Question. What benefits do generic drugs provide to consumers?

Answer. Approved generic drug products provide a safe, effective, low cost alternative to the American public.

Question. What are the downsides to generic drugs?

Answer. We do not believe there are any downsides to generic drugs. A generic drug product is comparable to an innovator drug product in dosage form, strength, route of administration, quality, performance characteristics and intended use.

NEUTRACEUTICALS

In recent years, the marketplace has seen a sharp increase in the number of herbals and other natural products that are purported to have a beneficial impact on health and nutrition, giving rise to an entire industry known as "neutraceuticals." Over 60 million U.S. adults, or approximately 1 in 2, take some form of dietary supplement.

Question. With the number of Americans using neutraceuticals rising, what action is the Food and Drug Administration taking to evaluate potency and chemical composition of neutraceutical products?

Answer. Substances referred to as "neutraceuticals" are not specifically recognized in statutes or in regulations. All products regulated as foods must meet applicable safety and labeling requirements. In many cases, these products may be marketed without premarket review or approval by FDA. As such, it is the manufacturer's responsibility to ensure that marketed products are safe for their intended use and are labeled in a truthful and not misleading manner. Consistent with all foods, and as warranted by public health concerns and enforcement priorities, FDA will evaluate the potency and/or chemical composition of specific products on a case-by-case basis.

Question. What technologies are being employed by the Food and Drug Administration to evaluate the composition of neutraceuticals?

Answer. Evaluation of the composition of all food products, including what some call neutraceuticals, is dependent on identifying and validating methods that are appropriate for the particular substance of interest, for the matrix in which the substance is found, and for the nature of the question being asked. Thus, the type of technology used is decided on a case-by-case basis. For example there are a variety of chromatography techniques and mass spectrometry that might be helpful.

Question. What new technologies are being developed to evaluate the safety of neutraceuticals?

Answer. The types of new technologies needed to evaluate the safety of foods that may be referred to as "neutraceuticals" are similar to the types of new technologies needed for many food ingredients and products. In evaluating foods, it is more a matter of adapting existing techniques and technologies to the specific types of products under evaluation, as would be the case with electron spin analysis.

SUBCOMMITTEE RECESS

Senator COCHRAN. The subcommittee will stand in recess.

[Whereupon, at 12:01 p.m., Tuesday, March 7, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2001

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

MATERIAL SUBMITTED BY AGENCIES NOT APPEARING FOR FORMAL HEARINGS

[CLERK'S NOTE.—The following agencies of the Department of Agriculture did not appear before the subcommittee this year. Chairman Cochran requested these agencies to submit testimony in support of their fiscal year 2001 budget request. Those statements follow:]

DEPARTMENT OF AGRICULTURE

AGRICULTURAL MARKETING SERVICE

PREPARED STATEMENT OF KATHLEEN MERRIGAN, ADMINISTRATORE

Mr. Chairman and Members of the Committee, I am pleased to have this opportunity to represent the Agricultural Marketing service in presenting our fiscal year 2001 budget proposals.

MISSION

AMS' mission is to facilitate the marketing of agricultural products in the domestic and international marketplace, ensure fair trading practices, and promote a competitive and efficient marketplace so that producers, traders, and consumers all benefit. We accomplish this mission through a variety of activities funded from appropriations and from fees charged for services. Since most of our user-funded services are voluntary, we must be responsive to customer needs while remaining conscious of the cost. Through our services such as market reporting and grading, we maintain close contact with our customers, who help to keep us informed about their concerns. We also recognize and support USDA-wide efforts to assist the agricultural industry.

CHANGES IN AGRICULTURAL MARKETING

American agriculture is confronting rapid changes in industry structure, decreasing government price supports, new trade agreements and market outlets, evolving consumer expectations, and new production methods. Industry concentration in certain agricultural industries threatens to inhibit competition. While global trade agreements open new markets, they often set new market requirements and restrictions such as the hormone testing of beef required by the European Union, and new questions on the labeling of genetically engineered food. Furthermore, since price supports are no longer available for producers to "fall-back" on, agricultural producers, particularly smaller producers, must increasingly depend on marketing to maintain their profitability. Small and medium-sized farmers have the fewest resources to compete in this evolving marketplace. USDA policy recognizes the importance of small farms to the nation's economy, resources, and social fabric. In fact, small farms lead the development of organic production systems in the U.S. We pro-

pose to make available the information, tools, and expertise all agricultural producers need to market their products. Furthermore, AMS' international marketing efforts assist all sectors of the agricultural industry to maintain their foreign sales, which are critical to our nation's farm economy. Our budget proposals reflect, in priority order, AMS' response to the current needs of our customers.

MANDATORY MARKET NEWS

Concern over the potential harmful effects of industry concentration on competition resulted in the Livestock Mandatory Price Reporting Act of 1999. Consolidation in the red meat industry has resulted in the growth of private marketing agreements and declining participation in public markets. Since voluntary price reports do not reflect transactions from marketing agreements, it is difficult for producers to determine prevailing market prices or to evaluate contract offers from packers. The lack of price information also makes it difficult to administer programs that address economic stress in the livestock industries. Mandatory price reporting will increase the transparency of market price signals for producers and others in the marketing chain. These mandatory reports will include 90 percent of the beef, 96 percent of the hogs, 84 percent of the lambs slaughtered and 80 percent of the lambs imported. Congress authorized the Secretary to initiate mandatory reporting by the industry in the fiscal year 2000 thousand budget and provided start-up funding of \$4.7 million from CCC funds allotted to AMS in fiscal year 2000. Since these funds will not be available to AMS in fiscal year 2001, we are requesting an increase of \$5.9 million to finance the annual cost of the mandatory reporting program. As we implement mandatory reporting, Market News reporters will expand their contacts throughout the industry—with producers, processors, wholesalers, retailers, importers, and exporters of livestock, meat, and related products. At the same time, the agency has been encouraged to continue all of its voluntary reporting that falls outside the coverage of the mandated program. Because of the mandatory nature of the new program, an extensive monitoring and review system will ensure that the information is accurate and timely. During fiscal year 2000, AMS must hire additional reporters and support staff to analyze and edit the dramatically expanded volume of data to be collected, and compliance personnel to audit packer records to ensure that packers are accurately reporting the required information. We will also begin development of a computer system to manage the data, and establish outreach programs to educate producers about the new information. The fiscal year 2001 request reflects a full year of program activity at fully staffed levels, and continuing development and maintenance of the computer system. We expect to publish the proposed rule for mandatory reporting in the near future, and hope to have the program implemented before the end of this summer.

ORGANIC CERTIFICATION

A segment of the agricultural industry that is continuing to grow is organic products. American consumers are embracing organic foods at a rate of 20 percent a year. Congress determined that there should be a nationwide minimum standard and a system to certify that products meet that standard. AMS' organic certification program, now in the final stages of development, will assist producers by facilitating interstate commerce of organically produced food, and assure consumers that organically produced products meet a consistent standard.

AMS is proposing budget increases that are designed to better serve consumers and our customers in the organic industry. These increases are for organic certification, market news, and marketing agreements and orders.

We are requesting a net increase of \$703 thousand for the organic certification program, of which \$639 thousand is needed only for one year. These funds will allow us to "jump-start" the certification program and provide outreach to new customers. As we begin implementing the program, we will educate producers, consumers, processors, certifiers and traders about the program while accrediting at least 49 certifying agents and monitoring their activities. We will monitor State programs' compliance with national regulations and develop a system to prevent fraudulent labeling. In addition, we will implement an international program component to develop standards and accredit international certifying agents, and will participate in the development of international agreements for organic products and production. The additional funding requested will enable us to begin full operation of the certification program.

ORGANIC MARKET NEWS

AMS is requesting \$614 thousand to expand market reporting on organically-grown fruits and vegetables so that producers can find the best markets for their

products and maximize their returns. Producers of organically-grown fruits and vegetables need timely, reliable, consistent, and unbiased marketing information on factors such as prices, supply, demand, and trends. Such information is scarce, especially for smaller producers with fewer resources, which places the larger participants in the market at an advantage. Efficient markets can help consumers by keeping prices reasonable.

MARKETING ORDERS AND ORGANIC PRODUCTION

The growing market for organic products is becoming an issue facing industry fruit and vegetable marketing agreements and orders committees. Virtually all of the 36 active fruit and vegetable marketing agreement and order programs could soon include some organically produced commodities. We are requesting \$1 million of Section 32 Administrative funding to develop our expertise and provide research on the economic impact of marketing order programs on the organic sector. Marketing agreements and orders are designed to help stabilize market conditions for fruit and vegetable products for the benefit of producers and consumers. Marketing order programs assist farmers by allowing them to collectively work to solve marketing problems. AMS oversees the activities of the industry committees. AMS and the marketing order committees need additional data on organic production, marketing and distribution channels, as well as a projection of future organic fruit and vegetable production in order to resolve the issues raised. Without supporting data, it is difficult for AMS to make informed decisions on the interrelationship between organic and conventionally grown commodities.

SMALL FARMERS AND FSMIP

To assist small farmers on a local scale, AMS is requesting an additional \$300 thousand in "Payments to States" matching grants funding. These funds will be made available to the States for local and regional product development and marketing initiatives that will assist small farmers to identify and develop marketing opportunities. The new projects would focus on: marketing opportunities emphasizing local or direct marketing; export-oriented market research and technical assistance targeting small, limited resource producers and marketing organizations; and encouraging sustainable agricultural production and marketing. By providing matching funds, we are able to compound the benefits received by small farmers. In conjunction with these new grants funds, we are requesting \$31 thousand in appropriated funds to administer the additional grants and conduct outreach efforts. We will assist cooperators to develop their submissions, monitor the projects in progress, and ensure that the results are made widely available to potential beneficiaries.

FOREIGN MARKET NEWS

Our request for \$453 thousand to expand agricultural market reporting on foreign markets will assist all agricultural producers and traders interested in international trading, but particularly the small and medium-sized farmer with limited resources who is interested in export markets. Rapid changes in international markets are largely due to shifts in global partnerships and trade agreements, production methods, and customer preferences. The U.S. agriculture industry must maintain its market share and expand sales in international markets in order to maintain its profitability. Expanded market data will help U.S. commercial interests gain access to foreign markets by supplying a greater quantity of data on more foreign markets. Farming and ranching operations of all sizes are increasingly dependent on market expansion and exports for their growth in income. Overproduction of many commodities makes it particularly necessary to increase exports to maintain farm revenues. Trade agreements can provide improved access to foreign markets; however, traders need information to determine the most favorable markets. AMS is the only publicly available source for centralized, consistent, and timely information on international prices and trade volume. The dairy, meat, poultry, and fruit and vegetable industries have asked AMS to expand its international market coverage so that they can take advantage of business opportunities available around the world. Foreign market information is especially important to small and medium sized producers who would otherwise have no access to the data.

PDP—WATER TESTING PROGRAM

Foreign buyers and U.S. consumers are concerned about pesticide residue levels in food. We are asking for \$1.1 million to plan and implement a new water testing program within the Pesticide Data Program, or PDP. AMS, under the provisions of

the Food Quality Protection Act, or FQPA, samples, tests, and compiles pesticide residue levels on fresh and processed foods. EPA uses AMS pesticide data findings to develop consumption risk data and to determine whether pesticides should be re-registered for continued use. The FQPA requires EPA to consider all routes of pesticide residue exposure, including drinking water. EPA's current reliance on models may significantly overstate the residue levels in drinking water and threatens the continued availability of several agricultural pesticides. EPA continues to require the type of data being collected on food commodities under the current program. Due to the complexity of testing water, AMS cannot redirect current PDP funds to begin a water testing program without seriously compromising the statistical reliability of the program's findings on other commodities. Pesticide residue analysis provides the data needed by EPA for informed decisions on the safety of agricultural pesticides, and reassures foreign and domestic buyers that the pesticide residues on U.S. foods meet safety standards.

MICROBIOLOGY DATA PROGRAM

In the area of food safety, we are requesting \$6.2 million to initiate a microbiological data program as part of the President's Food Safety Initiative. This program responds to concerns generated by the sporadic cases of microbiological contamination resulting from food-borne disease outbreaks in recent years. The requested funds will allow AMS to build on the framework of the Pesticide Data Program to design a scientifically-sound program to collect data related to microbiological contamination that causes food-borne outbreaks. The program will collect data pertaining to food-borne pathogens and spoilage microflora on domestic and imported fruits and vegetables that can be used to identify and avoid potentially dangerous situations that can cause loss of life. Under this program, AMS will perform almost 30 thousand analyses a year on a maximum of 11 commodities in 10 participating states that represent approximately 50 percent of the population. Samples will be collected at terminal markets and chain store distribution centers, from commodities selected based on per capita consumption from those that are usually eaten raw. There is no other statistically valid Federal or State program that can give a complete microbiological picture of fruits and vegetables nationwide. By using the existing Pesticide Data Program infrastructure for sampling, participating State laboratories, and data reporting, AMS is able to minimize costs for this program.

COMMODITY PURCHASE SERVICES

Our two final budget increases will allow AMS to improve service to our customers and enhance the overall efficiency of the Commodity Purchase Services program. We are requesting \$795 thousand of Section 32 Administrative funding to customize our Economic Database Information Network, or EDIN, for use in purchase decisions, and \$225 thousand to develop a Management Information System for the Food Quality Assurance Program and initiate an outreach effort toward new customers.

Increased funding will allow us to expand the EDIN database so that it can be used to administer surplus commodity and Federal feeding program food purchases. The database was begun in fiscal year 2000 to house information on fruits and vegetables for decision-making by industry marketing order committees and for government regulatory impact analyses. Commodity purchase decisions also depend on access to comprehensive, readily accessible information. For many of the commodities involved, information must be drawn from a variety of sources and constantly updated. The database will provide an interactive repository of commodity data that supports several hundred million dollars of annual government purchases for federal feeding program outlets. We will add meat and fish, poultry, and specialty commodities, current and historical data sets on commodity prices, shipments, production, inventories, and other information that will support decision-making. The database will streamline purchase activities by eliminating duplication and improving the scope and timeliness of data for more comprehensive analyses on commodity purchases. AMS will make the database information available via a Web page and CD-ROMs, to the public—including farmers, processors, wholesalers, brokers, retailers, and researchers—and to other government agencies.

Additional funding will also be used to develop a publicly-accessible information system for the Food Quality Assurance Program and support a heightened outreach effort for current and potential users of this information. The Food Quality Assurance Program develops government-wide food purchase specifications, including Commercial Item Descriptions, or CIDs, Institutional Meat Purchase Specifications, and other product descriptions. These purchase specifications allow for product standardization and increased competition within the market, and ultimately, a

more uniform product and lower price for the buyer. Purchase specifications find widespread use by many private sector institutional buyers. Public sector purchasers such as schools are also finding these specifications to be of tremendous value. Current and potential customers have requested that AMS expand the product variety and customer base for CIDs. To better facilitate their use by all interested parties, we will develop a centralized database that will contain information on all CIDs and other product specifications, quality assurance results, and inspection plant surveys to verify quality and safety. The database will allow AMS to expand the range of CIDs on products not covered by U.S. grade standards and provide electronic access to the various product specifications maintained and developed by the Food Quality Assurance Program. This increase will allow us to better serve our current customers such as Federal and State food purchasers, and expand the program to include school districts that buy food for their child feeding programs. Through substantial outreach, we will assist other potential public sector users, including local schools and state governments, in the application of these specifications to their purchases of food products.

BUDGET REQUEST SUMMARY

That concludes our list of budget increases proposed for fiscal year 2001. By fund, our increase requests total \$15 million for "Marketing Services," \$300 thousand for FSMIP grants under "Payments to States," and \$2 million in "Section 32 Administrative funds."

I hope you agree with me that these requests will allow AMS to move forward in assisting the agricultural industry by facilitating domestic and international marketing, particularly for the small and medium-sized farmer.

Thank you for this opportunity to present our budget proposals.

AGRICULTURAL RESEARCH SERVICE

PREPARED STATEMENT OF DR. FLOYD P. HORN, ADMINISTRATOR

Mr. Chairman and Members of the Subcommittee, I appreciate this opportunity to present the Agricultural Research Service's budget recommendations for fiscal year 2001. Before I begin to outline the Agency's program and financing recommendations, I would like to take a moment to reflect on the truly amazing transformation that has taken place in American agriculture.

A hundred years ago, nearly 40 percent of employed people worked on farms. Today, less than 2 percent work on farms. In the span of a century, the number of farms has fallen by two-thirds, while the average farm size has more than tripled. This reflects increased off-farm employment opportunities and growing productivity in agriculture.

Farm production has become more concentrated. In 1900, 17 percent of U.S. farms produced 50 percent of farm sales. In 1997, only 2 percent of farms produced half of all agricultural sales.

There has also been a dramatic increase in crop yields over the past 100 years. From 1900 to 1999, wheat yields have multiplied from 12.2 bushels per acre to 42.7 bushels per acre; corn, from 28.1 bushels per acre to 134.5 bushels per acre; soybeans, from 10.9 bushels per acre to 36.7 bushels per acre; cotton, from 203 pounds per acre to 592 pounds per acre; peanuts, 661 pounds per acre to 2,660 pounds per acre; and potatoes, from 52 hundred weight per acre to 348 hundred weight per acre.

Similarly, with higher crop productivity, animal production has jumped substantially. Chicken production has expanded more than 10-fold. Hog production has increased 3-fold. With significantly higher output per cow, milk production has also risen sharply.

Without question, many of the advances we have seen which have literally transformed American agriculture are the direct result of new technologies and practices which have been developed through agricultural research. It is agricultural research that has made possible the huge increases in agricultural productivity that we have seen.

Agricultural research is constantly adjusting to address new challenges of a dynamic world. At the beginning of the twentieth century, the emphasis of agricultural research was primarily on the production of crops and animals and their protection from diseases and pests. The role of research has expanded beyond agricultural production efficiencies to include food safety, human nutrition, emerging diseases and exotic pests, new products and agricultural uses, sustainable agricultural practices, and natural resources conservation. Today, agricultural research embraces a variety

of new approaches and technologies, from integrated pest management to remote sensing technologies and biotechnologies, and tools, from precision agriculture to bioinformatic tools and genetic sequencing. The new technologies and tools are being used to improve the nutritional value and safety of the food supply, convert agricultural materials to biofuels, manipulate the properties of plant and animal genes, etc.

MAJOR ARS ACCOMPLISHMENTS

During the past 10 years, ARS accomplishments have significantly benefitted American agriculture. Examples (organized under four broad goals) include:

An agricultural system that is highly competitive in the global economy

- Pioneering the concept of using gene markers to assist in selecting plants and animals for improving yield, imparting disease resistance, enhancing nutritional value, and making food products safer for the consumer.
- Publishing the first genetic linkage maps in the world for swine and cattle which were key contributors in the first genetic map for poultry.
- Organizing a multi-State areawide integrated pest management project to control the codling moth, the key pest affecting commercial apple and pear production in the Pacific Northwest. This initiative was so successful that pesticide usage was reduced 75 percent and products from the area were able to be exported to nations where they had been previously restricted. This strategy is now being followed for other important crop pests.
- Discovering and patenting a new method to immunize poultry from a number of diseases by injecting vaccines into the egg. Today, this technology protects 85 percent of North American broilers.
- Developing and releasing a new cotton variety with high fiber strength, which has enabled the industry to introduce new processes for wrinkle-resistant cotton slacks, and open a multi-billion dollar market.

A safe and secure food and fiber system

- Cloning a plant gene conferring resistance to disease causing viruses. The ability to breed agriculturally important plants that are resistant to virus borne diseases is critical to preserving a secure food production system.
- Developing the first practical live animal test for scrapie in sheep, a disease similar to “Mad Cow” disease that has plagued Europe. This technology will allow producers to develop disease free flocks. APHIS is using the third eyelid test in their planning for a scrapie eradication program in sheep.
- Developing a five minute test to identify bacterial contamination on meat. A second rapid detection test for E. coli is being used by commercial laboratories that screen ground meat for fast food restaurants and other retail food outlets.
- Developing a product called Preempt (TM) that can be sprayed over newly hatched chicks to reduce the potential for salmonella contamination. This technology, known as “competitive exclusion,” will significantly decrease the potential for human illness from salmonella.

A healthy and well nourished population

- Demonstrating that the nutritional status of a host can influence the pathogenesis of a known human viral pathogen.
- Producing the only reliable human studies on the effects of transfatty acids in the diet and their adverse impact on the risk factors for heart disease.
- Demonstrating how supplementing the diets of postmenopausal women with additional calcium and vitamin D lowers the rate of bone loss, slowing the development of osteoarthritis.
- Identifying how the brain function of children with certain nutritional deficits differs from those with good nutritional status.
- Maintaining the Nutrient Database which is the primary source of data on nutrients in food used in managing Federal nutrition programs and widely used throughout the food industry.
- Developing a series of high fiber, low calorie products (OATRIM, Z-TRIM and NU-TRIM) that can be used as fat substitutes in prepared foods.

An agricultural system that protects natural resources and the environment

- Developing conservation tillage systems and crop residue management practices that have increased profitability and improved soil quality on hundreds of thousands of acres in the United States.
- Developing methods to remediate toxic element contaminated sites using specially designed biosolids compost. This approach has greatly reduced the remediation cost at some toxic metal contaminated “Superfund” sites.

- Developing an indexing tool for mapping the vulnerability of landscapes and locating areas with the greatest potential for contributing to water contamination by phosphorus. This index provides Federal and State agencies with the tools to manage watersheds to reduce water pollution.
- Developing the Riparian Ecosystem Management Model to provide landowners and environmental agencies with guidelines to design and manage forest buffers.
- Altering the nutritional or other end-use quality of certain grains to reduce their phytic acid, phosphorus, and mineral content. This research is focused on animal feeds and is designed to increase the absorption rates of nutrients by the animal while reducing the amount of phosphorus entering the environment.
- Screening thousands of American Elm trees to identify resistance to Dutch Elm disease. As a result, two new resistant varieties were developed and released to wholesale nurseries for propagation and sale to the public.

FISCAL YEAR 2001 BUDGET

ARS' fiscal year 2001 budget recommends a funding level of \$894,258,000 which represents an increase of \$63,874,000 above the Agency's fiscal year 2000 level. This budget includes \$97,815,000 in national high priority research initiatives, and \$8,500,000 to finance pay costs. To help fund these high priority initiatives, the proposed budget also includes a reduction of \$42,441,000 of both lower priority ongoing research and earmarked research projects added to the Agency's fiscal year 2000 appropriation.

NEW AND EXPANDED RESEARCH INITIATIVES

ARS' fiscal year 2001 research initiatives are directed at maximizing productivity and product quality while preserving natural resources and environmental quality. The initiatives are also directed to the concerns of every American—for a safe, healthy, nutritious food supply. The specific research initiatives are detailed below.

An agricultural system that is highly competitive in the global economy

One of ARS' principal goals is to conduct research which results in strengthening U.S. agriculture at home and abroad. This is accomplished by developing new techniques and strategies to prevent or control insects and diseases which reduce economic losses and increase product longevity and market quality. Research is conducted which demonstrates new postharvest technologies that add value, improve quality, and overcome technical barriers to trade. ARS also carries out research which results in the development of new products and new uses for agricultural products. Under this goal, ARS is recommending in its fiscal year 2001 budget new and expanded research initiatives in biobased products and new uses.

Biobased products and new uses (to expand markets, improve farm income, and reduce dependence on nonrenewable fossil fuels)

Biobased feedstocks and products are commercial and industrial products, other than food and feed, that utilize biological products or renewable domestic agricultural (plant, animal, and marine) or forestry materials in their production and manufacture. On August 12, 1999 the President signed an Executive Order 13101 to accelerate the development and commercialization of biofuels and biobased products. Legislation to enhance this program area was also introduced by the Congress. Biobased products research is a high priority for several reasons. First, there is a need for new products and uses to expand markets for farm and forest products and improve farm income. Second, there is an increasing concern regarding the long term adverse environmental impacts from the continuing use of nonrenewable fossil resources. Third, our Nation is growing increasingly dependent on imported sources of energy and industrial feedstocks.

