN. Thank you very much, Mr. Chairman. I understand we are going to try to keep our remarks brief here so that we can be off to a vote in a few minutes.

I want to welcome the Secretary, my friend and former colleague, as well as his team. Secretary Glickman, you have done a great job, and I am glad that you decided to stay in public service and to perform this role, for all of us across America are concerned about the future of agriculture.

Over the last 4 years, freedom to farm has fizzled and failed. If I had to give it a grade, I would give it an F, and I voted for it. But I did not think I had voted for a bill, or a law, that was written in stone.

We have been spending more federal money trying to bail out farmers than ever in our history. Yet we in Congress refuse to take a look at the law that is governing these payments. And frankly, we lurch from year to year with emergency appropriations containing provisions which many of us will never be able to defend if we are put on the spot for specifics, instead of looking at the big picture.

Some of my colleagues believe trade is an important part of this. I do, too. But I think there are other elements. When a State like mine has reports from the University of Illinois that about a fifth of the State's 73,000 farms will not cover their 1999 operating expenses, and the majority will not make enough to cover family living expenses, this is a true disaster, because Illinois is a pretty strong state when it comes to farming. We usually do not catch a cold the first time around, and others suffer before we do.

So, I hope we can work on, perhaps, addressing some chances in freedom to farm that really will help farmers over the long haul.

The last point I would make, Mr. Chairman—and thank you for this opportunity. I just returned several weeks ago from Africa, and my visits there have had such dramatic impact on me, having seen the devastation of the AIDS epidemic.

[The statement follows:]

PREPARED STATEMENT

Food assistance that the United States is sending is critically important in dealing with what could be the greatest moral challenge of our time. And I also want to tell you that the agricultural research that we have been involved in Africa has reaped benefits far beyond what we can measure in continuing to provide foodstuffs for people who are living merely on the edge of life. I hope we can continue that. I have entered some legislation to move along that line.

I thank you for being here today. Thank you.

Senator COCHRAN. Thank you, Senator.

[The statement follows:]

PREPARED STATEMENT OF SENATOR RICHARD J. DURBIN

Chairman Cochran, thank you for holding this important hearing this morning. I look forward to working with you and Senator Kohl on the fiscal year 2001 Agriculture Appropriations bill.

Mr. Chairman, it's always good to have Secretary Glickman before this Committee. I've had the pleasure of serving with him in the House and working with him in his capacity as Secretary and find him to be dedicated, energetic, and responsive. We're lucky to have him at USDA. Mr. Secretary, welcome back.

I would like to take a few minutes this morning to talk about some very important issues that affect the Department.

First, I am encouraged by the Administration's proposal designed to improve the farm safety net. A quick review of that proposal suggests that it would be a significant boost to Illinois farmers. In fact, it would mean more than \$140 million under USDA's Supplementary Income Assistance Program, over \$60 million for conservation programs, and more than \$64 million in new risk management assistance for Illinois farmers in the first year alone.

Obviously, our farmers need help. According to a University of Illinois study, about a fifth of the State's 73,000 farms won't cover their 1999 operating expenses

and a majority won't make enough to cover family living expenses. Farm net worth is expected to drop about 15.5 percent on average. The Illinois Farm Bureau predicts that about 18 percent of Illinois farms will have negative 1999 net incomes and about 22 percent are in danger of going out of business.

Mr. Chairman, since 1989 the Federal Government has spent \$27 billion in emergency funding for farm-related disasters, 60 percent or \$15.9 billion in the last 2 years alone.

I think it's important for all of us to realize that the 1996 Farm Bill, Freedom to Farm, was not written in stone. It can and should be changed. I believe we must start now by reforming Freedom to Farm because clearly it has failed to meet the most basic needs of producers. Restoring the farm safety net, targeting payments to farmers in need, and ensuring that livestock producers are not left behind should be the first steps. And, Mr. Secretary, I believe you have opened this critical dialogue with your proposal.

I also believe that we should begin a bipartisan effort to expand markets for American agricultural products so that farmers can take advantage of the immense buying capacity of developing countries. And, reforming crop insurance should be on the top of everyone's "to do" list.

We must also work to broaden the market for alternative uses of agricultural products. More specifically, I hope that my colleagues in Congress, and the Clinton Administration, will make every effort to expand the role of ethanol in the reformulated gasoline program. Knowing what we know about MTBE, this should be a top priority. I believe expanding ethanol's role is a win for our farmers, a win for the environment, and a win for the rural economy.

We have a great deal to do and a very short year in which to accomplish these initiatives for rural America and our farm families. It's time for Congress to roll up its sleeves and get to work.

Now at the risk of repeating myself, let me mention food safety.

Our country has been blessed with one of the safest and most abundant food supplies in the world. We have the science and know-how to make it even safer.

Currently, our food safety system is fragmented with at least 12 different federal agencies, 35 different laws governing food safety, and 28 House and Senate subcommittees with food safety oversight. With overlapping jurisdictions, federal agencies often lack accountability on food safety-related issues.

As you know, I've introduced legislation—the Safe Food Act of 1999—that would replace the current fragmented federal food safety system with a single, independent food safety and inspection agency. This new agency would be funded with the combined budgets from the 12 federal agencies which currently have jurisdiction over food safety. A single, independent agency would create a streamlined food safety system and lead to improved enforcement of food safety and inspection.

I hope the Department will continue to explore this idea and work with me on ensuring that our food supply is the safest in the world.

Mr. Secretary, I want to take a minute to thank you and the Department for your fine work in Chicago and the surrounding suburbs with regard to the Asian Longhorned Beetle.

As you know, the City of Chicago and the State of Illinois have been battling these pests for over 2 years now. Both APHIS and the Forest Service have been invaluable partners in this effort. I'm pleased to see that the President's Budget includes \$29 million, a fivefold increase in funding, for emergency efforts to fight Beetles in Illinois, New York, Vermont, and Pennsylvania. It is my understanding that Illinois may receive up to \$7 million for Beetle eradication and tree replacement in fiscal year 2001. I know my colleague Senator Kohl from nearby Wisconsin is watching anxiously as the State and City continue to battle the Beetle.

Mr. Secretary, I'm concerned that the Department chose to recommend cutting a number of important ARS projects at the University of Illinois Urbana-Champaign and at the ARS lab in Peoria, in particular, regarding soybean diseases. Further, ARS does not include any funding for modernization efforts at the Peoria lab. I'll be working with my colleagues on this committee to address these omissions.

Allow me to touch briefly on Africa. As you probably know, I was in Africa in January and had an opportunity to see U.S. food aid programs in action. I was impressed and heartened by direct feeding programs as well as programs that sell U.S. food products at low cost to finance development projects. But I was overwhelmed by the impact of AIDS on Africa—particularly by the millions of children being left orphaned by the epidemic and the devastating impact on African countries' economies. I believe U.S. food aid could be used to target communities heavily affected by AIDS. I introduced a bill to target \$50 million of U.S. food aid for nutritional assistance for people living with AIDS, for families and children affected by AIDS, and for development projects for communities heavily impacted by AIDS.

I would like to get the Department's views on the potential for U.S. food aid being used to help those children, families, and communities affected by AIDS in Africa and elsewhere in the world.

Finally, Mr. Secretary, I included language in last year's bill calling upon the Administration to specifically request funding in fiscal year 2001 to implement the U.S. Action Plan on Food Security. Instead, I found a 17 percent drop in Public Law 480 funding (from \$1.23 billion to \$1.02 billion), and no specific program funding for the Action Plan. I'm very interested in an explanation on this matter.

Mr. Chairman, again thank you for the opportunity to raise these issues this morning.

Senator COCHRAN. Senator Kohl.

STATEMENT OF SENATOR HERB KOHL

Senator KOHL. Thank you. Mr. Chairman, I am pleased to join you again as we review the budget proposal of the Department of Agriculture. It is apparent to me that this subcommittee will continue to face growing challenges. Initially the last 2 years, we have had to pass multi-billion-dollar emergency agriculture packages. This year, farm income is projected to fall again and again, but we will be called on to mend the farm safety net.

To help meet this challenge head-on, the Administration has proposed a spending program of approximately \$11.5 billion through the next 2 years.

Mr. Secretary, when I looked at this package, I was stunned, for as you know, there is nothing of any significance for dairy. And, Mr. Secretary, this is not acceptable. Low milk prices and federally sanctioned price discrimination have devastated the dairy industry in my region.

Is it not an emergency that we have lost more than 10,000 dairy farms in Wisconsin since 1990? Does the Federal Government owe nothing to the family dairy farmers who you have beat almost out of existence with a skewed, anti-competitive Federal milk pricing system?

Now, I know that you worked hard to bring about modest reform for the milk market order system last year and to end the Northeast Dairy Compact. But, as you know, by the end of the year, the Administration accepted the complete revocation of those reforms and an extension of the Northeast Dairy Compact. And now you want help passing another multi-billion-dollar farm aid package that ignores dairy. Well, Mr. Secretary, not this year.

The Administration will have my support when it produces a farm package based on something other than what crops and regions it thinks are most politically popular. You will have my support when you bring up a package that is fair and redresses some of the grave wrong that has been done to honest and productive dairy farmers, and not until then.

The budget proposal before us deals with these and many more issues such as feeding programs for the poor and bases it on fair trade, food safety conservation and rural development.

These programs are not only important to Wisconsin, but to America's farmers. They are important to all Americans, and I certainly hope we can find a way to work together on all of this as the year progresses.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Senator Harkin.

STATEMENT OF SENATOR TOM HARKIN

Senator HARKIN. Thank you, Mr. Chairman.

Again, I want to join my colleagues in thanking you, Mr. Secretary and Mr. Rominger, and your team for the outstanding job you are doing. It is just superlative in the face of some real problems out there on the farms.

I will try to be as quick as I can. First, I want to applaud the Administration for its agriculture conservation proposals that we see in the budget. Particularly the funding for the conservation security program, which I proposed, and I think this could really be an area where we can really put some more safety nets under those farmers out there in a good, beneficial manner for the country.

The increase in the wetlands reserve program, the EQIP program, and the farm land protection program and the wildlife habitat incentives program, all great. I applaud you for putting that money in the budget.

Secondly, the bio-based product and the bio-energy initiatives at USDA and DOE and the proposed tax incentives in the President's budget, again, very positive. Again, I hope that you will continue your strong support and your department's strong support for those.

How we can marry DOE and USDA together to provide for more bio-based deals similar or like the project that we have in Iowa, I will not go into that.

I also strongly support the \$9 million budget request for designing a bio-containment facility at the ARS's National Animal Disease Center in Eames, Iowa. This center, this national center, is a premiere center for research of diseases of animals important to agriculture.

You, Mr. Secretary, and I toured that, as you know, in December. And this \$9 million item is a first step in upgrading the ARS and the APHIS veterinary facilities which are badly—I might say, Mr. Chairman, I would like to invite all the Senators to come out and look at this national asset that we have out there. It is old. It has been there 50 years now, I guess, 40 years, something like that—it is the 1960s, I am told, so about 40 years.

And they are scattered around and they just need to be upgraded, and I applaud you for putting that in the budget.

Again, I just want to reiterate, back to what Senator Durbin just said. I am at this point with Catholic Relief Services. And I have watched them at work from every place from East Timor to Africa to Macedonia.

And again, the issue of food comes up. And they are working in places where they really need foodstuffs, and this is just one of the NGO's. The Mennonites, the Lutheran church, they are all doing great things out there.

There is certainly some way with soybeans, the surpluses we have in pork, in wheat, we are flooded with surpluses. And, as you said, Senator, these people are starving over there, malnourished, and we have got the NGO's, the people who do not charge an arm and leg, and with whom you can trust and deal, to deliver these services.

We have got to break this down some way, Mr. Chairman and Mr. Secretary, and get more food stuffs to these ND's that are out there doing a great job.

Thank you, Mr. Secretary. Thank you.

Senator COCHRAN. Thank you, Senator.

Senator Stevens.

STATEMENT OF SENATOR TED STEVENS

Senator STEVENS. Mr. Secretary, I look forward to having a discussion on specific items that affect my State in particular, as these hearings go along.

But I have come today to make a suggestion to you. I was a solicitor in the Interior Department in the Eisenhower Administration. We helped work out, at that time, some land exchange programs with the Forest Service and BLM, which led to expanding lands for Tucson and Phoenix and other places that had real problems about expansion.

This year, we are going to spend \$450 million, according to the President's budget, to put land back into federal ownership. But there is substantial land out there that has substantial value that is adjacent to many Western States that is owned by the Federal Government, and actually, it can have no further Federal purpose.

I would urge you to go back and look at the concept of exchanging lands owned by the Federal Government, but not necessarily by the same agency.

I was just visited by people from Alaska. This is a little particular issue, but some of the places in southeast Alaska do not have enough land to put in air strips. They used to be dependent on amphibious planes.

Now, most of the planes that are being used are not amphibious and they need air strips, but they have to fight with the Forest Service to get land. I think we ought to find some land that the Forest Service wants to acquire and exchange it.

But basically, I would urge you, we have got to stop spending \$450 million a year to, according to the Administration's budget, put land back into Federal ownership. The Federal Government already owns too much land, in my judgment. And we are land poor in the West as far as the States are concerned.

I would urge you to think about some way to alleviate this strain on the budget from this annual increase the President is asking for in terms of dollars to acquire land.

Now, I know you do not have a chance to answer, but my point of view is that we ought to use land exchanges to the maximum extent possible and only use cash when it is absolutely necessary.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Stevens.

Mr. Secretary, I thank you for your patience in listening to our comments and observations about the President's budget request. You may proceed.

STATEMENT OF DAN GLICKMAN

Secretary GLICKMAN. Okay. Thank you very much, all of the Senators. I appreciate your kindnesses.

My team is here. Deputy Secretary Rominger is here, of course, with Keith Collins, our Chief Economist. Steve Dewhurst, our long standing and perennial budget director—and I say that in a positive way, because perennials always come back and look better each year—Gus Schumacher, who is our Under Secretary for Farm and Foreign Agriculture Services.

I have a long statement, which will be part of the record, and I just thought I would make a couple of comments and perhaps address some of the comments that were made, because I know you are going to have to leave fairly soon.

FARM ECONOMIC SITUATION

It is clear the farm economy in many quarters is in serious shape, and what we have done in our budget proposal is to give you, early on, an idea of what we can do to augment the current farm bill—I repeat that, augment the current farm bill, so that we can have early debate on what not only the emergency proposal ought to look like, but what the next farm bill ought to look like as well. What we have proposed is \$11.5 billion package of assistance containing three general pieces.

FARM SAFETY NET PROPOSAL

One is a counter cyclical income assistance piece that will help producers when times are bad, but will not trigger-in relief necessarily when times are good. That is different than the Freedom to Farm Bill. While we propose doing this in an emergency context, our proposal is on budget and paid up, as you know, quite frankly, I would have liked to have seen more money in the proposal.

We will work with Congress on that, but given the fact that this was presented in the context of a balanced budget proposal of the President, we did the best we could under the circumstances, and we want to work with you on the numbers that are there. But the principle of counter cyclical farm assistance, we think needs to be part and parcel of both the emergency relief as well as the next farm bill.

In addition to that, we proposed a significant conservation piece, and it was based on an idea that Senator Harkin proposed. But what it does is to pay producers, not on a cost share basis, but on a direct basis, based upon certain conservation practices that producers carry out on their land to protect their resources.

The theory here is there is more to farming than just producing the crop. There is value in the land itself, so that we can continue producing crops for the next generations to come, so we have the significant conservation piece which values the land separately from what is produced on the land.

The third part is the risk management system where we propose additional funds. And just to comment on what Senator Gorton says, a major proposal is included here to get rid of the area-wide trigger in the non-insured assistance program under current law—this is particularly true on specialty crops—there has to be a wide-based geographical loss in order for an individual producer to get anything out of the program. We are proposing ending that with this proposal.

That will have profound effect, particularly in areas of the country which have significant individual losses, but may not have a massive hurricane or other widespread catastrophic loss.

We think that these three pieces I've outlined here, taken together will be helpful to the farm sector over the next 2 years.

DAIRY PRICE SUPPORT

We are also proposing that the dairy price support program be extended because it will end at the end of this year. Senator Kohl is right, there is nothing more for dairy producers, and we want to work with you on that.

Quite frankly I got burned last year when I tried to venture into the dairy debate, but there is no question a lot of dairy farmers are hurting.

The proposal we have put forward would just continue the dairy price support program, otherwise the price could fall considerably further. We would be glad to work with you on some additional dairy legislation.

In addition, we have frozen loan rates. They would have come down if I had not taken that step. There was a lot of pressure on us to reduce the soybean loan rate. I was not going to do it. I was not going to reduce any loan rates given the economic condition of agriculture.

FARM STORAGE FACILITY PROGRAM

We have also proposed to begin a new farm storage facility program. We used to have a program like that year ago. We give farmers low interest loans to build on-farm storage. Why? In this era of identity-preserved agriculture, GMOs, all the niche marketing, farmers should have the ability to store on farm, so they can be able to market on a more individualized basis. We think that this is also an important program.

So what we have got here is a targeted, national-in-scope program that will act as a bridge to the new farm bill, and we want to work with you on these proposals. You have challenged us, and I think correctly, we have got to put our money where our mouth is.

We have tried to do that within the context of the President's balanced budget, but we know that we will have to work with you on perhaps making modifications where necessary.

In terms of exports, I want to make a couple of comments there. Last year, the Department programmed 8 million metric tons of food assistance, the highest in the last 25 years. What Senators Harkin and Durbin said is correct, it is disgraceful that there is a huge number of hungry people out there, and we have resources available here to help.

EXPORT CREDIT GUARANTEE PROGRAM

Sales under the CCC export guarantee program exceeded \$3 billion, and we have got to continue those efforts on the trade policy front. This budget provides about \$5.8 billion for international programs including \$3.8 billion for the CCC export credit guarantee program which can be increased if necessary. I want to repeat that

we will not be locked into that number internally within our CCC authority if we think more is necessary.

We are requesting, for a third year in a row, authority to use unspent EEP funds for food assistance and market development purposes. If we do not use the EEP money, we would like to be able to use it in other market development activities. We would like that kind of flexibility.

The budget also supports opening three new agricultural trade offices. And of course, we are trying very hard to get the WTO China Agreement through, because as you know, China has made an initial agreement with us to reduce their tariffs on our products to levels, in many cases, below the levels Europe has in place. This is something that is an extremely important part of trade policy and U.S. agriculture.

MARKETING AND INSPECTION

I am not going to go over everything, only a few critical things. In marketing and inspection, we have asked for additional monies to deal with mandatory price reporting, so we can implement that program beginning this summer. That is a high priority with many members of this committee.

We have asked for additional authority so we can have additional resources in our GIPSA market concentration activities concerning livestock and poultry. We have asked for significant additional money in inspection at the borders, as well as dealing with problems like citrus canker, Asian longhorn beetle, medfly, hog cholera. And we have asked that some of these funds be converted from CCC emergency spending to appropriated spending in the budget for the year 2001.

RURAL DEVELOPMENT

In the rural development area, our budget will support over \$12 billion in loans, loan guarantees and grants and technical assistance, which is \$1.3 billion more than the year 2000 for housing, waste and water programs, dealing with the digital divide that is part of the continuing support for rural electric and communications and funding for helping rural businesses.

RESEARCH

In the research area, the budget proposes an increase of 3 percent, funding these research activities at \$2 billion, and a lot of that has to deal with the emerging threats from weeds, pests and diseases. Again, that invasive species problem is a very, very serious one.

FOOD SAFETY

In the food safety area, as you said, the budget does contain additional fees, and I am sure that we can talk about this as we have done every year since I have been up here. But in addition to that, we are increasing monies directed at the President's food safety initiative and enhanced implementation of the HACCP systems.

I just spoke to a group this morning about this, and the incidence of salmonella in poultry is down 50 percent since HACCP has gone

into place. Safe food sells. If people have confidence the food system is safe, they will buy it, and we have the safest food in the world.

A lot of these programs in the food safety area are geared to giving people confidence that the food is safe. And if they believe it, we can deal with some of the hysteria that is out there both domestically and on the international front as well.

FOOD NUTRITION

In nutrition, the budget provides for full funding for food stamps, child nutrition and WIC. Based on proposed legislation, the food stamp eligibility would be restored to over 200,000 eligible people.

For Food Stamp participants one of the things we are doing is increasing the value of their vehicle to make it easier to qualify for the program. It has not really changed much since the 1970s. It is still at around \$4,600 per year, for the maximum value of their vehicle. A lot of working poor people cannot qualify in that kind of circumstance.

NATURAL RESOURCES MANAGEMENT

Management of natural resources has been mentioned before. The farm safety net proposes a new conservation security program, and we have additional funding for EQIP, technical assistance, the clean water action plan, as well as the global climate change and the land legacy program. An important piece is the bio-based fuels and bio-energy program, which we can discuss in detail.

CIVIL RIGHTS

We continue to work on our civil rights problems, as well as proposing \$10 million for the 2501 grant program to reach out to help socially disadvantaged farmers. We are trying hard to improve customer service by streamlining and restructuring the county offices to support one-stop USDA service centers, but we have got to have the tools to do that, including the common computing environment, as well as other service center modernizations and e-Commerce-related capabilities for the Department.

PREPARED STATEMENT

I have indicated other things in my formal statement that we need for the whole Department, but in the interest of time, I just wanted to highlight those items as kind of a summary of the major items that need your attention.

Senator COCHRAN. Thank you very much, Mr. Secretary.

[The statement follows:]

PREPARED STATEMENT OF DAN GLICKMAN

Mr. Chairman, Members of the Committee, it is a privilege to appear before you to discuss the 2001 budget for the Department of Agriculture (USDA).

The President's budget proposes \$66.4 billion in budget authority for 2001 for USDA compared to a current estimate of \$72.3 billion for 2000 and \$67.8 billion for 1999. Budget authority for discretionary spending, which accounts for about 25 percent of USDA total budget authority, increases slightly from \$16.3 billion in 2000 to \$16.7 billion in 2001. The request before this Committee for discretionary spending is \$14.4 billion.

The Department's 2001 budget request provides the necessary resources that will enable USDA to meet its ongoing program responsibilities as well as focusing on some key Presidential initiatives. These key initiatives include:

- A new Farm Safety Net Initiative that will provide over \$11 billion in additional assistance to the rural economy from 2000 through 2002. The initiative includes proposals for new legislation to provide supplementary countercyclical income assistance payments targeted to producers actually facing reduced prices and revenues and to reform the crop insurance program to provide better protection from production losses. Other legislative proposals include a new Conservation Security Program, expansion of the Conservation Reserve and Wetlands Reserve Programs and other conservation programs. This will strengthen farm income support for those producers most in need of assistance due to depressed prices and natural disasters while also stimulating achievement of major environmental benefits through better management of farmland.
- A continuing Food Safety Initiative for improving the Federal food inspection system from farm-to-table through better surveillance of foodborne illnesses and ways to combat them, strengthened Federal-State partnerships, and expanded research and consumer education. The budget includes increases of \$27.5 million in five USDA agencies to support the Initiative.
- A Biobased Products/Bioenergy Initiative to expand markets for agricultural and forestry products to reduce U.S. dependence on oil imports, expand rural business opportunities, and cut our pollution and greenhouse gas emissions. The budget includes increases totaling nearly \$90 million to support these activities.
- A continuing Lands Legacy Initiative that proposes \$1.4 billion for a national program to protect great places and provide the tools for localities and States to plan for smart growth and open space presentation. Of this total program, \$300 million would be allocated to USDA to carry out work by the Forest Service and the Natural Resources Conservation Service.

The budget also focuses resources on the following other high priority areas:

- Providing adequate funding for Food Stamp, Child Nutrition, and WIC programs, increased funding for Farmers' Market Nutrition program, new assistance for the Colonias, and legislation to improve child care food program management as well as make it easier for Food Stamp families to own a car and restore Food Stamp benefits to certain groups of legal immigrants.
- Meeting the urgent needs for water, housing and jobs in rural communities.
- Supporting research, education, technical assistance and inspection activities to improve agricultural productivity, competitiveness, and small farm viability; help solve pest and disease as well as environmental problems; and provide a safe and nutritious food supply.
- Expanding domestic and overseas markets through aggressive promotion and a reduction in trade barriers.
- Continuing an aggressive civil rights policy, providing for quality customer service and efficient program delivery particularly by county-based agency service centers, and effectively managing financial, human, information and other resources.

The Department also will propose legislation that could affect the appropriations process because of the discipline imposed on the 2001 budget. User fees for the Food Safety and Inspection Service, the Animal and Plant Health Inspection Service, and the Grain Inspection, Packers and Stockyards Administration are again included in the budget. Legislation is also proposed for a number of mandatory programs, including farm safety net legislation, which also provides for crop insurance reform, legislation to expand eligibility for the Food Stamp Program, and improve Child and Adult Care Food Program management, as previously mentioned.

I would now like to discuss the President's budget proposals, as they relate to each of the Department's mission areas.

FARM AND FOREIGN AGRICULTURAL SERVICES

The mission of the Farm and Foreign Agricultural Services area to secure the long-term vitality and global competitiveness of American agriculture has surely been tested by the tough times farmers and ranchers have been encountering over the past couple of years. While planting flexibility provisions of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act), strong export and trade policy programs, and other program initiatives already underway have helped many crop and livestock producers, it is clear, as the President indicated, that the farm safety net still needs to be reinforced.

The Administration and the Congress worked together over the past 2 years to provide emergency support for farmers in areas hit hard by declining prices and production losses. However, this emergency assistance has been expensive and not well targeted to those producers who need it the most.

The budget includes several legislative proposals for farm, conservation, and crop insurance programs, coupled with new initiatives to be undertaken using current authorities, which will provide \$11.5 billion in additional assistance to farmers, ranchers and rural communities from 2000 through 2002. These initiatives to improve the farm safety net would provide about \$7 billion in additional direct farm income assistance over this period. This includes proposed legislation for the 2000 and 2001 crop years to provide \$5.6 billion in supplementary, crop-specific income assistance to producers of wheat, feed grain, rice, upland cotton and oilseeds suffering from low prices and revenue. The proposed legislation also includes an extension of the dairy price support program and a new program to fund livestock processing cooperatives to improve income opportunities for producers. The Administration's initiatives under current authorities will also include maintenance of maximum levels for marketing assistance loan rates for the 2000 crops, a new program of incentives to encourage increased use of farm commodities for biofuels production, and a new farm storage facility loan program to aid producers to expand on farm storage capacity to be better positioned to effectively market their crops.

Continued efforts to expand and improve programs which help producers manage risk will also be emphasized, and it will be necessary to work with Congress to further reform the insurance programs for crop and livestock producers. Over \$1 billion is included for crop insurance and related reforms. This includes a proposal to make noninsured crop disaster assistance more accessible to producers by replacing the requirements for an area-wide loss before assistance can be made available to producers with a less restrictive disaster declaration.

Enhanced conservation initiatives totaling nearly \$3 billion, a \$1.3 billion increase over authorized levels for 2001 and 2002, including a new Conservation Security Program at \$600 million per year for 2001 and 2002 are proposed. The conservation proposals are also a critical component of our farm safety net improvements to assist producers in maintaining environmentally sound practices during these economically troubling times. The budget proposes legislation to increase the Conservation Reserve Program (CRP) acreage cap to 40 million acres. It also promotes the continuous, non-competitive signup that has been underway to enroll land in filter strips, riparian buffers, and similar special conservation practices to enhance achievement of water quality objectives by providing additional incentives under current authority to enhance participation. The proposal also would expand other conservation programs funded by the Commodity Credit Corporation (CCC) but administered by the National Resources Conservation Service (NRCS) including the Wetlands Reserve Program (WRP), the Environmental Quality Incentives Program (EQIP), the Wildlife Habitat Incentives Program (WHIP), and the Farmland Protection Program (FPP).

These initiatives will serve as the basis for more permanent and effective assistance to help producers cope with continuing economic stress at less cost to the taxpayer. Unlike previous Ad Hoc (off-budget) emergency assistance enacted late in the year, the proposal is fully paid for in the context of a balanced budget. It is presented as a part of the regular budget process so that Congress can take action early in the year allowing farmers and their creditors to plan ahead. This proposal will enhance and improve the safety net during the remaining 2 years of the 1996 Farm Bill and provide a bridge to a new farm program. There also will be continuing efforts by the Department to work to expand opportunities for small farmers and others who traditionally have been under served in our farm programs.

Commodity Credit Corporation

Changes over the last decade in commodity, disaster, and conservation programs have dramatically changed the level, mix, and variability of CCC outlays. CCC outlays increased from \$10 billion in 1998, to \$19 billion in 1999, and are projected to increase to a new record high of about \$27 billion in 2000. The increase in CCC spending for 2000 is accounted for by higher marketing assistance loan program outlays, expenditures related to various Administration initiatives, and emergency spending authorized by the 2000 Appropriations Act that provided about \$9 billion in emergency assistance.

Projected CCC outlays for 2001 under current law are estimated at over \$15 billion, including nearly \$800 million for initiatives planned under current authority. Approximately \$4 billion in additional CCC outlays would occur in 2001 based on the proposed safety net legislation.

Conservation program outlays account for a significant portion of CCC expenditures as well. The 1996 Act authorized direct CCC funding for CRP administered by FSA and several new conservation programs administered by NRCS.

CRP provides landowners annual payments and half the cost of establishing a conserving cover in exchange for retiring environmentally sensitive land from production for 10 to 15 years. The 1996 Act authorized the program through 2002 and set maximum enrollment in the program at 36.4 million acres. About 34.6 million acres in total will be enrolled in the program in 2001 up from an estimated 32.3 million acres in 2000.

Finally, the budget addresses problems with section 4 of the Commodity Credit Corporation Charter Act which caps CCC expenditures for computer equipment and section 11 which limits total allotments and transfers to State and Federal agencies for administrative support services to the 1995 expenditures level. The latter provisions impose significant restrictions on the availability of CCC funds for transfers and reimbursable agreements used to fund conservation technical assistance and other support services for the conservation, commodity, and export programs. The budget proposes an adjustment to these limitations to permit additional funds for the technical assistance needed to carry out the conservation programs authorized in 1996 as well as newly proposed programs.

By 2001, the amount available under the section 4 computer cap will be fully exhausted, preventing CCC funding of data processing and related activities needed to support efficient and timely delivery of FSA programs. If the cap is not raised, a portion of the appropriated funds for salaries and other expenses will likely have to be diverted to maintaining legacy systems thereby impacting staffing levels. The loss of CCC funds for information technology and data processing also will impede needed investment in streamlining and Service Center modernization initiatives, restricting the Department's investment in much-needed technology to implement ongoing business process reengineering efforts. USDA needs these investments to improve service to its customers and reduce program delivery costs, but the high cost of operating and maintaining the current legacy systems that serve our customers precludes investment in modernization without additional funding.

The budget for 2001 includes a legislative proposal to raise the limit on CCC expenditures for computer equipment by \$35 million per year for the period 2001 through 2002. The increase in the multi-year cap is essential if CCC is going to meet its most basic ongoing computer operations and maintenance costs for the farm programs.

Farm Loan Programs

Traditionally, USDA's role in the farm credit market has been to provide a safety net for farmers who are unable to qualify for credit from private lenders. The Department supplies about 4 percent of farm credit. Private lenders, including the federally-chartered Farm Credit System, supply the rest. Although the amount of farm debt has been rising, the portion supplied by the Department is about half of what it was in 1994. The Department's farm loan programs help farmers who are experiencing financial difficulties due to adverse market and production conditions, as well as socially disadvantaged, beginning, and limited resource farmers.

Changes in market conditions impact the willingness of private lenders to make new loans. Thus, the number of applicants seeking USDA program assistance increases dramatically during an economic downturn. This occurred in 1999 and is expected to continue through 2000 and 2001. As long as commodity prices remain low, farmers will have difficulty presenting positive cash-flow scenarios to their lenders, and many will not be able to qualify for credit.

The trend in recent years has been a shift to more guaranteed loans, as opposed to direct loans. Especially during an economic downturn like this one, loan guarantees play an important role. Loan guarantees provide private lenders with a way in which they can minimize their exposure to risk while continuing to provide credit to their borrowers who are experiencing temporary financial difficulties. A loan guarantee with interest assistance allows borrowers who temporarily cannot meet cash flow requirements to continue to be served by their current lenders. USDA has streamlined its guaranteed loan making regulations in order to encourage more private lenders to participate in the program. Guaranteed loans have lower subsidy costs, and lower administrative costs since much of the loan making and servicing actions are handled by private lenders.

The 2001 budget request for farm loans is based on the assumption that the farm economy will begin to recover in 2001 and that the supplemental funding provided in 2000 will reduce the backlog of loan applications. Specifically, the 2001 budget request includes about \$1.1 billion in direct farm loans and \$3.5 billion in loan guarantees—a total of \$4.6 billion. This is \$1.2 billion less than the \$5.8 billion that will

be available in 2000, but the 2000 total includes over \$2 billion provided through emergency funds. Because interest rates have been rising, subsidy costs for the direct loan programs are higher this year. This means each dollar of direct loans made in 2001 will cost more than in 2000. Overall, subsidy costs for 2001 total \$186 million, \$83 million less than in 2000.

For farm operating loans, the 2001 budget includes \$700 million in direct loans, \$2 billion in unsubsidized guarantees, and \$478 million in subsidized guarantees—a total of \$3.2 billion. The availability of farm operating loans provides farmers with short-term credit to finance the costs of continuing or improving their farming operations, such as purchasing seed, fertilizer, livestock feed, and equipment.

For farm ownership loans, the 2001 budget includes \$128 million in direct loans and \$1 billion for guaranteed loans. The availability of farm ownership loans provides farmers with long-term credit to finance the costs of enlarging, improving, or purchasing a family farm. In addition, the guaranteed farm ownership loan program allows farmers to use real estate equity to restructure debts. The direct farm ownership loan program cannot be used for this purpose.

In addition, the 2001 budget includes funding for the boll weevil eradication program, Indian tribal land acquisition loans, and emergency loans. Due to numerous natural disasters in recent years, demand for emergency disaster loans has been very high and supplemental appropriations have been needed in order to adequately fund the program. The request for emergency loans for 2001 is \$150 million, which includes loans that would be made to larger-sized farms at higher interest rates, under our proposal to close the “eligibility gap” between USDA and the Small Business Administration emergency loans.

Farm Program Delivery

The weakened farm economy has challenged our efforts to improve customer service while improving efficiency in the Farm Service Agency (FSA) and the other county-based conservation and rural development agencies. The increasing demand for CCC marketing assistance loan programs and disaster assistance has dramatically increased workload and placed new burdens on county office staff. The higher workload, particularly for the marketing assistance loan programs, is projected to continue into 2001.

FSA Federal and county staffing since 1993 has declined by about 6,000 staff years, from over 22,500 staff years at the end of 1993 to about 17,200 staff years at the end of 1999. Additional funds appropriated in 1999 and 2000 have allowed the agency to avoid reductions-in-force and to hire and maintain additional temporary staff to meet pressing workload needs. The proposed program level in 2001 for salaries and expenses of \$1.1 billion is estimated to support a ceiling of 5,901 Federal staff years, and 10,766 non-Federal county staff years, assuming proposed legislation is enacted allowing for CCC to cover a portion of FSA's computer operations and maintenance costs for the farm programs. The workload requirements to deliver projected current programs and proposed new programs in 2001 is expected to require over 16,600 staff years as well as continued investment in modernization of the delivery system. The current high level of costs of operating and maintaining current legacy computer system will continue to be incurred in the short run until the common computing environment is operational, if FSA and the other field service center based agencies are to provide necessary and adequate customer service. As recommended in the Civil Rights Action Team report, legislation will be submitted to convert all FSA employees to Federal status this year.

Crop Insurance

Crop Insurance is fast becoming a primary source of risk protection for our Nation's farmers. Participation has increased to about 70 percent of the insurable acres—more than half of which is insured at higher levels of coverage that producers select, and the rest at the premium-free catastrophic coverage level of 50 percent of approved yield and 55 percent of expected market price. The program is operating on an actuarially sound basis, and the concern that farmers had about the high cost of premiums has been addressed by providing approximately a 30 percent discount in premiums in 1999 and about a 25 percent discount in premiums in 2000 as part of the emergency assistance package that was enacted for those years.

More work needs to be done in this area and the Administration is prepared to work with the Congress toward this end. Based on the response received for discounting premiums, the budget includes a proposal to increase the premium subsidy on buy-up coverage for the 2001 crop. This new legislative authority would also address the problem of multi-year coverage and establish a pilot program for livestock. In addition, the proposed legislation would expand the risk management education program and provide incentives, such as royalties, to developers of new insurance

products. The legislative proposal also includes a provision for replacing the area-wide trigger on eligibility for the non-insured crop disaster assistance program with disaster declarations, beginning with the 2000 crop, so that producers with individual losses on crops for which crop insurance is not offered will be better positioned to receive assistance.

The 2001 budget requests that “such sums as necessary” be appropriated for all costs of the crop insurance programs, except for Federal salaries and expenses. This is consistent with prior year appropriations and offers the flexibility necessary to meet increases in the demand for insurance. The budgetary impact of our legislative changes will be reflected on the mandatory side of the ledger.

As for Federal salaries and expenses in the Risk Management Agency, the 2001 budget includes \$67.7 million in discretionary spending, compared to the \$64 million that was appropriated for 2000. About \$1.6 million of the \$3.7 million increase is necessary to cover pay costs and \$0.4 million is for information technology investments. The remaining \$1.7 million would be used to establish a pilot program for insuring bio-based value added products, and to enhance our civil rights activities.

International Trade and Export Programs

Strong export markets remain an essential component of the farm safety net, and the aggressive pursuit of overseas markets for our farmers and ranchers is one of the Department’s highest priorities. For 2000, the value of U.S. agricultural exports is projected at \$49 billion, unchanged from last year. While export growth remains sluggish, export levels should improve as the economies of Asia, Latin America, Russia, and elsewhere recover from the financial disruptions of recent years. However, a more solid recovery in U.S. exports is unlikely until global commodity stocks are reduced from their present high levels.

In view of the current export situation, a number of steps have been taken during the past year to bolster our export performance, while assisting other countries to meet their food and agricultural import needs. For example, the Department programmed nearly 8 million metric tons of food assistance under various program authorities last year, the highest tonnage level in 25 years. This included over 5 million tons of wheat programmed under the President’s Food Aid Initiative and additional assistance provided to Russia. The Department also continued to make available sizeable levels of CCC export credit guarantees to facilitate sales to buyers in the countries in Asia and elsewhere, which required the guarantees in order to secure financing to purchase needed imports. Sales registrations under the programs exceeded \$3 billion last year.

Progress has also been made in our efforts to expand market access through trade policy. Noteworthy among these accomplishments are the U.S.-China Agricultural Cooperation Agreement reached last April, and the broader bilateral agreement on China’s entry into the World Trade Organization (WTO) reached last November. These agreements are important as the first will remove longstanding technical barriers related to imports of U.S. grains, citrus, and meat and, upon China’s accession to the WTO, the second will result in reduced tariffs and enhanced access to Chinese markets for many of our products. Moreover, the WTO agreement will place disciplines on Chinese agricultural policies, which would reduce the possibility of disruptions in world trade stemming from their policies as has occurred in the past. In order for United States to benefit fully from the agreement on WTO accession, however, it will be necessary for permanent Normal Trade Relations (NTR) status to be approved for China. The Administration will be working closely with the Congress this year to ensure a positive outcome on the NTR matter.

Another important trade policy activity is the new round of multilateral negotiations on agricultural trade. The objectives we have established for the negotiations—elimination of export subsidies, improved market access by reducing tariffs and increasing quotas, reform of state trading enterprises, tighter rules on trade distorting domestic support, and facilitation of trade in products of new technologies—are crucial for the achievement of our long-term export expansion objectives. Although full agreement on the framework for a new round of negotiations was not achieved at the Seattle Ministerial, the Seattle meeting is not the end to further negotiations on agricultural trade. Because of the “built-in agenda” for agricultural reform in the Uruguay Round Agreement, work on the new agricultural negotiations will continue, and the Administration will be working vigorously to ensure that U.S. objectives are advanced as we move forward.

The President’s budget for 2001 is designed to ensure that the work of the Department on these important trade policy and export promotion activities can continue. The budget provides an overall program level of nearly \$5.8 billion for the Department’s international programs. For the CCC export credit guarantee programs, the largest of our export programs, the budget includes a projected program level of \$3.8

billion, unchanged from this year's level. These are current estimates of the level of sales that will be facilitated by the programs; however, the actual level of programming will be determined by market conditions and program demand. As export markets recover, the level of export credit guarantee activity should pick up and the level of guarantee programming can be increased in order to meet demand and maximize export sales.

For the Department's market development programs, the budget provides funding of \$120 million for 2001. This includes \$90 million for the Market Access Program (MAP), the maximum level authorized by law. MAP is the largest market development program and is a key component in the Department's efforts to increase sales of high value products. The program has also served an important role in assisting small and new-to-export companies build new overseas markets.

For the Foreign Market Development Program, commonly referred to as the Cooperator Program, the budget continues funding for the program at this year's level of \$27.5 million. As proposed in last year's budget, the Cooperator Program is now funded through CCC rather than funds appropriated to the Foreign Agricultural Service (FAS). This change will provide increased stability in the level of annual program funding and, thereby, will enhance long-term planning by program participants.

The budget also includes funding for the Quality Samples Program, which was first proposed in last year's budget and is being implemented by CCC this year. Under the program, samples of U.S. agricultural products will be provided to foreign importers in order to promote a better understanding and appreciation of their high quality. The program will be carried out through private sector organizations and agricultural trade associations. For 2001, the budget provides funding of \$2.5 million for the Quality Samples Program, the same as this year's level.

The budget includes funding for both of the Department's export subsidy programs—the Export Enhancement Program (EEP) and the Dairy Export Incentive Program (DEIP). In the case of EEP, the budget provides funding of \$478 million, the maximum level authorized by law and the level which is consistent with the U.S. export subsidy reductions agreed to in conjunction with the Uruguay Round Agreement on Agriculture. Although EEP programming has been limited in recent years due to world supply and demand conditions, the awarding of EEP bonuses can be resumed whenever market conditions warrant. Again this year, proposed legislation will be submitted which would allow unobligated balances in EEP funds to be transferred toward the end of the year to help support increased programming under the Department's foreign food assistance authorities. This would be a very useful tool for ensuring that EEP funds do not go unused, while helping to maximize agricultural exports and assisting other countries meet their food import requirements.

For DEIP, the budget assumes a program level of \$66 million for 2001. This is a reduction from the levels of recent years and reflects two primary factors. The first is full implementation of the Uruguay Round export subsidy reduction commitments. The second is the phaseout this June of the so-called "rollover" provision which allows countries under certain circumstances to exceed their annual export subsidy reduction commitments by drawing on unused subsidy quantities from previous years. In view of the constrained level of DEIP programming, the Department will need to work with the domestic industry to determine how it can continue to facilitate U.S. dairy exports and maintain efforts to develop long-term markets overseas.

The budget provides an overall program level of just over \$1 billion for Public Law 480 food assistance in 2001, which is expected to provide approximately 2.9 million metric tons of commodity assistance to recipient countries. As in recent years, Public Law 480 programming is likely to be supplemented by food assistance made available under other authorities, including the Food for Progress Act of 1985 and section 416(b) of the Agricultural Act of 1949.

For FAS, the budget provides appropriated funding of \$118 million, an increase of more than \$4 million over this year's level. Included in the increase is funding to support the opening of three new Agricultural Trade Offices in Canada, Mexico, and the Philippines. These countries have been identified by FAS as priority markets which offer significant market growth potential over the next 5 to 10 years. These offices, working in conjunction with U.S. market development organizations, private exporters, State trade officials, and others, will help to ensure that U.S. agricultural products benefit from the projected growth.

Increased funding is also included to enhance FAS' market access compliance and negotiation activities. The workload associated with these activities has increased substantially with implementation of the Uruguay Round Agreement, and it is expected to increase even further with the onset of new multilateral negotiations on

agriculture. The increased funding will help to ensure that resources are available to monitor implementation and compliance with existing agreements and to ensure that U.S. agricultural interests are fully represented as new agreements are negotiated.

Additional funding is also provided for the increased costs associated with maintaining an FAS presence at the American Institute in Taiwan and for a portion of projected pay cost increases in 2001. The FAS request also includes \$3.5 million for the Cochran Fellowship Program, which maintains appropriated funding for the program at this year's level.

RURAL DEVELOPMENT

Rural America is tremendously diverse in terms of its dependence on farming and other sources of jobs and income, and its ability to reap the benefits of the Nation's economic prosperity. Likewise, there is a substantial range in the wealth and economic well-being of rural residents. Homeownership is higher in rural America than in the Nation as a whole. Yet, many rural residents lack the resources to qualify for mortgage credit, and rental housing is often unavailable or unaffordable, particularly for the elderly. Even the basic amenities of clean running water and waste disposal are lacking in many rural communities.

USDA's rural development programs are designed to provide loan, grant and payment assistance for a variety of needs—rural housing, community facilities, water and waste disposal, electric and telephone service, and rural businesses. These programs represent a substantial investment of public funds—nearly \$13 billion for 2001. The returns on this investment include jobs—an estimated 200,000 for 2001—as well as decent, safe and sanitary housing, improved community services, and more opportunities for rural areas to compete successfully in the high-tech, global economy.

Through initiatives, such as Empowerment Zones and Enterprise Communities (EZ/EC), USDA helps rural communities with strategic planning and implementation. The Department works with other Federal agencies, State and local governments, and other rural development partners to ensure a coordinated effort in meeting local priorities.

The 2001 budget provides more than \$2.5 billion in budget authority. This is an increase of over \$300 million in budget authority over the \$2.2 billion provided in 2000, and reflects higher subsidy costs due primarily to a projected increase in the Government's cost of borrowing.

Almost \$3.5 billion in loans and grants is budgeted under the Rural Community Advancement Program (RCAP) that was enacted as part of the 1996 Act. RCAP funding would be provided in three funding streams, with States having the full flexibility to transfer up to 10 percent of the funds within the funding streams, and up to 25 percent between the three funding streams. This is consistent with the 1996 Act, and would ensure better coordination in meeting State and local priorities. Within RCAP's three funding streams, \$24 million would be earmarked for Federally recognized Indian tribes. There are several other earmarks, including \$42.6 million for EZ/EC communities, and other initiatives.

The 2001 budget provides mandatory funding of \$15 million annually for the communities that were selected in Round II of the EZ/EC Initiative. This will assist these communities, which have a 10-year designation, in meeting the goals of their strategic plans to create jobs and economic growth. The budget also provides for targeting of about \$200 million in loans and grants under USDA's rural development programs to projects in EZ/EC communities.

The 2001 budget includes \$581 million for salaries and expenses, which is approximately \$47 million over the 2000 level. The increase will allow the mission area to increase staffing and to fund a limited number of information technology initiatives.

Rural Utilities

The Rural Utilities Service (RUS) finances rural electric, telephone and water and waste disposal services. Although most rural Americans now have access to these basic necessities, there is still a need to maintain and upgrade these facilities to ensure that rural America does not fall further behind in the fast-paced world of high-tech communications, and to address the increasing risks of unsafe or poor quality water.

The 2001 budget would support over \$2.2 billion in electric and telephone loans, down from \$2.8 billion. Guaranteed loans would be reduced from \$1.7 billion to \$1.2 billion. Direct 5 percent electric loans would be reduced and municipal rate loans would be maintained at about the current level.

The Distance Learning and Telemedicine Program offers rural communities an opportunity to receive enhanced learning and medical services and to connect to the information-based economy. In 1997, the program was expanded to include loan as well as grant assistance. RUS expects to see continued progress in loan activity. Therefore, the 2001 budget proposes an increase in direct loans from \$200 million in 2000 to \$300 million, and an increase in grants, from \$20 million in 2000 to \$25 million. This program will also fund \$100 million in loans and \$2 million in grants as part of the Administration's initiative to close the "digital divide."

The Water and Waste Disposal Program provides financing for rural communities to establish, expand, or modernize water treatment and waste disposal facilities. Eligibility is limited to communities of 10,000 or less in population that cannot obtain credit elsewhere. The program supports the Administration's Water 2000 initiative, which targets a portion of the funding to serve those rural communities with the Nation's most serious water quality problems, including even the lack of a dependable supply of drinking water.

The program level for 2001 includes \$502 million in grants, \$1,032 million in direct loans and \$75 million in guaranteed loans for water and waste disposal projects. This level will provide financing for new or improved water systems that will serve about 1.7 million rural residents. In addition, about 700,000 rural residents will be served through new or improved waste disposal systems. The 2001 budget includes \$648 million in budget authority to support the program, which is an increase over the \$606 million appropriated for 2000.

Rural Housing

USDA rural housing programs, managed by the Rural Housing Service (RHS), have played a key role in providing affordable homeownership and rental opportunities for rural residents since the 1960s. The programs serve very low to moderate income families who cannot obtain conventional credit and cannot otherwise afford decent, safe and sanitary housing. Interest and rental payment assistance reduce the cost of such housing to the families' ability to pay, based on income and other factors. The direct loan program serves low income families with incomes less than 80 percent of the area median. The average borrower's income is \$17,500. The 2001 budget would support \$1.3 billion in direct (single-family) homeownership loans—compared to \$1.16 billion in 2000.

The 2001 budget would also support \$3.7 billion in guarantees—\$500 million more than in 2000. The program offers no interest payment assistance, so borrowers must be able to pay commercial rates of interest. This keeps the subsidy cost of the program less than 1 percent per dollar of loan guaranteed, allowing it to fill gaps in the commercial credit market where lenders are reluctant to make loans on their own. The Administration will propose legislation to increase the fee on guaranteed loans, which will further reduce the subsidy cost.

The combined total of \$5.0 billion in homeownership loans and guarantees reflects the Administration's strong commitment to improving homeownership opportunities in rural areas and is expected to serve almost 70,000 rural families.

The 2001 budget provides for \$120 million in direct loans and \$200 million in guarantees for rental housing. The guaranteed program for rental housing differs from the direct loan program in that it serves families with incomes up to 115 percent of the area median income, rather than those below 80 percent of the area median. The guaranteed program is proposed to operate without interest payment assistance. Currently 20 percent of loans have interest payment assistance. The program will continue to use other sources of funds and financial incentives, such as tax credits. This combination of the guaranteed loan with other incentives keeps rents affordable for low income families.

In the direct rental housing program, RHS currently has a portfolio of about 18,000 projects with approximately 245,000 units receiving rental assistance payments. About 42,800 of these units will require renewal at a cost of \$634 million. The budget of \$680 million also provides for some additional units in existing projects for servicing purposes, as well as a small number of units provided in new projects, including farm labor housing.

RHS administers several housing programs that serve specific needs, including farm labor housing, self-help housing for families who trade their sweat equity for a chance to own their own home, and repair loans and grants for very low income households. The 2001 budget recommends \$30 million in loans and \$15 million in grants for farm labor housing. It also includes \$5 million for emergency assistance for migrant farm workers. The budget also recommends an increase in Self-Help grants from \$29 million available for 2000 to \$40 million for 2001.

The community facilities program provides direct loans, guarantees and grants to finance essential community facilities, with priority given to health and safety facili-

ties. In recent years, the priority has been to serve children and the elderly through child care centers and health facilities; however, a wide range of projects have received this assistance, reflecting the diversity of State and local priorities. The 2001 budget provides \$250 million in direct loans, \$210 million in guarantees, and \$24 million in grants, including \$5 million for early warning system grants that would allow rural areas to reduce the loss of life resulting from inadequate warnings of hazardous weather. The total program level of \$484 million is about \$75 million more than 2000, and will support over 200 new or improved health care facilities and other facilities which will improve the standard of living in rural America.

Rural Business

In order to create thriving local economies that provide good paying jobs and withstand the challenges of a high-tech global marketplace, many rural communities need a more diversified economic base. In response to the EZ/EC initiative, many communities have prepared strategic plans for their development. Implementing these plans, however, requires significant sources of private-sector capital. Within USDA, the Rural Business-Cooperative Service (RBS) administers several programs, including loan guarantees, direct loans, and technical assistance, that encourage private lenders to be more responsive to unmet needs and opportunities in rural communities.

RBS' largest program is the business and industry (B&I) loan guarantee program, which has been operating at a level of about \$1 billion for the last few years. The 2001 budget provides \$1.25 billion in B&I guarantees and \$50 million in direct loans, which are targeted to areas that have traditionally been under-served by commercial lenders. This level of funding reflects the Administration's strong commitment to expanding the rural economy, and is expected to create or save more than 40,000 jobs in rural America.

The 2001 budget provides \$64 million for the Intermediary Relending Program with \$4 million of this amount earmarked for the Administration's Native American Initiative. This program provides loans at 1 percent interest to intermediaries who relend those funds to local businesses and other organizations to improve the local economic base.

The rural business enterprise grant program would be funded at \$41 million, a small increase over the 2000 level. These grants help rural entities, including public bodies, nonprofit corporations and federally recognized Indian tribes, finance and facilitate development of small and emerging businesses. The budget provides \$8 million for rural business opportunity grants, which help rural communities develop comprehensive strategies for revitalization and to better coordinate Federal assistance. The budget also includes \$5 million for the National Sheep Industry Improvement Center, which is expected to use up most of the \$20 million in mandatory funding authority that the Center was provided in the 1996 Act.

The 2001 budget also provides \$6 million for rural cooperative development grants and \$2 million for cooperative research agreements, compared to 2000 levels of \$3 million and \$500 thousand, respectively. The increase will be used to provide technical assistance to small-scale farmers to assist them in developing ways to add value to their product in processing and marketing through the cooperative form of business organization.

FOOD, NUTRITION AND CONSUMER SERVICES

America has the most affordable, safest food supply in the world, thanks to its hard-working farmers and ranchers, not to mention the world's most sophisticated food distribution system. Despite the strongest economy in a generation and the continued strength of the Nutrition Assistance Programs, the problem of hunger persists, and too many people have an inadequate diet. The Food Stamp Program, WIC, the Child Nutrition Programs, and commodity programs provide nutrition assistance to meet this need, as part of the national safety net. By improving nutritional status, these programs are contributing to a healthier and more productive America.

The budget includes \$35.8 billion to fully fund the Food Stamps, Child Nutrition, and WIC Programs, the Nation's primary means for carrying out nutrition assistance policy. Over two-thirds of this money directly helps low-income children, school age or under.

The Food Stamp Program is budgeted at \$22.2 billion, including a \$1.0 billion contingency fund for unforeseen needs, on participation of about 18.8 million people. The request is \$1.1 billion higher than the 2000 level, and the participation estimate is 0.5 million higher. Food Stamp participation peaked in March 1994 at 28 million participants but has declined over 10 million participants since then. This trend began before welfare reform was enacted, intensified in 1997 and 1998, and has since slowed somewhat. The strongest economy in a generation, increased support

from absent parents and the success of welfare reform in moving people into work are helping vulnerable households reduce their dependency on food stamps. However, too many people eligible for the Food Stamp Program are not applying for these benefits, often because they do not realize they are eligible for food stamps or have difficulty obtaining them. This trend is problematic because food stamps can be the difference that brings working poor families above the poverty line. Several initiatives have been launched to help make sure that those who are still eligible for food stamps know that they can participate. To facilitate participation, funding to promote knowledge of the program among likely eligibles has been included in the budget.

Several Food Stamp legislative proposals and initiatives are also included in this budget. Eligibility would be restored to legal immigrant adults whose children are eligible for food stamps and legal immigrants living in the U.S. at the time of welfare reform, who have since turned 65. The budget would allow States the option of conforming food stamp rules on the treatment of vehicles with more generous Temporary Assistance for Needy Families (TANF) program procedures. The change will simplify administration of both programs, and help program participants own a reliable automobile so that they will have the transportation they are likely to need to take advantage of training and job opportunities. Using current authorities, efforts will be increased to reduce program error rates.

For the Child Nutrition Programs, the budget requests \$9.5 billion, slightly below the 2000 enacted level. This includes Team Nutrition funding of \$10 million and \$2 million for the Nutrition Education and Training program. A request of \$6 million, the final increment needed to complete the evaluation of the universal free breakfast pilot is also included. Legislation is being proposed that would improve administration and program integrity for the Child and Adult Care Food Program, and also to reduce barriers for eligible children without health insurance to enroll in the Child Health Insurance Program (CHIP) or Medicaid by allowing health departments to use National School Lunch Program free meal application data to target insurance outreach efforts.

The WIC request includes an increase of \$116 million, which will support a monthly average of about 7.4 million participants with a gradual increase so that 7.5 million participants could be served by the end of the fiscal year. A sum of \$20 million, a \$5 million increase, is requested separately under the Commodity Assistance Program for the Farmers' Market Nutrition Program. The Food and Nutrition Service and WIC State agencies are working to improve vendor management and tighten program targeting and integrity. Among the initiatives in this regard, \$6 million is requested to further State implementation of WIC Electronic Benefit Transfer (EBT) technology already under development. WIC EBT will improve efficiency and integrity in benefit redemption, and it will increase operational efficiency in WIC clinics.

The budget provides \$145 million for the Emergency Food Assistance Program (TEFAP), including \$100 million in food purchases (from Food Stamp Program funds) and \$45 million for State and local administration, not including bonus commodities. The Commodity Supplemental Food Program is funded at \$93 million, while funding for the Nutrition Program for the Elderly (NPE) is increased by \$10 million, to \$150 million, to allow for increases in participation.

Finally, USDA also would increase its efforts to manage the nutrition programs effectively and to promote good nutrition. Through well managed programs with effective targeting and increased payment accuracy, program dollars can be stretched and the benefits magnified. The budget includes \$129 million for the Food and Nutrition Service nutrition program administration, an increase of \$14 million from the 2000 level. This includes \$5 million for Partnership for Change, promoting coordination of Federal, State, local and private efforts in specific target areas, primarily the Colonias along the Mexican border from Texas to California. Also included is \$2 million to effectively promote the Dietary Guidelines to nutritionally at risk individuals and low income households, as well as \$8 million to improve program integrity. Federal resources needed to effectively manage the nutrition programs have dwindled significantly over the years, now down to less than one half of 1 percent of program funding. Resources to oversee States and to implement program improvements, such as EBT for WIC, are extremely limited. Therefore, it is very important to the recipients of these programs that this request be fully funded.

FOOD SAFETY

Over the last 5 years, USDA has pursued a course to reduce the incidence of foodborne illness associated with meat and poultry products. The backbone of this effort has been the planning, development, and implementation of a new inspection

system to achieve pathogen reduction through the implementation of hazard analysis and critical control points (HACCP) systems. With the phased-in implementation of HACCP 3 years ago, steps were taken to introduce science-based inspection practices into a system that had not changed in nearly 100 years. Under HACCP, the industry has taken the responsibility for identifying and addressing food safety hazards that may occur during production and improving the sanitation of their facilities. To coincide with these changes, the inspection program has refocused its efforts on ensuring that production systems are producing products that meet sound, science-based microbiological performance standards; as well as preventing transmission of diseases from animals to humans.

In January 1998, approximately 300 large establishments entered the program and the following year over 2,800 small plants implemented the new requirements. Recently, on January 25, 2000, the program was fully implemented when the remaining very small establishments entered the program. At this time, all meat and poultry establishments have in place standard operating procedures for sanitation and HACCP systems for controlling food safety processes. All slaughter establishments are testing product for generic *E. coli* contamination to ensure that they are preventing fecal contamination, and all establishments producing raw product must achieve *Salmonella* performance standards. Compliance with the new requirements, by the large and small establishments, is very high and it is expected that the first year experience for the very small establishments will also be successful.

Now that this system is fully implemented, there is evidence that improvements made by the industry and inspectors are providing valuable benefits for consumers. Data from the first 2 years of implementation of the Pathogen Reduction/HACCP rule in large and small establishments indicates that the prevalence of *Salmonella* in meat and poultry products was reduced by nearly 50 percent in chicken carcasses. In addition, data released from the FoodNet disease surveillance system indicates that during 1998, the rate of *Campylobacter* and *Salmonella* infections declined nationwide.

For 2001, the budget for inspection of meat, poultry, and processed egg products is based on a program level under current law of \$688 million, a net increase of \$18 million over the 2000 level. The 2001 budget includes an increase for pay and benefits to meet statutory obligations to provide inspection services without disruption. The 2001 budget repropose legislation to recover the full cost of providing Federal meat, poultry, and egg inspection. The user fee proposal excludes Grants to States and Special Assistance for State Programs. Requiring the payment of user fees for Federal inspection services would not only result in savings to the taxpayer, but would also ensure that sufficient resources are available to provide the mandatory inspection services needed to meet increasing industry demand, while representing less than 1 cent per pound inspected to consumers.

The 2001 budget includes increases to enhance the implementation of HACCP and science-based inspection procedures. Currently, the Food Safety and Inspection Service (FSIS) is examining how to redefine the functions of inspection personnel under a HACCP-based food safety system. The inspection reforms being evaluated are expected to have a substantial impact on the deployment and compensation of FSIS in-plant personnel. The overall complexity of inspection work will increase as will the inspector's responsibility. Offsetting increased costs for implementing the reforms will be savings resulting from an anticipated reduction of part-time and temporary personnel not needed to conduct certain inspection functions. In addition, FSIS will also implement daily randomized inspection in processing establishments, rather than conducting inspection during each shift. Implementation of randomized processing inspection practices in 2001 will lead to better utilization of inspection personnel and eliminate the need for inspection services on an overtime basis, saving the industry overtime charges.

In order to ensure that all establishments producing meat and poultry products for U.S. consumers are meeting HACCP requirements, the budget includes funding to increase the number and intensity of comprehensive reviews of State and foreign inspection programs to assure that they are equivalent with Federal requirements. In addition, the implementation of HACCP and other regulatory reforms has placed increased demands on supervisors and inspectors for learning new processes that have increased the complexity of inspection activities. In order to ensure that these new functions are uniformly and effectively applied, FSIS needs to enable its inspection workforce to hold periodic meetings to address concerns and questions inspectors may have regarding verification of HACCP systems, process control systems, and pathogen testing. The budget also provides the resources needed to accelerate regulatory reform through the elimination of regulations not compatible with HACCP. The budget provides additional funding for Codex Alimentarius, which will

be used to prepare U.S. delegates to Codex for leadership in international food safety issues through technical training seminars.

The USDA strategy for improving food safety has been multi-faceted and broad, involving not only Federally inspected establishments, but also the entire farm-to-table continuum. Under the President's Food Safety Initiative for 2001, eight USDA agencies are requesting a total of \$163.7 million, an increase of \$27.4 million over the 2000 level. Research and data collection on food safety hazards and developing means to control them continue to be a high priority activity for USDA. In order to continue USDA's success in reducing microbial contamination of meat, poultry, and eggs, the budget includes funding to implement proposed legislation to permit the interstate shipment of State inspected products, and implement the Shell Egg Action Plan.

NATURAL RESOURCES AND ENVIRONMENT

At a national conservation summit that USDA hosted late last year, the Department released the latest Natural Resources Inventory (NRI) demonstrating that American agriculture will be facing a mounting array of conservation challenges in the 21st century. Many of these challenges, which appear to be growing faster than we can solve them, are all too familiar and include the need to conserve and protect our Nation's valuable private land, reduce soil erosion, improve water quality, limit the loss of prime agricultural land to development, protect and restore wetlands, and enhance fish and wildlife habitat. The 2001 budget recognizes the importance that the public has placed on these natural resource concerns and a number of proposals are included in the budget to help the Department address them.

Overall the budget for 2001 includes a funding level for the Natural Resources Conservation Service (NRCS) that totals about \$2.3 billion, including \$877 million in appropriated funding and \$1.4 billion in funding from the CCC. This also includes \$654 million for conservation technical assistance, a 13 percent increase, which represents the foundation of the Department's partnership with conservation districts and farmers, as well as the primary means by which the Department addresses many of the conservation priorities mentioned above.

The budget recognizes the important contribution that agriculture can make in addressing water quality and implementing the Administration's Clean Water Action Plan. Polluted runoff resulting from animal feeding operations (AFO's) are one of Agriculture's most critical challenges in preventing water pollution in the Nation and meeting this challenge continues to be a high priority within the Department. To help AFO's develop and implement nutrient management plans, NRCS will direct a total of \$87 million in technical assistance funding in 2001 which represents an increase of \$20 million and a redirection of \$11 million. Financial assistance that AFO's might need to implement the plans will come from the EQIP which is funded through CCC and for which we are seeking an increase of \$151 million. The budget also supports actions to strengthen local leadership capacity in the area of watershed restoration planning. NRCS will direct \$10 million to competitive partnership grants to enable locally-led institutions, such as conservation districts or watershed councils, to hire non-Federal watershed coordinators who will take an active role in problem identification and goal setting. An additional \$3 million is provided for monitoring work to help target resources and document baseline conditions and performance.

Last month the Vice President announced an ambitious new plan to support the farm safety net while at the same time promoting conservation, preserving farmland, and protecting soil and water quality. This plan recognizes the fact that soil and water are vital resources, and that producers should be compensated for their husbandry of these resources, just as they are for crop and livestock commodities. A cornerstone of this proposal is the new \$600 million Conservation Security Program which will be targeted to family farmers and ranchers who meet certain income-related criteria but who still want to practice environmentally sound land management practices. Through this program, the Department will make direct payments to producers to keep their agricultural operations economically and environmentally sustainable by compensating them for voluntary land stewardship. It will also be a significant new incentive for farmers to install important additional conservation practices such as nutrient and residue management and environmentally sound grazing. In further support of this farm safety net proposal, the Department will seek to reauthorize and fund the Farmland Protection Program and the Wildlife Habitat Incentives Program and to expand the Wetlands Reserve and Conservation Reserve Programs.

In support of the Administration's Global Climate Change Initiative, the budget includes an additional \$12 million for the conservation technical assistance program

to develop accurate baseline soil carbon data and to determine the impacts of Federal programs on soil carbon stocks at the national, regional and field levels. In addition, NRCS will devote \$3 million to fund demonstration and research pilot projects to test various carbon sequestration and greenhouse gas mitigation strategies and monitoring mechanisms.

Other budget increases include \$5 million to enable NRCS to help communities plan, develop and implement conservation based biomass production systems and \$5 million for financial and technical assistance for the Community/Federal Information Partnerships in support of the Administration's Livability initiative, which will allow communities to develop and use geospatial data for land-use planning and decisions.

Funds will again be limited in the watershed planning and construction area where allocations will be made only to those projects that demonstrate cost effectiveness and clear environmental need. Watershed plans will continue to be closely examined to eliminate those projects that have become infeasible in order to reduce the backlog of unfunded work. The budget request also includes the use of \$4 million in subsidy budget authority for a new \$60 million loan program that will provide loans to State and local governments for the rehabilitation of the more than 10,000 project dams that have been installed with USDA funding over the past 50 years. Many of these older projects are now approaching the end of their projected life span.

Finally, the Department's 2001 budget will continue to support the 315 authorized Resource Conservation and Development areas. While budget constraints preclude any new area authorizations this year, the ongoing program will continue to improve State and local leadership capabilities in planning, developing and carrying out resource conservation programs.

RESEARCH, EDUCATION, AND ECONOMICS

The Research, Education, and Economics (REE) programs aim to address increasingly complex issues faced by producers as we enter the 21st century by: (1) warding off any potential threats to agricultural productivity posed by deadly pests and diseases of U.S. and foreign origin; (2) helping the farming community to produce affordable high quality foods that are safe and nutritious by taking advantage of cutting edge tools such as biotechnology; and (3) creating a future workforce that is capable of addressing emerging issues in agriculture.

For the REE mission area increases are provided for developing novel methods to prevent and control exotic diseases, pests, and invasive species that threaten U.S. productivity; accelerating the development and commercialization of biofuels and other valuable biobased products made from agricultural and forestry resources; promoting agricultural production practices that are environmentally-sound; expanding higher education capacity in agricultural and food sciences; enhancing nutrition education and food recovery efforts to fight hunger; and providing important economic and statistical information for decision-makers to better address key issues in agriculture.

Agricultural Research

The 2001 budget provides \$894 million for the research programs carried out by the Agricultural Research Service (ARS), reflecting an increase of about \$64 million, or 7.7 percent above the 2000 enacted level. Within the total, the budget provides increases totaling nearly \$98 million, for top Administration initiatives and priorities, such as biobased fuels and products and the counter-terrorism initiative aiming to prevent and control acts of chemical and biological terrorism against U.S. agriculture. The initiatives will be funded in part through the savings achieved from the termination of lower priority projects, totaling more than \$42 million. An increase of \$2 million is also provided for the National Agricultural Library to rapidly respond to information requests in print and electronic form, increase digital publishing, and expand access to key agriculture-related information.

To identify, prevent, and control exotic and invasive diseases and pests, an increase of \$23.2 million is included in the ARS budget. The increase includes \$14.4 million for expanding the diagnostic capabilities to prevent acts of biological terrorism against U.S. agriculture, and preventing and controlling infectious zoonotic diseases afflicting livestock and aquaculture. The increase also includes \$4.3 million for invasive species, and \$4.5 million for Food Quality Protection Act (FQPA) related activities. An increase of \$21 million is also provided to the Cooperative State Research Education, and Extension Service (CSREES) for competitive grants to develop intermediate- and longer-term pest control alternatives in response to FQPA.

Additional investments in genetic research can potentially increase agricultural productivity and lessen the impact of agricultural practices on the environment by

generating economically desirable crops and animal products that are naturally resistant to deadly diseases and pests. The ARS budget contains an increase of \$12 million for genetic research. Additional funding, totaling \$12 million, is also available under the National Research Initiative (NRI) competitive grants for constructing genomic maps, conducting map-based cloning of select genes, and manipulating microbial genomes to increase agricultural productivity.

Scientific and technological advances in biobased products research make it possible to enhance farm income, strengthen U.S. energy security, and protect the environment. An increase of \$14 million for research to improve the conversion of agricultural materials and feedstocks into biofuels, and enhance the development of valuable biobased products. An additional \$9.6 million is also included in the CSREES budget for competitive grants to generate new information and tools for producers to grow and harvest alternative crops, and for manufacturers to convert the raw materials into valuable products for use by industry and consumers.

Other continuing ARS budget proposals include:

- An increase of \$5.7 million for food safety research in support of the President's Food Safety Initiative. The increase will support both pre-harvest and post-harvest research. Additional funding, totaling \$7.7 million, is available under the NRI to better identify risk factors in food production from farm-to-table.
- An increase of \$17.3 million for research in support of the President's Human Nutrition Initiative, aimed at increasing the understanding of how certain nutrients impact human health and weight-loss in individuals.
- An increase of \$23.7 million is provided to promote environmentally sound production practices, enhance the understanding of the adverse impacts of global climate change on food production, and develop methods to improve air quality.

The ARS budget also includes an additional \$39.3 million for facility construction and modernization projects at five ARS locations, including planning and design of a new Biosafety Level-3 facility at the National Animal Disease Center at Ames, Iowa, improvements to support new facilities at Beltsville, Maryland; continued modernization and construction at the Plum Island facility in New York, continued modernization of the Western Regional Research Center at Albany, California; and to upgrade the U.S. National Arboretum and the National Agricultural Library.

Research, Education, and Extension

The 2001 discretionary budget request for CSREES over \$972 million, an increase of \$22 million above the 2000 enacted level, with a shift within the total for several integrated research, education, and extension activities, targeting important programs such as water quality, food safety, and the economic viability of small farm producers. In addition to research programs financed with discretionary funding provided in appropriation bills, the Department has launched the \$120 million initiative for Future Agriculture and Food Systems and will also use funding available under the Fund for Rural America for various research and extension initiatives. These initiatives will be continued in 2001. An increase of \$31 million is also provided for the NRI, funding it at \$150 million. NRI supports cutting edge research aimed at addressing critical issues in agriculture by allowing the Nation's best scientists to compete for grant funds. The research funded under the NRI targets key areas, such as plant and animal genetics, human nutrition, global climate change, animal waste management, and pest control.

Specific budget proposals for CSREES include:

- An increase of over \$9 million for higher education programs through expanding Institution Challenge Grants, Graduate Fellowship Grants, and the Multicultural Scholars program, as well as enhancing the educational capacity at the Hispanic Serving Institutions, and the 1890 institutions. The increase also adds to the balance of the Native American Institutions Endowment Fund to enhance educational capacity and support facility renovation and construction at Tribal colleges.
- Over \$5 million in new funding for nonprofit groups and faith-based organizations to expand community-based efforts to fight hunger, improve nutrition, strengthen local food systems, and help low-income families move from poverty to self-sufficiency.
- \$5 million in new funding for a new Youth Farm Safety Education and Certification program to deliver safety training and certification to youth and migrant workers who may have limited access to formal education.

Economics and Statistics

The 2001 budget for the Economic Research Service (ERS) and the National Agricultural Statistics Service (NASS), in total, is \$156 million, down \$9 million from the 2000 enacted level. The proposed increases of \$5.2 million are provided to sup-

port economic analysis that improves public and private decisionmaking and meet the statistical data needs of our customers, are offset by a decrease of \$14.2 million, resulting in part from the proposal to transfer food program studies from ERS to the Food and Nutrition Service.

Funding proposals include:

- An increase of \$1 million for ERS for continuing analysis of market concentration, focusing on identifying where concentration is occurring in the marketing chain and who is affected. Assistance would also be provided to the Department of Justice for monitoring merger activity.
- An increase of \$0.7 million for ERS to assess the economic potential for domestic carbon sequestration in agricultural soils and identify the appropriate economic incentives for such activity.
- An increase of \$0.5 million for ERS to expand research and collaboration with appropriate institutions in developing countries to find solutions for global food insecurity.
- Increases of \$3.2 million for NASS to expand the monitoring of pesticide use, expand the current hog survey, develop computer security for confidential and market sensitive information and statistics, and begin preparations for the 2002 Census of Agriculture.

MARKETING AND REGULATORY PROGRAMS

The Marketing and Regulatory Programs facilitate domestic and international marketing of U.S. agricultural products by: (1) reducing international trade barriers and assuring that all sanitary and phytosanitary requirements are based on sound science; (2) protecting domestic producers from animal and plant pests and diseases; (3) monitoring markets to assure fair trading practices; (4) promoting competition and efficient marketing; (5) reducing the effects of destructive wildlife; and (6) assuring the well-being of research, exhibition, and pet animals. Consumers, as well as farmers, ranchers, handlers, processors, and other marketers in the agricultural sector, benefit from these activities.

The budget includes an increase of \$15 million for the Agricultural Marketing Service (AMS) for a number of important activities. It would be used to (1) continue the Mandatory Price Reporting for livestock begun in 2000; (2) expand voluntary market news reporting to include international and organic markets data; (3) finalize the National Organic Standards; (4) enhance the rapid response capability of the Pesticide Data Program (PDP) necessary to support the Department's responsibilities to meet the Environmental Protection Agency's data requirements for agricultural pesticide residues for drinking water under the Food Quality Protection Act; and (5) conduct microbiological testing of fruits and vegetables to support the President's Food Safety initiative.

For the Animal and Plant Health Inspection Service (APHIS), the budget includes an increase in current law appropriated funding of \$74.3 million. The increase for 2001 reflects a decision to fund, through appropriations, several programs that had been started with funds transferred from CCC. These continuing activities can no longer be considered "emergencies." These programs address the detection and exclusion of pests and diseases, including Mediterranean fruit fly, Citrus Canker, Asian Long-horned Beetle, and Hog Cholera. The budget also improves APHIS' Emergency Management System and implements a new Invasive Species program. These efforts will address demands to protect American agriculture from deliberate or accidental introductions of animal and plant pests and diseases from abroad. Other priority increases are requested in the following areas: (1) Agricultural Quarantine Inspection services will be improved along U.S. borders and ports of entry to match the greater demands for these services, by using additional point-of-entry inspectors, expansion of canine teams, and state-of-the-art high-definition x-ray machines; (2) Animal Health Monitoring and Surveillance will continue to assure our trading partners of the highest quality products, by maintaining epidemiological and statistical principles of critical animal disease control and diagnostic testing methods; and (3) Animal care activities will increase the number of inspections to assure violations are corrected, expand public outreach, and encourage stakeholder and industry participation. Also, legislation will be proposed to increase license fees on the entities regulated under the Animal Welfare Act to recover the field level costs of administering the Act and to increase biotechnology permit fees to recover the costs of providing such services.

The budget requests an increase for the Grain Inspection, Packers and Stockyards Administration (GIPSA) in current law appropriations of \$7.1 million so that grain inspection activities for standardization, compliance, methods development, and all activities under the Packers and Stockyards Program are achieved. GIPSA needs to

address the complex quality information needs emerging as a result of today's biotechnological advances, in order to meet market and consumer demands with respect to genetically engineered grains and grain products. New testing methods will permit greater transparency from grain inspection, adding value to grain products so producers can continue to compete in the global economy. Specifically, \$2 million would be used to develop new biotechnology testing methods, analytical tests, and greater quality assurance procedures, and \$150,000 will be used to address emerging sanitary and phytosanitary standards required by the WTO and NAFTA. Under the Packers and Stockyards Programs, \$5 million would be used to: (1) develop models which could be used to verify the existence of anti-competitive behavior; (2) expand the Rapid Response Teams used to investigate time-sensitive financial, trade, and anti-competitive behavior issues; (3) examine the competitive structure of the poultry industry; (4) establish a swine contract library, and (5) enhance civil rights activities and establish an information staff. This funding will allow GIPSA to promote competition and improve market performance, which is vital to increasing confidence in the livestock and poultry sectors. Legislation will again be proposed to charge user fees for grain standardization activities and license fees for packers and stockyards activities.

DEPARTMENTAL MANAGEMENT ACTIVITIES

The Departmental offices provide leadership, coordination and support for all administrative and policy functions of the Department. These offices are vital to USDA's success in providing effective customer service and efficient program delivery. The 2001 budget proposes targeted increases for USDA's central offices and management functions to strengthen Departmentwide management oversight, leadership, coordination, and administrative support in keeping with the Department's Strategic Plan Management Initiatives to:

- Ensure that all customers and employees are treated fairly and equitably, with dignity and respect;
- Create a unified system of information technology management;
- Improve customer service by streamlining and restructuring the county offices; and
- Improve financial management and reporting.

The budget request reflects a continuing commitment to improving civil rights enforcement throughout USDA. In recent years, the Congress has provided funding for key civil rights initiatives in the Department, which is greatly appreciated. This budget includes further increases to ensure the achievement of the Department's civil rights goals. For example, an increase of \$1 million is included to enhance the Department's capability to more efficiently and effectively resolve workplace conflicts, including equal employment opportunity complaints, through an expanded Alternative Dispute Resolution program that will be jointly administered by the Office of Civil Rights and the Conflict Prevention and Resolution Center. An increase of \$7 million is included for the Department's Socially Disadvantaged Farmers Outreach Program. In 2000, this program was provided with an additional \$5.2 million from the Fund for Rural America. Authorized by Section 2501 of the Food, Agriculture, Conservation, and Trade Act of 1990, this program provides grants to organizations to help increase socially disadvantaged farmers' and ranchers' participation in USDA programs and to help enhance the success of their operations by providing outreach and technical assistance. The budget also includes \$500,000 for a Small Business Education and Development Pilot Program that will: (1) demonstrate strategies for the growth and stability of small businesses in rural America; (2) identify new markets for agricultural products of small, limited-resource farmers; and (3) deliver educational and technical resources to sustain economic growth and development.

The Office of the Chief Information Officer (OCIO) provides policy guidance, leadership, and coordination in USDA's information management and technology investment activities. The budget includes an increase of \$6.6 million to implement a comprehensive USDA Cyber-Security Program and \$2 million to support electronic commerce and information management and collection initiatives. The cyber-security program will ensure that the Department's information technology (IT) systems are protected from unlawful and malicious intrusions. Activities include establishing a department-level IT risk management program to provide means to identify vulnerabilities in USDA's information assets and mitigate security risks; further the development of an information and telecommunications security architecture; and conduct security awareness and training programs to educate our employees about security risks as well as their role in protecting USDA's information resources. As USDA agencies increasingly provide customers access to programs and services on

the Internet, Department-wide electronic commerce initiatives will facilitate the development of unified and more resource efficient approaches to common issues such as electronic signatures, information security, and rapidly evolving technical standards. Information management and collection initiatives will also provide a quick and easy way for customers to conduct business with the Department, reduce customer reporting burdens, and help the Department meet the requirements of the Government Paperwork and Elimination Act.

OCIO also has oversight of the Common Computing Environment (CCE) that is part of the Service Center Modernization Initiative (SCMI). CCE is a critical component of our plan to reengineer the Department in a way that improves customer service while reducing the long-term costs of providing those services. In recent years, the Department has collocated field offices of the Farm Service Agency, Natural Resources Conservation Service and Rural Development to create about 2,500 one-stop USDA service centers. A key ingredient in providing seamless, quality service at service centers is the replacement of these agencies' separate, incompatible, and aging information technology systems with a single, integrated, and modern information system. CCE will allow these agencies to share common information, will reengineer business processes to reduce the redundant requests, office visits, and paperwork burden faced by customers participating in multiple programs, and will save customers time and money by making Internet-based services available. Significant progress on SCMI has already been achieved. Business processes are being reengineered to streamline administrative functions and improve program delivery; modern telecommunications systems have been installed; and 30,000 computer workstations are being deployed that can be used interchangeably among the agencies. Significant efficiencies will be achieved when the service centers are allowed to integrate their administrative functions. A comprehensive Service Center Modernization Plan has recently been completed and adopted by the Department. It lays out the next steps and implementation timeframe for attaining the goal of one-stop service for USDA customers at the county level.

Until such time as the CCE is fully operational, the service center agencies will continue to rely on outmoded legacy computer systems, many of which have been in place since the early 1980's. These systems are becoming increasingly unreliable and are expensive to operate and maintain, costing an estimated \$250 million to operate in 1999. While spending on existing legacy systems will be held to minimum levels, there are operational and maintenance requirements of these systems that must be met to provide ongoing customer service. It is just not possible to finance the new CCE solely with funds diverted from the legacy systems. Additional investments will be needed in the current and upcoming years to reach the goal of bringing the CCE into full operational status during 2002. Failure to develop a modern IT infrastructure poses high risks for the continued ability of USDA to meet its basic customer service responsibilities. Thus, consistent with the Service Center Modernization Plan, this 2001 budget includes \$75 million for IT investments under the Office of the Chief Information Officer that will help achieve a fully operational common computing environment during 2002. Additional funds from the Service Center agencies' 2001 budgets will support the reengineering of business processes, additional equipment for the common computing environment, data acquisition to support geographic information systems, and training needed to maximize the benefits of this technology.

USDA's Office of the Chief Financial Officer (OCFO) provides overall direction and leadership in the development of modern financial systems in the Department. The budget includes an increase of \$1.5 million for a variety of strategies needed to strengthen the Department's financial credibility and accountability. These efforts include expanding departmental use of a new, integrated financial management system (the Foundation Financial Information System) and ensuring that all USDA agencies, including OCFO, develop and retain a level of expertise to ensure the effective and efficient use of financial management information. This funding will be used to effectively implement legislative mandates such as the Government Performance and Results Act, debt collection and cost accounting that are aimed at promoting sound business practices and making valid and reliable data and financial expertise available to support decision-making processes, and to help USDA achieve a clean audit report on its financial statements.

The budget also reflects a number of increases to strengthen departmentwide management oversight and leadership in support of USDA programs. An increase of \$800,000 is proposed to support the Department's Biobased Products and Bioenergy Coordination Council. Funds will be used to develop standards for and a list of biobased products as part of departmental and governmentwide initiatives to further the use of environmentally preferable products.

The Department's Office of Communications (OC) plays a critical role in disseminating information about USDA's programs to the public. The budget includes increases of \$0.9 million to enable OC to utilize new technology to reach audiences in a more timely and effective manner, and to lead departmentwide communications efforts to reach underserved populations.

Legal oversight, counsel, and support for the Department's programs is provided by the Office of the General Counsel (OGC). The budget provides an additional \$3.7 million to strengthen OGC's ability to provide timely response to increasing requests for legal assistance from the program agencies, especially in the areas of civil rights, natural resources, food safety, concentration, and general law. Funds are also included to provide IT improvements to further enhance the efficiency of the office.

The National Appeals Division is responsible for all administrative appeals of adverse decisions issued by certain agencies within the Department and conducts administrative hearings in a fair and impartial manner. The 2001 budget includes an increase of almost \$900,000 to maintain current activities while providing training to its employees that will enhance their required knowledge and skills regarding adjudication procedures and USDA regulations and policies.

The Chief Economist advises the Secretary on policies and programs related to U.S. agriculture and rural areas, provides objective analysis on the impacts of policy options on the agricultural and rural economy, and participates in planning and developing programs to improve the Department's forecasts, projections, and policy analysis capabilities, including the collection and dissemination of weather data to the agricultural community. The budget includes an increase of \$400,000 to continue the modernization of USDA's weather and economic data systems, including the installation of a second automated weather station to better cover prime agricultural areas and Internet-based dissemination of economic and weather data. An increase of \$1 million is requested to provide analysis and evaluation needed to support the Department's and governmentwide efforts to use more biomass energy and biobased industrial feedstocks and products. This proposal includes \$700,000 to address increasing concern about the effects of agricultural operations on the environment and food safety by enhancing USDA's ability to assess these risks and reduce them.

The budget also includes funding to continue ongoing implementation of the USDA Washington Area Strategic Space Plan, which seeks to reduce facilities' costs by moving headquarters employees into efficient and safe government-owned workspace. In 2001, the Department is requesting an increase of \$46 million for:

- required increases in rental payments to GSA;
- renovation of the nearly 70-year old South Building to address serious fire and health hazards and electrical malfunctions;
- maintaining and operating our buildings; and
- addressing the increasing threats of terrorism and intrusion to USDA's employees and systems.

The Hazardous Materials Management Program provides for Departmental compliance with legislation requiring the cleanup of sites and facilities contaminated by hazardous wastes and the responsible management of hazardous materials. An increase of \$14.4 million is requested to accelerate investigative and cleanup activities in order to protect public health and stay on track to meet the goal of cleaning up all sites under our jurisdiction by 2045. Along with protecting public health and the environment, funding will reduce the likelihood of costly enforcement actions and lawsuits against the Department. It also will contribute to a proactive effort to seek out and reach agreements with outside parties responsible for contamination of sites under USDA's jurisdiction. Getting these groups to pay their fair share of cleanup efforts contributes significantly to ensuring activities in this area are completed as quickly and comprehensively as possible.

OFFICE OF INSPECTOR GENERAL

The Office of Inspector General (OIG) conducts and supervises audits and investigations relating to programs and operations of the Department, and as such, is the principal law enforcement provider in the Department; reviews and makes recommendations on existing and proposed legislation and regulations; and recommends policies and activities to promote economy and efficiency and to prevent and detect fraud and mismanagement in USDA operations. The request provides an increase of \$5.1 million to conduct additional audits aimed at ensuring the safety of agricultural products and protecting the integrity of USDA's information systems. The proposal will also support the acquisition of specialized law enforcement equipment to enhance the safety and security of OIG law enforcement activities, and increase criminal investigations in USDA public integrity vulnerabilities.

That concludes my statement. I am looking forward to working closely with the Committee on the 2001 budget so that we can better serve those people who are in need of USDA programs and services.

Senator COCHRAN. I apologize for our obligation to have to leave to vote. We will recess quickly and resume our questions.

Secretary GLICKMAN. Okay.

Senator COCHRAN. Thank you very much.

Secretary GLICKMAN. Thank you.

Senator COCHRAN. The subcommittee will come to order.

SAFETY NET PROGRAM

Mr. Secretary, thank you for your patience. I understand the budget proposal includes, for this next fiscal year, \$5.8 billion out of this \$11 billion safety net program that you mentioned, and that a major component includes a payment limit income assistance program.

You said that even with the proposed payment limit, only 2 percent of current recipients under the AMTA payment scheme will be ineligible. And further, it is my understanding that an individual that receives less than the \$30,000 payment limitation would have his supplemental payment reduced by the amount of his AMTA payment.

The ad hoc emergency disaster assistance provided by the Congress in the last 2 years has been offset from within the spending caps established by the balance budget agreement. Is this new \$11 billion proposal submitted by the Administration offset, or is it being taken from the budget surplus?

Secretary GLICKMAN. Well, I would ask Mr. Dewhurst to respond. It is not in the category of emergency spending. That, I can tell you. So, it is part of the basic budget of the government, and I suppose one could say it is paid for in the context of the President's balanced budget proposal, but Mr. Dewhurst may have a little more specific answer to that.

Mr. DEWHURST. Well, the Secretary is correct. The President's budget has a section on mandatory proposals. It has increases, it has decreases, and it has a balance at the end. Our increases are in that table.

None of the offsets were in the Department of Agriculture. They are in other places in government, but essentially we are within a proposal that is a balanced proposal.

INELIGIBILITY OF CURRENT AMTA RECIPIENTS

Senator COCHRAN. Another concern I have is that your suggestion that only 2 percent of current AMTA recipients would be ineligible under this new program. I think just the opposite is going to be true in my State. I think only 2 percent of the producers are going to be eligible, and 98 percent are going to be ineligible. I hope you will take another look at that.

Secretary GLICKMAN. I wonder if, perhaps, Mr. Collins can respond—I have not done a State-by-State analysis, but he can tell you a little bit more than what I have mentioned.

Mr. COLLINS. I have not done a State-by-State analysis either, but I could get you that data. I can only say that based on the 1998 data that we report to the IRS for purposes of issuing Form 1099's

for tax purposes, only 2 percent of the total number of recipients of payments receiving 1099's had more than \$30,000 and dependents in 1998.

That is the basis on which we say that 2 percent would, right out of the box, be excluded nationally. It may be that a disproportionate share of those are in your State, but I could certainly check that.

Senator COCHRAN. Or even in the region. It seems to me that there is a likelihood that you are going to have the payment skewed toward the upper Midwest.

Not to be critical of that, Senator Kohl.

But I really think you are going to find, if you look at this carefully, it is going to discriminate possibly against the Southern Region, the Southern producers. I am suggesting that s a possibility. It is a concern of mine. Have you done a regional analysis of this?

Mr. COLLINS. I think that is true, that it will disproportionately affect some crops, such as cotton and rice. There tend to be higher payments associated with those crops because they are high value crops.

Senator COCHRAN. Right. It costs more to produce the crops.

Mr. COLLINS. Correct.

Senator COCHRAN. Okay. Well, I am hopeful, before we rush to embrace the Administration's proposal, we will look at some of the details carefully. And I am confident that is what the legislative committee will do.

Frankly, it will not be up to this committee to change the law as you are suggesting to get to the point where appropriated dollars would have to be made available to support this program.

NEW CROPS ELIGIBLE FOR SUBSIDIES

Do you expect there would be an expansion of farm program subsidies to new crops as well?

Secretary GLICKMAN. Our proposal helps new crops, in two ways. One is that conservation payments would be available to all farmers, everywhere in the country.

So, the direct conservation payments to the farmers, whether in Mississippi or anywhere else, would be on top of AMTA. In addition, they would be available to every producer of every type of crop. We still have to come up with legislative language for this, but it will be a profound enhancement of the current farm program.

In addition, as I mentioned before, our crop insurance programs are going to be modified to ensure more participation by producers of non-program crops. We are also developing of new insurance programs to cover additional crops and to get rid of the area-wide trigger that has limited assistance under the non-insured assistance program.

NEW DELTA INITIATIVE

Senator COCHRAN. One other concern that I raised in my opening statement is this new delta initiative. I am suspicious that this is not going to do nearly as much as the President is advertising that it will do. Can you tell us out of this \$153 million proposal to create

a new delta regional authority, how this money is actually going to be spent?

Secretary GLICKMAN. I would ask Mr. Dewhurst to, perhaps, respond to that question.

Mr. DEWHURST. The honest answer to your question is: I do not know. It is presented as proposed legislation in the President's budget to be administered by an agency outside the Department of Agriculture, and I am just not versed in what that proposal is.

Senator COCHRAN. I had an opportunity to make comments about the user fees. I am convinced that this is just not going to be enacted by the legislative committee, and so the expectation that we are going to impose what would amount to be new taxes, over a half billion dollars in new taxes on producers, processors and handlers of agriculture and food products, is just not going to happen. I do not think Congress is going to go along with that.

On the subject of the census, I understand that you have granted a waiver—

Secretary GLICKMAN. That is right.

Senator COCHRAN [continuing]. So that food stamps recipients can be employed in the taking of the census, and I commend you for getting that done. HUD has also made a similar kind of waiver. Thank you.

It seems to me that if we have people involved in taking the census, even if they are beneficiaries of food programs, they are going to be from the community, and they are going to be familiar with where people live and who people are, and we will have a more accurate census.

And people who are being questioned by the census takers are going to be more likely to respond to someone they know, rather than somebody who is hired out of Washington to come down there and try to check up on everybody, and where everybody is, and get all the answers to these census data forms.

I remember being chairman of that subcommittee one time. We had hearings around the country, New York City and rural areas of the country, and how we could actually ensure that a more accurate census is being taken.

That was one of the suggestions that we kept hearing, "Get local people who are well known in the communities you are trying to examine and review, and that is how you will end up building confidence." And so, I think this is a very important step, and thank you.

I have other questions, and I am going to defer to my friends on the committee to ask questions, and then I will return to continue my questioning.

Senator Kohl.

Senator KOHL. Thank you, Mr. Chairman.

Secretary Glickman, your safety net plan will provide more than \$6 billion to support crops on top of AMTA payments and loan deficiency payments they already receive.

DAIRY ASSISTANCE

I do not begrudge crop producers a meaningful safety net. I encourage that. But I am dumbfounded that this Administration has not proposed something more meaningful for dairy, particularly in

light of the disaster of the low milk prices that your agency is predicting this year. Still, the Federal Government has a record of what I consider to be destructive dairy policies.

So, Mr. Secretary, what am I supposed to tell dairy farmers in Wisconsin, or for that matter, across the country, to explain this policy? Can I tell them that volatility in dairy is not as devastating as it is for other commodities; or perhaps should I tell them that when the pie was cut up, their income simply was not as important to this Administration as income for farmers of other commodities? Mr. Secretary?

Secretary GLICKMAN. I am fully cognizant of the price and volatility issues, but let me just talk about a couple of things.

Number one, we have proposed extending price supports for 2 years. That is a cost of \$300 million, and if that is not done, prices could fall to levels way below where they currently are.

I also think it is important, in this context, to note what we have already done. And a lot of what we have done is because of what Congress has put in emergency bills. We raised class one differentials in the upper Midwest.

When did we do that?

Mr. COLLINS. January 1st.

Secretary GLICKMAN. January the 1st. We ran a \$200 million economic assistance program last year. We will run a \$125 million program for dairy farmers again this year. We will scale up the dairy options pilot program. We will run the DEIP—dairy export incentive program—at its maximum.

Most dairy farmers will benefit from crop programs. Most, if not virtually all dairy farmers produce row crops, and will benefit from that as well. And the conservation proposals and the EQIP program will have a significant impact on dairy producers.

Now, is that enough? It probably is not enough, and we are going to have to work with you on seeing if there are other things that we can do. And the fact is, as you know, I did try last year to make changes in the milk marketing order system. For a lot of different reasons, it was not successful.

But I do want you to know that we are trying to deal with this in a multi-disciplinary approach, from the conservation approach, from the risk management approach, from the export approach, as well as for direct payments. We just have to work with you to kind of continue going down this road.

Senator KOHL. So you are prepared to consider some alterations?

Secretary GLICKMAN. Well, our proposals were the initial proposals based upon our budget. But, you know, I am a student of the legislative process. We are going to have to work with you, and I fully recognize there are going to be some changes in these proposals. If history is any guide, there will be.

We presented an intellectual framework for what the emergency package ought to look like. But do I expect that Congress, working with us, will make some changes? Of course.

REGIONAL DAIRY COMPACTS

Senator KOHL. Mr. Secretary, in addition to low milk prices, I am very concerned about the impacts, as you know, of regional dairy compacts. On dairy farmers in the middle west, particularly, of

course, Wisconsin. As you know the concerns of the upper Midwest dairy farmers are based on the distortion that such compacts create and the inevitable increase in milk production that will result from these compacts. Ultimately these policies will reduce prices for all farmers outside the pricing cartel.

Studies of the impact of the Northeast Dairy Compact, some of which are actually commissioned by the Compact Commission itself, show: One, that consumers are paying higher milk prices in that area; two, that not all nutrition programs are being reimbursed for their increased cost under the program; three, that when effective, the compact prices encouraged excess production of manufactured dairy products; and four, that the compact does not prevent the loss of family farms in the Northeast.

Earlier this week, Mr. Collins reviewed, for the Agriculture Committee, some of the economic studies at the University of Wisconsin, Vermont, Missouri, and Massachusetts, the impact of the Northeast Dairy Compact.

And, Mr. Collins, would you like to review those studies and conclusions to this committee? Will you just spend a minute or two or three telling us what the major—

Mr. COLLINS. I would just probably repeat what you just said, Mr. Kohl. The studies generally show that when the over-order price under the compact exceeds what would have been the price under federal orders, consumers in New England have paid a higher price than they otherwise would have paid.

The University of Vermont study shows that in the first 12 months after the compact was in effect, milk production increased 1 percent or 45 million pounds in the compact area, due to the compact itself. So, there was an increase in milk production.

The third point you made was the issue related to assistance provided to food and nutrition programs. The compact commission has provided compensation for the WIC program, and has started doing it for the school lunch program. The food stamp program recipients, of course, will pay higher milk prices without being compensated.

There have been some studies to show that the compensation has not been perfect. That is, in Massachusetts, WIC recipients have received compensation to offset their higher milk costs, but this is not true in the State of Connecticut, for example.

Senator KOHL. Mr. Secretary, any justification for setting up a price fixing cartel arrangement? Any justification, whatsoever, Mr. Secretary? Is there any justification for it, Mr. Secretary, in the United States of America?

Secretary GLICKMAN. Nobody wants to set up a price fixing cartel that is violating anti-trust laws or anything else.

But let me comment on this. As you know, we proposed milk marketing order reform, under the Congressional statute. When that reform became effective, the Northeast Dairy Compact would end. That may have been one of the reasons why we could not get milk market order reform because there were a lot of folks who did not want the Compact to end.

We have not taken a formal Administration position on compacts. However, I had stated publicly that compacts do raise some of the concerns that Mr. Collins has talked about.

If you were going to go down that road, you would have to protect against other parts of the country being affected by excessive milk supply, because that could affect dairy farmers by getting lower prices in those areas. It could have an effect on our programs for the poor.

Also, I have said that if you were going to have compacts, you would need to give authority to the Secretary to revoke the compact if, in fact, these terrible things happened.

Now, I have not addressed absolutely whether we would approve the compact or not approve it, because I do not know whether you could work out any language that could deal with some of the problems that you and Mr. Collins have raised. I do not know if that is possible yet.

REGIONAL DAIRY COMPACTS

Senator KOHL. Price fixing arrangements, whether they are in the milk industry or any other industry, whether it is in commodities or manufactured products, price fixing arrangements that prevent producers or manufacturers from selling their products in all 50 States, the basis of the American economy, price fixing arrangements.

Any way that you can support them, whether it is milk or any other commodity or any other manufactured product—can you support that? I asked you another question.

In terms of the larger issue that I am raising, and in terms of your legacy, our legacy, the American economy, what makes it great, are you not willing to stand up and say, “I do not know if I will win and I do not know if I will lose, but I will fight them to my last breath because price fixing cartels are not consistent with the way the American economy has worked”?

Secretary GLICKMAN. Senator Kohl, I hope that I showed last year that I was willing to weigh in. I am not afraid of the political fallout of taking a position which, apparently, a majority of the Congress did not agree with me on.

The fact is, even under a compact, you can move milk around in interstate commerce. A compact will affect the volume of milk that is moved, and perhaps the price as well. It also may affect lower income citizens.

As a general proposition, all products should flow in interstate commerce as freely as possible. I agree with that.

Senator KOHL. And they do.

Secretary GLICKMAN. But I am just saying that I think it would have been better if we would have adopted the milk marketing order reform that we had proposed, so that we would not have to continue to deal with this issue.

There are problems with compacts. I have said that before. I think that if Congress were to decide to go ahead with compacts, they would have to address our concerns. I have said that before. Those concerns relate to effects on other parts of the country. They relate to pricing in other parts of the country. They relate to how the poor would be dealt with.

Senator KOHL. Is there some idea as to how we are going to deal with apparent effort on the part of other regions to set up their compacts? That is the way these things work. And it is going to

work. It is expected to work. I have heard from members of this committee that compacts are going to be proposed for other regions this year. Are you all prepared to take a position?

Secretary GLICKMAN. We will, I am sure, take a position when the legislation is at a ripe point where we think we need to do that. I am willing to work with you and the other members on our concerns. Obviously we have serious concerns about it. I have raised that. Mr. Collins has raised it.

But I am not willing, at this stage, to give you a formal position, because I do not have a piece of specific legislation to deal with right now.

Senator KOHL. Mr. Collins, do you have a comment on that?

Mr. COLLINS. No, sir.

Senator KOHL. Really? I mean this whole thing is—what is the logic in the year 2000 of paying farmers, the further away they get from Wisconsin, more for their product?

Secretary GLICKMAN. I do not disagree with you on that point.

Senator KOHL. What is going on here? Is there no justice? Is it just “might makes right”? Is that all it is about? I’ve worked here for 12 years and I have learned, and I wish I had not learned, that that is all we are talking about here—“might makes right.” If you got the votes and you have a Federal court decision in your favor, you can do anything.

Is that the way it works? Why has not the Administration, even though maybe this is a small issue, I recognize that, but why is not the Administration taking a stronger position on this? There is no logic to defend the present milk pricing system, just “might makes right.”

Secretary GLICKMAN. Well, Senator, I would have to say this: There are an many of parts of agriculture that are hurting very much right now, and people are looking for alternative ways to address the problems, the low prices, that producers are getting everywhere.

Now, we do know that in this particular area, you have a situation of regional conflicts, which you do not tend to have in other areas of agriculture. Cotton pricing tends not to be parochially regional, whereas dairy does get to be regional.

But I think that the reason why this issue has been so difficult to resolve is because those in Congress from farm States are looking for ways to help their producers any way they can. You know, we have to ultimately take a position based upon what we think is the right thing to do, and we will. But at this stage, I think it is premature for us to tell you absolutely one way or the other which way we would go.

REGIONAL DAIRY COMPACTS

Senator KOHL. Well, you know, ultimately I am hoping that we can work constructively again this year on this issue, both in terms of the pricing policy and the compacts, because I do not hear any defense for them except that that is just the way it is. And I appreciate that, and I know you did not create it, and it is not easy to change it, but it is certainly worth the effort.

There is no justification. I defy Senator Cochran or anybody else to tell me why the further away you get from Wisconsin, the more

you should get for your milk, while we are the State with the most milk producers in the nation. Dairy is Wisconsin's leading industry, and we are not asking for any advantages, we just do not want to have any disadvantages. It does not make any sense.

Senator COCHRAN. You pay your quarterback from Mississippi a lot more than you pay any other quarterback.

Senator KOHL. Right.

Senator COCHRAN. For Green Bay.

Senator KOHL. Right.

FOOD STAMP PROGRAM

Anyway, just another question: Mr. Secretary, this subcommittee provides more spending for nutrition than any other USDA programs. However, over the past few years we have seen dramatic declines in spending for the food stamp program.

In fact, we now learn that over \$1 billion of food stamp funds are estimated to lapse at the end of this fiscal year, and despite the economy and the decline in food stamps spending, we continue to hear reports of increased demand at food banks and in soup kitchens.

According to USDA, over 14 million children do not have food to meet their basic needs and they are going hungry. In Wisconsin, one paper, the Green Bay News Chronicle, has reported extensively on the growing hunger problem in that region. What has USDA been doing, and what have you learned about this phenomena, what actions can the subcommittee take to start turning these numbers around, especially the disturbing trend of growing child hunger?

Secretary GLICKMAN. Well, one thing we have done is we have asked for full funding for the food stamp program in our budget. We also want to take into account a large number of people that we think ought to be participating in the program that are not.

This is a very serious problem. The rate of reduction in participation in the food stamp program, is much greater than the rate of reduction in our poverty rates. We have an awful lot of people we believe are not on the food stamp program that are eligible. There may be many reasons why.

One reason may be confusion about the welfare reform law and its impact on other laws, the TANF law, AFDC, and Medicaid. People are no longer eligible in certain circumstances for the State run programs, but food stamps is still an entitlement program with federally set eligibility criteria, and a lot of people, I think, thought if they were off one program they were ineligible for food stamps, which is often not the case.

So, we have an obligation to do a much more intensive outreach and education effort, both in English as well as Spanish and other foreign languages, if necessary, to let people know what they are eligible for. We are encouraging the States to do the same thing, because they basically run the programs as well.

But this is a phenomenon that is out there. The fact is that the differential between the haves and the have nots in many parts of this country is growing.

The Food Stamp program is one that most people are on for a very short period of time. It is our largest food assistance program,

and over half of the recipients are children. It is a program where the rules have been changed through legislation to encourage people to go to work. Outreach and education are needed, however to ensure that low income working families know that they remain eligible for food stamps.

We also are proposing some legislative changes. The President has proposed making some legal aliens, some people who were cut off before, eligible. We have also proposed to ease the rules on automobile ownership, because it has been the same for almost 20, 25 years. We want to encourage more people to own a car. So, if you have a car, you can at least go to work, and car ownership has been disqualifying people from being on food stamps for some time.

This is a very serious problem. We are working with the activists and the hunger groups and the non-profit community, the church communities, to try to deal with this issue. But the law does allow people with eligibility to participate in the program, and there are an awful lot of people who are not doing it.

CONSERVATION PROGRAMS

Senator KOHL. Okay. One last question. I am a strong supporter of USDA conservation programs and all conservation activities in general. In fact, I am very proud that Wisconsin takes credit as the birthplace of today's conservation movement. In current law, and in the farm safety net initiative you propose, many of the major conservation programs are funded directly out of the Commodity Credit Corporation.

The 1996 farm bill set in place limited funds made available through Section 11 of the CCC charter act, which has had the result of making it difficult for USDA to carry out these important programs.

Last year, I, along with Senator Cochran, provided you some relief in order to make funds available in fiscal year 1999 and 2000, to carry out programs like the Wetlands Reserve Program and the Conservation Reserve Program, notwithstanding the so called Section 11 cap.

SECTION 11 CAP

What action do you plan to take in working with the authorizing committees to change the Section 11 cap problem and what will be the effect in carrying conservation programs in fiscal year 2000 if no action is taken?

Secretary GLICKMAN. I would ask Deputy Secretary to respond.

Mr. ROMINGER. It is true, Senator, that we are looking at a shortfall in funds for technical assistance because of the Section 11 cap, and so we are going to be asking the committee for a supplemental to be able to cover that. If we do not get the supplemental, there will be farmers out there who do not get the assistance in developing their plans so they can participate in the programs.

Senator KOHL. Do you have any other—

Mr. DEWHURST. No, I do not. But to be precisely correct, the Administration is going to be asking, in the safety net proposal, the authorizing committees to lift the cap, as appropriate, to provide the necessary technical assistance.

If Congress were to take all the actions the Administration recommended to create the Conservation Security Program and expand the other mandatory conservation programs, without expanding the cap, it would produce on the order of a \$100 million shortage in technical assistance funds to support these programs. So, increasing the cap is a very important part of the conservation initiative of the Administration. Thank you.

Senator KOHL. No questions.

Senator COCHRAN. Thank you, Senator. Senator Burns.

Senator BURNS. Thank you, Mr. Chairman, and thank you, Mr. Secretary, for coming up today. I am not going to take long. No good deed shall go unpunished, right?

Senator COCHRAN. That is right.

Senator BURNS. We can look at the overall budget and there are some things we are just tickled to death with, and other areas we do not like so much, which means that if we had one foot in the hot oven and one foot in a bucket of ice water, we ought to feel pretty good. But we do not.

EXPORT ENHANCEMENT PROGRAM

The area of EEP, I would like to see some kind of reform made there, so that we can use that tool effectively, and the right people get the help in their exports. And I know you have done a lot of work in that line, and I would like to work with you on reform of EEP and the initial thrust.

I was quite disappointed in the Department of Agriculture when Frito Lay made its announcement that it was not going to use any of the enhanced products, genetically enhanced products. And I did not hear anything from the USDA, not one word. And yet, my good friend from Missouri has done a lot of work as far as building a scientific case why this should be.

LAND ACQUISITION

And I also want to take note of another area of which Senator Stevens brought up, is land acquisition. It is the United States Department of Agriculture. It is not the United States Department of Acquisition. And because the government has got too damn much land now.

They cannot even manage what they have got, and so I would take a good strong look at that and even though it may come all fuzzy and warm and green and all that. It is really hurting some of our communities on this land acquisition, because we are just very, very concerned about that.

And in our area, are we making the best use of rural utilities—and I appreciate your help on the RUS and those areas. That is very good. But those are areas that we will be looking at. Our research, we are still losing plant breeders—we are still losing people in facilities where we do our research and development. As the population grows, demand for food is going to be there, and this other stuff that we do.

CIVIL RIGHTS

And then the last area is in the area of civil rights. Let us get that taken care of. Let us just not give it lip service, because we have got several cases pending in Montana that we really need to do something about that, Mr. Secretary, and we get the feeling that that is being put on the back burner.

I know some of our Native Americans in Montana that have really had a case, and that should be dealt with. And I want to make sure those are the areas in which we will work with the Chairman and work our way through. But those are areas that I have quite a lot of concerns with and we will work with the Chairman and try to allocate the funds where we think they will be best used. But I would just ask you, and I would not mind coming down and sitting down and talking to you about the civil rights thing, because I think there is a way to handle that.

Secretary GLICKMAN. This is not being put on the back burner, I can assure you. It is a civil rights responsibility of the Department. Of course, I have been to your office once. We have talked about these cases.

Senator BURNS. Yes.

Secretary GLICKMAN. I know that they have been very troublesome, both for us as well as for you.

Senator BURNS. Yes.

Secretary GLICKMAN. As well as for the applicants, and maybe it is not a bad idea to come down to talk specifically about them again.

Senator BURNS. I would like to do that, and I would like to work with you in that area. And again, I would tell you, there has never been a time like this, I know why the concerns of Senator Kohl.

Our concerns in agriculture, Mr. Secretary, there is not anything wrong on the farm except in the price when we compare it to the grocery store, one way or the other. And I would tell you, can we justify a cartel? You can if we use our leverage in the market, agriculture today, as soon as that drill or that planter hits the ground. We use our leverage in the market as soon as we turn the bull with the cows. And some way or the other, you have got to be an advocate for the producer. You have got to be.

FRITO LAY

And just like in this Frito Lay thing, you should have picked that up right now and ran with it and defended the producers.

Secretary GLICKMAN. Can I just comment on that point?

Senator BURNS. Yes.

Secretary GLICKMAN. Okay. Look, I suppose I could have called the president of Frito Lay and asked why are you doing this.

Senator BURNS. I tried to.

Secretary GLICKMAN. Okay.

Okay. But let me talk about what we have to do in this context. You know, as much as I think that the decision of Frito Lay may not have been the decision I would have made if I had been the head of this company, because I do not like to see farmers out there confused as to what they can plant and what they can sell, the fact

of the matter is that they are responding to consumer pressures. Right or wrong, they are responding to them.

So, what do we have to do at USDA? The most important thing we can do is to give people the confidence, consumers the confidence that these products are safe. I cannot tell Frito Lay to do anything. The president of Frito Lay would laugh in my face if the government tried to tell him what to do.

But what we have done on the GMO issue is the following: Number one is that I appointed this 36, 37 member biotech advisory committee composed of people who can help us deal with a lot of the tough regulatory issues. I have had the National Academy of Science peer-review our approval process in order to make sure that the public has confidence. Most of this is in the FDA's jurisdiction any way in terms of food products. Frito Lay produces food products so I cannot tell them exactly what to do.

If people have confidence their food is safe, if they think it is on the level, they will buy it, and a lot of the hysteria will go away, and that is the most important thing.

Senator BURNS. Well, I would agree to allow that, but I noticed also in your food safety, in here we have got a little bit of a cutback and I think the Chairman noticed that. And I will point that out—we will talk about that later on. And I got another appointment.

Senator COCHRAN. All right.

Senator BURNS. I thank the Chairman for his courtesy, and I thank you for coming.

Senator COCHRAN. Senator Feinstein.

STATEMENT OF SENATOR DIANNE FEINSTEIN

Senator FEINSTEIN. Thank you very much, Mr. Chairman.

Mr. Secretary, I know you have had a hard time personally with loss of members of your family, and I want to extend my condolences. And I do not want to give you a bad time, but I have to give you a bad time.

Secretary GLICKMAN. I can separate the personal from the professional.

Senator FEINSTEIN. This is not a good budget for California, and I am going to try to take a little bit of time, with the Chair's indulgence, to tell you why. The budget does provide enough dollars with respect to pest exclusion.

INVASIVE SPECIES

In the last 6 months alone, California has had six quarantines. Let me tick them off to you; Oriental fruit fly eradication quarantine, a 9 square mile area, Burbank; September 2nd, pink hibiscus mealy bug, Imperial County; September 3rd, oriental fruit fly eradication, 9 square miles, City of Westchester; September 17th, fruit fly eradication, 11 square mile area, City of Pico Rivera; November 19th, Mexican fruit fly quarantine in 72 square mile area of Fallbrook, California. And I want to talk about that in a moment—January 13th, 2000, melon fruit fly quarantine in a 75 mile area of Los Angeles County.

In addition, California's \$1 billion nursery industry is threatened by red imported fire ants. And the \$2.8 billion grape industry faces a complete destruction due to an infestation of the glassy wind

sharp shooter for which there is no treatment. I really want you to hear this.

Secretary GLICKMAN. Yes. Okay.

Senator FEINSTEIN. Let me talk for a moment about staffing on the border.

Secretary GLICKMAN. Yes.

USDA UNDERSTAFFED INSPECTORS

Senator FEINSTEIN. California's land, air and seaports are understaffed. That is clearly reflected in the rates of infections that are occurring at these ports of entry. In 1998, more than 60,000 foreign aircraft landed at California's six major international airports. Fewer than half were inspected by USDA officials.

Of the nearly 10,000 foreign vessels that arrived at California ports, fewer than 3,000, less than a third, were inspected. Most astonishing, of the more than 29 million vehicles entering California from Mexico, fewer than 90,000 were inspected.

In San Diego, the USDA has only 49 agents and support personnel to monitor three land ports, two airports and a harbor.

Another problem is that the ports of entry are not always staffed during hours of operation. At Otay Mesa, for example, the USDA operates from 8:30 a.m. to 6:00 p.m., even though the ports are open a lot longer.

Sorry, you are going to have to wait for a minute while I find the right page here.

Inspection hours are limited and shippers are known to slam the border before the end of a shift to avoid rigorous inspection. Virtually non-existent penalties for violators do not deter the smuggling of illegal produce.

I happened to be sitting next to the United States Attorney in San Diego about a week ago, and I said, how many cases have you prosecuted in the last year or so for illegal smuggling of produce? Guess what the number is? Zero. Guess what? USDA has not sent a single case to the U.S. Attorney for prosecution, and we now have almost a dozen quarantines. The penalty for criminal violation of the smuggling laws is a \$5,000 fine.

For an illegal shipper, this is simply a minor cost of doing business, not an effective deterrent. I urge you to use your authority to remedy this situation.

Now, let me talk for a moment about this latest Fallbrook quarantine. The Fallbrook quarantine, if I can find the right notes again, as I said is 72 square miles. It involves 1,470 growers and 20 specialty crops.

Now, where is the rub? These farmers were encouraged by your department to grow these specialty crops. They thought to reduce the risk of exotic pest introduction no pre-or post-harvest treatment was provided for any of these crops by USDA.

As a result of two fruit flies, 150 growers, among the 1,452 affected, are going to lose their entire harvest, virtually everything, almost \$3 million worth. And because they are small, they face the real probability they are going to lose their land and/or their homes as well.

I have met with your staff. I urge that some assistance be provided. I outlined the sections of the code which would enable this

to be treated as an emergency. That the fact that it was extraordinary because USDA had encouraged the growing of these specialty crops, and I got nowhere. Zip, zero, nothing.

SUPPLEMENTAL APPROPRIATION

Now, Mr. Chairman, I would hope that in the supplemental appropriation, we could add something, because out of the 1,400, we estimate that there are 150 people that are going to lose everything because their whole crop is on the ground. They cannot touch it. They cannot put it in a lunch bag to go to school. They cannot sell any portion of it, and so they are effectively dead for this entire crop season. So, this is a huge problem.

I have met with a number of your inspectors. They all tell me that staffing is inadequate on the Mexican border, and I have given you a list of the quarantines that is resulting from inadequate inspection. And I think we are going to have a huge problem, and you can very well see the wipe out of California as an agricultural community unless we do something about it.

Now, the quarantine in Fallbrook in San Diego County has resulted in six countries not accepting the produce from the entire San Diego County and Riverside County as well. That is the present situation today.

C&H SUGAR REFINERY

Now, let me go on because the distinguished senator and colleague on my left is present, and I think he has an issue as well. And that is the issue of the sugar program. As you know, I first met with you in 1994 about the largest cane refinery in the United States, C&H Sugar. I have written you 13 letters. The refinery is 93 years old.

When I first met with you, it had over 1,000 employees. It is now down to 500, and once again about to close its doors. It is also the only source of employment, major employment, in Crockett. It refines about 15 percent of the total cane consumed in the United States. It requires an excess of 700,000 tons of raw cane sugar to meet its demand.

Hawaii is C&H's sole source for its domestic raw cane sugar needs. But the cane industry has been in decline for over 10 years. So, C&H has been forced to cover over half its annual consumption through imports, and the quota prevents it from importing enough sugar. Higher restrictive import systems force C&H to pay an inflated price for raw sugar from both domestic and foreign suppliers.

Even more devastating, the quota limits the amount of sugar available to the refinery. That is why they are down to 500 workers. Simply put, it cannot buy sugar to refine, and it has been forced to close its doors.

In a letter to me, the CEO reports C&H was forced to close November 8th to November 15th because it ran out of raw sugar. The closing is extremely costly. Other competitor refineries, Savannah and Domino, have had similar experiences. The government imposed shortage is forcing up the market price for raw sugar to levels that are bankrupting refiners.

The recent production capacity has resulted in a severe downsizing of the work force. As recently as 1987, C&H employed over 1,400 people. They are now down to just over 500 people.

Recently, as a short term solution, the USDA allowed C&H to import an additional 100,000 tons and expanded the re-export period from 90 days to 5 years. I was shocked to learn on December 29th of this past year that your department reversed its position and reduced the re-export period to 180 days. C&H may now be forced to forfeit the bond posted for the sugar at a cost of more than \$20 million.

Frankly, according to C&H, the department's actions have done far more damage than if you did nothing at all. And according to Mr. Conselic had you not intervened, C&H would have been forced to shut its doors, and that would have been preferable to forfeiting its bond, which I am told could go up to \$40 million.

You have got to find a way to resolve this mess. And I would say to the sugar beet states, you cannot prevent a refiner from getting cane or beet or some sugar to be able to refine. It is an unfair policy. And if I have to, I will do everything I can on the floor. I will find a way to shut down the entire sugar program. I have appealed to sugar senators. I just get blank stares.

But can you carve something out so that C&H can at least buy sugar at market prices to be able to refine and nobody cares? It is a phenomenon.

So, the sugar policy of the United States Government is going to drive the largest domestic refinery out of business. I have no doubt that that is going to happen. And that is a flawed policy. But we have got—these are the two big problems.

Secretary GLICKMAN. Okay.

EXOTIC PEST INFESTATION

Senator FEINSTEIN. One is a huge exotic pest infestation that has resulted in nine quarantines, two of them large now. And two pests that will wipe out, one, the grape industry and the other, the entire nursery industry, unless something is done with it. As you know, you have got money in the budget. Three-quarters of it is earmarked and it is earmarked to states other than California. But we have a huge problem. Could you respond to this?

Secretary GLICKMAN. Yes, I will try to. Thank you. First of all, let me tell you—increasing penalties for violating our regulation on importation of pest-laden fruit has not passed the Congress. One of the problems is if you send a case over to the U.S. Attorney it may not be prosecuted if it is small and only a misdemeanor. We need to get the penalties up.

Senator FEINSTEIN. This U.S. Attorney will prosecute.

Secretary GLICKMAN. Okay. Well, I am just telling you that a bill is in the Congress, and if you raise the penalties, the incentives will follow and it will make it a lot more attractive to prosecute everywhere. We will work with you on that legislation. I am told that, my staff has met with you. Where they came back and told me about the meeting, and I asked them why are we not sending cases to the U.S. Attorney.

I would like to know from the U.S. Attorney what kind of cases actually would be prosecuted. But if we can raise the penalties, it

would make it a lot more worthwhile for these cases to be prosecuted.

Senator FEINSTEIN. I would be happy to ask him to come back, to sit down with you and discuss this.

Secretary GLICKMAN. Yes. And I will tell you, I am going to call the U.S. Attorney myself. I know the person.

Senator FEINSTEIN. Please.

Secretary GLICKMAN. I will talk to him and ask him what can we do to get him the kind of cases that he might pick a couple to prosecute to send the signal out there. I also will talk to our Office of Inspector General on this as well.

On the budget, I understand what you are saying. Clearly as we go into a more globalized trade situation, the entire government of the United States has to do a better job of inspection. In our budget, as you know, fruit fly exclusion and detection has been increased from \$25 million to this year to a request of \$55 million, over 100 percent increase for that effort.

For the agriculture quarantine inspection we have asked for a 15 percent increase, from \$210 million to \$240 million.

Senator FEINSTEIN. May I stop you there?

Secretary GLICKMAN. Yes.

Senator FEINSTEIN. My staff tells me it is a just a shift of accounts.

Secretary GLICKMAN. Mr. Dewhurst.

Mr. DEWHURST. Well, we started with the med-fly which was begun with emergency CCC money, but under our rules we can do that for 2 years and then we have to budget for it and count it against our targets. And we have done that.

Secretary GLICKMAN. I would have liked to keep it as emergency spending so that I would not have to count it but we are not able to do it that way any longer.

Senator FEINSTEIN. But is it net new money or is it a shift?

Secretary GLICKMAN. It is both. It is some net new money and some shift. We will get you the specifics on it. For, emerging plant pests, we have gone from \$1.5 million in 1999 to \$29 million for 2001. We do have a responsibility to protect animal and plant resources and we do not have enough people at the border, you are correct.

Now, on the other issues, as you know, the basis of our meeting, I sent Dr. Siddiqui who ran the Plant Protection Activities for the California Department of Agriculture, to San Diego where he had a meeting, I believe.

Senator FEINSTEIN. Day before yesterday.

Secretary GLICKMAN. Yes, the day before yesterday with us. I think some of your staff were there.

Senator FEINSTEIN. The Agriculture commissioner.

Secretary GLICKMAN. The Agriculture commissioner and others.

Senator FEINSTEIN. Correct.

Secretary GLICKMAN. Now, what I am told is that there are two basic issues. One of the issues is the issue of compensation. That is, does the government have a responsibility to compensate these producers when there is a quarantine.

Senator FEINSTEIN. And when you encourage them to grow the crops in the first place.

Secretary GLICKMAN. Okay. In any event, we, on occasion, have provided compensation. We did it for Karnel bundt in wheat. Some of that wheat was in California. We are now looking closely at the case of plum pox in Pennsylvania.

CITRUS CANKER

Senator COCHRAN. Citrus canker.

Secretary GLICKMAN. Yes, citrus canker. We have done it when the authorities asked us. Even then there were some cost share between the State and the Federal Government. I do not think the Governor from the State of California has declared an emergency or asked us to participate in the funding.

Senator FEINSTEIN. He has not.

Secretary GLICKMAN. But that would obviously be helpful.

Senator FEINSTEIN. Right.

Secretary GLICKMAN. In addition to that—

Senator FEINSTEIN. If the Governor declares an emergency, will you then help?

Secretary GLICKMAN. It would make it a lot easier for us to do that. I have to go back and talk to my folks, but if the State declares an emergency, it was a situation where we were able to participate, such as citrus canker, we would consider providing cost share money on some compensation. So, that would make a big difference.

Now, the other thing is we have a lot of quarantines every year. The policy is the government cannot compensate every producer for every quarantine for every purpose. Now, what you are telling me is we may have contributed or caused a specific type of production.

Therefore, there may be some responsibility. Maybe not legal responsibility, but if nothing else, moral responsibility. I have instructed our people to go back and take a look at that as a result of the meeting a couple of days ago. So, we will do that.

Senator FEINSTEIN. And the border staffing?

Secretary GLICKMAN. Well, the border staffing is a function of money, and some of this money will go for additional staffing. I cannot tell you how much. We may need to work with you, perhaps, to augment these numbers a little bit.

SHORTAGE OF USDA INSPECTORS

Senator FEINSTEIN. Let me tell you what I am told by the Deputy Ag Commissioner of San Diego County. That your people work very hard, but they are completely overwhelmed, and they cannot keep up with it. And like with drugs, those who smuggle get very sophisticated. And when they go off duty and the port is open for 2 more hours, they just pour across.

Secretary GLICKMAN. Yes.

Senator FEINSTEIN. Now, the avocado growers told me that they got one smuggled avocado shipment because they thought the pits were narcotics. But, if it is an infestation, they do not get them.

Secretary GLICKMAN. Well, I do think then, when we are trying to encourage globalization of agriculture, we have a special responsibility to protect American producers and to do the adequate amount of inspections. I agree with you, we do not have enough inspectors on the borders.

Whether the budgeted amounts are enough or not, I do think it requires a very high priority from our government in all aspects, whether it is in California, Arizona, Texas, Florida or the Canadian border. We will continue to look at the compensation issue. This is on my plate now. I want you to know that.

SUGAR ISSUE

Senator FEINSTEIN. All right. Good. Sugar?

Secretary GLICKMAN. Now, on the sugar thing, I might ask Under Secretary Shumaker to respond to you. I would let him go first and I will respond.

Mr. SHUMAKER. You want to go first?

Secretary GLICKMAN. No, you go first.

Mr. SHUMAKER. Senator, sugar, as you know, is an issue throughout the country and it is a very, very complex problem. We administer the sugar program. Let me just take 1 minute on where we are with the overall sugar issue, because I think some members here may be very interested in it.

We had an increase in acreage in both cane and beets in recent years. Good weather, combined with increased acreage have meant record cane and beet sugar crops throughout the country, including the major producing States such as North Dakota, Louisiana, Florida and others.

So, we have this increased domestic production and increased imports of sugar products which are outside the sugar tariff rate quotas. These are the key factors in the question of the low domestic prices. So, what have we done?

We are working, particularly, on non-recourse loans. They are now available to domestic producers of sugar cane and sugar beets. Many of the processors are taking advantage of these loans, which in turn benefit the producers that sell to these processors. Apart from these loans, there are not many other provisions under the current sugar legislation.

Part of the problem is, of course, Hawaii. I have been to Hawaii several times and it has reduced substantially its sugar production for a variety of reasons and that has really affected C&H over time. So, the Hawaiian diminution of sugar production has really affected that one sugar refining plant in California.

That's why we have the problem, and I have to be honest with you, there was some unfortunate set of circumstances in the way we handled the TRQ and its impact on C&H. We provided a waiver and allowed them to import raw outside the TRQ at a time when there is excess domestic sugar on the market.

We have since initiated, I think my staff has worked and kept you fully informed, in an effort to mitigate some of the negative effects which you have outlined today that this original waiver has had on the sugar program overall. We are trying to mitigate the effects on C&H. Obviously we have not been as helpful as you would have liked us to have been.

Senator FEINSTEIN. What about requiring that they forfeit their bond?

Mr. SHUMAKER. Well, I do not have exact information on this question. I will get back to you on that bond issue, because I have not been formally briefed on that. But we are trying to mitigate the

effect on C&H and at the same time, trying to see that there are no unfortunate circumstances if that waiver was provided on the rest of our sugar industry.

Secretary GLICKMAN. If I may talk for a minute. I must tell you, not that I agree with you on everything, but if we put a company in jeopardy because we made a mistake at the Department, that is inexcusable. I am going to get to the bottom of this matter.

Senator FEINSTEIN. Thank you.

Secretary GLICKMAN. This is inexcusable, and it is one of the things I used to get frustrated with when I was in Congress. You just can say here, well, it may have been because of the tariff rate quota. It is kind of like saying it was the law, when you try to explain what you did. We have got to somehow make good on this.

I do not know how we are going to do it, and that is very troubling to me. I promise you that I will see what I can do, because it is not an excuse that some employee made a decision and it was not in conformance with what we are supposed to be doing.

Senator FEINSTEIN. Right.

SUGAR TARIFF RATE QUOTA

Secretary GLICKMAN. This company was misled and went out and did certain things based upon that and we have an obligation to do what we can to deal with it. I would have to tell you domestic production of sugar has gone from 7.3 million tons in 1995 to 8.8 million tons last year, a significant increase in production. Because of the TRQ and the way that we have to administer it under the law, imports have gone from 2.2 million down to 1.2 million, largely as a result of the dramatic increase in production of domestic sugar.

So, you and others have called me about how to try to deal with this problem in the most sensible way that we possibly can. But the underlying problem is domestic production is going up very significantly.

Therefore, the administration of the TRQ means imports are coming down rather significantly. I gather C&H probably used to get a lot of its sugar from Hawaii, but now they having to rely on importing their sugar.

Senator FEINSTEIN. They were, yes. They were limited. And you see, the problem is they are not allowed to buy sugar. Remember we talked about this? They cannot bring sugar in, as I recall. They cannot import it. Now, that is ridiculous. I mean, this a free market. Why should not a huge refiner be able to import it?

Secretary GLICKMAN. There is a limitation under the tariff rate quota. I am not telling you it all makes a lot of sense. All I can tell you is that I understand your frustration with respect to this firm who is employing people and, trying to buy sugar. But I am going to get to the bottom of it. It is unacceptable as far as I am concerned.

Senator FEINSTEIN. Thank you very much.

Senator COCHRAN. Senator Dorgan.

SUGAR PROGRAM

Senator DORGAN. Mr. Chairman, I respect the statement of the Senator from California. She has a problem and has to address

that and resolve it. I know she will not expect anyone to apologize for a sugar program that works for sugar producers or for family farmers in this country who are raising beets, for example. This is one program that has worked over the years among a range of programs that have largely failed in agriculture. But, you know, she makes a point.

I appreciate the Secretary's response to her about dealing with the C&H issue. But, we ought not believe that repealing the sugar program is a thoughtful response. I know you are not suggesting that.

Senator FEINSTEIN. It is the only thing I can do.

Senator DORGAN. Well, but I do not think—

Senator FEINSTEIN. I have tried since 1994.

Senator DORGAN. With all due respect, I do not think you can do that either.

Senator FEINSTEIN. Just to get adequate sugar.

Senator DORGAN. I mean, I do not think you are able to repeal the sugar program, nor should you be able to. We should solve your problem, but do so without ravaging family farmers.

Senator FEINSTEIN. That is right. That is all I want.

Senator DORGAN. Mr. Secretary, I waited because I wanted to ask you a couple of questions about something that is often more discussed in the agriculture committee, the authorizing committee. But the appropriations in the budget really reflect the need for funds that come from farm policy.

You are now proposing additional money with respect to a counter cyclical program. My assumption is that that reflects your belief that you have previously stated, that the farm program should be significantly changed. That is the statement you have made?

Secretary GLICKMAN. That is correct. Let me discuss with you the urgency of that.

CHANGE CURRENT FARM PROGRAM

Senator DORGAN. Some of us believe that rather than wait for 2002, that we ought to change the underlying farm program this year. We are going to attempt to make the changes to the farm program to make it counter cyclical this year. How do you feel about that? Would you support that? Do you think there is an urgent need to change the farm program?

Secretary GLICKMAN. First of all let me say, I think the 1996 farm bill has had major radical changes in the last 2 years, because the Congress had to appropriate more money in emergency spending on top of the basic AMTA-payments.

Senator DORGAN. But that is not the farm program itself.

Secretary GLICKMAN. No. But what I am saying is that if the farm program is has to have these additional direct payments, the Congress has basically said the underlying farm program does not work very well.

Congress has not made any authorizing structural changes in the farm bill. The net impact intellectually does not work very well. Now, what we would like to see is significant additional revisions to that base farm program.

Knowing how difficult it sometimes is to actually get some of this done, what we have proposed is this counter cyclical program on top of the existing program. But we would be willing to work with you on more fundamental structural changes in the farm bill. That is, I think we have developed the intellectual principle that we would like to see this program based on, and that is a counter cyclical formula and not on straight lined payments.

Senator DORGAN. Now, the chairman of the Agriculture Committee likened the emergency aid in 1998 and 1999 to ad hoc counter cyclical aid. My assumption is that almost no lender is going to consider ad hoc cyclical aid as a part of a regular farm program, and that, I think, underscores the need to change the underlying farm bill itself or to, as you are suggesting, add something to it that changes the nature of the safety net.

Secretary GLICKMAN. If you cannot change the basic formula, then I think you need a bridge to the new farm bill that gives a signal to producers as to where we are going to be going.

Senator DORGAN. But let me ask you, do you think it advisable to change the basic formula? Do you basically support the efforts of those of us who think it is urgent we do so?

Secretary GLICKMAN. I think it would be advisable to change the basic structure of the current farm bill. I would add two caveats. Number one is whether it is, in fact, something that could be done. And number two, there are a lot of lenders and farmers out there that have factored in these AMTA payments into their debt repayments, and into their operating programs. So, there is a possibility of creating some instability out there unless you were to give them at least as much as they are getting in the basic AMTA program.

Senator DORGAN. Your recommendation to fund something that is counter cyclical in your budget also anticipates targeting. Can you describe how that is different from AMTA? AMTA does not target, is that correct?

Secretary GLICKMAN. AMTA does not target. There is the payment limitation.

Senator DORGAN. Right.

AMTA PROGRAM

Secretary GLICKMAN. This program would have a more restrictive payment limitation than the AMTA program does. It is based on income losses, not just based upon a straight payment, irrespective of what the market is doing.

Senator DORGAN. So, targeted to actual losses and also targeted with respect to limitations?

Secretary GLICKMAN. That is correct.

Senator DORGAN. And that differs from the AMTA payment in that the AMTA payment may well go to people, not only that did not have losses, but may go to people who did not produce anything?

Secretary GLICKMAN. That is correct.

Senator DORGAN. And one more attempt at this. There will be a disagreement, I assume, in this Congress. Those of us who are attempting to change the underlying farm bill as opposed to just grafting some counter cyclical piece to it, because we think it ought to be done now rather than later.

We think the year 2000 is important to do it, rather than 2002, only because history shows us that the current farm bill does not provide counter cyclical support. It was not designed to, nor will it help farmers when prices collapse, respond to that price collapse. In light of that, is it your feeling that it is a reasonable thing to do, to try to get an early start on changing this farm bill rather than waiting until 2002?

Secretary GLICKMAN. I would say a couple of things. Number one is that AMTA payments are going to come down by about a half billion dollars this year and a billion in 2001. So, you are going to have some reduction in farm assistance even with the 1996 farm bill. Unless it is made up some way, it will result in more net income losses to farmers.

I think it is very reasonable to look at the underlying structural nature of the 1996 farm bill, but I would say that if you do not think you can do a fundamental re-write of the legislation, then you try to at least set some principles for interim legislation that will give some leadership to where you are going to be going in the 2002 farm bill.

Two other points. The conservation piece cannot be ignored, because for the first time we are going to make payments to producers everywhere in the country, not just in the regions that have been getting the farm program payments, for practices of good conservation practices, and not cost share payments. More and more I think in the future, you are going to see more farm bills related to conservation as well as basic commodity policy.

Senator DORGAN. I support a conservation element, too. But I do not, for example, want to see someone saying, well, let us just have CRP replace farming.

Secretary GLICKMAN. Right.

Senator DORGAN. I want family farmers to be able to live and operate the family farm and make a decent living. And those of us who come from farm country have a real stake in seeing that happen. And regrettably, as you have said, the AMTA payments ratchet down this year.

Even if grain prices continue to soften, you have a farm program that provides less income, even as prices collapse. That is the reason it needs to be rewritten.

Secretary GLICKMAN. Right.

Senator DORGAN. Mr. Chairman, thank you.

Senator COCHRAN. Thank you, Senator.

Senator BOND.

Senator BOND. Thank you very much, Mr. Chairman. I appreciate being able to come back and pick up where we left off. I know that you all are having a great time today. I am sorry I have had to go to other hearings.

BIOTECHNOLOGY ACTIVITIES

But, Mr. Secretary, I did want to get into, and I am glad we had the opportunity in the public forum, to talk more about the biotechnology activities. Are you aware of any food hazard that has resulted from utilizing the transgenic process? The process as opposed to what comes out.

Secretary GLICKMAN. I am not personally aware of anything. I am aware that in the past, the FDA has looked at this issue as it relates to hypoallergenic responses.

Senator BOND. That is correct. The product.

Secretary GLICKMAN. Yes.

Senator BOND. The product when they try to incorporate a Brazil nut and a soybean resulted in the potential of causing an allergic reaction, and therefore, the Brazil nut was dropped as an additive to soybeans. And that was the product. And I think that we all agree that each product needs to be reviewed on its own.

Secretary GLICKMAN. Right.

Senator BOND. But the process itself should not cause any harm, should it?

Secretary GLICKMAN. I am not aware of any. I would say that one of the things we are doing at USDA is to continue to upgrade our approval process, because the big thing you have to do is to give the public and consumers confidence that we are doing everything we can. The process needs to be forward thinking.

I mentioned the National Academy of Sciences is doing a peer review of our approval process. I have created a biotech advisory committee chaired by a former member of the House, Dennis Eckart from Ohio, to basically keep a continuous advisory eye on what we are doing.

As you know, the approval of foods themselves is a responsibility of the FDA and the EPA has some responsibility. But as long as we continue to do this kind of thing and give the public confidence, I think this technology will and should go forward.

Senator BOND. Well, and I mentioned to you, and I think I have shared with your staff, I do not know if you have seen it, but the letter that I took to Seattle signed by 500 scientists from all walks, all across the country, saying that we have got as good a process as science can develop through the EPA, the USDA and the FDA.

And I agree with you that we need to continue to take—actually, these are extraordinary methods. Dr. Martina McGlouglin, the Director of Biotechnology at the University of California, Davis, in her comments to the FDA said that she believes that the regulatory oversight must be science and safety based.

She says that suddenly altered products on our plates, coming from biotechnology, have been put through more thorough testing than any conventional food has ever been subjected to. I guess that is a fair statement. There is no other—we have never tested any other food products.

Secretary GLICKMAN. Certainly in the recent period of time, I think that is probably true and will continue to be true.

Senator BOND. And, you know, we agree that labeling of foods ought to be based on science.

Secretary GLICKMAN. I have said that if companies may find it useful to engage in labeling, information labeling, it is voluntary labeling. They have to make the decision to do that. For the government to come in and mandate labeling is clearly premature. We have not established a basis or thresholds for it. We do not have the scientific basis to determine really what is in the product from a commercial basis right now.

I would have to say this, I want to go back to this point again, we have got to make sure that the consuming public, not only here but around the world, have confidence that the food supply is safe.

This morning, I went over and spoke to a group of consumers from around the world. They are meeting on this very point. I was trying to tell them that we have got a food safety system, that while it is not perfect, it is by far and away the best in the world.

Whether it is our food borne pathogen safety system or our GMO review process, it is a science based system and it is on the level. It is independent from industry.

The industry is not running this system, because that for sure would make it kind of suspect. Because of that, I think that the industry ought to take our lead and develop similar systems.

BIOTECHNOLOGY ACTIVITIES

Senator BOND. We just need to get you a bigger megaphone because I believe you are exactly right. That you have to have the best science. I understand from the FDA that the FDA says that the only reason to label a food if it is different, significantly different or if there is a health concern, and then the consumers have a right to know that.

But, if there is no safety issue, the companies can label a product if they want to, but it has to be truthful. In other words, if they label something as GMO free, then you could not sell cheese, most of which is produced with chymosins that are—chymosin that are genetically altered in my understanding. You could not sell most of the cheese we have today.

Secretary GLICKMAN. I tell you, one of the things we are doing at USDA to address this, in something of an indirect way, is to issue our rules on organic certification. As you know, the Congress passed a law in 1990 that required us to issue rules on how to certify organic products.

UNDER THE RULE

Organic foods can not contain GMOs. That is the result of the rule making process. It does not mean the food is any safer.

Senator BOND. Do they get to use BT and still it as an organic?

Secretary GLICKMAN. I do not want to prejudge everything within the final rule.

Senator BOND. Cultural practice.

Secretary GLICKMAN. Yes, as a cultural practice, they can use BT. I do not want to go through all of it, but all I am saying is that there is a group of people out there that want a certain kind of food. But I have made it clear this is not a safety issue.

Some people argue that a lot of the things we do with our food actually improves the safety of food. But, you know, this is an interesting issue. I have been working on this for about 9 months. It is causing a lot of havoc out there in the countryside with farmers, as you know, not knowing what to plant, where to sell their products. One of the reasons why we are talking about doing an on farm storage program for producers is so they have a little more control over the marketing of their product than they did before.

When we come up with products that the consumer believes is in their interest, nutritional things like the Vitamin A rice, may be

health related things, I don't think this thing is going to turn overnight. But until such time as that happens, I think there is still going to be a lot of controversy.

Senator BOND. I am very much concerned that this technology is under such broad scale attack, if we do not have scientists speaking out and knowledgeable government officials, like you, speaking out to say, hey, we are using the best science, this is another step in the continuum of development.

We have come many, many miles with hybrid corn and cross breeding to get better food products from animals and from crops, because we have fiddled with Mother Nature. And we have come up with improved plants. This is another step. It is a more precise step. But I think, and some of the opponents call it "a largely untested technology," would you agree with that?

Secretary GLICKMAN. I cannot agree—there is no new food that is approved for use in this country, or no new seed that is approved for use in this country, that is untested. Period. I mean that is just wrong. Does that mean that we should just rest on our laurels?

Senator BOND. No.

Secretary GLICKMAN. Should we not help to produce better systems? We clearly need to do that.

Senator BOND. Let me—I have written you a letter, and it is very important that, I think, that we try to stop the spread of ural sclerosis to other parts of the world, which are, frankly, under attack from Europeans and others who want to stop all genetically modified foods. I just came back from Southeast Asia, and in Thailand and countries there, they want to know what our regulatory process is.

They have some excellent scientists. Scientists who have worked hand in glove with American scientists. They are working on genetic engineering to get rid of the gemini virus in tomatoes that causes the yellow leaf welt that destroys 95 percent of their crop. The papaya ring virus, are things that can be dealt with by genetic engineering.

They want very much to have contact with the USDA and the FDA, and I would urge you, if you have someone available who can make a trip to Bangkok, to go over with them the process that you go through so that they can assure their consumers. I sent the letter in the last day or so.

Secretary GLICKMAN. Okay. But we also have our agricultural attache in Thailand. I do not know if you saw this person when you were over there.

Senator BOND. Yes.

Secretary GLICKMAN. Do we have one in Bangkok?

STAFF. Yes.

Secretary GLICKMAN. I will make sure they are aware of this.

Senator BOND. Yes.

Secretary GLICKMAN. We do have the programs and we will work on it.

Senator BOND. They do not seem to believe the embassy or visiting senators. They want to hear somebody from the USDA who is involved in the regulatory process.

Secretary GLICKMAN. I will make sure that Mr. Shumacher follows up on this.

Senator BOND. Yes, if you would, please because we want to make sure, because this part of the world is going to benefit tremendously from genetically modified organisms. And we need to work with them. And our Ambassador there, Bob—excuse me—Ambassador Hechlinger is working very closely with them to provide the resources.

Mr. Chairman, I probably have another 2½ hours of questions, but I will submit them for the record, and I am sure the Secretary would like to go to lunch, too. So, thank you very much, sir, for accommodating me.

Senator COCHRAN. Thank you, Senator.

I have a number of questions that I will submit as well.

One final question, though, of you, is about the rescission the Department elected to impose on the Title I Public Law 480 program under the budget resolution that we finally wound up with. We had a 0.38 required rescission and you singled that program out. And I also notice that you have singled it out again with a cut proposed in this budget request.

I am curious about the lack of support in the Administration for Public Law 480, Title I. It is a very useful tool in assisting developing countries with the potential of becoming commercial markets for U.S. agricultural products at a time when we are seeing barriers and difficulties in international trade, like Senator Bond was talking about, and others. It seems like a poor time to be targeting an export promotion program for under funding and cutting and rescinding.

Secretary GLICKMAN. Perhaps Mr. Dewhurst can respond first.

Mr. DEWHURST. Yes, sir. Well, the cut that we were required to take added up to about \$96 million in the Department in discretionary money and the emergency money that Congress had provided. It was simply not easy to find \$96 million in reductions. One of the things that happened, frankly, is that we looked at areas where there were substantial carry over balances or other ways we thought the impact of the cut could be ameliorated.

In Title I, we had over \$100 million in available funds carried over from the prior fiscal year. So, when we worked with the agency, \$8 million of the \$96 million was taken out of Title I. It was done with the understanding that there were these balances and the cut could be handled, at least for this year, without a serious impact on the program.

ADDITIONAL COMMITTEE QUESTIONS

Senator COCHRAN. Thank you. Mr. Secretary, we appreciate your patience with our committee. Thank you for your cooperation.

Secretary GLICKMAN. It was good working with you. Thank you.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

COMPUTER SECURITY

Question. Mr. Secretary, I notice that the budget for the National Agricultural Statistics Service includes funds for the security improvement of the agency's computer systems. With the recent news of computer hackers breaking into computer

systems of major national companies and government agencies, how do you perceive the threat to USDA computer systems? What would be the potential consequences of a computer break-in at the Department? Is this not something that should be dealt with by the Chief Information Officer (CIO) of the Department, instead of dealing with these needs on an agency-by-agency basis?

Answer. Recent security break-ins in the private sector and security problems at the Environmental Protection Agency make it clear that no organization is safe from cyber-security attacks. We are working to strengthen our cyber-security program, and have thus far managed to repel efforts at intrusion without apparent damage.

USDA takes such threats seriously due to the market sensitivity of many of our reports as well as the confidential information collected by the National Agricultural Statistics Service from producers and agribusinesses that is maintained on our information systems. The information USDA manages affects the financial markets and the lives of individuals. The National Finance Center processes payroll for 450 thousand federal employees and administers the Thrift Savings Plan for over 2 million federal employees. Rural Development's loan portfolio exceeds \$100 billion. At the same time, USDA is increasingly using the Internet to provide customers information about programs and services, and will eventually use it to allow customers to conduct transactions online. I do not want to speculate on the potential consequences of a computer break-in at the Department, other than to say that USDA clearly has significant resources that are at risk.

The Department's CIO is taking a holistic approach to strengthening our cyber-security program. We have recently hired an Associate CIO for Cyber-Security who is an expert in this area and who reports directly to the CIO. His mission is to work with each USDA agency to improve cyber-security while also strengthening security at the Departmental or perimeter level. Given the interconnectedness of the Department's networks, and the common issues that all agencies face, we are strengthening our corporate approach to security while also continuing to identify and address specific weaknesses at the agency level. Individual agencies such as NASS have identified immediate needs based on their programs, missions, and current vulnerabilities. These security steps are important and necessary, but equally importantly they must be addressed in the context of strengthening cyber-security throughout the Department.

COMPUTER SECURITY FUNDING

Question. Are the needs for computer security funds widespread within the Department? What are the practical implications if this funding is not provided?

Answer. OCIO has requested an increase of \$6.6 million for fiscal year 2001 to complete implementation of a corporate cyber-security program. This will allow OCIO to expand USDA's Cyber-Security Program Office, establish a department-level Information Technology Risk Management Program, develop a USDA Information and Telecommunications Security Architecture, and conduct employee training program to heighten awareness among all USDA employees about security risks and their responsibilities in mitigating those risks. Strengthening cyber-security is a top priority across

USDA. Each agency has already or will soon be undertaking a comprehensive risk assessment to identify its vulnerabilities and take steps to mitigate them based on the value of the data that they manage. Some, such as NASS, have completed these assessments and have requested funding to implement corrective measures. We anticipate that future agency budget requests will reflect their cyber-security needs once their assessments are complete.

COTTONSEED ASSISTANCE

Question. Mr. Secretary, as you are aware, the fiscal year 2000 Consolidated Appropriations Act provided you with discretionary authority to provide assistance to producers of cottonseed. This authority referenced some \$117.2 million in available unobligated funds which could be used to finance such assistance.

It is my understanding that of the \$117.2 million in unobligated funds that we identified in the bill, the Department first subtracted the \$4.7 million for implementation of the mandatory price reporting, then used these funds for the across-the-board cuts that were also required by the bill, then reserved \$10 million for the Step-2 program for Extra Long Staple cotton, thus leaving \$74 million for cottonseed assistance. It is my understanding that assistance in the order of \$20 per ton would be necessary to raise the price received to a 5-year Olympic average. The amount of funds that you have left for cottonseed would only provide about \$13 per ton—35 percent less than the average.

It is also my understanding that prior to the clarification included in the Consolidated Appropriations Act, the Department was already working to develop a program to assist cottonseed producers from other disaster funds. So, it would seem to me that because we identified available funds from which assistance to cottonseed producers could be made, we actually reduced the amount of money they would have received.

Why were the mandatory price reporting funds not subjected to the across-the-board cut?

Answer. The statutory authority for the 0.38 percent government-wide rescission provided the Secretary with discretion to target the reduction. Implementation of livestock mandatory reporting is a key element in providing information needed to promote competition in livestock markets and is especially critical to smaller producers. Taking more than a token cut would have hampered our ability to implement this effort during fiscal year 2000.

Question. It is my understanding that no final decisions have been made to date about whether to exercise this authority. You and I last spoke about this issue in December. When do you intend to make a decision?

Answer. Department staff are developing options for the cottonseed support program and the ELS cotton competitiveness payment program. We have determined that approximately \$84 million will be available for the two programs. We expect to determine the operating provisions of the programs soon.

Question. Do you have any intention to supplement the \$74 million remaining from other disaster funds?

Answer. We likely will allocate \$10 million for the ELS program. That would mean that the cottonseed program could be funded at \$74 million, a payment of about \$11.50 per ton of seed produced. We would not propose to increase the cottonseed payment unless our preliminary estimate of unspent supplemental AMTA funds proves too low. In that case, we would allocate any small increment to cottonseed payments and not propose to increase funding for ELS.

SUPPLEMENTAL INCOME ASSISTANCE PROGRAM

Question. Mr. Secretary, I understand that the budget includes a legislative proposal estimated to cost \$5.8 billion in fiscal year 2001 and \$11 billion over the next three fiscal years (2000–2002).

It is my understanding that a major component of this initiative includes a payment-limited income assistance program. Mr. Secretary, you have been quoted as saying that even with the proposed payment limit, only 2 percent of current AMTA payment recipients will be ineligible. Further, it is my understanding that an individual that received less than the \$30,000 payment limitation would have his supplemental payment reduced by his AMTA payment.

On what basis did the Department estimate that only 2 percent of current AMTA recipients would be ineligible? In my State of Mississippi, I would estimate that the opposite would be true, only 2 percent would be eligible for a payment under this new program.

Answer. The \$30,000 Supplemental Income Assistance Program (SIAP) payment limit was selected to limit the amount of supplemental assistance provided to very large family and non-family farms. This limit would apply to combined payments under SIAP and Agricultural Marketing Transition Act (AMTA) payments. This combined payment limitation is mutually exclusive to the \$40,000 payment limitation for AMTA payments alone. For example, a producer eligible for \$20,000 in AMTA payments would be eligible for up to \$10,000 in SIAP payments, but a producer receiving more than \$30,000 in AMTA payments would not be eligible for any SIAP payments. The purpose of SIAP is to target smaller producers who have lower farm incomes. For that reason, SIAP payments would supplement farm incomes of those producers who already receive less than \$30,000 in AMTA payments. Our preliminary analysis of 1998 AMTA payments indicates that only 2 percent of all producers would be ineligible for some level of SIAP assistance and an additional 6 percent would have their supplemental assistance reduced under the proposed limit. Based on the same analysis, only 8 percent of Mississippi producers would be ineligible for SIAP payments. By reducing the amount of payments that go to the very largest producers, supplemental assistance to small- and medium-sized family farms would increase by more than 20 percent.

Question. Can you give us an estimate of the geographic distribution of these payments?