ARS is requesting an increase of \$14,000,000 to develop biobased materials from agricultural commodities and byproducts; improve conversion of agricultural materials to biofuels; expand development of novel crops for value added products; improve biomass for energy; and increase our knowledge of fundamental biomaterials science. The proposed research will bring to commercialization an increased number of biobased feedstocks and products that can successfully compete in the marketplace with fossil fuel-based feedstocks and products. Success will increase the use of environmentally preferable feedstocks and products while reducing the use of those that add global warming gases to the atmosphere. Success will add new profit potential to old crops and create profitable new crops. Moreover, adoption of biobased feedstocks and new products will bring growth in processing and manufacturing businesses near to where the crops are grown, providing new off-farm jobs and income growth for rural America.

A safe and secure food and fiber system

One of the Agency's principal goals is to perform research which will ensure that U.S. farmers and food processors have the technologies and resources necessary to produce a safe and secure food system. Under this goal, ARS is recommending in its fiscal year 2001 budget new and expanded research initiatives in emerging and exotic diseases, invasive species, agricultural genome and genetics, and food safety.

Emerging and Exotic Diseases, and Pests (to reduce agricultural losses, protect the Nation from bioterrorism, and help ensure food safety)

Emerging and reemerging infectious diseases and pests during the past several years have become and remain a major public and animal health concern. The globalization of trade, increased international travel, climate change, intensive agriculture, and changing agricultural demographics have created new opportunities for reemergence and spread of infectious diseases and pests. Exotic (non-native) pathogens or pests once introduced into the U.S. can explode into an epidemic due to the absence of natural control agents and the lack of resistance of host animals. For emerging diseases to be detected and effectively controlled, the biology of the pathogens, pests, and parasites must be researched and strategies developed to limit their establishment and spread.

ARS is requesting a total increase of \$4,358,000, which includes an increase of \$3,750,000 for preventing and controlling emerging exotic and domestic infectious diseases of livestock and aquaculture, controlling livestock pests, and developing vaccines for brucellosis in wildlife, and an increase of \$608,000 to prevent and control emerging and exotic plant diseases. The proposed animal and plant disease research will lead to better diagnostic tests and improved control technologies and practices resulting in reduced production losses. It will also help ensure that the U.S. food supply remains the safest, healthiest, and least costly in the world.

United States agriculture is also extremely vulnerable to a deliberate introduction of highly infectious diseases and pests, particularly foreign diseases not endemic to the U.S. A recent GAO report cites that certain countries are engaged in developing biological warfare agents directed at animal and plant agriculture. Disease pathogens that could be used include highly infectious viruses, bacteria, nematodes, fungi, and insects that attack major commodities, such as cattle, swine, poultry, cereals, vegetables, and fruits. The malicious introduction of these pathogens would affect consumer confidence in the safety of their food and could have profound impacts on the U.S. economy. The potential impact of an outbreak of foot and mouth disease in cattle and swine in the U.S. was vividly demonstrated in 1997 in Taiwan where eight million pigs had to be destroyed causing \$5 billion in economic losses, environmental consequences, and a total shutdown of their swine exports.

To protect U.S. agriculture from its vulnerability to acts of bioterrorism, ARS is requesting an increase of \$10,000,000. Terrorist acts against U.S. agriculture have the potential to cost tens of billions of dollars and many lives. It is therefore necessary to take preventive action now. Research will focus on developing a forensic capability to rapidly identify highly infectious pathogens that have been turned into biological weapons. Also, new tools will be developed which will facilitate the epidemiological mapping of disease outbreaks and tracking of disease agents to their geographic origin. This new generation of technology will also substantially augment our traditional mission and capacity to deal with animal diseases that naturally or accidentally enter the U.S. and threaten the livestock industry.

Invasive Species (to detect and eradicate new invading weed and pest species)

Invasive weeds and other pest species cost the Nation over \$122 billion a year. At last count, there were more than 30,000 invasive species in the U.S.—they impact production agriculture, organic farming, the environment, and other plant and animal species. For example, weeds such as purple loosestrife, leafy spurge, salt cedar, Brazilian Pepper, yellow starthistle, water hyacinth, downy brome, and melaleuca infest at least 100 million acres in the U.S. Arthropod pests, such as the silverleaf whitefly, Asian longhorned beetle, and Russian aphid destroy 13 percent of crop production each year. About one half of the endangered plants in the Nation are at risk because of invasive species. In 1999, the President signed an Executive Order on Invasive Species directing agencies to increase their efforts to detect and eradicate incipient populations and prevent invasive species from entering the U.S. Many Members of this Subcommittee are aware of these problems in your own States and districts.

In addressing the growing invasive species problem, ARS is requesting an increase of \$4,300,000. Research will be directed toward developing pathogens for biological control of invasive weeds and insects. In addition, integrated management systems will be developed for weeds such as purple loosestrife. Also, new biological

information, and the systematics of key groups of invasive weeds and insects will be developed. The proposed research will aid APHIS and other regulatory agencies, and State land managers in managing established invasive species, and detecting and eradicating new invading species.

Agricultural Genome (to enhance the quality and safety of the food supply, and strengthen U.S. agricultural competitiveness in world markets)

The U.S. agricultural system faces formidable challenges, from new pests and diseases, water and soil pollution and degradation, climate events, and less land available for farming. These challenges can only be met by harnessing the inherent potential of genetic resources. More rapid and efficient methods are necessary to identify and manipulate the useful properties of genes and genomes. New methods termed “genomics,” rely on more detailed, accurate, and comprehensive knowledge of genetic organization and function. This will enable scientists to examine the genetic potential of plants, animals, and beneficial organisms.

ARS is proposing an increase of \$5,350,000 to develop bioinformatic tools, biological databases, and information management technology for plants. The research includes manipulating the function of important genes in crops, and developing new genomic approaches for improving economically important traits in livestock and poultry. In addition, marker genes of pathogenic microorganisms will be characterized to develop disease prevention in plants and animals. The proposed research will provide the means for maintaining and enhancing the quality and safety of the U.S. food supply. It will also strengthen the Nation’s agricultural competitiveness in world markets by ensuring continued improvement of plants and animals.

Agricultural Genetic Resources (to protect the Nation’s agriculture from genetic vulnerability, and strengthen U.S. agricultural competitiveness)

The United States needs a comprehensive program to maintain: crop germplasm; genetic diversity within animal species which provide abundant high quality food and fiber; and microbial germplasm, including pathogens and microorganisms, which may be useful in bioconversion, bioremediation, or biocontrol. Genetic diversity is critical for further improvement of production efficiency and for the protection of valuable germplasm from catastrophic events including climate change and disease epidemics.

ARS is requesting an increase of \$6,600,000 to provide a program which will secure and maintain critical plant, animal, and microbial germplasm. Specifically, ARS will identify threatened germplasm and incorporate it into USDA/ARS gene banks. The germplasm will be preserved, documented, characterized, evaluated, and enhanced. The proposed germplasm program will protect U.S. agriculture from genetic vulnerability, and strengthen U.S. competitiveness in agricultural, pharmaceutical, and industrial markets by ensuring continued genetic improvement through an optimal pool of genetic resources.

Food Safety (to control pathogens and reduce food-related illnesses/deaths)

Food safety is a National Presidential priority. The Department is committed to providing consumers with the safest, highest quality food possible. It recognizes that food safety problems must be addressed and solved from the “farm-to-the-table.” ARS’ research begins at the preharvest stage of crop and animal production. It is there, during the production and transportation of animals to slaughter, that exposure and infection to pathogens takes place. This is a major source of contamination in meat-based foods. During production pathogens also contaminate harvested fruits and vegetables. Similarly, toxic metals from soils and allergens contaminate various commodities.

ARS is requesting a total increase of \$5,720,000. Within that total is a proposed increase of \$2,860,000 for preharvest food safety research to develop methods for controlling pathogens during preslaughter and transportation, and develop technologies to extend the useful life of antibiotics. Toxins, heavy metals, and allergens which contaminate food products will also be researched. In addition, management and animal health practices will be developed to reduce Salmonella enteritidis on and in shell eggs.

Postharvest operations—slaughter and processing—are also key links in the food safety chain. Postharvest operations can provide an opportunity for removing or inactivating pathogens previously acquired during production. Pathogens can rapidly develop resistance to antimicrobials and traditional control measures.

ARS is also requesting an increase of \$2,860,000 for postharvest food safety research. The proposed research will develop methods to: control pathogens in meat, poultry, and fruits and vegetables; detect pathogens and residues during processing and storage; and improve egg sanitation technologies and storage conditions to reduce contamination. Also, an Internet-based food safety research information system

will be developed as part of the Food Safety Research Information Office established at the National Agricultural Library. The proposed pre- and postharvest food safety research will result in fewer pathogens in the production and processing environment thereby reducing consumer food-related illnesses and deaths.

Food Quality Protection Act (to reduce the use of pesticides which are harmful to humans)

The Food Quality Protection Act (FQPA) requires a change in the standard for evaluating pesticides from an acceptable risk/benefit to a reasonable expectation of no harm. This change in the evaluation standard is likely to affect the permissible uses in agriculture of many pesticides that can have toxic effects on humans.

USDA policy already places high priority on the funding, development, and testing of replacement technology for currently used pesticides at risk of being taken off the market due to the new FQPA tolerance standards. The Department is committed to implementation of IPM practices on at least 75 percent of the Nation's crop acreage. In addition, USDA supports efforts to develop area-wide pest management programs using bio-intensive IPM approaches, IR-4 minor use pesticide programs, biological control agents, methyl bromide alternatives, and other IPM component technology.

In implementing FQPA, ARS is requesting an increase of \$4,537,000. Research would be directed at expanding area-wide IPM programs demonstrating alternatives to at-risk pesticides. IPM systems will be developed for fruits and vegetables treated with organophosphates and carbamates, and for pests under large scale control/eradication programs. In addition, methyl bromide alternatives will be developed and registered. The proposed research will develop new technologies and practices as substitutes for "hard" pesticides (e.g., organophosphate and carbamate pesticides) and provide new, target specific bio-intensive approaches to control crop and other agricultural pests. The research will also contribute to fulfilling the Department's commitment to implement IPM practices or methods on 75 percent of the Nation's crop acreage. Within the amount requested, ARS is also requesting an increase of \$1,500,000 to increase its support of the Department's Office of Pest Management Policy. Established in 1997, this office provides a coordinated and rapid response to FQPA data analysis needs, interacts with grower groups, and coordinates USDA programs with EPA.

A healthy and well nourished population

A healthy diet is critical to an individual's growth and development, susceptibility to diseases, and their quality of life. Poor nutrition underlies many chronic conditions, such as obesity, cardiovascular disease, cancer, osteoporosis, and diabetes. Research is only now beginning to reveal how nutrients and genes interact to cause various diseases. Under this goal, ARS is recommending in its fiscal year 2001 budget the largest increase for any one program area to support the President's Human Nutrition Research Initiative.

Human Nutrition (to reduce nutritionally-related diseases, and produce a more healthy, productive population)

The goal of the President's Human Nutrition Research Initiative is to improve the overall health of the American people by reducing health care costs and enhancing the quality of life by further defining the relationship between diet and health; improving the scientific basis of more effective food assistance programs; generating a more nutritious food supply; improving resistance to infection and immune disorders; promoting changes in diet by understanding the factors that affect food choices; and extending dietary guidance to nutritionally vulnerable groups by determining how food consumption at points in the life cycle affects risk of disease. In the first phase of the initiative, emphasis was placed on the dietary requirements of children. In the second phase, cutting edge research approaches such as molecular biology were applied to human nutrition to identify the role of nutrients in promoting health.

In this phase of the Initiative, ARS is requesting an increase of \$17,250,000. Emphasis will be on the identification and measurement of the active components of a healthy diet; determination of the factors that maintain healthy body weight; role of nutrition in bone growth and maintenance; importance of diet in maintaining optimal neurological function throughout life; effects of diet on the immune function; role of nutrition throughout the life cycle; and development of nutritional biomarkers. In addition, the National Nutrient Databank (the database of foods consumed in the U.S. and the foundation for food composition tables) will be updated. The proposed research will lead to a reduction in the number of nutritionally-related diseases, and to a more healthy and productive population. This in turn will lead to

a decrease in the staggering costs (estimated in excess of \$200 billion per year) associated with the treatment of nutritionally-related diseases.

An agricultural system that protects natural resources and the environment

Agricultural growth and enhanced productivity must be balanced with maintaining and preserving the Nation's natural resources. One of ARS' goals is to provide a better understanding of the complex interactions between agricultural production and the soil, water, and air. Under this goal, ARS is recommending in its fiscal year 2001 budget new and expanded research initiatives in global climate change, climate change technology, air quality, and integrated science for ecological challenges.

Global Climate Change (to reduce the harmful effects of global climate change on U.S. agriculture)

Agriculture is vulnerable to changes in climate. Rising temperatures and changing amounts and patterns of precipitation can reduce crop yields. A changing climate can also alter the competitive relationships between weeds and crops, and the frequency of insect infestations and the severity of weed infestations which challenges our ability to control pests. Strategies and technologies need to be developed so that we better understand the effects of climate change thereby mitigating their impacts on agriculture.

ARS is requesting an increase of \$7,900,000 for research on the effects of climate change on food availability; the impacts of atmospheric and climate change on the Alaskan agro-ecosystem; and the carbon cycle research initiative. In the carbon cycle initiative, ARS will collaborate with other Federal agencies in determining how farmers and ranchers can store carbon in agricultural soils to improve air quality. Rates of emissions of greenhouse gases associated with crop, livestock, and forage production systems will also be documented, and technologies to reduce them will be developed.

ARS will also conduct U.S. global change research program national assessment activities. Assessments assemble and synthesize scientific results, help increase interaction among scientists and the public, and aid in identifying gaps in knowledge. The national assessments and the other proposed global climate change initiatives will help mitigate the effects of global climate change. Accurate measurements of greenhouse gas emissions or rates of storage in agricultural soils will reduce climate change and assist in the prediction of future greenhouse gas concentrations.

Climate Change Technology (to expand biomass for energy, and predict/adapt to global change impacts)

By making changes in production and land use practices, agriculture can reduce greenhouse gas emissions. Practices such as, biomass conversion to fuels, improved animal management and waste utilization, conservation tillage, and other management practices (e.g., cover crops, buffers, etc.) will enhance long-term storage of carbon in soils. These practices will also increase energy efficiency, and improve soil tilth, fertility, and water holding capacity.

ARS is requesting an increase of \$7,000,000 to develop new technologies both for predicting and adapting to global change impacts, and for improving and expanding biomass for energy. The proposed research will provide farmers and ranchers with the means to adapt agricultural production methods in response to climate change. Expanding biomass for energy will contribute to sustainability, environmental quality, and efficiency of crop and livestock production, and forestall potential climate change.

Air Quality (to improve air quality)

With the adoption of the EPA's National Ambient Air Quality Standards, the role of agriculture in polluting air came under greater scrutiny. Concerns about the regulation of agricultural air quality prompted the establishment of the Agricultural Air Quality Task Force. The Task Force has identified the emission of particulates (which penetrate human lungs and cause various ailments) as its number one priority.

ARS is requesting an increase of \$2,000,000 to develop new knowledge on particulate matter and precursors. New knowledge will also be developed on the emission and control of animal manure odors. In addition, research will be conducted on protecting agricultural crops from the effects of tropospheric ozone. The proposed research will make it possible to develop technologies to control or mitigate dust and odor emissions. Also, practices will be established to protect crops from ozone damage.

Integrated Science for Ecological Challenges (to protect the Nation's soil and water resources)

Changes in land and resource use, the introduction of invasive species, the input of pollutants and excessive nutrients, extreme natural events, and changes in atmospheric and climate conditions—these stresses and their cumulative effect on the Nation's ecological systems is poorly understood and raises numerous questions. The Federal agencies in the National Science and Technology Council, Committee on Environment and Natural Resources propose to begin addressing these major ecological questions under a broad coordinated effort entitled, "Integrated Sciences for Ecological Challenges."

ARS is requesting an increase of \$6,800,000 under this initiative to protect the Nation's natural resources, by improving livestock manure management systems to protect environmental quality; controlling eutrophication, harmful algal blooms, and hypoxia in waterways; restoring riparian zones and coastal habitats; developing practices for managing agricultural production while protecting soil and water resources; and conducting integrated ecosystem risk assessments. The overall goal of the proposed research is to protect the Nation's natural resources.

Enhancing information systems

The National Agricultural Library (NAL) is the largest agricultural library in the world. Its print and electronic collections support the information needs of farmers, agricultural producers, researchers, policymakers, educators, and others. Under this goal, ARS is recommending in its fiscal year 2001 budget enhanced support of its research and information programs.

Enhanced Support of Research and Information Programs (to preserve and increase access to agricultural research information)

The number and variety of electronic information resources in agriculture continues to increase. At the same time, NAL must improve access to printed agricultural literature currently maintained in its collection. NAL also must initiate a digital archiving program to ensure that the Department's digital publications are accessible in the future.

ARS is requesting an increase of \$2,000,000 for increasing access to research information; updating and improving NAL's information delivery system; and preserving USDA digital publications. The proposed funding increase will ensure that NAL will be able to meet the growing needs of the agricultural community for rapid delivery of print and electronic information.

PAY COSTS

The Agency is requesting \$8,500,000 to cover part of the anticipated fiscal year 2001 pay raise. These funds are essential to the ongoing research effort of the Agency. The absorption of these costs over the last several years has eroded resources which has hindered the Agency's ability to hire new scientists, and procure equipment, materials, etc., which are critically needed to carry out ARS' research programs.

PROJECT TERMINATIONS

ARS is recommending no new funding for earmarked projects funded in fiscal year 2000, as well as lower priority projects. Resources that would have gone to these activities would be able to be allocated to high priority initiatives of national importance. None of the reductions in lower priority projects will be taken from the Administration's priority initiative areas.

BUILDINGS AND FACILITIES

Many of ARS' laboratories are inefficient and outdated. Major systems (i.e., water, heating, air-conditioning, electrical) in many of the laboratories have long passed their useful life expectancy and fail to meet building code requirements. The modernization or replacement of these laboratories which began several years ago remains a high priority.

In fiscal year 2001, the Agency recommends under its Buildings and Facilities account \$39,300,000 for the following modernization projects:

National Animal Disease Center, Ames, Iowa

The Center serves as USDA's primary animal health research facility. Its research is widely recognized as preventing and controlling animal diseases, and protecting the food supply. Scientists at the Center have developed vaccines for porcine

parvovirus, bovine viral diarrhea virus, and brucellosis, and have developed diagnostic tools for hog cholera, bovine tuberculosis, and scrapie.

In fiscal year 2001, \$9,000,000 is requested to plan and modernize facilities for ARS and APHIS. Specifically, ARS is requesting \$8,000,000 to complete planning and design for new Biosafety Level 2 and 3 Animal Isolation Facilities, and \$1,000,000 for utility distribution system improvements to support the new facilities. These facilities will be located on the NADC grounds and will be used by both ARS and APHIS scientists.

Beltsville Agricultural Research Center, Beltsville, Maryland

The largest agricultural center in the world, it is renowned for its prominent scientists, quality of research, and contributions to agriculture. Its research programs encompass natural resources and environmental sciences, plant sciences, livestock and poultry sciences, and human nutrition. In fiscal year 2000, ARS received an appropriation of \$13,000,000, primarily for modernization of the Beltsville Human Nutrition Research Center. In fiscal year 2001, the Agency is requesting an increase of \$13,300,000 to complete construction of the Beltsville Human Nutrition Research Center and for the modernization of the Building 307.

Western Regional Research Center, Albany, California

The Center conducts research principally on food safety and new agricultural uses. Research, however, is hampered by facilities which were built before World War II. In fiscal year 2000, ARS received \$2,600,000 for the design of a new Research and Development Facility. In fiscal year 2001, the Agency is requesting \$4,900,000 for the first phase of construction of the Research and Development Facility.

Plum Island Animal Disease Center, Greenport, New York

The Center conducts state-of-the-art research and diagnostic work on foreign diseases that are an ongoing threat to U.S. livestock. Located on an island off Long Island, the Center is the only site authorized by Congress to carry out such research. In fiscal year 2001, ARS is requesting \$7,000,000 for continuation of the modernization of existing facilities at the Center. No new construction is being proposed.

National Agricultural Library, Beltsville, Maryland

NAL is the largest agricultural library in the world and serves as a national resource for access to information on agriculture and related sciences. Built in 1968, many of the systems in the building are unreliable and require replacement. A 1991 facility condition study identified numerous mechanical, electrical, and architectural deficiencies. In fiscal year 2001, ARS is requesting \$1,770,000 to continue modernization projects currently underway.

U.S. National Arboretum, Washington, D.C.

The Arboretum was created by an Act of Congress in 1927 as a center for research and education on plant sciences. Since 1959, the Arboretum has been open to the public. Each year, thousands of residents and tourists who visit Washington, D.C. visit the Arboretum. A 1990 facility condition study of the Administration Building (which includes offices, laboratories, an auditorium, and an herbarium) found numerous building and system deficiencies. In fiscal year 2001, ARS is requesting \$530,000 in design funds for the modernization of the Administration Building, and \$2,800,000 for replacement of the irrigation distribution system leading into the collections and research plots, and for installation of an automated control system.

SUMMARY

In the span of a century, the face of American agriculture has changed dramatically—horses and mules have given way to power farm machinery, precision agriculture, remote sensing technologies, and bioinformatics. What has been achieved through agricultural research is truly remarkable.

As we begin a new century, we look ahead to the new opportunities and challenges that lie ahead. For the discoveries and advances that have not been made, ARS is hard at work. ARS is committed to solving the agricultural problems that affect both producers and consumers, and to improving the life of each and every American.

I will be pleased to respond to any questions that you may have regarding ARS' budget request.

ECONOMIC RESEARCH SERVICE

PREPARED STATEMENT OF SUSAN E. OFFUTT, ADMINISTRATOR

Mr. Chairman and members of the Committee, I am pleased to have the opportunity to present the proposed fiscal year 2001 budget for the Economic Research Service (ERS).

MISSION

The Economic Research Service provides economic and other social science research and analysis on efficiency, efficacy, and equity issues related to agriculture, food, natural resources, and rural development to improve public and private decision making.

BUDGET

The agency's request for 2001 is \$55.4 million, a net decrease of \$10 million from the 2000 appropriation. The net decrease consists of four parts: a \$1 million increase for an initiative on structural changes and concentration in food and agriculture; a \$.5 million increase to support a global research and outreach initiative; a \$.7 million increase for a study on carbon sequestration; and a \$12.2 million decrease for evaluations of food stamp, child nutrition, and WIC programs. Funding for these evaluation studies in 2001 is included in the Food and Nutrition Service (FNS) budget.

ERS CONTRIBUTIONS TO MISSION AREA GOALS

ERS shares five general goals with its fellow agencies in the Research, Education, and Economics (REE) mission area: (1) a highly competitive agricultural production system, (2) a safe and secure food supply, (3) a healthy and well nourished population, (4) harmony between agriculture and the environment, and (5) enhanced economic opportunity and quality of life for all Americans. These goals are fully consistent with the U.S. Department of Agriculture mission.

Goal I: The agricultural production system is highly competitive in the global economy

ERS helps the U.S. food and agriculture sector effectively adapt to changing market structure and post-WTO and post-NAFTA trade conditions by analyzing the linkage between domestic and global food and commodity markets and the implications of alternative domestic and international policies on competitiveness. ERS economists analyze factors that drive change in the structure and performance of domestic and global food and agriculture markets; provide economic assessments of structural change and competition in the food industry; analyze how global environmental change, international environmental treaties and agreements, and foreign trade restrictions affect U.S. agricultural production, exports, and imports; and provide economic analyses that determine how fundamental commodity market relationships are adjusting to changing trade, domestic policy, and structural conditions.

ERS will continue to work closely with the World Agricultural Outlook Board and other USDA agencies to provide short- and long-term projections of U.S. and world agricultural production, consumption, and trade. Cooperative efforts will seek to understand how commodity price and farm income variability affect market performance and interact with Federal policies and programs. ERS has sustained the frequency of reporting on commodities' outlooks, while strengthening the analysis that leads to a better understanding of reported observations and reporting needs in a sector that is witnessing profound structural change. In addition, ERS will continue to work closely with the Foreign Agricultural Service and the Office of the U.S. Trade Representative to assure that agricultural negotiations under the auspices of the World Trade Organization are successful and advantageous for U.S. agriculture. Research will target issues that prevented the Administration from fully meeting its goals for the Seattle-round of WTO trade negotiations—namely, the interrelationships involved among biotechnology, intellectual property rights, environmental concerns, and agricultural trade. ERS' December 1998 publication of *Agriculture in the WTO* demonstrated the Agency's ability to provide critical information on the benefits of earlier trade rounds and the potential gains from further liberalization of key markets. ERS experts will provide critical technical expertise in taking a more in-depth look at China's evolving role in world agricultural markets, including its potential membership in the WTO. ERS will conduct research designed to significantly improve the understanding among decision makers of the changing structure of the food marketing chain (for example, the implications for producers of the increasing

replacement of open markets by contractual arrangements and vertical integration). ERS will also continue to analyze the use and effectiveness of alternative marketing strategies and risk management tools in mitigating farm income risk. ERS' 1999 publication of *Managing Risk in Farming: Concepts, Research, and Analysis* demonstrates the broad and deep knowledge that ERS brings to addressing the risk concerns of the sector.

ERS analyses can help guide and evaluate resource allocation and management of public sector agricultural research—a key to maintaining increases in productivity that underlie a strong competitive position for U.S. farmers. ERS economists track and seek to understand the determinants of public and private spending on agricultural R&D; evaluate the returns from those expenditures; and consider the most effective roles for public and private sector research entities.

Structural change, coordination and concentration in food and agriculture

The request for an increase of \$1,056,000 in fiscal year 2001 is intended to greatly enhance research and the dissemination of information related to structural changes within the food and fiber system. These changes within the market structure can have far reaching impacts on farmers, consumers, rural communities, and U.S. competitiveness in international agricultural markets. Through this initiative, ERS will shed light on the appropriate role of agricultural policy in this new structural environment while looking at new ways to examine markets and conduct aggressive data collection programs. ERS will also examine opportunities for small farmers and rural communities to remain viable in the changing market structure.

Global Research and Outreach Initiative

The request for an increase of \$500,000 is part of an REE mission area inter-agency initiative to focus research and outreach programs on international issues of vital interest to the U.S. food and agriculture sector and on alleviation of the causes of global food insecurity. ERS will develop programs which are designed to strengthen research and outreach capacity in developing countries. Through collaborative activities with institutions in selected developing and former Soviet Block countries, ERS will be able to access information needed to support substantive research on challenges to developing a better understanding of the global agricultural market within which the U.S. food and agriculture sector functions. In the process, institutional and professional relationships will develop that facilitate long term exchanges and continued access to needed information and data.

Goal 2: The food production system is safe and secure

ERS focuses on improving the efficiency and effectiveness of public policies and programs designed to protect consumers from unsafe food by analyzing the benefits of safer food and the costs of food safety policies; efficient and cost-effective approaches to promote food safety; and how agricultural production and processing practices affect food safety, resource quality, and farm workers' safety. This research helps government officials design more efficient and cost-effective approaches to promote food safety. For example, ERS works closely with various USDA agencies and the Centers for Disease Control and Prevention (CDC) on pathogen reduction efforts, including Hazard Analysis and Critical Control Points (HACCP). The ERS research program provides detailed and up-to-date appraisals of the benefits of safer food, such as reducing medical costs and costs associated with productivity losses from foodborne illnesses caused by microbial pathogens. Specifically, in 1999 ERS used data provided by the CDC's "FoodNet" active surveillance system to update estimates of the costs of foodborne disease caused by four major microbial pathogens (estimated at \$9.2 to \$10.2 billion annually), and collaborated with CDC staff to refine and update the methodology for measuring the cost of foodborne disease. In fiscal year 1999, ERS established a new extramural research program to measure the benefits of safer food. ERS established a competitive selection process to award funding for cooperative agreements in food safety research. ERS awarded grants to Harvard University and the University of Wyoming to begin a multi-year effort to apply state of the art economic analysis to develop national estimates of the benefits of improving the safety of the Nation's food supply. In addition, ERS has undertaken new research on the costs of coming into compliance with various food safety policies, including assessment of the distribution of costs across the food industry and across different consumer demographic groups.

Understanding how food prices are determined is increasingly important in responding to domestic and international market events and opportunities that promote the security of the U.S. food supply. As the farm share of the food dollar declines, accurate retail price forecasts depend more heavily on understanding the marketing system beyond the farmgate. ERS systematically examines the factors that help set retail prices, including an assessment of the roles of the transpor-

tation, processing, manufacturing, wholesaling and retailing sectors, the impact of imports and exports, and linkages to the total economy.

Goal 3: The nation's population is healthy and well-nourished

ERS helps identify efficient and effective public policies that promote consumers' access to a wide variety of high-quality foods at affordable prices. ERS economists analyze factors affecting dietary changes as well as trends in America's eating habits; assess impacts of nutrition education and the implications for the individual, society and agriculture; and provide economic evaluations of food nutrition and assistance programs, such as factors determining changes in Food Stamp program participation. In addition, ERS studies the implications for producers and consumers of movement towards adoption of the dietary guidelines, evolution of trade in food products, and the determinants of food prices.

Analysis of nutrition education efforts considers what kinds of information motivate changes in consumer behavior, the food cost of healthy diets, the influence of food assistance programs on nutrition, and the implications of healthy diets for the structure of the food system. In 1999, ERS released the study, *America's Eating Habits: Changes and Consequences*, which poses questions and answers on several issues including: what are the economic costs associated with unhealthy eating habits; how much do people know about nutrition; how do national income and prices and demographic trends affect nutrient intake; and how do Government programs and regulations influence food expenditures and consumption. Since trade in high valued agricultural products now exceeds the value of bulk commodity flows, ERS will spend more time to disaggregate the components of these trade flows, understand their relationships to international investment and strategic behavior of U.S. food firms, and investigate the implications for U.S. consumers of a globalized food marketplace.

Goal 4: Agriculture and the environment are in harmony

In this area, ERS research and analytical efforts in cooperation with the Natural Resource Conservation Service (NRCS) support development of Federal farm, natural resource, and rural policies and programs. Such efforts promote long-term sustainability goals, improved agricultural competitiveness, and economic growth. This effort requires analyses of the profitability and environmental impacts of alternative production management systems in addition to the cost-effectiveness and equity of public sector conservation policies and programs. ERS analysts focus on evaluating the benefits and costs of agricultural and environmental policies and programs in order to assess the relationship between improvements in environmental quality and increases in agricultural competitiveness. For example, in its 1999 publication *Economic Valuation of Environmental Benefits and the Targeting of Conservation Programs: The Case of the CRP*, ERS demonstrated that targeting of land for inclusion in the Conservation Reserve Program with the use of a new environmental benefits index approximately doubled the benefits of outdoor activities affected by the CRP—particularly freshwater-based recreation and wildlife viewing. The ERS research report, *Economics of Water Quality Protection from Nonpoint Sources* (released in November 1999), compares and contrasts five different approaches to the prevention or resolution of the type of water quality problems most frequently associated with agriculture. This serves as a guide to agriculturally-related program development under the Clean Water Act. ERS is working with NRCS to provide a combination of economic, farm structural, and geographic information to inform ongoing decision making about the regulation of animal waste.

ERS is putting increasing emphasis on understanding and analyzing trends in adoption of genetically modified crops and the emergence of markets for both genetically modified and non-genetically modified commodities—becoming a leader in the public sector in releasing new and timely information on this topic. For example, ERS was the first government agency to provide and interpret survey data on the extent of adoption of genetically engineered soybeans, cotton, and corn. This included information on impacts on pesticide use, crop yields, and net returns.

Carbon sequestration initiative

This initiative will focus on the economic potential for domestic carbon sequestration and control of greenhouse gases (GHG) in agriculture, the use of economic incentives to encourage carbon sequestration on agricultural lands, and the potential to target USDA conservation programs to promote GHG mitigation activities in the farm sector. A request of \$700,000 for this initiative would allow ERS to analyze the economic potential of alternative practices that increase soil carbon levels and identify the most efficient policies to facilitate adoption of soil carbon building practices. It would also enable ERS to collaborate with researchers around the world to incorporate estimates of carbon sequestration in global economic models, as well as

to consider the potential for other GHG mitigation efforts on agriculture. This would build on modeling work to estimate the impacts of climate change on agriculture which links to the broader issue of threats to global agricultural sustainability such as water quantity and quality and land constraints and soil degradation.

Goal 5: Enhanced economic opportunity and quality of life for rural Americans

The ERS contribution to this goal is based on analysis that identifies how investment, employment opportunities and job training, and demographic trends affect rural America's capacity to prosper in the global marketplace. ERS economists analyze rural financial markets and how the availability of credit (particularly Federal credit) and public spending, taxes, and regulations influence rural economic development. ERS analyzes the changing size and characteristics of rural and farm populations and the implications of these changes on the performance of rural economies. In addition, ERS studies the economic structure and performance of non-farm economic activities in rural areas, including the rebound in population growth in non-metropolitan counties.

ERS will also monitor rural earnings and labor market trends with emphasis on regional and other disaggregations in order to provide insight into the determinants of variation in trends among rural counties. Such work should yield a better understanding of the factors that promote rural vitality and the opportunities for effective public sector intervention.

Because the effects of changes in welfare programs may vary between rural and urban residents, ERS social scientists will track implementation of recent program changes to understand impacts unique to rural residents. In particular, ERS analysis can help anticipate changes in participation across assistance programs for rural housing and for food security. For example, ERS has conducted the first nationally representative sample survey of participants in USDA's Section 502 rural housing program. Responses indicated that without the Section 502 program, 90 percent of borrowers thought it would have taken longer than 2 years, if ever, for them to be able to buy a comparable home. Another opportunity for understanding whether rural America faces unique circumstances will come with analysis of a recently-completed survey designed to determine characteristics of the rural manufacturing sector.

ERS continues to monitor the financial situation of the farm sector through establishing farm business organization and performance benchmarks. This task includes study of the financial position of farmers who employ technological advances and innovative risk management strategies in their businesses, compared with the financial position of farmers who use more traditional approaches. ERS has developed and widely disseminated a new farm typology that goes beyond the traditional classification of farms by sales class alone to a grouping that is much more reflective of operators' expectations from farming, stage in their life cycle, and dependence on agriculture. The development of the typology brings new understanding about the diversity of the U.S. farm community and the factors that can enhance success among small and minority-owned farms.

CUSTOMERS, PARTNERS, AND STAKEHOLDERS

The ultimate beneficiaries of ERS's program are the American people whose well-being is improved by informed public and private decisionmaking leading to more effective resource allocation. ERS shapes its program and products principally to serve key decision makers who routinely make or influence public policy and program decisions. This clientele includes White House and USDA policy officials and program administrators/managers; the U.S. Congress; other Federal agencies and State and local government officials; and domestic and international environmental, consumer, and other public organizations, including farm and industry groups interested in public policy issues.

ERS depends heavily on working relationships with other organizations and individuals to accomplish its mission. Key partners include: the National Agricultural Statistics Service for primary data collection; universities for research collaboration; the media as disseminators of ERS analyses; and other government agencies and departments for data information and services.

CLOSING REMARKS

I appreciate the support that this Committee has given ERS in the past and look forward to continue working with you and your staff to ensure that ERS makes the most effective and appropriate use of the public resources. Thank you.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

PREPARED STATEMENT OF DR. CHARLES W. LAUGHLIN, ADMINISTRATOR

Mr. Chairman and Members of the Committee, I appreciate the opportunity to present the proposed fiscal year 2001 budget for the Cooperative State Research, Education, and Extension Service (CSREES), one of four agencies in the Research, Education, and Economics (REE) mission area of the United States Department of Agriculture (USDA). I am especially honored as this is my first opportunity to submit testimony to this Committee.

I have been the Administrator of CSREES for a little over eight months, having come to CSREES from the land-grant university system. Through the years I spent in that great system, first as a student and then as an educator, I gained an appreciation for the strong partnership the agency has forged with the land-grant system, other colleges and universities, and public and private research and education organizations.

Over the years, I have witnessed how funding from the broad portfolio of CSREES programs has taken scientific discovery from conception to application. Formula funds have leveraged dollars from other sources, provided the start-up funds needed for an investigator to establish a research program and obtain the results needed to compete successfully in a competitive program, and allowed for a rapid response to an emerging problem. Competitively funded research from the National Research Initiative has supported individual investigators undertaking basic research aimed at generating new knowledge. Finally, research results were applied to real life problems through the Cooperative Extension System's outreach efforts. All of these efforts were undertaken in an environment which prepared students to meet the ongoing needs of agriculture, the environment, individuals and communities.

The broad portfolio of CSREES programs, whether formula based or competitively awarded, ensure that research leads to the transfer and implementation of practical outcomes. With this broad portfolio as a base, the strong Federal, state, and university partnership has supported great successes that have far reaching impacts on the food we eat, the environment in which we live, and the quality of life of our citizens. For example: In an Animal Health Program in the School of Veterinary Medicine at the University of Minnesota, three investigators teamed up to study three important pathogens, *Pasteurella multocida* (a multispecies animal pathogen of major national importance), *Cryptosporidium* (primarily a disease of cattle causing morbidity in calves, but also an opportunistic cause of disease in humans), and Avian pneumovirus (a new and emerging disease of turkeys). University and National Institutes of Health (NIH) funds supported the establishment of a gene sequencing facility. The research on *Pasteurella* and the *Pneumovirus* was extended by a grant from private industry, while CSREES formula funds were used to support the initial gene sequencing. These preliminary studies, in turn, led to successful grant applications to the National Research Initiative (NRI) and NIH. The NRI grant funds provided the sequencing of the entire *Pasteurella* genome, one of the first non-viral animal pathogens to have its entire genetic blueprint deciphered. The practical outcomes of this work have been enormous. First, for all three organisms, there has been the development of practical diagnostic kits and experimental vaccines based on knowledge gained from gene sequences. In the case of Avian pneumovirus, experiment station support allowed an accurate and sensitive diagnostic kit to be available within three months of obtaining the genome sequence. Two vaccines were developed within 12 months.

As a result of the development of the diagnostic kits and vaccines, extension professionals were able to work with producers to confine the spread of the disease and prevent a national epidemic. This example indicates how a variety of funding mechanisms may be necessary to take discovery research from conception to application. In particular, it demonstrates how formula funds provided to research directors can underwrite a new study such that it quickly becomes competitive. It shows how funds from one source can be used to leverage funds from another, and how both research and extension formula monies can be used to respond quickly to an emerging and potentially devastating disease that began at the local level but showed every likelihood of becoming a national catastrophe.

The questions before us involve not only important issues requiring the application of hard data and science, as in the scenario described above, but problems involving human behavior and motivation, complex social systems, and personal values. These questions require an agency that is engaged, and an engaged agency must be organized to step up to today's and tomorrow's needs. The challenge to CSREES is to move from a knowledge-dissemination model to an engagement model, developing and sustaining mutually beneficial partnerships with a wide

array of constituents. The fiscal year 2001 budget strongly moves us in that direction.

The fiscal year 2001 budget proposes an increase of approximately 2.3 percent in discretionary funds. CSREES is committed to seven overarching themes in its fiscal year 2001 budget:

- Increases for competitively awarded grant programs* such as the \$30.7 million increase for the NRI;
- Funding for targeted areas*, including Biobased Products, Invasive Species, and Pest Related issues;
- Integrated research, extension, and education activities*, as evidenced by an increase of \$36.6 million increase in the Integrated Activities Account;
- A balanced program portfolio*, as evidenced by sustained support at the fiscal year 2000 level for all formula programs;
- Expanded partnerships to reach diverse audiences* through increases in funding for the 1890 and 1994 land-grant institutions, as well as for Hispanic-Serving Institutions; and through increases in programs that support the USDA Civil Rights Implementation Team Recommendations;
- Development of human capacity* to address the need for a highly trained cadre of quality scientists, engineers, managers, and technical specialists in the food and fiber systems through increased funding for the Higher Education Programs and International Science and Education Grants; and
- Streamlined management and improved accountability* of CSREES programs through increases for the Research, Education, and Economics Information System (REEIS), and through the integration of research, extension, and education under certain programs as intended in the Agricultural Research, Extension, and Education Reform Act of 1998 (AREERA).

FISCAL YEAR 2001 BUDGET HIGHLIGHTS

The fiscal year 2001 budget request is a conscious effort to address concerns raised about the distribution of funding between formula grant programs and competitive grant programs in the Administration's fiscal year 2000 Budget. In order to reduce the disparity in funding between formula and competitive grant programs, the fiscal year 2000 budget proposed \$200 million for the National Research Initiative and \$489 million for the six major formula programs (a reduction from the fiscal year 1999 enacted level of \$540 million). In response to the concerns raised about this reduction, the fiscal year 2001 budget has proposed to fund major formula programs at the fiscal year 2000 enacted level of \$542 million, and to request a more modest funding level of \$150 million for the NRI. We hope that the Committee will recognize and respond to this action, and provide this more modest increase for the NRI.

One of the most crucial variables in the food and fiber system is scientific and professional human capital. The research and education agenda of the future depends on a highly trained cadre of qualified scientists, engineers, managers, and technical specialists. However, the higher education institutions that produce this essential human capital are confronted with two increasingly serious issues: expertise development and institutional development. Increases are provided in the fiscal year 2001 budget for several of the CSREES Higher Education Programs. An increase of \$2 million is provided for the Food and Agricultural Sciences National Needs Graduate Fellowships Grants Program to expand support for the recruitment and training of outstanding graduate students in the food and agricultural sciences. An increase of \$1.65 million is provided for the Higher Education Challenge Grants Program to enhance programs and capabilities for educating baccalaureate students in priority food and agricultural science areas, including food safety. An increase of \$1 million is provided for the Multicultural Scholars Program which will support efforts to increase the multicultural diversity of the food and agricultural scientific and professional workforce.

The CSREES budget request reflects USDA Civil Rights Action Team recommendations to address disparities in funding and enhance the Department's cooperative efforts with institutions of higher education that are primarily devoted to the needs of minority students. An increase of \$650 thousand is provided for the Hispanic Serving Institutions Education Grants program and an increase of \$300 thousand is provided for the 1890 Institutions Teaching and Research Capacity Building Grants Program. CSREES is proposing an increase of \$2.5 million for the Native American Institutions Endowment Fund to increase the endowment which will increase the interest earned on the endowment for use by the 1994 Institutions. CSREES also is proposing that the 1994 Institutions be authorized to use endowment income for facility renovation and construction and will encourage the 1994

Institutions to use the increased funding for that purpose. An increase of \$0.5 million is provided for the second year of the 1994 Institutions competitive research program; an increase of \$0.4 million is provided for the Extension Services at 1994 Institutions program; and an increase of \$3.3 million is proposed for the Extension Indian Reservations Program to enhance the ability of extension agents to provide educational programs to isolated and under-served audiences on the reservations. Additionally, eligibility under the Section 406 Integrated Authority, first used in 2000 and for which a total of \$76 million in 12 programs is requested in 2001, is open to colleges and universities, including the 1890 institutions.

Achieving sustained long-term improvement in the competitive position of United States agriculture relies critically on the Federal government's assurance that producers and marketers have access to the basic tools for success. Studies have shown that successful producers (farmers, ranchers, and foresters) are better educated, more apt to adopt new technology, have lower costs of production, and take better advantage of or have more opportunities for spreading production and marketing risk across alternative enterprises and mechanisms, than their less successful counterparts. The fiscal year 2001 CSREES budget proposes a new \$9.6 million Biobased Products Program that will generate information and tools for farmers to grow, harvest, and handle alternative crops, and for manufacturers to convert renewable, raw materials to useful products for industry and/or consumers. The \$4 million proposed for a new Small Farms Initiative will develop research, education, and extension programs in appropriate marketing strategies for small farms, business skills for small farmers, and help beginning farmers establish viable farm operations and enterprises. A proposed increase of almost \$3.7 million will be focused on organic farming under the research and extension components of the Sustainable Agriculture Research and Education Program. An additional \$1 million is requested for a new program to develop and implement biologically based pest management practices that mitigate the ecological, agronomical and economic risks associated with the transition from conventional to organic production systems.

Increases are proposed to support the development and application of new technology and management practices to replace the traditional pest controls that are at risk of being restricted or prohibited due to the Food Quality Protection Act of 1996 (FQPA). The budget proposes a \$6 million increase to support long-term development and implementation of innovative pest management for major acreage crops, fruits, and vegetables through an integrated research, education, and extension competitive grants program. A \$2 million increase is proposed for the development of intermediate-term alternative pest controls for fruit and vegetable crops to replace pesticides at risk of not meeting the new FQPA requirements.

An additional \$3 million is proposed for development of practical management alternatives and technologies for commodities affected by the methyl bromide phase-out now scheduled for 2005 under recent amendments to the Clean Air Act. The budget includes an increase of \$1.5 million for a Regional Crop Information and Policy Centers program that will address high priority pest management needs of Federal and State regulators, extension personnel, and the public through a coordinated effort at the regional level. These programs, in conjunction with increased funding for the Critical Issues, Pest Management Alternatives, Minor Crop Pest Management, Expert IPM Decision Support System, Integrated Pest Management extension, and Pesticide Applicator Training programs, as well as sustained funding for the Integrated Pest Management research program, will ensure a more safe and secure food and fiber system.

Establishing the scientific basis for optimal health, developing knowledge of the eating habits of Americans, and modifying food intake behavior are critical components to having a well-nourished population. An increasingly important component to having a well-nourished population is empowering our communities to build their capacities to meet a greater share of their food needs. The fiscal year 2001 budget proposes a new \$5.25 million Anti-Hunger and Food Security Grants Program to provide support to non-profit entities for projects that reduce hunger, improve nutrition, bolster community food security, and help families move from poverty to self-sufficiency. An increase of \$2.3 million above the 2000 appropriated level also is proposed for the Expanded Food and Nutrition Education Program (EFNEP) to support nutrition education programs aimed at meeting the needs of undernourished segments of the population, especially children.

As a Nation, we increasingly value the environment—clean air and water, unique ecosystems, and pristine land. We recognize that, given the vast amounts of land being used in agricultural or forestry production, we must ensure that our production practices, as well as our public policies and programs affecting these practices, are consistent with the dual objectives of promoting competitiveness while preserving natural resources and environmental quality. To achieve these goals, a bet-

ter understanding of the complex interactions between agricultural production and the environment is needed. An increase of \$1.5 million is proposed for a new Invasive Species Program in fiscal year 2001 to target invasive species issues on an ecoregional basis. Water Quality also is a serious national concern as reflected in the President's Clean Water Action Plan. We propose an increase of \$3.2 million for the integrated research and extension water quality program that will support projects to investigate such issues as the linkage between agricultural practices and outbreaks of harmful algal blooms, which can lead to conditions that cause massive fish-kills, human health problems, and significant economic losses to the seafood industry.