Answer. Yes, I can provide that information for the record.
[The information follows:]

The table below provides an estimated percentage breakdown of Supplemental Income Assistance Program Payments by State for 2000 crops. The numbers are a preliminary estimate based on 1999 production of wheat, feed grains, rice, upland cotton, and soybeans. The distribution of payments by State are determined by the level of SIAP payments going to each crop and the level of each State's production of that crop. This distribution can vary widely from year-to-year as payment and production levels vary among the crops and States. For crops, such as wheat, upland cotton, sorghum, and rice, where a large percentage of all U.S. production is concentrated in a relatively small number of States, changes in payment levels for these crops can significantly affect the overall distribution of SIAP payments among States. With the exception of North Dakota (the second largest wheat-producing State in 1999), the States with estimated shares of SIAP payments greater than 5 percent were also the leading producers of wheat, upland cotton, sorghum, and rice. (North Dakota was the leading wheat producing State in 1995 and 1996.) Because SIAP is intended to offset current year reductions in revenues for each supported crop, the large shortfall projected for wheat revenues in 2000 results in projected SIAP payments for wheat which are more than the SIAP payments for all other crops combined. The largest share of wheat SIAP payments would go to those States with the largest share of wheat production. If future prices for the various commodities generate larger payments to commodities other than wheat, the geographic distribution of payments would of course, be much different from the example distribution shown in the table which assumes most of the payments would be for wheat.

Wisconsin34
Wyoming
Total	100

NOTE. Estimates are based on 1999/00 wheat, feed grain, rice, upland cotton, and soybean production.

Question. Do most of them go to the upper Midwest?

Answer. No, not necessarily. Since the Supplemental Income Assistance Program (SIAP) payments are tied to production, the largest shares go to the corn belt, central plains, and northern plains States. However, the southern States, including Oklahoma, Missouri, and Texas, would account for 28 percent of all SIAP payments, based on the above estimates.

Question. One could infer from this new program that in order to spend the \$2.4 billion allocated for these payments, that farmers of crops other than traditional program crops (corn, wheat, cotton, rice) would be eligible. Is this true?

Answer. The Administration's proposal assumes \$5.6 billion in payments for 2000 and 2001 crops. The Supplemental Income Assistance Program (SIAP) would provide assistance to producers of wheat, corn, grain sorghum, barley, oats, oilseeds, upland cotton, and rice. The proposed program could be expanded to include other crops, but recognize that we are working with a limited budget. We will work with Congress to include other crops, but will insist on remaining consistent with budget spending limits.

NEW DELTA REGIONAL AUTHORITY

Question. Mr. Secretary, the budget includes a \$153 million legislative proposal to create a new Delta Regional Authority, \$30 million of which is for start-up costs for the new entity, and the remaining \$123 million is to be targeted to the Delta counties from existing programs within the Departments of Housing and Urban Development, Commerce, Transportation, Agriculture, Labor, Health and Human Services and Education. Can you explain how much of this \$123 million is for the Department of Agriculture?

Answer. The proposal contains \$10 million in funding for the Rural Business-Cooperative Service, \$8 million in program level for the Intermediary Relending program and \$2 million in technical assistance grants.

Question. For what programs will it be used?

Answer. The Intermediary Relending program and Rural Business Opportunity Grants.

Question. Is this in addition to the funds already set-aside for empowerment zones from within existing USDA programs?

Answer. Mr. Chairman, all of the funds referenced in the initiative are new funds. In the case of Rural Development's programs, they are in addition to the funds set-aside for the empowerment zones and enterprise communities.

PARTNERSHIP FOR CHANGE—COLONIAS INITIATIVE

Question. A Colonias Initiative is proposed by the fiscal year 2001 President's budget to promote nutrition assistance, health care, and job training placement to eligible participants. This new initiative would be a Federal-State pilot program funded at \$5 million within the Food Program Administration account. Why is this a USDA proposal rather than a Health and Human Services initiative?

Answer. The Colonias Initiative is part of the Partnership for Change Initiative that has been operating in the Food and Nutrition Service's Southwest Regional Office for several years. So it is primarily a USDA, not a Department of Health and Human Services (HHS) effort. The Regional Office, as part of its normal operating activity, worked in conjunction with other USDA and Federal Agencies in 10 Colonias communities in Texas in 1999, sparking the building of some WIC clinics, helping with USDA rural development targeted loans and grants to the Colonias for installed water and sewer systems, and also getting the various programs there working together to assist residents in finding employment and job training, housing, and language and health services.

In addition to HHS, the Regional Office has worked with the Department of Housing and Urban Development (HUD), with Texas A&M staff, and with the many local agencies that operate social services and infrastructure development projects.

COLONIAS SITE SELECTION

Question. How did the Department determine that only the Colonias was to be the appropriate site for a Federal-State Pilot program?

Answer. Partnership for Change works in other areas, but the Colonias are the focus of the budget initiative due to their need. These are very needy communities along the U.S. Mexican border occupied primarily by Hispanics experiencing high poverty and unemployment rates and little infrastructure—substandard housing, utilities, water, health, and roads.

The Initiative will increase coordination of Federal, State and local programs and resources to work with residents to address their special needs. The initiative fosters effective use of existing social services and infrastructure building resources. The Initiative does NOT seek to initiate new, not-yet-authorized programs or to change existing regulations.

OTHER SITES CONSIDERED FOR PARTNERSHIP FOR CHANGE

Question. Were other areas, such as the Mississippi Delta and Alaska native villages also considered for this type of program?

Answer. The Southwest Region is presently assessing the possibility of a similar Federal-State initiative in the Mississippi Delta region of Arkansas and Louisiana.

TIME FRAME FOR PARTNERSHIP FOR CHANGE

Question. What is the time frame for this proposed pilot program?

Answer. The \$5 million requested by FNS would be used to expand the Partnership for Change model to all four U.S. Mexico border States and to increase the effort at existing sites. Depending upon the extent of success, we may seek expanded funding in future years.

NUTRITION EDUCATION AND PROGRAM INFORMATION

Question. The President's budget request proposes additional funding for a food stamp nutrition education and a program information initiative to inform eligible non-participants of the availability of food stamp benefits. How much additional funding is proposed for this initiative?

Answer. We are requesting \$10 million for this initiative.

PROVISION OF FOOD STAMP INFORMATION

Question. How will the agency use this funding to inform non-participants?

Answer. The funding will be used to try to ensure that eligibles are aware of their eligibility. We are pleased that many former food stamp recipients have moved on to jobs, and off of the food stamp rolls. Data reflect, however, that there are many who are eligible for food stamps whose households could use food stamp assistance in their transition towards work and responsibility, but who are not signing up for benefits. I will ask the agency for more details on this campaign.

[The information follows:]

The Food and Nutrition Service (FNS) is considering a number of ways to most wisely use these resources. Some of the approaches under consideration include:

- Staffing of the FNS toll free information number with live operators.
- Developing a device to prescreen households for eligibility and benefits. This prescreening tool might also be placed on the FNS Web site so that participants, advocates, and others can use the guide in the privacy of their homes or offices.
- Increasing the number of program access reviews in States with identified customer service problems.
- Printing our educational materials in bulk quantities to assist others in their efforts to reach underserved individuals.
- Funding grants or cooperative agreements with national organizations that are willing to actively promote the campaign through their constituency networks. Such groups could include advocacy groups, health organizations, the faith based community, Federal, State, and local program managers, and others.

Ultimately FNS will try to identify all potential ideas, evaluate to determine which of them would yield the most positive impact on recipients, and implement the most effective strategies.

FOOD STAMP INFORMATION BUILDS ON EXISTING EFFORTS

Question. How will this differ from the agency's current outreach activities?

Answer. Currently USDA and program stakeholders have done much to reduce potential barriers to participation, including ensuring that eligible recipients know they are eligible and how to apply. The fact that too many eligibles appear not to be signing up for benefits, however, suggests that additional effort is needed. That is why we seek the additional funds. Let me ask the food and Nutrition Service to supply some additional details on how this effort differs from current efforts.

[The information follows:]

Our current campaign essentially relies on the voluntary efforts of organizations willing to support the campaign financially and with their own resources. However, these organizations are indicating to us that, while they are willing to facilitate the campaign through their own communications networks, they need materials in large quantities to support their efforts. To date, we have not had resources to produce the bulk copies that these organizations could use to effectively reach potentially eligible individuals.

The new educational initiative will continue to be targeted towards the elderly, disabled, working poor families, and households containing legal immigrants, those persons most underserved in the Food Stamp Program. This initiative will enable FNS to print and distribute the educational materials that have already been developed but have not had wide distribution. Widespread dissemination of the materials will help to overcome Program misconceptions and barriers to Program participation, such as changes in Food Stamp Program policy that facilitate program access and availability, special accommodations for elderly persons, information to help working poor understand that they may still qualify for Food Stamp Program benefits, and encouragement to certain immigrants that they may be eligible for the Food Stamp Program.

These materials, as well as increased use of the media and enhancements to our Web site and toll free number services, will enable FNS and the stakeholders to more effectively educate the public about the Food Stamp Program and its requirements. The new initiative will build on the existing plans by providing the tools our partner organizations say they need to be successful.

MONITORING ABUSE VIA ELECTRONIC BENEFIT TRANSFER (EBT)

Question. A congressional study showed that the Government loses billions of dollars to fraud, abuse, and mismanagement.

Many States have switched from food stamp coupons to electronic benefits transfer (EBT) for disbursement of food stamps. This study claims that problems still persist. How is the Department monitoring the abuse of EBT as it applies to food stamp disbursement?

Answer. EBT has been misunderstood as a panacea to all program waste, fraud and abuse. It is not. EBT improves the efficiency of delivering, redeeming and accounting for food stamp benefits. It makes it much easier for USDA and the States to detect trafficking and some types of fraud and abuse. The largest area of loss in the report is erroneous allotment calculations for food stamp households, which cannot be affected by how the benefits are actually delivered—be it by the efficient EBT system, or by the traditional paper coupon system.

Nonetheless, EBT is a big help. USDA and the States are moving up the learning curve on how to best use EBT audit trail data for fraud reduction. FNS uses a system called Anti-Fraud Locator Using EBT Retailer Transactions (ALERT) which uses EBT transaction data to identify suspicious retailer activity.

LOWER MISSISSIPPI DELTA NUTRITION RESEARCH

Question. It has been noted in the press that USDA will audit what people in Mississippi are eating to see what makes them so obese. How is the Department implementing this new anti-fat campaign?

Answer. ARS has a project in the Lower Mississippi Delta region known as the Nutrition Intervention Research Initiative (NIRI) whose goal is to improve the nutrition and health of families of the Delta region, including Arkansas, Louisiana, and Mississippi. NIRI is currently conducting a telephone survey of a random sample of individuals in these states to determine what they are eating. From the existing data, we know that obesity is a problem in all of the three states. However, to date we do not have the evidence to suggest that they are necessarily eating more fattening foods in comparison with the rest of the U.S. population. From the new data that we collect, we hope to better understand the causes of obesity in the Delta

region and develop appropriate intervention strategies to change eating behaviors, if necessary.

Question. Is this a nationwide campaign?

Answer. The Delta NIRI is currently conducting a telephone survey of a random sample of individuals residing in Arkansas, Louisiana, and Mississippi.

ACTIONS TO ADDRESS HUNGER IN SEVEN STATES

Question. Mississippi was one of the seven States with hunger rates of 12.6 percent or higher according to a USDA study conducted during 1996–1998. What actions have USDA made to address the hunger rates in these seven States?

Answer. Our programs directly address these problems for the low-income population. In addition to the efforts of Child Nutrition, WIC and commodity distribution programs, the Food Stamp Program, being the cornerstone of the Nation's nutrition assistance effort, has made a number of initiatives to increase participation. Allow me to have the Food and Nutrition Service summarize their efforts.

[The information follows:]

The seven states with hunger rates of 12.6 percent or higher are: Arizona, Arkansas, Louisiana, Mississippi, New Mexico, Oregon and Texas. Specific actions taken by the Food Stamp Program to address high hunger rates in these States include:

- State and local government and advocacy organizations in these States were among those provided with Food Stamp Program educational and access materials for distribution to potentially eligible households. These materials include flyers, posters, information packets and CD ROMS. The CD ROMS were provided by FNS so that States and organizations may print additional materials for an even wider distribution.
- We have conducted Food Stamp Program access reviews in each of the seven States cited above. We are working with each State to correct any deficiencies or obstacles to program access identified in each review. In addition, we are currently accumulating a listing of best practices in program access among the high-performing States and we will work with these seven States to implement these practices and procedures where appropriate.
- Some of these targeted States are already developing and adapting best practices to address the issue. Oregon and Arizona have State optional program educational plans. In addition, the Oregon State agency has placed their application on their Web site to facilitate the food stamp application process. Mississippi and a number of other States have developed educational materials and videos targeted to needy households. This material is distributed through State and local agencies, cooperative extension offices, faith-based communities, WIC offices and advocacy groups.
- We have in place a USDA food stamp toll-free number, 1-800-221-5689, for households to call to obtain information on participating in the FSP. We recently upgraded this system to provide callers with the option of obtaining their State's toll free number. For example, when prompted, a resident from Mississippi simply punches in his/her zip code to obtain Mississippi's toll-free number.

We are requesting \$8 million in additional funding to do more to assure that eligible persons have access to the FSP. These seven States will continue to be targeted in any future activity.

CAUSE OF HIGH RATE OF HUNGER

Question. What is this high rate of hunger attributed to?

Answer. USDA does not have the definitive answer to this question. Research on both household and State determinants of food insecurity and hunger is ongoing. Factors that are likely to affect State prevalences include the poverty rate, cost of living, income stability (vs. cyclically or seasonally variable income), and strength of extended family and community support systems, including the effective use of USDA-funded nutrition assistance programs.

WIC VENDOR ACCESSIBILITY

Question. Why does USDA want to limit the number of retailers that can participate in the WIC program?

Answer. USDA policy is that WIC retailers should be accessible to WIC recipients and that they should carry and have available all of the WIC foods, taking into account cultural preferences. There is no effort to reduce the number of retailers. Stakeholders are cognizant that there is a cost to the States to adequately manage and monitor retailers. States seek to maintain an appropriate number—balancing

recipient access and the State's ability to adequately monitor the program to prevent abuses.

WIC VENDER ACCESS IN RURAL AREAS

Question. Won't this burden recipients, especially those living in rural communities?

Answer. We anticipate no particular change affecting rural communities. The changes to the rules are to ensure that only qualified retailers, accessible to recipients, are authorized.

TECHNICAL ASSISTANCE FOR MANDATORY FUNDS

Question. The Department will propose legislation to expand the Wetlands Reserve Program (WRP), the Wildlife Habitat Incentives Program (WHIP), the Environmental Quality Incentives Program (EQIP), the Farmland Protection Program, and the Conservation Reserve Program (CRP). This proposed "Farm Safety Net Initiative" includes an additional \$1 billion in mandatory spending over authorized levels to enhance these conservation programs. How much of this new mandatory funding proposed would be used to provide technical assistance for these programs?

Answer. The proposed legislation to implement the Farm Safety Net Initiative will provide a total of \$266 million in Conservation Credit Corporation funding over the five year period fiscal years 2001–2005 for technical assistance costs related to the CRP, WRP and FPP. This will support the enrollment of 250,000 acres annually in the WRP and will enable the acreage cap for CRP to be raised to 40 million acres. Technical assistance needed for WHIP and EQIP are not subject to the Section 11 cap and are based on a percentage of each program's total funding level. WHIP would require 25 percent of the program level, or \$12.5 million while EQIP would require 19 percent or \$61.75 million.

Question. Currently Commodity Credit Corporation (CCC) funds for administrative support services is capped at the 1995 level of total allotments and transfers to Federal and State agencies (the so-called Section 11 "cap"). This limitation affects the amount of dollars used for conservation technical assistance. How does this limitation affect the conservation technical assistance available for each of the mandatory conservation programs?

Answer. The programs that are affected by the "Cap" include the Wetlands Reserve Program (WRP), the Conservation Reserve Program (CRP), and the Farmland Protection Program (FPP). The current limitations of the "Cap" do not allow for the full reimbursement of all of the required technical assistance needed to carry out these programs.

Question. The President's fiscal year 2001 budget request proposes an increase of \$86 million, for a total of \$652 million in 2001, for conservation technical assistance for the President's Clean Water Action Plan. What type of activities will this increase support?

Answer. The Conservation Technical Assistance proposes a \$86 million increase of which \$33 million is for activities associated with the Clean Water Action Plan. This includes \$20 million in accelerated technical assistance to animal feeding operations (AFOs) to develop and begin implementing comprehensive nutrient management plans and \$13 million for additional environmental monitoring and research work. In addition, \$11 million will be redirected to AFO technical assistance.

The balance of the increase that is not associated with the President's Clean Water Action Plan will include \$28 million for additional field-based technical assistance staff to provide needed conservation technical assistance to farmers, ranchers, and other land users across all states; \$15 million for activities that are related to global climate change, including soil carbon studies and livestock management pilot programs; \$5 million to help farmers plan, develop, and implement conservation-based biomass production systems; and \$5 million for cooperative agreements with State and county governments to develop various geospatial data to help communities better plan and assess their zoning and development strategies.

Question. The Conservation Reserve Program's current acreage enrollment is a total of 36.4 million acres. Does the fiscal year 2001 budget request for NRCS conservation operations propose enough funding provided for the needed conservation technical assistance and staff years to meet this current "cap"?

Answer. Technical assistance for CRP is provided by reimbursements from CCC. Therefore, the fiscal year 2001 President's Budget does not propose CRP technical assistance funding in the NRCS Conservation Operations account. Instead, the Budget proposes to increase the CCC reimbursable cap to provide for needed technical assistance.

Question. The fiscal year 2001 request includes \$4 million in subsidy budget authority for a new \$60 million loan program to provide loans to state and local governments for the rehabilitation of aging dams built over the past 50 years. (This need exists nationwide, including Mississippi.) How many projects will be supported through the new program?

Answer. It is estimated that 10–20 watershed projects per year could receive loans at this funding level. Funds would be transferred to the Rural Utilities Service (RUS) for servicing these loans. Funds for loan subsidies, \$4.17 million, would come from the existing watershed operations, financial assistance account and expenses necessary to administer the loans would be transferred to RUS from the existing watershed operations, technical assistance account.

FARM LOANS

Question. Mr. Secretary, in your opening statement, you mention that USDA has streamlined its guaranteed loan making regulations in order to encourage more private lenders to participate in the program. What is the difficulty that private lenders have had with participating in the guaranteed loan program?

Answer. In the past, lenders have been hesitant to participate in FSA's guaranteed loan program because of the perception that the program was required too much paperwork required.

Question. What changes did the Department make in the regulations that will encourage increased private lender participation?

Answer. The streamlined guaranteed loan regulations give lenders increased flexibility and make the rules more consistent with standard procedures in the banking industry. The new regulation reduces requirements for loans of \$50,000 or less. For these applications, FSA requires limited supporting documentation and historical data. The only forms needed to apply are an FSA application, balance sheet, and cash flow statement.

We also implemented a Preferred Lender Program (PLP) for lenders experienced with the FSA guaranteed loan program. Under PLP, FSA approves the lender's system of credit management, and the lender is then able to obtain a guarantee under a simplified process tailored to each lender's own policies. To apply for an FSA guarantee, the PLP lender submits only a one-page signed form and a narrative addressing certain credit criteria. The guarantee is automatically approved if FSA does not take any action within 14 days of receiving a complete application.

We also increased flexibility in our collateral and servicing requirements. We now permit the subordination of direct loan security in favor of a guaranteed loan when specific indicators, such as cash flow and equity, are at a level that indicates sufficient financial strength. In addition, we allow the subordination, exchange, or release of collateral when in the borrower's and Government's best interest.

COMMODITY CREDIT CORPORATION

Question. The fiscal year 2001 President's Budget request includes an increase of approximately \$55 million to continue emergency operations to eradicate Mediterranean fruit fly, Citrus Canker, and Asian Long-horned beetle infestations. In past fiscal years, the agency's contingency funds and Commodity Credit Corporation (CCC) funding were used for emergency operations. Why has the Department requested this increase in appropriated funds for emergency operations for this particular fiscal year instead of using its current authority to use CCC funds and APHIS contingency appropriations?

Answer. An important factor in the decision was the anticipated length of time necessary to combat the infestations. In all three cases, we used emergency funding sources to begin a multi-year eradication effort. We are submitting the budget request and believe it is appropriate to obtain Congressional scrutiny through the regular appropriations process.

Question. How will this shift from CCC to direct appropriations reduce the agency's ability to meet its ongoing requirements?

Answer. Our request assumes that adequate funds will be appropriated to enable us to meet our ongoing requirements and that the continued eradication funds would not come at their expense.

Question. How much of this increase is going to be used for the Mediterranean fruit fly?

Answer. Of this increase, \$23,200,000 will be used for the Mediterranean fruit fly program.

Question. The Citrus Canker?

Answer. Of this increase, \$20,500,000 will be used for Citrus Canker.

Question. The Asian Long-horned beetle infestations?

Answer. \$4,600,000 of this increase will be used for the Asian Long-horned beetle infestations.

EMERGENCY LOANS

Question. The President's fiscal year 2001 budget request for emergency loans is \$150 million. According to the U.S. Department of Agriculture's 2001 Budget Summary, this proposal reflects funding to accommodate the expansion of eligibility to larger farms through Treasury loans, and to close the eligibility gap with the Small Business Administration (SBA) emergency loans. What is the current gap in eligibility for emergency loans between the USDA and SBA programs?

Answer. Existing statutes prohibit the SBA from providing disaster loans to any agricultural enterprise. The FSA emergency loan program is presently limited to family farms. The net result is that larger than family farms (those farms which require substantial labor beyond that required by the family and exceed the size of a typical farm in the community) cannot receive a disaster benefit that smaller farms receive, and some agricultural businesses are currently not eligible for any emergency loans.

Question. Does this legislative proposal have a related cost?

Answer. A major component of the cost of the emergency loan program results from subsidizing the difference between the interest rate borrower's pay (3.75 percent) and the government's cost of borrowing money (6 percent). The legislative proposal would reduce the subsidy cost of the emergency loan program because larger than family-size farm borrowers would pay an interest rate equal to the Government's cost of borrowing money. The subsidy rate for the emergency loan program is 24.53 percent for fiscal year 2001. Under the proposed legislation, the subsidy rate is estimated to be 21.54 percent based on the assumption that 30 percent of emergency loan borrowers would be large farmers paying 6 percent interest, and 70 percent would be family-size farmers eligible to receive the subsidized rate of 3.75 percent.

RURAL HOUSING DIRECT AND GUARANTEED LOANS

Question. The President's fiscal year 2001 budget request proposes \$120 million for direct loans and \$200 million in guaranteed loans for multi-family housing. The Administration plans to propose an elimination of the statutory requirement that 20 percent of the loans guaranteed must receive interest assistance. This legislative proposal would reduce subsidy cost of this program. What is the cost savings, assuming this legislative change is made by the Senate Banking Committee?

Answer. Currently, the cost of the guaranteed loan program is less than two cents on the dollar. We are proposing to make the program even more cost effective by eliminating the provision that requires us to provide subsidies for at least 20 percent of the loans. We feel that this provision is unnecessary in most cases because the tenants served by this program have incomes high enough to generate sufficient cash flow to the borrower to allow repayment of the loan. This provision makes the loan much more difficult and costly to administer equitably and market across the country. In addition, operation of the program is burdensome for banks because while borrowers make monthly payments to the banks, RHS pays the interest credit on the loan annually. Should Congress revise the Housing Act as proposed, the Section 538 program will become budget neutral.

The cost savings to the Government for the proposed change is estimated to be about \$3 million for fiscal year 2001.

EMERGENCY ASSISTANCE TO MIGRANT FARM WORKERS

Question. For fiscal year 2001, the President's proposed budget includes \$5 million for emergency assistance to migrant farm workers. Is this a new program?

Answer. This is not a new program. It is a continuation of the emergency grants to assist low-income migrant and seasonal farm workers that the Congress funded in the fiscal year 1999 spring supplemental appropriations bill.

Question. If yes, how would the program be implemented?

Answer. This program will be implemented through a Notice of Funding Availability (NOFA) process.

Question. What type of emergency assistance would be provided?

Answer. This money will help farmworkers who face natural disaster or economic hardships by providing emergency services to low income migrant and seasonal farm workers. The types of services could include assistance directly to the farm worker such as meeting rent or mortgage payments, utility bills, child care, transportation, school supplies, food, repair or rehabilitation of farm worker housing. In addition, facilities related to farm worker housing such as an infirmary for emer-

gency care, a child care facility, or construction of new farm worker housing units could also be provided.

Question. How does this program differ from the emergency grants to assist low-income migrant and seasonal farm workers that the Congress funded for \$20,000,000 in the fiscal year 1999 spring supplemental appropriations bill?

Answer. This program is a continuation of the assistance from the fiscal year 1999 supplemental appropriations bill.

Question. From fiscal year 2000 funds made available for the Fund for Rural America for fiscal year 2000, \$2.5 million was allocated for farm labor housing projects at three or four high priority areas. What are the geographic locations of these priority areas?

Answer. The three high priority areas are the States of California, Florida, and Washington.

Question. The budget proposes funding to maintain Farm Service Agency (FSA) federal and permanent non-federal staffing levels in fiscal year 2001 at the fiscal year 2000 levels, but to reduce temporary non-federal staff by 622 staff year positions due to the decreased workload requirements of the agency to carry out programs for crop and market loss assistance. Will the FSA staffing levels proposed in the fiscal year 2001 budget be adequate to support the Administration's "Farm Safety Net Initiative"?

Answer. FSA fiscal year 2001 non-federal staff year levels are based on performing workload activities similar to fiscal year 2000, with the exception of assumed decreases for crop and market loss assistance programs and somewhat lower loan deficiency payments. These activities account for the proposed decrease of 622 temporary FTE's. Staffing impacts associated with the proposed "Farm Safety Net Initiative" have not been determined and are not included in the proposed fiscal year 2001 staffing levels.

Question. The budget also indicates that the Administration will propose legislation to convert all non-federal Farm Service Agency personnel to Federal employee status in 2000. Will this proposal have any impact on the agency's funding requirements or affect the staffing levels presented in the fiscal year 2001 budget?

Answer. The conversion of all non-Federal county office employees to Federal status in fiscal year 2000 will allow greater accountability of all employees under one personnel system and improve efficiency of Agency operations. It is not anticipated that the conversion will have a significant affect on agency funding needs or staffing levels.

Question. In November 1999 the FSA had approximately 5,300 to 5,700 temporary employees on board to help with the delivery of payments to farmers. FSA knew at the start of the fiscal year that it could not keep this very high level of temporary employees if additional funds were not appropriated. The Congress appropriated an additional \$56 million for basic program delivery needs, not for temporary employees. Did the agency have to reduce the number of temporary employees after November 1999?

Answer. Although we are not certain what is meant by "basic program needs", we cannot meet those needs effectively without temporary employees. The FSA used the \$56 million to retain about 665 permanent county office employees who were originally budgeted for separation in order to meet basic program needs and the balance of the funding was used to retain the temporaries needed to deal with extremely high volumes of ongoing workload, including record loan deficiency payments. We consider that to be basic program needs because long delays in getting payments to producers were avoided. In order to achieve timely delivery of programs and handle ongoing producer requests, FSA will likely spend all funding available for temporary staff years, except for staff years needed to operate county committees, in the first 6 months of the fiscal year. We will then begin releasing temporaries in late February and March.

Question. If yes, by how many?

Answer. During the months of February and March, FSA anticipates the need to reduce nearly all of the temporary employees except for temporary staff years associated with county committees.

Question. If a reduction occurred, how did this affect the timeliness of the delivery of payments to farmers?

Answer. A reduction did not occur in the numbers of temporaries after November because Congress appropriated \$56 million in CCC funds for use by FSA. We used this funding as previously discussed and "front-ended" the use of temporaries to keep current on all workload for as long as we can. We have had no producer or congressional complaints about payment delays, as we did last year, as a result of this policy.

Question. If a reduction did not occur, what was the time line for the delivery of ad hoc disaster payments to farmers?

Answer. We anticipate some difficulty in completing timely sign-ups for some of the disaster assistance programs and an increasing lag in providing other payments to producers.

Question. Which payments have not been delivered to farmers to date?

Answer. By using most available funding for temporaries during the first 6 months of the fiscal year, the Agency has remained current in most workload and late-payment interest being paid to producers has dropped considerably from fiscal year 1999.

INVASIVE SPECIES

Question. The Department has been addressing problems caused by invasive plant pests and pest species. What has triggered the need to increase and strengthen the Department's efforts in this area, as reflected by the 33 percent increase in funding (from \$396 to \$528 million) presented to this subcommittee?

Answer. Two events have triggered the need to increase the USDA request. First, in February 1999, an Executive Order charged the USDA and 20 other Federal agencies with coordinating a strategy to combat non-native species which pose a threat to agricultural and natural resources. Second, the on-going acceleration of trade and transportation systems to meet the demands of the global marketplace reflects the Department's request for these funds. Unfortunately, these organisms or invasive species do not honor traditional geographic boundaries. Indeed, the pests are one of the by-products of global trade. Without the requested funding, easy opportunities will continue for unwanted pests and non-native organisms. A total of \$561 million, an increase of \$136 million or 32 percent, is proposed to exclude, detect, and eradicate incipient populations and manage established species. However, the USDA portion of this request represents only \$15.4 million. The Department's Animal Plant Health and Inspection Service (APHIS) is the largest stakeholder for this Initiative. The requested increase will continue to strengthen the Department's on-going programs which have been addressing problems caused by invasive plant and pest species. The APHIS fiscal year 2001 request is \$8.8 million (including \$4.45 million in prevention, \$3.95 million for detection, rapid response, and control, and \$400,000 to promote public awareness). In addition, increases of \$1.1 million are proposed to support research efforts at Agricultural Research Service (ARS) labs, universities and with other cooperators, \$1.5 million for a Cooperative State Research, Education, and Extension Service (CSREES), and \$4 million for the Forest Service to expand control, restoration, and monitoring for invasive species within the National Forests.

BIOTECHNOLOGY

Question. Secretary Glickman, would you please discuss the significance of biotechnology to the future of American agriculture.

Answer. Biotechnology has enormous potential to benefit American farmers, to help us address difficult environmental problems, and better enable us to help combat hunger worldwide and improve nutrition. Biotechnology is only one of the tools we are using in approaching these problems, but it may be our most important one. Biotechnology-derived crops currently or potentially may offer farmers savings of time and energy, be more economical to produce, enable better disease and pest control, reduce pesticide use, decrease soil erosion, increase crop yields, improve nutritional content, and use less water. In addition, new value-added crop varieties with new and desirable output traits may provide important new sources of income for producers.

U.S. and world agricultural markets are rapidly evolving and diversifying. The development of new differentiated markets will offer new opportunities and challenges throughout the agricultural production and marketing chain. With the high technology farming and identity preservation tools available to American farmers, they should be uniquely able to profit from these innovations. Pharmaceutical, nutraceutical, and other specialty crops under development may increase the unit value of agricultural production. It will, however, be vital to ensure that farmers themselves are able to realize a significant portion of this added value.

Over the past several growing seasons, U.S. farmers have rapidly adopted the new technologies, so that, according to one recent study by the International Service for the Acquisition of Agri-biotech Applications, over 70 percent of the world's roughly 100 million acres of transgenic crops were planted in the U.S. in 1999. However, ultimately our ability to realize these potentials depends on maintaining and enhancing public confidence in our regulatory system and in resolution of the current

problems in international acceptance of our new biotechnology products, particularly in Europe. Market uncertainties and an increased level of domestic concern have complicated seed purchase calculations for farmers. Issues of concern, scientific and otherwise, need to be addressed in a fuller public dialogue before we can fully benefit from appropriate uses of biotechnology in agriculture.

Question. Please tell us what significance, if any, the new international agreement on genetically modified organisms would have and what are its shortcomings from the United States' point of view.

Answer. The Biosafety Protocol to the United Nations

Convention on Biological Diversity (CBD) will provide a regulatory framework for international trade in bioengineered products known as living modified organisms (LMOs). The Protocol is an environmental agreement aimed at protecting biodiversity, and was adopted by more than 130 countries on January 29, 2000 in Montreal, Canada. The Protocol has to be ratified by 50 countries before it can go into effect, taking from 2–3 years. U.S. is not a party to the CBD, and therefore cannot ratify the Protocol. However the U.S. exporters will be called upon to conduct trade of LMOs in a manner consistent with the objective of the Protocol.

The Protocol preserves the countries' rights under other international agreements, including the World Trade Organization (WTO). It requires that regulatory decisions regarding biodiversity be based on scientific risk assessments. Countries will not be able to use unfounded concerns about biotechnology as the basis for keeping products out of the country. If an exporting country challenges the decision of an importing country to not accept a bio-engineered product, it will turn to WTO for assistance. WTO establishes a biosafety clearinghouse to help countries exchange scientific, technical, environmental and legal information about LMOs produced through the use of biotechnology. The agreement requires governments to provide the clearinghouse with information on the final decisions on the domestic use of an LMO commodity within 15 days of deciding on a course of action.

Because the Protocol is designed primarily to protect the environment from the potential effects of introducing an LMO, the most immediate impact on agricultural trade will be for seeds exported for planting. Bioengineered seeds will be part of an Advanced Informed Agreement procedure where importing country must decide whether to approve the import of a biotech seed. If the seeds are approved they require documentation specifying their identity and traits.

The Protocol will not alter the status quo for bulk commodities containing a biotech component. These commodities will not have to be segregated. Many countries require the approval of new biotech crop varieties under their national laws and regulations. The Protocol, however, does not mandate or encourage that countries take such action nor does it mandate any type of notice and consent procedure for commodities. Upon the enforcement of the protocol, documentation for shipments of bulk commodities will have to state that the shipment "may contain" LMOs and that the contents of the shipment are not intended for planting. In addition, the Protocol establishes a two-year process under which further documentation requirements will be considered. The scope of the Protocol does not cover food safety. Processed products are not covered by the Protocol. As a non-Party to the CBD, our ability to directly influence the outcome of the negotiations was somewhat limited. Thus, we were unable to correct a series of more minor drafting flaws in the text. Despite our disadvantaged position, however, we were able to achieve all of our major objectives in the negotiation.

BIOTECHNOLOGY

Question. What is the Department doing to address the dissension among agriculture groups, the concerns of the food industry, and opposition from activist groups regarding genetically modified organisms and the effect this controversy is having on U.S. farmers?

Answer. With the current level of controversy and concern, it is very important that all the relevant Federal departments, including USDA, provide accurate information to the public regarding biotechnology. USDA has developed a web site on biotechnology to address key questions for the public and we have formed an internal Biotechnology Communications Committee to ensure that our various agencies provide consistent messages on topics that arise. This group is also working with the communications offices at FDA and EPA to improve interagency coordination in public outreach. A key responsibility we have as a Department is to defend the integrity of our regulatory processes and decisions. This is a role our regulatory and policy officials perform in public meetings throughout the U.S. as well as in bilateral and multilateral fora. It is vital for our continued credibility that we continue in this role, and are seen as balanced and impartial.

There has been increased media attention to various potential risks posed by biotechnology and there have been questions raised by some about the adequacy of the existing Federal regulatory system for biotechnology products. It is to be expected that, as for any new technology, questions will continue to arise. To ensure that we can address, in an authoritative manner, any scientific issues that may arise, I have asked the National Research Council of the National Academy of Sciences to set up a Standing Committee on Biotechnology. The membership on this committee and its charge will be announced shortly. The first task of the Standing Committee will be to examine the risk assessment process and the assumptions underlying it as used by USDA's Animal and Plant Health Inspection Service in its safety reviews of biotechnology products for agricultural use. The Standing Committee will in that study consider whether we are addressing all of the relevant scientific issues appropriately, and identify any areas where USDA might improve its regulatory oversight based on the most recent scientific knowledge. It will also consider how most appropriately to monitor biotechnology products that have been approved for commercial use.

Question. What do you think the role of USDA should be in protecting the interests of U.S. farmers in this matter?

Answer. A variety of social and economic issues have been raised by critics either of the technology itself or of some of its key agribusiness proponents. A number of these complex questions need to be aired in a balanced public forum and the implications raised carefully considered, in order both to shed light on the public debate and to provide me with important recommendations to help guide future USDA activities. On February 4, 2000, USDA announced the membership on our new Advisory Committee on Agricultural Biotechnology which will address these issues. The committee will meet for the first time on March 29–30, 2000 in Washington, DC. Additionally, we believe that it is essential that there be accurate information available about the economic impacts on farmers who use biotechnology-derived crops, and on the environmental effects of their use in terms of inputs such as pesticides. We are increasing our data-gathering efforts in these areas.

The increased controversy surrounding export concerns have led a few food processors and shippers to shy away from biotechnology-derived materials. This has added confusion in the marketplace, as there are increasing demands by some end-users for testing of commodity shipments for the presence of biotechnology-derived materials. There are no common standards for such testing, nor are there common requirements from end-users, but there are an increasing number of companies offering a variety of testing services. This is an arena ripe for unsubstantiated claims and abuse, which can ultimately impact producers, shippers, and processors. USDA is setting up, under the auspices of its Grain Inspection, Packers, and Stockyards Administration, a reference laboratory which will evaluate and validate the testing claims of the various testing kits and services available in order to minimize these impacts. We are also considering whether there are other appropriate activities we might undertake to help address current marketplace uncertainties.

ADMINISTRATIVE CONVERGENCE

Question. The fiscal year 2000 Appropriations Act prohibits funding for the establishment of a Support Services Bureau, as proposed by the President last year, or a similar entity to converge the administrative functions of the Farm Service Agency, the Natural Resources Conservation Service, and Rural Development agencies. I find no mention of this in the fiscal 2001 budget. Does the Department plan to proceed with any convergence of the administrative functions of these agencies in fiscal years 2000 or 2001?

Answer. The fiscal year 2001 President's budget proposes the elimination of section 750 of the General Provisions, which prohibited the establishment of the Support Services Bureau (SSB). Proceeding with the consolidation of the administrative and information technology staffs of the county-based agencies is essential to gain the efficiencies and management improvements that are needed to provide one-stop quality service to our customers.

Currently, each of the three Service Center agencies (the Farm Service Agency, the Natural Resources Conservation Service, and Rural Development) retains separate administrative structures. This arrangement defeats our goal of providing seamless, quality service to our farmers and rural residents as efficiently and effectively as possible.

The SSB organization would converge three redundant, overlapping agency bureaucracies into one cost-effective, comprehensive administrative services operation. The scope of this convergence would be limited to the administrative areas of human resources management, financial management, management services, infor-

mation technology, and civil rights. For example, the SSB organization will eliminate two-thirds of these agencies' existing administrative structures and will immediately consolidate 44 separate administrative divisions in these agencies down to 10. The SSB will not divert program resources to administrative activities; in fact, it is needed because USDA agencies are being asked to provide improved program delivery services with less funding and staff. The SSB is designed to allow agencies to operate efficiently at lower levels of administrative staff and funding.

As we have continued our related efforts to reengineer Service Center business practices and develop a common computing environment, the need for the SSB has only become more urgent. We are committed to streamlining these functions and I urge the Congress to remove the restrictive language that prevents the Department from moving this initiative forward.

BIOBASED PRODUCTS/BIOENERGY

Question. The fiscal year 2001 budget proposes a 56 percent increase in USDA spending for the development of biobased products and bioenergy in support of the President's goal of tripling U.S. use of biobased products and bioenergy by 2010. What is the significance of this proposed investment to U.S. farmers and rural communities?

Answer. We expect that this investment will have a significant strengthening effect on farm product prices and will enhance the pace of job formation and income generation in rural communities. We have not, as yet, conducted analyses that adequately quantify either the likely increases in farm and forest product prices and farm income generated by the proposed increases in biomass activities or the effects on rural job formation and income generation. One of the pressing needs for which we have requested additional funding for the Office of Energy Policy and New Uses (OEPNU) in the 2001 budget is to undertake such analyses.

Based on very limited analysis, however, we have determined the projected farm gate price to be paid farmers for switchgrass used for co-firing electric power generation. A payment to farmers of \$40 per ton would be required to bid 42 million acres away from other land uses (crop, pasture, and CRP land) in order to produce 188 million tons of switchgrass in 2008. That would be used to generate 43,371 megawatts of electric power. Most of the switchgrass would be produced in the Southeastern and Midwestern states. Based on the analysis, major crop prices rise, as a result of bidding land into switchgrass production. In 2008, corn prices are projected to be 24 cents per bushel higher, soybean prices 61 cents per bushel higher, wheat prices 49 cents per bushel higher, and rice prices \$1 per hundredweight higher, than what prices would have been without the switchgrass production. Net farm income in 2008 is projected to be \$5.5 billion higher than without the switchgrass production.

We believe it is very important to understand the likely effects on farm and forest product prices and on farm income as a result of the President's biobased products and biomass for energy initiative. We believe, as well, that it will be important to better understand the extent to which this initiative will stimulate new business development, employment growth, and income generation in rural communities, analyses we intend to undertake with the requested funding.

We also intend to undertake analysis of market potential that will identify those biobased products and crops that represent high potential markets. In this way it will be possible to focus product research, development, and demonstration efforts in ways that deliver the maximum payoff for taxpayer dollars invested.

We believe the requested 2001 funding will enable us to both identify high potential markets and also to develop a much better understanding of the benefit of this initiative to producers, and rural America.

TRADE

Question. What efforts are being made by the Department to improve agricultural trade and how does USDA's fiscal year 2001 budget request expand and enhance economic and trade opportunities for U.S. agricultural producers?

Answer. The Department has taken a range of actions to improve our trade performance over the past several years. We have undertaken a significant expansion in the programming of CCC export credit guarantees in response to the financial crisis in Asia and elsewhere. We have increased our food aid activities substantially. Last year, U.S. food aid programming increased to over 9 million metric tons, more than the double the previous year's level. We will again be providing a substantial level of foreign food assistance this year, including nearly 4 million metric tons under the authority of section 416(b).

We continue our efforts to improve access to overseas markets through a vigorous trade policy agenda. Last year, the United States reached two significant trade agreements with China that will improve access to that growing market. We also continue our preparations for the new round of multilateral agricultural trade negotiations.

The 2001 budget provides increased funding for the Foreign Agricultural Service which will support an expansion in some of its most important activities related to trade, including its market access compliance and negotiation efforts and overseas trade offices.

Again this year, the budget contains proposed legislation which would authorize the Secretary of Agriculture to reallocate unobligated EEP funds to carry out other export related activities, including foreign food assistance and overseas market development.

Question. What have been our major successes to expand and open markets for U.S. agricultural products?

Answer. The Department has had numerous successes during the past year. A summary of some of the most significant will be submitted for the record.

[The information follows:]

RECENT PROGRESS IN THE OPENING AND EXPANSION OF OVERSEAS MARKETS

Asia.—The United States and China signed an Agreement on U.S.-China Agricultural Cooperation in April 1999, an unprecedented step forward in U.S.-China agricultural trade relations. Once fully implemented, this agreement should result in an estimated \$900-million increase in annual U.S. agricultural exports to China.

In December 1999, U.S. and Indian negotiators reached agreement on India's phase-out of quantitative import restrictions on a wide range of food and agricultural products in accord with an April 1999 WTO Dispute Settlement Resolution. Elimination of these restrictions, which are to be phased out by April 1, 2001, has the potential to increase U.S. food and agricultural exports by as much as \$200 million a year.

The Japanese Ministry of Agriculture, Forestry, and Fisheries (MAFF) officially lifted its ban on unapproved varieties of tomatoes (primarily roma and cherry varieties) from the United States and Canada in September 1999. The sales potential for these varieties in Japan is estimated at up to \$10 million a year. Also last year, Japan's Ministry of Construction (MOC) agreed to allow construction of three-story wood-frame apartment buildings in its major urban areas for the first time, a historic change to its building code that is estimated to increase U.S. wood export opportunities by \$150 million annually.

Sponsorship by the Foreign Agricultural Service (FAS) of purchasing officials from 85 South Korean food importing companies at the May 1999 Food Marketing Institute Show in Chicago, Illinois paid handsome dividends. Of those in attendance, 49 South Korean companies made purchases totaling \$42 million in U.S. sales.

Europe and Newly Independent States.—After 5 years of negotiations, the United States and the EU signed a Veterinary Equivalency Agreement on July 20, 1999, to facilitate trade in animal and animal products. The agreement covered approximately 40 product areas valued at \$3.0 billion, combined.

In 1999, FAS negotiators helped to conclude important bilateral agreements that paved the way for Estonia and the Republic of Georgia to join the WTO as full members. U.S. agricultural exports to the two countries are expected to grow by approximately \$3–4 million annually following their accession to the WTO.

Market Access Program (MAP) and Foreign Market Development (FMD) funded activities by the American Hardwood Export Council earned the organization an award from a United Kingdom Government agency promoting business sponsorship of the arts. This and a wide range of other creative activities promoting US hardwood, resulted in increasing press coverage and market profile in Europe, the leading overseas market for U.S. hardwood products, with annual exports valued at over \$600 million.

In a major effort to assist Russia through its acute food shortages and economic crisis, the United States supplied the country with Public Law 480, Title I credit financing to purchase U.S. corn, soybean meal, soybeans, beef, rice, and poultry. Proceeds from the sale of the commodities allowed the Russian Government to make overdue payments to pensioners. Other commodities, including Alaskan salmon, rice, lentils and peas, dried beans, soybeans, and vegetable oil were provided as food donations to vulnerable populations throughout Russia through various Private Voluntary Organizations.

In fiscal year 1999, the CCC Supplier Credit Guarantee Program was used for the first time by importers in the Baltic Region, the Republic of Georgia, and Turkey.

Program coverage for the Baltic Region included roughly \$940,000 worth of meat products. Coverage for the Republic of Georgia and Turkey included about \$2.9 million worth of U.S. poultry products and \$57,000 in U.S. hides and skins sales.

The United States and several countries within the EU worked jointly in 1999 to apply biotechnology and other tools to improve crops and food safety, identify costly plant pathogens that limit trade, reduce production and post-harvest costs, monitor genetic diversity in economically and environmentally important forest species, and improve management strategies to prevent environmental contamination from agriculture. FAS's role in the effort helped bring together U.S. scientists from universities and USDA agencies with the EU counterparts.

Western Hemisphere.—The Southern U.S. Trade Association (SUSTA), a regional FAS cooperator, was honored with the 1999 Produce Business Marketing Excellence Award for its "Go South!" marketing campaign. Now in its third year, the MAP-funded multi-year marketing campaign produced outstanding results, reaching approximately 20 million consumers through its advertisements, which were aimed at increasing consumer awareness, and increasing commodity sales an average of 106 percent in fiscal year 1999.

Foreign Market Development Program funds were used by the USA Rice Federation to sponsor one Ecuadorian and two Colombian rice trade delegations to the United States to familiarize them with the U.S. rice industry. This resulted in several Ecuadorian and Colombian importers purchasing U.S. rice for the first time, pushing rice sales to the two countries to \$28 million and \$74 million, respectively.

In response to Hurricane Mitch, CCC donated 200,000 metric tons of wheat valued at \$31 million to the Governments of Honduras, Nicaragua, El Salvador, and Guatemala in fiscal year 1999 under the authority of section 416(b). An additional 45,000 metric tons of corn valued at \$6 million also was donated to the region under the same program.

Africa and Middle East.—The Cochran Fellowship Program developed a U.S.-Sub Saharan Africa Workshop on Codex Alimentarius and the WTO, involving 37 participants from 17 African countries. The training improved participants' understanding of the processes at work in the WTO and the international standard setting bodies. Most importantly, the discussions pointed out areas of shared interests, including mutual concerns in the next round of multilateral negotiations. The participants agreed that there are significant areas in which the United States and Sub-Saharan African countries can cooperate in international trade and the work of the international standard setting bodies.

FAS staff implemented many first-time Food for Progress programs in Sub-Saharan Africa in 1999. Sub-Saharan African countries benefitting from the programs included South Africa, Zimbabwe, Swaziland, Togo, Cote d'Ivoire, and Equatorial Guinea.

Commodities donated included: rice, wheat, wheat flour, vegetable oil, and pinto beans. The proceeds from the sale of these commodities are being used to address basic infrastructure development needs in these countries.

TRADE

Question. What have been the major barriers?

Answer. There are a number of different types of barriers.

First, while U.S. agricultural exports have been trending down, so has global trade in agricultural commodities. Global demand has been weak due to the lingering effects of the 1998 Asian financial crisis and higher production of basic commodities worldwide. This has resulted in soft world market prices for many basic agricultural commodities and foodstuffs. Additionally, the U.S. dollar remained strong during fiscal year 1999, making U.S. products more expensive relative to competitor countries' products.

Second, our major competitors—the European Union (EU) and the Cairns Group—have been outspending the United States in both public sector and private sector market promotion funding by a wide margin. Market promotion activities were not disciplined in the Uruguay Round. Our competitors were quick to recognize this, increasing spending by 35 percent in the past three years. Also, direct export subsidies, while disciplined under the Uruguay Round, are still at formidable.

Third, the commodity composition of our competitors' exports are more closely aligned with the fastest growing sector of global import demand—namely high value products. U.S. high value product exports have performed well over the past two decades and have grown in importance, but they still represent a smaller share of our overall agricultural exports than our competitors. This is especially true of our top competitor, the European Union, which is already the world's leading high value

product exporter and could, as early as this year, overtake the U.S. as the world's leading agricultural exporter.

CIVIL RIGHTS

Question. This Committee has provided increased resources over the past couple of years to strengthen the Department's civil rights efforts and to assure the timely handling of civil rights investigations and complaints. What progress has the Department made in this area and what additional resources are requested in the fiscal year 2001 Budget (by agency and activity as compared to fiscal year 2000 to enhance these efforts?)

Answer. Ensuring that all customers and employees are treated fairly and equitably with dignity and respect has been one of my top priorities. Your support has been critical to the Department's progress in aggressively addressing civil rights concerns. We have taken several steps toward turning USDA into a civil rights leader in the federal government.

We have nearly eliminated the backlog of more than 1,000 old program civil rights complaints. We are providing the support needed to resolve the cases under the *Pigford v. Glickman* class action lawsuit. As a result, the adjudicator has made decisions in about half of the cases filed to date. We have also made changes to our internal processes for handling civil rights complaints, instituted universal civil rights training for USDA employees at all levels, and stepped up monitoring and review of civil rights enforcement both in programs and employment throughout the Department. All agency heads were evaluated on civil rights performance during fiscal year 1999, and there was improved performance in all but two agencies. Over 90 disciplinary actions, including removal, have been taken against employees for discrimination or misconduct related to civil rights. Consistent with the recommendation of our Civil Rights Action Team, the Office of Civil Rights has been reorganized into separate units with distinct responsibilities for overseeing the timely and effective resolution of program and employment discrimination complaints. USDA also launched a new tracking system for processing program discrimination complaints in 1999.

Departmental Administration has overall responsibility for the civil rights program at USDA and the President's fiscal year 2001 budget request for DA contains several increases related to civil rights. An increase of \$1 million is requested to enhance the use of Alternative Dispute Resolution (ADR) for resolving employee and program complaints. ADR can reduce the number of complaints and accelerate the resolution of many cases. We believe the program will resolve workplace and programmatic conflicts in less time and with less financial and human cost. The budget request also includes a \$500,000 increase for a pilot program in small rural business education and development. This effort will support traditionally under-represented groups in establishing viable commercial operations and guide them in identifying new markets for agricultural products. A \$7 million increase is requested for the Outreach for Socially Disadvantaged Farmers Program to provide education and training needed to help these farmers succeed. In the coming weeks, I will be releasing a progress report on civil rights that provides additional details on efforts throughout the Department to address these issues.

AGRICULTURAL CONCENTRATION

Question. Increased funding has been provided over the past few years to support the implementation of the recommendations of the Secretary's Advisory Committee on Agriculture Concentration. Would you please give the Committee a report on the status of implementing each of the recommendations made by the Advisory Committee.

Answer. The Secretary's Advisory Committee on Agricultural Concentration made a large number of recommendations in four broad areas: antitrust and regulation, a market-based disclosure policy, vertical linkages, and cooperatives and producer bargaining. USDA's Grain Inspection, Packers and Stockyards Administration (GIPSA) has undertaken several initiatives that address the Committee's recommendations; our response to each of these broad areas is listed below.

For Anti-Trust and Regulatory actions, GIPSA increased staffing to address competition, due to its recent reorganization. In this way it added economic, statistical, and legal expertise to pursue prospective anti-competitive practices. It also established a Memorandum of Understanding between USDA, the Department of Justice and the Federal Trade Commission so that greater cooperation is achieved in the areas of anti-competitive packer and grain practices.

For Market Based Disclosure the Congress passed, legislation requiring mandatory price reporting of livestock. AMS recently proposed a rule to implement this legislation.

For Vertical Linkage actions, GIPSA conducted a broad investigation of fed-cattle in Texas and followed this up with a peer review to assure that GIPSA's analysis was sound. USDA has also worked with the Department of Justice (DOJ) to investigate the proposed acquisitions by Smithfield Foods, Inc. of Murphy Family Farms and Tyson's pork operations. While DOJ allowed this merger, USDA is ready to pursue other troublesome mergers in the future.

For Cooperative and Producer Bargaining Agreements, GIPSA is now contracting in a cooperative fashion with researchers at universities across the Nation to address issues of competition in the poultry markets. Also GIPSA has conducted major investigations to determine whether contract poultry grower settlements are fair and non-discriminatory.

Question. What additional funding is requested for fiscal year 2001 to continue the implementation of these recommendations?

Answer. GIPSA has asked for an increase of \$1.2 million to develop econometric models to help identify collusion, predatory behavior, price leadership, market allocation, failure to compete, price and non-price discrimination and other restraints in the procurement of cattle, hogs and lambs by meatpackers.

An increase of \$800,000 is requested to examine the competitive structure of the poultry industry. This project will assess the characteristics of markets for poultry grower services. Over 95 percent of broilers are grown under contract so there is no market for the birds. But there is a market, with supply and demand functions, for grower services. We know that integrators offer contracts for grower services and we know the general terms of those contracts. We also know that many growers complain about being unable to negotiate the terms of their contract, about insufficient information about contract terms, about early termination of contractual arrangements, and about contract settlements. However, we know very little about the supply of grower services at various levels of compensation; grower costs and returns; why integrators offer contracts in some areas but not others; how integrators compete with each other for growers; how contract terms vary with the number of competing integrators in an area; and other information relating to the structure and competitive behavior of this industry.

An increase of \$1.3 million is requested for Rapid Response Teams to address major investigative issues of immediate and often National concern regarding anti-competitive, financial and trade practice issues.

An increase of \$350,000 is requested for an Information Staff. In addition, GIPSA is required to collect, compile, and publish a monthly report. Recent events strongly indicate that hog and chicken producers, as well as others in the farm community, need to become better informed about GIPSA's role in the marketplace. Grain farmers, and the grain industry as a whole, are also going through a difficult period. Some groups, especially small farmers and socially-disadvantaged farmers, lack information to successfully deal with the increasingly complex business of growing and selling farm products.

Also, an increase of \$400,000 is requested to establish a swine contract library as required by the Livestock Mandatory Reporting Act 1999.

FARM SAFETY

Question. I note that the fiscal year 2001 budget proposes a new \$5 million youth farm safety education and certification program under the Cooperative State Research, Education, and Extension Service. What is the need for this program and why can't the activities proposed be supported through the existing farm safety program?

Answer. The Fair Labor Standards Act and selected state laws allow child agriculture workers to work at younger ages, for longer hours, and in more hazardous occupations than in other industries. Minors 16 and 17 years of age are exempt from prohibitions on work in hazardous occupations identified by the Secretary of Labor, and 14 and 15 year old children are exempt from the hazardous occupation restriction if they possess a valid certificate documenting completion of safety training for tractor operation or other machine operation. This new Youth Farm Safety Education and Certification Initiative would establish a USDA-administered competitive grants program to States to provide formal safety training and certification targeted to youth age 16-17 years. These grants would also be used for related purposes such as curriculum improvement for current safety programs and development of new safety education curricula for other agricultural occupations as needed. The initiative would provide funds to land-grant institutions in order to contract with quali-

fied private businesses and community and youth organizations to deliver education and training, such as 4-H, Future Farmers of America, and other similar organizations that would provide safety education that prepares youth for safety certification.

This initiative is intended to augment state and local vocational agriculture school funds for safety training by agricultural employers and other private businesses, and is intended to enhance the safety of young farm workers, while maintaining their employability in agriculture and minimizing disruptions to farm employers' access to youth workers.

Question. How was the rescission of fiscal year 2000 funding for farm safety applied, i.e., what reduction was made in funding for the AgrAbility program versus the farm safety formula program.

Answer. The rescission was applied proportionately against the formula portion and AgrAbility. The revised appropriation for Farm Safety in fiscal year 2000 is \$3,400,430. This appropriated amount is split between formula funds and AgrAbility.

[The information follows:]

Formula Funds	\$803,352
AgrAbility	2,597,078

Question. Does the fiscal year 2001 budget continue funding for AgrAbility?

Answer. Funding for AgrAbility is not proposed in the fiscal year 2001 budget.

Question. If not, why?

Answer. This action is consistent with the Administration's belief that the most effective use of taxpayer dollars is through competitively-awarded, peer reviewed grants. Alternate funding from formula programs, State and local governments, and private sources could be used to support aspects of this program deemed to be of high priority at State and/or local levels.

LIVESTOCK REPORTING

Question. The fiscal year 2000 Consolidated Appropriations Act made available \$4.7 million which the Department indicated was necessary to implement the Livestock Mandatory Reporting Act of 1999 (Title X of the fiscal year 2000 Agricultural Appropriations Act). The Committee requested it but did not receive a detailed justification on why this level of funding was required and just how these funds would be spent. Would you please provide that for the record?

Answer. Additional staff are required to analyze and edit large amounts of new data that has never been available through voluntary reporting. Also, a compliance unit must be established to audit packer records to insure that packers are accurately reporting the required information. Time sensitive information requires electronic transmission of a large volume of records on a daily basis during periods of short duration. A computerized process must be developed to manage the data. Outreach programs to educate producers about the new information will increase travel, in addition to travel associated with managing the program. I will provide for the record a detailed accounting of how these funds would be spent.

[The information follows:]

[In millions of dollars]

<i>Fiscal year 2000 Costs</i>	
Salary and Benefits	2.2
Travel, Transportation, Rent, Utilities, & Communications	0.5
Training, Agreements, & Supplies	0.4
Computer System Development Contracts	1.1
Equipment: Hardware, Software, & Licenses	0.5
 Total	 4.7

Question. What increase, if any is included in the fiscal year 2001 request to implement the requirements of the Livestock Mandatory Reporting Act of 1999?

Answer. Congress authorized the Department to initiate mandatory reporting in 2000 and provided start-up funding of \$4.7 million through a one-time transfer from Commodity Credit Corporation funds. For 2001, the budget includes \$5.9 million in funds appropriated to the Agricultural Marketing Service to continue the mandatory livestock reporting program; \$0.4 million to the Grain Inspection, Packers and Stockyards Administration to establish a swine contract library; and, \$0.6 million to the National Agricultural Statistics Service to increase the frequency of hog and pig reports from quarterly to monthly.

Question. Please provide a detailed justification as to how the funds requested for fiscal year 2001 for this purpose would be obligated.

Answer. The budget justifications are included in the agency budget submissions. I will provide you the budget justifications included in the agencies' explanatory notes.

[The information follows:]

FSIS' FOOD INSPECTOR RECRUITMENT EFFORTS

Background

A number of factors have made it difficult to successfully recruit individuals to fill vacant positions in Field Operations. In the case of Veterinary Medical Officers, positions are not competitive in today's job market. Top quality candidates for Food Inspector positions are also in short supply in many locations, due to many factors. The work is typically very demanding, with strict physical requirements. Remote locations often have a limited applicant pool, and many who do apply have conflicts of interest that do not allow them to serve in a regulatory capacity. In the case of Intermittent Inspector positions, the requirement to be on-call with no guarantee of hours, and the limited benefits, make that position less attractive to most applicants than other options in the current job market. The Food Safety and Inspection Service, however, is confident it will recruit a well-qualified and diverse workforce.

FSIS efforts to increase the number of inspectors include:

- Refocusing efforts within Human Resources to increase the number of applicants on standards registers for field occupations. Applicants to these registers are solicited through a variety of recruitment initiatives such as on-campus visits, conventions, advertisements, direct mailings, and posted announcements on the Internet and at all Office of Personnel Management Service Centers. FSIS also publishes job opportunities in agricultural publications, such as the Cattleman's Journal and Farm Bureau. FSIS recruits from veterinary schools, Hispanic-serving institutions, and historically black colleges and universities, as well as at veterinary conventions and agricultural career days at universities where candidates are identified. In addition, public notices about FSIS jobs are available at all State employment agencies.
- Recruiting and hiring 80 more inspectors by the end of the fiscal year to achieve a target employment level of 7530.
- Broadening the emphasis of FSIS' recruitment program to include other scientific backgrounds to meet current and future hiring needs and conducting recruitment training in September to train new recruiters in this area.
- Asking current agency personnel to assist in publicizing recruitment needs.
- Asking candidates who applied for inspector positions in areas surrounding locations with shortages if they would be interested in a position in locations that are experiencing shortages.
- Providing Veterinary Medical Officers with a recruitment bonus up to 25 percent of their salary, particularly in areas where there are fewer candidates. This has been approved in eastern Pennsylvania, Iowa, and Nebraska. FSIS is also exploring additional options, such as relocation and retention bonuses for inspectors.
- Scheduling inspector entrance tests in locations where there is a need for inspectors. FSIS conducts tests in 10–12 locations around the nation each month. These tests are spread out geographically.
- Exploring alternative ways to fill other than permanent (OTP) full-time positions, such as permanent part-time tours of duty, and term and temporary appointments. We will be working with the inspectors union to explore the feasibility of options identified.
- Collecting and analyzing exit interview data to identify possible retention issues.
- For an application, contact Keith McFarlin at 1–800–370–3747, ext. 2580, or visit the U.S. Government official site for jobs and employment information at www.usajobs.opm.gov.

SERVICE CENTER MODERNIZATION FUNDING

Question. What is the total dollar amount that USDA has invested on its modernization effort to date? What will be the total cost for implementing the entire effort and what are the milestones for completing all aspects of it?

Answer. The USDA has invested \$322,265,000 in the modernization effort through the end of fiscal year 1999. This amount includes \$8.6 million for program management and change management training, \$31.1 million for Business Process Re-engineering (BPR), \$122.4 million for installation of the LAN/WAN/Voice shared

telecommunications system, \$77.9 million for development and initial acquisitions for the Common Computing Environment (CCE), and \$82.3 million for acquisition of base data for Geographic Information Systems (GIS).

The total implementation cost is estimated at \$875 million through fiscal year 2005. Major milestone dates are reflected in the following excerpts from Appendix Q of the Service Center Modernization Plan. They are currently under review in light of funding availability in fiscal year 2000. It is critical that adequate resources be available to quickly transition to modern systems and processes. During the transition period, we are forced to pay for two sets of systems. We must make investments in the modern technology needed to serve our customers in the future while maintaining existing legacy systems to serve our customers today. Delays in the modernization process mean that the Department will incur costs for these two systems over a longer period of time, reducing savings and delaying benefits.

FISCAL YEAR 2000 FUNDING FOR COMMON COMPUTING ENVIRONMENT

Question. For fiscal year 2000, Congress appropriated \$12.6 million to your office for the Common Computing Environment. Once Congress approves expenditures of these funds, what will you require to be completed in terms of planning and management of the Service Center Modernization Initiative (SCMI) before you allow the funds to be spent, and whom in the Department are you going to hold responsible and accountable for its success?

Answer. The Deputy Secretary of Agriculture recently enhanced the role of the Chief Information Officer (CIO) in managing the information technology component of the Service Center Modernization Initiative (SCMI). In March 2000, the CIO's role will be modified from one of oversight and facilitation to one that includes direct responsibility for implementation. The CIO will have direct involvement in CCE planning and acquisition decisions. The CIO will also be responsible for developing the necessary management mechanisms to ensure that the IT modernization activities are conducted in full cooperation and coordination with the administrative and program business elements of the overall modernization effort. Expanding the CIO's role will ensure that the necessary planning has been done, consistent with legislative and other requirements, and that there is an appropriate management structure in place to ensure successful acquisition, deployment and operation of investments funded from this account.

SERVICE CENTER MODERNIZATION FUNDING REQUEST

Question. For fiscal year 2001, USDA requested \$75 million for its common computing environment as a separate line item, and an additional \$62.4 million from service center agency budgets. First, why did USDA decide not to include this request under the Office of the Secretary to ensure that these expenditures would be closely watched at that level? Second, for the record, could you provide for the record a detailed explanation of exactly what these funds will be used for?

Answer. These expenditures will be closely monitored by the Deputy Secretary. However, we believe the Chief Information Officer (CIO) has the needed expertise to direct the acquisition and implementation of the Common Computing Environment (CCE). Therefore, the \$75 million request for hardware and software acquisitions is included in the CIO's budget.

With respect to the \$62.4 million in agency funds, we interpreted congressional action on our previous centralized funding requests to mean that Congress wanted to retain the base funding the agencies were contributing to modernization in the agency budgets and provide any increased funding under a central account.

Following is a summary of planned uses of fiscal year 2001 modernization funding:

- \$75 Million Common Computing Environment Fund

These funds will be used specifically for the acquisition and deployment of shared hardware and software to implement a CCE for the Service Center agencies. Depending upon final fiscal year 2000 activities, the planned acquisitions and amounts are as follows:

- \$1.5 million for technical architecture maintenance, piloting, operations and deployment support;
- \$33.3 million to complete the acquisition of network/communications servers/software to fully connect the CCE workstations and provide for remote management;
- \$15 million to begin acquisition of application servers/software needed to host business applications;
- \$14.6 million for workstation and server software, including GIS;
- \$8.1 million for shared peripheral equipment including networked printers and plotters; and
- \$2.5 million for training.

—\$62.4 Million in Agency Funds

Planned use of agency funding is as follows:

- \$22.7 million to continue BPR and pilot testing and related change management training and program management costs;
- \$23.6 million for continued acquisition of base data needed for GIS applications, and
- \$16.2 million for individual employee CCE equipment such as workstations, portable printers, and data collection devices.

SERVICE CENTER BUSINESS PROCESS REENGINEERING

Question. Over the past several years, GAO has been supportive of USDA's effort to modernize the service centers computer systems but very critical of the Department's approach of focusing first on buying new technology without clearly understanding how one-stop services will be delivered at all sites. What is the department's status of defining business process for its service centers?

Answer. Business process reengineering (BPR) is at the heart of the Service Center Modernization Initiative (SCMI). BPR analyzes the service center agencies' current program and administrative processes to see how they can be streamlined and integrated to improve the effectiveness and efficiency of USDA's service to customers. Our BPR efforts to date have given us the understanding of our basic business processes needed to move forward with the CCE and have served as the basis for defining the CCE technology architecture. We recognize that the CCE will need to support business as we know it today as well as any changes in that business over the next decade. That is why our CCE architecture is designed around open, interoperable and scalable systems. We look at the CCE as the basic technology infrastructure to support county-based program delivery through the first decade of the 21st century. Failure to move forward will hamper our ability to service our customers and respond to the needs of the future.

There are 20 active BPR projects focusing on core business areas such as lending, managing risk, conservation and environment, community development and outreach, and administration. Each of these projects is tested in a laboratory environment before being piloted in the field and deployed nationally.

SCMI has initiated the reengineering design of approximately 60 percent of the Service Center business processes and will reengineer the remaining 40 percent of the business processes as resources permit. The BPR project designed to streamline human resources administration has completed all testing and piloting and is being deployed nationally. BPR projects involving the lending, community development, managing risk, conservation, and administrative areas are scheduled to complete testing and piloting in fiscal year 2000 and be deployed nationally in fiscal year 2001.

ONE-STOP CUSTOMER SERVICE

Question. If I were a customer, what can I expect in terms of one-stop service at an office where only NRCS is located but I want to apply for a farm loan?

Answer. Currently, you could expect an NRCS employee to generally describe the farm loan programs and provide some written information and a referral to the FSA office servicing your county. As we complete the development and pilot testing of some of the reengineered process and install full CCE technology, the level of service provided will increase. In the future, you should also be able to go into the NRCS only office and through a user-friendly kiosk or computer terminal run through an automated question/answer process to pre-qualify for a loan and submit an application for the loan. You would have the option of scheduling an appointment with the

FSA loan officer either at his or her base Service Center or at the NRCS office or going on-line automatically, using the computer or kiosk and a two-way video connection, to discuss your loan application and needs. The NRCS employee could assist you to get started with the technological connection, but since he or she is a conservationist and not a loan officer, the technology connection will deliver the one-stop service that we envision. In order to achieve these and other benefits of the CCE, it is critical that the funds requested in the fiscal year 2001 President's budget be appropriated.

SERVICE CENTER MODERNIZATION/INFORMATION TECHNOLOGY

Question. In light of the e-business revolution, what steps is the Department taking to give a fresh look at the way it does business across all agencies and whether its organizational structure at headquarters is appropriate to deliver benefits and services to customers in the new millennium?

Answer. Modernizing the county-based agencies is the primary effort underway to reengineer the way business is conducted across agencies. We are also taking steps towards implementing unified financial, human resources, procurement, and other administrative systems that will substantially change the way business is conducted in our headquarters complex. Our fiscal year 2001 budget for the Office of the Chief Information Officer requests funding for e-government initiatives that will allow us to develop a corporate strategy for e-government, including taking advantage of opportunities to leverage agency initiatives across the Department. In addition, part of the \$75 million requested for the Common Computing Environment will provide enabling technology to support e-government activities in the USDA Service Centers. Most USDA agencies are at the initial stage of e-business, which we refer to as e-government. Agencies are providing a wealth of information about their programs and services, as well as market data and other information, to citizens via the Internet. However, agencies are also increasingly exploring ways to use the Internet to enable farmers, rural residents, and other customers to actually conduct secure business transactions with the Department online. In some cases, this involves working with other Federal agencies on web sites that will provide citizens a common online access point to programs and services so a customer can get to important program information without having to know which specific agency provides the service.

CIO PRIORITIES

Question. With a new Chief Information Officer (CIO), what are the three highest priority issues, in order, for the CIO to address at the Department? What are the time frames for addressing these issues? How will the CIO be held accountable and what authority have you provided to him?

Answer. Among the CIO's highest priorities are to: provide effective leadership and oversight to the Department's Service Center Modernization Initiative, specifically the information technology component; enhance the security of our financial and information assets and protect the privacy of our customers; and improve the corporate management of the Department's telecommunications resources. With the Congress' support, we expect to make significant progress on each of these issues this year. The CIO is personally committed to these priorities. He has all of the authority vested in him by the Office of the Secretary and by the Congress through the Clinger-Cohen Act and is working closely with the USDA management.

LESSONS LEARNED FROM THE YEAR 2000 COMPUTER PROBLEM

Question. To its credit, USDA recently made a successful transition to the Year 2000. In preparing for Y2K, the Department spent more than \$50 million to get its information systems ready. What were the positive lessons learned, and how are they being applied today at USDA?

Answer. Our Y2K success, as well as the successful transition through the Leap Year rollover, was the result of partnership and close collaboration between the Information Technology and Program Management officials. The involvement of program officials in what was previously viewed as an IT issue ensured that accountability would rest with the system users, not just the IT departments. Program managers have also learned valuable lessons about the role of IT in their business operations. This principle will continue to apply as the Department addresses cybersecurity and other key IT issues. The use of Independent Verification and Validation—IV&V's—to provide independent assessments throughout the Y2K project has also been demonstrated to be a very positive tool with which to better assess and manage our critical IT investments. In addition, the Business Continuity and Contingency Plans—BCCPs—developed by each mission area have helped prepare us to

continue providing vital programs and services should any future problem threaten to disrupt our mission-critical systems. A close collaboration between program and IT officials, the use of IV&V's, and BCCPs will continue to characterize how we manage information technology at USDA.

Question. Beside making the actual transition itself, to what extent has the Department been able to capitalize on its Year 2000 investment and make added improvements in the Department-wide use of information technology?

Answer. USDA has been able to capitalize on the transition by improving the use of information technology in several key areas. The need to purchase Y2K compliant equipment accelerated efforts to upgrade computers in the county-based agencies; modernize the equipment in our Agricultural Research facilities; and upgrade many of our mission area software applications.

SPENDING TO RESOLVE YEAR 2000 COMPUTER PROBLEM

Question. For the record, what was the total dollar amount spent by the Department on Year 2000 fixes and what does this include?

Answer. The total amount spent on USDA's Y2K activities since fiscal year 1996, including supplemental funding, was approximately \$188 million. This included funds for hardware and software upgrades and replacements, renovation, validation and implementation of systems undergoing repair, and technical assistance. Emergency supplemental appropriations in fiscal years 1999 and 2000 provided \$57 million of this amount.

OUTREACH/TECHNICAL ASSISTANCE

Question. The fiscal year 2001 budget requests additional resources for USDA outreach and technical assistance activities (e.g., the Department's Office of Outreach, the Outreach Program for Socially Disadvantaged Farmers and Ranchers, and various outreach efforts of the USDA agencies). Please provide a list of all outreach activities of the Department of Agriculture, by agency, account and activity. Please provide the fiscal year 1999, fiscal year 2000, and proposed fiscal year 2001 funding levels for each of these programs/activities, along with a brief description of each program or activity and how it is distinguished from the various other outreach/technical assistance activities of the Department.

Answer. The Department is in the process of preparing a report that will provide these details. We will make that report available to you as soon as possible.

DETAILEES

Question. Provide a list, by USDA agency, of each employee detail or assignment (by employing agency, title, and position) in each of fiscal years 1999 and 2000 to date for a period of up to 32 days, and identify the agency to which that detail or assignment was made and the purpose of the detail assignment.

Answer. Not Included.

Question. Provide this same information for employee details/assignments made for a period of more than 30 days, and indicate the dollar amount of the reimbursement made to the employing agency for each detail/assignment.

Answer. Not Included.

ADVISORY COMMITTEES, PANELS, COMMISSIONS, AND TASK FORCES

Question. Provide a list of the advisory committees, panels, commissions, and task forces funded in each of fiscal year 1999, 2000 (planned), and proposed to be funded for fiscal year 2001, and the amount of funding in each of these years to be allocated for each.

Answer. The following table lists advisory committees, panels, commissions, and task forces funded in fiscal years 1999, 2000, and 2001 and the amount of funding for each year.

[The information follows:]

USDA ADVISORY COMMITTEES

Policy Area and Committee Title	1999 Actual	2000 Estimate	2001 Estimate
FOOD, NUTRITION AND CONSUMER SERVICES:			
National Advisory Council on Maternal, Infant and Fetal Nutrition	\$42,611	\$47,350	\$50,000

USDA ADVISORY COMMITTEES—Continued

Policy Area and Committee Title	1999 Actual	2000 Estimate	2001 Estimate
FOOD SAFETY:			
National Advisory Committee on Meat and Poultry Inspection	36,314	61,350	67,000

QUESTIONS SUBMITTED BY SENATOR ARLEN SPECTER

DAIRY

Question. Milk prices dropped to \$9.63 per hundredweight at the end of 1999, the lowest price in 21 years. Over the past several years, price swings of 30 to 40 percent from one month to the next have become common. Pennsylvania is the fourth largest dairy producer and there are approximately 9,900 dairy farms which produce \$1.73 billion worth of milk each year. Over the past decade, however, Pennsylvania has lost an average of 300–500 farmers per year. Between 1993–1998, Pennsylvania lost 11.4 percent of its dairy farmers. What action is the Administration taking to help dairy farmers who are facing record low milk prices?

Answer. The Commodity Credit Corporation (CCC) is purchasing cheese and nonfat dry milk to support the price of milk. The extension of the price support program through 2000 has permitted the CCC to purchase almost 1 million pounds of cheese and 156.5 million pounds of nonfat dry milk to support the price of milk. CCC expects to purchase another 1–9 million pounds of cheese and 100–150 million pounds of nonfat dry milk in fiscal year 2000. The change in the wholesale beverage milk price formula as part of USDA's market order reform will help dairy farmers this year. Now the beverage milk price is adjusted by the higher of the milk for cheese price or the milk for butter/nonfat dry milk price. Since USDA is supporting the nonfat dry milk price, the wholesale beverage milk price is about \$1.40 per hundredweight higher than it would be without CCC's administration of the milk price support program. The higher beverage milk price increases dairy farm income by over \$800 million for fiscal year 2000. The price support purchases also yield farmers an income increase of another \$800 million through the increased wholesale price of

milk solids and cheese. The Administration's proposal to strengthen the farm safety net includes extending the milk price support program for 2 more years, until the next Farm Bill. The Farm Service Agency is also making \$123 million in Dairy Market Loss Assistance payments to dairy farmers this spring.

DROUGHT

Question. The Mid-Atlantic States suffered \$2.5 billion in losses as a result of the drought in 1999. Pennsylvania alone suffered \$700 million in drought losses. While the fiscal year 2000 Agriculture Appropriations bill provided \$8.3 billion in disaster assistance for farmers, the vast majority of this money went to farmers in the Midwest to compensate for low commodity prices. Only \$1.2 billion was provided for natural disasters which had to compensate for all natural disasters nationwide, including Hurricane Floyd, flooding in the Midwest, livestock loss and fishery loss. What action is the Administration taking to provide assistance to farmers hit by drought?

Answer. The Administration is implementing all the programs within our authority to alleviate the financial hardship caused by drought. These programs include the crop disaster program, crop insurance, non-insured assistance program, emergency conservation program, the livestock assistance program, the pasture recovery program, and emergency loans.

FISCAL YEAR 2000 SUPPLEMENTAL REQUEST

Question. Does the Administration plan to seek additional funds for farmers in the fiscal year 2000 Emergency Supplemental Appropriations Bill?

Answer. The Department is currently working with OMB to develop a supplemental request for fiscal year 2000. The supplemental will likely include authority to use unobligated Emergency Conservation

Program funds to repair farm structures and equipment damaged by Hurricanes Dennis, Floyd, or Irene. The request will also include language to allow CCC funds to be used to fund loan forgiveness for loans made by producer-owned associations that suffered losses from Hurricanes Dennis, Floyd, or Irene. We also plan to request selected funding for the Rural Housing Service.

PLUM POX

Question. On October 20, 1999, the USDA announced that the Plum Pox virus was found on peaches grown in Adams County, PA. This is the first discovery of the Plum Pox virus in the United States. The virus infects many fruit species, including peaches, apricots, plums, and almonds and causes the fruit to fall prematurely from the tree. This outbreak has the potential to cause severe damage to the PA fruit industry. The orchards have been placed under quarantine and the USDA has recommended destroying all of the fruit trees in the infected region. What action have you taken to ensure the swift distribution of indemnification money to PA fruit farmers?

Answer. We are considering a compensation plan based on sound economic principles, and the compensation plan is still under review.

Question. When can farmers expect to receive appropriate compensation?

Answer. As soon as the funding is announced, we will be proposing regulations on how producers can participate.

YEAR 2000 DIETARY GUIDELINES

Question. The proposed Year 2000 Dietary Guidelines for Americans, currently under review by the Secretaries of Agriculture and HHS, make changes to the 1995 Guidelines for fats and sugars. The proposed Year 2000 guideline advises: "Choose a diet that is low in saturated fat and cholesterol and moderate in total fat" and advises "if you drink alcoholic beverages, do so in moderation." However, in regard to sugar, the proposed guidelines state "Choose beverages and foods that limit your intake of sugars." Why do the proposed guidelines use "moderation" language in connection with fat and alcohol but use "limit" language concerning sugar?

Answer. The Dietary Guidelines Advisory Committee was charged with reviewing the 1995 Dietary Guidelines and determining if, on the basis of current scientific and medical knowledge, revisions were warranted. The Committee is composed of leading academic researchers. Collectively, they embody immense expertise in evaluating research studies in the areas of nutrition, medicine, and epidemiology. The recommendations from the Committee for all guidelines are based on their scientific judgements of the information available in the peer-reviewed scientific literature. As a general principal, I trust science. Let me get some more specific details as to why the specific wordings were chosen.

[The information follows:]

According to the Committee's final report, the term "moderation" in relationship to total fat intake was used for the following reasons:

- The proposed change in terminology from low to moderate represents the committee's view that a change in perception has occurred in the meaning of these two terms with respect to total fat. This change is not accompanied by a change in the numerical recommendation (30 percent) for the maximum percentage of energy provided by fat.
- There has been a long-standing belief among experts in nutrition that low-fat diets are most conducive to overall health. This belief is based on epidemiological evidence that countries in which very low fat diets are consumed have a relatively low prevalence of coronary heart disease, obesity, and some forms of cancer. However, populations in these countries tend to be rural, consume a limited variety of food, and have a high energy expenditure from manual labor. Therefore, the specific contribution of low-fat diets to low rates of chronic disease remains uncertain. Particularly germane is the question of whether a low-fat diet would benefit the American population, which is largely urban and sedentary and has a wide choice of foods.
- Another reason for not overly restricting intake of total fat comes from evidence that populations consuming higher quantities of unsaturated fats have a favorable profile of blood lipoproteins and a relatively low prevalence of coronary heart disease, provided that intakes of saturated fats are low. Thus, the recommendation for a diet moderate in total fat is based in part on the recognition that unsaturated fats carry potential benefits.
- The committee further held the concern that the previous priority given to a "low-fat intake" may lead people to believe that, as long as fat intake is low, the diet will be entirely healthful. This belief could engender an overconsumption of total calories in the form of carbohydrate, resulting in the adverse metabolic consequences of high-carbohydrate diets.

According to the Committee's final report, the use of the term "limit" in relationship to sugars intake was for the following reasons:

- The committee recommends changing the wording of the guideline to include the word limit because intake of sugars has increased steadily since the early 1980s.
- Although dental caries continue to provide a major rationale for this guideline, the committee expressed very serious concern about current trends in the consumption of sugars by the U.S. population. These trends raised concerns because of their coincidence with other undesirable changes in the country's nutritional well-being, e.g., increasing rates of obesity and inadequate intakes of calcium that carry a risk of impaired long term bone health.
- Nationwide food intake survey data for all age groups demonstrate that consumption of soft drinks and other sweetened beverages like fruitades and tea increased dramatically over the past decade.
- Other data suggest that a significant proportion of the population may not be meeting its needs for calcium and other nutrients because of their displacement by the increased consumption of sweetened beverages.

The Committee concurred with the 1995 wording of the alcohol guideline, and therefore offered no rationale for use of the term "moderate" in relationship to alcohol consumption.

The Committee has submitted its final report to the Secretaries of Agriculture and Health and Human Services. The Secretaries are in the process of reviewing the report, and will publish the official Dietary Guidelines for Americans, Fifth Edition, after the review and clearance process is completed. The Dietary Guidelines for Americans, Fifth Edition, will form the basis for official nutrition policy of the Department.

WIC FOOD PACKAGING RECOMMENDATIONS

Question. I understand that the WIC program has made recommendations that juice products should be provided in a 46 oz. can which was the least expensive package available at the time of the recommendation. However, it has been brought to my attention that a 46-oz. glass packaging alternative could be made available to WIC consumers at a slightly reduced cost. From a standpoint of good sanitary practice, the glass jar can be resealed and is 100 percent recyclable. Does WIC plan to provide an updated list of packaging recommendations that takes into account current costs and benefits?

Answer. Federal WIC regulations do not restrict the form of packaging allowed for authorized juices. State agencies are responsible for determining the brands and

types of WIC foods authorized for use in their State from among those foods authorized in Federal WIC Program regulations. They are also responsible for determining allowable packaging sizes. Some States may currently be allowing the 46 ounce glass bottle of juice.

State decisions may be influenced by a number of factors such as cost, product distribution within a State, and WIC participant acceptance. They are not obligated to authorize every available food allowed via Federal WIC requirements. Additionally, the State can limit the type, e.g., frozen concentrate, single strength, etc., or the brand, e.g., the least expensive.

QUESTIONS SUBMITTED BY SENATOR CHRISTOPHER S. BOND

BIOTECHNOLOGY

Question. With respect to genetically-engineered foods do you think that labeling of such foods should rely on science-based criteria?

Answer. The issue of labeling is unresolved. It is a debatable proposition whether labeling can be science-based. Studies are inconclusive regarding the food safety risk associated with using GMOs. The recent National Organic Standards regulations preclude the use of GMOs, but it is based on marketing needs for the industry, not science-based criteria.

GMO CROPS AND LIVESTOCK

Question. Scientists, farmers and ranchers have been genetically-modifying crops and livestock for centuries, have they not?

Answer. The genetic makeup of crops and livestock has been improved by selection and cross-breeding for thousands of years, with increased precision as the rules of genetics have become better understood over the past century and a half. The modern tools of biotechnology have made these processes more rapid, precise, and better controlled than ever in the past. However, it should also be noted that these tools also enable the movement of genes into crops and livestock, and in some instances traits that could not have previously been introduced by traditional means.

GMO CROPS AND MANDATORY LABELING

Question. In the immediate term, please speak to the difficulty farmers would face if forced to segregate crops for the purpose of mandatory labeling?

Answer. There is no mechanism, measure, or verifiable test presently in place to certify whether a segregated commodity is GMO free. However, the Grain Inspection, Packers and Stockyards Administration is requesting nearly \$2 million to develop such tests.

Question. Please indicate how mandatory labeling requirements might undercut our ability to negotiate trade openings abroad?

Answer. Assuming products were required to indicate whether it contained a genetically-modified organism, USDA believes this requirement may limit our markets abroad. There is no overall consensus whether and under what circumstances labels would apply and whether the perceived benefits associated with a label can be achieved.

On a related note, the United States is a signatory to the Biosafety Protocol held in Montreal earlier this year. This agreement leaves GMO decisions to the state. It reflects the lack of consensus among the signatories on the GMO issue. It will impact bio-engineered seeds, where an Informed Agreement process is in place so that an importing country can decide whether to approve or disapprove of its entry onto their soil. If approved, documentation must accompany this shipment specifying seed identity and traits. The Protocol does not mandate or encourage countries to segregate or label products used for feed or food, nor does it mandate any transaction-by-transaction notice and consent procedure.

GRAIN STORAGE LOAN PROGRAM

Question. Do you believe that beyond the immediate term, that additional storage capability will assist farmers if segregation and identify-preservation is necessary?

Answer. Yes, based upon the Department's evaluation of current storage utilization, additional storage facilities would allow farmers to segregate or preserve the identity of certain crops if necessary.

GMO CROPS AND MANDATORY LABELING

Question. Are you concerned that there is a risk that mandatory labeling could scare consumers in an unwarranted way that would make them think falsely that their food is not safe and encumber processors to such an extent that farmers would quit using biotechnology?

Answer. USDA is concerned about the marketing risks associated with mandatory labeling of bio-engineered crops and genetically modified agricultural products for traditional commodities. Whether or not labels can truly capture all the necessary information remains a debatable proposition. Meanwhile, some farmers are limiting or discontinuing the use of seeds that are genetically engineered.

Question. Would you expect that if consumers demanded particular information—that the marketplace would, in effect, drive companies to label absent a government mandate?

Answer. While the USDA encourages a market approach, it must uphold policies that are fair. USDA is concerned that these decisions may not be based upon a rational science-based approach, but instead focus on the perceived risks. The trends indicate a move toward voluntary standards, where some notable firms have already announced a ban on genetically modified foods. Whether one agrees with the merits of this approach, voluntary standards by some notable firms may create a catalyst to all producers to provide a label, in lieu of a government requirement.

Question. Please provide additional information on the NAS review of our regulatory structure to ensure that it is as effective as possible.

Answer. In 1986 a regulatory regime for biotechnology products was established by the National Academy of Sciences (NAS). This organization used a coordinated framework, with shared responsibilities for biotechnology products among the USDA, EPA, and FDA. USDA recently proposed a further review by the (NAS), through the National Research Council (NRC). The NRC has since established a Committee on Biotechnology, Food and Fiber production, and the Environment. Establishing the committee through NAS will bring the best science to address the issues facing our regulators now and in the future. For example, a current study is underway on genetically modified pest protected plants which puts NAS in a unique position to judge the merits of introduction of these new products into our environment. It also allows NAS to further develop information obtained from its last general biotechnology study in the 1980s to assure the regulatory structure is as effective as possible.

STORAGE FACILITIES

Question. What is the scope of storage facilities eligible under the President's request?

Answer. The eligibility will include grain storage facilities including all necessary permanently attached fixtures.

Question. Do they include storage capacity for livestock feed such as silos and pits?

Answer. High moisture grain storage facilities will be eligible to receive a loan. Pits and silos will not be eligible because the program will be geared toward the storage of grain.

HACCP MODELS

Question. With respect to inspector shortages, some have been told the implementation of HACCP models program will allow the agency to change in-plant staffing configurations. Please tell me your time line for implementation of these new staffing arrangements.

Answer. The Food Safety and Inspection Service (FSIS) has developed a time line for implementing changes as a result of the HACCP-based Inspection Models Project (HIMP). I have asked FSIS to provide information on the time line for the project.

[The information follows:]

In the models phase of the HIMP the staffing of each plant is reduced to the complement needed for HIMP inspection procedures. In inspection activities the 30 plants scheduled to participate in the models phase of the HACCP-based Inspection Models Project are operating under new staffing configurations. Data are being collected about inspection workload to validate the staffing configurations in use in the models plants, and to determine further staffing configuration proposals. If the new inspection procedures are proven to be effective, based on data collected by a third party, the Agency plans to publish a proposed rule this summer that would propose extending HIMP procedures to all young chicken slaughter plants under Federal inspection. Consultations and negotiations with the National Joint Council (NJC), rep-

resenting inspectors, would be necessary to discuss the impact on inspector working conditions, including changes in staffing configurations. FSIS will not make any permanent changes until the new system is demonstrated to be effective, the rule has been presented to the public for comment, and is reviewed prior to any final decision.

Question. For the county-based agencies (FSA, NRCS, RD), please provide an estimate of the degree to which these agencies contract with private sources for services, both at headquarters and in the field, which have traditionally been performed by Federal employees, such as accounting, loan servicing, information technology development and maintenance, etc. Include estimated expenditures and FTE levels for fiscal year 2000 and for fiscal year 1995. Finally, please describe the process used to analyze decisions to contract out to insure that the service level is not compromised and that cost savings are actually achieved.

FARM SERVICE AGENCY

Answer. The following services are performed at FSA Headquarters and our Kansas City Administrative Office (KCAO). These services are of a type traditionally performed by government personnel.

Category	Degree	FY 1995 Expenditure/FTE	FY 2000 Expenditure/FTE
Accounting	N/A	None	None
Loan Servicing	N/A	None	None
IT Support Services, PC Help Desk and Mail Room Operations.	High	\$35,000,000	\$42,100,000
		220 FTE	230 FTE
IT Maintenance	Low	None	None

These positions have never been staffed by government personnel, but have been performed by contractors because the government lacks the employees with the skill levels, needed to perform these efforts in-house. Only after the agency performs a capability assessment to determine if the effort can be performed by government personnel is the effort awarded to contractors. Typically, large system operation and maintenance is provided by contracts.

NATURAL RESOURCES CONSERVATION SERVICE

Answer. The Natural Resources Conservation Service's (NRCS) strategic information technology development model is based on the Government's development of its business requirements. A capability assessment is then made to determine whether the NRCSI business requirements can be achieved in house or if contract services are required. Typically IT project management is performed with NRCS personnel; while contract support services are used for the actual software development. The following matrix identifies the degree, estimated expenditures, and FTE levels to which NRCS contracts with private sources for services.

Category	Degree	FY 1995 Expenditure/FTE	FY 2000 Expenditure/FTE
Accounting	N/A	None	None
Loan Servicing	N/A	None	None
IT Development	High	\$7,000,000	\$4,700,000
		88 FTE	59 FTE
IT Maintenance	Low	None	None

RURAL DEVELOPMENT

Answer. In 1999, the Rural Housing Service's Centralized Servicing Center in St. Louis used task order contracts (under the Office of Personnel Management's temporary services contracting rules) to acquire the services of approximately 50 persons to perform one-time tasks and to provide transitional support. All other loan portfolio administration tasks are performed by government personnel. other than these specific CSC related temporary services, all other contract services are commercial in nature and are awarded based on the mandatory sources, socioeconomic preference programs or competition requirements contained in the Federal Acquisition Regulation.

The information technology systems used by Rural Development for portfolio administration tasks are supported by a combination of government and contractor staff. If the required services are determined to be inherently governmental, only in-house resources are used. In those cases where the government possesses a capability similar to a commercial service provider, the decision to contract out is based on the duration and nature of the tasks involved: the ability to timely meet statutory or other external deadlines, and the level of expertise and number of staff resources required to successfully complete the tasks. All laws, regulations and guidelines on contracting out for services are followed.

The total number of contract actions for program support services, whether awarded by formal contracts or simplified purchase procedures, have been coming down since 1995, due largely to changes in the budget and in how the program is conducted in the field. In fiscal year 1995, the total amount of service contracts was \$57 million, while in fiscal year 2000, we anticipate awards equaling \$38 million or less. All formal contracts (actions above \$100,000) for program support services are essentially continuations under existing contract options or are new competitions for services that have been traditionally contracted out. The single exception to this trend in the past 5 years occurred with the contracts awarded in fiscal year 1995 to support the Dedicated Loan Origination and Servicing (DLOS) system at the CSC. The upward blip in the trend resulted from a number of high dollar amount contracts awarded for CSC support, such as the DLOS system's hardware and software, and the related contracts for a tax reporting service, force-placed insurance service, and escrow investment and disbursement service.

In the headquarters, contract services, such as for information technology support, have been relatively stable or have involved the acquisition of unique services like the DLOS actions described above. Approximately 126 fewer actions occurred in 1999 than in 1998. The trend thus far into 2000 appears to continue downward. In the field, almost all program support services are awarded using simplified purchasing methods (small purchases) and average less than \$10,000 each. The majority are commercial in nature (real estate appraisals, inventory housing repairs, caretaker services, legal foreclosure services, title services, commercial credit reports, etc.); and, the annual number and amount of awards are dependent on program loan cost funding levels.

Because Rural Development's service contracts are based primarily on functional Statements of Work, they require the contractor to deliver specified results rather than a specific number of workers. Information concerning the number of contractor employees performing a contract is not collected. No cost comparison studies were required under current Federal Acquisition Regulation rules, nor done for these program support contracts, since they were for commercial services not normally performed by government employees. The support contracts require the timely delivery of commercial services at fixed prices, and at specified levels of quality, without regard to the number of employees used by the contractor. The following matrix identifies the degree, estimated expenditures, to which RD contracts with private sources for services.

Category	Degree	FY 1995 Expenditure/FTE	FY 2000 Expenditure/FTE
Accounting	N/A	None	None
Loan Servicing	N/A	None	None
IT Development	N/A	None	\$469,000
			No FTE comparison
IT Maintenance	N/A	\$5,000,000	\$7,500,000
			No FTE Comparison

QUESTIONS SUBMITTED BY SENATOR CONRAD BURNS
ADMINISTRATION IGNORING CONGRESSIONAL REQUEST

Question. I am concerned that this budget was put together without any input from Congress, or from producers. There is a failure to implement many of the focus areas that farm- state senators have been consistently pushing for. Why did the administration ignore the requests we have made over and over?

Answer. The Administration has tried to be responsive to the needs of producers and others while also being responsible with the use of the taxpayers' money. The farm safety net and other priority initiatives in the budget include many elements consistent with proposals advanced by key members of Congress and others. Obvi-

ously, not every worthy idea can be accommodated in the budget, but the Administration has put forth a set of reasonable and specific proposals for consideration. Congress can, of course, accept, reject or modify the proposals put forth in the budget.

Question. Why is this Administration asking for less money than last year? Emergency spending was a good portion of the expenditures last year. Under the circumstances, I believe we need to take a close look at where the markets are, and decide what we are going to do to actually help the producers who are faced with low commodity prices.

Answer. The Administration has proposed a supplemental income assistance program specifically to aid producers of crops with depressed prices. This proposal attempts to supplement the deficiencies the current production flexibility contract payments which are neither based on current production or prices. And, the safety net proposal is designed to provide a more stable basis for providing aid to producers in crisis than the expensive unpredictable ad hoc emergency assistance of the level enacted over the past couple of years. Outlays for the Commodity Credit Corporation will likely reach a record \$27 billion this year due in large part to the \$9 billion emergency aid package enacted with the fiscal year 2000 budget. Outlays for fiscal year 2001 by CCC under our regular programs are projected to be over \$15 billion, which is still relatively high since commodity prices are not projected to improve significantly if at all although the AMTA production flexibility contract payments will be \$1 billion lower in 2001 as required by the 1996 Act.

FSA STAFFING

Question. Your market analysts are not calling for a significant price upswing during the upcoming 12 months, meaning we will again see a high level of activity in FSA's LDP and Price support programs. The Administration has proposed a new conservation payment program to help small farmers, saying the majority will be eligible for payments up to \$30,000. Part of that same initiative is to increase CRP acres from 36.5 million acres to 45 million acres, meaning there will be more contracts to administer. You are also implementing a farm facility loan program. How will staff levels be allocated to cover these programs?

Answer. FSA fiscal year 2001 non-federal staff year levels are based on performing workload activities similar to fiscal year 2000, with the exception of assumed decreases for crop and market loss assistance programs and somewhat lower loan deficiency payments. These activities account for the proposed decrease of 622 temporary FTE's. Staffing impacts associated with the proposed "Farm Safety Net Initiative" have not been determined and are not included in the proposed fiscal year 2001 staffing levels. If the Farm Safety Net Initiative or any other legislative assistance package is enacted, we would work with OMB and the Congress to address staffing requirements. However, I would note that, except for CRP, the conservation proposals would be administered by the NRCS, thereby impacting their workload. Furthermore, increasing CRP enrollment to the proposed 40 million acre level would occur over a number of years, not just in fiscal year 2001, and the relatively small acreage increment in fiscal year 2001 could probably be absorbed in terms of agency workload. We are concerned about the farm facility loan workload in 2001, as the program was announced for implementation too late for administrative funding to be considered in the budget.

Question. FSA's need for temporaries has caused Supplemental Appropriations requests at least twice in the last 2 years. If there is a continuous need for this help, why isn't USDA budgeting for it?

Answer. Recent supplemental funding has allowed FSA to avoid budgeted permanent employee separations, and commit additional temporary staff resources to meet increased workload requirements due to the economic crisis in agriculture. FSA cannot budget for emergency and disaster program activity in advance of legislative requirements, and as a result must respond to increased workload demand through supplemental requests for funding and staffing resources.

Question. If we are increasing FSA programs, but decreasing available staff, what are you doing to accommodate that?

Answer. In November, 1999 FSA received \$56 million in additional funding which allowed FSA to retain critical permanent county level staff and commit additional staff resources to meet increased farm loan program workload and address program delivery and payment processing needs for marketing assistance loans and loan deficiency payments this past fall and winter. The workload for these programs was and is still high and new emergency programs were added by the Congress last fall.

FSA is reviewing its potential needs with the Department for additional fiscal year 2000 supplemental funding. This supplemental funding would permit the

Agency to pay for more temporary staff years in order to complete implementation of over 20 new emergency disaster provisions in a timely way and also to ensure that producer payments, including loan deficiency payments, are made timely in coming months.

Question. Are you increasing technology, or are there any efforts being made within FSA to streamline the commodity and direct lending programs to ease workload, and take the burden off farmers?

Answer. FSA is currently working towards posting market prices on the Internet for use by the Agency's customers for market loan repayments or loan deficiency payments. The process would automatically calculate the loan deficiency payment for the farmer.

For Price Support Loan and Loan Deficiency Payment Programs, FSA provided an Internet-based reporting system for access by Federal entities, industry, and general public. Data excludes producer-specific information, but does provide loan and loan deficiency payment information. Users can also initiate queries for reports by commodity for any active crop year.

FSA was one of the first agencies to use smart cards. For the Agency's Peanut program, through the use of smart card technology to store sales information, FSA assures fair and equitable quota allocations to peanut growers.

FSA has several projects underway to streamline direct lending to reduce workload for producers and FSA staff. The Agency has developed procedures to reduce documentation requirements for loans under \$50,000 and for repeat loan customers with acceptable loan performance history. The revised procedures have been finalized by the Agency and will be transmitted to the Department and then the Office of Management and Budget (OMB) for final approval and publication. These procedures will reduce the required paperwork on qualified loans to a few pages. The Agency is also revising procedures for processing emergency (EM) disaster loans. The new procedures must be cleared by OMB and published for public comment, which we expect in late summer, 2000. As proposed, the changes to the EM program will reduce the submission requirements for producers and simplify the calculations, that must be performed by field staff. In addition to these two initiatives, FSA has undertaken a major initiative to streamline all other direct loan regulations. This project will reduce the affected regulations by nearly half, eliminate several forms, and simplify processes and procedures for making and servicing direct farm loans. Because of the sweeping nature of this project, completion is not projected until 2002.

Question. What is the status of allowing farmers to electronically file for USDA/FSA programs?

Answer. FSA has taken the lead role in organizing a multi-agency effort to develop the electronic filing capability defined by HR-852 and S-777. FSA intends to develop capabilities even if the bills do not become law. This effort is being integrated with the Secretary's paperwork reduction initiative and the electronic access initiative (EAI), which is a component of the Service Center Initiative (SCI). Significant achievements have been made in building the fundamental components of the desired capability. We will provide more detailed information for the record.

[The information follows:]

The Paperwork Reduction Implementation Team (PRIT) developed a five-phase approach to meet the requirements of the bills. This approach is being utilized to prioritize and fund development efforts. The technical infrastructure is being developed under the Service Center Initiative (SCI).

Phase 1.—Place digitized forms on the Web. Customers complete on-line but mail fax to USDA service center. News and information for farmers consolidated and organized for simplified access.

Phase 2.—Forms completed on-line and e-mailed to USDA service center.

Phase 3.—Intelligent forms that perform basic field edits.

Phase 4.—Forms linked to service center data bases. Fields pre-filled with customer data.

Phase 5.—Forms replaced with on-line software applications.

The short-term priorities are to implement phases 1 and 2. USDA deployment of forms on the web site is limited to forms with prior OMB approval for on-line collection including approval of the customer instructions. A small number of forms among the three service center agencies and RMA already meet this criteria.

PRIT is currently seeking approval from OMB for the deployment of Phase I. In addition, FSA makes available electronically on a daily basis:

- market rates,
- CCC rates,
- Farm Loan rates,

—News releases via FSA's news listserver. Farmers and producers can subscribe to the news list through the FSA web site.

FSA also provides burley tobacco lease and transfer information online for selected states. The Agency is also establishing a website for each Service Center that will be available to the general public, including farmers, producers, and vendors. That site will provide the public with national and local farm program news and information, including notices of meetings for farmers to attend.

CIVIL RIGHTS

Question. The budget mentions you wish to federalize county office employees. This will ease administration—none of us can disagree with this. You have stated this is necessary for a variety of reasons, including to make them more directly accountable to you for civil rights reasons. However, over 90 percent of the complaints are about Federal employees working in farm lending programs. What are you doing to make them more accountable? What energies are you expending to rectify this larger, more real problem? How many people have you disciplined and/or fired over these matters?

Answer. I have clearly communicated to all USDA employees my expectation that every customer and every employee be treated fairly and equitably with dignity and respect. There are no exceptions and no excuses.

Our employees have an enormous role to play in maintaining a positive, equal opportunity environment. Therefore, we have provided civil rights training for nearly all USDA employees. We are conducting compliance reviews of the USDA agencies and are monitoring the compliance review activities of the agencies' own civil rights offices. We are improving our policies on accountability and discipline in civil rights cases. The new policy will require an investigation into conduct whenever a settlement agreement is approved or a finding of discrimination is issued. Over 90 disciplinary actions have been taken against employees, ranging from removals to letters of reprimand.

I am holding agencies accountable for meeting civil rights goals. For example, the Farm Service Agency's annual performance plan contains measurable, annual targets for its goals to: increase the number of small, limited-resource, and socially disadvantaged family farmers and ranchers elected to County Office Committee positions; increase the number of program and employee complaints processed on time; increase workforce diversity; and increase the number of loans to beginning and socially disadvantaged farmers/ranchers. In fiscal year 1999, the number of FSA direct and guaranteed loans made to minorities and women increased 25 percent from the number made in fiscal year 1998 and 50 percent from the number made in fiscal year 1997.

Question. How many staff years of field level employees have been consumed by doing the research on the Pigford Vs. USDA lawsuit?

Answer. We estimate that the full-time equivalent (FTE) of almost 240 field level staff years will be used during fiscal year 2000 for Consent Decree activities related to the Pigford vs. USDA lawsuit. About 80 percent of this estimated staff year usage will have been expended by the end of March. Existing agency field level employees have been doing the work at Headquarters and in the field, but this has necessarily diverted them from their normal duties of loan making, loan servicing, and other ongoing Farm Service Agency workload.

NATIVE AMERICANS CLASS ACTION LAWSUIT

Question. What should we expect now with the class action lawsuit brought by the Native Americans?

Answer. *Keepseagle v. Glickman* is a class action lawsuit filed on November 24, 1999, in the District Court for the District of Columbia on behalf of Native Americans. The Complaint alleges discrimination under the Equal Credit Opportunity Act and Title VI of the Civil Rights Act of 1964 in the access to and participation in USDA's farm programs. In addition, the Complaint alleges that USDA failed to process properly the civil rights complaints of Native Americans. The Plaintiffs are seeking damages in the amount of \$19 billion. The Complaint defines the potential class as:

All Native American participants in FSA's farm programs who petitioned USDA at any time between January 1, 1981 through November 24, 1999, for relief from acts of racial discrimination visited on them as they tried to participate in the farm programs.

To date, the Plaintiffs have identified 5 potential class agents, 396 identified potential class members, and a potential class of 19,000 Native Americans. USDA filed an Answer to the Complaint on January 24, 2000. The Plaintiffs must submit a mo-

tion to certify the class by April 12, 2000. The lawsuit is in the early stages of litigation and USDA will continue to evaluate the merits and litigation risks as the case moves forward.

CIVIL RIGHTS SETTLEMENTS

Question. What is the status of the civil rights settlements? If this is what you consider a high priority, how long will it take you to respond to lesser priorities?

Answer. When I became Secretary of Agriculture, I made a commitment to addressing longstanding civil rights concerns in the Department. I am very pleased with the steps we have taken to address these issues and ask for your continued support as we continue the difficult process of remedying past abuses.

In April 1999, the Department entered into a class action settlement agreement with African-American farmers, providing compensation for those who felt they had been discriminated against in applying for USDA programs. The agreement provides for an independent facilitator to determine if each case meets the class definition, an independent arbitrator, and an independent adjudicator who all operate independently of USDA. In addition, the Department of Justice (DOJ) is responsible for coordinating most of the settlement payments in these cases.

Thus far, over 19,000 farmers have joined the class action suit, a much larger number than was expected. The adjudicator has made a final determination on over 40 percent of the claims and, in about 60 percent of these, decided in favor of the farmer. Because of the volume of claims to be paid, there has been some difficulty in coordinating the payments. In some cases, payments to farmers have been delayed. USDA, DOJ and the facilitator are working to solve these problems and all payments will be made as quickly as possible, with the goal of making payments within 90 days of the decision.

RESOLUTION OF CIVIL RIGHTS COMPLAINTS

Question. The Administration's budget suggests that there is strong support for USDA Civil Rights activities. Unfortunately, I find that very difficult to believe when, in Montana, we have cases that have been languishing at the Office of Civil Rights for years. What do you intend to do to get these cases resolved in a timely manner?

Answer. I understand that nearly half of these cases have been closed and the majority of the remaining cases are in various stages of the investigation process. We are working diligently to resolve these cases as quickly as possible and have taken steps to ensure that all cases alleging discrimination in USDA programs are resolved in a timely manner. However, conducting thorough and objective investigations is often time-consuming. Consistent with the recommendation of our Civil Rights Action Team, the Office of Civil Rights is being reorganized into separate units with distinct responsibilities for overseeing the timely and effective resolution of program and employment discrimination complaints. USDA also launched a new tracking system for processing program discrimination complaints in 1999.

EXPORT PROGRAM FUNDING

Question. Nearly every export program was cut. The Public Law 480 program was cut drastically, as was the Section 416 program. The export subsidy program shows a decrease in funds of \$154 million. At a time when we are fighting for a place in the world market why are we cutting funds for important export programs?

Answer. The budget does not represent any reduction in the Administration's commitment to expanding overseas markets for America's farmers and ranchers. In many cases, the budget continues export promotion and trade programs at or near current program levels. This is true for CCC export credit guarantees, the Market Access Program, and Foreign Market Development Program.

In some cases, the budget reflects lower program levels for 2001, but this is due to special considerations. For example, the Export Enhancement Program is reduced to be consistent with the maximum program level established in its authorizing statute as well as the Uruguay Round export subsidy reduction commitments. Funding for the Public Law 480 program appears to decline, but this is due primarily to large funding balances which carried over from 1999 and have expanded substantially the level of funding available in 2000. In the case of section 416(b) food donations, the budget was sent to print before the recent decision to increase this year's programming by 3 million metric and, thus, does not reflect the full extent of this year's activity.

Question. Farm-states like Montana depend on export programs for their agricultural economy. The Foreign Market Development (FMD) Program and the Export Enhancement Program (EEP) especially provide much-needed help to farmers and

ranchers to create new product markets. How can USDA cut the EEP program and give no additional funding to FMD when President Clinton has heavily promoted global trade?

Answer. The Department has taken many actions to expand trade and develop new markets in recent years. We expanded substantially the level of programming under the CCC export credit guarantee programs in response to the financial crises in Asia, Latin America, and elsewhere. Last year, we undertook a tremendous increase in food aid programming through the authority of section 416(b) and programmed the highest level of food aid in at least the past 25 years. We have reached two very important agreements with China which will provide significant benefits to America's farmers and ranchers. The President also has taken action to reform our policy on unilateral economic sanctions in order to provide additional sales opportunities in markets where previously U.S. exporters could not compete. Taken together, these actions plus others, clearly demonstrate the Administration's commitment to expanding trade.

There is always more that can be done of course. Funding for EEP has been reduced in order to comply with the limitation established in its authorizing statute and to meet our commitment to reduce export subsidies under the Uruguay Round Agreement. Nevertheless, to ensure that EEP funds are fully used, the Administration again this year is proposing that Congress pass legislation which would authorize the Secretary of Agriculture to reallocate unobligated EEP funds to support other export activities, including market development and foreign food aid. If this authority were available, the Department would have the option of expanding funding for other export programs, one of which could be the Foreign Market Development Program.

FSIS INSPECTOR SHORTAGE

Question. Historically, Congress has fully funded the Food Safety Inspection Service's budget. Yet every year there is a shortage of inspectors. These shortages have caused backups at the plant and financial losses for producers. Our commitment to funding food safety programs is proven every year, but if the agency is missing the mark in projecting its needs, this problem will become worse. How can the agency assure that it has asked for the funding necessary to hire all needed inspectors for this year and next?

Answer. The budget is based upon historical levels of industry growth and includes a level of funding necessary to ensure that the Government meets its responsibilities for providing inspection services without disruption to the industry.

TELECOMMUNICATIONS TO RURAL AREAS

Question. I have been a major proponent of bringing telecommunications to rural areas. Bringing internet access to Montana farmers and ranchers increases market opportunities. It provides valuable information on agricultural research. A vast amount of information is made available to better their farm operations and improve their bottom line. The internet is becoming an increasingly valuable tool for agricultural producers and Rural Utilities Service (RUS) funding is an important part of that. How can this administration promote development and a better way of life for agriculture and then decrease funding for a program which offers rural areas an opportunity to dig out of the agricultural crisis?

Answer. Since 1993, RUS has provided over \$112 million in loans to eight telecommunications borrowers in Montana and has funded 13 distance learning and telemedicine projects across the state totaling \$3.9 million in grants. We are pleased to report that the Administration's funding request for fiscal year 2001 is actually higher than the current fiscal year appropriation. Our infrastructure lending levels are proposed to remain at the same level as this year, but our distance learning and telemedicine program is requesting a \$100 million increase in loans, to \$300 million total, and a \$5 million increase in grants, to a total of \$25 million. In addition, under the authority of the distance learning and telemedicine loan and grant program, the administration is seeking \$100 million in loans and \$2 million in grants for a pilot program to promote broadband initiatives and internet service.

CONSERVATION SECURITY PROGRAM

Question. \$1.3 billion for the conservation in the farm safety plan is a fairly large increase over last year's budget. This funding must not be used as the only route to provide assistance to farmers. Nor should it be used solely for set-asides. How can USDA assure that the conservation funding will truly be help for agricultural producers and not an avenue to lock more land out of production?

Answer. The Conservation Security Program (CSP)—the centerpiece of the President's initiative—is a new voluntary program targeted to family farmers and ranchers who would receive a direct payment for maintaining or improving their natural resources. The program is built on the concept of helping people who actually work the land and keeping that working land in agricultural production in a sustainable condition. The CSP is not a cost-share program, but would be another conservation tool in the USDA "toolbox" of conservation programs.

The CSP is not intended to take land out of production. In fact, land that is currently enrolled under a Federal conservation easement would not be eligible for the CSP, unless the easement agreement allows agricultural production to be continued. Conservation easement or similar long-term conservation protection programs provide payments for a variety of purposes, including conservation, farmland protection, and flood reduction. Under such easements, program participants must protect and maintain the land in a prescribed manner and have agreed to do so in exchange for the program payments. Since these lands are adequately protected by contract, additional payments under the CSP would not be responsible. This policy would make ineligible land enrolled in programs such as the Conservation Reserve Program, easement feature of the Wetlands Reserve Program, Debt Cancellation Conservation Contract Program, Water Bank, Emergency Watershed Protection Program floodplain easements, and similar Federal programs.

Question. Why is this Administration focusing on "Conservation Programs" when what is broken in agriculture is the Market side?

Answer. The Conservation Security Program is one piece of the policy mix in dealing the agricultural economy. It is not intended to be connected in any way with the price of the commodities being produced or to try to fix market issues. The CSP would build upon the existing conservation technical infrastructure and complement other USDA programs. Direct annual payments would be made to producers to financially recognize them for good land stewardship that produces the environmental benefits which we all enjoy—clean water and air, reduced soil erosion, improved wildlife habitat, and sustainable soil. Payment levels would be based on the comprehensiveness of producers' conservation efforts.

LANDS LEGACY INITIATIVE

Question. The Administration's budget includes \$236 million as part of the Land's Legacy Initiative. Of that, \$130 million will be used to acquire lands for recreation, wildlife habitat, and watershed protection. A portion will be used to establish and expand community forests and open spaces. Has the USDA lost sight of the producer and what the USDA was created to do? The "A" in USDA stands for "agriculture" not "acquisition of lands". Setting aside such sums of money for purchasing land for wildlife habitat is not my idea of assisting our producers. Was any thought given to offering producers incentives based on Conservation plans? Purchasing more land will simply take it off the tax rolls and further over burden our Counties and the States. When did USDA go into the business of land acquisition? What programs will go without funding or with limited funding to allow such purchases?

Answer. The Land's Legacy Initiative contains the Farmland Protection Program (FPP) administered by the Natural Resources Conservation Service (NRCS). The FPP is beneficial to agricultural producers because it is used to purchase conservation easements from landowners enabling the land to remain in agricultural use rather than being converted to other uses. This program was authorized in the Federal Agriculture Improvement and Reform Act of 1996 (H.R. 2854/Public Law 104-127) for the purpose of purchasing conservation easements or other interests on lands with prime, unique, or other productive soil to limit non-agricultural uses of the land. The authorization language requires that all lands in the FPP have a conservation plan on any highly erodible lands. Other incentives based on conservation plans are not authorized for the program at this time. The 1996 Federal Agriculture Improvement and Reform Act of 1996 authorized \$35 million for the FPP and all funds have been exhausted. However, demand for the program continues to increase, agricultural producers want to sell the development rights for their farms and be assured that their family farms will remain in agricultural use for future generations. The funding for the FPP will not impact other NRCS conservation programs.

The Forest Service (FS) also supports the Lands Legacy Initiative primarily through two of its program areas. The Land Acquisition Program acquires lands, waters and related interests within the National Forest System as authorized by the Land and Water Conservation Fund Act of 1965 (Public Law 88-578). Many of the acquired lands are located in congressionally designated areas such as Wilderness, National Recreation Areas, Wild and Scenic Rivers and National Scenic Trails. Land

acquisitions also improve forest management through consolidation of boundaries and providing access to existing National Forests and Grasslands. Land acquisition funds are provided through the Land and Water Conservation Fund under the Department of the Interior. In fiscal year 2001, a total of \$130 million has been requested for acquisition, management, forest and wilderness inholdings and cash equalization.

The second FS mission area that focuses on the Lands Legacy Initiative is State and Private Forestry. The purpose of these programs is to maintain working landscapes, to assure the economic vitality of communities and individuals through sustainable management of the natural resource base on which they rely. Among the State and Private Forestry programs, the Forest Legacy Program (FLP) conserves resource values of forest land, emphasizing lands of regional and national significance that are threatened with conversion to nonforest uses. Working in partnership with State Foresters, local governments, land trusts and interested landowners, the Forest Service supports the acquisition, by States or local entities, of conservation easements or fee simple title to unique lands. The program provides a cost-effective mechanism to protect critical wildlife habitat, conserve watershed functions, and maintain recreation opportunities.

Another State and Private Forestry program, the Urban and Community Forestry Program works to assist local communities in managing trees, forests, urban parks, greenspace and vegetation in order to improve urban lands livability, and reduce sprawl that encroaches on rural working lands. Through planning, demonstration projects, and technical assistance, Urban and Community Forestry programs improve air quality, diminish noise pollution, cool air, reduce erosion, and cut water treatment costs.

Finally, the FS will also serve as a key partner with USDA's Rural-Business Cooperative Service to make loans available through a new USDA revolving loan program to State, local and tribal governments in order to establish a green trust partnership that enables communities to protect open space, limit sprawl, enhance air and water quality, and reduce greenhouse emissions

PROJECT TERMINATIONS

Question. The Administration's budget proposes a 50 percent increase in funding for development, production, and commercialization of biobased products and biotechnology. This sounds like a glorious boost to research funding. However, what would you suggest I tell the producers of the Northern Great Plains when they ask why the funding for agriculture research at the Sidney ARS facility was cut?

Answer. The President's budget required that very difficult choices be made. All of the projects are evaluated within the ARS research portfolio. Decisions are based on (1) the relevance of the research project in addressing critical issues; (2) the availability of sufficient funds to conduct the research; and (3) the overall impact of the research on American agriculture. The research recommended for elimination at Sidney is in the area of irrigated crop rotation research. Other research activities at Sidney, such as biological control of invasive species like leafy spurge and the wheat stem sawfly were considered higher priority.

Question. These people are more interested in the leafy spurge and sawfly research that acutely hit them in their wallet. There is also \$561 million for Invasive species research. This is for fiscal year 2001. Aren't leafy spurge and sawfly invasive species?

Answer. Yes. Leafy spurge (*Euphorbia esula*) is an invasive weed from the Mediterranean and Northern Europe, and wheat stem sawfly (*Cephus cinctus*) is an invasive insect from Eastern Asia and China. New natural enemies from Europe have been found for leafy spurge, and will be introduced after testing them. This work is based out of the ARS European Biological Control Laboratory in Montpellier, France. Biological control of the wheat stem sawfly, based out of the ARS Biological Control Laboratory in Beijing, China, is also progressing well. A promising parasite of the sawfly has been introduced to quarantine in Bozeman, in a program conducted in cooperation with Montana State University. It will be released after testing if it appears to be restricted in its host range to the pest.

Question. What makes them so important in 2001 and not now?

Answer. Leafy spurge and wheat stem sawfly are as important now as they will be in fiscal year 2001. Funding for these projects is not proposed for termination.

Question. Why cut these programs one year and boost them the next?

Answer. As stated above, funding for research on leafy spurge and wheat stem sawfly will continue.

GLOBAL CHANGE RESEARCH

Question. What do you suggest I tell the producers that depend on these grass roots programs when they see \$32 million being set aside for Global Change research?

Answer. ARS research on global change addresses challenges that face agricultural producers and provides a wide array of environmental benefits. Research on rangelands indicates that woody species such as mesquite are replacing the more desirable grasses. Among the possible causes being investigated are altered climate and increasing atmospheric concentrations of carbon dioxide, a greenhouse gas. ARS research shows that increasing concentrations of carbon dioxide stimulate growth of some weeds more than crops. Work on managing crops, rangelands, and soils to sequester carbon dioxide into plants and soils increases soil organic matter, which helps crop productivity, decreases erosion by wind and water, and suppresses leaching of agricultural chemicals into waterways. Other ARS researchers are working on ways to use weather and climate models to predict and avoid risks to agriculture associated with extreme weather events.

BUILDINGS AND FACILITIES

Question. The Agricultural Research Service (ARS) Buildings and Facilities budget was cut by \$14 million. This concerns me greatly. As agricultural producers look for new ways to increase profits and enhance production, it is extremely important that they have facilities available to conduct research and hold classes. As an example, I was extremely pleased that last year \$530,000 was included for a new building at Fort Keogh in Miles City, MT. This agricultural research station had been operating on a shoe-string and is in major need of a new facility. The new building will help sheep and cattle ranchers learn about new methods and utilize agricultural research. If we hope to ever dig agriculture out of the hole it's in, innovation must be encouraged. Can the USDA find a way to restore the funding necessary for new innovation in agriculture?

Answer. The fiscal year 2001 Federal budget submitted by the President recommends a number of new initiatives to address changing priorities facing agriculture and the American consumer. The research budget proposed for ARS reflects an increase of \$97.8 million in support of new research initiatives in emerging and exotic diseases in plants and animals; agricultural genomics and genetics; human nutrition; invasive species; food safety; food quality protection; air quality; biobased products and new non-food and commercial uses of agricultural commodities; global climate change; integrated ecological sciences; and agricultural information dissemination.

Examples of new innovations that would result from expanded research initiatives proposed in fiscal year 2001 include developing new methods for the biological control of invasive weeds and other pests important to agriculture; finding new markets for biobased feedstocks and products to increase economic opportunities for agricultural producers and rural communities; developing new ways to increase carbon storage in soils and determining ways to predict and investigate climate change impacts on agriculture; improving the economically desirable traits of livestock, poultry and aquaculture species; and expanding diagnostic capabilities to prevent acts of biological and chemical terrorism on U. S. agriculture and a host of other new innovations.

MARKET INFORMATION PROGRAM

Question. The Economic Research Service (ERS) budget was cut by \$10 million. ERS provides important market information to agricultural producers. Many Montana producers rely on reports issued by ERS for cattle numbers and market reports. Again, the USDA is not giving producers a fighting chance to make their way in global markets. How will you change this?

Answer. The agency's request for 2001 is \$55.4 million, a net decrease of \$10 million from the 2000 appropriation of \$65.4 million. The change consists of four parts: a \$1 million increase for an initiative on structural changes and concentration in food and agriculture; a \$5 million increase to support a global research and outreach initiative; a \$.7 million increase for a study on carbon sequestration; and a \$12.2 million decrease for evaluations of food stamp, child nutrition, and WIC programs. Funding for these evaluation studies in 2001 is included in the Food and Nutrition Service (FNS) budget. The net decline has no implications for the ERS market information program. ERS continues work closely with other agencies in supporting the USDA market information program and meeting the needs of American producers. The agency continues to publish a monthly report on the livestock sector

outlook. This report includes analysis of major market developments, as well as key data on cattle, hogs, poultry, and dairy. ERS has an active program of research supporting the cattle industry and the work of other USDA agencies which relates to cattle. Examples include work on cattle cycles and our role in developing the Department's new price reporting program.

BIOTECHNOLOGY

Question. In regards to Frito Lay's recent announcement that they will no longer use genetically modified corn in response to consumer concerns—is USDA working with these companies and processors to make sure that the public is receiving the proper information on food safety and the potential benefits of technological advancements in genetically enhanced crops?

Answer. USDA's regulatory processes are open and transparent and the information on the safety reviews undertaken by USDA's Animal and Plant Health Inspection Service (APHIS) are made available to the public. Companies that are regulated by APHIS, or by the Food and Drug Administration (FDA) or the Environmental Protection Agency (EPA), are well aware of the extensive reviews that biotechnology products have undergone. Food manufacturers have spoken with me and other USDA officials regarding their concerns on these issues. In my view, we do not have a role in trying to influence companies as they decide how to respond to what they perceive to be their customers' demands, whether domestic or foreign. In addition, the responsibility for assuring the safety of food falls to FDA.

However, we do believe that we need to devote more energy to demonstrate to the public our commitment to ensure that concerns are addressed. USDA has developed a web site on biotechnology to address key questions for the public and we have formed an internal Biotechnology Communications Committee to ensure that our various agencies provide consistent messages on topics that arise. This group is also working with the communications offices at FDA and EPA to improve interagency coordination in public outreach.

Question. Additionally, Frito Lay is the largest user of cotton seed oil in the U.S. 60 percent of cotton seed oil is produced from genetically enhanced crops. It is past time to give some serious thought on how to address biotechnology. What plans does USDA have to do so?

Answer. A key responsibility we have as a Department is to defend the integrity of our regulatory processes and decisions. This is a role our regulatory and policy officials perform in public meetings throughout the U.S., as well as in bilateral and multilateral fora. It is vital for our continued credibility that we continue in this role, and are seen as balanced and impartial, rather than as simply pro-biotechnology.

There has been increased media attention to various potential risks posed by biotechnology and there have been questions raised by some about the adequacy of the existing Federal regulatory system for biotechnology products. It is to be expected that, as for any new technology, questions will continue to arise. To ensure that we can address, in an authoritative manner, any scientific issues that may arise, I have asked the National Research Council of the National Academy of Sciences to set up a Standing Committee on Biotechnology. The membership on this committee and its charge will be announced shortly. The first task of the Standing Committee will be to examine the risk assessment process and the assumptions underlying it as used by USDA's Animal and Plant Health Inspection Service in its safety reviews of biotechnology products for agricultural use. The Standing Committee will in that study consider whether we are addressing all of the relevant scientific issues appropriately, and identify any areas where USDA might improve its regulatory oversight based on the most recent scientific knowledge. It will also consider how most appropriately to monitor biotechnology products that have been approved for commercial use.

A variety of other issues have been raised by critics either of the technology itself, or of some of its key agribusiness proponents. A number of these complex questions need to be aired in a balanced public forum and the implications raised carefully considered, in order both to shed light on the public debate and to provide me with important recommendations to help guide future USDA activities. On February 4, 2000, USDA announced the membership on our new Advisory Committee on Agricultural Biotechnology which will address these issues. Representatives of the Grocery Manufacturers of America and other groups along the food production and distribution chain are represented on the committee. The committee will meet for the first time on March 29–30, 2000, in Washington, DC.

Additionally, we believe that it is essential that there be accurate information available about the economic impacts on farmers who use biotechnology-derived

crops, and on the environmental effects of their use in terms of inputs such as pesticides. We are increasing our data-gathering efforts in these areas. As niche consumer markets develop for identity-preserved non-biotechnology commodity streams or value-added biotechnology-derived products, USDA will have a role in certifying the testing methods used to verify the contents of a shipment through its Grain Inspection, Packers, and Stockyards Administration, and validating the identity of value-added products through its marketing and regulatory agencies.

WHEAT LOAN DEFICIENCY PAYMENTS

Question. In the last agricultural appropriations bill, Representative Lucas included language which would provide an LDP for grazing wheat. Although grazing wheat is not mechanically harvesting the crop as the 1996 Farm Bill specifies, the USDA did set a precedent when they allowed an LDP for silage. When does the USDA expect to have the program in place to give an LDP to producers that graze their wheat crop?

Answer. The language you refer to was in the conference report and not in the bill. It is my understanding that the current law, however, only allows USDA to make LDP payments to producers who actually harvest their loan eligible crops. The Federal Agriculture Improvement and Reform Act of 1996 provides for marketing assistance loans with respect to certain commodities that are produced on farms containing eligible cropland covered by production flexibility contracts and on any production of extra long staple cotton or oilseeds. LDP's are an option available under the marketing assistance loan program that allows a producer to receive an LDP from CCC provided the producer agrees to forgo obtaining a marketing assistance loan. Marketing assistance loans and LDP's are made on the actual harvested production of the commodity. Producers who do not harvest a crop do not have a commodity to pledge as collateral for a loan. Therefore, a producer is not eligible for an LDP on a commodity that was utilized as pasture.

In short, with respect to the conference report language request to include wheat acres utilized for pasture to the commodities eligible to receive an LDP, my understanding is that I do not have the authority to base marketing assistance loans, and subsequently LDP's on anything other than actual harvested production. Such a change would require legislative action by Congress.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

SETTLEMENT OF PROGRAM CIVIL RIGHTS CASES

Question. I continue to hear of problems at USDA related to civil rights issues. Please provide the status of ongoing issues regarding the civil rights settlement with plaintiff Black farmers and any other major issues before the Department including those involving Native Americans.

Answer. I am committed to ensuring the civil rights of USDA's customers and employees. I am very pleased with the steps we have taken to address these issues and ask for your continued support as we continue the difficult process of remedying past abuses.

In April 1999, the Department entered into a class action settlement agreement with African-American farmers, providing compensation and closure for those who felt they had been discriminated against in applying for USDA programs. The agreement provides for an independent facilitator to determine if each case meets the class definition, an independent arbitrator, and an independent adjudicator who all operate independently of USDA. In addition, the Department of Justice (DOJ) is responsible for coordinating most of the settlement payments in these cases.

Over 19,000 farmers have joined the class action suit, a much larger number than was expected. The court-appointed adjudicator has made a final determination on over 40 percent of the claims and, in about 60 percent of these, decided in favor of the farmer. Because of the volume of claims to be paid, there has been some difficulty in coordinating the payments. In some cases, payments to farmers have been delayed. USDA, DOJ and the facilitator are working to solve these problems and all payments will be made as quickly as possible, with the goal of making payments within 90 days of the decision.

Regarding other major issues, I have been told that the Department is working to resolve 13 employment-related and 4 program-related class action cases. One of these is a complaint alleging discrimination against Native Americans. The complaint was filed on November 24, 1999 and an answer to the complaint was filed by USDA on January 24, 2000. The class would be comprised of all Native American

participants in Farm Service Agency programs who complained to USDA about discrimination in farm programs between January 1, 1981, and November 24, 1999.

CIVIL RIGHTS INVESTIGATION AND ENFORCEMENT

Question. Please provide details involving the Department's ongoing activities regarding civil rights investigation and enforcement as they relate to both client and employee issues.

Answer. Since last year, the Office of Civil Rights (CR) has developed procedural manuals and standard operating procedures and realigned the program and employment divisions. All CR program complaint files are being reviewed to determine priority for investigation and appropriate resolution. CR will provide management diversity training to all USDA managers in headquarters and each agency will provide similar training to their managers in the field. Consistent with the recommendation of our Civil Rights Action Team, the Office of Civil Rights is being reorganized into separate units with distinct responsibilities for overseeing the timely and effective resolution of program and employment discrimination complaints. USDA also launched a new tracking system for processing program discrimination complaints in 1999.

The Program Compliance Division has scheduled evaluations of agency civil rights programs to assess whether the offices are properly staffed and to determine the level of enforcement of applicable civil rights statutes, regulations, and policies. I understand that four agencies will be evaluated this year: the Natural Resources Conservation Service, Rural Development, the Foreign Agricultural Service, and the Office of Inspector General. Employment compliance reviews are scheduled or are being conducted throughout the Department to identify any violations of employee civil rights. All agency heads were evaluated on civil rights performance during fiscal year 1999, and there was improved performance in all but two agencies. Over 90 disciplinary actions, including removal, have been taken against employees for discrimination or misconduct related to civil rights.

We have nearly eliminated the backlog of more than 1,000 old program civil rights complaints. We are providing the support needed to resolve the cases under the class action lawsuit brought by Black farmers (*Pigford v. Glickman*). The adjudicator has made decisions in about half of the cases filed to date.

USE OF SECTION 2501 FUNDS

Question. Please provide a detailed analysis of your historical, current, and projected (fiscal year 2001) use of section 2501 funds including the results from such use (both results sought and realized).

Answer. Congress began funding the 2501 program in fiscal year 1993 to provide training and technical assistance to small and disadvantaged farmers. The initial funding level was \$1 million and has increased to \$3 million on an annual basis. In fiscal year 2000, \$5.2 million of additional funding has been made available from the Fund for Rural America. The fiscal year 2001 Budget requests a program level of \$10 million to fund the program at the level recommended by the Civil Rights Action Team's Report. Additional information follows.

[The information follows:]

Fiscal year 2000 is the final year for 23 of the 26 projects that have been funded. Final project reports will be submitted in the first quarter of fiscal year 2001. I am particularly encouraged by projects such as those at the Federation of Southern Cooperatives/Land Assistance Fund in Georgia and Tuskegee University in Alabama. They have provided outreach and technical assistance that has increased ownership of farms and ranches by socially disadvantaged citizens.

For example, Georgia reported 111 counties with a population of black farmers. Statewide, from 1992 to 1997, there was an increase of 95 black farmers. Eighteen of these counties were in the 2501 program and they reported an increase of 66 black farmers. Thus, the 2501 projects contributed to 73 percent of the total increase in black farmers in Georgia. Nearly all counties reporting increases in black farmers had double-digit percentage increases.

In Alabama, 8 of the 12 project counties showed an increase in black farm numbers between 1992 and 1997. In Bullock, Lowndes, and Hale Counties the increases were 46 percent, 42 percent, and 25 percent, respectively. USDA intends to build on these successes of the Federation of Southern Cooperatives/Land Assistance Fund and Tuskegee University.

For fiscal year 2001, USDA plans new outreach projects. We are currently preparing a request for proposals for new projects to be published in the Federal Register. We plan to evaluate proposals by the end of the fiscal year so we will be ready to make awards upon enactment of fiscal year 2001 appropriations. The planned Mi-

nority Farm Register and Small Farms Register and the increased agreements with community organizations will also help the program meet its objectives.

FUND FOR RURAL AMERICA

Question. The budget justification indicates that \$60 million in budget authority is being obligated under the Fund for Rural America in fiscal year 2000. Of that amount, \$5.2 million is being added to the amount already appropriated for section 2501 activities. It has been brought to my attention that interest has been expressed by the University of Arkansas at Pine Bluff (an 1890 Institution) to further develop a demonstration farm in the vicinity. I also understand that you visited this site in 1998. Would funding provided through section 2501 be appropriate for use in development of the facility as envisioned by UAPB, or would any other program included under the Fund for Rural America?

Answer. The University of Arkansas at Pine Bluff partnered with the Natural Resources Conservation Service to establish a National Wetland Water Management Center on a 870-acre farm in Lonoke, Arkansas. I visited this Center in 1998. Successful technology from this farm is transferred to the State's small farmers, many of whom are socially disadvantaged. Five small farmers who are participants in the University's 2501 project are also demonstration farmers with the Center.

Section 2501 provides funds for training and technical assistance to small and disadvantaged farmers. In April 2000, the Office of Outreach intends to solicit new proposals for 2501 grants to be awarded in fiscal year 2001, subject to appropriations. Demonstration projects like this one, may well meet the requirements for a grant under the 2501 program and we encourage all proposals.

USER FEES

Question. The fiscal year 2000 Appropriations Act includes language requiring information to be submitted with the budget in the event unauthorized user fee revenues are assumed in the overall budget. The budget proposal for the Agriculture Subcommittee includes \$600 million in such fees, most of which are related to USDA programs. In the event these fees are not authorized, what items within the proposed budget do you want reduced in order to keep our spending within prescribed limits?

Answer. The budget is based upon a current law request. Should the authority for user fees not be approved by the authorizing committee this current law request would not have to be revised.

COMMISSION ON 21ST CENTURY AGRICULTURE

Question. The 1996 Farm Bill included a provision authorizing the Commission on 21st Century Agriculture to examine and recommend options for farm policy to replace the current farm law. What is the status of this commission and when should its report be released?

Answer. The Commission on 21st Century Production Agriculture has been actively meeting since February 1998. Most recently, the Commission met January 27-28, 2000, in Washington, D.C. with policy experts from around the country to discuss the future of agricultural policy in the United States. The next meeting is scheduled for March 7, 2000. The Commission and staff are working to develop recommendations for future farm policy and expect to publish a report January 1, 2001 pursuant to § 183b and § 184b of the Federal Agricultural Improvement and Reform Act of 1996.

Question. The 1996 Farm Bill included a provision authorizing the Commission on 21st Century Agriculture to examine and recommend options for farm policy to replace the current farm law. What is the status of this commission and when should its report be released?

Answer. The Commission on 21st Century Production Agriculture has been actively meeting since February 1998. Most recently, the Commission met January 27-28, 2000, in Washington, D.C. with policy experts from around the country to discuss the future of agricultural policy in the United States. The next meeting is scheduled for March 7, 2000. The Commission and staff are working to develop recommendations for future farm policy and expect to publish a report January 1, 2001 pursuant to § 183b and § 184b of the Federal Agricultural Improvement and Reform Act of 1996.

FARM*A*SYST/HOME*A*SYST

Question. The Farm*A*Syst/Home*A*Syst program funded by CSREES has proven itself to be an integral component of Departmental strategies to improve water

quality and protect the environment through its national network of state Farm*A*Syst programs. Congress has recognized the value of this program by directing CSREES to fund the program by name including funding for national headquarters in Madison, WI and for grants to states from the water quality accounts. While we recognize that the Integrated Accounts are generally competitive, the intent of Congress to specifically fund the existing Farm*A*Syst program is clear. Still, CSREES has thus far refused to provide the funding for this valuable program as directed by Congress. Please inform this Committee how you interpret the direction of Congress to fund the Farm*A*Syst/Home*A*Syst program at no less than fiscal year 1999 levels and how you intend to comply with congressional direction.

Answer. Section 406 of the Agricultural Research, Extension and Education Reform Act of 1998 (Public Law 105-185) provides the authority to award grants to colleges and universities in accordance with section 1404 of the National Agricultural Research, Extension, and Teaching Policy Act of 1977 (7 U.S.C. 3103) on a competitive basis for integrated agricultural research, education, and extension projects. CSREES is finalizing the fiscal year 2000 Water Quality Program Request for Proposals (RFPs) in which the national and state Farm*A*Syst/Home*A*Syst providers may compete openly for grants. The funds available under Sec. 406 of the RFP far exceed those spent on Farm*A*Syst/Home*A*Syst in fiscal year 1999.

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION

Question. I have long been a supporter of the Sustainable Agriculture Research and Education programs and I applaud the Department for budgeting additional funding for the SARE program for the first time in many years. For too long this valuable program has received inadequate funding and inadequate support from the Department, relative to spending on research for conventional agriculture. However, as you know, sustainable agriculture includes a wide range of cultural, biological and other practices designed to ensure that farms are both economically and environmentally sustainable. While I strongly support research and education to support organic agriculture, I am concerned that the Administration's proposal is limited solely to organic when the field of sustainable agriculture is much broader. Why did the Administration limit its SARE increase to organic when the research needs of the broader system of sustainable agriculture is in equal need of new research and education funding?

Answer. The SARE program has supported over 200 projects related to organic agriculture. The increase requested in the fiscal year 2001 President's Budget for SARE will enable the agency to focus all of the current funding to the needs of the broader system of sustainable agriculture while targeting organic agriculture through the increase. The existing SARE program has significant experience with organic farming and marketing issues under the larger umbrella of sustainable agriculture, and an innovative structure. The SARE structure consists of regional organization with strong stakeholder involvement; integration of research with extension and outreach; multi-institutional collaboration; and a commitment to on-farm research that is well-suited to the involvement of organic stakeholders and to addressing organic farming and marketing research and extension in a holistic manner. The SARE initiative on organic research and extension will serve an expanding and increasingly active constituency of producers and consumers.

BIO-TERRORISM

Question. I understand the Federal government is developing an ongoing strategy for defense against bio-terrorist activities. Please outline the role of USDA in this effort.

Answer. The U.S. agricultural food and fiber production system is uniquely vulnerable to deliberate introduction of highly infectious diseases and pests, particularly those of foreign origin. USDA has successfully prevented widespread damage caused by numerous accidental introductions of non-endemic plant and animal pests and diseases in the past by rapidly responding to outbreaks and implementing appropriate control measures. The Department is participating in an inter-agency effort regarding bio-terrorist threats affecting agriculture.

METHYL BROMIDE

Question. Please provide information regarding USDA activities regarding the search for a methyl bromide alternative.

Answer. The USDA is working with the U.S. Environmental Protection Agency (EPA), States, industries, including the Crop Protection Coalition, to address high priority needs of commodities and products in both soil and postharvest fumigation. Co-chaired by ARS, USDA participates in a USDA/EPA methyl bromide working

group, established by the Secretary Glickman and EPA Administrator, to review potential alternatives for efficacy and EPA registration status. A long list of action items has been identified relative to registration and some registration problems were recently resolved due to that effort.

[The information follows:]

Agricultural Research Service Research Program: In 1999, ARS reviewed its methyl bromide research program with growers and other methyl bromide users in meetings in Florida and California to receive input on the methyl bromide research program to make sure it is properly focused on the highest priority problems. In addition, ARS organized a field trip of USDA and EPA personnel to study issues particular to the floral and nursery industries in California. ARS also provides a representative to the Montreal Protocol Methyl Bromide Technical Options Committee to conduct assessments of the availability and efficacy of methyl bromide alternatives and to provide technical advice to the Montreal Protocol on related issues.

ARS conducts research at 20 Federal laboratories to find alternatives to present soil fumigation and postharvest uses of methyl bromide as follows:

At Weslaco, Texas, and at Orlando and Miami, Florida, ARS is developing alternative quarantine treatments for citrus, vegetables, and subtropical fruits, as well as studying ways to minimize phytotoxic effects of these treatments. Emphasis is placed on pest-free zones, irradiation, heat and cold treatments, and advanced quarantine pest detection systems.

At the Hilo/Honolulu, Hawaii, ARS laboratory, alternatives are being developed for tropical fruit infested with fruit flies, especially Mediterranean and oriental fruit flies, to allow export of Hawaii-grown fruit to foreign markets and mainland United States, and to protect mainland United States from introduction of pests present in Hawaii. This research focuses on irradiation, heat and cold commodity treatments and on techniques to eradicate fruit flies.

At Manhattan, Kansas, ARS is developing alternatives to use of methyl bromide to fumigate flour mills, food processing plants, and other structures for insect infestations. Building heat-ups alone and in combination with other treatments such as diatomaceous earth are the approaches being researched.

Research to develop alternatives to soil fumigation with methyl bromide to control pathogens and weeds is conducted at 15 ARS locations. Methyl bromide is used to some extent on more than 100 crops, although nearly 80 percent of all the preplant methyl bromide soil fumigation is used on just four crops—strawberries, tomatoes, ornamentals/nursery crops, and peppers. Alternatives to methyl bromide soil fumigation include host plant resistance, biological control, alternative chemicals, and different cultural practices, either alone or in combination.

At Washington, D.C., biological control and alternative, naturally-occurring chemicals are being evaluated as alternatives to methyl bromide for control of soilborne diseases of ornamentals.

At Beltsville, Maryland, biological control agents are being identified and their mode of action determined to improve control of diseases of vegetables.

At Kearneysville, West Virginia, natural plant volatiles are being evaluated as alternative fumigants and compost and other cultural methods identified for disease and weed control.

At Fresno, California, integrated strategies are being tested that involve host plant resistance, biological control and alternative chemicals for control of disease, nematodes and insects of strawberries, grapes, tree fruits, and vegetables. The application of alternative chemicals using irrigation systems is being tested.

At Riverside, California, research is under way to reduce methyl bromide emission in strawberry and vegetable production and to track the movement and degradation of methyl bromide and alternative fumigants.

At Davis, California, work is directed at using host plant resistance and cultural modifications to manage diseases in tree fruits and nuts.

At Salinas, California, research is aimed at finding biological and cultural control methods to manage strawberry and vegetable diseases, and characterize the ecology of pathogens.

At Wenatchee, Washington, disease problems in tree fruit production are being identified, and strategies for their control are being sought.

At Corvallis, Oregon, biological controls are being investigated for diseases of ornamentals and nursery crops, and the role of beneficial microorganisms in disease and weed management is being explored.

At Stoneville, Mississippi, biological control agents to control weeds in vegetables are being identified and characterized.

At Tifton, Georgia, the emphasis is on finding cultural methods and alternative chemical treatments and integrated strategies for control of nematodes and diseases on vegetables, and on identifying alternative herbicides for control of weeds.

At Byron, Georgia, research is aimed at improving cultural practices and host resistance to manage nematodes and diseases in peaches and other tree fruits.

At Gainesville, Florida, work is under way to find alternative soil treatments, such as solarization, flooding, or heating, to control pests, weeds, and pathogens in vegetables.

At Orlando, Florida, integrated methods involving biological control, cultural practices, and alternative chemicals are being developed for control of weeds, nematodes and diseases in tomatoes, peppers, and other vegetables.

At Charleston, South Carolina, alternative fumigants, host-plant resistance, and cultural practices are being explored as alternative disease management strategies in vegetables and fruits. The survival and spread of soilborne pathogens as influenced by other microorganisms and the environment is being determined.

In addition, field-scale validation projects that were begun in fiscal year 1996 were continued in Fresno, California, and Orlando, Florida, to determine if the most promising experimental alternatives were effective, economically feasible, and adaptable to commercial production systems of strawberries, vegetables and perennial crops.

Cooperative State Research, Education, and Extension Service Research Program: Research dollars in Hatch, Special Research Grants, and NRI was \$298,000 for fiscal year 1998 and \$778,000 for fiscal year 1999. It is estimated that \$2.8 million will support methyl bromide activities in fiscal year 2000. The Methyl Bromide Transition Program is a \$2 million competitive grants program designed to support the discovery and implementation of practical pest management alternatives for commodities affected by the phase out of methyl bromide. This new program will focus on short to intermediate term solutions for all commodities at risk using either combinations of presently available technologies or newly developed practices. The emphasis of the new funding will be towards integrated management approaches, their development and implementation, including research, education and extension activities on all commodities at risk.

USDA's Interregional Research Project No. 4, (IR-4) began addressing the methyl bromide issue in 1998. A team was formed to work on discovery and development of safe products and new technologies that have the potential to fill the void in tomato and strawberry production created when methyl bromide is phased out. Much work has already been done and is ongoing with the standard products currently used to control the same spectrum of pests as methyl bromide. A weakness of all of the standard products is poor or no control of annual and perennial weeds. IR-4 has ongoing programs to address this for tomato producers and a new program is evaluating materials for crop safety and control of yellow and purple nutsedge in tomatoes. Weed control in strawberries is also being approached. IR-4 is also evaluating new, unregistered products as methyl bromide alternatives for strawberries and tomatoes. Strawberry field trials began this fall and tomato trials are scheduled for early in 2000.

METHYL BROMIDE

Question. What changes in agricultural production and marketing have occurred in the private sector in anticipation of the loss of methyl bromide?

Answer. Currently, there are no substitutes that are as efficient or cost effective as methyl bromide. Continuing research and field trials of alternatives will provide substitutes when the phase-out is completed in 2005. However, without methyl bromide, some production changes may take place in areas of the U.S. where alternatives are not cost effective for production of certain crops. There are some new materials in field trials at this time that hold promise as replacement chemicals but are not commercially available at this time.

USDA data are not currently available to show changes in production and marketing due to the anticipated loss of methyl bromide. Economic models predict production declines and acreage shifts for such crops as tomatoes, peppers, cucumbers, watermelons, and strawberries in California and Florida if methyl bromide is no longer available. The U.S. is scheduled to reduce methyl bromide consumption by 25 percent in 1999, 50 percent in 2001, 70 percent in 2003, and 100 percent in 2005. USDA data from 1997 to 1999 show stable or increasing acreage and production of affected crops. USDA estimates of methyl bromide-treated tomato, pepper, strawberry, and eggplant acreage in Florida were stable or increasing from 1992 to 1998 (available in even years only), while methyl bromide-treated strawberry acreage in California decreased between 1996 and 1998.

MINOR USE PESTICIDES

Question. Please outline the efforts of USDA to assist in the development and availability of minor use pesticides.

Answer. The Pest Management for Minor Crops (IR-4) Program is a highly effective effort between the State Agricultural Experiment Stations, CSREES, and the Agricultural Research Service (ARS). IR-4 provides the national leadership, coordination, and focal point for obtaining data to support the regulatory clearance through the U.S. Environmental Protection Agency (EPA) for pesticides and biological control agents for specialty food crops such as fruits and vegetables as well as non-food crops like ornamentals.

In many cases, the agricultural chemical industry cannot economically justify the time and expense required to conduct the necessary research for products with limited market potential. With assistance from IR-4, producers of small acreage crops such as vegetables, fruits, nuts, and herbs have expedited access to pest control products. In order to accomplish the above, a four step process has been developed for food crops. Step one involves research prioritization. Because of limited resources, IR-4 requests and receives input from stakeholders on potential research projects. Yearly workshops are conducted that involve growers, commodity organizations, university research and extension specialists, EPA staff, and industry representatives to determine which projects are the most critical to minor crop agriculture. Step two is research planning. Research protocols are written after careful review and comments from stakeholders. Step three is research implementation. A typical IR-4 program consists of both field and laboratory phases. For the field work, researchers apply the crop protection chemical to the target crop according to the experimental protocol. The crop is harvested and transferred to the laboratories where the chemical residues in the crop, if any, are determined. All field and laboratory research is conducted under EPA Good Laboratory Practices. Step four is data submission and approval. The data are critically reviewed and formatted into a regulatory package and submitted to the EPA for the review. If appropriate, the EPA will approve the submission and grant a pesticide food tolerance to support registration of the use on the minor crop. The process for ornamental crops is similar, however, these crops do not require a pesticide tolerance.

Question. Please provide any economic data available regarding the cost to producers due to the unavailability of these products.

Answer. At this time, data and/or models are not available to allow for development of a comprehensive economic analysis of the impact of the unavailability of pesticides that are needed for minor crops. In total, minor crops farm gate value is \$40 billion or 40 percent of total U.S. crop value.

IR-4 has a few specific examples of economic impact as a result of their work. IR-4 has developed and submitted data to EPA for the insect growth regulator tebufenozide on blueberries, blackberries, raspberries, canola, cranberry, mint, and turnip. This chemical received the 1998 Presidential Green Chemistry Award because of its unique ability to control problem pests without damaging non-target organisms and the environment. Many consider this Reduced Risk pesticide an efficacious alternative for many high risk pesticides which are under EPA scrutiny associated with the Food Quality Protection Act (FQPA). The Cranberry Institute has estimated the use of tebufenozide will provide economic benefits ranging from \$17 to \$35 million annually depending on the severity of the target pest infestations.

In another example, the clearance of the herbicide pyridate on the ultra-minor crop garbanzo beans—chickpea, grown on only 15,000 acres in the states of Washington, Oregon and Idaho has resulted in a net revenue increase of more than \$3.3 million on the part of producers. This single registration combined with changes in government farm programs has allowed garbanzo beans to become an important rotational crop in certain production systems in the Pacific Northwest region.

Finally, IR-4 is currently assisting sweet corn growers in Wisconsin and other North Central states with the clearance of the herbicide glufosinate. IR-4's data has supported an EPA-approved Emergency Exemption. The emergency exist due to the cancellation of cyanazine and use restrictions of other triazine herbicides to protect the ground water. The University of Wisconsin has estimated that without the emergency approval of glufosinate for Wisconsin sweet corn, losses to Wisconsin farmers would exceed \$2.9 million and the loss to Wisconsin overall economy would be much greater.

As EPA continues to implement FQPA, we expect to see many older chemical pesticides come under increases scrutiny. A likely outcome is the reduction or elimination of existing tolerances. The impacts on minor crops are potentially severe because there are few registered alternatives. The IR-4 program mitigates these im-

pacts by helping to assure that modern pest management tools are available to minor crop producers.

MINOR USE PESTICIDES

Question. Please describe your ongoing collaboration with EPA regarding the development of minor use pesticides in order to protect producers, consumers, and the environment.

Answer. Though IR-4 has worked closely with EPA since the Agency's inception, the two groups started some new initiatives in 1998 to build better coordination and cooperation. First an EPA/IR-4 Technical Working Group was formed. This group meets quarterly and focuses on a number of important issues involving better productivity and efficiency in handling minor crop registrations. Some highlights of this collaboration effort are noted as follows:

For the first time in IR-4's history, a three-year work plan with a schedule of all of IR-4's projects and petitions has been submitted to the EPA. This will allow the Agency to schedule their petition review process more efficiently, more importantly it will allow EPA to schedule and review IR-4 submissions along with the submissions from industry on the minor crops.

EPA and IR-4 have developed a standard format summary for IR-4 data submissions. This summary has saved EPA significant time in reviewing IR-4 submission, with a savings estimated as much as two months, and eliminating EPA funding of expensive external contract review to develop a similar summary.

IR-4 proposed to EPA that they utilize existing IR-4 and industry data to establish crop group tolerances for most minor uses of the reduced-risk pesticides, spinosad and azoxystrobin. EPA has approved IR-4's proposals. This resulted in direct savings of over \$1 million for IR-4 in field residue and laboratory analysis expenses in 1999. These resources were directed to developing solutions for other important minor crop pest control needs. More importantly, EPA approval will allow grower access to these two new materials almost three years earlier than under normal circumstances.