Americans recognize that their quality of life depends largely on economic, physical, and institutional factors affecting their families, businesses, and communities. The fast pace of changes in these factors, and their increasingly complex interactions, present a growing challenge. CSREES, in partnership with the land-grant university system, enhances the capabilities of individuals, families, and communities to improve their quality of life. An increase of \$5 million is proposed for a new Youth Farm Safety Education and Certification Program for support to States to provide formal safety training and certification programs targeted to youth who are 16 to 17 years of age and working in agriculture to help mitigate farm-related injuries and deaths. The fiscal year 2001 budget proposes an increase of \$1 million for the Children, Youth, and Families at Risk program to enhance child care programs for those segments of the population in greatest need, including limited resource families, isolated farm and rural families, and families needing child care during non-traditional hours, such as families of migrant farm laborers.

CSREES strategies to ensure responsive and effective management of USDA's extramural research, extension, and education programs include: strengthening the Federal/State partnership; integrating research, extension, and education activities as appropriate; improving information management systems which are accessed by both internal and external users; and participating in efforts to improve financial management within USDA. The fiscal year 2001 budget proposes an increase of \$250 thousand for REEIS. Increased funding will help further the implementation of the system to enable CSREES and the REE mission area to meet the reporting requirements of the Government Performance and Results Act and help facilitate implementation of various reporting requirements and accountability provisions of AREERA.

The fiscal year 2001 Budget also includes mandatory funding of \$120 million for the Initiative for Future Agriculture and Food Systems under Section 401 of AREERA for competitive research, education, and extension grants to address critical and emerging agriculture issues. Mandatory funding also is available under the Fund for Rural America, where a minimum of \$20 million is expected to be provided for a wide range of research, extension, and education activities. The budget also supports funding for the Community Food Projects grants program at \$2.5 million (supported with mandatory funds provided by the Food and Nutrition Service Food Stamp Program).

An increasing portion of Federal funds will be distributed competitively to address the most critical needs of the agricultural community and fund the most highly meritorious projects. The increases proposed for competitive programs are partially offset by decreases in non-competitive projects slated for reductions due to constrained budget resources. The additional flexibility provided in AREERA, where a portion of the formula funds can be used to support either research or extension projects, allows states more authority to use Federal funds in addressing their highest priority needs.

SUMMARY

The CSREES fiscal year 2001 budget represents a critical investment in research, extension, education, and integrated programs that focus on the development and delivery of tools to help agriculture compete in the long-term, enhancement of the environment, improvement of human health, and development of human capacity.

FOOD AND NUTRITION SERVICE

PREPARED STATEMENT OF SAMUEL CHAMBERS, JR., ADMINISTRATOR

Thank you, Mr. Chairman and members of this Subcommittee: I am Samuel Chambers, Jr., the Administrator of the Food and Nutrition Service (FNS). This is my second appearance before the Subcommittee having come to FNS eighteen months ago from the Michigan Family Independence Agency for Wayne County

where I served as the Director. In my previous position, I gained a substantial familiarity with the U.S. Department of Agriculture's nutrition assistance programs, particularly how these programs operate at the State and local level. I wish to thank you and the other Subcommittee members for the opportunity to again appear before this Subcommittee to discuss the fiscal year 2001 budget request for FNS.

2001 BUDGET REQUEST

The FNS requests \$36.3 billion in new budget authority for fiscal year 2001, a level that will maintain and augment the long-standing contribution of the Nation's nutrition assistance safety net in fighting hunger and improving nutrition for children and low-income people. The request meets the priorities described in FNS's Strategic Plan, which was recently revised to better reflect the agency's unifying mission and purposes. The new Strategic Plan, and the fiscal year 2001 Annual Performance Plan which was derived from it, chart a clear course toward the food security and nutrition outcomes that these vital programs are intended to achieve, and to meeting the stewardship responsibilities that are critical to continued public confidence in Federal nutrition assistance. Both plans provide a strengthened foundation for both internal management improvements, and better coordination with our State and local nutrition assistance partners. I look forward to working with you as we meet the challenges of implementing these plans.

The fiscal year 2001 request includes funds to fully support all Federal nutrition programs and to make targeted improvements to these programs in a number of areas, some of which include the following.

- We propose to restore Food Stamp benefits to certain legal immigrants who lost their eligibility as a result of Welfare Reform;
- We are proposing simplification of certain food stamp rules related to the ownership of vehicles, which would encourage work by eliminating barriers to participation that result from owning a reliable vehicle;
- We propose an array of management changes designed to improve oversight in the Child and Adult Care Food Program (CACFP);
- The request includes the second increment of resources necessary to carry out the School Breakfast Program Pilot which we initiated in fiscal year 2000; and
- The request for the Women, Infants and Children's (WIC) Program is sufficient to provide benefits for all those eligible who wish to participate.

FOOD STAMP PROGRAM

The Food Stamp Program continues to serve the Nation as the primary source of nutrition assistance for low-income Americans. The program's mission is to ensure that low-income Americans have access to a nutritious, healthful diet through nutrition assistance and education. The resulting improvements in the nutritional status of low-income Americans protects their health and strengthens the food and agricultural economy. We are requesting \$22.2 billion for the Food Stamp Programs in the context of continuing strong economic conditions. This estimate includes a benefit reserve of \$1 billion, a \$900 million increase over fiscal year 2000 level. This benefit reserve will ensure that funds can be made available quickly in the event of some unforeseen circumstance, thereby ensuring the program's ability to get food quickly to people who need it. Based on current economic forecasts from the Office of Management and Budget (OMB) for fiscal year 2001:

- The average unemployment rate is projected to be 4.4 percent;
- Food Stamp Program participation is projected to average 18.8 million persons monthly under current law; and
- The average monthly benefit is projected to be \$76.40 per person.

The cost of the Thrifty Food Plan for a family of four is projected to rise about 2.9 percent from fiscal year 2000 to fiscal year 2001. Participation is projected to rise by approximately 750,000, reflecting a slight increase in the population eligible for benefits. In addition, the request reflects our legislative proposal to restore benefits to legal immigrants made ineligible for benefits under welfare reform. Benefits would be restored: (1) to legal immigrants who resided in the U.S. on August 22, 1996 and who subsequently reach age 65 benefiting 10,000 people by fiscal year 2005 ; and (2) to legal immigrant adults who resided in the U.S. on August 22, 1996 and live with eligible children, effective April 1, 2001, benefiting 155,000 people by fiscal year 2005. Another proposal will allow States the option of conforming food stamp rules on the treatment of vehicles to a more generous Temporary Assistance to Needy Families Program (TANF) policy. This change would help participants to access food stamp benefits and also own a reliable vehicle so they may have the needed transportation to obtain and keep a job. A final proposal in our request

would allow States to use the same rules for defining income in the Food Stamp Program as in the Medicaid Program. Also included under the Food Stamp account is \$100 million authorized for the purchase of commodities for The Emergency Food Assistance Program and \$1.3 billion to fund the Nutrition Assistance Program for Puerto Rico. Our request also includes \$76.5 million for the Food Distribution Program on Indian Reservations (FDPIR), a slight increase from fiscal year 2000 reflecting the increased costs to the Indian Tribal Organizations (ITO) for administration of the program. The FDPIR provides benefits to eligible needy persons living on or near Indian reservations and was authorized by the Food Stamp Act in response to the need for an alternate program for those who do not have access to the regular Food Stamp Program. The estimates for participation in the program during fiscal year 2001 average 133,300 persons monthly, the same level projected for fiscal year 2000.

CHILD NUTRITION PROGRAMS

The purpose of the Child Nutrition Programs is to assist State and local governments in providing healthful, nutritious meals to children in public and nonprofit private schools, child care institutions, including family day care homes and summer recreation programs. FNS is requesting \$9.5 billion which is slightly less than the level enacted for fiscal year 2000. We estimate that in fiscal year 2001, the requested funds, plus about \$416 million in projected carryover funds available from fiscal year 2000, will support:

- 4.6 billion meals in the School Lunch Program;
- 1.3 billion meals in the School Breakfast Program;
- 1.8 billion meals in Child Care Centers and Day Care Homes;
- 155 million meals in the Summer Food Program; and
- 130 million half pints of milk in the Special Milk Program.

For fiscal year 2001, expected average daily participation in both the National School Lunch Program (SLP) and the School Breakfast Program (SBP) are projected to be somewhat higher than in fiscal year 2000—the SLP is up by 1.6 percent while the SBP is up by about 3.2 percent.

Included in our request for fiscal year 2001 is \$6 million to fund the final phase of the School Breakfast Program Pilot which was initiated by FNS during fiscal year 2000. During the three year project, FNS will carefully evaluate the effect of eating a free school breakfast on children's behavior and educational performance. The final increment of resources requested is sufficient to fully fund the collection and analysis of data as well as food costs necessary to complete the evaluation.

In the Child and Adult Care Food Program we project a 4.5 percent increase (77 million) in meals served over fiscal year 2000. In an effort to improve program integrity of the CACFP program, we are proposing legislation that would net the agency estimated savings of about \$800 thousand in fiscal year 2001 and \$115.2 million over a five year period. The proposal will include measures to strengthen oversight by sponsors, including prohibiting participation by sponsors that have a track record of mismanagement in other government programs and limiting and funds that may be retained by sponsors of child care centers for administration. The proposal also includes measures to strengthen State oversight, such as allowing States to retain a portion of program funds recovered through audits and reviews. In addition, the proposal would enhance Federal oversight and fund an evaluation of the program's administrative reimbursement structure. This proposal effectively addresses a number of issues raised in Federal audits which can only be addressed through legislation. These resources would be a complement to and reinforced by the additional funds for Child Nutrition Program integrity enforcement which we are requesting in the Food Program Administration (FPA) account.

Included as part of our child nutrition request is \$2 million for the Nutrition, Education and Training (NET) Program. I urge your support for this modest amount which will help to fund the State infrastructure that provides training for school food service personnel in food service management, for instructing teachers in nutrition education, and for teaching children about the relationship of nutrition and health in order to help them make better food choices.

SCHOOL MEALS INITIATIVE AND TEAM NUTRITION

The School Meals Initiative for Healthy Children regulation updated the nutrition standards for school meals and recognized the importance of training and technical assistance for school food service professionals and nutrition education for students. To implement this regulation, the Food and Nutrition Service established the Team Nutrition Initiative, a comprehensive, structured plan for improving the nutritional standards of school meals as well as creating an environment in the school dining

area, in the classroom and in the community that fosters good dietary practices among children and their families. This initiative involves schools, parents and the community in efforts to continuously improve school meals, and to promote the health and education of 50 million school children in more than 96,000 schools Nationwide. Through training and technical assistance for school food service professionals; fun, interactive nutrition education for children and their parents; and support for school and community leaders, Team Nutrition works to change current behaviors to be more supportive of healthy eating and physical activity. These strategies are accomplished through direct Federal operations as well as grants to State agencies. In fiscal year 2001, we are requesting a total of \$10 million for Team Nutrition, the same level appropriated for fiscal year 2000.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN
(WIC)

The purpose of the WIC Program is to improve the health of nutritionally at-risk, low-income, pregnant, breastfeeding and postpartum women, infants and children up to their fifth birthday. WIC participants receive three primary benefits: nutritious food packages designed to supplement their diets; nutrition education intended to improve their nutrition practices; and referrals to other critical health and social services.

We are requesting \$4.1 billion in fiscal year 2001 to provide nutrition education and food benefits to a monthly average of almost 7.5 million needy women, infants and children. This funding level is sufficient to provide benefits for all those eligible who wish to participate in the program.

WIC ELECTRONIC BENEFIT TRANSFER (EBT)

FNS is engaging in activities complementary to the Food Stamp Program to advance EBT systems to improve program benefit delivery and client services for the WIC Program. Our WIC Program request for fiscal year 2001 includes \$6 million which will be dedicated to EBT development. Our goal is to implement EBT in States that have embarked on planning and eventually expand EBT development to additional States. Our current progress includes:

- A successful WIC/Food Stamp EBT pilot in Wyoming which resulted in the State's decision to proceed with implementing the EBT system Statewide;
- Nevada has completed WIC EBT system design development and is scheduled for a March 2000 launch of a pilot in the Reno area involving 7,200 WIC recipients and 30 retailers;
- Ohio has finalized their contract with Citibank for WIC EBT system design, development and implementation and expects to launch their pilot during the summer of 2000 in Montgomery County. The Ohio WIC EBT pilot will include up to 11,000 WIC recipients and 80 retailers;
- Michigan has finalized their contract with Citibank for WIC EBT system design, development and implementation and is in the process of negotiating the timeline and details of the WIC pilot, which is expected to begin by the end of calendar year 2000;
- Texas and New Mexico expect to launch WIC EBT pilots in fiscal year 2001;
- The PARTNERS project, a consortium of 6 WIC State agencies (CT, MA, ME, NH, RI, VT), plans to release a joint Request For Proposal (RFP) for WIC EBT pilots in fiscal year 2001, and is continuing extensive planning for the development and implementation of WIC EBT systems; and
- New Jersey plans to release an RFP for a WIC EBT pilot in fiscal year 2001.

FARMERS' MARKET NUTRITION PROGRAM

The Farmers Market Nutrition Program provides WIC participants access to fresh fruits and vegetables while also expanding the awareness and use of farmers' markets by consumers. We firmly believe this program is a strong complement to the WIC Program and should not be competing with WIC for needed funds. Accordingly, we are requesting funding for the Farmers' Market Nutrition Program separate from the WIC Program, that is, as part of the Commodity Assistance Programs. The requested level of \$20 million for fiscal year 2001 is an increase of \$5 million above the fiscal year 2000 level. This level of funding would allow the program to continue to grow to new counties in States currently participating and to expand beyond the current 39 State agencies participating in the program to other States which have expressed interest in having this program.

COMMODITY ASSISTANCE PROGRAMS

The Commodity Assistance Programs include funding for the Commodity Supplemental Food Program (CSFP), administrative funding for The Emergency Food Assistance Program (TEFAP) and funds for the Farmers' Market Nutrition Program. Our budget request for fiscal year 2001 includes:

- \$93.3 million in support of the women, infants, and children and elderly caseload in CSFP;
- \$45 million for TEFAP administrative expenses in addition to the \$100 million for commodity purchases available in the Food Stamp account providing for a cumulative total program of \$145 million; and
- \$20 million for the Farmers' Market Nutrition Program.

The CSFP level requested will support an average monthly participation of 102,800 women, infants and children as well as an average monthly participation of 320,100 elderly. The request of \$93.3 million, in conjunction with use of \$7 million in inventory, will allow for a total program of about \$100 million in fiscal year 2001. The request of \$93.3 million (which is a \$5 million increase from fiscal year 2000) is required in order to continue the program at the level of participation expected to be attained by the end of fiscal year 2000 which will include participants from five new States. These States include Ohio, Mississippi, Texas, Montana and Vermont.

NUTRITION PROGRAM FOR THE ELDERLY

Our request for the Nutrition Program for the Elderly is \$150 million, an increase of \$10 million above the fiscal year 2000 level. The request will allow FNS to support an increase in the number of meals served by about 7.7 percent.

FOOD PROGRAM ADMINISTRATION

Our request for fiscal year 2001 is \$128.6 million—an increase of \$14.0 million over fiscal year 2000. We are requesting a total of \$8 million (a \$5 million increase) to be used for program integrity initiatives in both the Food Stamp Program and the Child Nutrition Programs. This investment in program integrity, although significant in absolute terms, is small when compared to the more than \$36 billion spent annually for program benefits, State administration and other supporting activities. The requested increase of \$5 million would be divided between the Food Stamp and Child Nutrition Programs. Efforts in the Food Stamp Program would be directed to improving the accuracy of the quality control systems, working with States to reduce error rates and avoid error rate increases while ensuring benefits for eligible households; and efforts to ensure that States are efficiently using procedures designed to help eligible families retain food stamp benefits when they move from welfare to work. Efforts in the Child Nutrition Programs would be used in part to study sources of errors in school meals applications and evaluate alternative methods for determining and verifying children's eligibility for free and reduced price benefits in the School Lunch Program. Also, some of the resources would be devoted to enhanced Federal monitoring of the CACFP State agencies, sponsors and child care facilities.

The overall importance of nutrition to health is being increasingly recognized with diet-related medical and lost productivity costs soaring over an estimated \$71 billion annually. To reduce these costs, we are asking for \$2 million to develop an integrated nutrition education campaign to aggressively promote both the Dietary Guidelines for Americans and the Food Guide Pyramid to targeted segments of the general population (including the Spanish language community). This increase also provides for development of consumer materials that will help income individuals apply the Dietary Guidelines and Food Guide Pyramid concepts within a limited budget.

We also are asking for \$5 million to support an intergovernmental partnership led by FNS to address the nutrition, health, and employment needs of impoverished citizens in border areas known as "Colonias." These resources will allow FNS to expand efforts to a larger proportion of the 1,500 Colonias located near the Mexican border in Arizona, California, New Mexico and Texas.

STUDIES AND EVALUATION

For fiscal year 2001, we are requesting funds for practical, focused analysis in support of the agency's nutrition assistance programs. In the Food Stamp account, our request is for \$10.7 million; in the Child Nutrition account, our request is \$3 million; and in the WIC account, we are requesting \$3.5 million. The continued absence of study, demonstration and evaluation funds over the last three fiscal years

has severely limited the depth of FNS support to Congressional staff, decreased our ability to respond to States, and restricted us from providing practical, research-based guidance to the managers of our programs. FNS has a critical need to target program specific studies and evaluations, rather than general research. FNS has designed its studies and evaluations to be useful in formulating its nutrition policy, measuring program impacts and integrity, and advising both Administration officials and the Congress of the potential costs and effects of legislative proposals under consideration.

GOVERNMENT PERFORMANCE AND RESULTS ACT

The FNS Annual Performance Plan (APP) has been submitted as part of the fiscal year 2001 budget request. As previously indicated, the fiscal year 2001 APP has been structured to support the revised FNS Strategic Plan which has been extensively modified to better support the FNS mission. The goals outlined in the APP are directly related to the achievement of the agency's strategic goals and objectives.

CONCLUSION

The mission of FNS is to increase food security and reduce hunger in partnership with cooperating organizations by providing children and low-income people access to food, a healthful diet, and nutrition education in a manner that supports American agriculture and inspires public confidence. This fiscal year 2001 budget request reflects our commitment to the achievement of this mission. We also believe that our request for \$36.3 billion is crucial to continued efficient program operations. Mr. Chairman, this summarizes the FNS fiscal year 2001 budget request. I will be happy to answer questions that you or other members of the Subcommittee may have.

FOOD, NUTRITION AND CONSUMER SERVICES

PREPARED STATEMENT OF SHIRLEY R. WATKINS, UNDER SECRETARY

Mr. Chairman and Members of the Subcommittee. Thank you for the opportunity to present the fiscal year 2001 budget request for the Food, Nutrition, and Consumer Services (FNCS). I am accompanied today by Samuel Chambers Jr., the Administrator for the Food and Nutrition Service (FNS), Dr. Rajen Anand, the Executive Director for the Center for Nutrition Policy and Promotion and Stephen Dewhurst, the Department's Budget Officer. As Under Secretary for FNCS, I am responsible for nutrition assistance programs administered by the Food and Nutrition Service, including the three core programs: Food Stamp; Child Nutrition; and the Special Supplemental Nutrition Program for Women, Infants and Children (WIC). I am also responsible for the Center for Nutrition Policy and Promotion which is the lead Federal agency in the research and promotion of human nutrition issues.

The mission of FNS is to increase food security and reduce hunger in partnership with cooperating organizations by providing children and low-income people access to food, a healthful diet, and nutrition education in a manner that supports American agriculture and inspires public confidence. The importance of the nutrition assistance programs administered by FNS is clear. Despite the strongest economy in a generation, hunger in America remains a problem, and about one in five individuals participates in one or more of these programs. In 1998 over 9 million people, more than one-third of them children, lived in households that experienced hunger.

A nutritious diet and access to sufficient food are critical to lifelong health and well being, and a poor diet has been proven to be a significant factor in 4 out of the 10 leading causes of death in the United States. We know that obesity, in children and in adults, is a major factor in the incidence of such conditions as diabetes, hypertension and stroke, osteoporosis, heart disease, and some types of cancer. These diseases account for 1.4 million deaths annually, and they cost society an estimated \$71 billion in medical costs, lost productivity and premature deaths. Diet plays a central role in the prevention of virtually all of these appalling statistics. Our programs can play an effective role in education and prevention.

By fighting hunger and promoting good nutrition, these programs help to promote the well-being of millions of families and children in this country, and they play a crucial role in supporting those who are making the difficult move from welfare to work and self-sufficiency. Today we celebrate an extraordinarily strong economy and good times for the majority of our people. But even now, National economic success has not led to personal prosperity for everyone. Many continue to face difficulty and hardship, and our nutrition assistance programs exist to help. Even now—especially

now—we must not lose sight of the ongoing contribution that Federal nutrition assistance programs make in ensuring that, in good times and bad, no one in this land of unparalleled agricultural abundance should have to go without adequate and nutritious food.

PROGRAM HIGHLIGHTS

Before discussing some of the particulars of our budget request, I would like to share with you some of our efforts to maintain and improve the effectiveness of the Federal nutrition assistance programs.

The Food Stamp Program

Food Stamp Program (FSP) participants represent a broad cross-section of the Nation's needy families and children. The Food Stamp Program provides a critical nutrition safety net for low-income working families, children, the disabled, some of our legal aliens, and the elderly. We are working to ensure that the program reaches all those who need it and to serve them efficiently and with dignity.

As a result of welfare reform legislation, some groups of individuals have become ineligible for our programs. Many immigrants and unemployed adults without dependents are no longer entitled to receive food stamps. The Agricultural, Research Extension and Education Reform Act of 1998 (the 1998 Act) restored food stamp benefits to some of our legal aliens, but we continue to be concerned for those who remain ineligible for benefits. In our fiscal year 2001 request, we are asking that eligibility be restored (1) to certain legal aliens who become elderly and (2) to certain legal aliens living with eligible children. Additionally, we are requesting simplification of certain food stamp rules which relate (1) to the ownership of vehicles and (2) to the definition of income. I will have more to say about these specific policy initiatives.

The agency is leading the way in new benefit delivery technologies. At the end of fiscal year 1999, about two-thirds of all food stamp benefits were issued using Electronic Benefit Transfer (EBT). Thirty-two States and the District of Columbia had fully implemented EBT for issuing food stamp benefits. FNS continues efforts to provide needed technical assistance associated with State EBT implementation and to provide ground breaking technology in the development of a multi-program delivery system which includes both WIC and food stamp benefits.

Participation in the Food Stamp Program averaged 18.2 million people in fiscal year 1999, and has since fallen even further, reaching a 20 year low. Part of this decline can be attributed to the strength of the economy and the success of welfare reform in moving many families from welfare to work. Part of the decline is also due to new restrictions on the participation of legal aliens and unemployed able-bodied adults without dependents. However, between 1995 and 1997, food stamp participation fell five times faster than the poverty rate, a sign that the nutritional needs of some low-income people may be going unmet. The number of people in poverty fell by .8 million over this period while the number of food stamp participants fell by 3.8 million, suggesting that many poor families have left the program despite their continuing eligibility. Some families who leave welfare for work may not be aware that they are still eligible for food stamps and, in other instances, State or local agencies may have discouraged or even prevented those eligible for benefits from applying. In any case, families and children are suffering needlessly.

In July, 1999, the President responded by taking action to help these needy families. The efforts included (1) issuing guidance to make it easier for families to own reliable vehicles without losing their benefits, (2) providing States with options to simplify income reporting rules and (3) announcing a public education campaign for the Food Stamp Program. The goals of the education campaign are to reach and inform potential applicants about the Program and its requirements and to help those who may be eligible. The campaign is targeting four groups: the general public, the elderly, working poor, and immigrants. Using models developed by FNS, a variety of materials have been produced in both English and Spanish, and have been distributed by State and local agencies, community organizations, and advocacy groups.