EPA has also developed new procedures directions in order to allow IR-4 to have certain minor uses classified as Reduced-Risk. Prior to the modification, industry was required to submit a comprehensive justification document. The new process is streamlined requiring only pertinent data in order to allow EPA to make the classification.

Finally, one of the IR-4 scientists has been assigned to EPA, working on the staff of the Director of the Office of Pesticide Programs. That IR-4 scientist provides day to day linkages from IR-4 to EPA, including working closely with EPA's Minor Use Team Leader and Ombudsperson to support efforts to address minor crop policy issues and challenges brought about by FQPA implementation.

DAIRY FORAGE/INTEGRATED FARMING SYSTEMS

Question. For a number of years, funding has been provided through the ARS Dairy Forage Center in Madison, WI for research related to Integrated Farming Systems. In fiscal year 1997 a cooperative agreement was executed between ARS and the University of Wisconsin and the Michael Fields Institute, a non-profit research organization, for work related to Integrated Farming Systems. Please provide information showing the level of funding provided for Integrated Farming Systems each year since fiscal year 1997 including an explanation of activities by ARS, the University of Wisconsin, and the Michael Fields Institute.

Answer. The levels of funding assigned to the Integrated Farming Systems research area conducted by or funded through the U.S. Dairy Forage Systems Research Center (USDFRC) by year are as follows: \$500,000 in fiscal year 1997; \$497,100 in fiscal year 1998; \$490,900 in fiscal year 1999, and \$501,600 in fiscal year 2000. ARS, the University of Wisconsin (UW) and the Michael Fields Agricultural Institute (MFAI) all conducted research under these funds. The USDFRC has provided funding for this project, conducted research, and participated in the annual meetings of cooperators. The UW provides leadership and conducts research. The MFAI conducts research on the project, publishes a quarterly newsletter and a Profitable Farming Update Series (2500 subscribers), and cooperates on the development and testing of a Software Decision Making Program "Crop Rotation Options Program" (CROP).

Question. Provide information explaining specific actions taken by the ARS Dairy Forage Laboratory since 1997 in support of the Integrated Farming System's mission.

Answer. The U.S. Dairy Forage Research Center (USDFRC) conducted research on (1) developing low-input management of intensive grazing systems, giving em-

phasis to procedures that provide needed supplements to growing and lactating dairy cattle without nutrient buildup in pastures and loss to the environment; (2) evaluating and developing cropping systems that provide quality feed for profitable dairy farms in an environmentally safe manner; (3) developing strategies for managing nutrients in crop-livestock systems with special emphasis on animal manure to, at minimal cost, maximize nutrient recycling and minimize environmental risks, (4) investigating surface loss of phosphorus and nitrogen from pasture paddocks that have been managed in different ways, and (5) cooperating in a multi-agency/institute project on farm diversification—"Small Grains Initiative", the goal is to incorporate small grains and legumes into a normal corn-soybean rotation while considering production and marketing objectives.

Question. Please provide materials showing ongoing activities at the Dairy Forage Center including what is proposed for fiscal year 2001.

Answer. The activities given in the answer to the previous question related directly to the Integrated Farming Systems mission. The Dairy Forage Center conducts several lines of basic research that help to support the systems research. These lines address (1) inefficient soil fertility management that reduces forage quality and yield and adversely affects water quality; (2) inability to fully exploit the plant genetic potential and manipulate the genetics by environment interactions for improved forage quality; (3) excessive harvest and storage loss of forage nutrients; (4) plant cell walls limit the consumption and digestion of forages; (5) excessive loss of forage protein during digestion in the rumen; (6) insufficient integration of research information to allow field evaluation of management options (systems approach) in the dairy forage enterprise.

Additionally, for fiscal year 2001, using currently available funds, new thrusts will be initiated in the areas of (1) evaluating how modification in forage phenolic and fiber affect the production and utilization of forage crops by dairy animals and the cycling of nitrogen and carbon on dairy farms and (2) the development of forage legumes that are productive, pest resistant, persistent, non-estrogenic, high-quality, and compatible in mixtures with grass for silage, hay and grazing.

Full funding of the President's fiscal year 2001 budget request for bioenergy will support the development at USDFRC of improved methods for harvesting, handling, and storing herbaceous biomass and chemical characterization of feedstock quality parameters affected by management and storage.

The President's budget also proposes that the USDFRC investigate the function of important genes in crops. Full funding for this initiative will allow the application of the ARS system for regulating gene expression to enhance the quality and value of cool season forage and turf grasses.

AQUACULTURE RESEARCH FUNDING

Question. It was my understanding that there were discussions in fiscal year 1999 to transfer \$400,000 from the Kearneysville, WV ARS facility to Leetown, WV for work at the NCCCWA. I further understand that Senator Byrd was opposed to this transfer. I now learn that a total of \$1.3 million was transferred. Please explain the level of all transfers (including specific project increases and decreases) from Kearneysville to Leetown and also indicate whether Senator Byrd was appraised in advance of these transfers.

Answer. Your understanding of the discussion in fiscal year 1999 on the transfer of funds between the ARS Kearneysville, WV, facility and the NCCCWA at Leetown, WV, is correct.

The aquaculture grant which provides funding in the amount of \$1.3 million to the Fresh Water Institute at Shepards town, WV was transferred to the new Cold Water Aquaculture Center at Leetown, WV. These funds were initially appropriated in fiscal year 1989 and managed from headquarters from 1989 through 1995. These were eventually transferred to the ARS facilities at Kearneysville, WV beginning in 1996 for closer program coordination. These are extramural funds and are not implemented inhouse. Since these are aquaculture funds, they are more appropriately managed at the new aquaculture facility at Leetown. No inhouse funds were transferred from Kearneysville.

Question. If Senator Byrd was not so appraised, please explain.

Answer. Our failure to appraise Senator Byrd of this move was based on our clear understanding from the conception of the National Center for Cool and Cold Water Aquaculture that there should be a close working relationship between the NCCCWA and the Fresh Water Institute. We believed that the transfer was consistent with Senator Byrd's desires.

CLIMATE CHANGE TECHNOLOGY

Question. The Budget includes funding for the Climate Change Technology initiative of which \$300,000 would be directed to the Appalachian Farming Systems Center in Beaver, WV. Please explain how the Climate Change Technology initiative fits in with the newly recognized mission of the Beaver, WV center which is to assist small farmers in Appalachia.

Answer. Successful and productive research through the Climate Change Technology initiative conducted at the Appalachian Farming Systems Research Center will provide expanded economic opportunity for small farmers in Appalachia. Funding through the Climate Change Technology initiative would be used to quantify the rates of soil carbon sequestering of alternative farming systems. The funds will also be used to identify and develop grasses and trees that have a high value as energy biomass. Development of perennial legumes that are suitable for the acid, low-fertility soils of the region is an important part of the core program to improve pasture productivity for cow-calf operations, and could also be used in a system to produce biomass for energy or value-added products. Research results will be used to develop farming systems that best meet small-farm economic and environmental goals including greater diversification of farm products, trading in carbon credits, and an improved ability to sustain production during droughts. Additionally, carbon sequestration in soils improves the soil's capacity to store nutrients and to hold water, which is especially beneficial during droughts.

INVASIVE SPECIES

Question. Your fiscal year 2001 budget provides significant increases to battle invasive species. Please identify the most significant invasive species threats facing Wisconsin and what the Department is doing to eradicate or manage these species.

Answer. The most significant invasive species threats facing Wisconsin are gypsy moths. To combat this pest, we are cooperating with the State of Wisconsin on survey and regulatory activities, as well as on the eradication of isolated outbreaks. Bacterial spraying is planned for 85,000 acres, including sites in Madison, Janesville, Beloit, and Wausau. In fiscal year 1999, the bacteria that attack the pest were sprayed last year on about 54,000 acres. With the funds requested in our Invasive Species request, we would conduct pathways analyses to develop target invasive species (such as gypsy moth) for national survey through cooperative agreements and development of response capabilities. These analyses will help us target invasive species for national and State survey and activities. Another significant threat in Wisconsin is the Eurasian Water milfoil (*Myriophyllum spicatum* L.). This submerged aquatic weed originates from Europe, Asia, and North Africa. It is rapidly spreading throughout the United States by invading lakes, ponds, and reservoirs. It is especially troublesome in nutrient rich waters with high motor boat use. Due to its unique growth habits, Eurasian Water milfoil competes aggressively with native plants. The plant's ability to grow in eutrophic conditions over a broad temperature range also contributes to its competitive edge over native plants.

Question. Please describe efforts taken by the Department in working with foreign nations to help avoid the introduction of these species?

Answer. We have over 80 foreign service officers assigned to over 30 countries around the world that are high risk for the entry of invasive species. These officers work with foreign governments and exporters to minimize the risk of entry of invasive species in agricultural imports through activities such as preclearance programs, the certification of export facilities, and the establishment of inspection protocols. In addition, we have control programs in select countries to reduce the threat of key invasive species, such as Mediterranean fruit fly, foot-and-mouth disease, and screwworm.

Question. To what extent would the problem of invasive species be controlled by an increase of border personnel?

Answer. An increase in border personnel could significantly enhance our capability to exclude invasive species, as well as improve our response to threats from various exotic pests, and provide us with opportunities to examine emerging pathways, such as rail cars entering the U.S. from Canada. This is why we are requesting additional inspectors through our Agricultural Quarantine Inspection (AQI) program. Also, the revenue from our AQI user fees that took effect on January 1, 2000, will help in our exclusion efforts by providing for the hiring of additional inspectors, expanded canine teams, and state-of-the-art high-definition x-ray machines.

Question. To what extent will the inspection levels included in the fiscal year 2001 budget accomplish this objective?

Answer. While our AQI program of user fees will bolster our border efforts with more staff years. Our fiscal year 2001 Invasive Species request does not include po-

sitions at the borders or ports-of-entry. The new positions we are proposing for this program are statisticians and program analysts at the State, regional, operational methods, and policy levels. These personnel would collect, validate, and use import and pest data to diagnose and predict the pathways of various invasive plant pests and animal diseases into the United States. They would also evaluate the impact of new inspection strategies at ports of entry.

Question. To what extent is USDA working with other federal agencies on border inspections to halt the introduction of invasive species?

Answer. About half of our Invasive Species request is targeted to help establish a new partnership with the U.S. Departments of Commerce, Interior, EPA, while seeking greater collaboration with State agencies and other stakeholders, through increased use of grants. For example, we plan to incorporate existing educational grants to the States with the goal of expanding public knowledge on the types of invasive species under USDA regulation. To address the needs of the nation's plant health industries and the State plant health agencies, we plan to increase cooperative funding and grant opportunities that increase the efficient use of Federal and State resources involved in the protection of the environment, and plant and animal health.

ANIMAL WELFARE

Question. The fiscal year 2000 appropriations bill included an increase of \$1 million above the previous year level (nearly \$500,000 above the budget request). How is the \$1 million increase being incorporated in the fiscal year 2000 plan of operations?

Answer. APHIS intends to use this increase to hire additional inspectors; expand inspections of existing facilities; replace vehicles; provide necessary training for our inspectors; and purchase imaging and communications equipment to provide documentation and evidence of violations.

Question. Please provide a summary of fiscal year 1999 Animal Welfare activities including number of investigations, the nature of violations, enforcement actions, and their outcomes.

Answer. In fiscal year 1999, APHIS investigated a total of 313 cases. Examples include a case where USDA and the U.S. Attorney's office in Oregon successfully prosecuted 9 people for their roles in a pet-theft ring. Charges included providing false information concerning the suppliers of dogs sold into research. Two of the people received sentences of 4 to 6 months of home detention and 1-year term of probation, and they agreed to be permanently disqualified from being licensed under the AWA. They were also prosecuted in the State Circuit Courts for theft of companion animals.

Another example occurred in October 1998, when APHIS settled a case with an airline which agreed to donate \$25,000 to an APHIS-approved organization to research methods to promote the safe and humane handling of pet animals during transportation. The results of this research will be disseminated to all carriers registered under the Animal Welfare Act.

A particularly innovative enforcement case settled in August 1999, involved a major primate research laboratory. Terms of the settlement included reducing the number of chimps at the facility by 300 over a 3-year period; submitting to a review of their animal care program by an external team of experts; establishing an independent compliance official with access to all facilities, records, and animals; and a \$100,000 civil penalty, held in abeyance, assuming no new AWA violations.

The budget proposes a \$5 million increase in these activities for the coming year. In addition, legislation relating to the Safe Air Travel for Animals Act is in conference which might affect USDA program activities.

Question. Would any of the request for the fiscal year 2001 be tied to new regulatory activities not related to the Safe Air Travel for Animals Act?

Answer. None of the request for fiscal year 2001 is specifically related to the Safe Air Travel for Animals Act. APHIS intends to use this increase to maintain current activities; expand inspections of existing facilities; provide necessary training; and hire additional inspectors. This would include an overall increase in oversight of registered airline carriers.

Question. Has USDA reviewed the pending Safe Air Travel for Animals Act to determine if it would have any affect of USDA operations or budget?

Answer. APHIS has a copy of and has reviewed the proposed Act.

Question. If so, what were the findings?

Answer. One area of significant impact of the proposed Act arises from the requirement for airlines to notify USDA 24 hours prior to any live animal transport. If the intent is to have USDA inspect those flights with live animal shipments, it

would have a major impact since there are approximately 500,000 animals shipped annually. Additionally, if USDA is to be responsible to inspect cargo areas of aircraft to assure compliance with the Act, this would require extensive training for USDA inspectors.

AGRICULTURAL CONCENTRATION

Question. Concentration and the structure of agriculture. There is an ongoing debate about the changing structure of the U.S. farm sector and the extent to which the concentration of marketing power is harmful to small independent family farmers. I hold the unique position of serving as not only the ranking member of the Agriculture Appropriations Subcommittee, but also as the ranking member on the Judiciary Subcommittee on Antitrust, Business Rights, and Competition. Therefore, I have special interest in this debate. What are your overall views of this debate and do you think moratoriums on mergers, as was proposed last year, would be appropriate?

Answer. Moratoriums on mergers may not necessarily be appropriate. However, USDA feels concentration and vertical coordination in agriculture requires increased vigilance. USDA is applying scrutiny to a number of proposed mergers and will take appropriate action to mitigate any detrimental effects that might be caused by those mergers.

USDA's Grain Inspection, Packers and Stockyards Administration (GIPSA) has responsibility for enforcing the Packers and Stockyards Act, including investigating competitive practices, trade practices, and ensuring financial protection for producers in the livestock industry. The Justice Department, along with the Federal Trade Commission, has primary responsibility for enforcing the traditional antitrust statutes, including the Sherman Act and the Clayton Act.

Question. Do you think USDA should have authorities similar to those at the Justice Department to examine and address problems related to the structure of the U.S. farm sector?

Answer. It may not be necessary to pursue additional authority at this time. On August 31, 1999, the USDA signed a Memorandum of Understanding (MOU) with the DOJ and FTC. The MOU calls for the three agencies to cooperate on issues related to monitoring competitive conditions in the agricultural marketplace. The agencies will confer regularly to discuss and review law enforcement and regulatory matters to increase each agency's understanding and to improve each agency's effectiveness in carrying out its respective legal responsibilities, so there is no need for separate authority at this time.

RAPID RESPONSE TEAMS

Question. The fiscal year 2001 budget request includes an increase of \$1.3 million for Rapid Response Teams at GIPSA. What have the Rapid Response Teams, alone or in conjunction with other USDA activities, done to address small producer concerns regarding their perceived disadvantages in the market place?

Answer. To date, small producer concerns and problems have been addressed in the following ways. First, the Rapid Response Teams have met with producers in Missouri and South Dakota provide local, on-site counsel and assistance to producers in order to enhance communication and respond to specific producer complaints and concerns to proactively respond to potential violations of the Packers and Stockyards Act as well as consider new legislation passed by these states. Second, the Rapid Response Teams have responded to small-producer complaints and concerns regarding two poultry integrators and one livestock auction market. Swift, decisive action by the rapid response teams protected the producers' interests and prevented or minimized financial harm. These actions were most beneficial to small producers, who may not have the resources to properly protect their interests.

Question. Provide a listing of locations and reasons for deployment of Rapid Response Teams in fiscal year 1999 or, to the extent information is available, in fiscal year 2000. Describe specific incidents or corrective actions that were taken in fiscal year 1999 or in fiscal year 2000 resulting from the deployment of these teams.

Answer. In July 1999—Sioux Falls, Brookings and Mitchell, South Dakota—the Rapid Response Teams addressed concerns of cattle and hog producers that packers allegedly violated the Packers and Stockyards Act since enactment of South Dakota's mandatory livestock price reporting law on July 1, 1999. The portion of the law prohibiting packers from discriminating in prices paid for livestock was declared unconstitutional by a U.S. District Court on July 26, 1999. An investigation was completed by GIPSA's Denver regional office, and is under review at GIPSA headquarters.

[The information follows:]

September 1999—Kirksville, Marshall, Maryville and Mexico, Missouri—The Rapid Response Team responds to livestock producers' concerns that packers may have violated the Packers and Stockyards Act when Missouri's new mandatory livestock price reporting law was enacted on August 28, 1999. Enforcement of the Missouri law is presently held in abeyance pending a Federal court decision on its constitutionality, but the law initially generated a considerable amount of controversy and misunderstanding among producers and the packing industry. Swift action by the Rapid Response Team enhanced communication between GIPSA, the state of Missouri, producers, and the packing industry. Possibly as a result of the pro-active actions of the Rapid Response Team, no violations of the Packers and Stockyards Act and regulations were found.

November 1999—Excel, Wichita, Kansas—The Rapid Response Team responds to an issue concerning two Excel plants that were harvesting kidneys before carcasses were weighed on the hot weight scale, resulting in carcass weight being short about 2 pounds per carcass. Excel made \$710,791 in restitution to its feedlot suppliers, who were expected to reimburse their customers.

January 2000—Tecumseh, Nebraska—The Rapid Response Team responds to complaints concerning a broiler processor that ceased operations on January 14, 2000, owing 29 poultry growers \$461,619 for unpaid poultry obtained under a poultry growout contract. A team of Packers and Stockyards investigators was immediately dispatched to the plant to marshal trust assets, determine who was unpaid, and assist them in filing trust claims under the Packers and Stockyards Act. Emergency funding of operations under a bankruptcy court order was agreed to, allowing for the purchase of feed and for processing of chicks on hand to continue until all birds have been processed. All valid trust claims, calculated to total \$250,820 will be fully funded.

February 2000—Jackson, Mississippi—The Rapid Response Team responds to poultry growers' concerns of unfair treatment under the Packers and Stockyards Act as a result of complaints made by poultry growers about changes to their growout contracts. The poultry firm's management and grower representatives negotiated amendments to the original contract offer that improved grower pay and addressed other grower concerns. Most growers have signed the negotiated contract.

February 2000—Paxinos, Pennsylvania—A packer ceased operations in February 2000, owing approximately \$175,000 for livestock. An immediate investigation resulted in sellers receiving payment in full without further delay and/or litigation expense to collect the amounts owed.

February 2000—Williston, North Dakota—The investigation concerns the proper payment for leased livestock sold at auction. The investigation is pending.

February 2000—Blackfoot, Idaho—An auction market operated without the required surety bond. The Rapid Response Team worked with the auction market and its surety company to immediately reinstate the bond before further sales were held. The investigation is continuing.

CRANBERRIES

Question. In the fiscal year 2000 Consolidated Appropriations Bill, Congress directed USDA to evaluate the current supply/demand situation in cranberries to make purchases to relieve the downward pressure on cranberry prices. Several Senators from the nation's top cranberry producing states also wrote you last winter urging you to take action to purchase surplus cranberry supplies.

Please update this Committee on the status of your efforts to address the oversupply situation in the cranberry industry.

Answer. USDA has made efforts to assist the industry through several purchases of cranberry products for distribution through domestic food feeding programs. In 1999, USDA purchased 1.0 million pounds of cranberry/apple juice. In 2000, USDA has purchased an additional 5.0 million pounds of cranberry/apple juice and for the first time, purchased 3.7 million pounds of trail mix, of which one-fifth or approximately 750,000 pounds consisted of dried cranberries. USDA is aware of the situation that the cranberry industry still finds itself in and is presently considering the feasibility of an additional purchase of cranberries.

ORGANIC RULES

Question. The budget request of fiscal year 2001 includes an increase of \$614,000 for reporting of organically grown fruits and vegetables and a net increase of \$703,000 for organic market protection and promotion. When do you expect to publish a final rule on National Organic Standards?

Answer. USDA will release its revised organic standards proposed rule in early March. We expect to have a final rule in place by the end of 2000.

Question. Please provide information regarding steps taken by the Department to offset the initial costs of accreditation services from within available funds.

Answer. The proposed rule will provide for a waiver in the accreditation fees during the first 18 months of the program. This will provide an incentive for certifying agents to become accredited under the new national program as soon as possible.

GIPSA AND BIOTECH GRAINS

Question. There is growing debate over the use of biotechnology as related to agricultural production, such as the discussion about segregation of grain that may or may not have been genetically altered. Please describe the activities of GIPSA regarding this issue.

Answer. USDA, through the Grain Inspection, Packers and Stockyards Administration (GIPSA) establishes standardized quality grades and testing methodologies. These standards are used every day by sellers and buyers to communicate the type and quality of cereals, pulses, and legumes bought and sold. Biotechnology is affecting this program in two fundamental ways: (1) increased consumer demand for conventional crops has created a need for reliable testing methodologies to distinguish bio-engineered from conventional crops; and (2) an anticipated increase of new value-enhanced traits will create an expanded need for standardized testing methodologies to measure the enhanced quality attributes.

To meet the market's need for impartial, professional verification of biotechnology testing technologies, GIPSA announced on November 12, 1999, that it would establish a biotech reference laboratory. The laboratory will evaluate and verify the validity of analytical procedures used to detect and quantify biotechnology traits in grains and oilseeds and establish sampling procedures for use in testing genetically enhanced grains and oilseeds. However, questions remain as to the capability of the U.S. marketing system to segregate conventional and biotech crops. Accurate and consistent testing technology is essential as the market struggles to segregate crops in an efficient and effective manner.

Question. If this debate becomes more heated in the coming months, especially if it becomes more complicated by trade considerations, do you think the levels currently requested for fiscal year 2001 will be adequate?

Answer. It appears that GIPSA's request for an additional \$1.98 million and 10 staff years is adequate. This projected need is based on GIPSA validating the performance of methodologies and accrediting commercial laboratories to provide testing services. If market conditions create a need for direct Federal testing, additional funding will be necessary to develop expanded methods for the testing capabilities of GIPSA's technical center in Kansas City, Missouri. Once methods are developed, these tests will be funded by user fees.

MILK FORWARD PRICE CONTRACTS

Question. Please outline the steps you are taking to ensure that the Department meets its statutory obligation to establish a pilot program for forward price contracts between milk producers and milk handlers by the beginning of March.

Answer. USDA has developed a proposed rule to implement the program, a Program Announcement, a set of Questions and Answers about the program, and a Forward Pricing Pilot Program Fact Sheet and Disclosure Statement. The proposed rule will be published at the beginning of March with a 15-day comment period. A final rule implementing the pilot program will be published as soon as possible after comments received on the proposed rule are addressed.

HACCP

Question. I am aware of a recent court challenge rising out of Texas related to your authorities under HACCP. Can you provide an update to this action?

Answer. Supreme Beef's legal action contesting USDA's authority to promulgate the *Salmonella* performance standard regulations and to suspend inspection for failure to meet that standard continues. Both USDA and Supreme Beef have filed cross motions for summary judgment. On February 14, 2000, USDA held the suspension of inspection for Supreme Beef in abeyance after the company committed to take action to meet USDA regulatory standards. The suspension will remain in abeyance pending verification by USDA that Supreme Beef's corrective and preventive measures are effectively implemented.

Question. In the event USDA does not prevail in the particular action, what would be the effect on the HACCP program overall to USDA food safety operations?

Answer. USDA is not able to predict either the basis or the scope on which the judge might rule in the Supreme Beef litigation. However, in a worst case scenario under which the judge overturned the USDA's authority to require that establish-

ments meet microbiological performance standards, the current approach to food safety might be disrupted. The use of Hazard Analysis and Critical Control Point (HACCP) systems itself is a process requirement, not a substantive performance standard. The current *Salmonella* performance standards for carcasses and ground products serve as direct, pathogen-based measures of the accomplishments of establishment HACCP systems.

Question. What have been the reactions to this action form within the meat and poultry industry and from consumer advocates?

Answer. Industry and consumer advocates share our concern for establishing the most effective food safety system possible. Several, but not all, industry organizations have joined in filing amicus curiae briefs in support of Supreme Beef. Conversely, consumer groups are expected to file an amicus curiae brief in support of USDA.

EGG SAFETY ACTION PLAN

Question. I have heard some concern from egg producers about the Egg Safety Action Plan released by the President's Council on Food Safety on December 10, 1999. There is concern that the extensive environmental testing requirements might be particularly costly for egg producers. What is the Administration's estimates of the total cost for testing? Of egg diversion?

Answer. Total cost estimates for environmental testing will be developed as USDA and HHS progresses through the rulemaking necessary to implement the Egg Safety Action Plan.

Question. What are the relative differences in effectiveness and cost of testing eggs rather than production environment?

Answer. The Salmonella Enteritidis (SE) Pilot Project, conducted by FSIS prior to the development of the President's Shell Egg Action Plan, showed that testing manure in the layer houses was effective in identifying flocks with SE infected eggs. Based on the cost of analysis, the number of samples required, and the degree of correlation associated with the analytical results, it is more cost effective and practical to conduct environmental testing rather than testing eggs to determine SE infection in a layer flock.

Question. Since public funds pay meat, poultry and egg product inspection cost, including costs for Salmonella testing in meat and poultry, would the use of taxpayer funds be appropriate in this case as well?

Answer. The meat and poultry industry currently pay for the costs of *E. coli* testing. *E. coli* testing under the Pathogen Reduction/HACCP rule serves the same purpose that microbiological testing under the Shell Egg Action Plan would serve, which is to ensure that their food production processes are under control. Accordingly, the cost of environmental testing requirements is a cost that should be borne by the egg production industry.

Question. Egg producers have expressed concern about the possibility of inconsistent enforcement of regulations if the Administration relies heavily on state agency personnel to implement the Plan. Please list steps that the Department of Agriculture will take in order to ensure consistent enforcement of any eventual federal egg regulations by state agencies.

Answer. The 2000 budget for the Food Safety and Inspection Service requests an additional \$2.0 million to begin implementation of the Shell Egg Action Plan. Under the plan the agency plans to provide State agencies the training and information necessary to ensure consistent enforcement of egg regulations by State and Federal agencies.

Question. The Food and Drug Administration has proposed a warning label on egg, which differs from the food safety and handling label required on meat and poultry products required by the Food Safety and Inspection Service. In your view, should safe handling labels on meat, poultry and eggs be consistent?

Answer. Safe handling labels on meat, poultry, shell eggs and processed egg products should be consistent in providing appropriate information to consumers to ensure safe handling.

Question. CDC first identified internally contaminated eggs as a source of Salmonella enteritidis infection in the late 1980's. Many consumer groups are concerned about the length of time it took for USDA and FDA to develop an action plan to address this public health problem. What steps could be taken to reduce the government's reaction time to food safety problems in the future?

Answer. The establishment of the President's Council on Food Safety has helped ensure that food safety problems in the future will be quickly identified and responded to. The Council provides the necessary forum for ensuring increased agency cooperation and coordination for addressing complex food safety issues. In addi-

tion, the Food Safety and Inspection Service (FSIS) and the Food and Drug Administration (FDA) have signed a Memorandum of Understanding to facilitate the exchange of information about establishments under dual jurisdiction of FSIS and FDA and emerging food safety issues.

FSIS INSPECTOR SHORTAGES

Question. To what extent have inspector shortages caused disruptions in the meat and poultry industries over the past year as reported on a month to month basis?

Answer. The additional funding included in the fiscal year 2000 budget for inspection staffing has permitted FSIS to hire additional inspectors to staff meat, poultry and egg products plants and will help to minimize inspector shortages. Inspector shortages have occasionally caused plants in certain locations to alter production practices to accommodate inspector staffing problems. Since the beginning of December, 1999, the agency estimates that there has been a minimal disruption to the industry due its inability to have an inspector available at all times an establishment wants to operate.

Question. What assurances can you provide that projected staff year reductions for fiscal year 2001 will not continue or exacerbate problems of inspector shortages?

Answer. The projected staff year reductions are based on two separate and distinct initiatives. In both cases, USDA is committed to a full and complete public dialogue and will not move forward unless the changes are demonstrated to be effective. If the data and analysis support the change, USDA anticipates being able to implement staff year reductions without exacerbating inspector shortages.

Question. What is USDA doing to improve inspector recruitment activities?

Answer. USDA has taken a number of actions to improve inspector recruitment activities. Those actions are outlined in the paper developed by the agency, which I will provide for the record.

[The information follows:]

FSIS' FOOD INSPECTOR RECRUITMENT EFFORTS

Background

A number of factors have made it difficult to successfully recruit individuals to fill vacant positions in Field Operations. In the case of Veterinary Medical Officers, positions are not competitive in today's job market. Top quality candidates for Food Inspector positions are also in short supply in many locations, due to many factors. The work is typically very demanding, with strict physical requirements. Remote locations often have a limited applicant pool, and many who do apply have conflicts of interest that do not allow them to serve in a regulatory capacity. In the case of Intermittent Inspector positions, the requirement to be on-call with no guarantee of hours, and the limited benefits, make that position less attractive to most applicants than other options in the current job market. The Food Safety and Inspection Service, however, is confident it will recruit a well-qualified and diverse workforce.

FSIS efforts to increase the number of inspectors include:

- Refocusing efforts within Human Resources to increase the number of applicants on standards registers for field occupations. Applicants to these registers are solicited through a variety of recruitment initiatives such as on-campus visits, conventions, advertisements, direct mailings, and posted announcements on the Internet and at all Office of Personnel Management Service Centers. FSIS also publishes job opportunities in agricultural publications, such as the Cattleman's Journal and Farm Bureau. FSIS recruits from veterinary schools, Hispanic-serving institutions, and historically black colleges and universities, as well as at veterinary conventions and agricultural career days at universities where candidates are identified. In addition, public notices about FSIS jobs are available at all State employment agencies.
- Recruiting and hiring 80 more inspectors by the end of the fiscal year to achieve a target employment level of 7530.
- Broadening the emphasis of FSIS' recruitment program to include other scientific backgrounds to meet current and future hiring needs and conducting recruitment training in September to train new recruiters in this area.
- Asking current agency personnel to assist in publicizing recruitment needs.
- Asking candidates who applied for inspector positions in areas surrounding locations with shortages if they would be interested in a position in locations that are experiencing shortages.
- Providing Veterinary Medical Officers with a recruitment bonus up to 25 percent of their salary, particularly in areas where there are fewer candidates. This has been approved in eastern Pennsylvania, Iowa, and Nebraska. FSIS is also

- exploring additional options, such as relocation and retention bonuses for inspectors.
- Scheduling inspector entrance tests in locations where there is a need for inspectors. FSIS conducts tests in 10–12 locations around the nation each month. These tests are spread out geographically.
- Exploring alternative ways to fill other than permanent (OTP) full-time positions, such as permanent part-time tours of duty, and term and temporary appointments. We will be working with the inspectors union to explore the feasibility of options identified.
- Collecting and analyzing exit interview data to identify possible retention issues.
- For an application, contact Keith McFarlin at 1–800–370–3747, ext. 2580, or visit the U.S. Government official site for jobs and employment information at www.usajobs.opm.gov.

Question. In the event that inspector shortages remain a problem, what steps can the Department take in the management of food safety operations to reduce the harmful effect of these shortages to industry and the ultimate consumer?

Answer. The 2001 budget requests the funding necessary for a sufficient number of inspectors to meet industry demand. Our intensified recruitment program is showing results that should prevent future shortages.

HACCP INSPECTION MODELS

Question. Please provide an update on the HACCP Inspection Model in place, including a description of any problems that might delay full implementation of the HACCP Inspection plan by the fourth quarter of fiscal year 2001?

Answer. The HACCP-based Inspection Model Project is progressing as planned. I have asked the Food Safety and Inspection Service to provide an update on the project for the record.

[The information follows:]

At present, 24 plants slaughtering young chickens, swine, and turkeys are listed as volunteers in the HACCP-based Inspection Models Project (HIMP). Baseline data collection, which measures current inspection program performance, has been completed in sixteen young chicken plants, four swine plants, and two turkey plants. Baseline data collection will be completed in a fifth swine plant in March and will begin in the third young turkey plant the first week of April.

Seven young chicken and two swine plants have entered the models phase, in which the plant assumes post-mortem responsibilities while FSIS conducts oversight and verification inspection. Of these, six young chicken plants and one of the swine plants are in a models transition phase that precedes the collection of data for measuring plant performance under new models phase procedures. One young chicken plant and one swine plant are now in the actual models data collection phase.

A public meeting on HACCP-based Inspection Models Project is scheduled in March. Input from this meeting should help us identify any problems that may delay the implementation schedule as planned.

FOOD RECALLS

Question. Consumer groups have criticized USDA recently in the Washington Post Magazine for taking too long to issue a recall notice in the Sara Lee outbreak, an outbreak where 100 people became ill and 21 died from hazardous bacteria, *Listeria*, in ready-to-eat meat products. What was the reason for the delay in issuing a recall in this case?

Answer. Sara Lee initiated a voluntary recall. USDA did not have any positive laboratory results that would have mandated requesting the announcement of a recall any earlier. Sara Lee took action before there was a USDA laboratory result from intact Sara Lee product that was positive for *Listeria monocytogenes*, or a legally sufficient, epidemiological association between the product and the illnesses could be established. On the same day Sara Lee announced the recall, USDA posted a recall Notification Report on its website, and faxed and e-mailed the same report to over 300 public health and food safety officials throughout the country.

LISTERIA TESTING

Question. Consumer groups have criticized USDA for failing to require testing of ready-to-eat meat products and plants for *Listeria*. While USDA recommended such testing, it has not issued regulations to mandate testing for all processors. Does USDA have any concerns that this voluntary policy will result in uneven adherence with the testing recommendation?

Answer. We are concerned about the voluntary policy and we are currently evaluating the need to require testing for *Listeria*.

Question. Would mandatory testing provide public health protections and a level-playing field for the industry?

Answer. Mandatory testing for *Listeria* could further enhance the safety of meat and poultry products by reducing the risk of *Listeria* entering the food supply.

Question. Has USDA considered this?

Answer. USDA is considering the need for mandatory testing for *Listeria monocytogenes* and is gathering additional information to determine the need for rulemaking.

DAIRY MARKET LOSS PROGRAM

Question. As you know, last year the Agriculture Appropriations bill provided \$125 million in emergency relief payments for dairy farmers. While I appreciate the Secretary's decision to target the funding to small operations, I am concerned that the payments may not get into farmers' hands until this spring. Please tell this Committee what caused the delay in the announcement of the sign up period, particularly given that USDA is using the same process to distribute payments used in fiscal year 1999.

Answer. The Dairy Market Loss Assistance Program was implemented in February, 2000. Payments will be issued in March. Though the process remained relatively unchanged, an amendment to the regulations was necessary to implement the program. The amendment to the regulations is anticipated to be published in the Federal Register on or about February 16.

Question. You've called for an end to ad hoc emergency payments for agriculture and proposed instead the two-year stop-gap safety-net plan. That proposal provides only for an extension of the dairy price support program, which is viewed inadequate by most farmers. I know that dairy farmers would prefer a more meaningful solution to price volatility than emergency payments, but given the regionalism I have encountered, emergency payments have been the only way I have been able to get assistance into the hands of dairy farmers.

Since you have excluded dairy and livestock from your safety net proposal when prices are so low, will you support emergency assistance for milk and livestock producers this year?

Answer. The Administration's safety net proposal includes the proposal to extend the milk price support program which was estimated to cost \$300 million and \$200 million for a pilot livestock insurance program. However, the dairy situation has worsened since the proposals were developed which makes the dairy price support extension even more critical and could increase the cost of the program. It is not clear yet if other livestock producers will need emergency aid in 2000.

Question. And if so, how much funding do you think will provide adequate income in light of our low milk prices?

Answer. It is too premature to determine funding levels for 2000. It is clear that milk producers will be stressed as dairy prices are expected to average about 40 percent less in fiscal year 2000 than fiscal year 1999. Poultry prices are down but red meat prices are up. If the current dry conditions in most parts of the country continue, there may be great need for emergency assistance for milk and other livestock producers. We are willing to work with Congress to determine adequate funding levels as the condition of milk and livestock producers becomes clearer in 2000.

NAD DECISIONS

Question. I am concerned about recent reports that 86 percent of the decisions of regional hearing officers that are favorable to farmers were overturned by the Director of the National Appeals Division, but that only 5 percent of adverse decisions were overturned at the national level. Is the Department's analysis consistent with these figures?

Answer. The Department has taken a close look at this issue and is concerned with the misconceptions that have been raised. While it is unclear what specific figures were used by the Farm Journal, the Department's analysis shows similar trends. However, it is important to consider the fuller context of the roles of the parties in the adjudicative process in order to understand why these numbers are not indicative of bias. Provided for the record is the most recent Departmental analysis of this matter.

[The information follows:]

Each NAD appeal is adjudicated on its own merits. The basis for NAD determinations and its procedures are specified in Title 7 Code of Federal Regulations, Part 11. The NAD Director has no control over the numbers or merits of any case for

which a review of a hearing officer's determination is timely requested by a party. By law, Title II, Subtitle H, of the Federal Crop Insurance Reform and Department of Agriculture Act of 1994, the Director upholds, reverses, modifies or remands hearing officer determinations on review.

If a hearing officer determines error in an agency's administrative decision, only the head of an agency may seek a review. In most cases, however, no error is found by hearing officers. In fiscal year 1999, for example, no agency error was determined by hearing officers in 75 percent of the cases appealed to NAD. If error is determined by a hearing officer, the head of the agency must state specific reasons why the hearing officer's decision is wrong, including violations of statutes and regulations. Under USDA regulations, the Director must base his decision on the laws and regulations of the agency and their generally applicable interpretations. Moreover, an appellant cannot challenge the validity of agency regulations because only the federal courts can determine that an agency regulation is invalid.

NAD has no jurisdiction over the appropriateness of agency regulations. Agencies promulgate their own regulations. Given agency expertise with respect to its own regulations, the head of an agency will select for review only those cases in which the hearing officer's determination is not consistent with the agency's laws and regulations. This results in a higher percentage of reversals of hearing officers' determinations in cases taken on review by the head of an agency. On the other hand, there is a far greater number of cases in which the hearing officer determines no agency error. In these cases, the hearing officer found that the Agency correctly applied its own regulations, and it is highly unlikely that the Director would determine on review that both the hearing officer and the agency misconstrued the latter's own requirements. Thus, there is a very low percentage of reversals of hearing officer's determinations in cases taken on review by appellants.

In 1997, the USDA Inspector General issued a comprehensive report on NAD covering part of the period in which reversal rates were reported as such by the Farm Journal. The report found that NAD hearings were not appropriately focused on whether adverse decisions were consistent with laws, regulations, and agency policies and procedures, . . . NAD hearing officers exceeded their authority and substituted their judgment for that of the agency. The report recommended that NAD update its written guidelines, improve its management information system, and provide employee training on the proper exercising of authorities and responsibilities. In response, NAD has published its latest rules of procedure in the Code of Federal Regulations (Title 7, Part 11, Subpart A), is continuing improvements to its management information system, and has conducted employee training on topics surrounding the adjudicative process and exercising of authorities. Included in NAD's 2001 budget request is a funding increase that would allow the Division to set in motion a comprehensive and continuous employee training program. A copy of the report is provided for the record. (Evaluation report No. 50801-2-AT, March 1997)

[The information follows:]

EXECUTIVE SUMMARY

Purpose

This report presents our evaluation of decisions rendered by the National Appeals Division (NAD) to individuals and others who were originally denied U.S. Department of Agriculture program benefits and who appealed those denials. Our evaluation was performed as part of the Office of Inspector General's farm program strategy designed to ensure overall program integrity and assist program managers to find solutions for known or potential program weaknesses. Our review concentrated on administrative appeals related to Commodity Credit Corporation programs administered by the Farm Service Agency (FSA). The review included an (1) examination of the agencies' documentation used to support their adverse decisions and present their cases to NAD hearing officers and (2) evaluation of the hearing officers' decisions and of NAD director reviews.

Those who appeal to NAD need to demonstrate that when the agency made its adverse decision, either it (1) did not base the decision on proper criteria (i.e., laws, regulations, or procedures), (2) did not consider all relevant evidence, (3) relied on evidence that was inaccurate, or (4) relied on evidence that did not prove a violation of the stated criteria. NAD must confine its rulings to the criteria upon which the adverse decision was based and not substitute its judgment for that of the agency.

Results in brief

NAD hearings were not appropriately focused on whether adverse decisions were consistent with laws, regulations, and agency policies and procedures. In some cases, this occurred because FSA did not clearly show the criteria used and the evi-

dence it considered in making its adverse decision. In other cases, NAD hearing officers exceeded their authority and substituted their judgment for that of the agency. We concluded that significant resources were expended by NAD, FSA, and the appellants to arrive at decisions that misconstrued agency program requirements. Improper decisions like these could either deny an appellant benefits to which he/she is entitled or hinder FSA's efforts to pursue program abuses. We also found that FSA personnel did not always adhere to decisions made by the State and/or county committees when presenting the agency's cases at NAD hearings.

Management controls over NAD hearings need to be strengthened. We concluded that NAD needs to:

- update its written guidelines clarifying policies and procedures for evidentiary hearings and director's reviews,
- improve its management information systems to help ensure that the division adheres to timeframes established by legislation and that resources are used efficiently and effectively, and
- provide training which better explains the differences between the authority and responsibilities of NAD and those of the agencies.

We also concluded that FSA needs to improve training for State and county office personnel to ensure the quality of adverse decisions and to ensure that adverse decision letters provide sufficient information to explain the basis for the adverse decisions.

Key recommendations

We recommended that FSA clearly show the criteria and evidence used in making its decisions by providing sufficient information in adverse decision letters to explain the authority and basis for the decisions, and that any modifications to the initial adverse decision are adequately explained and related to any new evidence or criteria.

In order to ensure that NAD hearing officers do not substitute their judgment for that of the agency, we recommended that the NAD director require hearing officers to limit the scope of NAD hearings by identifying the laws, etc., that the appellant claims the agency did not adhere to, and the evidence that the appellant contends was erroneous or omitted. Hearing officers should also state whether the appellant contends there is no reasonable basis for the agency's determination. In addition, we recommended that hearing officers limit their determinations to whether an agency complied with applicable laws, regulations, and generally applicable interpretations.

To strengthen management controls over NAD hearings, we recommended that NAD formalize and update its policies and procedures, improve its management information system, and provide training for hearing officers and reviewing officials which ensures they understand the difference between NAD's authorities and those granted to the agencies.

Agency position

In their written responses to the report, both NAD and FSA agreed with the findings and recommendations. Based on their responses, we agreed with their management decisions for 6 of the 11 recommendations.

INTRODUCTION

Background

The Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994, Public Law 103-354, required the Secretary of Agriculture to establish and maintain an independent National Appeals Division (NAD) within the Department to handle administrative appeals. On December 27, 1994, a notice was published in the Federal Register (59 F.R. 66,517) establishing NAD. NAD was assigned responsibility for all administrative appeals formerly handled by NAD of the former Agricultural Stabilization and Conservation Service and by the National Appeals Staffs of the former Farmers Home Administration (FmHA), the former Soil Conservation Service (SCS), the Commodity Credit Corporation, and the Federal Crop Insurance Corporation.

Current agencies whose appeals are assigned to NAD include (1) the Farm Service Agency (FSA), (2) the Rural Development Service (RD),¹ and the Natural Resources Conservation Service (NRCS).

¹RD includes the Rural Housing Service, the Rural Utilities Service, and the Rural Business-Cooperative Services.

NAD is headquartered in Alexandria, Virginia, and has 3 regional offices and 65 field locations in 37 States. As of September 30, 1995, NAD had 131 fulltime employees—including 80 hearing officers and 12 reviewing officials.²

Under Public Law 103-354, a participant has the right to appeal an agency's adverse decision to NAD if the request is made no later than 30 days after the date on which the participant first received notice of the decision. The appellant (participant) has the right to have a hearing by NAD within 45 days after NAD receives the request for the hearing.

The act requires the appellant to bear the burden of proving that the agency's adverse decision was erroneous. The hearing officer must consider any information presented regardless of whether the evidence was known to the agency official, employee, or committee making the adverse decision at the time the decision was made. The hearing officer must also leave the record open for a reasonable period after the hearing to allow the appellant or agency to submit information necessary to respond to new facts, information, arguments, or evidence.

If a NAD hearing officer upholds an adverse decision by the agency, the appellant may submit a written request to the NAD director for review of the hearing officer's determination. The written request must be filed no later than 30 days after the date on which the appellant receives the hearing officer's determination. If a NAD hearing officer reverses the agency's adverse decision, the head of the agency may make a written request to the NAD director for a review of the determination. The notice must be filed no later than 15 business days after the date of the hearing officer's determination. When requested by the appellant or the agency, the director, or designated NAD official, will review the hearing officer's determination to determine whether it is supported by substantial evidence. Exhibit A presents a flowchart of the NAD administrative appeals process for FSA adverse decisions.

From October 1, 1995, through September 30, 1996, NAD hearing officers reversed FSA's adverse decisions 35.8 percent of the time compared to 24.7 percent for RD cases and 21.7 percent for NRCS cases. Table 1 shows a comparison of hearing officers' determinations on FSA, RD, and NRCS cases. A comparison of hearing officers' determinations in the three NAD regions is provided in exhibit B.

TABLE 1.—HEARING OFFICER DETERMINATIONS

(October 1, 1995 through September 30, 1996)

	Agency Reserved		Agency Upheld		Modified		Total Number
	Number	Percent	Number	Percent	Number	Percent	
FSA	666	35.8	1,073	57.6	123	6.6	1,862
RD	368	24.7	1,090	73.1	33	2.2	1,491
NRCS	18	21.7	63	75.9	2	2.4	83
Total	1,052	30.6	2,226	64.8	158	4.6	3,436

Also, during fiscal year 1996, NAD hearing officers were overturned on 114 of 772 FSA cases (see table 2). Exhibit B provides information concerning director review requests made by appellants and by agencies.

TABLE 2.—DIRECTOR'S DETERMINATIONS

(October 1, 1995 through September 30, 1996)

	Hearing Officer Reversed	Hearing Officer Upheld	Modified	Total
FSA	114	636	22	772
RD	14	323	20	357
NRCS		49		49
Total	128	1,008	42	1,178

² Reviewing officials perform Director reviews.

Objectives

Our evaluation was performed as part of the Office of Inspector General's (OIG) farm program strategy designed to ensure overall program integrity and assist program managers to find solutions for known or potential program weaknesses. Our review concentrated on administrative appeals related to Commodity Credit Corporation programs administered by the FSA. The review included an (1) examination of the agencies' documentation used to support their adverse decisions and present their cases to NAD hearing officers and (2) evaluation of the hearing officers' decisions and of NAD director reviews.

Scope

The evaluation was conducted in accordance with "Quality Standards for Inspections" issued in March 1993 by the President's Council on Integrity and Efficiency. We conducted work at the NAD Headquarters in Alexandria, Virginia, and at FSA Headquarters in Washington, D.C. Fieldwork was performed during the period October 23, 1995, through October 4, 1996. We used judgmental sampling to select cases for review in order to focus our resources on problem areas identified during our discussions with personnel from NAD and FSA.

Methodology

To accomplish the evaluation objectives, we conducted interviews at both NAD and FSA Headquarters. We also telephonically interviewed NAD personnel from the three regional offices located in Golden, Colorado; Indianapolis, Indiana; and Memphis, Tennessee.

We reviewed NAD's authorizing legislation and regulations to provide background and criteria for evaluating the quality of NAD determinations and for evaluating NAD's overall operations.

We judgmentally selected and reviewed hearing records from 35 NAD cases based on problem areas identified by various sources such as congressional inquiries, discussions with personnel from NAD and FSA, input from various OIG regional offices, and whistleblower requests received by OIG.

- Three cases were reviewed because of a congressional inquiry.
- Ten cases were recommended for review by NAD.
- Ten cases were selected from a list of cases which FSA had planned to submit to the Secretary's office for review.
- Two cases were recommended for review by FSA National and State office personnel.
- Eight cases were identified by various OIG regional offices as problem cases.
- Two cases were from whistleblower complaints received by OIG.³

In selecting our sample, we picked cases which related to specific problem areas identified by the various sources including

- the preponderance of evidence standard for review,
- granting of equitable relief,
- remands,
- acceptance and use of oral testimony,
- acceptance and use of Office of the General Counsel (OGC) legal opinions, and
- use of NAD subpoena powers.

We reviewed NAD procedures related to these areas, reviewed the NAD hearing records as they pertained to the problems, and determined whether procedures provided sufficient guidelines to ensure that NAD's policies and procedures were clear.

For each of the 35 sample cases, we reviewed NAD determinations and evidence included in the hearing record and listened to tapes of the hearing. We reviewed the findings of facts and conclusions in the hearing officers' and review officials' determinations to evaluate whether they were consistent with the evidence presented at the hearing. We also evaluated the agencies' preparation and presentation of the adverse decisions for each case.

In addition, we (1) evaluated NAD's management information systems (2) attended training with NAD personnel and evaluated the training, and (3) followed up on a prior audit report and management alert.

OIG Audit Report No. 46001-1-At, issued September 29, 1995, presented the results of an audit performed at the request of the former FmHA administrator to evaluate hearing officer decisions and FmHA program staff decisions related to FmHA loans. In contrast, our current evaluation focused on the Commodity Credit

³We reviewed two whistleblower complaints (Nos. PS-4601-0001 and PS-4601-0002) as part of our evaluation of NAD appeals. However, administratively final NAD determinations can only be reviewed by a U.S. district court. Therefore, we were unable to make specific audit recommendations to address individual cases.

Corporation programs administered by FSA. Therefore, recommendations in the prior report were not applicable to FSA programs on which the current report focused.

During the course of fieldwork on Audit No. 46001-1-At, NAD was established as an independent agency responsible for various other programs. Although NAD was established as a new and independent agency, the initial organization of NAD was centered around the old FmHA's internal appeals organization. The prior audit report, as well as a management alert, dated February 8, 1995, included issues regarding the establishment of NAD. Management decisions were completed for all of the recommendations contained both in the management alert and the prior report.

Even though corrective action was taken on our prior audit recommendation to issue procedures for the issuance and enforcement of subpoenas, our current evaluation disclosed additional improvements needed in procedures related to subpoena power. (See Finding No. 3.)

FINDINGS AND RECOMMENDATIONS

I. NAD hearings were not appropriately focused on whether adverse decisions were consistent with laws, regulations, and agency policies and procedures

NAD hearings did not appropriately focus on whether adverse decisions were consistent with laws, regulations, and agency program policies and procedures. This occurred because (a) FSA did not always clearly show the criteria used (i.e., laws, regulations, etc.) and evidence considered in making its adverse decisions and (b) NAD hearing officers sometimes substituted their judgment for that of the agency. As a result, significant resources were expended by NAD, FSA, and the appellants in debating matters which were not within NAD's authority to determine. Additionally, resulting improper NAD determinations could either deny an appellant benefits to which he/she is entitled, or hinder FSA's efforts to pursue program abuses.

FSA did not always clearly show the criteria used and the evidence considered in making adverse decisions

Finding No. 1

FSA did not always adequately cite laws, regulations, and handbook instructions, nor relate the applicable criteria to the evidence considered when making adverse decisions. This often resulted in unclear and confusing issues during NAD hearings. Although FSA had implemented procedures to provide the required notification of decision,⁴ we concluded that the notification did not always give sufficient information to the participant. Also, FSA personnel did not always adhere to their agency's determinations while presenting the agency's case to NAD.

When making adverse decisions, State committees (STC) and county committees (COC) should ensure the following.

- Relevant laws, regulations, and procedures are followed.
- All relevant evidence is considered and evidence used in making the decision is accurate and reliable.
- Judgment decisions are based on accurate, reliable, and convincing evidence and the decisions are reasonably related to the appropriate laws, regulations, and procedures.

FSA should provide sufficient information to the participants so they understand the basis for the decision, know what options are available if they dispute the adverse decision (i.e., appeal to the county or State level, mediation, NAD, etc.), and clearly understand the scope of NAD hearings. To explain the adverse decision, the agency's letter to the participant should address each of the three areas cited in the previous paragraph.

Our review of 35 NAD hearing records disclosed that the criteria, evidence considered, and basis for the agency's decision were clearly presented in the adverse decision letter for only 10 of the cases. For the remaining 25 cases we found the following. (See exhibit C.)

- Neither the criteria nor the evidence was cited in seven cases.
- Criteria was cited but the evidence was not in seven cases.
- Evidence was cited but the criteria was not in nine cases.
- There was no adverse decision letter in the hearing record for two cases.

⁴Public Law 103-354, section 274, requires: "Not later than 10 working days after an adverse decision is made that affects the participant, the Secretary shall provide the participant with written notice of such adverse decision and the rights available to the participant * * * for review of such adverse decision."

Even though OGC recognizes that appellants cannot challenge agencies' generally applicable interpretations,⁵ it is important that both the appellant and the hearing officer understand the basis for the procedure. In many instances, handbook procedures are not provided as part of routine communication between FSA and participants because they are often tools or tests used to determine whether the participants have complied with laws, regulations, and contract requirements. In such situations, it is important for FSA to adequately relate the procedures to the laws and/or regulations so that the hearing officer can determine whether the procedures were correctly applied. An example follows.

NAD LOG NUMBER—95001121W

The appellant was denied program benefits because FSA determined that he did not provide the required active personal labor or management, and therefore was not actively engaged in farming. As criteria, FSA cited Handbook 1-PL, paragraph 154, which states that: "If a member of a joint operation receives a guaranteed payment for any part of a contribution of labor or management, exclude all of the specific type of contribution for which payment is received." However, FSA did not explain how the criteria related to the agency's determination that the appellant was not actively engaged in farming.

The hearing officer determined that "Nowhere in the regulation cited * * * is there any reference to withdrawing of funds being a constraint on eligibility," and concluded:

The appellant was unaware of the ramifications of these actions until notified by the CFSA [Consolidated Farm Service Agency] that he had been denied eligibility for program benefits because he was determined not to be actively engaged in farming * * *. Therefore, because the Appellant was not notified of the policy of the Agency prior to being determined ineligible for program benefits, the determination is unfair.

The hearing officer also concluded:

The Appellant denies he is receiving a "guaranteed payment" from the partnership and contends it is, in fact a draw.

It was clearly the intent of the Appellant for these funds to be considered a draw from his one-half of the partnership. The only documentation considered by the CFSA was in the form of the tax return. The tax return was prepared incorrectly for the intent of the Appellant.

The hearing officer did not conclude that the agency's procedure was wrong but that it was misapplied (e.g., definition of guaranteed payment). We concluded that the agency should have explained how the handbook procedure related to regulations which address contributions to farming operations, and why the appellant was not provided prior notification of the handbook procedure.

We also found that FSA personnel did not always adhere to COC, STC, or FSA National Office determinations and subsequent modifications while presenting the agency's cases to NAD hearing officers. In two of the sample cases, the FSA representative attending the hearings improperly determined that the finality rule (90-day rule) applied in those cases. In another case, the FSA representative improperly used the COC's initial determination of scheme or device, even though the adverse decision had been modified to a "failure to fully comply" determination which is based on different criteria. Details of the latter case follow.

NAD LOG NUMBER—95001142W

The COC determined that the appellant participated in a scheme to circumvent the provisions of the malting barley program. In an FSA State office appeal review, the STC determined that the "failure to fully comply" provision of the regulations better fit the circumstances of the case. A letter from the acting deputy administrator for farm programs approved the STC's request to handle the matter by stating: "Based on the determination of the State committee and the informal advice from your Regional Attorney's office this is your authority to handle the cases referred to in your memorandum under the 'failure to fully comply' provision of the regulation."

The STC notified the appellant that "[T]he State Committee normally would have determined a scheme was used to obtain additional benefits and denied barley program benefits. However, after communication with your county committee, the state committee sought a more moderate solution."

However, the FSA representative at the hearing improperly contended that the appellant participated in a scheme or device to circumvent spot checking procedures.

⁵ OGC comments included in NAD's Interim Final Rule, dated December 29, 1995.

In summary, we concluded that FSA needs to improve its adverse decision letters by ensuring they provide sufficient information to explain the authority and basis for the decision. Additionally, any modifications to the initial decision should adequately explain and relate to new evidence, criteria, or other reason for the modification. The initial adverse decision letter along with modifications should serve as FSA's primary evidence in presenting cases to NAD. This would reduce the time and resources needed by FSA in preparing and presenting cases to NAD. FSA representatives should adhere to the agency's determination when presenting cases to NAD. We also concluded that information provided to the appellant should relate handbook procedures to the appropriate law or regulation whenever necessary to clarify how the procedures apply to the applicable criteria and evidence.

Recommendation No. 1a (to the FSA Administrator)

Provide sufficient information in adverse decision letters to explain the authority and basis for the decision. At a minimum, the letters should provide a (1) brief summary of the applicable law or regulation and handbook procedure, (2) summary of the evidence used in making the determination, and (3) description of the adverse decision relating the evidence to the applicable criteria in order to show a reasonable basis for the determination.

Recommendation No. 1b (to the FSA Administrator)

Ensure that any modifications to the initial adverse decision are adequately explained and related to any new evidence or criteria, and that the modifications are sufficiently communicated to the appellant and to NAD. Also, ensure that FSA personnel attending NAD hearings adhere to determinations and any subsequent modifications made by the COC, STC, or FSA National Office when presenting the agency's case in NAD hearings.

FSA Response

In its March 21, 1997, response, FSA replied that it "accepts and agrees with the findings and recommendations of the audit."

OIG Position

FSA's response did not specify the actions it plans to take for these two recommendations. To reach management decisions, we need to be informed of the action to be taken and the timeframe for carrying them out.

NAD Hearing Officers sometimes substituted their judgment for that of the Agency

Finding No. 2

NAD hearing officers sometimes substituted their judgment for that of the agency. We concluded this occurred because hearing officers did not limit issues to whether the agency's adverse decisions were consistent with the laws, regulations, and generally applicable interpretations.⁶ Instead of determining whether agencies complied with applicable criteria and considered accurate and relevant evidence in making their adverse decisions, hearing officers allowed discussion of broad issues for which they determined the merits of each party's position. As a result, the hearing officers' determinations often failed to identify where agencies had erred in their adverse decisions.

In 25 of the 35 NAD cases reviewed, we concluded that the hearing officers had not related their determination to relevant criteria. In 24 of the 25 cases, we also concluded that the determination was not related to relevant evidence. (See exhibit C.)

Legislation which authorizes U.S. Department of Agriculture (USDA) programs gives the Secretary authority to carry out the programs. This authority is delegated by the Secretary to the appropriate agency such as FSA, RD, NRCS, and other USDA agencies. In order to carry out these programs, certain steps are taken by the administering agency. Rules and regulations governing the programs are published in the Federal Register, and the administering agency establishes policies and procedures which are generally applicable interpretations of laws and regulations used in program administration. Agencies' adverse decisions must be made in accordance with the applicable laws, regulations, and the generally applicable interpretations made by the agencies to carry out programs.

NAD determinations, on the other hand, are based on information from the case record and whether the agency's adverse decision is consistent with the laws and regulations of the agency, and with the generally applicable interpretations of such

⁶Generally applicable interpretations refer to the administering agency's interpretations of laws and regulations which are applicable to all program participants.

laws and regulations. In order for the hearing officer to overturn the agency's adverse decision, the appellant must show that the adverse decision was erroneous.

As presented in NAD's Interim Final Rule, OGC had determined: "NAD Hearing Officers are not administrative law judges. NAD has no jurisdiction over questions of law or the appropriateness of agency regulations. It simply decides the factual matter of whether an agency complied with such laws and regulations in rendering an adverse decision."

OGC further determined that "NAD is not a forum for appellants to challenge agency statutes, regulations, or the generally applicable interpretations of those statutes and regulations."

Based on our review of the applicable legislation and regulations, we concluded that issues appealable to NAD would include the following.

—The agency did not follow laws, regulations, and procedures.

—All relevant evidence was not considered.

—Evidence considered was not accurate.

—The agency had no reasonable basis for its judgment (i.e., the evidence had no relationship to the criteria used in making the adverse decision).

The NAD Hearing Officer Manual states that "[O]nly evidence that is relevant to the underlying issues should be considered." However, issues discussed at hearings were often broad and not related to whether the agency made an error in making its adverse determination. Therefore, considerable time was used to debate matters which were not within hearing officers' authority to determine.

The following is an example where excessive time (approximately 18 hours) was used because the hearing officer did not determine the appropriate scope of the hearing. More specifically, the hearing officer did not relate his determination to the relevant criteria, utilized unsubstantiated evidence in drawing conclusions, did not consider all relevant evidence, and did not apply the appropriate burden of proof standard.

NAD LOG NUMBER—9500104OW

The producers applied for benefits under the Disaster Assistance Program, claiming their crop was damaged by flooding. FSA denied the benefits, stating that the producers did not operate their farm in a workmanlike manner—they did not till the soil before planting their crops (a practice referred to as "no-till"), and they did not properly maintain a culvert that was necessary to drain the affected acreage. The producers appealed, and NAD reversed FSA's decision. NAD based its reversal on an SCS handbook published for another area of the State, and on the producers' unsubstantiated claim that their crop failed because of a natural disaster, not because they used improper farming methods.

FSA based its argument on the requirements stated in FSA Handbook 5-PA, paragraph 149. This paragraph provides that certain practices such as "cultural practices normal to the area or introduced by ES [Extension Service] or SCS to improve conservation" and minimum till and no-till practices customary to the area should not be considered unworkmanlike. FSA had determined that the producers' soil was not conducive to the "no-till" method and that the method was not normal and customary to the area.

Although the hearing officer focused on the tillage method used by the producers, he failed to appropriately address FSA's generally applicable procedures found in paragraph 149 of the handbook. Instead, he relied on the evidence supplied by the producers, an SCS pamphlet promoting "no-till" practices. We concluded that this pamphlet was irrelevant as evidence because it applied to a different area of the State, and to a soil type different from the type on the producers' farm.

Even though the producers' evidence did not apply to their farm, the hearing officer's finding of facts stated "Appellants' exhibits * * * demonstrate and promote conservation tillage (notill, minimum till, etc). Such practices are not uncommon in the area of Appellants' farm." From this assumption, the hearing officer concluded that "the practice of minimum or no tillage is an acceptable practice (more than acceptable by some) notwithstanding what some farmers in (the county) may practice." The producers did not contend that ES or SCS recommended the "notill" practice for their farm, and they did not provide any evidence of such a recommendation.

For the cause of the crop loss, the hearing officer used unsubstantiated evidence and concluded that "it is obvious that the development (of the crop) was retarded by lack of sunlight." The hearing officer inappropriately introduced this unsubstantiated evidence into the hearing record by asking the producer whether the crop could have been stunted by a "lack of sunlight." However, no evidence was introduced to show that there was a lack of sunlight or that the crop was affected by this condition.

In calculating the producers' crop yields, FSA determined that a contributing factor to the producers' crop loss from flooding was their failure to properly maintain a drainage culvert located on their farm. However, the hearing officer gave no consideration to this determination when making his decision.

The hearing officer utilized broad criteria defining overall eligibility for the Disaster Assistance Program payments to conclude that "the Appellants met their burden of showing that their crops failed due to flooding and subsequent drought conditions." However, we concluded that the hearing officer should have focused on more specific criteria in FSA Handbook 5-PA, paragraph 149, and should have specifically identified whether FSA's decision was erroneous, as it relates to the applicable criteria.

We concluded that by relying on broad criteria and failing to utilize relevant criteria and evidence, hearing officers used the "preponderance of evidence" standard (see Finding No. 3) to make determinations which they were not authorized to make, and failed to determine whether the producer met the burden of proving that the agency's adverse decision either contained an error or was based on one.

Recommendation No. 2a (to the NAD Director)

Require hearing officers to limit the scope of NAD hearings to matters relevant to the agency's alleged errors. In order to provide this assurance, the ISSUE section of the hearing officers' determination should

- identify the law, regulation, and/or procedure to which the appellant claims the agency did not adhere (ensuring that the criteria is not broad and vague),
- identify the evidence that the appellant contends was not considered by the agency or the evidence which was supposedly erroneous, and
- state whether the appellant contends there is no reasonable basis for the agency's determination.

NAD Response

In its March 21, 1997, response, NAD stated that "The format for a Hearing Officer determination was revised to include citations to relevant laws and regulations, specific exhibits entered into the record, and to address the burden of proof."

OIG Position

We concur with NAD's management decision for this recommendation.

Recommendation No. 2b (to the NAD Director)

Require hearing officers to limit their determinations to the factual matter of whether an agency complied with applicable laws, regulations, and generally applicable interpretations. In order to provide this assurance, the conclusion section of the hearing officers' determination should include the following.

- Cite the specific laws, regulations, and/or procedures which are relevant to determining whether the agency's adverse decision was in error, and avoid referring to broad criteria not specifically related to the alleged error. When determining that the agency failed to follow appropriate criteria, state how the agency erred.
- Cite the specific evidence used in drawing the conclusions, whether the agency had considered all relevant evidence, and identify what evidence was in error.
- Contain a description of how the relevant evidence did or did not logically relate to the relevant laws, regulations, and/or procedures. The description should also include a conclusion as to whether the appellant met the preponderance of evidence standard by showing that there was no logical relationship between the two, when applicable.

NAD Response

In its March 21, 1997, response, NAD stated:

As stated in response to recommendation 2a, the Hearing Officer determination format has been revised since the issuance of the 1995 determinations reviewed for the audit. There has also been specific training on writing of determinations and all Hearing Officers will have had substantial training and discussion on writing determinations by the end of this fiscal year.

The "Conclusions" section now cites specific laws and regulations which are relevant to determining whether the agency's adverse decision was erroneous or not. Specific statements are used to analyze evidence that was considered relevant and credible as well as setting forth the applicable regulations used in determining whether the agency's adverse decision was erroneous. Further, a specific conclusion is dedicated to determine whether the burden of proof has been met through a preponderance of the evidence.

OIG Position

We concur with NAD's management decision for this recommendation.

II. Management controls over NAD hearings need to be strengthened

Management controls over NAD hearings need to be strengthened. We concluded that NAD needs to (a) update its written guidelines and clarify its policies and procedures for evidentiary hearings and director's reviews, (b) improve its management information system (MIS) to provide performance measures at various NAD levels, and (c) provide training which better explains the differences between the authority and responsibilities of NAD and those of the agencies.

*NAD needs to update its policies and procedures**Finding No. 3*

NAD's policies and procedures did not always provide sufficient guidance to address issues arising during NAD hearings. As reported in NAD hearing officers sometimes substituted their judgment for that of the agency. We also noted that NAD did not have a formal system for maintaining current NAD policies and procedures, and that FSA instructions regarding appeals to NAD were not consistent with NAD regulations.

In selecting our sample of 35 cases, we picked cases which related to problem areas identified through discussions with NAD and FSA personnel and through inquiries made to various OIG regions. Some of the material issues which were causing difficulties at NAD hearings included

- the preponderance of evidence standard for review,
- granting of equitable relief,
- remands,
- acceptance and use of oral testimony,
- acceptance and use of OGC legal opinions, and
- use of NAD subpoena powers.

We reviewed NAD's regulations, policies, and procedures related to these areas, and NAD's hearing records as they pertained to the problems. The following discussion details areas where we concluded that NAD's policies and procedures need to be updated.

Preponderance of Evidence Standard

NAD legislation requires that the appellant bear the burden of proving that an agency's adverse decision is erroneous. However, NAD's Interim Final Rule, dated December 29, 1995, added that the appellant must prove that the decision is erroneous "by a preponderance of the evidence." In its comments to NAD's Interim Final Rule, FSA expressed concern that the inclusion of the "preponderance of evidence" standard shifted the burden of proof from the appellant to the agency by diluting the statutory requirement that the appellant must prove that the agency's decision was erroneous. FSA also commented that the "preponderance of evidence" standard conflicted with the law, and should be removed from the regulations.

We did not attempt to determine whether the "preponderance of evidence" standard was consistent with NAD legislation. However, we did find that neither NAD's regulations nor procedures explained how the "preponderance of evidence" standard was to be applied in NAD hearings.

As discussed in Finding No. 2, hearing officers sometimes used the "preponderance of evidence" standard to make determinations which they were not authorized to make, and, in doing so, failed to determine whether the appellant met the burden of proving that the agency's adverse decision either contained or was based on an error. NAD should provide written guidelines defining "preponderance of evidence" and explaining how this standard applies to evidence presented at NAD hearings.

Equitable Relief

Public Law 103-354 states that the NAD director shall have the authority to grant equitable relief in the same manner and to the same extent as the authority given to the Secretary. Although NAD has established procedures relating to equitable relief cases, we questioned whether such cases should be subject to review by hearing officers.

Equitable relief involves instances in which participants who have taken actions which could affect their eligibility, acted in good faith by relying on the actions or advice of an authorized representative of the Secretary. In these instances, the NAD director is authorized to grant relief to the participants by providing program benefits to the extent determined appropriate for fair and equitable relief.

Even though hearing officers do not have the authority to grant equitable relief, Public Law 103-354 includes the denial of equitable relief in the definition of an

adverse decision. In cases where the appellant challenges the agency's denial of equitable relief, NAD's Hearing Officer Manual instructs the hearing officers as follows:

[Y]ou should make findings and conclusions concerning the appropriateness of granting or denying such relief. If you determine that the agency erred in denying equitable relief, you may so hold and return the case to the agency for further action consistent with your determination. You do not have the authority to affirmatively grant equitable relief yourself, although the Director may do so if the case comes to him for review.

We concluded that such cases should not be subject to review by hearing officers since they have no authority to make a determination on the appeal. If hearing officers overturned agencies' denials of equitable relief, they would in effect be granting equitable relief. We concluded that cases involving denial of equitable relief should be reviewed only by the NAD director.

Remands

NAD's policies and procedures did not adequately address remands. There were no policies or procedures for establishing timeframes to complete remand cases. Also, there were no guidelines to explain what types of situations warrant a remand.

Public Law 103-354, section 278(b), requires the NAD director to issue a final determination or remand a case back to the hearing officer within 10 business days if a review is requested by the agency or 30 business days if requested by an appellant. NAD's Interim Final Rule, section 11.9(d)(1), states:

If the Director determines that the hearing record is inadequate or that new evidence has been submitted, the Director may remand all or a portion of the determination to the Hearing Officer for further proceedings to complete the hearing record or, at the option of the Director, to hold a new hearing.

Neither the legislation, NAD's Interim Final Rule, nor NAD's procedures establish timeframes for completing remand cases. We contacted the NAD regions and found that each region assigned new case numbers for remands. Regional office personnel told us that remands were handled as though they were new hearings for tracking purposes, and that hearing officers had 45 days to hold another hearing (if necessary) and another 30 days to make their determinations. Notifications of remands are sent to the regional offices. However, regional office personnel said that there is a time lag of 1 or 2 weeks before the notice is received and the hearing officer receives the case.

In one of our sample cases, the NAD appeal was concluded approximately 7 months after the request for appeal was filed. The hearing officer used 74 days to make his determination for the remand. The delay in processing the participant's appeal resulted in a congressional inquiry into the timeliness of the NAD process. The following is a summary of that case.

NAD LOG NUMBER 95000494E

RD disapproved the appellant's request to obtain funding for a waste water treatment plant. The agency determined that proposed basic engineering services (BES) fees were excessive as compared to fees charged for similar projects when agency funding was not involved. The appellant contended that the BES expenses were appropriate for the complexity of the proposed project and that a fee curve should not be used to establish BES expense limits.

The hearing officer reversed the agency's determination based on his determination that regulations did not authorize the agency to establish a fee curve maximum to evaluate proposed BES expenses. However, the hearing officer neither had the authority nor the expertise to determine whether the fees were reasonable. Further, from our review of the hearing record, and based on the reviewing official's conclusion which follows, we concluded that the appellant did not show that the agency's decision was adverse to the appellant (as opposed to a matter of general applicability) and did not meet the burden of proving that the agency's determination was erroneous.

During the director's review, the reviewing official concluded:

The data which the appellant submitted to show engineering fees on other projects is conflicting and does not readily identify the fees charged for projects not involved in Agency funding. We find no substantive evidence to support the HO's (hearing officer) finding that the proposed BES is not in excess of those ordinarily charged by the profession for similar work when Agency financing is not involved.

Further, we find no substantive evidence to support the Hearing Officer's determination that RD has approved other projects in which the BES exceeded the maximum allowable.

Even though the reviewing official's conclusion indicated that the appellant did not meet the burden of proof, the case was remanded to the hearing officer to "determine if the fees are reasonable." However, since the agency's decision was a matter of general applicability and the reviewing official determined that there was no substantive evidence to show that the agency's decision was erroneous, we concluded that the hearing officer's initial determination should have been overturned instead of remanded back to the hearing officer.

Acceptance and Use of Oral Testimony

NAD's policies and procedures do not provide guidelines to assist hearing officers in weighing oral testimony. FSA officials told us that one of their major concerns was that hearing officers were accepting unsubstantiated oral testimony as persuasive evidence.

NAD's Interim Final Rule, part 11.8(5)(ii), states:

Any party shall have the opportunity to present oral and documentary evidence, oral testimony of witnesses, and arguments in the support of the party's position * * *. Any evidence may be received by the Hearing Officer without regard to whether that evidence could be admitted in judicial proceedings.

NAD's Hearing Officer Manual instructs hearing officers to keep in mind that not everything that a witness says is factual evidence. However, NAD's policies and procedures do not provide general guidelines on how to weigh oral testimony. We found that hearing officers sometimes accepted and inappropriately relied on unsubstantiated oral testimony. The following is an example.

NAD LOG NUMBER—95001719E

FSA determined that the appellants participated in a scheme or device to evade payment limitations by misrepresenting their interest in the farming operation. The agency's evidence showed that the producers did not maintain separate bank accounts for their interest. The agency also noted that the producers had no evidence to show that cash rent was paid for the land, that they owned or leased the land, or that they supplied capital for the farming operation.

The hearing officer subsequently overturned FSA's determination largely on unsubstantiated oral testimony of the appellants. Little to no physical documentation was offered by the appellants to support the oral testimony. The reviewing official who conducted the director's review wrote: "Although the record contained little documentation of [the appellants'] 1993 farming activities, the Hearing Officer determined that the appellants' testimony sustained the burden of proof required to reverse CFSA's decision." [Underlines added.]

The reviewing official also concluded: "In the absence of testimony by CFSA personnel involved in accepting the appellants' applications for disaster and associated documents, the Hearing Officer accepted the appellants' testimony as persuasive."

We concluded that the hearing officer's reliance on unsubstantiated oral testimony, given the seriousness of an adverse decision concerning a scheme or device, was improper. As a result of NAD's decision, an assistant U.S. attorney declined prosecution of the case, and stated: "We are declining prosecution in this matter. While it appears that the (appellants) engaged in a scheme to defraud the Department of Agriculture * * * by accepting the [appellants] uncorroborated, and false statements, the NAD has undercut our ability to prove any criminal violations."

In many instances, especially where matters such as schemes and devices or bad faith determinations are made by FSA, hearing officers should ensure that oral testimony, other than expert witnesses providing an opinion, is substantiated by the appellant.

Acceptance and Use of OGC Legal Opinions

Even though NAD is in the process of establishing procedures to obtain independent legal opinions when needed, there are no procedures addressing situations in which a hearing officer should utilize OGC legal opinions obtained by the agency.

In the "NAD Notes" for February through March 1996, the director wrote: "OGC is developing a system to provide us independent legal opinions related to program issues. We will work with * * * OGC to effect an appropriate means of securing definitive legal opinions on the laws applicable to matters at issue * * *"

The hearing officers are further instructed to refer requests for legal opinions to NAD regional directors. However, situations arise where hearing officers must determine the relevance of OGC opinions obtained by the agency to their determinations, or where the agency's opinions from OGC should be included as criteria or evidence relevant to the NAD determination. In these situations, NAD procedures should instruct hearing officers to determine the relevance of OGC opinions to the administrative hearing and, when appropriate, include the opinions in making their

determinations. Independent legal opinions should be obtained when necessary to ensure that “definitive” opinions clarify any ambiguous ones.

The following is an example where the hearing officer improperly made a legal determination which was contrary to an OGC opinion obtained by the agency.

NAD LOG NUMBER—95000487W

In this case, the agency determined that the appellant acted in “Bad Faith” by illegally converting chattel property which was part of a farm operating loan. The agency based its adverse decision, in part, on an OGC opinion that the appellant’s sale of chattel constituted conversion as defined by the appropriate State’s statutes.

Although the agency had approved the sale through public auction of certain equipment owned by the appellant, the appellant sold the equipment prior to the public offering for less than the amount the agency determined the equipment was worth. The appellant received a check from the buyer which was made payable to both the appellant and the agency. Although, the check was neither deposited nor cashed, the purchaser refused to return the equipment.

The hearing officer incorrectly concluded that “since there is no acceptance of the offer by all parties (Appellant and Agency), the sale had not been executed, thus, no valid sale has occurred.” From this conclusion, the hearing officer determined that the appellant had not illegally converted chattel property. Therefore, the hearing officer not only exceeded his authority by making a legal determination, but also erred in his determination (acceptance occurred when the purchaser agreed to the price and tendered the check to the producer).

For this appeal case, we concluded that the hearing officer should have considered the OGC determination when making his determination. If the hearing officer questioned the accuracy of OGC’s decision, he should have requested assistance from the NAD regional director.

Subpoenas

Public Law 103–354 gives the NAD director and hearing officers the authority to issue subpoenas requiring the attendance of witnesses and the production of evidence. In response to OIG Audit Report No. 46001–1–At, dated September 29, 1995, NAD issued procedures for the issuance and enforcement of subpoenas. However, NAD procedures do not address instances where hearing officers may determine that the attendance of a witness is necessary even though no request is made by the appellant or the agency. An example follows.

NAD LOG NUMBER—95001333S

FSA determined that the appellant participated in a scheme or device designed to evade payment limitations. The appellant alleged that he acted only as a custodian of farm records, financing, and bills for another individual’s farming operation. FSA concluded that the appellant was, in fact, the producer in that farming operation. Important evidence presented by FSA included a signed statement from the other individual stating that he had no interest in the farming operation other than as a hired hand.

As part of an appeal to the STC, the other individual had provided a signed statement in September 1989, showing that he was a separate person for payment limitation purposes. Subsequently, in April 1990, the other individual provided a statement to the county executive director recanting the September 1989 statement and showing that he was only a hired hand on the farm. Even though the agency had a signed statement from the other individual stating that he was not truly a producer in the farming operation for which the adverse decision was made, the hearing officer gave the statement little consideration by stating:

We find it significant to note that neither statement was prepared by [the other individual] and as addressed by Appellants the second statement was obtained by the county executive director and contained vague and ambiguous references to Appellants. Therefore, while this information was reviewed in making our decision, we did not consider the information to be compelling evidence.

The fact that the statement was prepared by someone other than the person who signed it was of little significance compared to the statement itself and the signature of the producer. The appellant claimed that the statement was coerced and false. However, he did not provide any evidence to support his claim. If the hearing officer believed that the statement may have been coerced or false, he had the authority to subpoena the other individual as a witness.

NAD needs to update its written guidelines to clarify its policies and procedures regarding when witnesses may be subpoenaed and establish a formal system to assist the NAD director in ensuring that the division’s policies and procedures are consistently applied throughout the agency.

FSA Instructions Need Clarifying

We also noted a need for FSA to improve its instructions. FSA instructions regarding appeals to NAD were inconsistent with NAD regulations. FSA Notice APP-11 presented suggested notification language for initial COC decisions. The suggested language, in part, stated:

If you believe the decision by the County Committee is in error, you may elect any of the options in the following sequence:

- Reconsideration by the County Committee.
- Request mediation.
- Appeal to the State Committee.
- Appeal to the National Appeals Division.

You may elect these options in the indicated sequence. You may select any of the first three options, or you may skip any of the first three options and select a later choice, or skip all three and appeal to NAD.

We found that the suggested language was not consistent with NAD regulations which state:

A participant must seek an informal review of an adverse decision issued at the field service office level by an officer or employee of FSA * * * before NAD will accept an appeal of an FSA adverse decision. Such informal review shall be done by the county or area committee with responsibility for the adverse decision at issue. * * * After receiving a decision upon review by a county or area committee, a participant may seek further informal review by the State FSA committee or may appeal directly to NAD.

NAD regulations also allow an optional informal review for adverse decisions issued at the FSA State office level. The participant is not required to seek the informal review before appealing to NAD in these situations.

Recommendation No. 3a (To the NAD Director)

Implement a formal policies and procedures system by combining the current Hearing Officer Manual and various "NAD Notes" into a numbered and dated manual.

NAD Response

In its March 21, 1997, response, NAD stated that it had "created a directive system to disseminate NAD policies and procedures. The directives are to be numbered and incorporate expiration dates."

OIG Position

We concur with NAD's management decision for this recommendation.

Recommendation No. 3b (To the NAD Director)

Update NAD guidelines to clarify policies and procedures related to the following areas.

- Preponderance of evidence standard for review
- Granting of equitable relief
- Remands
- Acceptance and use of oral testimony
- Acceptance and use of OGC legal opinions
- Use of NAD subpoena powers

NAD Response

In its March 21, 1997, response, NAD replied:

The NAD Interim Final Rule and comments published in the Federal Register cover the areas addressed. Further, the issues of Preponderance of Evidence, Equitable Relief, OGC Opinions and Subpoenas are covered in the NAD Hearing Officer Manual. Subpoenas and Equitable Relief have also been addressed in NAD Notes.

OIG Position

We disagree with NAD's management decision for this recommendation. Based on our review of 35 cases, we continue to conclude that needs to provide additional guidance on the 6 areas enumerated in the recommendation.

Recommendation No. 3c (To the FSA Administrator)

Ensure that guidance given to State and county offices concerning NAD appeals is consistent with NAD regulations by updating Notice APP-11 to notify appellants that they must first seek an informal review of COC determinations before appealing to NAD.

FSA Response

In its March 21, 1997, response, FSA replied that it “accepts and agrees with the findings and recommendations of the audit.”

OIG Position

FSA’s response did not specify the actions it plans to take for this recommendation. To reach a management decision, we need to be informed of the actions to be taken and the timeframe for carrying them out.

*NAD’s Management Information System Needs Improvement**Finding No. 4*

NAD’s MIS does not provide information necessary to make key decisions for evaluating the division’s performance. This occurred because NAD’s data base was unreliable and current management reports were ineffective. As a result, NAD’s management does not have sufficient means to ensure that the division adheres to timeframes established by legislation (i.e., hearing must be held within 45 calendar days of request) or ensure that resources are used efficiently and effectively.

In testimony before Congress addressing the 1997 appropriation, the NAD director stated:

The current tracking system was initially designed to handle only former FmHA type appeal cases and provide canned reports. The current tracking system does not meet NAD’s monitoring and reporting needs and limits our ability to provide Congress and USDA critical data regarding the appeals handled by NAD.

An MIS should provide decision-makers with the necessary data to guide operations towards fulfilling the division’s mission. The system must be effective and efficient so that reliable and timely information can be generated. A well designed system that incorporates these elements provides management with the necessary information to evaluate appeal case progress and employee performance.

A critical function of NAD’s MIS is to track appeals to NAD in order to ensure that appellants are given a timely hearing and determination as prescribed by the timeframes required by law. In addition to tracking timeframes, the MIS is an important tool for measuring the performance of the division at all levels, and determining where resources are needed within the division to ensure efficient and effective operations. Management reports can be designed to identify problem areas in the performance of hearing officers, regional personnel, and national reviewing officers. Once problem areas are identified through these reports, the director can take appropriate action such as focusing quality assessment reviews in order to better identify the cause of problems, update policies and procedures based on problems identified, and determine training needs for both individuals and the organization.

Based on our review and our discussions with NAD personnel, we concluded that NAD’s current MIS was inefficient and ineffective because of an unreliable data base and ineffective management reports.

Unreliable Data Base

We found that NAD’s data base is unreliable because it does not include sufficient dates and status codes needed to ensure compliance with legislated timeframes and the proper allocation of resources. The MIS does not track NAD hearings to determine whether hearings took place within 45 days from the date the request was received and if hearing officers’ determinations were made within 30 days from the date of the hearing. We also found that remand cases were not tracked to ensure timely resolution.

NAD’s current MIS consists of a data base called “NASTRACK” for data entry. “NASTRACK” is a combination of two subsystems. One subsystem is the system used by the former FmHA’s internal administrative appeals unit. It contains all information related to appeals filed through FSA. The second subsystem was created by NAD and contains all information related to appeals filed by all other agencies for which NAD has responsibility. Information is retrieved by NAD using the Statistical Analyses System (SAS).

The data base provides for three entries relating to the dates in which a hearing officer must hold a hearing and make a determination. These entries include the date the request was received, the date of the hearing, and the hearing decision date. However, information concerning the date of the hearing was unreliable. In instances where hearings are held open,⁷ the date the hearing was closed is entered

⁷Public Law 103-354 requires that the hearing officer shall leave the hearing record open for a reasonable time to allow for the submission of information by the appellant or the agency to respond to new facts, information, arguments, or evidence presented.

as the hearing date. Also, even though a hearing may take more than 1 day, the last day of the hearing is normally entered as the date of the hearing.

In order to determine if hearings are held within 45 days of the request, the MIS should include data to reflect the first day of the hearing. This would provide reliable data for determining whether the hearing was held within 45 days of the date of request. Since hearings are not always concluded in 1 day, the MIS should also include data to reflect the date that the hearing was closed. By comparing the closed date with the date of the hearing officer's determination, NAD will have reliable data to determine whether determinations are being made within 30 days of the hearing.

The MIS does not include status codes needed to determine why timeframes were not met. For example, when a hearing is not held within 45 days as required by NAD legislation, certain factors may have caused the delay (i.e., the appellant waived the 45-day requirement, or a hearing officer was unable to schedule the hearing within the timeframes because of a heavy caseload). Similar status codes should be used for other timeframes designated by legislation, regulations, or the director's instructions. We concluded that this type of information is necessary to evaluate the division's compliance with legislative requirements and to ensure the efficient use of resources.

Additionally, we found that NAD assigns new case numbers to remanded cases. Thus, timeframes allowed for all remand cases are the same as for those required for new evidentiary hearings and determinations. We concluded that the director should establish appropriate timeframes for remand cases to ensure that the appellant is provided a timely determination, and that NAD should keep track of the remand cases to ensure that those timeframes are met. (See Finding No. 3.)

Ineffective Management Reports

NAD's MIS produces 13 standard management reports through SAS. We concluded that the standard management reports were inefficient and ineffective. In the past, RD has provided a SAS programmer to query data fields and produce custom reports. However, as of November 1, 1996, RD no longer provides this assistance to NAD. Because NAD no longer has the capability to query on specific data fields in order to produce custom reports, it must now rely solely on its standard management reports.

The "Hearing Officer Backlog Report" and the "Overdue Hearing Decision Report" are generated by NAD's National Office. However, NAD personnel told us that both reports utilize the date that the appeal request is made and are considered overdue when more than 75 days have passed. Therefore, these reports do not reflect whether the appropriate timeframes were met. Additionally, questions concerning the status of the hearings must be investigated by the individual regions. In many instances, regions must contact the appropriate hearing officer to follow up on possibly overdue hearings or determinations.

To create the reports, regional management assistants must retrieve information from each of the two subsystems within the MIS and must manually calculate the totals for overdue hearings, decisions, and caseload reports per hearing officer and per region. The management assistants must also rely heavily on individual casefiles and hearing officers as well as "NASTRACK" screens to follow up on cases for which NAD may potentially exceed timeframes or has apparently exceeded them, and to verify the overall accuracy of the reports. Management assistants also told that NAD's MIS was inefficient because only 4 of 12 reports available to the regions provided useful information in determining the status of the hearings. The reports include the

- reversed, upheld, modified report,
- overdue hearing officer's report,
- overdue decision report, and
- suspended hearing report.

NAD's standard management reports do not provide information useful in monitoring the performance of personnel such as hearing officers. For example, we noted that there were no reports to show the number of times that an individual hearing officer was reversed by a reviewing official or the backlog associated with individual hearing officers. Also, there were no reports to evaluate regional performance (i.e., summary of the number of times hearing officers within the region were reversed, or backlog by region), or reviewing officer performance.

Recommendation No. 1b (To the NAD Director)

- Update the MIS in order to provide necessary information to ensure that
 - NAD provides appellants timely determinations and complies with legislative timeframes, and

—management reports contain relevant information, provide a means for measuring the performance of the division at all levels, and provide tools for determining where resources are needed.

NAD Response

In its March 21, 1997, response, NAD replied:

One of the highest priorities of NAD is to upgrade its current Management Information System (MIS) in order to provide more accurate and timely data, as well as to provide a more effective monitoring tool to ensure timely hearings and determinations. NAD has requested special initiative funds in fiscal year 1998 to achieve this priority. The request for additional funds stated that the current tracking system was put in production in 1989 to track former Farmers Home Administration (FmHA) appeals and does not fulfill NAD's monitoring and reporting needs. Additionally, the current MIS limits the ability of NAD to furnish the Secretary, the Congress, and other interested parties information regarding the appeals handled by NAD. This vital initiative is being coordinated with the Department's OIRM [Office of Information Resources Management].

OIG Position

We concur with NAD's management decision for this recommendation.

Training from NAD and FSA Could be Improved

Finding No. 5

Our review disclosed that NAD's training program has not provided the support needed to ensure complete and accurate determinations. Past training was provided by judicial colleges which emphasized judicial training for administrative law judges. More recent training provided overviews of how the farm agencies operate day-to-day with some indepth instruction relating to how agency decisions are made. However, the training has not provided NAD's staff with information needed to reinforce their current hearing and review skills or to understand why and under what authorities agencies make decisions. As a result, hearing and review officers have made errors at the basic level and have inappropriately made decisions that are reserved by law or regulations to the agencies (see Finding No. 2). We also found that FSA needs to provide further training to State and county personnel to ensure that adverse decisions are clear and sufficiently supported.

We concluded that NAD training should be directed toward teaching and reinforcing basic skills related to conducting administrative hearings, rendering administrative hearing decisions, and understanding the authorities of hearing officers. The training should help ensure that hearing officers utilize only relevant criteria and evidence and limit their determinations to whether the agencies complied with applicable criteria and considered accurate and relevant evidence in making their adverse decisions. Hearing officers should be trained to avoid broad issues and ensure that determinations address whether the adverse decisions were erroneous. The training should also be directed toward the following areas. (See Finding No. 3.)

- Preponderance of evidence standard
- Burden of proof
- Equitable relief
- Remands
- Acceptance of oral testimony
- Acceptance and use of OGC legal opinions
- Use of subpoena power

Our evaluation also disclosed that NAD had not implemented a quality assurance review system. Such reviews should be used to identify individual and organizational training needs as well as identify needed policy and procedure updates, and assist in evaluating how well NAD is achieving its mission.

FSA should provide additional training to its State and county office personnel to improve the quality of the adverse decisions and documentation, especially adverse decision letters, supporting the decisions. The training should help ensure that COC's and STC's adequately document their adverse decisions (i.e., clearly show the basis for their determinations including summarizing applicable criteria and evidence) and provide sufficient information to the participants and to NAD through their adverse decision letters and any subsequent correspondence when necessary. (See Finding No. 1.)

Recommendation No. 5a (To the NAD Director)

Provide training to review and hearing staff which is directed toward teaching and reinforcing basic skills needed to conduct hearings and reviews and issue appro-

appropriate determinations, and which focuses on explaining the differences between the authorities of NAD and those granted to the agencies.

NAD Response

In its March 21, 1997, response, NAD replied:

NAD is providing regional training in the area of writing determinations, conducting hearings, and exercising the authorities of NAD this fiscal year. Additional training has been scheduled for fiscal year 1998 in the adjudicative process. Further, each employee of NAD is developing individual training plans in coordination with the Planning, Training, and Quality Control section of NAD. These individual plans include basic curriculum, established by the Deputy Director for Hearings and Administration, as well as advanced courses related to the employee's job responsibilities.

OIG Position

We concur with NAD's management decision for this recommendation.

Recommendation No. 5b (To the NAD Director)

Establish a quality assessment review system.

NAD Response

In its March 21, 1997, response, NAD replied:

The Planning, Training, and Quality Control (PTQC) Section of NAD was established in 1996 to address this area as well as training and the Government Performance and Results Act of 1993 (GPRA). The PTQC Section of NAD has established a quality assessment review system for hearing and review determinations. The assessment reviews will evaluate the quality of hearing determinations; identify common proficiencies and weaknesses to determine training needs; and satisfy GPRA Annual Performance Plan goals. A final report on the review will be submitted annually to the Director. The staff of the PTQC Section has randomly selected 36 cases, 12 from each region, for review in fiscal year 1997 and plans on selecting a minimum of 48 cases in fiscal year 1998. The number of cases reviewed will increase in future years.

OIG Position

We concur with NAD's management decision for this recommendation.

Recommendation No. 5c (To the FSA Administrator)

Provide additional training to State and county office personnel designed to improve the quality of their adverse decisions and assist them in understanding the documentation needed to support the adverse decisions.

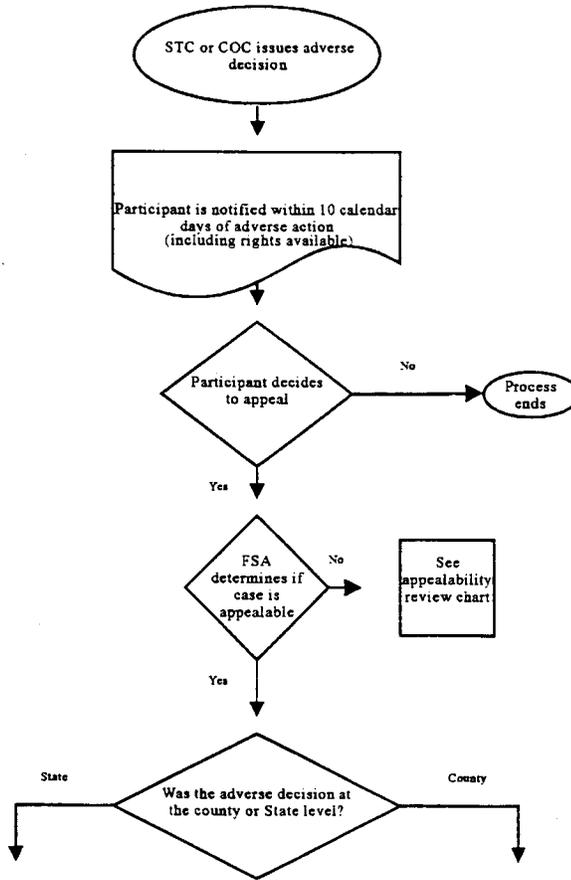

FSA Response

In its March 21, 1997, response, FSA replied that it "accepts and agrees with the findings and recommendations of the audit."

OIG Position

FSA's response did not specify the actions it plans to take for this recommendation. To reach a management decision, we need to be informed of the actions to be taken and the timeframe for carrying them out.

¹This case involves the farm operating loan program which is now administered by FSA.
²There was no adverse decision letter in the hearing record.
³The FSA representative attending the hearings improperly determined that the 90-day rule applied.
⁴This case was also recorded as NAD No. 96000756E.
⁵There was no adverse decision letter in the hearing record.

NAD DECISIONS

Question. What is the Department doing to ensure that the appeals process is not biased against producers?

Answer. The Director has issued specific guidance in a NAD Directive, which is provided for the record. Bias is not established by percentages of results, but in a failure to conform to the highest standards of integrity and objectivity in applying the law. NAD adheres to such standards.

[The information follows:]

MARCH 19, 1999.

NATIONAL APPEALS DIVISION DIRECTIVE NO. NAD-98-08

DISQUALIFICATION OR RECUSAL FROM AN APPEAL

Purpose: The purpose of this directive is to clarify National Appeals Division (NAD) policy on disqualification or recusal from an appeal case. This policy is in addition to, and not in lieu of, any requirements regarding conflict of interest or bias imposed on United States Department of Agriculture (USDA) employees by Federal statutes (including civil rights laws), particularly 18 U.S.C. 201-209, the Standards of Ethical Conduct for Employees of the Executive Branch (5 CFR 2635), and USDA policies and regulations applicable to employee conduct.

Authority: 7 U.S.C. 6992, 7 CFR part 11.

Background: The mission of NAD is to conduct impartial administrative appeal hearings and reviews. The proper adjudication of NAD appeal cases requires an unbiased adjudicating official with no personal interest in the outcome of the case, i.e., a neutral decision maker. The question of impartiality in NAD cases usually takes on one of two forms: bias and conflict of interest. For the purpose of this directive the term "Adjudicating Officer" refers to Hearing Officers, Appeals Officers, the Deputy Director for Hearings and Administration, the Deputy Director for Planning, Training and Quality Control and the Director, NAD.

Policy:

Conflict of interest

A conflict of interest in an appeal can arise in several instances. Examples include, but are not limited to, cases where the Adjudicating Official has a close or familial relationship with a party to the appeal, a financial interest in the outcome of the appeal, or any other circumstance where a gain or loss to the Adjudicating Official flows directly from the appeal determination and interferes with the ability to make an impartial determination.

As a matter of practice, the Adjudicating Official should be attentive to any conflict of interest or the appearance thereof in every case assigned. When such instances occur, Hearing Officers should notify the Assistant Director for the region that they must be recused from the appeal case. Appeals Officers will likewise notify the Supervisory Appeals Officer. When allegations of a conflict of interest are leveled at the Adjudicating Official by either party to the appeal, the Adjudicating Official will notify his/her supervisor, as appropriate and will either recuse himself/herself based on his/her own assessment of the validity of the allegations, or make note in the appeal record that the allegations are without merit. Should the Director recuse himself/herself on an appeal, the Director will assign the case to another Adjudicating Official.

Bias

The concept of bias is more subtle than conflict of interest and more complex to deal with in that it rarely arises as a result of self-assessment by the Adjudicating Official, but usually surfaces as an allegation by a party to the appeal. In NAD appeals, bias is usually alleged as: (1) a prejudgment based on prior rulings (either with the same parties or in a similar case) or attitude toward an issue, or (2) a personal bias (attitude toward a person) expressed as partiality, animosity or favoritism. Prior rulings on the same or similar case, a point of view or prejudgment about regulations, policy or law are rarely grounds for disqualification or recusal. However, personal bias, can be, if proven or admitted. The ethical responsibilities of the Adjudicating Official require recusal if personal bias will affect impartiality. When allegations of bias are made by a party to an appeal, the Adjudicating Official will either recuse himself/herself, if appropriate, or make note in the appeal record that the allegations were made but have no merit.

Responsibilities of supervisory personnel: Assistant Directors for the regions, and the Supervisory Appeals Officer should exercise good judgment in assigning or reassigning cases where there is the appearance of a conflict of interest or bias.

DAIRY OPTIONS PILOT PROGRAM

Question. Please provide this Committee with an update on the status of the Dairy Options Pilot Program.

Answer. The Dairy Options Pilot Program (DOPP) Round II, Notice of Availability was published in the Federal Register on Thursday, February 24, 2000. Producer training sessions are scheduled to begin in some States during late March and early April. All producer Round II DOPP training sessions will conclude by late September, 2000.

Major changes for Round II include the following:

- Producers choosing to participate in DOPP can submit a completed application (contract) within 2 weeks from the date of training. (In Round I, producers were required to sign a contract before they were permitted to attend the training session.)
- The DOPP producer contract will specifically allow participants to refrain from buying milk contract options for future sale if such a strategy is not in their best interest at the time. (Round I contract language required that participants buy contract options equivalent to a minimum of 100,000 pounds.)
- The time that participants have to purchase contract options has been expanded from 2 months to 4 months from the date of the training.
- The forward horizon over which participants can hedge has been expanded from 6 months (from the date contract options are purchased) to 12 months (from the date of training).

Question. During the oral questioning, you indicated that the Department planned to scale up on the DOPP. How, specifically, does the Department plan to do this?

Answer. Section 191 of the Federal Agriculture Improvement and Reform Act of 1996, limited the Secretary of Agriculture from operating a pilot options program in more than 100 counties. During Round I of the DOPP, the program was operated in 38 counties in seven States. During Round II, 61 counties in 32 States were selected. DOPP will be available in the following States and counties: Maricopa County, Arizona; Marin and Sonoma counties, California; Weld County, Colorado; Gilchrist and Okeechobee counties, Florida; Morgan and Putnam counties, Georgia; Gooding, Jerome, and Twin Falls counties, Idaho; Clinton and Washington counties, Illinois; Elkhart and Marshall counties, Indiana; Clayton, Dubuque, and Winneshiek counties, Iowa; Nemaha County, Kansas; Adair and Barren counties, Kentucky; Carroll and Frederick counties, Maryland; Franklin County, Massachusetts; Allegan, Clinton, and Sanilac counties, Michigan; Fillmore and Wabasha counties, Minnesota; Webster and Wright counties, Missouri; Gage County, Nebraska; Chaves, Lea, and Roosevelt counties, New Mexico; Madison and Wyoming counties, New York; Iredell County, North Carolina; Ashtabula, Mercer, and Wayne counties, Ohio; Adair and Mayes counties, Oklahoma; Marion and Washington counties, Oregon; Lebanon and Tioga counties, Pennsylvania; Deuel and Grant counties, South Dakota; McMinn County, Tennessee; Archer County, Texas; Cache and Utah counties, Utah; Washington County, Vermont; Franklin and Rockingham counties, Virginia; Skagit, Snohomish, and Whatcom counties, Washington; Barron and Shawano counties, Wisconsin.

FORAGE CROP INSURANCE PROGRAM

Question. Over the years, farmers have complained that insurance for forage is far too limited, that payments are not always made when they are warranted due to inadequate data collection of forage production. This has particularly been a problem for producers who have historically grown forage for on-farm use and not for sale. Please review for the Committee the status of forage insurance and steps the Department has taken to improve the forage crop insurance program.

Answer. The Risk Management Agency (RMA) currently has three basic programs for insuring forage: (1) actual production history (APH) plan for forage production, (2) a dollar plan for forage seeding, and (3) a group risk plan (GRP). We will provide for the record more details of how the programs operate, steps taken to improve them, and their current status.

[The information follows:]

The forage production APH program and the forage seeding dollar plan have been in existence for more than 20 years, but recently improved through a proposed and final rule in the Federal Register for the 2001 crop year. The APH forage production program is an individual yield based program and improvements include: allowing optional units, providing for acreage reporting dates to be based on regional differences for program flexibility, providing year round coverage for certain California counties, allowing direct marketing, and simplifying the program by eliminating the Winter Coverage Endorsement and building the winter coverage protection into the policy provisions. The forage seeding program has been improved by: adding insurance dates for California and South Dakota, providing for acreage reporting dates to be based on regional differences for program flexibility, allowing an increased replanting payment, if allowed by the Special Provisions, allowing replanting payments in certain California counties, and removing planted acreage requirements for qualifying for a replanting payment.

The GRP forage program was first piloted the 1994 crop year in Minnesota and Wisconsin. While the program remains a pilot, it has been expanded to additional

counties in 8 States. For the 1998 crop year, RMA added acreage intended for rotational grazing as insurable acreage. RMA's determination of payment yield by county and by year is based, in part, on the National Agricultural Statistic Service (NASS) county yield for harvested acres. RMA is currently evaluating methodology and overall effectiveness of the GRP forage program and consulting with other Federal agencies whose data is used for program determinations. RMA is also using a Fellow from the American Academy for the Advancement of Science (AAAS) to help identify other ways to insure forage.

In addition to the programs mentioned above, RMA continues to research options for insuring the quality of forage produced under the Forage Production Policy. In 1999, RMA began offering a Rangeland and Pasture Group Risk Plan. The program is being piloted in 12 counties in Montana, with 2 million acres insured under this policy in its first year. In 2001, RMA plans to offer an insurance product covering producers of forage seed in seven States. RMA is also researching a rangeland and pasture APH product to provide individual coverage for rangeland and pasture producers. These initiatives have included consultation with forage specialists and forage growers to determine their needs.

In 1999, there were 14,000 policies in effect for forage; total acreage insured was approximately 3,680,000 acres. States with the most acreage insured were Wisconsin and Minnesota; in other major producing areas such as Nebraska, Colorado, California and Oregon, participation in the forage insurance program is much lower.

RMA has conducted numerous listening sessions with growers of hay and forage in an attempt to determine concerns of producers. The major concern is the need for quality provisions in the current Forage Production policy. RMA is currently developing a quality provision which will be included in the forage production policy in the future.

Many producers are not interested in a risk management tool for forage production because they produce forage for on-the-farm use only. Since they don't consider this a marketable crop, they often do not keep records. Growers have also advised that in some markets, most notably in California—the nation's largest forage producing area—the ability of growers to harvest multiple cuttings per year provides them with a spread of risk sufficient to preclude interest in a risk management tool.

Question. Are there any legislative changes required to provide meaningful insurance for forage producers, particularly for those farmers who grow forage for on-farm feed?

Answer. No legislative changes are required for RMA to continue its efforts to improve the insurance options available for forage producers including those who grow forage for on-farm feed.

MILK PRICE PROTECTION

Question. In the recently announced safety net proposal, the Administration proposed a new program to provide livestock producers with price protection. Why hasn't the Administration proposed something comparable to provide milk price protection?

Answer. At this time, RMA has neither the legislative authority nor the funding to offer a milk price insurance program or livestock insurance. RMA currently has the Dairy Options Pilot program to help dairy farmers manage risk. The livestock proposal is also for a pilot-scale program. RMA would need to evaluate the performance of both types of programs before expanding them to a national scale.

Question. How could a milk price protection program be structured?

Answer. We have consulted with private insurers who are studying how best to design a milk price insurance program. They inform us that they would begin by trying to adapt the livestock price design to milk, but are unsure if it will work. At this point there are uncertainties involving the availability of price data as well as the different sales patterns—daily for milk, occasionally for cattle.

FSA COUNTY OFFICE PERSONNEL

Question. I understand the Department intends to propose legislation to convert all non-Federal FSA employees to Federal employee status in 2000. Is there a cost associated with this conversion? If so, what?

Answer. The conversion of all non-Federal county office employees to Federal status in fiscal year 2000 will move all employees under one personnel system and improve efficiency of Agency operations. It is not anticipated that the conversion will have a significant cost effect on agency operations.

Question. Have the Federal employee union representatives expressed an opinion on this proposal? If so, what?

Answer. We are unaware of any employee union comments on the specific proposal to convert non-Federal county office employees to Federal status, with their tenure.

RESOURCE CONSERVATION AND DEVELOPMENT

Question. The Resource Conservation and Development Program has been valuable for the rural communities in Wisconsin. Unfortunately, the last remaining RC&D Council in Wisconsin—Glacierland—has not yet received official designation by the Secretary. This is despite an increase in fiscal year 2000 appropriations for RC&D which Congress directed be spent to designate new councils. What is the status of the designation application of Glacierland RC&D?

Answer. There are currently 315 RC&D areas nationwide, including five in the State of Wisconsin. The Glacierland RC&D applied for designation in May, 1997. Although the fiscal year 2000 appropriation provides an increase of \$265,000 for RC&D, this funding is needed to cover pay and other cost increases. Similarly, the additional funds proposed in the fiscal year 2001 Budget are requested to cover cost increases, rather than to increase the number of designated areas.

DEBT FOR NATURE

Question. With declining farm income and increased environmental pressures on agricultural lands in Wisconsin, there is a growing farmer interest in the FSA debt forgiveness provisions of the Debt for Nature program. However, I understand that existing funding for Conservation Operations may be inadequate to meet demand for this valuable program. In order to meet estimated demand for Debt for Nature without reducing existing conservation services, what level of increase in Conservation Technical Assistance would be required.

Answer. NRCS estimates that field efforts to address 31,000 contracts affecting 4.2 million acres would require over \$50 million in technical assistance funding and could require up to 775 staff years of effort. This estimate is based on a 20 percent participation rate in the program by the 157,000 borrowers who have loans secured by real estate. In some states, such as Wisconsin, landowner interest is very high and preliminary efforts to deliver the program reveal that the participation rate may be greater if a concerted effort is made to market the program. In addition to technical assistance it would be important for financial assistance authority and funding to be available.

FLOOD CONTROL STRUCTURE REHABILITATION

Question. The fiscal year 2000 appropriations act included language directing the \$8 million be available for technical and financial assistance for pilot rehabilitation of upstream structures in four states. Please provide the status of this effort in terms of criteria for locating pilot areas and a timetable for action.

Answer. NRCS is currently working with local communities, project sponsors and state dam safety officials in Ohio, Wisconsin, Mississippi, and New Mexico on their high priority dam rehabilitation projects. The projects underway are those that have some of highest risk to public health and safety. These projects will demonstrate the variety of alternatives that will be involved and issues that will be encountered with rehabilitation, as well as the many benefits. We are currently assisting project sponsors with planning, design and implementation. There is currently over \$540 million in known dam rehabilitation needs nationwide and communities in these 4 States are already on the waiting list for assistance. NRCS has provided watershed project sponsors the opportunity to apply for Pilot Rehabilitation Project funds provided in the fiscal year 2000 Appropriation Bill. Construction should begin during this summer and continue through 2001.

Question. Has the Department established a priority national listing of endangered structures, and if so, what criteria was used and please provide a copy.

Answer. The Department has not established a priority national listing of endangered structures. Currently there is no statutory authority, other than annual appropriation language to conduct an assessment or provide assistance.

Question. If not, are there plans to do so? Explain.

Answer. Since there is no statutory authority for rehabilitation, there are no plans to develop criteria for ranking endangered structures. The Administration's budget includes \$4 million in subsidy budget authority for a new \$60 million loan program to assist State and local governments that wish to rehabilitate dams. None of the costs for rehabilitation activities (including any technical assistance costs such as planning, design, and engineering costs) shall be borne by the Department of Agriculture. If NRCS provided technical assistance, all costs would be required to be reimbursed by watershed sponsors.

CONSERVATION AND DAIRY

Question. There is growing concern among dairy farmers about the impact of state and federal environmental restrictions and the lack of voluntary conservation programs to assist them. With the exception of EQIP, other conservation programs have been geared primarily to cropland and crop producers. Please tell this Committee how the Department plans to meet the conservation needs of dairy farmers under existing programs as well as under the Administration's new conservation initiative.

Answer. Under the proposed conservation programs proposed as part of the Administration's Farm Safety Net, more farmers would be included in national conservation programs and more funding would be available for current USDA conservation programs. The Conservation Security Program (CSP) would be open to farmers and ranchers nationwide who voluntarily practice good stewardship on cropland, pasture and range grazing land, hayland, and other agricultural lands for the production of agricultural products. Thus, many dairy farmers would be eligible for CSP. The CSP, proposed to be funded in the amount of \$600 million in both fiscal years 2001 and 2002, would provide direct annual payments to producers to financially recognize them for good land stewardship that produces the environmental benefits which we all enjoy—clean water and air, reduced soil erosion, improved wildlife habitat, and sustainable soil. Payment levels would be based on the comprehensiveness of producers' conservation efforts. The \$125 million increase in the Environmental Quality Incentives Program would mean that 50 percent more farmers and ranchers would receive cost share to implement conservation practices. Of this increase, 50 percent must be targeted for livestock production. The announced increases in other programs would be available to eligible dairy farmers as well, including the Wetland Reserve Program to enroll 250,000 acres, the Wildlife Habitat Incentives Program to \$50 million per year, the Farmland Protection Program to \$65 million per year, the Conservation Reserve Program to 40 million cumulative acres, and the "continuous sign-ups" bonuses under the Conservation Reserve Program to \$125 million in fiscal years 2001 and 2002. \$100 million in continuous sign-up bonuses will be provided in fiscal year 2000.

In addition to the technical and financial assistance that would be provided through the Conservation Initiative, a total of nearly \$56 million in technical assistance will be specifically directed to animal feeding operation (AFO) owners this fiscal year through the Conservation Technical Assistance activity and will increase to \$88 million next fiscal year.

Question. Additionally, there is concern that NRCS has insufficient resources to help livestock producers develop nutrient management plans under the time frame proposed under the Unified Strategy for Animal Feeding Operations. In order to help livestock and dairy producers meet the deadlines of the strategy, how much additional staffing would be required and is that reflected in the Administration's fiscal year 2001 budget proposal?

Answer. NRCS estimates that approximately 300,000 animal feeding operation (AFO) owners and operators will seek NRCS comprehensive nutrient management planning technical and financial assistance. Preliminary information derived from the NRCS Workload Analysis System indicates that it takes, on average, 235 hours of technical assistance to plan, design, and provide appropriate oversight, according to NRCS technical standards, the components related to manure management for a typical AFO. This average is currently under review to adjust for expected efficiencies. NRCS anticipates that partners will contribute about 14 percent annually, or about 335 FTEs per year—their expected level for fiscal year 2000. Assuming that the remainder is done by NRCS and that CNMP planning is completed in 2009, and that CNMP implementation assistance is needed through 2012, preliminary estimates indicate that NRCS will need approximately 2,935 FTEs per year over the next 10 years. Fiscal year 2001 budget levels propose approximately 800 FTEs for AFO planning and implementation assistance.

CONSERVATION TECHNICAL ASSISTANCE

Question. The budget request includes an increase in the Conservation Operations account. We continue to hear concerns from conservation districts and from other stakeholders that the USDA county-based delivery network is under increasing strain due to declining staff and increasing workload. Some have suggested that the increase in the budget may not be sufficient to meet current demand for conservation assistance let alone the new conservation initiative. In any case, if the \$1.3 billion in new conservation programs included in the Farm Safety Net Initiative is enacted, I expect that problem will be exacerbated. Will your requested budget levels

for Conservation Operations be sufficient to carry out the conservation programs currently authorized and those included in the new initiative?

Answer. The requested funding levels for the Conservation Technical Assistance program and the CCC funded mandatory conservation programs in the Farm Safety Net proposal provide sufficient technical assistance to implement these expanded programs. Specifically, within Conservation Operations, the President's Budget proposes an \$86 million increase and the farm safety net proposal includes language to provide an additional \$75 million in fiscal year 2001 for technical assistance related to certain conservation programs including the Conservation Reserve Program.

COUNTY-BASED STAFFING LEVELS

Question. Concern about inadequate staffing at USDA Service Centers has not been limited to conservation. We've seen, in particular, problems with the delivery of emergency assistance because of inadequate staffing levels. Would you also comment on the other county-based agencies in regard to their staffing needs?

Answer. Staffing levels in all three of the county-base agencies have declined below the levels projected in the Department's streamlining plan and reflect levels that can be supported given current budgets and other demands, such as the need to maintain information technology (IT) systems. Recent budgets for these agencies have been developed on the basis that funding would be provided for implementation of a Common Computing Environment (CCE) that would provide a single, modern system to serve the needs of the agencies and their customers more efficiently than the patchwork of the existing systems. Actual appropriations for the CCE have fallen far short of requested and needed levels, meaning that agency staffs do not have the benefit of modern technology and agencies must continue to maintain aging systems. Further, in the case of Rural Development, the fiscal year 2000 appropriation or salaries and expenses was \$8 million below the request.

Question. If there is additional emergency assistance provided in fiscal year 2001, will the Administration's budget proposal for county staffing be sufficient to deliver that assistance in a timely manner?

Answer. The FSA budget proposal does not include any assumption of emergency assistance in fiscal year 2001, other than a small amount of carryover activity for programs legislated in fiscal year 2000. If additional emergency assistance legislation is enacted, we will work with OMB and the Congress to address requirements.

CONSERVATION RESERVE PROGRAM

Question. In the fiscal year 2000 Appropriations Act, three separate general provisions were included that placed limitations or required changes to the Conservation Reserve Program. These are found in sections 763, 764, and 765. Please describe the effects of these provisions on the implementation of the CRP in fiscal year 2000 and include information regarding how these provisions affected farmer participation and the conservation goals of the program.

Answer. The effects of Sections 763, 764, and 765 on the implementation of the CRP in fiscal year 2000, along with other related information will be provided for the record.

[The information follows:]

Section 763 rescinds Section 1232(a)(11) of the Food Security Act of 1985, as amended (1985 Act), commonly referred to as Conservation Reserve Program Highly Erodible Land (CRP HEL). Because this section amended the 1985 Act, no further action is necessary. The provisions of section 763 may increase farmer participation in the program and are consistent with the goals of the program to reduce soil erosion, promote water quality, and enhance wildlife habitat. The Farm Service Agency amended 7 CFR part 1410 withdrawing CRP HEL as a producer obligation and issued instructions to the field implementing this section.

Section 764 permits land to be enrolled with minimal environmental value at much greater cost by prohibiting implementation of FSA's Notice CRP-338 which was issued with NRCS concurrence regarding contour grass strips. Section 764 permits enrollment of these existing strips installed according to NRCS standards. Enrollment of this land with little erosion improvement would cost an estimated \$25 per ton compared to the historical program average for cost-share practices of \$.62 per ton. Producers utilizing this provision would be required to refund the federal cost of any remaining value of the federal cost of the original installation. The provisions of section 764 will increase farmer participation in the program but appear to be inconsistent with the goals of the program to reduce soil erosion.

Instructions implementing section 764 are in development for issuance to field offices.

Section 765 provided that none of the funds made available under the Act could be used to implement Notice CRP-327 or any related administrative action, but further clarified that the section does not apply to any lands for which there is not full compliance with the conservation practices required under terms of the CRP contract. Notice CRP-327 prohibited commercial shooting preserves on CRP acreage.

The Farm Service Agency worked with industry representatives in fiscal year 2000 to develop procedures to implement the provisions of section 765. Although fee hunting has been allowed on CRP acreage since the program's inception, commercial shooting preserves on which the cover is manipulated are not compatible with the authorizing statute, which prohibits making commercial use of the forage on CRP acreage except during droughts or other emergencies. The provisions of section 765 have had no known impact on farmer participation in the program and although the provision includes language requiring compliance with the CRP contract, this is difficult.

DISCONTINUATION OF SECTIONS 764 AND 765

Question. If the Department does not support continuation of these changes in fiscal year 2001, please specify with justifications.

Answer. The Department does not support the continuation of Section 764 because:

- Contour Grass Strips were developed to address sheet and rill erosion as rain-water washes across a field and many farmers installed these strips according to NRCS standards which did not require a grass cover.
- Enrollment of land with little erosion improvement would cost an estimated \$25 per ton compared to the historical program average for cost-share practices of \$.62 per ton.
- The Department also does not believe continuation of Section 765 is necessary. FSA will continue to work with landowners and hunting interests to maintain the purposes of CRP while permitting fair hunting opportunities.

FUNDING FOR ROUND II EC/EZ

Question. In fiscal year 2000, specific set-asides were provided under rural development programs for EC's and EZ's. In addition, funding was also provided directly to benefit Round II EC/EZ's. Please provide information relating to the distribution of funds under these set-asides.

Answer. The \$15 million in discretionary grants is distributed to the second round empowerment zones and enterprise communities as follows: \$2 million each to the five empowerment zones and \$250,000 each to the 20 enterprise communities. These funds are used in a variety of ways, but for the most part, provide a financial base that allows the communities to develop long-term investment strategies, and provide a source of funds that are used to attract other investment capital, including the Rural Development funds that are set-aside for use by the empowerment zones and enterprise communities.

RUS FFB ACTIVITY

Question. The fiscal year 2000 Appropriations Act provided a program level of \$1.7 billion for FFB electric loans. The budget request for fiscal year 2001 reduces this program level almost in half even though there is very little budget authority exposure. What is the reason for this reduction?

Answer. The fiscal year 2001 budget request for RUS guarantee funding totals \$1.2 billion. This represents a \$500 million reduction when compared with the \$1.7 billion that Congress provided in the fiscal year 2000 Appropriations Act.

The Agency believes the additional \$500 million that Congress provided in the fiscal year 2000 Appropriations Act will help to reduce the large backlog of loan applications the Agency has on hand. In light of this, we believe that the \$1.2 billion is adequate to meet the electric borrowers' capital needs that are anticipated during fiscal year 2001.

Question. Why is demand not adequate given the need expressed by the rural electric community for expanded loan programs?

Answer. There has been extensive need expressed by the rural electric community. In an effort to meet the capital needs of the electric borrowers while minimizing the budgetary impact, this Administration proposed new lending authorities in the fiscal year 1999 and fiscal year 2000 budgets. We now believe we can adequately address the demand through the FFB program.

Question. Do you think the proposed \$400 million program level for Guaranteed CFC/CoBank loans will meet the demand of borrowers as a satisfactory alternative to reductions in Direct 5 percent and FFB loan levels?

Answer. We are hopeful that borrowers will utilize the CFC/CoBank alternative, if they are unwilling to utilize an FFB funded guarantee program. The CFC/CoBank option is not intended to serve as an alternative to the Direct (5 percent) hardship loan program. We believe the \$50 million request for hardship loans in fiscal year 2001 will be adequate to meet the anticipated need. The flow of hardship loan applications has slowed recently.

NATIVE AMERICAN PROGRAMS

Question. The fiscal year 2000 Appropriations Act provided a specific set-aside for water and wastewater programs for Native Americans. Please provide the status on this initiative.

Answer. As provided in the fiscal year 2000 Appropriations Act, the Rural Utilities Service has allotted \$12 million for Native Americans. That amount is being retained in the National Office reserve. State Offices may request funds from the National Office reserve. The Rural Utilities Service has limited individual grants to \$1 million. As of March 1, 2000, \$2,555,500 has been allocated for 7 projects. Based on inquiries received, it appears that all of the funds will be used.

WIC VENDOR ACCESSIBILITY

Question. I am concerned about the way food assistance is, in some instances, distributed to those in need. For example, I understand USDA is considering a rule change for the WIC program that might limit the availability of WIC-participating retail outlets. What is the rationale for this limitation and what impact will it have on the ability of some WIC-eligible persons to participate in the program?

Answer. USDA policy is that WIC retailers should be accessible to WIC recipients and that they should carry and have available all of the WIC foods, taking into account cultural preferences. There is no effort to reduce the number of retailers. Stakeholders are cognizant that there is a cost to the States to adequately manage and monitor retailers. States seek to maintain an appropriate number—balancing recipient access and the State's ability to adequately monitor the program to prevent abuses. We anticipate no particular change affecting rural communities. The changes to the rules are to ensure that only qualified retailers, accessible to recipients, are authorized.

PUERTO RICO'S EBT PROGRAM AND PROGRAM ABUSE

Question. Another distribution problem, unfortunately, is tied to program abuse or, in some cases, rules that allow people to circumvent the intent of nutrition programs. For example, I understand that an EBT pilot has been implemented in Puerto Rico that has few if any restrictions on how nutrition assistance is distributed and potentially could impair the program's ability to get the intended benefits to the most vulnerable participants such as children. Could you describe what the Department is doing to curtail program abuse, and can you speak to the situation in Puerto Rico and what you are doing to make sure benefits are properly distributed?

Answer. First, with respect to Puerto Rico's program—based on a congressional mandate, Puerto Rico began issuing cash nutrition assistance benefits in lieu of food stamps in the early 1980's. Several studies of this benefit delivery system established that it did not significantly affect recipients' expenditures on food. In 1999, when Puerto Rico began to pilot EBT, no new limitations were placed on the nutrition assistance funds. However, I am told that Puerto Rico will look into the possibility of limiting all or part of its EBT benefits to food purchases sometime in 2001.

With respect to efforts to curtail program abuses via EBT, the program has been having growing success. But EBT is not a panacea that can address all program waste, fraud and abuse. And, for a cash program like Puerto Rico has been operating, much of the anti-fraud advantages of EBT are moot. The cash system does not have "ineligible items" and trafficking.

In the continental U.S., however, the Food and Nutrition Service aggressively tackles fraud via the EBT system.

I will ask the Food and Nutrition Service for additional detail on both of these topics.

[The information follows:]

FNS aggressively tackles trafficking food stamp benefits for cash to ensure benefits are used properly and not diverted from their intended purpose. FNS actions to detect and punish store traffickers include:

The Anti-Fraud Locator Using EBT Retailer Transactions (ALERT) system helped the FNS Compliance Branch target its investigations of authorized stores. In fiscal year 1999, the Compliance Branch completed 517 retailer investigations which involved the trafficking of food stamp benefits for cash. Due to serious violations of program benefits, including trafficking and selling ineligible items such as alcohol or tobacco, 1,365 stores were disqualified from being able to accept food stamps or sanctioned with Civil Money Penalties in fiscal year 1999.

To increase States' ability to finance activities to disqualify recipient traffickers, the Food Stamp Program has issued a proposed rulemaking which would allow the States to establish claims for the misused benefits and to retain 35 percent of collected amounts. This regulation is expected to be published in final this year.

Puerto Rico began issuing cash nutrition assistance program benefits in July 1982. Studies of this benefit delivery system in 1983 and 1985 established that issuing benefits in this form did not significantly affect recipients' expenditures on food.

Public Law 99-198 of December 23, 1985 allowed the Commonwealth to continue using its cash program which has remained in operation since then. A pilot EBT program was implemented in two local offices in Puerto Rico in November 1999. This EBT project is scheduled to be expanded to the entire Commonwealth within a year. Puerto Rico will look into the possibility of limiting all or part of its EBT benefits to food purchases sometime in 2001.

BREAKFAST PILOT

Question. Last year Congress provided USDA with new funding of \$7 million to carry out a pilot project to research the connection between consumption of a nutritious breakfast and academic performance. Please provide the Committee with an update on the status of the School Breakfast Pilot.

Answer. USDA is continuing preparations to commence the demonstration of universal free school breakfast in School Year 2000-2001. A rigorous study design has been developed with the assistance of a contractor and a panel of national experts. A number of school districts, across the nation have also expressed interest in this, and selection of an evaluation contractor is underway.

[The information follows:]

A Federal Register notice announcing the application process for school food authorities (SFAs) who wish to participate was published in early December, 1999.

School districts throughout the country have expressed interest in participating in the pilot project demonstration. A total of 383 school districts from 43 States submitted applications. Selection of the six school districts to participate in the pilot projects will occur in early Spring. These districts will be selected to be geographically dispersed, with a blend of urban and rural areas, and consideration given to socioeconomic conditions.

In addition, the process of selecting an evaluation contractor to collect and analyze data and produce a final report is underway. The request for proposals (RFP) for the evaluation of the pilot projects were mailed to over 60 potential offerors in February, 2000. We expect to make a final selection of the evaluation contractor by early Summer.

SCHOOL BREAKFAST PARTICIPATION

Question. Several years ago, Congress eliminated funding for school breakfast start up funds. However, in some states, including Wisconsin, school participation in breakfast lags well behind participation in the National School Lunch program. What steps is USDA taking to improve participation in school breakfast?

Answer. In recent years, we have made a concerted effort to enhance the availability of the School Breakfast Program. These efforts have borne fruit. The number of schools participating in the program and the number of children receiving breakfasts have more than doubled.

A number of factors undoubtedly contributed to this growth: the start-up grants may have encouraged schools to participate because the cost of special equipment was defrayed; also, Congress added 6 cents on top of the basic reimbursement. And, just as importantly, schools and communities recognized the value of school breakfasts for both health and learning. Currently, about 7 million children participate daily at about 70 thousand schools around the country.

Nevertheless, we are aware that participation in the breakfast program lags far behind the numbers for the National School Lunch Program, and we are working with our partners in the U. S. Department of Education to help school administrators understand the contribution that school breakfasts can make to academic achievement and to deal with local issues such as bus schedules and to try to have

schools provide children with an environment conducive to eating school meals and allowing them enough time to do so. We must stress, however, that in some ways the most important factor is parental and community involvement. If people understand that breakfast is a vital part of the school day, they will be receptive to making the breakfast program available in their schools and encouraging their children to eat the breakfasts that are available to them.

SCHOOL BREAKFAST REIMBURSEMENT

Question. I am concerned by anecdotal reports that the reimbursement schools receive for school breakfast, even for free meals, does not cover the costs of providing the meals. Has USDA examined this concern? If so, what has it concluded?

Answer. The Food and Nutrition Service completed a study on school lunch and breakfast costs in the past few years. The study suggested that the revenue stream to schools, including Federal and child payments, exceeded the cost of meal production. Funding for breakfast program schools generally were able to deliver meals within the maximum reimbursement rates provided. The majority of breakfasts are reimbursed at the "severe need" free meal reimbursement rate of \$1.30, with many others supported at the regular free rate, \$0.21 less. Let me provide some additional information from the study.

[The information follows:]

The Department has conducted a study, the *School Lunch and Breakfast Cost Study*, concerning food costs and school revenues. The study, on a statistically representative sample of schools which participate in the National School Lunch and School Breakfast Programs, examined food preparation and other costs (e.g., utilities) which schools incur in operating these programs, and compared these costs with the total revenues the schools receive from USDA reimbursements, student payments for reduced price and paid meals, and other program revenue sources.

The study found that, overall, the revenues from all sources obtained from reimbursable lunches exceed the cost of producing these meals, and that "SFAs appear to subsidize breakfasts and non-reimbursable meals with surplus revenues derived from reimbursable lunches." In other words, food service managers treat their non-profit food service accounts as an aggregate; they balance total revenues for all the programs they operate, but not for each program separately. Because nearly all schools that participate in the breakfast program also participate in the lunch program, most school food service accounts operate on a break-even basis.

Schools with a high percentage of low-income students are also eligible to receive additional reimbursement for breakfasts to free and reduced price eligible students if their costs of production for these meals exceed the regular reimbursement rates, less any payments received from students for reduced price breakfasts. Schools may be reimbursed for their full production costs for these breakfasts up to a maximum rate in school year 1999–2000 of \$1.30 for a "severe need" free meal, and \$1.09 for a free breakfast. Reduced price meals are reimbursed at \$0.21 less, and paid meals are reimbursed at \$0.21 in all schools. In fiscal year 1999, "severe need" breakfasts accounted for 76 percent of all free and reduced price breakfasts, and 65 percent of all program breakfasts served nationwide.

The Department is required by law to establish uniform reimbursement rates and procedures for school food programs. These rates may not exceed costs in a some very high cost areas.

However, the available information suggests that reimbursement levels do not hinder schools' participation in the breakfast program. Approximately 73 percent of schools which participate in the school lunch program also participate in the breakfast program.

The Department's *School Nutrition Dietary Assessment* study found that those which do not participate have decided not to do so based on perceived lack of need for the program, scheduling and busing issues, or other issues not related to the level of program reimbursements. Therefore, it appears likely that the level of reimbursement for breakfasts is adequate.

TEMPORARY INCREASE IN BREAKFAST REIMBURSEMENT RATE

Question. Would a temporary increase in the per meal reimbursement for school breakfast encourage additional school participation?

Answer. It is possible that some schools might start up a program if the initial reimbursement were higher. Although, with 73 percent of school lunch schools in the breakfast program, and the size of the reimbursement rate not really figuring into the decision of the other schools not to participate, we believe the number of new schools would not be large. While the costs could be kept down by limiting such a proposal only to new schools, since the schools would know that the higher rates

are temporary, we think they will be reluctant to make the investment to begin and continue to operate the breakfast program.

WIC FARMERS MARKET FUNDING DELAYS

Question. The fiscal year 2000 Appropriation Act provides for \$10 million to be made available for the WIC Farmers Market Nutrition Program within 45 days of enactment and an additional \$5 million to be made available upon a determination that caseload will be maintained. Since for planning purposes it is important for farmers market groups to know well in advance the level of funding available for the program, a long delay in the availability of the contingent \$5 million could have been problematic. Have there been any problems regarding the availability of total funding for the WIC Farmers Market program due to the time of the release of funds?

Answer. Yes, some States have complained that delays have occurred in program implementation due to the uncertainty created by the contingency provision. We would much prefer that the entire appropriation be made available at the start of the year.

IMMEDIATE AVAILABILITY OF WIC FARMERS MARKET FUNDING

Question. If the WIC Farmers Market Program funding is not moved to the Commodity Assistance Program (as suggested in the budget request) but instead is retained in the WIC account, would it be advisable to include language that would immediately make available the full amount (whether the level be \$15 or \$20 million) even though a contingent amount would be based on the availability of carry-over funds?

Answer. Yes, we would prefer that the full amount be made available at the beginning of the year.

CHILD AND ADULT CARE FOOD PROGRAM POOLING

Question. In Senate Report 106-80, the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Bill, 2000, I asked for language to be inserted that said:

“The Committee urges the Department to provide technical assistance and guidance to those states not maximizing the number of children served under the Child and Adult Care Food Program in their jurisdiction. These states should be encouraged to follow the example of those states that pool a limited amount of Title XX with Child Care Development Block Grant (CCDBG) funds to meet the technical requirement of the current law.”

I also had similar language included in the Senate Report on the Departments of Labor, Health and Human Services, and Education and Related Agencies Appropriations. It said:

“The Committee recognizes that some states have successfully pooled resources from the Social Services Block Grant (SSBG) to maximize the number of children served under the Child and Adult Care Food Program. The Committee believes that the Department could provide technical assistance and guidance to other states so that they may use SSBG resources to serve more children in the CACFP.”

What has the Department done to carry out the directive in Senate Report 106-80 described above?

Answer. I know that we have done our best to carry out the intent of this language. By encouraging States to pool funding streams with Title XX, they can increase the number of proprietary child care centers with 25 percent or more low income children that can participate in CACFP. Expanding the supply and quality of child care is a national objective, so this is very important to us. Allow me to submit some additional information as to how we addressed this.

[The information follows:]

The issue here is the limitation on proprietary child care programs that allows them to participate in CACFP only if 25 percent or more of their children receive support from Title XX, a Federal social services block grant program that assists low income children and other low income persons. Over the years, States have found it necessary to use more and more of their Title XX funds for purposes other than child care, often using other funds to help the low income households with their child care costs. This has had the unintended consequence of disqualifying proprietary child care providers serving the same low income children, simply because some non-Title XX support for low income children is being used. The law, however, permits non-Title XX money to function like Title XX money, if it is put into the same account as some Title XX money. Thus, with a portion of funding coming from Title XX and the rest coming from other sources, all of the funds can function like

Title XX funds for the purpose of measuring the extent of federal support for low income children that a proprietary child care center may be receiving. If they have 25 percent or more supported by this pooled Title XX money, they may qualify for CACFP.

Over the past several years, the Department has provided guidance and technical assistance to State agencies relative to the pooling of Title XX funding. The most recent formal guidance was issued to all Child and Adult Care Food Program State administering agencies on July 6, 1999. That memorandum informed State agencies of the Congressional interest in and support for pooling of Title XX funding; provided guidance on how pooling can be accomplished; and offered technical assistance to States in establishing a pooling mechanism.

In the near future, the Department will be issuing a second memorandum to State agencies. This memorandum will provide information on the Department's recent efforts in this area, including the technical assistance that has been provided to four States, three of which are now using pooling. It will also contain a clarification to the earlier memorandum that may facilitate other States' use of this process.

COORDINATION WITH HHS RE NUTRITION EDUCATION

Question. What is the Department doing to coordinate with the Department of Health and Human Services in these efforts?

Answer. We have worked with the Department of Health and Human Services, the States and others in this effort. Allow me to have the Food and Nutrition Service provide some additional detail.

[The information follows:]

We have worked with the Department of Health and Human Services on this issue in the past in order to fully understand the structure of Title XX funding to the States. We have also worked with Congressional staff, members of the National Child Care Council (a largely proprietary child care organization) and State Title XX and Child Nutrition agencies. As a result of these efforts some States have already begun pooling some portion of their Title XX funds, and other States, including California, are moving toward pooling. The Department issued a memorandum in 1999 encouraging States to consider this approach, and we will be issuing a follow-up memo on this topic in the near future.

AFTER-SCHOOL CENTERS

Question. In Senate Report 106-80, the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Bill, 2000, I asked for language to be inserted that said:

"The Committee urges the Secretary to develop a better strategy to encourage participation in after-school centers by adolescents and older children through programs available under the authorities of the Child Nutrition Act. The Committee is concerned that members of the qualifying age group who lack proper after-school supervision will be more prone to participation in undesirable activities. The use of nutritional programs should be considered an appropriate tool to attract adolescents to a more risk-free environment which should help improve academic performance and reduce the incidence of juvenile crime. In addition, the Secretary is directed to provide information to the Committee relating to the effectiveness of such a program and provide views on the advisability of expanding the availability of free or reduced meals under this authority to children over the age of 12."

Question. What progress has the Department made in developing the strategy asked for in this language?

Answer. Improved child care accessibility and quality is a national priority. We have developed and implemented a strategy to encourage the use of this new after school snack program authority. For example, USDA entered into a partnership with the U.S. Department of Education (21st Century Community Learning Centers), as well as the Department of Justice and its numerous programs designed to help "at risk" youth. USDA has also done promotional work with various organizations, particularly the American School Food Service Association, the National School Age Child Care Alliance, and the National Head Start Conference and more. We have even helped develop a web site to provide one-stop-shopping of Federal resources for local after school programs.

Please allow me to have FNS submit some additional detail on these efforts.

[The information follows:]

The enactment of the William J. Goodling Child Nutrition Reauthorization Act of 1998, Public Law 105-336, significantly expanded the availability of after school snack programs. It made snack reimbursements available to every child through age 18 in every public and nonprofit private school of high school grade and under in

the Nation. Previously eligibility was limited to a small number of schools, and to participants only through the age of 12. It also made snacks available to public and nonprofit private organizations that provide after school programs for children through age 18 in areas in which at least half of the children are eligible for free and reduced price meals. Such programs could operate for participants only through age 12 prior to the Act.

Since the enactment of Public Law 105-336, the Department has undertaken a number of activities to encourage participation in the after school snack programs. The Department has entered into a partnership with the U.S. Department of Education (21st Century Community Learning Centers), as well as the Department of Justice and its numerous programs designed to help "at risk" youth; done promotional work with a number of organizations including the American School Food Service Association, the National School Age Child Care Alliance, and the National Head Start Conference; conducted "Roll Out" sessions in the seven Food and Nutrition Service regions; joined other Federal agencies involved in the Federal Support to Communities Initiative which has developed a web site to provide one-stop-shopping of Federal resources for local after school programs; begun participating in "Federal Fairs" at various sites throughout the Nation at which agencies will promote their after school programs; and developed and distributed an after school snack "success stories" booklet to State agencies. We can assure the Committee that the Department will continue its efforts to make the availability of after school snack programs known to those who might benefit from them.

The Department shares the Committee's belief that after school programs are an effective way of providing supervision to a vulnerable population and that the availability of nutrition benefits can be helpful in drawing children to these programs. For that reason, making these program available to school children through the age of 18 in non-school programs, rather than only in school settings, is something the Department would support in principle. However, given the fact that the after school snack programs established under Public Law 105-336 are relatively new and that information on them is limited, we believe that it is premature at this time to provide the Congress with an assessment of their effectiveness. This is something that could be done after two or three years of program operation.

EXPANDING AFTER SCHOOL MEALS TO CHILDREN OVER 12

Question. Also, has the Secretary developed an opinion yet on advisability of expanding the availability of free or reduced meals in after-school programs to children over the age of 12?

Answer. The Department has been working internally with its regulations to provide programs with a more "seamless" structure, with the idea of making it easier for schools to use school meals programs for more of the student's nutritional needs. Because after school programs appear to be an effective way of providing supervision to a vulnerable population and that the availability of nutrition benefits can be helpful in drawing children to these programs, we certainly support in principle, the extension of after school snacks to all school children through the age of 18 in all school and non-school settings when the programs are primarily organized to provide care for the children. This change would put the benefits available under the Child and Adult Care Food Program (CACFP) on par with those in the National School Lunch Program.

This expanded-eligibility, more seamless program structure would be well received by the school and child care community. There would be some additional cost that would need to be considered, which is why I can only say we support this in principle. But this additional flexibility in the Child and Adult Care Food Program would provide assistance to non-school based community programs targeted to at risk teenagers and this might reduce costly problems elsewhere, creating the budgetary offsets that would be needed to make this change cost neutral if not a savings on a Government-wide basis.

FOOD GLEANING

Question. For several years, the Secretary has encouraged food gleaning. Please provide an update on USDA's efforts to encourage food gleaning activities from both within the public and private sector.

Answer. The Department has encouraged, energized, and provided technical assistance to private, non-profit, and corporate food recovery and gleaning efforts. Such efforts have been increased and incorporated into the broader Community Food Security Initiative. The outcome is a substantial increase in the amount of excess food collected and distributed to the hungry. However, the nonprofit groups are not able to make the necessary infrastructure expansions on their own to dramati-

cally increase food recovery and gleaning efforts. In fiscal year 2001, the Department is seeking about \$5.3 million to assist faith-based organizations and other nonprofit groups in engaging in a wide range of food security, gleaning, and anti-hunger activities. [The information follows:]

USDA has taken the following steps to bolster gleaning activities:

Created or aided grass-roots food recovery projects in over 40 states in conjunction with farmers and ranchers, where USDA's Farm Service Agency has facilitated the donation of over 6 million pounds of excess food.

- Worked with the Department of Transportation to provide support to Second Harvest and other nonprofit groups to transport food that is recovered and gleaned. The project has brought together a consortium of nonprofit groups and industry representatives in assessing needs and developing pilot projects to assist public, private, and non-profit entities in distributing additional food.
- Worked with the nonprofit group World Hunger Year to establish "1-800-GLEAN-IT," a toll-free hotline to provide an easy-to-reach source of information on how to get involved in a local gleaning or food recovery program.
- Distributed over 20,000 copies of a Citizens' Guide to Food Recovery and Gleaning, an easy-to-use "how to manual" on how to start or expand food recovery efforts. Changed USDA crop insurance regulations to allow producers receiving crop insurance to donate any product that is still wholesome from fields that are partially damaged.
- Worked with the National Restaurant Association to produce a guide for its members on how to safely donate excess food.
- Awarded 12 school districts funds to develop "best practices" to increase the donations of excess food from school meals and to develop innovative ways to engage students in fighting hunger through community service.
- Utilized a USDA report which correlated the location of farmers' markets to the location of food banks and other food recovery groups to begin actively working to increase donations from farmers' markets to food banks and other recovery groups throughout the country.
- In collaboration with the Department of Defense, and the General Services Administration, USDA has donated more than \$8 million worth of excess canned food.

COOPERATOR PROGRAM

Question. Beginning with fiscal year 2000, funding for the Foreign Market Development (Cooperator) Program is mandatory. A letter from USDA was included in the Congressional Record during Senate consideration of the fiscal year 2000 Agriculture Appropriations Act which indicated that the funding level for the Cooperator Program would remain the same as in the previous year. I understand that OMB concurred in this commitment. What was the actual program level of the Cooperator Program in fiscal year 1999, including any carryover funding?

Answer. For fiscal 1999, the FAS appropriation provided \$27.5 million in new funding for the Cooperator Program. Drawing upon available carry-over balances in addition to the new funding, FAS was able to approve marketing plans of nearly \$34.0 million in 1999.

Question. Does the Department intend to maintain, at least, the total fiscal year 1999 level in fiscal year 2000 and fiscal year 2001? If not, please explain.

Answer. Yes, the President's Budget provides \$27.5 million, funded from CCC, for the Cooperator Program in both 2000 and 2001. These funds, coupled with carry-over balances, are sufficient to continue marketing plans at the fiscal 1999 level.

DAIRY EXPORT INCENTIVE PROGRAM

Question. International markets in dairy trade are becoming increasingly important to our Nation's dairy farmers. But because world dairy markets are so badly distorted, U.S. milk producers have relied on the Dairy Export Incentive Program to help them compete in world markets. I am concerned, however, about the future of this program in fiscal year 2001, given our WTO obligations to reduce both the volume of DEIP exports as well as the value of product exported. This is particularly a concern given the low milk prices predicted for the duration of this year and surplus production of milk powder. Please tell this Committee what will be the impact of our trade agreement obligations on both the opportunities of U.S. dairy farmers in world markets and the price depressing effect of excess product in this country.

Answer. Beginning July 1, 2000, the United States will be in the final year of phasing in Uruguay Round commitments limiting the volume of subsidized exports. Limitation commitments applicable to the total value of export subsidy bonus awards, will take effect with the beginning of fiscal 2001.

The DEIP was originally intended to be a trade policy tool to counteract the export subsidies and other unfair policies of competing exporters, especially the European Union. It was not designed as either a price support program or a surplus disposal program for dairy products, although it clearly has provided benefits in terms of helping support prices and moving dairy products onto world markets.

Beginning with the 1996 Farm Bill, more emphasis has been placed on the market development aspects of the DEIP to help lay the groundwork for expanded U.S. commercial dairy product exports in anticipation of ongoing reforms in domestic and international dairy policies. While difficult to quantify, the DEIP has encouraged greater interest by the U.S. dairy industry in international markets. Today, more than 90 percent of U.S. cheese exports are unsubsidized, and exports of other unsubsidized dairy products such as ice cream, yogurt, whey products and many dairy based food ingredients have experienced steady growth despite ongoing economic difficulties in Asia, Russia, South America, and elsewhere. Although the domestic market will continue to be of greatest importance to U.S. dairy producers, we see growing opportunities for exports to the benefit of the entire U.S. dairy sector.

Question. What does USDA plan to do to mitigate the impacts of significant reductions in subsidized exports?

Answer. First, it is important to note that the Department will continue to help facilitate commercial exports with the program. DEIP will continue, although at a reduced level as noted in your question.

In addition, we will have to work with the U.S. dairy industry in other export related activities, such as foreign market development activities. For example, to help expand commercial dairy product exports, the Foreign Agricultural Service has awarded nearly \$2.5 million this year to the U.S. Dairy Export Council for a variety of foreign market development purposes. At a time of tightened budgets for foreign market development, the amount dedicated to promoting U.S. dairy product exports has more than doubled since 1995. We believe this is money well spent, having contributed to expanding non-subsidized dairy product exports, and opportunities can only improve as Asian economies recover, China enters the WTO, and the world economy in general accelerates.

Question. In the event that WTO rules impair the effectiveness of the DEIP program, what opportunities are there to include dairy products in some form of humanitarian assistance?

Answer. Food aid and humanitarian assistance provides additional outlets for surplus nonfat dry milk. Already we have programmed 25,000 tons of surplus milk powder for donation under the authority of section 416(b). We will continue to look for additional opportunities to provide dairy products as part of U.S. humanitarian assistance efforts.

Question. Please provide data on expected volume of subsidized dairy products, and the value of the subsidies for both the U.S. and European Union when the WTO obligations are completed next year.

Answer. That information will be provided for the record.

[The information follows:]

	United States		European Union	
	(Dollars)	(MT)	(ECU)	(MT)
Butter and butter oil	30,497,220	21,097	947,800,000	399,300
Skim milk powder	82,463,935	68,201	275,800,000	272,500
Cheese	3,635,638	3,030	341,700,000	321,300
Other milk products	20,974	34	697,700,000	958,100

Exchange rate US \$1 = 1.03 ECU as of February 29, 2000.

AID TO RUSSIA

Question. While food aid to Russia serves both humanitarian objectives and as an outlet for U.S. production, concerns remain about the food distribution process in that country. Please provide information regarding safeguards in place to ensure proper distribution of food to the Russian people and note any problems that have or are occurring.

Answer. USDA took many steps to minimize any irregularities within this very large program. The agreements with the Government of Russia included several clauses on monitoring and the proper uses of commodities and proceeds from the sale of commodities. A critical part was the creation of a bilateral working group that discussed issues and developed solutions to any irregularities.

USDA and the U.S. Embassy in Moscow assigned several monitors to travel throughout Russia to observe commodity arrivals and speak with recipients of the commodities to ensure that commodities were actually received. The monitors, the working group, and the Government of Russia prepared shipment, arrival, and distribution reports that provided a path from the arrival of the commodity in Russia to the recipient. No major irregularities in distribution were observed. Any discrepancies were discussed and resolved within the bilateral working group.

A few issues arose relating to the quality of commodities, but the bilateral working group and the U.S. industry worked with the Russian Government and customs officials to work out these difficulties. Finally, private voluntary organizations were instrumental in delivering commodities to the most needy individuals and institutions. Organizational controls and reporting requirements helped to ensure proper distribution by these groups.

WORLD HUNGER

Question. Several years ago, you used authorities of the section 416(b) program to make surplus U.S. commodities available for donation to overcome world hunger. Of course, the Public Law 480 programs, like Title II, have long proven to be of vital importance to help combat world hunger. These programs also have the added benefit of providing an outlet for U.S. production, which will become increasingly important as the U.S. complies with its WTO obligations. However, the budget request for 2001 shows a major reduction in all Public Law 480 program levels, including a significant reduction in the Title II account. In addition, the budget indicates that section 416(b) donations during 2000 will return to more traditional (which means lower) levels. I find this combination of facts troubling. Can you describe your understanding of world food needs now and in the foreseeable future and, how closely are you working with USAID to ensure that those needs are met?

Answer. Current and foreseeable food needs are considerable. The Economic Research Service produces an annual Food Security Assessment which reviews the world food situation and identifies food aid needs around the world. This is the basis on which decisions on foreign food aid programming can be made.

The Foreign Agricultural Service and USAID meet several times each month to coordinate the U.S. government's food aid programs. USDA, USAID, the State Department, and OMB are members of the Food Assistance Policy Council, chaired by USDA, that establishes policy for U.S. food aid activities and reviews food aid allocations. In recent months, the FAPC has met frequently to review food aid concerns around the world, and to ensure that critical food aid needs are met on a timely basis.

INTERNATIONAL TRADE SANCTIONS

Question. Last year, considerable debate occurred in Congress on the subject of trade sanctions and their effect on the U.S. agricultural sector. What is the current status of international trade sanctions that affect U.S. agriculture?

Answer. On April 28, 1999, President Clinton announced the administration would exempt commercial sales of food, medicine and medical equipment from future unilateral economic sanctions regimes where it had the authority to do so, and would apply that policy immediately, with appropriate safeguards, to currently embargoed countries. The Treasury Department's Office of Foreign Assets Control issued regulations last July to amend the current sanctions regimes for Iran, Libya, and Sudan to implement the new policy. This significant step by the Administration to rationalize U.S. sanctions policy has already resulted in food sales to Iran and Libya.

The Administration also has taken steps during the past year with respect to sanctions imposed on certain individual countries. A summary of those actions will be submitted for the record.

[The information follows:]

Recent administration actions on sanctions

North Korea.—On September 17, 1999, the President announced some easing of sanctions against the Democratic People's Republic of Korea (North Korea) under the Trading with the Enemy Act, Defense Production Act, and the Export Administration Regulations. The easing of sanctions will allow most consumer and other non-sensitive goods to be available for export to North Korea and will allow importation of most North Korea-origin goods to the U.S., including raw materials. Investment in North Korea sectors such as agriculture, mining, petroleum, timber, cement, transport, infrastructure, travel/tourism will be permitted. To support the goods trade, most commercial and personal funds transfer will be allowed between

U.S. and North Korean persons and transport restrictions will be relaxed to allow commercial air and sea transport between the U.S. and North Korea for passengers and cargo, subject to normal regulatory requirements.

India and Pakistan.—On October 27, 1999, the President used new authority granted by Congress in the Defense Appropriations Act to continue waivers on all economic sanctions, including USDA agricultural credit guarantees that apply to India under the Glenn Amendment. In the case of Pakistan, however, the President chose to waive only sanctions related to USDA agricultural credits and U.S. commercial bank lending.

Cuba.—On January 5, 1999, the President announced that the United States Government would authorize case-by-case licensing of food and agricultural exports to independent, non-governmental entities in Cuba.

INTERNATIONAL TRADE SANCTIONS

Question. Do you foresee any changes in the status of these or other countries in the coming year in the absence of Congressional action?

Answer. The Administration recognizes the need to rationalize sanctions policy. The Administration's steps with regard to food, medicine and medical equipment are appropriate first steps, and the Congress has taken a similar step in proposing sanctions reform. It is necessary that both branches of government work together if U.S. sanctions policy is to be rationalized. The Administration has worked and will continue to work with interested parties in Congress towards achieving meaningful sanctions reform.

We continue to believe that comprehensive sanctions reform legislation must include meaningful waiver provisions for the President, symmetrical disciplines imposed on the executive and legislative branches with respect to the process by which new sanctions can be imposed, a determination that the expected gains to the United States outweigh the expected costs to other national interests, and a preference for multilateral rather than unilateral sanctions.

Question. Please quantify, if possible, the economic shifts that might occur to the U.S. agricultural sector if these sanctions were lifted or substantially modified.

Answer. According to a recent USDA analysis, the removal of unilateral sanctions on six countries—Cuba, Iran, Iraq, North Korea, Libya and Sudan—could have increased annual shipments of U.S. agricultural products by 0.9 to 1.5 million tons annually.

While the losses are only a small percentage of total U.S. agricultural exports, American producers and exporters would like an opportunity to compete in those markets. For sanctions to be effective, they must have broad multilateral support. Our ability to deny key economic benefits unilaterally to any country is sharply limited because many nations can supply the same kinds of food and agricultural commodities.

Question. What is the current Administration position on the subject of international trade sanctions as they relate to agriculture?

Answer. The current Administration position on international trade sanctions as they relate to agriculture is based on two basic principles. The first is a humanitarian principle that basics, such as food and medicine, should not be used as a tool of foreign policy. The second is an economic principle that our sanctions policy should not impose undue burdens on our farmers.

QUESTIONS SUBMITTED BY SENATOR BYRON L. DORGAN

FARM SAFETY NET

Question. You recently made the following statements * * *

“As you all know, many in the farm sector have not shared in the overall national prosperity * * * That's why the USDA budget includes a new safety net proposal worth \$11.5 billion over the next two years. I believe that this plan represents a shift in farm policy philosophy, one that I hope will guide lawmakers as they begin to think about the 2002 farm bill.”—*Press Release, February 7, 2000*

The farm financial picture would be much different had Congress not passed emergency aid legislation in 1998 and 1999. Without the added government payments, net cash income would have likely fallen below \$50 billion in 1999, the lowest level since the farm financial crisis of the mid-1980s. Rising crop surpluses, continued low prices and declining incomes will contribute to increasing farm financial stress in 2000, indicating a need for further Federal assistance. However, added assistance should not be made in the form of emergency legislation with the bulk of the payments in the form of Agricultural Market Transition Act (AMTA) payments.

That approach, taken the past two years, is not in the best interests of farmers and taxpayers, as the assistance is ad hoc and ineffectively targeted.—*News Release, February 2, 2000*

I assume you stand by these remarks.

Now, the Chairman of the Ag Committee has likened the emergency aid legislation in 1998 and 1999 to “ad hoc counter-cyclical” farm support, and thus feels there is no need to change farm legislation. Do you believe that the banks that finance the planting of crops in Rural America share the Chairman’s view and are happy with cash-flowing farms based on the whims of whether or not Congress will pass yet a third emergency aid package?

Answer. No, I believe bankers would be happier knowing with certainty that their customers will be safeguarded with a counter-cyclical payment. Producer payments based on ad hoc emergency assistance are generally unknown at the time loan applications are reviewed and therefore, add more risk to the banker’s portfolio.

Question. Given the counter-cyclical proposal made by the Administration, would the Administration be willing to support a move in Congress to change or amend the current farm program, popularly known as “Freedom to Farm,” provided any change in the support structure was counter-cyclical and targeted in nature?

Answer. Yes, the Administration’s safety-net proposal is intended to be an amendment to the Federal Agriculture Improvement and Reform Act of 1996 (FAIR Act) and operates during the remaining life of the FAIR Act. However, the Administration has proposed that its Supplementary Income Assistance Program (SIAP), the key income support provision in the safety net package, be provided in addition to existing FAIR Act income and price support provisions. The Administration’s proposal is counter-cyclical: producers of an eligible crop would receive a payment sufficient to bring the gross income for the entire U.S. production of the crop up to 92 percent of the average gross income of the crop during the preceding five crop years. If income equals or exceeds 92 percent of the five-year average, then no payment would be made. The proposal is targeted in two ways: first, the payments would only go to producers whose crops are suffering an income shortfall and, second, SIAP payments would be limited. The sum of the fixed FAIR Act payments plus the SIAP payments could not exceed \$30,000 per producer. The Administration would consider alternative specifications of a supplementary income assistance program provided that the program is counter-cyclical and targeted.

ADMINISTRATIVE FUNDING LEVELS

Question. The reorganization of USDA was to coincide with the government becoming less involved in the business of farming. The various agencies serving farmers were straight-lined, as far as staff personal levels were concerned, and budgets for administration were scrutinized and kept at bare bone levels.

We now know that “the government” did not disengage from agriculture. In fact, due to the various emergency disaster packages which were necessary to implement due to the ongoing farm crisis, USDA is now involved in administrating programs for farmers at record levels. This has caused a backlog of work in local county Farm Service Agency offices.

Furthermore, the Risk Management Agency has been reforming crop insurance to make it more affordable while at the same time, offering a higher level of coverage. In 1993, one basic crop insurance policy was available. Now, there are a number of policies available, with more coming on line each year. However, these new products are being offered with basically the same number of staff.

Computer technology notwithstanding, the proper administration of this growing array of programs and services being provided will need to be addressed. Do you anticipate that the level of funding proposed for FSA and the RMA in this budget is sufficient to administer these programs?

Answer. The FSA staffing levels proposed in the budget reflect a decrease of temporaries due to a current assumption that there will be no new programs of economic or disaster assistance legislated for fiscal year 2001. There is also no new FSA staffing proposed for the proposed Safety Net Initiative. Pending legislation to reform the crop insurance program may require a significant increase in RMA administrative resources, including increases in staffing and funding for computer support. As events unfold for 2001, we will need to work with OMB and the Congress to address staffing needs when specific workload impacts can be determined.

RURAL EMPOWERMENT ZONES AND ENTERPRISE COMMUNITIES

Question. This year’s budget proposes to provide mandatory funding for \$15 million in grants annually for Round II Rural Empowerment Zones and Enterprise Communities (EZ/EC). This approach, however, has been tried unsuccessfully in the

past. Last fall, the conferees of the VA–HUD Appropriations Conference Committee struggled to find discretionary funds to make sure that our commitment to rural EZ/ECs was not abandoned after it was apparent that the plan to provide grants through mandatory funding had failed. Please provide for the record a statement outlining what the Administration will do differently this year to actually move legislation forward that would grant mandatory funding for EZ/EC.

Answer. The Administration will be working with the House Committee on Ways and Means and the Senate Finance Committee on securing the final eight years of mandatory funding through the Social Services Block Grants administered by the Department of Health and Human Services. This also was the funding source for the first round of Empowerment Zones/Enterprise Communities. It is our understanding that a bill containing the funding will be considered by the Oversight Subcommittee of the Ways and Means Committee in the very near future.

Question. What assurance can you give the Members of this subcommittee that we won't have to struggle to find discretionary funds for this purpose?

Answer. We will make every effort to secure mandatory funding for the final eight years as was outlined in the Administration's original proposal.

REGULAR MULTILATERAL FOOD AID PROGRAM

Question. USDA's own Economic Research Service estimates that global food aid requirements in 2000 are expected to be at least 14 million metric tons, not including emergency needs. However, the Administration's request for global food aid (Public Law 480 Title II) for fiscal year 2001 is less than that estimated to be distributed in the current year. Why in the face of growing global food aid needs has the Administration requested a smaller allocation for Title II in fiscal year 2001 (\$837,000,000) than it estimates spending in the current year (\$967,000,000)?

Answer. The Public Law 480 Title II program level for 2000 is higher than it has been in recent years due to special circumstances. An unusually large amount of funds—\$123 million—carried over from 1999 to 2000, and these have been made available for programming this year.

The President's budget requests \$837 million for Title II in 2001, which is an increase of \$37 million above the level of funding appropriated for 2000. We believe the funding requested should be adequate to help meet global food needs in 2001. This level of Title II programming will, of course, be supplemented by food aid commodities made available through other programs and authorities.

SURPLUS COMMODITY PROGRAM

Question. Last year, USDA purchased more than eight million metric tons of wheat and other grains from hurting U.S. farmers and donated it to needy countries under CCC authority. Last October, USDA announced that only three million tons of surplus commodities would be purchased in the current fiscal year. Thus far, however, only a little over 800,000 tons has been purchased by USDA—more than a third of the way through the current fiscal year. At a time when U.S. agricultural production and carryover stocks are at record high levels, and farm-gate prices are at historic lows, why hasn't USDA used its authority under the CCC Charter Act and section 416(b) to help offset the crisis in farm country by purchasing surplus commodities for countries in need?

Answer. USDA is using its authorities to help improve our export performance and support farm prices and income. In the case of foreign food assistance, this year, we expect to provide nearly 4 million tons of commodity donations to food deficit countries under the authority of section 416(b) of the Agricultural Act of 1949. When coupled with assistance we will be providing under other USDA program authorities, total USDA food aid programming should reach nearly 6 million tons. This amount will be supplemented by donations made under the Public Law 480 Title II program, which is administered by AID and, thus, total U.S. food assistance could total as much as 9 million metric tons this year.

QUESTIONS SUBMITTED BY SENATOR RICHARD L. DURBIN

ANTITRUST IN THE LIVESTOCK INDUSTRY

Question. The Office of the General Counsel (OGC) is budgeted at \$32.1 million and 350 staff years in 2000; to \$36 million and 370 staff years in 2001, increases of 12 and 6 percent respectively. Will these additional resources include a focus on antitrust in the livestock industry?

Answer. The proposed budget for fiscal year 2001 reflects OGC's heightened emphasis on concentration issues, food safety, natural resources and civil rights. As

part of its emphasis on concentration issues, OGC will provide substantial legal services to the Grain Inspection, Packers and Stockyards Administration in the enforcement of Packers and Stockyards Act provisions that support fair trade practices and competition in the livestock industry.

Question. How many lawyers will work on antitrust and competitiveness issues in the livestock industry?

Answer. Because of budget constraints in fiscal 2000, OGC has been unable to fill attorney positions vacated by attrition. Currently, there are 3.5 FTEs in attorney positions that work on competitiveness issues in the livestock industry. If OGC receives its requested appropriation for fiscal 2001, we would expect to add attorney positions such that there would be at least 5 FTEs working on concentration and competitiveness issues in the livestock industry.

LIVESTOCK PILOT PROGRAM

Question. Will Illinois counties be included in any pilot programs in risk management to be instituted for livestock producers?

Answer. When authorized, RMA will follow a very deliberate process to determine the scope and area of availability of pilot programs that are initiated. Factors involved in that process include producer interest, economic value for the area (State and counties), data availability, and resource availability and the feasibility of the pilot plan of insurance to meet the specific needs of the producers in an area. Although Illinois counties may be included in such a pilot program, it is impossible to determine which counties will be included in a pilot at this time.

EXPORT ENHANCEMENT PROGRAM

Question. EEP funding for fiscal year 2001 in your budget is set at \$478 million. Less than \$3 million has been used under EEP annually since 1997. EEP programming is currently limited because of world supply and demand conditions. Given this situation, shouldn't we consider a legislative change so that we can use these resources for other activities, including food aid and market development?

Answer. Yes, the Department shares your view. In conjunction with the budget, the Administration again this year will submit legislation to authorize the Secretary of Agriculture to reallocate unobligated EEP funds to support other export program activities, such as market development and food assistance. We understand that legislation similar to the Administration's proposal has already been introduced in the Senate.

U.S. ACTION PLAN ON FOOD SECURITY

Question. As you know, I included language in last year's appropriations bill calling upon the Administration to specifically request funding in fiscal year 2001 to implement the U.S. Action Plan on Food Security. What we see instead is a 17 percent drop in Public Law 480 funding (from \$1.23 billion to \$1.02 billion), and no specific program funding for the Action Plan. Can you explain the Administration's lack of commitment to this important issue?

Answer. USDA is committed to promoting both global and domestic food security. International food aid is one part of our work to implement the U.S. Action Plan on Food Security. The decrease in the proposed 2001 Public Law 480 program level occurs because of large carryover funding balances in the Public Law 480 programs which carried over from 1999 into 2000. Public Law 480 Title I carryover funds were relatively large because the large scale of section 416(b) foreign donations in 1999 reduced the demand for Title I assistance. Also, a portion of the emergency Public Law 480 Title II funds provided in 1999 were carried over to 2000.

USDA is working closely with other agencies to develop a detailed implementation plan to determine how we can best contribute to meeting our goal of halving malnutrition on a global basis by 2015. We hope to have a unified plan for the U.S. Government by late spring. This will provide a guide for future budget requests to implement the action plan.

The Economic Research Service (ERS) has produced an important study of why countries are at risk for food insecurity and examines ways we can help. ERS classified its global research, statistics and outreach as a high priority area and has budgeted for research collaboration with appropriate institutions in developing countries on issues critical to both the U.S. and foreign governments to implement the Action Plan on Food Security. Emphasis will be placed on developing better science, more efficient technology transfer mechanisms, better information for market and policy decisions, and creating a safer and more secure world food supply.

SECTION 416(B) DONATIONS

Question. Similar to the decline in Public Law 480 funding, section 416(b) seems to be in decline. Yet, the most recent Food Security Assessment indicates an increase in the current status quo food gap over the previous year's report—from almost 11 million tons to 12.7 million tons. How can we be giving less to programs like the World Food Program when the need is greater than ever?

Answer. We are continuing to make available large quantities of commodities to the World Food Program (WFP) during fiscal year 2000. At present, we estimate we will program a total of four million tons under section 416(b) authority this year, of which approximately one million tons will be through the WFP. This is in addition to the donations provided to WFP under the Public Law 480 Title II program.

Question. With regard to section 416(b), we are four months into fiscal year 2000 and I'm concerned that a section 416(b) soybean program has not been initiated and very little wheat has been produced for donations. For soybeans, I understand that private voluntary organizations, such as CARE, Catholic Relief Services, and Africare, developed section 416(b) proposals with the assistance of U.S. soybean producers. In sub-Saharan Africa, where 70 percent of the population lives in poverty, these programs would improve HIV/AIDS prevention, construct community-managed irrigation, provide literacy training, and introduce improved agricultural practices. Why have the fiscal year 2000 section 416(b) soybean and wheat programs been delayed?

Answer. Concerns regarding the overall U.S. budget situation this year required some time to assess. The final calculations of the non-Social Security budget surplus were not complete until mid-January. This was a key piece of information for the Administration as it considered additional budget allocations, including those to the agriculture sector. With the release of the President's budget on February 7, the Administration was able to move ahead with an announcement on section 416(b) programming.

While assessing the overall budget situation, USDA staff compiled production and trade data on a number of countries experiencing food import needs, but lacking large financial resources. Developing such information takes some time both for USDA to compile and for other agencies to review. All of this activity was on-going to provide sufficient information to make country/commodity decisions once the overall budget situation was clear.

Question. When can we expect to see them initiated?

Answer. USDA intends to program close to 4 million metric tons of commodities to nearly 50 countries in 2000. We are actively working with foreign governments and private voluntary organizations. A number of agreements have already been signed, including agreements for Bosnia, Ethiopia, Jordan, Indonesia, and the World Food Program.

FOOD AID TO AFRICA

Question. I traveled to Africa in January and had an opportunity to see U.S. food aid programs in action. I was impressed and heartened by direct feeding programs as well as programs that sell U.S. food products at low cost to finance development projects. But I was overwhelmed by the impact of AIDS on Africa—particularly by the millions of children being left orphaned by the epidemic and the devastating impact on African countries' economies. I believe U.S. food aid could be used to target communities heavily affected by AIDS. I introduced a bill to target \$50 million of U.S. food aid for nutritional assistance for people living with AIDS, for families and children affected by AIDS, and for development projects for communities heavily impacted by AIDS. I would like to get your view on the potential for U.S. food aid being used to help those children, families, and communities affected by AIDS in Africa and elsewhere in the world.

Answer. In addition to food donated through the World Food Program to needy people in Africa, USDA works with private voluntary organizations (PVOs) to target African and other countries with humanitarian and development programs. USDA anticipates working closely with PVOs to target programs that can be of assistance to AIDS-affected communities. We will review proposals for the most affected countries and seek to take advantage of programming opportunities.

FACILITY MODERNIZATION

Question. Six USDA/ARS facilities were included in the budget. The Peoria Lab was not. Although it was not specifically listed, a need still exists for modernization efforts. What is the Department/Agency doing to help expedite the modernization of the Peoria ARS Lab?

Answer. Modernization has been ongoing at the Peoria Lab since 1993. The scope of the modernization includes renovation of the North Wing (Pilot Plant), Chemical Wing, South Wing (Biological Wing), Administration Wing, and upgrade site utilities and infrastructure improvements.

The site utilities and infrastructure improvements are complete. The North Wing Modernization is being accomplished in three phases. Design for all phases is complete. Construction of the first phase was completed in fiscal year 1999. Construction of the second phase is scheduled to be completed in the third quarter of fiscal year 2000. The last phase of construction will be awarded late in the third quarter or early in the fourth quarter of fiscal year 2000 and is expected to be completed in the second quarter of fiscal year 2002.

The Chemical Wing modernization will also be accomplished in three phases. Design of all phases will be awarded in March 2000 and is expected to be completed in fiscal year 2001.

Question. Will the Agency undertake rehabilitation work in fiscal year 2001?

Answer. Modernization funds are not being requested in fiscal year 2001 for the National Center for Agricultural Utilization Research (NCAUR) due to more critical funding requirements in other ARS buildings and facilities projects and since completion of the design project for the Chemical Wing modernization is not expected until the latter part of fiscal year 2001.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

WATER AND WASTEWATER GRANTS PROGRAM

Question. How do you justify a reduction in the water and wastewater grants program when basic needs like those in West Virginia will go unmet?

Answer. It is recognized that the amount included in the fiscal year 2001 budget for Water and Waste Disposal grants is slightly lower than the current fiscal year 2000 estimate. However, there are competing needs for funding, and additional funding for Water and Waste Disposal programs would likely come at the expense of other programs.

West Virginia's initial allocation of Water and Waste Disposal grants has averaged about \$8.5 million the past few years. Since the need for this assistance is greater in West Virginia, additional funding has also been provided from the national reserve. In fiscal year 1998, actual obligations totaled \$12.9 million, and in fiscal year 1999, obligations totaled \$14.3 million, increases on 61 percent and 55 percent respectively over the initial allocation. In addition, for Water and Waste Disposal loans, the state allocation for West Virginia has averaged \$13 million, and actual obligations have averaged about \$19.5 million in each of the last two years.

NEW SPENDING FOR RURAL AMERICA

Question. Don't you think that \$11.5 billion in new spending for rural America should be distributed in a way that benefits all of rural America?

Answer. I do think the \$11.5 billion in funding for Rural Development should be distributed in a manner that provides benefits to all residents of rural America. The Rural Development agencies allocate most of the funds based on each state's proportion of rural population, rural poverty, and other factors that differ somewhat depending on the individual program and its purpose. The intent being to ensure equal treatment, but to also ensure that the funds are used in a manner that assists those most in need.

PROGRESS ON WATER AND WASTEWATER SYSTEMS DEVELOPMENT

Question. Would you provide me information about the progress of developing water and wastewater systems in West Virginia?

Answer. West Virginia has a very active Water and Waste Disposal program. Since October 1, 1996, the State has obligated 68 loans for over \$56 million and 89 grants for \$56 million. The State's initial allocation levels for loans and grants have totaled a little over \$20 million; the additional amounts have come from National Office reserves. In spite of these expenditures, however, there are still significant needs.

Question. To what extent is West Virginia catching up to other states in meeting these basic needs and how much of a need still exists?

Answer. There are still significant unmet needs in West Virginia. The State currently has applications for 35 loans and 18 grants totaling over \$77 million, which is well over three times its allocation level from recent years. Due to the many variables involved, RUS does not monitor States' progress against that of other States.

While RUS has not compiled comprehensive listings of water and wastewater needs, the WV Infrastructure and Jobs Development Council conducted an assessment that indicated needs totaling over \$2.7 billion in West Virginia. Our State staff advises that the vast majority of the entities and projects would be eligible for RUS assistance.

EMERGENCY LIVESTOCK ASSISTANCE AND PASTURE LAND REVEGETATION

Question. I want to thank Secretary Glickman for the attention that he has given to reducing the impact of the drought of 1999 on West Virginia farmers. Last August, as we stood together under a cloudless sky in the crispy brown cornfields of West Virginia, and Secretary Glickman declared all fifty-five West Virginia counties disaster areas, thereby allowing special circumstance USDA assistance to be provided to farmers in my state. West Virginia farmers, and I, are grateful for his ongoing attention to the needs of small family farmers in smaller agriculture states. Cooperative efforts between the U.S. Department of Agriculture and the West Virginia Department of Agriculture have helped speed available assistance to distressed farmers. However, I am concerned about delays in distributing emergency funds to provide assistance to livestock producers for losses due to drought or other natural disasters, and for the cost of restoring pasture lands damaged by the drought. I am concerned that the difficulties in providing this assistance may be a direct result of a shortage in appropriated funding for these programs. Could the Secretary explain what is causing delays in administering emergency assistance programs, specifically the livestock assistance program and the pasture land revegetation program?

Answer. Sign-up for the Livestock Assistance Program began November 1, 1999, a few weeks after the fiscal year 2000 Appropriation bill was signed by the President. Sign-up ended in mid-February, which allowed time for producers to enroll in the program and our county offices to complete the application process. We expect to process and issue payments soon, possible in March.

The Pasture Recovery Program was created by the Administration in response to the extreme drought that plagued much of the eastern half of the United States. It took time to develop because the program is new. We expect to begin sign-up shortly.

Question. How can Congress be of assistance in these matters?

Answer. Short-term ad hoc programs cause us to react to emergencies, and by their very nature, these programs often come too late and offer too little. I would like to work with the Congress to establish long-term solutions that would reduce or eliminate the need for ad hoc programs. The President's budget purposes an improved approach to providing assistance to farmers in times of distress including supplementary countercyclical income assistance targeted to producers faced with reduced revenues, improved risk management programs, and new programs combining income and environmental benefits. While some of our initiatives can be done administratively, most will require legislation. Producers and their bankers will be better served if we can get these programs in place early so they can rely on them in their planning and make better informed farming decisions.

MILK MARKETING ORDERS

Question. How has the implementation of the Option 1A for pricing fluid milk impacted West Virginia dairy farmers, and dairy farmers in other regions of America?

Answer. To date, the implementation of Federal milk order reform has benefitted all West Virginia producers delivering to Federal milk markets. It is important to recognize that the Federal milk order program is not a price support program, and that the changes made as a result of consolidation and reform were to improve the marketing of milk. I have asked the Agricultural Marketing Service to provide more information on the impact of consolidation and reform on West Virginia.

[The information follows:]

The most recent information indicates that about 96 percent of West Virginia's Grade A milk is marketed under four of the newly consolidated Federal milk marketing orders—Northeast, Appalachian, Mideast, and Southeast. Prior to consolidation the Federal order markets shipped to were: Middle Atlantic, Carolina, Louisville-Lexington-Evansville, Ohio Valley, Eastern Ohio-Western Pennsylvania, and Southeast. We believe the rest of West Virginia milk was marketed in areas of Virginia or Pennsylvania where milk marketing is regulated by State orders.

The implementation of Option 1A Class I differentials is only a small part of the overall impact of Federal milk order reform on farm milk prices. Changes in Class I differentials in the markets where West Virginia farmers deliver milk ranged from -\$0.09 to +\$0.09 per hundredweight. The effect of these changes in Class I dif-

ferentials on producer blend prices are projected to range from $-\$0.04$ to $+\$0.07$ per hundredweight.

The consolidation of markets also had some impact on producer blend prices depending upon whether consolidation of the orders increased or decreased the proportion of milk used in Class I products. For the markets served by West Virginia dairy farmers, Class I utilization changed only slightly, ranging from up 0.1 percent to down 2.7 percentage points. The impacts of market consolidation on West Virginia producer blend prices range from almost nothing to about $-\$0.05$ per hundredweight.

The most important factor affecting producer milk prices was the implementation of a Class I mover based on the higher value of the Class III or Class IV price formulas. The adoption of the new Class I price mover increased the Class I price for January 2000 by $\$1.11$ per hundredweight, and for February 2000 by $\$1.08$ compared to what it would have been under the old system. The resulting higher Class I prices during these two months increased producer blend prices about $\$0.55$ to $\$0.80$ per hundredweight, depending on point of delivery. Although we expect these price impacts from the new Class I price mover to moderate later in the year as milk supplies and demand come more into balance, they have been beneficial to dairy farmers during this period of low farm milk prices.

In conjunction with the milk order consolidation and reform process, USDA analyzed the impacts of a number of proposals and published the analyses in a Final Regulatory Impact Analysis. The following table summarizes the expected average impacts on all-milk prices to dairy farmers delivering to Federal order markets over the six-year analytical period. The all-milk price is a weighted average price determined by multiplying the change in the minimum price for milk in each class (Class I, II, III, and IV) by the amount of milk used in each class. The average all-milk price for all Federal order markets was forecast to be $\$.03$ per hundredweight higher under Federal order reform and Option 1A Class I location differentials. In 17 former Federal order markets, the all-milk price was projected to decline, while in 15 former markets, the all-milk price was projected to increase.

CHANGE FROM BASELINE IN ALL-MILK PRICES

Question. How has the implementation of Option 1A impacted the price of milk for consumers?

Answer. Implementation of the Option 1A is expected to have a minor impact on the price of milk for consumers. I have asked the Agricultural Marketing Service to provide additional information for the record.

[The information follows:]

A \$0.12 increase in the Class I price translates into about a \$0.01 increase in a gallon of milk. Option 1A increased the average Class I price differential for all markets about \$0.04 per hundredweight or less than \$0.01 per gallon. The change in the Class I mover raised Class I prices on average about \$1.10 per hundredweight for the first two months of 2000. Therefore, the average price of a gallon of milk in January and February in all Federal order markets may have been between \$0.09 to \$0.10 per gallon higher than it would have been under the old system. This is the short-term impact of Federal order reform. USDA's Regulatory Impact Analysis indicates that Federal milk order reform with Option 1A Class I differentials would increase the retail price of a gallon of milk, on average, across all markets about \$0.01 for the period 2000 through 2005. For the part of West Virginia that is in the Mideast market, no real change is expected on average for the analytical period.

Question. What can we do to improve the income of dairy farmers?

Answer. There are a number of things that can be done to improve dairy farm income, and almost as important, to reduce the risk of volatile farm milk prices to dairy farmers. I have asked the Agricultural Marketing Service to provide more information on the actions taken by USDA to improve the income of dairy farmers.

[The information follows:]

A 2-year extension of the dairy price support program that is due to expire on December 31, 2000 would help protect farm income. The dairy price support program has been a critical safety net during the past several years, purchasing 121 million pounds of nonfat dry milk in fiscal year 1998, 172 million pounds in fiscal year 1999, and 171 million pounds so far this fiscal year. Absent this program, farm milk prices would be even more depressed. The President's budget request for 2001 proposes extension of the price support program through 2002, at which time the current farm bill expires.

USDA has committed to use the Dairy Export Incentive Program (DEIP) to the maximum extent allowed by international agreements. The assistance that is provided by DEIP expands the market for U.S. dairy products and helps build future markets abroad for dairy products.

For several years, USDA has been using the Dairy Options Pilot Program to educate and assist dairy farmers in managing risk through use of the futures and options market. The second phase of the program was announced on March 7, 2000, and will provide training in the use of futures and options and subsidize the cost of options contracts to dairy farmers in 61 counties in 32 States.

On March 1, 2000, USDA announced a proposed Dairy Forward Contracting Program as authorized by the Agricultural Appropriations Act of 2000. This program

will give proprietary handlers who market milk under Federal milk orders more flexibility in offering forward price contracts to dairy producers. Forward price contracts provide another tool for producers to reduce price risk. Cooperatives already offer forward contracts to their members' producers. USDA, in designing this pilot program, has created certain safeguards for dairy farmers as they learn to use this new method of pricing. Implementation of the program is tentatively scheduled for May 1, 2000.

On the cost side, USDA's Cooperative State Research, Education and Extension Service in conjunction with the land grant university system continues to provide educational materials to dairy farmers. Though expanded internet services, dairy farmers now have access to the the latest information on production methods, new technology, and current dairy and feed market information that can be used to increase efficiency. Also, information is available on the Sustainable Agriculture Research and Educational Agriculture program, organic farming and other value-added production and marketing information that enables farmers to receive more of the consumer's dollar.

Milk prices are currently at levels unseen in more than two decades. The recent collapse in milk prices will result in severe economic hardship for the Nation's dairy producers. To assist dairy producers through this economic emergency, the Administration is working with Congress to develop an emergency aid package for agriculture that will include assistance to dairy producers.

AQUACULTURE

Question. Could you please provide a status report regarding construction of the National Center for Cool and Cold Water Aquaculture, including milestones that will occur during construction of the center and timetables for the completion and maintenance of this project?

Answer. The National Center for Cool and Cold Water Aquaculture is about 35 percent complete. Site grading and subgrade piping and electoral work are 95 percent complete. Structural steel and roof decking for the Lab/Office building and the Tank/Aquaria building is scheduled to be completed by May 2000. The final inspection of the main building is scheduled to start August 2000. The scheduled completion date for all work is September 1, 2000.

AQUACULTURE

Question. What is the USDA's strategic plan for a national policy to encourage development of, promote, and support U.S. aquaculture as required by the National Aquaculture Act of 1980?

Answer. The USDA's strategic plan for a national policy to encourage development of, promote, and support U.S. aquaculture is being updated and the working draft entitled, "National Aquaculture Development Plan of 2000" is near completion.

Question. What efforts are underway to coordinate American aquaculture efforts on a national level?

Answer. As mandated by the National Aquaculture Act of 1980 and amendments, the Joint Subcommittee on Aquaculture (JSA) coordinates Federal research, technology transfer, and assistance programs in aquaculture, reporting to Congress and the Executive Office of Science and Technology Policy through the cabinet level National Science and Technology Council (NSTC), chaired by the President.

The JSA has interacted with the aquaculture industry and other customers, stakeholders, and partners to assure federal programs meet the needs of the industry and the American public. ARS participates in JSA sponsored workshops as well as holding program planning workshops to obtain stakeholder input on ARS aquaculture research program. The JSA meets formally four times a year to bring membership from 12 plus agencies together; ARS is a regulate participant. ARS national program leaders and ARS scientists are regular participants in planning meetings with the five Regional Aquaculture Centers administrated by Cooperative State Research, Education, and Extension Service (CSREES) and frequently collaborate on research projects.

ARS has developed a plan Aquaculture Research for the future: Five Year Research Plan in response to an outcome of a stakeholder meeting. Stakeholders identified under investment in aquaculture research by ARS as a major issue. In response to that criticism, ARS is developing within a broad framework specifically how the Agency would invest future appropriations for aquaculture research.

Program managers in ARS and CERÉES are responsible for assurance for quality and relevancy of national aquaculture research.

Question. What role will the National Center for Cool and Cold Water Aquaculture play in the strategic plans?

Answer. ARS scientists, especially Research Leaders, participate in workshops, both intramurally and extramurally to establish relevancy of ARS aquaculture research programs and often are requested to participate in similar activities held by others at the national level. The staff at the National Center for Cool and Cold Water Aquaculture will participate in national strategic planning meetings sponsored by ARS. Another very important role for the National Center for Cool and Cold Water Aquaculture is to conduct the research to solve the aquaculture industries highest priority problems. This research will involve intramural and collaborative extramural and intramural projects.

POULTRY GROWERS

Question. Contract poultry growers face the difficult task of disposing of excess poultry litter. West Virginia State College and the West Virginia Department of Agriculture are working to explore technology to control the adverse impact of excess poultry litter and, at the same time, produce a value-added product from the litter. A \$500,000 appropriation that I added for waste utilization through the West Virginia Department of Agriculture's Poultry Waste Energy Recovery (POWER) project was reduced by fifteen percent as a result of across-the-board rescissions. Excess poultry litter is a serious problem that pollutes water supplies and causes health problems. What USDA efforts seek to improve disposal methods of excess poultry litter?

Answer. An important conceptual consideration regarding poultry litter management is that we attempt to have industry personnel and others understand the need to utilize a valuable source of nutrients, rather than to dispose of a waste. One problem is excess nutrient availability from all sources, which include commercial fertilizer and bio-solids, as well as urban run-off. When poultry litter/manure is seen as having a comparative value, utilization options should increase.

USDA has a number of programs that attempt to assist the poultry industry in dealing with environmental issues. For example, CSREES cooperates in various ways with the Environmental Protection Agency (EPA) National Agricultural Compliance Assistance Center, such as in grant coordination. CSREES is managing competitive grants for a National Curriculum Development for Environmental Protection project, and the USDA/EPA National Agricultural Compliance Assistance Program.

CSREES has recently initiated the Waste Management National Initiative Team. CSREES has for many years provided competitive and other grants to states through the Water Quality National Initiative Team, some of the results of which are summarized in the document entitled, "National Extension Targeted Water Quality Program, 1992-1995".

The CSREES National Research Initiative (NRI) can support research on poultry litter utilization methods through competitively-awarded grants. In the past, the NRI has funded poultry research, which included a broiler litter project.

CSREES, Land Grant University, other agency personnel, and private groups recently held the Alliance for Environmental Stewardship: A Comprehensive Approach workshop in St. Louis, Missouri. The proceedings, which will be available by April, prioritized recommendations as to what is needed to develop a comprehensive approach to environmental protection, and how all parties can fulfill their responsibility to protect the environment.

POULTRY GROWERS

Question. What opportunities are available to West Virginia poultry growers who wish to employ better poultry litter management techniques?

Answer. Independent poultry growers should first contact their county Extension agent for assistance with concerns about poultry litter management. Note that litter refers to the manure and wood shavings or other absorbent material used in the production of poultry, but for this response the term will include caged layer manure. Agents will provide written and technical assistance to the farmer. If the problem is beyond the expertise of the agent, assistance will be requested from state specialists at West Virginia University.

CSREES supports the National Poultry Waste Management Symposium. This symposium is a biennial event started in 1988, focuses on cutting edge technologies and concepts, and includes commercial exhibits and poster sessions that cover various hot topics. Grower participation is encouraged through publicity and through a reduced registration fee. The next symposium is scheduled for October 2000.

The West Virginia Poultry Association holds an annual Convention and Festival during which educational sessions are held, and participate in other areas of assistance throughout the year and cooperate in various educational events. Independent

producers and growers are encouraged to attend meetings such as the National Poultry Waste Management Symposium.

Future opportunities for the West Virginia industry relate to projects on which the industry is working at this time, such as the pelleting of poultry litter, and generation of electricity from litter.

CONSERVATION AND WATER

Question. The Natural Resources Conservation Service in West Virginia, under the leadership of Bill Hartman and Paul Dunn, continues its important work to implement watershed and conservation programs in West Virginia that make a positive impact on the state's rural communities. Funding for Small Watershed Projects in West Virginia was reduced by fifteen percent. This will delay treatment of mine drainage sites, and slow the work of the Potomac Headwaters Land Treatment Watershed Project. Unfortunately, delays to these programs will also mean a delay of the day when all West Virginians have reliable access to healthy drinking water. What action is the USDA taking to improve conservation and water services in rural America? How can West Virginians participate and benefit from these programs?

Answer. One option for rural communities and watershed sponsors in West Virginia would be to include water supply source development in any new Public Law 566 or Public Law 534 watershed projects that are currently being planned. Although these projects have been historically developed for upland land treatment, flood prevention, water quality, or recreation purposes, local sponsors can include water supply as a project purpose. By doing so, the cost for developing a quality water supply can be significantly reduced. Currently NRCS has statutory authority under Public Law 566/534 to provide a 50 percent cost-share for such source water development. However, priorities for funding watershed projects in the last ten years has been focused on soil erosion control, land treatment, water quality and environmental benefits.

Also, the President's Budget provides \$1.6 billion for the Rural Utilities Service's water and waste loans and grants programs.

SUBCOMMITTEE RECESS

Senator COCHRAN. The hearing is recessed.

[Whereupon, at 12:55 p.m., Thursday, February 10, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

TUESDAY, FEBRUARY 29, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 2:03 p.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Gorton, Kohl, Dorgan, and Durbin.

AND PROGRAM ANALYSIS**

OPENING STATEMENT OF SENATOR THAD COCHRAN

Senator COCHRAN. The subcommittee will please come to order. Today we are convening a hearing of our Subcommittee on Agriculture Appropriations to review the outlook for production agriculture, and the budget request for farm programs. We are pleased to have as our panel today Mr. Gus Schumacher, Jr., Under Secretary for Farm and Foreign Agricultural Services of the U.S. De-

partment of Agriculture, Mr. Keith Collins, Chief Economist of the Department of Agriculture, and Dennis Kaplan of the Budget Office of the U.S. Department of Agriculture.

We are coming off 2 years where Congress and the Administration have agreed to supplement the assistance that is provided directly to producers of agriculture commodities. This assistance has taken place because of disasters that have occurred on the farms and ranches in the United States by reason of weather, other related problems, and economic stress that has beset agricultural producers due to changes in economic growth and health in other parts of the world, and among the customers who buy what is produced on the farms and ranches in the United States.

Statistics have indicated that this difficulty in production agriculture is not yet over. As a matter of fact, the President's budget request includes increases of some \$10 to \$11 billion that would be made because of changes that are recommended in farm program law and conservation programs and other Agriculture Department activities because of changes that are recommended by the President in the laws, not to produce any more discretionary funding from this committee, necessarily, but rather to mandate additional spending by changing the law.

The difficulty with that is that we are under a 5-year farm bill. It has not yet expired. It has 2 more years to go. It is not likely that Congress is going to, in an election year, be able to come in and revamp the agriculture programs as the Administration is suggesting, so I hope this panel will help us look at alternatives to changing the law and the program law and looking at the discretionary funding that we might consider if we should consider any such supplementary payments as we did during the last 2 years, or what other forms of relief we might consider to help deal with this problem.

I understand that some of the commodity prices may be increased, or the outlook for increases in prices over the next couple of years, but I am also told that this year we could have just as serious a problem in some commodity areas as we have had since 1993.

I also have heard that we may see some substantial increases in production in foreign countries that could have an effect on the overall world supply of commodities. For example, in Brazil, cotton production is expected to be much higher. What impact is that going to have on the U.S. cotton producer? These are things we will look at today, and we appreciate very much your being here and helping us work our way through this dilemma and figuring out what we can do as a committee in charge of setting the spending and funding levels for the Department of Agriculture to solve the problems that are faced by the producers of U.S. agriculture commodities.

We have copies of your statements, and we will make those a part of the record in full. We encourage you to make whatever summary comments you think would be helpful to the committee.

Mr. Collins.

STATEMENT OF KEITH COLLINS

Mr. COLLINS. Mr. Chairman, thank you. Thank you for inviting me, and I am going to take just a few minutes to provide some context for this discussion today. I will try to answer at least a couple of questions about the state of the farm economy that you just raised in your comments.

As you look back over the last couple of years, as you and everyone know we have had very weak commodity markets in the United States, but we have not seen an erosion or a deterioration in the U.S. farm financial condition to the extent that might be expected, and there are a lot of reasons for that, and let me mention four.

One, of course, is the large built-in payments of the farm bill and the supplementary payments that have been enacted in the last 2 years.

A second reason is, I think farmers have made lots of prudent choices not to take on more debt over the last 2 years.

A third reason is that we have an overall farm balance sheet that has not broken down during the last 2 years, and a fourth reason is, we have had a strong off-farm economy which has helped farmers have better off-farm job opportunities and higher off-farm incomes.

The result of all of that is that when we look at nonperforming loans at agricultural banks, and we have data as of October 1999, we see that nonperforming loans have hardly increased. They are not much different than they were in the early 1990's, for example. Nevertheless, certain farms, certain regions, certain commodities around the country will have more financial pressures than others.

I think in all likelihood, as we look out to the rest of this year, that we are going to face very weak markets for all of our major commodities in the year 2000, particularly for crops and for dairy. Despite an improving world economy, our exports are still stagnant. They are moving sideways. We expect the global economy to grow a little over 3 percent this year. That would be the highest rate since 1996, and that is certainly good news. However, import recovery in a number of our major markets is very slow.

We can look at Japan. We can look at Europe. As well as that, we have fierce competition, as you mentioned, from a number of competitors such as Argentina and Brazil, in addition to China and even the European Union as well.

For 2000, we are currently projecting agricultural exports at \$49½ billion. That is up only slightly from last year's \$49 billion. When we add in USDA's recently announced humanitarian assistance package, that will add to that forecast.

I want to mention a few forecasts of average farm prices to again put this situation in a historical context and illustrate the farm price problem that producers face. Soybean prices during this marketing year are expected to be the lowest since 1972–1973. Cotton prices, so far since August, have been the lowest since 1974–1975. Corn and wheat prices this year we think will be the lowest since 1986–1987. Milk prices this year will be the lowest since 1990–1991, and rice prices the lowest since 1992–1993.

Those are all price forecasts for the 1999–2000 year, so many farmers could see an escalation of financial stress in the year 2000 as the farm economy, I think, is poised to take a fairly sharp drop in farm income. Farm cash receipts this year are going to go down another \$2 billion. That will make them about \$18 billion below the record of 1997.

In addition to that, without new legislation, Government payments would go down \$5½ billion in the year 2000. So with lower receipts from the market and lower Government payments, we have a forecast of net cash farm income in 2000 of \$49.7 billion, which would be a 16 percent, roughly \$9 billion, drop. That would be the lowest net cash farm income since 1986.

Many farmers are also going to face higher production costs this year, and I would mention interest rates and fuel prices are also squeezing that income level down. During the fourth quarter of 1999, farm interest rates averaged 35 to 45 basis points higher than the fourth quarter of the year earlier. In addition to that, if you look at West Texas intermediate crude oil prices during 1999 they averaged \$19.24 a barrel. At the end of last week they hit a 9-year high of almost \$31 a barrel, and farmers are not going to be able to avoid those higher fuel costs, particularly as we move now into the peak diesel fuel period of use from February through May.

Farm real estate values have maintained farm balance sheets up to this point. However, with rising interest rates, and if we get this drop in income that we are projecting, we expect little to no growth in farm land values over the next couple of years.

I would like to conclude with just a couple of very brief comments about the state of commodity markets. Last week, the Department of Agriculture held its annual Agricultural Outlook Forum, and we had about 1,300 people, an all-time record high in attendance, and I think you could hear much concern at that conference about the weakness in commodity markets. If I could summarize the concerns in two words I would say they are weather and competition, and wheat is a good example of that.

If you look at wheat acreage, it is going to be down again in the year 2000. We have had very dry weather in the plains States, and we think that the lower acreage will reduce U.S. production, but our stocks on June 1 are going to be the highest level since 1988. The Australians in all likelihood will have a record crop this spring. The European Union will likely have a record crop in the fall. As a result of that, any wheat price advances are going to be limited.

For corn, we have had record high total use in 1999. Next year, we expect higher production, with use about the same. That would result in little to no change from the \$1.90-a-bushel price that we see this year, and China's role as a corn exporter is going to be a very important factor in the price outlook.

I would say that the soybean perspective is a little different than that for grains. Soybean acreage is likely to expand again in the year 2000. We could see record production, rising carry-over, and even lower prices than the \$4.75 a bushel expected this year.

Cotton and rice prices have also been very low this marketing year. Cotton production, we think, will be up in the year 2000, with

the price outcome dependent very much on the role of China as a cotton exporter in the world market.

This year's lower rice prices—they are down about 33 percent this year—will probably trim back acreage a little bit, but continuing large rice stocks are going to hold prices in check.

The picture for livestock and poultry in the year 2000 I think is more optimistic than it is for crops. We expect cattle prices to average about 5 percent higher. I would point out that we are starting out this year with the largest number of animals in feed lots in 25 years, so we are probably not going to see much of a pop in cattle prices until we get into the second half of the year.

Lower hog numbers are expected to reduce pork production and push up hog prices about 15 percent. Broiler prices, on the other hand, I think will be down a little bit, but lower feed costs will help maintain producer net returns.

Milk is going to be the significant weak spot on the whole livestock side of the economy this year. In the last 2 years, 1998 and 1999, and we had strong milk prices, we had low feed costs. That gave us, in 1999, the highest year-over-year increase in milk production in the decade of the 1990's, and that continuing surge is going to keep pressure on milk prices for much of the year 2000 and probably result in about a 13-percent drop in milk prices for the year.

PREPARED STATEMENT

Well, Mr. Chairman, in conclusion I would say that the year 2000 is shaping up to be a year of lower income, particularly for producers of major field crops, for dairy, as well as for other crops which I did not go into, such as tobacco, sugar, peanuts, and some horticultural crops. So once again, it appears that the role of Government payments is going to be a crucial factor in determining where the state of farm finances end up at the end of the year 2000.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF KEITH COLLINS

Mr. Chairman and Members of the Subcommittee, thank you for inviting me to discuss the state of the farm economy and its prospects. I will describe the situation in major commodity markets, the financial well-being of farmers and the prospects for economic recovery.

While an overall farm economic crisis during the past year of generally weak markets has been averted, in part due to emergency assistance, market fundamentals remain weak, especially for crops. Global economic prospects are improving, yet commodity supplies are large and rapid recovery in farm income appears unlikely. In fact, under current legislation and programs, net cash farm income in 2000 is projected to be the lowest level since 1986, prompting the President, consistent with his concerns about the 1996 Farm Bill, to include several proposals in his budget to provide farmers and ranchers additional income protection. While U.S. agriculture continues to face the prospect of low prices and incomes and ongoing structural change, many indicators remain favorable up to now, including asset values, debt levels, inflation, interest rates, and productivity.

GENERAL ECONOMY BOOMS; AGRICULTURE SLUMPS—WHY?

The U.S. economy just established a record for the longest expansion in history. Strong income growth, low unemployment, surging productivity, low inflation and interest rates and a stunning increase in equity markets have made life better for

most Americans. While the farm economy prospered in the mid 1990s, it did keep pace with the general economy in the late 1990s. Several factors that propelled the national economy have been absent from the farm economy.

One factor has been strong investment in the U.S. economy. The growth in the U.S. economy combined with economic problems in recent years in other countries has fueled an enormous increase in direct foreign investment in the United States and a large increase in investment in U.S. stocks and bonds. Another factor has been rapid technological change and productivity increases which have reduced per unit labor costs and improved competitiveness. The U.S. appears to be in the global lead in high technology, ranging from information sciences to biological sciences to communications, creating new industries and transforming other industries that can use these technologies, such as financial sectors, retailing, travel and entertainment.

Production agriculture has been helped by some of these trends, such as low inflation and interest rates and new technology. However, production agriculture has been particularly vulnerable to foreign competition and economic recession in foreign countries, which have reversed the upward export trend of the earlier 1990s. In addition, growth in investment has lagged that in the general economy, as agriculture has not benefitted greatly from international capital and has had a reduced rate of return on assets. Moreover, production agriculture has probably not been able to utilize new technology to the extent of the rapidly growing nonfarm industries.

As we assess the prospects for 2000, many agricultural commodity markets show little improvement in their fundamentals. For the 1999/2000 marketing year, USDA forecasts the average price of soybeans to be the lowest since 1972/73, the prices of corn and wheat the lowest since 1986/87 and the price of rice the lowest since 1992/93. Cotton prices are also down sharply and so far this season are the lowest since 1974/75. Cattle and hog prices were relatively weak in 1999 but have strengthened recently and are expected to be up this year. Milk prices were relatively strong in 1999 but dropped sharply at year's end and are expected to average the lowest level in 9 years in 2000.

In addition to historically low agricultural commodity prices, many producers the past couple of years have been adversely affected by drought, excessive heat, pests, flooding and wind which lowered crop yields and quality, reduced forage supply and quality and lowered milk production. In recent months, many areas of the United States have experienced subnormal precipitation. Unseasonably mild and windy weather also has accompanied the lack of precipitation since October, increasing the evaporation of moisture from the topsoil. Soil moisture levels are very low in the northern Great Plains and upper Mississippi Valley due to the prolonged absence of precipitation. Another area, extending from western Texas to southern California, also remains very short of soil moisture. In addition, parts of the Great Plains, eastern Corn Belt, mid-Atlantic and New England endured long-term drought in 1999, depleting subsoil moisture reserves in those areas.

Congress and the Administration have responded to these problems by providing over \$15 billion in emergency assistance to farmers and ranchers the past 2 years, greatly limiting the farm financial stress that farmers and ranchers would otherwise face because of historically low prices and reduced production. These emergency payments plus payments authorized under the Federal Agriculture Improvement and Reform Act of 1996 (1996 Farm Bill) pushed government payments to a record-high level in 1999 and net cash farm income to a near record-high. Had Congress not provided emergency assistance, net cash income would have likely fallen below \$50 billion in 1999, the lowest level since the farm financial crisis of the mid-1980s. Reduced government payments and continued low prices could push net cash farm income below \$50 billion in 2000, increasing farm financial stress and debt repayment problems.

EXPLAINING THE FARM ECONOMIC DOWNTURN IN MORE DETAIL

The primary source of the farm economy's weakness is imbalances in commodity markets brought about by several years of large U.S. production—despite production problems in many areas—and by lower exports. Exports have been pulled down by large foreign production, economic problems in Asia, Russia and South America and a strong dollar.

Reduced Exports.—The value of U.S. agricultural exports in fiscal year 2000 is forecast to remain at last year's \$49 billion, after reaching a record high of \$60 billion in fiscal year 1996. Asia accounts for a large portion of the drop in exports of both bulk and high-value agricultural products. In fiscal year 1996, \$26 billion in U.S. agricultural products were exported to Asia, compared with \$18 billion projected for this fiscal year, a drop of \$8 billion.

As for total bulk products, such as feed grains, wheat, soybeans, cotton and rice, export value is down 40 percent since 1996. Declines in tonnage account for about one-fifth of the drop in export value of bulk agricultural products, and declines in export prices account for four-fifths of the drop. In contrast, the export value of high-value agricultural products has changed little since fiscal year 1996, remaining steady at about \$32 billion. The value of livestock product exports is projected to be down about 2 percent and the value of poultry product exports is forecast to be off nearly one-quarter in fiscal year 2000, compared with 4 years ago. However, the volume of livestock and poultry products exported has increased since 1996.

As the global economy has improved, exports for some commodities have picked up. Within this weak export picture, there has been some positive news. In volume terms, U.S. corn exports are up nearly one-third during January–November, compared with the same period last year, with expanded sales to Japan, South Korea, Egypt, South America and Taiwan. Wheat and wheat flour exports are up 9 percent over that period, as sales to Japan, South Korea, Mexico and South America have improved and food aid shipments to Russia led to a sharp increase in exports to that country. During January–November, soybean exports were up 13 percent over a year ago, as increased sales to East and Southeast Asian countries more than offset reduced sales to Europe.

Although an acceleration of U.S. exports toward 1996 levels is not expected, the apparent turnaround in several key macroeconomic indicators make the outlook for higher exports more positive than it has been in a couple of years. South Korea's economy has emerged from recession, growing 9 percent in 1999, and the economic recovery that began last year in Southeast Asia is expected to accelerate in 2000. In addition, several Latin American countries are forecast to show positive growth in 2000 after being in recession last year. With economic recovery, most forecasters expect world economic growth in 2000 to exceed 3 percent, a rate not seen since 1997.

Another key factor for U.S. exports is the U.S. exchange rate. Over the past year, the value of the U.S. dollar has been declining in value against several key currencies. On an agriculture trade-weighted basis, the value of the dollar is down about 5.5 percent from a year ago, although the dollar continues to remain about 11 percent stronger than in the early 1990s. A decline in the value of the dollar makes U.S. commodities more attractive to foreign buyers.

Large Global Crop Production and Stocks.—Despite some weather problems, global crop production exceeded consumption each of the past 3 years leading to rising U.S. and world stocks of grains and oilseeds. Global stocks of grains at the end of the 1998/99 marketing year reached 350 million tons, up from 256 million tons at the end of 1995/96 marketing year. The growth in global carryover of grains is almost entirely due to increased yields per acre, as grain planted area over the past 3 years is about unchanged relative to the average of the early to mid-1990s. In 1999/00, global consumption is expected to exceed production causing global ending stocks of grain to drop to 335 million tons.

Global stocks of oilseeds have risen by 63 percent since 1996/97, increasing from 17.1 to 27.9 million tons at the end of the 1998/99 marketing year. Unlike grains, much of the increase in oilseed carryover can be attributed to increased plantings. World oilseed area increased 8 percent from 1996 to 1998 and global oilseed area remained about unchanged in 1999. In 1999/00, record global oilseed production for the fourth consecutive year is expected to cause global ending stocks of oilseeds to remain at near last year's level.

While adverse weather has reduced crop yields in many areas of the United States over the past 2 years, these production declines generally have been offset by good yields in other sections of the country. In 1998/99, the U.S. corn and rice crops were the second highest on record, soybean production was record high and the wheat crop was the largest since 1990. Only cotton production was down appreciably in 1998, as severe weather problems in much of the cotton belt resulted in the smallest crop in nearly 10 years. In 1999/00, weather adversely affected yields for most major crops. Even so, U.S. rice production was record high, the corn crop was the fourth highest on record and the soybean crop was the third highest on record.

IMPLICATIONS OF THE FARM CRISIS AGGREGATE INDICATORS

Cash Flow.—For 2000, farm cash receipts are forecast to fall to \$189.9 billion, or \$17.7 billion below the record of \$207.6 billion set in 1997. Lower receipts mean lower net cash farm income, which for 2000 is forecast at the lowest level since 1986 and more than \$9 billion less than in 1999. These aggregate figures mask the steep declines in cash receipts and farm income expected for major crops, hogs and milk.

Cash receipts for wheat, feed grains, soybeans, cotton and rice are forecast to decline from a record \$56.8 billion in 1997 to \$40.3 billion in 2000, a 29-percent drop. While projected to be up from last year's \$9.2 billion and 1998's \$9.4 billion, cash receipts for hogs are forecast to be \$9.7 billion in 2000, down 26 percent from 1997's \$13.1 billion. Dairy receipts are forecast to drop to \$21.4 billion in 2000, down 9 percent from last year.

Government payments have offset much of the decline in cash receipts for major crops, thereby helping to maintain producers' cash flow. Total government payments increased from \$7.5 billion in 1997 to a record \$22.7 billion last year. In calendar 2000, government payments could exceed \$17 billion under existing program authorities, the second highest ever. The emergency farm aid package passed by Congress in 1999 is expected to provide \$2.4 billion in payments to farmers in calendar 2000.

Farm cash production expenses, forecast at \$171.5 billion in 2000, are expected to increase by about 1 percent for the third consecutive year, after rising more than 4 percent each year from 1993–97. A large part of the stagnation in production expenses is due to the fall in grain prices, which has greatly lowered livestock producers' feed costs. Feed costs are projected to fall to \$23.8 billion in 2000, down from \$26.3 billion in 1997.

Balance sheet.—Farm business balance sheets have shown considerable improvement since the mid-1980s. Farm operator debt levels are about 10 percent below the peak levels of the 1980s and asset values are substantially higher. The debt-to-asset ratio for farm operators is up a little from 1997, but it is still expected to remain at about 16 percent at the end of 2000, compared with the low 20s during the mid-1980s. Even though farmers' balance sheets are much improved from the mid-1980s, the projected decline in farm income will reduce farmers' credit reserves and an increasing number of producers will face debt repayment problems.

Debt repayment capacity utilization measures the extent to which farmers are using their available lines of credit. In 1999, record government payments boosted net cash income and increased the level of debt farmers could service, lowering farmers' debt repayment capacity utilization to 56 percent of the debt that could be supported by current income. In 2000, farmers are expected to use more than 66 percent of the debt that could be supported by their current income. This figure is substantially down from over 100 percent in 1981 and somewhat down from the more than 70 percent during 1977–85, but would be the highest level since 1985.

While the balance sheet for agriculture in the aggregate looks reasonably sound, that could change if farmland values fall sharply. Farm real estate values, which showed strong increases through much of the 1990s, started to level off last year. Cropland values declined in 5 states in 1998, and in 1999, cash rents declined in 9 states, although the declines were small. In 2000, the value of farm real estate, which represents the largest component of farm assets, is expected to rise 0.5 percent, compared with a 1-percent increase estimated last year. Farmland values will likely remain stagnant or decline in areas of the country in which crop production dominates the farmland market, but increase in those areas where farmland values are influenced by urban pressure and other factors, such as the Northeast and some Western States. Farmland value data are reported with a lag, and thus far, the data show the drop in hard hit crop regions have been fairly modest. Recent Federal Reserve Bank data show that for certain parts of the country, such as portions of Iowa, Illinois and Indiana, land prices declined 2–5 percent between October 1, 1998, and October 1, 1999. Given current production and price prospects, we can expect further pressure on land prices in the months ahead, particularly in the Corn Belt, Plains States, and Mid-south.

Commercial lenders report declining farm loan repayment rates, increasing numbers of farm loan extensions and renewals and more stringent collateral requirements. However, all major institutional lenders continue to experience historically low levels of delinquencies, foreclosures, net loan charge-offs and loan restructuring. In 1985, over 10 percent of all bank nonreal estate loans to farmers were either delinquent (past due 30–90 days) or nonperforming (past due 90 or more). In the first quarter of 1999, 2 percent of all bank nonreal estate loans were either delinquent or nonperforming. Bank charge-off rates, which reached 3.36 percent of nonreal estate loans in 1986, remained below 0.2 percent in the first quarter of 1999. In addition, delinquencies of the Farm Service Agency (FSA) have declined from a year ago and since 1996.

Over the past year, the amount of credit provided to farmers and ranchers by FSA directly or through credit guarantees to commercial banks has increased sharply. The total value of loans provided to farm borrowers through direct and loan guarantees is up 75 percent, compared with a year ago. Congress authorized over \$5.7 billion in FSA guaranteed and direct loan program authority in fiscal year 2000 to as-

sist farmers in obtaining credit. The fiscal year 2000 program level for FSA farm loans is \$1.9 billion more than the \$3.8 billion obligated during fiscal year 1999 and \$3.5 billion more than the \$2.2 billion obligated in fiscal year 1998.

IMPLICATIONS OF THE FARM CRISIS—FARM LEVEL INDICATORS

On January 1, 1999, USDA classified 59 percent of farms as being in a favorable financial position—positive cash flow and low debt compared with assets. The remaining farms had a debt-to-asset ratio above 0.4, 4 percent of farms; or negative farm income, 33 percent of farms; or both, 5 percent of farms. Most dairy producers entered this year in a strong financial position following 2 years of strong prices and low feed costs. However, sharply lower milk prices could contribute to growing financial stress for those producers who remain highly leveraged. For producers of field crops who are already highly leveraged, continued low prices of these commodities and weather-reduced production will increase their financial vulnerability. The areas of the country that specialize in the production of these commodities, such as the Corn Belt, Plains States, Delta and Southeast and areas affected by adverse weather, will likely see more of an increase in farm financial stress than other areas of country. The extent farm financial stress increases in the coming months will also depend on whether the Congress passes an emergency aid package and the size of that package.

Looking ahead at the 2000/01 crop years, income prospects from a crop sector perspective suggest sharp declines in income. The net income—cash receipts plus government payments less cash production expenses—for wheat, feed grains, upland cotton, rice and soybeans could fall to \$18 billion, down \$6 billion from \$23.8 billion for 1999/00 and the 1995–99 average of \$24.0 billion.

MARKET PROSPECTS—THE NEXT 12–18 MONTHS

Crops.—Large U.S. and global production of major crops coupled with more than ample stocks going into 1999/2000 marketing year are expected to continue to pressure grain, oilseed, cotton and rice prices through the remainder of the 1999/00 marketing year. Given no major weather disruptions in the major crop growing regions of the country, crop prices are expected to remain low over the next several months and into the 2000/01 marketing year.

In 1999, U.S. producers planted the lowest wheat acreage since 1972. But, wheat prices in 1999/00 are projected to decline from \$2.65 per bushel last season to \$2.50–\$2.60 per bushel this marketing year, as winter wheat yields were record-high in 13 states and higher carryin stocks this season nearly made up for the year-to-year drop in production, leaving total wheat supplies very near last year's level. Wheat exports are forecast to be up slightly, reflecting the combination of strong export competition and increased food aid shipments. However, total use is projected to fall this season due to a nearly 100-million-bushel drop in feed use. Ending stocks are forecast to increase from 946 million bushels at the end of the last season to 997 million bushels at the end of this marketing year, the highest since 1987/88. (This forecast does not account for the 3-million-ton food aid program announced on February 10.)

Looking ahead to the 2000/01 marketing year, which begins on June 1, a further decline in winter wheat acreage will likely push total U.S. wheat acreage and wheat production lower. Winter wheat plantings last fall were down 1 percent from a year earlier. Lower wheat supplies and some improvement in exports could lead to slightly higher wheat prices next season.

The 1999/00 corn crop of 9.44 billion bushels is down from last year's crop of 9.76 billion bushels. While the size of the corn crop is down this season, total supplies are up as higher beginning carryover added nearly 500 million bushels to current-year supplies. Higher use is expected to more than offset the increase in total supplies, causing ending stocks of corn to drop from last season's 1.79 billion bushels to 1.74 billion bushels at the end of this marketing year. Total corn use this season is projected to reach a record-high 9.5 billion bushels, compared with last season's 9.3 billion bushels, as domestic use is projected to increase by about 3 percent while exports are projected to fall slightly from last year. The farm price of corn for the 1999/00 marketing year is projected to average \$1.75–\$2.15 per bushel, compared with last year's \$1.94.

In 2000, corn acreage is expected to be near last year's level and assuming trend yields the corn crop would be up slightly and total corn supplies would be near this year's level. Total use also may be near this year's level, as ethanol use expands but declining livestock numbers hold down feed use. With little to no change in ending stocks, corn prices are expected to show only modest improvement next season.

Soybean plantings of nearly 74 million acres in 1999 exceeded the record of 72 million acres in 1998. However, soybean production dropped 4 percent in 1999, as drought adversely affected yields in several States. Despite the drop in production, total soybean supplies this season are record-high, as larger carryin stocks more than compensated for the drop in production. Most of the increase in supplies is expected to be absorbed by larger exports, which are forecast to be up 11 percent, leaving soybean ending stocks about unchanged from last year. Soybean prices for 1999/00 are currently projected to average \$4.50–\$5.00 per bushel, compared with last season's \$4.93.

Plantings of soybeans could continue to expand in 2000, as returns to soybeans, including loan deficiency payments and marketing loan gains, relative to other major crops encourage farmers to switch acreage into soybeans. Higher acreage and trend yields could lead to record soybean production in 2000 and another year of rising carryover. Under the pressure of rising stocks, soybean prices could face additional pressure in the 2000/01 marketing year.

The 1999 cotton crop is estimated at slightly less than 17 million bales, up 22 percent from last year's crop of 13.92 million bales, pushing 1999/00 carryover stocks up nearly 12 percent from last year's 3.94 million bales. In both, 1998 and 1999 weather reduced cotton yields in several States. Despite abundant current-year supplies, U.S. cotton mill use is projected to decline from last season's 10.4 million bales to 10.2 million bales, as textile imports continue to grow. U.S. cotton exports are forecast at 6.4 million bales during 1999/00, up 2.1 million bales from last year, as the continuation of Step 2 payments has improved the competitiveness of U.S. cotton in U.S. and foreign markets. From August through December, the U.S. farm price of cotton averaged 44.9 cents per pound, compared with 60.2 cents last season.

Plantings of cotton are expected to remain about unchanged in 2000. However, cotton production could be up in 2000, assuming weather does not adversely affect yields in the major cotton producing States. Despite the expected increase in production, price prospects could possibly improve, especially if China's supply of exportable cotton declines in the coming months.

Rice production in 1999 rose 12 percent from a year earlier, as acreage rose 7 percent to the second highest level on record and per acre yields improved. The combination of larger production and stagnant total use is projected to lead to a near doubling in carryover stocks to 40.6 million cwt. Rice exports are projected to increase slightly in 1999/00, due to stronger milled rice exports resulting from lower U.S. prices and larger food aid shipments, while domestic use is expected to drop from last year's record high. Rice prices are forecast to average \$5.75–\$6.25 per cwt., compared with last season's \$8.89. The decline in prices could lead to a cutback in rice plantings and production in 2000, but large carry-in and another year of large supplies will likely continue to pressure rice prices during the 2000/01 marketing year.

Other crops face mixed prospects in 2000. Sales receipts of fruit, vegetable, greenhouse and nursery crops are expected to rise \$1.2 billion to \$41.7 billion. While fresh vegetable prices are likely to rise from last year's reduced levels, fresh citrus prices are returning to normal after the December 1998 freeze. Horticultural exports are also likely to rise slightly in 2000 after 2 flat years, as Asian economies strengthen and U.S. citrus supplies recover. Tobacco receipts will decline again in 2000 to \$1.8 billion, down \$0.4 billion from the year before. Rising retail prices and reduced use are causing sharp quota reductions. Peanut production may decline a little with a return to trend yields and reduce cash receipts somewhat. Sugar production is likely to continue growing, despite reduced prices, as weak prices for alternative crops deter switching. International trade obligations will cause increasing concern about 2000/2001 imports and supplies.

Livestock and Poultry.—Record-high per capita meat production pressured livestock and broiler prices last year. In 2000, higher poultry production is expected to be about offset by lower beef and pork production, causing per capita meat consumption to drop below last year's. Lower red meat production is expected to boost prices for cattle and hogs in 2000. In addition, livestock, poultry and dairy producers should benefit from another year of low feed costs.

In 1999, hog prices steadily improved throughout the year averaging \$34 per cwt. for the year. During the fourth quarter of 1999, hog prices averaged over \$36 per cwt., more than \$14 higher than one year earlier. In December and January, hog prices averaged \$38 per cwt., moving above break-even for the first time since late 1997. Responding to the low returns the past couple of years, producers began to reduce their breeding herds in late 1998 and continued to reduce them in 1999. Although the number of sows farrowing in June–November was down 4 percent from a year earlier, the increase in pigs per litter was up 2 percent, leading to a 3-percent decline in the pig crop. The drop in hog numbers is expected to lead to nearly a

4-percent decline in pork production in 2000. The decline in pork production could push hog prices above \$40 per cwt. during the second half of this year, with hog prices averaging \$39–\$41 for the entire year.

Cattle prices are projected to average about 5 percent higher in 2000 following last year's nearly 7 percent increase, as the liquidation of the nation's cattle herd finally leads to reduced beef production. The USDA's January 1 inventory of cattle and calves on farms showed 98 million head, down from 103.5 million head on January 1, 1996. In 1999, lower cattle and calf numbers did not translate into less beef production, as record slaughter weights, another year of poor incentives to hold back heifers for herd expansion and reduced forage due to drought led to record beef production. Beef production will remain large during the first 6 months of 2000, as cattle on feed inventories continue at record levels. On January 1, the number of heifers on feed was up 11 percent, while the number of steers on feed was up 6 percent from a year ago. During the second half of 2000, higher cattle prices and low feed costs should provide an incentive for producers to reduce heifer slaughter and begin rebuilding the cattle herd. Reduced placements of cattle on feed is expected to lead to a sharp reduction in beef production during the last half of 2000. For all of 2000, beef production is forecast to be down 3 percent.

Broiler prices in 2000 are projected to be off about 2 percent from last year after falling 8 percent in 1999. In response to attractive returns in 1998, poultry producers expanded the hatchery flock which could be about 5-percent larger than a year ago through the first half of this year. In the face of larger supplies, prices for whole birds are expected to remain weaker than a year ago. Prices for most broiler parts in January were 10–20 percent below a year ago, while strength in the export market kept leg quarter prices about 5 percent above last year. Despite the price drop, producer net returns are expected to continue to remain positive.

For all of 1999, milk prices averaged \$14.38 per cwt., down from the record of \$15.42 per cwt. in 1998, but still well above the previous 5-year average. These strong milk prices coupled with low feed costs and favorable weather in most areas of the country caused producers to expand milk production by over 3 percent in 1999, the highest year-to-year gain in milk production this decade. Increasing milk production and seasonally soft demand for dairy products caused milk prices to collapse at the end of 1999. The surge in milk production will likely pressure milk prices over the next several months. For all of 2000, the all-milk price is forecast to average \$12.55 per cwt., down nearly \$2 from last year and about \$1.60 below the previous 5-year average.

OTHER FACTORS AFFECTING THE OUTCOME

There is no doubt the farm economy is weak and many producers are having serious cash-flow problems. A number of key factors that will determine the financial fate of U.S. agriculture over the coming year are as yet unknown. A few key things to watch:

Market access.—There is continuing concern by producers over the acceptance of transgenic crops and the economic returns to producing them. Consumer and government reaction to these crops in overseas markets will determine producer use of transgenic seeds, marketing practices, and farm prices.

China.—China will continue to be a potentially major factor in world agricultural markets for several reasons. First, China's domestic macroeconomic policy is a factor in Asian trade patterns and exchange rates. Second, China has not been much of a wheat importer in recent years and holds large stocks of cotton and corn. China has lowered producer prices for major commodities in 2000 and that may result in some crop production cutbacks or switching among crops. China's exports limit U.S. prices of corn and cotton, but production changes and stock reductions in the 2000 crop year may begin to limit China's effect on world markets.

Accession to the World Trade Organization (WTO) would be a very positive factor for U.S. exports and farm prices. China's commitment to eliminate export subsidies should reduce their exports and reinforce domestic policy changes that reduce production incentives. Recent USDA analysis suggests that U.S. farm exports to China could rise as by at least \$2 billion by 2005.

Global weather.—As always, adverse or exceptionally good weather around the world could affect the level of crop food, feed and fiber supplies and prices. At this point, weather generally looks favorable, with dry areas in the U.S., North Africa and the Middle East.

Emergency assistance legislation.—The drop in farm prices the past 2 years raised concerns with the farm income safety net resulting in Federal emergency assistance of over \$15 billion. The President's fiscal year 2001 budget proposes a new farm safety net initiative. The initiative, designed to broaden Federal support, includes

four complementary proposals that would: (1) enhance farm income support by providing supplementary countercyclical income assistance, (2) increase environmental benefits and farm income with expanded conservation programs, (3) improve risk management programs and (4) expand economic opportunities in farm and rural areas. These legislative proposals would provide about \$11.5 billion in additional assistance to the farmers and ranchers during 2000–2002.

The income assistance program would provide supplemental income assistance payments to eligible producers of wheat, feed grains, rice, upland cotton, and oilseeds. The supplemental payments would be provided to eligible producers if the projected nationwide gross income for the crop falls below 92 percent of the preceding 5-year average. To target the program to smaller farmers who typically have lower farm income, payments would be subject to a separate \$30,000 per person payment limitation. The income assistance program is projected to cost \$3.1 billion during fiscal year 2000–01. In addition, the President proposed to extend the dairy price support program, which terminates at the end of this year, for 2 additional years.

The budget proposes an additional \$1.3 billion for a Farm Conservation Programs Initiative, which includes a new \$600 million Conservation Security Program to provide annual payments to farmers and ranchers who implement sound conservation practices. Additional funding is also provided for the Environmental Quality Incentives Program (EQIP) and the Wildlife Habitat Incentives Program (WHIP). In addition, the President proposed to remove the enrollment cap on the Wetland Reserve Program (WRP) and to increase the enrollment cap on the Conservation Reserve Program (CRP) from 36.4 to 40 million acres.

The fiscal year 2001 budget would extend the premium discount available in 1999 and 2000 for farmers who purchase buy-up coverage for crop insurance. The premium discount and the costs associated with higher participation are expected to total \$640 million. The budget also requests \$100 million to establish coverage for multi-year losses and \$100 million to provide livestock producers with price protection.

Lastly, the Administration proposes using \$80 million in fiscal year 2001 to provide equity capital for new livestock and other processing cooperatives. The proposal would help address concerns about market concentration and provide farmers with an additional source of income through cooperative ownership.

That concludes my remarks, and I invite questions. Thank you.

TABLE 1.—FARM ECONOMY OVERVIEW

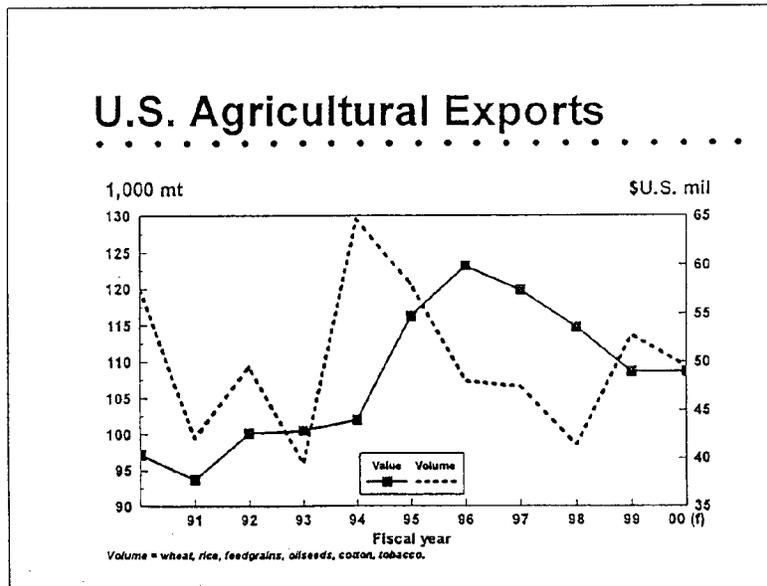

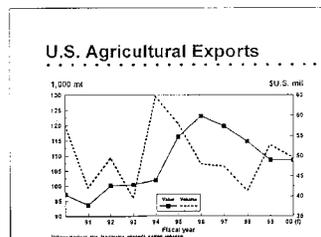

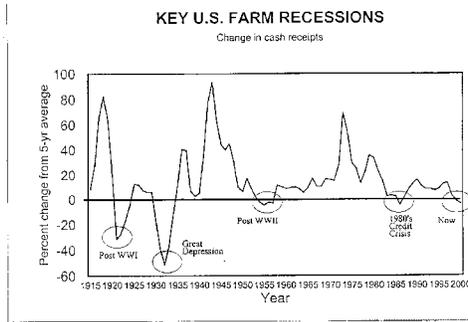

[Dollars in billions]

	1996	1997	1998	1999E	2000F
Cash receipts	\$199.1	\$207.6	\$196.8	\$191.9	\$189.9

Senator COCHRAN. Thank you, Mr. Collins. We have been joined by other Senators, members of the committee, and I am going to yield to them at this point for any comments or questions they may have of our witness panel.

Senator Gorton.

STATEMENT OF SENATOR SLADE GORTON

Senator GORTON. I thank you very much, Mr. Chairman. You recognize better than anyone how we are pulled by our various responsibilities. I have a hearing starting in 10 minutes or so with another part of the Department of Agriculture, the Forest Service, for which I have a particular responsibility, so I appreciate being able to make a statement and at least leave some questions for Mr. Schumacher with respect to my constituents who live under the ambit of his jurisdiction.

We are not any different than that of the rest of the country, from wheat growers to apple orchards, potato growers, asparagus farmers, and an adverse set of markets has really taken its toll in Washington State as well as it has elsewhere. My farmers produce more than 230 food, feed, and seed crops, and only two, wheat and barley, are under the guise of program crops. When overseas markets are lost and ignored, and when excessive regulations are imposed, when the tools necessary for production are stripped away, and when the younger generation becomes discouraged, they do need some forms of assistance.

Last year, one of our peculiar needs was with apple growers. Our most recognizable and profitable crop had its lowest price level in decades. There was a combination of adverse economic conditions both at home and abroad that were directly related to that struggle. There were all kinds of environmental restrictions placed on the growers, and our growers also needed support in overseas marketing and sales.

Under Secretary Schumacher visited the State last July, unfortunately politicized the plight of the growers and Members of Congress from the State. They did tell him of a desire to see loan programs made available for their commodity as well as increased trade and market access.

You, Mr. Chairman, ended up being tremendously helpful in providing in the big agricultural relief bill a specific mention of apples, I think perhaps for the first time ever.

Then, of course, in December the President came to Seattle during the World Trade Organization ministerial, and made the apple industry his poster child for world trade 1 day before he trashed the entire WTO ministerial itself and guaranteed for all practical purposes that we will not get any agricultural trade opening during the balance of his term.

Now, in spite of what you did, Mr. Chairman, I have just learned that several of our apple grower applications for the loan program have been declined by the Department of Agriculture, and I hope that Under Secretary Schumacher will explain why, and when we can get some of the things that you helped create for us.

On perhaps a less significant level our potato growers have expressed concern about their markets, and are very worried about the closure of the Foreign Agricultural Service Office in Singapore, and perhaps the Under Secretary can tell us what his alternatives are to that.

Now, we did just in the last 48 hours have the good news that China has finally gotten into the wheat market and announced a 50,000 metric ton purchase, but that 50,000 metric ton purchase by China is exactly one-eighth of the loss that we had from 1998 to 1999 in wheat sales to Pakistan, our best existing market, and I think we need to know, my wheat growers need to know how it is that we suffered such tremendous losses in our sales to Pakistan.

Asparagus growers are concerned about the influence of low cost product from Peru, hop growers about the loss of chemical tools, cherry growers are threatened by a lack of labor and housing, dairymen and cattlemen are constantly battling Federal agencies on water use and buffer zones, pea and lentil growers are at odds over the cuts in the Public Law 480 program, and all of the commodities in my State are barraged by those in the Administration and out of it advocating an anti-dam sentiment, cutting off water supplies in areas in which agriculture is simply not possible without irrigation.

So basically, it seems to me that we need an Administration that speaks with one voice in favor of agricultural industries, that does not simply advocate with lip service opening up foreign markets, but really helps to do so, that does not destroy by its regulations with respect to the tools of agriculture the availability of the tools that agriculture needs, including water, and that attempts to ad-

vance both a free market system and the use of the huge amounts of money, the billions of dollars that we appropriated for temporary relief, at the same time.

I must say, I am frustrated when you provide us with help for crops like apples and nothing much happens. I am frustrated by the loss of markets that we have historically held in the United States, and I am frustrated by the increasing regulations that impose grave difficulties on a business, on a profession that already has enough problems created by lower market prices overseas, and by increasing competition, and does not need to be regulated out of existence by its own government at the same time.

So I thank you, and now I have got to do the Forest Service bit, but I do hope that Secretary Schumacher will talk both about the apple loan program, about the office in Singapore, and about how it is that we have managed to lose our wheat markets so dramatically in countries that have been good customers of ours in the past, while we are at least beginning to get a little bit of encouraging news from China, though only very modest in comparison with what we have lost.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Senator, and we will see that the questions you have are submitted for the record.

Senator GORTON. Thank you.

Senator COCHRAN. Senator Burns.

[The statement follows:]

PREPARED STATEMENT OF SENATOR CONRAD BURNS

Mr. Chairman, thank you for holding another hearing today so we may further discuss the administration's farm proposal.

As I mentioned at the last hearing, I have more than a few concerns with this plan. To start with, this administration is asking for less money than last year. In small grain country there has been no improvement in price or movement. An effective and imaginative approach that will provide adequate short-term assistance, as well as a long-term plan to keep farmers in business is not only needed but required. The administration's proposal before us today, does neither.

It appears that the Administration is putting a heavier emphasis on the conservation side of their proposal, when we have an economic emergency across the countryside. Our efforts should be spent on trade and economic issues, not on promoting Vice President Gore's environmental agenda. Good economics and prosperity in farm country do more for good conservation practices.

I am very concerned about the \$1.3 billion for conservation in the farm safety plan. Not only does it promote an agenda that is not necessarily in the best interest of the agricultural community, but it leaves out any real commitment to crop insurance reform. It is imperative we have an effective risk management plan. All the conservation initiatives in the world are not going to help a producer make sound economic decisions to keep their farm a sustainable operation in the first place.

I think conservation plans can be highly effective. I don't mean to downplay their importance. However, I am very suspicious about this proposal and its intent. Especially when staff levels for technical assistance for NRCS were not adequately increased. CRP acreage would be increased in this proposal from 36.5 million acres to 45 million acres, meaning there will be more contracts to administer. There is no way the staff levels allocated will be able to handle the increased workload.

Effectively, this proposal provides no real solutions to the farm crisis. The counter-cyclical income support proposal provides only \$6 billion over the next 3 years. Last year alone, the emergency package totaled \$8.5 billion, and over the past 2 years, over \$16 billion has gone to agricultural producers. Even with the counter-cyclical income assistance plan as a supplement to AMTA, \$6 billion is simply not going to pull farmers through.

This new Farm Safety Net proposal also contains a \$30,000 cap on payments. Montana producers cannot support their families and stay in business on \$30,000. Currently, with the \$40,000 payment limit, many Montana farmers and ranchers are already eliminated. I have no idea why the USDA is decreasing the amount to further hurt farmers.

18 percent of producers in this nation account for 85 percent of production. USDA figures estimate that only 8 percent of the nation's producers will be eliminated from this payment plan. Again, I have no idea where USDA came up with this figure. I believe a much larger number than 8 percent would be eliminated from the counter-cyclical payment. It should not be the intent of this proposal to put the primary producers of this country at a disadvantage.

I know my Montana farmers and ranchers are not looking forward to another year of zero profit. However, it seems that is what this plan would provide them.

At a time when we are fighting for a place in the world market, why we are cutting funds for important export programs? Nearly every export program was cut. The Public Law 480 program was cut drastically as was the Section 416 program. Farm-states like Montana depend on export programs for their agricultural economy. We have been cut off from over 10 percent of the world market, due to sanctions and under-funded and under-utilized market development programs.

This administration has shown no stomach to take on our competitors. We must use these programs and stop allowing our competitors an advantage. Why do you feel these tools provided you by Congress are either unimportant or misunderstood or ineffective? If it is the latter two, why hasn't the administration approached Congress with some ideas to make them understood and effective?

Mr. Secretary, all the social programs that look and sound nice can all be replaced by a strong farm economy. That is what we need for rural economic development. There can be no other way. Excess acres in CRP has led to the decay of our rural cities and towns. Our standard of life in rural America continues to decline. This administration can brag all they want about how great this economy is and has been, but that has not been the case in farm country and the figures show it. We cannot get a handle on our cost production. Unrealistic rules and regulations cost untold dollars—dollars we do not have. It is not whether we like to do the right thing to ensure sustainability of our operations; it is a fact that we do not have the money.

In times like these our producers need every available marketing option open to them. We must provide them effective risk management. If we are not, why not? We must assist in a reliable export system. If we are not, why not? We must assist in short-term resources to again cope with another year of depressed grain prices and if we are not, why not?

I do not know how many employees you have there between 13th and 14th on Independence and how many of them have BS's, MS's and PHD's . It sounds like we have some misdirected resources that should be spending valuable time devoted to farm income. Mr. Secretary, that is where it is at . . .

Thank you again Mr. Chairman. I look forward to working with you and other members on this committee to come up with effective solutions to the farm crisis.

Senator COCHRAN. Senator Dorgan.

STATEMENT OF SENATOR BYRON L. DORGAN

Senator DORGAN. Mr. Chairman, thank you for holding this hearing, and let me also thank you for helping us in Congress craft an emergency package to respond to collapsed commodity and livestock prices, which has been very important to family farmers. In fact, I think the testimony today by Mr. Schumacher and Mr. Collins indicates that, without the two emergency packages in the last couple of years, the farm economy would have been in much more desperate trouble than it now finds itself in.

I must say—just to begin, before I ask a question of the witnesses—I was in Seattle as well, and it is interesting how two people can have different views of the exact same event. I was, in fact, at the presentation that President Clinton made to the apple growers and others in Seattle, and my own view of that circumstance is that the President did not trash the WTO, as was said by my colleague.

In fact, he stated the obvious: When we talk about globalization, and the movement towards a global economy, the rules of trade must keep pace with the movements towards globalization. The rules have not kept pace, and the result was tens of thousands of people marching in the streets of Seattle. I think the President simply stated the obvious, and did not in any way trash the WTO talks and put us in a position where we will not get an agricultural agreement. I just wanted to make that point.

I do not think you will ever have trade talks, especially dealing with agriculture, but trade talks generally, without having substantial numbers of people demanding that the rules of trade be discussed along with the increasing pace towards globalization. Those rules are critically important to working people, to the environment, and to a range of other issues.

Having said that, let me now say to Mr. Schumacher and Mr. Collins: Your testimony is not very heartening to those of us who are yearning for a stronger agricultural economy. Mr. Schumacher, you talked about the past. Last year, U.S. farmers experienced the lowest wheat prices in 8 years, lowest corn prices in more than a decade, lowest soybean prices in 27 years, lowest hog prices since the depression, the steepest decline in milk prices in history, and so on. When you talk about the future, Mr. Collins, you talk about U.S. agriculture continuing to face the prospect of low prices and incomes, and ongoing structural change.

I guess that leads to this question. Farmers are now in the Dakotas preparing to think through their plans for the year. They are going to need to borrow some money. They are going to go to a lender to talk about getting some seed, and some fuel, perhaps machinery repairs in order to plant some seed this spring.

Their lenders are only going to look at what the current farm program provides as a safety net. I assume the lenders will not be able to look at some anticipated emergency response that may or may not happen later in the year. While these emergency responses have been critical, I expect that if we do not do something to change the underlying safety net itself, a lot of farmers are going to find their lenders saying, well, look, all we can do is project what might happen to you given market prices and given the current farm program. We cannot anticipate that Congress may or may not pass some kind of emergency piece later.

Am I correct in that circumstance? I mean, have you analyzed that, Mr. Schumacher?

Mr. SCHUMACHER. If I may, Mr. Chairman. Yes, I went through the same discussions with farmers from North Dakota, Washington, and California in the last few weeks. The farmers are saying that the Congress will provide another emergency package. And the lenders are saying, well, we are not sure, or, we are not sure what form that might take. The Administration has a proposal on the table that will extend a couple of years, to give a little more surety to farmers and their lenders so they can get through probably another year or year and a half, of a pretty tough time in commodities.

Senator DORGAN. Mr. Collins.

FARM SAFETY NET

Mr. COLLINS. I agree with your general assessment, Mr. Dorgan. Certainly a bird in the hand is worth two in the bush. I think if you are a banker particularly, we know from Federal Reserve surveys over the last 2 years, that bankers have been increasing credit requirements on farmers.

You combine that with the fact that income to debt is going to go down. That ratio will go down quite substantially in the year 2000 without additional government payments. And I think there is no question that makes it more difficult to get a loan for those producers that are on the edge. Yes.

Senator DORGAN. Mr. Chairman, I know that you do not relish seeing myself and my colleague, Senator Conrad, come to the floor to talk about agriculture, but to us it is the single most important issue in our State's economy. Almost 40 percent of North Dakota's economy is agriculture. And it has just dropped off the table. We have been hit by floods, by chronic rain and moisture that has caused the worst crop disease in an entire century, on top of collapsed prices and a safety net that just does not make up the difference. So that is what has pressed us on behalf of our constituents to say we have to do something different.

Your testimony today, Mr. Schumacher and Mr. Collins, in my judgment, underscores the need for us to review how we can change the underlying safety net, how we can make changes to it that provide more structure and more assistance during collapsed grain prices without having to rely on an emergency bill later in the year. Because if we have to rely on an emergency bill again this year or next, a lot of those farmers will be told by their bankers, you do not cash flow here, you better take whatever little equity is left and get off the family farm.

And my fear is that we are losing so many family farmers because we have a lot of pride of authorship in the current farm bill and a reluctance to reopen it. It is painfully obvious to virtually everyone that this is not working. This would work in certain times. During good times, when prices are good, you could transition and it would be just fine.

You could transition people out of a safety net with \$5 wheat. I suppose it would be just fine. But when grain prices collapse, this is an unworkable system. This farm program does not work. The quicker Congress comes to grips with that, the better, and the more family farmers will be given a chance to continue to do what they do best.

So I think your testimony today gives us a good description of where we are, a description of where you think we are headed, and this ought to be a wake-up call to every single Member of Congress who cares about farm policy and cares about retaining a network of family farms in this country's future.

Mr. Chairman, thank you very much.

Senator COCHRAN. Thank you, Senator Dorgan.

Senator Durbin, I had indicated that Senators could either make an opening statement or ask questions, because I know there are other obligations that each of us has. If you want to do both or one, that is your choice.

STATEMENT OF SENATOR RICHARD J. DURBIN

Senator DURBIN. At the risk of pushing too hard, I will submit my statement for the record and make a very condensed version of it, and ask a few questions, all in 5 minutes.

Let me first thank you all for being here. Thank you, Mr. Chairman for this hearing.

Mr. Collins, we have had a chance to speak many, many times. And, Mr. Schumacher, of course, Mr. Kaplan, great to have your team here with us today.

I am trying to step back for a moment. I listened to my colleague from the State of North Dakota and so many others in the farm belt, I'm probably trying to do the impossible. I am trying to figure out whether this is an anomaly that we are living through and, a few years from now, we will look back and say, those were the bad times and we have recovered, or whether we are facing a trend line here, which is inexorable, that we just cannot overcome.

Are we facing changed circumstances in the global economy, when it comes to agriculture, which we just have to concede are inevitable? Are we facing new production in countries that, years ago, could not have considered it, at levels that we never would have been able to predict, that have now become our competition? Are we dealing with a global demand for product which is so unpredictable from year to year that we find ourselves at the mercy of this market? Can we even, on the best bipartisan day, come up with a new approach to helping American farmers that can anticipate some of these variables, as well as the variable of weather and exchange rates and so many other things that come into play?

PREPARED STATEMENT

I guess, Mr. Collins, since yours is the role of an economist, I really would try to ask you if you feel that there are certain changes in the global economy that account for the current doldrums that we have been in in agriculture for the last couple of years and appear to face for the next few months at least.

[The statement follows:]

PREPARED STATEMENT OF SENATOR RICHARD J. DURBIN

Good afternoon. Chairman Cochran, Senator Kohl thank you for holding this important hearing today. I think it is important for this committee to examine the severe economic crisis that continues to plague rural America while exploring options that can help relieve the stress and promote U.S. agricultural products abroad.

First, as I've said before, I am encouraged by the Administration's proposal designed to improve the farm safety net. A quick review of that proposal suggests that it would be a significant boost to Illinois farmers. In fact, it would mean more than \$140 million under USDA's Supplementary Income Assistance Program, over \$60 million for conservation programs, and more than \$64 million in new risk management assistance for Illinois farmers in the first year alone.

Obviously, our farmers need help. According to a University of Illinois study, about a fifth of the state's 73,000 farms won't cover their 1999 operating expenses and a majority won't make enough to cover family living expenses. Farm net worth is expected to drop about 15.5 percent on average. The Illinois Farm Bureau predicts that about 18 percent of Illinois farms will have negative 1999 net incomes and about 22 percent are in danger of going out of business.

Mr. Chairman, since 1989 the federal government has spent \$27 billion in emergency funding for farm-related disasters, 60 percent or \$15.9 billion in the last 2 years alone.

I think it's important for all of us to realize that the 1996 Farm Bill, Freedom to Farm, was not written in stone. It can and should be changed. I believe we must start now by reforming Freedom to Farm because clearly it has failed to meet the most basic needs of producers. Restoring the farm safety net, targeting payments to farmers in need, and ensuring that livestock producers are not left behind should be the first steps.

I also believe that we should begin a bipartisan effort to expand markets for American agricultural products so that farmers can take advantage of the immense buying capacity of developing countries. I am pleased that Under Secretary Gus Schumacher has joined us today to talk about efforts being undertaken by the Foreign Agricultural Service.

Allow me to touch briefly on Africa. As you probably know, I was in Sub-Saharan Africa in January and had an opportunity to see U.S. food aid programs in action. I was impressed and heartened by direct feeding programs as well as programs that sell U.S. food products at low cost to finance development projects. But I was overwhelmed by the impact of AIDS on Africa—particularly by the millions of children being left orphaned by the epidemic and the devastating impact on African countries' economies. I believe U.S. food aid could be used to target communities heavily affected by AIDS. I recently introduced legislation, the AIDS Orphans Relief Act of 2000 (S. 2030), to target \$50 million of U.S. food aid for nutritional assistance for people living with AIDS, for families and children affected by AIDS, and for development projects for communities heavily impacted by AIDS.

Mr. Chairman, I would like to get Under Secretary Schumacher's views on this legislation and the potential for U.S. food aid being used to help those children, families, and communities affected by AIDS in Africa and elsewhere in the world. I would also like to suggest that the Senate Appropriations Committee, particularly the Agriculture and Foreign Operations Subcommittees, should schedule a joint hearing to further explore this issue.

Finally, I included language in last year's bill calling upon the Administration to specifically request funding in fiscal year 2001 to implement the U.S. Action Plan on Food Security. Instead, I found a 17 percent drop in Public Law 480 funding (from \$1.23 billion to \$1.02 billion), and no specific program funding for the Action Plan. I'm very interested in an explanation on this matter.

Mr. Chairman, again thank you for the opportunity to raise these important issues today.

CAUSES OF AGRICULTURAL SLUMP

Mr. COLLINS. Your comment just before those questions is a whole bunch of questions in one, and I would almost like to say, all of the above, to all of the factors that you raised. There are a couple of things that strike me, and let me go back to the simplistic part first. There are two fundamental forces that have been at play over the last couple of years. One has been a dramatic slowdown in the world economy. We were growing at 3 to 3.5 percent and, all of a sudden, we were growing at less than 2 percent. And that has really pared back demand in a lot of areas of the world.

Second, we have had several successive years of very good crops around the world, part of it due to technology, but part of it due to just very good weather. We are on track to have pretty good weather again this year. I just reviewed all of the global weather maps, and we have dry weather in western North Africa, some dry weather in Iran, and I think that is pretty much it for the major commodities.

So those two factors have helped create a cyclical trough that we have been in right now. Agriculture does run in cycles, not predictable ones, but we go up and down, and we are down right now. And I think you have to take care not to think that we are going to be down forever.

But, at the same time, there are some surprising structural changes taking place around the world that are going to be, I think, promising for some crops and not so promising for others.

Senator DURBIN. May I ask you, if I might, to kind of zero in on one particular thing? For a long period of time, the Federal farm policy, among other things, focused on the belief that if we took certain acreage out of production in the United States of America, it would have an impact on world price. And we used that thinking for a long time in terms of the number of acres you could plant in certain program crops, the conservation reserve program and the like. Is that premise still valid in the world today?

Mr. COLLINS. I think that it is for major field crops. To give you an example, our share of world wheat trade this past year was 31–32 percent. Our share of world cotton trade, 25–26 percent. Our share of world corn trade, 70 percent. Our share of world soybean trade, somewhere about 60 percent. These are very large percentages of world trade. And if we were to take acreage out of production, no doubt it would have an effect on foreign acreage.

Now, some of those shares are not as big as they used to be. The soybean share is not as big. The wheat share is not as big. So, to that extent, taking land out of production would have less of an effect than it would have had in the past, but it still would have an effect.

Senator DURBIN. But are we such a market maker that if we took the 31 percent of world production in wheat and said, we are going to set aside 10 percent of the acreage and we are going to reduce our production by 10 percent, in other words, reduce 3 percent of the total sales of wheat worldwide, that would have a price impact sufficient to warrant that plunge on our part?

Mr. COLLINS. No, I did not say that. I do not know that it would have a price impact sufficient to warrant taking that land out of production, but it would have some price impact. I still think that we are in a world market where we have lots of competitors who are price responsive—Argentina and Australia, with respect to wheat prices. When wheat goes up, we know Australia will divert land from livestock to wheat, for example. Brazil and Argentina, with respect to soybeans, we know that they would like to see higher soybean prices, and that would accelerate the rate at which they are bringing new land into production in Brazil.

So we could take land out of production; I think we could affect prices, but, over time, the effect would be eroded by competitor response.

Senator DURBIN. Well, I am going to make one last footnote on this particular aspect and say that I have a special interest, as many do in the Midwest, about the ethanol program. I think it has been conceded by you and others that absent a quick response by the Administration to our concerns about this ethanol program, we put at risk some 10 cents a bushel in corn price. So I hope that our friends in the EPA and the White House could come together on this very quickly.

FOOD ASSISTANCE FOR AFRICA

Mr. Schumacher, it is good to see you. Let me ask you a specific question based on a trip that I took in January to Africa. I really went to look at food assistance programs and microcredit, and ended up spending most of my time looking at the AIDS epidemic,

which is just overwhelming and devastating, and may be the most moral challenge of our generation.

One of the things I came away with was the belief that, as overwhelming as it is, there are things that work. And some of the things that work are food assistance, particularly to those families willing to bring in AIDS orphans. These are families that literally are living hand to mouth on a day-to-day basis, who, because of the extended family custom in Africa, will bring in the orphans from the households of their brothers and sisters and relatives and bring them under their roof if they can do it economically.

The question is answered as to whether they can do it by basic things, like microcredit programs, which do not relate directly to your Department, but equally food assistance programs. I really came away believing that if we did nothing else but try to strengthen the existing African families so that they can bring in these orphans and find a home for them and keep them off the street, it may have more tangible impact on this epidemic than many other grandiose plans.

In the nation of Uganda, which is viewed as the most successful nation in Africa in dealing with the AIDS epidemic, they have reduced the infection of pregnant women from 30 percent just 10 years ago to 15 percent. That is an amazing thing to occur in a very small country. And yet, in this nation of 17 million people, there are 1.7 million orphans today.

What I am hoping to do is to work with you and the Department to talk about food assistance programs directed toward Africa and other countries facing this epidemic in the hopes that we can strengthen these families and keep the kids off the street and the girls out of prostitution. But when I look at the Administration's budget when it comes to Public Law 480, for example, or the 416(b) donations, we are moving in the opposite direction.

At a time when we have more stock on hand, it appears that we are cutting back in the food assistance that we want to provide in the world in the donations that might come out of food sales in countries in Asia and Africa. So I would like to ask you, can you tell me what the Administration's commitment is in these two areas and whether you think there is a receptive attitude toward some of the suggestions I have made?

Mr. SCHUMACHER. I think you have two questions. I had not really thought about that first question, and certainly it is something I will go back and discuss with my staff. Because if you look at what happened about a year ago in Kosovo, when the Kosovars were being driven out by the Milosevic government, refugee camps were set up, but many Albanian families took in their cousins from Kosovo and fed them.

What we tried to do with our food aid is to provide food for the host families, which I think is what you would like to counsel us to do in Africa, as well, to have some kind of programs where people take in AIDS orphans and would get some relief funds, food, and also provide some microcredit to help them move along. I think it is an excellent idea and I am going to explore that with my staff later on.

On the level of food aid overall, we did 9 million tons last year, feeding 40 million people in nearly 60 countries. This year we have

announced another 3 million tons, and we are going to push very, very hard. If there are additional needs due, for example, to the floods in Mozambique or difficulties in Ethiopia, certainly we will consider those on their merits.

Senator DURBIN. Well, let me be specific with you. When it comes to the U.S. action plan on food security, a 17-percent decline in the Administration's request in funding for that program. That worries me.

Similar to that decline, the 416(b) donation program seems to be in decline. Yet the most recent food security assessment report indicates an increase in the current food gap over the previous year's report, from almost 11 million tons to 12.7 million tons. So we would be giving less assistance in food to the World Food Program, the largest food program on the earth, at a time when the demand is growing in Africa, as well as other countries, Africa in particular, presents a great challenge to us as to whether we will respond to this AIDS crisis.

So my question to you is, why are we gearing down in these programs at a time when it appears the world need is gearing up?

Mr. SCHUMACHER. Well, I think we are in fact increasing our 416(b) over last year, and we have pushed hard this year to get the 3 million tons. We had some carryover funding available for Public Law 480 this year. Because we used so much 416(b) last year, we did not use as much Public Law 480. And I think that is why the request for new budget authority was a little less this year, because of the carryover we had from unused Public Law 480 that we are going to be using this year.

Senator DURBIN. Thank you. And I hope to work with you, as I have in the past, on this, particularly as it relates to this AIDS epidemic.

Mr. Chairman, I want to thank you for the hearing and for all your cooperation. Just last week, Senator Frist had a hearing in the Foreign Operations Committee, on the African Subcommittee, about this AIDS epidemic. And it is our belief that we have an opportunity this year, on a bipartisan basis, to try to address this terrible crisis. And I hope that in the course of this appropriation bill we can as well.

Mr. SCHUMACHER. Tim Galvin, Administrator of the Foreign Agricultural Service, was indicating that last year we did quite a lot of food aid, the highest in 25 years. And our budget reflects not only the fact that we have the carryover this year in Public Law 480, but also that we donated 500,000 tons of food to Russia last year, and we do not have that big Russian donation this year. I think on our day-to-day work, especially in Africa, in really vulnerable countries, we have been pretty aggressive. But if you feel that we need to do more in certain areas, I will come to visit with you on that.

Senator DURBIN. I learned a lot on my trip, Mr. Chairman. I learned, in Africa, that we are shipping a lot of vegetable oil, which is being sold locally and used for development. Their biggest complaint is we are shipping it in a can and they wanted it in durable plastic containers. So I told them, if I do nothing else as a United States Senator from Illinois, I am going to work on changing that

container. And so, maybe as part of this hearing, we can get into that as well. Thank you.

Senator COCHRAN. Thank you very much, Senator. I appreciate your participation in the hearing and your work of this subcommittee.

Mr. Schumacher, you really did not have a chance to make a statement before we started asking you questions. I will yield to you now for any comments or statements that you would like to make as a part of your testimony to the committee.

STATEMENT OF AUGUST SCHUMACHER

Mr. SCHUMACHER. I do have a prepared statement I hope we can put in the record.

Senator COCHRAN. It will be.

Mr. SCHUMACHER. But if I may I would like to make a very short statement, because there are many questions I would like to answer. First of all, I have my three administrators here who are going to counsel me when I make mistakes or, with your permission, come to the table, and also Mr. Fritz, our General Sales Manager, who has really worked very, very hard on this food aid issue. It has not been easy, but we have managed to ship an enormous tonnage to many, many countries and have had a major benefit.

For example, I was down in the Dominican Republic over the weekend and looked at the impact of the 100,000 tons of wheat that we donated, and how that had affected that country, and the enormous number of small projects that we have done, including even starting some very small markets that are benefitting producers. So when you see the results actually on the ground, it is quite extraordinary what is occurring with the counterpart monies of this food aid.

As Mr. Collins has indicated, things do not look great for this coming year in agriculture, and it was brought home to me in a number of areas. Mr. Gorton mentioned my trip to Washington State last year. With all due respect to Senator Gorton, that was not a political trip. I was invited out because the apple industry was in such trauma. They have the lowest prices in many, many years. Growers were going out of business. They were desperate. There were 270 growers of all sizes that came, and we talked and we listened. The result of that is, working together, we developed an apple action plan, and we are putting a lot of things together to help the apple industry.

In my own home State of Massachusetts, I met yesterday with some of the cranberry growers. Usually we call cranberry income the Massachusetts mortgage lifter, but prices have plummeted from \$80 a few years ago to, they said yesterday, \$20. Those producers are in desperate straits.

Governor Bush of Florida was in to see the Secretary and me on Sunday at the Governors Conference and was mentioning the crisis in his citrus industry, not only with citrus canker but some of the low prices that I think, Keith, you mentioned in your testimony. So beyond just the major commodities, we are seeing low prices in almonds, apples, oranges and, in California, some very great difficulties as well, so this poor price outlook is extending except in livestock.

We have a chart here where you can see that total CCC outlays, which we are predicting to be \$27 billion this year, are higher than the previous peak. Total CCC outlays, in unadjusted numbers, were \$25.8 billion in 1996 and \$19 billion in 1999.

What we have done, as you have indicated, is put on the table a proposal in four parts to take us through the end of the 1996 farm bill, building on it and adding to it where we think it really is needed. What we propose, Mr. Chairman, is an \$11 billion package, offset and on budget. Let me go through the four parts, and then Keith and I can answer questions on those. First, as Mr. Dorgan has indicated, we need to build on the basic AMTA payments with a countercyclical income assistance program. Our proposal calls for payments if the projected gross income for major commodities falls below 92 percent of its 5-year average. Payments would be made in addition to, not in lieu of, the production flexibility contract payments. We propose, and it is controversial, combined supplemental payment limitations of \$30,000.

It does not address the issues that Senator Gorton raised, of how to assist other commodities, for example, his hard-pressed apple industry. We can discuss that here or elsewhere as well.

These payments, in contrast to the AMTA, will be countercyclical, as I mentioned, rising when farm incomes fall and falling when farm incomes rise. They would also be crop specific, and they would be based on actual production rather than some historical base, so that only producers actually producing the crop would be eligible for the payments. As I have travelled around the country I have picked up some criticism from farmers, who say that some folks who live in the apartments in Chicago were getting payments when perhaps the farmers were not. There has been a bit of controversy in some of the areas there. So that is one of our proposals: countercyclical income support.

The second part of our proposal is improving crop insurance. We understand the Senate Agriculture Committee is beginning to mark up a crop insurance reform bill, and we certainly commend that. We have noted that farmers responded very favorably to the subsidy of buy-up coverage last year and the year before. We want to build on that success, and the budget proposes to extend the buy-up discount, thus encouraging farmers to become steady customers, and to provide multi-year coverage just like any other business.

We are also proposing a pilot livestock insurance program. And for those crops that do not have crop insurance, the budget proposes removal of the NAP area trigger, which will be particularly welcome I think in California and some of the eastern parts of the country, and maybe even the South, where you have crops that are not insured.

This will help those farmers that are hit by hailstorm or an isolated freeze get support. The yellow sticker is to remind me to talk about the Non-insured Assistance Program. At my age, I sometimes forget to do that. We have a very major issue on crop insurance. The budget provides a total of \$1.3 billion through fiscal year 2002 for these reforms.

The third part of our proposal is on conservation. And this we think is also a very important part. Senator Durbin inquired about set-asides. What we are proposing here is sound land management.

I think the heart of our conservation proposal is the \$600 million Conservation Security Program, which could help all farmers, because all farmers would be eligible to receive it. If, for example, a cranberry grower, an apple grower or a soybean grower undertook good conservation practices by reducing chemicals or reducing runoff, they would be entitled to a payment regardless of where they farmed. The program would be available to all farmers. We are working out the details with NRCS. I think this is an important issue and we would like to discuss it further if you wish.

And then, finally, the fourth part of our proposal is getting trade back on track. One of the things we call for, and we have called for it a couple of years in a row, is the authority from Congress to use the unobligated balances of the Export Enhancement Program to promote our exports overseas.

One of our problems, and we will come to this in a minute, is staffing. Senator Gorton has raised the issue of Singapore. We have some major staffing problems in our mission area. And we are not able to do the kind of work we were doing a couple of years ago when I was before you. This is the seventh year I have been before you in different capacities. So we would like to use the unexpended funds. For example, when China comes into the WTO, we will need to ratchet up our trade promotion work in China and, Senator, ratchet up more food aid. We would like to use those unexpended balances for food aid or trade promotion, to move products overseas.

We also have in the budget some proposals to enhance marketing flexibility. We have asked for \$130 million over 2 years to help cooperatives develop livestock processing facilities. We will be announcing fairly shortly the program under CCC for construction of on-farm grain storage. This is going to be very important as more and more marketeers would like specialty kinds of grains, and we want those farmers to have access to storage to provide for those specialty grains. And we are launching a new program to encourage production of bio-based energy.

Let me focus for just 1 or 2 minutes more, with your permission, on the staffing issue, Mr. Chairman. We are in trouble on staffing. If you look at the graph in front of you—it is kind of a busy graph—but you can see that in 1998, 1999, and 2000, as our CCC outlays have gone up, our staffing has gone down a bit. And we really are working very hard. We proposed some staffing initiatives here. We are proposing not to lay off any permanent staff. FSA has been using temporary staff, but we are under tremendous pressure. We had to absorb, for example, and I think quite rightly to absorb, the staffing for the consent agreement implementation. That is \$13 million to \$15 million.

We are very concerned about staffing in the Foreign Agricultural Service, where we have been down \$5 million over the last couple of years. We have asked for increases. We have not received them. And we really need to work with you to see if we can get the Foreign Agricultural Service back on track to get exports back up again.

For the Risk Management Agency, we are having some difficulties with staffing, because their liabilities have gone up quite a bit and the staffing has been basically straight-lined. Again, in the Farm Service Agency, the county employees are working overtime night after night after night to service the kind of demands that we are putting on them to implement the 22 new programs that Congress gave us last year. So we have a lot of work to do in the staffing area, and my gency Administrators are here to answer any of your questions on staffing issues that you may want to ask us.

Finally, we very much appreciated your help last year on the critical funding authority for CCC for the current appropriation for net realized losses. We thank you for giving us this authority. It was very, very important. I also want to particularly thank you and the committee for recognizing the strain that the workload has placed on our agencies and providing the additional resources last year to the Farm Service Agency for delivering those programs. We have been overtaken by events in all three mission areas. And in addition to those staffing resources, we are asking for a little bit more in this budget in certain key areas.

So, to summarize, we focused on proposals for countercyclical assistance, trade, conservation, and crop insurance, and also some of the difficult management issues we have had in delivering 22 new programs in addition to administering the loan deficiency payments and related programs that have gotten farmers through and provided the kind of income support to stabilize agriculture through these very difficult times that Mr. Collins has described.

PREPARED STATEMENT

I appreciate being before you today, sir, and look forward to taking your questions.

[The statement follows:]

PREPARED STATEMENT OF AUGUST SCHUMACHER, JR.

Thank you, Mr. Chairman. I am pleased to appear before you and members of the Subcommittee to talk about the Administration's budget proposals which assist farmers and ranchers. I would like to thank my colleague Keith Collins for his opening statement. I have with me today Keith Kelly, Administrator of the Farm Service Agency, Ken Ackerman, Administrator for the Risk Management Agency, Tim Galvin, the Administrator of the Foreign Agricultural Service, and Richard Fritz, the Department's General Sales Manager.

As Keith Collins indicated, and as you are all aware, this will be yet another challenging year for America's family farmers.

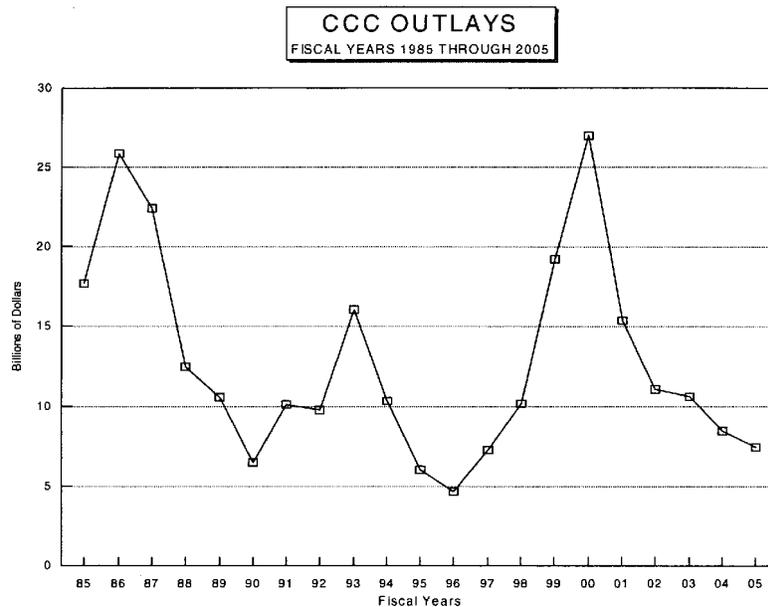

Last year, U.S. farmers experienced the lowest wheat prices in 8 years; the lowest corn prices in more than a decade; the lowest soybean prices in 27 years; the lowest hog prices since the Great Depression; and the steepest decline in milk prices in history. Even cranberries, which are known in my home State as the Massachusetts mortgage lifter, have plunged from \$65.90 a barrel in 1996, to \$38.80 a barrel in 1998—down some 37 percent.

And, to make matters even worse, Mother Nature has added to farmers' problems with continuing bad weather in broad areas of the country, including hurricanes, tornadoes, and the recent drought that plagued virtually the entire East Coast.

This situation has put USDA and its support programs in the spotlight. As you are aware, domestic farm commodity loan and income support programs are administered by the Farm Service Agency (FSA) and financed through the Commodity Credit Corporation (CCC), a government entity for which FSA, as well as certain other agencies, provides operating personnel. The CCC is also the source of funding for the Conservation Reserve Program (administered by FSA) as well as many of the conservation programs administered by the Natural Resources Conservation Service (NRCS), and it funds many of the export programs administered by the For-

ign Agricultural Service (FAS). When called upon, CCC also finances various disaster assistance programs authorized by Congress. Funds are borrowed by the Corporation from the Treasury to finance CCC programs. Commodity support operations, handled primarily through loans, payment programs and some limited purchase programs, currently include those for wheat, corn, soybeans, minor oilseed crops, cotton (upland and extra long staple), rice, tobacco, milk and milk products, barley, oats, sorghum, peanuts and sugar.

Fiscal year 1999 CCC net outlays totaled over \$19 billion, and net outlays in 2000 are expected to reach an all-time high of \$27 billion. The historical CCC outlay trend is shown on the following graph:

When you look at these trends, they are particularly ironic, especially given that the thrust of the provisions of the 1996 Farm Bill was aimed at distancing government from providing disaster assistance. In an effort to address a looming farm crisis, Congress has had to provide ad-hoc assistance, time and again.

But why is the farm economy in crisis? Can you lay all the blame on the Federal Agriculture Improvement Act and Reform of 1996? No, in large part, the crisis is being fueled by 4 consecutive years of record global grain production and weak export demand—both of which are beyond the scope of the 1996 Act. U.S. agricultural exports are projected to be only \$49.5 billion this fiscal year after reaching a record high of nearly \$60 billion in fiscal year 1996. Large global production, the Asian and Russian economic crises, and a strengthening dollar, have all contributed to a weakening in our exports.

The more appropriate question is: Is the 1996 Act doing what farm policy should to help deal with the problem and help with the recovery? Clearly the answer to that question is no.

PRESIDENT'S 2001 BUDGET PROPOSALS FOR AMERICAN AGRICULTURE

Last month, in his State of the Union Address, the President made clear his commitment to this country's farmers. The President said "We must work together to strengthen the farm safety net, invest in land conservation, and create new markets by expanding our program for bio-based fuels and products." This Administration has put forward a set of proposals that will address the shortcomings of the 1996 Act directly.

Let me be clear today, the President's proposal reaffirms that Government farm policy cannot simply keep lurching from one expensive bailout to another. Ad-hoc

assistance is expensive; it's inefficient; it's hard on our farmers; it's hard on our over-worked USDA staff; and it's hard on the taxpayers. It is time to move beyond annual "damage control," and to a stable policy that helps farmers prepare for disasters and price downturns, invest in long-term market development and export promotion programs, and gives them the tools they need to thrive—not just survive.

This set of proposals will focus the spotlight on our mission area—Farm and Foreign Agricultural Services. The Farm Service Agency, Risk Management Agency, and the Foreign Agricultural Service will have the lead in administering the President's package.

When I've spoken with various farm groups, I've likened this proposal to the solid kitchen chairs that my family used to have at the farm house, with four firm legs and a well-built back.

- The first leg is a counter-cyclical income support for the basic program crops—which we estimate at approximately \$6 billion over 3 years.

- The second is the reformed and broader risk management/crop insurance package.

- The third leg is a creative conservation package (\$4.8 billion through 2005) that expands CRP to 40 million acres, provides for a conservation security reserve investment, and provides for farmland protection cost sharing.

- Leg four is an expanded trade initiative that aggressively uses all of our export programs and in addition requests authority to use any unobligated Export Enhancement Program (EEP) funding for long-term investment in trade promotion as well as for food aid.

- Equally important is the back of the chair, which supports the farmer when the farmer leans back on the back legs of the chair. This chair back includes proposals for stabilizing the crucial USDA workforce that has become over-stressed the past 3 years, farm loan programs, a bio-fuels initiative, the freezing of loan rates, and an extension of the dairy program.

The Administration package has a number of benefits: it is flexible; it benefits farmers in all regions (of vital importance following 1999 eastern droughts and floods and California freezes); it is targeted; it continues to provide planting flexibility; it has conservation initiatives benefitting all farmers in all regions; it is on budget and funded within the President's balanced budget that preserves the Social Security surplus; it is consistent with our trade commitments; and most importantly, it provides some stability—and a consistent framework—for a new farm bill in 2002.

Counter-Cyclical Income Support

It seems like a pretty common-sense notion—that those who are struggling the most deserve the most help. But the AMTA formula that we've been living by for nearly 4 years, with its fixed payments, has no such logic. Thanks to AMTA, recent supplementary farm payments haven't been tied to need, to size, or to current production.

The Administration proposes supplemental income assistance for crop years 2000 and 2001, to eligible producers of wheat, feed grains, rice, upland cotton and oilseeds. The payments would be made only if projected gross income—including other Government payments—from the crop falls below 92 percent of the preceding 5-year average. These payments would be crop-specific and would be based on actual production rather than some historical base. The proposed program will provide payments only to current producers of those crops with low prices and income. It is estimated that \$600 million in assistance will be provided in fiscal year 2000, \$2.5 billion in fiscal year 2001 and \$2.5 billion in fiscal year 2002.

Still, we're not looking to replace AMTA with our plan. We are letting the basic principles of the FAIR Act live on through the life of the bill. The new income assistance will come on top of—not in place of—AMTA payments and other 1996 Farm Bill payments. AMTA participants would continue to receive their full payments, and 98 percent of them would also be eligible for an additional check under this proposal. However, we believe this counter-cyclical method of income assistance should form the basis for how the next farm bill proposal should be structured.

Crop Insurance Reform

Even with such improvements in our farm programs, we know that we will continue to need strong risk management programs. That brings me to our efforts to reform our crop insurance programs. Crop insurance is and will continue to be USDA's primary means of helping farmers survive major production losses. In 1999, American farmers purchased some 1.3 million crop insurance policies covering 196 million acres. Liability coverage rose from just \$14 billion in 1994 to more than \$30 billion in 1999, with indemnity payout in 1999 at \$2.2 billion.

Past reform of the crop insurance program was made in the context of an agricultural program that no longer exists. Plunging prices, the effects of multiple years of crop losses, and under-insured farmers have prompted us to develop an aggressive crop insurance reform proposal.

While crop insurance hasn't been the panacea for all our producers' problems, there is a certain irony about the crop insurance program: When people say the system is broken, what they mean is there isn't enough crop insurance coverage.

Today's crop insurance program was designed to work in tandem with our farm programs. We need a program with sturdy underpinnings, solid, steady, reliable legs, that can withstand price and weather volatility.

We need a strengthened crop insurance program, a program that provides premium discounts, a strong risk management education effort, new product development, assists livestock producers, provides multi-year loss coverage, and lifts the Non-insured Assistance Program (NAP) area trigger. I understand the Senate Agriculture Committee will conduct markup on risk management in early March 2000, with the House of Representatives having already passed its version on voice vote in 1999. Some Senators favor a direct payment approach, while others like the alternative of enhanced coverage for all producers. Crop insurance has become a hot political item. There are high expectations that cannot be met by current resources.

The Administration also proposes to modify the Non-insured Assistance Program area-wide trigger requirement, so that producers with individual qualifying losses in areas that have been designated for natural disasters are able to receive program assistance. This change will provide an additional \$110 million of assistance in fiscal years 2000 and 2001.

Conservation Initiatives

The Administration believes that any reform initiatives should promote conservation. The 2001 President's Budget seeks an additional \$1.3 billion in budget authority for a Conservation Programs Initiative. This is a key component of the Administration's Farm Safety Net Proposal to strengthen farm family income while promoting environmentally sound land management. Within the \$1.3 billion, increases are provided for five ongoing CCC-funded conservation programs: the Environmental Quality Incentives Program (EQIP); Wetlands Reserve Program (WRP); the Conservation Reserve Program (CRP); Farmland Protection Program (FPP) and the Wildlife Habitat Incentives Program (WHIP). Under current law, an additional \$125 million in bonuses will also be offered to producers who enroll in CRP through the continuous signup.

For EQIP, part of the President's Clean Water Action Plan, the annual authorized funding level would be increased from \$200 million to \$325 million. This program provides financial, technical, and educational assistance to farmers and ranchers who wish to implement conservation practices for land currently in production.

Under WRP, which offers technical and financial assistance to farmers who wish to restore and protect agricultural wetlands, the initiative would remove the current cumulative acreage cap of 975,000 acres and enroll an additional 210,000 acres in 2001, and an additional 250,000 acres in each subsequent year.

The Conservation Reserve Program provides farmers with technical and financial assistance in exchange for removing environmentally sensitive land from production for a 10-15 year period and implementing conservation practices. The CRP currently allows for up to 36.4 million acres to be enrolled. The President's Initiative would increase the enrollment cap by another 3.6 million acres to 40 million. Bonuses totaling up to \$100 million in 2000 and up to \$125 million each year in 2001 and 2002 would also be offered to producers who enroll land in CRP through continuous signup. These bonuses are expected to encourage enrollment of high environmental-value acreage, and are included in the CCC baseline. Legislation is also being proposed to provide \$75 million in additional technical assistance funding for the CRP and WRP for 2001.

CRP is USDA's largest environmental program. The purpose of CRP, administered by FSA, is to cost-effectively assist farm owners and operators in conserving and improving soil, water, air, and wildlife resources by converting highly erodible and other environmentally sensitive acreage normally devoted to the production of agricultural commodities to a long-term resource-conserving cover. CRP participants enroll contracts for periods from 10 to 15 years in exchange for annual rental payments and cost-share and technical assistance for installing approved conservation practices. CRP acreage also contributes to the USDA Conservation Buffer Initiative, the Conservation Reserve Enhancement Program, and the Administration's Clean Water Action Plan, which are estimated to enroll 4.2 million acres through 2002. Also, in rules adopted after the 1996 Act, USDA reinstated the eligibility of certain cropland wetlands.

In 1999, a general CRP signup was held (signup 18) from October 26, 1998, through December 11, 1998. Of the 7.1 million acres offered, a total of 5 million acres were approved for enrollment beginning in 2000. The national average annual rental payment for this acreage is estimated to be about \$46 per acre. Technical assistance for this signup was funded with unobligated appropriated funds and authorized CCC funds. Rental payments for signup 18 begin in 2001.

Another general CRP signup began on January 18, 2000, and continued through February 11, 2000. We are in the process of collecting bid data from our field offices, and expect to make final enrollment decisions and offers in April.

In 2000, CCC made payments of approximately \$1.450 billion for rental costs and will make payments of about \$124 million for sharing the cost of permanent cover on replacement acres. For 2001, the Budget projects CCC program costs of approximately \$1.690 billion, consisting of \$1.567 billion for rental payments on previously enrolled and extended acres and \$123 million for cost-share assistance for permanent cover on enrolled acres. Rental payments for 2001 are not affected by the 20th signup which just concluded, since rental payments are not due until 2002.

The Initiative proposes a new \$600 million Conservation Security Program (CSP), which would provide annual payments to farmers and ranchers who implement certain conservation practices including practices related to such matters as nutrient management, grazing, grassed waterways and windbreaks. Payments would be based on the comprehensiveness of the farm's conservation plan. Of the \$600 million, \$90 million (15 percent of the program) will be used by the NRCS to provide necessary technical assistance to farmers and ranchers.

Funding provided by the 1996 Farm Bill for both the FPP and the WHIP has been exhausted. Under the conservation initiative, the FPP, which is also part of the President's Lands Legacy Initiative, would be funded at \$65 million annually. This program provides matching funds to State, local, and Tribal governments to purchase permanent easements and thereby protect farmland which may otherwise be threatened by urban and suburban sprawl. The initiative also proposes \$50 million annually for WHIP, which offers cost-share assistance to farmers and landowners for habitat restoration and technical assistance.

Successes in Food Aid, and Export Promotion

The last leg of our chair will be provided by our initiatives in food aid and export promotion.

With domestic supplies high, one can only imagine how much worse the situation would be if we had not continued the vigorous use of our long-standing food aid programs. With large surpluses and rock-bottom prices here at home, we have actively used food aid to move commodities out of the U.S. marketplace to needy areas around the world. Under 1999 food aid programs, including the President's Wheat Initiative, USDA programmed nearly 8 million metric tons of U.S. commodities—close to five times the previous year's shipments and the largest tonnage in many, many years.

American commodities went to around 50 countries last year—from the unprecedented assistance package for Russia to food relief for Kosovo refugees, famine victims in North Korea, and hurricane victims in Central America and the Caribbean. Under the authority of Section 416(b) of the Agricultural Act of 1949, as amended, CCC donated nearly \$800 million worth of commodities, including 5.2 million tons of wheat and wheat products, 274,000 tons of corn, and about 23,000 tons of dry milk. These U.S. surpluses were taken off the market and put to good use, helping to relieve hunger and suffering abroad.

Our export credit guarantee programs facilitated sales of more than \$3 billion in U.S. agricultural products. Our GSM-102 program helped U.S. exporters overcome disadvantages in Turkey, and make record sales of over \$1.2 billion in Mexico. The program helped U.S. oilseed exporters sell more than \$19 million worth of oilseeds to Uzbekistan, traditionally a buyer of South American oilseeds. Our GSM-103 program helped U.S. exporters sell over \$14 million worth of wheat to Jordan. The Supplier Credit Guarantee Program was used for the first time by importers in the Baltic Region, Georgia, and Turkey, resulting in sales of nearly \$1 million worth of meat products to buyers in the Baltic Region, and nearly \$3 million worth of poultry products and other products to buyers in Georgia and Turkey.

With the aid of the Dairy Export Incentive Program (DEIP), U.S. exporters sold more than 136,000 tons of dairy products valued at \$337 million. USDA awarded more than \$145 million in bonuses to help U.S. dairy exporters meet prevailing world prices and develop foreign markets.

The Export Enhancement Program was used only sparingly in 1999 because of market conditions, with bonuses of about \$1.4 million awarded for sales of more than 2,000 tons of frozen poultry.

We continue to stress the importance of market development. In 1999, we allocated \$90 million to 65 U.S. trade organizations, State regional groups, and cooperatives for export promotion activities under the Market Access Program (MAP), and approved allocations of \$27.5 million for 26 trade organizations under the Foreign Market Development (FMD) program.

And, through the Cochran Fellowship Program, USDA introduced nearly 800 participants from 70 emerging markets to U.S. products and policies in 1999, and plans to meet and exceed that record this year.

TRADE POLICY INITIATIVES

On the trade policy front, USDA worked successfully to open, expand, and maintain markets for U.S. agriculture. For example, last April, the United States and China signed the Agreement on U.S.-China Agricultural Cooperation, an unprecedented step in U.S.-China agricultural trade relations. With this agreement, China finally removes the longstanding bans on exports of U.S. wheat, citrus, and meat and poultry to China, and calls for China's commitment to the application of sound science, a key principle of the Uruguay Round Sanitary and Phytosanitary (SPS) Agreement. The agreement confirms a U.S.-China agricultural partnership in achieving some key objectives: resolving trade barriers, increasing technical cooperation and scientific exchanges and further developing our agricultural sectors.

In addition, we negotiated an agreement with China regarding its membership in the World Trade Organization (WTO). Implementing that agreement could add an estimated \$1.6 billion annually to U.S. exports of grains, oilseeds and products, and cotton by 2005, and could grow to nearly \$2 billion as the Chinese reduce their tariffs on other products. These gains will mean higher prices for farmers and, ultimately, higher U.S. farm income. Of course, the first step toward realizing these gains would be Congressional approval of permanent Normal Trade Relationship status for China.

USDA continues to monitor aggressively foreign countries' compliance with Uruguay Round Agreement commitments. For example, a WTO dispute settlement panel is examining Korea's import and domestic support programs for beef. As a result of Korea's failure to meet minimum import quotas under its Uruguay Round commitment in 1997 and 1998, it became clear that numerous market access barriers exist, and threaten to inhibit full market liberalization. We will continue to insist on compliance in this and all cases where access to U.S. agriculture is at stake.

For example, at 1999 meetings of the Committee on Agriculture, USDA analysts reviewed and raised questions on over 250 WTO notifications. The value of trade addressed through U.S. vigilance of commitments is over \$500 million. This was achieved through questioning member's domestic grain purchasing policies that appeared to violate export subsidy commitments; challenging the discriminatory issuance of import licenses for dairy products, pork and poultry; questioning the WTO-inconsistent execution of a preferential trade arrangement that harmed U.S. apple exports; and questioning low tariff rate quota (TRQ) application for a range of commodities. These efforts contributed to several members halting implementation of or modifying WTO inconsistent practices.

Exports have played, and will continue to play, a key role in the health of our farm economy, and we intend to step up our efforts in the near future, ensuring that U.S. agriculture is competitive around the globe.

"The Chair Back"

Mr. Chairman, meeting sharply growing workload demands within existing resources is having a profound affect on the working environment in my mission area. FSA is implementing over 20 new or additional emergency related programs that were enacted by Congress this year—more than twice the number of such programs it had to deliver in 1999. Unbudgeted costs associated with the Consent Decree—which came out of the lawsuit filed by African-American farmers against USDA—have also added to FSA's administrative expenses and workload in 2000. Similarly, the Risk Management Agency has been undertaking new initiatives to strengthen our risk management services for producers.

In the case of the Foreign Agricultural Service, its workload has increased dramatically as a result of record levels of food assistance we are providing. The Agency also is deeply immersed in a number of critical trade policy matters, including the accession of China to the WTO, the new round of multilateral trade negotiations, as well as trade issues related to biotechnology and food safety.

I point out these workload concerns in order to stress the importance of working with you and the committee to ensure that adequate resources are made available

to these agencies. It is vitally important that the work of the FFAS mission area, which is critical to the future of American agriculture, can continue.

I would like to review with you some of our projected outlays, so that you can fully appreciate the magnitude of the workload.

CCC PROGRAM OUTLAYS

The current 2001 budget estimates largely reflect estimated supply and demand conditions for the 2000 crop based on November data. Commodity Credit Corporation net expenditures for 2001, including proposed "Safety Net" legislation outlays of \$3.6 billion, are estimated at \$19.0 billion, down \$8.7 billion from a record high expenditure level of \$27.7 billion—including \$700 million in proposed legislation outlays—in 2000. The previous record CCC expenditure level occurred in 1986, when net outlays were \$25.8 billion.

The net decrease of \$8.7 billion in projected 2001 CCC expenditures reflects decreases which include the ending of the \$5.8 billion of 2000 market loss assistance payments, the ending of \$1.3 billion in 2000 crop loss assistance, the ending in \$210 million of 2000 emergency livestock assistance, a decrease in production flexibility payments of \$992 million, a decrease in commodity net lending of \$595 million, a projected decrease in of \$848 million in loan deficiency payments from the huge levels of 2000, a decrease of \$130 million in Section 416(b) ocean transportation expenses, a decrease in other direct producer payments and expenditures of \$369 million.

Other Initiatives

FUND COOPERATIVE DEVELOPMENT INITIATIVES

Total funding proposed for cooperative development for new livestock and other processing cooperatives includes \$80 million in 2001 and \$50 million in 2002. These funds would be used to provide equity capital for new livestock and other cooperatives to help finance, for example, the construction of cooperative-owned, value-added, meat processing facilities that would help counter concentration and retain income in rural areas.

EXTEND THE DAIRY PRICE SUPPORT PROGRAM

The Administration also proposes the extension of the dairy price support program. Current appropriations language extended the dairy price support to December 1, 2000; however, this proposal further extends the dairy price support program to December 2002. Under this proposal, \$150 million is estimated to be needed to support dairy prices in each of fiscal years 2001 and 2002.

CCC AUTOMATED DATA PROCESSING CAP

In April 1996, a cap of \$275 million for CCC-funded automated data processing (ADP) obligations for 1997 through 2002 was mandated by the 1996 Act. Subsequently, the Agricultural Research, Extension, and Education Reform Act of 1998 reduced the CCC ADP cap to \$193 million. Finally, the Fiscal Year 1999 Agriculture Appropriations Act (Public Law 105-277) again reduced the CCC ADP cap to \$188 million. As last year, legislation is again proposed to provide annual funding of \$35 million in 2001 and 2002 for Farm Service Agency computer systems to ensure essential system availability and continued ADP services in headquarters and field offices at bare minimum levels. This funding is critical because such expenditures were formerly made using the CCC's general funds subject to the mandated ADP limit. The funds available under that limit were depleted in early fiscal year 2000. Without further new funding, Mr. Chairman, it will be virtually impossible for FSA to adequately respond to the thrust of Service Center modernization or to ensure the continuity of uninterrupted program delivery.

REIMBURSEMENT FOR REALIZED LOSSES

Mr. Chairman, the 1999 appropriation for reimbursement of CCC net realized losses was \$8.4 billion. This appropriation reflected reimbursement for net realized losses which covered the actual amount of unreimbursed losses incurred 2 years earlier.

The 2000 appropriation for reimbursement of net realized losses was \$30.037 billion, an increase of \$21.637 billion from the 1999 appropriation of \$8.4 billion. The appropriation reimbursed CCC for the remaining unreimbursed net realized losses for 1997 and 1998, and all of 1999 actual losses. The appropriation to reimburse the Corporation for net realized losses enacted by Congress for 2000 was a current, in-

definite appropriation. This provided CCC with the flexibility to request funds as needed from Treasury, up to actual losses recorded for the most recent actual year. Without this current, indefinite appropriation, CCC would have been unable to fully replenish its borrowing authority at the beginning of 2000, and timely assistance to farmers would have been jeopardized due to insufficient borrowing authority. Mr. Chairman, we appreciate your help in providing that critical funding authority.

The 2001 budget reflects a request to once again enact appropriation language to eliminate the requirement that only allows reimbursement for actual realized losses recorded in CCC books as of the end of the preceding year. Our request is that you provide a current, indefinite appropriation to reimburse the Corporation for all actual net realized losses, even if incurred in the current fiscal year.

FARM LOAN PROGRAMS

The loan programs funded through the Agricultural Credit Insurance Fund (ACIF) provide a variety of loans and loan guarantees to farm families who would otherwise be unable to obtain credit. In times of economic stress, access to adequate farm credit is often the only way for some farmers to continue their operations.

As a result of the continuing financial hardship in much of the agricultural sector, the demand for Farm Service Agency loans and loan guarantees remains very high in 2000. However, the 2000 subsidy funding provides loan levels totaling a record \$5.8 billion that are expected to meet the strong demand including \$2.5 billion through emergency funds. The 2001 budget likewise responds to an anticipated high demand by providing a total program level of about \$4.6 billion in loans and guarantees, an increase of \$1.6 billion excluding emergency funds. The largest segment of FSA lending is carried out in partnership with private lenders through the guarantee programs, and this budget continues strong support for guaranteed loans, with a proposed program level of nearly \$3.5 billion.

For direct farm ownership loans we are requesting a loan level of \$128 million, a decrease of \$22 million from the 2000 appropriated level (including supplemental funding). The proposed program level would enable FSA to extend credit to about 1,250 small and beginning farmers to purchase or maintain a family farm, about 500 fewer than estimated for the current fiscal year. The agency has established annual county-by-county participation targets for members of socially disadvantaged groups, based on demographic data. Also, 70 percent of direct farm ownership loans are reserved for beginning farmers, and about 35 percent are made at a reduced interest rate to limited resource borrowers, who may also be beginning farmers. For direct farm operating loans we are requesting a program level of \$700 million, \$200 million above the 2000 level, excluding supplemental funding, to provide over 14,400 loans to family farmers.

For guaranteed farm ownership loans in 2001, we are requesting a loan level of \$1 billion, the same as 2000. This program level will give over 4,500 farmers the opportunity to either acquire their own farm or to save an existing one. For guaranteed farm operating loans we propose a fiscal year 2001 program level of nearly \$2.5 billion, compared to \$1.8 billion in 2000 excluding emergency loans. This level will enable approximately 16,600 producers to finance their farming operations.

The Budget also proposes \$150 million in emergency disaster loans in fiscal year 2001, sufficient to provide approximately 1,800 low-interest loans to producers whose farming operations have been damaged by natural disasters. We are proposing to close the "eligibility gap" between USDA and SBA emergency loans, so that in times of natural disaster, every sized farm and ag businesses have a place to turn to for emergency assistance. These new loans would be made at higher interest rates than our currently authorized borrowers. In addition, our budget proposes just over \$2 million for Indian tribe land acquisition loans and \$100 million for boll weevil eradication loans.

STATE MEDIATION GRANTS

Our request of \$4 million for State Mediation Grants would assist States in developing programs to deal with disputes involving a variety of agricultural issues—distressed farm loans, wetland determinations, conservation compliance, pesticides, and others. Operated primarily by State universities or departments of agriculture, the program provides neutral mediators to assist producers, primarily small farmers, in resolving disputes before they culminate in litigation or bankruptcy. Mediation, at about \$500 per case, offers significant savings over national level administrative hearings, which cost about \$3,000 to \$4,000 per case in direct costs alone. Authority for State Mediation Grants expires at the end of 2000. A legislative proposal is being submitted to reauthorize the program through 2005.

SERVICE CENTERS

Another important part of our effort to deliver services to rural customers is the initiative to streamline and modernize the field offices and create Service Centers. While we have physically established these Centers, we still have much work to do to make the promise of better service a reality. A key ingredient in providing well coordinated, quality assistance at USDA Service Centers is the replacement of separate agency, aging information technology systems with the common computing environment along with reengineered business processes. The USDA Budget proposes \$75 million for this effort in appropriated funds under the Office of the Chief Information Officer. Rural Development will provide additional funding, as necessary, to support the modernization plan and service center initiative. Additionally, an important part of the efforts to modernize field operations is the streamlining of the administrative services for the Farm Service Agency, Rural Development, and Natural Resources Conservation Service. By conserving resources in this arena, each agency will be in a better position to provide greater program support. We would like to work with you to see that these administrative services can be consolidated.

CONCLUSION

Over the last 60 years, agriculture has been dramatically transformed, and yet farm policy has remained relatively stagnant. People generally do not and cannot farm the way they did in the 1930s and 40s, so government's role in helping them has to change accordingly.

The days when every farmer could survive by simply bringing commodities to market are over. That's why a new farm policy must change and improve the ways the government provides assistance, and highlight new and different ways for farmers to make money and capture a greater share of the consumer dollar. That means promoting future access to food systems through improved marketing, strong farm cooperatives, reinforced direct marketing schemes, innovative use of the Internet, and farmers markets. It means encouraging the use of crops for energy and bio-based fuels, encouraging the production of value-added, consumer-ready goods, organics, aquaculture and so on.

Of course, traditional row crop farming will continue to be an important part of the American agricultural portfolio. And the government will continue to support the people who grow traditional crops. But a new century calls for a more holistic approach based on the understanding that, even if there are fewer farmers, there are more kinds of farmers living in more places than ever before.

In closing, I am reminded of an event at which Secretary Glickman was talking about helping farmers through tough times—helping them to survive, which is a common theme these days. All of a sudden a farmer in the front row stood up and shouted, "Hey, I don't want to survive! I want to thrive!" We are doing all we can to help American family farmers reach that goal. As we work to pull our farm economy up from these tough times, I encourage your input and look forward to an ongoing dialogue with you.

Thank you.

STAFFING

Senator COCHRAN. Thank you very much. I think I will ask a couple of questions right away on the staffing issues that you raised. You have highlighted the workload demands here with this last chart in the Farm Service Agency, administering programs, and also the Foreign Agricultural Service, administering food aid and trade policy programs. Does the Administration's budget request provide adequate resources to deal with these requirements that you have outlined?

Mr. SCHUMACHER. I am going to ask Keith Kelly, with your permission, to join me on this issue, and Dennis Kaplan to help as well. With your help last year we basically have been able to maintain our staffing, and the request this year maintains the permanent staffing levels. Where we are going to get some problem is on temporary employees. And I mentioned the issue that was unexpected, which is the much larger than expected budgetary requirements for the consent agreement.

Keith, do you want to expand a little bit on some of the concerns you have on staffing?

PREPARED STATEMENT

Mr. KELLY. Yes, thank you, Senator. With regard to your question on staffing in the 2001 budget, the budget proposal before you right now would provide for a reduction of actually around 622 temporary staff years but leave the permanent Federal and non-Federal county staffing at the 2000 level. We are committed to carrying out a timely program. And if service delays do occur, then we will have to work with you to readdress this issue. In the past, you have been helpful to us in providing some relief, such as this year's \$56 million reimbursement from CCC for program delivery. We put that mostly into the temporary staffing level, to handle the very, very heavy workload related to this agricultural crisis, to get those programs out the door.

[The statement follows:]

PREPARED STATEMENT OF KEITH KELLY

Mr. Chairman and Members of the Subcommittee, I am pleased to present the fiscal year 2001 budget for the Farm Service Agency (FSA). This budget focuses on a response to the continuing economic hardships facing much of agriculture. As you know, fiscal year 2000 is setting new records in two major areas: Commodity Credit Corporation (CCC) net outlays are expected to reach an all-time high of \$27.7 billion, and farm loan programs are providing loans and loan guarantees amounting to \$5.8 billion. While this assistance is enabling most producers to keep their farming operations afloat, depressed commodity prices are forecast to continue into fiscal year 2001. In this context, the budget for fiscal year 2001 emphasizes timely delivery of the programs currently in place to assist producers through difficult times, and it offers a number of proposals to strengthen the safety net for those in the farm sector who are not sharing in the overall prosperity being enjoyed across the nation.

COMMODITY CREDIT CORPORATION

Domestic farm commodity price and income support programs are administered by the Farm Service Agency and financed through the CCC, a government entity for which FSA provides operating personnel. The CCC is also the source of funding for the Conservation Reserve Program administered by FSA as well as many of the conservation programs administered by the Natural Resources Conservation Service (NRCS), and it funds many of the export programs administered by the Foreign Agricultural Service (FAS). When called upon, CCC also finances various disaster assistance programs authorized by Congress. The Corporation borrows funds from the Treasury to finance CCC programs. Commodity support operations, handled primarily through loans, payment programs and some limited purchase programs, currently include those for wheat, corn, soybeans, minor oilseed crops, cotton (upland and extra long staple), rice, tobacco, milk and milk products, barley, oats, sorghum, peanuts and sugar.

Program Outlays

The current 2001 budget estimates largely reflect estimated supply and demand conditions for the 2000 crop based on November data. Commodity Credit Corporation net expenditures for fiscal year 2001, including proposed "Safety Net" legislation outlays of \$3.6 billion, are estimated at \$19.0 billion, down \$8.7 billion from a record high expenditure level of \$27.7 billion—including \$700 million in proposed legislation outlays—in fiscal year 2000. The previous record CCC expenditure level occurred in fiscal year 1986, when net outlays were \$25.8 billion.

The net decrease of \$8.7 billion in projected fiscal year 2001 CCC expenditures reflects the expiration of \$5.8 billion of 2000 marketing loss assistance payments, the expiration of \$1.3 billion of 2000 crop loss assistance, the expiration of \$210 million of 2000 emergency livestock assistance, a decrease in production flexibility payments of \$992 million, a decrease in commodity net lending of \$595 million, a projected decrease of \$848 million in loan deficiency payments from the huge levels of

fiscal year 2000, a decrease of \$130 million in Section 416 ocean transportation, and a decrease in other direct producer payments and expenditures of \$369 million.

The following "Safety Net" legislative proposals are included in the budget for commodity, conservation, and other CCC-funded programs.

CCC Program Initiatives

Supplemental income assistance is proposed for crop year 2000 and 2001 to eligible producers of wheat, feed grains, rice, upland cotton and oilseeds. The payments would be made only if projected gross income, including other Government payments, from the crop falls below 92 percent of the preceding 5-year average. The supplementary payments would be crop specific and would be based on actual production rather than some historical base. The proposed program will provide payments only to current producers of those crops with low prices and income. It is estimated that \$600 million in assistance will be provided in fiscal year 2000, \$2.5 billion in fiscal year 2001 and \$2.5 billion in fiscal year 2002.

Total funding proposed for cooperative development for new livestock and other processing cooperatives includes \$80 million in fiscal year 2001 and \$50 million in fiscal year 2002. The fund would be used to provide equity capital for new cooperatives and help finance the construction of cooperative-owned, value-added, processing facilities needed to counter concentration and retain income in rural areas. The fund would provide financing and obtain an equity interest in new processing cooperatives.

The initiatives propose to modify the Non-insured Assistance Program areawide trigger requirement so that producers with individual qualifying losses in areas that have been designated as natural disaster areas are able to receive program assistance. This change will provide an additional \$110 million of assistance in both fiscal year 2000 and 2001.

Extension of the dairy price support program is proposed. Current appropriations language extended the dairy price support to January 1, 2001; however, this proposal further extends the dairy price support program to January 2003. Under this proposal, \$150 million is estimated to be spent to support dairy prices for fiscal years 2001 and 2002.

Legislation will also be proposed to enable unused balances in the Export Enhancement Program during fiscal year 2000 to be transferred to other USDA export promotion and food aid programs.

In April 1996, a cap of \$275 million for CCC-funded automated data processing (ADP) obligations for fiscal year 1997 through 2002 was established by the 1996 Act.

Subsequently, the Agricultural Research, Extension, and Education Reform Act of 1998 reduced the CCC ADP cap to \$193 million. Finally, the Fiscal Year 1999 Appropriations Act (Public Law 105-277) again reduced the CCC ADP cap to \$188 million. As it was last year, legislation is proposed to provide annual funding of \$35 million in fiscal year 2001 and 2002 for Farm Service Agency computer systems to ensure essential system availability and continued ADP services in headquarters and field offices at bare minimum levels. This funding is critical because such expenditures were formerly funded under the legislated CCC ADP expenditure cap, and the new cap was depleted in early fiscal year 2000. Without further funding, Mr. Chairman, it will be virtually impossible for FSA to adequately respond to the thrust of Service Center modernization or to ensure uninterrupted program delivery.

Conservation Programs Initiative

The fiscal year 2001 President's Budget seeks an additional \$1.1 billion in budget authority for a Conservation Programs Initiative. This is a key component of the Administration's Farm Safety Net Proposal to strengthen farm family income while promoting environmentally sound land management. Within the \$1.1 billion, increases are provided for five ongoing CCC-funded conservation programs: the Environmental Quality Incentives Program (EQIP), the Wetlands Reserve Program (WRP), the Conservation Reserve Program (CRP), the Farmland Protection Program (FFP), and the Wildlife Habitat Incentives Program (WHIP). Also, under current law, an additional \$125 million in bonuses will be offered to producers who enroll in CRP through the continuous signup. The Vice President announced these proposed conservation program initiatives on January 7. They include the following:

For EQIP, part of the President's Clean Water Action Plan, the annual authorized funding level would be increased from \$200 million to \$325 million. This program provides financial, technical and educational assistance to farmers and ranchers who wish to implement conservation practices for land currently in production.

Under WRP, which offers technical and financial assistance to farmers who wish to restore and protect agricultural wetlands, the Initiative would remove the current cumulative acreage cap of 975,000 acres, under which only 40,000 acres remain, and

provide for the enrollment of an additional 210,000 acres in fiscal year 2001 and an additional 250,000 acres in each subsequent year.

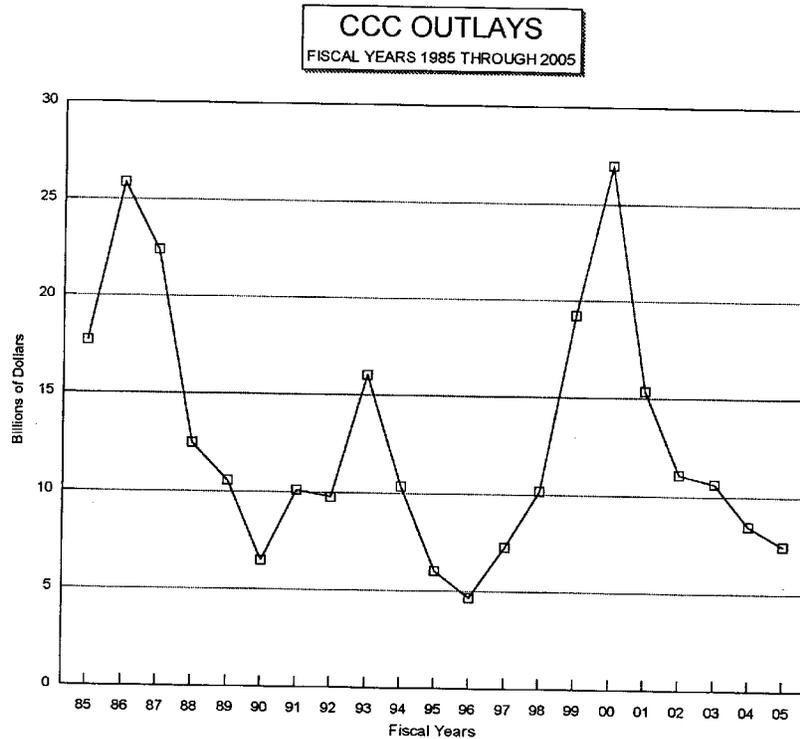

Funding provided by the 1996 Farm Bill for both FPP and WHIP has been exhausted. Under the Conservation Initiative, the FPP, which is also part of the President's Lands Legacy Initiative, would be funded at \$65 million annually. This program provides matching funds to State, local, and Tribal governments to purchase permanent easements and thereby protect farmland which may otherwise be threatened by urban and suburban sprawl. The Initiative also proposes \$50 million annually for WHIP, which offers cost-share assistance to farmers and landowners for habitat restoration and technical assistance.

The CRP provides farmers with technical and financial assistance in exchange for removing environmentally sensitive land from production for a 10- to 15-year period and implementing conservation practices. The CRP currently allows for up to 36.4 million acres to be enrolled. The President's Initiative would increase the enrollment cap by another 3.6 million acres to 40 million. Bonuses totaling up to \$100 million in fiscal year 2000 and up to \$125 million each year in fiscal year 2001 and fiscal year 2002 would also be offered to producers who enroll land in CRP through continuous signup. These bonuses are expected to encourage enrollment of high environmental-value acreage, and are included in the CCC baseline. Legislation is also being proposed to provide CRP and WRP technical assistance of an additional \$75 million for fiscal year 2001.

The Initiative proposes a new \$600 million Conservation Security Program (CSP), which would provide annual payments to farmers and ranchers who implement such conservation practices as nutrient management, grazing, grassed waterways and windbreaks. Of the \$600 million, \$90 million (15 percent of the program) will be used by the NRCS to provide necessary technical assistance to farmers and ranchers.

CCC Outlays

Fiscal year 1999 net CCC outlays totaled over \$19 billion, and outlays in fiscal year 2000 are expected to reach an all-time high of \$27 billion. The historical CCC outlay trend is shown on the following graph.

Emergency Assistance Outlays

The 1999 appropriations bill provided about \$5.8 billion in budget authority to support farmers and rural communities with emergency assistance. The Fiscal Year 2000 Agriculture Appropriations Act (Public Law 106-78) and the Consolidated Appropriations Act (Public Law 106-113), authorized emergency disaster and market loss assistance to producers of almost \$9.0 billion in budget authority using several programs.

Reimbursement for Realized Losses

Mr. Chairman, the fiscal year 1999 appropriation for reimbursement of CCC net realized losses was \$8.4 billion. This appropriation reflected reimbursement for net realized losses which covered the actual amount of unreimbursed losses incurred two years earlier.

The fiscal year 2000 appropriation for reimbursement of net realized losses was \$30.037 billion, an increase of \$21.637 billion from the fiscal year 1999 appropriation of \$8.4 billion. The appropriation reimbursed CCC for the remaining unreimbursed net realized losses for fiscal years 1997 and 1998, and all of 1999 actual losses. The appropriation to reimburse the Corporation for net realized losses enacted by Congress for fiscal year 2000 was a current, indefinite appropriation. This provided CCC with the flexibility to request funds as needed from Treasury, up to actual losses recorded for the most recent actual year. Without this current, indefinite appropriation, CCC would have been unable to fully replenish its borrowing authority at the beginning of fiscal year 2000, and timely assistance to farmers would have been jeopardized due to insufficient borrowing authority. Mr. Chairman, we appreciate your help in providing that critical funding authority.

The 2001 budget reflects a request to again revise the current appropriation language to eliminate the requirement that only allows reimbursement for actual realized losses recorded in CCC books as of the end of the preceding year. Our request provides a current, indefinite appropriation to reimburse the Corporation for all actual net realized losses, even if incurred in the current fiscal year.

Conservation Reserve Program

CRP is USDA's largest conservation/environmental program. The purpose of CRP, administered by FSA, is to cost-effectively assist farm owners and operators in conserving and improving soil, water, air, and wildlife resources by converting highly erodible and other environmentally sensitive acreage normally devoted to the production of agricultural commodities to a long-term resource-conserving cover. CRP participants enroll contracts for periods from 10 to 15 years in exchange for annual rental payments and cost-share and technical assistance for installing approved conservation practices. CRP acreage also contributes to the USDA Conservation Buffer Initiative and the Conservation Reserve Enhancement Program, which are part of the Administration's Clean Water Action Plan and are estimated to enroll 4.2 million acres through 2002. Also, in rules adopted after the 1996 Act, USDA reinstated the eligibility of certain cropped wetlands.

In fiscal year 1999, a general CRP signup (signup 18) was held from October 26 through December 11, 1998. Of the 7.1 million acres offered, a total of 5 million acres was approved for enrollment beginning in fiscal year 2000. The national average annual rental payment for this acreage is estimated to be about \$46 per acre. Technical assistance for this signup was funded with unobligated appropriated funds and authorized CCC funds. Rental payments for signup 18 begin in fiscal year 2001.

Another general CRP signup was held January 18 through February 11, 2000. We are in the process of collecting bid data from our field offices and expect to make final enrollment decisions and offers in April.