FNS continues its efforts to support State welfare reform efforts while providing technical assistance as State policies evolve. In early fiscal year 1999, Food Stamp Program eligibility was restored to about 225,000 legal aliens who were made ineligible by the welfare reform legislation of 1996. FNS developed guidance for States on implementation and bilingual materials for immigrants, and also worked with the Social Security Administration (SSA) on a notice to Social Security Income (SSI) recipients advising them that they may again be eligible for food stamp benefits.

FNS continues to be a leader among Federal agencies in the implementation of the Treasury Offset Program (TOP) to collect delinquent food stamp recipient debt. Through TOP, Treasury is able to match Federal payments to a delinquent debtor

database. Under certain circumstances, when a match occurs, the payment is intercepted to satisfy the debt, either in whole or part. Claims collections for overissued food stamps increased to \$206 million in fiscal year 1999. In fiscal year 1999, over \$88 million in food stamp recipient debt was collected through TOP. FNS is currently working with State agencies to improve the process of submitting debts to TOP by (1) allowing State agencies to move from an annual submission process to a quarterly process and (2) providing direct online access to TOP for States for more timely updates and submissions.

In the Food Distribution Program on Indian Reservations (FDPIR) we have been working through a unique partnership between the Tribal Governments and USDA to make some important program changes. First, we have improved the FDPIR food package based on a comprehensive review conducted in fiscal year 1997. The nutritional content of the food package has been improved by decreasing the percent of calories from fat and making it conform more closely to the USDA's Food Guide Pyramid. Second, the successful and popular FDPIR Fresh Produce Initiative continues to expand to new sites across the country, providing enhanced nutritional benefits to nearly 78,000 people each month. This initiative is the result of a successful partnership with the Department of Defense, and has now expanded to 64 sites. Third, Indian Tribal Organizations (ITO's) that receive shipments through Federal warehouses are now enjoying significantly better service. By altering the basis on which orders are placed, the ITO's now only need place their requests two months in advance of delivery instead of the five months previously required.

In early fiscal year 1999, FNS published a rule which reinstated the agency's authority to grant waiver requests from ITO's in Oklahoma to allow Indian households living in urban areas to participate in the Food Distribution Program for Indian Households in Oklahoma (FDPIHO). This rule provides households living in urban areas with the choice of receiving either food stamps or commodities each month. To date, two Indian tribes in Oklahoma (the Choctaw Nation and the Chickasaw Nation) have requested waivers to expand FDPIHO services to urban areas. Both waivers were approved.

Child Nutrition

The Child Nutrition Programs, which include the National School Lunch and School Breakfast and After School Snack Programs, the Child and Adult Care Food Program, Summer Food Service Program and the Special Milk Program serve meals to millions of children in schools and other sites each day. For example, on an average school day during fiscal year 1999, more than 50 percent of all children enrolled in school ate a Federally supported school lunch. These programs are important because providing nutritious meals and nutrition education to these children helps them to be more productive and more likely to succeed in school and in life. Well-educated and healthy children mature into productive and healthy adults.

We are currently working to evaluate the potential impact of changes in the School Breakfast Program on student behavior and performance in school. The William F. Goodling Child Nutrition Reauthorization Act of 1998 (the Goodling Act) authorized FNS to pilot test the serving of breakfast in elementary schools in six districts. This pilot will test the impact of providing free breakfasts to all elementary school children without consideration to family income. I am pleased to report the agency has done a considerable amount of work in preparation for the planned beginning of the pilot in school year 2000-2001. Our fiscal year 2001 budget request includes \$6 million for the second and final installment of funding necessary to complete the pilot. These funds will support the provision of meals and a rigorous evaluation of the impact of providing free breakfasts regardless of income on student nutrition and educational achievement.

In the Child and Adult Care Food Program (CACFP) the Agency continues to aggressively expand program integrity activities. We are taking advantage of the Goodling Act which authorizes \$1 million each year targeted toward improved management and oversight of the CACFP. The preponderance of these resources are being used to fund additional staff years and associated travel costs to provide additional management support to State agencies. Additionally, we have reconvened the CACFP Management Improvement Task Force and significantly expanded its efforts. To date, the Task Force has developed training modules based on the previously issued management improvement guidance. As a part of our comprehensive integrity improvement strategy, we expect to publish a proposed and final child care initiative rule during the current fiscal year (2000). In addition to ongoing program oversight activities in fiscal year 2000, the agency will conduct an enhanced management evaluation of CACFP administration in one State in each of our seven regions. Finally, we are submitting, as part of the fiscal year 2001 budget, a proposal

which includes an array of management changes designed to further address the issues of integrity and oversight in the CACFP.

WIC

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) is widely regarded as one of the Nation's most successful, cost-effective public programs, and it continues to be one of our top priorities. This Administration has consistently demonstrated its commitment to ensuring that every eligible mother, infant and child is provided the opportunity to receive WIC benefits. In fiscal year 1999, average monthly participation was slightly above 7.3 million persons. We are working hard to make the program an even greater success. I would like to mention some noteworthy examples:

- In mid-December 1999 Vice President Gore's National Partnership for Reinventing Government announced that the WIC Program scored second highest among 30 high impact government programs in customer satisfaction. Only the Head Start Program scored higher. The rating was 83 out of a possible 100, and was about 10 points higher than the National average for the programs evaluated. These high customer satisfaction ratings are a testament to the close and productive partnership among USDA, the National Association of WIC Directors (NAWD), and the staff at the State and local levels who work with WIC participants every day. Together we vow to continue to provide the best quality service to WIC customers to help ensure the health of America's children.
- The agency has also continued its efforts to improve WIC program integrity. We recently issued a regulation to strengthen the determination of income eligibility during the certification process. All WIC State agencies have implemented a standard set of criteria to be used for nutritional risk determinations, and work continues to improve the consistency of determinations based on dietary risk. In the area of vendor management, we issued a proposed rule in June 1999 that would implement the provisions in the Goodling Act pertaining to vendor selection, monitoring, and the detection of high-risk vendors. This rule further proposed other comprehensive management provisions designed to strengthen vendor integrity. We plan to issue this final rule before the end of fiscal year 2000. In addition, in March 1999 we published a final rule to curb vendor-related fraud in the WIC Program by mandating uniform sanctions across WIC State agencies for the most serious program violations. These violations include trafficking, overcharging, and exchanging food vouchers for alcohol or tobacco products. The rule also requires the disqualification of any WIC vendor who has been disqualified from the Food Stamp Program. This rule is intended to promote WIC and Food Stamp Program coordination in the disqualification of vendors and retailers who violate program rules.
- FNS is engaged in activities to advance EBT systems that would improve benefit delivery and client services for the WIC Program. The agency is working with individual State initiatives to research, plan, fund, and implement WIC EBT systems. Several States continue to pursue hybrid benefit delivery systems at point-of-sale locations which would combine on-line food stamp benefit redemption with off-line WIC benefit authorization. FNS has earmarked \$2.6 million in grants for WIC EBT in fiscal year 2000. Our fiscal year 2001 request includes \$6 million dedicated to EBT development in States that have already begun EBT planning, with an ultimate goal of implementing EBT in additional States.
- The Farmers' Market Nutrition Program (FMNP) now operates in 39 State agencies, providing fresh fruits and vegetables to WIC participants. During 1999, the FMNP was expanded to add one new State (Alabama), one new Territory (Guam) and two Indian Tribal Organizations (Rosebud and Osage Tribal Councils). The President's budget transfers the program from WIC to the Commodity Assistance Program (CAP) and proposes to increase funding to allow for growth in those States currently participating as well as expansion into other States not currently in the program.
- FNS and the Center for Disease Control (CDC) continue to work with non-federal partners to increase access to immunization services through the WIC Program. Currently, about three quarters of all local WIC agencies assess client status and make appropriate referrals to immunization services for children. The CDC reports that about 81 percent of pre-school children are being assessed for immunization status and receive the needed services thanks to the intervention of the WIC Program.
- Over the past 10 years, WIC per person food costs have either declined or have reflected only a modest increase due to the diligent cost containment efforts of State and FNS partnerships. The most successful part of this strategy has been

competitively bid rebate contracts between State agencies and infant formula manufacturers. These successes have been instrumental in supporting more participation than would otherwise have been possible.

- The WIC Program promotes breastfeeding as the best form of nutrition for infants through the provision of support and encouragement to new mothers and through nutrition education during pregnancy. In fiscal year 1998, State agencies spent nearly \$57 million on this effort. FNS continues to sponsor semi-annual meetings of the Breastfeeding Promotion Consortium—a group of health professionals representing government, advocacy and public health interests. In 1997, FNS implemented a National Breastfeeding Promotion Campaign, in cooperation with State agencies. The goal of the Loving Support Campaign is to raise awareness of the benefits of breastfeeding among WIC-eligible women, fathers, and family health care providers to help create a community environment that accepts and supports a woman's decision to breastfeed. Currently, 54 WIC State agencies are participating in the campaign and a recent evaluation indicates that the campaign is a tremendous success. Along with the Department of Health and Human Services (DHHS), USDA participated in the development of a Health Care Physicians' and Providers' Breastfeeding Support Kit by Best Start. The kits were developed for health care professionals to complement the Loving Support Campaign materials which focus on consumer education. Finally, the authorization in the Goodling Act to allow program funds to be used for the purchase or rental of breast pumps was a giant step forward.

WIC is, without a doubt, one of the best nutrition assistance programs ever created. It provides mothers access to nutrition education, health care referrals, and supplemental foods rich in the necessary dietary elements they could not otherwise afford. WIC babies do get a healthier start in life, and we intend to continue our hard work so that all who need the program will be able to participate.

Commodity Supplemental Food Program

In our Commodity Supplemental Food Program (CSFP), we have improved the flexibility of State and local agencies to serve needy populations. In short, agencies operating CSFP can now serve women, infants, children and the elderly as needed. We are seeing a distinct increase in elderly participation, and we want to make sure that the program is responsive to their needs.

Program services have been improved through a redesign of inventory systems. Federal inventory is now replenished based on historical data, rather than on a requirement for organizations to place orders five months prior to delivery. This change significantly reduces the need for organizations to adjust orders and helps to ensure that they will have the foods they need on hand.

The Emergency Food Assistance Program

During fiscal year 1999, the States once more had the prerogative of using administrative funds for the purchase of food. This was a significant improvement and allowed administrative funds to be more efficiently used to increase the total flow of food from all sources through The Emergency Food Assistance Program (TEFAP). As a result, we have been able to purchase a greater variety of healthful foods. In fiscal year 1999, bonus commodities donated to States were valued at a total of \$108 million.

Food Program Administration

FNCS has a fundamental responsibility to ensure both the program and financial integrity of each nutrition assistance program including the timely delivery of benefits to all qualified recipients. It is a responsibility that the Administrator and I take very seriously. The FNS Food Program Administration (FPA) account, which supports most of the Federal administrative activity for our nutrition assistance programs, is an important part of such assurance. The FNS staff continues to be committed to finding new and innovative approaches to improving program integrity and services. I will have more to say concerning those new initiatives in this account.

In addition to its nutrition assistance programs, FNCS operates the Center for Nutrition Policy and Promotion. The Center is the focal point for the advancement and coordination of nutrition promotion and education policy. It provides important research and analysis and actively collaborates with public, private and non-profit organizations to expand the body of critical nutrition information and research.

Nutrition Education

FNCS nutrition education programs offer one of the Nation's best opportunities to improve dietary practices in our target populations in ways that promote health and well-being. These programs offer an extraordinary opportunity to reach partici-

pants, particularly children who participate during their formative years, with nutrition and healthy lifestyle messages. Research confirms that well-designed, behavior-focused interventions can effectively improve diets and nutrition-related behaviors. FNCS is working toward a comprehensive nutrition education approach that is fully integrated into all FNCS programs, and provides consistent, reinforcing nutrition messages across programs. Members of the target groups are encouraged to make healthy food and nutrition-related choices throughout their life cycle. The FNCS nutrition education objective is to reach all those we serve with state-of-the-art nutrition education that can effectively change behavior and promote long-term health. Last year, in response to a request included in the conference report accompanying the Fiscal Year 2000 Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, FNS prepared and submitted a report to Congress, "Promoting Healthy Eating: An Investment in the Future." That report presents a range of recommendations in support of a comprehensive, integrated nutrition education approach that reaches across programs. I commend the report to your attention, and I look forward to working with Congress to implement its recommendations.

FISCAL YEAR 2001 REQUEST

FNS has recently revised its Strategic Plan to better reflect the agency's unified mission and purposes. The new Strategic Plan (and the associated fiscal year 2001 Annual Performance Plan) charts a clear course toward the nutrition security outcomes that each of our vital programs are intended to achieve and fully meets our stewardship responsibilities which are so critical to maintaining public confidence. Our request of \$36.3 billion in new budget authority for fiscal year 2001 fully supports the goals and objectives set forth in the Strategic Plan and will maintain and augment the long-standing contribution of the Nation's nutrition assistance programs. I will focus the remainder of my remarks on key aspects of the budget request, including a number of policy changes we have proposed. The testimony of the Administrator, Samuel Chambers, is being submitted for the record and presents many of the technical aspects of our request.

FOOD STAMP PROGRAM

We are requesting \$22.2 billion for the Food Stamp Program, a slight increase from fiscal year 2000, resulting principally from an increase in projected participation and food costs. The request would also fund a number of important policy changes that the Administration is proposing. Two of our policy initiatives deal with the issue of eligibility for certain legal aliens. As I have indicated on previous occasions, the Administration believes that some provisions of welfare reform went too far, making some changes that had nothing to do with the stated goal of moving people from welfare to work. The 1998 Act restored food stamp eligibility to several of the most vulnerable groups of legal aliens, including those who were age 65 or older and legally residing in the U.S. when welfare reform legislation passed in 1996. It is now time to take the next steps. We propose to restore food stamp eligibility to aliens who legally resided in the U.S. on August 22, 1996, and who subsequently reach age 65, correcting the inequity of treating some elderly legal aliens differently from others solely on the basis of a birth date.

Another proposal included in our request for fiscal year 2001 will restore food stamp eligibility to aliens adults who legally resided in the U.S. on August 22, 1996, and who live with eligible children—effective April 1, 2001. Families with children of immigrant parents, even the children born into citizenship in this country, receive fewer benefits than families with children of native born parents facing the same circumstances. This proposal will eliminate this inequity and improve the well-being of children by increasing food stamp benefits to their low-income households.

We are also pursuing changes to better serve the working poor. As more families move from welfare into the job market, there is a growing recognition of the importance of owning a reliable vehicle to find and keep a job. Under today's Food Stamp Program rules, people leaving welfare to go to work may not qualify for food stamps because of the value of their vehicle(s). These rules are complicated and may be inconsistent with the regulations States use in the Temporary Assistance to Needy Families (TANF) Program. The stringent limit currently in place is a barrier to participation by low-income people, many of whom are faced too often with the choice between buying food and reliable transportation. To mitigate this situation, we have included in our request a legislative proposal to allow States the option of making Food Stamp Program vehicle rules conform to TANF Program rules, simplifying administration and improving access for the working poor.

Finally, we have included a legislative proposal to allow States to conform the mandatory income exclusions in the Food Stamp Program to those used in the Medicaid Program. Current food stamp law excludes certain categories of income from benefit calculations, exclusions which are somewhat different from Medicaid. These differences introduce unnecessary complexity in State administration. This proposal, which allows for the alignment of Food Stamp and Medicaid income definitions, will help eliminate this complexity.

This estimate includes a benefit reserve of \$1 billion—a \$900 million increase from fiscal year 1999. The Food Stamp Program is the primary source of nutrition assistance for low-income families with a mission to ensure that all households have access to healthful diets and receive sound nutrition education and guidance. As part of the Food Stamp Program operations, States conduct an Employment and Training (E&T) Program to assist program participants in gaining the skills, instruction or experience that will increase their ability to move from welfare to regular employment. In fiscal year 2001, we are requesting \$381 million to support the E&T Program. In addition, during fiscal year 2000, States will be allowed to use any carryover fiscal year 1999 E&T funds.

Also included in our request for the Food Stamp Program is \$10 million to support a nutrition education initiative and a campaign designed to reach potentially eligible families and individuals with information about (1) the nutritional benefits of the Food Stamp Program and (2) application procedures. The effort will target the following groups: the general public; the elderly; working poor; the disabled; and households containing legal aliens. Educational materials will be produced in both English and Spanish.

CHILD NUTRITION PROGRAMS

In the Child Nutrition Programs, we are requesting funding of \$9.5 billion—a very slight decrease from fiscal year 2000. The decrease is the result of a \$416 million projected carryover from fiscal year 2000, reducing the need for new budget authority. We do project modest increases in participation in both the National School Lunch and School Breakfast Programs. These increases are attributable to higher school enrollments and the resulting rise in the numbers of children participating in the programs.

We have included a modest request of \$2 million for Nutrition Education and Training (NET) Program activities for which I strongly urge your support. NET provides training for school food service personnel in food service management and for teachers in providing nutrition education and information for children. It is a critical tool for building capacity at the State level to support and deliver nutrition education to our young people—education that helps them develop healthy eating habits that can last a lifetime. We are also requesting \$6 million for meals and to fund a rigorous evaluation of the School Breakfast Program Pilot which was authorized by the Goodling Act. The evaluation will be designed to ensure that the results of the pilots are measured and analyzed so they will be reliably valid and useful in making future policy decisions. Finally, our request for resources to support the crucial Team Nutrition Program remains at the fiscal year 2000 level of \$10 million.

I have been most concerned about the cases of mismanagement and fraud that both FNS and Federal auditors have identified in the Child and Adult Care Food Program (CACFP). In an effort to improve CACFP program management, we are proposing legislation that would net the agency savings of about \$800 thousand in fiscal year 2001 and \$115.2 million over a five year period. This legislative proposal includes an array of management changes designed to improve integrity and oversight in CACFP. The proposal will include measures to strengthen oversight by sponsors, including prohibiting participation by sponsors that have a track record of mismanagement in other government programs and limiting the funds that may be retained by sponsors of child care centers for administration. The proposal also includes measures to strengthen State oversight, such as allowing States to retain a portion of program funds recovered through audits and reviews. In addition, the proposal would enhance Federal oversight and fund an evaluation of the program's administrative reimbursement structure. This proposal effectively addresses a number of issues raised in Federal audits which can only be addressed through legislation. These resources would complement and reinforce the additional funds for Child Nutrition integrity enforcement which we are requesting in the Food Program Administration (FPA) account.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS AND CHILDREN
(WIC)

For the WIC Program, our request is \$4.1 billion—a \$116 million increase from the level enacted for fiscal year 2000. This level of funding will support an average monthly participation of nearly 7.5 million at-risk women, infants and children who receive the nutrition education and food benefits of this crucial assistance program. This requested amount is sufficient to ensure that all who are eligible will be able to participate.

COMMODITY ASSISTANCE PROGRAMS

In our Commodity Assistance Programs (CAP), we request a funding level of \$158.3 million—a net increase of only \$5 million from the fiscal year 2000 level. The Farmers Market Nutrition Program (FMNP) is included at \$20 million—an increase of \$5 million over the fiscal year 2000 level which is funded in the WIC appropriation. The \$20 million request will sustain or expand the current program level in the 39 State agencies now participating and allow for new States that have expressed an interest in joining the program. To give you a sense of the magnitude of the program, in fiscal year 1998, coupons were given to 1.3 million WIC participants. The participants redeemed their coupons at 1,529 authorized farmers' markets providing revenue for almost 9,600 small family farmers—contributing to the commitment to support American agriculture which is reflected in the FNS mission statement.

As you know, the CAP also supports the Commodity Supplemental Food Program for women, infants and children as well as the elderly. Our request of \$93.3 million, in conjunction with the use of about \$7 million from inventory, will serve a combined caseload estimated at about 423,000—an increase of almost 9,000 from fiscal year 2000. The nominal \$100 million which we will spend in fiscal year 2001 will include participants from five new States which are being brought into the program in fiscal year 2000. Those new States are Ohio, Mississippi, Texas, Montana and Vermont. Our request for The Emergency Food Assistance Program (TEFAP) administrative expenses is \$45 million—the same level as for fiscal year 2000.

FOOD DONATIONS PROGRAMS

We are requesting \$150 million for the Nutrition Program. The \$10 million increase will provide for an approximate 7.7 percent increase in the number of meals served. Our two smaller programs remain at the same level as fiscal year 2000.

FOOD PROGRAM ADMINISTRATION

In the Food Program Administration account, our request is \$128.6 million—about \$14 million above the fiscal year 2000 level. Included in our request level are several noteworthy initiatives. First, we are requesting \$5 million to support a new intergovernmental partnership to be led by FNS. The objective is to address the nutrition, health, housing and employment of the very impoverished Southwest border areas known as Colonias. FNS would help these communities maximize the current assistance programs offered by Federal, State, local and non-profit partners. FNS began work in fiscal year 1999 in 10 Colonias in Texas, providing partnership support and program benefits to participants. The fiscal year 2001 level of \$5 million will allow FNS to expand its efforts to a larger proportion of the 1,500 Colonias near the Mexican border in Arizona, California, New Mexico and Texas.

Second, we are requesting \$2 million for use in developing an integrated nutrition education program which will aggressively promote the 5th edition of the Dietary Guidelines for Americans and the Food Guide Pyramid, including the recently-released Food Guide Pyramid for Young Children. Nutrition promotion efforts will be targeted to individuals with particular needs, such as low-income children and women, and pregnant and post-partum women, particularly teenagers. The increase for CNPP also provides for development of consumer materials that will help low-income individuals apply Guidelines and Pyramid concepts within a limited budget. With diet-related medical and lost productivity cost in the U.S. now reaching an estimated \$71 billion annually, we must move decisively to promote both the Guidelines and the Pyramid if we are to effectively help Americans improve and maintain their health. This is a very modest investment which can result in a large payback in terms of a healthier America.

Third, we are requesting a total of \$8 million to supplement other ongoing program integrity activities within FNS. The \$8 million will be distributed to the Food Stamp and Child Nutrition Program integrity activities. Efforts in the Food Stamp Program would be directed at: (1) improving the accuracy of the quality control sys-

tems, (2) working with States to reduce payment error rates and avoid error rate increases, while ensuring access to Food Stamps for all eligible households; and (3) efforts to ensure that States are effectively implementing procedures set forth in regulations which are designed to guarantee that eligible households moving from welfare-to-work continue to receive nutrition assistance. Efforts in the Child Nutrition Programs would be used, in part, to study sources of errors in school meals applications and evaluate pilots of alternative methods for determining and verifying eligibility for free and reduced price benefits in the National School Lunch Program. Also, some of the resources would be devoted to enhanced Federal monitoring of the CACFP State agencies, sponsors and child care facilities.

Federal administrative resources to support our nutrition assistance programs have declined very significantly over the years to the point where they represent less than one-half percent of the total FNS funding. For example, resources available to oversee States and implement improvements such as WIC EBT are extremely limited. Therefore, it is most important to us that our FPA request be fully funded.

STUDIES AND EVALUATIONS

The Administration is once again requesting that funding for studies and evaluations be provided to FNS. Our request is for \$10.7 million in the Food Stamp account, \$3 million in the Child Nutrition account and \$3.5 million in the WIC account. The continued absence of study, demonstration and evaluation funding over the last three fiscal years has severely limited the depth of FNS support to Congressional staff, decreased our ability to respond to requests from the States, and restricted us from providing practical research-based guidance to the managers of our programs. FNS has a strong record of studies and evaluations used to formulate its nutrition policy, measure program impact and integrity and advise both Administration officials and the Congress of the potential costs and effects of legislative proposals under consideration. The proximity of research staff to FNS' program and policy staff is critical to ensure a research agenda that is practical and relevant to program operations and policy development. With enhanced research funding FNS can more effectively address problem areas on a short term basis. It is appropriate that study funds be located in FNS because of the strong need to target those funds for action-oriented and program-specific studies and evaluations, rather than for general research purposes.