In fiscal year 2000, CCC made payments of approximately \$1.450 billion for rental costs and will make payments of about \$124 million for sharing the cost of permanent cover on replacement acres. For fiscal year 2001, the Budget projects CCC program costs of approximately \$1.690 billion, consisting of \$1.567 billion for rental payments on previously enrolled and extended acres and \$123 million for cost-share assistance for permanent cover on enrolled acres. Rental payments for fiscal year 2001 are not affected by the 20th signup which just concluded, since rental payments are not due until fiscal year 2002.

FARM LOAN PROGRAMS

The loan programs funded through the Agricultural Credit Insurance Fund (ACIF) provide a variety of loans and loan guarantees to farm families who would otherwise be unable to obtain credit. In times of economic stress, access to adequate farm credit is often the only way for some farmers to continue their operations.

As a result of the continuing financial hardship in much of the agricultural sector, the demand for FSA loans and loan guarantees remains very high in fiscal year 2000. However, the record \$5.6 billion loan level that Congress provided for fiscal year 2000 is expected to meet the strong demand. The 2001 budget likewise responds to an anticipated high demand by providing a total program level of about \$4.6 billion in loans and guarantees, an increase of \$1.5 billion, excluding emergency funds. The largest segment of FSA lending is carried out in partnership with private lenders through the guarantee programs, and this budget continues strong support for guaranteed loans, with a proposed program level of nearly \$3.5 billion.

For direct farm ownership loans we are requesting a loan level of \$128 million, the same as the fiscal year 2000 appropriated level, excluding supplemental funding. The proposed program level would enable FSA to extend credit to about 1,250 small and beginning farmers to purchase or maintain a family farm, about 500 fewer than estimated for the current fiscal year. The agency has established annual county-by-county participation targets for members of socially disadvantaged groups, based on demographic data. Also, 70 percent of direct farm ownership loans are reserved for beginning farmers, and about 35 percent are made at a reduced interest rate to limited resource borrowers, who may also be beginning farmers. For direct farm operating loans we are requesting a program level of \$700 million, \$200 million above the 2000 level excluding supplemental funding, to provide over 14,400 loans to family farmers.

For guaranteed farm ownership loans in fiscal year 2001, we are requesting a loan level of \$1 billion, the same as 2000. This program level will give over 4,500 farmers the opportunity to either acquire their own farm or to save an existing one. For guaranteed farm operating loans we propose a fiscal year 2001 program level of nearly \$2.5 billion, compared to \$2.9 billion in 2000. This level will enable approximately 16,600 producers to finance their farming operations.

The Budget also proposes \$150 million in emergency disaster loans in fiscal year 2001, sufficient to provide approximately 1,800 low-interest loans to producers whose farming operations have been damaged by natural disasters. We are pro-

posing to close the eligibility gap between USDA and Small Business Administration emergency loans so that in times of natural disaster every size farm and ag business has a place to turn for emergency assistance. In addition, our budget proposes just over \$2 million for Indian tribe land acquisition loans and \$100 million for boll weevil eradication loans.

OTHER APPROPRIATED PROGRAMS

State Mediation Grants

State Mediation Grants assist States in developing programs to deal with disputes involving a variety of agricultural issues—distressed farm loans, wetland determinations, conservation compliance, pesticides, and others. Operated primarily by State universities or departments of agriculture, the program provides neutral mediators to assist producers, primarily small farmers, in resolving disputes before they culminate in litigation or bankruptcy. Mediation, at about \$500 per case, offers significant savings over national level administrative hearings, which cost about \$3,000 to \$4,000 per case in direct costs alone.

Participating States certify their programs with FSA annually. In fiscal year 2000, 23 certified States have received grants.

The Budget requests \$4 million, an increase of \$1 million over fiscal year 2000, to help participating States expand the range of issues they are able to mediate and to meet the rising demand expected as a result of the slump in the farm economy. This year's record volume of farm loan activity, particularly in the context of continuing economic stress for producers, can be expected to generate an increased number of conflicts needing mediation.

Authority for State Mediation Grants expires at the end of fiscal year 2000. A legislative proposal is being submitted to reauthorize the program through fiscal year 2005.

Emergency Conservation Program

The President's Budget requests no Emergency Conservation Program (ECP) funding for fiscal year 2001. Although no new funding was provided in the Fiscal Year 2000 Agriculture Appropriations Act, the Fiscal Year 2000 Consolidated Appropriations Act provided supplemental funding of \$50 million. With these funds as well as carryover unallocated balances remaining from fiscal year 1999 and reallocation of unused portions of prior allocations, ECP has allocated about \$58.6 million to States so far in fiscal year 2000. All funding is likely to be allocated by the end of the fiscal year.

Dairy Indemnity Program

The Dairy Indemnity Program compensates dairy farmers and manufacturers who, through no fault of their own, suffer income losses on milk or milk products removed from commercial markets due to residues of certain chemicals or other toxic substances. Payees are required to reimburse the Government if they recover their losses through other sources such as litigation. The fiscal year 2001 appropriation request of \$450,000 would cover a higher than normal but not catastrophic level of claims.

ADMINISTRATIVE SUPPORT

The costs of administering all FSA programs are funded by a consolidated Salaries and Expenses (S&E) account. The account is comprised of direct appropriation, transfers from program loan accounts under credit reform procedures, user fees, and advances and reimbursements from various sources.

The fiscal year 2001 Budget proposes funding of \$1.095 billion from appropriated sources including credit reform transfers, a net increase of about \$89.4 million over the fiscal year 2000 level. The largest component of the increase reflects a change in source of financing rather than an actual increase in funding. Under Section 822 of the Fiscal Year 2000 Agriculture Appropriations Act, \$56 million was reimbursed to the S&E account from CCC for program delivery costs in fiscal year 2000. Based on economic assumptions used in the President's Budget, we estimated the need for \$45.2 million in fiscal year 2001 to carry out similar workload, which was expected to decline somewhat. Therefore the fiscal year 2001 Budget proposes restoration of \$45.2 million of the one-time CCC funding to the S&E appropriated baseline. Other items of increase include pay and related costs, a new funds control system for farm loan programs, reengineering of other farm loan program systems, and telecommunications costs. These increases are partially offset by decreases in some operating costs and a reduction in temporary employee staffing. Based on historical trends, the Budget also assumes that \$16 million in carryover funding from fiscal

year 2000 will be available to support the proposed county office staffing level in 2001.

The Budget also proposes to adjust the proportion of total S&E funding that is provided by transfer from the Agricultural Credit Insurance Fund in order to accurately reflect the full cost of administering the farm loan programs in accordance with the Federal Credit Reform Act of 1990. Over the past 5 years, the transfer has remained virtually flat and has not reflected approved pay raises and rising operating costs or an increase in the number of employees actually carrying out the farm loan programs. To rectify the accumulated imbalance and bring our accounts into compliance with credit reform requirements, we are proposing an increase of \$55.5 million in the ACIF transfer amount for fiscal year 2001. A corresponding decrease has been taken from the S&E direct appropriation component, although it is not readily discernible due to the aforementioned increase for baseline restoration.

Mr. Chairman, I would like to comment briefly on the current status of FSA's program delivery and the outlook for the months ahead.

As you know, 2000 is expected to be a record high for both CCC and farm loan program outlays, and the level of expenditures is mirrored in the FSA workload in county offices. We made maximum use of temporary employees early in the year to enable county offices to keep up with their workload and avoid the delays that were experienced during the early months of fiscal year 1999. However, funding to retain these temporary employees is insufficient, and it has become necessary to begin dismissing many of them. Most will be off the payroll by mid-March. We have also encountered significant unbudgeted costs during fiscal year 2000, including both contractor and in-house costs associated with the Pigford Consent Decree. We have also had to pay for maintenance of information technology operations from the S&E account due to the depletion of the CCC cap on ADP expenditures early this fiscal year. The 2001 Budget does propose an increase of \$35 million in the ADP cap for 2001 and 2002, which would allow us to meet our minimum ADP operations requirements. However, in order to make any progress toward realizing the considerable benefits of a Common Computing Environment (CCE) for the county-based agencies, positive action by the Congress is needed on the Department's request for \$75 million under the Office of the Chief Information Officer for CCE expenditures.

A key element in the success of this effort is the replacement of aging business and technology systems of these partner agencies that will allow sharing of data and implementation of streamlined business processes. The new technology will also allow these agencies to use modern business approaches such as the Internet to provide better access to programs for customers. However, until the CCE is fully operational, the service center agencies will have to continue to fund the outmoded existing systems to provide programs to customers.

The proposed \$75 million in CCE funds for 2001 would fund essential capital investments needed to achieve the goal of a fully operational common computing environment in 2002 as set forth in the Department's Service Center Modernization Plan. These investments are needed to integrate the workstations and more fully achieve the benefits of shared systems and re-engineered business processes, in order to improve service to our customers.

An important part of the effort to modernize field operations for FSA, the Natural Resources Conservation Service, and Rural Development agencies is the effective consolidation of three separate and largely redundant administrative systems into one under the proposed Support Services Bureau. Separate systems constitute a glaring inefficiency that needs to be eliminated. Consolidated support would be provided for information technology, financial management, travel, procurement, civil rights, and human resources management. These services would be provided under the direction of an Executive Director who would report to a board of directors comprised of the heads of the serviced agencies. Unfortunately, language in the Fiscal Year 2000 Appropriations Act prevented us from implementing our plans for the Support Services Bureau. I ask the Committee to take a look at that language and work with us to move our operations into the modern world. By pooling resources in the administrative arena, each agency will be in a better position to provide greater program support.

Before closing I would like to note that the Administration will soon transmit a legislative proposal to convert all non-Federal county office employees to Federal status in 2000. This change will allow greater accountability of all employees under one personnel system and improve efficiency of Agency operations.

Mr. Chairman, this concludes my statement. I will be happy to answer your questions and those of the other Subcommittee Members at any time.

SUPPLEMENTAL FUNDING NEEDS

Senator COCHRAN. We are considering, as you know, a supplemental funding bill. You have pointed out these problems that you have right now in this fiscal year. Can you identify the levels of funding that you need to meet your current workload requirements?

Mr. SCHUMACHER. We have a proposal that Mr. Kelly has provided to me that I passed through to the Secretary, and Dennis, that we will be hopefully moving forward in an expedited fashion. Truthfully, Mr. Chairman, we have basically used up most of the support for temporary staffing in the first 6 months of the year because of the tremendous workload we have had. So we are working through a supplemental right now, and the exact numbers will hopefully be available very shortly from the OMB.

Senator COCHRAN. We noticed that in the budget request you basically request the amount of money that you have already gotten for the next fiscal year in this year's fiscal year budget. Is that not true?

Mr. KELLY. Senator, what you have to look at in the budget is that we got—

Senator COCHRAN. That is for the Farm Service Agency; let me be more specific.

Mr. KELLY. Correct. The budget request reflects the fact that we got Commodity Credit Corporation reimbursement for program delivery through the emergency title of the appropriation this fiscal year. So of the increase in the President's Budget, \$45 million is just to get us back to a comparable appropriated baseline and prevent the reduction in force of about 700 employees, just to hold us completely neutral. That is the key part of it. When you see that increase in the budget, actually \$45 million is to restore the portion of the \$56 million reimbursement that the President's Budget estimated would be needed to carry out similar types of workload in fiscal year 2001.

STATUS OF FSA COUNTY EMPLOYEES

Senator COCHRAN. The budget suggests that the Administration will request legislation to convert non-Federal Farm Service Agency personnel to Federal employee status in 2000. Will this have any impact on the Agency's funding requirements or affect the staffing levels presented in the fiscal year 2001 budget?

Mr. SCHUMACHER. I do not think so. Keith? I will get back to you on that one, Mr. Chairman. I do not believe so, unless I stand corrected.

Mr. KELLY. Mr. Chairman, I can respond on that. The budget impact of that conversion is neutral, with the exception of some administrative costs of converting people from the county system to the GS employment system. We could ensure that those employees converting from the county to the Federal system would maintain their grades and maintain their seniority and all of those things, to leave it relatively neutral other than some administrative costs that we would necessarily absorb.

FSA TEMPORARY STAFFING

Senator COCHRAN. What impact has this had on the delivery of payments to farmers under the disaster assistance program? You talked about having to reduce the number of temporary employees since November of 1999. What impact has that had on delivering benefits, ad hoc disaster payments to farmers?

Mr. KELLY. Senator, if I can comment. First, we are just in the process right now of starting to lay off of the temporary employees. We started looking at that with all of our States, depending on the individual State, right after the 1st of the year. As the Under Secretary indicated earlier, we did keep people employed on the front end. We have had them employed at a very heavy level, to keep us from getting behind in the county offices. And one needs to recall only last year, as we got so buried with paperwork in the loan deficiency payments that we were forever digging ourselves out, which really necessitated two supplementals.

So now we are just getting in. We just closed the signup for the crop disaster program last Friday. We have been making the advance payments of 35 percent of the projected disaster programs payments. We have just about depleted all of the resources for temporary help to keep offices current with whatever disaster or emergency program or loan deficiency payment has been going on.

We are at a point that we are going to be sending people home. This month of March is the targeted date. Some have already gone home. And so we will probably be slowing down in getting some of these other payments, the remainder of the 22 programs, out the door.

FSA WORKLOAD

Senator COCHRAN. Are you going to tell the farmers that they are not going to get their payments on time or there will be a delay in getting their benefits? How are you all going to spin that one?

Mr. KELLY. Senator, we are doing the best we can with what we have out there. We just do not have the ability to go in the red. At one time or another it is going to happen. The loan deficiency payments, if we get behind on them, farmers are going to be banging on our doors. And I believe nobody here has been contacted with complaints yet, because at least for all of the payments and programs so far, we have been able to keep—I guess for lack of a better word—our nose above the water.

But we have got two major programs still sitting out there to finish up—the disaster program and, probably the biggest labor-intensive one, the oilseed program. We are going to have 800,000 to 1 million farmers coming through the door to sign up for the oilseed program, for that \$475 million of the emergency legislation from last year. That is going to be the most labor-intensive program we have. And we are just going to have to set priorities of which programs we get through first.

Senator COCHRAN. We want to work with you to help deal with that problem. I do not know how quickly we can get the work done here and a consensus on the exact amount of money available for a supplemental, but we want to support you and be helpful to you. Any suggestions that you might have about action that we should

take to help deal with these shortfalls and these problems, we would love to have the benefit of your suggestions.

Mr. SCHUMACHER. This is my seventh hearing before you. You have always been very supportive, and I have indicated that in my testimony. We would very much like to work with you, Mr. Chairman. These are tough times. You know it in your own State. Keith and I and Parks and everybody here has worked very hard to get this huge level of the emergency payments out the door. This year it has been quite difficult with the 22 new programs, because it requires training. And I visited with some staff just yesterday about the consent agreement. They are just now going back to deal with the oilseed program.

So Keith and I and perhaps your committee and the committee on the other side can work together if and when this supplemental comes forward on an expedited basis.

CCC ADP CAP

Mr. KELLY. Senator, if I can add one other thing which would help us. That is to get the Commodity Credit Corporation cap on data processing lifted. Because the same thing with those——

Senator COCHRAN. Is this the so-called Section 11 cap?

Mr. KELLY. This is not the Section 11 cap. This is the ADP cap.

Senator COCHRAN. Another cap. How many caps are there?

Mr. KELLY. There are two caps that I refer to.

Senator COCHRAN. Are these your caps or our caps?

Mr. KELLY. The caps have come down from the Congress, with adjustments over time. I am talking now about the cap on the amount that the Commodity Credit Corporation was allowed to expend on automated data processing. Last year, we had a proposal up for a \$35 million increase.

We had to use some salary and expense money this year just to keep the basic core computer operations running. And I know that proposal will be before you to raise that cap so we can maintain the tools for our employees to do the work. Otherwise, we guarantee it will become very, very labor-intensive and manual-intensive to do the work.

Senator COCHRAN. Thank you for telling us about that.

Senator Kohl, any comments or questions? You are recognized for whatever time you may want.

STATEMENT OF SENATOR HERB KOHL

DAIRY EXPORT INCENTIVE PROGRAM

Senator KOHL. Thank you, Senator Cochran.

In my opening statement, which I will submit for the record, I express my disappointment in the lack of any meaningful support for dairy in the Administration's farm safety net proposal. I will not belabor that point at this time. But I do want to focus on other tools that the Department has to help dairy farmers address market volatility, to take advantage of global markets and to manage financial risk. I think even in these categories the Administration is not doing all it could to help dairy farmers.

U.S. milk producers have relied on the Dairy Export Incentive Program to help them compete in badly distorted world markets.

I am concerned, however, about the future of this program in fiscal year 2001, given our WTO obligations to reduce both the volume and the value of DEIP exports. This is particularly a concern given the low milk prices predicted for the duration of this year. The dairy industry has often relied on DEIP to reduce price depressing surpluses.

How will our WTO obligations affect exports under DEIP in the coming years, and will there be an associated impact on milk prices?

[The statement follows:]

PREPARED STATEMENT OF SENATOR HERB KOHL

Welcome Secretary Schumacher, and Mr. Collins, it is good to see you again.

In reviewing your prepared statements, I noticed you have plainly stated an unfortunate generalization with which we have all become too familiar. In spite of an overall economic boom, the American farmer—and indeed, people throughout rural America—are suffering through difficult times.

Partially in response to this, Secretary Schumacher, you have outlined for us the Administration's proposal for a farm safety net initiative. Secretary Glickman provided a similar overview when he was before us a few weeks ago. Now, as then, I have to stress the glaring omission of any meaningful relief in your proposed package for dairy farmers—even though you highlight in your opening statement—in fact in your first few paragraphs—that last year dairy prices experienced their steepest decline in history. I repeat, in history.

Yet, your \$11.5 billion package only offers an extension of the current dairy price support program. While better than nothing, I think you would agree, as Secretary Glickman conceded, that it falls far short of the type of assistance needed to protect dairy farmers in my State and elsewhere. And, I have to restate, the type of assistance you are providing for dairy farmers is nowhere close to the types and levels of assistance you are proposing for other agricultural commodities.

In my State, agriculture IS dairy. I will not watch another farm relief package go by that ignores this important and struggling industry.

Of course, the Farm Safety Net Initiative is only part of the President's proposal relating to agriculture. Aside from that legislative proposal, we have before this subcommittee a sizable request for discretionary and mandatory appropriations to fund a host of farm and foreign agricultural trade programs.

It goes without saying that USDA programs within the Farm and Foreign Agriculture mission area are far reaching. These programs range from the annual operating loan for a small or beginning farmer to humanitarian food assistance needed to feed a starving world. It is important that we all work together to make sure these programs function as they should. Risk Management must be designed in a way that truly manages risk. The Farm Service Agency must have the resources necessary to ensure that farmers receive adequate services. Our Foreign Market Development programs must truly develop and maintain foreign markets.

I look forward to your remarks.

Mr. SCHUMACHER. I want to ask Mr. Fritz to join me. He runs the Dairy Export Incentive Program. And while he is coming to the table let me say that we have used the DEIP program very aggressively, Senator. We have also used some of the rollover funds, as well, to help dairy farmers as much as possible to move some of this product overseas.

We also, in a related way, used our food aid authorities. We donated a substantial amount of nonfat dry milk last year. We may have to do more because more of that is coming in now. With your permission, I will ask Mr. Fritz to brief you on where we are on DEIP for this coming year.

Mr. FRITZ. Yes, sir, we feel we have used the DEIP program very aggressively in the last few years. We have used the rollover authority that we do have, to get up to over 100,000 tons of nonfat dry milk last year. But we will be significantly constrained due to

our WTO commitments in that in 2000, for nonfat dry milk, we are going to be at a maximum of 68,000 tons. And obviously we are not quite sure what the rollover level may be from this current year, but it will probably be in the neighborhood of 7,000 tons. But our tonnage and our dollar values will go down based on the WTO commitment significantly.

How this will impact dairy prices, I am not sure. Maybe Mr. Collins has an answer for that. We are taking in a lot of nonfat dry milk in the CCC loan forfeitures. We have put in 25,000 metric tons into the 416 program. And we will be using nonfat dry milk, as well, for PVO donations overseas.

Senator KOHL. I would like to ask what USDA plans to do to mitigate the impact of significant reductions in subsidized exports and to aid exports of U.S. dairy products. You have said a little bit; is there more you can say?

Mr. SCHUMACHER. Yes, sir, if I may, Mr. Fritz. Frankly, the Dairy Export Council does a terrific job. I think we are now providing about \$1.5 million to promote their commercial exports overseas. And if the Congress were to allow us to use any unused Export Enhancement Program funds, we could provide further assistance for trade promotion for groups like this and your cranberry growers.

Mr. COLLINS. Can I make a comment on that, just in answer to the price effect question?

Senator KOHL. Yes, please.

NONFAT DRY MILK

Mr. COLLINS. I think, in the short term, it would not have much effect on prices. And I say that only because, as Mr. Fritz pointed out, we are making very substantial purchases under the price support program of nonfat dry milk. We could buy 300 million pounds of nonfat dry milk this year, probably 30 percent of the total nonfat dry milk production in the United States. So what happens is if you are not moving it out through DEIP—and most of the DEIP is nonfat dry milk—with prices at support, it is going to end up in the support program. So we will just keep prices right at support.

Now, if prices start to move above support, then the lack of having 100,000 tons of nonfat dry milk DEIP, like we had last year, then that would have a price reducing effect.

Senator KOHL. The Department recently announced 3 million tons of commodity donations under the Section 416(b) program. This program and others, like Public Law 480, have long proven to be of vital importance to help combat world hunger. They have the added benefit of providing an outlet for U.S. production, which will become increasingly important as the U.S. complies with its WTO obligations.

Unfortunately, the recent Section 416 announcement includes only 25,000 tons of nonfat dry milk as part of the 3 million ton aid package. Since it is clear that the Department will be purchasing surplus dry milk throughout much of the year as milk prices remain near the price support, why did not the Administration include more significant quantities of dry milk powder in this aid package?

Mr. FRITZ. If I could address that, Senator. One of the difficulties we do have is programming nonfat dry milk in terms of finding recipients for such a product. Number one, generally it is a non-fortified product, so we have to find people who are willing to fortify the product so that it can be used in various countries overseas. And, two, it is often used as an ingredient for other foods rather than consumed as nonfat dry milk. So it is a very difficult item to program in less developed and developing countries based on its usage and the fact that it is a non-fortified product.

Senator KOHL. Well, is there something that the Department can and will do to increase the proportion of milk powder provided in this aid package?

Mr. FRITZ. As we have done in the past, we are trying to do something to increase the fortification of the dry product. And we are meeting with the dairy industry, as we have with other commodities in 416, to try and better target our programming both now and in the future.

DAIRY OPTIONS PILOT PROGRAM

Senator KOHL. In addition to viable export markets, dairy farmers need risk management tools. That is why I have long been an advocate for the Dairy Options Pilot Program. When the Secretary was here 2 weeks ago, he told us the Department would be ramping up this program. However, I am troubled to learn that USDA is significantly limiting program availability in round two of the pilot. USDA is not allowing farmers from the initial pilot to participate in this program.

This is of special concern to Wisconsin farmers, where participation in round one of the pilot was strong. This decision is apparently based on what I believe to be a misinterpretation of the authorizing statute. You have effectively prevented any individual farmer from participating in the pilot more than once. And despite the Secretary's commitment to ramp up this program, it appears the program will terminate in just over a year.

Would you please tell this committee what steps the Department will take to ensure that this program will continue to be a risk management tool available for dairy farmers?

Mr. SCHUMACHER. Thank you, Senator. I am going to ask Ken to join me, Ken Ackerman of Risk Management, and I will certainly go back and check with our attorneys. We felt that this was a pilot program for 1 year, to help farmers get in to use the Dairy Options Pilot Program and it was just for 1 year. We will check again with the attorneys on that.

Ken, do you want to comment on that?

Mr. ACKERMAN. Yes, Senator, you are correct. We have been operating this program under a legal structure which designed it as a pilot program. That structure was created under the 1996 Farm Act which had limitations on the number of counties that can be in the program, limitations on the number of counties in each State, and it had a general approach that we would use it as an educational tool. A farmer would be in the program for 6 months, a limited period of time, during which they would have subsidized use of futures or options and then they would basically be on their own.

PREPARED STATEMENT

We are planning to roll out Round Two of the program later this year. We want to wait until milk prices are a little higher, so farmers would be more inclined to lock in a milk price rather than do it when prices are very low. But there will be these limitations on counties and States because of the pilot program structure of the Dairy Options Pilot Program.

[The statement follows:]

PREPARED STATEMENT OF KENNETH D. ACKERMAN

Mr. Chairman and members of the Subcommittee, I am pleased to testify in support of the President's fiscal year 2001 budget for the Risk Management Agency (RMA). Crop insurance remains USDA's principal means of production risk protection for the nation's producers. In 1999, the program provided farmers with more than \$30 billion in protection on roughly 196 million acres through approximately 1.3 million policies. During that time, we and our private-sector partners provided hard-hit farmers with nearly \$2.2 billion in payments, most delivered within 30 days of claims being filed.

Since 1993, the number of policies, insured acres, and liability have increased significantly. Further, the total crop insurance premium for 1999 exceeded our estimates by approximately 28 percent, representing a sizeable, 24 percent increase over the 1998 level. This remarkable increase can be attributed to the approximate 30 percent premium discount that was offered in 1999. Producers who have expressed concern over the increased cost of higher levels of insurance coverage responded to this initiative by enrolling approximately 20 percent more acres in buy-up coverage compared to the 1998 level. Emergency funding was also provided in 2000 to allow an approximate 25 percent discount on buy-up premium rates.

While impressive results have been achieved in a short period of time, rapidly changing events are forcing a hard examination of the agricultural safety net. The continuing farm crises have exposed weaknesses in the safety net as it too ultimately suffers from depressed commodity prices and deals with those areas hit repeatedly by crop loss in a depressed economic environment. In addition, crops and commodities, like livestock, do not have federally backed insurance available to them, and farmers have far too little instruction on the risk management tools and strategies that can protect and improve their farm revenue.

The Administration recently announced an \$11.5 billion initiative to strengthen the farm safety net. This initiative will help thousands of cash-strapped producers lay the basis for more permanent and effective assistance to be enacted in the next farm bill. Components of the reform initiative directly related to the crop insurance program include the following:

- Premium Discounts.*—Extends the initiatives taken in 1999 and 2000 by offering approximately \$400 million in premium discounts on buy-up coverage for crop insurance in 2001. In addition, \$200 million will be used to pay the delivery costs associated with the increase in coverage this discount will produce and \$40 million will fund a reserve against under-estimation of increased program participation. Based on past experience, RMA anticipates that farmers will buy even more coverage and become steady customers.
- Multi-year Coverage.*—Includes \$100 million to address the problem of production losses and price declines that extend over several years. These funds will be used to provide producers with more options than currently available so that they are not driven out of the program by sharp reductions in their actual production history and allocated deductible.
- Livestock Insurance Pilot Program.*—Funds \$100 million to establish a pilot program for insuring livestock. The pilot program would be designed to subsidize producers' participation and establish intermediaries to offer options contracts. Conceptually, this program may be similar to the Dairy Options Pilot Program.
- Risk Management Education.*—Expands risk management education activities through four methods: risk management clubs, direct producer training workshops, agricultural education at community colleges, and technology based information and education. The \$40 million initiative would be modified regionally to accommodate the local needs of producers.
- Research and Development.*—Includes \$30 million to expand research and development activities through incentives and use of private and public sources uti-

lizing their expertise and resources to address an ever-changing risk environment.

RMA is committed to helping our private-sector partners build participation by providing new crop insurance programs and helping producers understand and manage their agricultural risks. Over the past several years, this goal has carried RMA into many areas beyond providing traditional crop insurance, including the development of innovative products and services based on proposals from the private sector. As a result of these partnerships, we have developed innovative insurance products, a dairy options pilot program, and a wide range of projects to help farmers become better risk managers. Today, I'd like to briefly highlight some recent initiatives and detail plans for fiscal year 2001.

RESPONDING TO THE MARKET

To help farmers manage their risk and diversify their operations, RMA has been aggressively creating new programs and expanding the availability of existing plans of insurance. For example:

—*New Crop Programs.*—For 1999 alone, RMA created new insurance programs to cover avocado, cabbage, cherries, crambe, cultivated wild rice, barley, mustard, rangeland, and winter squash. Crop insurance provides individual risk protection at higher levels than available under the Noninsured Assistance Program (NAP).

During fiscal year 2001, RMA will be continuing development of programs to better protect growers not currently covered by crop insurance. For 2000, priorities will be given to the development of insurance programs for cultivated clams, chile peppers, processing cucumbers, Florida fruit trees, onion stage removal, pumpkins, strawberries, and a coverage enhancement option on apples, canola, potatoes, grapes, rice, and citrus fruit.

—*Asiatic Citrus Canker (ACC).*—Several revisions to the Florida Fruit Tree Pilot Program were announced for the 2000 crop year. One key policy change insures producers against losses of citrus trees to ACC. The ACC coverage is part of the standard policy, not an option that the producer would purchase separately. Counties covered under the Florida Fruit Tree policy for crop year 2000 are: Brevard, Broward, Charlotte, Citrus, Collier, Dade, DeSoto, Glades, Hardee, Hernando, Henry, Highlands, Hillsborough, Indian River, Lake, Lee, Manatee, Marion, Martin, Okeechobee, Orange, Osceola, Palm Beach, Pasco, Polk, Sarasota, Seminole, St. Lucie, and Volusia.

—*Adjusted Gross Revenue (AGR).*—The AGR insurance plan is a non-traditional, whole farm risk management tool. The AGR concept uses a producer's historic Schedule F tax form information as a base to provide a level of guaranteed revenue for the insurance period. AGR provides an insurance safety net for multiple agricultural commodities in one insurance product, establishes a common denominator for commodity production-cash receipts, makes simple straightforward use of income tax forms, and reinforces program credibility by using Internal Revenue Service tax forms and regulations. Eligible producers may choose one of three coverage levels: 65 percent coverage and 75 percent payment rate (65/75), 75 percent coverage and 75 percent payment rate (75/75), or 80 percent coverage and 75 percent payment rate (80/75).

—*Dairy Options.*—Through training and paying a portion of the transaction costs, the dairy options pilot program helps producers create their own financial safety net by purchasing exchange-traded options on the price of their milk. When milk prices fall, producers are able to offset losses based on projected future earnings, in effect putting a "floor" under their milk prices. Producers in certain pilot states and counties are now actively using the program.

LEVERAGING SCARCE RESOURCES

RMA is leading a joint effort with the Cooperative State Research, Education and Extension Service, the Commodity Futures Trading Commission, and a number of private-sector partners to help producers become active risk managers. In order to leverage scarce resources, the Agency funded approximately \$900,000 in grants to diverse partnerships all around the country to better equip producers to manage risk. Without such partnerships, the cost of meeting our educational mandate would increase significantly.

For fiscal year 2000, under current law, we anticipate that 12,300 producers will receive direct training through approximately 600 RMA coordinated/facilitated risk management education sessions. In addition, we anticipate that around 1,000 producers will participate in risk management or marketing clubs. These estimates have dropped and are likely to continue dropping due to lack of funding.

RMA places a strong emphasis on reaching small and limited resource producers on the topic of risk management. These efforts are carried out through partnerships with community based organizations. These outreach efforts will be complemented with an information campaign to highlight educational themes and opportunities.

ADMINISTRATIVE AND OPERATING (A&O) EXPENSES

Discretionary account expenses are estimated to increase by \$3.7 million from the fiscal year 2000 level of \$64 million. This increase includes: \$1.6 million for pay costs, of which \$415,000 is for the annualization of the fiscal year 2000 pay raise and \$1.2 million for the anticipated fiscal year 2001 pay raise; \$1 million for research and development costs related to the study and evaluation of a program for biobased products as part of the President's initiatives; \$700,000 for civil rights activities aimed at increasing the participation of women and minorities, and assuring that underserved and socially-disadvantaged producers/ranchers have full access to RMA programs; and an additional \$403,000 for information technology costs. Fiscal year 2001 information technology needs include a wide variety of enhancements, additions, services, and maintenance in continued support of system integrity to meet the continuing growth and demands of the program.

FCIC FUND

Under current law, the budget for the FCIC Fund proposes an estimated \$1.0 billion increase in program level. This seemingly large increase is a result of using a portion of prior years' unobligated balances—\$953.8 million—to cover indemnities and other expenses in fiscal year 2000.

Premium subsidy is expected to increase by \$66.2 million due, in part, to an estimated increase in participation. In accordance with the Federal Crop Insurance Reform Act of 1994, for the purpose of encouraging the broadest possible participation of producers, FCIC pays a portion of crop insurance premiums. The \$956.1 million in premium subsidy, of which \$298.6 million is for catastrophic (CAT) coverage and \$657.5 million is for additional coverage, assists in providing producers a cost-effective means of managing their risk.

Delivery expenses, which represent the amount of administrative and operating expense reimbursements provided to approved insurance providers for delivering risk management services and products, are based on 24.5 percent of estimated total premium for fiscal year 2001 in accordance with the Agricultural Research, Extension, and Education Reform Act of 1998. As a result of increased total premium, RMA anticipates delivery expenses in the amount of \$507.7 million, compared with the fiscal year 2000 estimate of \$486.3 million. This increase will assure continued effective delivery of risk management products to the agricultural community.

RMA also expects excess losses, which are based on calculations of increased premium and program losses, to increase by \$13.7 million to a level of \$298.8 million. This estimate supports a loss ratio of 1.075 and is authorized under the appropriation language "such sums as may be necessary." Without these funds, which directly support the mission and goal of the Agency, FCIC would be unable to fully fund expected indemnities, thereby weakening the producers' safety net.

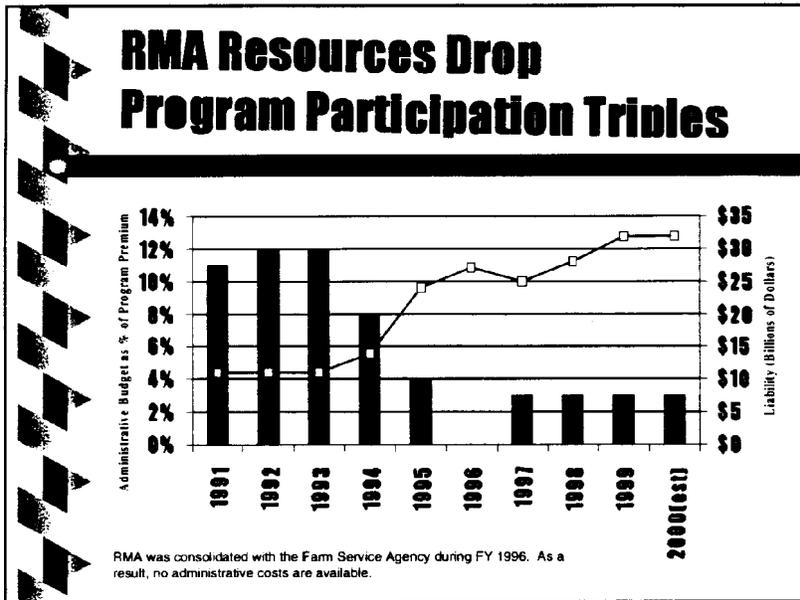

The fiscal year 2001 current law funding request for research and development expenses is \$3.5 million. No increase or decrease is requested. In accordance with the Agricultural Research, Extension, and Education Reform Act of 1998, RMA's ability to develop new products, support private sector initiatives through section 508(h) products, and help farmers become better risk managers was severely limited. Under that legislation, RMA's research and education funds were capped at \$3.5 million per fiscal year, an immediate 67 percent reduction from the fiscal year 1998 level of \$10.7 million. This reduction has created an immediate need for additional funding so that we can continue to provide new products, support private sector initiatives, and provide educational outreach to farmers. This need is being addressed in the Administration's safety net initiative, which provides \$30 million for research and development activities and \$40 million for risk management education initiatives in 2001.

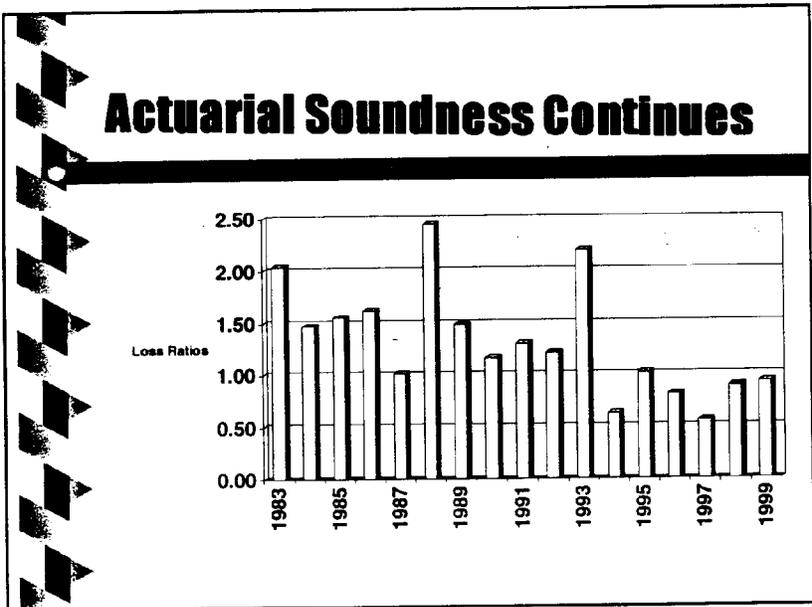

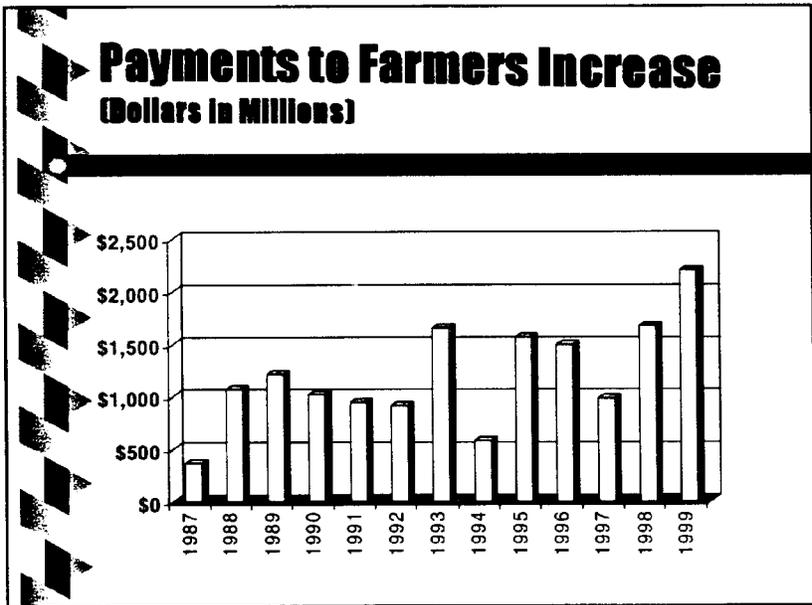

CONCLUSION

Mr. Chairman, we must succeed in strengthening the farm safety net or we may have a repeat of prior years' emergency spending package. We have made a good start by reducing farmer premiums by an estimated 30 percent in 1999 and an estimated 25 percent in 2000. However, more can and must be done.

I know of no other program in all of government that has produced a greater return on the taxpayers' dollar (please see the attached graphics.) While proposals to enhance the crop insurance program are working their way through Congress, RMA

is requesting \$3.7 million more in discretionary funding. This funding level is essential if RMA's infrastructure is to support and leverage the necessary initiatives and demands for continued maintenance, growth, and expansion of the program. Even at full funding, RMA will only be able to maintain products and services at the current level, while slightly increasing activities aimed at increasing the participation of women and minorities and assuring that underserved and socially-disadvantaged producers and ranchers have full access to all RMA programs. In addition, RMA would be able to support the Presidential Biobased Products/Bioenergy Initiative. Personnel ceilings will continue to hold at fiscal year 1999 levels. Mr. Chairman, this concludes my testimony. I will be pleased to answer any questions.

Crop Insurance Reform Priorities (Dollars in Millions)	
○ Premium Discounts	\$640*
○ Multi-year Loss Coverage	\$100
○ Livestock Insurance Pilot	\$100
○ Risk Management Education	\$ 40
○ Research and Development	\$ 30

* Includes \$400 million for premium discounts, \$200 million for delivery expenses associated with increase in business, and \$40 million for a reserve against under-estimate of increased program participation.

Senator KOHL. So you are saying the program will terminate or it will not terminate?

Mr. ACKERMAN. The program will have a Round Two later this year, but the overall authority for the program I believe, had a limit in terms of the number of years that it was available. It does phase out, but we are not terminating it at this point. Again, we have a Round Two of the Dairy Options Pilot Program that we will be rolling out later this year, but it will have these limitations on States and counties.

CONSERVATION TECHNICAL ASSISTANCE

Senator KOHL. When Secretary Glickman and Deputy Secretary Rominger were before this subcommittee, I raised the question about the shortfall in technical assistance for the Conservation Reserve Program and the Wetlands Reserve Program due to the so-called Section 11 cap. Mr. Rominger indicated that despite the supplemental appropriation provided by this committee for fiscal year 2000, USDA would still be short of necessary funding to deliver technical assistance for these important programs this year.

He stated on the record that a request for additional funding would be included in the Administration's supplemental request. And so I was dismayed last week to see that the Administration's request does not ask for funding to deal with this very serious problem. The result could be, Secretary Schumacher, that USDA will not be able to deliver these important programs.

So, how do you account for the lack of conservation technical assistance funding in the Administration's supplemental request?

Mr. SCHUMACHER. I am going to ask Dennis if he could address that.

Mr. KAPLAN. That, like the FSA problem, is still being looked at within the Administration, and they will hopefully have an answer very soon.

FFAS FUNDING ISSUES

Mr. SCHUMACHER. I indicated on the record just a few minutes ago, Senator, we are working through some additional issues. I received a request from the Farm Service Agency. That has been passed through, and we hope to get that up to Congress. Not only the Farm Service Agency, but what we are finding is that, in the Foreign Agricultural Service and in the Risk Management Agency, this crisis that is upon us more and more is being overtaken by events, whether it is the additional money for the consent agreement or the need—if we can put that other chart up there on Risk Management, Ken—we have gone from \$14 billion, Senator, to \$30 billion in liability coverage, yet the Risk Management Agency has been basically straight-lined.

And similarly in our export programs. So in all three agencies we are having some difficulties on the staffing side. And included among our concerns is the computer side, because the legacy systems have been overused. I heard a figure this morning, Senator, that really stunned me at my staff meeting. Ken, someone told me you had something like 1.3 billion in terms of the numbers of requests, computer transactions, you handle in crop insurance on an annualized basis. It was absolutely stunning.

Mr. ACKERMAN. The number of actual transactions is in the billions every year in crop insurance. In the past half a dozen years, the program, as Mr. Schumacher points out, has expanded by two to three times. We have literally gone from about 20,000 county crop programs to 35,000 county crop programs. We have gone from insuring about 70 crops in the mid-nineties to now having 138 different crop insurance programs that we administer during a time when our budget has stayed constant.

So, yes, we, like the Farm Service Agency, are hitting the wall in terms of our staffing and our ability to continue to expand and grow.

CONSERVATION RESERVE PROGRAM

Senator KOHL. Just in connection with that, we have got many farmers in Wisconsin trying to prepare for this growing season, and they do not know whether or not they have land under CRP contract or not. So when do you expect these farmers will receive a decision on their CRP cases from the FSA?

Mr. SCHUMACHER. Parks Shackelford is with us, as well. He is working very hard on the CRP and also the CREP. Maybe he could take just a minute to present that to you.

Mr. SHACKELFORD. I think there is a misunderstanding, because all the contracts eligible for renewal during the signup that is going on now are in effect until September 30th of this year. So land that is under contract will continue to be under contract for this growing season. The new contracts for the signup that we have just completed will become effective on October 1st. We will notify producers, hopefully, I believe, in the month of April about the lands that will be under contract starting in October.

Senator KOHL. But there are nine case, I understand, that the Wisconsin State FSA office has sent on to headquarters here in October and November of last year. And they have not yet been specifically addressed.

Mr. SHACKELFORD. I will have to follow up on those.

Senator KOHL. Can you follow up on those?

Mr. SHACKELFORD. I am not familiar with the specific nine cases, but we will certainly get you an answer.

Senator KOHL. Can we do that?

Mr. SHACKELFORD. Yes, sir.

Senator KOHL. Excellent. That would be appreciated.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Kohl.

When Senator Gorton was here, he mentioned the agriculture trade office in Singapore and the plans to close it. The FAS has cited budgetary constraints as the reason. And I note that in the fiscal year 2001 budget request, additional appropriations for FAS to open three new agriculture trade offices in Mexico, Canada and the Philippines are included. Why are these three new offices of higher priority than retaining the agriculture trade office in Singapore? Did FAS consider requesting additional resources to retain the office in Singapore. And if not, why not?

CLOSING ATO SINGAPORE

Mr. SCHUMACHER. I am going to ask Tim to expand on that. We looked at that pretty hard, Senator, on Singapore. Not only Senator Gorton raised that question, but Senator Bond and others are raising the issue of Singapore. That is probably one of the highest cost cities we have. We looked at the available funding and what we could save by closing Singapore and moving the local people to Kuala Lumpur. That gave us additional resources for more critical offices, where our trade is growing.

But on the broader budget issue, I would like to have Mr. Galvin comment. Again, I do not want this to be just staffing issue hearing, because we have many more issues to discuss. But I am concerned as well about the Foreign Agricultural Service, on the overall budgetary issue, in terms of how we can work together on that issue.

Mr. GALVIN. Thank you, Mr. Chairman. As Mr. Schumacher pointed out, that agriculture trade office in Singapore is one of our highest cost operations, about \$900,000 a year. We felt that if Singapore were to close, we could continue to provide marketing services in that region from our other attache offices throughout that part of the world. Then, we looked to the future and sought budget increases for additional ATO's, that would offer us an increased return in terms of market development and increased export sales.

PREPARED STATEMENT

I might say that the closure in Singapore was not the only action we took. And I can tell you that we took that action very reluctantly. But actually, over the past year, we have closed offices or reduced our presence in about half a dozen locations, including office closures in Milan, in Berne, and Jeddah, as well as reducing

our presence in Hamburg and Tokyo. All together, those actions saved us about \$1 million in the current year. And as we follow through on our plans to close Singapore this year, as I mentioned, that should bring us about \$900,000 in savings in the coming year. [The statement follows:]

PREPARED STATEMENT OF TIMOTHY J. GALVIN

Mr. Chairman, members of the Subcommittee, I appreciate the opportunity to review the work of the Foreign Agricultural Service (FAS) and to present the President's budget request for FAS programs for fiscal year 2001.

U.S. TRADE PROSPECTS

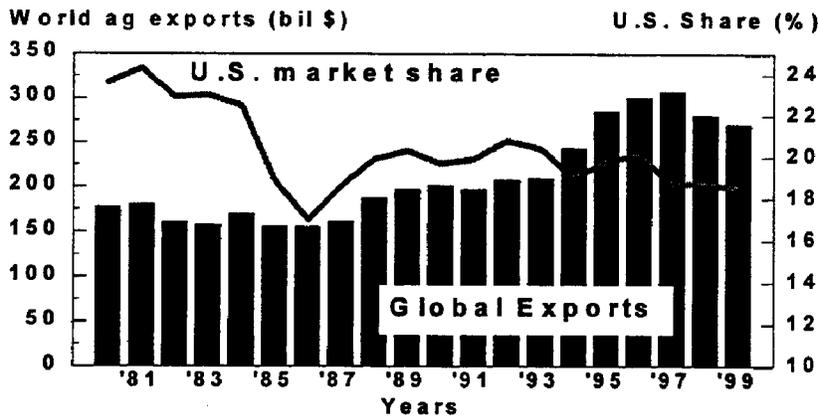

Fiscal 1999 was a mixed year for U.S. agricultural trade. Exports reached \$49 billion—down almost 20 percent from the \$60 billion record of 4 years ago, and we project that U.S. exports will remain flat at \$49 billion again this year.

This past year, we actually saw a gain in export volume of about 15 percent. However, 4 consecutive years of bumper crops worldwide and the slow pace of economic recovery in Asia continue to weigh down prices. As a result, much lower prices caused export value to decline this past year, and they explain why export value will remain flat this year.

Also troubling is the steady erosion in U.S. market share of global agricultural trade over the past two decades. This could culminate in the United States losing out to the European Union (EU) as the world's top agricultural exporter sometime in 2000.

From fiscal year 1981 until the global economic crisis in fiscal year 1998, worldwide trade in food and agricultural products nearly doubled. While U.S. agricultural exports also grew during this period—especially over the past decade—the fact is that U.S. export growth lagged behind that of its major competitors, resulting in a loss of U.S. market share, from 24 percent in 1981 to its current level of 18 percent.

U.S. Share of World Agricultural Trade

The decline in market share seems to defy what we know about the strength of the U.S. food production system. After all, the United States has the world's most efficient producers, processors, and distributors of agricultural products. We have one of the safest food supplies in the world. We have an abundance of high-quality bulk commodities and world class high-value and consumer-ready food products, and we have consistently shared our bounty with less fortunate nations through food aid and related assistance.

However, over the past few years, several factors have contributed to the drop in U.S. agricultural export levels and market share.

First, while U.S. agricultural exports have declined, so has global trade in agricultural commodities. The value of global agricultural trade shrunk from \$302 billion in 1997 to an estimated level of \$270 billion in 1999. The Asian financial crisis and

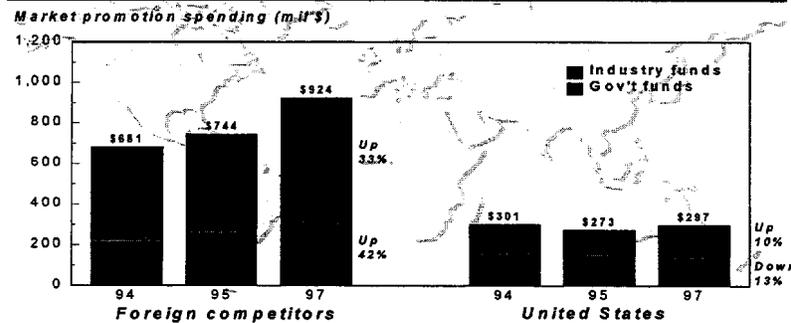

higher production of basic commodities worldwide resulted in soft world market prices for many agricultural products.

Second, the U.S. dollar remained strong, making U.S. products more expensive relative to competitor countries' products.

Third, our major competitors—the European Union (EU) and the Cairns Group—have outspent the United States in both public and private sector market promotion funding by a wide margin. Market promotion activities were not disciplined in the Uruguay Round. Our competitors were quick to take advantage, increasing spending by 35 percent, or nearly \$1 billion, in the past 3 years. Meanwhile, U.S. spending remained flat. Notably, our competitors have directed this increase almost exclusively to the high-value and consumer-ready product trade, where global import demand is growing fastest.

Competitors' vs U.S. Investment in Market Promotion Funding

Combined with greater spending by industry groups, total spending by foreign competitors has grown by 36% while spending by U.S. declines by 1%

Note: Market promotion is defined as market development activities comparable to those carried out under MAP & FMD

Source: FAS Competitor Reports 1994, 1995, & 1997

Fourth, direct export subsidies, though disciplined under the Uruguay Round, are still at formidable levels. The EU was by far the largest user of this form of assistance, spending \$7.5 billion in 1997, the latest year data are available. U.S. direct export subsidies contrast sharply with the EU's—\$121 million, or 1.6 percent of the EU total, in 1997.

FAS EFFORTS TO SUPPORT FARM INCOME

One can only imagine how much worse the situation would be, especially for U.S. exports, if we had not continued the vigorous use of our long-standing export programs. With large surpluses and rock-bottom prices here at home, we have actively used food aid to move commodities out of the U.S. marketplace to needy areas around the world. Under fiscal year 1999 food aid programs, USDA programmed nearly 8 million metric tons of U.S. commodities—close to five times the previous year's shipments and the largest tonnage in many, many years.

American commodities went to around 50 countries last year—from the unprecedented assistance package for Russia to food relief for Kosovo refugees, famine victims in North Korea, and hurricane victims in Central America and the Caribbean. Under the authority of Section 416(b) of the Agricultural Act of 1949, as amended (Section 416), CCC donated nearly \$800 million worth of commodities, including 5.2 million tons of wheat and wheat products, 274,000 tons of corn, and about 23,000 tons of dry milk. These U.S. surpluses were taken off the market and put to good use, helping to relieve hunger and suffering abroad.

Our export credit guarantee programs facilitated sales of more than \$3 billion in U.S. agricultural products. Our GSM-102 program helped U.S. exporters overcome disadvantages in Turkey, and make record sales of over \$1.2 billion in Mexico. The program helped U.S. oilseed exporters sell more than \$19 million worth of oilseeds to Uzbekistan, traditionally a buyer of South American oilseeds. Our GSM-103 program helped U.S. exporters sell over \$14 million worth of wheat to Jordan. The Supplier Credit Guarantee Program was used for the first time by importers in the Baltic Region, Georgia, and Turkey, resulting in sales of nearly \$1 million worth of meat products to buyers in the Baltic Region, and about \$2.9 million worth of poultry products and \$57,000 worth of hides and skins to buyers in Georgia and Turkey.

With the aid of the Dairy Export Incentive Program (DEIP), U.S. exporters sold more than 136,000 tons of dairy products valued at \$337 million. USDA awarded more than \$145 million in bonuses to help U.S. dairy exporters meet prevailing world prices and develop foreign markets. The Export Enhancement Program was used only sparingly in 1999 because of market conditions, with bonuses of about \$1.4 million awarded for sales of more than 2,000 tons of frozen poultry.

We continue to stress the importance of market development. In 1999, we allocated \$90 million to 65 U.S. trade organizations, State regional groups, and cooperatives for export promotion activities under the Market Access Program (MAP), and approved marketing plans of \$33.5 million for 26 trade organizations under the Foreign Market Development (FMD) program.

FAS introduced record numbers of agricultural policymakers to U.S. products and policies in 1999, and plans to meet and exceed that record this year. Nearly 800 Cochran Fellows from 70 emerging markets participated in short-term courses that introduced them to U.S. products, ranging from wheat to wine. The Cochran Program provides USDA with a unique opportunity educate foreign governments and private sectors not only about U.S. products, but also about U.S. regulations and policies on critical issues such as food safety and biotechnology.

On the trade policy front, USDA worked successfully to open, expand, and maintain markets for U.S. agriculture. For example, after years of negotiations and technical exchanges, Japan lifted its ban on several previously unapproved varieties of U.S. tomatoes. We estimate that Japan could purchase up to \$10 million worth of U.S. tomatoes annually as a result.

FAS played a key role in defending the U.S. position against the EU's ban on growth-promoting hormones. FAS directed the interagency effort to calculate and then defend before a WTO Arbitration Panel, the loss of U.S. beef exports caused by the EU's refusal to remove its WTO-inconsistent ban on imports of beef produced with growth-promoting hormones. The Arbitration Panel awarded the United States \$116.8 million in damages and the United States suspended trade concessions to the EU of equal value.

The 1999 meeting of the U.S.-Mexico Binational Commission (BNC) succeeded in achieving additional market access for U.S. exports while enhancing long-term market development objectives. Mexico committed to improve market access for exports of U.S. wheat, dry beans and slaughter hogs, and to reduce costly preclearance inspection for U.S. apples and stone fruit. Mexico represents one of the strongest and fastest growing markets for these five commodities, with total U.S. sales estimated at approximately \$400 million in 1998.

Last April, the United States and China signed the Agreement on U.S.-China Agricultural Cooperation, an unprecedented step in U.S.-China agricultural trade relations. With this agreement, China finally removes the longstanding bans on exports of U.S. wheat, citrus, and meat and poultry to China. The agreement also calls for China's commitment to the application of sound science, a key principle of the WTO Sanitary and Phytosanitary (SPS) Agreement. The agreement confirms a U.S.-China agricultural partnership in achieving some key objectives: resolving trade barriers, increasing technical cooperation and scientific exchanges and further developing our agricultural sectors.

FAS worked to ensure the successful implementation of the U.S.-Taiwan WTO bilateral market access agreement that was signed in 1998. This agreement, which falls under the Taiwan WTO accession negotiations, provided immediate access for U.S. pork, poultry and variety meat exports. During fiscal year 1999, the United States shipped poultry, which had previously been subject to a ban, worth about \$16 million and pork and beef worth an estimated \$60 million. These shipments mark the successful implementation of the "down payment" quotas provided for by the WTO Bilateral Agreement signed by Taiwan and the United States. Under the agreement Taiwan also modified its administration of the potato quota. This modification led to the importation of an estimated \$10 million in fresh potatoes.

In 1999, FAS negotiators helped to conclude important bilateral agreements that paved the way for Estonia and the Republic of Georgia to join the WTO as full members. The market access agreements require Estonia and Georgia to reduce import tariffs on important U.S. farm products, which will create greater market opportunities for U.S. farmers and ranchers. Both countries agreed to bind tariffs at or below 10 percent on U.S. priority products and committed to not use export subsidies. U.S. agricultural exports to these two countries are expected to grow approximately \$3-4 million annually following their accession into the WTO. FAS negotiators also concluded agricultural bilateral accession agreements, worth approximately another \$4 million, with Albania, Croatia, Oman and Jordan, and continued to work on two dozen other accessions including Russia, Saudi Arabia, and Ukraine.

FAS continues to monitor aggressively foreign countries' compliance with Uruguay Round Agreement commitments. For example, at the request of the United States, a WTO dispute settlement panel is examining Korea's import and domestic support programs for beef. As part of its Uruguay Round commitments, Korea agreed to liberalize its beef market by January 1, 2001. However, after Korea failed to meet its minimum import quotas in 1997 and 1998, it became clear that numerous market access barriers exist that are inconsistent with Korea's WTO commitments and threaten to inhibit full market liberalization. These impediments include restricted sales of imported beef at the retail level, a government "mark-up" on imported beef, excessive support payments to domestic producers, and limitations on import authority. Korea's imports of U.S. beef reached \$319 million in 1995, before dropping to only \$140 million in 1998.

At 1999's meetings of the Committee on Agriculture, FAS analysts reviewed and raised questions on over 250 WTO notifications. The value of trade addressed through U.S. vigilance of commitments is over \$500 million. This was achieved through questioning member's domestic grain purchasing policies that appeared to violate export subsidy commitments; challenging the discriminatory issuance of import licenses for dairy products, pork and poultry; questioning the WTO-inconsistent execution of a preferential trade arrangement that harmed U.S. apple exports; and questioning low tariff rate quota (TRQ) application for a range of commodities. These efforts contributed to several members halting implementation of or modifying WTO inconsistent practices.

PRIORITIES FOR 2001

Faced with continuing budget constraints, a strong U.S. dollar and continued aggressive spending on market promotion by our competitors, we must redouble our efforts to improve the outlook for U.S. agricultural exports. We are closely examining why the United States is losing market share in certain markets, and intend to take actions to remedy the situation, consistent with our budget resources. For example, we plan to continue to:

- pinpoint constraints to U.S. agricultural, fish, and forest products;
- work to remove trade barriers and trade-distorting practices;
- safeguard U.S. agricultural interests by advocating U.S. policies in the international community;
- help producers, processors, and exporters to strengthen their export knowledge and skills;
- ensure that the U.S. farm, forest and fishery sectors and our research community have timely and complete intelligence about emerging market opportunities;
- inform foreign buyers about the superior quality and reliable quantities offered by U.S. agricultural producers, and educate them about how to locate U.S. products;
- use our export credit guarantee programs to reach new customers for U.S. agriculture;
- use our food aid authorities to help needy people overseas and farmers here at home;
- use USDA export assistance programs such as the Foreign Market Development Program and Market Access Program to the maximum extent reasonable to pursue export opportunities; and
- work with emerging markets and developing countries to promote economic development to help meet the U.S. commitment to reduce by half the number of food insecure persons by 2015.

As we forge ahead, it is obvious that we need to look at new ways of doing business to reduce costs, streamline programs and tap into new technologies. In 1999, FAS received two prestigious Hammer Awards from the Vice President's office for improving the operational efficiency of its programs.

One was awarded for FAS's development and implementation of a "Unified Export Strategy" (UES). This process reinvented the planning and application process for the MAP and the FMD program, dramatically reducing paperwork requirements and improving operational efficiency for both programs. The UES encourages our strategic partners to formulate market-specific strategies for developing or expanding export markets. This approach facilitates a more effective use of FAS' full arsenal of market development programs.

The other was awarded for FAS's streamlining of the process for advancing funds to Private Voluntary Organizations (PVO) for humanitarian food distribution. The streamlined process helped private sector partners initiate Food for Progress program activities with much greater cost effectiveness and time efficiency. The

streamlined process resulted in a reduction in average cycle time of transferring funds to a PVO from 41 to 7 business days—an 83-percent improvement in the delivery of this service.

These efforts grew out of our strategic planning process that integrates all the marketing, credit, and trade policy tools that we have available to maximize the market for agricultural products. This process lets us review the competition and all FAS-sponsored efforts in a given market to determine whether we have the optimal mix of programs and funding, given that market's potential as a buyer of U.S. agricultural products. It also allows us to step back and review our efforts regionally as well as globally.

I would like to take a few moments to outline our priorities for fiscal year 2000.

GLOBAL PRIORITIES

At the top of our list is moving forward in the WTO trade negotiations on agriculture. Although agreement on the framework for a new round of negotiations was not achieved at the Seattle Ministerial, the Seattle meeting is not the end to further negotiations on agricultural trade. Because of the "built-in agenda" for agricultural reform in the Uruguay Round Agreement, work on the new agricultural negotiations is continuing. It is clear that we are on the threshold of a major new opportunity to advance open markets around the world. And as President Clinton has said many times, agriculture is at the center of the next round.

We have been doing a number of things to prepare for the negotiations, including 13 public hearings around the country; numerous meetings with representatives of the broad agricultural sector; periodic sessions of our Agricultural Policy Advisory Committee and our several commodity specific Agricultural Trade Advisory Committees; and of course regular consultations with Congress.

We have heard from the agricultural community and members of Congress, on a bi-partisan basis, that they are supportive of the goals that we have established for the next round: abolishing export subsidies, disciplining State Trading Enterprises, increasing market access through lower tariffs, reducing trade distorting domestic subsidies, defending the sanitary and phytosanitary agreement against those who want to weaken it, and opening the door for new technologies, such as biotechnology.

There are very few calls at this point for turning back the clock or closing our borders. I believe producers recognize that by and large we made progress in the Uruguay Round to begin the process of reducing export subsidies, reducing import tariffs, increasing quotas, and disciplining domestic subsidies. But because the formula chosen to achieve much of this progress relied on percentage adjustments, it left those countries—such as the EU—which began the process with higher levels of protection or more generous farm support budgets in a better position as the end of the Uruguay Round implementation period draws to a close. Our farmers clearly understand that reality and, as a consequence, I think most of them will judge the outcome of the next round on whether we have been successful in bringing greater uniformity to the levels of support provided to farmers globally.

Another priority on the trade policy front is how we deal with the issues surrounding products produced through biotechnology. There is a lot to say about what is happening in the biotechnology field and how it is affecting trade, and I could go on at length to describe our efforts at USDA to try to stay on top of the issue or to ensure that government actions on labeling and product approval in the EU, Japan, Korea, Australia, New Zealand, and elsewhere, do not irrationally reduce market access for U.S. commodities.

But I believe that the past few months have made clear that developments in the marketplace are running ahead of where various governments are at this point. The result is that the environment for biotech products is as unsettled as it has ever been during the short commercial life of this new technology. The demand by some users for non-biotech commodities only, the resulting calls for segregation by some handlers, and the indications that premiums and discounts may be appearing for non-biotech vs. biotech commodities are bound to have an effect on farmers' decisions regarding what to plant next year.

The next few months will likely determine whether biotech acreage continues to increase in the United States, or whether there is some retrenchment. Either way, this issue is likely to be a dominant one for U.S. agriculture in the immediate years ahead, whether in the WTO or in our bilateral relationships with customer and competitor nations alike. That is why we have said that when it comes to biotech and the next trade round, our focus will be in making sure that biotech approval regimes, wherever they exist, are transparent, timely, predictable, and science-based.

We also will be working to improve the way we carry out our market development programs. We have had some notable successes in these programs in the past year. For example, last January, the first container of U.S. mohair was shipped to Peru, and the Mohair Council of America (MCA) expects an additional \$400,000 worth of mohair to be shipped this year. This initial shipment resulted from a series of FAS and MCA activities, funded partly by the MAP.

A study by the Northwest cherry growers found that for every dollar spent in MAP funds for Northwest cherries, there was a \$5.54 return per 20-pound case in terms of state and federal tax revenues in 1998. Northwest cherry export sales for 1998 were valued at \$75 million with an impact on the local community of \$330 million in tax revenues. In addition, over 18,000 jobs were associated with Northwest cherry exports.

A San Diego-based company used MAP funds to reach out to Mexican consumers. This company saw its export sales grow by 60 percent in 1998 and by 34 percent in 1999. To handle the increased workload created by additional export sales, the business hired two new employees. In addition, local warehouses added employees to keep pace with this higher volume. The company averages 25 truckloads of product to Mexico daily (half by U.S. truckers). These shipments keep a minimum of three truck drivers and three warehouse workers employed yearly.

As part of an extensive trade servicing effort in Latin America, the USA Rice Federation successfully expanded U.S. rice exports to Colombia and Ecuador. Using FMD funds, the federation sponsored visits by Ecuadorian and Colombian rice trade delegations to the United States. The delegations included importers who had not purchased U.S. rice in the past and were not familiar with the U.S. industry. Several importers purchased U.S. rice for the first time. With these new sales, U.S. rice exports to Colombia and Ecuador rose to \$74.0 million and \$28.0 million, respectively.

These are just some of the successes we have seen through our market development programs. During the next 18 months, we hope to build on these successes by completing the Unified Export Strategy system. The next step is to implement a standardized evaluation process to measure program performance and effectiveness. This will help ensure that program allocations will have the greatest impact. We also will incorporate into the UES data base all FAS and private sector (including universities, profit, and non-profit enterprises) market development efforts and results including those under the Emerging Markets, Section 108 and Quality Samples programs. Together, these steps will provide a comprehensive view of all market development activities funded by FAS and provide a means to evaluate them.

We also expect to review the effectiveness of our first efforts under the Quality Samples Program. We announced the Quality Samples Program (QSP) last November and, to date, CCC has accepted proposals totaling \$1.2 million for this pilot program. The QSP provides funds to private sector recipients so they can showcase the quality of U.S. agricultural products to foreign buyers.

We also will continue work on a Clean Wheat Initiative. Under this effort, we asked for public comment on a question first posed by U.S. wheat producers—whether CCC should finance the installation of grain cleaners at certain elevators around the country. At a January 28th public hearing, testifiers included U.S. wheat growers and exporters—and more importantly, buyers of U.S. wheat from Brazil, Colombia, and Nigeria.

The hearing was a sobering one, especially as we heard our customers describe the noticeably cleaner wheat offered by some of our major competitors, including countries that clean their wheat at export as a matter of policy.

Just 10 years ago, less than 25 percent of the world's wheat was purchased by private buyers; today that percentage has jumped to nearly 60 percent, or about 25 million more tons than a decade ago. Private buyers tend to have tighter quality and cleanliness specifications on the wheat they purchase, so the question is, are we in the United States going to respond to the apparent demand by our customers?

A number of interesting options were aired at the hearing, including:

(1) whether CCC should specify cleaner wheat in making purchases for our humanitarian donations overseas; that could help to set an industry standard;

(2) whether the CCC should develop, for the first time, a standard, comparable to that established by Canada and Australia, for the amount of dockage in our wheat;

(3) whether CCC should offer, under the EEP program, bonuses for those who deliver cleaner U.S. wheat; and

(4) whether CCC should carry out the original proposal to finance the installation of grain cleaning facilities.

These are the options that we will be reviewing as we work toward a final decision.

To further increase our chances of expanding market share, we will continue to seek new partners through our outreach efforts to state government officials, small and minority businesses, and first-time exporters. We must increase the awareness, at all levels, of the importance of trade and increased exports to the health of U.S. agriculture. For example, FAS has encouraged the four State Regional Trade Groups (SRTGs) to increase the number of small companies exporting. Last year, the state groups worked with over 400 MAP participants, educating them about the growth potential of export markets and how to take advantage of the opportunities. By providing export education and sponsoring trade shows and missions, the SRTGs have played a significant role in increasing the number of small firms participating in the MAP branded program. The resulting increases in sales generated by these new exporters have contributed to local revenues and employment.

Together our outreach efforts and the MAP were instrumental in making FOODEX '99, the major food trade show in Japan, a success for the Intertribal Agriculture Council. Five American Indian tribes were represented at the show—Quinault Pride Enterprise representing traditional smoked seafood products, Seminole Indians of Florida with food seasoning, Gila River Far Board displaying grapefruit and tangelos, Navajo Agricultural Products Industry (NAPI) with pelletized alfalfa and pinto beans, and Yakima Land enterprises showcasing cherries and fresh vegetables. Quinault Pride Enterprise confirmed sales of nearly \$200,000 of fresh seafood products and established a new market outlet for a smoked shellfish product with a Tokyo retailer operating 33 upscale sushi restaurants. The Seminole Tribe met with two food distributors who made offers to distribute “Seminole Swamp Seasoning” in their respective supermarket chains.

REGIONAL PRIORITIES

Asia

With the conclusion of bilateral negotiations with China over its WTO accession, our work will shift toward implementation of the agreements and establishing permanent normal trade relations with China. This is our top priority in this region and we will be working tirelessly on this effort. Chinese concessions will be important for improved access opportunities, but we must remain vigilant and work with Chinese officials to ensure market opening.

With more than 1.2 billion people or one-fifth of the world's population, China's accession to the WTO will give U.S. agriculture access to the world's second largest economy in terms of domestic purchasing power. This could result in at least \$2 billion in additional U.S. agricultural exports by 2005.

China's WTO accession will strengthen the global trading system, slash barriers to U.S. agriculture, give U.S. farmers and agribusinesses stronger protection against unfair trade practices and import surges, and create a more level and consistent playing field in this market.

In order to realize these gains, we will be vigilant to ensure that China lives up to its WTO commitments, effectively administers tariff-rate quotas, eliminates discriminatory licensing, and fully implements last April's Agricultural Cooperation Agreement reducing phytosanitary barriers for citrus, wheat, and meat.

The full impact of the China accession agreement will be significant for U.S. agriculture by accelerating some of the policy changes apparently already underway in China. If our experience of the past few years has made one thing clear, it is that China is an important factor in the world trading picture. China's relative presence as an importer or exporter has a very direct impact on U.S. sales and on the bottom line of American producers.

China seems to have recognized that the policy of self-sufficiency that it had embarked on for the past many years was costly, wasteful, and not in its own best interests. The result of this new agreement, hopefully, will be a more market-based system and greater opportunities for efficient exporters, including the United States.

The U.S.-China Scientific Cooperation Program continues to be a strong element in our relationship with China, since this program focuses on research issues of mutual benefit to both countries. Among priorities identified at the January 2000 U.S.-China Joint Commission and Science and Technology Meetings were dryland agriculture, water and soil conservation and management, germplasm exchange, and plant and animal disease resistance.

Also in this region, our efforts to monitor and enforce our trading rights continue, especially in markets such as Korea, Japan and Taiwan where we continue to work to prevent the erosion of previous trade concessions.

Finally, our participation in the Asia Pacific Economic Cooperation (APEC) forum supports trade liberalization efforts in this region. While APEC itself is not a nego-

tiation structure, it allows us to work with other members to advance our goals in the WTO and other fora.

RUSSIA AND THE NEW INDEPENDENT STATES

Our top priority in this region is the implementation of food aid agreements with Russia. As negotiated, last year's final package totaled 3.7 million tons of U.S. commodities valued at \$1.2 billion, including transportation costs. We donated more than half the aid, and once completed, Russia will have purchased more than 1.8 million tons under Public Law 480, Title I. We are also undertaking a 500,000-ton humanitarian food aid initiative in Russia this year.

USDA staff continues to closely monitor the final stages of implementation. We also have received a formal request from the Russia government for another substantial food assistance package for this year; this is separate from the humanitarian program mentioned above. A number of considerations have come into play in reviewing this request.

Our assessment of Russian food needs and our experiences with the current program are key. If an agreement is reached on additional aid, we will insist on similar monitoring measures. There are a number of other considerations as well. For example, we have to be careful not to reduce incentives for Russian farmers. We also have an obligation to other trading nations to avoid actions that would disrupt international markets, and we would consult closely with the EU and other major food exporters.

Our trade policy focus in this region is to help a number of these countries join the WTO. While membership in the WTO is a high priority, we will continue to insist that these accessions be made on commercially viable terms that provide trade and investment opportunities for U.S. agriculture. This means that the acceding countries will need to continue the transition from centrally planned to full market economies by implementing new trade policies and regulations that are fully consistent with WTO rules and obligations.

FAS will continue to work with officials in these countries to help them make the necessary changes in their countries' trading regimes. We plan to do this through bilateral and multilateral discussions, as well as direct technical assistance programs. For example, FAS is presently providing assistance to the Ministry of Agriculture in Turkmenistan to encourage that country to move toward open market policies. FAS will place a high priority on compliance with the WTO SPS measures and Technical Barriers to Trade (TBT) Agreements given the growing number of bilateral issues in this area. While we anticipate that these reforms will create new market opportunities for U.S. exporters, we will also emphasize to officials in these countries the importance of the changes in terms of revitalizing their economies, attracting foreign investment, and using international trade as an engine for economic growth.

A more long-term FAS goal is our continued participation in international agricultural research studies to expand and improve crop-assessment resources for estimating wheat production in Russia and Kazakhstan.

Europe

Within Europe, maintaining market access and trade policy issues dominate our list of priorities. We will continue to monitor the reforms to the EU's Common Agricultural Policy (CAP), evaluating how the current set of reforms will affect U.S. agricultural competitiveness not only inside the EU, but also in third countries. In addition, we are closely monitoring the EU's implementation of bilateral agreements on rice and oilseeds.

After 6 years of difficult negotiations, the United States and the EU signed the Veterinary Equivalency Agreement in July 1999. The Agreement went into force in August. We expect to have the first meetings of the joint management committee later in 2000. The first issue we expect to be addressed will be the equivalency of the U.S. and EU residue testing programs.

At the request of the EU, a WTO panel was formed in 1999 to investigate the procedures used in establishing the safeguard action protecting the U.S. wheat gluten industry. We are working closely with the U.S. Trade Representative's office to defend this action. In addition, we are evaluating options identified by the International Trade Commission in its mid-quota review that will maintain and increase the effectiveness of the quotas operation.

We continue to work with the European Commission and member state governments on the bilateral market access issues regarding agricultural products produced with biotechnology. Current issues include proposed EU labeling regulations, amendments to the EU approval process, and identification of options to re-open the EU corn market to U.S. exports. Furthermore, we are currently engaged in a pilot

project with the EU and member states to compare data requirements for biotech product approvals.

FAS, in cooperation with the Agricultural Marketing Service, will continue to work with the EU and member state governments to fully implement an International Standards Organization (ISO) accreditation program developed by USDA in 1999. This program allows qualified U.S. exporters of organic products to maintain and expand their estimated \$200 million in annual exports to the EU.

After opening negotiations in 1999, we continue to work towards negotiating a new bilateral wine agreement with the EU. In addition, we are working closely with other wine exporting countries to maximize opportunities in global market access for wine exports.

In the Baltics, we will continue to deliver an agriculture improvement and agribusiness program under the President's Northern Europe Initiative. We will follow up on our dairy sector improvement seminar with continuing links between participating U.S. universities and the Baltics dairy industry. Additional programs will enhance agribusiness investment and trade opportunities, particularly in the forestry and pork sectors.

FAS will continue to monitor developments as several countries proceed with plans to join the EU. While we support this next round of accessions, the change could have a significant effect on U.S. agricultural exports to the region. The EU is already putting increasing pressure on the candidate countries to adopt EU regulations, particularly in the area of SPS measures and technical barriers to trade (TBT). In response, FAS will continue to work to ensure that the acceding countries do not adopt SPS/TBT policies or regulations that will disadvantage U.S. exporters during the transition period leading to full EU membership. In addition, FAS will focus particular attention on areas where the United States would be entitled to compensation from the EU for market losses attributable to higher border protection resulting from EU accession. We will also look for opportunities during the new round of WTO negotiations to maintain or improve market access for U.S. agriculture in this region.

Americas

We are active in negotiations to establish a free trade zone in the Western Hemisphere, under the proposed Free Trade Area of the Americas. The FTAA negotiators are meeting regularly with the goal of achieving a new hemispheric trade agreement by 2005.

Also in this region are two of our three largest agricultural markets—our neighbors and partners in the North American Free Trade Agreement (NAFTA), Mexico and Canada. Trade into these countries often faces a plethora of policies and programs potentially detrimental to continued access. We will continue to monitor and enforce our rights under the NAFTA and various side agreements as well as coordinate compliance with our obligations under these accords.

Other trade policy activities will include monitoring the tendency of several countries in the region to introduce "price bands" on primary commodities (a form of a variable levy), as well as unjustified phytosanitary restrictions on our wheat in Brazil. We will use the Cochran Fellowship Program to reinforce the U.S. position on these issues to senior level Latin American agricultural policy makers.

We also will continue to alert exporters to the potential of the Latin American market, the fastest growing region for U.S. agricultural exports, by stepping up our marketing activities. Efforts by our offices in this region last year met with great success and high praise from participants.

FAS will continue to build relationships in the Caribbean through its Cochran Fellowship Program, which offers technical assistance and training activities for potential foreign buyers. Following a Cochran training activity in 1999, the U.S. Meat Export Federation reported sales of U.S. lamb to Barbados, a market that has been essentially closed to U.S. food and agricultural products because of its close ties to France.

In Central America, FAS is monitoring reconstruction and agricultural production in the aftermath of Hurricane Mitch. We will improve our monitoring of the reconstruction of the agricultural sectors, which affects regional food security. We will also be providing critical food safety improvement assistance to help these countries build their food distribution and processing centers so that they agree with U.S. standards.

Last year, FAS administered CCC donations of wheat under Section 416(b) totaling 200,000 metric tons and valued at \$31 million to the Governments of Honduras, Nicaragua, El Salvador, and Guatemala. An additional 45,000 metric tons of corn valued at \$6 million also was donated to the region under Section 416(b). Sales proceeds are being used by the governments for post-hurricane reconstruction efforts.

In Brazil, USDA will monitor and report on the expansion of crop areas into the Cerrados region of Brazil's Center West. Farmers in this region are rapidly expanding soybean area, which will have a substantial effect on U.S. soybean production, prices and trade.

Africa

FAS will continue to encourage economic reform, market liberalization, and infrastructure development in the African countries, emphasizing to African officials the importance of meeting their current WTO obligations and commitments. We will also look for common interests during the new round of WTO negotiations and work together to improve global market access for agriculture.

In particular, FAS will address the growing number of sanitary and phytosanitary (SPS) issues with our African trading partners, stressing the important difference between justifiable science-based food safety measures and protectionist non-tariff barriers. Efforts will be made to demonstrate how science-based measures can protect human, animal, and plant health with minimal trade disruption. In addition, we will offer technical assistance on understanding and complying with the WTO SPS Agreement to enable these countries to have improved access to world markets.

FAS will also continue to engage African countries in a dialog on the important advantages of biotechnology in agriculture. We will encourage discussions at several levels, from broad high-level reviews to detailed working-level scientific exchanges.

Of all of the regions of the world, Africa remains the most threatened by food insecurity. FAS has, with USAID and the Department of State, developed a three pronged approach to implement the U.S. Action Plan on Food Security, released in 1999. FAS will initiate a pilot project on food security in Sub-Saharan Africa. This will include providing U.S. technical and policy assistance to Ethiopia/Eritrea to expand the United Nation's Food and Agriculture Organization (FAO) Special Program on Food Security. FAS will also be helping local governments create national food security plans to promote long-term rural development, improve trade, and reduce malnutrition.

On the market development side, FAS plans to expand the Cochran Fellowship Program to three new countries in the Sub-Saharan Region, bringing the total number of Sub-Saharan participants to 11. The goals are to develop agricultural systems to help these nations meet domestic food needs, and to strengthen trade linkages with the United States.

These endeavors are paying off in terms of U.S. trade. For the first time in 1999, a Senegalese company imported U.S. frozen chicken and meat. The participant intends to purchase two containers per month, the value of which is estimated at over \$200,000 per year.

In Africa, USDA will increase its monitoring of agricultural sectors to enhance the USAID's Famine Early Warning System. This will help us assist these countries make the transition from subsistence to market economies. And we will continue to coordinate our food aid programs with USAID's Public Law 480, Title II programs.

We will continue to foster research and scientific exchanges in this region. Both the United States and countries in Africa benefitted last year from 24 research and scientific exchanges under the FAS-administered Scientific Cooperation Research Program involving U.S. scientists and 11 African countries. Projects include providing alternatives for small farmers; improving seedless mandarins for new domestic and international markets; using natural enemies for biological control of stemborers, which cause more than \$1 billion in damages to U.S. crops each year; and preventing introduction of exotic pathogens on the Protea flower in a multi-million dollar industry with tremendous growth potential for farmers in both the United States and Africa.

BUDGET REQUEST

There is no question that today's budget environment requires us to prioritize our activities. Adjusted for the ICASS base transfer, which was implemented in fiscal year 1998, the level of funding available to FAS has essentially remained unchanged from fiscal year 1997, forcing FAS to again absorb unavoidable wage and price increases in fiscal year 2000. The combined impact of the fiscal year 2000 Federal pay raise and higher overseas costs resulted in a \$5.6 million shortfall in the FAS operating budget. Addressing this shortfall required FAS to adopt the following stringent fiscal measures:

- Savings of \$1.0 million from closing or downsizing six overseas offices. (Closing Bern and Agricultural Trade Offices (ATOs) Milan and Jeddah, and downsizing Ukraine and ATOs Hamburg and Tokyo. Additionally, ATO Singapore will be closed at the end of this fiscal year which will save \$.9 million in fiscal year 2001);

- Savings of \$1.6 million from a 50-percent reduction in marketing activities conducted through FAS offices overseas;
- Savings of \$2.0 million from a 25-percent reduction in domestic discretionary spending such as travel, training, supplies and equipment; and
- Savings of \$1.0 million from up to a 5 percent reduction in current U.S. employment levels to be achieved by continuing a hiring freeze and offering an early retirement opportunity.

Mr. Chairman, the fiscal year 2001 budget proposes a funding level of \$117.9 million for FAS, excluding \$27.5 million for the Cooperator Program, which is now funded through CCC. In addition to partially funding the fiscal year 2001 pay raise, the budget proposes a modest increase to support several agency initiatives including:

- \$750,000 and 8 staff years for market access compliance and negotiation activities. U.S. agriculture made groundbreaking progress in the Uruguay Round of multilateral trade negotiations, improving world market opportunities for U.S. agricultural products by an estimated \$5.17 billion during the implementation period. However, this has led to a sharp increase in FAS' trade compliance workload including monitoring implementation of numerous trade liberalization provisions by other countries and ensuring their compliance, negotiating agreements with countries seeking to accede to the World Trade Organization, and developing harmonized rules of origin for customs purposes. The onset of new multilateral negotiations on agricultural trade is expected to increase our current market access workload even further.

The requested funds will support additional staffing needed to meet this heavier workload and to fund technical expert participation from other USDA agencies in international consultations, particularly related to food safety and biotechnology issues, and to contract for technical expertise as needed to work effectively with foreign regulators.

- \$1,500,000 and 12 staff years to open three new ATOs in priority markets that offer significant growth for U.S. exporters over the next 5 to 10 years. These markets include:
 - Mexico (a new ATO in Monterrey and an ATO satellite office in Guadalajara \$400,000) Increased FAS representation in the banking and northern trade center of Mexico will allow the United States to take advantage of U.S. exporters' proximity and the market access provisions of NAFTA. A presence in western Mexico will allow the United States to take advantage of the expanding hotel, restaurant, and institutional trade in the region and in Mexico's second largest city. Mexico is currently the third largest, single country market for U.S. agricultural exports.
 - Canada (new ATO in Toronto \$550,000): Significant trade opportunities exist for small-to medium-sized U.S. exporters in our second largest, single country market. This new office would form the hub for an enhanced market development effort targeting new exporters in the United States.
 - Philippines (new ATO in Manila—\$550,000): The Philippines is the 9th largest foreign market for U.S. agricultural goods, importing \$730 million of U.S. agricultural products in fiscal year 1999. An ATO in Manila will make further inroads into this major market and protect U.S. interests from major nearby competitors such as Australia.
- \$618,000 for funding of the FAS attache office in the American Institute in Taiwan (AIT). Citing budgetary pressures, AIT is proposing to shift the funding responsibility for direct and indirect costs to resident agencies that historically have been funded through the AIT contract with the Department of State (DOS). The AIT contract is funded through appropriations made to DOS. Because DOS will no longer fund the costs of other agencies through its contract with AIT, an additional \$618,000 will be needed to maintain the FAS Agricultural Attache Office at the AIT.

Responding to conference report language directing the Department to develop a plan for establishing an account to manage overseas currency fluctuations, the budget proposes the establishment of an overseas buying power maintenance account. Under this proposal, up to \$2 million of the FAS annual appropriation shall remain available until expended solely to offset fluctuations in international currency exchange rates.

EXPORT PROGRAMS

Mr. Chairman, the export promotion, food assistance and foreign market development programs administered by FAS are key to expanding global market opportuni-

ties for U.S. agricultural producers. Our program proposals provide the tools to meet these new sales opportunities.

Export Credit Guarantee Programs.—The budget includes a projected overall program level of \$3.8 billion for CCC export credit guarantees in fiscal year 2001. As in previous years, the budget estimates reflect actual levels of sales expected to be registered under the programs rather than authorized program levels. Of the total program level, \$3.5 billion will be made available under the GSM-102 program and \$101 million will be made available under the GSM-103 program. For supplier credit guarantees, the budget includes an estimated program level of \$150 million and an estimated program level of \$40 million for facility financing guarantees.

Foreign Market Development.—The budget includes \$27.5 million for the Foreign Market Development (Cooperator) Program, unchanged from last year. As a means of providing stability for future program activities, funding for the Cooperator Program is now provided through CCC rather than the FAS appropriation.

The budget also proposes \$2.5 million in funding from CCC for the Quality Samples Program. Under this program, samples of U.S. agricultural products are provided to foreign importers in order to promote a better understanding and appreciation of their high quality. The Quality Samples Program is carried out through private sector organizations.

Market Access Program (MAP).—The budget provides funding for MAP in fiscal year 2001 at the maximum authorized level of \$90 million, unchanged from fiscal year 2000.

Public Law 480.—For fiscal year 2001, the budget includes a total program level for all titles of Public Law 480 food assistance activities of \$1.017 billion, which is expected to provide approximately 2.9 million metric tons of commodity assistance. As was the case last year, the budget requests no specific level of funding for Title III grants; however, current authorities provide that up to 15 percent of the funds of any title of Public Law 480 may be transferred to carry out any other title.

Export Enhancement Program (EEP).—World supply and demand conditions have limited EEP programming in recent years. However, the fiscal year 2001 budget does include a program level of \$478 million for EEP, the maximum level authorized by the Agricultural Trade Act of 1978. In addition, proposed legislation will be submitted in conjunction with the budget that will authorize the Secretary of Agriculture, in the last quarter of the fiscal year, to reallocate unobligated EEP funding for use in carrying out U.S. foreign food assistance activities, including Public Law 480 and Food for Progress programs, and for purchasing commodities to replenish the Food Security Commodity Reserve, and to assist the CCC in conducting market development activities.

Dairy Export Incentive Program (DEIP).—The budget assumes a DEIP program level of \$66 million for fiscal year 2001, below the current estimate for fiscal year 2000 of \$119 million. The projected decline in DEIP programming is the result of two factors: full implementation of the Uruguay Round export subsidy reduction commitments and the phase out in June 2000 of the so-called “rollover authority” that allows countries under certain conditions to exceed their annual export subsidy commitments by drawing on unused subsidy authority from previous years.

This concludes my statement, Mr. Chairman. I will be glad to answer any questions.

COCHRAN FELLOWSHIP PROGRAM

Senator COCHRAN. I appreciate your comments on that issue. While you are at the table, I noticed in your prepared statement, which we have included in the record now, you talked about introducing record numbers of agricultural policymakers around the world to U.S. products and policies during this last fiscal year, and you plan to meet and exceed that record this year. You mentioned the Cochran Fellowship Program. And I must say that I had an opportunity to meet with agriculture consuls or attaches in two North African countries, where I travelled with Senator Stevens and other members of the Appropriations Committee recently.

They were telling us how effective that program has become. It was a new program in those areas and they were very excited about the prospects for developing new relationships and using that as a way to improve cooperation in a number of different areas

of interest with those countries and people and businesses in those countries.

You point out that 800 Cochran fellows from 70 emerging markets participated in courses that introduced them to U.S. products. And I assume that is an annual figure, is it not? And that was just in 1999?

Mr. GALVIN. Yes, sir, just in 1999. That was a record year. You are correct, it has been a very successful program for about 15 years now. It has led, I think, to a lot of examples where we have seen increased U.S. exports and benefits in the area of trade policy. One thing that we have seen in the last couple of years is that we have really been able to use the program in an effort to help us address some of the pressing trade policy problems that we face today. And I think, in particular, of the biotech issue that continues to cause us great problems.

To give a specific example there, we used the Cochran program last year to bring in 15 technical specialists, scientists and policy-makers, from Eastern Europe, to educate them on our system here in the U.S. for ensuring that biotech products are safe and offer substantial benefits and that sort of thing. We currently have in the planning stage a similar type effort directed toward Southeast Asia. That part of the world is still somewhat open to biotech, and we want to make sure that we meet with the appropriate policy-makers there to ensure that the door remains open to biotech products.

I should also mention that one of the other current major topics that we face right now is in the area of food safety, not just in the U.S. but of course worldwide as well. We currently have in this country a Cochran team of 15 or 20 individuals from more than seven countries. They are here to learn about the U.S. food safety system, learning about things such as the HACCP approach to inspection and that sort of thing. That delegation arrived here about a week ago, and they will be here through much of March, learning about the U.S. food safety system and hopefully taking those lessons back to their own countries.

Senator COCHRAN. That is interesting. And I wonder if you could, for the record, give us a report, over the period of time that the program has been in operation, what the figures are in kind of a summary form. I do not want to put anybody to any extra trouble, but if you have those in your computers and can press a button and gin them up without too much difficulty, that would be helpful to have in the record.

Mr. GALVIN. Yes, sir, we would be glad to try to do that.

[The information follows:]

COCHRAN FELLOWSHIP PROGRAM

The Cochran Fellowship Program has received funding from three sources: direct appropriations, funds from FAS' Emerging Market Program for specific countries, and funding from USAID for activities in the New Independent States. The following table provides the number of participants by country and by funding source since the program started in 1984.

PARTICIPANT LEVELS BY COUNTRY AND BY FUNDING SOURCE, 1984–1999

	Appropriations	Emerging market pro- gram	USAID Free- dom Support Act	Total
Asia:				
China	283	4		287

Mr. GALVIN. I should mention that the total funding for the program is about \$5 million. About half of that comes from direct appropriations, another million or so comes from our emerging markets program. That is, I think, an example of where we have really married the two programs in a very positive way. The balance comes from AID funding.

Mr. SCHUMACHER. If I may, Tim.

Senator COCHRAN. Mr. Secretary?

Mr. SCHUMACHER. Since 1984, nearly 7,000 mid- and senior-level people have participated in this program from over 70 countries. And of course, as I travel around, I see the extraordinary benefit.

But I want to emphasize again what Tim said on the biotechnology and food safety issues, which are going to be so important in the future for our trade. More and more of these have been coming in. And studying our HACCP systems, studying how the biotechnology is benefitting not only our country but how it could benefit their countries' food needs, as Senator Durbin so eloquently put it, they are going to be ratcheting up in many of these coun-

tries, they need to adapt and adopt some of these new technologies for the future. Coming here, with the Cochran program, has worked really well—7,000 have benefitted.

Senator COCHRAN. I have received word from some other members of Congress, who have been in these countries who are participating in the program, how some have formed what they call Cochran clubs. And they bring together on a regular basis the alumni who have participated in the program and they talk about their experiences and also just stay in touch. And they are serving as catalysts for better communication and understanding of the U.S. and its market economic system and our democracy and food production techniques that can help improve trade for us and also benefits that are widely shared because of the program throughout the world.

Well, I appreciate your work on the program and your continued support for looking for ways to use it to benefit our interests as well as the interests of the countries that are participating.

CAPACITY BUILDING

Mr. GALVIN. If I may, Mr. Chairman, just one other example, because this is an issue that we hear a lot about from developing countries. And that is the whole issue of capacity building. It is an issue that we hear quite often in the WTO context, when developing countries say they are a little bit leery of trade liberalization because they just do not have the capacity to implement TRQ's and tariff reduction schedules and that sort of thing.

Last year, we also had a very good program in Africa on the WTO and the Codex system and how these developing countries can come to have a better understanding of how to implement their obligations as WTO members or as Codex members. And it was extremely successful and one that we would like to continue as well.

COTTONSEED ASSISTANCE PROGRAM

Senator COCHRAN. Thank you very much.

Mr. Secretary, I was pleased with your announcement that you are going forward with the cottonseed assistance program. You mentioned that just before the hearing began. Could you tell us how the Department intends for the program to work and when the sign-up will occur and what the payments are that can be expected?

Mr. SCHUMACHER. Yes. I would ask Parks if he could come to the table. He has worked very hard, with Keith Kelly, to get this up and running in a timely fashion. And maybe he could just take us through briefly how the program is going to operate.

Mr. SHACKELFORD. Well, sir, as the release carefully states, until we have the regulations out, this is not final. However, I can at least talk about what we propose to do.

This year is somewhat unique in that virtually all of the cotton gin in the U.S. was classed by the AMS. So we hope to be able to run this program in a much simpler manner than some of the programs where we have to go through major signups. We hope to take the AMS data, which is provided in specific form, use that to determine basically a list of the bales, provide that data in letter form to the gins, get them to verify it, and then make the payments based on that data. So it should be very simple, and we

should not have to go through the whole signup process and much of the trouble we have had before.

We will estimate a seed-to-lint ratio to basically determine the tons of seed per bale and probably just make those payments based on the number of bales ginned by each particular gin. The payments will go to the gins, to the first handlers, with the understanding that they will be shared with the producers where it is appropriate, where ginning charges were increased, for example.

Senator COCHRAN. We appreciate that information, and we hope you will let us know if you encounter any problems, just like we will let you know if we hear of any problems.

Mr. SHACKELFORD. Yes, sir, you will. Thank you.

EMERGENCY ASSISTANCE PAYMENTS

Senator COCHRAN. Mr. Secretary, as you know, we had a \$9 billion emergency assistance package last year, signed by the President. What are the expectations on when the final payments are going to be made and whether progress is being made as you envisioned in getting the funds out to the producers and those who are beneficiaries of this program?

Mr. SCHUMACHER. I am going to ask Keith to comment. But I think what I would like to do is just summarize very briefly. And if I may, I will give you a written report tomorrow or the next day, because we have 22 programs and it would take a fair bit of time to go through all of them.

Senator COCHRAN. That is fine.

Peanut Program	Oilseed
Tobacco Program	Pasture Restoration Program (PRP)
Livestock Assistance Program (LAP)	Farm Storage Facility Loan Program
Livestock Indemnity Program (LIP)	Commodity Certificates
Dairy Market Loss Assistance Program	Lamb Program

II

Mr. SCHUMACHER. Of course, the AMTA payments went out very, very quickly last fall. We have closed the signup now on the disaster payments. We will be uploading those in the next few weeks. Advance payments are going out on the disaster programs for that. And let me just look at my notes.

Senator COCHRAN. When do you expect those payments would go out?

Mr. SCHUMACHER. In about 3 or 4 weeks, I hope. As soon as we can get the upload done and we get the factor, we can get those payments out. Farmers have received, according to my notes here, advance disaster payments of about \$170 million so far. But that does not reflect a lot of the late signups. So when we go through the register I expect that will be much more as we process the last

filers, the people who registered last Friday. We will finalize their paperwork this week.

I think honey and mohair have gone very well. We are working well on the tobacco and peanuts. And tobacco in Kentucky is 96 percent paid out. In the livestock assistance program, we have got 80,000 farmers that have applied for \$141 million, as of January 18th. So that is working reasonably well.

In the livestock indemnity program, the dairy market loss, we hope to get that out in mid-March. Those are the major ones. We have just discussed cottonseed. The oilseed program, that is a difficult one. Signup is now under way. The postcards have gone out already and we have got the training done. That is moving forward.

I have talked about the farm storage and the pasture restoration. So, by and large, I think we are reasonably well on schedule. I think oilseeds will be the one that will be most difficult to administer. We have done the training. The staff are going to be working on that. The farmers will be coming in to get signed up.

Senator COCHRAN. Can you provide an estimate of the percentage of qualifying losses that will be covered by the crop loss portion of this package?

Mr. SCHUMACHER. Not at this time, sir.

IMPACT OF DISASTER ASSISTANCE

Senator COCHRAN. Dr. Collins, I know you are the prognosticator here. Where would our farm economy be if these funds had not been made available to producers?

Mr. COLLINS. Well, over the past 2 years we have made available a total of some \$15 billion, which represents a tremendous portion of what people had as net farm income. Without that—kind of the obvious—we would have had a credit crisis.

Senator COCHRAN. A lot of bankrupt producers?

Mr. COLLINS. Absolutely. In fact, we saw a surprising thing over the last couple of years. We have seen the number of farms in the United States actually go up, in 1998 and 1999. I do not think we would have seen that. And I think particularly among the commercial operations, we would have seen a sizable decline.

It is hard to correlate credit stress with declines in farm numbers, because sometimes it takes several years, because people will pay out of their savings account, they will sell off assets, and so on. But I think, if not in 1999 or 2000, certainly in 2001 or 2002 we would have seen a sharp drop in farm numbers had we not made the kind of payments that were made over the last 2 years. There is no doubt that a lot of people would not have been able to extend their loans or qualify for credit, particularly in 1999, had we not made these payments.

Senator COCHRAN. Yes, sir, Mr. Secretary, go ahead.

Mr. SCHUMACHER. A lot of those payments, of course, went out to program crops. But if I may add, Senator Gorton mentioned the apple industry. For example, in a number of Eastern States, there were difficulties in 1998 with pollination, and farmers have written me personal letters indicating that if it was not for the disaster program passed by your committee and Congress in 1998, tens of those family apple orchards would have gone out of business, and were basically saved by the disaster program that was put in place.

Senator COCHRAN. You were maybe both here when Secretary Glickman discussed whether the countercyclical payments proposed by the Administration as part of this budget would be beneficial as the disaster programs that we already passed. Dr. Collins specifically testified that no analysis had been conducted on whether there would be any geographical bias in the distribution of payments. That was a concern that I had at the time.

I wonder if you have had an opportunity to look further at that question. I was suggesting that with the payment limitations specifically that cotton and rice producers were going to be treated unfairly under this Administration's proposal. Have you had a chance to look at that and do any analysis of it?

Mr. SCHUMACHER. I have not done a geographic analysis but I have done a commodity analysis and a farm size analysis. And I would say that probably I would not use the word bias, I would say that the distributions would be different than they would be under an AMTA payment payout, for example. Your sense about cotton and rice I think is accurate. One of the things that we reported under our supplementary assistance proposal was that there are about 30,000 entities, persons, in the United States that would not be eligible for payments under that proposal because of the \$30,000 payment limit. That is about 2 percent of all the persons in the United States.

However, for cotton, it would be about 7 percent of all the cotton persons, of which there are over 100,000. And for rice, it would be about 22 percent of all the rice persons who would not be eligible because they already get \$30,000 or more in payments. So it certainly hits differentially cotton and rice, a problem that regular payment limits would have for cotton and rice, as well.

Secondly, I would say that if you compare the distribution of payments under the supplementary assistance proposal to that under AMTA payments, you would find that proportionally more payments would go to wheat, slightly more to rice, and fewer payments would go to feed grains and cotton under the Administration's proposal as opposed to AMTA payments. That reflects the changes in farm income from one crop to another crop, and with wheat and rice having sharper drops in farm income, that triggers a little bit higher proportion of the payments going to them.

Senator COCHRAN. Has there been any analysis of farm size and efficiencies and whether or not that ought to be considered when a program of this kind is developed? Are you going to legislate some sort of government policy on farm size by imposing a limitation as suggested by this program?

Mr. COLLINS. I do not see how this legislates a farm size. I think we have payment limits now for AMTA payments, for marketing loan gains and LDP's. We have had payment limits for other programs as well. This simply is another payment limit in the long-standing tradition of payment limits on payment programs. The difference here is that this one tends to be a little bit tighter.

That means that large producers that were receiving fairly large payments would not be eligible. I do not know that that mandates a particular farm size. It turns out, if you look at the data, those producers that get the largest payments also tend to have the highest farm incomes. And so, to some extent, they have deeper pockets

for dealing with a downturn in the farm economy than some of the medium-sized producers.

I think the issue here was that there was a finite amount of money to spread around. And for that reason, a little bit tighter payment limit was advocated.

PRICE IMPACT OF CONSERVATION PROGRAMS

Senator COCHRAN. The Administration's proposal includes expansion of a number of different reserve programs, like the conservation reserve, wetlands reserve, other environmental and conservation programs, all of which are good programs, and some of which I authored. The WHIP program, for example, was authorized by Congress based on legislation that I had introduced. So I am in favor of these programs.

My question is: What impact would you predict the expansion of these programs in the way the Administration requests would have on commodity prices, if any?

Mr. SCHUMACHER. Can I address part of that, and then perhaps Keith Kelly and Keith Collins can expand.

There are five programs that we have asked for, and I will walk through them very quickly. Concerning the farmland protection program, we have asked for \$65 million to cost-share. Many parts of the country are really pushing very, very hard. Whether it is California or some of the mid-Atlantic States or the Northeast, they were putting in substantial amounts. And they would like some cost-share, in a modest sense, for farmland protection. I do not see that having any major impact on commodity prices. It will most certainly help family farmers stay in business during tough times.

Neither the WHIP nor the EQIP would have a significant impact on commodity prices. Perhaps, Parks, you can assist me on the wetlands reserve, a modest program; and, Keith, on the 4-million-acre expansion of CRP, a fairly modest impact, I would think, if any.

Mr. COLLINS. Probably about half of that acreage, half of the 4 million, would compete with the principal eight program crops. And so you might be talking about a reduction in plantings of a million or two acres at the most. And, that would be phased in over a multi-year period as well. So I think the impact of that is quite small. There would be some, but it would be pretty small.

Mr. SCHUMACHER. And the additional one, of course, is the conservation security program that we propose for \$600 million in this budget. And that I think is a very important issue that we would like to continue to work with you on. Because I think that, as I indicated earlier, would not only help heartland agriculture, including rice and cotton, but also help dairy farmers as they try and deal with plunging prices, in terms of giving them some support for runoff control. It would help livestock operators as well. So I would hope you would consider that as you do your markup, Senator.

Senator COCHRAN. So the benefits would be in spending that would go to farmers or landowners that are controlled in these conservation programs? They would not get any benefit from increased commodity prices, then, would they?

Mr. COLLINS. I think the price effects would be quite small. I think the main benefits would be to help producers be better stewards of the land, to promote sustainable agriculture objectives, and

to lower their costs of production in doing so. And in the case of the conservation security program, probably provide producers some benefit over and above and beyond the mitigation costs of environmental problems. So there would be some direct income effect from the conservation security program, cost-reducing effects from the other programs, and a very, very limited effect on prices from the CRP program.

PROPOSED CROP INSURANCE LEGISLATION

Senator COCHRAN. Let me ask you about crop insurance. I know Mr. Ackerman was up a little while ago answering questions from Senator Kohl and maybe others. But the Agriculture Committee here in the Senate is going to consider legislation regarding crop insurance. We have a number of bills pending before the committee. I have cosponsored a couple of them, so I have got two bases covered anyway.

What have you concluded with respect to the legislation that we are going to be considering? And do you have any favorites among the three? I guess there are three major bills, the Lugar bill, then there is the Kerrey-Roberts bill, and there is the Cochran-Blanche Lincoln bill. And I am sponsoring also the Lugar bill. I do not want to get crossed up with the chairman here right off the bat.

Mr. ACKERMAN. Well, Senator, it has been a little hard to keep score of all of them, and they have been changing a lot the last couple of days. We have seen some drafts that have come out just within the last day on some of these different proposals. I understand there will be meetings going on up until the 11th hour before the markup.

Generally what we would like to see is certain basic objectives accomplished in a crop insurance bill. We put our proposals on the table, because after the last couple of years, there have been problems with crop insurance. I have been at farmer town meetings in about 20 different States, and you hear certain problems repeated time and time again about the crop insurance program—that the buy-up policies are too expensive, that we do not cover enough crops, that there is a problem when farmers have multi-year losses, that we do not cover enough of the specialty crops, that farmers do not have enough information to make good decisions, that there are problems with the NAP program.

Those half dozen themes get repeated time and time again on crop insurance, even with the gains we have made. What we would like to see is a bill come out of this process. I should say that, number one, we would like to see a bill come out of this process that will actually deal with the issues. And number two, for that bill to deal with those half dozen key problems with crop insurance—making it more affordable, dealing with the multi-year issue, providing more funding for research and development for specialty crops and new programs, risk management education, fixing the NAP program, and so on.

In the different bills before the committee, some deal with these problems more than others—some have different focuses. We have tried to avoid getting too hung up on which vehicle the committee is going to mark up because there are a lot of factors the committee

is looking at. But we are looking at something that will accomplish these objectives.

IMPACT OF LEGISLATION ON BUDGET

Senator COCHRAN. What impact would the passage of any of these bills have on the budget request for the Risk Management Agency and the Farm Service Agency?

Mr. ACKERMAN. I could tell you that for the Risk Management Agency, it would have a very significant impact. For example, just taking one provision by itself, the research and development for specialty crops—and all of the bills are very similar on this one point—the vision is to make available \$10 million, \$20 million, or \$30 million for researching new programs. All of those programs, once they are developed and they come in, will have to be processed by RMA. They will have to be reviewed, will have to be added into our computer systems and we will have to develop accounting systems for them.

That will create need for more administrative budget. What the exact numbers are, we have not calculated because the bills are a moving target. But clearly it will have an impact.

Mr. SCHUMACHER. The same thing on FSA. I think some of the language we have seen has some requirements for the Farm Service Agency and I understand, Dennis, there has been no provision made for assisting on the staffing for that either. So on both RMA and FSA, in the language I have seen so far, there has been no provision to assist in any implementation of this.

ADMINISTRATIVE CONVERGENCE

Senator COCHRAN. Let me ask about the issue of administrative convergence of the Farm Service Agency, Rural Development, and the Natural Resources Conservation Service. In your written statement to the committee, you state that by streamlining the administrative services for these three agencies, the Department will be able to conserve resources. In what dollar amounts are these savings going to be realized? Do you expect to achieve predictable or concrete savings by this convergence?

Mr. SCHUMACHER. Certainly in the longer term. And Dennis, maybe you and Keith can outline where we are on the support services. In the effort we have been making to get savings, for example, in Iowa or Alabama, where we have some procurement of vehicles, we can share vehicles among all three agencies, and it would be very helpful indeed. Just saving the procurement costs would be of great benefit. That will take some time to work through. We think there will be some significant savings over time through administrative convergence.

And perhaps, Keith, you can expand on that.

Mr. KELLY. Senator, since FSA has been right up against a wall with employment, we have been a strong advocate of administrative convergence all along because we have been struggling for the last couple of years to deliver programs. And what we saw, and we still see, is the advantages of administrative convergence to do all of the back room type things. It is hard to understand why we and RD and Natural Resources cannot use the same documents for procurement and for some of these other things. That has to have

some major cost savings, especially with regard to a common computing environment. I think the CCE would be the most obvious example of that.

And those efficiencies have to get translated back into savings, with the idea that they are going to free up resources and give us some help to do a better job in the struggle that we have had on the program side. So, yes, I clearly do think that there would be some cost savings all the way through on this.

Senator COCHRAN. But has anybody quantified it?

Mr. KELLY. Senator, there were efforts to quantify it during the development of the Support Services Bureau, in the report that was brought up here last year. It was quantified at the same time we were doing the downsizing. The quantification really was showing us trying to stay within the employment targets. As far as an exact dollar estimate, we would have to get that for you if there was one, because I do not know if there were any specific dollar figures for that.

Senator COCHRAN. What is the status of the initiative? Where are we? What have you done?

Mr. KELLY. As you can see in the statement that I have presented for the record, we are still supportive of moving forward with this. And we are asking the committee to take a look at that language and work with USDA, again, across all three mission areas, to try and see if we cannot join the modern world. And again, the IT, the computer information technology, is clearly our biggest concern because we do not have a very good common computing or a current computing environment out there at all.

And the lack of that is very costly and inefficient for us in whatever we do. I think that was discussed in some hearings up here last year, the idea of e-commerce and e-trade and e-mail and things like this that we can do over the computer network—we are a long ways from that.

Mr. SCHUMACHER. We were disappointed, quite honestly, Mr. Chairman, that it was taken out of the budget last year. It was not authorized and appropriated. We just think it is good business practice, when you have people serving the same farmers, to be in the same offices and to have some cost savings just by merging the administrative units there. There was some opposition to that. You and I both know where the opposition was. There was opposition in a number of areas.

But I think we just have to move forward and, in the 21st century, look at these new management techniques for keeping costs down.

DONATIONS OF SURPLUS COMMODITIES

Senator COCHRAN. With more than a third of the fiscal year gone, why is USDA not moving more aggressively to exercise its authority under the CCC Charter Act to provide donations of surplus commodities to countries in need? With commodity prices still as low as last year and financial difficulty for farmers as severe as ever, why should USDA hold back or be reluctant to act? Will USDA reach last year's Section 416(b) levels?

Mr. SCHUMACHER. We have worked very hard on that. I am the chairman of the Food Aid Policy Council. We have had a number

of interagency meetings to move this agenda. We announced a month or so ago the 3 million ton 416(b) allocations. I outlined those earlier in my testimony.

If we have additional demands on the 416(b), where we can place the humanitarian need, we will certainly do that. And I have outlined, for example, that Mozambique may be one area. We are going to monitor that very, very carefully. We will come back to meetings of the Food Aid Policy Council when we see additional demands being made and to utilize the 416(b) effectively and efficiently.

PUBLIC LAW 480

Senator COCHRAN. This is a question that relates to the \$1 billion appropriations level for Public Law 480 Title II. Current year funding is estimated to be \$967 million, and the average amount disbursed for Title II since fiscal year 1993 is \$906 million. Section 416 cannot be relied upon to make up the difference, since the types and levels of commodities vary year to year and often are not available at all. Yet the Administration is requesting only \$837 million for Title II for fiscal year 2001.

How will the U.S. maintain its commitments and be prepared to meet emergency needs without higher Title II appropriations?

Mr. SCHUMACHER. Well, as we indicated earlier, we used quite a bit of 416(b) this last year for wheat, and that diminished the need for a call on the Public Law 480. So we have some rollover. Maybe, Mr. Fritz, you could expand further on how we see that in the future.

Mr. FRITZ. If I may, Mr. Chairman, going back to your earlier question, I will tell you that we are in the process of negotiations with recipient countries and the World Food Program on the 416(b) programs that were approved recently. Some of those agreements will be signed very soon. Others, of course, will take further negotiations and stretch out into the spring and summer. But that process has actually begun with a number of countries and organizations, as well as the PVO's.

With regard to Title I and Title II of Public Law 480, as Mr. Schumacher pointed out, we have used 416 in place of Title I, especially to meet our needs. For Title II, which is administered by AID, there is sufficient money to meet this year's obligations. There is also the ability to transfer some money between Titles, including Title III which was zeroed out within the budget. But we feel we are sufficient for this year and, if need be, would come back and, with the further indulgence of the Congress, look at funding levels for outyears when 416 is not available.

ADDITIONAL COMMITTEE QUESTIONS

Senator COCHRAN. I appreciate very much your cooperation with our committee. We have been here a couple of hours now and we thank you for your patience and your handling of all of our questions. I know there will be additional questions we will submit. We hope you can respond to them in a timely way.

[The following questions were not asked at the hearing, but were submitted to the Agencies for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO THE FARM SERVICE AGENCY

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

CONSERVATION PROGRAMS

Question. The Department will propose legislation to expand the Wetlands Reserve Program (WRP), the Wildlife Habitat Incentives Program (WHIP), the Environmental Quality Incentives Program (EQIP), the Farmland Protection Program (FPP) and the Conservation Reserve Program (CRP). This proposed "Farm Safety Net Initiative" includes an additional \$1 billion in mandatory spending over authorized levels to enhance these conservation programs. Currently Commodity Credit Corporation (CCC) funds for administrative support services is capped at the 1995 level of total allotments and transfers to Federal and State agencies (the so-called Section 11 "cap"). This limitation affects the amount of dollars used for conservation technical assistance. How does this limitation affect the conservation technical assistance currently available for each of the mandatory conservation programs?

Answer. The Section 11 cap severely restricts CCC's ability to fund technical assistance for conservation programs. Proposals in the Farm Safety Net Initiative reflected in the fiscal year 2001 President's Budget total nearly \$1.3 billion in fiscal year 2001. Funds for technical assistance are included in most program levels and would not be subject to the Section 11 cap, such as for EQIP and the Conservation Security Program. As part of this legislative proposal, funds for Conservation Reserve Program, Farmland Protection Program, and Wetlands Reserve Program technical assistance, to be exempt from the CCC Charter Act Section 11 cap, in the amount of \$75 million, are requested for fiscal year 2001.

EMERGENCY LOANS

Question. The President's fiscal year 2001 budget request for emergency loans is \$150 million. According to the U.S. Department of Agriculture's 2001 Budget Summary, this proposal reflects funding to accommodate the expansion of eligibility to larger farms through Treasury loans, and to close the eligibility gap with the Small Business Administration (SBA) emergency loans. What is the current gap in eligibility for emergency loans between the USDA and SBA programs?

Answer. Existing statutes prohibit the SBA from providing disaster loans to any agricultural enterprise. The FSA emergency loan program is presently limited to family farms. The net result is that larger than family farms (those farms which require substantial labor beyond that required by the family and exceed the size of a typical farm in the community) and certain agricultural-related businesses cannot receive a disaster benefit that smaller farms receive.

Question. Does this legislative proposal have a related cost?

Answer. A major component of the program cost is the subsidizing of the difference between the interest rate charged to the borrower and the Government's cost to borrow. All borrowers in the current program pay a subsidized interest rate of 3.75 percent. Under the proposed legislation an estimated 30 percent of borrowers (large farmers) would pay an interest rate equal to the Government's cost of borrowing, and small farmers (70 percent of borrowers) would continue to pay a subsidized interest rate of 3.75 percent. As a result, the subsidy cost of the program would be reduced by a small amount.

FARM LOANS

Question. Mr. Secretary, in your opening statement, you mention that USDA has streamlined its guaranteed loan making regulations in order to encourage more private lenders to participate in the program. What is the difficulty that private lenders have had with participating in the guaranteed loan program?

Answer. In the past, lenders have been hesitant to participate in FSA's guaranteed loan program because of the perception that the program was cost prohibitive due to the time and paperwork required to apply.

Question. What changes did the Department make in the regulations that will encourage increased private lender participation?

Answer. The streamlined guaranteed loan regulations give lenders increased flexibility and make the rules more consistent with standard procedures in the banking industry. The new regulation reduces requirements for loans of \$50,000 or less. For these applications, FSA requires limited supporting documentation and historical data. The only forms needed to apply are an FSA application, balance sheet, and cash flow statement.

We also implemented a Preferred Lender Program (PLP) for lenders experienced with the FSA guaranteed loan program. Under PLP, FSA approves the lender's sys-

tem of credit management, and the lender is then able to obtain a guarantee under a simplified process tailored to each lender's own policies. To apply for an FSA guarantee, the PLP lender submits only a one-page signed form and a narrative addressing certain credit criteria. The guarantee is automatically approved if FSA does not take any action within 14 days of receiving a complete application.

We also increased flexibility in our collateral and servicing requirements. We now permit the subordination of direct loan security in favor of a guaranteed loan when specific indicators, such as cash flow and equity, are at a level that indicates sufficient financial strength. In addition, we allow the subordination, exchange, or release of collateral when in the borrower's and Government's best interest.

QUESTIONS SUBMITTED BY SENATOR SLADE GORTON

Question. Apples were mentioned specifically in the \$1.2 billion disaster package of last year, but unfortunately for many, the loan program instigated and proposed by the USDA did not provide the kind of aid some apple producers sought. In most cases, Washington growers were facing a surplus of commodity and therefore a surplus purchase by USDA would have proved beneficial. Instead, the Department imposed a "one-size-fits-all" loan program to all producers nationwide who experienced disaster. Unfortunately, it was brought to my attention recently that USDA is not honoring loan applications submitted by apple growers for "quality loss", although that provision was stipulated in the law. Can you respond to the concern by orchardists that this is the case?

Answer. The 1999 Crop Disaster Program compensated producers for crop losses due to adverse weather conditions. The program did not authorize payments to producers in compensation for low prices due to "flooded" markets. The 1999 program is a "production and quality" loss program as opposed to a "market loss" disaster program.

FSA pays apple producers for quality losses under the 1999 Crop Disaster Program (both insured producers and those without apple insurance). Producers who market apples in the lower priced "processed" market receive credit for the difference in price. Quality losses count toward the minimum 35 percent loss threshold under the disaster program.

In Washington State, the disaster payments are based on prices for fresh apples of \$4.25 per box and for processed apples of \$1.19 per box. The prices used under the 1999 Crop Disaster Program are historical averages and may not always be reflective of current market prices.

Question. Also included in the disaster package last year was a specific call to the Farm Service Agency to review all loan programs that could be utilized by apple growers and report back to Congress what, if any, changes needed to be made in order to assist these producers. How is that review coming and when should we receive a response?

Answer. We have created an interagency team to review the Department's programs for the apple industry. As soon as this review is completed, we will provide you the results.

QUESTIONS SUBMITTED BY SENATOR CONRAD BURNS

Question. Projections are dismal at best for the vast majority of America's farmers and ranchers. The Supplemental Income Assistance Program appears to take a heavy amount of analysis. Is this a long-term program, and will it go away when prices return?

Answer. The supplemental income assistance program, by its design, is a long-term program that only provides benefits when revenues are low. When prices are relatively high, there would be less need for the program, unless widespread crop losses reduced revenues beyond the proposed threshold of 92 percent of the 5-year average.

Question. When producers seem to prefer the Marketing Loan Assistance programs, why isn't that a viable option?

Answer. The supplementary payments were designed to supplement the marketing loan assistance program.

Question. You have likened your proposal to a chair with four solid legs. I don't think this counter-cyclical income support plan has a leg to stand on. It provides only \$6 billion over the next 3 years. Last year alone, the emergency package totaled \$8.5 billion. Prices are not expected to go up. How do you expect \$6 billion to help all the farmers in this country?

Answer. I am willing to work with Congress on funding levels given current budget constraints.

Question. This plan is not designed to replace AMTA. It's a good thing. With the \$40,000 payment limit in effect already, many of my Montana farmers are not eligible. I know my State is not alone in that problem. When 18 percent of farmers in this country account for 85 percent of production, you simply cannot cut them out of the plan. I realize this plan is designed to help the small farmer. I am all for that. But don't eliminate the agricultural producers who are producing the lion's share of commodities. How did USDA arrive at the assumption that only 8 percent of producers in this country would not be eligible for this program?

Answer. The Administration's \$30,000 payment limit proposal would limit supplemental assistance to some very large family and non-family farms. We estimate that the payment limit would make about 2 percent of all producers ineligible to receive supplemental assistance under the Administration proposal and an additional 6 percent of producers would have their supplemental assistance reduced. By reducing payments to the very largest producers, more payments can be targeted to smaller producers that are generally more financially vulnerable and have lower incomes. The Administration's payment limit proposal could increase the amount of supplemental assistance going to small- and medium-size family farmers by more than 20 percent.

Question. USDA's new farm income proposal is supposed to be designed to help small farmers, saying the majority will be eligible for payments up to \$30,000. The majority of farmers in Montana are NOT going to be eligible for that payment. Why is the Administration trying to push out the medium-sized farmer?

Answer. The Administration's proposal is targeted at both small- and medium-size farms. Most producers in Montana will receive supplemental payments, even though farms tend to be large in this State.

Question. You say in your testimony that government farm policy cannot keep lurching from one expensive bailout to another. I agree with you 100 percent. However, I fail to see how this proposal prevents another bailout. What assurances do farmers have that this proposal will protect their income and keep them farming?

Answer. No proposal can offer farmers a guarantee that they will remain in business. This proposal does offer farmers the assurance that, on average, payments will be made when gross revenue falls below 92 percent of historical levels.

Question. This proposal increases CRP acres from 36.5 million acres to 40 million acres, meaning there will be more contracts to administer. The staff levels allocated will not be able to handle that increased workload. How does USDA intend to cover the shortage in staff?

Answer. Expansion to 40 million acres would require some additional workload requirements at county offices. However, using the projected end-of-year acreage enrollments under the proposal, annual acreage increments do not reflect large signups in any one year, and FSA staffing impacts would likely be minimal, or could be absorbed. The Administration has proposed increased NRCS technical assistance funding to administer the higher CRP enrollments.

Question. It appears that the Administration is putting a heavier emphasis on the conservation side of their proposal, when we more truthfully have an economic emergency across the countryside. Why is this emphasis so heavy when we need to spend our time and money on trade and economic issues?

Answer. An enhanced conservation initiative, which proposes to increase conservation spending by \$1.3 billion in fiscal year 2001, is included as part of the Administration's proposal to strengthen the farm safety net. This represents 23 percent of total farm safety net spending proposed by the Administration for fiscal year 2001. The Administration believes this to be a crucial part of achieving the dual objectives of protecting this country's precious resources for our future generations, while improving the income security of farmers during these troubling economic times. Through these USDA programs, farmers and ranchers can receive cost-share assistance, technical assistance, and annual payments for installing and maintaining high-priority conservation activities, such as soil and water quality protection, wetland restoration, wildlife habitat enhancement, farmland protection, and comprehensive nutrient management.

Question. You have said that this proposal contains a plan for stabilizing the crucial USDA workforce that has become over-stressed the last 3 years. I haven't seen any evidence that it will lessen workloads or increase staffing levels. How does it stabilize the workforce?

Answer. The budget provides for maintenance of current levels of permanent full-time staff in FSA for 2001, with some reduction in temporary staff. Funds for continued modernization of our information systems and business processes are also requested to improve program delivery productivity in the long term. Fluctuations in

workload due to emergency conditions and new programs will require adjustments in the level of temporary staffing, however.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

Question. The high capital costs of farming coupled with the current low market prices is creating extreme difficulty for young people wishing to enter farming. In addition, census information has shown that the average age of today's farmers is rapidly approaching that of retirement. Please describe the activities of the Department, including loan programs, to assist beginning farmers.

Answer. FSA is providing substantial financing to beginning farmers. In fiscal year 1999, the number of direct and guaranteed loans provided to beginning farmers increased by 25 percent compared to fiscal year 1998. FSA assisted over 8,400 beginning farmers with loans and loan guarantees in fiscal year 1999. Between fiscal years 1994 and 1999, FSA provided loans totaling \$2.5 billion to more than 34,000 beginning farmers.

In addition, the Secretary has established an Advisory Committee on Beginning Farmers and Ranchers which will provide counsel to the Secretary on ways to coordinate financial assistance (Federal and State programs) to beginning farmers, encourage State participation, and maximize the number of new farming and ranching opportunities.

Question. To what extent and in what way do these programs work to encourage non-traditional farming activities?

Answer. FSA encourages family farmers to utilize all available resources to maximize their farm income. An example of this was the policy decision to allow FSA loans to be made for the production of ratites. FSA does not preclude the financing of other enterprises for which a reliable market exists and the farm customer has the necessary training, experience, or educational background to ensure a reasonable prospect of success.

Question. Do demographic indicators suggest that introduction of new farmers to farming is keeping pace with the number of farmers who are either retiring or simply leaving the occupation and if not, in what ways do you think this condition will alter the structure of U.S. agriculture?

Answer. Despite the achievements of FSA in assisting beginning farmers with loan assistance to purchase and maintain farming operations, regrettably, the number of new entrants into farming is falling over time. This shrinkage is attributable to the depressed economic conditions in the farm economy, increased productivity of farmers that requires fewer producers to maintain the same production, and better employment opportunities in today's strong general economy. Still, the typical path to farming is entry through the family farming business.

As you know, the Secretary has expressed strong concern about the need for strong, diverse family farm agriculture. Current economic conditions and trends combined with governmental policies appear to be driving the industry in the opposite direction, toward fewer, larger farms. The result has significant implications for the farm economy, rural America, and the Nation's food supply. These implications are too extensive to discuss here, but I would hope as the authorizing committees review the Secretary's proposals and conduct hearings, a policy consensus will emerge. Hopefully, these policies will encourage and promote entry into farming by young people.

STATE MEDIATION GRANTS

Question. The budget includes an increase for the State Mediation Program. Please provide information that suggests the level of savings to both the public and private sector that has been achieved through the use of this program.

Answer. The majority of cases handled by mediation would have gone directly to the appeals process or civil courts if certified mediation had not been available. Savings to the Federal Government is apparent when mediation results in a restructured loan which offers a greater return than net recovery buyout. Mediation also saves staff time and effort by quickly resolving the dispute outside of the appeals or court system. The National Appeals Division (NAD) published its 1999 budget to be \$13.363 million to administer its typical 3,500 cases. Those figures suggest that NAD's cost per case is approximately \$3,817. The average cost of a mediation case is \$500.

The Marketing and Economics Division at the Alabama Department of Agriculture and Industries reported in its annual report that their benefit-to-cost ratio for agricultural mediation is estimated to be \$8 in benefits for every \$1.00 of mediation costs. The Oregon Department of Agriculture reported in its annual report

that the benefit-to-cost ratio was estimated at \$2.56 to \$1.00 for mediation program expenditures. The annual funding for mediation has been \$2 million to \$3 million for the State Mediation Program. A high range of annual Federal savings, using the Alabama benefit-to-cost of 8 to 1, is \$21 million. A low range of annual Federal savings, using the Oregon benefit-to-cost of 2.56 to 1, is \$3.12 million.

Legal fees and costs for administering or selling a property through foreclosure or bankruptcy and the added costs of maintaining a non-performing asset on the books that are often avoided by mediation are difficult to estimate and are not included in these estimates. The Nebraska Department of Agriculture Farm Mediation Program reported in its annual report that "A significant amount of money is saved by the parties using mediation (the attorney fees, alone, for a person in bankruptcy average between \$3,500 and \$7,500)". The Iowa Mediation Service (IMS) reported in its annual report that savings for other creditors can also be presented in terms of legal savings. Using a cost projected at \$75 per hour for legal fees, IMS reported that the savings on each case exceed \$350. Similarly, IMS reported that farmers are not using lawyers for many of these cases and the savings can be applied to debt service.

Question. Given the current state of the farm economy, can you quantify an increase in the demand for this program?

Answer. In fiscal year 1999, 22 States requested \$3,703,508 in matching mediation grant funds. Only \$2 million was available and qualifying States received a pro-rated share, or about 60 percent of their request. This fiscal year, 24 States requested \$4,106,526 and received 79 percent of their request from the \$3 million appropriated. State mediation programs continue to be bare-bones operations that depend on the mediation grants to operate. Adding to the financial restrictions is an increased case load for the program. The additional case load will place a greater burden on existing funds and the ability of the States to effectively and efficiently provide mediation services to USDA.

FSA has received inquiries from new States interested in obtaining USDA certification and funding, including Pennsylvania, New Jersey, Kentucky, Louisiana, Mississippi and Montana. We anticipate certifying at least five additional State mediation programs if funds are available. Because of the potential and need for new certified State mediation programs and the additional case load USDA is experiencing, the demand can be estimated at \$4.95 million. That figure is based on the following:

[In millions of dollars]	
Existing State requests	4.10
New State mediation programs85
	4.95
Total	4.95

Question. The budget request for fiscal year 2001 calls for a substantial decrease in the program level of USDA farm credit programs. Although part of the loan levels for fiscal year 2000 were included as part of an emergency farm package, the farm economy has not recovered and it is reasonable to assume that credit needs are no less than they were a year ago. Please provide information, by type of farm loan activity, on the backlog of credit applications on hand.

Answer. Supplemental appropriations for fiscal year 1999 and fiscal year 2000 have allowed FSA to fund all viable applications and to fund new requests as they are received. There is no backlog of approved applications awaiting funding. Since FSA anticipates entering fiscal year 2001 without a backlog of applications, the budget request is expected to be sufficient.

Question. Please provide a projection of the actual farm credit needs for which USDA programs could be utilized in fiscal year 2001.

Answer. The following table provides farm loan program needs and proposed funding in the President's Budget for fiscal year 2001.

[The information follows:]

Direct Farm Ownership	\$128,000,000
Guaranteed Farm Ownership	1,000,000,000
Direct Farm Operating	700,000,000
Guaranteed Farm Operating	3,000,000,000
Emergency Disaster	150,000,000
Indian Land Acquisition	2,000,000
Boll Weevil Eradication	100,000,000

SHARED APPRECIATION AGREEMENTS

Question. Farmers in Wisconsin are concerned that certain Shared Asset Appreciation (SAA) agreements which they entered into as a condition of credit relief during the farm crisis of the 1980's may be especially burdensome now during the current price downturn. I understand that an extension has been granted in some of these cases until 2002 and that a further rule on the subject is nearing publication. Please provide an overview of the status of SAA claims.

Answer. Currently, over 10,600 debt writedowns with Shared Appreciation Agreements (SAA) have been processed since 1989. Of this total amount, over 4,200 agreements have been triggered or matured. The debt to be recaptured from SAAs must be suspended, amortized, or repaid at maturity if other factors have not previously made the recapture amount due. Approximately 1,200 SAAs will mature in 2000 and approximately 388 will mature in 2001. Regulations are in effect that permit a 1- to 3-year deferral of SAA obligations. Further, proposed regulations permitting non-program loans to repay SAA obligations at concessional interest rates were published in November 1999.

Question. If the soon-to-be-published rule includes an elimination of capital improvements from the calculation of appreciation, will such a provision be retroactive for capital improvements that were incurred since execution of the original SAA agreement?

Answer. Yes the provisions will be retroactive for capital improvements made since the original SAA agreement was entered into. However, the new rule will apply only to SAA's which are currently suspended or not yet due. The new rule will not apply to SAA's which have already been repaid.

Question. When do you expect publication of the final rule?

Answer. It is in the Agency and Departmental clearance process and will be published on or about May 31, 2000.

Question. What is USDA doing in anticipation of the expiration of the current extension in the event the farm economy has not properly recovered or that enforcement of the agreements then would place an undue hardship on farmers?

Answer. SAAs maturing in the year 2000 may be suspended for up to 3 years if necessary because of the borrower's inability to make the payments due to low commodity prices or natural disasters. Also, the balance owed may be amortized over a period of 25 years. The rate of interest equal to 25 basis points above the cost of money to the Government (also known as the Homestead Protection Rate) will be used once the new rule is published.

USDA/SBA EMERGENCY "ELIGIBILITY" GAP

Question. Secretary Schumacher's statement mentions a proposal by USDA to close the "eligibility" gap between USDA and SBA emergency programs. Please provide details of this proposal and your definition of the "eligibility" gap.

Answer. In recent years agriculture has experienced significant consolidation, with a net result of fewer, larger farmers. Most of these farms are family owned, even though the operation has grown beyond the point that the family can operate the farm by themselves. Current statutes require that FSA lend to only family size farmers. Therefore, when natural disasters occur, these larger operations are precluded from receiving FSA loan assistance. The Small Business Administration (SBA) is statutorily prohibited from lending to agricultural enterprises in disaster areas. Thus, larger than family size farms (those farms which require substantial labor beyond that required by the family and exceed the size of a typical farm in the community) are unable to receive disaster benefits that smaller farms receive. Most of these larger farms would receive SBA disaster loans if they were any other kind of business. Additionally, SBA classifies any business with a Standard Industrial Classification (SIC) code of agriculture as ineligible for SBA disaster loans. Any business dealing with animals including tropical fish, dog kennels, and horse boarding and riding operations are currently ineligible under SBA guidelines and FSA does not consider them to be eligible operations either. There are a large number of businesses which are not farming operations but have a SIC code of agriculture and therefore no disaster assistance is available to them. For the two reasons cited above, a gap exists between the eligibility requirements of the two programs.

FSA has drafted legislation which would allow emergency loans to larger than family size farms and certain agriculture-related businesses. Financing non-agricultural businesses even if animals are involved, such as dog kennels or production of lab animals, is being refused on both legal and programmatic grounds by SBA. Congress could aid this process resolving this issue explicitly in the law once it is proposed.

Question. Is the provision in the Administration's fiscal year 2000 supplemental request which calls for language to allow Emergency Conservation Program funds to be used for farm structure repair fall into that category since that has been a discrepancy between USDA and SBA programs?

Answer. The Administration proposed language allowing ECP to be used to repair farm structures and equipment to address the unmet needs of farmers that suffered damages from Hurricanes Floyd, Dennis, and Irene. Many of the producers affected by these natural disasters are low-income and lack sufficient financial resources to purchase insurance on farm structures and equipment. Most farm structures and equipment are covered by USDA loans (damage to non-agricultural equipment and buildings are covered by SBA loans), but many of the affected producers run small operations or are low income and cannot assume additional debt in addition to the losses they already have sustained.

Question. Why does the supplemental request to allow ECP funds for structure repair apply only to damages relating to Hurricanes Dennis, Floyd, or Irene and not other similar needs resulting from other natural disasters that have occurred since these hurricanes?

Answer. No other recent natural disaster has affected as many producers and caused as much damage as Hurricanes Dennis, Floyd, and Irene. These hurricanes created an enormous need for many different types of assistance, including financial assistance to repair structures and equipment. Because many producers were already facing significant crop and livestock losses, the Administration believes that additional assistance to repair structures and equipment is necessary to protect these farms' viability, many of which are small, family operations.

Question. The President's budget request includes \$11.5 billion in new farm spending through 2002 of which a sizable portion is identified for obligation in the current fiscal year. Has legislative language for this initiative been forwarded to the Congress and if not, when do you expect to propose it?

Answer. Our target was to get a first draft of the legislative language by March 1st. We were able to accomplish that, and now the language is in final clearance within the Department. I cannot specifically say when you will receive the language, but I can tell you that you will have the language in time to act on our proposal. Our overriding goal is to provide Congress with a useful document and to get this legislation in your hands in a timely fashion.

Question. Since fiscal year 2000 is nearly half over, what strategy do you intend to employ to see that farm benefits related to the Farm Safety Net Initiative will be available to farmers yet this year?

Answer. If the necessary legislation is enacted timely for the Supplemental Income Assistance Program, we will begin to make payments this summer.

GRAIN STORAGE LOAN PROGRAM

Question. Earlier this month Secretary Glickman announced a Grain Storage Loan Program. However, I understand publication of the final rule for this program is some time away even though harvests are not far off. How soon does USDA plan to have this program implemented?

Answer. Our target implementation date is June 1, 2000.

Question. In order to make this program available in a timely fashion, is it anticipated that it may be made retroactive in order to cover construction of storage facilities that may occur between now and publication of the final rule?

Answer. We are publishing an interim rule with a request for comments. We cannot make the program retroactive to cover any storage structure that has been started before publication of the interim rule.

Question. If the program is made retroactive, how will farmers be informed of the opportunity?

Answer. The program will not be retroactive.

DAIRY ASSISTANCE PAYMENTS

Question. \$125 million was provided as emergency payments to dairy producers in the Fiscal Year 2000 Appropriations Act. I understand that these payments are to be distributed in a manner similar to payments for dairy producers last year. However, I am aware of certain instances in which the program, as announced by USDA for fiscal year 2000, presents some inequitable results.

For example, I am aware of a farmer in Wisconsin who began milking cows in the last few weeks of 1998. Therefore, USDA does not view him as a new farmer in 1999. However, as a result of this determination, his production for 1999 will be based only on what he produced in 1998. In other words, USDA will not consider him a new farmer in 1999 (and therefore eligible for special treatment under this

program for purposes of his actual 1999 production) but will instead consider his production for all of 1999 to be the same as the previous year. In this case, he will be given credit for production in 1999 of only a few weeks of production when, in fact, he has been in production all 52 weeks. Does USDA have plans to provide relief for a farmer in situations as the one I described above and if so, what form of relief and in what fashion?

Answer. USDA has become aware of what appears to be an inequitable circumstance with regard to the Wisconsin dairy farmer who began production in December 1998. The affected farmer's case is under review and a decision will be made shortly.

FSA OFFICE SPACE

Question. As the USDA field structure continues to reorganize, the relocation of office space is inevitable. I am aware of an instance in Winnebago County, Wisconsin, in which a previous contract for relocation of USDA offices had been executed with local authorities which was going to result in savings for all agencies involved. However, I understand a subsequent ruling was made by the Department regarding a limitation of space within an office which would disqualify the arrangement already made between FSA and others in the county. Consequently, higher costs, disruption of services, and frustration with federal agencies by the community will all result.

In addition, the square footage requirements for USDA Service Centers also do not account for the space needs of temporary employees. This is an increasing concern given the growing importance of temporary employees as permanent service center staff are reduced just as program demand is growing. Please explain if the physical space limitation is purely arbitrary or if there are allowances for exceptions in special cases.

Answer. USDA space standards (DR-1620-2) are mandated by the Department and are an attempt by the Department to ensure a consistent policy for all USDA agencies. Due to feedback from our field offices, FSA has been working with the Department and other USDA Agencies to amend DR-1620-2 and develop USDA space requirements that are more realistic. Until the Department publishes these revised guidelines, FSA has developed an interim policy to offer immediate relief to the current overcrowding in field offices. FSA has delegated authority to its State Offices allowing them to grant individual county offices an exception to the current USDA space standards.

Question. Has USDA considered allowing flexibility in square footage requirements under lease agreements to account for space requirements for temporary employees?

Answer. FSA does allow flexibility and changes within their space. FSA space standards for county offices allow each office to acquire office space for temporary and part-time employees.

COUNTY OFFICE STAFFING

Question. For fiscal year 2000, Congress provided the budget request for FSA salaries and expenses and provided up to an additional \$56 million to assist in the delivery of the farm emergency package approved last year. Please describe the current needs of FSA staffing in completing the fiscal year 2000 activities including both those of permanent and temporary employees.

Answer. FSA funding for fiscal year 2000 is sufficient to maintain all Federal employees and county level non-Federal permanent staff. However, in an effort to provide timely delivery of programs and to handle producer requests, FSA will likely spend most funding available for temporary staff years in the first 6 months of the fiscal year, and a majority of these employees will be off the rolls by mid-March. Although these temporary employees have allowed the Agency to remain current on most workload, we expect continued high program and payment workload during the last 6 months of the fiscal year. FSA is working with the Department to review additional fiscal year 2000 supplemental funding. Supplemental funding would permit the Agency to pay for more temporary staff years to assist in implementing over 20 new emergency disaster provisions and also to possibly increase the speed in which producer payments, including loan deficiency payments, are made timely in coming months.

Question. To what extent is the need for improved information technology essential to the delivery of farmer services at the county level and how does that need compare to that of retaining personnel?

Answer. Improved technology is essential to improving and speeding the delivery of farmer services at the county level. FSA currently spends about \$35 million per

year operating and maintaining its "legacy" A/36 computers. These computers were a sound investment which have served America's ranchers and farmers well over the years, but are unable to meet today's program requirements. These machines were designed before the Internet and before databases were common in mid-range computers. As a result, the data on these computers are isolated. They are not directly available to the Service Center partner agencies, other USDA, Federal or State agencies and they are not available to the public. As a result, these computers will not support E-commerce and are not capable of otherwise taking advantage of the common computing environment investments already made and those to be made soon. These operating system concerns are as critical as our need to retain FSA personnel to carry out ongoing and ad hoc workload associated with the continued farm crisis.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

CATTLE FARMER AMENDMENTS

Question. An \$8.7 billion emergency assistance package was attached to the Fiscal Year 2000 Agriculture Appropriations bill. A portion of these funds were intended for a Livestock Assistance Program, a Livestock Indemnity Program, a Dairy Indemnity Program, and a pasture revegetation program. When can farmers expect to receive assistance from these programs?

Answer. LAP and LIP payments have been distributed with a payment factor established at .46 of the eligible payment amount. Original funding for LIP would have been adequate to pay all claims. LAP funding was insufficient to cover all claims and pooling of LIP and LAP resulted in the payment factor of .46 for all claims under both programs.

The Pasture Recovery Program signup period is March 20–April 14. Payments can be made upon certification of completion of reseeding which must take place after signup. No payments will be made until it is determined if a payment factor will need to be applied. Signup reports are expected to be received on April 21. Funding would cover maximum allowable payments to about half of the eligible producers.

The 2000 Dairy Market Loss Assistance Program is an extension of a similar program from fiscal year 1999. Additional signup was taken through February 28, 2000, with participants of last year's program automatically included in the extension of the program. Determination of a payment factor should be in process and payment distribution should begin soon.

Question. Has a sufficient sum of money been provided for these programs to ensure that farmers will receive the full amount that they are eligible to receive under these programs?

Answer. LIP had sufficient funding. LAP did not. PRP and DMLA funding adequacy is not known yet.

Question. Does the amount of funding for these programs meet the need for these programs?

Answer. Funding for the LAP program does not appear to have been adequate to compensate for the feeding needs to make up for large losses of grazing forage due to drought. LIP funding was adequate because much of the livestock lost was owned by contract production firms that do not meet the gross annual income limitation for program eligibility.

DROUGHT

Question. In 1999, all 55 counties in West Virginia were declared disaster areas due to losses caused by drought. Nationwide, 1,942 counties have been declared disaster areas due to losses by drought, with the most recent declarations occurring in Kansas and Texas. What progress is the U.S. Department of Agriculture Farm Service Agency making to update national drought loss estimates?

Answer. FSA does not formally estimate future crop year losses by disaster program. FSA does monitor drought conditions and attempts to anticipate funding needs for Emergency Conservation Program and Emergency (EM) loans plus human resource needs to staff service centers and perform crop loss appraisals in impacted areas.

Question. When will updated drought loss estimates be made available to Congress?

Answer. FSA does not formally estimate future crop year losses by disaster program. FSA does monitor drought conditions and attempts to anticipate funding needs for Emergency Conservation Program and Emergency (EM) loans plus human

resource needs to staff service centers and perform crop loss appraisals in impacted areas.

Question. Will the U.S. Department of Agriculture be submitting a request for additional emergency assistance for farmers suffering drought-related losses?

Answer. It is premature to address this issue. Only if a drought develops during the growing season and as the extent of losses become more apparent can this question be answered.

Question. What preparations are being made should there be a drought again this year?

Answer. Standing FSA-administered programs are available and currently being utilized by producers in geographic areas with recently planted or maturing crops impacted by drought. Available programs include: Emergency Conservation Program, Emergency Haying and Grazing of CRP lands, Noninsured Crop Disaster Assistance Program, American Indian Livestock Feed Program and Emergency Loans. We would also expect prudent farmers to practice good risk management by buying crop insurance and planting drought resistant varieties.

The National Drought Policy Commission (Commission), chaired by Secretary Glickman, will be submitting a report to the President and Congress to provide advice and recommendations on the creation of an integrated, coordinated Federal policy designed to prepare for and respond to serious drought emergencies. The Commission's draft report is currently available on the Commission's website, <http://www.fsa.usda.gov/drought>, for public review and comment. The comment period will close on March 31. The final report will be submitted in May to give this Congress the opportunity to propose meaningful legislation that will help to reduce and mitigate the impacts of drought.

Question. Farming in the Northeast (USDA's definition of Northeast includes West Virginia) accounts for 6 percent of U.S. farm numbers and 8 percent of rural agricultural production values but receives just 1 percent of direct payments and Federal crop insurance payments to producers. I am concerned that the hard-working West Virginia farmer is not receiving a fair portion of assistance provided by the U.S. Department of Agriculture. What factors contribute to the discrepancy between amount produced and assistance received?

Answer. As you indicated, West Virginia receives a relatively small portion of Federal assistance payments to farmers compared with other States based on the total value of agricultural output. Over the previous 5 years, the total value of agricultural output has averaged \$504 million, which is 0.23 percent of the national total. For the value of crop production, the relative total is only 0.07 percent of the U.S. total because the crop portion of total agricultural output in West Virginia averaged 14 percent, compared with the U.S. average of 42 percent. However, because most of the direct payments made to producers are made to crop commodities, West Virginia's share will be relatively low. Further, crop insurance participation in West Virginia is low relative to the rest of the country. In 1999, only 51 percent of eligible acres were insured.

Historically, direct payments to producers in West Virginia have reflected the relative value of crop production. That is, West Virginia crop producers have received 0.07 percent of the direct payments which mirrors the relative proportion of the crop value output indicated above. Further, the 1997 to 1999 history of loan deficiency payments, marketing loan gains, production flexibility contract payments and market loss assistance payments shows that the payments made on eligible acres in West Virginia are commensurate with the national level. (See Tables 2 and 3, attached.) For instance, in 1998, West Virginia had LDP's paid on 0.023 percent of the national total LDP payment acres for wheat, corn, barley, oats and soybeans. Meanwhile, it received 0.025 percent of the total national LDP payments (Table 2). Likewise, in both 1998 and 1999, West Virginia had PFC payments made on .042 percent of total U.S. PFC payment acres and received .039 percent of the total national PFC payment (Table 3). In other words, given the amount of acreage that qualifies for these government benefits, West Virginia is, in fact, receiving a proportionate share of the payment pie.

[The information follows:]

Percent West Virginia/ United States	0.043	0.045	0.042	0.039	0.039	0.042	0.039

Question. What can be done to ensure that a farmer who does not live in a larger “farm-state” receives an equitable portion of the assistance available to his fellow farmers?

Answer. West Virginia appears to be receiving a proportionate share of Federal payments to producers based upon current program availability. Communicating program availability through media, mail, and outreach programs appears to have been equally effective in West Virginia compared with the national results. Efforts by FSA will continue in all State and county offices to inform all producers of Federal agricultural assistance programs.

Federal assistance to livestock producers has historically been based on the occurrence of disasters. As a result, relatively few Federal dollars are paid to West Virginia farmers because the livestock sector is the predominant source of agricultural output in West Virginia. Further, livestock producer groups in the past have preferred not to have major price and income support programs which helps explain why livestock producers nationally receive relatively few Federal payments.

QUESTIONS SUBMITTED TO THE FOREIGN AGRICULTURAL SERVICE

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

Question. Secretary Schumacher, you recently submitted a letter to me, dated February 17, 2000, on Public Law 480 Title I and Title II unobligated balances. That letter explains only the reasons for the unobligated balances carried over from fiscal year 1999 to fiscal year 2000. Please explain the reasons for the Title I unobligated balances carried over from each of the fiscal years 1996, 1997, and 1998, and projected to be carried over at the end of fiscal year 2000.

Answer. The Title I unobligated balance carried into 1996 was \$9.5 million; into 1997, \$6.8 million; into 1998, \$68.4 million and into 1999, \$58.3 million. The unobligated balances carried into 1996 and 1997 were the result of allocations being withdrawn at the end of the fiscal year without adequate time to reprogram the funds. The unobligated balances carried into 1998 were due to the following: a \$10 million Title I allocation was withdrawn from Angola because reporting responsibilities relating to previous Title I shipments were unresolved; the \$5 million allocation to the Congo was withdrawn due to the civil war and subsequent government disarray; the \$5 million allocation to Guatemala was withdrawn when the Guatemalan government ministries did not come to agreement among themselves on commodities to be included in the program and on whether to exempt Title I importers from a newly-leveled import tax before the signature deadline for the agreement; in Moldova the \$10 million allocation was withdrawn due to lack of interest among government ministry officials caused by a change in focus, within the Government of Moldova, on the use of proceeds from the sale of program commodities; in the Philippines the \$10 million allocation was withdrawn because the Government of the Philippines was unable to complete the agreement before the signature deadline due to internal disagreements on administrative matters; and the \$5 million allocation to Suriname was withdrawn because the Government of Suriname decided not to purchase commodities through Public Law 480.

In addition to allocations that were withdrawn, some countries did not purchase all the commodities allocated in their agreements. For example, Jamaica was allocated \$10 million to purchase rice but only used \$5.3 million. Lithuania was allocated \$10 million to purchase soybean meal but only purchased only \$7.6 million. Some of these unused allocations were offset by increased allocations to other coun-

tries such as Pakistan. However, the end result was a rather large carryover of funds into fiscal 1998.

Unobligated balances carried into fiscal 1999 were also primarily due to countries deciding not to purchase commodities through Public Law 480 Title I and other countries not purchasing all of the commodities allocated in their agreements. For example, Cote d'Ivoire and Pakistan decided not to purchase commodities and Albania, Angola, Bangladesh, Bolivia, Bosnia-Herzegovina, El Salvador, Guyana, Kyrgyzstan, Moldova, Mozambique, and Tajikistan did not purchase all of the commodities allocated in their agreements. In addition, approximately \$20 million was allocated to develop private trade agreements. These agreements did not materialize and it was too late in the fiscal year to reprogram the funds. Some of these unused allocations were offset by increased allocations to other countries such as Nicaragua. However, the end result was a rather large carryover of funds into fiscal 1999.

At the current time, we are not projecting any significant carryover of fiscal year 2000 unobligated balances into fiscal year 2001.

FAS HOUSES

Question. I understand that in the mid-1950's the Department of Agriculture purchased residences for FAS Agriculture Attaches with the proceeds of Public Law 480 purchases in approximately 12 countries. While USDA purchased the property, by law it could not hold legal title for the property so the Department of State took title to these homes. I am told that now the Department of State is in the process of selling these homes and retaining the proceeds, forcing FAS to incur the cost of providing housing for attaches in these countries. Is this accurate? What is USDA doing to resolve this situation and what additional costs is FAS facing if it is not resolved? What legislative solution might be appropriate to ensure that the USDA either receives the proceeds from the sale of this property or is provided with comparable housing at the same cost?

Answer. Through the foresight of the Congressional Agriculture Committees, legislation was included in various DOS appropriations authorizing the acquisition of residences for Agricultural Attaches. Seventeen properties were purchased by the Department of State (DOS) during the years from 1957 to 1979 to provide housing for Agricultural Attaches in specific countries.

Congressional testimony by State's Office of Foreign Buildings Operations (FBO) during those years reflects their intent to acquire pieces of property for the use of these Attaches. Both DOS appropriated funds and excess Public Law 480 currencies were used to acquire the specific properties. The DOS's use of funds to acquire these properties was based on priorities in agreement with USDA for acquisition of a number of residences for occupancy by the senior Attache of the agency.

In the early 1990's, FBO claimed that it could sell some of those residences although they had been occupied by Agricultural Attaches since their purchase, in some cases for more than 40 years. Although FAS contested this view, FBO has subsequently sold four of these residences (in Lima, Peru; Quito, Ecuador; Santiago, Chile; and Rabat, Morocco) and retained the proceeds for its own purposes. FAS no longer has an Attache in Quito and was granted another government-owned house in Rabat; however, FAS now pays over \$85,000 annually for leased housing for Lima and Santiago. In addition, two FAS residences have been put into embassy housing pools, thus requiring FAS to pay for leased housing. These are in Nairobi, Kenya (annual leasing cost in excess of \$26,000) and Warsaw, Poland (\$43,000).

In total, the impact of the loss of these residences has been additional costs of \$680,000 to the FAS budget over the past 5 years. Since the FAS administrative budget has been frozen during the past 3 years, these increased costs have had to come from other FAS programs and activities.

During the past 2 years, FBO has announced that it intends to sell two additional FAS occupied houses, in Vienna, Austria and Stockholm, Sweden. If FBO succeeds in this, FAS will face annual leased housing costs estimated at \$70,000 for these two posts. Finally, FBO now claims that FAS has no rights for continued assignment to two long-term FAS houses, in Bangkok, Thailand and Cairo, Egypt. If FAS is forced out of these residences, leased housing costs for the two posts are estimated at over \$120,000 annually.

Although FAS has contested this FBO policy for nearly 10 years, we have been unable to deter the plan to sell off FAS houses. Most recently, on December 7, 1999, Secretary Glickman wrote a letter to Secretary Albright regarding the sale of the house in Vienna. The Secretary asked that the proceeds of the sale be used to purchase replacement housing for the FAS officer. In addition, Secretary Glickman asked that he be advised of any actions which State might take for other dedicated FAS housing. On February 18, 2000, Patrick Kennedy, Assistant Secretary of State

for Management, responded to Secretary Glickman's letter, noting that State had no record that Department of Agriculture funds were used to purchase or maintain the residence in Vienna.