CONCLUSION

As I conclude today, I wish to personally thank you for your support and for the support of the Subcommittee in helping to make our programs the enormous success stories that they have become. Thanks to you, they continue to make a significant and positive impact on millions of families and children across this country. This concludes my statement. I will be happy to answer any questions you may have.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

PEREPARED STATEMENT OF JAMES R. BAKER, ADMINISTRATOR

Mr. Chairman and members of the Committee, I am pleased to submit the fiscal year 2001 budget proposal for the Grain Inspection, Packers and Stockyards Administration (GIPSA).

GIPSA is part of USDA's Marketing and Regulatory Programs, which works to ensure a productive and competitive global marketplace for U.S. agricultural products. GIPSA's mission is to facilitate the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and to promote fair and competitive trading practices for the overall benefit of consumers and American agriculture.

GIPSA has both regulatory and service roles. GIPSA's Packers and Stockyards Programs (P&S) ensure fair business practices for livestock, meat, and poultry while providing financial protection to livestock producers. The Agency's Federal Grain Inspection Service (FGIS) provides the U.S. grain market with Federal quality standards and a uniform system for applying them. It also provides impartial, accurate measurements of grain quality to create an environment that promotes fairness and efficiency in the U.S. grain marketing system. GIPSA, an unbiased, third-party entity in the marketplace, helps ensure fair and competitive marketing systems for all involved in the merchandising of livestock, meat, and poultry, and grain and related products.

ORGANIZATION

During fiscal year 1999, GIPSA completed its consolidation of headquarters activities and established three field offices for the Packers and Stockyards (P&S) Programs to replace the previous 11 offices. Each office is responsible for the major issues in a particular commodity—beef, pork, or poultry—and has investigative units to focus on the core activities of competition, trade practices, and financial responsibility. Funding to complete the reorganization was provided for in fiscal year 1999, which allowed GIPSA to step up staffing efforts in the regional offices and to fill resident agent positions that provide routine services to areas not proximate to the three main offices. The reorganization has significantly improved P&S Programs' ability to focus program resources on providing financial protection and promoting fair business practices and a competitive marketing environment for livestock, meat, and poultry. The new structure and the addition of economic, statistical and legal expertise to the investigation staff of the field offices significantly strengthens GIPSA's ability to investigate anticompetitive practices, and provides greater flexibility and efficiency in enforcing the trade practices and payment protection provisions of the P&S Act. This, in turn, enables GIPSA to rapidly respond to high priority investigations that require fast action.

Federal grain personnel work with over 2,000 State and private inspectors to provide high-quality inspection and weighing services on a user-fee basis. Federal inspectors service 37 export elevators located in Georgia, Illinois, Indiana, Louisiana, Maryland, New York, Ohio, Oregon, and Texas. Under a cooperative agreement with GIPSA, the Canadian Grain Commission provides official services, with GIPSA oversight, at 6 locations in Canada for U.S. grain transshipped through Canadian ports. Eight delegated States provide service at an additional 19 export elevators located in Alabama, California, Minnesota, Mississippi, South Carolina, Virginia, Washington, and Wisconsin. Fifty-nine (59) designated agencies service the domestic market under GIPSA supervision. In 1999, this unique mix of Federal, State, and private inspection agencies provided nearly 2 million inspections on over 228 million metric tons of grains and oilseeds; weighed over 106.5 million metric tons of grain; and issued over 90,000 official weight certificates.

GIPSA'S PACKERS AND STOCKYARDS PROGRAMS (P&S)

GIPSA's P&S Programs provides financial protection and promotes fair business practices and a competitive marketing environment for livestock, meat, and poultry. Our programs foster fair competition, and guard against deceptive and fraudulent practices affecting the movement and price of meat animals and their products. The production and marketing of livestock, meat, and poultry are important to American agriculture and significantly impact the Nation's economy. The Commerce Department estimates the annual wholesale value of livestock, meat, and poultry products produced in fiscal year 1999 by firms subject to the P&S Act to be \$109 billion. At the close of fiscal year 1999, there were 1,287 stockyards; 6,434 market agencies/dealers; 2,000 packer buyers registered with GIPSA to engage in the livestock marketing business. In addition, there are 377 slaughtering packers who purchased over \$500,000 of livestock annually that are required to be bonded, 205 poultry firms, and a significant number of meat distributors, brokers, and dealers subject to the P&S Act.

P&S Programs conducted over 1,200 investigations during the 1999 fiscal year. Most violations were corrected on a voluntary basis with several resulting in livestock and poultry producers receiving additional funds for the sale of their product. During fiscal year 1999, 12 administrative or justice complaints were issued to bring subject firms into compliance with the provisions of the P&S Act. In addition, 18 decisions and orders were issued by USDA against 22 individuals or firms for violating the P&S Act.

GIPSA closely monitors anticompetitive practices which may impede the free trade of livestock, meat, and poultry. A high priority is placed on investigating all complaints and further developing information received concerning the failure of firms and individuals in the livestock, meat, and poultry industries to operate in a fair and competitive manner. Appropriate corrective action is initiated when evidence of anticompetitive practices is discovered.

USDA has committed to conducting peer reviews of major investigations to ensure that the investigators asked the right questions, collected the right data, and conducted appropriate analyses. Peer reviews by objective, qualified reviewers may contribute to GIPSA's plans to strengthen enforcement of anticompetitive behavior in the livestock, meat, and poultry industries. GIPSA initiated the peer review process for the current Texas fed-cattle investigation. A panel of seven outside peer reviewers was assembled in January 1999; the group reported their findings to GIPSA in

May 1999. Their comments were used by the analysts who conducted econometric analyses as part of the Texas investigation as they prepared their final report.

GIPSA has received information that some livestock transactions are conditioned on an agreement that the transaction price not be reported to public or private reporting services. GIPSA is concerned that the non-reporting of price as a condition of the purchase or sale of livestock may result in inaccurate and incomplete price information, thereby adversely affecting the price discovery process. On September 10, 1998, GIPSA published in the Federal Register an Advance Notice of Proposed Rulemaking (ANPRM) concerning the practice of non-reporting of price as a condition of purchase or sale of livestock. The comment period for the ANPRM closed on December 9, 1998. Eighteen comments were received and have been analyzed by GIPSA.

USDA's fiscal year 2000 appropriation mandates, subject to funding, creation of a swine marketing-agreement library and monthly reporting of types of contracts in use, provisions providing for expansion in the number of swine to be delivered in 6 months and 12 months, estimated number of swine committed for delivery to packers in 6 months and 12 months, and the estimated maximum number of swine that could be delivered to packers in 6 months and 12 months. GIPSA is preparing a regulation to implement the provisions.

As part of its responsibility to strengthen investigations and assess competitive implications of structural changes in the livestock, meatpacking, and poultry industries, GIPSA entered into five cooperative research agreements. Two of the projects will examine competitive conditions in beef markets. Two projects will examine competitiveness issues and compensation methods used in broiler production. The final project will examine bidding behavior in a laboratory auction setting in order to gain insights into expected behavior in actual markets. GIPSA obtains special procurement information for the Nation's top 15 steer and heifer slaughter firms annually. This information is related to livestock purchased through contracts, packer feeding arrangements, or marketing agreement/formula-priced transactions. Much more work must be done to determine the effects of these captive supplies in both the beef and pork industries. Additional resources are critical to provide for data collection, and economic and statistical analyses in this very important and sensitive area.

GIPSA's P&S Programs continues to provide payment protection to livestock and poultry producers. Financial investigations, during fiscal year 1999, resulted in \$2.7 million being restored to custodial accounts established and maintained for the benefit of livestock sellers. Since the 1976 amendments to the P&S Act, livestock sellers have been paid \$53.8 million under the statutory trust provisions. In 1999, no poultry trust complaints were received by GIPSA. During Fiscal year 1999, 169 insolvent dealers and market agencies corrected or reduced their insolvencies by \$4.5 million. Insolvent packers corrected or reduced their insolvencies by \$4.6 million.

GIPSA continues to receive complaints from contract growers that integrators use their dominant positions to impose unfair or unjustly discriminatory terms or conditions on contract growers. GIPSA published an Advance Notice of Proposed Rulemaking in the Federal Register to solicit input on the need for regulations to protect growers. Subsequently, GIPSA proposed amending regulations pertaining to scales and weighing in regard to feed weights. These amendments to the regulations are in the clearance process. Specifically, GIPSA is proposing to include requirements regarding the weighing of feed whenever the weight of feed is a factor in determining payment or settlement to a livestock grower or poultry grower when that livestock or poultry is produced under a contract growing arrangement.

Concentration in the poultry processing industry and its effects on contract growers is an area that needs attention to determine whether the processors are using their dominant positions to impose unfair or unjustly discriminatory terms or conditions on contract growers. Grower complaints continue to highlight the need to address concerns about their relative bargaining position. If GIPSA is to effectively address this issue, it must obtain the resources needed to fully staff both the Trade Practices and Competition Units in its Atlanta office, which are responsible for major issues in the poultry industry across the Nation.

GIPSA'S FEDERAL GRAIN INSPECTION SERVICE

GIPSA's grain inspection program plays a critically important role in facilitating the marketing of U.S. grain and related commodities for the benefit of American agriculture. We provide the U.S. grain market with Federal quality standards and a uniform system to apply these standards. Through this program, GIPSA provides descriptions (grades) and testing methodologies for measuring the quality and quantity of grain, rice, edible beans, and related commodities, and, provides an array of

inspection and weighing services, on a fee basis, through a unique partnership of Federal, State, and private laboratories.

By serving as an impartial third party, GIPSA ensures that the standards are applied and the weights recorded in a fair and accurate manner. Our presence in the market advances the orderly and efficient marketing and effective distribution of U.S. grain and other assigned commodities from the Nation's farms to domestic and international buyers.

Our guidance in carrying out these important tasks is provided by the U.S. Grain Standards Act (USGSA) and the Agricultural Marketing Act of 1946 (AMA) as it relates to the inspection of rice, pulses, lentils, and processed grain products. Through voluntary and mandatory programs, GIPSA promotes the efficient and effective marketing of U.S. grain and other commodities from farmers to end users.

For an average cost of 22 cents (adjusted for inflation to 1992 dollars) per metric ton of grain in fiscal year 1999, exporters received USDA export certificates from GIPSA on which they relied to facilitate the marketing of over \$20 billion worth of cereals and oilseeds. Likewise, here at home, buyers and handlers requested over 1.9 million domestic inspections that facilitated the trading of 127 million metric tons of cereals and oilseeds destined for domestic use.

While current services are effective and efficient, GIPSA recognizes that to remain relevant in today's marketplace, continuous efficiency enhancements and service improvement are essential. To that end, GIPSA is focusing on improving our efficiency and service delivery through the introduction of new technology; preparing to enter the world of e-commerce; and responding to new market needs being driven by technology and global market demands. The grain program has made a number of enhancements to its operations and structure to improve the efficiency and productivity, not only of the inspection and weighing process and GIPSA's service delivery, but, more importantly, to the actual handling and marketing of grain.

Structurally, GIPSA has, over the years, continuously realigned to optimize its staffing levels and organization. Since 1994, the grain program reduced staffing levels by 8 percent and streamlined its field structure from 31 to 21 offices, thereby allowing for more flexible staff utilization and more consistent policy implementation. Our Commodity Testing Laboratory, formerly in Beltsville, Maryland, was merged into our Technical Center in Kansas City, MO. The Technical Center is now a model of how streamlining and cross-functional teams can result in cost efficiencies and a sharpened customer service focus.

We also are reengineering to provide more efficient and effective programs and services. We reengineered our quality assurance program, already known worldwide for ensuring consistent and accurate inspection and weighing results. By automating to a PC-driven system and decentralizing the process to the local level, our reengineered quality assurance program provides for proactive problem solving and immediate quality control feedback. Automation is also the key to improving our inspection services. To integrate our export inspection process with the export industry's technological advances, GIPSA is automating the export inspection statistical shiploading plan, also known as Cu-Sum Plan. Automating Cu-Sum allows for direct data sharing with our export grain customers, thereby eliminating manual data entry and reducing administrative costs both for GIPSA and our customers. We are working closely with export elevators to automate their scales and material systems to official requirements. This automation reduces official oversight personnel, which produces a considerable cost savings for our customers, and provides for superior supervision and greatly improved efficiency for GIPSA. To date, five export elevators are operating approved systems; 6 more are in the process of automating. To improve the efficiency and productivity of U.S. grain handling, GIPSA established a public/private partnership to automate inspection processes. This effort reduced the agency's operating costs and improved the speed, productivity, and efficiency of export operations—essential factors in today's competitive global market. A prototype system currently is being installed at an export elevator in Destrehan, Louisiana. These are only some of the ways that GIPSA is seeking to enhance the efficiency of our operations. Future technological advances and customer needs will drive even further improvements.

Our efforts are paying off for our customers, both in terms of their bottom lines and in greater customer satisfaction. GIPSA's service delivery costs decreased from \$0.27 per metric ton in fiscal year 1994 to \$0.22 per metric ton in fiscal year 1999, saving American agriculture over \$5 million in fiscal year 1999 alone.

These savings in inspection service costs pale in comparison to the savings achieved by the industry through improved productivity. GIPSA is proud to be a partner with the industry in realizing that productivity enhancement. Last year, at a single facility in Iowa, GIPSA fostered a unique and unprecedented cooperative partnership to provide service and made rules more flexible in order to implement

a new, on-site rapid inspection program that saved one the customer more than \$250,000 per year.

Applying technology to our inspection and weighing services is only one part of our continuous improvement process. We also are implementing new services to keep pace with an increasingly sophisticated market that requires end-use quality information. In fiscal year 1999, GIPSA approved two new deoxynivalenol (DON) test kits for use in the official grain inspection and weighing system. These test kits expand the availability and choice of test kits for the official system. In fiscal year 1999, GIPSA also approved a new instrument for use in conjunction with an approved mycotoxin test kit—this flourometer provides the official system alternative equipment at approximately half the cost of the original equipment.

In fiscal year 1999, GIPSA also developed a reference method for fumonisins in grain. This method reduces direct costs and improves efficiency through use of robotics technology. In the spring of 2000, the Food and Drug Administration is expected to establish advisory levels which will specifically address fumonsins levels in grains destined for human, cattle, swine or poultry consumption. The reference method will be used to evaluate the performance of rapid fumonisin tests submitted to GIPSA to for approval and use in the official system. GIPSA plans to evaluate and approve fumonisin rapid tests for the official inspection system prior to the fall corn harvest.

Our efforts to harness technology, improve service delivery, and meet new market needs are diverging most clearly in our work to address American agriculture's needs in the area of biotechnology.

Biotechnology has accelerated the rate of change in agriculture with new varieties meeting both the agronomic needs of the farmer and the specific quality attributes of the end user. It also has created new market challenges as a result of increased consumer demand for non-biotech foods.

The entire infrastructure of agriculture including production, transportation, storage, handling, processing, distribution, and marketing is being influenced.

When markets around the world reject or limit imports of biotech crops, it has enormous implications for all of America's farmers. In 1999, one third of the U.S. corn crop and over half of the soybean crop were biotech varieties. U.S. corn growers lost approximately \$400 million in potential export sales since 1998, and face similar losses this year.

As local markets around the world began to demand a distinction between conventional and biotech crops, GIPSA provided a letterhead statement indicating that for certain crops, the United States was not producing any biotech varieties. Specific statements to facilitate trade involved dry edible beans, sorghum, wheat, and barley.

GIPSA also initiated action to establish a biotech reference facility. Our laboratory will meet the market's need for reliable and accurate analytical techniques that differentiate non-biotech from biotech grains and oilseeds by evaluating and verifying the validity of analytical procedures used to detect and quantify genetically enhanced traits in grains and oilseeds. It also will be used to establish sampling procedures for use in testing genetically enhanced grains and oilseeds. These standardized sampling and testing methods will be implemented through GIPSA's inspection program. The laboratory will meet a market need to ensure reliability of biotech crop detection methods and to facilitate information exchange, which, in turn, will decrease transaction costs and increase overall market efficiency. GIPSA's fiscal year 2001 budget request includes funding that will enable GIPSA to complete establishment of the laboratory.

GIPSA has developed and will continue to develop the standardized testing methods needed by the market to measure the true value of the new enhanced quality attributes being introduced through biotechnology. This is a formidable challenge as more and more traits are introduced. New soybean traits alone include high content levels of oleic and stearate fatty acids, low linolenic acid content, and high sucrose content.

GIPSA has traditionally taken this role in the marketplace. We facilitate the marketing of grain by providing accurate and cost-effective measures of grain quality. We have been viewed as an independent, third party in providing grades and standards, establishing procedures, and in the actual provision of inspection and weighing services.

We are an integral part of America's grain handling infrastructure—a superior infrastructure of storage facilities, rail lines, and waterways that makes American agriculture preeminently successful in the global marketplace. We recognize our role and will continue to provide all members of the U.S. grain handling system with the innovative, high-quality official inspection services they need to efficiently and effectively meet the challenges of a changing marketing environment.

Our commitment to reaching our customers does not end at our borders. Exporters, importers, and end users of U.S. grains and oilseeds, as well as other USDA agencies, USDA cooperator organizations, and other governments, frequently ask for GIPSA personnel to travel overseas. These activities include representing the Agency at grain marketing and grain grading seminars, meeting with foreign governments and grain industry representatives to resolve grain quality and weight discrepancies, helping other countries develop domestic grain and commodity standards and marketing infrastructures, assisting importers with quality specifications, and training local inspectors in U.S. inspection methods and procedures. In fiscal year 1999, GIPSA saw a dramatic increase in the number of requests for technical assistance overseas. During the fiscal year, GIPSA helped other USDA agencies and USDA cooperators conduct destination sampling, provide technical assistance, give grain inspection seminars overseas, lead a U.S. delegation to review several receiver's grain scale operations, and investigate quality discrepancies, on a cost recovery basis.

At home, GIPSA regularly holds seminars and meetings to educate our worldwide customers about the quality and value of U.S. grain exports. In fiscal year 1999, GIPSA representatives met in the United States with 89 teams from 50 countries to provide information, technical guidance, and educational seminars. These international outreach efforts help promote greater harmony between U.S. and international standards, and foster a better understanding of the U.S. grain marketing system, the official U.S. grain standards, the national inspection system. This, in turn, reduces the risk of new barriers in today's open and freer global marketplace, enhances purchasers' confidence in U.S. grain, and facilitates the export of U.S. agricultural products.

The grain program will continue to work to ensure our relevance and value to American agriculture. We are reaffirming our commitment to facilitating the marketing of U.S. grain by responding to our customers' needs and providing the highest quality grain inspection and weighing services to all whom we serve—from farmer to domestic and international end users, and all those in between.

Our efforts in fiscal year 2001 will focus on working with our customers to identify how we can apply automation to reengineer our administrative and inspection processes to achieve greater efficiency and productivity, and on helping American agriculture maximize the opportunities presented by biotechnology by providing the information the market needs to effectively and equitably market value-added products. In fiscal year 2001, our commitment to improved efficiency and effectiveness will continue to serve American agriculture well, as U.S. agricultural exports are expected to total \$49 billion.

GIPSA accomplished a great deal in fiscal year 1999 and much is planned for fiscal year 2000. Our efforts to continuously improve our programs and services were further guided by the Agency's Strategic Plan, developed under the provisions of the Government Performance and Results Act.

CIVIL RIGHTS

In addition to improving our services and programs in fiscal year 1999, GIPSA also accomplished a great deal in the area of civil rights. In accordance with USDA's efforts to change and improve the way we do business; and to ensure that every employee and customer is treated fairly, equitably, and with dignity and respect, GIPSA is working to improve all areas of Civil Rights. Accordingly, we have taken a number of actions.

In fiscal year 1999, GIPSA implemented a strengthened Alternative Dispute Resolution (ADR) Program that reflects GIPSA's commitment to operate more efficiently and effectively, and to encourage, where possible, consensual resolution of disputes. Under this program, GIPSA is promoting greater use of mediation, arbitration, early neutral evaluation, agency ombuds, and other alternative dispute resolution (ADR) techniques.

GIPSA continued to seek early resolution of employee complaints. The Agency targeted several formal cases for resolution and worked closely with the USDA's Employee Complaints and Adjudication Division to reduce the Agency's caseload by 25 percent by the end of fiscal year 1999.

In addition, GIPSA strengthened its support for educational initiatives, Land Grant and other minority institutions, the USDA summer intern program, and the college recruitment initiative Ag-HOPE, Agriculture Helps Our People Earn, at Alcorn State University, Lorman, Mississippi. The Agency also strengthened its relationships with small and disadvantaged businesses by entering into agreements with these contractors where possible.

These are only some of the steps GIPSA has taken in the EEO/CR area. The Department of Agriculture has made Civil Rights a major priority and GIPSA is completely committed to supporting the Department's efforts.

FISCAL YEAR 2001 BUDGET REQUEST

To fund these important initiatives and to enable GIPSA to remain a valuable part of American agriculture, GIPSA's budget request for fiscal year 2001 is \$33.5 million under current law for salaries and expenses and \$42.6 million for our Inspection and Weighing Services. GIPSA also is submitting legislation to collect \$23.1 million in new user and license fees in fiscal year 2001.

The President's fiscal year 2001 budget proposes a current law request for grain inspection of \$14.2 million. There are proposed increases of \$150,000 to support GIPSA's increased role in international trade services and trade activities, and \$1,980,000 for methods development activities. Proposed legislation to authorize the collection of \$3.7 million in new user fees to cover the costs of grain standardization activities also is being submitted.

The budget proposes a current law request of \$19.3 million for the Agency's P&S Programs.

There are proposed increases of \$1,200,000 to develop sophisticated models to help identify anti-competitive behavior and examine causes and competitive implications of contract livestock production; \$800,000 to examine the competitive structure of the poultry industry; \$1,300,000 for rapid response teams within GIPSA; and \$400,000 to establish a swine contract library. Additionally, proposed legislation is being submitted to authorize the collection of \$19.3 million in new license fees to cover the cost of the P&S Programs.

There are additional increases in the budget of \$100,000 for Civil Rights activities and \$350,000 for an Information Staff that will benefit both the grain inspection program and the P&S program.

The \$150,000 increase to support GIPSA's increased role in international trade services and trade activities would allow GIPSA to increase international travel. GIPSA has become increasingly involved in addressing international grain trade issues, including emerging sanitary and phytosanitary (SPS) issues and other technical barriers to trade, as well as trade issues with the World Trade Organization (WTO) and the North American Free Trade Agreement (NAFTA). For example, compelled to adhere to the requirements of WTO and NAFTA, some grain and oilseed importing countries have created other barriers to limit or restrict unencumbered trade.

GIPSA works cooperatively with associated agencies to resolve critical issues that limit or restrict trade; assist individual governments and organizations in developing and/or enhancing their grain inspection and weighing capabilities; and enhance the international market's understanding of the U.S. inspection and weighing system.

The increase of \$1,980,000 for methods development activities will enable the Agency to begin the process of addressing the changes occurring due to biotechnology. As the commercialization of bioengineered crops has expanded, consumers worldwide have expressed an interest in having access to better and more reliable information about foods that do not contain biotech ingredients. In addition, U.S. producers and industry representatives are seeking to ensure that claims by competitors as to the biotech-free nature of their products are not false and misleading. As American agriculture works to address these complex and difficult issues involving the production and marketing of bioengineered crops, it is vital that USDA establish the framework to ensure the reliability of biotech crop detection methods. Measuring the traits of newly engineered grains is of critical importance in keeping grain markets open and fair. Of greater importance is the United States government's ability to provide leadership in establishing consistency in test methods to measure bioengineered grain and oilseeds. Producers, grain handlers, processing facilities, life science companies, and foreign buyers have all expressed their full support of USDA-GIPSA providing this leadership.

The \$1,200,000 increase to develop sophisticated models to help identify anti-competitive behavior, and to examine the causes and competitive implications of contract livestock production will allow the Agency to look closely at potential anti-competitive behavior and its effects. The increase will be used to (1) develop econometric models to help identify collusion, predatory behavior, price leadership, market allocation, failure to compete, price and non-price discrimination, and other restraints in the procurement of cattle, hogs, and lambs by meatpackers; and (2) examine economic variables associated with production and marketing contracts for livestock, and the effects of contracting on the structure of livestock production and slaughter,

and on competition in meatpacking and processing. This initiative addresses complex issues that are important in examining the competitiveness of firms and markets in the meatpacking industry. An ongoing effort will be needed to develop methodology, databases, and analyses to effectively monitor competitive behavior and the competitive effects of structural changes in the meatpacking industry.

The increase of \$800,000 to examine the competitive structure of the poultry industry will assess the characteristics of markets for poultry grower services and develop basic information about the structure and competitive conditions associated with the market for grower services. It will examine geographic distributions of growers around integrators' facilities; production and transportation costs; entry and exit conditions; contract terms; general grower-integrator relationships; and how contract terms are implemented; such as which chicks are assigned to which growers, feed weighing arrangements, and measurement of factors used in settlements.

This project will provide fundamental information about the relevant markets for grower services and address questions such as whether treatment of growers varies among integrators and among growers of a particular integrator. We have long focused our attention on contract disputes. This project will begin to examine underlying competitive conditions in the market for grower services.

The \$1,300,000 increase will allow the Agency to designate a special investigation rapid response team for each of the three regional offices to handle the complex, high priority investigations. These investigations are time sensitive that require expeditious examination and analysis to protect constituent interests, and to prevent or minimize major competitive or financial harm caused by ongoing violations of the P&S Act. These teams will be comprise of an economist/marketing specialist, legal specialist, auditor, and computer specialist, all of whom are experts in their area and experienced in P&S investigations. Full utilization of the team is anticipated within in the respective region, however, multi-teams will be used for investigations, when required.

The increase of \$400,000 to establish a swine contract library will allow the Agency to comply with Section 222 of the fiscal year 2000 Agriculture Appropriation Bill that mandates that GIPSA implement a "library or catalog of each type of contract offered by packers to swine producers." GIPSA is required to collect, compile, and publish a monthly report on the estimated number of swine expected to be delivered within the 6-month or 12-month periods following the date of the report. This mandate is "subject to the availability of appropriations to carry out this section"; GIPSA was not provided funding for this project.

Additional staff will be required to collect swine contracts on an ongoing basis from all packers slaughtering over 100,000 head of swine yearly. Contracts must be reviewed; all proprietary information redacted from the contracts; and then assembled and cataloged. We anticipate that the library or catalog to be accessible by the general public through the Internet.

Conclusion

Mr. Chairman, this concludes my statement. I appreciate the opportunity to testify on behalf of the Grain Inspection, Packers and Stockyards Administration (GIPSA). I will be happy to answer any questions the Committee may have.

NATIONAL AGRICULTURAL STATISTICS SERVICE

PREPARED STATEMENT OF R. RONALD BOSECKER, ADMINISTRATOR

Mr. Chairman and members of the Committee, I appreciate the opportunity to submit a statement for this Committee's consideration in support of the fiscal year 2001 budget request for the National Agricultural Statistics Service (NASS). This Agency now conducts the census of agriculture which was begun in 1840, and the agricultural statistics program created in 1842. The basic mission of both programs is to provide factual information for and about the Nation's food and agricultural industry.

As American farms and ranches have progressed to making greater use of agricultural science and technology, the need for more detailed information has increased. The periodic surveys and censuses conducted by NASS contribute significantly to the overall information base for agricultural producers, handlers, processors, wholesalers, retailers, and ultimately, consumers. Voids in relevant, timely, accurate data contribute to wasteful inefficiencies throughout the entire production and marketing system.

The most critical complaints received by NASS occur when there is an absence or shortage of official data available for a commodity, and therefore that segment of agriculture is forced to operate with insufficient information. Recent environ-

mental concerns have meant that entirely new surveys are needed to accurately measure the chemicals used by the food and fiber industry. The globalization of agricultural commodity markets also increases the demand for relevant, accurate, timely, and impartial statistical information to assist those who sell U.S. agricultural commodities worldwide. For example, information concerning genetically engineered crops and crop varieties will enable the United States to better compete in the world market.

The crop, livestock, and other related statistics are provided throughout the year, in cooperation with each State Department of Agriculture. This program, which began in 1917, has served the agricultural industry well and is often cited by others as an excellent model of successful State-Federal cooperation. The addition of the census of agriculture, which provides a wealth of detailed information at the State and county level, has strengthened NASS's partnership with its State cooperators. This joint State-Federal program helps meet State and national data needs while minimizing overall costs by consolidating both staff and resources, eliminating duplication of effort, and reducing the reporting burden on the Nation's farm and ranch operators. The success of this partnership was demonstrated this past year as NASS, through its State-Federal cooperation, was able to complete the census in almost half the time of previous censuses, increase the total response, and, through the use of a toll-free number, better respond to questions from farmers and ranchers completing the census questionnaires. NASS's 45 field offices, which cover all 50 States (New England States are combined), support the six goals and outcomes in the Research, Education, and Economics (REE) mission area strategic plan by providing statistical information that serves national, State, and local data needs.

NASS statistics contribute to providing fair markets where buyers and sellers alike have access to the same official statistics. This prevents markets from being unduly influenced by "inside" information which might unfairly affect market prices for the gain of an individual market participant.

With the enactment of the Federal Agriculture Improvement and Reform Act of 1996, the demand for agricultural statistics has increased as producers make production decisions based solely on market information. Empirical evidence indicates that an increase in information improves the efficiency of commodity markets. Information on the competitiveness of our Nation's agricultural industry will become increasingly important as producers rely more on the world market for their income.

NASS's agricultural statistics are used throughout the agricultural sector to evaluate supplies and determine competitive prices for world marketing of U.S. commodities, which directly supports Goal 1 of the REE Strategic Plan: Through research and education, empower the agricultural system with knowledge that will improve domestic production, processing, and marketing to successfully compete in the global market.

Through new technology, the products produced in the United States are changing rapidly. This also means that the agricultural statistics program must be dynamic and able to respond to the demand for coverage of newly emerging products. For example, genetic engineering technology will be producing new commodity varieties, such as BT corn and cotton, and Roundup Ready soybeans. Data users are already requesting information on genetically modified crops in order to help assess the magnitude and impact of these new varieties.

Not only are NASS statistical reports important to assess the current supply and demand of agricultural commodities, but they are also extremely valuable to farm organizations, commodity groups, and public officials who analyze agricultural policy, foreign trade, construction, and environmental programs, research, rural development, and many other activities. NASS numbers are scrutinized very closely by producers, agribusinesses, industry analysts, economists, investors, as well as government policy makers. As a result of their analysis, major decisions are made that affect the Nation's agricultural economy.

All reports issued by NASS's Agricultural Statistics Board are made available to the public at previously announced release times to ensure that everyone is given equal access to the information. NASS has been a leader among Federal agencies in providing electronic access to information. All of NASS's national statistical reports and data products, including graphics, are available on the Internet, as well as in printed form. Customers are able to electronically subscribe to NASS reports by clicking on the appropriate release. A summary of NASS and other USDA statistical data are produced annually in USDA's Agricultural Statistics, available on the Internet through the NASS Home Page, on CD-ROM disc, or in hard copy. Each of NASS's 45 field offices have Home Pages on the Internet, which provide access to special State statistical reports and information on current local commodity conditions and production.

Beginning in fiscal year 1997, NASS received funding for the census of agriculture which is conducted every 5 years. The transfer of the responsibility for the census of agriculture to USDA streamlines Federal agricultural data collection activities and has improved the efficiency, timeliness, and quality of the census data. The release of the 1997 Census of Agriculture on February 1, 1999, came exactly one year from the date the questionnaires were due to be returned by the Nation's farmers and ranchers.

Statistical research is conducted to improve methods and techniques used in collecting and processing agricultural data. This research is directed toward providing higher quality census and survey data with less burden to respondents, producing more accurate and timely statistics to data users, and increasing the efficiency of the entire process. For example, NASS has been a leader in the research and development of satellite imagery to improve agricultural statistics. The NASS statistical research program strives to improve methods and techniques for obtaining agricultural statistics with an acceptable level of accuracy. The growing diversity and specialization of the Nation's farm operations have greatly complicated procedures for producing accurate agricultural statistics. Development of new sampling and survey methodology, along with intensive use of telephone and face-to-face contacts and computer technology enable NASS to keep pace with an increasingly complex agricultural industry. Considerable new research will be directed at improving the 2002 Census of Agriculture to be conducted in 2003.

NASS performs a number of statistical services for other Federal, State, and producer organizations on a cost-reimbursable basis. In addition, NASS has an expanding international program to provide technical assistance to a number of countries on a cost-reimbursable basis.

MAJOR ACTIVITIES OF THE NATIONAL AGRICULTURAL STATISTICS SERVICE (NASS)

The primary activities of NASS are to conduct periodic surveys and the census of agriculture every 5 years to meet the current data needs of the agricultural industry. The periodic surveys include the collection, summarization, analysis, and publication of reliable agricultural forecasts and estimates. Farmers, ranchers, and agribusinesses voluntarily respond to a series of nationwide surveys about crops, livestock, prices, chemical use and other agricultural activities each year. Periodic surveys are conducted during the growing season to measure the impact weather, pests, and other factors have on crop production. Frequent surveys are also needed for food products that are perishable. Many crop surveys are supplemented by actual field observations in which various plant counts and measurements are made. Administrative data from other State and USDA agencies, as well as data on imports and exports, are thoroughly analyzed and utilized as appropriate. NASS prepares estimates for over 120 crops and 45 livestock items which are published annually in almost 400 separate reports.

Agricultural reports issued by NASS include: number of farms and land in farms; acreage, yield, and production of grains, hay, oilseeds, cotton, tobacco, major fruits and vegetables, floriculture, and selected specialty crops; stocks of grains; inventories and production of hogs, cattle, sheep and wool, goats, catfish, trout, poultry, eggs, and dairy products; prices received by farmers for products; farm real estate values and land rental rates; prices paid by farmers for inputs and services; cold storage supplies; agricultural labor and wage rates; agricultural chemical usage; crop production cultural practices; and other data related to the agricultural economy.

The census of agriculture provides national, State, and county data for the United States on the agricultural economy every 5 years, including: number of farms, land use, production expenses, farm product values, value of land and buildings, farm size and characteristics of farm operators, market value of agricultural production sold, acreage of major crops, inventory of livestock and poultry, and farm irrigation practices. The census of agriculture is the only source for this information on a local level which is extremely important to the agricultural community. Detailed information at the county level helps agricultural organizations, suppliers, handlers, processors, and wholesalers and retailers better plan their operations. Important demographic information supplied by the census of agriculture also provides a very valuable data base for developing public policy for rural areas. The local detailed data provided by the census of agriculture which facilitates locality-based policy and business decisions supports Goal 5 of the REE mission area Strategic Plan: Empower people and communities, through research-based information and education, to address the economic and social problems facing our youth, families, and communities.

Nearly two-thirds of NASS's staff are located in the 45 field offices; 24 of these offices are collocated with State Departments of Agriculture or land-grant univer-

sities. NASS's State Statistical Offices issue approximately 9,000 different reports each year and maintain Internet Home Pages to electronically provide their State information to the public.

NASS has developed a broad environmental statistics program under the Department's water quality and food safety programs. Until 1991, there was a complete void in the availability of reliable pesticide usage data which became evident during the Alar situation with apples. Therefore, in 1991 NASS cooperated with other USDA agencies, the Environmental Protection Agency (EPA), and the Food and Drug Administration, to implement comprehensive chemical usage surveys that collect data on certain crops in selected States. Beginning in fiscal year 1997, NASS also began survey programs to acquire more information on Integrated Pest Management (IPM), additional farm pesticide uses, and post-harvest application of pesticides and other chemicals applied to commodities after leaving the farm. These programs have resulted in significant new chemical use data, which are important additions to the data base. These surveys, conducted in cooperation with the Economic Research Service, also collect detailed economic and farming practice information for the purpose of determining the use of IPM practices as well as to analyze the productivity and the profitability of different levels of chemical use. American farms and ranches manage half the land mass in the United States, underscoring the value of complete and accurate statistics on chemical use and farming practices to effectively address public concerns about the environmental effects of agricultural production. NASS's chemical use survey programs supports both Goals 2 and 4 of the REE Strategic Plan which relate to ensuring an adequate food and fiber supply and the promotion of food safety, and enhancing the quality of the environment.

NASS conducts a number of special surveys as well as provides consulting services for many USDA agencies and other Federal, State, and private agencies or organizations on a cost-reimbursable basis. Consulting services include assistance with survey methodology, questionnaire and sample design, information resource management, and statistical analysis. NASS has been very active in assisting USDA agencies in programs that monitor nutrition, food safety, environmental quality, and customer satisfaction. In cooperation with State Departments of Agriculture, land-grant universities, and industry groups, NASS conducted 122 special surveys in fiscal year 1999 covering a wide range of issues such as farm injury, nursery and horticulture, farm finance, fruits and nuts, vegetables, and cropping practices.

NASS provides technical assistance and training to improve agricultural survey programs in other countries in cooperation with other Government agencies on a cost-reimbursable basis. NASS's international programs focus on developing countries, such as those in Asia, Africa, and Central and South America, as well as emerging markets countries in Eastern Europe. Accurate information is essential in these countries for the orderly marketing of farm products. NASS works directly with countries undergoing the transition from centrally-planned to market economies by assisting them in applying modern statistical methodology, including sample survey techniques. This past year, NASS provided assistance to Chile, China, Ecuador, Ethiopia, Ghana, Guinea, Kazakhstan, Mexico, Nicaragua, Russia, South Africa, and Ukraine and received approximately \$.9 million in reimbursements for these services.

NASS annually seeks input on improvements and priorities from the public through: displays at major commodity meetings, data user meetings with representatives from agribusinesses and commodity groups, special briefings for agricultural leaders during the release of major reports, and through numerous individual contacts, especially those made at the grass roots level through NASS's 45 field offices. As a result of these activities, the Agency has made many adjustments to its agricultural statistics program, published reports, and electronic access capabilities to better meet the statistical needs of customers and stakeholders.

FISCAL YEAR 2001 PLANS

The fiscal year 2001 budget request is for \$100,615,000. This is a net increase of \$1,282,000 from the fiscal year 2000 current estimate.

The fiscal year 2001 request includes changes in activities associated with the census of agriculture, implementation of a monthly hog survey to improve market information, expansion of the agricultural chemical use surveys, and improvements to computer security to assure the integrity of market sensitive data prior to official release.

A net decrease of \$1,490,000 and 12 staff-years for the census of agriculture.

The 2001 census of agriculture budget request is for \$15,000,000. This includes an increase of \$410,000 and 5 staff-years for increased activities associated with preparations for the 2002 Census of Agriculture. It also reflects a decrease of

\$1,900,000 and 17 staff-years for the Agricultural Economics and Land Ownership Survey. The survey will be completed in 2000 and is being removed from the budget since it is to be conducted only once every 10 years following alternate censuses of agriculture.

A net increase of \$572,000 and 4 staff-years consisting of \$1,272,000 for the monthly hog survey and a decrease of \$700,000 for the quarterly hog survey.

Title IX—Livestock Mandatory Reporting, Subtitle C—Related Swine Reporting Provisions, Section 931. Improvement of Hogs and Pigs Inventory Report, which passed as part of the fiscal year 2000 Agriculture Appropriations Bill in October 1999, states that the Secretary of Agriculture will publish on a monthly basis the Hogs and Pigs Inventory Report, and that for a period of 8 quarters after the implementation of the monthly report, the Secretary shall continue to maintain and publish on a quarterly basis the Hogs and Pigs Inventory Report. The purpose of a monthly survey is to provide more timely information on market supplies of pigs than the present quarterly surveys provide.

The current NASS quarterly Hogs and Pigs report provides detailed information, by State, for the 17 largest hog producing States, accounting for 93 percent of the total U.S. hog inventory, together with all “other States” combined in order to provide U.S. totals. The proposed funding increase of \$572,000 would provide, on a monthly basis, total breeding herd inventory, number of sows farrowed, pigs born, and number of sows bred. An offset of \$700,000 will limit comparable quarterly and monthly State-level data to nine States covering approximately 77 percent of the total U.S. breeding herd inventory plus the U.S. total. Full funding at \$1.272 million is necessary for NASS to implement a monthly breeding herd program which mirrors the existing quarterly program but provides important breeding herd data on a monthly basis. The goal is to provide more timely information on both the location and supplies of pigs to facilitate more orderly marketing of hogs.

An increase of \$800,000 and 4 staff-years is requested for expansion of pesticide use surveys.

In order to accurately analyze the impact of chemical use as directed by the Food Quality Protection Act, EPA and USDA, together with other agencies and industry officials, have requested an expansion of NASS’s current pesticide data collection program to include coverage of additional crops, sectors, and States. This additional funding would enable NASS to expand the number of field crops covered in the current pesticide use survey program in order to address existing data gaps. Pesticide usage survey information collected by NASS provides accurate data which are critically needed by the agricultural industry, EPA, and others with an interest in the evaluation of pesticides, setting of pesticide residue standards, and the determination of exposure risks. In the absence of actual data, default assumptions or worst case scenarios are often used in chemical risk assessment analysis.

An increase of \$1,400,000 is requested for development of NASS Computer Security Architecture.

There is a growing need for cyber-security given the increased incidences and threats of the loss, misuse, unauthorized access to, or modification of information on computer systems. The level of sophistication displayed by hackers and others also supports the need for security reforms, such as the need for early warning systems for attacks, intrusions, and viruses. Cyber-security has replaced Year 2000 as the top priority in the information technology community. Information security is of vital importance to maintain NASS’s credibility given the market sensitivity of the reports released as well as the confidential nature of the data collected by NASS from the Nation’s farmers, ranchers, and agribusinesses.

This concludes my statement, Mr. Chairman. Thank you for the opportunity to submit this for the record.

NATIONAL APPEALS DIVISION

PREPARED STATEMENT OF NORMAN G. COOPER, DIRECTOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you to discuss the fiscal year 2001 budget request for the National Appeals Division.

INTRODUCTION

The National Appeals Division—NAD—was established by the Secretary of Agriculture pursuant to the Reorganization Act of 1994. The Act consolidated the appellate functions and staffs of several USDA agencies to provide for appeal hearings of adverse agency decisions, and review of appeal determinations by the NAD Director. NAD appeals currently involve program decisions of the Farm Service Agency,

Risk Management Agency, Natural Resources Conservation Service, Rural Business-Cooperative Service, Rural Housing Service, and Rural Utilities Service. NAD is headquartered in Alexandria, Virginia, and has regional offices located in Indianapolis, Indiana; Memphis, Tennessee; and Lakewood, Colorado. NAD's staff of 133 includes 75 hearing officers Nationwide.

MISSION

Our mission is to conduct evidentiary administrative appeal hearings and reviews arising out of program decisions of specific USDA agencies. Our strategic goal is to conduct timely hearings and issue timely and well-reasoned determinations that correctly interpret applicable regulations. NAD's mission is statutorily specific, but the administration of such is dynamic and challenging, given the complexities of changing laws, regulations and policies.

FISCAL YEAR 2001 BUDGET REQUEST

NAD is requesting \$12,610,000 in direct appropriations for fiscal year 2001. This request represents an increase of \$903,000 over the fiscal year 2000 current estimate. The increase is comprised of \$589,000 for training costs, and \$314,000 for pay costs.

NAD employees must possess a broad, in-depth knowledge of many areas, including adjudication procedures as well as the laws and regulations of subject agencies. The hearing and review officers must stay abreast of changes in the law, regulations and agency policies, in order to issue determinations that withstand challenge in the Federal courts. Continuous training and development is essential to providing the public a competent and fair administrative appeal system that recognizes the rights of program participants and promotes the lawful operations of agency programs. NAD's budget request for training will be used to sustain high-quality skills development that is critical to accomplishing our goal.

We are also requesting \$314,000 for pay costs in order to maintain current staffing levels. In the last five years, our funding level has gone from \$11,846,000 to a level of \$11,707,000. During this time, NAD has absorbed approximately \$1,454,000 in pay costs. This trend adversely impacts NAD's ability to execute its mission. To help offset these costs, NAD offered four buyouts in fiscal year 1997, and has reduced costs through attrition and other cost reduction initiatives. Additional pay cost absorption will negatively affect our ability to provide an effective administrative appeals system.

CONCLUSION

NAD's administrative appeals process is a cost-effective means for USDA program participants to have adverse agency decisions fairly and impartially adjudicated in a timely manner consistent with the intent of Congress. The initiatives in the fiscal year 2001 budget will help ensure that we accomplish our mission in a more efficient and effective manner—making correct determinations and continuing to assure the rights of all participants in appeals. The initiatives provide the groundwork for accomplishing the goals and objectives outlined in NAD's Strategic Plan and Annual Performance Plan. More importantly, these initiatives assure farmers, ranchers, cooperatives, agencies, and others an avenue to a fair and equitable adjudicative process.

That concludes my statement, and I look forward to working with the Committee on the fiscal year 2001 National Appeals Division budget.

NATURAL RESOURCES CONSERVATION SERVICE

PREPARED STATEMENT OF PEARLIE S. REED, CHIEF

Mr. Chairman and members of the Committee I am providing a copy of the statement that I used before the House of Representatives for your consideration and use.

Thank you Mr. Chairman and members of the Committee for the opportunity to appear before you today. Conservation is important to me. I've spent most of my life and my professional career devoted to addressing environmental problems and getting sound conservation on the ground.

I want to thank the Committee for their support during the fiscal year 2000 appropriations process. I promise you that I will do my best to make sure NRCS effectively and efficiently delivers the conservation programs and projects we have been directed to oversee.

I will continue our efforts to develop web-based tools that increase employee productivity in service centers and give many farmers and ranchers electronic access to automation that can assist them in making conservation decisions. As Chairman of the National Food and Agriculture Council, I am also working closely with the other field based agency heads to ensure that automation tools in service centers are user friendly for both our customers and employees and that databases are seamless between the agencies and our partners.

I am hopeful that we will be able to work with the Committee to continue your funding support for conservation in fiscal year 2001 and address the top conservation issues facing private landowners and operators, farmers and ranchers, and local communities.

In recent years, public concern for the environment and demand for NRCS technical assistance has increased dramatically. Public concern has grown about pollutants from animal feeding operations, improper application of pesticides and fertilizers, over-application of nutrients, continued excessive soil erosion, and poor land use decisions at the individual and community level. Invasive plant species on agricultural land, pfiesteria and other harmful algal blooms along our coasts, hypoxia in coastal waters, and declines in salmon and other fish and wildlife are leading the public to demand that agricultural producers act to address these natural resource issues.

However, few farmers and ranchers are able to respond to these demands on their own, let alone coordinate efforts at the watershed and regional scales. They frequently call upon the NRCS at the local level to provide them with technical assistance to address these emerging concerns and financial assistance from USDA conservation programs to help share the cost of implementing mitigating conservation measures. In addition, these concerns have required that we increase our investment in new, cost-effective, science-based practices that producers can install, operate, and maintain. I have accelerated our work on identifying appropriate technologies with the Agriculture Research Service and with other research entities. I have made an initial investment to improve the technology transfer and technical training of NRCS' field employees to meet the demands for new and innovative solutions.

Mr. Chairman, as you know, the NRCS conducts a National Resources Inventory (NRI) every five years. Recently, the results of the 1997 study were published. Significant NRI results include:

- Loss of prime and important farmland. From 1992 to 1997, nearly 16 million acres of agricultural and forestland were developed. We are now losing 3 million acres per year, double what was lost each year from 1982 to 1992.
- Soil erosion. Nearly 2 billion tons of soil erosion is occurring annually on the Nation's non-Federal lands. Despite gains in erosion control during the past 15 years, there have been no substantial improvements since 1995.
- Wetland losses. The U.S. still has not reached the goal of "no net loss". But wetland preservation efforts, like the Wetlands Reserve Program are helping us move towards that goal.
- Grazing lands losses. The nation's grazing lands total 583 million acres and include pastureland, rangeland, and grazed forestland. Since 1982, total pastureland and rangeland have declined by nearly 26 million acres.

The fiscal year 2001 budget proposals seek to address many of these significant NRI trends.

DISCRETIONARY FUNDING

Overall, the fiscal year 2001 President's budget proposes a net decrease of \$6.2 million from fiscal year 2000 Appropriations level for NRCS' discretionary accounts, including supplemental funding provided in November 1999 for natural disasters. These budget proposals for discretionary funding reflect difficult choices for addressing the most significant environmental and conservation concerns.

Conservation operations

Mr. Chairman, the fiscal year 2001 budget request proposes an increase of \$86.4 million for Conservation Operations from the fiscal year 2000 appropriations level of \$660.8 million. This increase is essential for NRCS to fund the necessary technical assistance components so vital to getting sound conservation on the ground.

Specifically, the budget includes a \$28 million increase for providing basic technical assistance for private landowners who are not typically participants in CCC cost-share conservation programs. Assistance to these landowners and local entities has eroded in recent years. In addition, because of increasing budget constraints, we have had to indefinitely postpone essential training, eliminate key field positions, minimize partnerships, compromise administrative support, and postpone re-

placement of aging equipment. While we have taken internal steps through automation to improve our processes and increase the time available to provide direct customer assistance, we would like to improve our service even more by providing additional trained personnel in the local communities. However, we cannot do this without additional funding assistance.

The budget also proposes a \$20 million increase to provide additional staff needed to perform the increased workload associated with developing nutrient management plans for Animal Feeding Operations (AFO). This is an integral part of the President's Clean Water Action Plan (CWAP). During the past 24 months, some form of state or local regulation on AFOs has been debated in 34 states. It is clear that solving the nation's nonpoint source pollution is critical to making drinking water safe and lakes, streams and rivers clean. NRCS provides leadership and technical assistance to local communities in addressing the environmental concerns associated with AFOs. Specifically, NRCS helps set the nutrient management technical standards, develops comprehensive nutrient management plans with producers, including the development and design of manure management systems, and helps producers implement components of the plans.

The AFO related workload is tremendous. Based on our latest workload analysis, there are approximately 300,000 AFOs that will need some form of nutrient management planning in order to address the concerns of the Clean Water Act. With the proposed budget, we anticipate that we can complete the second year of a ten-year work plan to address this AFO workload. In fiscal year 2000, Congress provided an additional \$8 million for this increased workload, bringing the total funding for AFO technical assistance to \$56 million. The fiscal year 2001 budget proposes a total AFO workload effort of approximately \$87 million under the Conservation Operations account, which includes a redirection of \$11 million from within the technical assistance from other activities that are currently being provided within the account.

In other CWAP-related activities, the budget also proposes an increase of \$13 million to provide \$10 million in grants on a competitive basis to local organizations to coordinate watershed restoration activities among our Federal, State, and local partners allowing resources to be more effectively targeted and \$3 million to enable additional environmental monitoring and research work that would be used to implement water quality assessment actions and set local and national priorities.

Fifteen million dollars is needed to support the Administration's Global Climate Change Initiative by expanding soil carbon studies and conducting pilot projects to better understand the impacts of climate change on soil carbon status. NRCS global change related activities have focussed on delivering technical assistance to help American farmers and ranchers cope with either human-caused climate change or natural climate variability that influences so many of their land management and farming decisions. NRCS efforts have emphasized the sequestration of atmospheric carbon in the soil, which increases the organic matter of the soil, and leads to improved rainfall infiltration, larger water and nutrient holding capacity, and reduced erosion. The increased funding would enable us to expand our understanding of soil carbon exchanges and develop new technologies and methods for improving carbon sequestration that will aid both producers and the wider American public.

Five million dollars is proposed to help farmers plan, develop, and implement conservation based biomass production systems, and an additional \$5 million is requested again this year for the Community Federal Information Partnership. This will support the Administration's Livability Initiative through the development of consistent and compatible geospatial data systems.

Proposed funding remains stable for soil surveys, snow survey and water forecasting, and plant material centers. These functions play a vital role in the delivery of conservation services to private landowners. Soil surveys help us understand soils, snow surveys provide information on future water supplies important to water conservation, and the plant material centers provide native conservation plants unavailable from other sources that help solve natural resource problems. Additional funds are not requested for mandatory pay increases or inflationary costs.

Grazing Lands.—In fiscal year 2000, Congress provided \$17 million for the Grazing Land Conservation Initiative, a \$2 million increase in funding from past years. The fiscal year 2001 budget proposes to continue funding at that level. At the \$17 million level, NRCS is able to maintain staff needed to provide technical assistance to private grazing landowners and managers.

In fiscal year 1999, approximately 700 NRCS employees allocated a majority of their time to providing technical assistance to over 28,000 individuals for grazing related issues. The total impact of NRCS assistance affected more than 20 million acres of grazing land. In addition, NRCS staff provided assistance with 790 grazing land demonstration projects nationwide that demonstrated grazing land technologies

and management, and conducted over 1,800 education and awareness activities (workshops, field days, tours, etc.) involving more than 100,000 individuals. With the increase in fiscal year 2000 funding for Grazing Lands Conservation, NRCS expects to build upon the fiscal year 1999 effort and impact on more than 22 million acres of grazing land.

Resource Conservation and Development (RC&D)

Through the RC&D program, NRCS works in partnership with local volunteers organized as Resource Conservation and Development Councils representing multi-county areas. Council members include local civic and elected officials who set an agenda to care for and protect their natural resources while improving local economies and quality of life. RC&D Councils, established as non-profit entities, undertake projects in the areas of natural resource improvement, recreation and tourism, and economic development. These Councils operate on the premise that local people know the most about the local natural resource and development needs. Currently, 315 USDA designated RC&Ds serve 2,304 counties in all 50 states, the Caribbean, and the Pacific Basin.

Information gathered from our new RC&D management database indicates that councils and their partners are very active in the development and expansion of rural business. In fiscal year 1999, 248 new businesses were created with RC&D assistance. RC&Ds helped expand 284 businesses, and financially assisted 678 businesses with non-RC&D funds. An estimated 3,000 jobs have been created through Area projects. The councils also are very effective in obtaining grant funds to implement their projects. Those Areas reporting in our database brought in over \$312.8 million to rural America. Efforts to improve natural resources have resulted in improvement of 500,000 acres of wildlife habitat, improvement of 510,000 acres of lakes, and 1,500 miles of streams. Educational projects have helped 556,000 people develop new skills. RC&D projects have helped 446,500 economic or socially disadvantaged people.

Mr. Chairman, this program plays a vital role in rural communities. The President's budget proposes an increase of \$1 million to support mandatory pay increases that cannot be absorbed without seriously degrading the program's success and benefits.

Watershed and Flood Prevention Operations

In fiscal year 2000, the Watershed and Flood Prevention Operations account was reduced by \$7.8 million in financial assistance from the appropriated level of \$99.443 million as a result of the rescission associated with Public Law 106-113.

For fiscal year 2001, the budget proposes a decrease of \$88.2 million from the fiscal year 2000 appropriations level of \$171.6 million. This includes a reduction of \$80 million in Emergency Watershed Protection (EWP) supplemental funding provided in fiscal year 2000 and an \$8.2 million reduction in financial and technical assistance provided under the account reflecting a redirection of administration priorities. The requested level of \$83.4 million for the Watershed and Flood Prevention Operations account reflects the minimum needed to address high priority sub-watershed projects under the Public Law 78-534 and 83-566 program authorities.

Also included in the budget proposal is a new loan program for helping communities rehabilitate aging Public Law 78-534 and 83-566 watershed structures that were built 30 to 50 years ago. A recent survey has revealed rehabilitation needs for more than 2,200 of these structures in 22 states for an estimated cost of \$540 million. The budget proposes a \$4.2 million subsidy budget authority that would be used to support a \$60 million program loan level to provide loans to state and local governments to help them begin to address this problem. Under the proposal, Rural Development offices would service the new loans and NRCS would provide technical assistance to communities receiving the loans on a reimbursable basis.

The budget also includes a proposal to use \$3 million in funding to provide financial and technical assistance to communities to implement disaster mitigation plans.

Emergency Watershed Protection.—Of the \$80 million in supplemental funding appropriated in fiscal year 2000 to repair damages to waterways and watersheds resulting from natural disasters, NRCS has committed funds to 28 states. Currently, we have 173 EWP ongoing projects in 46 states. EWP provides vital assistance to local communities when disasters occur. For Hurricane Floyd, for example, NRCS provided assistance to 98 producers in 20 counties with the disposal of approximately 2 million dead animals. By having funding available, the agency was able to quickly provide the much needed financial and technical assistance. In fiscal year 2000, Congress provided \$8 million for pilot rehabilitation projects in New Mexico, Ohio, Mississippi and Wisconsin. The State Conservationists in each state have been working with local watershed project sponsors and state dam safety officials to se-

lect high priority projects. We have set aside \$2 million for each state and expect that construction will begin by this fall and will continue through fiscal year 2001. While we are in the planning process for these projects, local sponsors must obtain land rights, easements, permits and other project administrative needs, as well as finding financing for 35 percent of the total estimated cost of rehabilitation.

Watershed surveys and planning

Funding has been requested for fiscal year 2001 at the same level as the fiscal year 2000 appropriation, \$10.368 million.

Forestry Incentives Program

In fiscal year 2000 the Forestry Incentives Program was reduced by \$948 thousand in financial assistance from the appropriated level of \$6.325 million as a result of the rescission associated with Public Law 106-113. The President's budget does not propose funding for fiscal year 2001.

COMMODITY CREDIT CORPORATION FUNDED CONSERVATION PROGRAMS

Conservation Security Program

Under Secretary Lyons has highlighted the budget proposal in his testimony, I would like to provide an overview of how NRCS would deliver the program if it were authorized and funded.

First, we would issue program regulations in an expedited manner. We would base our program delivery on past successes and complement other conservation programs. In the field, we would quickly train our existing staff and use conservation district employees to help us roll out the program.

The program will be designed to reward those who are currently maintaining sound stewardship on their private lands. It will ideally also provide an incentive for those who wish to increase their level of conservation treatment. Under the program, farmers and ranchers would receive an annual payment based on the level of conservation treatment covered by the program agreement. One option could have payments covering conservation measures by land use. Examples could be crop residue management for cropland, proper grazing use for range and pastureland, integrated pest management, hayland management, and irrigation water management for irrigated land.

Our goal is to gain conservation benefits. The Secretary has asked us to provide the opportunity for those not covered by current commodity programs such as owners and operators of grazing land, orchards, vineyards, as well as those covered by the current farm programs. Both of these groups are the NRCS traditional customers. Essentially, the program would be used to help keep past investments intact and reward good stewards of our natural resources.

Environmental Quality Incentives Program

This program, which began in late 1996, has provided producers and landowners with incentives to implement long term, comprehensive conservation farm plans. We've had some growing pains. We've listened to public and Congressional concerns, and we are taking action to reduce program processing problems and overall make the program more responsive.

The fiscal year 2001 funding request reflects the full \$200 million authorized level under current law and, an additional \$125 million for a total program level of \$325 million. Demand for EQIP has historically exceeded available funding. For example, approximately 52,000 program applications were received in fiscal year 1999 with only 36 percent, or approximately 19,000 applications, approved. Cost-share assistance programs like EQIP provide a significant incentive to installing voluntary conservation practices based on local and national conservation issues. Components of the \$325 million EQIP budget include: \$178.5 million for AFO related activities, \$16 million for priority environmental issues on American Indian and Alaskan Native lands, \$10.5 million for Pacific salmon habitat recovery and \$3.6 million to fund demonstration or pilot projects concerning methane gas recovery and utilization projects. The remaining \$116.4 million would be available for local priority conservation concerns.

Wetlands Reserve Program

Re-authorized under the 1996 Federal Agriculture Improvement and Reform Act (1996 Act), the program is authorized to enroll a total of 975,000 acres in permanent easements, 30-year easements, and wetland restoration cost-share agreements.

Through the end of fiscal year 2000, the agency will have enrolled approximately 935,000 acres toward the total authorized for the program. The fiscal year 2001 budget proposes to enroll the remaining 40,000 acres and under proposed legisla-

tion, to enroll an additional 210,000 acres for a total acreage enrollment of 250,000 acres. The proposed legislation would also increase the total annual enrollment to 250,000 acres through 2010. This requested program level is needed in order for us to achieve a no-net loss of acres per year and begin to achieve our national goal of an increase in wetlands annually.

Farmland Protection Program

According to the Census of Agriculture, nearly 85 percent of domestic fruit and vegetable production and 80 percent of our dairy products come from urban influenced areas. Rapid development and urban sprawl have significantly threatened this valuable and productive farmland.

As part of the Farm Safety Net proposal, the budget proposes legislation to fund the Farmland Protection Program at \$65 million level annually. The initial funding level of \$35 million authorized by the 1996 Act was exhausted at the end of fiscal year 1998. The FPP provides assistance to communities interested in protecting unique or prime agricultural lands from conversion to non-agricultural uses. The FPP provides matching funds to states, tribes or local government entities to acquire conservation easements or other interests in land. It helps protect strategic farmland from urbanization and ensures that valuable farmlands are preserved for future generations.

If the requested \$65 million is provided in fiscal year 2001, NRCS would be able to reduce the significant loss of prime agricultural lands and protect approximately 130,000 farmland acres from conversion.

Wildlife Habitat Incentives Program

First authorized by the 1996 FAIR Act, the program provides incentives to farmers, ranchers, and other landowners to install conservation practices that improve wildlife habitats. These practices include native grass restoration, riparian area restoration, and aquatic habitat establishment. The budget proposes, under new legislation, an annual funding level of \$50 million since all available funds from the original authorization have been used.

Conservation Reserve Program

NRCS provides technical assistance to CCC in the delivery of this conservation program. Under proposed legislation, the acreage enrollment caps would be increased from 36.4 million acres to 40 million acres in fiscal year 2001. The acreage increase, coupled with bonus payments proposed for continuous signup, would help address the significant problem of soil erosion and improve the quality of our nation's waterways.

The Department has concern regarding technical assistance funding to implement the WRP and CRP. These two programs fall under a legislative cap in the Commodity Credit Corporation fund transfers, known as Section 11. Although \$35 million in emergency supplemental appropriations was enacted in May, 1999 for the fiscal year 2000 program to make up for shortfalls under this cap, our most recent estimates raise the possibility that amounts available may not be sufficient. This matter is under review within the Administration.

CONSERVATION THROUGH PARTNERSHIPS

Mr. Chairman, as you know, NRCS has operated since its creation through voluntary cooperative partnerships with individuals, state and local governments, and other Federal agencies and officials. That partnership is as important today as it ever was. In fact, it may be even more important, if we are to meet the challenging conservation problems facing our Nation's farmers and ranchers.

NRCS has worked with 4.7 million farmers, ranchers, producers, operators, private landowners and local communities to help them conserve their natural resources by gaining knowledge about new conservation problems and solutions, by providing guidance and advice, and by developing and helping implement conservation plans. NRCS does this by working with 3,000 local conservation districts that have been established by state law and with American Indian Tribes and Alaska Native Governments.

State and local governments contribute substantially, with both people and funding to complement NRCS technical and financial assistance. Approximately 7,750 FTE of assistance is provided annually by NRCS partners and volunteers. In addition, state and local governments match Federal funding by \$1.60 for every one Federal dollar provided for conservation. And Americans have generously given their time to volunteer with NRCS as part of the Earth Team Volunteers effort. In fiscal year 1999, over 29,000 people volunteered their time locally, working approximately

350 FTE. The Points of Light Foundation calculated the value of this volunteer service at \$10.4 million.

And we work closely with other Federal agencies such as our sister agencies in the Department of Agriculture, the Forest Service, Farm Service Agency, and Rural Development, as well as Agricultural Research Service, Cooperative State Research, Education and Extension Service and other Departments, including the Environmental Protection Agency.

Good conservation doesn't just happen. It takes all of us, including Congress, working together to make it happen. This concludes my statement, Mr. Chairman. I will be glad to answer any questions.

OFFICE OF THE CHIEF FINANCIAL OFFICER

PREPARED STATEMENT OF SALLY THOMPSON, CHIEF FINANCIAL OFFICER

Mr. Chairman and members of the Subcommittee, I am pleased to present the fiscal year 2001 budget request for the Office of the Chief Financial Officer—OCFO—and the Department's Working Capital Fund—WCF.

I would like to thank you, your colleagues, and your respective staff members for taking this time to focus on the multiple financial management challenges facing USDA and how we are working to address these concerns. Secretary Glickman has made resolving these issues a major priority, and I thank him for his strong leadership. I also want to recognize this committee's staff for your efforts on behalf of improving financial management. We are moving forward, and this budget request highlights the next steps that we must take to fully achieve USDA's financial management objectives.

During fiscal year 1999, USDA made significant progress towards improving its financial credibility and accountability. The following examples give you a glimpse of our progress:

Financial Statements.—USDA submitted its consolidated financial statements to the Office of Management and Budget—OMB—by the March 1 deadline. The previous year's submission arrived at OMB five months past the deadline. USDA has six stand-alone audits, three of which—the Food and Nutrition Service, the Rural Telephone Bank, and the Federal Crop Insurance Corporation—received unqualified—clean—audit opinions. An unqualified audit opinion assures policy makers, the Congress, program recipients, and taxpayers that these financial statements reflect credible, reliable information that complies with laws, regulations, and accepted authoritative requirements. These clean opinions on three stand-alone audits are a major step toward USDA achieving an unqualified audit opinion on its consolidated financial statements in fiscal year 2001.

Debt Collection.—USDA collected \$136.2 million in delinquent debt through Treasury's Administrative Offset Program and other debt-collection tools during fiscal year 1999. This figure represents a 45 percent increase over the \$93.9 million collected in fiscal year 1998 and a 90-percent increase over the \$71.5 million collected in fiscal year 1997. In addition, USDA lowered the amount of delinquent debt in its overall loan portfolio from \$7.5 billion in delinquencies in fiscal year 1997 to \$6.4 billion in fiscal year 1999, a drop of nearly 15 percent.

Integrated Financial Management System.—USDA made significant progress in implementing the Foundation Financial Information System—FFIS. Along with senior-level staff from the Office of the Secretary and other top USDA officials, I made significant changes to the implementation's project management. Under this new management structure, the Forest Service and the Food Safety and Inspection Service, which together represent 46 percent of USDA's workforce, implemented the system on October 1, 1999. The Risk Management Agency implemented this administrative system on October 1, 1998. This success led the Secretary to accelerate the system's implementation in the current fiscal year to include four major agencies—Animal and Plant Health Inspection Service—APHIS, Rural Development—RD, Farm Service Agency—FSA, Natural Resource Conservation Service—NRCS. These agencies are expected to have the system in place by October 1, 2000.

National Finance Center.—OCFO's National Finance Center—NFC—in New Orleans processes the payroll for 40 percent of the Federal civilian workforce and administers the \$90 billion Thrift Savings Plan, a 401(k) type plan for 2.5 million Federal employees. NFC has added three new payroll clients: The Peace Corps—900 employees, The Federal Elections Commission—350 employees, and the county-based employees from the Farm Service Agency within USDA—1,200 employees in addition to the 16,300 in fiscal year 1999. NFC has added 21,400 individuals to the list of employees receiving payroll services in the last two years. Adding customers to the

NFC payroll service helps to reduce the cost per transaction for all users of the service.

These examples represent progress that will continue only if we receive the necessary resources to establish the framework in which we will lead, direct, and coordinate USDA's financial management priorities to satisfy congressional mandates and provide the Secretary, the Congress, and program managers with credible financial information on which they can base decisions.

FISCAL YEAR 2001 BUDGET REQUEST

Mr. Chairman, OCFO is requesting an increase of \$1,505,000 over our fiscal year 2000 appropriation. The \$500,000 increase that we received in fiscal year 2000 marked the first time in several years that OCFO, or its predecessor agency, received an increase in its appropriated budget. We thank you for recognizing financial management's increasingly important role in ensuring that sound business practices are in place. We will use the increase in fiscal year 2001 to devote the necessary staff and resources to continue working on the following goals:

Lead Corporate Systems Strategy.—The Secretary has directed me to lead a executive group, including the Chief Information Officer and the Assistant Secretary for Administration, to develop a corporate strategy for Department-wide administrative/financial systems, including accounting/budget execution and formulation functions, procurement, property, human resources, travel, and the associated telecommunications and security. These financial management systems require OCFO to review all current business practices in the affected agencies to ensure that these systems will produce accurate, timely and reliable data. Currently, program managers, policy officials, members of Congress, and other stakeholders do not always have the reliable and timely information needed to support essential program and financial management decisions, as well as develop, monitor, and report on performance plans and their goals and objectives, as required by GPRA. The added resources for this corporate systems strategy will help OCFO accomplish these specific objectives: (1) adequately implement Congressionally mandated debt collection provisions, (2) implement a financial information architecture that fully complies with Federal requirements, (3) maintain guidelines for cost distribution processes to include guidelines for the establishment of fees, (4) ensure compliance with the Single Audit Act and non-procurement debarment and suspension/drug-free workplace requirements, and (5) participate as a key player in Government-wide efforts to continually define and refine financial information requirements.

Implement Information Infrastructure.—Consistent with the corporate systems strategy, OCFO will work with four agencies—Rural Development, FSA, NRCS and APHIS—to implement FFIS, the integrated administrative accounting system that 46 percent of the Department's workforce now relies on for its accounting services.

Resolve Credit and Debt Management Issues.—In fiscal year 1999, OCFO initiated a pilot with the Department's two major credit agencies—Rural Development and FSA—to jointly address credit reform issues in partnership with OCFO, the Office of Inspector General, and the Office of the General Counsel. The pilot was funded through reimbursable agreements among OCFO, FSA, and Rural Development. The Federal Government's quest for a clean audit opinion on the Government-wide Financial Statements is in jeopardy if the Department does not resolve these credit-related issues.

Fully implement GPRA.—OCFO must (1) conduct oversight and provide expert guidance within the Department to ensure that the strategic planning function meets legislative requirements; (2) publish the Department's Strategic Plans and the annual performance reports; and (3) ensure that a demonstrated linkage exists between annual performance plans and the strategic plan and that cost data are aligned with performance goals and correlate with budget requests. The resources OCFO needs to manage financial and administrative systems reforms will be used to link program managers with the essential information they need to examine performance measures and cost data.

Direct Cost Accounting Reforms.—OCFO leads the USDA Cost Accounting Task Force efforts and will use the additional resources to ensure that the systems modernization efforts comply with these standards and produce the appropriate cost-accounting information that program officials need.

Produce An Accountability Report.—Without additional resources, OCFO would have to divert resources from other high profile financial management initiatives, new systems implementation, and/or audit resolution to issue an accountability report. An accounting report would streamline financial and performance reporting and provide internal and external stakeholders with a single source of comprehensive information on the Department's performance on program and financial man-

agement issues. With this funding, an accountability report could be produced by March 31, 2001.

Provide oversight, guidance, and coordination for audit monitoring, tracking, and resolution.—The added resources would ensure that Federal funds are utilized for the purposes for which they are intended, and that instances of program abuse and/or fraud do not go undetected, but are addressed by Government managers in a timely fashion. In the last year, OCFO developed an Automated