BUYING POWER MAINTENANCE ACCOUNT

Question. The FAS is requesting authority in fiscal year 2001 to establish a Buying Power Maintenance Account to manage overseas currency fluctuations. Please detail for each of the past 5 fiscal years what impact overseas currency fluctuations have had on FAS' direct appropriation as compared to the amount budgeted for these costs in each of these years.

Answer. The information below compares the amount estimated at the beginning of the fiscal year and the actual annual costs of maintaining FAS overseas offices for the last 5 fiscal years. While not all the differences can be attributed to just exchange rate movement, the data is representative of general currency fluctuation trends.

Fiscal year	Budget	Actual	Difference
1995	\$22,963	\$23,842	(\$879)
1996	25,354	24,605	749
1997	24,912	24,915	3
1998	25,841	24,092	1,749
1999	25,678	24,240	1,438

PAY COSTS

Question. The fiscal year 2001 request includes a total \$1,533,000 increase to partially offset the fiscal year 2001 pay raise. What increases in mandatory pay costs does the budget assume FAS will absorb in fiscal year 2001 and how will FAS meet these costs?

Answer. The fiscal year 2001 budget request for pay costs reflects half the amount actually estimated to be needed. Absorbing the \$1.5 million balance could require the elimination of up 20 staff years.

AGRICULTURAL TRADE OFFICE

Question. FAS has cited budgetary constraints as the reason for having to close its Agricultural Trade Office (ATO) in Singapore at the end of the year. I note that the fiscal year 2001 budget requests additional appropriations for FAS to open three new ATOs in Mexico, Canada and the Philippines. Why are these three new offices of highest priority? Why establish ATOs in Mexico and Canada which are currently our largest agricultural markets and are in close geographic proximity to the United States, rather than in countries/regions with market access/expansion potential?

Answer. The three proposed ATOs were chosen on the basis of their market potential. The Philippines, with a population of 80 million, has a rapidly growing economy which has largely escaped the financial downturn suffered by many other Asian economies over the past 2 years. While Philippine consumers often favor U.S. products, they also have ready access to products from China and Australia, which are very active in that market. ATO Manila should be able to provide a showcase for a wide range of products in this growing market with major potential.

Mexico is the third largest market for U.S. agricultural products, and while nearby, it is not an easy one for U.S. exporters. The proposed ATO in Monterey would provide support for exporters in developing markets in the border region of Northern Mexico, which has had the most dynamic economy in the country. With higher incomes, this region has expanded demand beyond the traditional bulk commodities and is taking increasing quantities of processed and consumer ready goods. Besides working with U.S. suppliers of these products, ATO Monterey would also focus on the problems of moving goods across the border. Such problems often require some U.S. government intervention in resolving issues of food inspection or safety.

Canada, the second largest destination for U.S. agricultural products, has provided a particularly strong, consistent and growing market for high value and processed foods. Although Canada is often viewed as an easy nearby market, there are significant hurdles for first-time exporters. The proposed ATO Toronto would focus on the thousands of U.S. food producers who have never exported and who should view Canada as a good "starter" market. In this context, the ATO would provide specialized services for new exporters, providing them with a higher level of support than would normally be offered. The ATO would also play an active role in outreach

in the Upper Midwest, encouraging companies in the region to get involved in the Canadian market.

Question. Did the Department consider retaining the Singapore ATO, despite the higher cost of this office, given Singapore's strategic prominence in the Southeast Asia region?

Answer. When the Agricultural Trade Office (ATO) was opened in Singapore 21 years ago, the city was the major transshipment point for agricultural trade with Southeast Asian countries, particularly nearby Malaysia and Indonesia. Since that time, however, the city's share of trade tonnage for the region has been eroding, a trend that is likely to accelerate in the future. In Malaysia, for example, the opening of Port Klang in 1996 (the first in the country which could handle the larger, Panamax-sized vessels) and of the new Kuala Lumpur International Airport in 1998 have stepped up the trend in displacing transshipments that previously went through Singapore. Upgrades in port and transportation facilities in Indonesia are also displacing trade through Singapore. Indeed, the governments of both Malaysia and Indonesia are pursuing policies which will further favor the use of their own transportation facilities.

FAS has also made substantial gains in its staffing in Southeast Asia during the past few years, opening an Attache Office in Hanoi, Viet Nam in 1996, an ATO in Jakarta, Indonesia in 1997, and an office in Ho Chi Min City, Viet Nam in 1997. Two additional Malaysians were added to staff of the Agricultural Attache's Office in Kuala Lumpur in 1997. Consequently, many of the services previously offered by the ATO in Singapore to these countries are now handled in-country by local staff.

FAS recognizes the continuing importance of Singapore as a regional financial and commodity trading center and will continue to maintain an office with a staff of two Singaporeans to cover these issues as well as trade servicing for this city of 4 million. This office will be supervised by the Agricultural Attache in nearby Kuala Lumpur. In addition, FSN staff from Kuala Lumpur will travel to Singapore to support major events, such as regional trade shows.

With an annual budget of \$900,000, ATO Singapore is the sixth most expensive FAS office in the world. Its annual cost is higher than that of several of our most critical posts, including the Minister Counselor's offices in Beijing and in Mexico City. With a budget for administrative costs frozen for the past 3 fiscal years, FAS has been forced to absorb rising costs and to close posts whose cost exceed their contribution to the agency's mission. For the reasons stated above, we believe that Singapore is one of these posts and that the resources expended there can be better used to support critical needs in other areas.

Question. Mr. Galvin, in the prepared statement you submitted to the Committee, you indicate that the ATO in Singapore will be closed at the end of this fiscal year and you will save \$0.9 million in fiscal year 2001. For what specific purposes will the \$0.9 million in saving from the Singapore ATO be utilized in fiscal year 2001?

Answer. Savings from closing ATO Singapore will be utilized to offset unavoidable wage and price increases. As a result of straight-lined budgets for the past 3 fiscal years, FAS has been closing and downsizing overseas offices and reducing marketing activities as the means of offsetting these unavoidable cost increases. The fiscal year 2001 budget again requires FAS to absorb a significant portion of these estimated costs.

COOPERATOR PROGRAM

Question. Beginning in fiscal year 2000, the Cooperator Program is being funded through the Commodity Credit Corporation rather than through FAS's direct appropriation. In shifting funding to the CCC, \$500,000 was retained in FAS's direct appropriation for fiscal year 2000 to cover the costs of administering the program. What was the cost to FAS of administering the Cooperator Program in fiscal year 1999 and is the full \$500,000 being used for this purpose for fiscal year 2000. Can CCC funds be used to administer the Cooperator Program. What level of funding is included in the fiscal year 2001 appropriations request to administer the Cooperator Program.

Answer. The cost of administering the Cooperator Program in fiscal year 1999 was approximately \$2.1 million. For fiscal year 2000, the full \$500,000 retained in the FAS appropriation will be used for this purpose. For fiscal year 2001, the budget includes approximately \$2.3 million for administration of the Cooperator Program.

While the program costs of the Cooperator program have shifted to the CCC, CCC funds cannot be used to finance the costs of administering the program.

SCIENTIFIC COOPERATION RESEARCH PROGRAM

Question. Please describe briefly each of the research and scientific exchanges being carried out under the FAS administered Scientific Cooperation Research Program in fiscal years 1999 and 2000 and the sources of funding for each. Does the fiscal year 2001 FAS request include funding for this program? If so, what level of funding is requested?

Answer. The FAS Scientific Cooperation Research Program is funded from the annual appropriation made available to FAS. In fiscal year 1999, the program level totaled \$1.8 million. The budgets for fiscal years 2000 and 2001 include \$1.9 million annually for these activities. We will provide Research and Exchange Project Abstracts by Country for both fiscal years 1999 and 2000 for the record.

[The information follows:]

**U. S. DEPARTMENT OF AGRICULTURE
Foreign Agricultural Service
International Cooperation and Development
Research and Scientific Exchanges Division
Scientific Cooperation Program**

The Scientific Cooperation Program supports international cooperative research efforts focused on practical uses of science to help solve critical problems affecting U.S. agriculture and forestry, such as trade barriers and phytosanitary issues, food safety, and exotic diseases and pests. This competitive program provides links to world resources in both developed and developing countries, and enhances research and technical efforts in the U.S. agricultural scientific community.

In fiscal year 1999, Foreign Agricultural Service appropriations were leveraged to provide less than 30% of cost of supporting 145 mutually beneficial international research and exchange activities. A diverse group of U.S. institutions collaborated in research partnerships with 52 countries in scientific cooperation, which is a vital component of the sustainable agricultural development necessary for domestic and global food security.

New scientific cooperative research activities selected for funding in 1999 promote the safe and appropriate development and application of biotechnology and other tools for food safety, improving the nutritive value and resistance of crops and livestock, environmental sustainability, and other priority food and agriculture issues affecting needs of limited resource and small farmers. Collaborative research and scientific exchanges also help increase the technical and scientific capabilities of both U.S. and foreign scientists, including the increasing participation of women and minorities.

December 1999

1999 Scientific Cooperation Program
37 Research Projects Selected for Funding

Argentina**AR40**

Judith K. Brown University of Arizona

Distribution of Prospective Whitefly Vector/Parasitoid Complexes by Morphological and/or Molecular Analysis

University of Arizona and scientists in Argentina are using biotechnology and other techniques to more accurately map the identity and distribution in Argentina of costly whitefly crop pests and the viruses they transmit that could pose a threat to US agriculture by their accidental introduction on imported plants and plant products.

AR43

Maria Gallo-Meagher	University of Florida	\$30,000
Luis Mroginski	Instituto de Botanica del Nordeste	Florida
		Argentina

In Vitro Conservation of Arachis spp. (Leguminosae) Germplasm

University of Florida and Argentine scientists would collaborate to adapt and apply in vitro techniques such as bud and tissue culture to preserve of the germplasm of valuable wild peanut species, many of which are currently maintained as costly and risky field or greenhouse collections.

Australia**AS75**

Gail A. Wicks	University of Nebraska	\$30,000
Warwick L. Felton	New South Wales Dept. of Agriculture	Nebraska
		Australia

Use of Reflectance Technology to Identify Weed Competitive Wheat Cultivars

University of Nebraska and Australian scientists would collaborate on research to develop and test near-infrared/red reflectance sensor technology using a crop-canopy analysis to provide information on weeds to wheat growers during the growing season to improve integrated pest management systems and minimize use of costly agricultural chemicals.

AS 80

Frederick J. Crowe	Oregon State University	\$30,000
Jason Dennis	Tasmania Dept. of Primary Industries & Fisheries	Oregon
		Australia

Using Soil-Applied Dehydrated Garlic and/or Onion Products to Reduce Populations of Sclerotium cepivorum, as the Basis for Integrated Control of Allium White Rot and Sustained Production of Onions and Garlic in Infested Fields

Oregon State University and Australian scientists would collaborate on research to use food-grade and waste onion and garlic products to provide more reliable and sustained control of the white rot disease which severely limits onion and garlic production.

Chile

CI25		\$29,997
Robert I. Gara	University of Washington	Washington
Dolly Lanfranco	Universidad Austral de Chile	Chile

Harvesting, Transporting & Storing of Radiata Pine Logs in Chile to Minimize Movement of the Scolytids, Hylastes ater & Hylurgus Ligniperds to Ports of Embarkation

University of Washington and Chilean scientists would collaborate on research to develop a successful integrated pest management program for preventing the importation of pine bark beetles into the United States on logs from Chile.

China

CH291		\$30,000
David H. Byrne	Texas A&M University	Texas
Lirong Wang	Chinese Academy of Agricultural Sciences	China

Low Chill Prunus Germplasm Development and Analysis

Texas A&M University and Chinese scientists would collaborate on research to expand the diversity of peach germplasm and introduce new sources of traits such as unique flesh type with better post harvest characteristics; adaptation to humid and mild winter conditions; and greater resistances to a wide range of diseases and insects.

CH297

Edward J. Garvey	USDA/ARS
------------------	----------

Collection, Documentation, and Preservation of Hemlock (Tsuga spp.) from Central China

USDA Agricultural Research Service, the Universities of Pennsylvania, Maine, and Tennessee and the Chinese Academy of Agricultural Sciences are collaborating on research to develop genetic resistance to the Asian hemlock woolly adelgid, a serious pest of native forests and cultivated hemlocks important to the timber and landscape industries.

CH300

		\$30,000
Thomas D. Bunch	Utah State University	Utah
Ya-ping Zhang	Chinese Academy of Science	China

Characterization and Preservation of Germplasm from the Argaliform Wild Sheep (Ovis ammon spp.) and Selected Breeds of Domestic Sheep (Ovis aries) within P.R. China

Utah State University and Chinese scientists would collaborate on research to preserve genes from wild sheep important for survival on open ranges which are valuable for improving domestic sheep.

CH304

Warren A. Dick Ohio State University

Integration of No-Tillage and Organic Amendments for Creation of Sustainable Agroecosystems

Ohio State University, the Chinese Academy of Agricultural Sciences and Canada's University of Saskatchewan are collaborating on research to determine the effects of applying organic amendments on the physical, chemical and biological properties of the soil and on the growth of crops in no-tillage soils of sustainable agricultural systems.

CH324

Hongwei Xin Iowa State University

Evaluation and Demonstration of Livestock Waste Pollution Reduction Strategies and Practices

Iowa State University and Chinese Academy of Agricultural Sciences are collaborating on research to identify cost-effective, practical manure systems and management practices that can be used by both American and Chinese animal producers to reduce environmental pollution while maintaining production efficiency.

CH328

Zhi-Yong Huang Michigan State University

Infertility of Varroa on Apis cerana Worker Brood: Physiological and Genetic Mechanisms

University of Illinois and Chinese Academy of Agricultural Sciences are collaborating on research to help develop techniques for alternative control measures against the biggest threat to European honey bees, varroa mites, and minimize the use of chemicals in honey bee colonies.

Denmark**DA10**

Thomas H. Terrill	Fort Valley State University (HBCU)	\$27,500
Michael Larsen	The Royal Veterinary and Agricultural Univ.	Georgia
		Denmark

Biological Control (BC) of Gastrointestinal Nematodes in Goats Using Nematode-Trapping Fungi

Fort Valley State University and Danish scientists would collaborate on research to determine effective biological control of the internal parasites which are a major obstacle in limiting growth of the goat industry in the Southeast and other areas of the U.S.

Ghana

GH13		\$30,000
Claude McGowan	Florida A&M University (HBCU)	Florida
Bawa Awumbilla	University of Legon	Ghana

Stabilization and Utilization of Seafood Processing Waste as a Feed Supplement for Small Ruminants, and as Slow Release Fertilizer for Crop Production

Florida A&M University and Ghanaian scientists would collaborate on research to develop products and alternative methods to recycle waste from the seafood industry, reduce feed costs for small ruminants, and produce a slow release nitrogen fertilizer.

Guyana

GY02		\$30,000
James O. Garner	Mississippi State University	Mississippi
Natasha Floy	Partners of the Americas Guyana School of Agriculture	Guyana

Germplasm Evaluation for Drought Tolerant Sweet Potatoes in Mississippi and in Guyana

Mississippi State University researchers would collaborate with scientists in Guyana to identify genes for drought tolerance, yield, and root storage quality for improving the sweet potato, Mississippi's top cash crop.

Indonesia

ID14		\$30,000
Buford M. Shepard	Clemson University International Potato Center (CIP)	South Carolina Indonesia

Biological Control of Liriomyza Huidobrensis: An Exotic Leafminer Destructive to Food Crops in the United States and Indonesia"

Clemson University, University of Hawaii, International Potato Center, Food and Agriculture Organization, and Indonesian scientists would collaborate on the development of biological control programs for the leafminer, a devastating pest of food and ornamental crops.

Ireland**EI 114**

Samuel A. Palumbo	USDA/Agricultural Research Service
-------------------	------------------------------------

Risk-Based Determination of Animal Slaughter and Food Processing Critical Control Points to Provide the Scientific Basis of HAACP

USDA Agricultural Research Service and Ireland's National Food Centre are collaborating on joint research using microbiological criteria to evaluate the steps in meat animal slaughter and dressing and where controls or interventions can be determined to allow Hazard Analysis Critical Control Point Analysis plans to be validated and adjusted as needed.

EI 113

Frank L. Brewer Michigan State University

Examination of the Role of the Effective U.S. Practitioner in Community Development with Particular Reference to Rural Development in Ireland

Michigan State University and Ireland's University College Dublin are collaborating to quantify information using Action Research methodology useful in the development of agricultural policy and promotion of economic and community development.

EI 116

Thomas E. Besser Washington State University

Escherichia coli O157:H7: Epidemiology and Control in Cattle Production and Beef Processing

Washington State University and Ireland's University College Dublin are collaborating on joint food safety research using bacteriological and biotechnological procedures to identify on-farm factors that influence the prevalence of E. coli in cattle on infected farms.

Jamaica

JM10

Juan Manuel Blanco	Centro de Estudios de Rapaces Ibericas	Spain

Comparative Semen Cryopreservation of Poultry and Non-Domestic Avian Species: Characterization of Sperm Freeze Damage and Development of Applicable Semen Preservation Procedures

USDA Agricultural Research Service and U.S. wildlife and conservation centers would collaborate with Spanish scientists to develop simple, practical methods of freezing poultry and non-domestic avian semen which could be adapted for on farm and in field use in artificial insemination.

Sweden

SW10		\$30,000
Daniel Cullen	Forest Service	Wisconsin
Tuula T. Teeri	Royal Institute of Technology	Sweden
T. Alwyn Jones	Uppsala University	

Enzyme Discovery for Pulp Fiber Modification

USDA Forest Service and Swedish scientists would collaborate on research using recently developed experimental techniques (genetic and protein engineering) to identify new enzymes for improving pulp and paper processing, particularly for recycled fibers.

Syria

SY02		\$30,000
Jan Dvorak	University of California	California
Jan Valkoun	International Center for Agricultural Research in Dry Areas (ICARDA)	Syria

Acquisition and Characterization of Germplasm of Triticum Urartu and Aegilops Tauschii, Ancestors of Bread Wheat

University of California and International Center for Agricultural Research in Dry Areas scientists would collaborate on research on wild ancestors of wheat to maximize usefulness of the currently inadequately represented U.S. collections.

Uruguay

UR08		\$30,000
Douglas C. Sanders	North Carolina State University	North Carolina
Juan Carlos Gilsanz	National Research Institute of Agriculture	Uruguay
Jorge Arboleya		

Impact of Vegetable Rotation Systems on Yield and the Environment

North Carolina State University researchers would collaborate with scientists in Uruguay to provide the cost and benefits to the farmer and the environment of seven rotational systems by evaluating the impact on the economics of vegetable crop production, pest populations and environmental consequences for vegetable crops in the two countries which share similar climate, soils, and producer needs.

Viet Nam

VM13		\$30,000
Dennis A. Shannon	Auburn University	Alabama
Tran Duc Vien	Hanoi Agricultural University	Vietnam

Environmentally Sustainable Alley Cropping Systems in the Uplands of Northern Vietnam

Auburn University and Vietnamese scientists would conduct joint research on alley cropping which could provide Alabama and other southeastern farmers short-term income from annual crops while waiting for trees such as pine planted to protect highly erosive soils mature for harvesting several years later.

**1999 Scientific Cooperation Program
18 New Exchange Visits Selected for Funding**

Australia

AS70		\$3,670
Lori M. Carris	Washington State University	Washington
Gordon M. Murray	Wagga Wagga Agricultural Institute	Australia

Detection and Characterization of Smut Fungi Infecting Australian Perennial Ryegrass

Washington State University, USDA and Australian scientists would collaborate on accurate and timely identification of smut fungi similar to Karnal bunt found in ryegrass from Oregon and the southeastern U.S. for use by regulatory agencies and seed certification laboratories for the continued free movement of seed.

AS79		\$4,950
Roger A. Coulombe, Jr.,	Utah State University	Utah
Steven M. Colegate	CSIRO Australian Animal Health Laboratory	Australia

Immunological Detection of Pyrrolizidine Alkaloids in Animal Products

Utah State University and Australian scientists would initiate collaboration to develop a reliable and rapid method for screening animals and animal products for exposure and contamination from natural toxins in plants the animals have grazed on.

China

CH298		\$4,950
Richard A. Casagrande	University of Rhode Island	Rhode Island
Hong-Zhang Zou	Academia Sinica	China

Taxonomic Confirmation and Natural Enemy Exploration for the Lily Leaf Beetle, *Lilioceris lili*

University of Rhode Island and Chinese scientists would collaborate on biological control of the lily leaf beetle, an increasingly serious horticultural pest established in the U.S. since 1992.

Costa Rica

CS17		\$5,000
Julio S. Bernal	Texas A&M University	Texas
Victor Cartin Leivas	Universidad Nacional	Costa Rica

Exploration for Natural Enemies of Fall Armyworm in Central America

Texas A&M University and Costa Rican scientists would seek in Central America, natural enemies of the costly fall army worm, an important pest of several U.S. crops, including corn, cotton and sorghum.

Egypt

EG14		\$3,700
Steve Comfort	University of Nebraska	Nebraska
Hesham M. Gaber	University of Alexandria	Egypt

Permeable Zero-Valent Iron Barriers for In-Situ Containment and Remediation of Pesticide Contamination in Unsaturated Soils

University of Nebraska and Egyptian scientists would collaborate on an innovative, inexpensive, low tech and easily adaptable approach to dealing with on-site contamination problems from chemical spills.

Finland

FI09		\$2,400
William E. Jokela,	University of Vermont	Vermont
Martti Esala	Agricultural Research Center of Finland	Finland

Manure Management Methods to Improve Nutrient Utilization and Reduce Losses to the Environment

University of Vermont would collaborate with Finland, England, Sweden and the Netherlands where innovative approaches are used in research and extension to address environmental impacts of manure application.

Republic of Georgia

GG03		\$5,000
Fernando E. Vega	Agricultural Research Service	Montpellier, France
Cisia Chkhubianishvili	Georgia Academy of Agricultural Sciences	Republic of Georgia

Insecticide Use Reduction in U.S. Agriculture Through Biological Control

USDA Agricultural Research Service and scientists in the Republic of Georgia would collaborate on biological control of the codling moth, one of the most serious pests of apples, pears, and walnuts in the United States.

Greece

GR06		\$5,000
Kent M. Esridge	University of Nebraska	Nebraska
Stamatis Stamatiadis	General Secretariat for Research and Technology Goulandris Natural History Museum and Fisheries	Greece

***Evaluation of a Constructed Wetland for Wastewater Treatment and Crop Irrigation
Travel of U.S. Scientists***

University of Nebraska would collaborate with Greek scientists on a unique opportunity to evaluate the performance, sustainability, and suitability of using reclaimed wastewater for irrigation at a prototype constructed wetland established in Greece, which would be applicable to agricultural use in the US.

Guatemala

GT04		\$5,000
Ronald T. Riley	Agricultural Research Service	Georgia
Olga R. Torres	Instituto de Nutricion de Centro America	Guatemala

***Exposure to Fusarium Toxins at Two Different Geographical Locations in Guatemala -
Improved Food Safety at a Minimum Cost***

USDA Agricultural Research Service and Guatemalan scientists would collaborate in validating a valid health risk assessment procedure for fungal toxins found on corn that can be life-threatening, as well as economically devastating to U.S. agricultural exports.

Hungary

HU32		\$4,400
Theodore T. Kramer	Iowa State University	Iowa
Bela Nagy	Hungarian Academy of Sciences	Hungary

Poultry Vaccines Against Salmonella for Food Safety

Iowa State University would collaborate on a food safety program testing new live vaccines against salmonella in poultry in Hungary for application in the US if successful.

Japan

JA34		\$4,750
Renee M. Wagner	Agricultural Research Service	Missouri
Takashi Okuda	Ministry of Agriculture, Forestry and Fisheries	Japan

Corpora Allata Activity as an Indicator of Reproductive Capacity in the Locust

USDA Agricultural Research Service and Japanese scientists would collaborate on one of the major obstacles to using beneficial insects, the mass rearing of weed-feeding insects for the biological control of noxious, invasive, exotic weeds such as the spotted knapweed, which has invaded millions of acres of grazing land in the US.

New Zealand

NZ52		\$4,010
Henry A. Fribourg	University of Tennessee	Tennessee
John Hay; Gary Latch; Syd Easton	AgResearch	New Zealand

Continuation and Coordination of a Joint Tall Fescue Toxicosis/Beef Cattle Research Program Between the Agricultural Experiment Station and the New Zealand Pastoral Agriculture Research Institute Limited

University of Tennessee and New Zealand scientists would collaborate on improved forages for cattle consuming fungus infected tall fescue, a major grass in the eastern US, have reduced growth, lowered conception, reduced milk production and intolerance to heat, with annual losses nationwide estimated at over \$850 million.

Nigeria

NI09		\$5,000
Robert L. Brown	Agricultural Research Service	Louisiana
Abebe Menkir	International Institute for Tropical Agriculture (IITA)	Nigeria

Identification and Characterization of Corn Germplasm with Resistance to Aflatoxin Contamination by Aspergillus Flavus

USDA Agricultural Research Service and International Institute for Tropical Agriculture scientists in Nigeria would collaborate on developing corn resistant to aflatoxins, a food safety problem that is also important as a trade barrier for US corn export.

Russia

RS76		\$5,000
Albert E. Percival	Agricultural Research Service	Texas
Albert Kassianenco	N.I. Vavilov Institute for Research	Russia

Cotton (Gossypium spp.) Germplasm Exchange

USDA Agricultural Research Service and Russian scientists would collaborate to greatly increase the US seed collection of a major US crop, cotton, with seed from Russia while helping to preserve the valuable genetic resources in the Russian collection.

RS83			\$4,000
Barbara Illman	Forest Service		Wisconsin
Valentina P. Vetrova	Sukachev Institute of Forest and Wood Russian Academy of Sciences		Russia

Collection and Characterization of Fungi Associated with Xylophagous Insects Attacking Spruce and Pine Trees Worldwide

USDA Forest Service and Russian scientists would collaborate on the most efficient method of identifying predicting potential import of pathogens on timber into the U.S. and spread of disease outbreaks worldwide.

Scotland

UK55			\$4,953
Sophien Kamoun	Ohio State University		Ohio
Paul Birch; David Cook	Scottish Crop Research Institute		Scotland

Comparative Analyses of Gene Expression Profiles in Economically Important Phytophthora-Plant Pathosystems

Ohio State University and Scottish scientists would collaborate on development of novel alternative and durable methods for biotechnological and chemical control strategies of some of the most devastating reemerging plant pathogens which cause diseases in potatoes, tomatoes, strawberries and soybeans.

South Africa

SF35			\$3,000
Norman W. Schaad	Agricultural Research Service		Maryland
J. L. Serfontein	ARC Plant Protection Research Inst.		South Africa

Collection of Germplasm and Information on the Exotic Causal Agent of Bacterial Blight of Grape

USDA Agricultural Research Service and South African scientists would collaborate to develop on-site, effective detection techniques for the easily misdiagnosed, very destructive bacterial blight disease of grapes which has a high potential for introduction into the United States.

SF40			\$5,000
Arthur L. Goetsch	Langston University (HBCU)		Oklahoma
Merida Smuts	Agricultural Research Council		South Africa

South African Boer Goat Research and Production Systems

Langston University and South African scientists would collaborate on effective use of the Boer goat breed for meat goat production, in the most rapidly growing livestock industry in the U.S.

**2000 Scientific Cooperation Research Program
Research Projects and Scientific Exchanges Selected for Funding**

	U.S. Institution	Amount Requested State
Argentina		
AR49 Seal	USDA Agricultural Research Service	\$7,000 Georgia
<i>Improved Methods for Detection of Newcastle Disease Virus</i> which limits poultry exports.		
Armenia		
AM87 Gibson		\$42,000
<i>Plant Cell Biotechnology for the Production of Hypericin and Hyperforin</i> to identify superior germplasm for cell culture to optimize production of the medicinal plant St. John's Wort.		
Australia		
AS87 Gadoury	Cornell University	\$45,000 New York
<i>Ontogenic Resistance to Powdery Mildew in Grapes</i> for a solution to this important agricultural pest.		
AS90 Peterson	USDA Agricultural Research Service	\$33,000 Maryland
<i>Development of an International Pest Risk Assessment for Karnal Bunt of Wheat</i> to prevent regulatory actions which could cause losses to the US \$5 billion wheat export market.		
Brazil		
BR58 Hester	Purdue University	\$45,000 Indiana
<i>The Use of Bone Densitometry as a Diagnostic Tool for Monitoring the Incidence of Osteoporosis in Live Layer Breeders</i> evaluating birds before they are finished laying and for alternative uses of spent hens.		
Chile		
CI27 Torres	Oregon State University	\$44,370 Oregon
<i>Microbiologically Safe Foods by Hydrostatic Pressure Technology</i> to improve safety of raw and cooked refrigerated foods such as seafood and fruit, and to extended the shelf-life and fresh-like appearance.		

China

CH335		\$45,000
Stucki	University of Illinois	Illinois

Collaborative Project to Study Improved Soil Test for Potassium using precision farming technology to improve fertilizer application.

CH347		\$44,850
Hannaway	Oregon State University	Oregon

Using GIS, Remote Sensing and Visualization Technologies as a practical application of precision agriculture to identify potential markets for US products.

CH355		\$41,219
Hajek	Cornell University	New York

Insect Pathogenic Fungi for Control of Asian Long-horned Beetle and Gypsy Moth for the biological control of two insect which devastate North American forests.

Costa Rica

CS20		\$3,000
Rudis	USDA Forest Service	Mississippi

Designing Multipurpose Resource Inventories for forests.

Croatia

HR06		\$43,600
Pfister	USDA Agricultural Research Service	Utah

Improving Livestock Production by Increasing Consumption of Tannin- and Terpene- Rich Plants in Shrub land Ecosystems and to lessen toxicity losses in livestock of \$4 million.

Germany

GM65		\$45,000
Calamari	USDA Agricultural Research Service	Louisiana

Natural Fiber Composites for Ecologically Benign Automotive Interiors for use of cotton blends.

Guatemala

GT04		\$45,000
Riley	USDA Agricultural Research Service	Georgia

Validation of the Mechanism-based Biomarker for Fumonisin Exposure-Ensuring an Accurate Risk Assessment for Nixtamalized Corn Products in the USA and Central America using biotechnology for food safety, targeting fungal toxins in corn heated in water with lime.

Indonesia

ID16		\$32,800
Armstrong	USDA Agricultural Research Service	Hawaii

Heat and Cold Temperature Death Kinetics of Mango Fly, Bactrocera Frauenfeldti (schiner) for the quarantine threat to US fruit exports which could result in losses of \$8 million.

Israel

IS30		\$15,000
Hopper	USDA Agricultural Research Service	Delaware

Genetics of Host Specificity of Aphelinid Parasitoids of Pest Aphids for biological control of the Russian wheat aphid and advances in integrated pest management.

Kenya

KE23		\$11,057
McIntosh	USDA Agricultural Research Service	Missouri

A Novel Baculovirus of the Diamond Back Moth using biotechnology for biological control.

Korea

KS19		\$30,000
Shannon	USDA Agricultural Research Service	California

Selecting for Salt Tolerance in Rice - The Role of Osmoprotectants using a novel approach to help improve health and the environment with US rice consumption which has increased nearly 50 percent from 1988 to 1998.

Mongolia

MG04		\$43,500
Majerus	USDA Natural Resources Conservation Service	

Collaborative Evaluation of Mongolian Forage Germplasm.

New Zealand

NZ60		\$30,500
Lane	USDA Agricultural Research Service	Arizona

Soil/Site Stability and Sustainable Rangeland Ecosystems including use of the Internet to share rangeland management research results.

Nigeria

NI11		\$45,000
Brown	USDA Agricultural Research Service	Louisiana

Identification, Characterization and Development of Corn Germplasm with Resistance to Aflatoxin Contamination by Aspergillus flavus, a food safety and trade issue.

Philippines

RP23		\$45,000
Toledo	University of Georgia	Georgia

Adding Value to Edible By-Products (Broiler Meat) for International Markets to increase the variety of broiler meat products.

Russia

RS85		\$43,865
Pelkki	University of Kentucky	Kentucky

Investigation of Natural Forest Forming Processes on Open-Pit Coal Mines in Western Siberia and Kentucky to reduce reclamation costs on millions of acres of surface mines in the US using high value forests which could be worth \$500 million.

RS86		\$30,000
Rinderer	USDA Agricultural Research Service	Louisiana

Screening of Honey Bees of Far Eastern Russia for Resistance to Varroa jacobsoni pest which would have a major impact on the US industry and indirectly on other segments of US agriculture.

South Africa

SF45		\$41,500
Elzen	USDA Agricultural Research Service	Maryland

Integrated Pest Management Studies of the Small Hive Beetle to help abate this major honey bee pest.

Spain

SP36		\$43,118
Johnson	University	

Genetics of Astaxanthin Biosynthesis in the Yeast Phaffia rodozyma for carotenoids in fish feed.

Taiwan

TW24		\$44,800
Humenik	North Carolina State University	North Carolina

Nurturing an Asian Environmental Center for Livestock Waste Management testing and demonstrating techniques used in the US.

Thailand

TH31		\$4,450
Angle	University of Maryland	Maryland

Assessment of Phytoremediation as a Possible Technology to Remediate Cd Contaminated Soils in the TAC Province of Thailand exchange to refine technology to lessen the impact of heavy metals in soils.

United Kingdom

UK60		\$30,000
Cutter	Pennsylvania State University	Pennsylvania

Nisin-incorporated Plastic to Control Pathogenic and Spoilage Bacteria in Fresh or Ready-to-Eat Meat Products to help reduce pathogens which result in \$12 billion in medical costs and microbial spoilage which causes millions of dollars in losses.

Vietnam

VM19		\$45,000
Van Taoi	USDA Agricultural Research Service	Ohio

Exchanging, Characterizing and Preserving Soybean Germplasm with Vietnam for genetic diversity.

Zimbabwe

ZI03		\$45,000
Reid	USDA Agricultural Research Service	Maryland

Collection and Characterization of Phakospora using biotechnology for protection from the threat of soybean rust.

FOREIGN MARKET DEVELOPMENT

Question. Please provide a breakout of how FMD Foreign Market Development Cooperator Program funds were allocated in each fiscal years 1999 and 2000.

Answer. The FMD approved marketing plan levels for fiscal years 1999 and 2000 are as follows:

FMD APPROVED MARKETING PLAN

Cooperator	1999 budget	2000 Budget
Cotton Council International	\$1,853,934	\$1,953,000
American Peanut Council	572,123	561,945
American Seed Trade Association	260,197	272,163
American Soybean Association	6,977,863	7,081,782
National Cottonseed Products Association	139,846	140,374
National Sunflower Association	269,604	265,871
Leather Industries Association	196,915	198,069
U.S. Dairy Export Council	601,135	708,348
American Sheep Industry Association	163,316	167,537
U.S. Hide, Skin & Leather Association	85,489	85,759
Mohair Council of America	30,020	26,129
U.S. Livestock Genetics Export Inc	774,145	801,336
National Renderers Association	1,123,589	1,009,044
USA Poultry & Egg Export Council	1,564,498	1,512,990
U.S. Meat Export Federation	1,423,672	1,528,287
U.S. Beef Breeds Council	73,083
American Seafood Institute	79,403	80,069
American Forest & Paper Association	2,836,132	2,851,287
North American Millers Association	81,215	81,528
National Hay Association	46,000	55,345
National Dry Bean Council	98,038	122,103
USA Dry Pea & Lentil Council	161,036	187,890
USA Rice Federation	1,657,709	1,739,535
U.S. Grains Council	5,676,788	5,709,387
U.S. Wheat Associates	6,789,084	6,394,954
California Agricultural Export Council (Western Growers Association)	11,167	11,269
Grand Total	33,546,001	33,546,001

ALLOCATIONS

Question. Please provide the Public Law 480 funding allocations, by title, and by country and commodity for each of fiscal years 1999 and 2000 to date.

Answer. [The information follows:]

NOTE: The reserve includes Title I / Title I funded food for progress, and CCC funds unallocated to Russia.

Sources:

- P.L. 480 Title I - Based on Program Summary as of September 25, 1999, and the food assistance package announced by the Secretary of Agriculture on Nov. 6, 1998. The total does not reflect ocean freight financing of \$94 million.
- P.L. 480, Title II - Based on Approved Program Summary Country/Sponsor/Commodity Profile as of October 4, 1999.
- For Title II the total does not reflect ocean freight costs of \$386.1 million.
- P.L. 480, Title III: Based on Approved Program Summary Country/Sponsor/Commodity Profile as of October 4, 1999. The total does not reflect freight cost.

FUNDING FOR COCHRAN FELLOWSHIP PROGRAM

Question. The fiscal year 2001 budget proposes to maintain FAS funding for the Cochran Fellowship Program at a level of \$3.5 million. Are available resources sufficient to extend fellowships to all countries which seek to participate in the program? If not, what additional funding would be required to meet these requests?

Answer. The success of the Cochran Fellowship Program to initiate and pursue short- and long-term trade objectives and to influence public- and private-sector decision makers has led to increased requests to initiate the program in numerous countries around the world. For fiscal year 2001, we have had requests from Agricultural Affairs Offices and U.S. Embassies to start a Cochran Program in Egypt,

Jordan, Peru, Ecuador, Argentina, Uruguay, Mongolia, and Cambodia, and expect requests for several additional African countries. The most frequent requests for the Cochran Program is to provide training in areas related to WTO/CODEX agricultural issues, food safety, sanitary and phytosanitary (SPS) issues, genetically modified organisms (GMOs), and biotechnology. In general, one of every four candidates that apply for the program are selected.

Question. Please provide fiscal year 1999 and fiscal year 2000 Cochran Fellowship Program participant levels by country and region, along with the projected participant levels for fiscal year 2001.

Answer. In fiscal year 1999, a total of 797 participants from 65 countries received training under the Country Fellowship Program. Participant numbers by region and by country follow:

- Asia: 131 participants from seven countries: Korea (1 participant), Malaysia (11), China (37), Thailand (18), Indonesia (25), Philippines (11), and Vietnam (28).
- Eastern Europe: 215 participants from 15 countries: Turkey (23), Poland (47), Hungary (15), Czech Republic (16), Slovakia (14), Albania (5), Bulgaria (15), Slovenia (8), Croatia (8), Latvia (14), Estonia (13), Lithuania (12), Romania (20), Bosnia (2), and Macedonia (3).
- Latin America and Caribbean: 149 participants from 14 Latin American and Caribbean countries: Mexico (42), Venezuela (6), Trinidad & Tobago (5), Caribbean Islands (44), Panama (8), Colombia (17), Chile (1), Guatemala (3), Costa Rica (9), Nicaragua (5), Brazil (5), El Salvador (2), Suriname (1), and Guyana (1).
- Africa and Middle East: 113 participants from 18 African and Middle Eastern countries: Cote d' Ivoire (9), Ghana (6), Senegal (10), Nigeria (5), South Africa (22), Namibia (1), Kenya (12), Uganda (9), Tanzania (5), Tunisia (12), Morocco (1), Oman (4), and 17 participants from 6 additional countries.
- New Independent States: 189 participants from 11 countries of the New Independent States: Russia (53), Ukraine (21), Kazakstan (17), Kyrgyzstan (13), Uzbekistan (20), Turkmenistan (13), Tajikistan (3), Armenia (16), Moldova (15), Georgia (9), and
 - Azerbaijan (9).

The selection of participants for fiscal year 2000 has not yet been completed, thus we cannot provide exact Cochran participant levels by country for fiscal year 2000. We expect, however, to provide training to about 750 to 800 participants—roughly the same level as in fiscal year 1999. We will extend the program to six new countries in fiscal year 2000 (India, Sri Lanka, Pakistan, Botswana, Zimbabwe, Mozambique).

In fiscal year 2001, we estimate that we will again provide training to about 750–800 participants if funding levels remain at present levels.

Question. Please provide examples of the benefits of the fiscal year 1999 Cochran Fellowship Program to U.S. agriculture.

Answer. Cochran Fellowship Program participants attend trade shows, seminars, and meet with public and private sector contacts to pursue the objectives of their training. Several examples of fiscal year 1999 programs that had immediate benefits to U.S. agriculture include:

- The Cochran Program joined with FAS International Trade Policy and FAS Emerging Markets program areas to develop a U.S.-sub-Saharan Africa Workshop on Codex Alimentarius and the World Trade Organization involving 37 participants from 17 African countries. The training improved participants' understanding of the processes at work in the WTO and the international standard setting bodies. Most importantly, the discussions pointed out areas of shared interests, including mutual concerns in the next round of multilateral negotiations. The participants agreed that there are significant areas in which the U.S. and sub-Saharan African countries can cooperate in international trade and the work of the international standard setting bodies.
- The Cochran Program sponsored a Biotechnology and Genetically Modified Organism (GMO) training activity for 15 experts from five Central European countries: Czech Republic, Hungary, Slovenia, Croatia, and Slovakia. The program provided a balanced U.S. viewpoint of this topic to Eastern European policy makers. A film on U.S. biotechnology has been developed by a Czech researcher from Prague Agricultural University and is now available to Central and Eastern Europe audiences.
- The FAS Agricultural Offices in China reports that fiscal year 1999 Cochran teams have led to sales of: U.S. frozen seafood (2 containers of conch, 3 containers of squid, and 5 containers of scallops), live seafood (geoduck clams,

- crabs, Maine lobster and abalone), french fries (4 containers), and pistachios (over 10 containers) to date.
- The FAS Agricultural Officer covering Senegal reported that a fiscal year 1999 participant purchased two containers one each of frozen poultry and frozen meat. This was the first U.S. export of frozen chicken and meat to Senegal. The participant intends to purchase two containers per month, the value of which is estimated at over \$200,000 per year.
 - Despite the slowdown in the Indonesian economy, fiscal year 1999 participants report they purchased U.S. supplies of raw popcorn, almonds, prunes, dried fruits, walnuts, organic vegetables, wheat flour, and skim milk powder, as a result of their fiscal year 1999 Cochran training programs.
 - The U.S. Meat Export Federation reports sales of U.S. lamb to Barbados after a Cochran training activity.
 - The FAS Agricultural Trade Office in Miami states that: “The Cochran Fellowship Program continues to be the most effective FAS program used by our office in fiscal year 1999. The constraints in the Caribbean of limited training opportunities and some resentment of U.S. government policy continue to be issues for our office. The ability to offer training opportunities to persons in our sector is a powerful tool for us to use in our efforts to expand our exports in the Caribbean.”
 - The Agricultural Officer in Costa Rica reports pilot sales of 190 cases of US wine following a Cochran Wine Merchandising program.
 - FAS Agricultural Attaches and former Cochran participants from Central and Eastern Europe report that Cochran training activities led to sales in fiscal year 1999 of: soybeans and wheat to Albania; wild rice to Czech Republic; tofu grade soybeans to Slovakia; almonds and walnut meal to Hungary; the first ever direct sale of Florida citrus and U.S. walnuts to Poland, and meat to Romania. We have heard that citrus and walnut sales continue through the present.
 - The FAS Agricultural Affairs Officer in Vietnam states that all the fiscal year 1999 Cochran Programs were useful: “. . . the two programs in Animal Health helped stave-off a possible ban on all beef imports (i.e., dioxin scare in EU) and greased the skids on the quarantine period for 309 U.S. breeding hogs. Moreover, the participant who attended the Grain Purchasing program actually bought 10,000 MT of wheat last week. The Agricultural Banking Team has been brought up to speed on GSM-102, and will be very useful in the event of a Vietnam-specific GSM program.”
 - The Texas Grain Sorghum Board reports that over 126,000 metric tons of South Texas grain sorghum was sold to Mexican buyers as a direct result of a Cochran activity in June 1999.
 - Natalia Markelova from the Samara region of Russia purchased 54 pregnant dairy goats at a value of \$50,000 from an Illinois company during her fiscal year 1999 Cochran program. She plans to introduce goat milk into the domestic market and offer goat milk as an option for baby formula.
 - The FAS Agricultural Specialist in Uzbekistan states: “The five participants from the oilseed industry found the Cochran/American Soybean Association training to be very professional and effective. They established many useful contacts with U.S. producers and processors of soybeans. Following the training, Uzbekistan imported a total of 123,000 tons of US soybeans under GSM-102 and Public Law 480 Title I programs. We strongly believe that Cochran training was one of the effective tools which positively affected Uzbekistan’s decision to import US soybeans for the first time. Post anticipates that Uzbekistan is likely to continue to import U.S. soybeans.”

Question. Please provide the total amount of funding made available for the Cochran Fellowship Program, including any funding made available by other Federal agencies and the CCC, for each of the fiscal years 1995–2000.

Answer. The Cochran Fellowship Program receives funding from three sources: direct Congressional appropriations, funding from the FAS Emerging Markets Program (EMP) for Cochran activities in specific countries, and from the U.S. Agency for International Development (USAID) under the Freedom Support Act for Cochran activities in the New Independent States (NIS). The following lists funding levels from these sources, 1995 to 2000.

Year	Appropriations	EMP	FAS USAID	Total
1995	\$2,178,000	\$2,100,000	\$2,250,000	\$6,528,000
1996	2,428,000	1,800,000	1,500,000	5,728,000
1997	2,428,000	945,000	1,800,000	5,173,000

Year	Appropriations	EMP	FAS USAID	Total
1998	3,000,000	1,120,000	1,800,000	5,920,000
1999	3,500,000	1,834,000	1,846,000	7,180,000
2000	3,500,000	(¹)	1,562,000	5,062,000

¹ Not yet determined.

ALLOCATIONS

Question. Please provide the Market Access Program allocations for fiscal year 1999, including the amount of the grant, the recipient company, commodity, and targeted markets.

Answer. The information is provided for the records.
[The information follows:]

1999 MAP Brand Companies and Products

EXPORT CREDIT GUARANTEE ACTIVITIES

Question. Please provide a listing of the activities supported under each of the four export credit guarantee activities in fiscal year 1999 and in fiscal year 2000 to date: Supplier Credit Guarantees, Facilities Guarantees, GSM-102, and GSM-103.

Answer.

[The information follows:]

Summary of FY 99 Export Credit Guarantee Program Activity for GSM-102 as of close of business:
September 30, 1999

Country / Commodity (Maximum Credit Period 3/)	Announced Allocations FY 1999	Exporter Applications Received	Balance	Remarks/Additional Information 1/ 2/
	--coverage in millions of dollars--			
Andean Region	350.00	267.20	82.80	5/ 8/ 9/
Cotton (36)		21.90		
Feed Grains (36)		98.30		
Meat, Frozen or Chilled (36)		3.10		
Oilseeds (36)		2.00		
Protein Meals (36)		34.80		
Rice (36)		9.20		
Tallow (36)		0.30

FOR COMPARISON PURPOSES:

FY 1999 PAYMENT GUARANTEE COMMITMENTS THROUGH 9/30/99:

TOTAL FOR CCC CREDITS | **5,859.00** | **3,045.32** | **2,813.68** |

For Comparison Purposes: FY 1998 Payment Guarantee Commitments through September 30, 1998.
TOTAL FOR CCC CREDITS | **6,396.00** | **4,036.70** | **2,359.30** |

FY 99

FOOTNOTES:

- 1/ **These announcement footnotes are Indicative only. See actual provisions set forth in Program Announcements. These FAS news releases are available on the Internet at <http://www.fas.usda.gov> or through fax polling. Callers should set their fax machines for polling and dial (202) 720-1728. For additional information, contact the FAS Information Division (202) 720-7115.**
- 2/ Except as noted, the following terms apply:
 --Coverage is available on an FAS/FOB basis
 --Maximum coverage is 98% of port value, SCGP is 50% of port value
 --Final registration date for is 9/30/99
 --Final export date is 11/30/99
- 3/ UNLESS OTHERWISE INDICATED, GSM-102 is shown in months, 103 in years and SCGP in days.
 *For SCGP no interest coverage is offered.
- 4/ Coverage on a C&F basis is available on sales made on C&F or CIF basis.
- 5/ Commodities as reflected in program announcement PR-0122-99. Credit terms as set forth in country/regional program announcements.
- 6/ China (102)--Total authorization was \$200.0 million, however, \$100.0 million remains unallocated i.e. non-operational.
- 7/ Egypt(102)--Total authorization was \$225.0 million, however, \$125.0 million remains unallocated i.e., non-operational.
- 8/ Credit terms for solid wood products, wood pulp and wood chips are offered up to 720 days.
- 9/ Breeder Livestock coverage is available on C&F basis to point of ocean vessel or international carrier discharge.
- 10/ For credit periods exceeding 6 months, principal repayments plus accrued interest are due at 6 month intervals.
- 11/ Products have been determined to be "high value products". See program announcement for details.
- 12/ Mexico(103)--Total authorization was \$100.0 million, however, \$50.0 remains unallocated i.e. non-operational.
- 13/ Jordan (102)- Allocation offers coverage on sales to buyers in Jordan other than the Ministry of Supply.
- 14/ Lebanon (103)--For the \$10.0 million line, registrations eligible for Central Bank of Lebanon only. Any approved Lebanese bank is eligible for the \$5.0 million line.
- 15/ Tunisia (102)--For the \$10.0 million line, Central Bank of Tunisia is the CCC approved bank. Also, the eligible buyer is National Office of Oil.
- 16/ Tunisia (103)--The eligible buyer is the Office National des Cereales.
- 17/ Lebanon (102)--For the \$7.0 million line, any approved Lebanese bank is eligible. For the \$5.0 million line, the Central Bank of Lebanon is the only eligible bank.
- 18/ Turkey(102)--Credit terms amended to include an additional credit option. See program announcement for details.
- 19/ Korea(102)--Contractual arrangements must call for shipment no later than December 31, 1999.
- 20/ Jordan(103)--The eligible buyer is the Ministry of Industry and Trade.

COUNTRIES INCLUDED WITHIN REGIONS:

GSM-102/103

ANDEAN REGION:	Bolivia, Chile, Colombia, Ecuador, Peru, and Venezuela
CENTRAL AMERICA REGION:	Belize, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, and Panama
BALTIC REGION:	Estonia, Latvia, and Lithuania
CENTRAL EUROPE REGION:	Czech Republic, Hungary and Slovakia
EAST AFRICA REGION:	Kenya, Uganda and Tanzania
EAST CARIBBEAN REGION:	Barbados, Grenada, Guyana, St. Lucia, St. Vincent & the Grenadines, Suriname and Trinidad & Tobago
SOUTHEAST ASIA REGION:	Indonesia, Malaysia, Philippines, Thailand, Singapore and Vietnam
SOUTHERN AFRICA REGION:	Angola, Botswana, Burundi, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Rwanda, Seychelles, South Africa, Swaziland, Democratic Republic of the Congo (formerly Zaire), Zambia, and Zimbabwe
SOUTHEAST EUROPE REGION:	Bosnia, Croatia, and Slovenia
WEST AFRICA REGION:	Benin, Burkina Faso, Cameroon, Cape Verde, Central African Republic, Congo, Cote d'Ivoire, Gabon, Gambia, Ghana, Guinea-Bissau, Guinea, Liberia, Mali, Mauritania, Nigeria, Senegal, Sierra Leone, and Togo
WEST CARIBBEAN REGION:	Dominican Republic, Haiti, and Jamaica

FY 2000

FOOTNOTES:

- 1/ These announcement footnotes are indicative only. See actual provisions set forth in Program Announcements. These FAS news releases are available on the Internet at <http://www.fas.usda.gov> or through fax polling. Callers should set their fax machines for polling and dial (202) 720-1728. For additional information, contact the FAS Information Division (202) 720-7115.
- 2/ Except as noted, the following terms apply:
 --Coverage is available on an FAS/FOB basis
 --Maximum coverage is 98% of port value for GSM 102/103, SCGP is 65% of port value and FGP is 95% of port value.
 --Final registration date for is 9/30/00
 --Final export date is 11/30/00
- 3/ UNLESS OTHERWISE INDICATED, GSM-102 is shown in months, 103 in years, FGP in years and SCGP in days.
 *For SCGP no interest coverage is offered.
- 4/ Coverage on a C&F basis is available on sales made on C&F or CIF basis.
- 5/ commodities as reflected in program announcement PR-0450-99 or as superseded. Credit terms as set forth in country/ regional program announcements.
- 6/ Credit terms for solid wood products, wood pulp and wood chips are offered up to 720 days.
- 7/ For Breeder Livestock, animal genetics, feeder cattle and poultry breeder stock, coverage is available on C&F basis to point of ocean vessel or international carrier discharge.
- 8/ For credit periods exceeding 6 months, principal repayments plus accrued interest are due at 6 month intervals.
- 9/ Products have been determined to be "high value products". See program announcement for details.
- 10/ Mexico(102)-- Total authorization was \$1.5 billion, however, \$500 million remains unallocated i.e., non-operational.
- 11/ Mexico(103)--Total authorization was \$100.0 million, however, \$65.0 million remains unallocated i.e., non-operational.
- 12/ Korea(102)--Total authorization was \$590.0 million, however, \$90.0 million remains unallocated i.e., non-operational.
- 13/ Pakistan(102)--Total authorization was \$210.0 million, however, \$85.0 million remains unallocated i.e., non-operational.
- 14/ Egypt(102)--All commodities except poultry parts are eligible.
- 15/ Jordan(102)--The eligible buyer for the \$40.0 million line of credit is Ministry of Industry & Trade.
- 16/ Jordan(103)--The eligible buyer is Ministry of Industry & Trade.
- 17/ Tunisia(102)--For the \$10.0 million line of credit the eligible buyer is National Office of Oil.
- 18/ Tunisia(103)--The eligible buyer is Office National de Cereales.

SECTION 108

Question. It has come to my attention that "Section 108" resources are being utilized to supplement FAS's resources for market development. Please provide for the record a description of what "Section 108" is; what level of "Section 108" resources are available to the FAS for each of the fiscal years 1999, 2000, and 2001; and for what specific purposes and in what amounts Section 108 funds are being utilized in each of fiscal years 1999, 2000, and 2001?

Answer. "Section 108" refers to foreign currency accruing from the repayment provision of Public Law 480 Title I agreements which financed the sale and exportation of agricultural commodities to Costa Rica, Dominican Republic, Guatemala, Jamaica, Morocco, Sri Lanka, and Tunisia prior to November 22, 1990. At that time, certain Public Law 480, Title I agreements permitted foreign countries to repay the United States in local currencies. The law required that up to 95 percent of these foreign currencies be loaned to financial institutions within the foreign country to support productive private enterprise development, and up to 5 percent be made available to the Secretary of Agriculture for agricultural technical assistance including market development activities that would ultimately increase the consumption of and markets for U.S. agricultural commodities and products. The Agency for International Development (U.S.A.I.D.) carried out this loan program. After the local financial institutions repaid the loans, the law stipulated that the United States could only use the foreign currencies for the following purposes:

- (1) to make additional loans to local financial institutions;
- (2) to develop new markets for U.S. agricultural products;
- (3) to repay U.S. government obligations, e.g., embassy expenses; or
- (4) be converted to dollars. However, 10-years after the last delivery of the commodity for which the Public Law 480 loan was made, any unobligated foreign currencies must begin to be converted to dollars and turned over to the U.S. treasury.

Examples of activities for which Section 108 funds were used include local travel and per diem for trade teams, consultants and technicians or local consultant fees, development, translation and publication of printed material, point of sale promotional items, FAS trade promotion activities, market potential surveys, and MAP/FMD related cooperator activities.

Examples of activities for agricultural technical assistance include construction of feed lots, in-country trade and technical symposia, demonstrations, and training seminars or construction, curricula development, and purchase or upgrading of equipment for demonstration projects, baking schools and other training or demonstration facilities.

The Office of the General Counsel for the Department of Agriculture has determined that FAS may use the Section 108 foreign currencies for market development and agricultural technical assistance in addition to any other funds available to it for this purpose. These currencies allow FAS to support market development activities which they would otherwise not be able to support with existing resources.

It is difficult to place an accurate value on these resources because they exist in seven different countries with volatile exchange rates. However, the most accurate assessment of the total accrued value of the foreign currencies in the seven countries amounted to approximately \$56 million in U.S. equivalents in October of 1999. Obligations for these funds for 1999 and 2000 were \$1.5 million and \$5.3 million respectively. There are no funds yet obligated for 2001.

QUESTIONS SUBMITTED BY SENATOR SLADE GORTON

WHEAT SALES TO PAKISTAN

Question. Can you explain why wheat sales to Pakistan are at half the levels they were a year ago? According to the statistics I've reviewed, sales to Pakistan in 1998 hovered around 793,000 metric tons, whereas this year it's projected that the U.S. has sold only 400,000 metric tons. Of the top 10 countries the U.S. promotes and sells wheat to overseas, Pakistan was the one country that dipped so low in sales. Can you explain why sales to Pakistan have slipped? Because Washington soft white wheat is the premier choice of Pakistan purchasers, I am obviously concerned.

Answer. In recent years, Pakistan has usually been a 1.5 to 2.0 million ton market for U.S. wheat producers in the Pacific Northwest. However, so far in the current marketing year, we've only sold about 400,000 tons. It is essentially because Australia has been particularly aggressive in light of a record wheat crop this year which has resulted in enormous exportable supplies. In addition, the country has increased its credit offering to Pakistan and is able to make use of a significant freight advantage to the Pakistan market. Finally, Pakistan's military government appears to be drawing down stocks in anticipation of a good harvest this year, reducing total import needs by 25 percent.

FAS will make maximum use of food aid donations and concessional sales of wheat in order to keep U.S. wheat in Pakistan. In January, we extended the term of our current GSM-102 offering from 2 years to 3 years as a means of increasing our competitiveness against Australia.

Question. Potato growers and other high value and specialty crops in the Pacific Northwest are very concerned about the potential closure of the FAS office in Singapore. Because growers in my state consider Singapore as the gateway into other Asian markets, can you explain why such an invaluable office is being eliminated? As a follow up, I understand USDA might be considering opening other offices in the region?

Answer. When the Agricultural Trade Office (ATO) was opened in Singapore 21 years ago, the city was the major transshipment point for agricultural trade with Southeast Asian countries, particularly nearby Malaysia and Indonesia. Since that time, however, the city's share of trade tonnage for the region has been eroding, a trend that is likely to accelerate in the future. In Malaysia, for example, the opening of Port Klang in 1996 (the first in the country which could handle the larger, Panamax-sized vessels) and of the new Kuala Lumpur International Airport in 1998 have stepped up the trend in displacing transshipments that previously went through Singapore. Upgrades in port and transportation facilities in Indonesia are also displacing trade through Singapore. Indeed, the governments of both Malaysia and Indonesia are pursuing policies which will further favor the use of their own transportation facilities.

FAS has also made substantial gains in its staffing in Southeast Asia during the past few years, opening an Attache Office in Hanoi, Viet Nam in 1996, an ATO in Jakarta, Indonesia in 1997, and an office in Ho Chi Min City, Viet Nam in 1997. Two additional Malaysians were added to staff of the Agricultural Attache's Office in Kuala Lumpur in 1997. Consequently, many of the services previously offered by the ATO in Singapore to these countries are now handled in-country by local staff.

FAS recognizes the continuing importance of Singapore as a regional financial and commodity trading center and will continue to maintain an office with a staff of two Singaporeans to cover these issues as well as trade servicing for this city of 4 million. This office will be supervised by the Agricultural Attache in nearby Kuala Lumpur. In addition, FSN staff from Kuala Lumpur will travel to Singapore to support major events, such as regional trade shows.

With an annual budget of \$900,000, ATO Singapore is the 6th most expensive FAS office in the world. Its annual cost is higher than that of several of our most critical posts, including the Minister Counselor's offices in Beijing and in Mexico City. With a budget for administrative costs frozen for the past 3 fiscal years, FAS has been forced to absorb rising costs and to close posts whose costs exceed their contribution to the agency's mission. For the reasons stated above, we believe that

Singapore is one of these posts and that the resources expended there can be better used to support critical needs in other areas.

FAS recognizes the fact that East Asia is likely to be the major growth market for agricultural trade in the next few years and is prepared to add more staff and to open additional offices in the region if its budget is increased enough to support these openings. As you are aware, the 2001 budget proposes increased funding for FAS to support the opening of a new ATO in Manila, the Philippines, one of the most promising growth markets in that region.

QUESTION SUBMITTED BY SENATOR CONRAD BURNS

Question. The expanded trade initiative portion of this plan is supposed to use all of the export programs and to utilize EEP funds and food-aid programs. Yet, almost every single export program received a budget cut this year. How can the USDA promote a trade initiative that does not contain adequate funding?

Answer. While the President's fiscal year 2001 budget does project lower levels of food assistance for fiscal year 2001, this largely reflects the assumption of a return to more traditional program levels after the unprecedented volume of activity in fiscal years 1999 and 2000. The fiscal year 2001 budget continues credit guarantee and market development programs at fiscal year 2000 levels. Additionally, the budget includes increases totaling \$4.4 million for FAS, including \$.8 million for market access compliance and negotiation activities. If we are to meet the workload challenge facing FAS, it is crucial that FAS receive funding at the level requested in the President's budget.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

FOREIGN TRADE AND ASSISTANCE

Question. U.S.-China WTO Accession Agreement. The Congress may be asked to consider the U.S.-China WTO Accession Agreement later this year. The impact of this agreement on agriculture will play a strong role in my position on this issue.

I know there is a great deal of support for this agreement within agriculture. But I have to say, I am concerned about whether or not at least with respect to dairy the opening of markets in China will necessarily benefit U.S. agriculture.

The U.S. dairy industry has long been concerned about the impact of state trading enterprises namely the New Zealand Dairy Board on free trade. While I know this Administration has made State Trading Enterprises a top negotiating priority, to date, you've not made much progress in reducing the trade distorting effects of these organizations.

Despite the optimism about the China WTO Accession Agreement, what can U.S. dairy farmers reasonably expect in terms of access to China until we can fully reduce existing trade distortions?

Answer. The direct impact of WTO membership for China on U.S. dairy exports is likely to be relatively modest at least for the first 5 or so years. China has a rapidly expanding domestic dairy industry, but compared to the potential size of the market for dairy products, the domestic industry is very small. Demand is expanding and dairy product imports are growing rapidly. The major items imported on both a volume and value basis are milk powder and dried whey. China's WTO package does not call for reduced tariffs for milk powder and dried whey since duties on whey are already relatively low (6 percent) while domestically produced powder tends to be in surplus at times.

Cheese, ice cream, and lactose are three products where imports have been rapidly increasing and where reduced tariffs might be expected to cause a further acceleration in demand. China's tariff on cheese imports is to drop from 50 to 12 percent and with expanding pizza and fast food restaurants, imports should grow rapidly.

Availability and consumption of ice cream is growing rapidly in the large cities but penetration of more rural markets is difficult. Expanding markets are expected to create demand both for direct imports of ice cream and more imports of ice cream ingredients. The tariff for ice cream is to drop from 45 to 19 percent. A similar situation exists for yoghurt where the tariff will drop from 45 to 10 percent.

A large population with limited incomes means China's food industry is always very interested in sources of low-priced high-quality food ingredients. The already-low tariff on whey products, plus the scheduled reductions for lactose (35 to 15 percent) and dairy based food preparations (25 to 10 percent) should result in a big boost for dairy product imports.

MARKET ACCESS AND FOREIGN MARKET DEVELOPMENT PROGRAMS

Question. Beginning in fiscal year 2000, the Foreign Market Development Program was to secure funding through mandatory spending at levels no less than that available in fiscal year 1999. What levels of funding did the Foreign Market Development Program receive in fiscal year 1999 and what are your estimates for 2000 and 2001?

Answer. The Foreign Market Development Program was funded at \$27.5 million for both fiscal year 1999 and 2000, and we anticipate \$27.5 million for 2001.

Question. Please provide the levels and description of activities through both the Market Access and Foreign Market Development Programs related to dairy products.

Answer. The U.S. Dairy Export Council (USDEC), has received \$703,348 in fiscal year 2000 Foreign Market Development funds, and \$1,699,394 in fiscal year 1999 Market Access Program funds. USDEC is a nonprofit industry trade membership organization representing processors, exporters, producers and suppliers to the dairy industry. The Council's activities include market research, technical seminars, trade shows, product literature, and in-country trade servicing. Promoted products include cheese, whey, yogurt, ice cream, milk powder, and fluid milk. USDEC's efforts are concentrated in Japan, China, Korea, Mexico, and Brazil.

WORLD HUNGER/U.S. ASSISTANCE

Question. World news too often reminds us of the tragic consequences of human events and those of nature that take the form of malnutrition and starvation, especially among children. U.S. food assistance provides the double benefit of offering food to those in need and establishing an outlet for U.S. production. It has been suggested by some, such as former Senator and now U.S. Ambassador to the United Nations for Food and Agriculture, George McGovern, that the time has come for the U.S. to provide leadership in the creation of a world-wide program modeled after the School Lunch and WIC programs designed to curb child hunger. Ambassador McGovern has suggested the initial U.S. cost in such an endeavor would be in the \$1 billion range. Does such a proposal fit within USDA's vision of providing humanitarian food assistance.

Answer. USDA is a primary agency in the United States' efforts to combat both domestic and international hunger and food security. This effort goes beyond just humanitarian food assistance to development assistance and policy interventions that will create sustainable food security around the world. Last year, in March 1999, we released the *U.S. Action Plan on Food Security*. This document provides a long-term road map for the efforts of both the U.S. Government and civil society. School feeding programs around the world are an important intervention that can help build food security and end hunger, not just for those who attend school, but for the households and the communities in which children live over the long term. These types of programs help address many of the root causes of food insecurity, as well as its most obvious symptom: malnutrition.

School feeding programs encourage school attendance, particularly among women and girls, and when properly structured, can help reduce the costs associated with rural families sending their children to school rather than putting them to work by providing supplemental food for the household. We know that women's education is one of the most important elements in reducing population growth. It also provides greater economic opportunities.

It is difficult to accurately estimate the cost of a global program because it will take a different shape in each country, depending on local conditions and the strength of existing infrastructure.

Question. Assuming a large share of such assistance would serve as an outlet for U.S. agricultural products, what effect, if any, would such a proposal have on U.S. commodity prices?

Answer. To the extent that these programs lead to increased U.S. agricultural exports, this should lead to increases in U.S. commodity prices. This impact, of course, would vary by commodity and would be dependent upon other dynamics taking place in the market. Additional food assistance programs can also support the development of U.S. export markets over the longer term, with an ongoing positive effect on U.S. commodity prices.

EXPORT ENHANCEMENT PROGRAM

Question. Secretary Schumacher's statement suggests that the Export Enhancement Program (EEP) might be a more appropriate tool for U.S. producers should market conditions change. Given the current commodity surpluses and ongoing

trade disputes with many of our trade partners, what change in market conditions need to occur in order to make better use of EEP?

Answer. In order for EEP to be beneficial to U.S. producers, it must be used in a market environment where it would lead to significant improvement in wheat prices without greatly depressing feed grain prices. In the current market environment of large global supplies and low prices for wheat and feed grains, the use of EEP would likely result in only a modest boost in U.S. wheat prices and would undoubtedly lead to increased imports of wheat from Canada and lower U.S. feed grain exports. Furthermore, any increase in wheat producers' incomes would be slight, since higher wheat prices would reduce loan deficiency payments and marketing loan gains. EEP is most effective when feed wheat does not compete with feed grain exports, and Canada, and to a lesser extent Australia, do not have large crops. Under these conditions, EEP would enable us to compete directly against EU subsidized exports and lower world wheat prices would not displace feed grain exports. In addition, reduced crop supplies in Canada and Australia would lessen the displacement in U.S. export sales in non-EEP markets and reduce the surge in imports from Canada following the resumption of EEP. Of course, resumption of EEP has international trade implications that also would have to be considered along with the market environment for wheat and feed grains.

FAS HOUSING

Question. I understand some FAS Agriculture Attaches in foreign missions reside in housing acquired through the use of Public Law 480 proceeds, yet the title for these properties is held by the U.S. Department of State. I further understand that under State Department policy, some of these properties are in the process of being sold with the proceeds not accruing back to USDA from which they came. Please explain how proceeds from these sales will be distributed. Please explain the effect these sales will have on the housing needs of foreign FAS personnel and on other agency's budget. If these sales will have an adverse effect on agency activities, what is USDA doing to negotiate an arrangement with the State Department or elsewhere within the government to correct this problem?

Answer. Through the foresight of the Congressional Agriculture Committees, legislation was included in various DOS appropriations authorizing the acquisition of residences for Agricultural Attaches. Seventeen properties were purchased by the Department of State (DOS) during the years from 1957 to 1979 to provide housing for Agricultural Attaches in specific countries.

Congressional testimony by State's Office of Foreign Buildings Operations (FBO) during those years reflects their intent to acquire pieces of property for the use of these Attaches. Both DOS appropriated funds and excess Public Law 480 currencies were used to acquire the specific properties. The DOS's use of funds to acquire these properties was based on priorities in agreement with USDA for acquisition of a number of residences for occupancy by the senior Attache of the agency.

In the early 1990's, FBO claimed that it could sell some of those residences although they had been occupied by Agricultural Attaches since their purchase, in some cases for more than 40 years. Although FAS contested this view, FBO has subsequently sold four of these residences (in Lima, Peru; Quito, Ecuador; Santiago, Chile; and Rabat, Morocco) and retained the proceeds for its own purposes. As a consequence, FAS now pays over \$85,000 annually for leased housing for these posts. In addition, two FAS residences have been put into embassy housing pools, thus requiring FAS pay for leased housing. These are in Nairobi, Kenya (annual leasing cost in excess of \$26,000) and Warsaw, Poland (\$43,000).

In total, the impact of the loss of these residences has been additional costs of \$680,000 to the FAS budget over the past 5 years. Since the FAS administrative budget has been frozen during the past 3 years, these increased costs have had to come from other FAS programs and activities.

During the past 2 years, FBO has announced that it intends to sell two additional FAS occupied houses, in Vienna, Austria and Stockholm, Sweden. If FBO succeeds in this, FAS will face annual leased housing costs estimated at \$70,000 for these two posts. Finally, FBO now claims that FAS has no rights for continued assignment to two long-term FAS houses, in Bangkok, Thailand and Cairo, Egypt. If FAS is forced out of these residences, leased housing costs for the two posts are estimated at over \$120,000 annually.

Although FAS has contested this FBO policy for nearly 10 years, we have been unable to deter the plan to sell off FAS houses. Most recently, on December 7, 1999, Secretary Glickman wrote a letter to Secretary Albright regarding the sale of the house in Vienna. The Secretary asked that the proceeds of the sale be used to purchase replacement housing for the FAS officer. In addition, Secretary Glickman

asked that he be advised of any actions which State might take for other dedicated FAS housing.

PUBLIC LAW 480

Question. The budget request for fiscal year 2001 reflects a drop in the program level of all Public Law 480 programs. Title II, for example, drops from \$962 million for the current year to \$837 million. In addition, the level for fiscal year 2001 is more than \$100 million below the level in fiscal year 1999. While use of the 416(b) program has been used in the past to supplement the assistance of Title II, that program can not be relied on as a permanent tool to complement Title II. In fact, use of 416(b) now seems to be quite less aggressive than a year ago. What are the anticipated needs of international food assistance programs for fiscal year 2001 and do the World Food Program or other international organizations concur with those estimates?

Answer. The only annual assessment of future international food aid needs we are aware of is the one prepared by the Economic Research Service. And we believe this assessment is generally accepted by those working in the field of international food aid. The World Food Program provides to donors its estimates of the commodity needs of the projects it is supporting, as well as estimates of emergency needs as they arise.

Question. Why is 416(b) not being more aggressively used now?

Answer. We believe Section 416(b) authority is being both aggressively and responsibly used. At the present time, we expect to program about 4 million tons of food aid under this authority this fiscal year; of this total, 500,000 tons will benefit needy people in Russia. Last year, we programmed about 5.5 million tons, of which 1.7 million tons went to people in Russia.

Question. In the event 416(b) is not practically available, how does the U.S. plan to meet its world assistance obligations in fiscal year 2001 with a reduced program for Title II?

Answer. The United States' international commitment to provide food aid is our commitment to the Food Aid Convention; this commitment is 2.5 million tons on a 12 month basis. Therefore, the combination of Public Law 480 and Food for Progress programs assures that this commitment is met. As is always the case, international food aid needs will vary depending on weather, unforeseen natural disasters, and unfortunately, often man-made disasters. The availability of Section 416(b) commodities does help the United States respond to such situations. However, in addition to the Public Law 480 and Food for Progress programs, there are commodities held by the Commodity Credit Corporation in the Bill Emerson Humanitarian Trust—the Food Security Commodity Reserve—which can also be used to help meet such needs.

DEIP

Question. In my oral questions I expressed concern about the impact of DEIP volume and value reductions resulting from our WTO commitments. I am concerned that the Department hasn't taken steps to ensure the full use of DEIP tonnage by reallocating canceled DEIP tonnage from previous years. This is particularly troubling given that milk prices have fallen to 20 year lows. What are the Department's plans to utilize the canceled tonnage in order to maximize DEIP exports and help relieve price depressing surpluses of milk powder?

Answer. To utilize the DEIP program to the maximum extent possible, and consistent with our WTO commitments, USDA has used the rollover provision in the Agreement on Agriculture to bring tonnage forward from past years. We have reprogrammed an additional 74,861 metric tons of nonfat dry milk powder and 7,500 metric tons of whole milk above our annual WTO commitments during 1997/1998, 1998/1999 and 1999/2000. In using this rollover tonnage, we have fully exhausted our flexibility to program canceled tonnage.

The additional canceled tonnage that the industry is now seeking would require changing the U.S. methodology for reporting our WTO export subsidy commitments. We established and committed to an accounting methodology with respect to our subsidy reduction commitments and should uphold this methodology, just as we would expect other members to do. Changing in the final year of the implementation period would be viewed as disingenuous, and probably subject to challenge by other members. Finally, we believe such an action would undermine our position of leadership as we enter a new round of global negotiations that are of great importance to all of U.S. agriculture.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

FOREIGN TRADE

Question. What steps has the U.S. Department of Agriculture taken to expand markets for West Virginia agricultural products?

Answer. Through the Market Access Program (MAP), funding for international market promotion activities to export-ready companies is offered through the Southern U.S. Trade Association (SUSTA) in marketing SUSTA regional products. West Virginia, 14 other southern states, and the Commonwealth of Puerto Rico are included in the SUSTA region. West Virginia through its representation on SUSTA's Board of Directors and its international marketing representatives, is involved in the development and management of these activities.

FAS also provides MAP support funds through the National Association of State Departments of Agriculture (NASDA) for the U.S. Food Export Showcase (USFES). The USFES is part of the Food Marketing Institute (FMI)'s major trade show for U.S. food products, held in Chicago annually in May. NASDA organizes and supports individual pavilions for State Departments of Agriculture at the USFES every year, including West Virginia, at reduced rates.

Question. What has been the result of these efforts?

Answer. SUSTA has actively recruited in West Virginia to assist the West Virginia Department of Agriculture's Market & Development Division in a renewed effort to take advantage of MAP funding for export-ready companies.

NASDA has assisted West Virginia with its individual pavilion within the Food Export Showcase during the last 3 years. At the Showcase 8–10 West Virginia companies have been participating, and sales have resulted.

Through the Southern U.S. Trade Association (SUSTA) last November, West Virginia contacted FAS about other potential USDA programs concerning its agricultural products. Robert Williams, Director of West Virginia's Market & Development Division, has worked with a program (WV Jobs Investment Trust) in moving foreclosed aquaculture farms in its state and possibly other related entities into an independent cooperative. He submitted a summary of the "High Appalachian Project" to FAS and USDA/Rural Business—Cooperative Service in February. Cooperative Service reviewed this summary in early March, and this group may independently request technical assistance (i.e., business planning, market strategy development) in the near future.

QUESTIONS SUBMITTED TO THE RISK MANAGEMENT AGENCY

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

RISK MANAGEMENT EDUCATION

Question. What amount of current funding is devoted annually to risk management education activities? Are all of these funds discretionary, or are there available funds for these activities in the FCIC Fund? If so, please delineate these.

Answer. During fiscal year 2000, RMA plans to devote \$1 million to Risk Management Education (RME) initiatives. All of these funds will be obligated from the mandatory Federal Crop Insurance Corporation (FCIC) Fund.

Question. Please provide a list of outside organizations with which RMA has contracts or cooperative agreements for risk management education activities and the value of each.

Answer. As of February 29, 2000, RMA has obligated \$118,874.40 to outside organizations in the form of contracts or cooperative agreements to support RME activities. RMA plans to obligate remaining RME funds over the next 6 months. Please see the attached table.

[The information follows:]

**RISK MANAGEMENT AGENCY—RISK MANAGEMENT EDUCATION
CONTRACTS AND COOPERATIVE AGREEMENTS FISCAL YEAR 2000**

[As of 2–29–00]

Cooperative Agreements: Foreign Agriculture Service with the National Future Farmers of America Foundation	\$40,000.00
Purchase Orders/Contracts:	
Pennsylvania Farm Bureau	7,000.00
National Introducing Brokers Association	800.00
Montana Grains Foundation	7,500.00

RISK MANAGEMENT AGENCY—RISK MANAGEMENT EDUCATION CONTRACTS AND COOPERATIVE AGREEMENTS FISCAL YEAR 2000—Continued

University of Nevada	2,000.00
University of Arizona	1,500.00
University of Arizona	4,500.00
University of California	1,000.00
Futures Industry Institute	15,000.00
Oregon State University/Ag Research Foundation	3,000.00
Country Hedging, Incorporated	5,000.00
Washington Association of Wheat Growers	2,000.00
Oregon Wheat Growers League	7,000.00
University of Idaho Cooperative Extension	3,000.00
Ohio State University	2,850.00
Illinois Farm Bureau	1,734.40
Purdue University	5,000.00
Financial Ag Risk Management Services	2,500.00
Alabama Farm Bureau Federation	4,490.00
1Ft. Valley State University	2,000.00
Georgia 4-H Foundation	1,000.00
Total	\$118,874.40

INFORMATION TECHNOLOGY (IT) COSTS

Question. The budget includes an increase of \$3,717,000 for RMA administrative and operating costs, of which \$403,000 is for information technology costs. How much funding is included in the discretionary base for IT costs? In the mandatory base?

Answer. The fiscal year 2001 discretionary base includes \$22.1 million for IT costs. A portion of the IT base includes projects that have been unfunded in prior years due to cuts in the budget process. The fiscal year 2001 funding base for IT costs in the mandatory FCIC Fund is \$1.5 million.

COMPANY UNDERWRITING GAINS

Question. The budget estimates delivery expenses for fiscal year 2001 of \$507,679,000. What are the estimated underwriting gains for fiscal year 2001 between buy-up coverage and catastrophic coverage? What were the underwriting gains for fiscal year 2000?

Answer. Based on the fiscal year 2001 President's Budget, RMA estimated company underwriting gains of \$156.5 million for fiscal year 2000 and \$163.8 million for fiscal year 2001.

QUESTION SUBMITTED BY SENATOR CONRAD BURNS

Question. The emphasis the Administration has put on conservation in their latest budget proposal appears to leave any real commitment to Risk Management reform out of picture, which is sorely needed across the nation. What changes are you proposing that are significant, and capable of breaking the stagnation we current see occurring? What was the budget score on this proposal?

Answer. The Administration continues its strong desire to improve crop insurance participation and farmer applied risk management tools. The Administration has continued to work closely with Congress to ensure that significant improvements are achieved. Recently, the Senate Agriculture Committee, working closely with the Administration, took a significant step forward by approving its version of a Risk Management improvement bill. The bill was approved by the Senate.

In fact, this Administration's budget request included a continuation of discounts on crop insurance premiums paid by farmers begun in fiscal year 1999 (this year, the administration assumes the cost of these premium discounts to be about \$400 million), a proposal that reaffirms our commitment to increasing crop insurance coverage and participation levels. Additionally, the Administration continues to support insurance coverage to support farmers who have suffered multiple years of losses at a level of \$100 million, expanding crop insurance to cover livestock at a cost of \$100 million, budget to make more flexible NAP, costing \$110 million, by eliminating the area trigger and by requesting \$40 million of Congress to improve Risk Management Education and \$30 million in additional funds for product research and development.

Most of these proposals are contained in all the crop insurance improvement bills under consideration by Congress. All, these proposals could be considered significant by themselves, however, this Administration believes this basic package critical for Congress to enact this year.

QUESTIONS SUBMITTED BY SENATOR TED STEVENS

Question. As you are aware, last year, at my request, Congress directed the Risk Management Agency to perform an actuarial study to determine the feasibility of including salmon in the Federal crop insurance program. I understand that the Agency is proceeding with this study. What is the status of the study?

Answer. Risk Management Agency (RMA) personnel contacted Dr. Ray Ralonde of the University of Alaska, Marine Advisory Program, to review the Alaskan salmon industry and gain an overview of the economic risks. Dr. Ralonde provided information and suggested RMA contact Dr. Terry Johnson, State Extension Agent for the National Marine Fisheries Service, and Dr. Gunner Knapp, Professor of Economics, University of Alaska. RMA also contacted Dr. Johnson and Dr. Knapp to discuss industry concerns as well as the feasibility of developing a crop insurance program based on sound actuarial risk management principles.

Dr. Knapp & Dr. Johnson both verified they would be available and interested in conducting such a study. Dr. Ralonde also expressed willingness to help in whatever way he could but expressed that the study was probably less within his areas of focus. Funds have been budgeted to conduct the study this year.

Question. I want the Risk Management Agency to conduct a pilot program to determine the feasibility of including salmon within the crop insurance program. If it met the actuarial soundness requirement are you prepared to initiate this pilot program also?

Answer. RMA has initiated discussions with several industry experts in terms of identifying sources of both production & economic risks associated with producing salmon.

We are gathering information concerning the main areas of interest so RMA can accurately direct our focus and resources. The results of the feasibility study will determine what crop insurance plan to offer and if any legislative authority is required.

After discussions with your staff (Mr. Butzlaff), RMA is proceeding toward developing a feasibility study and pilot program which focuses our efforts on the commercial fisheries area of Bristol Bay. RMA has advised your office that a change in the Federal Crop Insurance Act is likely necessary for RMA to implement a pilot program that includes premium subsidies. Your office has been furnished information from USDA's Office of General Counsel on this matter.

Question. What funds will the Risk Management Agency need to complete this study and a subsequent pilot program in Alaska?

Answer. RMA is using \$75,000 from the fiscal year 2000 Research and Development fund Section 516(b)(2) of the FCIC Act to complete the initial feasibility study. Budget requirements for subsequent fiscal years for pilot program research, development and implementation are estimated at \$800,000, however, no commitment of funds have been allocated at this time pending numerous other program requests of RMA and the annual spending limitation placed on these funds within the Act.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

DAIRY OPTIONS PILOT PROGRAM

Question. During the hearing I asked what the Department is planning to do to ramp up the Dairy Options Pilot Program consistent with Secretary Glickman's commitment on February 10. I am concerned by the Department's response that dairy farmers should be able to participate in the program for no more than one round.

RMA has operated multi-year pilot programs for many other commodities. Moreover, given the complexity of using the options market as a risk management tool, it is reasonable to expect that dairy farmers and USDA would need more than one round to determine the benefits and short comings of options markets as risk management tools in dairy. Finally, it is clear that Congress envisioned the options pilot program operating in a county for multiple rounds since the statute limits participation to no more than 3 years. Congress limited participation to 100 counties concurrently, not in total.

How can RMA resolve the inconsistency between its operation of the DOPP and its unnecessarily narrow interpretation of the authorizing Act with the statements made by Secretary Glickman regarding the Department's efforts to increase use of DOPP?

Answer. The Federal Agriculture Improvement and Reform Act of 1996 says that "the Secretary may operate the pilot program in not more than 100 counties" It does not say "not more than 100 counties at any one time". The intent of Congress is unclear. As a result, RMA has been advised by USDA's Office of General Counsel that legislative action will be required to expand into more than 100 counties. RMA is currently reviewing ways to expand the Dairy Options Pilot Program.

QUESTION SUBMITTED BY SENATOR ROBERT C. BYRD

IMBALANCE OF USDA ASSISTANCE

Question. Farming in the Northeast (USDA's definition of Northeast includes West Virginia) accounts for 6 percent of U.S. farm numbers and 8 percent of rural agricultural production values but receives just 1 percent of direct payments and federal crop insurance payments to producers. I am concerned that the hardworking West Virginia farmer is not receiving a fair portion of assistance provided by the U.S. Department of Agriculture.

What factors contribute to the discrepancy between amount produced, and assistance received?

Answer. There could be several reasons for differences between the Northeast and the rest of the country. These other reasons would argue against the premise "that the hardworking West Virginia farmer is not receiving a fair portion of the assistance provided by USDA." For example:

1. *Crop income versus livestock income.*—The share of agricultural income derived from crops versus livestock and livestock products (e.g.—meat and milk). Both direct payments and crop insurance focus on crop production rather than livestock production. If the Northeast has relatively more income from livestock than rest of the country, then its share of direct payments and crop insurance, by definition, will be lower than the national average, when measured as a percent of the value of agricultural production.

2. *Crops produced.*—Direct payments are focused on the loan commodities that are of lesser importance to the agriculture of the Northeast than to rest of the country. Crop insurance is not yet available on all crops produced in the Northeast, but RMA's Adjusted Gross Revenue (AGR) insurance program, which is currently in the very early pilot stages, does cover all vegetative crops and provides limited coverage for livestock.

3. *Farmers' choices of coverage levels.*—The portion of farmers who chose to sign up for FCIC's free, basic crop insurance product—called CAT, for catastrophic coverage—compared to the higher coverage levels for which a premium is charged, is higher in the Northeast than the rest of the country.

4. *Participation in crop insurance program.*—If farmers elect not to sign up for crop insurance—for whatever reason—then they and the region in which they farm will have a lower share in the benefits of the crop insurance program.

Question. What can be done to ensure that a farmer who does not live in a larger "farm-state" receives an equitable portion of the assistance available to his fellow farmers?

Answer. It is helpful to think of this problem both from two perspectives—the farmers' and Governments'. One must try to "push" crop insurance benefits to areas of need, the other must try to pull them from the center.

The most important actions from the "pull" side would be for farmers to sign up for the various crop insurance programs that are available and to sign up at higher coverage levels. This, of course, immediately causes the desired benefits to flow. But it also converts potential demand into effective demand and makes money for agents' commissions and insurance company underwriting profits to become available.

On the "push" side, it is important to note that FCIC uses a "for-profit" delivery system—private insurance companies and their agents—to deliver its products to farmers. An increase in effective demand from the "pull" side, as suggested above, convince companies and their agents to be more aggressive in pushing products in agriculturally sparse areas such as the Northeast.

SUBCOMMITTEE RECESS

Senator COCHRAN. We will have our next hearing on Tuesday, March, in this same room, 138, Dirksen Senate Office Building. At that time, we will review the President's budget request for the programs and activities of the Food and Drug Administration. Until then, the committee stands in recess.

[Whereupon, at 4 p.m., Tuesday, February 29, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**AGRICULTURE, RURAL DEVELOPMENT, AND
RELATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

TUESDAY, MARCH 7, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:08 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Gorton, Stevens, Harkin, and Durbin.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

FOOD AND DRUG ADMINISTRATION

STATEMENTS OF:

**HON. DONNA E. SHALALA, SECRETARY, DEPARTMENT OF HEALTH
AND HUMAN SERVICES**
JANE E. HENNEY, M.D., COMMISSIONER

ACCOMPANIED BY:

BERNARD SCHWETZ, D.V.M., PH.D., ACTING DEPUTY COMMISSIONER
**ROBERT J. BYRD, DEPUTY COMMISSIONER FOR MANAGEMENT
AND SYSTEMS, CHIEF FINANCIAL OFFICER**
**DENNIS P. WILLIAMS, DEPUTY ASSISTANT SECRETARY FOR BUDGET,
DEPARTMENT OF HEALTH AND HUMAN SERVICES**
**JOSEPH A. LEVITT, DIRECTOR, CENTER FOR FOOD SAFETY AND
APPLIED NUTRITION**
MITCHELL R. ZELLER, DIRECTOR, OFFICE OF TOBACCO PROGRAMS

OPENING STATEMENT OF SENATOR THAD COCHRAN

Senator COCHRAN. The subcommittee will please come to order. Today we continue our hearings reviewing the President's budget request for fiscal year 2001 for the subjects that come under the jurisdiction of this subcommittee. This morning we are pleased to have witnesses from the Department of Health and Human Services, the Secretary, as well as the Commissioner of the Food and Drug Administration. We appreciate very much your being here. We understand that accompanying the Secretary and Commissioner are Dr. Bernard Schwetz, who is Acting Deputy Commissioner of the Food and Drug Administration, and Mr. Robert J. Byrd, Deputy Commissioner for Management and Systems and Chief Financial Officer of the Food and Drug Administration, and

Mr. Dennis Williams, who is Deputy Assistant Secretary for Budget at the Department of Health and Human Services.

We notice from reviewing the statements that have been submitted, which will be made a part of the record, that the FDA has some high priorities, and we are looking forward to hearing more about those in the testimony this morning.

One area that we are aware of that causes particularly difficult challenges for the agency is the technological advances that continue to be made that have resulted in a proliferation of new products and devices that are designed to benefit the American public in our quest for health and safety. We appreciate the challenge this creates for the Food and Drug Administration. We want to allow safe and effective products to reach the marketplace as quickly as possible, but we realize at the same time that the potential risks have to be monitored, as well as for products that are already on the market.

We will be carefully considering the budget request in this area, along with the other priority areas, and consider the need for adequate resources to inspect more products on the market, to further reduce product approval times, to strengthen adverse events reporting systems, to ensure the safety of foods and imports, and to meet the new challenges, such as the illegal sale of drugs over the Internet.

We are particularly pleased that the Secretary is here this morning. We want to assure her that we will work with her and her Department to address this agency's most critical needs.

We also want to take this opportunity to commend the Commissioner, Dr. Henney, for her excellent service as administrator of the Food and Drug Administration.

Madam Secretary, we invite you to proceed. We look forward to your statement. We will then hear from Dr. Henney. You may proceed.

Secretary SHALALA. Thank you very much, Mr. Chairman. I appreciate the invitation to be here. Chairman Stevens, Senator Gorton, Senator Durbin. I am delighted to join our very distinguished Commissioner who will describe in more detail FDA's first budget of the 21st century.

FDA has earned worldwide respect as a premier public health agency, and the members of this subcommittee know the extensive responsibilities FDA has to ensure the safety of our food, our life-saving drugs, and medical devices. And you know the work of this agency has created a quality and safety standard that many similar agencies around the world use as a benchmark.

I would like to discuss with you today some of the specific areas where FDA is an essential partner in the progress we hope to achieve.

First, we have made great progress on a bipartisan basis to improve the safety of our food supply, but we have farther to go. I look forward to your continued support on this critical issue.

Second, the Nation faces a potentially dangerous threat from terrorists who would use disease agents rather than bullets or explosives to harm us. The administration and the Congress have been working to guard against this threat. We need the Food and Drug Administration to ensure that we have new vaccines to protect

against these threats and powerful pharmaceuticals to protect us in the event of an attack.

Third, we need a bipartisan effort to reduce the preventable deaths and injuries resulting from medical errors. We need better information on which drugs and medical devices are the most prone to error so that we can help physicians and medical personnel to use them more effectively and safely. A stronger adverse event reporting system at FDA is essential to our success in the area of medical errors.

Fourth, we know that the Internet can help us to improve health and medicine. But we want to make sure that when Americans use the Internet to order pharmaceuticals, they can be sure that the drugs they receive are safe and effective and that they are the drugs they need. I hope you will support our initiative to make Internet drugs safe.

Fifth, assuring products are safe and effective before they get to market is essential to our public health. Doing so quickly is necessary to a strong and innovative medical industry. We need to increase the resources that we make available for premarket review.

We also request funding to support compliance checks of those who would sell tobacco products to our children.

Sixth, one of my top priorities this year is to ensure that our scientists have the facilities they need. I have made similar requests for the Centers for Disease Control, for example, and the NIH. For FDA, this means replacing the dilapidated laboratory in Los Angeles with a state-of-the-art facility on the campus of the University of California at Irvine.

Finally, Mr. Chairman, during his State of the Union address last month, the President noted that innovations in science and technology will be the key to miraculous improvements in the quality of our lives and advances in the economy. He discussed the remarkable fruits of the major expansion we have provided in taxpayer funded research that promises to improve our health and the way health care is delivered.

However, as you know, these new breakthroughs, whether drugs or vaccines or medical devices or food additives, must come through the FDA review process to ensure their safe and effective exposure to millions of Americans who will use them. So, I would ask you to consider how we can strengthen FDA's capacity to oversee the entry of these products to market.

These new products will change health care in America forever and will help us all to lead longer and healthier lives. In other words, Mr. Chairman, this is really a warning, perhaps the last one that I will give to this Congress. This is possibly my last testimony. We are about to see breakthroughs in American science that were unbelievable decades ago, but they will get clogged up in the FDA process if FDA does not continue its modernization process. So, investing in the science at FDA and smoothing out the review processes and making sure FDA has the kind of facilities it needs will be important so that there is a seamless system of the breakthroughs in basic science to the development of product to approval by FDA.

Both Republicans and Democrats in this Congress have worked very hard on FDA reform. We have, in fact, made FDA the model

agency of the world from the point of view of scientists around the world, but also from the point of view of those that produce the products that get to market that improve our health. But we are in danger in this age of breakthroughs in biomedical science of again getting clogged up in the process unless FDA also has the proper investments. That is what we need to do and that is what I believe this committee will see as one of its major priorities.

PREPARED STATEMENT

Mr. Chairman, again I want to thank you and members of this committee for your past support for FDA funding, and again thank you for considering the important investments we have proposed for the agency for the next fiscal year.

[The statement follows:]

PREPARED STATEMENT OF HON. DONNA E. SHALALA

Mr. Chairman, Senator Kohl and members of the subcommittee, I am delighted to join Commissioner Henney, who will describe in more detail FDA's first budget of the 21st century.

FDA has earned worldwide respect as a premier public health agency. The members of this subcommittee know the extensive responsibilities FDA has to ensure the safety of our food, lifesaving drugs and medical devices. And you know that the work of this agency has created a quality and safety standard that many similar agencies around the world use as their benchmark.

I would like to discuss with you today some of the specific areas where FDA is an essential partner in the progress we hope to achieve.

We have made great progress on a bipartisan basis to improve the safety of our food supply. But we have farther to go. I look forward to your continued support on this critical issue.

The nation faces a potentially dangerous threat from terrorists who would use disease agents rather than bullets or explosives to harm us. The Administration and the Congress have been working to guard against this threat. We need the FDA to ensure that we have new vaccines to protect against these threats, and powerful pharmaceuticals to protect us in the event of an attack.

We need a bipartisan effort to reduce the preventable deaths and injuries resulting from medical errors. We need better information on which drugs and medical devices are the most prone to error, so that we can help physicians and medical personnel to use them more effectively and safely. A stronger adverse event reporting system at FDA is essential to success.

We also know that the Internet can help us to improve health and medicine. But we want to make sure that when Americans use the Internet to order pharmaceuticals, they can be sure the drugs they receive are safe and effective, and that they are the drugs they need. I hope you will support our initiative to make Internet drugs safe.

Assuring products are safe and effective before they get to market is essential to our public health; doing so quickly is necessary to a strong, innovative medical industry. We need to increase the resources that we make available for premarket review.

We also request funding to support compliance checks of those who would sell tobacco products to children.

One of my top priorities this year is to ensure that our scientists have the facilities they need. For FDA, this means replacing the dilapidated laboratory in Los Angeles with a state-of-the-art facility on the campus of the University of California at Irvine.

Mr. Chairman, during his State of the Union address last month, the President noted that innovations in science and technology will be the key to miraculous improvements in the quality of our lives and advances in the economy. He discussed the remarkable fruits of the major expansion we have provided in taxpayer-funded research that promises to improve our health and the way health care is delivered.

However, as you know, these new breakthroughs—whether drugs or vaccines or medical devices or food additives—must come through FDA's review process to ensure their safe and effective exposure to the million of Americans who will use them.

So I would ask you today to consider how we can strengthen FDA's capacity to oversee the entry of these products to the market.

These new products will change health care in America and will help us all to lead longer, healthier lives. They also will bring enormous economic benefits, both in lowering health care costs and in returning profits on the investments that are being made in research. And these advancements are not just theoretical. They are moving—now—from the laboratory into clinical trials and on to general availability. But if FDA does not have the increasingly complex scientific capacity needed to get safe and effective technologies to the market expeditiously, and monitor their safe use after approval, both patients and the industry will suffer.

Again, I want to thank you for your past support for FDA funding. And thank you for considering the important investments we have proposed for the Agency for the next fiscal year.

Senator COCHRAN. Thank you very much, Madam Secretary.

We know you have another commitment, but before you leave, I am going to give Senators an opportunity to make any comment or reaction to your statement. Senator Durbin.

Senator DURBIN. Mr. Chairman, I have several questions I would like to save the time for those questions and waive an opening statement. I would like to thank the Secretary and Dr. Henney for being with us today.

Senator COCHRAN. Senator Gorton.

STATEMENT OF SENATOR SLADE GORTON

Senator GORTON. Mr. Chairman, my statement is directed more at Commissioner Henney than it is at the Secretary. But, of course, it has to do with what seems to me to be the emergent and most troubling issue of all, and that is the price of prescription drugs to the citizens of the United States, something that I know that these two heard and discussed when they were before the House committee.

We are the only free market in the world in prescription drugs, and other countries have imposed the kind of price controls that cause Americans to bear overwhelmingly the burden of cost for the research and development of new drugs. I think it is absolutely unconscionable, Mr. Chairman, that the American taxpayer essentially subsidizes the research and development of new drugs for other countries in three ways.

First, we put almost \$18 billion a year through the NIH.

Second, we of course grant a very important research and development tax credit.

And finally, we subsidize a third time around at the pharmacy in the form of higher prices.

Prescription drug costs, as the Commissioner and the Secretary well know, are becoming an increasingly important part of the cost of health care, and we need all of our best possible thoughts put to the proposition as to how we at least equalize this burden and cause our neighbors, both to the north and south, to pay their fair share of those costs.

I represent a border State, bordering on Canada. A family, noted in the newspapers recently, from Tacoma saved \$600 by going to Canada to buy a 3-month supply of blood pressure, stomach, and sinus medications. One of the cancer treatments cost \$15 for a 1-month supply in Canada, \$95 if you are simply on our side of the border. I may say I myself take Zocor, very much advertised; \$3.16 a pill here, \$1.65 in Canada. Other different prices are as much as

5 or 6 to 1 between the United States and Canada or the United States and Mexico.

I think this is just simply unconscionable. At this point I am not aiming my comments so much at the drug companies that obviously have to pay at least their share of these development costs, but it seems to me entirely and totally unfair and inappropriate that our drug developers and manufacturers—and I am sure Commissioner Henney can speak to this, if she will—who do the overwhelming lion's share of the research and development throughout the world, that we are, in effect, letting almost every other foreign country ride on that research, sell these prescription drugs at much lower prices than are charged to people here in the United States.

We hear much about this being a problem for seniors, and of course, it is. But it is a problem for everyone, not only everyone who pays cash for prescription drugs, but it is reflected undoubtedly in the cost of health insurance where health insurance plans in the United States provide for a drug benefit. I very much hope that Commissioner Henney will speak to this issue during the course of her testimony.

Senator COCHRAN. Thank you very much, Senator Gorton.

Senator STEVENS.

Senator STEVENS. Well, I do want the Secretary to be able to leave and make her other appointment.

I am constrained to say, do you know something I do not know? You said this may be your last appearance before our committee.

Secretary SHALALA. I have finished my appropriations testimony for this year, and I do not expect to be here next year, Senator.

Senator STEVENS. I expect you to be back before us this year.

Secretary SHALALA. Senator, at your request, I will always be there.

Senator STEVENS. We look forward to that pleasure.

I do thank you both for the work you are doing. I will have some comments later, but I am extremely pleased, as I told you personally, with the progress now being made on the PET scan and other imaging systems and having them being properly considered by the Medicare and Medicaid programs.

I do have a comment later addressed to Dr. Henney about the seafood monitoring provision in this bill, but for now, thank you very much for being here, Madam Secretary.

Secretary SHALALA. Thank you.

PREPARED STATEMENT

Senator COCHRAN. Thank you, Madam Secretary. We appreciate your presence and we look forward to working with you on these proposals.

Senator STEVENS. Senator Cochran and I can arrange for you to have a trip here for other activities whenever you are ready. She is one terrific tennis player, I will tell you.

[The statement follows:]

PREPARED STATEMENT OF SENATOR TED STEVENS

Good morning Secretary Shalala and Commissioner Henney (Hay-nee). It's a pleasure to have you here today before the subcommittee. The FDA'S budget request for fiscal year 2001 of \$1.4 billion is a 13 percent increase over fiscal year 2000. I certainly appreciate the importance of the work that the FDA does, but, as I have

said in other budget hearings, I believe the President's budget request represents an unrealistic spending level when we consider Congress' commitment to keep a balanced budget and to not dip into the Social Security surplus to finance current government operations.

I note that the administration will be proposing legislation to consolidate the seafood monitoring activities of the Federal Government in the FDA, including the Commerce Department's Seafood Inspection Program. That program provides voluntary inspections and certification services for fish and fishery products on a fee-for-service basis. The seafood industry is of critical importance to Alaska, and I will be watching carefully how this proposal develops.

On another subject, I'd like to commend Commissioner Henney and the Secretary for the way that FDA has worked cooperatively with the pet community to come up with a reasonable framework for regulating the radiopharmaceuticals used in pet scans. I understand that FDA will be issuing a notice within the next couple of weeks approving the radiopharmaceutical "FDG" for use in pet scans to diagnose a wide range of cancers and heart disease. I'm pleased at FDA'S cooperation with the pet community.

I know that both the Secretary and Commissioner Henney are aware of my strong support for pet and for obtaining broad coverage for pet scans under the Medicare program. I would urge both of you to help FDA and HCFA work more closely together so that we can bring new technologies into the Medicare program to benefit seniors much more quickly than is the case today. I ask you both to join me in working towards this goal.

Senator COCHRAN. Dr. Henney, we are prepared to hear your statement now. We welcome you to the committee, and thank you for your cooperation with us.

STATEMENT OF JANE E. HENNEY

Dr. HENNEY. Thank you, Mr. Chairman and members of the committee. It is a privilege today, as Commissioner of Food and Drugs, to present FDA's plans and expectations as reflected in the administration's proposed budget for fiscal year 2001.

Patients, researchers, health professionals, manufacturers, educators, grocers, public sector administrators, or just ordinary citizens want a public health regulatory agency such as the FDA to be fair, competent and, above all, credible. I have heard this message in different words on many occasions in many settings this past year. I believe that the accomplishments of this year will demonstrate that FDA has done a remarkable job in maintaining the public's confidence and credibility even though we face numerous unpredictable issues on a day-to-day basis.

It may be far too easy for Americans to assume FDA's competence and credibility because we have long enjoyed public confidence in the past. However, from listening to my European counterparts, public confidence, once lost, is not easily or quickly restored. A series of highly publicized crises in Europe over the past several years have caused my counterparts to ask: What is FDA's secret and how does FDA utilize science and build consensus answers to so many inherently contentious issues? The answers are not found in FDA's organizational diagrams or job titles.

We find ourselves explaining modern versions of two very old history lessons, what Alexis de Toqueville reported long ago in Europe about the uniquely open processes of American lawmaking and its modern derivative, rulemaking; and Dr. Harvey Wiley's discussions with President Theodore Roosevelt at the beginning of the last century about the importance of science-based regulatory decisions. From a world perspective, FDA's utilization of public issue meetings, access to agency information, voting advisory committees, re-

quirements for scientific evidence and reliance on scientific facts in its decisionmaking processes are more uniquely American than we may realize. The interplay of these features into an independent regulatory function that coexists with prescribed congressional and judicial roles constitutes the most envied regulatory model in the world.

Today I want to share with you my priorities for preserving this capability and for preserving the agency's commitments to and credibility with the American public. As we begin the 21st century, fiscal year 2001 will be critically important for FDA because so much of our environment is changing rapidly and our capability to understand, adapt, and respond will be stretched to new limits. To maintain our strength, we must strengthen our science; we must address the highest priority risks; we must engage in effective collaborative and leveraged activities; and we must design ever more predictable, timely, and transparent regulatory processes.

Stronger science. FDA's commitment to assuring safe products rests squarely on our ability to keep pace with the explosion in scientific advances and then to use our knowledge to assure safe products. We must apply our intellectual capital at every point in the life cycle of the product. We can apply this science at the point when the new technology arrives and when it is absolutely essential to steward these products, many of them lifesaving, to the market.

FDA is the regulatory gateway through which an estimated \$50 billion in annual biomedical research and development investment must pass and be judged. You and your colleagues in the Congress have overseen a major expansion of Federal research, biomedical research in recent years, and those investments will pay dividends many times over for all of us.

FDA can deliver when properly resourced. Congress' authorization and support of the Prescription Drug User Fee Act and its recent reauthorization is a prime example. Review of drugs and biologics in the United States is now as fast or faster than anywhere in the world and this has been accomplished without lowering our very high standard for safety and effectiveness. We want to be able to perform this well in all of our products that require premarket evaluation. But this will require being adequately resourced.

Assuring safety by managing risk. A strong FDA science capability is equally critical in understanding and managing risks associated with products that are already in the marketplace. Each year hundreds of thousands of adverse experiences are reported in association with foods, drugs, and medical devices. In managing risk, FDA has always adhered to the principle that the most serious risks should be addressed first. The idea takes on added meaning, given the complexities of our 21st century environment. You will see evidence throughout our budget that the most serious problems are on the top of the list.

To illustrate, the medical error initiative in the budget emphasizes FDA working with other agencies across the Government as part of the President's new and comprehensive plan to improve health care through the prevention of medical errors or misadventures.

Second, drugs marketed and sold from rogue Internet pharmacy sites present real risk for the American consumer. These have been made a priority for fiscal year 2001.

And we have addressed the most serious risks first as part of the Food Safety Initiative. If provided the funding requested, we will be able to inspect the high risk food firms at least once a year. We would continue the work supported by the Congress in the past which focuses our efforts in the import arena by targeting imported produce that contain microbiological pathogens.

Let me speak for just a moment about collaboration and leveraging opportunities. Working with FDA's assets alone is not sufficient to address the complex risk management challenges that we face. Many of the initiatives in our budget require our agency to work in concert with a broad spectrum of stakeholders to strengthen the safety net for the American consumer.

Because we regulate in a global marketplace, our collaborative efforts must extend beyond our domestic borders. In this regard, we collaborate with our foreign regulatory counterparts in joint efforts that include setting standards to reduce the risk of products to the consumer. Whether it is within our domestic border or beyond, FDA undertakes collaborative initiatives because all parties can unify behind goals that are in the best interest of public health and safety. With such efforts, we will be able to move our world to better health outcomes.

Open, transparent, and predictable regulatory processes. Another key provision of the FDA Modernization Act of 1997 directed our agency to consult with our many stakeholders on an ongoing basis, to keep them apprised of our strategies and new product decisions, and to generally make them an informed participant in our regulatory processes. The relevant principle here is that a confident and well-informed individual or industry also becomes a partner in shouldering the management of risks.

We intend to keep these communication channels alive and humming. This spring we will listen at two additional formal stakeholder forums, the first at Stanford University in March and the second at Duke in April. At both of these sessions, we will no doubt receive suggestions on how to improve our programs and further strengthen our working relationships with our constituencies.

These 21st century ways of doing business—strengthening science, addressing the highest risk priorities, collaborating effectively with our partners and leverage our resources, and using open, transparent regulatory processes—must be applied across the entire spectrum of product development, review, and post-market monitoring. When we are able to play all these roles effectively, bolstered by science and augmented by partners who share our goals, American citizens can be confident that an effective safety assurance system is in place. FDA's budget proposals for fiscal year 2001 move us toward that desirable state of affairs.

Before I close my remarks, I would just like to briefly highlight for you the key elements of our budget request.

\$42 million to enhance the science-based review of new health-giving products so that they can more rapidly enter the marketplace.

\$30 million to enhance the safety of the food supply through strengthening the key elements of the President's Food Safety Initiative.

\$20 million to replace the FDA's obsolete Los Angeles laboratory facility. I would contrast the pictures before you. Our L.A. lab with a modern facility of Cincinnati that you provided the funding for us a few years ago. We need this kind of facility in Los Angeles. This lab is the critical linchpin in assuring the safety of a major portion of the U.S. imports, particularly food, that enter this country.

\$15.9 million to strengthen our systems which report on and correct medical errors. This is an interagency cooperative effort designed to reduce those 100,000 annual deaths that occur from medical misadventures or mistakes.

\$13.5 million to focus on domestic inspections of our firms in order to target high risk violators and come closer to meeting the agency's statutory inspection requirements.

\$10 million to stop the illegal sale of drugs over the Internet.

And \$11.5 million as part of the President's comprehensive response to possible bioterrorist attack.

\$5 million to further the administration's efforts to reduce smoking by the youth of our Nation.

In summary, Mr. Chairman and members of the committee, fiscal year 2001 is the year in which FDA must cope with the maturation of two of the most massive and significant change forces the agency has ever faced. In 2001, the increasing impact of molecular science, genetics or genomics in particular, and the information revolution, especially the Internet and its linkage to an array of real-time data and as a new vehicle of commerce will combine their forces to change how FDA regulated products are discovered, researched, manufactured, distributed, marketed, and advertised. When the world around us changes this much, we must be prepared to respond in order to assure that products are still safe for American consumers. Our credibility to provide valid assurance is at risk without strong science, effective collaborations and consultation, and even greater openness and transparency in our processes.

I wish to thank the members of this committee, their staff, and the staff of the individual subcommittee members for your support during this past year. This committee has many legacies from improved agricultural production to safer consumer products to protection of the American farmer. I ask you to add another critically important one to the list, bringing forth the technological promise of the 21st century. If you provide FDA the resources to do the job, I will commit to you that those funds will be well and wisely spent.

PREPARED STATEMENT

I look forward to our discussions with this committee today to ensure that we are able to fulfill our mission in this ever-changing and challenging environment.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF JANE E. HENNEY

Mr. Chairman and members of Congress, it is my privilege today as Commissioner of Food and Drugs to present FDA's plans and expectations as reflected in the Administration's proposed budget for fiscal year 2001. One year ago, I told you that I was lured to renewed public service by the dedication, energy and commitment of the talented people in FDA. I was equally attracted by the enormity of the changing demands upon the Agency and the difference this agency can make in improving the public health.

Patients, researchers, health professionals, manufacturers, educators, grocers, public sector administrators or just ordinary citizens want a public health regulatory agency such as the FDA to be fair, competent and, above all, credible. I have heard this message in different words on many occasions in many settings this year. I believe that the accomplishments of the past year will demonstrate that FDA has done a remarkable job in maintaining the public's confidence and credibility even though we face numerous unpredictable issues on a day-to-day basis.

It may be all too easy for Americans to assume FDA's competence and credibility because we have long enjoyed public confidence in the past. However, from listening to my European counterparts, public confidence, once lost, is not easily or quickly restored. A series of highly publicized crises in Europe over the past several years have caused my counterparts to ask: What is FDA's secret and how does FDA utilize science and build consensus answers to so many inherently contentious issues? The answers are not found in FDA's organizational diagrams or job titles.

We find ourselves explaining modern versions of two very old history lessons—what Alexis de Toqueville reported long ago to Europe about the uniquely open processes for American lawmaking (and in its modern derivative—rulemaking), and Dr. Harvey Wiley's discussions with President Theodore Roosevelt at the beginning of the last century about the importance of science-based regulatory decisions. From a world perspective, FDA's utilization of public issue meetings, access to agency information, voting advisory committees, requirements for scientific evidence and reliance on scientific facts in its decision-making process are more uniquely American than we may realize. The interplay of these features into an independent regulatory function that coexists with prescribed Congressional and Judicial roles constitutes the most envied regulatory model in the world.

Today, I share with you my priorities for preserving this capability and for preserving the agency's credibility with the American public. As we begin the 21st Century, fiscal Year 2001 will be critically important for FDA because so much of our environment is changing rapidly and our capability to understand, adapt and respond will be stretched to new limits. To maintain our strength: We must strengthen our science; we must address the highest priority risks; we must engage in effective collaborative and leveraged activities; and, we must design ever more predictable, timely and transparent regulatory processes.

Stronger science.—FDA's commitment to assuring safe products rests squarely on our ability to keep pace with the explosion in scientific advances—and then to use that knowledge to assure safe products. We must apply our intellectual capital at every point in the life cycle of the product. When consumers buy food items, drugs or medical devices, they're purchasing not only the product itself, but FDA's implicit assurance that the product is safe. To give them such assurance in a world with so many new products, FDA must quickly understand these sophisticated new products and the science within them and judge their suitability for the market place. Timing is everything! Wayne Gretzky, of ice hockey fame, was asked to tell what made him a successful player. He said: "I skate to where the puck will be." FDA is in a similar position. We must be able to anticipate and access the cutting-edge science that will be needed to regulate the products of future technology. When this is possible, we can apply this science at the point when the new technology arrives, and when it is absolutely essential to steward these products, many of them life-saving, to the market.

FDA is the regulatory gateway through which an estimated \$50 billion in annual biomedical research and development investment must pass and be judged. During the President's State of the Union address last month, he noted that innovations in science and technology will be the key to miraculous improvements in the quality of our lives and advances in the economy as we enter the 21st Century. He discussed the remarkable fruits of research—much of it taxpayer funded—that promise to improve both our health and the way health care is delivered. You and your colleagues on other appropriations committees have overseen a major expansion of Federal research in recent years, and those investments will pay dividends many times over for us all.

If FDA is not in a state of scientific readiness when applications are received, then we must either delay regulatory decisions on important new applications until we have adequate knowledge or make very conservative decisions in order to err on the side of caution. Neither of these choices is good for the American people because they delay the availability of critically needed treatment as well as result in increased health and economic costs. A recent industry survey by Pricewaterhouse Coopers concerning FDA's relationships with its regulated industries reinforces the need for FDA to be scientifically prepared. The survey concludes that FDA must invest in recruiting and training exceptionally qualified personnel at all levels. So I would urge your careful consideration of our resource needs as they relate to FDA's scientific strength.

FDA can deliver when properly resourced. Congress' authorization and support of the Prescription Drug User Fee Act and its Reauthorization in the FDA Modernization Act is a prime example. Review of drugs and biologics in the U.S. is now as fast or faster than anywhere in the world and this has been accomplished without lowering our very high standard for safety and effectiveness. We want to be able to perform this well in all of our products that require premarket evaluation.

ASSURING SAFETY BY MANAGING RISK

A strong FDA science capability is equally critical in understanding and managing risks associated with products that are already in the market place. Each year, hundreds of thousands of adverse experiences are reported in association with foods, drugs and medical devices. When we can apply cutting edge science to these problems, particularly in cooperation with our health and regulatory partners, as well as those in the regulated industry, we can quickly identify significant risks and minimize them.

In managing risk, FDA has always adhered to the principle that the most serious risks should be addressed first. This idea takes on added meaning, given the complexities of our 21st Century environment. You will see evidence throughout our budget that the most serious problems are at the top of our list. To illustrate:

The medical error initiative in our fiscal year 2001 budget emphasizes FDA working with other agencies in the Department of Health and Human Services and with Departments across the Federal government as part of the President's new and comprehensive plan to improve health care through the prevention of medical errors and enhancement of patient safety.

Drugs marketed and sold from illegitimate Internet pharmacy sites present real risk for the American consumer. These have been made a priority for fiscal year 2001. FDA will use prevailing Internet hardware and software to focus on suspect web sites, and will convey a rapid response team to deal with these sites. FDA also intends to work very closely with State authorities and other Federal agencies in order to expedite the elimination of this fraudulent activity. We also plan to step up our efforts to educate consumers about the risks involved and what types of sites or practices they should avoid.

Again, we have addressed the most serious risks first as part of the Food Safety Initiative. If provided the funding requested, we will be able to inspect the high risk food firms at least once a year. We would continue the work supported by the Congress in the past which focuses our efforts in the import arena by targeting imported produce that contain microbiological pathogens. Your support has also allowed us to invest in new science-based tools like PulseNet, a collaborative project between CDC, FDA, USDA and state health departments, which uses rapid analysis of bacterial DNA fingerprints to pinpoint the exact source of food borne illness outbreaks. More of these detection tools will revolutionize our ability to detect and prevent a wide range of adverse experiences and to focus on the most serious ones first; but we need resources to do this.

While we have identified the aforementioned as investments that would be focused on high risk in each of our product review centers, we must also focus and invest in applications that have the greatest potential for providing widespread health benefits. A critical provision provided by FDAMA is our ability to delegate to third parties the responsibility for reviewing medical device applications in lower risk categories. In this year's budget request, a Device user fee is proposed to further encourage reviews to be performed by third parties which will result in greater efficiencies for both FDA and the industry. This allows our Agency's scientific review resources to be dedicated to the more complex new products that often carry significant risks but have the potential for great health benefits.

COLLABORATION AND LEVERAGING OPPORTUNITIES

Working with FDA's assets alone is not sufficient to address the complex risk management challenges that we face. Many of the initiatives in the fiscal year 2001 budget require our Agency to work in concert with a broad spectrum of stakeholders to strengthen the safety net for the U.S. consumer. A prime illustration of this approach is in Food Safety.

Because we regulate in a global market place, our collaborative efforts must extend beyond our domestic borders. In this regard, we collaborate with our foreign regulatory counterparts in joint efforts that include setting standards to reduce the risks of products to the consumer. Whether it's within our domestic boundaries, or beyond, FDA undertakes such collaborative initiatives because all parties can unify behind goals that are in the best interest of public health and safety. With such collective efforts we will be able to move our world to better health outcomes.

Open, transparent and predictable regulatory processes.—Another key provision of the FDA Modernization Act of 1997 directed our Agency to consult with our many stakeholders on an ongoing basis, to keep them apprised of our strategies and new product decisions, and to generally make them an informed participant in our regulatory processes. The relevant principle, here, is that a confident and well-informed individual or industry also becomes a partner in shouldering the management of risks.

A recent example of this principle in action is the success FDA is enjoying in the "Take Time to Care" Initiative. This involves a partnership between FDA, the National Association of Chain Drug Stores, senior citizen groups, professional associations, business/labor women's organizations and other health organizations. This partnership effectively delivered an important message about safe drug use by distributing a brochure titled "My Medicines" through more than 20,000 pharmacy outlets to millions of citizens. The intent was to positively affect their use of medications. A national evaluation has revealed that 99 percent of both men and women found the drug information they received to be useful and 86 percent indicated an intention to speak with their physician or pharmacist about their medication.

We intend to keep these communication channels alive and "humming." This Spring we will listen at two additional stakeholder forums—the first at Stanford University in March, and the second at Duke University in April. At both of these sessions, we will no doubt receive suggestions on how to improve our programs and further strengthen our working relationships with our constituencies.

These 21st Century ways of doing business—strengthening science; addressing the highest risk priorities; collaborating effectively with our partners and leveraging our resources; and using open, transparent regulatory processes—must be applied across the entire spectrum of product development, review and postmarket monitoring. The total safety assurance system requires FDA's best performance at several critical points. It starts with effective communication with industry prior to the submission of applications, thus improving the quality of submissions received and helping to reduce product development times. Next, we must monitor the progress of new therapies as they are developed, including the important responsibility of overseeing clinical trials. Once a product is approved for the market place, we must continue to assess and manage risk through regular plant inspections and analysis of adverse event reports. Feedback from our monitoring and analysis activities also influences future pre-market review decisions and appropriately informs us so that directed intervention can take place in the postmarket arena should threats to the public health and safety arise. Interventions can take several forms, including education, technical assistance and when necessary, enforcement actions and product removals. When we are able to play all of these roles effectively—bolstered by science and augmented by partners who share our goals—American citizens can be confident that an effective safety assurance system is in place. FDA's budget proposal for fiscal year 2001 moves us toward that desirable state of affairs.

FDA Accomplishments

When I appeared before you last year I outlined five issues that I considered to be my highest priorities. These were implementation of FDAMA, strengthening the Agency's science base, implementing the Food Safety initiative, assuring the safety of the U.S. blood supply, and reducing young people's use of tobacco products. I am pleased to report to you today that thanks to your continued support we have made significant progress in each of these priority areas:

FDAMA IMPLEMENTATION

Last year I committed to you that FDA's energies would be dedicated to carrying out both the spirit and letter of the Law. I am pleased to report another year of exceptional accomplishments in this regard.

To meet the letter and spirit of FDAMA, a scientifically strong and efficient FDA must join forces with other organizations to address increasingly complex challenges in order to protect the public health. While consultation and collaboration with our constituents is not a new practice for FDA, the FDA Modernization Act made the collaborative principle so central to the agency's operations that its implementation required a fresh look at some of our long-standing practices. The Agency's record this past year provides demonstrable evidence that FDA is meeting FDAMA's expectations for outstanding effort and bold new thinking.

FDA has continued working to implement the many specific requirements of FDAMA. Last year I reported that the Agency had completed over 80 FDAMA-related actions. To date, the Agency has completed over 110 FDAMA-related actions with more expected; all within statutory deadlines. Some of the initiatives completed within the past year include: the OTC final monograph for sunscreens, a final rule to exempt selected class I medical devices from pre-market notification, a final rule that governs requirements associated with reporting adverse events for medical devices, and guidance that grants market exclusivity to drug sponsors who provide information relating to the use of the drug by children.

Another key provision of the FDA Modernization Act was the reauthorization of the Prescription Drug User Fee Act of 1992. I am proud to report once again that FDA has met or exceeded practically all performance goals required. As I mentioned earlier, FDA has demonstrated that if we are provided adequate resources, we meet or exceed our goals.

Patients receiving safe and effective therapies they need in a timely fashion is the primary public health benefit of this program. The median approval times for NDA submissions in calendar 1999 was 13.8 months, but if the current rate of first review approvals is sustained, 2001 and 2002 median approval times may drop significantly. Median approval times for priority applications submitted in calendar 1999 dropped to 6 months, which is more than twice as fast as the corresponding times before PDUFA.

This shortening of development times also results in incredible savings to the pharmaceutical industry. A report released this past summer by the Tufts University Center for the Study of Drug Development shows that clinical development times for new drugs in 1996–1998 dropped 18 percent from the period of 1992–1995; thus saving industry up to \$2 billion for the \$140 million annual PDUFA investment. This savings is realized not only because important new products go to market more rapidly, but also because drug firms are able to operate in a more predictable regulatory climate—one that makes their own product development planning more efficient.

It is also heartening to note that several new products that received approval this past year represented significant advances over those previously available.

For patients with HIV and AIDS FDA's work in 1999 added several new products to the growing number of treatments. One of them is Amprenavir (Agenerase), a new protease inhibitor that received an accelerated approval for use in children as young as four. Amprenavir attempts to prevent HIV from making new copies of itself by interfering with HIV protease enzyme.

For the elderly FDA approved new medications and indications added to the treatment options for many of the 18 million Americans—mostly senior citizens—affected with rheumatoid arthritis and osteoarthritis. The Agency also approved a combination of aspirin and extended-release dipyridamole (Aggrenox) to reduce the risk of stroke.

For people with diabetes three new products approved last year will bring benefits to many of the 16 million Americans affected by diabetes, a disease that can cause damage to the eyes, kidneys, heart and peripheral circulation.

For people with hepatitis C FDA approved several new treatments for the almost four million people in the U.S. who suffer from this disease. Hepatitis C, is the nation's most common blood-borne infection that poses a serious risk of cirrhosis, liver cancer and liver failure.

For people with rare diseases I am pleased, also, to report major progress in our Orphan Products Program, a key program developed after the passage of the Orphan Drug Act of 1983. Orphan products are those that treat diseases or conditions affecting fewer than 200,000 people. That program reached a major milestone last year by approving the 200th designated orphan product. In 1999, 78 drugs and biological products received designation as orphan products—a 16 percent increase over

1998. We estimate that past levels of sponsor orphan designation applications may soon be doubled. Nineteen designated orphan drugs were approved for marketing in 1999, including treatments for neoplastic meningitis, ovarian cancer and hemophilia.

STRENGTHENING FDA'S SCIENCE BASE

As I have mentioned previously, strong science is critical for FDA to safeguard the credibility of its regulatory decisions made at every stage during the life span of the product. Science must underpin every one of our activities including our consultation with product sponsors, review of commercial applications, the establishment of product and process standards, and the identification and correction of hazards in the market. FDA science must also provide the foundation for all of the Agency's negotiations on product standards in the international arena. In each of these facets of FDA responsibility, the Agency must keep pace with the incredible pace and complexity of new science developments. The biomedical science community is developing novel approaches to detect, treat, and prevent disease. If FDA does not keep pace, our judgements and decisions may become risk averse and at times slow, possibly wrong—or both. Neither of these is an acceptable outcome. The Agency must build its own capabilities and have the ability to leverage talents and expertise of scientists and scientific organizations outside of the organization.

Let me provide a few examples of the importance of science to our regulatory role:

FDA scientists have developed a single rapid technique (rapid screen) that identifies as many as 13 common foodborne pathogens, including *Salmonella* spp., *Shigella* spp., and *Escherichia coli* 0157H7 from one sample in a test that takes only 8 hours to complete. This method is permitting faster hazard detection and removal of potentially dangerous foods from the marketplace.

Our scientists also developed a test system that would help to determine the extent of interference of cardiac pacemakers caused by cellular telephones. This research has formed the basis of a standard for implantable cardiac pacemakers and defibrillators that are being proposed by the Association for the Advancement of Medical Instrumentation.

FDA scientists have developed a transgenic model that can be used to screen for toxicities. By using this model, scientists are learning more about how specific chemicals cause toxicity in humans, and how to extrapolate results from animal species to the human. Some of our molecular epidemiologists have also worked with academia and industry to develop and validate a microchip product designed to identify individuals at risk for cancer and/or adverse drug interactions. The significance of this chip technology is that it allows for researchers to screen large numbers of people simultaneously for different types of biomarkers, or potential disease vulnerabilities.

FDA has successfully launched the Product Quality Research Institute Initiative (PQRI). PQRI is a non-profit corporation whose mission is to conduct research to support science-based regulatory policy regarding product quality.

FDA has also taken action to assure that our scientists keep pace with and effectively monitor products that are produced by state-of-the-art manufacturing and quality control technologies. This past fall FDA launched a new joint training program focused on emerging technologies of relevance to the Agency. The training is conducted in cooperation with the regulated industry. The first of these courses brought together more than 30 FDA field investigators, Center scientists and field lab analysts to a Merck manufacturing plant in Pennsylvania to address state-of-the-art sterilization methodologies. Similar advanced courses are planned for the future.

These selected examples illustrate the direct and immediate value of applying FDA's science expertise at critical junctures in the regulatory process.

To remain a strong science-based agency, we must continue to assess emerging technologies well in advance of their arrival on FDA's doorstep. We must prepare for and remain prepared to meet not only the public health challenges of today, but also the future challenges of a rapidly changing science and technology environment.

FOOD SAFETY INITIATIVE

FDA, in collaboration with the Centers for Disease Control and Prevention (CDC), the U.S. Department of Agriculture (USDA), and State and local governments, continued progress towards developing an integrated national food safety system. Your support has also provided for mechanisms in the shortening of several significant outbreaks of food borne illness, translating into fewer deaths and illnesses. In 1999, FDA placed particular emphasis on enhancing the safety of imported food products.

At the border, FDA initiated a 1,000-sample survey of high volume fresh produce imports. Overseas, FDA doubled the number of foreign food establishment inspections, conducted five assessments of foreign food safety systems, and provided extensive education and technical assistance on use of the Good Agricultural Practices/Good Manufacturing Practices guidance for produce.

Other accomplishments in the food safety arena include the following:

FDA and the U.S. Customs Service developed an Imported Foods Action Plan to further enhance border surveillance. The Plan will be implemented this year.

FDA conducted the second year of seafood HACCP inspections, with priority to processors with implementation problems. FDA found clear progress by most seafood processors, but also issued warning letters to those firms with significant, unaddressed deficiencies.

FDA issued two guidance documents to enhance the safety of sprouts, including guidance for microbiological testing.

FDA published a proposed rule that would require refrigeration of shell eggs at retail and safe handling statements on labels of shell eggs.

In collaboration with USDA, EPA and the Department of Commerce, FDA completed an Egg Safety Action Plan that identifies the systems and practices that need to be implemented to sharply reduce eggs as a source of human Salmonella enteritidis illness. Implementation will begin in fiscal year 2000.

FDA completed revisions to the Food Code to enhance the safety of food prepared outside the home, including restaurants, nursing homes, hospitals, and day care centers. The Food Code was adopted by agencies in 15 states.

FDA continued the expansion of the National Antimicrobial Resistance Monitoring System (NARMS), a collaborative effort among the FDA, USDA, and CDC that monitors susceptibility to 17 antimicrobial drugs in food borne pathogens from human and animal clinical specimens, healthy farm animals, and carcasses of food-producing animals at slaughter. Important augmentations of the NARMS were funded from the Food Safety Initiative during fiscal year 1999.

FDA also provided educational materials to farmers regarding how to prevent future outbreaks and the spread of the multi-resistant organism, Salmonella typhimurium DT104, among animals and to human beings. This was accomplished through collection of information from a field study, several farm-based efforts, and molecular genetic research on a Vermont dairy farm. On-farm poultry studies were initiated in five States in collaboration with USDA to determine the management, production, and drug use practices that influence the development of resistant zoonotic pathogens. Studies examining the effect of the prudent use of antimicrobials on chicken farms began in association with the University of California and Michigan State University.

FDA and USDA collaborated with medical microbiologists from hospitals in Mexico and Guatemala who are interested in initiating an antimicrobial resistance monitoring program. This collaboration between the U.S. NARMS officials and the Mexican antimicrobial surveillance group represents the beginning of the first international human and animal monitoring system for food borne antimicrobial drug susceptibility surveillance in the Americas. The collaboration will lead to improvements in the Mexican Surveillance Program, which will reduce the possibility that contaminated food products will be shipped to the U.S.

ASSURING SAFETY OF THE U.S. BLOOD SUPPLY

Last year I shared with you that more than 3.5 million Americans receive blood from volunteer donors. The most serious risk that these citizens face is the possibility of transmitting undetected diseases. Blood shortages, however, can also present a life-threatening situation. In February 1999, the National Blood Data Resource Center (NBDRC), a corporation affiliated with the American Association of Blood Banks, published a projection that the Nation's demand for blood could exceed the available supply in the foreseeable future. FDA has the responsibility for balancing the need for greater blood supplies with the increased risk associated with more diverse sources of blood and wider access.

Last year I indicated that FDA had developed a Blood Action Plan to address these issues. I can report to you now that with your support the Agency has continued successful implementation of that Plan. The Plan is being jointly carried out by FDA, the Centers for Disease Control, the National Institutes of Health, and the Health Care Financing Administration. The Plan addresses highly focused areas of concern such as emergency operations, response to emerging diseases, updating and reinvention of regulations, monitoring the blood supply, and ensuring compliance with blood regulations. Last fiscal year, the Agency satisfied several key elements of the Plan:

The Agency completed a systematic update of the blood regulations. As a result of this update, obsolete blood regulations were eliminated; and guidance documents are now focused on those standards that are enforceable.

Under the Blood Action Plan, FDA is harmonizing its new Biologics License Application for blood products with its New Drug Application. In addition, FDA, CDC, and NIH representatives have formed an Emerging Infectious Diseases Committee that has developed plans for responding to emerging infections that threaten the blood supply.

The Agency met its statutory requirement of inspecting all registered blood banks and source plasma operations within the past two years. Compliance of these establishments with current Good Manufacturing Practice requirements now exceeds 95 percent.

Agency scientists responded to challenges by blood-borne pathogens for which there are no vaccines or adequate therapies. Blood supplies are often exposed to the dangers posed by such pathogens as HIV, Hepatitis B & C, and Transmissible Spongiform Encephalopathies (TSE). Because these pathogens have evaded known therapies, our strategy is to test and disqualify donors and blood donations found to be contaminated with these pathogens.

Assuring the safety of the blood supply is paramount; but FDA also recognizes that assuring the availability of safe blood is also a major public health challenge. To that end, FDA participated in a workshop this month sponsored by the National Heart Lung and Blood Institute, entitled: "National Strategy to Increase Blood Donation." Several initiatives were reviewed at this workshop, including: considering the use of previously deferred blood donations—e.g., therapeutic hemochromatosis donations, using computers to simplify blood donor interviews, and generally increasing donor incentives for participation.

Challenges to the safety of the U.S. blood supply remain ongoing. One of the Agency's most effective responses is to join forces with its fellow health and regulatory partners to stem these threats. The Blood Action Plan demonstrates such a united effort. I will keep you apprised of further developments fulfilling this critical Agency priority.

REDUCING YOUNG PEOPLE'S USE OF TOBACCO

I reported to you last year that over 400,000 Americans die from tobacco-related illnesses each year. Virtually all of these people began the use of tobacco as children. Thanks to funds you and your colleagues appropriated in fiscal year 1998 and fiscal year 1999, FDA, in cooperation with its federal and state partners, and with the retail community, has been able to launch an effective enforcement and outreach effort. We have early indications that these combined efforts are starting to have an effect. The University of Michigan's Institute for Social Research reported that although accessibility to cigarettes by 8th graders was still very high (72 percent) that figure has been falling since 1996.

Let me cite a few highlights of the program efforts in 1999 that are contributing to this hopeful turn-around in youth smoking:

In the enforcement area, FDA now has contracts in place with all 50 states and 3 territories to conduct compliance checks of retail establishments. This establishment of a comprehensive compliance network exceeded all of our expectations. As a result, in 1999 we achieved a 166 percent increase in the number of compliance checks conducted. Existing contracts resulted in a total of 107,200 compliance checks completed.

We also provided retailers with a mediation procedure to resolve civil monetary penalty complaints and avoid litigation. Many of the violators were small businesses such as convenience stores or gasoline stations. During a mediation conference call, the mediator offers the retailer suggestions for preventing future violations. This process has resulted in almost all cases being settled to the satisfaction of the retailer. They have been very favorably impressed. FDA has also capitalized on information technology by designing and installing a computer system to automate the program's processes and to develop and maintain a list of retailers selling tobacco in each state. This is of tremendous benefit to the states because it gives them a way of tracking up to 1.5 million retailers who may be selling tobacco. It also provides the States with the legal record that may be necessary for later civil monetary penalty proceedings.

FDA has also been active in attempting to reach retailers through a broad scoped advertising and education campaign. In addition to reminding retailers and sales clerks not to sell to minors and to check young peoples' photo identification, the campaign also urges customers to cooperate with retailers to help keep young people

tobacco-free. Last year, FDA received the marketing industry's highest honor for effective advertising, the EFFIE Award, for its advertising and education campaign.

In addition to the priority areas I have outlined above, we have also undertaken work in a variety of high profile and controversial areas—bioengineered foods and dietary supplements, to name a few. We are making strides in these areas, but each is a work in progress.

A final issue I raised with the Committee last year as a recently confirmed Commissioner, was my desire and intention to restructure and streamline the Office of the Commissioner in order to realign resources and functions. I appreciate the Committee's support of my plans. The reorganization is now complete. We are now undertaking an additional step to reinvent many of our processes to make the Office of the Commissioner and the Agency programs which it supports operate in an efficient and effective manner. During the course of this past year I appointed two people to key leadership positions in the Agency. Dr. David Fiegel is our new Director of the Center for Medical Devices and Radiological Health. He brings with him an extensive background in the academic sector as well as managerial experience in two of our other product centers—Biologics and Drugs; Dennis Baker is our Associate Commissioner for Regulatory Affairs. Mr. Baker was Chief of the Bureau of Food and Drug Safety within the Texas Department of Health . and while he was in that position he established a strong reputation for being a regulatory 're-inventor.' He will be a very valuable resource to me as we work closely with the states to achieve our mutual public health and safety goals.

Now, let me discuss our fiscal year 2001 request before you for your consideration.

FISCAL YEAR 2001 BUDGET REQUEST

No matter how many or laudable our accomplishments may be, there still is much to do. This year's budget is reflective of the high priority areas where we need your support to assure that strong science will guide our decisions and ensure a strong safety net is in place for the American Consumer. The fiscal year 2001 President's budget request for FDA is \$1,390,831,000—an increase of \$176 million over FDA's fiscal year 2000 enacted level. This budget targets improvements that will: bring new products to market through strong science; and assure a strong safety net for products on the market through strong science.

By strengthening both of these areas, FDA is assuring safety throughout the life cycle of the product.

In addition, the budget identifies major initiatives of special note and interest to the President and the Congress including Food Safety, Youth Tobacco Prevention and Bioterrorism. The budget also targets critically needed improvements to FDA's Infrastructure—specifically replacement of the Agency's Los Angeles regional laboratory facility, completion of the Center for Food Safety and Applied Nutrition in College Park, Maryland and continued support for the Arkansas Regional Laboratory.

Let me briefly highlight our major initiatives in each of these areas:

Bringing New Products to Market Through Strong Science

(1) \$42 million to enhance the science-based review of new health-giving products so that they can more rapidly enter the market place.

(2) Improving pre-market review of products submitted and accelerating the process of generic drug review thereby reducing the cost of medical care to the public.

(3) Expanding the scientific expertise to meet increasing demands while maintaining FDA's high standards.

Assuring A Strong Safety Net Through Strong Science

(4) \$15.9 million to reduce the number of Americans who die annually from medical errors, currently estimated at 100,000. We would significantly upgrade and make more comprehensive our adverse event report systems, including those for dietary supplements and animal drugs. With our labeling initiative we would also be able to reduce the errors made because names of drugs sound similar.

(5) \$13.5 million to better ensure the safety of products on the market by conducting more inspections to support statutory compliance.

(6) \$10.0 million to protect consumers from illegitimate Internet pharmacies that inappropriately prescribe medications, increase the risk of dangerous drug interactions or sell potentially counterfeit or contaminated drugs. Our rapid response team would be supported with upgrades to our computer technology used to identify, investigate, and prosecute illegitimate Internet pharmacies. In addition, we would enhance our public education campaign on safe ways to purchase pharmaceuticals over the Internet.

Initiatives of Special Note and Interest to the President and the Congress

(7) \$30.0 million to enhance the safety of the food supply through strengthening key elements of the President's Food Safety Initiative by increasing inspection frequency for high risk food firms; implementation of an Egg Safety Action Plan; developing nation-wide standards for food safety; and expanding the research activities necessary to support the entire initiative.

(8) \$11.5 million to ensure expeditious development and licensure of vaccines to be used in response to possible bioterrorist attacks; and to respond to foodborne contamination.

(9) \$5.0 million to promote and protect the health of our nation's youth by reducing the number of young people who begin to use tobacco products. Compliance checks and compliance-based outreach efforts would increase with these funds.

FDA Infrastructure Improvements

(10) \$20.0 million to replace our outdated and unsafe Los Angeles laboratory facility. This facility is the site that must test many of the products imported from foreign countries, particularly food products.

(11) \$5 million in one-time costs to move the Center for Food Safety and Applied Nutrition into a new facility at the University of Maryland in College Park.

(12) \$3 million to continue the next phase of the plan for the Arkansas Regional Laboratory.

In addition, the Agency is requesting \$14.2 million in proposed existing user fees; and \$19.5 million in proposals for new user fees.

Each of these requests is described in more detail which follows:

BRINGING NEW PRODUCTS TO MARKET THROUGH STRONG SCIENCE

New products entering the marketplace will change the face of health care and will help us lead longer, healthier lives. They will also bring enormous economic benefits, both in lessening the cost of health care and in returning profits on the investments that are being made in research.

We are requesting \$42 million to enhance the review of new health-giving products so that they can be considered in a timely fashion for entry into the market place. FDA efforts will focus on: direct food additive petitions; generic drugs; animal drugs; children's vaccines; the blood supply; pandemic flu; and medical device reuse. The requested funding for direct food additive petitions, together with funds provided in fiscal year 2000, would provide full funding for this important program.

FDA will use new funding to develop a focused effort in the rapidly evolving field of food biotechnology. FDA requires scientific expertise capable of reviewing products developed through the tools of biotechnology and for providing public assurance of their safety.

ASSURING A STRONG SAFETY NET THROUGH STRONG SCIENCE

Medical Errors (\$12.8 million).—One of my first initiatives as Commissioner was to establish a Task Force to evaluate the system for managing the various risks of FDA-approved medical products. The task force issued a report in May 1999, entitled, "Managing the Risks from Medical Product Use". The report confirmed that the high standard of premarket review has been maintained even as our reviews have become more timely. However, several key areas were identified where the safety net for consumers and patients could be strengthened. This report has led to a bold initiative in which FDA is a key participant along with other major health agencies in the public sector as well as health practitioners, hospitals, and states. In a related study the Institute of Medicine (IOM) estimates that close to 100,000 Americans may be dying each year as a result of preventable medical errors because of failures within the complex systems of modern health care. The aim of FDA's initiative in response to its own report and the IOM study is to aggressively deal with the medical errors and adverse events that are reported annually in the U.S.

Patients, doctors, nurses and other health professionals represent a key human component of our health care delivery system. This same system also includes a vast array of drugs, medical devices, blood and other biological products that are regulated by FDA. While the causes of medical error cover a broad spectrum, many involve the use of medical products. Preventing the errors can save people's lives and the health care system and society billions of dollars annually in unnecessary costs. FDA is working with agencies within DHHS and across the Federal government to develop and implement strategies to prevent medical errors.

Features that contribute to errors in actual product use are not always identifiable before FDA approval. Once products are widely used in today's complex and fast-paced healthcare delivery system, these "human factors" can emerge as safety

risks. The Agency has a number of surveillance systems to identify harm resulting from use of FDA-regulated products. We receive problem reports from hospitals, other health-care facilities and individual health care professionals. When the FDA is alerted to problems with a medical product, we conduct a thorough safety analysis using medical and scientific experts to identify critical factors causing the problem, and to identify problematic product features and safety procedures. To prevent further harm to patients, FDA takes actions necessary to minimize problems including communicating with doctors, other health professionals, and patients and requiring changes to the medical product. The “lessons learned” about safe product features are incorporated into the Agency’s review of future products.

Recent and dramatic increases in the complexity and numbers of newly-approved medical products, the trend toward their increased patient use, and increased time and cost pressures on health care providers, have raised the level of risk for human error in the use of medical products. While FDA receives over 300,000 reports each year, it is known that the vast majority of incidents are not reported.

The estimated costs for these medical errors are as high as \$29 billion a year. Increased resources will allow the agency to elicit more complete reporting as well as analyze report data in a timely manner and to invest in information technology to develop more effective systems. The Administration has set the goal to reduce preventable medical errors by 50 percent within the next 5 years. FDA’s request includes an additional \$12.8 million. If provided these funds we will:

- (1) Improve the reporting systems for blood errors and accidents.
- (2) Implement Phase II pilot of the Medical Device Surveillance Network (MeDSuN) to address under-reporting and incomplete user facility reporting of medical device errors. To accomplish this, FDA will recruit over 150 hospital reporting sites into a national reporting network. This system has the potential to be extended to drugs and other areas in future years.
- (3) Increase FDA’s capacity to conduct multi-factor analyses to correctly identify the sources of safety problems and potential solutions. This includes establishing links to safety databases maintained within community healthcare delivery systems and regional safety surveillance systems as well as augmenting our expertise in medical epidemiology and statistical analysis.
- (4) Develop new standards to ensure that pharmaceuticals are packaged and labeled in a manner that promotes patient safety.
- (5) Increase FDA’s capacity to act on safety findings, through better risk communication to providers and patients who use medical products; and partnerships with other health agencies and health care organizations.

Adverse Event Reporting Systems (\$3.1 million).—In addition to the adverse events discussed as part of medical errors, FDA monitors adverse events related to dietary supplements and animal drugs.

The dietary supplement industry is one of the fastest growing industries in the world. Dietary supplement sales have nearly doubled in the past five years and one study estimates that sales will increase by over 90 percent over the next six years. Surveys show that over half of the US population now uses some type of dietary supplement, spending over \$12 billion per year for these products. FDA estimates that the industry markets approximately 29,000 of these products which are sold under 75,000 distinct labels.

The number of adverse event reports related to animal drug products has risen from about 1,000 per year in the early nineties to over 12,000 for 1999. Because FDA does not have the resources to process these reports in a timely manner, they must be triaged and only those showing the most serious health hazards are evaluated.

Consequently, a substantial backlog exists in reviewing adverse event reports in both of these important areas. This budget request will improve our Adverse Event Reporting System (AERS) for animal drugs and dietary supplements. This will enable us to provide greater assurances to consumers that problems will be identified and action taken promptly.

Inspectional Activities (\$13.5 million).—FDA inspections, laboratory analysis, and related surveillance activities are the primary means of assuring industry compliance and thus consumer safety once products are in use. New technologies, international regulatory commitments, and increasing coordination with State partners require new and challenging expansions of FDA’s traditional inspection role.

FDA’s ability to physically verify the safety of domestic and imported products has eroded considerably in all product areas, even as consumer expectations continue to rise. We are falling significantly short of the minimum inspection obligations required by the FDC Act.

Import entries alone increased 14 percent in fiscal year 1999, and over all, less than 1 percent of import entries are physically examined. Even in conjunction with

its State regulatory partners, FDA is able to annually inspect less than a third of the domestic firms within its purview. The number of foreign and domestic inspections for foods, drugs, and devices (excluding mammography), has decreased from 28,000 to 22,000 between 1991 and 1999. This decrease of 6,000 inspections, or 21 percent, is due to the impact of the time required to perform the increasingly complex science based inspections, the almost static level of investigative personnel in the past eight years, and the increases in imports. The total volume of FDA-regulated imports is estimated to exceed \$50 billion per year and imports continue to grow in volume, complexity, and diversity of sources.

FDA requests \$13.5 million in additional funding to improve statutory inspection coverage for Human Drugs, Biologics, Animal Drugs and Medical Devices, where the law requires specific inspection frequency. The requested funds will keep the FDA from falling behind the fiscal year 2000 level of inspectional effort. Through the use of leveraging and expanding existing state contracts, FDA will make modest gains in inspection coverage. Specific performance improvements are identified in FDA's fiscal year 2001 Performance Plan. These funds will also allow FDA to enhance laboratory testing for pesticides, chemical contaminants and dietary supplements.

Internet Sales of Drugs (\$10 million).—The number of people who use the Internet for the purchase of medical products is growing rapidly. Many consumers, including those in rural or remote areas, those that can not leave their homes because of disabilities or who are elderly, greatly benefit from the access and convenience features of this option. However, on-line sale of prescription drugs also poses risks for the consumer. When buying from a brick and mortar pharmacy, a corner drug store, a strong safety net of State and Federal laws exists. Prescription drugs are to be dispensed only with a valid prescription, because they are not safe for use without the supervision of a licensed health care practitioner and dispensed from a licensed pharmacy. The availability of pharmaceuticals from the Internet can greatly disrupt this safety net. Patients who buy prescription drugs from Internet websites operating outside the law are at increased risk. During fiscal year 1999, illicit or illegal operated sites grew dramatically and we anticipate this trend to increase. This initiative will enable us to track down illegitimate operations and educate consumers by coordinating efforts with the states.

For fiscal year 2001, FDA seeks \$10 million primarily to conduct investigations and to carry out a public education campaign on safe ways to purchase pharmaceuticals over the Internet. FDA would use part of this request to support a rapid response team and to upgrade our computer technology to identify, investigate and prosecute illegitimate Internet pharmacies.

INITIATIVES OF SPECIAL NOTE AND INTEREST TO THE PRESIDENT AND THE CONGRESS

Food Safety Initiative (\$30 million).—The world of food has changed significantly over the past 50 years. Consumers' diets are more varied and include foods that are more susceptible to foodborne pathogens. A much larger percentage of meals are prepared and consumed outside the home. Vulnerable populations have increased by as much as 25 percent of the U.S. population to include pregnant women, children, the elderly, and immuno-compromised persons. Finally, the number of identified pathogens found in food has more than tripled. More to the point, these pathogens are more deadly.

The Food Safety Initiative represents a multi-year, inter-agency effort to respond to these changes and to improve food safety for the Nation. This initiative has successfully built a strong foundation for a state-of-the-art, science-based food safety system, and has promoted partnering among the key Federal agencies (FDA, USDA, and CDC), States, academia, industry, and consumers. A total of \$218 million, representing a \$30 million increase, is requested for FDA for fiscal year 2001. With this \$30 million increase in funding we will:

(1) Expand research and risk assessment activities that provide the cornerstone for a science-based food safety system. Food safety research is critical for the rapid and accurate identification of foodborne hazards; for regulatory enforcement; for the development of effective intervention techniques; and for better detection of antibiotic resistance. Risk assessment activities provide the information necessary to allocate food safety resources to the highest risks in the food supply.

(2) Develop consistent nationwide food safety standards. Standards development includes technical standards for particular products or processes, as well as product and/or process-specific guidance documents and regulations. Such standards provide consumers with increased assurance regarding the uniformity and safety of the food they consume. In addition, by providing current, clear and understandable expectations for industry, food safety standards provide a "level playing field" for food producers and processors.

(3) Begin implementation of the Egg Safety Action Plan to sharply reduce eggs as a source of human Salmonella enteritidis (SE) illness in the U.S. While eggs are an important source of protein in the diet, an estimated 1 in 20,000 eggs in the U.S. contain the SE bacteria and can cause illness if eaten raw in food or not thoroughly cooked before consumption. The Egg Safety Action Plan presents a comprehensive nationwide strategy to address this important food safety and public health concern.

(4) Expand domestic inspections to ensure annual inspection of all establishments producing food that is at high risk of microbiological contamination or high risk of causing severe disease. There are approximately 6,250 such firms. By "high risk" we mean: infant formula; ready-to-eat foods; heat and serve products; seafood; and low acid canned foods and acidified foods. The new resources would also be used to enhance FDA's oversight of state inspection programs, as well as to enhance laboratory capabilities for the analytical support associated with these inspections.

(5) Complete the National Antimicrobial Resistance Monitoring System (NARMS) by adding national and international data collection sites. At this fully operational level, NARMS will provide an effective early warning system to detect the emergence of antimicrobial resistance among foodborne pathogens. Also, develop new methods for routine surveillance of fluoroquinolone resistant Salmonella and Campylobacter to gather the data needed to make informed risk decisions concerning the use of quinolone-based antimicrobials in poultry and antibiotic resistance.

(6) Develop new methods for routine surveillance of fluoroquinolone resistant Salmonella and Campylobacter to gather the data needed to make informed risk decisions concerning the use of quinolone-based antimicrobials in poultry and antibiotic resistance.

Food Safety Initiative investments for the past three years have paid tremendous dividends. Foodborne outbreaks have been shortened. The risk of foodborne illness and death related to microbiological contamination of both domestic and imported foods has decreased. With the resources requested in fiscal year 2001, we will continue to provide the U.S. with a consistent, uniform system to respond to foodborne illness that will contribute significantly to shortened outbreaks and reduced incidence of illness and death.

Countering Bioterrorism (\$11.5 million).—Preparing for and responding to an attack involving biological agents is critical. Our task is made more complex by the large number and characteristics of many of the potential agents, many of which are rarely encountered naturally and have the ability to remain undetected for long periods of time. There is often potential for secondary transmission as they could be genetically engineered to resist current therapies and evade vaccine-induced immunity. While there is a clear and unquestionable need to develop specialized vaccines for these biological agents, there are limited commercial interests or market incentives addressing this problem. Thus, it falls upon the Federal government to ensure that such vaccines are developed.

FDA is an important contributor to the Nation's capability to respond to potential chemical and biological threats from bioterrorism. The FDA's critical role in bioterrorism includes assuring that new vaccines and drugs are safe and effective, safeguarding the food supply, and conducting research for diagnostic tools and treatment of disease outbreaks. Whether the issue is the development and use of rapid diagnostics to quickly identify a suspected biological agent or the capability to make available and administer large quantities of a vaccine, immune globulin, or drug to counter the effects of a bioweapon, FDA's research is the linchpin that makes it possible for the Centers for Disease Control and Prevention (CDC), the National Institutes of Health (NIH), the Office of Emergency Preparedness (OEP), the Department of Defense (DOD), and others to effectively respond.

FDA's research includes the development of new analytical approaches and methodologies to determine if new products provide needed benefits without causing adverse side effects that would outweigh those benefits. This research includes both laboratory and non-laboratory investigations to address FDA's regulatory responsibilities.

Due to the highly toxic nature of the agents identified as potential bioterrorist agents, specialized equipment and facilities are necessary and needed in the FDA to understand these agents to prevent, diagnose and treat outbreaks.

Other Bioterrorism activities that support FDA's efforts are:

(1) Vaccine development in collaboration with NIH, CDC, DOD, academia, and private industry to ensure expeditious development and licensure of vaccines for smallpox, anthrax, plague, tularemia, Q-fever, encephalitis-causing alpha viruses, and botulinum; Coordination of vaccine, drug and device stockpiling and preparation for emergency response including rapid detection and decontamination procedures.

(2) Development of new diagnostic products, rapid methods development, and comprehensive reviews for new drugs, therapeutics, and vaccines including new uses of existing products; development and stockpiling of specialized immune globulins; expansion of research to identify toxicity indicators associated with biological warfare agents; and, initiation of a monitoring system for chemical and biological agents in feed for food-producing animals.

*(3) In collaboration with NIH, CDC, DOD, academia and private industry, ensure that rapid methods are developed to detect biological agents that may contaminate the food supply.

The fiscal year 2001 request is \$11.5 million. This funding will allow the Agency to expeditiously review and approve every drug, therapeutic, vaccine, and anti-toxin to be administered to humans; complete the FDA review process for safety and efficacy of the pharmaceuticals, rapid diagnostics, and vaccines that are needed in the event of a bioterrorist attack; and, to educate vaccine manufacturers on the information needed for FDA approval.

Preventing Tobacco Use Among Children (\$5 million).—Tobacco products are responsible for more than 400,000 deaths annually due to cancer, respiratory illness, heart disease, and other health problems, representing five million years of potential life lost each year. Each day, nearly 3,000 young people across the country begin smoking regularly. Of these 3,000 young people, 1,000 will die prematurely because as a child they decided to smoke. Conservative estimates are that children and adolescents illegally purchase tobacco products 250 million times each year.

The Agency has devised a three-pronged approach of enforcement and evaluation, compliance outreach, and product regulation. The \$5.0 million in this request will be used to increase leveraging contracts with State and local tobacco stakeholders to allow more compliance checks of age and ID restrictions, and 100 percent re-checks of violators. It will also be used to develop a reliable, national list of tobacco retailers and complete installation of an information technology system to automate the program's business and communications processes, as well as increase the scope of the media campaign aimed at increasing retailer awareness of, and compliance with, the tobacco regulation.

Our overall goal—to reduce young peoples' use of tobacco—is a goal upon which we can all agree. We will continue to work with other organizations within the Department of Health and Human Services, other agencies, the States, and other stakeholders.

FDA INFRASTRUCTURE

Los Angeles Laboratory (\$20 million).—FDA's field laboratories provide critical laboratory and analytical support to the domestic and import inspection effort and are a key element in the science base of FDA. The Los Angeles District annually reviews nearly 1.2 million import line entries, almost 24 percent of the Agency total. In fiscal year 1999 alone, the Los Angeles laboratory analyzed 22.9 percent of the imported Foods samples taken by FDA. This laboratory facility is over 40 years old, outmoded and unsafe.

FDA simply cannot remain in the present Pico Boulevard facility in Los Angeles. We have the land and construction plans to relocate the laboratory to Irvine, California. This will assure that products are safe, provide the ability to partner more effectively with State laboratory personnel, and provide a safe working environment for FDA employees.

FDA requests \$20.0 million to fund a portion of the construction of the Los Angeles Laboratory and Office project. The request also includes \$23.0 million as an advance appropriation in fiscal year 2002 to complete the project. This construction will consolidate all three Los Angeles district sites into one location, replacing three existing leases totaling \$2 million annually. The new construction will concentrate the scientific talent available to permit better management of the analytical workload and will provide significant improvement in operational efficiency, especially during emergencies.

If funding is not provided, the Agency will be forced to shift work to labs in other states, further from the point of entry. This will obviously have an impact on FDA's import surveillance capability, the southern California food import industry and our consumers.

College Park Relocation (\$5 million) and Arkansas Regional Laboratory (\$3 million).—In 2001, the Center for Food Safety and Applied Nutrition (CFSAN) will be moving to a newly constructed facility in College Park, Maryland. Funds are needed to pay for one-time costs associated with equipping and occupying this facility. The fiscal year 2001 funding will support: telecommunications equipment and necessary

network connections, files consolidation and moving costs. We will also continue construction of the next phase of the Arkansas Regional Laboratory.

CONCLUSION

In summary, Mr. Chairman, fiscal year 2001 is the year in which FDA must cope with the maturation of two of the most massive and significant change forces the agency has ever faced. In 2001, the increasing impact of molecular science—genomics in particular—and the information revolution—especially the Internet and its linkage to an array of real-time data that was unimaginable only a few years ago—will combine their forces to change how many FDA regulated products are discovered, researched, manufactured, distributed, marketed and advertised. When the world around us changes this much, we must be prepared to respond in order to assure that products are still safe for American consumers. Our credibility to provide valid assurance is at risk without strong science, effective collaborations and consultation, and even greater openness and transparency in our processes.

I wish to thank the members of this Committee, their staff and the staff of the individual subcommittee members for their support this year. This subcommittee has many legacies, from improved agricultural production to safer consumer products to protection of the American farmer. I ask that you add another critically important one to the list—bringing forth the technological promise of the 21st century. If you will give FDA the resources to do the job I will commit to you that those funds will be used wisely. I look forward to discussions with this committee to ensure that we are able to fulfill our mission in this challenging environment.

RECRUITMENT AND TRAINING

Senator COCHRAN. Thank you very much, Dr. Henney, for your statement.

I noticed that the first point you make in your statement is about the scientific strength of the agency and how important it is to maintain that strength and to be prepared to deal with the challenges of regulating industries who are utilizing the newest developments in science. You also point out that there was a study by an independent industry with regard to the relationship of FDA and its regulated industries and concluding that FDA must invest in recruiting and training exceptionally qualified personnel at all levels.

My question is, is FDA successful in its recruiting and training efforts?

Dr. HENNEY. Well, Mr. Chairman, I would say that when provided the funds, we have been very successful in recruiting the kind of scientists and medical officers we need into the agency. I would cite in particular those funding patterns provided by the Prescription Drug User Fee Act and those provided particularly through the Food Safety Initiative. In very short periods of time, we have been able to recruit very highly qualified people.

The trick is retaining them and keeping them at the top of their game because this requires close attention to professional development while they are with us. I would say that particularly in the area of drugs and biologics reviews, to meet those very tight performance standards that we are held to, it becomes somewhat of a sweatshop for our reviewers to keep to those time constraints, and the limitations on time away to do the kind of training and re-investment we need has not been adequate in the past. Across the board in the agency science is needed in our other centers, our Center for Devices, our Center for Foods and other parts of the Center for Biologics as well.

This, therefore is an overall issue for the agency in terms of a time commitment and a funding commitment. We really have to

think about our reviewers as a 110 percent FTE, if you will, rather than a 100 percent FTE if you are going to provide them with time away for sabbaticals, retraining courses, and the like so that they keep current.

STRENGTHENING SCIENCE BASE

Senator COCHRAN. You mentioned in your statement that you have launched a product quality research institute initiative. That is a training program focused on emerging technologies of relevance to the agency. How are these initiatives working to strengthen the agency's science base?

Dr. HENNEY. Those are two separate initiatives, Mr. Chairman. The product quality research institute was launched this past year. It really is a leveraged or a partnership opportunity that we have entered into with both professional groups and industry to investigate more efficient methods of answering research questions about drug quality and manufacturing. They are particularly looking at issues related to stability studies and bioequivalence measures. So, this is using our resources in a leveraged capacity to look at issues that benefit all parties.

We have also launched this past year, after the appropriate reviews for conflict of interest and the like, educational sessions, training sessions, if you will, jointly with industry. We have had two successful training sessions where we have taken investigators and reviewers from several of our centers to an on-site location within industry that is looking at an emerging technology so we will know what is going on in their plant operations and that they will know what we will be looking for as we would develop or inspect against standards. These have been extremely productive sessions and we plan to continue them in the future. One was held at Merck on barrier isolation technology and one was held in Minnesota on issues related to food and food safety.

PREPARED STATEMENTS

Senator COCHRAN. I am going to yield to other Senators for questions at this point, and I am going to recognize Senators for questioning in the order at which they arrived at the hearing. My notes indicate Senator Gorton arrived first, Senator Durbin, and Senator Stevens who has left his opening statement for inclusion in the record and already made one comment, and Senator Harkin.

Senator Kohl and Senator Burns have previous engagements to attend, therefore I will submit each of their respective statements for the record.

[The statements follow:]

PREPARED STATEMENT OF SENATOR HERB KOHL

Mr. Chairman: I am glad to welcome our distinguished guests this morning. Secretary Shalala, I am especially pleased to see you here today. While most of the agencies under the jurisdiction of your Department are funded through appropriations subcommittees other than this one, the Food and Drug Administration is, of course, an exception. Still, in all the years I have served on this subcommittee, the Secretary of the Department of Health and Human Services has never appeared before us. I interpret your being with us today a welcome departure from protocols of the past and a statement on your part of the growing importance of programs under the purview of the FDA.

Dr. Henney, it is good to welcome you back. A year ago you appeared before us not long having been appointed as Commissioner of the Food and Drug Administration. Since that time, you have made great progress settling in as head of that agency. My congratulations to you.

I will not here go into all the programs under the FDA nor attempt to catalogue their importance for maintaining the health and safety of the American people. The evidence of that is apparent on its face. I would mention, however, the changing nature of the challenges before your agency. A global economy means a greater chance that food or disease harmful to us may be introduced on our shores either inadvertently or otherwise. The ever-rising costs of health care, prescription drugs in particular, is fast becoming one of the highest priorities of an aging and demanding public. Even the unfortunate specter of bioterrorism now hangs over our heads with new demands for proper and rapid responses in the event such a cataclysm should ever occur.

Your budget request calls for an increase above last year. I hope we will be able to accommodate that need. As we proceed through this year's budget process, and as we establish the level of resources available to this subcommittee for all our responsibilities, I will continue to place a focus on the importance of your mission.

I look forward to your comments.

PREPARED STATEMENT OF SENATOR CONRAD BURNS

Mr. Chairman, Thank you. I would like to first thank those who are presenting testimony before the Committee today. We all appreciate you taking the time to be here today.

It is quite possible that the Food and Drug Administration plays a larger role in day-to-day life in America than any other government entity. For this reason it is vital that we regularly re-evaluate the methods and practices of the FDA to ensure the best interests of Americans are being appropriately addressed.

Prescription drugs present ever-expanding medical opportunities. The advances in medications mean continued development of non-invasive treatments, enhanced quality of life, and expanded options in preventative medicine. Just reading over short descriptions of today's research initiatives gives us a glimpse of the future of patient care, disease treatment and, most importantly, even the elimination of the illnesses that have plagued us for centuries. It is truly exciting.

But is this to be a future that all Americans can afford? Is Montana going to have the opportunity to take advantage of cutting-edge advances in medicine? Our current course leaves behind those who lack the financial resources to purchase the new generation of pharmaceuticals. The same holds true for those who live in rural areas. The pharmaceutical revolution is leaving them behind.

I am encouraged to see that the average time period for FDA approval of a new drug has decreased since the enactment of the Pharmaceutical Drug User Fee Act. But in the aftermath of PDUFA, just as approval times have dropped the costs of drug approval have increased. These increases are, of course, passed on to consumers, with Senior Citizens bearing the brunt of the increasing prices.

I am very concerned about access to affordable drugs. Every day there are new stories about people choosing between food and pharmaceuticals. I represent a district where these problems aren't just stories in the newspaper but reality. I don't think that Americans should have to make this choice.

Generic competition makes drugs more affordable. They are as safe and effective as brand name drugs, but cost much less. My concern is that FDA is not helping to bring these products to the market as expeditiously as possible. In fact, the statutory review time for generic drugs is 6 months, but your actual review is 19.9 months. Review of pharmaceuticals in a timely fashion is a central part of FDA's core mission, but FDA is not meeting that mission. This is very worrisome, especially when I hear that the review process is predicted to lengthen to almost 21 months. How will FDA address this problem?

I believe it is time to change the system of dis-incentives which discourage FDA approval of new, innovative drugs. I call for a return to the concentration on the most important person in the health care equation—the patient. I look forward to seeing these changes and the positive results they will carry for all Americans.

Senator COCHRAN. Senator Gorton.

IRRADIATED FOODS—LABELING

Senator GORTON. Thank you, Mr. Chairman.

Before I get to the subject of my opening statement, a couple of questions on your direct responsibilities. As I had worked in that direction for more than a decade myself, I was delighted when the Food and Drug Administration approved the petition to irradiate red meat. Even more satisfying is the fact that the petition just reached the implementation phase and several beef processors have employed that technology.

As prescribed by law, your agency was to formulate a new label for irradiated food at the inception of implementation, but that has not happened. Why not?

Dr. HENNEY. Mr. Gorton, we have, as you note, been working in this issue of irradiation and labeling for some time. If you will indulge me, I will ask Mr. Levitt to join me—he is the Director of the Center for Food Safety and Applied Nutrition—to give you an update of where we are on that issue.

I think that we have also, in addition to this labeling issue, been trying to attack another problem that may be related and that is consumer confidence in irradiated products. To that effort, we have joined with many partners in terms of developing educational and informational material about that, and perhaps Mr. Levitt could share both of those initiatives with you.

Mr. LEVITT. Thank you.

In terms of food irradiation, we did put out a brochure, which really is an interim measure, not the rule you are speaking of, jointly with a number of private organizations, the American Meat Institute, the Food Marketing Institute, the Grocery Manufacturers Association, the National Food Processors Association, among others, to be sure that we educate consumers about this important technology, what it is, why it is safe, and why we believe it is making food safer for the American public. This will be distributed widely throughout the country as a way to get the communication to consumers, which really is what the rule was trying to get at.

We did put out, as directed by the Congress, an advance notice of proposed rulemaking last year to solicit public comments and get the right views. Really the issue is should we call it “food irradiation” on the label or should we use an alternative term. Things like “cold pasteurization” have been suggested.

What we found from the public comments is we really have widely divergent views. There is one view that we ought to use alternative terms because they view food irradiation as too scary. The alternative is, as Dr. Henney said, in terms of public confidence. We get a lot of comments from consumers. They say, no, please tell us what it is. Tell us what it is, educate what it is, and let us make our choice. So, I think we are struggling, in terms of going ahead with a final rule exactly, with what the right balance is to strike. That is why the interim measure. We are working jointly with other groups, as I said, on consumer education.

We also have instituted our expedited review for new technologies, including irradiation, and we have a number of petitions before us that we are trying to move through rapidly.

Senator GORTON. You are working hard on this then.

Mr. LEVITT. Yes.

GENERIC DRUGS

Senator GORTON. Good. Thank you.

Again, Dr. Henney, on another subject, perhaps the single step that FDA has taken in the last decade and a half has been to implement the Hatch-Waxman Act on generic drugs. Obviously, our people have saved billions and billions of dollars on this.

You were directed, as I understand it, to get the time for moving drugs from a laboratory to patients down to 6 months. It has come down, but it is still three times that length of time. What is being done to reduce that time lag even further?

Dr. HENNEY. Mr. Gorton, actually I think this speaks well or a bit to the first point and statement that you gave because I have long learned that there are some things I can control and others that I can only try to influence. On the issue of pricing in the marketplace and making sure that there are alternatives out there, this is one way in which FDA can be exceedingly helpful to the American consumer who is concerned about the price of prescription drugs; that is by running an efficient and effective generic drug program.

I think that we have invested over the last 2 years in terms of increasing our staffing in this area by some 15 percent. Some 10 FTEs were added in fiscal year 1999 and another 11 this past year. I think you should also know that we approved nearly 198 generics last year. 40 were first-time generics, and we have some 68 sort of waiting in the pipeline for other products to go off patent. So, this is a very vigorous program.

Could it be better? Certainly any system always can be. It always takes resources to do that.

PRESCRIPTION DRUG PRICING

Senator GORTON. Well, let us go on to the other question then. Obviously, this is not your direct responsibility, but speak to me to this price discrimination and to the most unjust burden, it seems to me, that is being imposed on all Americans in the cost of their prescription drugs by the kinds of price controls in other countries that simply seem to me to be designed to say that they will not contribute to the research and development. They will pay the cost of the pill after it has been developed and not much more than that. We do all the work in the United States and our reward is that our people either pay way more for many prescription drugs at least or, if they are fortunate and live close to a border, they can get onto a bus and go to Canada or Mexico and come back with those drugs at a much lower price. Just speak to that proposition in general, will you? It is hard to come up with a greater injustice in the field of health care than that one.

Dr. HENNEY. Mr. Gorton, I would speak to you in two ways. As a doctor and as a daughter, I am very concerned about this pricing issue. I see its impact not only on the patients that I used to care for that would make not good decisions because of the price of medication, and as a daughter who has—I cannot classify them as elderly parents, even though they are both in their eighties. They run around too much to be called elderly but they are concerned

about this whole issue of the price of prescription drugs and the constraints that it puts on decisionmaking.

But speaking to you as both a doctor and a Commissioner, I also have to be concerned about safety, particularly as people make choices about purchasing products from other countries and whether that is a safe practice or not. So, I would just get that out as a general premise.

I would also say that while the FDA Commissioner is given a lot of responsibility and much authority, pricing is not one of those issues that we play in directly except in the area of, as I have said, generics and, except in the area of our support of the administration's position on a prescription drug benefit. We can only try to influence some of the other areas. What goes into drug companies' decisions as they set their price on any particular product is not something that we are necessarily privy to, nor do we have much influence on.

But I would agree with your statement that there is much to be questioned here in terms of the impact that pharmaceutical drug prices ultimately have on the American consumer who needs these products.

FOREIGN PURCHASE OF PRESCRIPTION DRUGS

Senator GORTON. I have one more followup then. Is there a question of safety with respect to people who cross, let us just say in this case, the Canadian border and buy a prescription drug by its brand name? Is there any question as to whether that is not identical to what is manufactured and sold in the United States?

Dr. HENNEY. Mr. Gorton, I think when people point to Canada as a possible purchase site for products, and knowing the strength of their regulatory system as well in our interactions with them, there is perhaps a lessened concern about safety, but still a concern. We do know that in Canada some medications that are manufactured are manufactured at a different potency or equivalence than they might be here. That could cause a risk for an American consumer.

The trackability of a pedigree of a drug is more than in question. Where did bulk product come from? How was it manufactured? One is just put at increased risk when you do not know all of those things.

I think as we have listened to our Canadian counterparts—and it had already been a concern of our own—there is this whole issue driving Canada to somehow be used as a front port, if you will, for counterfeit or, in many ways, contaminated product becoming available. So although I could not point to any statistics in this regard, one has to be concerned about a safety issue here.

Senator GORTON. Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Gorton.

Senator Durbin.

BIOTECHNOLOGY FOODS

Senator DURBIN. Thank you, Mr. Chairman.

I have a series of questions and I will try to make them concise and hope that we can elicit some answers for better understanding. But let me start by thanking you, Dr. Henney, and your team at

the Food and Drug Administration. I have the highest respect for your agency and your leadership. The American taxpayers and consumers are well served by what is, by Federal standards, a relatively small agency with a huge impact on everyone's life in our country and beyond. So, thank you again for dedicating your time to public service, as well as the people who join you today.

We are blessed in this country to have a Food and Drug Administration. Europe is now talking about establishing one and it is long overdue. They are in the midst of an international panic within Europe over genetically modified organisms that find their place in the food supply. It has created a ripple effect across the globe. The farmers in Illinois and Iowa and other places are planting their crops based on the concerns of European consumers.

I guess the bottom line question, since the FDA also considers food safety is this, do you have any indication or evidence that any genetically modified organism in America's food supply is unsafe?

Dr. HENNEY. Mr. Durbin, I would respond to you by agreeing that some of the issues that have been very hot items in Europe, specifically with respect to food safety and now to the issue of does the technology also create an issue of food safety, have drifted a bit into our own country, although coming to us first because of the trade issues that you implied.

When we started hearing this level of concern last summer, we decided to hold a series of three public meetings to reexamine whether our policy, with respect to foods developed using the tools of biotechnology, appropriately serves us. We heard much at those meetings. We received over 25,000 comments from those sessions. And we are now weighing all of those things.

Let me just give you a glimpse I think of what we heard. We essentially posed two issues.

One: Was there any science out there that should give us a pause or cause for concern that would lead us to change our current policy, which in essence has companies coming to us in a consultative process if they intend to market a food that has been developed using the tools of biotechnology? To date, our experience had been that we have seen over 40 such products. Issues that were raised were resolved, and we do not see any issues with respect to safety of those that have been reviewed and are on the market.

I think with respect to new safety issues, in general there were none raised at these meetings, but I think that there was some consistency of thought that the complexity of the science that will be used in the future should be weighed as we reevaluate this policy. And we are doing that.

The second series of issues really revolves around how does one communicate best to consumers information that they may want to know. Is an appropriate way through a website, through disclosures at a point of purchase; or is it through a labeling kind of process? Therefore, we opened up that question.

Again, just to give you a thumbnail sketch of what we heard: We have heard four distinct messages.

One message was from one group who felt that it was not a matter of food safety necessarily, but this group wants to do anything they can to make sure that the environment is safe, and because of environmental concerns more than food safety concerns, want

this kind of information available to them so they can make those choices.

A second group clearly was more concerned about food safety, and it was expressed not in terms of evidence that could be pointed to in terms of an ongoing food safety issue, but what might potentially happen in future generations. This is a much more precise concern, but still more ill-defined in terms of scientific basis.

A third group basically was saying—and this is a less vocal group and yet a fairly sizable group—I am not really concerned about a food safety issue here, but I am an American who likes information. If there is some information out there, I would like to have it. In some way I would like to know more about these products.

A fourth group represented a minority at our meetings and in our responses, and yet I hear, as I have traveled in Europe and many of my colleagues have as well, that voice as a strong voice from the developing countries who say do not do anything to limit or constrain this technology. We need this technology to bring both real health to our people and economic health to our countries.

That gives you a glimpse into what we heard. We are still looking at our policy knowing this kind of information.

DIETARY SUPPLEMENTS

Senator DURBIN. Your answer, I am sure, reflects the attention that you have given to this issue. I do not know of a Senator or a Member of the House or anyone in public service who would compromise the safety of our food supply. I am looking to your agency, as I have for so many years, to lead the way in telling us the bottom line. If there is danger attached to genetically modified organisms of any kind, I trust that your agency is prepared to tell us as much, and if so, to take action against such things in our food supply.

I have a series of questions, and I am sorry I do not have more time. I promise the chairman I will be as concise as I can be.

Let me address another issue that is growing in interest among American consumers: dietary supplements. In 1994, we changed the law. We basically changed your responsibility in the Food and Drug Administration. Dietary supplements are now extremely popular in the United States—their sales have nearly doubled in the past 5 years, and estimates are that they will grow by over 90 percent over the next 6 years. Over half of the American people now take some form of dietary supplement.

We changed the law in 1994 and said that basically your agency did not have the authority to decide before these supplements were put on the market as to whether they were safe, but rather to monitor any reported bad incidents or bad experiences.

You also, under that law, do not have the authority, as I understand it, to establish a production or good manufacturing standards. So, those who want to advertise that they are selling certain supplements really do not have to prove at any point along the process that they are, in fact, selling what they purport to sell, the purity of what they sell, for example.

I would like to know what you think about instituting production standards or good manufacturing standards for dietary supple-

ments so that consumers would, in fact, be at least getting a known product of a known standard without potential contamination.

Dr. HENNEY. Mr. Durbin, yes, the Congress did pass in 1994 the Dietary Supplement Health Education Act, and it was signed into law. As with any law that you pass, we must develop an appropriate regulatory framework for that law, and we are busy about the business of doing that. We have completed this past year, under Joe Levitt's direction a comprehensive strategy that looks at how we put in place an overall regulatory framework for dietary supplements. It will take some time to complete that work.

I would just give you an example. When we were given the Safe Medical Devices Act in the early 1990's or the Medical Device Amendments of the 1970's, it took nearly 15 years to see the full impact of that law in place. So, we are working on this, slogging it out bit by bit in terms of putting this into place.

The issue with respect to GMP is that it is on our A list for this year, and we intend, by the end of this year, to have such a proposal completed.

SINGLE USE MEDICAL DEVICES

Senator DURBIN. Thank you.

One of the issues that I raised at last year's hearing and you responded to was the question of the reuse of single-use medical devices. For those who are not familiar with it, there are many hospitals across America which buy such important and medically sensitive devices as heart catheters which are labeled for single use only. Of the hospitals across America 30 percent pay no attention to that label and reuse that device, sometimes on five and six occasions. In between, it is to be sterilized and reprocessed, but patients are totally unaware of the fact that the device in most instances was sold to be used once and is being used over and over again.

A 32-year-old woman in Kansas had a heart catheter which had been reused multiple times. In the course of a procedure, the tip broke off and is now lodged in the right atrium of her heart. The manufacturer of the catheter had never before had to report one of the catheters breaking.

Now, what we tried to get across to you at the last hearing was the importance of collecting data on how often this happens across America with the thousands of single-use medical devices that are being reused mainly without the patient's consent or knowledge. Your MedWatch form, which your agency has produced, is designed to really, on a voluntary basis, collect this information as it relates to medications and medical devices. And we asked if you could make special note of this on future forms so that we could collect the data. But I am sorry to report, doctor, that we have not quite reached that point. I wonder how soon will your MedWatch form include a request for information as to whether the faulty medical device was in fact a single-use device that had been reprocessed and reused.

Dr. HENNEY. Mr. Durbin, with respect to the forms, when a device is faulty, it clearly is reported to us. Although it sounds simple, the issue of revising the form is not easily done. We have taken the burden really on ourselves to track back and see if a device was

originally labeled for single use or not. We still take your point that this change might be helpful, but in the meantime, we are tracking back to see what the labeling might have implied before.

Senator DURBIN. I will suggest to you that since we had our last hearing, you—at least your agency has exchanged correspondence with the association representing these medical device reproprocessors, really admonishing them that they have overstated the FDA's approval of their processing. So, at least it is fair warning that this industry may not be following standards that we would like. Consumers are totally vulnerable, unaware of the fact that these devices are being used repeatedly, and we have had some awful experiences. I do not know what it takes, but I hope that we can move more quickly to at least start reporting whether these are single-use devices being reprocessed, reused at the peril of the patient that is involved.

Dr. HENNEY. Mr. Durbin, I was only speaking to your issue about the form. FDA has been quite active in this area during the past year. We have developed a strategy which has been published to look at the different risk levels of reuse. We have published two companion guidances, one looking at this whole issue of reprocessing and reuse, looking at the high, moderate, or lower risk issues such as the likelihood of disease transmission, and the likelihood of a performance deterioration with reuse.

We also have guidance out with respect to our enforcement priorities in this area, and we have been issuing warning letters to reproprocessors as well.

We have worked very actively with the Joint Commission on Hospital Accreditation to engage their involvement with us in this whole area of reuse. There are many activities going on with respect to reuse and its appropriate use.

Senator DURBIN. I am going to quit at this point but tell you that I have two questions or observations that I will make a matter of record here. One relates to the orphan drug program, which I believe needs additional funding. I hope to persuade my fellow members of the subcommittee to join me in seeking that and, secondly, to some language that I included when I was a Member of the House on this same subcommittee in 1994, when it came to the question of clinical trials. My particular interest now is in gene therapy and the requirement that was included in our report to your agency many, many years ago that you track the individual patient data on these clinical trials. I think that the emergence of this issue of gene therapy and some of the sorry or sad results of the last few months really, I think, call into question whether we should revisit that and whether the 1994 advice to your agency should be followed.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Durbin.

Senator HARKIN.

Senator HARKIN. Mr. Chairman, I just first thank you and ask that my statement be made a part of the record.

Senator COCHRAN. It will be, without objection.

[The statement follows:]

PREPARED STATEMENT OF SENATOR TOM HARKIN

Thank you, Mr. Chairman, and thank you, Secretary Shalala and Commissioner Henney, for being here today to discuss the Food and Drug Administration's appropriations for fiscal year 2001. I am looking forward to hearing your priorities for the year.

I would like to especially thank FDA for its quick turn around on FSIS's request to allow the use of plastic packaging for e-beam pasteurization on an experimental basis. I think this is an excellent sign of FDA's commitment to making new food safety technologies available as rapidly as possible. I trust that FDA will continue to move as efficiently on the other petitions for new food safety technologies it has before it.

On FDA's budget requests, I am pleased to see that the Administration has requested an additional \$30 million in funding for FDA under the President's food safety initiative. This funding is absolutely vital to increasing FDA's food safety inspection and research activities. My staff has been visiting border inspection facilities and FDA-inspected establishments, and I can tell you that FDA is still greatly underfunded relative to the number of food products it covers. This money will be another step towards giving FDA the resources it needs.

I note that FDA also has requested \$20 million for renovation and relocation of its Los Angeles laboratory facility. This facility analyzes 23 percent of all the imported food samples taken annually by FDA. It is the primary laboratory for all produce coming across the border from Arizona and southern California, and is therefore very important to ensuring the safety of imported produce coming into the U.S. My staff has visited this facility as well, and I can vouch that this request is greatly needed.

Lastly, I am also happy to see the President's budget request includes a \$5 million increase for the FDA's tobacco program. This critical program does an excellent job getting enforcement dollars to local law enforcement to reduce tobacco purchases among teenagers, and includes important outreach and education efforts for retailers.

I look forward to working with the Chairman and members of the Committee to ensure that the FDA's efforts in these areas are funded at the President's request.

FDA-TYPE STRUCTURE IN EUROPE

Senator HARKIN. I appreciate that.

Commissioner Henney, again I first want to thank you and the FDA for its quick turnaround on the Food Safety and Inspection Service's request to allow the use of plastic packaging for e beam pasteurization on an experimental basis. I think this is an excellent sign of FDA's commitment to making new food safety technologies available as rapidly as possible. I trust that FDA will continue to move as expeditiously on the other petitions for new food safety technologies before it. But I want to thank you for that rapid response on that.

A couple of questions I was going to ask have been covered basically by Senator Gorton and Senator Durbin.

I am very happy to see that you are looking at, as you testified, new terminologies and new phraseologies and how that might work with respect to food irradiation. I think that is also very encouraging.

Last fall a number of us met. I think you were there too, Mr. Chairman, with Mr. Prodi, the president of the EU Commission, and a number of us I know met with him, and the EU trade minister from France, Mr. Lamy. But anyway, he committed to us that they were going to set up an FDA type structure in Europe. My question to him was, well, when? 10 years from now? No, they were going to move on it right away.

As I understand, they have sort of moved on setting up an FDA type of a structure in Europe, although I understand it is going to be just sort of an advisory nature only. It was my understanding,

when we talked with the members of the EU last fall, that it was going to have sort of a jurisdictional umbrella over all of the member countries. That does not seem to be the way that it is proceeding.

I am just wondering, have you been consulted? Has the FDA been involved at all in helping resolve these regulatory issues in Europe as they are trying to wrestle with this new structure? Are you involved in that at all?

Dr. HENNEY. Senator Harkin, we have been very involved with our counterparts in Europe as they started to discuss particularly the issue related to food safety or a food agency for the EU. I think that they were hoping in large part to implement a model like the FDA that has a strong legal framework, makes its decisions based on science, has both standard setting and enforcement capabilities, and can inspect and enforce against those standards.

As I understand it, their final framework is not reflective of all of those elements as you have just stated. I think that they at this point want to put this new model to use and modify it as they get more experience. But our folks at both a policy level, as well as a scientific level, were consulted by the Europeans about how we do our business, and we tried to give them the best advice that we could give.

I think the other thing that European countries, as well as others in the world, are always struck by is how open our processes are in terms of how we go about deliberating and decisionmaking. Many of them were in the Washington, DC area when we held our hearing on biotechnology or the bioengineered food issue. They were the people in the rows with their mouths open. They could not really fathom, I think, a governmental agency really seeking a wide range of opinions and being willing to listen to concerns across the board about a very controversial issue. It is just not how they do their business.

Senator HARKIN. So, you have been consulted. They are looking at FDA as a model then.

Dr. HENNEY. Yes.

Senator HARKIN. That has been done.

Dr. HENNEY. We are also supplying to the European Community a summary of how we ensure protection at all levels of our food safety system so that it is more of an open document rather than just a private conversation with them as well.

DIETARY SUPPLEMENTS—EPHEDRA

Senator HARKIN. Good.

The last thing I have a question about that I wanted to cover with you is about dietary supplements. I was very pleased to see that the agency recently pulled the part of its ephedra regulation that was heavily criticized by the GAO, that dealing with dosage limits. I know you are planning on shortly releasing adverse event reports received since your original proposed rule, and I understand that these will be accompanied by an analysis of these reports.

One of the reasons the GAO was highly critical of your old proposal is because they found that FDA failed to do causal analysis,

that is, to ensure that the taking of the ephedra had, in fact, caused the adverse event.

My question basically is, will your new analysis include this type of analysis in the new reports?

I am also told that as many as 3 billion servings of ephedra products are consumed each year. Will your analysis include this fact to put any adverse events in context? In other words, if there are seven adverse events, put it in the context of 3 billion servings or however many there are per year?

Dr. HENNEY. Senator Harkin, as you note, we had a very critical report from GAO with respect to ephedra. I think that while the report reflected that they agreed that there was a public health issue, the methodology that was used could certainly use improvement.

We have, for that reason, undertaken an analysis of the adverse events that have been reported since that time, looking at them with respect to many of the issues that you raised. We do intend to publish those, as well as the analysis that we did in-house and was done by consultants to the agency. We then intend to hold a public forum on this matter to see what all of these analyses mean, not with the intent to have them necessarily direct a regulatory action, but to really get this information out into the public arena.

I think with the other point that you raise in terms of amount of product consumed, we have widely varying ranges of what that might be, and we will try within what we publish to give a sense or a feel. But I do not know that we necessarily know the right number. We do know that it is an increasing amount over time. I would be interested if you could supply us with the data that you have and the source of the information.

Senator HARKIN. We can do that. It is again relying upon industry tabulations of sales of ephedra-containing products every year. I can only take their word for it. They have no reason that I can think of to manipulate the figures, but I will be glad to give you all that information we have on how many servings there are because I think it really should be put in a contextual framework.

Thank you very much, Dr. Henney.

Thank you, Mr. Chairman.

MEDICAL ERRORS

Senator COCHRAN. Thank you, Senator Harkin.

Dr. Henney, with respect to the medical errors initiative that Senator Durbin raised, could you tell us what FDA's current adverse events reporting systems include and whether there are plans in this budget to strengthen the systems to prevent medical errors and enhance patient safety?

Dr. HENNEY. Mr. Chairman, within the context of our medical errors reporting system, we have systems in place at the FDA for adverse reports to come into the agency. The systems, however, are in serious need of upgrading to make them both state-of-the-art and to make them comprehensive throughout the agency so that it would include the adverse events that may be related to drugs, biologics, blood, and the like.

Regarding adverse events that may be related to devices, a few years ago, we piloted an approach called a Sentinel Reporting Sys-

tem. That proved to be a strong and good way for us to track adverse events in that area. Unfortunately, because of limitations of funding, we did not go forward with expanding that program.

Our request to you this year is really to lay the groundwork for developing a comprehensive system. It would call for \$12.8 million to do that. That would allow us to get the kind of systems in place that we need, upgrade some of the systems that we have, be able to hire some of the types of analysts, epidemiologists or biostatisticians, that we need to make sense of the reports so that when we take actions based on them that these decisions are wisely made.

GENE THERAPY

Senator COCHRAN. In light of the recent death of a young man who died as a result of gene therapy treatment and the admission by the National Institutes of Health that it did not track adverse events in gene therapy, what is the FDA doing, if anything, to re-evaluate its oversight process to ensure safety compliance by institutions conducting these trials and to expand public disclosure of gene therapy clinical trials?

Dr. HENNEY. Mr. Cochran, the events that you cite have prompted us to do several things. One is, although we are in receipt of adverse events as they relate to many of our gene therapy IND's, and we have standard operating procedures for our interactions with NIH, we on a routine basis now, are sitting down with our colleagues from NIH to make sure that they know what we know and can act upon it as they should. We are two agencies charged with doing different things, but we must interact well to benefit all patients in these trials.

The other thing that we will be doing specifically with respect to gene therapy is requesting that all investigators engaged in this scientific area provide us with their plans for clinical trials monitoring. We need to assure that they have appropriate plans in place for that monitoring.

We also intend, along with NIH, to hold a series of conferences on safety issues specifically related to gene therapy. Some of those will be done in concert with their Recombinant DNA Advisory Committee. Some of them will also be done through our advisory committees within our Center for Biologics.

There are a number of steps I think that both institutions are taking to make sure that we do all that we can do and should do to assure the safety of these trials and to assure that patients have confidence in the system.

TOBACCO

Senator COCHRAN. In the conference agreement on the appropriations bill last year, we included a directive to the FDA to evaluate the feasibility of using automated identification systems to try to reduce the sale of tobacco to minors and the effect of compliance that such automated systems might have.

My question is, what is the status of FDA's compliance with this study requirement, and do you expect a report would be made to the committee as suggested in the conference report within 180 days of the enactment of the law? That would be in late April of

this year. Or when could we expect to receive the report, if you know?

Dr. HENNEY. Mr. Chairman, with your indulgence, I would like to call on Mitch Zeller who heads our Office of Tobacco Programs to respond.

Mr. ZELLER. Mr. Chairman, we put the report into clearance and assuming clearance goes smoothly, you should get it probably before the deadline.

Senator COCHRAN. Just as a matter of curiosity, what does that mean, put it into clearance?

Mr. ZELLER. It has to go through clearance within FDA and the Department before it can come to Congress. Therefore, we are confident that you are going to get it by the deadline or you may even get it before.

DIETARY SUPPLEMENTS

Senator COCHRAN. Great. Thank you. Thank you very much.

There are questions about the dietary supplements that have been raised at this hearing. When you came by the other day for a visit prior to the hearing to talk about some of the issues that we might ask about, I raised this as a question about whether or not it would be appropriate to include in this bill some funding for scientific studies on dietary supplement products, those that are on the shelf, to assess their quality, to strengthen the scientific understanding that we have about the overall quality of supplements and how they may affect those who are using them.

Dr. HENNEY. Mr. Chairman, as we develop the strategic plan, if you will, or framework for implementing an appropriate regulatory approach to dietary supplements, one of the key elements of it was to develop such a capacity. When it came to making choices within our budget and picking out the element most in need in the dietary supplement arena, what we have requested in the context of this budget is to upgrade our adverse event reporting systems for dietary supplements.

Certainly the whole issue of undergirding a science base or a research base for this program is something that we support in principle. It was a matter of choices and priorities in terms of risk that we used when we developed our budget proposal.

Senator COCHRAN. Could some of these studies be conducted by university laboratories that have proven expertise and experience in this research area?

Dr. HENNEY. Absolutely.

Senator COCHRAN. Are you including in this budget request any funds specifically for the purpose of exploring possible improvements in the quality of dietary supplements or understanding about microbiological contamination of dietary supplements or related questions?

Dr. HENNEY. Most of the money that is in this particular budget is directed at the adverse event reporting. I think that there is about \$200,000 within our total request that would go for the kinds of issues that you raise.

Senator COCHRAN. Do you have any recommendations that you have made to the National Institutes of Health or others for funding clinical trials on certain dietary supplements?

Dr. HENNEY. Mr. Chairman, we have had, between our Center for Food Safety and Applied Nutrition and myself, interactions with our colleagues at NIH, particularly through their offices or center for alternative medicines to let them know where we have issues that might need to be addressed. I would like to provide for the record any specifics of those discussions.

FEW USER FEES

Senator COCHRAN. Thank you very much.

We notice the proposals in the budget for new user fees. I think in this budget you assume the enactment by the Congress of legislation to impose user fees that would amount to \$19.5 million for premarket review of direct food additive petitions, food export certificates, and the review of medical device premarket notifications.

Do you have any reaction from the industry that they are going to support these proposals, or do you know what their position is? Are there legislative proposals that have been submitted to the Congress on these subjects?

Dr. HENNEY. With respect to your last question, there are legislative proposals under development. They have not been submitted as yet.

With respect to the first question in terms of industry reaction, I do know that they react to the words "user fees" and like the term "review fees" a bit better. I also know that they are very hopeful of what we will be able to do with respect to food additive petitions overall and probably would appreciate a bit more track record on our part before additional review fees might be imposed.

MEDICAL DEVICE USER FEES

Senator COCHRAN. The budget proposal contains a suggested device user fee to encourage reviews to be performed by third parties. I understand that an obstacle to the success of the third party review program is that FDA has made only 154 product types eligible for the third party program and the list of eligible products has not been expanded since May 1999.

What is the best way for FDA to encourage the industry to use third party review? Is it to expand the list of products to include more complex devices or not to impose a user fee?

Dr. HENNEY. Mr. Chairman, the third party review experiment that is really outlined within the Modernization Act is something that we are very committed to and want very much to work. While the number that you cite is correct in terms of categories, there were some 1,200 510(k) applications that we received in fiscal year 1999 that would have been eligible for third party review, but only a handful of these actually went to the third party review. While third party review does require a payment on behalf of a company, and there may be some issue there, the third party review takes much less time to do, some 57 days, as opposed to 107 days if the company chooses to come in to the FDA, simply because we are also working on other things.

We are looking at ways to expand the list of devices that might be eligible for third party review. We took first the low and moderate risk devices, as was intended by Congress, and those for which we already had standards developed so that those standards

could be used by the third party in terms of going about their review.

Our proposal here really looks at FDA in part as a conduit for payment of the third party review and then would both simplify and reduce our regulatory cost. And it also allows us to tap additional expertise from scientists outside the agency.

SEAFOOD INSPECTION

Senator COCHRAN. The budget request proposes a new administrative provision to transfer seafood inspection functions and authorities, the personnel of the Seafood Inspection Division and all related assets and liabilities from the Department of Commerce to the Department of Health and Human Services. It seems that this is something that would require the approval of the legislative committees of the Congress, and I am curious to know why the administration is proposing that the authority for the program transfer be provided in the appropriations bill and whether the administration is also submitting legislative language to the Congress to authorize the program transfer.

Dr. HENNEY. Mr. Chairman, yes, such a proposal will be developed and submitted. This is an administration proposal that would consolidate all of the Seafood efforts within the authorities of the Food and Drug Administration. I would go on the record that I am very interested in the assets, but perhaps not the liabilities.

Senator COCHRAN. Do you agree with one suggestion we have heard that combining these programs might undermine the objectivity and credibility of FDA's seafood HACCP program?

Dr. HENNEY. I have not heard that. This program has traditionally been of a voluntary nature, if you will. I think that we would use it to complement what we do in our HACCP program.

SEAFOOD EQUIVALENCY

Senator COCHRAN. Last year FDA indicated that it is working to improve the safety and sanitation of imported seafood by establishing equivalency agreements to ensure that exporting countries have seafood inspection systems equivalent to those of the United States. It also indicated it was in the process of evaluating submissions for equivalency agreements from numerous countries, including the European Union, and had plans to visit six countries, including Australia, Canada, Chile, Iceland, New Zealand, and the European Union before the end of the year.

What is the status of the FDA's effort with regard to seafood equivalency agreements?

Dr. HENNEY. Well, Mr. Chairman, as you know, this whole issue of equivalency is a very lengthy process. It involves doing a preliminary, side-by-side comparison of the different regulatory systems to make an initial determination. Many countries end up realizing, after they see the system that we use, that perhaps they need to upgrade their systems, or if we are not equivalent to theirs, we do some work ourselves. It usually goes the other way, however.

The second is when we do an analysis of the two systems. We then do this third step of the on-site site visits, which I believe you are alluding to. We are required to do a preliminary determination

and then a final determination, both of which need to be published. Then we go into negotiating the final agreement.

Our determinations for Canada, New Zealand, Australia, Norway, and Japan are all in their furthest state of development, and they have all had their first site visit. Canada's has been delayed about a year as they implemented some major system changes, but we do intend to site visit and review those changes sometime this spring.

Senator COCHRAN. Are any additional resources needed to complete the planned work? Is the current level of resources sufficient for that purpose?

Dr. HENNEY. Mr. Chairman, as I alluded to, these do require very intense work, but I would ask Mr. Levitt to give you some sense of actual resources required and resource needs.

Mr. LEVITT. Congress did provide us, I am sure you will recall, some resources specifically for this purpose I believe in the 1999 budget. Part of this is that it takes time to go through the steps. What we have done in this year's budget request is to focus more on coming back to domestic inspections, being sure that we are able to do those on an annual basis as well, which will in turn help us with the equivalency agreements. So, there is nothing in the budget that specifically requests an increase in this area, but we do have people who are dedicated to this work and will push it ahead as the pace will allow.

INTERNET DRUG SALES

Senator COCHRAN. In the prepared statement submitted, Commissioner Henney, you indicate that during fiscal year 1999, illicit or illegally operated drug sales sites grew dramatically. What was the growth in illicit or illegally operated sites?

Dr. HENNEY. Mr. Chairman, the area of consumer use of the Internet clearly has grown overall in terms of many product lines, prescription drugs being one of those. We know that there are several hundred sites now offering the sale of prescription drugs. How many of them do this illicitly or illegally is something that we have under active investigation.

Senator COCHRAN. The President announced that he would submit new legislative proposals to Congress to address the problem of illegal Internet drug sales. I understand the proposal will establish a new Federal requirement to enable consumers to identify legitimate Internet pharmacy sites, strengthen the current penalty structure for illegal pharmaceutical sales over the Internet, and provide new authority to FDA to ensure rapid and effective investigation of on-line sites.

To what extent is enactment of this new authority required before FDA can utilize the \$10 million requested in the budget for next year, and has the legislative proposal been submitted to Congress?

Dr. HENNEY. Mr. Chairman, the \$10 million request is, in essence, to provide us funding for the work we are doing in this area already. Because we saw this as an increasing issue and a matter of risk, we have been using hundreds of hours of investigative time. Our budgetary request before you is to focus on this as an identifi-

able issue and allow our investigations to go forward as well. It is largely that.

There is also part of this program that is education and public outreach in terms of the agency providing information to the public about how to find a site or what to look for when trying to use the Internet to purchase prescription drugs. The budget proposal really stands on its own.

The legislative proposal, which would be forthcoming and would have in it many of the elements that you mentioned, really speaks to additional tools that we might need either to aid our investigations or enhance the consumer's ability to find a site that is selling products and is selling them with all of the State or Federal laws in place.

Right now we clearly know that the Internet provides many benefits, the access, the convenience, the privacy, but there is no easy way for a consumer to tell whether the site they are using is complying with all State or Federal laws. It is not like going into your corner drugstore where you can see that the pharmacy has been licensed, the pharmacist has been licensed, and you know the doctor who wrote your prescription. The Internet essentially cuts out that part of the safety net system. We need to make sure that we have an equivalent safety net for those who choose to use the Internet as well as for those who choose to go to their corner drugstore to buy drugs.

FOOD BIOTECHNOLOGY

Senator COCHRAN. Another emerging scientific dilemma that you mentioned in your statement is the need for new funding on the rapidly evolving field of food biotechnology. What is actually planned by the agency for the use of funds that are requested in this next fiscal year as compared with what has been done in this year for this new effort?

Dr. HENNEY. The area of food biotechnology has not been an area where we have traditionally done the research. The research that has been done to develop specific crops, is either supported by the Department of Agriculture or industry.

As we focus more and more on a stronger regulatory position, however, and we have research questions related to those regulatory issues and bioengineered foods, we need to build this kind of a capacity. This would be done primarily by joint efforts between our Center for Food Safety and Applied Nutrition and our National Center for Toxicological Research where work in terms of regulatory matters related to bioengineered foods would be done.

GENERIC DRUGS

Senator COCHRAN. There is also a suggestion in your statement that you propose to accelerate the process of generic drug review. I wonder how you propose to accelerate this. Can you compare, for example, how you are going to use the additional resources that are requested? Are you going to increase staffing and funding levels for the generic drug review, as compared to the current fiscal year or last year?

Dr. HENNEY. FDA is requesting in the drug area \$2.3 million to improve scientific knowledge and skills across the board. That

would include the generic drug area. We do not have, within the context of our budget, targeted money for the Office of Generic Review. We feel that reviewers across the board need to be supported because both those medical officers or scientific officers in generic drugs or innovator are reliant on the capacity of the reviewers. We have not targeted this request, but it is a more general request of \$2.3 million to increase our skill base across the board.

IMPORTED FOODS ACTION PLAN

Senator COCHRAN. You also mentioned in your statement that FDA and the U.S. Customs Service have developed an imported foods action plan to enhance border surveillance. Could you tell us more about this surveillance effort?

Dr. HENNEY. Well, what we have done overall with the Customs Service was really modeled by our two agencies at the port site in Miami. We had several meetings during the course of this past year in terms of what we could do as two organizations to use the breadth of our authorities to make sure that imported products coming into this country are safe.

Therefore, using some of Customs authority, we are looking at the ability to refuse shipments, to mark shipments so that we can decrease what we have faced for many years that is port shopping, destruction of food products that pose serious public health risk, the standard setting for importers, contractors, or private labs that are going to analyze samples. The bond has been increased for imported foods to full market value of the product to deter illegal entry into the country, and also uses of civil money penalties.

EGG SAFETY

Senator COCHRAN. The budget suggests that an egg safety action plan at FDA, just completed in conjunction with the Department of Agriculture and the Environmental Protection Agency and Commerce, is to be implemented this year. I am curious to know how this is going to work to prevent illness and what level of funding is included in the FDA budget request for next year as compared with the current fiscal year.

Dr. HENNEY. Mr. Chairman, within the budget request for this year, I believe there is \$30 million for our Food Safety Initiative, of which \$5 million would be targeted toward the implementation of the egg program.

The issue of the safety of eggs and egg products really centers around the issue of Salmonella enteritidis. We know that there are some 300,000 cases of disease due to Salmonella enteritidis every year. We also know that eggs and egg products are consumed at quite high volume by the American consumer, some 234 eggs per person per year. So, this is a very real issue in terms of making sure that eggs and egg products are safe.

We held a public meeting on this last fall. We intend to hold two other additional meetings. One will be at the end of this month in Columbus, OH and one in Sacramento, CA on April 6. We are looking at this issue with the USDA, to provide an integrated approach to the regulation of egg safety and really a farm-to-table approach. We are also looking at how we communicate safe practices to the consumers so that they know that cooking eggs thoroughly, not

using raw eggs, is a strong and good preventative practice for this problem.

Senator COCHRAN. That was going to be my question. Does it take all of this to make us all understand that in order to guarantee your safety, you need to cook an egg before you eat it, and if it smells bad, do not cook it?

Dr. HENNEY. These may seem like very simple messages, but clearly we have not gotten these messages across yet because there are still many people who like their eggs sunny side up and who still like to make their Caesar salad with a raw egg. The issue remains.

BIOTERRORISM

Senator COCHRAN. I know that one of the serious biological threats, bioterrorism is causing us to look at how we are prepared to deal with this new threat including the development of new vaccines and drugs, safeguarding food supplies, research into the questions of diagnosing and treating disease outbreaks.

Can you give us an update on your agency's efforts in these areas and the level of resources currently being devoted to them and whether additional funding is needed in the next fiscal year?

Dr. HENNEY. Yes, Mr. Chairman. I am glad to. I would point out that we got caught a little bit on this issue last year as we made our request, through the Department. Clearly it went to the labor appropriations committee which did not feel that they needed to fund an agency in the agriculture appropriation committee. As a result, we did not receive funding in this area last year.

Nevertheless, we have received some one-time funding from the Department to proceed with some matters related to vaccine research in anthrax, smallpox, and the VIG, or that which is associated with immunoglobulin.

You have in the budget request before you this year—and we did convince our colleagues in the Department to let us ask you rather than them—an \$11.5 million request for our efforts in bioterrorism. This would largely go for the vaccine issue and vaccine development, but also for the important issue of stockpiling antibiotics that would require the efforts of the Center for Drug Evaluation and Research and the National Center for Toxicological Research in terms of looking at important research issues either related to food as a vehicle for a bioterrorist attack or neurotoxicity related to some of the products that may be used by a bioterrorist.

Senator COCHRAN. You mentioned the Department of HHS and Labor appropriations bill confusion. I wonder to what extent are FDA's activities in this area dependent on those of other Federal agencies and the funding that other agencies get for their part of the obligation?

Dr. HENNEY. Well, in the matter of bioterrorism, we are coordinated at really the highest level. But our efforts and plans really require us seeking the funding from, of course, the appropriate and separate committees of Congress. In terms of what we do in this area, however particularly our knowledge and interaction with the other agencies of our own Department, as well as those of the Department of Defense, is critical if we are to make an appropriate

response to a bioterrorist attack or to prevention of such an attack. Clearly, that kind of coordination needs to continue.

Senator COCHRAN. Dr. Henney, I do not have any other questions. I do want to repeat my commendation of you and the work you are doing at the agency. I am impressed with the commitment that you have made to improving the work at the agency, strengthening the scientific base. I agree with you. It has to be a top priority. We hope that we can find funds in the budget to help you with some of the laboratory problems that you have so graphically demonstrated for the committee this morning.

Secretary Shalala's presence here indicates the commitment of the administration and her Department to this area. We agree that it is a very high priority for our Government, the many areas that come under the jurisdiction of this agency.

ADDITIONAL COMMITTEE QUESTIONS

We will have additional questions to submit that others might be interested in learning about. So, we hope that you will be able to respond to those written questions in a timely way.

We thank you very much for your continued cooperation with our committee.

Dr. HENNEY. Thank you, Mr. Chairman.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing.]

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

STRENGTHENING FDA'S SCIENCE BASE

Question. Commissioner Henney, you have stressed the need to protect FDA's science base to keep pace with technological advances. Please discuss what specific increases are requested in the fiscal year 2001 budget to do this.

Answer. FDA needs to be able to respond to a rapidly changing environment and maintain the capability to understand, adapt and respond. To do this we must we must strengthen our science; address the highest priority risks; and engage in effective collaborative and leveraged activities, and design ever more predictable, timely and transparent regulatory processes.

We must be able to keep pace with the explosion in scientific advances and then use that knowledge to assure safe products. FDA must apply our intellectual capital at every point in the life cycle of the product. We must be able to anticipate and access the cutting edge science that will be needed to regulate the products of future technology. When this is possible, we can apply this science at the point when the new technology arrives and when it is absolutely essential to steward these products, many of them lifesaving, to the market.

A strong FDA science capability is equally critical in understanding and managing risk associated with products that are already in the market place. When FDA can apply cutting edge science to these problems, particularly in cooperation with our health and regulatory partners, as well as those in the regulated industry, we can quickly identify significant risks and minimize them.

Congress' authorization and support of the Prescription Drug User Fee Act and its reauthorization in the FDA Modernization Act is a prime example. Review of drugs and biologics in the U.S. is now as fast or faster than anywhere in the world, and this has been accomplished without lowering our very strict and high standard for safety and effectiveness.

FDA has always adhered to the principle that the most serious risks should be addressed first. To illustrate, the medical errors initiative in the budget emphasizes FDA's working with other agencies in the Department of Health and Human Services and with other departments across government as a part of the President's new comprehensive plan to improve health care through the prevention of medical errors and the enhancement of patient safety.

Second, drugs marketed and sold from rogue Internet pharmacy sites present real risk for the American consumers. Again, we have addressed the most serious risks first as a part of the food safety initiative, provided funding, we will be able to inspect high risk food firms at least once a year. We would continue to do the work supported by Congress in the past which focuses our efforts in the important arena of food safety by targeting imported produce that contain microbiological pathogens.

Many of our initiatives in this budget require our agency to work in concert with a broad spectrum of stakeholders to create a safety net for the U.S. consumer. A prime illustration of this approach is in food safety. In this regard, we collaborate with our foreign regulatory counterparts in joint efforts that include setting standards to reduce the risk of products to the consumer. Whether it is within our domestic borders or beyond, FDA undertakes collaborative initiatives because all parties can unify behind goals that are in the best interest of public health and safety.

The budget request is for \$1.4 billion which is a \$176 million increase over the fiscal year 2000 enacted level. The request includes \$42 million to enhance the science based review of new health giving products so they can more rapidly enter the marketplace and \$30 million to enhance the safety of the food supply through strengthening key elements of the President's food safety initiatives. These elements include increasing inspection frequency for high risk food firms, implementation of an egg safety action plan developing nationwide standards for food safety, and expanding the research activities necessary to support the entire initiative. The request also includes \$20 million to replace FDA's obsolete Los Angeles laboratory facility. \$15.9 million is included to strengthen our systems which report on and correct medical errors. This is the interagency cooperative effort designed to reduce the estimated 100,000 annual deaths that occur because of medical misadventures or mistakes. \$13.5 million is to focus on domestic inspections of our firms in order to target high risk violators and to come closer to meeting the agency's statutory inspection requirements. \$10 million is to help stop the illegal sale of drugs over the Internet. And finally, \$11.5 million is part of the President's comprehensive response to possible bioterrorist attacks.

Fiscal year 2001 is the year in which FDA must cope with the maturation of two of the most massive and significant forces the agency has ever faced. In 2001 the increasing impact of molecular science, genomics in particular, and the information revolution, especially the Internet, and its linkage to an array of real time data and as a new vehicle for commerce that was unimaginable only a few years ago, will combine their forces to change how products are discovered, researched, manufactured, distributed, marketed, and advertised.

ILLEGAL INTERNET DRUG SALES

Question. Commissioner Henney, you indicate in your prepared statement that during fiscal year 1999, illicit or illegal operated drug sale sites on the Internet grew dramatically. What was the growth in illicit or illegal operated sites?

Answer. In an attempt to better comprehend the universe of web sites selling drugs, FDA's Office of Criminal Investigations reviewed thousands of web sites early this year and identified approximately 326 web sites involved in the sale of drug products. Because new web sites are put up everyday and old ones are taken down, the total number of these sites is subject to change and will not be consistent over time. Also, due to differences in methodology and access to advanced technology search tools, our information may not coincide with data provided in studies produced by other organizations.

Many sites focus on selling prescription drugs and have been referred to by some as "Internet pharmacies." These sites offer for sale, in some cases, unapproved, illegal versions of prescription drugs. Some drug sale sites offer for sale other unapproved drug products, products making fraudulent health claims, drugs for recreational use such as products containing gamma hydroxy butyrate (GHB), unproven cancer therapies, or drug products illegally marketed as dietary supplements. While the increase in "Internet pharmacy" sites engaged in illegal sales is seen by some as a particularly potent threat, FDA considers the non-pharmacy sites to be just as harmful, or in some cases more so, and we have made efforts to step up regulatory actions taken or initiatives by FDA, which include both civil and criminal enforcement actions.

Question. How many Internet drug sale sites are there currently?

Answer. FDA's Office of Criminal Investigations reviewed thousands of web sites early this year and identified approximately 326 web sites involved in the sale of drug products. Because new web sites are put up everyday and old ones are taken down, the total number of these sites is subject to change and will not be consistent over time. Also, due to differences in methodology and access to advanced technology

search tools, our information may not coincide with data provided in studies produced by other organizations.

Question. Funding of \$10 million is requested for FDA to stop illegal Internet drug sales. How will this funding be utilized? How much will be spent for investigations; how much will be for upgrading FDA's computer technology; and how much for a new public education campaign on the dangers of buying pharmaceuticals over the Internet? Please provide level of funding and full-time equivalent staff years included in the request for each.

Answer. Included in the President's fiscal year 2001 budget is \$10 million for Internet drug enforcement. Because FDA's systematic review of Internet websites began in mid-fiscal year 1999, this enforcement work is still a relatively new undertaking, and we are learning more about our resource requirements as we proceed. Approval of this funding request would allow FDA to establish a significant and permanent presence concerning Internet drug sales enforcement and redirect its current resources back to its other enforcement priorities. Presently, FDA supports its Internet investigations and enforcement efforts with redeployed resources, at the expense of other critical FDA enforcement priorities, and this trade-off cannot continue indefinitely.

Specifically, the \$10 million funding request will be distributed as follows: \$9.7 million to fund 75 FTE positions in the Center for Drug Evaluation and Research—CDER, and the Office of Regulatory Affairs—ORA. These 75 FTE would work in field, laboratory, compliance and support positions to provide for the investigation and analysis of Internet sites suspected of engaging in unlawful drug sales, distribution or marketing; take appropriate enforcement actions, as required; and carry out public education campaigns on safe ways to purchase pharmaceuticals over the Internet. Also included in the \$10 million is \$250,000 to fund two FTE positions in the Office of Chief Counsel—OCC, to work with CDER, ORA—including the Office of Criminal Investigations, or OCI—and the Department of Justice—DOJ, to bring civil and criminal enforcement actions involving illegal Internet drug activity. FDA has already begun a public education campaign to educate consumers on the dangers of buying pharmaceuticals over the Internet and will continue this campaign through fiscal year 2001.

Question. What attention, in terms of dollars and FTEs, is FDA currently giving to the problem of illegal Internet pharmaceutical sales?

Answer. Since mid-fiscal year 1999, when FDA began its systematic review of Internet web sites, we have identified increases in the types of web sites, as well as the range of activities, that appear to violate the Federal Food, Drug, and Cosmetic Act. In approximately 6 months, FDA has devoted almost 40,000 staff hours to investigate hundreds of Internet sites. The Food and Drug Administration devoted approximately \$1.92 million in fiscal year 1999 to investigate internet drug sales practices. The Center for Drug Evaluation and Research expended approximately \$0.2 million and the Office of Regulatory Affairs, principally its Office of Criminal Investigations, expended approximately \$1.7 million. The internet drug work was conducted with resources in the Human Drugs program. Therefore, no resources were shifted from other FDA programs; these resources were redirected from other Human Drugs work.

ABSORPTION OF MANDATORY COSTS

Question. The fiscal year 2001 budget request for FDA salaries and expenses requests increased funding to support an additional 416 full-time equivalent (FTE) positions, yet the budget indicates that FDA will have to absorb 106 FTEs as a result of mandatory cost increases for which funds are not requested. If the budget request level is recommended by this Committee, in what areas will FDA make these staffing reductions to protect the priority areas for which funds and additional staff positions have been requested? Please indicate specific funding and staffing reductions by Center, program and activity.

Answer. Since 1994, the agency has had to absorb pay raise and other inflationary costs. The cumulative total through fiscal year 2000 equals \$207 million, including \$43.4 million in fiscal year 2001. The agency has cut non-payroll operating costs as much as possible, limiting travel, supplies, equipment, and significantly reducing extramural research and methods development. These actions alone have not been sufficient to absorb cost increases and maintain the same staffing level. While the agency does use tools like delaying recruitment for vacancies, overall the agency has had to cut staffing in all programs except those supported by user fees. However, these reductions fall far short of making available the amount required to maintain staffing levels. From fiscal year 1994 through fiscal year 1999, non-user fee FTE have declined from nearly 9,000 to about 8,100.

Although FTE increases were provided in the fiscal year 2000 appropriation, they were targeted to specific program areas. Current services absorption reduces the FTE available to perform at the Agency's core activities of premarket review and postmarket assurance. This has eroded the agency's ability to assure safety through strengthened science and meet our public health mission. The agency has had to limit research program and methods, limit staffing that can be devoted to new product application review, and particularly in the field, to reduce the numbers of inspection and sample analyses that can be conducted. As a result, FDA staff, whether they are reviewers or inspectors have not kept pace with the knowledge explosion in their particular field of expertise.

The fiscal year 2001 request reflects a reduced staffing level of 160 FTE. Fewer FTE translate into fewer people to perform FDA's core activities of premarket review and postmarket assurance. This hampers FDA's ability to assure safety through strengthened science and meet our public health mission. For the record we will include a chart which depicts FDA's fiscal year 2001 payroll and inflationary costs by activity and the FTE absorption.

[The information follows:]

CURRENT SERVICES ABSORPTION

[Dollars in millions]

Project	Total current service absorption	FTE absorption (FTE)
Foods	\$12,289	48
CFSAN	5,257	18
Field Activities	7,032	30
Human Drugs	10,250	38
CDER	6,943	24
Field Activities	3,307	14

Tobacco	978
Other Activities	3,255	15
Other Rent & Rent-related Activities	609
Rental Payments to GSA
Total, Salaries & Expenses	43,374	160
Non-Field Activities	29,354	100
Field Activities	14,020	60

Question. What success has PulseNet had in the past year in pinpointing the source of food borne illness outbreaks?

Answer. PulseNet had a very successful year in rapidly identifying common source clusters. This faster identification of the problem permitted quicker interdiction and regulatory action, hence preventing a significant number of additional cases. I would like to tell you about some of the more noteworthy successes.

Pulsed Field Gel Electrophoresis—PFGE, patterns linked the *Salmonella Munchen* isolates from orange juice and illnesses in multiple states in 1999. PFGE by Washington State Health Department confirmed the link after epidemiology detected the outbreak and the possible association. This finding added to the realization that unpasteurized juices pose a significant risk and spurred regulatory action in this area.

Epidemiologic investigations linked several clusters of *Salmonella Munchen* to a common seed source used to produce sprouts. Thereafter PulseNet confirmed the ep-

idemiology and helped to link other cases. This was part of the evidence used to foster the new regulations on testing sprouts.

Public Health Laboratory Information System—PHILIS, and *Salmonella* Outbreak Detection Algorithm—SODA, detected the 70 cases of *Salmonella Newport* illness in 10 states. PulseNet was used to confirm the link. This information and additional information obtained by CDC implicated imported Mangoes as the source of the infection.

PulseNet supported the establishment of the connection between liver pate and cases of *Listeriosis* in a number of northeastern states while extricating other possible food items.

In ongoing cases, PFGE technology is being used to determine the potential link between recalled product and human illness and death.

Epidemiologists have used PulseNet to confirm links, and tie in other sporadic cases, that have been made with other standard epidemiology approaches. It has been useful in providing supporting evidence in identifying a common source of infection.

PulseNet linked *Salmonella* from ill persons in the USA with those found in imported dog treats made from pig ears. This finding highlighted the role that certain non-human food items can play in foodborne illness and provided direction for FDA's surveillance activities.

The linkage established by PulseNet between lettuce and *Escherichia coli* O157:H7 infections in elderly humans in two U.S. States helped identify the contaminated batches and hence prevent further illnesses.

MEDICAL ERROR INITIATIVE

Question. Commissioner Henney, you acknowledge in your prepared statement that the complexity and numbers of newly-approved medical products have raised the risk for human error and that the majority of incidents are not reported. How is FDA proposing to strengthen its adverse events reporting to elicit reports and to assure more complete reporting?

Answer. We currently rely on reporting—both mandatory and voluntary—to find risk signals. FDA's current programs are designed primarily to serve as a "backstop" for the approval process—to find rare, unexpected side effects that could not be discovered in the clinical trials. They are not intended to, and cannot, uncover the incidence of adverse events, their prevention, or the overall health and economic impact on Americans. Of the 400,000 reports received by FDA, 21,000 of these describe fatalities and another 11,000 life-threatening events. Over 60,000 additional reports describe problems that required hospitalization or a prolonged hospital stay and 32,000 other reports concern medical device malfunctions. Despite the large number of reports, studies indicate that 90 percent of adverse events are not even reported to FDA at all.

MedWatch is FDA's program to encourage consumers and health care practitioners to report serious and unexpected adverse events associated with all FDA-regulated products. MedWatch adds this information to the AERS and other databases and, if warranted, disseminates new risk information directly to patient organizations and subscribers and to the general public through the Internet.

Ideally, a fully funded program that actively enlists health professionals in seeking out and reporting events is needed, as are other types of data sources (for example, reports from poison control centers). FDA pilot studies indicate that these are high-yield strategies for finding product safety risks. Ideally, we believe key steps in identifying and quantifying the risks associated with medical products require full-scale operation of MedWatch, to include full-scale, interactive, on-line reporting for health professionals and implementation of MedSun, the Congressionally-mandated sentinel program for medical devices. MedSun will actively enlist hospitals and associated health professionals in problem reporting. Ultimately, MedSun should expand to include reporting for all medical products. Additional key steps include expansion of reporting to health care settings other than hospitals; e.g., outpatient clinics, nursing homes, and home health care providers; development of additional data to monitor risk: accessing numerous additional sources of data already collected for other purposes (e.g., emergency rooms, poison center reports, organ transplant databases) to provide insight into the clinical context of product use and problems encountered; development of specialized systems for particular product risks—establishing patient registries for novel products or those with potential long-term safety risks; and identification of key obstacles and strategies to improve problem reporting—conducting the needed research to lead to improved reporting rates and quality. The fiscal year 2001 \$12.8 million request will be used to begin to address this issue.

Question. You mention that the additional resources requested will enable FDA to analyze report data in a timely manner. Is there a problem with this currently?

Answer. The Agency receives about 400,000 reports of adverse events associated with medical products yearly; 250,000 reports are for drugs alone. We estimate that more than one-third of these adverse events are preventable. However, the databases currently in place are not sufficient to achieve this task. Current systems are not designed to evaluate the rate or the impact of known adverse events. FDA is requesting an increase of \$12.8 million to address medical errors in fiscal year 2001. With this funding, FDA will discover and act to prevent more injuries that affect patients. The agency will complete construction of its state-of-the-art computerized drug injury reporting system. FDA also will begin construction of a hospital-based system to detect medical device errors. In addition, the agency will enhance the safety of the nation's blood supply by extending error reporting to local blood banks.

Question. You also indicate that FDA will implement Phase II of the Medical Device Surveillance Network. When was Phase I of this network implemented and what is Phase II? Please describe how the Medical Device Surveillance Network works.

Answer. FDA Modernization Act—FDAMA—allowed the option of replacing mandatory user facilities reporting with a National Sentinel Reporting Surveillance System, currently referred to as MeDSuN. FDA initiated a pilot study to determine whether a select group of highly trained reporting facilities could provide a statistical sample of adverse event reports that would represent all user facilities. Phase I of the network, called DeviceNet, was implemented in September of 1996. A small business, CODA Inc., was awarded the contract to conduct the study to evaluate the feasibility and effectiveness of a sentinel reporting system for adverse event reporting of medical device use in user facilities. Phase I involved 24 facilities.

Under Phase II, the reporting and feedback features of the network would be refined and tested. The number of facilities would be expanded to approximately 200–250 hospitals in three regions of the country, out of 6,000 hospitals currently required to report. The results of Phase II would be evaluated before FDA publishes a Proposed Rule, which will describe the plan for a national MeDSuN program. The plan for the national system will be based on lessons learned from Phases I and II. So if refinements need to be made, it will be easier and less expensive to make the changes at the initial stages of implementation, before the system runs nationally. If MeDSuN is successful, FDAMA authorizes FDA to discontinue user facility reporting other than sentinel reporting.

A comprehensive explanation of Medical Device Surveillance Network or MeDSuN, and the Phase I Pilot Study was provided in the September 1999 Report to Congress “Designing a Medical Device Surveillance Network”. The report also described the goal of MeDSuN, to improve the protection of the health and safety of patients, users and others by reducing the likelihood of the occurrence of medical device related adverse events and, if they do occur, reducing the likelihood that they will be repeated. This system would increase both the quantity and quality of reporting of adverse events and enable FDA to be proactive in preventing injuries from medical devices. Both FDA and users would have a better understanding of the causes of adverse medical device events and be better positioned to identify ways to minimize their occurrence and impact. MeDSuN would also create a two-way channel of communication between FDA and the user facility community by enhancing the quantity and quality of the reports that came in from designated user facilities and by ensuring feedback to reporters.

A copy of the 1999 Report to Congress “Designing a Medical Device Surveillance Network” can be found on the Internet at <http://www.fda.gov/cdrh/postsurv/medsun.html>.

Question. How does FDA propose to improve the reporting systems for blood errors and accidents in fiscal year 2001?

Answer. FDA proposes to improve the blood error and accident reporting systems in fiscal year 2001 by publishing a final rule that will: (1) expand the reporting requirement to include all establishments engaged in the manufacture of blood and blood products, which includes licensed and unlicensed blood banks, transfusion services and Source Plasma collection centers; (2) establish a time frame in which reports need to be submitted to FDA; and (3) replace the terminology of “errors and accidents” with “biological product deviations” to more clearly describe the types of events that must be reported. In conjunction with the final rule, FDA will publish a document that provides additional, more specific guidance regarding the types of events that must be reported.

In addition, FDA will provide a web-based electronic standardized format for the industry to use in submitting reports to FDA. FDA's ability to track and trend events will be enhanced by the use of a standardized format, which will assist FDA

in providing information to industry in an effort to reduce deviations. The information obtained by tracking and trending these events will also assist FDA in focusing the inspections of the blood industry. FDA will continue to post on its website, the summaries of biological product deviation reports.

Question. The fiscal year 2001 budget proposes to implement adverse events reporting systems for both dietary supplements and animal drugs. What backlog exists in reviewing adverse event reports in both these areas now, and how will the systems proposed to be funded for fiscal year 2001 improve the review of these reports?

Answer. In fiscal year 2001, FDA is requesting \$2.5 million and 2 FTE to begin the process of modernizing the Adverse Event Monitoring System for Dietary Supplements, including upgrading and automating record management and improving signal and report generation capabilities. Included in these efforts also are the clinical reviews and follow-up. We estimate that our current backlog would require approximately 6 FTE, over a significant period of time, to properly organize, paginate, redact each file and finally scan or rescan these files into the new system.

Specific program goals have been identified and will focus on four strategic areas. The first of these strategic areas is Systems Enhancement. This will improve adverse event report monitoring system capability by enhancing the data systems and integrating them into the Agency-wide adverse event report monitoring system program. The second of these strategic areas is Timely Release of Reports. This will reduce CFSAN's response time to Freedom of Information Act inquiries. Another area is Clinical Evaluation and Follow-up. This will institute an efficient system for the monitoring, clinical evaluation, and timely regulatory follow-up of significant adverse event reports. The fourth area is Outreach, designed to educate consumers and health care professionals on how to use the adverse event reporting system. These changes will be implemented as resources allow.

FDA is requesting \$0.6 million and 3 FTE to provide contractor staff, and provide for maintenance and data entry and evaluation enhancements for Adverse Event Reports and Drug Experience Reports for drugs given to animals.

We currently have a backlog of 6,000 adverse event reports on animal drugs. Currently, FDA only triages about 40 percent of the 12,000 annual incoming animal drug adverse event reports. FDA triages these reports because there simply are not enough resources to thoroughly review all reports. Triage allows us to review those that pose the most serious potential of risk or harm. About 20 percent of the total 12,000 reports received are thoroughly reviewed and evaluated. The additional funds would be used to increase our triage level from 40 to 60 percent and our thorough review level from 20 to 30 percent. This greater level of review would mean that more actual hazards would be identified, and corrective action taken. This would result in greater protection of human and animal risks, and increase public confidence.

In the Center for Food Safety and Applied Nutrition—CFSAN, all initial reports are reviewed—about 50 to 60 per month. Additional information is requested on all serious adverse events, which account for 45 to 50 percent of reports received. There is a current backlog of about 50 initial adverse events that are awaiting follow-up information. Current resources do not permit us to perform certain routine clinical evaluation components on each adverse event, including preparing clinical summaries, coding and classification of adverse events. In addition, we are unable to perform more in depth analyses and risk assessments of adverse events grouped by particular product or type of ingredient.

The preparation of dietary supplement adverse events information for CFSAN and Freedom of Information—FOI, process includes records management procedures, such as scanning and redacting, so that the records can be publicly released. The current backlog in this area consists of approximately 2,000 out of nearly 3,500 adverse events that FDA has received for dietary supplements. The FOI backlog for dietary supplement adverse events dates back to requests from 1998.

Upgrades to the database system, elimination of the clinical review backlog and timely public release of adverse event information are important because they affect FDA's ability to take timely actions to protect the public health.

FOOD SAFETY

Question. Commissioner Henney, you indicate that the additional funding requested for FDA food safety activities for fiscal year 2001 will enable FDA to be able to inspect the high risk food firms at least once a year. What is a "high risk" food firm and how often is FDA conducting such inspections currently?

Answer. High-risk establishments are those establishments that produce foods with the greatest risk for microbial contamination and those foods requiring specific

components for a safe and nutritious product. One example is an establishment that produces infant formula. Another example is an establishment that produces ready-to-eat food. FDA defines ready-to-eat foods as products that will undergo no or minimal processing such as heating, freezing, washing that would eliminate a pathogenic organism on the food. These products include fresh fruits and vegetables, bakery goods, cheeses, and cooked pasta dishes. Yet another example of a high risk establishment is one that produces heat and serve products, that is, products which normally receive a heat treatment, such as microwave, prior to final consumption by the consumer. Such products are hazardous if the recommended heat treatment is insufficient to eliminate pathogenic organisms which may be in the product.

Establishments that produce seafood products, particularly scombotoxics, such as mahi mahi, pompano, tuna, salmon, swordfish, and those susceptible to ciguetera are also considered high risk establishments. Also included are establishments that produce molluscan shellfish, which are eaten uncooked. Seafood not considered high risk would be raw fish, not of the scomboid species, which require cooking before consumption, such as trout, catfish and shrimp.

All low acid canned and acidified foods which if not properly processed may present a potential hazard to health in the form of botulism and are considered high risk. Examples of low acid canned food include not only foods in traditional tin and aluminum cans, but glass jars, and hermetically sealed pouches. Products which are usually low acid include canned vegetables, seafood such as tuna and sardines, and mushrooms. Acidified foods are low acid food products to which an acid, such as vinegar, is added for preservation. Examples of these products include barbecue sauces, salsas and pickles.

We want to be certain that we are including all firms that would be appropriately considered to be high-risk. Therefore, FDA has convened a working group from both the Center and Field components of the Foods program to delineate the optimal operational definition of a high-risk food establishment. We expect their definition by early summer. We expect to inspect a total of 4,200 firms producing high-risk products in fiscal year 2000. We plan to inspect all 6,250 firms currently identified as high-risk firms in fiscal year 2001.

Question. What improvements has FDA made in the past year to inspect imported food, particularly imported produce that contain microbiological pathogens?

Answer. One of the improvements FDA has made in the last year to inspect imported food, particularly imported produce that contain microbiological pathogens, was to conduct a 1000-sample survey for imported produce in fiscal year 1999. The primary focus for this sampling survey was to ensure public health and the safety of the food supply. Through sample collection and analysis, we established the incidence and extent of bacterial pathogen contamination for selected fresh imported produce to assist in the development of additional policy for the Produce Safety Initiative. As of March 4, 2000, 689 samples were collected and analyzed and 95 percent were found negative for the presence of *E. coli* O157:H7, *Salmonella*, or *Shigella*. The final data analysis in addition to other data sources will be used to help focus Agency efforts toward research and risk assessment needs; industry training needs; providing advice to industry on best practices that have been instrumental in minimizing microbial contamination; and emphasizing the importance of implementing and following good manufacturing and good agricultural practices.

This 1000 sample imported produce survey focused on eight imported products: loose-leaf lettuce, cantaloupe, celery, strawberries, scallions or green onions, parsley, cilantro and broccoli. These commodities were analyzed for *Salmonella*, *Shigella*, and *E. coli* O157:H7. The criteria used for selection of these commodities were based on epidemiological outbreak data, such as involvement in outbreak; attributes of the product, or structure, such as leafy; growing conditions, such as grown near the ground; processing and consumption data, as in normally cooked or cleaned; and the volume of product imported.

FDA is focusing greater efforts on preventing contamination by increasing education and outreach efforts to promote good agricultural practices—GAPs, and good manufacturing practices—GMPs.

Furthermore, FDA developed with the United States Department of Agriculture—USDA, and in consultation with industry and other stakeholders, a guide “*Guidance for Industry: Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables*.” This guide details a broad approach to minimize microbial contamination of produce through the control of water, manure, worker health and hygiene, field and facility sanitation and transportation of produce.

In addition, FDA established criteria for assessing food safety systems of individual countries by evaluating data from FDA and USDA import information systems on fresh and frozen produce shipments by tonnage, FDA Import Alerts, and known foodborne illness outbreaks. Criteria for priority products are based on ex-

pected eating patterns, such as fresh or cooked; and whether the produce has a protective mechanism, such as skin or rind, that is normally not eaten. Based on these criteria, FDA separated produce into three tiers, in order of priority. The first tier includes all minimally processed produce eaten raw with no protective rind or skin. This tier includes most produce growing in or close to the soil. The second tier includes most tree-grown fruit. And the third tier is produce that is normally cooked before ingestion and those with a protective skin. Based on these criteria, FDA generated a list of countries with a listing of key exports: Mexico, Canada, Chile, Guatemala, the Netherlands, New Zealand, Honduras, Costa Rica, Peru, Dominican Republic, Israel, Spain, and Nicaragua. For food safety evaluations, training and technical cooperation, FDA focused on those countries that have gaps in their food safety system and require training and technical assistance.

Another improvement included increasing inspections of high risk imported products that are susceptible to pathogen contamination. These high risk imported products included ready-to-eat products such as fresh fruit and vegetables and cheeses; heat and serve products, seafood products such as mahi mahi, tuna, and swordfish; low acid canned and acidified food (canned vegetables, pet foods, sardines, barbecue sauces, and salsas) and infant formula.

I would like to provide you with a table that lists the foreign foods inspections FDA accomplished in fiscal year 1999.

[The information follows:]

FDA FOREIGN FOODS INSPECTIONS, FISCAL YEAR 1999

Country	Product	Date
Mexico (6)	Cheese	2/99 thru 8/99
France (5)	Cheese	2/99 thru 8/99
Canada (1)	Cheese	2/99 thru 8/99
Germany (1)	Cheese	2/99 thru 8/99
El Salvador (1)	Cheese	2/99 thru 8/99
Singapore (1)	Cheese	2/99 thru 8/99
Ecuador (11)	Seafood	6/99
Taiwan (9)	Seafood	7/99
Philippines (9)	Seafood	5/99
Vietnam (9)	Seafood	4/99
Equador (5)	Low Acid Canned Food	4/99
Brazil (6)	Low Acid Canned Food	6/99 thru 7/99
Canada (9)	Low Acid Canned Food	8/99
Malaysia (1)	Low Acid Canned Food	3/99 thru 7/99
Philippines (1)	Low Acid Canned Food	8/99
Indonesia (1)	Low Acid Canned Food	5/99 thru 6/99
India (1)	Low Acid Canned Food	6/99 thru 8/99
Vietnam (1)	Low Acid Canned Food	4/99

Question. Commissioner Henney, you mention in your prepared statement that FDA and the U.S. Customs Service have developed an Imported Foods Action Plan to further enhance border surveillance. Would you please tell us more about this surveillance effort?

Answer. On October 27, 1999, FDA and the U.S. Customs Service submitted their joint report to the President that delineates action steps to target "bad actor" importers who violate regulations for importation of food into the United States, and work to subvert the system by moving unsafe food into the U.S. markets. There are several action areas for both FDA and U.S. Customs Service. The first of these is preventing distribution of imported unsafe food by requiring secured storage of products offered for entry by importers with a history of distribution prior to release, mis-declaration or substitution of product. The next is destroying imported food that poses a serious public health threat. This is followed by developing a regulation that would require the marking of shipping containers and/or papers of imported food that is refused admission for safety reasons. Another action item is proposing regulations to set standards for importers who use private laboratories for the collection and analysis of samples of imported food for the purpose of gaining entry into the United States. The next is increasing the amount of the bond posted by importers for imported foods when necessary to deter premature and illegal entry into the United States. And the last action item is enhancing enforcement against violations

of U.S. laws related to the importation of foods, including the imposition of civil monetary penalties.

We believe the full implementation of these action areas by both FDA and the U.S. Customs Service will provide greatly enhanced border surveillance of imported foods.

Question. What level of funding and FTEs are included in FDA budget request for fiscal year 2001 for the Egg Safety Action Plan, as compared to fiscal year 2000?

Answer. FDA's budget request for fiscal year 2000, included \$30 million for the Food Safety Initiative. FDA did not specifically identify the Egg Safety Action Plan within the amount requested for FSI. However, egg safety is a part of the FSI. In fiscal year 2000, we do have egg safety activities included in the Egg Safety Action Plan, which was issued in December 1999. In particular, FDA held two egg safety public meetings one in Columbus, Ohio on March 30 and the second in Sacramento, California on April 6, 2000. Additionally, FDA is in the process of developing the proposed nationwide consistent standards for egg safety. Expenditures for these activities have been minimal.

The fiscal year 2001 FDA budget request includes \$5 million and 17 FTE to begin implementation of the Egg Safety Action Plan. The funding will allow FDA to initiate an accelerated research program; hire staff to manage the egg safety program and train and evaluate federal, state, and industry officials in implementation of the standards. Additionally, FDA intends to propose nationwide consistent egg safety standards in fiscal year 2000, finalize these standards in fiscal year 2001, and implement the standards through state contracts in fiscal years 2002 through 2003. Adequate resources to fully implement this plan are crucial to the ability of FDA to meet the goal of reducing, by 50 percent, the rate of *Salmonella Enteritidis* illness associated with eggs, by 2005.

Question. What success has PulseNet had in the past year in pinpointing the source of food borne illness outbreaks?

Answer. PulseNet had a very successful year in rapidly identifying common source clusters. This faster identification of the problem permitted quicker interdiction and regulatory action, hence preventing a significant number of additional cases. I would like to tell you about some of the more noteworthy successes.

Pulsed Field Gel Electrophoresis—PFGE, patterns linked the *Salmonella* Munchen isolates from orange juice and illnesses in multiple states in 1999. PFGE by Washington State Health Department confirmed the link after epidemiology detected the outbreak and the possible association. This finding added to the realization that unpasteurized juices pose a significant risk and spurred regulatory action in this area.

Epidemiologic investigations linked several clusters of *Salmonella Munchen* to a common seed source used to produce sprouts. Thereafter PulseNet confirmed the epidemiology and helped to link other cases. This was part of the evidence used to foster the new regulations on testing sprouts

Public Health Laboratory Information System—PHILIS, and *Salmonella* Outbreak Detection Algorithm—SODA, detected the 70 cases of *Salmonella Newport* illness in 10 states. PulseNet was used to confirm the link. This information and additional information obtained by CDC implicated imported Mangoes as the source of the infection.

PulseNet supported the establishment of the connection between liver pate and cases of *Listeriosis* in a number of northeastern states while extricating other possible food items.

In ongoing cases, PFGE technology is being used to determine the potential link between recalled product and human illness and death.

Epidemiologists have used PulseNet to confirm links, and tie in other sporadic cases, that have been made with other standard epidemiology approaches. It has been useful in providing supporting evidence in identifying a common source of infection.

PulseNet linked *Salmonella* from ill persons in the USA with those found in imported dog treats made from pig ears. This finding highlighted the role that certain non-food items can play in foodborne illness and provided direction for FDA's surveillance activities.

The linkage established by PulseNet between lettuce and *Escherichia coli* O157:H7 infections in elderly humans in two U.S. States helped identify the contaminated batches and hence prevent further illnesses.

Question. PulseNet is a collaborative project between CDC, FDA and USDA. What portion of the total costs of PulseNet are borne by FDA? What additional investments are required in PulseNet and what is FDA's financial responsibility to this project? What amount of funding is included in the fiscal year 2001 FDA budget re-

quest for PulseNet? How does this compare with fiscal year 2000? How does this compare with the total fiscal year 2001 cost of PulseNet?

Answer. Scientists from these agencies developed PulseNet technology and application to identify and correlate pathogenic strains using “genetic fingerprints” in food and clinical matrices which are used to identify the common source of foodborne illness outbreaks. Currently, CDC, FDA and USDA, working with 32 states, Los Angeles County and New York City, operate the network. In fiscal year 2000, we are expanding the network to 40 states. For the future, CDC is exploring improved technology to identify “genetic fingerprints”.

The PulseNet system and database is financed, managed and maintained by CDC. CDC reports PulseNet operation costs to be about \$7 million. Of this \$7 million, 70 percent is financed through federal funds. The balance is supplied by State and Local governments. Since its development in 1998, FDA’s costs to support personnel, equipment and training have been approximately \$400,000. There is no specific line item in FDA budget for PulseNet. However, we have included in the fiscal year 2001 request an increase of \$800,000 and 1 FTE for PulseNet activities, under the Animal Drugs and Feeds portion of the Food Safety Initiative. The activities that the increase supports includes performing pulse field gel electrophoresis on animal isolates. The data on animal isolates is provided to CDC for entry into the PulseNet database to assist in the tracking of resistance in human and animal isolates. We estimate FDA’s fiscal year 2001 PulseNet related costs approximately \$300,000.

Question. What level of funding will FDA commit for fiscal year 2001 to complete the National Antimicrobial Resistance Monitoring System? What portion of the total cost of this system is being funded by FDA?

Answer. In fiscal year 2001 FDA has requested an increase of \$5.4 million to complete the expansion of the National Antimicrobial Resistance Monitoring System—NARMS. FDA has funded approximately 90 percent of the total cost of NARMS.

Question: What funding is included in FDA fiscal year 2001 budget request for the Center for Food Safety and Technology? How does this compare with the funding provided for the Center in each of fiscal years 1998, 1999, and 2000?

Answer. FDA is providing the National Center for Food Safety and Technology with an increase of \$1 million in fiscal year 2000 in FSI funding to expand the collaborative research in food safety for a total of \$3 million. This includes the previous fiscal year 1998 and fiscal year 1999 FSI base funding of \$2 million. In fiscal year 2001 FDA expects to continue to fund NCSFT at \$3 million.

Question. What level of funding and full-time equivalent staff years is included in the fiscal year 2001 request for *Codex Alimentarius*? How does this compare with each of fiscal years 1999 and 2000?

Answer. The fiscal year 2001 budget request includes \$1.8 million in support of Codex activities. This includes \$1.7 million in salaries and support for almost 15 FTE, and \$100,000 for travel.

In fiscal year 2000, FDA plans to spend \$1.6 million in support of Codex activities. This includes \$1.5 million in salaries and support for almost 14 FTE and \$100,000 for travel.

The total amount spent by FDA in fiscal year 1999 in support of Codex activities was \$1.4 million. This includes \$1.3 million in salaries and support for 12 FTE and \$100,000 for travel.

Question. For fiscal year 2000, the Congress provided funding of \$250,000 for a cooperative research program related to molluscan shellfish? What level of funding is included in the fiscal year 2001 budget request for this research program? Please provide a description of the research being conducted through this program and achievements to date.

Answer. The ISSC has conducted a number of projects, with funds provided by FDA, focusing on *Vibrios*. In 1997, the ISSC funded a two-year project at Louisiana State University to study possible markers for virulent strains of *Vibrio vulnificus*. All of the capsule genes evaluated were eliminated as possible markers. Also in 1997, the ISSC funded a project at Texas A&M University to study the effects of rapid ice chilling on levels of *Vibrio vulnificus* and on oyster mortality. Rapid chilling of sacked shellstock was shown to significantly reduce *vulnificus* levels, with no increase in oyster mortality. In 1998, the ISSC funded a study conducted by the Pacific Coast Institute and the University of Washington to determine if temperature can be used to predict *Vibrio parahaemolyticus* levels in shellfish. A final report on this study is being prepared. Also in 1998, the ISSC funded a collaborative study with the ISSC, FDA, states, and NMFS, to gather data on levels of *Vibrios* in raw shellfish at retail outlets, and to create a regional and seasonal reference collection of *Vibrio vulnificus* strains. The report on the retail study is being finalized and the reference sample collection work is ongoing.

In addition, the ISSC has funded two assessments. The first, conducted in 1997 and 1998, was to determine whether the time-to-refrigeration controls adopted by the ISSC had been able to limit post-harvest growth of *Vibrio vulnificus*. No significant impact on *Vibrio* levels was discernable. The second assessment, funded in 1999, was an analysis by Research Triangle Institute of the economic impact of mandating post-harvest treatment of oysters. A final report is in preparation.

In fiscal year 2000, ISSC is using funds from FDA to conduct training for states in gene probe methodology used for monitoring shellfish growing areas for pathogenic *Vibrio parahaemolyticus*, and for collection by states of baseline data on total and pathogenic *Vibrio parahaemolyticus* levels in shellfish. These data are necessary to assist states in making decisions on growing area closures to prevent illnesses.

In fiscal year 2001, FDA plans to continue funding cooperative research programs related to molluscan shellfish at the fiscal year 2000 level of \$250,000.

Question. Please provide the Committee with an update on FDA's education program on the consumption of raw shellfish.

Answer. In fiscal year 2000, FDA provided \$200,000 to the interstate Shellfish Sanitation Conference—ISSC, to educate consumers on the risks to certain individuals associated with *Vibrio vulnificus* and the consumption of raw molluscan shellfish. In April 1999, the ISSC published a final report on their *Vibrio vulnificus* education campaign, which was targeted towards high-risk consumers through their health care providers. In partnership with five states, ISSC distributed over 16,000 fact sheets and almost 29,000 patient education kits. The ISSC also surveyed the patients and health care providers who received the information. Both groups reported that the materials had increased their awareness of the risk of *Vibrio vulnificus*, and a majority of the high-risk patients who completed the survey said that they intended to stop eating raw shellfish.

In addition, FDA's Food Safety Initiative is focusing on educating consumers about high-risk foods, including raw shellfish. In 1999 the theme for National Food Safety Education Month was "Cook It Safely," and the FSI Education Staff added instructions on the safe preparation of seafood—including shellfish—to the 1999 National Food Safety Education Month Consumer Education Planning Guide, a 43-page compendium of ideas for food safety education activities, reproducible education materials, and sample media materials prepared by FDA and USDA and distributed to 35,000 health educators at the state and local levels. In October 1999, a representative of the FSI Education Staff participated in an ISSC *Vibrio vulnificus* Education Workshop concerning means of targeting education programs to persons at high risk. As a result, the FSI Education Staff has drafted a patient guide to food safety that stresses the importance of avoidance of raw shellfish by high-risk individuals. This patient guide, which is currently in review, is a part of the ongoing initiative of the agency in collaboration with American Medical Association, Centers for Disease Control and Prevention, and the Department of Agriculture to improve physician education on food safety, and will be distributed through physicians' offices.

Question. In March of 1999, the FDA provided to the Subcommittee a detailed Food Safety Initiatives Activities Plan. Please update that plan to show the current fiscal year 2000 funding and FTE levels and those proposed for fiscal year 2001 by Food Safety activity.

Answer. We are happy to provide a table that reflects total Food Safety Initiative—FSI, funding by major food safety activity, and another that reflects FSI funding by program. We are also providing by June 30, 2000, under separate cover, a detailed breakout that includes specific projects within each activity category. This will include resource data in the millions and associated FTE.

[The information follows:]

TOTAL FOOD SAFETY INITIATIVE FUNDING BY CATEGORY

	Fiscal year 2000 current est		Fiscal year 2001 increase		Fiscal year 2001 request	
	In dollars	FTE	In dollars	FTE	In dollars	FTE
Surveillance	\$11.0	51	\$5.4	4	\$16.3	55
Coordination	7.9	76	0.0	0	7.9	76
Inspections	119.1	1,126	17.0	116	136.1	1,242
Education	8.6	67	8.6	67
Research & Risk Assessment	40.6	278	7.6	11	48.2	289

TOTAL FOOD SAFETY INITIATIVE FUNDING BY CATEGORY—Continued

	Fiscal year 2000 current est		Fiscal year 2001 increase		Fiscal year 2001 request	
	In dollars	FTE	In dollars	FTE	In dollars	FTE
Total	187.2	1,598	30.0	131	217.2	1,729

Question. In fiscal year 1997, FDA was spending \$109.3 million for Food Safety initiatives. In the past year, FDA has received an additional \$79 million for its Food Safety initiatives. How has food safety been improved as a result of the additional funding provided?

Answer. On March 17, CDC reported a 20 percent reduction in overall foodborne illnesses associated with pathogens through their active surveillance network—Foodnet. The Centers for Disease Control—CDC, credited the federal, state and industry food safety partnership activities, such as Fight Bac!; HACCP and Good Agriculture Practices as major contributors to this public health improvement. CDC also reiterated the need to continue to make similar strides in prevention, improved food safety systems and outbreak response.

Additionally, the overall picture of trends for food safety knowledge and practices that emerges from research is quite encouraging. Between 1993 and 1998, the public's food safety practices, both the consumption of risky foods and food handling behaviors in home kitchens, show dramatic improvement. For example, for the population as a whole, the incidence of eating pink hamburger is down 33 percent and the incidence of eating raw oysters or clams is down 39 percent. The safety of reported hand-washing and cutting board practices has also improved markedly. The improvement is particularly strong for handling meat or chicken, which improved 74 percent compared to a 27 percent improvement for fish. Knowledge levels about microbial food pathogens increased, along with rising perceptions of the possible risk of getting foodborne illness.

That is not to say that there are no consumer education issues to be addressed. There are obvious gaps in consumer knowledge, attitudes and practices related to food safety. For example, although awareness of salmonella has increased most consumers still do not handle eggs very carefully and they are more likely to consume undercooked eggs or foods containing raw eggs than any other risky food. Most consumers have never heard of *Listeria* or *Campylobacter*, which are at least as prevalent in the food supply as the more well known pathogens, *Salmonella* or *E. Coli*.

The Food Safety Initiative has provided necessary resources for FDA to undertake the enormous challenge of foodborne illness. Even more is expected of this Agency as its responsibility encompasses a broader array of regulated products and potential hazards in foods.

Question. Commissioner Henney, you indicate in your prepared statement that the fiscal year 2001 budget proposed to accelerate the process of generic drug review. How specifically will the process be accelerated? Please give current review times as opposed to those that will be achieved with the additional resources proposed.

Answer. With additional resources FDA expects to accelerate the processing time for generic drug applications by improving its IT infrastructure which will increase the number of electronic submissions and reviews. An increase in the generic drug science base will also improve our processing time. Funding is needed for research to support the development of scientifically rigorous bioequivalence testing methodologies for non-systemically absorbed drug products. The stronger scientific support of these approvals, the more likely it will be that we can successfully meet innovator challenges.

Approval times reflect both time with the Agency reviewing applications as well as time with the sponsor or applicant responding to deficiencies noted by FDA reviewers. The time spent in FDA is measured by "review cycles." A cycle starts when an application is filed by FDA and ends when the Agency issues an "action" letter. Generally, these letters communicate to the sponsor that their application is approved or not. The majority of actions on an original Abbreviated New Drug Application (ANDA) are disapprovals. If not approved, the sponsor or applicant is provided with the reasons why and has an opportunity to submit information needed to address all of these deficiencies. When this information is received, a new cycle begins; often, the next action is another disapproval, due to inadequate information in the submission. For fiscal year 1999, the average ANDA took 2.4 review cycles to reach approval, a decrease from previous years' number of cycles of 2.7 in fiscal

year 1998 and 2.9 in fiscal year 1997. The time to reach approval has been decreasing as well, with the average time in fiscal year 1999 being 17.3 months, down from 18.7 months in 1998 and 19.6 months in 1997.

For fiscal year 1999, the Office of Generic Drugs does not expect to meet the original goal of reviewing 60 percent of the original, fileable applications in the statutory time frame. We expect to have acted upon 40 percent of the original applications in fiscal year 1999. Final performance data for the fiscal year 1999 cohort will not be available until April of 2000. The goal for fiscal year 2000 is 45 percent. The additional funding request for fiscal year 2001 will help us meet 50 percent within statutory timeframes.

For fiscal year 2000, the Committee approved the Administration's request to provide an additional \$28 million and 141 FTE staffing for premarket application review. The Committee indicated in its report that it was approving the following increases requested in the budget: \$11.4 million for foods (+51 FTEs); \$2.4 million for human drugs (+13 FTEs); \$4 million for biologics (+16 FTEs); \$1.6 million for animal drugs (+14 FTEs); \$7 million for devices (+45 FTEs); and \$1.6 million for NCTR (+2 FTEs). This was on top of the following base appropriations and staffing levels for premarket review, as follows: \$16.310 million and 134 FTEs for foods; \$162.813 million and 1,261 FTEs for human drugs; \$57.263 million and 410 FTEs for biologics; \$11.546 million and 115 FTEs for animal drugs; \$48.5 million and 477 FTEs for medical devices.

Question. Are these premarket application review funding and staffing levels being achieved for fiscal year 2000? If not, please indicate what specific funding and staffing levels are being changed and explain why. Also, please provide the fiscal year 2001 comparable funding and staffing levels.

Answer. FDA's total premarket review funding and staffing levels are being achieved for fiscal year 2000. The base resources referenced constitute those funds devoted solely to the review of an application. However, the application review process is entirely dependent on several activities that allow Agency to process and review an application. The areas historically included in the premarket review area include the review of an application, premarket research, premarket outreach and coordination, premarket inspections. These activities reinforce FDA's role of monitoring the industry and providing the consumer with the best assurances possible that the industry is meeting its responsibility. This strategy is designed to ensure that safety is built into the product rather than to check for safety after the product is on the market. Premarket review activities implement this strategy by ensuring that the premarket evaluations of drugs and medical devices are effective and timely, and the safety reviews of food and drug components are conducted to determine if they pose hazards in light of new scientific evidence and techniques. Agency staff actively work with manufacturers to identify critical control points and to develop good manufacturing practices. FDA is providing a table depicting total premarket review activity estimates through fiscal year 2001. The table provides data from fiscal year 1999 through fiscal year 2001 including the fiscal year 2000 mark, the effects of the recession, the PDÜFA reallocation and the increases for fiscal year 2001. Additionally, the agency is providing definitions of each of the pieces which make up premarket review.

PREMARKET REVIEW ACTIVITIES

Headings	Definition, examples
Premarket Review	All resources involved in the premarket review process, i.e. application review, notices, petitions, sample collections, sample analysis and method validations, premarket regulation writing and policy decision making. Product approval activities, e.g., ANDAs, colors, food additives.
Premarket Applied Research	Laboratory research to support premarket approval and activities. Includes Methods development for testing and non-testing purposes, and research to develop solutions for specific regulatory problems. Should include regulatory research, but exclude premarket methods development which should be included under premarket review. Excludes routine product testing, quality control, mapping, collection of general purpose statistics, experimental production, and training of scientific and technical personnel. Includes domestic and foreign standards development and recognition and international harmonization-related research activities.
Premarket Outreach/Coordination: Domestic.	Includes all consumer information, public affairs, legislative affairs, policy, meetings, conferences, media interviews, small business education and liaison activities. Premarket-related outreach activities includes manufacturers assistance and government, medical, and consumer liaison efforts.
Premarket Outreach/Coordination: Foreign.	All foreign non-inspection trips such as ICH, MRA and conferences. International Harmonization activities. Premarket-related outreach activities includes manufacturers assistance and government, medical, and consumer liaison efforts. This category includes all foreign travel that does not result in a written inspection report.
Premarket Inspections: Domestic ...	Physical inspection of regulated establishments, blood banks, manufacturers, etc. Investigations by field, non OCI personnel, trace backs, trace forwards. Includes domestic travel for inspection purposes. Includes sample collections.
Premarket Inspections: Foreign	Physical inspections of foreign establishments may include public health and trade issues. Includes foreign travel for inspection purposes. Should include all foreign trips for which an inspection report is written. Trips for GAP/GMP equivalence are contained in outreach.

Question. Included in the \$11.4 million increases provided by the Congress for premarket application review for the foods program for fiscal year 1999 is an additional \$5,400,000 for the direct additive process. Is this funding level being achieved? If not, why?

Answer. Yes, the additional \$5.4 million for the direct food additive petition review process has been targeted to that program in the Center for Food Safety and Applied Nutrition. Since passage of the fiscal year 2000 appropriations bill, the Center has begun the process of bringing on additional scientists as petition reviewers. To help improve productivity during the time it takes to hire and thoroughly train reviewers, we are also using some of the new resources to engage contractors to assist with some petition review tasks. Our performance in timeliness of petition review has been slowly improving in recent years; with the new resources, we expect to make significant further improvements in performance.

Question. For fiscal year 2000, funding of \$6 million was provided to FDA to fully implement the food contact substances program. Is this funding being provided? If not, why? How much is included in the fiscal year 2001 request for the food contact substances program, funding and FTE as compared to fiscal year 2000?

Answer. Yes, the funding necessary to implement the food contact substance premarket notification program has been allocated to that program. Indeed, since the program became effective upon passage of the fiscal year 2000 appropriations bill, more than four dozen pending petitions for food contact substances have been converted to notifications, and more than a half dozen new notifications have been received. The first of these notifications became effective in early March, 120 days

after receipt. FDA expects to continue to fund this program at the same level of \$6 million in fiscal year 2001 as in fiscal year 2000.

Question. For fiscal year 2000, the Committee indicated that at least \$0.2 million and 2 new FTE positions were to be made available from the increase provided for animal drug premarket application review for the Center for Veterinary Medicine to review aquaculture drug submissions on a timely basis. What funding and staffing increase has been allocated to the Center for fiscal year 2000 for this purpose and what reductions will it yield in the amount of time required for the Center to review aquaculture drug submissions?

Answer. In recent years, the Center for Veterinary Medicine—CVM, has had a heavy backlog of Aquaculture submissions waiting for review. Of the two positions specifically targeted for Aquaculture reviews in fiscal year 2000, one has been filled and the other will be filled shortly. The full effect of the new hires will not be felt until fiscal year 2001 when the reviewers are fully trained. This fiscal year CVM has made substantial progress in reducing the backlog of Aquaculture submissions, with only fourteen out of the sixty-two Aquaculture applications overdue at the current time. We intend to meet our goals in Aquaculture in fiscal year 2001, which are based on an Aquaculture Drug Team composed of four members, and submissions which fall within currently projected levels in subsequent years.

Despite the challenges, definite progress is being made toward Aquaculture drug approvals. Coalitions from the public and private sectors are providing leveraging and are producing the needed investigational data for individual drugs. CVM is a willing participant in these partnerships and continues to look for new ways to support the continued growth of an Aquaculture industry that produces safe and healthy domestic and imported food products.

Question. Provide the 2001 staffing (FTE) and funding levels for generic drug review, as compared with those in each of fiscal years 1998, 1999, and 2000.

Answer. I would be happy to provide information that reflects fully supported FTE for the Generic Drugs Program, including resources for both the Center for Drug Evaluation and Research and the Office of Regulatory Affairs. A fully supported FTE includes salaries, benefits, and other support costs such as training, office space, travel, equipment and supplies.

[The information follows:]

GENERIC DRUG APPROVAL PROCESS

[Dollars in thousands]

Fiscal year	FTE	Amount
1995	396	\$42,643
1996	327	33,634
1997	351	34,183
1998	345	34,898
1999	362	36,049
2000 ¹	372	37,873

¹ Estimate. Fiscal year 2000 data is not yet available that will allow the Agency to project year end data, but the Agency expects to expend an additional \$1.824 million for the Office of Generic Drugs—the \$1.9 million appropriation minus a \$76,000 reduction taken as a result of the fiscal year 2000 Budget Recission.

Question. Commissioner Henney, you indicate in your prepared statement that “FDA will use new funding to develop a focused effort in the rapidly evolving field of food biotechnology”. What is planned and what level of “new” funding is requested for fiscal year 2001, as compared with fiscal year 2000, for this new effort?

Answer. For fiscal year 2001, the Center for Food Safety and Applied Nutrition—CFSAN, is requesting an additional \$1 million to enhance our research efforts and our scientific expertise in the area of food biotechnology, with a particular focus on areas that will directly support our regulatory programs. We are seeking both to increase our in-house research and testing capabilities in this area, as well as to leverage our resources with other institutions with relevant expertise, such as the Joint Institute for Food Safety and Applied Nutrition—JIFSAN. The major focus of our efforts will be on developing and improving techniques for assessing the safety of bioengineered foods and feeds, for example, methods for predicting allergenicity of proteins, and new alternatives to animal models for determining safety. There is also a pressing need for a better knowledge of factors that influence the perception of risks associated with genetically engineered foods and feeds, and thus we intend to work with other institutions with expertise in this area to develop methods for

the effective communication of risks associated with these products. In fiscal year 2000, CFSAN expects to spend approximately \$700,000 on in the area of food biotechnology.

FDA's Center for Veterinary Medicine—CVM, in fiscal year 2000 plans to spend approximately \$120,000 in the area of food biotechnology. The activities include evaluating safety of biotech foods used in animal feeds and some outreach activities associated with biotech foods used in animal feeds. We are finding that the number of biotech related submissions is increasing.

In fiscal year 2001, the Center for Veterinary Medicine is requesting an increase of \$300,000 to be used for evaluating safety of biotech foods used in animal feeds.

FDA's National Center for Toxicological Research has no funding in fiscal year 2000 for biotechnology research. In collaboration with CFSAN and CVM, in fiscal year 2001, NCTR is requesting \$500,000 for research related to food derived from genetically modified organisms.

CLINICAL PHARMACOLOGY PROGRAM

Question. For each of fiscal years 1998, 1999, and 2000 please indicate the total funding level, by grantee, provided for the Clinical Pharmacology Program.

Answer. I would be happy to provide the requested funding level by grantee of the Clinical Pharmacology Program for fiscal years 1998, 1999 and 2000.

[The information follows:]

CLINICAL PHARMACOLOGY GRANTS

[In thousands of dollars]

Grantee	Fiscal year 1998 actuals	Fiscal year 1999 actuals	Fiscal year 2000 estimate	Totals
Mayo Foundation	60	60
University of Illinois	225	369	594
Meharry Medical College	131	131
Indiana University	460	460
Totals	285	500	460

Question. How much is included in the fiscal year 2001 budget request for the Clinical Pharmacology Program?

Answer. FDA plans to expend \$500,000 in fiscal year 2001 for clinical pharmacology grants awarded competitively.

Question. Please provide a description of the Clinical Pharmacology Program.

Answer. The Clinical Pharmacology Program provides financial assistance to investigators who conduct research as part of their clinical pharmacology training program. This program is funded through cooperative agreements. I will be happy to provide a more specific description of the Clinical Pharmacology Program for the record.

[The information follows:]

Specific goals important to the public health include: Advancing scientific knowledge of mechanisms of *in vitro/in vivo* metabolism/drug interactions; characterization of individual exposure-response to drugs; and, the effect of age, gender, and race on drug disposition and exposure response relationships.

Projects that fulfill any one or a combination of the following specific objectives are considered for funding:

- Mechanistic understanding of drug-drug, drug-food, and drug-non-prescription product interactions;
- Research to develop and evaluate biomarkers, and noninvasive imaging as a way to assess safety and efficacy;
- Computer modeling and clinical trial simulations: evaluation of clinical study designs to confirm drug safety and efficacy; evaluation of techniques in gender, age, race, and liver/kidney function-specific differences in drug response and drug interactions;
- Development of electronic databases to capture key metabolism/drug interaction data and provide a linkage to an expert system to assist the New Drug Application (NDA) review; and
- Research to define the clinical pharmacology characteristics of complex drug substances to assure proper use, define the biopharmaceutical characteristics of

the active ingredients, and develop ways to establish equivalency of dosage forms to establish standards.

WASTE-MANAGEMENT AND RESEARCH CONSORTIUM

Question. For fiscal year 2000, \$100,000 was provided for the Waste-Management and Research Consortium, as proposed by the House. What level of funding is included in the fiscal year 2001 budget request for this consortium.

Answer. FDA expects to provide approximately \$100,000 for the Waste-Management and Research Consortium in fiscal year 2001.

Question. What is the purpose of the Waste-Management and Research Consortium? What are its benefits to FDA and who are the participants in this program?

Answer. The purpose of this program is to provide talented college students with a chance to work on real world environmental or health related problems. FDA presented a problem—"Find a way to detect contaminated fresh produce quickly"—that the consortium posted on its website. Five colleges responded to the challenge and are competing to solve the problem. In April 2000, 10–12 judges drawn from a pool of experts from FDA, the California State Department of Health, academia, and an expert from Waste-Management in Manure Research will evaluate the solutions presented. If a viable solution is found, FDA will begin implementing the solution to inspect imported fresh fruit for contaminants.

SEAFOOD EQUIVALENCY AGREEMENTS

Last year, FDA indicated that it is working to improve the safety and sanitation of imported seafood by establishing equivalency agreements to ensure that exporting countries have seafood inspection systems equivalent to those of the U.S. Further, FDA indicated it was in the process of evaluating submissions for equivalency agreements from numerous countries and the European Union and had plans to visit six countries, including Australia, Canada, Chile, Iceland, New Zealand, and the European Union, before the end of the year.

Question. What is the status of FDA's efforts with regard to seafood equivalency agreements?

Answer. Thirty-four countries have made at least initial requests for equivalence determinations for seafood products. The determination process involves at least six significant steps. In the first step, FDA receives an initial inquiry from a country and, in response, provides a package of materials designed to help the country prepare a side-by-side comparison of regulatory systems. Many countries realize at this point that they need to upgrade their systems and they essentially allow their request for an equivalence determination to become dormant. FDA regards the determination process for 26 of the 34 countries that made initial inquiries to be in a dormant stage. The second step involves a full "paper" comparison of all relevant aspects of a country's food safety system. This is a rigorous and time-consuming process involving major exchanges of material and lengthy analysis. The third step includes one or more site visits to verify the findings of the paper review.

If FDA makes a preliminary determination of equivalence based on the paper review and on-site visits, the Agency will then progress to the fourth step, publishing preliminary determination for comment in the Federal Register. In the fifth step, a final determination is made after review of any comments received. The development of an equivalence agreement, if any, could then occur as the sixth and final step.

The countries that have advanced the furthest in the process are Canada, New Zealand, Australia, Norway, and Japan. All have had at least first site visits and extensive, although not fully complete, paper reviews. A second site visit is scheduled for Canada later this year to review recent changes in the Canadian regulatory system. A preliminary determination may be possible for Canada this year, as well as preliminary determinations for some of the others, depending on outcomes of their reviews.

Question. Did FDA complete the six country visits in 1999? If so, what has been the results of those visits? If not, why?

Answer. In 1999, the Agency planned to visit Canada twice, Chile, Japan, Iceland, and Thailand. FDA visited Canada once, for an audit of Canadian regulatory laboratories, but delayed an inspection audit until this year at the request of the Canadians. The site visit to Japan was made, and may be sufficient to enable FDA to make a preliminary determination about Japan without need for further information or visits. The results are still being reviewed. The other site visits were not conducted due to a number of outstanding questions related to the paper review. FDA is waiting to receive answers to these questions before performing the site visits.

Question. Has FDA established criteria for determining whether another country's food safety system is equivalent to the U.S. system? If not, why? Are these criteria specific to seafood?

Answer. In June 1997, FDA published draft equivalence criteria for all foods regulated by FDA. The Agency obtained comment on the draft criteria from consumer advocacy organizations, industry trade associations, and foreign countries. FDA is in the process of developing final equivalence criteria that take into account the comments received. Completion of the equivalency criteria is a priority for CFSAN in fiscal year 2000.

Question. Where will the FDA target overseas compliance visits this year?

Answer. In fiscal year 1999, FDA inspected seafood processing plants for compliance with U.S. safety regulations in Ecuador, Taiwan, Vietnam, and the Philippines. A trip to Indonesia was canceled due to political unrest in that country. For fiscal year 2000, the Agency has planned compliance inspections in Costa Rica—which has already been completed, Thailand, China, Indonesia, Mexico, Panama, India, and South Africa. Non-seafood overseas compliance visits will be targeted toward manufacturers of low-acid canned foods, one of FDA's designated "high risk" areas.

Question. What is the current level of resources for this effort? Are additional resources needed?

Answer. FDA plans to spend approximately \$4 million on all overseas compliance visits in fiscal year 2000. Our fiscal year 2000 plan for overseas compliance visits was drafted using available resource levels. Additional resources would allow FDA to increase the number of inspections.

TRANSFER OF VOLUNTARY SEAFOOD INSPECTION PROGRAM

Question. In a letter to me, the National Fisheries Institute has indicated its opposition to transferring the Department of Commerce Voluntary Seafood Inspection Program to the FDA. It feels it is inappropriate to combine the Department of Commerce voluntary marketing and quality assurance program with FDA's mandatory seafood HACCP program. It indicates that the National Academy of Sciences and the Department of Health and Human Services, in response to a 1992 General Accounting Office report, have warned against combining regulatory food safety programs with industry-funded marketing and promotional programs like Commerce's voluntary inspection service. Do you agree that combining these programs might undermine the objectivity and credibility of FDA's seafood HACCP program? If not, why?

Answer. FDA believes that safeguards could be put in place to eliminate a potential conflict of interest that could undermine the objectivity and credibility of the current regulatory seafood HACCP program. Transferring the program as a Performance Based Organization—PBO, would help. A PBO is a quasi-public organization that is located in a federal agency but operated like a business in that it is to be financially self sustaining. While FDA would oversee the policy direction of the PBO, no agency funds would be used to finance the organization. While the legislation would authorize PBO inspectors to perform regulatory inspections, FDA would adopt precautions to ensure the objectivity and credibility of the inspection. For instance, FDA could adopt a policy of utilizing PBO inspectors to perform regulatory inspections only for seafood firms that are not also paying customers of the PBO. In the end, FDA can always utilize its regulatory inspection force as a check against the PBO inspection force to ensure that the public health is protected.

Question. What benefits does the FDA believe would be obtained by transferring the National Marine Fisheries Service voluntary seafood inspection program to the FDA?

Answer. Transfer of the NMFS/SIP program to FDA will place all Federal seafood inspection authorities within one Federal agency, enabling increased efficiency and consistency of standards and implementation of FDA seafood requirements. It would establish FDA as the sole seafood agency with one HACCP standard, thereby promoting efficiency, effectiveness, and consistency of seafood regulation. This centralization will help both domestically and internationally. FDA would be able to train the voluntary inspectors in the regulatory HACCP standard along with the regulatory inspectors. Consequently, FDA may be able to contract with the voluntary inspectors to perform certain regulatory inspections or, in certain instances, to count a voluntary inspection as a regulatory inspection.

Question. I understand the proposal would allow for voluntary inspectors to be "cross-deputized" as mandatory HACCP inspectors. Is this correct? Does the FDA need additional HACCP inspectors? If so, why doesn't the Administration's budget request simply reflect a need to hire additional HACCP inspectors?

Answer. The legislative proposal does allow FDA to utilize the PBO inspectors to perform regulatory inspections under the Federal Food, Drug and Cosmetic Act. Such cross utilization could help to meet the agency's goal of annual HACCP inspections for seafood establishments.

ORPHAN DRUGS

Question. FDA policy already rewards an "improved" orphan drug by allowing it on the market immediately alongside the pioneer orphan drug, thus cutting short the pioneer's exclusivity. Is the grant of an additional reward on top of that, i.e., seven years of exclusivity for the improved drug, warranted? If so, why? What does it add to the incentive to develop improved versions of orphan drugs?

Answer. Under the Orphan Drug Act, if a drug is designated for an orphan indication and is approved for that indication, it will receive seven years of exclusivity. During this seven-year period, the agency will not approve or license the same drug from another sponsor. However, the first sponsor's exclusivity is not a barrier to approval of a product that is not the same drug. If a subsequent sponsor demonstrates that its drug is for the same indication, and is not the same drug as the drug with exclusivity, either because it is chemically not the same, as defined in the orphan drug regulations or is clinically superior the term you use is "improved", the second product will be approved. If the second drug was designated for the orphan indication, it will also receive orphan exclusivity. Hence, the second drug is entitled to the full seven years of orphan exclusivity because it is not the same drug as the product that already received exclusivity. The statute does not limit the drug's eligibility for exclusivity on the basis of indication, chemistry, or clinical behavior.

The current approach, in which improved forms of human growth hormone for human growth hormone deficiency and interferon-beta for multiple sclerosis have been granted exclusivity, provides substantial incentive for research and investment.

Question. In the case of an "improved" orphan, why does FDA insist on protecting the chemical entity itself for seven years instead of limiting protection to the improvement, e.g., a convenient long-acting formulation, or oral version that replaced an injection? FDA seems to be making orphan drug exclusivity even broader than patent protection. Is that necessary?

Answer. The Orphan Drug Act grants seven years of exclusivity to certain approved drugs for orphan indications. The analysis of whether approval of a new drug is blocked by orphan exclusivity turns on whether the two drugs are the same. Generally, an applicant wishing to establish that its product is not the same as one with orphan exclusivity must demonstrate that its drug is either chemically different, or clinically superior to the product with exclusivity. In that case, the first product's exclusivity is not a bar to the approval of the second product. If the subsequent product received an orphan designation, it will be entitled to its own seven year period of orphan exclusivity upon approval because it is not the same drug. That exclusivity will protect the second drug against competition from any drug that is chemically and clinically the same. The statute does not limit the scope of orphan exclusivity for some drugs only to certain characteristics of the drug.

It is not clear how this protection is broader than patent protection. Patents run for a period of 20 years from date of application and, with respect to those applicable to drug products, can vary in coverage from very broad, such as those patents that cover a drug substance, to narrow, such as patents that cover a specific dosing regimen for a single indication or a single formulation.

Please note that, in the rare case when there are at least three products that are chemically the same for the same orphan indication, different factors may be at issue. If the orphan exclusivity for the first of the products has expired, the new drug, if it is regulated under section 505 of the act, can also obtain approval despite the second product's exclusivity if it can demonstrate that it meets the criteria in 505(j) of the act as a duplicate to the product whose exclusivity has expired. The new drug would be approved because it is not the same drug as the drug that still has orphan exclusivity, but it would not receive its own exclusivity because the drug—albeit from a different sponsor—has already been granted exclusivity, which has expired.

Question. What is the rationale for allowing only drugs that qualify for short cut approvals to enter into competition with an older version of an orphan drug? Why prevent biologic drugs from competing, as long as they do not attempt to copy the improvement that resulted in approval of the subsequent product?

Answer. Any analysis of whether a drug can be approved in the face of existing orphan drug exclusivity turns upon whether the drug is the same chemically and clinically as the drug with exclusivity. When there are only two drugs at issue, the

sponsor of the second drug must demonstrate that its product is chemically not the same as, or clinically superior to the product with exclusivity in order to obtain approval, and its own exclusivity. When there are two drugs that are chemically the same, but each has been granted orphan exclusivity because of a finding of clinical superiority for the more recently approved product, the issues for approval of a third product are somewhat different. Once the first product's exclusivity has expired, the inquiry is still whether a proposed drug is the same as the drug that still has orphan exclusivity. The new drug can show that it is clinically superior to the drug that still has exclusivity or, in the alternative, it can demonstrate that it is not the same as the drug that still has exclusivity by showing it is the same as the drug whose exclusivity has expired.

The "short cut" approval process you refer to is the abbreviated new drug application program enacted by Congress in the Drug Price Competition and Patent Term Restoration Act of 1984 to provide a streamlined means for approving generic drugs that can be expected to be as safe and effective as the innovator product. FDA has determined that if the sponsor of a new product can establish that its product meets the approval criteria under section 505(j) of the Federal Food, Drug, and Cosmetic Act for a duplicate to the product whose exclusivity has expired, it will be approved because it is not the same as the drug that still has orphan exclusivity. There are scientific and technical barriers to demonstrating that two biological products from different manufacturers can be expected to have the same safety and effectiveness measures. There currently is no process for approving generic versions of biological products regulated under section 351 of the Public Health Service Act. The agency is reviewing its approach to orphan issues as they apply to biological products.

Question. In enacting the Food and Drug Administration Modernization Act in 1997, Congress specifically included a section mandating greater harmonization between drug and biologic regulation (noting that the provision was not intended as a mandate for "generic" biologics). How can FDA's orphan drug competition policy be reconciled with this mandate?

Answer. Under FDAMA section 123(f), the agency continues to work to minimize differences in the review and approval of products required to have biologics licenses and products required to have approved new drug applications. The issues raised in certain orphan exclusivity situations relate to establishing whether two orphan products from different sponsors can be expected to have the same safety and effectiveness. The generic drug approval process at section 505(j) of the act is an appropriate means for making this determination for drugs approved under section 505 of the act. However, the composition and characteristics of biologic products regulated under 351 of the Public Health Service Act pose different scientific and technical challenges. The agency currently does not have a means for making a determination that two biological products from different sponsors can be expected to have the same safety and effectiveness.

ASSESSING THE QUALITY OF DIETARY SUPPLEMENTS

Question. Has a study been done to assess the overall quality of dietary supplements that are being sold in the United States?

Answer. No, FDA has not conducted any systematic evaluation of the overall quality of dietary supplements in the marketplace

Question. What kinds of scientific studies should be performed on dietary supplement products that are on the shelf in order to assess their quality?

Answer. FDA believes that scientific studies, to assess quality of dietary supplements that are on the shelf, should verify that dietary supplement products offered for sale contain the ingredients that are stated on the label at the strength and purity claimed. Other quality factors appropriate for study include those that assure the dissolution, bioavailability, and shelf-life or stability of dietary supplement products.

A "market basket" evaluation should be performed of one or more botanical dietary supplements that are used extensively by U.S. consumers. This evaluation would provide the information needed to conduct effective exposure evaluations for future risk assessments, to assess the distribution of formulations that are available commercially, and to identify the areas where FDA should be focusing its activities in botanicals in the future.

DIETARY SUPPLEMENTS

Question. Are you concerned about microbiological contamination of dietary supplements?

Answer. Although we are not aware of specific microbiological risks that are unique to dietary supplement ingredients or products, like conventional foods, many

dietary supplement ingredients are natural products and we would expect that some natural products would be at risk for contamination with microorganisms that may affect the quality of the product or that may present disease risks.

Question. Are pesticides, herbicides and fungicides a potential problem with dietary supplements?

Answer. Yes, like any food ingredient, dietary supplements may become exposed to, and be contaminated with, various pesticides, herbicides, and fungicides used during their growth, harvest, production, or in the manufacturing facility. Additionally, cultivated and wild-crafted herbs or botanicals may unintentionally come in contact with pesticides, herbicides, and fungicides, via adjacent treated fields.

Question. Is contamination with lead or other heavy metals from the soil a potential health problem?

Answer. Yes, as with all plant-derived foods, plant-derived dietary supplements may accumulate heavy metals that are present in the environment. It is also possible for manufacturing equipment to unintentionally contaminate food and dietary supplements with heavy metals during processing. Whether a given heavy metal in a dietary supplement presents a health risk to consumers depends on many factors, including the amount present.

Question. Can or should some of these studies be conducted by universities that have expertise and experience in that research area?

Answer. Yes, partnering with universities and other academic institutions enables FDA to leverage both its financial and scientific resources to the benefit of U.S. consumers. In the areas of methods development and validation relative to issues of identity, bioavailability, dissolution and disintegration, potency, shelf-life stability, and quantification of contaminants, studies can be conducted, not only by FDA, but also by universities, research institutions, and other government agencies. To facilitate this process, FDA is talking with United States Pharmacopoeia—USP, academic institutions, and other interested parties to develop guidelines for the needed research, and a process to facilitate communication and coordination among research groups and users of these data.

Question. Are you aware of the research on the quality of dietary supplements that is being done in the National Center for Natural Products Research at the University of Mississippi?

Answer. During the past year, CFSAN has had increased interaction with the National Center for Natural Products Research—or NCNPR, at the University of Mississippi, including a site visit by several of our top scientists. This increased interaction is due in part to FDA's recognition of the NCNPR as center for excellence in the study of botanicals used as dietary supplements. We have identified dietary supplement research as a critical area for the future and are actively pursuing ways to work closely with the University of Mississippi to enhance the Agency's science-base. In the past, we have experienced great benefit from a government/academic/industry consortium at the National Center for Food Safety and Technology—or NCFST, at the Illinois Institute of Technology. FDA considers participation in such collaborative endeavors to be a vitally important resource in carrying out our mission to ensure that U.S. consumers have confidence in the safety of the drugs, foods, and dietary supplements that they purchase.

Question. What scientific information is needed to help FDA determine if the dietary supplements on the market are safe?

Answer. The Dietary Supplement Strategy—a comprehensive Ten Year Plan, outlines the scientific information that the agency believes is needed to help FDA determine if the dietary supplements on the market are safe. For safety purposes, FDA considers dietary supplements as foods. We believe that scientific studies of the same quality and scientific rigor as those required of novel food ingredients are appropriate to dietary supplements. Data is needed to form a basis to permit a science-based risk assessment of chronic and acute risks to general, high-risk, and vulnerable populations.

A broad range of multidisciplinary research efforts is needed to evaluate the safety of marketed products, including dietary supplements. These efforts include the types of research needed to ensure the quality of marketed products; methods for improving the use of adverse event reports; basic toxicological profiles and dose response curves for ingredients and finished products; potential for adverse interactions among ingredients and identification of vulnerable populations; other clinical studies and evaluations that reflect actual use conditions; and consumer use patterns and interpretation of label information.

Question. Does FDA fiscal year 2001 request include any funds for to improve the quality of dietary supplements? If not, what funding would be needed to initiate this research effort?

Answer. Within the Foods Premarket initiative, our fiscal year 2001 budget request includes an increase of \$200,000 for FDA to develop sound scientific data and expertise to support standards and guidance in evaluating the safety of dietary supplements. Our goal is to respond to 90 percent of notifications for dietary supplements containing new ingredients within 75 days.

Additionally, in fiscal year 2001, as part of the Foods Postmarket initiatives, FDA is requesting an increase of \$2.5 million to enhance the adverse event reporting system, or AERS, for dietary supplements. With this increased funding, FDA would develop a system component to collect data on drug-dietary supplement interactions to provide a faster, more efficient way to evaluate adverse event reports, thus shortening the time needed for any responsible actions. The potential benefits for this enhancement are lives saved and improved public safety.

We estimate that we would need approximately \$1 million to \$1.5 million for FDA to approach a collaborative research project with a leading academic institution. This would allow FDA to initiate an analytical survey of currently marketed dietary supplement products to determine the level of health risk to the consumers of dietary supplements.

Question. Has FDA conducted, or is it conducting, the studies described in the report that are necessary to evaluate the effectiveness of this technology?

Answer. FDA has conducted an extensive review of the available information regarding the effectiveness of the technology. Based on this extensive review we have come to understand the infancy of the technology and how little is known about its potential for reducing illegal sales. Our investigation included a search of published and unpublished peer-reviewed scientific literature, searches of computerized data bases, and extensive discussions with experts in tobacco and alcohol control. We have interviewed all of the identified manufacturers of the devices, and requested any studies they had done prior to or after marketing their devices.

Unfortunately, only one controlled study of the efficacy of the devices has been initiated and the results of that study will not be available until late summer of this year. Even when the study results are available, the applicability to sales of tobacco to minors will be limited. The study has as its end-points reduction in deaths from alcohol-related car crashes, a surrogate measure for alcohol use by minors.

A definitive study of the utility of the devices to reduce sales of tobacco to youth would need to test not only the reliability of the machines, but how they are actually used in the retail setting. They can be easily circumvented by the clerk. On the other hand, the machines clearly can assist clerks in determining age eligibility once an ID card has been requested and inspected by the clerk. It is also possible that the mere presence of the machine within site of an under-age customer might deter some youths from even attempting to purchase tobacco. A well-controlled study of these effects is certainly warranted before many merchants go to the considerable expense of installing the devices.

REPORT ON AUTOMATED IDENTIFICATION SYSTEMS

Dr. Henney, in its report on the Agriculture Appropriations, the Committee directed FDA to evaluate the feasibility of equipping tobacco retailers with technology to verify a tobacco purchaser's age through the use of an automated verification system capable of "reading" the magnetic strip or bar code on a driver's license in which the name and age of the licensee is encoded. Among other things, the report is intended to address the effects of reducing illegal tobacco sales to minors and the effect on compliance through the use of automated identification systems. The report accompanying the conference agreement on the bill indicates that FDA is to submit this report within 180 days of the date of the bill's enactment into law—that is, by late April of this year.

Question. Does FDA plan to consult with states, such as New York, that have enacted legislation promoting the use of this technology, or with other states that are considering such legislation?

Answer. FDA has monitored New York's experience with the legislation. The law in New York went into effect on September 1, 1999, and was intended primarily to protect merchants from minors attempting to buy liquor with falsified identification cards. The Agency has learned that to date no merchants have attempted to use the application of the machines as an affirmative defense. If the US Supreme Court affirm's FDA's jurisdiction to regulate tobacco products, FDA plans to continue to monitor the situation in New York, as well as consult with states such as Ohio, Florida, and Massachusetts that are considering the technology.

Question. Does FDA agree, as a general matter, that the federal government should encourage the states to promote the use of technology that can ensure that

the identification presented by tobacco purchasers has not been falsified, so as to help prevent underage purchases of tobacco?

Answer. FDA has encouraged merchants to use the wide array of tools and business practices available to them to reduce illegal sales and has mentioned to interested retailers that scanners are one thing they may want to consider. Unfortunately, our research has shown that these devices possess a number of limitations. These limitations include cost; ease with which they can be bypassed; privacy issues; and lack of any credible, scientific evidence that the machines actually are effective in reducing illegal sales. As a result, FDA believes that it is important to not overstate the value that these products may provide in reducing illegal sales to minors.

FDA COUNTER-BIOTERRORISM ACTIVITIES

Question. FDA performance plan indicates that in responding to chemical and biological threats of bioterrorism, FDA's roles include development of new vaccines and drugs, safeguards for the food supply, and research for diagnosis and treatment of disease outbreaks. Would you please give us an update on FDA's efforts in each of these areas, the level of resources currently (i.e., fiscal year 2000) being devoted to each, and how the additional funding requested for fiscal year 2001 will strengthen each of these efforts.

Answer. FDA participates on an interagency group formed by the Department's Office of Emergency Preparedness—OEP, with the Department of Defense, Veterans Administration, the Centers for Disease Control and Prevention—CDC, and the National Institutes of Health—NIH to plan for responses in the event of a bioterrorist attack. FDA's counter bioterrorism initiative focuses on the priorities for creating and maintaining a stockpile of pharmaceuticals and other materials, as well as furthering research on detection, diagnosis, antibiotics, therapeutics and vaccines. Under Emergency Support Function #8, FDA is the lead DHHS agency for ensuring the safety of regulated foods, drugs, biologics, and medical devices. This includes preventing and detecting the importation of contaminated FDA regulated products. Therefore, FDA has the responsibility for responding to any incident involving a FDA regulated product.

In fiscal year 2000, the Center for Biologics Evaluation and Research, CBER, received \$7.5 million one-time funding from the Department's Bioterrorism Vaccine Program Fund to begin the process of developing the necessary expertise and infrastructure to address regulatory activities related to the countering bioterrorism initiative. The one-time funding is being used to expedite the development and licensure process for improved vaccines for anthrax and smallpox, the associated immune globulin (VIG) products used to treat and prevent serious vaccinia infections brought on by the smallpox vaccine, and to continue on-going efforts to work with the interagency group on a variety of bioterrorism issues. The fiscal year 2001 request of \$6.5 million for CBER is for the following proposed activities: developing necessary expertise regarding the agents identified in the President's Initiative; expanding efforts to test and produce DNA vaccines against the lethal factor and edema factor of anthrax and further develop an Ebola DNA vaccine; exploring the use of DNA vaccines for smallpox and the use of RNA vaccines against some of the encephalitis-causing alphaviruses; initiating or expanding programs on pathogenesis and mechanisms of immunity for a variety of pathogens; developing microarray technology to rapidly detect the presence of nucleic acids, oligonucleotides, and RNA fragments; improving monoclonal antibody therapies, new approaches in the use of biotherapeutics, animal and human derived immune globulins in the treatment of viral and bacterial diseases and in the area of emerging infectious diseases.

The Center for Devices and Radiological Health has continued to conduct bioterrorism-related activities in fiscal year 2000. We estimate that the medical device program will expend approximately \$800,000 out of its base resources for bioterrorism activities in fiscal year 2000. The Devices program will collaborate with the Center for Disease Control—CDC, and the military to address domestic preparedness and responsiveness to chemical and biological threat agents, including review of reagents currently available to detect toxic organisms and development of procedures that State and local public health laboratories and the military will employ to diagnose suspected exposures to these chemical and biological agents. FDA will also review plans and protocol for a new diagnostic product sponsored by the Armed Forces Institute of Pathology. In addition, FDA will investigate the validity of products that claim to detect exposure to biothreat agents. This is a new intended use for many *in vitro* diagnostics (IVDs) that raises unique scientific and regulatory questions. FDA needs to evaluate the effectiveness of these products before they are commercially marketed with these claims. Finally, FDA will establish an internal

working group to develop a regulatory strategy, to support CDC's chemical-bioterrorism preparedness activities. This strategy is likely to require FDA to issue new guidances clarifying agency review of IVDs and may also require new rulemaking.

For the past several years, scientists in CDRH, have been researching the development of DNA tools for diagnostic devices. This technology has the potential to be very useful for the early identification of biothreat agents, diagnosis of emerging infectious diseases, possibly in the form of miniaturized diagnostic devices. Part of the \$800,000 requested for the device program bioterrorism initiative in fiscal year 2001 will be used to revive this research and take advantage of the scientific expertise CDRH has built in this area.

The Center for Drug Evaluation and Research, CDER, is devoting \$400,000 in fiscal year 2000 toward activities contributing to the development of a research agenda and the proposed rule to amend the new drug and biological product regulations to identify the kind of evidence needed to demonstrate efficacy of drug and biological products used to prevent or treat the toxicity of chemical, biological, or radiological substances. Activities also include working with academia to draft fact sheets that can be used by physicians and first responders so they can recognize the symptoms of bioterrorist agents and respond adequately to an attack. The fiscal year 2001 request of \$1.2 million for CDER is for the following proposed activities: premarket review of drug products for the treatment and prevention of exposure to bioterrorism agents; review of the preclinical and clinical data supporting the recommendations for treatment of bioterrorism agents; evaluation of the need and availability of alternative agents for the treatment of exposure to bioterrorism agents; and collaboration with other agencies in the development of a research program to develop and test therapeutic agents.

The Center for Veterinary Medicine, CVM, is devoting \$100,000 in fiscal year 2000 to activities including the participation in meetings with representatives of government and non-government organizations to consider the risk to animal agriculture, including the safety of feedstuffs and food from food-producing animals and the development of effective lines of communication among anti-bioterrorism units of federal and State governments. The fiscal year 2001 request of \$800,00 for CVM is for the following proposed activities: exploring ways to prevent microorganism and toxic chemicals including pesticides from entering animal feeds and food-producing animals; training senior State personnel as first responders to an attack; developing effective lines of communications among anti-bioterrorism units; and facilitating timely reporting events, diagnoses, and identifying research needs.

The Center for Food Safety and Nutrition, CFSAN, is devoting \$300,000 in fiscal year 2000 toward a contract to develop the Food Safety Strategic Plan for Chemical/Biological Terrorism; coordinate the development of information on Chemical/Biological Terrorism from other Federal Agencies, particularly the Department of Defense, DOD, and the Department of Agriculture, USDA; develop research and Infrastructure needs for FDA and associated food safety partners, including State and local governments; facilitate leveraging of resources and technology transfer from DOD and other government organizations to meet these needs; and develop and implement the needs for contracts and grants for food safety chemical/biological terrorism programs. The fiscal year 2001 request will help expand the agency's ability to safeguard the food supply from potentially harmful and lethal biological agents. The fiscal year 2001 request of \$1.2 million for CFSAN is for the following proposed activities: conducting research to develop rapid methods of detection of biological agents, such as anthrax; working with other governmental agencies and private sector organizations to developing cooperative exchange information on surveillance activities and develop crisis management procedures.

The proposed \$1 million request for fiscal year 2001 activities for the National Center for Toxicological Research include expanding the mass spectrometry-based approaches to identify biomarkers of toxicity associated with biological warfare agents; and developing novel techniques to identify new bacteriological and chemical contaminants in the food supply.

I will be happy to provide a table reflecting funding for the bioterrorism initiative. [The information follows:]

BIOTERRORISM FUNDING

[In thousands of dollars]

Program	Fiscal year 2000 estimate	Fiscal year 2001 requested increase
Foods	0.030	1.200
Human Drugs	0.400	1.200
Biologics ¹	7.500	6.500
Animal Drugs & Feed	0.100	0.800
Devices & Radiological Health	0.800	0.800
NCTR	0.000	1.000
Total	8.830	11.500

¹ Includes one-time funding from the DHHS Public Health and Social Services Emergency Fund in fiscal year 2000.

Question. For fiscal year 2000, the Administration requested that funding for FDA's counter-bioterrorism activities be made available from the Department of Health and Human Services Public Health and Social Services Emergency Fund. Why are funds for these activities now being requested in FDA's budget? To what extent are FDA's activities in this area dependent on those of other federal agencies, and FDA's ability to use the funds it has requested dependent on funding being received by other agencies?

Answer. The Administration requested \$13.4 million in its fiscal year 2000 budget request to support FDA's counter bioterrorism activities. This request was made through the Public Health and Social Services Emergency Fund to the Appropriations Subcommittee on Labor, HHS, Education and Related Agencies as part of a consolidated request for the Department of Health and Human Services. FDA's fiscal year 2000 counter bioterrorism request was not funded because FDA's appropriation falls under jurisdiction of the Appropriations Subcommittee on Agriculture. FDA's programs do not fall within the jurisdiction of this Subcommittee. In contrast, FDA's fiscal year 2001 request for activities related to the countering bioterrorism initiative is being made to the Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies, which has jurisdiction over appropriations for FDA programs. FDA's efforts in countering bioterrorism are critical to success of the bioterrorism activities government-wide.

In this, the third year of the Departmental anti-bioterrorism initiative, DHHS is continuing to build on its ongoing initiatives and also launch a number of new efforts that will further strengthen and enhance its capacity to anticipate and respond to bioterrorism. For fiscal year 2001, DHHS proposed an investment of \$265 million for its anti-bioterrorism initiative. To date, FDA has been contributing to this initiative on a limited basis without receiving base appropriations earmarked in this area.

FDA received \$7.5 million one-time funding from the Department's Public Health and Social Services Emergency Fund for fiscal year 2000 to begin the process of developing the necessary expertise and infrastructure to address regulatory activities related to the countering bioterrorism initiative. This one-time funding cannot be used by the Agency to develop staff experts or address the long list of agents identified as bioterrorism threats.

FDA participates on an interagency group formed by the Department's Office of Emergency Preparedness—OEP, with the Department of Defense, Veterans Administration, the Centers for Disease Control and Prevention—CDC, and the National Institutes of Health—NIH to plan for responses in the event of a bioterrorist attack. All of the agencies are involved in the medical research and planning in the event of an attack.

The Department of Health and Human Services' role is to meet the Nation's public health and medical needs associated with terrorist events. Preparing for the threat of bioterrorism requires government funding to train the health-care workers, improve laboratory testing, develop and produce vaccines and drugs, and expand hospitals' capacity to deal with a large influx of sick people. FDA's countering bioterrorism initiative focuses on the priorities for creating and maintaining a stockpile of pharmaceuticals and other materials, and furthering research on detection, diagnosis, antibiotics, therapeutics and vaccines.

FDA has the responsibility of determining whether pharmaceutical products produce the benefits they are supposed to without causing side effects that would

outweigh those benefits. This includes both laboratory and non-laboratory investigation that addresses questions either of immediate applicability to present-day regulatory problems, questions that can be expected to arise in the near-term, and fundamental studies in biomedical areas that can reasonably be expected to have long-term effects on FDA regulatory responsibilities. Unlike other DHHS agencies that are participants in the Department-wide anti-bioterrorism initiative, FDA plays a critical but less visible role with respect to its programs. Whether the issue is the development and use of rapid diagnostics to quickly identify a suspected biological agent or the capability to make available and administer large quantities of a vaccine or drug to counter the effects of a bioweapon, FDA is the linchpin that makes it possible for DOD, CDC, OEP, and others to carry out such activities.

Other than research, FDA has the responsibility to review and make approval decisions for drugs, therapeutics, vaccines, anti-toxins to be administered to humans and every diagnostic tool that is to be used clinically. In the event of bioterrorist attack, the public health goal is to have available pharmaceuticals, the rapid diagnostics and the vaccines that have already completed FDA review process for safety and efficacy. Since this regulatory process is lengthy, complex and fraught at times with the unforeseen, it is essential, in the interest of national security and public health, that FDA engages in the process as early as possible with sponsors and organizations that are developing the therapeutics, vaccines and rapid diagnostics. This means that FDA will assume a pro-active role and work with these organizations from the very outset, starting with outlining the individual steps that must be taken to obtain FDA approval, through pre-clinical toxicity testing, the development of protocols for conducting the clinical trials, to the review and analysis of the trial results, review of the proposed manufacturing procedures, inspection of the manufacturing process to assure compliance with Good Manufacturing Practices and post-marketing surveillance of adverse events.

Question. Commissioner Henney, you indicate in your prepared statement that specialized equipment and facilities are necessary and needed in FDA to understand these agents and prevent, diagnose and treat outbreaks. How much of the \$11.5 million requested is for specialized equipment and facilities?

Answer. The Agency estimates that approximately \$3 million of the requested \$11.5 million request for the Countering Bioterrorism Initiative is for specialized equipment and facilities.

Question. With respect to counter-bioterrorism, what is the total amount of funding required for FDA to complete its vaccine development and build an appropriate stockpile?

Answer. FDA's role is to develop tools to determine the safety and effectiveness of vaccines that cannot be tested against live viruses. Vaccine development is a joint effort between DOD, CDC, FDA, and the private sector. The President's Countering Bioterrorism Initiative has identified numerous agents as bioterrorism threats, including, anthrax, smallpox, plague, botulinum, tularemia, brucellosis, Venezuelan equine encephalomyelitis, ebola, and Q-fever, as well as others. FDA has begun the process of developing the necessary expertise and infrastructure to address regulatory activities for the President's initiative. The fiscal year 2000 \$7.5 million one-time funding is being used to expedite the development and licensure process for improved vaccines for anthrax and smallpox, and the associated immune globulin products (VIG) used to treat and prevent serious vaccinia infections brought on by the smallpox vaccine. These funds would be needed to develop, train and adequately equip staff experts that can deal with the range of agents that have been identified as part of the President's initiative. FDA's countering bioterrorism initiative includes other priorities as well for which funding is requested including safeguarding the food supply, development of pharmaceuticals and furthering research on agents with respect to detection, diagnosis, and treatment.

RENT AND RELATED ACTIVITIES

Question. Provide a detailed breakdown of the Commercial Rent and Related Services activities funded in each of fiscal years 1999 and 2000, as compared with the fiscal year 2001 request.

Answer. I am happy to provide the information detailing the specific expenses included in the Other Rent and Related Activities for fiscal year 1999 and fiscal year 2000 as compared to fiscal year 2001.

[The information follows:]

OTHER RENT AND RELATED ACTIVITIES, FISCAL YEAR 1999–FISCAL YEAR 2001

Total, Other R&R	25,854	25,855	25,855

Other Rent and Rent-Related Activities.—FDA costs for Other Rent and Rent-Related Activities are included in three subaccounts: Commercial Rent & Related Services, GSA Rent-Related Services and GSA Building Delegation Services.

Commercial Rent & Related Services are expenses that FDA pays directly to non-Federal sources under the delegation of direct lease and service authority. Services include rental of space and all building operation services, i.e., utilities, janitorial, guard and grounds maintenance, and operation and maintenance of heating, ventilation and air conditioning (HVAC) systems. FDA also pays similar expenses for a small number of buildings owned by the agency.

GSA Rent-Related Services are expenses that FDA pays to GSA that are over and above the standard level that GSA covers in its rent costs. Services include security systems, guard services and HVAC systems.

Building Delegation expenses are expenses that FDA pays to either GSA or non-Federal sources to operate and maintain buildings delegated to FDA by GSA for management of day-to-day operations. Services include utilities, janitorial, guard and grounds maintenance and operation and maintenance of HVAC systems.

Question. The fiscal year 2001 budget requests \$13.5 million in additional funding to improve statutory inspection coverage for human drugs, biologics, animal drugs and medical devices. Please provide the level of inspection effort in terms of frequency of inspection, level of funding and FTEs, in each of these areas proposed to be achieved in fiscal year 2001, as compared with each of fiscal years 1999 and 2000.

Answer. The Federal Food Drug and Cosmetic Act and FDAMA require FDA to conduct inspections at specified intervals. To meet the statutory requirement, FDA must inspect at least 50 percent of the statutory human drugs, biologics, animal drugs and feed, and medical device establishments annually. No food establishments are subject to the 2-year statutory inspection requirement. In fiscal year 1999, FDA inspected 26 percent of the domestic registered drug manufacturers, compounders, or processors; 64 percent of statutory biologics firms; 25 percent of domestic registered animal drug and feed establishments; and 30 percent of domestic registered

class II and III medical device manufacturers, compounders or processors. In fiscal year 2000, we project that the agency will conduct biennial inspections in 22 percent of the statutory human drug establishments, 50 percent of the statutory biologics establishments, 27 percent of the statutory animal drugs and feed establishments, and 24 percent of the statutory medical device establishments. In fiscal year 2001, without a funding increase and given our need to absorb current services, we project FDA will be able to conduct biennial inspections in 18 percent of the statutory human drug establishments, 50 percent of the statutory biologics establishments, 25 percent of the statutory animal drugs and feed establishments, and 21 percent of the statutory medical device establishments.

The current funding level for the field for domestic statutory inspections is \$44.31 million and the staffing level is 525 FTE. FDA is seeking an increase for field inspectional activities of \$13.5 million and 89 FTE. With the funds requested in fiscal year 2001, we expect to make modest improvements in statutory inspection coverage. The agency can increase the percentage of statutory inspections to 28 percent for the Human Drugs program, 28 percent for Medical Devices and 46 percent of Animal Drugs and Feeds. We expect to meet and possibly exceed the statutory inspection requirement in the Biologics program. In addition, \$1.7 million dollars of the increase will support sample collection and sample laboratory testing in the Foods program for chemical contaminants and pesticides and dietary supplements.

PERCENT OF FACILITIES INSPECTED ¹

	Human drugs	Biologics	Animal drugs and feeds	Medical devices
Fiscal year 1999	26	64	25	30
Fiscal year 2000	22	50	27	24
Fiscal year 2001 (proposed targets without enhancement)	18	50	25	21
Fiscal year 2001 (proposed targets with enhancement)	28	+ 50	46	28

¹ Includes only those with statutory inspection requirements.

I am happy to provide a table that shows the funding level and staffing levels for the field statutory inspectional activities by program area for fiscal years 1999, 2000 and 2001. Since the fiscal year 2001 budget request includes a modest increase for inspectional activities in the Foods program, the table also displays base and fiscal year 2001 resources for the field inspectional activities associated with chemical contaminants and pesticides and dietary supplements for reference.

[The information follows:]

FDA FIELD INSPECTION RESOURCES, FISCAL YEARS 1999–2001

[Dollars in thousands]

Program	Fiscal year 1999		Fiscal year 2000		Fiscal year 2001	
	Funding level	Staffing level (FTE)	Funding level	Staffing level (FTE)	Funding level	Staffing level (FTE)
Human Drugs	\$16,890	208	\$16,374	194	\$20,161	213
Biologics	11,368	140	11,141	132	13,141	136

Statutory Inspections Subtotal	43,686	538	44,310	525	56,097	567
Foods ^{1,2}	15,753	194	16,374	194	18,096	209

FDA FIELD INSPECTION RESOURCES, FISCAL YEARS 1999–2001—Continued

[Dollars in thousands]

Program	Fiscal year 1999		Fiscal year 2000		Fiscal year 2001	
	Funding level	Staffing level (FTE)	Funding level	Staffing level (FTE)	Funding level	Staffing level (FTE)
Total FDA	59,439	732	60,684	719	74,193	776

¹The Foods program has no biennial inspection requirement. The Foods resources are included for reference. The inspectional activities for the Foods program funded by the fiscal year 2001 increase are for sample collection and laboratory testing for chemical contaminants and dietary supplements. In addition, \$17 million is being requested in fiscal year 2001 for inspection of high risk food establishments. These funds are included under our Food Safety Initiative request.

²Base estimate represents the total field resources (for both domestic and imports) for the Pesticide and Chemical Contaminants program and resources for Dietary Supplements from the Food Composition Standards and Labeling Project.

Question. Of the \$13.5 million proposed, what amount of funding is to enhance laboratory testing for pesticides, chemical contaminants and dietary supplements?

Answer. Of the \$13.5 million increase in funding proposed for inspectional activities, \$1.7 million are designated to enhance laboratory testing for pesticides and chemical contaminants and for dietary supplements. The increase requested includes resources needed for sample collection and laboratory testing.

BUILDINGS AND FACILITIES

Question. The fiscal year 2001 budget requests \$3 million for the next phase of the plan for the Arkansas Regional Laboratory. What is the “next phase” of this project and what work will be accomplished with the \$3 million requested?

Answer. The \$3.0 million included in the fiscal year 2001 budget request continues work on Phase III of the Arkansas Regional Laboratory project. Phase III provides for the renovation of the existing Building 50 in its entirety and completes the common ORA/NCTR administrative and support area. Specifically, the \$3.0 million in the budget request will be utilized to fund the majority of the mechanical and plumbing systems infrastructure and related electrical system items necessary for the operation of the installed mechanical systems.

Question. Please give us a status report on funding provided to date for the Arkansas Regional Laboratory, including the work funded and the status of that work.

Answer. I would be happy to provide for the record the status of the Arkansas Regional Laboratory ARL.

[The information follows:]

Arkansas Regional Laboratory

The ARL facility project was initiated in fiscal year 1995 through a \$2.5 million appropriation for architectural and engineering design. The firm Kling-Lindquist (KL), Philadelphia, PA, was selected. KL, in consultation with FDA, developed an overall campus design comprising both new and renovated space:

- (1) joint NCTR and ORA animal quarantine facility—renovation of Building 62;
- (2) ORA’s Arkansas Regional Laboratory—new facility;
- (3) Building 50 renovation—3 floors of office space; and,
- (4) common Office of Regulatory Affairs (ORA)/National Center for Toxicological Research (NCTR) administration and support area.

The fiscal year 1996 appropriation included \$3.8 million for an animal quarantine facility and preparation of joint NCTR/ORALaboratory space.

Laboratory Building, Phases I & II, status

The estimated construction cost of the laboratory portion of the project totals \$37.95 million.

The fiscal year 1997 appropriation included \$13.0 million for Phase I construction of the ARL. Phase I began construction and provided the ARL building, foundation, substructure, superstructure, exterior enclosure, and roofing. Major building systems, such as fire protection, HVAC, electrical and some site work, is included.

The construction of the ARL project was awarded on September 26, 1997, to Charles N. White Construction Company (White) of Clarksdale, Mississippi. White was given notice to proceed on Phase I of the project on October 1, 1997.

A ground breaking ceremony was held at NCTR on November 18, 1997.

The fiscal year 1998 appropriation included \$14.55 million for Phase II construction. Phase II continues the ARL project by completing the building systems and providing some office and laboratory fit-out in the ORA laboratory building.

On December 24, 1997, White was given notice to proceed on a portion of the Phase II construction.

FDA received reprogramming authority for up to \$10.4 million of Buildings and Facilities funds for Phase II of the ARL project to complete the office and laboratory fit-out for the laboratory building.

On February 27, 1998, White was given notice to proceed on the remaining portion of Phase II to complete the office and laboratory fit-out for the laboratory building.

A building dedication ceremony for Phases I & II, the laboratory portion, was held on February 17, 2000.

Building 50 Renovation and Common Area, Phase III, status

Phase III provides the renovation of the existing Building 50 in its entirety and completes the common ORA/NCTR administrative and support area.

The fiscal year 1999 appropriation included \$3.0 million to begin construction of a portion of Phase III. This first portion included the exterior demolition, exterior structural work, exterior masonry work, and some roofing repairs.

On January 26, 1999, White was given notice to proceed on the first portion of Phase III.

The fiscal year 2000 appropriation included another \$3.0 million to continue the construction of a portion of Phase III. This portion of work includes exterior glass and glazing, roofing, an elevator, and some of the site work and utilities.

On February 2, 2000, White was given notice to proceed on the next portion of Phase III.

The total resources required to complete Phase III of the Arkansas Regional Laboratory project are currently \$9.5 million. With the \$3.0 million requested in the fiscal year 2001 budget, the balance required is \$6.5 million in today's dollars. Because the work remaining to complete Phase III is being divided into smaller increments, completed over a longer duration, and the construction market continues to be very active with increased competition for skilled labor, the costs of the construction continues to escalate. Therefore, a total of approximately \$7.2 million in additional funding will be needed to complete Phase III. We will evaluate the decision to request the remaining amount as we determine our total requirements to meet our mission critical responsibilities.

Question. What level of funding is required beyond the \$3 million requested for fiscal year 2001 to complete the plan for the Arkansas Regional Laboratory?

Answer. The total resources required to complete Phase III of the Arkansas Regional Laboratory project are currently \$9.5 million. With the \$3.0 million requested in this budget, the balance required is \$6.5 million in today's dollars. Because the work remaining to complete Phase III is being divided into smaller increments, completed over a longer duration, and the construction market continues to be very active with increased competition for skilled labor, the costs of the construction continues to escalate. Therefore, a total of approximately \$7.2 million in additional funding will be needed in fiscal year 2002 to complete Phase III. Prior to submitting our fiscal year 2002 budget submission to DHHS, we will re-evaluate the total cost requirements for this project and make the necessary adjustments to meet our mission critical responsibilities.

Question. The budget requests \$20 million to replace the Los Angeles laboratory facility. What is the total cost of construction of this project? Is there a lower-cost construction phase of this project?

Answer. The budget request of \$20 million is for the first phase of a two phase project that totals \$43.0 million. It is conceivable that the construction documents could be modified to define a "site-foundation" only project that would entail a first phase cost of \$10.5 million. However, this would delay the funding of a large portion of the construction work for another year, resulting in the prolongation of construction. As the construction market continuing to remain very active and with increased competition for skilled labor, the cost of construction may escalate.

Question. If funding is not provided to construct the Los Angeles laboratory replacement facility, where will FDA perform the work now performed by this laboratory?

Answer. Status quo is not an option, if funding is not provided the LA lab will close. The lease for the current laboratory facility at Pico Boulevard has been extended twice, and will expire at the end of March 2000. A short-term extension is being negotiated, which will allow adequate time for either new facility construction, or an orderly closing of the Los Angeles laboratory and reassignment of staff and workload. Closure will force the State of California, Department of Health Services to find a new facility for their laboratory operation that is co-located in the existing FDA lab. The closure of a large field laboratory, particularly a large lab such as Los

Angeles, on relatively short notice, will cause significant disruption due to the personnel impacts. Workload may be transferred to other existing labs, but the requisite staff with the skills and experience would not be in place for years. The other two laboratories in the Pacific Region, located in Alameda, CA and Seattle, WA, are essentially at capacity for people and space. It would be difficult for those labs to take on the additional workload and staff, and would add to the time frames for sample analysis. While space exists in the Arkansas Regional Lab, we would anticipate a potentially lengthier delay in recruiting and training new analytical staff to handle the increased workload since we would expect only a small percentage of displaced analysts from Los Angeles to transfer to the Arkansas facility. Other labs in the Southwest Region, at Kansas City and Denver are also at capacity. Furthermore, it would require additional time for shipping and sequencing of additional samples from the LA Lab into other lab operations. Longer delays would occur if the added workload puts the receiving labs into a backlog situation. If FDA had to ship more samples to other labs we would incur significant additional expenses in addition to the time delays. Since a large number of samples are perishable, they need expedited and environmentally controlled shipments. For shipments of a relatively short distance, we are often able to use the freight shipping services of bus companies, etc. For longer distances, we would likely need to go to airfreight, which is more expensive. We have no recent studies that would specifically quantify projected cost increases for sample shipments. Of equal or greater importance would be the resulting additional delays in obtaining analytical results.

MEDICAL DEVICE REVIEW

Question. As you know, this Committee has taken a significant interest in ensuring that medical device review times are improved and last year we earmarked an additional \$7 million to that end. In the device portion of the budget justification, it indicates that \$7.7 million will be devoted to device reviews. Can you please provide a breakdown of how that money will be spent?

Answer. FDA is requesting an appropriated enhancement of \$7.7 million and 14 FTE that will be spent in the medical device review areas of genetic testing, reuse applications, and premarket science. On genetic testing, \$2.6 million, including 5 FTE, will build capacity and develop strategies to respond to scientific breakthroughs in this area and review genetic testing applications. For reuse applications, \$2.8 million, including 5 FTE, will increase review activities and develop standards for premarket review of devices that may pose significant risk if reused. In premarket science, \$2.3 million, including 4 FTE will improve our scientific information base and evaluation methods to facilitate patient access to breakthrough technologies; intensify research and scientific collaborations that will enhance reviewer and user understanding of new technologies; and work with stakeholders to develop comprehensive test methods and performance requirements for critical devices.

Question. I also note that the justification references a number of times, the Center's performance goals. The agency indicates its performance goals to be reviewing and completing 90 percent of PMA first actions and 95 percent of 510(k) first actions within statutory review times, 180 and 90 days respectively. Can you please tell me the resources which are needed, both in terms of dollars and staffing (FTEs), to accomplish these goals?

Answer. In its fiscal year 2001 performance plans for the Medical Device program, FDA outlined a series of performance improvements that expand on fiscal year 2000 accomplishments. In fiscal year 2000, Congress appropriated an increase of \$7 million to enhance medical device reviews. Expanding on these efforts, the fiscal year 2001 budget requests a total of \$79.2 million and more than 640 FTE dedicated to improving and expediting premarket review work for medical devices. Without additional funding in fiscal year 2001, FDA will be severely limited in its ability to meet the heightened performance targets which are labor, as well as time intensive. These requested funds will allow FDA to improve fiscal year 2001 performance workload for the device program over fiscal year 2000 activity levels. For example, FDA would increase the percentage of PMA first actions completed within 180 days, and HDE first actions within 75 days, from a performance target of 85 percent in fiscal year 2000 to 90 percent in fiscal year 2001. Also, we will increase the percentage of PMA supplement final actions within 180 days from a performance target of 85 percent in fiscal year 2000 to 90 percent in fiscal year 2001. In addition, we will increase the percentage of 510(k) final actions completed within 90 days from a performance target of 65 percent in fiscal year 2000 to 75 percent in fiscal year 2001. The performance plan also indicates that in fiscal year 1999 FDA completed over 99 percent of 510(k) first actions within 90 days. FDA plans to build on this accom-

plishment with the more difficult task of increasing the percentage of 510(k) final actions completed within 90 days.

Question. A first action on device applications within statutory review times is laudable but even more important is final action. The agency is only planning a final action on 90 percent of PMA supplements within statutory review times and 75 percent of 510(k)s within statutory review times. The performance goals don't even reference objectives for PMA's, the most innovative products. Can you please provide the Committee with a breakdown of the resources that are needed, (both dollars and FTE) to get the job done in each of these areas?

Answer. Calculating the cost required to meet all of FDA's medical device review statutory obligations is a very difficult task given the rapid growth in the volume and complexity of emerging medical devices. In fiscal year 1999, FDA estimated that \$26.7 million would be required to review all statutory obligations as stated in FDAMA for medical devices. Since that time, in fiscal year 2000, the Medical Device program received a \$7 million increase, and the fiscal year 2001 President's Budget requests an additional \$5.4 million in appropriated funds, as well as a \$5.8 million user fee increase. If these spending requests are approved, the medical device program still needs \$8.5 million to fully meet all the medical device review statutory requirements in FDAMA. Furthermore, FDA has subsequently identified additional costs to the \$8.5 million that include: \$3 million for PMAs and PMA supplements, \$3 million for 510(k)s, and \$2.5 million for meetings with sponsors required by FDAMA throughout the medical device review process, bringing the total revised cost to \$17.0 million. This cost estimate may require future adjustments to reflect any changes in workload projections.

FDA is committed to increasing medical device review performance and appreciates the support of the Congress in continuing to make progress. FDA sets performance goals for both first actions and final actions in the fiscal year 2001 Performance Plan. As I said earlier, the fiscal year 2001 performance plan includes device review performance goals, at the resource level requested in the President's budget, of 90 percent of PMA original first actions within 180 days, and HDE first actions within 75 days; 90 percent of PMA supplement final actions within 180 days; and 75 percent of 510(k) final actions within 90 days.

The fiscal year 2001 performance plan also commits to improved timeliness in meetings with sponsors, as required by FDAMA, throughout the medical device review process. FDA is also committed to high quality, interactive as well as timely device reviews. By statute and regulation, we are required to take action—final action if possible or interim action if necessary—on 510(k)s within 90 days; approve or disapprove IDEs within 30 days; and take action again, final action if possible or interim action if necessary—on PMAs and PMA supplements within 180 days and HDEs within 75 days.

Question. Commissioner Henney you have made enhancing the Agency's science base a priority in your administration. This is a laudable goal and one that many of us would agree with given the increasing complexity of products the agency must review. Can you provide us with some sense of how that money will be used?

The budget justification, for instances, speaks to "improving the scientific information base" and "intensifying research and scientific collaboration in breakthrough technologies," "increas[ing] scientific interactions with industry during review," and "seeking outside expertise to ensure that its regulatory decisions are based on the latest scientific knowledge," etc. What do you mean? Are we talking about enhancing the training of existing reviewers? Hiring "bioengineers" or others that are schooled in the latest technological developments to review products? Increasing the agency's bench science? Also, please explain what is meant by "collaborative".

Answer. I am planning to improve the scientific information base via several avenues, a few of which you mentioned. We will work closely with the outside scientific community to focus our energies on breakthrough technologies and how best to regulate them. Consider the area of new medical devices. During the past two years, more than 800 new high technology products have entered the market or are under development. FDA will consult with the scientific community in establishing appropriate standards for these new products. We will also collaborate with internationally recognized research Centers to help focus their efforts in emerging areas such as non-invasive surgical techniques and computerized technologies. In other instances we are strengthening our science base by building models that will predict risk individuals will face in clinical trials for new products. These models are constructed in partnership with scientists from other government agencies and industry. Our science base is also strengthened by maintaining close consultation with product sponsors in the early stages of product development. These early dialogues are invaluable to both FDA and industry, not only because they expedite the specific products under development by sponsors, but also because they expand the under-

standing of scientific breakthroughs that can be incorporated into guidance provided to other product sponsors.

Our existing scientific reviewers need to continually update their knowledge of scientific advances in order to intelligently regulate new products. We need to strengthen the continuing active training programs that are already in place within the Agency. The ‘Staff College’ concept has worked well at FDA, but should be augmented by external expertise. A critical requirement for strengthening FDA science is the recruitment of scientists with state-of-the-art skill sets. We must be able to access the appropriate professionals to address the breakthrough areas. For example, as a continually larger number of products are spawned by the biotechnology revolution, we will have to recruit more scientists in such disciplines as molecular biology.

In answer to your question on the meaning of “collaborative,” we are defining that term as the creation of relationships and/or formal agreements with others outside FDA that will enhance FDA’s ability to meet its public health mission. We intend to enter into collaborations where the end results are greater for all concerned than could have been realized if all parties were working independently. We have demonstrated that these collaborative efforts in the science arena can work very well. One illustration is the Product Quality Research Institute. This Institute was created in 1999. It is a partnership between FDA and several drug industry associations, designed to find joint solutions to key issues associated with drug product quality. The partnership works because it marshals the experience and energies of many private sector, academic and government specialists and focuses it on important drug quality issues. All parties gain in this relationship. The patients receive higher quality products, and both FDA and industry benefit by solving the tough problems, and thus reducing both costs and regulatory burden.

Question. I understand that where more complex devices are eligible for 3rd party review, the industry is taking advantage of the 3rd party program. For instance, I understand the imaging sector of the device industry is using the program in much greater numbers, than other sectors. I also am aware that FDA has not yet met FDAMA’s statutory triggers for the pilot program to begin. Can you advise me of the steps being taken to make this program work?

Answer. In fiscal year 1999, we received 32 510(k)s with a third party review, the most in any fiscal year since the program began. But this is still a very small proportion, only 3 percent, of the approximately 1,200 submissions received that were eligible for third party review—including nearly 800 510(k)s for Class II moderate risk devices. The list of 154 devices currently eligible for third-party review includes a variety of diagnostic imaging devices, such as diagnostic ultrasound systems, magnetic resonance imagers, nuclear medicine tomography systems, and numerous types of x-ray systems and related products. The list of eligible devices is available on FDA’s website at <http://www.fda.gov/cdrh/dsma/3258.html>. In fiscal year 1999, diagnostic ultrasound devices accounted for 15 of the 32, or 47 percent, of the 510(k)s received by FDA with a third-party review, but only two third-party 510(k)s were received for all other types of diagnostic imaging devices. Thus, while one sector of the diagnostic imaging industry made significant use of the third party approach, most sectors did not. Even in the diagnostic ultrasound sector, approximately three-fourths of all 510(k)s processed by FDA in fiscal year 1999 did not have a third-party review.

While you are correct that the third party program has not met the two FDAMA triggers per section 523(c) of the Federal Food, Drug, and Cosmetic Act, FFD&C Act it is important to note that the statutory triggers do not impact the starting date of the third party program. Instead, they are triggers for beginning the time period that would result in sunset of the Accredited Persons provisions. FDA has already begun FDAMA’s third party program. On November 21, 1998, the agency began accepting reviews of premarket notifications—510(k)s—from qualified third party organizations under the Accredited Persons provisions. Before that date, the agency took numerous steps that were necessary for successful implementation of the program, including publishing the criteria for accreditation of third parties, as required by the FFD&C Act; issuing draft and final procedural guidance for the program; issuing a list of devices eligible for Accredited Person review; developing product-specific guidance and recognizing national or international consensus standards to assist third parties in conducting consistent and thorough 510(k) reviews; performing accreditation of prospective third parties; and conducting training of Accredited Persons.

One of the statutory triggers—section 523(c)(2)—that would begin the time period leading to sunset of the Accredited Persons provisions occurs when the Agency notifies Congress that it has processed a third-party review for at least 35 percent of the potentially eligible devices. Due to low industry use of the third-party approach,

together with the large number of potentially eligible devices, it appears unlikely that this trigger will be met. The other trigger—section 523(c)(1)—occurs when the agency notifies Congress that at least two third parties are accredited to review at least 60 percent of 510(k) submissions. Currently, 154 devices are eligible for third-party review—including many significant devices such as diagnostic ultrasound systems, magnetic resonance imagers, endoscopes, and cardiac monitors—and at least 2 of the 13 Accredited Persons are available to review each of the devices. In fiscal year 1999, the Agency received more than 1,200 510(k) submissions for the 154 devices, representing nearly 50 percent of all 510(k)s that are potentially eligible for third-party review based on the criteria in section 523(a)(3) of the FFD&C Act.

FDA is working on a significant expansion of the third-party program. The agency intends to pilot test an expansion of the program that will allow all devices eligible under the terms of the statutory provision to be candidates for third party review. CDRH is planning to issue a draft guidance document in April that will explain the agency's expanded program and provide an opportunity for comment from all interested parties. We are hopeful that expansion of the eligible device list will stimulate greater industry interest in the third party approach, and many trade associations have informed us that they will encourage their members to take advantage of these third party opportunities. In addition, we are optimistic that the additive user fee proposal included in the Administration's fiscal year 2001 budget proposal, if implemented, will jump-start the third party program. The revenue from these fees would be used to provide information about the availability of third-party reviews and to subsidize the cost of these reviews.

I understand that there may be a serious backlog as well as long review times for medical devices which get reviewed by the Center for Biologics Evaluation and Review.

Question. What is the backlog for devices reviewed by the biologics center?

Answer. Thank you for the opportunity to respond and provide information on the improvements made in device review performance by the Center for Biologics Evaluation and Research, CBER, since the enactment of the Food and Drug Administration Modernization Act of 1997. There are currently 4 overdue PMAs or 510(k)s at CBER. Because we define overdue reviews as reviews that did not meet the statutory deadline for first review action, once FDA misses a statutory deadline for a submission, the submission will remain on the overdue list until it is either approved, cleared, withdrawn or denied. Subsequent review cycles will not have an effect on an application's overdue status until the product is approved, cleared, withdrawn, or denied. Thus far, during fiscal year 2000 there have been no additional overdue submissions. Significant improvements in review of all types of devices has occurred during the past 2 years. These improvements have come about as a result of a concerted effort by CBER known as the Device Action Plan. One example of the improvement is the review of 510(k)s at CBER. During the past two years on-time review of all device submissions has improved dramatically. For example, in fiscal year 1998, only 22 percent of 510(k)s were reviewed on time, that is within 90 days, for the first response either approving or denying substantial equivalence. On-time review improved to 64 percent in fiscal year 1999, and to 100 percent on time thus far in fiscal year 2000.

CBER reviews devices that are used to ensure the safety of the blood supply, to prepare certain blood components, and tests that are used in the diagnosis of Human Immunodeficiency Virus (HIV). These devices involve complex issues and are critical to the public health. Devices reviewed by CBER include tests used to screen the blood supply for HIV, Hepatitis B virus, and Hepatitis C virus; diagnostic tests for HIV; blood-bank software; devices used to collect blood components; and other devices used to ensure blood safety. Approximately 12 million units of donated blood and 12 million units of donated plasma are collected each year. FDA considers the review of devices used to ensure blood safety one of its most important public health responsibilities.

As mentioned above, CBER initiated the Device Action Plan in 1999. Because most of the devices reviewed by CBER are reviewed within the Office of Blood Research and Review, OBRR has reengineered the review process to improve the effectiveness and timeliness of reviews including the following: (1) implementation of the Regulatory Project Management concept to set the target dates for the review of an applications; (2) integration of the scientific and regulatory reviews within a division; (3) delegation of the resolution of the scientific issues down the management chain; (4) issuance of the Office Standard of Operation Policy (OSOP) to achieve the consistency and timeliness of the review; and, (5) implementation of the monitoring process to ensure the achievement of the Office Streamline Review Process.

Question. What are the average review times for 510(k) and PMA devices reviewed by the biologics center?

Answer. As noted above, review of all devices has greatly improved over the past 2 years. For fiscal year 1999, the average 510(k)s review times were 77 days per review cycle. This figure does not include time that the manufacturer may have taken to respond to deficiencies identified by FDA. If the submission was found to be not substantially equivalent, and the manufacturer needs to submit additional information for product approval then a second or even a third review cycle may be necessary. In fiscal year 1998, the average PMA review time was 132 days per review cycle. Again, this does not include time a manufacturer may have needed to respond to FDA identified deficiencies. The average review time for PMAs for fiscal year 1999 are not yet available because submissions are still undergoing additional cycles of review before approval, denial or withdrawal.

Question. What resources are needed to get the job done?

Answer. The backlog of overdue medical device applications in CBER has been dramatically reduced. This accomplishment was achieved as the result of redirection of other mission-related, non-user-fee activities. In order to maintain the same level of response to device applications, as well as address other areas, the Office of Blood Research and Review, OBRR, requires additional resources. Specifically these needs are to meet predicted review workload; to address emerging infectious blood-borne diseases; and to deal with new technologies such as nucleic acid testing for infectious diseases, novel blood collection devices, and single-unit blood and plasma inactivation devices. Recent analyses of CBER workload predicts that there will be a continued upward trend in all types of device submissions to CBER, in particular to OBRR. The analyses were based on the trend in submissions over the past few years and on the degree of employee effort needed to review each type of submission. We have made significant progress on eliminating backlogged submissions and decreasing the review time on each application type. However, this progress will be difficult to maintain and has been accomplished at the cost of other components of our mission. Additional resources are needed to continue to provide the same speed and quality review in the blood program. The Office of Blood Research and Review estimates that 20 FTE and \$2.5 million are needed to sustain the reduction of the blood medical device backlog, and perform their other regulatory responsibilities. This estimate does not include resources needed to permit scientific professional development and research.

There are also additional needs related to special initiatives which include: expansion of reporting systems for transfusion-related errors, accidents and adverse reactions requiring approximately \$1 million including at least two FTE; completion of rulemaking, guidance, including monographs, and supply improvements under the Blood Action Plan at a cost of about \$1 million per year for 3–5 years; and research to permit science-based revision of the donor questionnaire costing about \$3 million.

HEALTHY PEOPLE 2010

I have a few questions about the Department of Health and Human Services' target for reducing underage smokeless tobacco use and the method for measuring whether the target is met.

For purposes of Healthy People 2000, the Department established a 1988 baseline of 6.6 percent for past-month use of smokeless tobacco by 12–17 year-old males and set a goal of reducing smokeless tobacco use among 12–17 year-old males to 4 percent by 2000. The Department used the National Household Survey on Drug Abuse to measure progress toward this goal. According to the National Household Survey, the 4 percent goal was not only reached but surpassed in 1993 and 1994.

In 1996, the Department indicated that it had changed its survey methodology, and that one effect of the change was to estimate 12–17 year-old male smokeless tobacco use at 5.1 percent in 1995—a much higher number than the 3.5 percent reported for 1994. Even with the new methodology and the higher 1995 estimate the department's 4 percent goal was reached and surpassed in 1996, 1997, and 1998. A past-month use rate of 2.1 percent was reported for 1998 for 12–17 year-old males.

Healthy People 2010 establishes a new goal of reducing smokeless tobacco use among all 9th through 12th graders to 1 percent by 2010, but it will use yet another methodology—the Youth Risk Behavior Survey—to measure progress toward this goal.

In the draft Healthy People 2010 Objectives issued for public comment however, the Department stated that “continuity” and “comparability” were important and that, whenever possible, Healthy People 2010 should use the performance measures already used in Healthy People 2000.

Question. Could you explain why the department has again revised its methodology for measuring underage smokeless tobacco use, for the second time in six years?

Answer. Continuity and comparability in the source of information from one year to the next are important factors in monitoring trends in tobacco use in the population. The Department supports three surveys to determine how adolescents use tobacco products—the National Household Survey on Drug Abuse, NHSDA; Monitoring the Future, MTF; and the Youth Risk Behavior Survey, YRBS. Each of these surveys takes a somewhat different approach. Monitoring the Future surveys youth in schools, the YRBS also focuses on school youth; and the NHSDA interviews a large sample of persons over 12 years of age. Because these surveys are somewhat different in how the samples are drawn, how interviews are conducted, and the general structure of the questionnaires, they produce somewhat different results with respect to absolute levels of use. The different approaches contribute to resolving the problem of what the level of true use may be. What is important is that the three surveys historically describe essentially similar trends.

Careful consideration was given to all available data sources for monitoring Healthy People 2000 and 2010 objectives. The tobacco working group, comprised of scientists and health professionals, suggested using YRBS because state data is available for both baseline and trend analysis, making it possible for states to accurately measure progress on the objectives.

Question. How can the department accurately gauge the actual trend of smokeless tobacco use over time when it changes its measurement tools every few years?

Answer. The Department does not change the tools it uses for measurement every few years. The YRBS, the NSDA, and the MTF have been used for more than a decade to measure changes in substance use and abuse. Each survey provides estimates of prevalence and trends over time. Each of the surveys can be used to provide a general picture of the trends in youth use of smokeless tobacco. Trend data are available in the current Healthy People 2010 data source, the Youth Risk Behavior Survey, which has collected information about smokeless tobacco use since 1993.

Question. Will the Department again change its measurement tools if the Healthy People 2010 target is achieved ahead of schedule? Is there some concern that we'll stop making vigorous efforts to reduce underage smokeless tobacco use if estimated use levels are too low?

Answer. The Department has maintained the NHSDA for almost 30 years, the MTF for 25 years, and the YRBS for almost a decade. There is no intention to modify these surveys because of a specific change in the trend. Indeed, in order to describe trends the surveys need to be modified as little as possible. In addition, the department has no intention to change the Healthy People data source during the decade. As long as any youth are using tobacco, a cancer-causing substance, the department will maintain vigorous prevention, cessation, and research efforts in this area.

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The first strategic goal focuses on premarket activities and the second on postmarket activities. Both the fiscal year 2001 budget request and performance plan are organized by these strategic goals. The fiscal year 2001 budget requests the resources necessary for FDA's core activities of premarket review and postmarket surveillance by program. The performance plan also organizes the agency's performance goals by these two strategic goals and links the performance goals to the agency's programs as presented in the budget request.

Question. Could you describe the process used to link your performance goals to your budget activities?

What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The process used to link performance goals to budget activities involved program managers, planners and budget representatives from each major program area, their field counterparts, and analysts in the Office of Planning and the Office of Financial Management in the Office of the Commissioner. It involved several steps, the most significant of which was the use of strategy teams composed of representatives of all agency programs and led by senior agency managers. These teams brought agency decision-makers together to look carefully at the difference between current Agency performance and specific performance targets established by statute, such as FDAMA. In this way we could focus on resources needed to close the gap between actual and intended performance and on the strategies needed such as leveraging and improving our science base to meet performance targets. Performance goals were developed to reflect the level of performance expected based on the budget request.

We did not encounter many difficulties in linking performance goals to budget activities in terms of developing goals related to the budget activities. The difficulties encountered were in precisely linking specific resources to specific performance goals and in the presentation of the budget and related performance goals in the performance plan. We learned we would need more precise performance data and cost accounting data to establish specific linkages between resources and specific goals. This data, would be costly and difficult to collect especially if we had to collect performance related data from the public, industry, and the health care community. The presentation and integration of the budget and the performance plan are a continuing challenge and a continuing learning process. We will continue to look for meaningful ways to relate agency outcomes with resource allocation decisions.

Question. Does the agency's Performance Plan link performance measures to its budget?

Does each account have performance measures?

Answer. Yes, the agency's performance plan links performance measures (goals) to its budget by its overall premarket and postmarket strategic goals and by program. The agency's budget has one major appropriation account which covers its programs. Each program within the account has corresponding performance goals in the performance plan.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Do you plan to propose any changes to your account structure for fiscal year 2001?

Will you propose any changes to the program activities described under that account structure?

Answer. The agency's performance planning structure is the same as the account and activity structure in its budget justification. The budget and the performance plan are both organized by the agency's two overall strategic goals for premarket and postmarket activities and by programs. We currently plan no changes to the agency's account structure nor to the program activities described under that account structure in fiscal year 2001.

Question. How were performance measures chosen?

How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Performance measures were selected by the agency leadership based on their direct support of the agency's long range, strategic goals, and also because they supported the strategies outlined during the planning phase of the fiscal year 2001 budget. Goals contained in the Performance Plan were determined to be the most critical indicators for successful achievement of strategic goals and strategies. The specific performance target levels for fiscal year 2001 were also influenced by several factors, including: the urgency of the health or safety risk addressed by the goal, the proposed level of funding, environmental factors such as size and complexity of workload, and actual performance results for fiscal year 1999.

The agency balanced the cost versus the need for performance data based on the degree of health and safety risks involved and on the availability of existing data. The greater the potential risks, the greater is the need for performance data to tell us how we are addressing that risk. Where mature data systems are already in place, costs are well justified by the quality of performance data we receive. PDUFA is a good example of this type of program. In some new areas in which the agency is re-inventing its review processes to expedite the marketing of safe products, such as the premarket notification program for food additives, we are obliged to re-engineer our data systems, and collect data to support our regulatory activities. Improvements to the existing data collection systems that support our regulatory efforts require an initial front-end investment that will yield benefits relatively soon within one or two years. The benefits resulting from these investments in terms of the public health impact and ultimate savings to the industry will exceed the cost of the improvements. For some areas, such as medical errors, a large front-end investment is required. But we believe that investment in data collection is well worth the cost, even though benefits will only be fully realized after five or more years. This is because a comprehensive medical error surveillance, assessment and correction system is a primary means for improving health and safety outcome.

Yes, FDA's fiscal year 2001 Performance Plan includes thirteen 1999 performance goals and measures for which data were not available for inclusion in the fiscal year 1999 Performance Report. These goals account for 20 percent of the 65 performance goal commitments for fiscal year 1999.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

For each key annual goal, indicate whether you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. I would be happy to provide that for the record.

[The information follows:]

FISCAL YEAR 200 ANNUAL PERFORMANCE PLAN KEY GOALS

Program	Fiscal year 2000 performance goal	Output/outcome	Strategic goal
Foods	Complete First Action on 40 percent of food and color additive petitions within 360 days of receipt.	Output	Provide consumers quicker access to new food ingredients and dietary supplements, while assuring safety and effectiveness.
Foods	Achieve adoption of Food Code by at least 18 states.	Outcome	Reduce the health risks associated with food and cosmetic products by preventing human exposure to hazards, monitoring product quality and correcting problems that are identified.
Foods	Inspect at least 90 percent of high risk domestic food establishments.	Output	Reduce the health risks associated with food and cosmetic products by preventing human exposure to hazards, monitoring product quality and correcting problems that are identified.
Foods	Conduct 60,600 import exams of high risk food products.	Output	Reduce the health risks associated with food and cosmetic products by preventing human exposure to hazards, monitoring product quality and correcting problems that are identified.
Drugs	Review and act on 90 percent of priority NDAs within 6 months.	Output	Reduce human suffering and enhance public health by providing quicker access to important, lifesaving drugs, and assuring availability of safe and effective drugs.
Drugs	Review and act on 45 percent fileable original generic drug application within 6 months after submission date.	Output	Reduce human suffering and enhance public health by providing quicker access to important, lifesaving drugs, and assuring availability of safe and effective drugs.
Drugs	Inspect 22 percent of registered human manufacturers, repackers, relabelers and medical gas repackers.	Output	Prevent unnecessary injury and death to American public caused by adverse drug reactions, injuries, medication errors and product problems.
Biologics	Review and act on 90 percent of priority original NDA/PLA/BLA submissions within 6 months of receipt.	Output	Ensure the expeditious availability of safe and effective human drugs, including biologics, for prevention, diagnosis, and treatment of disease.
Biologics	Meet the biennial inspection statutory requirement by inspecting 50 percent of registered blood banks, source plasma operations and biologics manufacturing establishments.	Output	Reduce the risk of biologics products on the market through assuring product quality and correcting problems associated with their production and use.
Animal Drugs	Increase the level of presubmission conferences with industry sponsors to 75 percent.	Output	Increase the availability and diversity of safe and effective animal drugs and feeds.
Animal Drugs	Review and act on 65 percent of NADAs/Abbreviated New Animal Drug Applications (ANADAs) within 180 days of receipt.	Output	Increase the availability and diversity of safe and effective animal drugs and feeds.
Animal Drugs	Improve biennial inspection coverage by inspecting 27 percent of registered animal drug and feed establishments.	Output	Reduce risks associated with marketed animal products.

FISCAL YEAR 200 ANNUAL PERFORMANCE PLAN KEY GOALS—Continued

Program	Fiscal year 2000 performance goal	Output/outcome	Strategic goal
Medical Devices	Increase the on-time percentage of Pre-market Approval Application (PMA) first actions (within 180 days) and Humanitarian Device Exemption (HDE) first actions (within 75 days) completed to 85 percent.	Output	Provide quicker access to important, life-saving and health-enhancing medical devices, while assuring their safety and effectiveness.
Medical Devices	Review and complete 65 percent of 510(k) (Pre-market Notification) final actions within 90 days.	Output	Provide quicker access to important, life-saving and health-enhancing medical devices, while assuring their safety and effectiveness.
Medical Devices	Inspect 24 percent of Class II and Class III domestic medical device manufacturers.	Output	Reduce the risk of medical devices and radiation-emitting products on the market by assuring product quality and correcting problems associated with their production and use.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. FDA's Office of Planning, OPL, uses a long-established liaison system to work with each Center's staff that is responsible for its Center's portion of the Performance Plan. Each OPL liaison has received extensive training in the types of GPRA goals. OPL liaisons consulted closely with the Centers' staffs during the development of the goals. Once in draft form, OPL liaisons reviewed and provided comments on the Performance goals back to the Centers' staffs. In many cases, OPL liaisons offered suggestions so the goals would provide outcome measures. The OPL liaisons meet weekly together to exchange comments and suggestions to encourage Centers to develop outcome goals. Finally, the OPL Director provided another review level to point out possible improvements in goals.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. In addition to the liaison program mentioned in my previous answer, the Office of Planning OPL has provided extensive GPRA training to many parts of FDA. Between 1996 and 1997 a three-person OPL team trained over 500 FDA personnel throughout the country on GPRA requirements in three-day workshops. An integral part of this training were lectures and exercises to identify, distinguish and write outcome goals. OPL has followed up this initial training with workshops tailored to Centers' specific needs. For instance, these workshops often involve participants rewriting draft goals to become outcome oriented.

While we believe that many managers understand the difference between output and outcome goals, by necessity we include output goals because many of our efforts provide information to an industry or the public. Even with this information in hand, there may be many external intervening factors that can affect the outcomes that we cannot control. Because change can be difficult, there can be economic, political, and cultural obstacles to altering people's behavior. For instance, providing the public information may require new spending patterns and challenging ingrained behavior.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Some examples of external customer satisfaction measures are usefulness of information provided by FDA on food labels, usefulness of Consumer Alerts about food safety problems, and consumer awareness of FDA's mission. These measures were used as part of a government-wide Customer Satisfaction Survey sponsored by the President's Management Council. The particular group of FDA customers targeted by this survey were the principal grocery shoppers and food preparers in U.S. households. The agency has also committed to the National Performance Review goal which focuses on the availability, quality and usefulness of prescription drug information provided to individuals who receive new medicines.

The agency applies a variety of performance measures to gauge service to internal customers, including measures of quality and timeliness of performance. Each of the agency's administrative support functions, including human resource management, procurement, facilities, information resource management and budgeting, are incorporating such measures into their continuous improvement efforts. Each week, exec-

utive officers from each of the agency's organizational components meet to address concerns in these areas of internal customer service. This meeting serves as an excellent forum for listening to feedback from customers and engaging in problem solving. In addition, the agency conducts periodic employee surveys to determine their degree of satisfaction at FDA. Their satisfaction is measured by such indicators as: job satisfaction, overall quality of the work being done, recognition for doing a good job and degree of flexibility in doing the work.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. The agency's measurable fiscal year 2000 goals were important, but not the only, inputs used in developing the fiscal year 2001 budget. We raised a series of questions during our planning and budgeting process. First, what was our long range goal? Second, what was our performance in fiscal year 1999? Third, how much closer did our fiscal year 2000 performance goal bring us toward closing the gap between actual and ideal? The gap between our fiscal year 2000 performance goals and our long range goals told us how much further we had to go to reach our ideal. The selection of an fiscal year 2001 performance goal represented a conscious decision concerning how much of the remaining gap we intended to close. The fiscal year 2001 budget increases are an estimate of the resources that would be required to achieve the fiscal year 2002 performance goals, as well as implement other key strategies.

The area of drug inspections provides a good example of this process at work: We knew that one long range goal in the area of drug inspections was to meet our statutory biennial inspection requirement, which meant inspecting at least 50 percent of the drug establishments annually. Our fiscal year 1999 actual performance was 22 percent. We had established the same 22 percent goal for fiscal year 2000, and knew that ideally we would have to inspect an additional 28 percent of the firms annually to meet the statutory requirement. We made a conscious decision to set the fiscal year 2001 performance goal at 28 percent rather than the statutory goal of 50 percent. The more modest inspection goal in fiscal year 2001 was selected because FDA had to also address higher priority health and safety risks such as imports, needed to strengthen its science capability to address 21st Century technology, and also wanted to invest in bringing the states up to speed so that they could be more effective partners with FDA in the future. The fiscal year 2001 budget request for drugs in the post market arena reflects a balance in funding the above strategies.

If a proposed budget number is changed by your Committee we would be able to estimate the likely impact of that change on our level of program performance for those areas where we have measurable performance goals. We would also be able to estimate the likely impact on less quantitative proposals, such as the strengthening of an adverse event reporting system; but the estimate would be made in qualitative terms.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. We do have the capability to measure program performance in those instances where performance goals are stated in quantitative terms. We have the technological capability of reporting program performance throughout the year on a regular basis. All levels of management have access to that information, and our progress on key performance goals are becoming increasingly available both on FDA's intranet and on the internet as well. The agency is improving in its ability to access performance-related data throughout the various information systems. More of FDA's performance information is being shared through the web as time goes on. We are generally aiming for greater accessibility by all who have a need for this type of information.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in the budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Have you faced such difficulty?

Answer. We have not been able to precisely link dollars to specific performance goals and results. However, our present budget account structure has not prevented us doing so. Rather, we do not have the necessary performance data or cost accounting systems to establish precise linkages between specific performance goals and results and resources. We have estimated resources for broad categories of goals based on our strategic goals and programs. For example, we estimate aggregate dollars for human drug premarket activities. We have also been able to estimate approximate changes to performance goal targets based on changes to related budget requests and final appropriations. However, it is not easy to estimate dollar amounts or FTE needed to meet specific statutory requirements or performance targets or to report on performance. Many factors affect performance. Using a risk based strategy the agency will emphasize higher priority risks over lower priority risks. Also, as we pursue more leveraging opportunities, we will have additional start up costs, set up time, and training requirements for our partners. Improving the agency's science capacity upon which decisions are based will also require resources and time. We need to expand our electronic submission and review capabilities, update our laboratories, and continuously train our staff in the scientific advancements that are creating the new products subject to FDA regulation. Allocating these investments which are intended to improve overall performance to specific performance results is very challenging.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. We do not believe that the linkages would be clearer if the budget account structure were modified. As described above, the difficulties in establishing linkages are not caused by the budget account structure.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. We do not propose modifying our budget account structure.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We do not propose modifying our budget account structure.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions.

Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. FDA has a good understanding of the resource requirements needed to achieve most of its performance goals. Inspectional coverage of food establishments, review time for new drug applications, and assessment of mammography facility quality are a few examples of areas in which good performance data are available or will be available soon. With that information, we can demonstrate how resources impact program performance. We have been able through analysis to discern the difference between available resources and the necessary resources to achieve the highest performance possible. This analysis also helped illustrate FDA's continuing need to set risk-based priorities.

As we continue to gain experience in implementing GPRA, we improve our ability to evaluate the impact of changes in funding level on our programs and our ability to achieve the performance commitments outlined in the Annual Performance Plan. In some instances, changes in funding level may require an increase or decrease in program efforts and target level of performance. It may require development of new performance goals.

Over the past few years, FDA has practiced several strategies for operating with reduced resources in spite of an increasing workload. These strategies have included reducing program efforts, refocusing program efforts to target the highest priority health risks, and re-examining the role we play in protecting public health relative to other government agencies, third parties, and industry. Some of those strategic changes have caused us to change our activity measures. In some instances, for example, the number of inspections conducted is not as appropriate a measure as the percentage of products approved by third-party sources. However, changes in approach will not change the agency's desire to improve health outcomes.

The performance goals in the annual performance plan link directly to the budget. Each individual performance goal supports a somewhat broader program strategic goal, which in turn supports a major FDA program. In the performance plan, budgeted amounts, both dollars and FTE, are aggregated at the program strategic goal level. So, for each major program area, the total budget request represents the total of the program strategic goal amounts.

FDA implemented managerial cost accounting as a pilot program during fiscal year 1997, in order to meet the Chief Financial Officers Act requirement for a "statement of net costs". The pilot initiated efforts to design, document, and implement the process of measuring full cost of FDA programs. A series of Excel worksheets were created identifying the resources consumed. In fiscal year 1999, total costs were allocated to 7 programs. Using the Excel format, the resources (or cost elements) were subsequently assigned directly, or allocated indirectly to the FDA components that consumed them. Additionally, the worksheets were linked in a manner where the data for each cost element was summarized and uploaded into published report formats. We also have experience in cost accounting as required by the Prescription Drug User Fee Act.

Integration of the budget and the annual performance plan is a continuous learning process. We continue to look for meaningful ways to relate Agency outcomes with resource allocation decisions. With no single answer on the horizon, we continue to emphasize agency results as a key driver for fiscal decisions.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting.

The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Will you be able to show us the per-unit cost of each activity and result?

To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. FDA is evaluating the need to enhance our existing system in order to support cost accounting requirements of the new accounting standards recommended by the Federal Accounting Standards Advisory Board, and issued by OMB for the other major programs and sub-programs in FDA. These enhancements will improve FDA's ability to adequately gauge the performance measurement activity.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. Several significant reform measures have been implemented, many of them mandated by FDAMA. The agency's performance plan contains specific goals, strategies and reports on accomplishments which reflect the agency's commitment to successfully implementing these reforms. Some of the key reforms highlighted in the performance plan include: a new notification process for dietary supplements containing new ingredients; a pre-market notification process for food contact substances; an initiative requesting additional pediatric information on clinical trials for new drugs; redesigning the Animal Drug Approval process to make it more efficient for FDA and industry; and reinventing many of the medical device premarket review processes to use resources more effectively and efficiently. Through regulatory reform efforts such as these, the agency has been able to improve the transparency of its processes, and facilitate participation by outside stakeholders. These reforms also enable the agency to focus on specific risk priorities, as in the case of dietary supplements and obtaining additional information on the impact of new drugs on children in the clinical trial setting. The performance plan provides an operational document which is used to help manage the implementation of these important new steps for FDA.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

If so, what steps have you identified to prepare, anticipate and plan for such influences?

What impact might external factors have on your resource estimates?

Answer. Yes, FDA's fiscal year 2000 Performance Plan identifies external factors that could influence goal achievement in the goal-by-goal presentation of perform-

ance of each FDA Program. Within the goal by goal presentation, external factors are discussed in the narrative description of each performance goal, the sections called “Context of Goal” and “Performance”. External influences include changes in our workload and changes in the environment in which FDA operates, the increasing complexity and sophistication of the industries we regulate, and the ever-increasing development of new products that evolve from emerging technologies are also among external factors that may present obstacles to the achievement of our goals.

In developing our program strategies, we have taken several steps to prepare, anticipate and plan for external influences. First, we make every effort to keep abreast of changes in our external environment through ongoing analysis of emerging issues, industry trends and existing and proposed policy and legislation. Occasionally, a particular public health issue may warrant special studies. Such studies allow us to gain insight on the various facets of the problem and to identify the most effective intervention strategies. Second, consultations with our stakeholders, contacts with trade associations and collaboration with partners provide valuable information and forums for exploring strategic alternatives and for identifying synergies and competing interests. This has become increasingly important now that FDA shares the responsibility for achieving national public health objectives, such as those of Health People 2010 and the Food Safety Initiative, with many government and non-governmental organizations. Third, the monitoring of FDA program performance and effectiveness provides valuable information about how the agency’s efforts impact public health. Fourth, the agency engages in strategic and operational planning both at the program level and the agency level. In developing agency strategic approaches, program planners and budget officers focus on strategies that leverage FDA resources to achieve the maximum public health impact despite external influences that potentially impede our progress.

FDA functions in a rapidly changing environment. Many factors that influence the achievement of our public health objectives are partially controlled by other organizations or are outside our direct influence and control. In addition, we acknowledge that despite our best efforts to anticipate and identify effective remedies to counteract the adverse effects of certain negative factors, unforeseen problems may arise. As a consequence, we may find that an unforeseen change in our environment adversely affects our ability to attain some of FDA’s performance targets and that the additional resources to address some external factors.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

If so, does the Performance Plan identify the overlap or duplication?

Answer. Potential overlaps were identified during the agency’s deliberations about fiscal year 2001 strategies, but as a result of those strategic discussions the overlaps were eliminated prior to the development of the performance plan. The performance plan reflects a clear division of responsibilities among the agency programs. Each program does address similar functional responsibilities—e.g., science-based pre-market review, and post-market surveillance, compliance and outreach. But the implementation of these responsibilities is tailored to the unique challenges addressed by each center.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Yes, agencies should and FDA does address management challenges, as well as potential duplication as part of their strategic and performance planning process. This is accomplished through the formation of ‘corporate’ strategic teams that are composed of individuals representing all organizational components. Each team is assigned to a major strategic area that the Agency is pursuing. The teams identify management challenges for the future in their respective areas, and formulate strategies for addressing these strategies. As part of the strategy development process, teams coordinate with each other and identify potential overlaps. The performance plan is a reflection of the division of responsibility agreed to by the teams and also clearly allocates a division of responsibility among FDA’s centers.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Will this use increase in the future and if so in what ways?

Answer. GPRA principles are adhered to by FDA’s leadership as they make strategic decisions about the agency’s future directions, operational decisions about the specific performance goals that they are willing to commit to, and budget decisions which will adequately fund these commitments. As the agency gains further experience in implementing GPRA, we will improve our ability to evaluate the impact of changes in funding levels on our programs and our ability to achieve the performance commitments outlined in the Annual Performance Plan. FDA leaders will also

be in a better position during the coming year to use information on actual performance to help make mid-course adjustments to plans. The ability to monitor performance, analyze variance and make decisions on adjustments will be further strengthened as the agency's information systems and web-based capabilities provide managers with greater access to performance information. Also, increasingly, GPRA-type of performance goals are being incorporated into the individual performance plans of senior executives. This enables their individual efforts to be directly linked to the agency's program commitments.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The maturity of our performance measures varies from program to program. In PDUFA-funded areas, for example, performance measures have remained relatively stable during the past several years. New measures have been added to implement PDUFA II, but the original measures are essentially the same. Because of this stability, the information and cost systems that support this endeavor have also matured and are able to provide reliable data. In the area of inspections, information systems do provide intelligence on actual performance, as well as costs associated with achieving target performance levels. In areas where significant reinvention has occurred, neither data bases nor base lines have yet been established which will allow the agency to report on historical progress. Thus, there would be no reference points from which goals could be established with a high level of confidence. FDAMA presented the agency with several regulatory reforms that required the creation of new review processes. Performance measures in these areas are not sufficiently mature to be used in a performance management setting.

In several other areas, the agency is investing new efforts in leveraging its own limited assets with partners such as states, the health professionals, other agencies and the regulated industry. These leveraging initiatives should ultimately yield greater returns on investment to FDA in terms of stronger science-based regulatory decisions, faster review times and increased inspection coverage. Although review times and inspection coverage are the same kinds of performance measures that the agency currently uses, the estimates of funding required to achieve performance gains will be much less certain. This is because initial investments in leveraging will not yield immediate gains in performance. Time will be required to determine the cost profiles associated with a new way of doing business.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No, we are not requesting a relaxation of transfer or reprogramming controls in return for specific accountability commitments.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. I believe that you are referring to the HHS Strategic Plan—not an FDA-specific strategic plan. The HHS Plan is in the process of being redrafted at this time. We suggested some modifications to FDA's contributions to the HHS Plan. Specifically, we placed additional emphasis on the fact that FDA would focus its future efforts on strengthening the science base of the agency. This is viewed as absolutely essential in order to keep pace with science and technology advancements so that FDA can pass judgements on the products and processes of these new advancements. We also suggested that FDA's future reliance on leveraging as a primary way of doing business be given greater emphasis in the HHS Strategic Plan.

QUESTIONS SUBMITTED BY SENATOR CHRISTOPHER S. BOND

I have some concerns about the possible effect on small businesses of FDA's final rule on the Prescription Drug Marketing Act, which was published on December 3, 1999. The FDA's small business analysis of the rule noted that 94 percent of pharmaceutical distribution firms, or about 4,000 companies, are small businesses. I have several questions about the rule and its small business impact:

Question. It is my understanding that nearly all of these 4,000 small businesses would have to provide their customers with a very detailed sales history for each product they wished to resell. If they cannot obtain the required information from

whomever they buy the products from, is it correct that they would not be able to legally resell the prescription drug products?

Answer. If the wholesalers who do not buy directly from the manufacturer cannot obtain the detailed prior sales history required by the final rule and they sell the product anyway, they would be violating the requirements of the rule.

Question. Does the final rule require manufacturers or authorized distributors to provide this detailed information to firms who purchase from them?

Answer. The final rule is consistent with the statute and the legislative history. Manufacturers or authorized distributors are not required to provide the sales history but unauthorized distributors are required to provide the sales history. The statute requires wholesale distributors who are not the manufacturer or an authorized distributor to provide a statement identifying each prior sale, purchase, or trade of such drug. There is no indication in the Prescription Drug Marketing Act, PDMA that Congress intended that the statement or pedigree include only those sales, purchases or trades since the drug was last handled by an authorized distributor. Moreover, the legislative history of PDMA indicates that the pedigree must include all previous sales of the product. Thus, an unauthorized distributor would be required to provide a full drug origin statement in accordance with PDMA and the final rule whether or not it has purchased a prescription drug from an authorized distributor of record. Although FDA has encouraged authorized distributors to provide a pedigree to unauthorized distributors, they are not required under PDMA to do so. Note, FDA has extended the effective date of this part of FDA's final rule and we are willing to consider the additional comments and information presently being provided to assist in developing a solution to this potential problem.

Question. Is it possible that this rule will drive some of these small resellers out of business? If so, how many resellers do you think are at-risk? If many of these small distributors were to go out-of-business, what would be the impact on prescription drug prices? Would we risk disruption in the supply of prescription drugs?

Answer. FDA agrees there could be a negative impact if thousands of drug resellers were forced out of business. However, because the PDMA has been in effect since 1988, FDA does not believe that this will occur and does not believe that there will be a disruption in the supply of prescription drugs to retailers and consumers. Assurances to consumers that they are not receiving subpotent, adulterated, counterfeit or misbranded drugs will be strengthened by the procedural and record-keeping requirements of the final rule. In any event, FDA is willing to work with Congress and others to resolve the concerns raised and allay any fears of supply disruption.

QUESTION SUBMITTED BY SENATOR SLADE GORTON

Question. As you know, Congress debated The Food and Drug Administration Modernization Act (FDAMA) for 3 years, from 1994 to 1997, with the purpose of streamlining the FDA and its product approval process for drugs, medical devices, etc. One of the key provisions in the Act involves FDA having a quasi-private-public partnership, using independent 3rd party scientific review organizations to make product approval recommendations to the FDA. Companies would pay 3rd parties to review their products, and the FDA would accredit these 3rd parties, as well as sign off on their final recommendations. I understand that the 3rd party system isn't working very well, because the list of products currently eligible for the program is very limited, to low-end products. Last year, this subcommittee allocated the largest increase for CDRH ever. In light of these new dollars, what is the FDA doing to expand the 3rd party program this year?

Answer. Currently, 154 devices are eligible for third-party review—including many significant devices such as diagnostic ultrasound systems, magnetic resonance imagers, endoscopes, and cardiac monitors—and at least 2 of the 13 Accredited Persons are available to review each of the devices. In fiscal year 1999, the agency received more than 1,200 510(k) submissions for the 154 devices, representing nearly 50 percent of all 510(k)s that are potentially eligible for third-party review based on the criteria in section 523(a)(3) of the Federal Food, Drug and Cosmetic Act. An important milestone of the third-party review program occurs when the agency notifies Congress that at least two third-parties are accredited to review at least 60 percent of 510(k) submissions. FDA expects to meet the 60 percent milestone with the next expansion of the eligible device list, which we plan to announce soon. In addition, the Administration's fiscal year 2001 budget proposal includes a proposal for additive device user fees to help jump-start the third-party program. The revenue from these fees would be used to provide information about the availability of third-party reviews and to subsidize the cost of these reviews.

QUESTIONS SUBMITTED BY SENATOR MITCH MCCONNELL

With respect to the FDA's regulations issued December 3, 1999 implementing the Prescription Drug Marketing Act, I am concerned that wholesale distributors will not be able to comply with the requirement that they provide a statement identifying prior sales back to the manufacturer. This is because many of the distributors buy from full line authorized distributors who are not required by PDMA to provide such information. This aspect of the final rule is inconsistent with the contemporaneous interpretation that the industry has operated under for the past twelve years.

Question. In its final rule, why did FDA change from its 1988 guidance to its present rule requiring a statement identifying prior sales that go back to the manufacturer?

Answer. FDA investigations have found that secondary wholesalers who are diverting prescription drugs will ship the drugs through an authorized distributor in order to erase, or wash, the record of all sales of the drugs prior to the authorized distributor. Since the Prescription Drug Marketing Act, PDMA, does not impose the drug pedigree—statement of origin—requirement on authorized distributors, the pedigree is—washed—with the drugs' passage through the authorized distributor, with the result that all sales of the drugs prior to the authorized distributor are erased. The secondary wholesaler can then claim that they purchased the drugs from an authorized distributor without divulging the true source or sources of the drugs. Traceability of the drugs through the wholesale distribution system is also, therefore, erased.

Question. What evidence does FDA have that authorized distributors who are not required by PDMA to provide prior sales histories of the drugs they sell will do so voluntarily?

Answer. Although FDA has encouraged authorized distributors to provide a pedigree to unauthorized distributors, they are not required under PDMA to do so. In any event, we have extended the effective date of that part of the final rule and are willing to consider the additional comments and information presently being provided to assist in developing a solution to this potential problem.

Question. Has FDA determined the cost to authorized distributors of implementing the same system of providing prior sales information that is now required of distributors who are not authorized?

Answer. As noted in the preamble to the final rule, most of the requirements in the proposed rule were already implemented by the industry in response to the enactment of the PDMA, FDA's guidance, and industry trade association recommendations. Therefore, the agency, in section IV, of the final rule determined that there would be one-time costs of \$318,000 for developing forms, and total annual costs of approximately \$82 million. Of these costs, approximately \$39 million has already been incurred by industry since Congress enacted PDMA in 1988.

QUESTIONS SUBMITTED BY SENATOR HERB KOHL

Question. Please provide information describing in detail the activities conducted by FDA using funds included as part of the Food Safety Initiative in fiscal year 2000 and proposed for fiscal year 2001.

Answer. I will be happy to provide this information for the record.
[The information follows.]

FOOD SAFETY INITIATIVE

For fiscal year 2000, FDA received a \$30 million increase for the President's Food Safety Initiative and thanks the Committee for their continued support. The additional resources are being targeted to further developing a nationally integrated, seamless, and science-based food safety, enhancing public health surveillance and increasing the speed and efficiency of responses to outbreaks of foodborne illness, and placing greater emphasis on the control of foodborne hazards in the pre-harvest phase of the farm-to-table continuum. Specifically the funds will be used to:

- Begin development of an electronic communication and data sharing system for use in Federal-state monitoring and traceback activities;
- Expand and increase the overall capacity of the National Antimicrobial Resistance and Monitoring System (NARMS) and the number of States covered to assure a higher probability of detecting emerging resistant pathogens capable of animal to human transmission and to minimize the occurrence of foodborne outbreaks including those from outside the United States;
- Increase inspection coverage and frequency of coverage of domestic firms, with top priority given to firms processing "high-risk";

- Increase the number of inspections of foreign processors and conduct evaluations of foreign food production systems;
- Provide training to State and local food safety officials and industry in the effective use of preventive control systems, such as HACCP and to perform inspections of HACCP systems;
- Develop methods for predicting the risk associated with foodborne pathogens and partnerships with government, industry, and academic scientists to conduct studies that demonstrate comparability of disease across species;
- Continue a program of research in quantitative risk assessment that is targeted to address the limitations in risk assessment methodologies;
- Continue to build the activities of the interagency Risk Assessment Consortium and to continue development, through the Joint Institute of Food Safety and Applied Nutrition, of the Risk Assessment Clearinghouse; and
- Continue to develop and provide multi-lingual education programs for food service workers and to implement a national education and training program to ensure greater safety in retail food preparation practices, including the use of HACCP principles in retail establishments.

The fiscal year 2001 request builds upon three years of intense work and cooperation among FDA, CDC, and USDA, as well as State and Local Health agencies. FDA's request would, among other things, ensure annual inspections of high-risk food establishments and enhance the supporting laboratory analyses; work with states to implement audit programs to ensure consistent application of regulations and develop consistent nationwide food safety standards; implement the Hazard Analysis Critical Control Point system for fruit and vegetable juices; develop and evaluate on-farm intervention strategies and/or technologies to improve testing methodologies for Salmonella Enteritidis (the Egg Safety Action Plan); and complete the National Antimicrobial Resistance Monitoring System by adding national and international data collection sites.

Question. To what extent has FDA's role in the Food Safety Initiative reduced the health threat of imported foods?

Answer. On March 17, CDC reported a 20 percent reduction in overall foodborne illnesses associated with pathogens through their active surveillance network—Foodnet. The Centers for Disease Control—CDC, credited the federal, state and industry food safety partnership activities, such as Fight Bac!, HACCP and Good Agriculture Practices as major contributors to this public health improvement. CDC also reiterated the need to continue to make similar strides in prevention, improved food safety systems and outbreak response.

Additionally, the overall picture of trends for food safety knowledge and practices that emerges from research is quite encouraging. Between 1993 and 1998, the public's food safety practices, both the consumption of risky foods and food handling behaviors in home kitchens, show dramatic improvement. For example, for the population as a whole, the incidence of eating pink hamburger is down 33 percent and the incidence of eating raw oysters or clams is down 39 percent. The safety of reported hand-washing and cutting board practices has also improved markedly. The improvement is particularly strong for handling meat or chicken, which improved 74 percent compared to a 27 percent improvement for fish. Knowledge levels about microbial food pathogens increased, along with rising perceptions of the possible risk of getting foodborne illness.

That is not to say that there are no consumer education issues to be addressed. There are obvious gaps in consumer knowledge, attitudes and practices related to food safety. For example, although awareness of salmonella appears to be on the rise, most consumers still do not handle eggs very carefully and they are more likely to consume undercooked eggs or foods containing raw eggs than any other risky food. Most consumers have never heard of *Listeria* or *Campylobacter*, which are at least as prevalent in the food supply as the more well known pathogens, *Salmonella* or *E. Coli*.

The Food Safety Initiative has provided necessary resources for FDA to undertake the enormous challenge of foodborne illness. Even more is expected of this Agency as its responsibility encompasses a broader array of regulated products and potential hazards in foods.

Question. Can FDA quantify the amount of unsafe food items that enter this country uninspected?

Answer. No, however, we are able to quantify the total number of FDA regulated food products that are offered for entry into the United States. From January 1-December 31, 1999, 3.4 million food or food related products were offered for entry. Of these products, two percent were refused entry due to their failure to meet FDA's regulations or because they were determined to be unsafe for human use.

BOTTLED WATER STUDY

The Safe Drinking Water Act Amendments of 1996 required a report related to bottled drinking water. Since that time, FDA has been charged with preparing a study on this subject for which the Senate Report for the Fiscal Year 2000 Appropriations Act directs completion by March 2000. The 1996 Amendments required a final report no later than February 1999. I now understand FDA has moved the completion date until later in the year.

Question. Please explain why FDA is causing a further delay for a report that has been pending for nearly four years?

Answer. In January 2000, FDA's Center for Food Safety and Applied Nutrition—CFSAN, published its workplan, titled "2000 CFSAN Program Priorities," to inform its stakeholders about CFSAN's priorities for the fiscal year. The workplan includes A and B list goals. Items on the A-list are projects that will be completed this fiscal year. Items on the B-list are projects on which CFSAN intends to make progress this year, but will likely not complete.

Among our A-list goals, pursuant to Senate Report 106–80, CFSAN will publish a "Bottled Water Feasibility Study," examining the feasibility of appropriate methods of informing consumers about the contents of bottled water as mandated by the Safe Drinking Water Act Amendment of 1996. The draft "Bottled Water Feasibility Study" was published on February 22, 2000. We expect this study to be finalized by August 2000.

Question. Will FDA be able to complete this report by a date more in line with the congressional directive?

Answer. The draft bottled water feasibility study was published on February 22, 2000. The comment period for the draft study will close on April 24, 2000. The final feasibility study is on CFSAN's list of priorities for this fiscal year, and we have requested an extension of the due date until August 2000 to complete this report. We believe we can meet an August 2000 completion date, given the amount of time needed for the evaluation of comments and development of the final report.

SEAFOOD INSPECTION FROM COMMERCE

Question. The President's budget proposes to transfer the voluntary seafood inspection program from the Department of Commerce to the FDA. Some have expressed concern that this action may undermine the public confidence provided by Seafood HACCP. Please respond to that concern.

Answer. Rather than undermine public confidence, such a transfer could strengthen it. Transferring the National Marine Fisheries Service—NMFS, voluntary program to FDA would establish FDA as the sole seafood agency with one HACCP standard. FDA would be able to train the voluntary inspectors in the regulatory HACCP standard along with the regulatory inspectors. Consequently, FDA may be able to contract with the voluntary inspectors to perform certain regulatory HACCP inspections or, in certain instances, to count a voluntary inspection as a regulatory inspection. The result is that the transfer would provide a skilled cadre of inspectors to implement FDA's regulatory HACCP program. Industry will benefit by eliminating redundant inspections at the federal level. Consumers will benefit by improved food safety resulting from inspections based on a single HACCP standard established by FDA.

FDA believes that safeguards could be put in place to eliminate a potential conflict of interest that could undermine public confidence in the current seafood HACCP program. While the legislation would authorize PBO inspectors to perform regulatory HACCP inspections, FDA would adopt precautions to ensure the objectivity and credibility of the inspection. For instance, FDA could adopt a policy of utilizing PBO inspectors to perform regulatory inspections only for seafood firms that are not also paying customers of the PBO. In the end, FDA can always utilize its regulatory inspection force as a check against the PBO inspection force to ensure that the public health is protected.

FOOD CONTACT SUBSTANCE

The Fiscal Year 2000 Appropriation Act provided an increase for premarket application reviews of food contact substances.

Question. How much of FDA's fiscal year 2000 budget was directed for this purpose?

Answer. For fiscal year 2000, funding of \$6 million was provided to FDA to fully implement the food contact substance notification program established by FDA Modernization Act.

Question. Does FDA require any additional resources to fully meet the needs of this premarket review process?

Answer. Our current estimate is that \$6 million would adequately fund this program in fiscal year 2001. FDA notes that this program has only recently begun to operate. As we gain experience with the notification program, and obtain better information about the number and complexity of notifications we can expect to receive, we may need to refine our cost estimates for future years.

GINSENG

The Senate Report to accompany the Fiscal Year 2000 Appropriations Act includes language that calls FDA's attention to potential problems of adulterated ginseng imports.

Question. What specific actions has FDA taken in response to this language?

Answer. FDA received information suggesting that a significant amount of imported ginseng may be treated with pesticides that are not approved for use in ginseng in the United States. In response to this information, FDA decided to determine the scope of the problem in September 1998. Accordingly, FDA collected samples of imports between October 1998 and May 1999. A total of 56 samples were collected and analyzed for organochlorine and organophosphate pesticide residues. Of the 56 ginseng samples analyzed, 33, or 58.9 percent were found to be violative for pesticide residues and appropriate regulatory action was taken.

I would like to provide a chart for the record that shows the countries in which the violative samples originated.

[The information follows:]

IMPORTED GINSENG

Country	Number of samples collected	Number of regulatory actions taken
China/Hong Kong	38	18
Korea	13	10
Canada	5	5

A total of 28 different manufacturers or shippers were involved in shipping violative ginseng samples from the countries listed above and were named on an Import Alert.

An Import Alert identifies and disseminates import information about problem commodities and/or shippers and provides guidance to FDA personnel on import coverage.

EGG SAFETY

Last year, the FDA proposed a warning label for eggs. I have heard from egg producers who feel it is overly alarmist and would prefer a different label; they do not oppose the concept of labeling, only the specific label the agency proposed.

Question. Can you give us some insight into your thinking on this label, and whether you are considering any changes to what you proposed last year?

Answer. From the results of previous focus group research on label statements used to alert consumers to potential hazards in foods—namely, iron supplements and fresh or unprocessed fruit and vegetable juice warning statements, FDA determined that certain types of information was required to adequately inform consumers about the potential risks associated with the food. In particular, our focus group research indicated that for consumers to understand and modify their behavior with regard to a particular food there needed to be an information statement explaining why there was a risk associated with the food. This information statement was especially important if the information was considered new information. In crafting the proposed safe handling instructions for eggs, FDA considered that consumers needed to be given information on why the product presented a risk. Accordingly, FDA proposed to include a sentence in the statement that informed the consumer that the eggs may contain harmful bacteria known to cause serious illness in children, the elderly, and persons with weakened immune systems. FDA included these groups because they are generally at higher risk of serious illness from food borne pathogens than the rest of the population.

FDA received several comments objecting to the introductory sentence in the proposed safe handling instructions. We also received comments offering alternative

wording for the safe handling instructions, as well as those asserting that the presence of *Salmonella* in eggs was not new information.

CONSUMER INFORMATION

Question. To what extent does the “Take Time to Care Initiative” duplicate the “MedGuide” program?

Answer. The programs were created to complement each other, not duplicate each other. As part of its mission, FDA makes approval decisions for new products based on a balancing the risks and benefits of a given product. Yet, that is just one small part of the process—all along the way, from the manufacturer who makes a drug, to the prescriber who writes a prescription, the pharmacist who fills the prescription, to the patients and consumers who make decisions about product use for themselves and their families, we all have a role to play in minimizing product risks.

Because women are the primary users of medicines and typically administer medicines to their families—they are ultimately the risk managers for their families—The Take Time to Care Initiative focuses on them. Women need to take charge of their own health and learn about proper use of medicines for themselves and in their role as family caregivers. Through this program, we have emphasized that there are very easy ways to do this, including: reading labels, keeping track of their medications, avoiding sharing or skipping of medications, keeping track of the basic side effects, and, simply—but importantly—asking questions. These very easy steps can ultimately have a very large impact on reduction in adverse events from medical products.

In this effort, FDA’s Office of Women’s Health partnered with more than 70 organizations in the “Take Time to Care” campaign, which distributed the *My Medicines* brochure to help women safely use medications. The brochure is available at the FDA website: www.fda.gov/womens/ttcc or by calling toll free 1-888-8-PUEBLO.

In addition, FDA’s Medication Guide program would provide additional information to patients and consumers regarding the prescription drugs that they receive for themselves and their families. Medication Guides contain specific information about each drug—information about dosage, warnings, contraindications, and other critical information to help individuals take their medications accurately and effectively. This program provides the specific information about each drug, ensuring that it is conveyed to the patient or consumer in a manner that is clear and intelligible. In contrast, the Take Time to Care Initiative is focused more broadly, underscoring the importance of reading and following such information.

INTERNET DRUG SALES

Question. Please provide information regarding identified problems related to current internet drug sales practices and the specific manner in which your proposal would solve these problems?

Answer. The Internet has provided a new marketplace for sales of unapproved new drugs including counterfeit drugs, prescription drugs sold without a prescription, drugs imported or re-imported illegally, and products marketed with fraudulent claims. Patients who buy prescription drugs from websites that engage in such illegal activities are at risk for adverse effects from inappropriately prescribed medications, dangerous drug interactions, and contaminated drugs. As you know, long before the Internet was created, Congress and the State legislatures enacted a comprehensive system of premarket approval, prescription drug designations, practitioner evaluation and pharmacy dispensing to protect patients from injuries resulting from unsafe or counterfeit drugs and from the illicit practice of medicine and pharmacy. This system has worked well over the years.

Because the current laws were not enacted with the Internet in mind, however, they do not provide regulatory and law enforcement agencies with fully effective tools to protect consumers from operators of online pharmacies that engage in illegal activities. For example, both consumers and law enforcement officials may have difficulty identifying the name, location, and State licensure of physicians, pharmacists, and online pharmacy operators. Even if the parties can be identified, because the Internet is largely unconstrained by State and national boundaries, States—traditionally the primary regulators of the practice of pharmacy and the practice of medicine are undercut in their efforts to regulate online pharmacies. Finally, both State and Federal agencies are limited in the causes of action that may be brought against illegal online sellers of prescription drugs.

The Administration’s proposal is designed to provide sufficient safeguards to protect the public health effectively without hindering the enormous potential benefit of the Internet. In addition, the proposal is designed to enhance the effectiveness of the Federal-State partnership in the regulation of prescription drugs and recog-

nize the importance of the States' traditional role in regulating the practice of medicine and pharmacy. Accordingly, the proposal would support and strengthen the States' authority to enforce applicable law within their borders, while providing enhanced Federal authority to monitor the multistate and interstate aspects of Internet prescription drug sales. By filling gaps in Federal and State authority, the bill seeks to curb illegal sales of prescription drugs and to ensure that consumers are receiving safe and effective drugs prescribed by health care professionals, and dispensed by pharmacies that properly licensed. The proposal will allow legitimate online pharmacies to be much more easily distinguished from illegal online pharmacies, which will enhance consumer safety and confidence, and level the playing field for legitimate online pharmacies by reducing their illegal competition.

Question. To what extent do you believe further regulation of internet drug sales will impair or reduce the availability of drugs through this medium?

Answer. New legislation regarding Internet drug sales will not reduce the availability of legally prescribed and dispensed medications through this medium, however, it will reduce the availability of illegal medications distributed through this medium. By increasing consumer confidence in the Internet as a medium for prescription drug sales, new regulations will advance the interests of legitimate online pharmacies.

Question. If you think further regulation of internet drug sales will have no effect on the availability of prescription drugs, please explain.

Answer. The legislation only targets illegal sellers of prescription drugs and would have little effect on those entities who are properly licensed by states and abiding by state and federal law.

ORPHAN DRUGS/EVERGREENING

Under current law, companies which bring certain orphan drug products to the market are granted a 7 year exclusivity period in which they are allowed to help recoup their development costs for that product. However, under a so-called "Evergreen" provision, any company which develops a further improvement of that product is granted a further 7 year exclusivity period for the entire product, not just for the "improved" component. This combination of factors can potentially lead to a product's exclusivity period running indefinitely and, thereby, cutting off competition and related cost savings to the consumer.

Question. Please explain why the exclusivity of a product improvement attaches to the entire product?

Answer. Under the Orphan Drug Act, if a drug is designated for an orphan indication and is approved for that indication, it will receive seven years of exclusivity. During this seven-year period, the agency will not approve or license the same drug from another sponsor. However, the first sponsor's exclusivity is not a barrier to approval of a product that is not the same drug. If a subsequent sponsor demonstrates that its drug for the same indication is not the same drug, either because it is chemically not the same, as defined in the orphan drug regulation, or clinically superior, the second product will be approved. If the second drug was designated for the orphan indication, it will also receive orphan exclusivity. The statute does not limit the drugs eligible for orphan exclusivity, or the scope of that exclusivity, on the basis of indication, chemistry, or clinical behavior.

Question. To what extent would consumers benefit from cost savings if the exclusivity attached only to the improvement?

Answer. It is well established generally that the entry onto the market of the first generic version of a drug begins what may ultimately be a sharp decline in the price. This is described in *How Increased Competition from Generic Drugs Has Affected Prices and Returns in the Pharmaceutical Industry*, July 1998, Congressional Budget Office. However, generic drugs are duplicates of innovator products and thus may be promoted by the sponsors only in the same manner as the innovator product. In contrast, an orphan drug exclusivity program that permitted the agency to approve any new orphan drug that did not copy a particular protected improvement could result in the introduction of new "innovator" products that would attempt to distinguish themselves from the other marketed products, and not result in any cost savings to consumers. It is useful to note that the availability of multiple "innovator" human growth hormone and erythropoietin products on the market for orphan indications has not resulted in a meaningful decrease in the cost of these drugs to consumers. In addition, because the expressed goal of the Orphan Drug Act is to encourage investment in drugs for rare diseases and conditions, it is important to keep in mind the need for adequate financial incentives for continuing development and improvement of these treatments. Although the availability of generic drugs is a continuing priority for the agency, any discussion of generic drugs for orphan dis-

eases would be fruitless if innovator companies do not first develop needed orphan products.

Question. Please compare this feature of orphan drug products to other drug or device products which enjoy periods of marketing exclusivity.

Answer. Every exclusivity under the Federal Food, Drug, and Cosmetic Act, FFD&C Act, that gives drugs some form of market protection has different characteristics. For example, there are substantial differences in what aspect of a drug is protected by each form of exclusivity. "New chemical entity" exclusivity under section 505(c)(3)(D)(ii) and 505(j)(5)(D)(ii) of the Act protects the active moiety of the drug from competition from other products containing the same moiety, regardless of whether the subsequent drug is for the same indication, has the same formulation, the same dosage form. In contrast, orphan drug exclusivity protects only the particular drug for the designated orphan indication; a subsequent applicant can obtain approval of the same drug for a different indication, even in the face of orphan exclusivity. In addition to differences in what aspect of a drug is protected, forms of exclusivity differ in what competition is prohibited. "New chemical entity" exclusivity and "clinical studies" exclusivity under section 505(c)(3)(D)(ii)-(iv) and 505(j)(5)(D)(ii)-(iv) of the Act grant protection to innovative drugs against competition from certain generic drugs and other drugs for which the sponsor did not do the supporting studies. However, these two forms of exclusivity do not protect against competition from a drug whose sponsor has conducted all the studies necessary to gain approval of its product, even though this product may be directly competitive to the product with exclusivity. Orphan drug exclusivity, on the other hand, protects the drug with the exclusivity from competition from the same drug for the same indication produced by another sponsor, regardless of whether the other sponsor may have conducted all the studies necessary to obtain approval of the drug. The pediatric exclusivity provisions passed as Section 111 of the FDA Modernization Act of 1997 include an express limitation upon the number of times a drug can benefit from the six month exclusivity period, but that exclusivity can attach to multiple other exclusivity and patent protections covering many drug products. There is no exclusivity protection in the Federal Food, Drug, and Cosmetic Act for devices.

GENERIC DRUGS

Over the next five years, brand drugs with approximately \$21.6 million in annual sales will come off patent, providing opportunities for substantial health care cost savings through the alternate use of generic drugs. However, it is reported that the median approval time for generic drugs in fiscal year 1999 was 17.3 months.

Question. What levels of savings in the costs of prescription drugs would be realized if approval times were shortened from the 17.3 month time frame to the statutory requirement of six months?

Answer. There would be some cost savings, but generic applications for most large selling drugs are submitted to FDA well before the date of patent expiration for the innovator drugs. As a result, in recent years FDA review time has not significantly delayed the availability of most generic products.

Question. How much of FDA's fiscal year 2000 budget will be directed to the Office of Generic Drugs?

Answer. Approximately \$13.6 million of fiscal year 2000 budget proposed for the Center for Drug Evaluation and Research will be allocated to the Office of Generic Drugs. These dollar and FTE figures do not include overhead expenses such as legal, facilities and telecommunications, personnel, budget development and execution, executive communications, labor/management, EEO, and general management oversight.

Question. How much of the fiscal year 2001 budget is proposed specifically for the Office of Generic Drugs?

Answer. It is estimated that approximately \$13.8 million of the proposed budget for the Center for Drug Evaluation and Research will be allocated to the Office of Generic Drugs in fiscal year 2001.

ANTIMICROBIAL PRODUCTS

I note that the National Antimicrobial Resistance Monitoring System (NARMS) expanded its activities from funds derived from the Food Safety Initiative during fiscal year 1999.

Question. Please provide information regarding specific activities of NARMS.

Answer. The National Antimicrobial Resistance Monitoring System—NARMS, monitors the emergence and spread of resistance in enteric bacteria and helps to ensure the continued safety and effectiveness of veterinary antimicrobials. Under

NARMS thousands of bacterial isolates are tested for resistance to antimicrobials. NARMS will provide an early warning to identifying resistance trends among bacteria. All data from NARMS are made public for review by scientists or the public. With the additional funds requested for NARMS in fiscal year 2001 we will expand the geographical scope and capacity of NARMS by increasing the number and sources of isolates of *Campylobacter*, *Salmonella*, and *E. coli* from both human and animal sources. Additional veterinary sentinel sites are also planned. Increasing the number and sources of these foodborne pathogens will increase the likelihood of detection of emerging resistance. Detecting the resistance early allows the implementation of strategies to contain or mitigate the resistance before it reaches public health concerns. These resources will also aid in the Center for Veterinary Medicine's ability to establish and implement monitoring thresholds for resistance development in food animals to guide post-marketing regulatory activity.

In addition, new pathogens will be monitored by NARMS from both animal and human isolates. Anticipated pathogens to be monitored include *Enterococcus* and *Shigella* species. Also, we plan to enhance and expand FDA support of current international efforts to develop a global resistance database. The incidence of multi-country foodborne outbreaks are increasing and the severity of foodborne disease originating in foreign countries is increased by resistant foodborne pathogens.

Question. What specific health risks have been identified resulting from the use of antimicrobial drugs in animals produced for human consumption?

Answer. The specific human health risks identified with using antimicrobial drugs in food animals is loss of efficacy of the drugs in treating human disease. The FDA recently contracted with a quantitative risk assessment expert to develop a model relating the prevalence of fluoroquinolone resistant *Campylobacter* infections in humans associated with the consumption of chicken to the prevalence of fluoroquinolone resistant *Campylobacter* in chickens. The risk assessment showed that fluoroquinolone use in chickens accounted for almost all of the fluoroquinolone-resistant *Campylobacter* in those persons who had not traveled outside the United States or had taken a fluoroquinolone drug prior to submission of a culture. This risk assessment estimated that out of 122,078 people seeking care for a campylobacter enteric infection from chickens, 58,450 persons would be treated with antibiotic and of those, 4,682 would be resistant to fluoroquinolone therapy.

Other human health risks due to antimicrobial use in food-animals are the potential development of resistant organisms in the gut of persons consuming an antimicrobial residue and an allergic reaction to the residue. Unlike the fluoroquinolones, for which the major hazard associated with their use in animals is the selection of resistant foodborne pathogens, the major hazard associated with the use of virginiamycin in food animals is the selection of resistant enterococci. The presence of virginiamycin resistant enterococci is of concern because a related antimicrobial, Synercid, was recently approved for use in human medicine. Synercid will be used in humans to treat enterococcal infections for which there are no other antimicrobial therapies available. To assess the risk associated with the continued use of virginiamycin in animal agriculture, a quantitative risk assessment framework is needed. This risk assessment framework will quantify the probability, uncertainty and variability associated with several factors. The agency will also be considering whether additional risk assessments should be conducted on other antimicrobial and foodborne pathogen combinations.

SINGLE USE MEDICAL DEVICES

Concerns have been expressed about the safety of reprocessed single use medical devices.

Question. Please provide your analysis on the safety of these devices including findings of any investigations you may have pursued relating to injuries caused by such devices.

Answer. In the past three years, FDA has received approximately 245 adverse event reports from manufacturers that involved the reuse of devices labeled for single use including 7 deaths; 72 injuries; 147 malfunctions, and 19 other. During that same time period, FDA received approximately 300,000 device adverse event reports, summary reports, and supplements. The 245 reports spanned approximately 70 different types of devices. An analysis of the events did not reveal any patterns of failures with the reuse of single-use devices—SUDs—that were different from patterns noted with the initial use of SUDs.

It is important to note that the Medical Device Reports—MDRs—are unlikely to represent an accurate assessment of failure rates for any medical device, regardless of whether they are single-use or non-disposable products, because of incomplete reports and under-reporting. The SUDs, however, pose a greater challenge because

there may be increased under-reporting of these events when end-users recognize that the failed device involved a reused device labeled for single use. In addition, infections that may have resulted from an improperly reprocessed SUD may be difficult to trace to a reused device.

Question. Please compare the current regulatory requirements related to marketing of reprocessed single use medical devices with similar requirements for “new” devices.

Answer. To date, FDA has enforced existing premarket submission requirements against original manufacturers, but not third party reproducers or hospitals that reprocess single use devices. FDA has enforced other requirements of the Act, such as good manufacturing practice and adverse event reporting requirements, against third party reproducers. FDA has not enforced Federal Food, Drug, and Cosmetic Act requirements against hospitals that reprocess single use devices. We FDA recently issued draft guidance entitled *Enforcement Priorities for Single-Use Devices Reprocessed by Third Parties and Hospitals*, proposing to enforce the premarket submission requirements and all of the other requirements of the act against third party reproducers and hospitals.

Question. What, if any, additional regulatory requirements regarding reprocessed single use medical devices would you recommend?

Answer. Under the proposed strategy outlined in FDA’s enforcement guidance, the agency would enforce the same regulatory requirements that are applicable to a new device to reprocessed devices labeled for single use, regardless of whether the reprocessor was a third-party or a hospital. Additional regulatory requirements would not be required; however, FDA’s proposed strategy would phase in enforcement of existing requirements over a period of 18 months.

Question. What effect would additional regulation of reprocessed single use medical devices have on health care costs?

Answer. As I said earlier, FDA is not proposing to promulgate new regulatory requirements regarding reprocessed single use medical devices. The agency’s strategy is to phase in uniform enforcement of all current requirements for third-party reproducers and hospitals, including premarket requirements. At this time, FDA cannot determine the economic effect of its proposed enforcement policy on the cost of health care. However, any evaluation would need to consider the expected reduction in the number and severity of adverse events as well as any costs associated with FDA’s phased in enforcement strategy.

DETROIT LABORATORY

Language was provided in the fiscal year 2000 Appropriations Act regarding the Detroit, Michigan, lab and field office.

Question. Please provide an update on activities at these locations.

Answer. I am happy to describe our efforts to relocate both the Detroit District Office and Detroit Laboratory. As you may recall, the current facility which houses both our laboratory and district office is scheduled to be acquired and demolished by the City of Detroit as part of a major downtown renovation project. We are proceeding in accordance with congressional guidance, which in short prohibited any geographical reassignment of the lab staff or reorganization of the district. We are actively engaged in dialogue with several Michigan State authorities and federal agencies in the area in an effort to develop mutually beneficial arrangements to house the remaining Detroit laboratory staff. Of particular interest to FDA at the moment, is the strong possibility of entering into a partnership arrangement with Wayne State University to co-locate our laboratory operations. Wayne State is a part of the university system of Michigan, and currently has state of the art facilities and equipment that would enhance our current level of operation, and the potential exchange of expertise between university scientists and FDA scientists would serve both parties well. We are continuing to explore other possibilities with other components within the State system, as well as with the Veterans Administration. We are committed to identifying and securing suitable accommodations in the immediate area to continue our inspectional operations and to maintain viable laboratory support.

LOS ANGELES LABORATORY

The budget request includes \$20 million for construction of the Los Angeles Lab. I understand that if improvements are not made at that location, FDA will be forced to transfer personnel to other FDA field locations.

Question. What would be the costs of such transfers and how soon would they occur?

Answer. The current lease for this facility has been extended twice and will expire at the end of March 2000. A short term extension has been negotiated which will allow for continued occupancy during construction of a new facility, or an orderly closing of the existing lab within three years.

Our experience with other field labs that have closed has been that most laboratory staff have not willingly accepted directed reassignments to gaining laboratories. Those staff not wanting to relocate to a targeted laboratory may apply for laboratory analyst jobs at other, more personally desirable locations; apply for other jobs within the district to which they are currently assigned; resign Federal service and accept positions in the private sector; retire if they met eligibility requirements; or, be separated, with severance pay, if they cannot retire and refuse a directed reassignment to a laboratory in another part of the country.

As is FDA policy for all closing field laboratories, all impacted laboratory staff in Los Angeles would be given a directed reassignment to an equal position at another FDA field laboratory, with full rights to relocation benefits for reimbursable expenses. The average cost for an employee move is \$35,000. Total staffing at the Los Angeles Laboratory at Pico Boulevard is 76. If the facility were to be closed with an estimated effective date of the end of fiscal year 2002, the agency could expect approximately 20 employee transfers to other sites, resulting in moving costs of approximately \$700,000 over the next three fiscal years.

If the Los Angeles Laboratory were to close, the greater cost to FDA would be the loss of productivity and expertise that would certainly occur over the next several years. We would expect a significant number of experienced analysts to retire or accept other positions in the Los Angeles area, either in the district or within the private sector. Inexperienced replacement staff would need to be hired and trained in other locations, causing delays in product analysis. Los Angeles is one of the agency's largest field laboratories, analyzing 25 percent of FDA import sample workload nationally. Workload in this area is increasing, and faster turnaround times for import sample analysis is a stated priority of both Congress and the import community.

Question. Can an amount be provided in fiscal year 2001 less than \$20 million that would allow construction at the lab to proceed?

Answer. The budget request of \$20 million is for the first phase of a two phase project that totals \$43.0 million. It is conceivable that the construction documents could be modified to define a "site-foundation" only project that would entail a first phase cost of \$10.5 million. However, since this would delay the funding of a large portion of the construction work for another year, partial funding would result in the construction being completed over a longer duration. With the construction marketing continuing to be very active and with increased competition for skilled labor, the cost of construction may escalate.

ARKANSAS REGIONAL LABORATORY

Question. Please provide an update on construction activities of the Arkansas Regional Lab.

Answer. I would be happy to provide that information for the record.
[The information follows:]

Status of the Arkansas Regional Lab

The ARL facility project was initiated in fiscal year 1995 through a \$2.5 million appropriation for architectural and engineering design. The firm Kling-Lindquist (KL), Philadelphia, PA, was selected. KL, in consultation with FDA, developed an overall campus design comprising both new and renovated space: (1) joint NCTR and ORA animal quarantine facility—renovation of Building 62; (2) ORA's Arkansas Regional Laboratory—new facility (Phases I & II); (3) Building 50 renovation—3 floors of office space (Phase III); and, (4) common ORA/NCTR administration and support area (Phase III).

The fiscal year 1996 appropriation included \$3.8 million for an animal quarantine facility and preparation of joint NCTR/ORALABORATORY space. This project has been completed. The fiscal year 1997 appropriation included \$13.0 million for Phase I construction of the ARL. Phase I began construction and provided the ARL building, foundation, substructure, superstructure, exterior enclosure, and roofing. Major building systems, such as fire protection, HVAC, electrical and some site work, is included.

—The construction of the ARL project was awarded on September 26, 1997, to Charles N. White Construction Company (White) of Clarksdale, Mississippi. White was given notice to proceed on Phase I of the project on October 1, 1997.

The fiscal year 1998 appropriation included \$14.55 million for Phase II construction. Phase II continued the ARL project by completing the building systems and providing some office and laboratory fit-out in the ORA laboratory building.

—On December 24, 1997, White was given notice to proceed on a portion of the Phase II construction.

FDA received reprogramming authority for up to \$10.4 million for Phase II of the ARL project to complete the office and laboratory fit-out for the laboratory building.

—On February 27, 1998, White was given notice to proceed on the remaining portion of Phase II to complete the office and laboratory fit-out for the laboratory building.

A building dedication ceremony for Phases I & II, the laboratory portion, was held on February 17, 2000.

Building 50 Renovation and Common Area, Phase III, status:

—The fiscal year 1999 appropriation included \$3.0 million to begin construction of a portion of Phase III. This first portion included the exterior demolition, exterior structural work, exterior masonry work, and some roofing repairs.

—On January 26, 1999, White was given notice to proceed on the first portion of Phase II. This work has been completed.

—The fiscal year 2000 appropriation included another \$3.0 million to continue the construction of a portion of Phase III. This portion of work includes exterior glass and glazing, roofing, an elevator, and some of the site work and utilities.

—On February 2, 2000, White was given notice to proceed on the this portion of Phase III.

—In fiscal year 2001, FDA requested \$3.0 million to continue work on Phase III. Therefore, approximately \$7.2 million in additional funding will be needed to complete Phase III. The \$3.0 million in the fiscal year 2001 budget request will be utilized to fund an additional portion of the Phase III construction. This portion will include work such as the majority of the HVAC and plumbing infrastructure and related electrical system items necessary for the operation of the installed HVAC systems.

Question. Please provide information regarding FDA field structure consolidation as it relates to completion of the Arkansas Regional Lab and please identify savings to be achieved by this action.

Answer. I would be happy to provide that information for the record.

[The information follows:]

The original field lab consolidation plan called for six field laboratories to be ultimately consolidated into the Arkansas Regional Laboratory. They are as follows, including dates of closure:

Chicago	1997
Minneapolis	2000
Detroit	2000
Dallas	2000
Denver	2010
Kansas City	2014

As leases have or will expire for these facilities, the agency will negotiate new leases for office space only, as opposed to full replacement space to include new laboratories. FDA will thus realize considerable savings on an annual basis in the form of “avoided rent” for replacement of expensive, state-of-the-art lab space in the above locations.

The current estimated differences in annual rent for office only versus office and lab space for each of these locations is presented below, and does not include Denver or Kansas City due to the lengthy time before planned closing of those facilities. Savings to FDA will increase again starting in 2010 with the additional closures of Denver, and then Kansas City in 2014.

[In thousands of dollars]

Facility	Annual cost for lab consolidation	Annual cost for lab replacement	Est savings with consolidation at ARL
CHICAGO (Lab only)	574	574
MINNEAPOLIS	664	2,500	1,836
DETROIT	783	1,900	1,117
DALLAS	132	1,700	1,568
ARKANSAS REG LAB ¹	3,650	– 3,650

(In thousands of dollars)

Facility	Annual cost for lab consolidation	Annual cost for lab replacement	Est savings with consolidation at ARL
TOTAL	5,229	6,674	1,445

¹The annual cost for ARL was calculated based on a 20 year amortization of constructions costs plus \$1 million per year in operating costs.

USER FEES

Question. Section 735 of Public Law 106–78, the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, 2000, requires the budget proposal for fiscal year 2001 to include information identifying savings in the event proposed user fees are not authorized prior to the convening of a committee on conference for the fiscal year 2001 appropriations act. The fiscal year 2001 budget request assumes revenues from the enactment of unauthorized FDA user fees.

Accordingly, which FDA activities proposed for fiscal year 2001 do you recommend for reduction in the event these user fees are not authorized this year?

Answer. In the fiscal year 2001 budget, FDA has requested user fees in the amount of \$8.4 million for Direct Food Additive Petition review, and \$5.8 million for the premarket review in the Medical Device program. These two proposed user fees are additive in nature, allowing for increased performance on the part of FDA, once enacted. Were these user fees not to be approved, the activities highlighted as being accomplished with the user fee funds would not be accomplished. For example, FDA would not be able to provide enhanced training to support scientific expertise of reviewers that need to keep pace with increasingly complex products; nor would there be time for the agency to be ready to engage in pre-filing consultations with petitioners. Medical device manufacturers would continue to face a significant financial disincentive to use the third party review option created by the Food and Drug Administration Modernization Act, or FDAMA.

FDA also requested \$5.3 million in new user fees for the food export certification program. Collection of user fees for export certificates for human drugs, animal drugs and devices is authorized by the Federal Food, Drug, and Cosmetic Act. This does not cover collection of user fees for export certificates for foods. FDA must divert significant resources from food safety work to address what in essence is an economic trade matter for these certificates. Were this user fee not authorized this year, FDA would continue to expend resources for the food export certificates, with no means to recoup the costs incurred as a result of inspections, laboratory analyses and administrative costs associated with issuance of food export certificates.

Question. Can you give us some insight into your thinking on this label, and whether you are considering any changes to what you proposed last year?

Answer. From the results of previous focus group research on label statements used to alert consumers to potential hazards in foods—namely, iron supplements and fresh and unprocessed fruit and vegetable juice warning statements, FDA determined that certain types of information was required to adequately inform consumers about the potential risks associated with the food. In particular, our focus group research indicated that for consumers to understand and modify their behavior with regard to a particular food there needed to be an information statement explaining why there was a risk associated with the food. This information statement was especially important if the information was considered new information. In crafting the proposed safe handling instructions for eggs, FDA considered that consumers needed to be given information on why the product presented a risk. Accordingly, FDA proposed to include a sentence in the statement that informed the consumer that the eggs may contain harmful bacteria known to cause serious illness in children, the elderly, and persons with weakened immune systems. FDA included these groups because they are generally at higher risk of serious illness from food borne pathogens than the rest of the population.

FDA received several comments objecting to the introductory sentence in the proposed safe handling instructions. We also received comments offering alternative wording for the safe handling instructions, as well as those asserting that the presence of *Salmonella* in eggs was not new information. We have fully considered all of the comments. We have been persuaded by those comments to reconsider the wording of the informational component of the safe handling instruction and will likely revise the safe handling instructions in a way that addresses both the con-

cerns raised by industry and the need to adequately inform consumers about the risk associated with eggs.

QUESTIONS SUBMITTED BY SENATOR TOM HARKIN

Question. Commissioner Henney, I was disturbed to read a recent report that DES had been found in a shipment of meat to Europe. Incidences such as this certainly don't help resolve our trade difficulties with the EU. Can you tell me what role FDA has in resolving incidences such as the DES incident, and what you have been doing to help address issues related to residues in meat?

Answer. In July 1999, Switzerland reported to the United States that it had found trace levels of diethylstilbestrol—DES—in two samples of U.S. beef. On July 13, the Swiss government published a press release that announced its DES findings in U.S. beef. The press release stated that the amounts detected were at low levels and did not pose an acute health threat.

FDA takes misuse of compounds of public health significance like DES, very seriously. The agency's Center for Veterinary Medicine—CVM—which has the responsibility to investigate the misuse of drugs in food animals, has carried out an intensive investigation during the past eight months. FDA inspectors have conducted on-farm investigations of animal producers and feedlots delivering animals to the establishment in question. They have investigated bulk drug re-packers, compounding pharmacies, and other points at which illegal diversions of drugs might be uncovered. FDA has thus far found absolutely no evidence of the diversion of DES for use in food animals.

In the meantime, we have learned that the Swiss government sent the two positive samples to a European Union—EU—reference laboratory for re-confirmation. The October 14, 1999 report from the EU reference laboratory states that the conclusion of the analyses does not confirm the presence of DES in the samples submitted for analysis. FDA scientists conclude that some type of laboratory contamination may have led to false positive samples.

In response to your question regarding FDA's role in resolving incidences such as the DES case, the FDA establishes tolerances for residues of animal drugs in edible tissues. Food-producing animals, even though not in their final, edible form, have been held to be food under a variety of statutes. Thus, live animals raised for food are "food" under the Federal Food, Drug, and Cosmetic Act.

CVM has implemented a compliance program to address consumer exposure to drug residues in the edible tissues of food animals. The Center assigns more Field resources to this program than to any other that it oversees. The immediate goal of this program is to prevent future residue violations through on-farm educational efforts, and/or enforcement activity as warranted. To this end FDA has developed cooperative agreements with 32 states to conduct educational follow-ups of first-time violators. State participation is an integral element of the U.S. residue reduction effort. The compliance program instructs the FDA District Offices to conduct onsite investigations whenever the Food Safety and Inspection Service—FSIS—reports finding a residue of a drug prohibited from food-animal use such as DES. FDA investigations are also required for all high-level residues which may pose a toxicological concern, as well residues from drugs not approved for food animal use. FDA also conducts investigations of any residue from drugs prohibited from extra-label use under the Animal Medicinal Drug Use Clarification Act of 1995. Additionally, FDA Districts are instructed to follow up on all repeat violators. A repeat violator is defined as an individual who sells a slaughter animal whose carcass is found to contain a violative concentration of a drug, pesticide, or environmental contaminant within a 12-month period after receiving the FSIS Violation Notification Letter. Complete instructions for these investigations are included in Compliance Program 7371.006. Last year FDA conducted approximately 485 investigations of illegal residues and the States an additional 1,000 on-farm visits in response to FSIS-reported tissue residue violations.

Question. FDA announced early in 1999 its intention to give "priority" to reviews of food additive petitions with food safety benefits. Several food irradiation petitions are pending at FDA, including one that would allow the use of irradiation on hot dogs or luncheon meats, and could be used to reduce the incidence of *Listeria*. The Conference Report accompanying the Fiscal Year 2000 Agriculture Appropriations bill directed FDA to propose and finalize a rule on this petition by August 2000. Do you intend to meet this deadline? How quickly does FDA intend to act on other pending irradiation petitions? How can we be assured they won't meet the same fate as red meat irradiation that FDA and USDA more than five years to complete?

When will we see faster reviews resulting from the more than \$5 million in additional funds the Congress provided FDA in fiscal year 2000?

Answer. First, FDA does not intend to propose a rule because under the food additive petition process, a proposal is not required. Rather, the filing notice, which was published in the Federal Register on January 5, 2000, meets the legal requirement of giving notice that a rule under consideration.

In the priorities established for food safety in fiscal year 2000, FDA has established a goal of completing the safety evaluation for 80 to 90 percent of expedited review petitions within one year of filing. FDA filed the petition that includes hot dogs and luncheon meats on October 27, 1999. This is the actual filing that preceded the notice in the Federal Register. Although we cannot comment on issuing a rule until we complete the safety evaluation and verify whether data in the petition will support a final rule, we are committed to completing that evaluation within a year of filing. FDA expects to complete evaluations of all other pending irradiation petitions within the same time frame.

With regard to the petition for red meat irradiation that FDA approved in December 1997, FDA received this petition at a time when there was a backlog of several petitions and before a priority was being placed on petitions intended to significantly reduce pathogens. Additionally, USDA regulations for meat irradiation now incorporate FDA regulations for the use of radiation which means that USDA will not be required to issue its own regulation to allow irradiation of meat after FDA issues such a regulation.

The time to complete reviews on food and color additives has been improving in recent years. FDA is committed to making further significant improvements as we hire and train additional scientists for review. We have already begun the process of bringing more reviewers on board and improving the training for current staff. In the interim as this process is ongoing, FDA is also using some of the newly appropriated resources to arrange for review help through the use of contractors. The most immediate results will be seen in the petitions that qualify for expedited review due to pathogen reduction described.

Question. FDA visits foreign countries to audit the safety of food produced in these countries for export to the United States. Please indicate for fiscal year 1998 and fiscal year 1999: (a) each foreign country for which such an audit was conducted, (b) the particular food product that was the subject of the audit, and (c) the approximate dates of each such audit. Are there written reports prepared on the results of each such foreign audit? If so, are these reports available to the public? If they are not available to the public, why not? Was the FDA ever denied access to a foreign country in which it wanted to conduct an audit in fiscal year 1998 or fiscal year 1999? If so, please briefly describe the circumstances.

Answer. An Establishment Inspection Report is prepared for each inspection of a firm. Reports are also prepared from audits conducted in response to foodborne outbreaks in other countries. These reports can be obtained through the Freedom of Information Act. When an inspection results in a regulatory action such as issuance of a Warning Letter or the firm placed on Detention with Physical Examination and added to an Import Alert, these documents are available on the agency's internet Website, at www.fda.gov.

Although in the past Mexico has a very positive record of cooperation with FDA, FDA was denied access to Mexico once in 1999 in follow-up to a foodborne outbreak associated with the consumption of unpasteurized orange juice in the United States. The Mexican Ministry of Health would not allow FDA investigators to visit the processor or orchards implicated in the outbreak. The Ministry of Health did its own evaluation and provided FDA with information. We would like to note that Mexico participates in a number of cooperative efforts with the U.S. and collaborative exchanges are underway in the areas of research and outbreaks. Additionally, in September 1999, Mexico hosted a food safety practices symposium for more than 4,000 government officials in Mexico and Central America.

I would be happy to provide two tables that reflects the import information you are requesting, for the record.

[The information follows.]

Country (number of firms)	Product	Date
Fiscal Year 1998 Foreign Foods Inspections/Audits		
Thailand (13)	Low Acid Canned Food	1/98 thru 8/98
Spain (5)	Low Acid Canned Food	1/98 thru 2/98

Country (number of firms)	Product	Date
Germany (3)	Low Acid Canned Food	2/98 thru 4/98
China (14)	Low Acid Canned Food	3/98 thru 4/98
Philippines (1)	Low Acid Canned Food	2/98
Indonesia (1)	Low Acid Canned Food	2/98
Mexico	Parsley	10/98
Guatemala	Fresh Raspberries	3/98, 6/98, 11/98
Honduras	Country Evaluation	8/98
Fiscal Year 1999 Foreign Inspections/ Audits		
Mexico (6)	Cheese	2/99 thru 8/99
France (5)	Cheese	2/99 thru 8/99
Canada (1)	Cheese	2/99 thru 8/99
Germany (1)	Cheese	2/99 thru 8/99
El Salvador (1)	Cheese	2/99 thru 8/99
Singapore (1)	Seafood	6/99
Ecuador (11)	Seafood	7/99
Taiwan (9)	Seafood	5/99
Philippines (9)	Seafood	4/99
Vietnam (9)	Low Acid Canned Food	4/99

QUESTIONS SUBMITTED BY SENATOR BYRON L. DORGAN

I know that we all recognize the enormous public health contributions that vaccines have made in preventing a wide range of adult and childhood diseases. It is my understanding that the pace of development of new vaccines and vaccine combinations is quite dramatic. I am concerned that FDA may not have sufficient resources to give appropriate priority to the review of new vaccines that have a demonstrable public health benefit.

Can you provide me and the Subcommittee with data from your Office of Vaccine Research and Review (OVR) in response to the following questions:

Question. For each of the past five years, what has been the funding and staffing at the OVR?

Answer. We are happy to provide a table showing the OVR funding and staffing for each of the past five years.

[The information follows:]

OFFICE OF VACCINE RESEARCH AND REVIEW FUNDING AND STAFFING

[In millions of dollars]

Resource	Fiscal years				
	1995	1996	1997	1998	1999
OVRR funding	18.6	18.5	18.7	18.4	19.3
FTE	171	185	179	166	177

Question. What is your proposed fiscal year 2001 request for funding and staffing at the OVRR?

Answer. The proposed fiscal year 2001 funding level for OVRR is \$24.2 million based upon the President's budget request.

Question. For each of the past five years, please break down the resources of the OVRR between new vaccine application review activities and other activities. Please describe those other activities.

Answer. We are happy to provide a table showing the break down of OVRR resources between new vaccine application review activities and other activities for each of the past five years. New vaccine application review activities include: IND and license application review; lot-release processing and testing; and assay validation. Other activities include: mission-related product research; post-approval surveillance and enforcement activities; and miscellaneous other activities including training/professional development; processing information requests, and international harmonization activities.

As shown below, while we have been able to increase our resources related to application review, much of which is funded through user-fees, it has been at the expense of critical non-review activities, funded entirely through appropriations, that assure the expeditious review of future vaccines and the continued safety and effectiveness of vaccines already on the market.

[The information follows:]

OFFICE OF VACCINE RESEARCH AND REVIEW FTE DISTRIBUTION

Activity	Fiscal years				
	1995	1996	1997	1998	1999
Application Review	75.6	83.9	85.9	90.3	98.2
Other	95.4	100.8	93.5	75.3	78.3
Total	171.0	184.7	179.4	165.6	176.5

Question. For each of the past five years, please provide the number of Biological License Applications (BLA) and Investigation New Drug Exemptions (IND) received for new vaccines.

Answer. We are happy to provide a table showing the number of OVRR application receipts for each of the past five years.

[The information follows:]

OFFICE OF VACCINE RESEARCH AND REVIEW VACCINE APPLICATION RECEIPTS

Application	Fiscal years				
	1995	1996	1997	1998	1999
INDs ¹	70	63	65	52	49
BLAs ¹	6	4	4	3	4
BLA Supplements	62	30	60	77	116

¹Note: INDs include commercial and non-commercial INDs. BLAs include: product license applications (PLAs), establishment license applications (ELAs), and biological license applications (BLAs).

Question. For each of the past five years, please provide the average review times for BLAs and INDs for vaccines.

Answer. INDs become effective automatically after 30 days unless the FDA imposes a clinical hold on the clinical trials. We are happy to provide a table showing the average BLA review times for each of the past five years. License application review time is the time to review completion for applications during the respective fiscal year. License applications may undergo several review cycles, in which an FDA action is taken and the sponsor responds, before approval.

[The information follows:]

OFFICE OF VACCINE RESEARCH AND REVIEW MEDIAN VACCINE LICENSE APPLICATION REVIEW
TIME

	Fiscal years				
	1995	1996	1997	1998	1999
Median BLA Review Time (months)	26.84	8.83	16.29	34.00	15.19

Question. What information does FDA have about future vaccine development and the number of INDs and BLAs for new vaccine products this year and in the future?

Answer. A 1998 survey by the Pharmaceutical Research and Manufacturers of America (PhRMA) found 350 new biotechnology medicines in development and 140 pharmaceutical and biotechnology companies testing biotechnology products. Among the 350 new biotechnology medicines in development, 77 are vaccines. They include vaccines either to prevent or treat HIV infection, AIDS, colorectal, pancreatic, breast, lung, colon and prostate cancers, multiple sclerosis, and stroke. Senator Richard J. Durbin

QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

CODEX

Question. The Codex Alimentarius Commission (“Codex”) is an international organization that seeks to set food safety standards that are then used by the World Trade Organization to determine whether a national food safety standard is a “trade barrier.” Please indicate the amount spent by FDA in fiscal year 1999 in direct support of Codex, showing separately how much of the fiscal year 1999 amount is for travel.

Answer. The total amount spent by FDA in fiscal year 1999 in support of Codex activities was \$1.4 million. This includes \$1.3 million in salaries and support for approximately 12 FTE, and \$100,000 for travel.

Question. FDA is part of the Codex Policy Committee, which is chaired by the Under Secretary for Food Safety of USDA and contains senior policy members from HHS, State, Commerce, USTR, and other parts of USDA. In June 1999, the U.S. acquiesced in four final decisions by Codex that provide less protection to U.S. consumers than current U.S. requirements: (a) international residue levels for methyl parathion and other pesticides even though in August 1999 the EPA banned methyl parathion for fruits and vegetables because of its potential adverse effects on children; (b) an international standard for natural mineral waters that permits higher levels of lead and other contaminants than the FDA now allows; (c) an international standard that does not require pasteurization of dairy products, as is now generally required by the FDA; and (d) an international standard for the labeling of a composite ingredient in prepackaged foods that permits it to be listed by a standardized name without declaring all its component ingredients if it is less than 5 percent of the food, even though the FDA now requires these components to always be listed in order to protect consumers who suffer from hypersensitivities. Please explain why the U.S. did not formally object last year to the approval of each of these four Codex standards?

Answer. Codex is the reference international organization for food safety standards under the World Trade Organization—or WTO, Agreement on Sanitary and Phytosanitary Measures—the SPS Agreement. While the SPS Agreement requires countries to base their food safety measures on Codex standards and guidelines unless they can scientifically justify a more stringent standard, there is no requirement under the WTO Trade Agreements for countries to adopt Codex standards. Codex standards remain voluntary. Additionally, under the SPS Agreement, countries are free to select their own level of public health protection.

While Codex maintains a provision for voting on standards—with each country, including the United States, having one vote—Codex operates on the basis of consensus. The United States works extensively within the Codex System to help assure that the U.S. position is well known, well supported and is the option selected by Codex. However, there is no assurance, under either the voting or consensus process, that the United States position on any given Codex standard or guideline will become the final Codex decision.

I would be happy to provide for the record details of certain CODEX standards. [The information follows:]

SELECTED CODEX STANDARDS

International levels for methyl parathion.—At the time the Codex Alimentarius Commission adopted the standard for this compound in June of 1999, the Environmental Protection Agency had made no decision on canceling this compound—the voluntary cancellation notification was published in October, 1999. Therefore, there was no reason for the U.S. to object to the adoption of the Codex standard at the June 1999 Commission meeting.

International standard for natural mineral waters.—The United States was very much aware that the standard permitted higher levels of lead and other contaminants than FDA currently allows. During the consideration of this standard in the Committee on Natural Mineral Waters and in the Commission, the U.S. and other countries made strong objection. This standard was the result of a vote in the Commission; the United States position was not upheld.

International standard for milk products not requiring pasteurization.—At no time did the United States adopt a position or strategy that would lower U.S. public health levels for milk or dairy products. For several years, the U.S. worked strenuously to ensure that language in Codex food hygiene codes and dairy product standards codes did not result in default language that would make it difficult for the United States to prevent the importation of raw milk or dairy products containing raw milk. This effort was a top priority of the United States. The U.S. was instrumental in helping to craft language for Codex dairy product standards that permitted maintenance of the high U.S. public health standards for milk and milk products while at the same time allowing Codex to move forward with the adoption of Codex dairy product standards. This language involved the insertion of a specific provision into Codex dairy product standards, that states: “From raw material production to the point of consumption, the products covered by this standard should be subject to a combination of control measures, which may include, for example, pasteurization, and these should be shown to achieve the appropriate level of public health protection.” This language permits countries—including the U.S. to allow entry of dairy products only if they meet the country’s level of public health protection, while at the same time not hindering a country’s ability to produce dairy products in any manner they see fit. This is a classic example of how U.S. public health officials worked within an international forum to arrive at a solution that allowed the U.S. to maintain its high public health standards while also achieving updated dairy product standards that greatly assist the U.S. dairy industry in their international trade effort.

International labeling standard for composite food ingredients.—While the 5 percent cut off level for listing composite ingredients is less restrictive than current U.S. regulations that require full disclosure of most ingredients, the value is substantially better than the previous figure of 25 percent, that the 5 percent figure replaced. The 5 percent figure is also coupled with a requirement that ingredients that are food allergens be fully disclosed. This new Codex labeling requirement is far more stringent than its predecessor. While the U.S. would have preferred a more stringent standard, and worked towards that end, the U.S. position was not supported by many other countries within the Codex commission. The compromise solution obtained was a distinct improvement over the earlier standard and, coupled with the food allergen mandatory disclosure, was the best solution that could be expected in a forum in which the U.S. held the minority view.

IMPORTED FOOD

Question. FDA visits foreign countries to audit the safety of food produced in these countries for export in the U.S. Please indicate for fiscal year 1998 and fiscal year 1999 each foreign country for which such an audit was conducted, the particular food that was the subject of the audit, and the approximate dates of each such audit?

Answer. I would be happy to provide that information for the record. [The information follows:]

FDA'S FISCAL YEAR 1998 AND FISCAL YEAR 1999 FOREIGN INSPECTIONS/AUDITS

Country (number of firms)	Product	Date
China (14)	Low Acid Canned Food	3/98 thru 4/98
Thailand (13)	Low Acid Canned Food	1/98 thru 8/98
Spain (5)	Low Acid Canned Food	1/98 thru 2/98
Germany (3)	Low Acid Canned Food	2/98 thru 4/98
Philippines (1)	Low Acid Canned Food	2/98
Indonesia (1)	Low Acid Canned Food	2/98
Mexico	Parsley	10/98
Guatemala	Fresh Raspberries	3/98, 6/98, 11/98
Honduras	Country Evaluation	8/98
Ecuador (11)	Seafood	7/99
Canada (9)	Low Acid Canned Food	3/99 thru 7/99
Philippines (9)	Seafood	4/99
Taiwan (9)	Seafood	5/99
Vietnam (9)	Low Acid Canned Food	4/99
Brazil (6)	Low Acid Canned Food	8/99
Mexico (6)	Cheese	2/99 thru 8/99
Equador (5)	Low Acid Canned Food	6/99 thru 7/99
France (5)	Cheese	2/99 thru 8/99
Canada (1)	Cheese	2/99 thru 8/99
El Salvador (1)	Cheese	2/99 thru 8/99
Germany (1)	Cheese	2/99 thru 8/99
Singapore (1)	Seafood	6/99
Costa Rica	Cilantro	7/99
	Country Evaluation	7/99
El Salvador	Post-Hurricane Mitch Food Safety Assessment.	7/99
Guatemala	Raspberries	3/99
	Mamey	4/99
	Post-Hurricane Mitch Food Safety Assessment.	7/99
Honduras	Post-Hurricane Mitch Food Safety Assessment.	7/99
India	Low Acid Canned Food	6/99 thru 8/99
Malaysia	Low Acid Canned Food	8/99
Mexico	Basil	12/99
	Green onions	3/99
	Parsley	2/99
	Celery/Lettuce	7/99
Nicaragua	Post-Hurricane Mitch Food Safety Assessment.	7/99
Philippines	Low Acid Canned Food	5/99 thru 6/99
Trinidad and Tobago	Country Evaluation	
Vietnam	Low Acid Canned Food	4/99

IMPORTED FOOD

Question. Was the FDA ever denied access to a foreign country in which it wanted to conduct an audit in fiscal year 1998 or fiscal year 1999? If so, please briefly describe the circumstances.

Answer. Although in the past Mexico has a very positive record of cooperation with FDA, FDA was denied access to Mexico once in 1999 in follow-up to a foodborne outbreak associated with the consumption of unpasteurized orange juice in the United States. The Mexican Ministry of Health would not allow FDA investigators to visit the processor or orchards implicated in the outbreak. The Ministry of Health did its own evaluation and provided FDA with information.

We would like to note that Mexico participates in a number of cooperative efforts with the U.S. and collaborative exchanges are underway in the areas of research and outbreaks. Additionally, in September 1999, Mexico hosted a food safety prac-

tices symposium for more than 4,000 government officials in Mexico and Central America.

Question. FDA inspects for safety a sample of imported food at the U.S. border. Please indicate for fiscal year 1999 the rejection rate by each major food product for each foreign country?

Answer. We will be happy to provide this information for the record. In the table we provide, the data will represent the total number of imported foods refused for entry into the United States by major food product category. We use the terms "rejection" and "refusal" interchangeably.

[The information follows:]

SEAFOOD EQUIVALENCY

Question. Seafood has been subject to mandatory process control systems, called HACCP, since December 1998. What percent of the domestic seafood industry is currently in compliance with the HACCP regulations? What percent of the imported seafood industry is currently in compliance with the HACCP regulation? How is FDA using the \$8 million that this committee appropriated for fiscal year 1998 to improve inspection of the seafood industry?

Answer. I will be happy to provide this information for the record.

[The information follows:]

Domestic compliance.—As background, FDA's traditional regulatory database captures data on the classification of inspections, for purposes of regulatory follow-up. In this database, inspections are categorized as:

- NAI—no action indicated, where there are essentially no significant inspectional findings and no regulatory response needed;
- VAI—voluntary action indicated, where there are some significant inspectional findings, but they are not sufficient to warrant a regulatory response; or
- OAI—official action indicated, where inspection findings warrant a regulatory response (e.g., warning letter, seizure, injunction, prosecution). For regulatory purposes, FDA has traditionally considered firms that are classified as NAI or VAI as being in compliance.

Approximately 5 percent of the 3,334 seafood HACCP inspections conducted in 1999 were classified OAI for HACCP purposes, and these firms were sent Warning Letters by FDA. These inspections constitute those firms that exhibited significant violations and did not exhibit a willingness to make prompt and appropriate corrections.

For the seafood HACCP program, FDA has created a separate database, which is used for program evaluation and management purposes. The database includes data on a wide range of very specific features of processors' HACCP plans and implementation. A deficiency in any of these areas counts as noncompliance under this grading system, even though the firm may be doing well in all other aspects of its HACCP system. "Compliance," as defined by this database, is a rigorous standard. In 1999, 55 percent of inspected firms were "in compliance" by this standard. This exceeded FDA's GPRA goal by 5 percent.

It should be noted that a significant percentage of firms that were not in compliance by the latter standard did not receive warning letters. As noted above, warning

letters were reserved for firms that were not showing good faith progress toward full compliance. The overwhelming majority of firms are now either in full compliance or demonstrating good progress towards it. For that reason, we expect to see significant improvement this year.

Foreign compliance.—Over half of all seafood consumed in the United States is imported from a total of about 135 countries. A number of these countries have advanced regulatory systems for seafood while others do not. There are literally tens of thousands of foreign processors that export to the U.S. Their products are therefore subject to U.S. requirements. FDA's traditional strategy for examining imports has been physical examination of a small percentage of products at ports-of-entry. The examination is primarily directed toward determining whether the product at the port contains substances that would cause it to be adulterated under U.S. law. This examination would not directly reveal whether the products were produced under HACCP controls in the country of origin.

Consequently, FDA has developed three new strategies to augment the port-of-entry examination process. These strategies should eventually enable us to determine an overall compliance rate for foreign HACCP. The first strategy is a new requirement on U.S. importers that they take "affirmative steps" to ensure that seafood products they are importing have been processed in accordance with U.S. requirements. Affirmative steps may be basic, threshold indicators of compliance, such as obtaining copies of the foreign processors' HACCP plans and records. Importers are not expected to be surrogate regulatory agencies. Nonetheless, the "affirmative steps" requirement is novel and, as anticipated, will take some time to be fully understood and implemented by the entire importing community.

The second strategy involves a significant increase in foreign regulatory inspections by FDA inspectors, primarily directed toward developing countries that are major exporters of seafood. The findings from those inspections generally parallel those for domestic inspections. Most processors are implementing HACCP but have not perfected it yet. For that reason, education—both for the industry and the local regulatory agencies—is a major component of these inspection visits.

The third strategy involves equivalence determinations. The nature of equivalence is such that it is expected ultimately to involve countries with advanced regulatory systems.

Improving inspections.—To provide you with a response in the shortest possible time, we are submitting the following materials that FDA has used to brief congressional staff on the seafood HACCP program. Last year, 85 percent of establishments in FDA's domestic inventory were inspected, targeted toward firms with problems reported during the previous inspection.

Question. The U.S. and Canada are now discussing an equivalency agreement on seafood imports. Are the approved levels for food and color additives permitted in seafood identical for Canada and the U.S.? If not, please list the approved levels for Canada and the U.S. for those food and color additives in seafood where the levels are not identical?

Answer. There are literally thousands of additives permitted in food in each country. One aspect of an equivalence determination is to review additives for major differences in approved uses and to assess the significance of those differences. One feature of this evaluation is to screen the additives for those that actually are approved for, and used in, seafood products being traded between the two countries.

FDA and the Canadian Food Inspection Agency are in the process of conducting such a screen. Where significant differences in approved uses are found to exist in additives that are germane to seafood products being traded between the two countries, those additives will be publicly listed and assessed pursuant to U.S. obligations under the Uruguay Round Agreements Act. FDA's preliminary assessment in this process is that there are few differences.

Question. In the seafood equivalency negotiations with Canada, has the Canadian government asserted that there are differences between the low-acid canned seafood containers approved by the FDA and by the Canadian government? If so, please summarize what these differences are and indicate whether the FDA believes the Canadian requirements provide more safety to consumers than the FDA's requirements.

Answer. With regard to low acid canned food containers, FDA and the Canadian Food Inspection Agency are reviewing differences in the way the agencies interpret the significance of certain types of can defects. FDA's preliminary view is that the US and Canadian interpretations yield the same level of protection for consumers. Neither FDA or the Canadian Food Inspection Agency have come to any conclusions about whether the issue affects equivalence. The issue remains the subject of technical discussion between the two governments.

USE OF HUMAN ANTIBIOTICS IN ANIMALS

Question. Last year, the Committee directed the Secretary of Health and Human Services to implement the GAO's recommendation on the use of human antibiotics in animals. What is the status of this implementation?

Answer. FDA has taken several steps to determine the nature of the problem associated with antibiotic resistance and will develop appropriate regulatory responses as the information permits. FDA issued Guidance for Industry Number 78, which addresses how the agency intends to consider the potential human health impact of the microbial effects associated with all uses of all classes of antimicrobial new animal drugs intended for use in food-producing animals when approving such drugs. FDA developed A Proposed Framework for Evaluating and Assuring the Human Safety of the Microbial Effects of Antimicrobial New Animal Drugs Intended for Use in Food-Producing Animals to attempt to promote animal health while protecting the public health. It describes a proposed regulatory approach, for antimicrobial products used in food producing animals. The agency has conducted a model risk assessment, plans for a second assessment, and initiates research to fill data gaps. It also describes the policy direction the agency will take in developing the new regulations.

The Center for Veterinary Medicine, CVM, is aggressively developing risk assessment strategies to assist in evaluating the human health effects from antimicrobial use in animals. The Center contracted with a quantitative risk assessment expert to develop a quantitative risk assessment model. The risk assessment intends to determine the feasibility of estimating risk to human health from resistant foodborne pathogens associated with the use of antimicrobial products in food-producing animals. In early December the draft risk assessment model was discussed at a public meeting. Scientific experts provided the agency with their comments on the strengths, limitations, and data gaps associated with the model. The agency will consider these comments, as well as comments submitted to the public docket, in finalizing the draft risk assessment.

The agency has also initiated planning for a second risk assessment to look at the indirect transfer of resistance from animals to humans. The use of antimicrobial products in food animals not only leads to the development of resistance in foodborne pathogens, but also in all bacterial associated with the animal. This risk assessment will quantify the probability, uncertainty, and variability associated with several factors. The agency initiated a feasibility study for this specific assessment in the first quarter of 2000. After the feasibility study is complete, the agency should be able to report on the timeframe to complete a risk assessment on this issue, or, if sufficient data are not currently available, identify the additional data that need to be generated to support the risk assessment.

The National Antimicrobial Resistance Monitoring System—NARMS, which is a collaborative effort among the Food and Drug Administration, the United States Department of Agriculture, and the Centers for Disease Control and Prevention, is a post-marketing activity to monitor the emergence and spread of resistance in enteric bacteria and to help ensure the continued safety and effectiveness of veterinary antimicrobials. In order to determine risks to the public health from the agricultural use of existing antimicrobials, CVM established and continues to expand NARMS. In addition, the system may form the basis for a regulatory tool to monitor the safety of new antimicrobial products after approval.

The Center has initiated its own intramural, extramural, and collaborative research efforts to investigate factors associated with development, dissemination, and persistence of bacterial antibiotic resistance in both the animal production environment and food supply. In late February, the agency sought input from experts via a public workshop. The appropriate design for pre-approval studies to evaluate the microbial effects of antimicrobial drugs intended for use in food-producing animals was discussed. The agency is considering the need to hold additional scientific workshops on risk management issues relating to the regulation of antimicrobials use in food-producing animals. Because the agency intends to solicit expert advice from the animal health industry, the animal production industry, and consumer groups, we are not able to develop a specific time frame for all activities associated with the antibiotic resistance issue. However, FDA does not intend to wait for all the answers before taking certain actions. As opportunities develop to implement changes, we will take the necessary steps.

NATIONAL CENTER FOR FOOD SAFETY AND TECHNOLOGY

Question. For fiscal year 2000, the National Center for Food Safety and Technology (NCFST) received a \$3 million appropriation. This \$3 million will continue the NCFST's progress in keeping our dinner tables safe. Will the Administration

continue to support food safety efforts by supporting another \$3 million appropriation for the National Center for Food Safety and Technology in fiscal year 2001?

Answer. FDA is providing the National Center for Food Safety and Technology with an increase of \$1 million in fiscal year 2000 in FSI funds to expand the collaborative research in food safety for a total of \$3 million. This includes the previous FSI base funding of \$2 million.

In fiscal year 2001 FDA expects to continue to fund NCSFT at \$3 million. FDA is not requesting new money in its fiscal year 2001 budget for this purpose.

PRESIDENT'S EGG SAFETY PLAN

Question. CDC first identified internally contaminated eggs as a source of *Salmonella enteritidis* infection in the late 1980's. Why has it taken so long for FDA and USDA to develop an action plan to address this public health problem? What steps could be taken to reduce the government's reaction time to food safety problem in the future?

Answer. FDA and USDA have a history of cooperation on food safety issues. FDA and USDA have supported the development of egg quality assurance programs at the state level since the early 1990s. FDA has responsibility for foodborne, including eggs, illness outbreak tracebacks, whereby the agency identifies and limits the number of contaminated eggs that reach the consumer. In addition, FDA and USDA identified the proper handling, storage and cooking of eggs in FDA's retail Food Code to reduce the potential hazard of *Salmonella Enteritidis*, or SE, contamination. Although these interventions have helped to reduce the problem of SE in eggs, they have not been as effective as the agencies had hoped in addressing the problem.

While SE was recognized as a problem in internally contaminated eggs several years ago, more recent scientific data have facilitated FDA's ability to pursue other farm-to-table interventions to prevent or reduce internal SE contamination of eggs. In June 1998, USDA and FDA completed its SE in eggs risk assessment. The risk assessment modeled the various pathways that eggs can become contaminated with SE and analyzed the effectiveness of interventions at each potential pathway. Using data generated in the risk assessment, both agencies have developed proposed regulations requiring refrigeration and labeling of eggs throughout distribution and storage. The risk assessment also serves as the basis for the scope of the Egg Safety Action Plan, which comprehensively addresses egg safety from farm to table. The Egg Safety Action Plan includes plans for additional research to fill existing data gaps in our understanding of SE in the environment and develop new technologies and interventions to further reduce the hazard.

Although the development of the risk assessment on SE in eggs has been beneficial in guiding the recent egg safety efforts of the agencies, both FDA and USDA over the past ten years have made attempts at addressing SE in eggs but have had legislation and or appropriations transferred or removed from their respective programs. For example, FDA drafted a proposal requiring refrigeration of eggs in the early 1990s when authority for refrigeration during transport and storage was legislatively given to USDA in the 1991 Egg Products Inspection Act amendments. Special funding for a successful USDA-sponsored on-farm SE risk reduction pilot project was established by Congress in 1992 but then was eliminated from appropriations in 1995. Likewise, federal authority in responding to foodborne illness through food tracebacks of egg-related illnesses was transferred from USDA to FDA in October 1995. The changes of authorities and lack of funding have contributed to delay in providing a comprehensive program to improve public health.

With regard to future government response to new food safety problems, the Food Safety Initiative funding received by FDA over the past three years has provided a solid foundation in surveillance, research, risk assessment, science-based inspection models, and education that should significantly shorten the time needed for effective government response. This will continue to improve as FDA's scientific knowledge advances and our regulatory programs develop solid track records. The recent data published by CDC through FoodNet underscore the significant progress being made by our science-based regulatory programs.

Question. While I believe the President's Plan on Egg Safety is a very ambitious first step to eliminate disease due to SE-contaminated eggs, I am puzzled as to why FDA and FSIS have divided up responsibility for egg safety. Please explain why it is better to have two agencies responsible—FDA for the producers and FSIS for the shell egg packers and egg products processors—rather than for one agency to have responsibility for egg safety from the farm to the retail level?

Answer. The President's Council on Food Safety identified one responsible agency for each stage of the farm-to-table continuum to consolidate oversight responsibilities, based on existing statutory authority and to provide clear authority at each

stage of the continuum. The Council further recognized and identified responsibilities based on the expertise and technical strengths of each agency.

Question. The President's Plan on Egg Safety gives responsibility for egg safety to several agencies: FDA develops standards for the producer; FSIS develops standards for both shell egg packers and egg products processors; and FDA and CDC conduct surveillance and monitoring. What kinds of resources need to be in place in order to ensure that monitoring from the farm to the retail level are being equally enforced? Does FDA feel they can meet the goals of the Presidents Plan on Egg Safety?

Answer. The fiscal year 2001 FDA budget request includes \$5.0 million to begin implementation of the Egg Safety Action Plan. The funding will provide FDA funding to initiate an accelerated research program; development of the nationwide, consistent egg safety standards and programs; hire staff to manage the egg safety program; hire staff to train and evaluate federal, state, and industry officials in implementation of the standards. FDA intends to propose nationwide consistent standards in fiscal year 2000, finalize these standards in fiscal year 2001, and implement the standards through state contracts in fiscal years 2002 and 2003. FDA anticipates that its fiscal year 2001 request for Egg Safety will provide sufficient resources to conduct monitoring of egg safety at both the farm and retail level. Fiscal year 2001 to 2003 funding and staffing will be critical to FDA's ability meet the 50 percent reduction goal for *Salmonella Enteritidis* illness associated with eggs by 2005 and to meet the goals of the President's Plan on Egg Safety.

SARA LEE LISTERIA OUTBREAK

Question. USDA has been criticized recently in the Washington Post Magazine for taking too long to issue a recall notice in the Sara Lee outbreak, an outbreak where 100 people became ill and 21 died from a hazardous bacteria, Listeria, in ready-to-eat meat products. Consumer groups have criticized USDA for failing to publicize the recall and require the industry to test ready-to-eat meat products and plants for Listeria. FDA foods, like soft cheeses and smoked fish, can also contain deadly Listeria. What steps are you planning to take to control this hazard in FDA-regulated foods? Does it make sense to have two separate agencies regulating the same hazard in different foods?

Answer. FDA, with cooperation from USDA, is conducting a Risk Assessment for Listeria monocytogenes in ready-to-eat foods. We are assessing risk management options in light of the outcome of the risk assessment. Certain foods may need to be monitored more closely than others. We are also developing appropriate risk communication messages for the consumer, medical professional, and industry.

FDA and USDA each regulate different commodities and frequently the same hazard may occur in different commodities. Each of the commodities has intrinsic factors that may affect the types of hazards that may be found. Also, the same hazard may behave differently in different commodities. We do not see the organizational structure to be a barrier in this regard.

DIETARY SUPPLEMENTS

Question. As you know, the Dietary Supplement Health and Education Act (DSHEA) which passed in 1994 has significantly reduced FDA's ability to ensure the safety of these products. Over half the U.S. population now uses some type of dietary supplement (\$12 billion per year in spending). Dietary supplements are not subject to premarket safety review or approval by FDA. These products do not currently have good manufacturing standards or any uniformity in content of the "active ingredient". FDA can only intervene after "serious adverse events" including death.

Answer. Yes, it is correct that, as a general matter, dietary supplements are not subject to premarket safety review or approval by FDA. FDA is currently developing good manufacturing practices regulations to address the issue of uniform composition of dietary supplement products.

Question. Does FDA believe that "production standards" or "good manufacturing standards" for dietary supplements should be instituted? If so does this require a legislative change or does FDA believe that they have current authority to require such standards?

Answer. FDA believes that production standards or good manufacturing standards for dietary supplements should be instituted. The purpose of these standards would be to establish the minimum current good manufacturing practices—CGMPs, that must be used in activities associated with the manufacture of a dietary supplement, including packaging, labeling, testing, quality control, releasing for distribution, and holding. CGMPs are intended to ensure that manufacturing practices will not result

in an adulterated dietary supplement, and thereby protects consumers from unsafe products. CGMPs are intended to assist manufacturers in producing unadulterated dietary supplements. CGMPs would allow consumers to have confidence that the dietary supplements they purchase have the identity, strength, purity, quality, or composition that they are represented to possess.

The Dietary Supplement Health and Education Act, also referred to as DSHEA, is Public Law 103-417, and was signed into law on October 25, 1994. DSHEA, among other things, amended the Federal Food, Drug, and Cosmetic Act by adding a section, to provide, in part, that the Secretary may by regulation prescribe good manufacturing practices for dietary supplements. DSHEA provides the Secretary the authority to issue regulations on dietary supplement CGMPs. FDA plans to issue a proposed regulation this year.

ORPHAN DRUGS

The FDA budget justification book states that the agency anticipates a significant increase in overall interest in the Orphan Product Research Grants program in fiscal year 2000 and fiscal year 2001.

Question. Has the agency, therefore, increased the level of funding for this vital program in their budget request?

Answer. The agency plans to maintain the level of funding for the Orphan Product Grants program at \$11.5 million in fiscal year 2001. In addition to the grant funds, the agency spends over \$2.3 million to administer the Orphan Products program. The agency makes a considerable effort to maintain spending in this area and must consider a proper balance amongst all competing priorities within the Human Drugs program, especially those programs with congressional mandates.

The Orphan Drug Act allows for the awarding of market exclusivity for a given orphan indication for a pioneer orphan drug. If an improvement in that orphan drug can be demonstrated, then a new orphan status with its concomitant market exclusivity may be issued for the improved orphan product. Under such a rationale, FDA judges the second "improved" drug to be dissimilar enough from the first version so as to grant new exclusivity to the "improved drug." Such was the case for a product that helps multiple sclerosis patients. Betaseron was first granted market exclusivity in 1993 and so its exclusivity will expire in 2000. FDA judged a modified version of this drug known as Avonex to be superior i.e. different from, Betaseron and granted Avonex exclusivity which will run until 2003. Under such a model, if a generic drug was developed that was identical to Betaseron, then it should be able to go to market in 2000 rather than 2003. Such a drug Rabif, which I believe is identical to Betaseron is seeking to come on the market in 2000. However, I understand that FDA has been considering a modification of this process which may not be in line with congressional intent with respect to the Orphan Drug exclusivity provisions of the Orphan Drug Act. This modification would deny multiple sclerosis patients access to a cheaper generic version of Betaseron until the exclusivity not of Betaseron but of the improved Avonex product expires in 2003.

Question. Would FDA agree that is in the interest of patients to have access to generic drugs in a timely fashion?

Answer. We fully agree that the availability of generic drugs in a timely fashion would be beneficial to patients.

Question. Would the FDA agree that if a drug is identical to the unimproved orphan product that it should be treated as such and should not be barred from the market until the improved product's exclusivity expires?

Answer. FDA agrees that if a sponsor can establish that its drug is the same as a drug whose orphan exclusivity has expired, it may obtain approval notwithstanding orphan exclusivity that still protects a drug that is chemically the same, but clinically superior to the drug with expired exclusivity. The only mechanism currently available for establishing that two drugs from different sponsors can be expected to have the same safety and effectiveness is the generic drug approval process established under section 505(j) of the act for drugs approved under section 505 of the act. There are scientific and technical barriers to demonstrating that two biological products from different manufacturers can be expected to have the same safety and effectiveness. Moreover, there currently is no process for approving generic versions of biological products regulated under section 351 of the Public Health Service Act.

Question. Does the FDA believe that the original "unimproved" orphan product should in effect gain additional near exclusivity merely because a second "improved" product gains exclusivity later than the original product?

Answer. A product's period of orphan exclusivity is limited by statute to seven years. When there are two orphan products that are chemically the same, but are

not the same drug because they have different clinical profiles, a third product will be able to enter the market upon the expiration of the first applicant's exclusivity, if it establishes it is not the same as the drug that still has exclusivity. The third product may show that it is clinically superior to the product that still has exclusivity, or it may establish that it is the same as the drug whose orphan exclusivity has expired and thus is different from the product that still has exclusivity. By using the clinically superior criteria, the orphan drug program protects the drug development incentive, while permitting the introduction of better products to treat serious diseases. Drugs regulated under Section 505 of the Federal Food, Drug, and Cosmetic Act may be shown to be the same as the drug whose exclusivity has expired by meeting the standard for approval of a generic drug under Section 505(j).

REUSE OF SINGLE-USE MEDICAL DEVICES

Question. Last year, FDA officials promised my staff, that they would revise either the MEDWATCH form or the guidance document used by health professionals in reporting injuries, so that information on whether a device was reused and the identity of a reprocessor might be collected. This has not happened to date.

Question. When will the FDA be revising the MEDWATCH voluntary reporting form so that appropriate tracking of injuries from reused devices may take place ?

Answer. Two years ago, FDA modified its MedWatch voluntary report form so that health professionals could indicate whether a device in an adverse event was labeled for single use and whether it was being used for the first time or reused. The instructions on FDA's web site for FDA Form 3500—voluntary report form—address the reuse of single use devices or SUDs. In block B5 of the form, the health care professional is requested to report the facts and perceived contributions of reuse to the adverse event. FDA has received about 1,399 adverse event reports from MedWatch forms involving the reuse of single use devices. Almost half of these reports involved dialyzer equipment. In response, FDA has worked with the medical device community to issue safety alerts and developed guidances on how to do reuse properly.

The instructions for FDA Form 3500A—mandatory report form—which were written in 1995, do not explicitly mention reuse. The MedWatch staff has revised the instructions to address the reuse issue. The new instruction requests information about reuse in blocks F10, H6, and H8. Also, a new device problem code has been added specifically for reuse. The revised instructions are currently undergoing internal agency review prior to OMB clearance.

FDA believes that implementing Phase II of the MeDSuN system, as proposed in the fiscal year 2001 President's budget, would be the best way to improve reporting of reused devices. MeDSuN will recruit a statistical sample of hospitals and train them to report both adverse events and routine procedures. This will enable FDA and the health care community to put the reuse problems in context. At present, there are no plans to further revise the MedWatch voluntary report form because FDA believes that the voluntary form, with its recent changes, and the proposed revised instructions for the mandatory form, when approved, will address reporting reuse problems.

Question. When is FDA going to come out with final rules that require high risk, highly-invasive devices be shown to be both SAFE and EFFECTIVE for their intended use, not just when they are used for the first time but for every use ?

Answer. FDA has sufficient authority to address the issue of reuse of single use devices. New regulations are not necessary. On February 8, 2000, FDA posted two draft guidance documents on FDA web site. One is titled *Reprocessing and Reuse of Single-Use Devices: Review Prioritization Scheme*. The second is *Enforcement Priorities for Single-Use Devices Reprocessed by Third Parties and Hospitals*. The availability of these guidances was also announced in the Federal Register on February 11, 2000 in 65 FR 7027.

The review prioritization scheme guidance document sets forth factors FDA would consider in categorizing a reprocessed SUD as high, moderate, or low risk. The enforcement priority guidance document sets forth the agency's priorities for various requirements based on the risk categorization of a device.

The end of the 60-day public comment period for both guidances is April 11, 2000. The agency plans to review and consider all comments by May 11, 2000 and expects the guidances to be finalized in July 2000.

Upon implementation of the final guidances, anticipated to be January 2001, FDA would enforce premarket requirements for reproducers of single use devices deemed high-risk. The agency believes that the requirement to submit premarket data will ensure the continued safety of these devices. Moreover, the agency has the authority

to take immediate action at any time that a device poses an immediate and significant risk to public health.

Question. If FDA believes or has research data that shows that some of these devices can not be reprocessed safely, shouldn't they move to prohibit the reprocessing of such devices?

Answer. To date, our research indicates that some single use devices are more difficult to clean than others. FDA does not have sufficient data associated with any particular models or brands of single use devices, or SUDs, to support removing those products from market. However, FDA has notified all stakeholders that reused SUDs are subject to all statutory controls, including premarket notification, and that FDA intends to phase in enforcement of all these controls for third party reprocessors and hospitals that reuse devices labeled for single use.

Question. When is the FDA going to start enforcing safety requirements for high-risk, highly invasive reprocessed medical devices?

Answer. FDA has proposed to start enforcing premarket requirements against third party and hospital reprocessors of devices categorized as High Risk—in FDA's draft guidance document A Reprocessing and Reuse of Single-Use Devices: Review Prioritization Scheme—within 6 months of issuance of the final enforcement guidance.

Question. How much money does the FDA need to do such enforcement?

Answer. To do such enforcement, FDA estimates that approximately \$1 million will be needed in fiscal year 2001 and \$2 million in fiscal year 2002. These estimates assume that hospitals will reprocess single use devices at a low or modest level.

Question. Of the \$7.7 million in the Administration's budget for new premarket device initiatives, how much is for the development of safety standards for high risk reused devices?

Answer. I would be happy to provide that information for the record:

[The information follows:]

FDA's fiscal year 2001 Budget request includes an increase of \$2.8 million for medical device reuse. FDA believes the requested funds are sufficient to carry out its regulatory responsibilities of this initiative. The requested funds will ensure the safety and efficacy of reprocessed devices by:

- increasing product review activities; and
- developing standards for high-risk reuse applications to ensure that if a single-use device is going to be reused, it is done safely and remains safe and effective for its intended use.

These activities will be accomplished through:

Hospital outreach.—FDA plans to conduct a variety of outreach activities like mailings, speaking at conferences, posting notices on the Web to aid hospitals in coming into compliance with the Federal Food, Drug, and Cosmetic Act.

Hospital compliance with reprocessing guidelines.—FDA is considering pilot testing a program where some third party or professional standards organization could include questions about reuse in surveys of hospital standards and possibly in audits of hospital practice.

Question. Is this sufficient?

Answer. Based on the expected volume of premarket submissions, this amount will be sufficient for reprocessing single use devices.

Question. Will the new rules apply to all reprocessors, or just third-party reprocessors?

Answer. There are no new rules, but FDA intends to explore existing requirements for third party reprocessors and hospitals.

Question. Would the FDA not agree that where a device is reprocessed is irrelevant to the consumer and therefore, the same standards and safeguards should apply whether the device is reprocessed by a third-party or a hospital?

Answer. FDA agrees that appropriate safeguards need to be in place for reprocessing operations. FDA's proposed guidance documents define the agency's intent to ensure that such safeguards are in place in both third-party reprocessing firms and in hospitals.

Question. What is FDA doing to make sure that hospitals fully understand the risks of reprocessing and learn about the research going on at FDA.

Answer. FDA has undertaken various efforts to make sure that hospitals fully understand the risks of reprocessing and to make them aware of the research going on at FDA. We have launched a major outreach program to help both hospitals and consumers become aware of the agency's proposed strategy to address the issue of reuse of single use devices—SUDs—and to solicit their input. Some examples outreach efforts included an FDA sponsored satellite teleconference on November 10, 1999 that was broadcasted nationally to explain the agency's proposed reuse strat-

egy and an FDA hosted public meeting that was held on December 14, 1999, to solicit public comment on the agency's proposed strategy. FDA scientists have held meetings as well to discuss their research. In addition, the agency created a web site to disseminate FDA information on reuse of SUDs and established an electronic mailbox whereby consumers and interested parties may submit questions to FDA concerning reuse of SUDs. FDA has also held several conference calls with the Joint Commission on Accreditation of Healthcare Organizations—JCAHO—to discuss the development of a joint program to audit hospital reproducers to ensure compliance to FDA regulations and to educate these facilities about our policies and relevant research.

Question. What is FDA doing to make sure that hospitals fully understand that these reprocessed devices are not FDA approved and have not been demonstrated to be "safe and effective" as FDA defines such terms?

Answer. FDA has launched a major outreach program to help hospitals and consumers become aware of the agency's requirements and proposed strategy to address the issue of reuse of SUDs and to solicit their input. In addition, FDA has held several conference calls with the Joint Commission on Accreditation of Healthcare Organizations—JCAHO to discuss the development of a joint program to audit hospital reproducers to ensure compliance to FDA regulations and to educate these facilities about our policies and relevant research.

FDA has contacted the American Hospital Association (AHA) to seek their assistance in disseminating FDA information. We also have requested that they serve as an intermediary between FDA and hospitals on a FDA-assisted educational program geared specifically to hospitals. We envision that the educational program will provide hospitals with information that may help them decide as to whether they should continue to reprocess SUDs in-house or to contract this service with commercial third party reproducers.

AHA surveyed its associated member organizations including the Association for Healthcare Resources and Materials Management and the American Society of Health Risk Management, as to what type of information they desired from the agency. The results of the survey indicated that articles, summaries of studies, and up-to-date web site information would be helpful and that the information be sent via electronic mail.

I would be happy to provide for the record some examples of our outreach efforts: [The information follows:]

- Sponsored a satellite teleconference on November 10, 1999 that was broadcasted nationally to explain FDA's proposed reuse strategy;
- Convened a public meeting on December 14, 1999, to solicit public comment on the agency's proposed strategy;
- Created a web site to disseminate FDA information on reuse of SUDs;
- Created an electronic mailbox whereby consumers and interested parties may submit questions concerning reuse of SUDs to FDA;
- Published a detailed article on the subject of reuse of SUDs in the User Facility Reporting Bulletin; and
- Compiled an electronic mailing list of the participants that attended the public meeting for the purpose of following up on inquiries or for notifying them of the availability of the risk prioritization scheme and enforcement priorities draft guidances.
- Conducted meetings where FDA device scientists discussed their research.

GENE THERAPY

The area of gene therapy clinical trials has come under close scrutiny lately. Problems have been found both with research protocols, lack of reporting and the public's ability to know when research protocols result in adverse patient outcomes. In 1994, I inserted report language in the Agriculture Appropriations bill that directed FDA to create a tracking data bank for patients involved in clinical trials. The language stated: "The Food and Drug Administration is one of the lead agencies involved in gene therapy biomedical technologies. Many gene therapy protocols are being approved by various government and institutional committees, yet there is no mechanism to track gene therapy patients throughout their lives to assess long-term effects. Currently, there are only a few hundred individuals that are under protocols for gene therapy. Now is the time to establish a tracking program. Accordingly, within the funds available, the Food and Drug Administration should create a gene therapy registry of patients."

According to inquires by my office to FDA, I am told that in response to this Congressional mandate the agency launched the development a prototype for such a system, the Gene Therapy Information Network (GTIN). However, FDA did not follow

the 1994 report language because in stead of tracking patients, FDA set up a pilot system to track research protocols. FDA limited the tracking to the life of the clinical trials under FDA supervision prior to product approval. So the long-term effects on individual patients were not studied and in fact no tracking of individual patients took place. The computer software generated for this initiative was eventually used for another purpose.

Question. Why did FDA not comply with the provision to set up a patient tracking data base?

Answer. FDA supports the gene therapy patient tracking system concept. FDA has begun to formulate a request for proposal (RFP) for the gene therapy patient tracking system that will incorporate automated methods to receive, track, and oversee adverse event information. Between December 1994 and 1996 FDA developed a pilot gene therapy patient tracking system, known as Gene Therapy Information Network (GTIN). The pilot was a project under FDA's Submission Management and Review Tracking (SMART) initiative. The GTIN was strictly a patient tracking system, did not contain or tie into adverse event reporting and was not expanded beyond the pilot phase. Some of the GTIN concepts were used in developing the National Xenotransplantation Database (NXD). FDA believes to effectively enhance patient protection, the gene therapy patient tracking system will need to tie into FDA's current adverse event reporting system and the short term and long-term effects for the patient population.

Some of the components needed for a gene therapy patient tracking system are in various stages of analysis. FDA is looking at the many factors which will affect the cost of such a system. Among those factors are: the development time frame; the size of the system; the tracking requirements and the staffing needs. While this analysis is not complete and the development cost and time has not yet been determined, we are certain there will be significant costs for development, startup, and maintenance phases of the project. Much of the system costs will be in creating and maintaining an infrastructure to assure proper maintenance of the database code and structure, resources to staff the function of the database including data entry personnel, medical and scientific reviewers to properly evaluate adverse events, support for coordination with the NIH OBA staff and RAC, and other infrastructure issues.

Question. Does FDA agree that in light of recent developments, this data base now actually seems like a pretty good idea and would have detected problems much earlier than happened without such a tracking mechanism?

Answer. FDA manages adverse event data in many product fields without a special product-specific database. The desire for such a database for gene therapy arose largely from the interest in lifelong monitoring of patients including monitoring of their off-spring for potential effects of the gene therapy. Such monitoring, while potentially appropriate given theoretical concerns regarding gene therapy, is not easily conducted under normal clinical trial paradigms. The recent University of Pennsylvania incident involved short term toxicities more typical of drug development.

For a class of treatments which is novel and rapidly expanding, a database potentially could facilitate rapid communication and integration of information. However, of note, gene therapy is very diverse, involving many essentially unrelated classes of treatment. There have only been a very limited number of protocols which have used adenoviral vectors into a blood vessel such as was done at the University of Pennsylvania. The limited amount of data could be well communicated within FDA through normal channels such as our Adenovirus gene therapy working group. Furthermore, there was not evidence that clinically significant disseminated intravascular coagulation or acute respiratory distress syndrome had occurred prior to the death at the University of Pennsylvania. Thus, the existence of the gene therapy information network would not have been expected to provide information which would have impacted the case.

Question. Given that FDA is the agency that oversees all clinical trials rather than just federally sponsored clinical trials, would the FDA agree that such a tracking mechanism is best housed at FDA?

Answer. We agree that FDA is the appropriate Agency to develop and maintain a gene therapy tracking registry. Cell and gene therapy products constitute a new and emerging scientific area that challenges existing regulatory systems. FDA would support, given adequate resources, the establishment of a functional gene therapy tracking registry.

Question. How much money would the FDA need to comply with the 1994 report language?

Answer. FDA will continue to work with the Committee to develop the costs of a gene tracking system as described.

Question. Under current FDA requirements for research protocols, how would a patient get information on risks associated with a research study independent of the researchers actually telling the patient the full risks ?

Answer. Under FDA's regulations pertaining to Institutional Review Boards (21 CFR Part 56), the IRB is responsible for requiring that information given to subjects as part of informed consent is in accordance with section 50.25 (21 CFR 56.109(b)). Further, the IRB has the authority to observe or have a third party observe the consent process and the research (21 CFR 56.109(e)). Thus, the information on risks would be available to the patient through the consent process and document, from the individual identified in the consent form as the individual to contact for answers to questions, and from the responsible IRB. FDA's informed consent regulations (21 CFR Part 50) describe the specific information that is to be provided to subjects in obtaining the subject's informed consent and how consent is to be documented. These regulations require "A description of any reasonably foreseeable risks or discomforts to the subject" (21 CFR 50.25(a)(2)). They also require, when appropriate, "A statement that significant new findings developed during the course of the research which may relate to the subject's willingness to continue participation will be provided to the subject" (21 CFR 50.25(b)(5)). Further, they are required to contain "An explanation of whom to contact for answers to pertinent questions about the research . . ." (21 CFR 50.25(a)(7)).

Question. How would a patient know of the financial interests of a researcher?

Answer. FDA's informed consent regulations which specify the minimum information that is required to be provided to research subjects, do not require that the patient be apprised regarding the investigator's financial interests. In accordance with 21 CFR 56.109(b), the IRB may require that information, in addition to that specifically mentioned in section 50.25, be given to the subjects when in the IRB's judgment the information would meaningfully add to the protection of the rights and welfare of subjects. Thus, when an IRB determines that such information would be meaningful in protecting the rights and welfare of subjects, the IRB has the authority to require that the subjects be made known of financial interests of a researcher.

Question. Does the FDA believe that full disclosure of financial interest should be required for researchers?

Answer. From the juxtaposition of this question with the previous question, FDA assumes that the question is referring to full disclosure to the subject, not to FDA (which is covered, in part by 21 CFR Part 54). The agency believes that this is a complex question for which a consensus has not yet emerged. Certainly, it is critical for a research subject to understand that the motivation of a researcher is different from the motivation of the individual's treating physician, particularly when these individuals are the same. FDA also recognizes that there are interests, beyond those that are financial, that may impact on a researcher's judgment and actions. Therefore, FDA is collaborating with NIH and the Office of the Secretary in planning a public consultation this summer with a view to developing better and more specific guidance for investigators, sponsors, IRBs and research subjects regarding the disclosure of financial interests.

Question. What is FDA doing to promote better public disclosure of adverse events and research risks to those enrolled in clinical trials?

Answer. FDA has formed a working group to determine its role in reviewing the adequacy of informed consent documents. Currently, the agency relies, in large part, on the work of the IRB. Sometimes, the agency reviews model consent documents provided to it as part of an application; in other instances, either the model consent form is not submitted or it is not reviewed. The agency is evaluating its review process in this regard.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

GENERIC DRUGS

Generic drug application median approval times have improved from twenty-seven months in 1995 to 17.3 months in 1999. However, generic drug applications are statutorily required to be completed within six months.

Question. What efforts are being made at the Food and Drug Administration to decrease processing time for generic drug applications?

Answer. FDA is required to take final action on generic drug applications within 180 days. The agency is making every attempt to complete all final action within 180 days. Either an approval or disapproval is considered by the agency to be a final action. The Federal Food, Drug and Cosmetic Act states in Section 505(b)(4)(A), "Within one hundred and eighty days of the initial receipt of an application under

(2) . . . the Secretary shall approve or disapprove the application". The agency makes every attempt to meet this requirement; however, for a number of reasons it is not always possible to do so. After receiving a disapproval action, manufacturers frequently resubmit applications that address the deficiencies indicated in the disapproval action. Approval times are substantially longer than review times because many reflect multiple review cycles.

The review time for generic drug applications can be decreased by improving our information technology infrastructure to enable us to increase the number of electronic submissions and reviews. We also believe that increasing the generic drug science base will improve our processing time. Funding is needed for research to support the development of scientifically rigorous bioequivalence testing methodologies for nonsystemically absorbed drug products. The stronger scientific support of these approvals, the more likely it will be that we can successfully meet innovator challenges.
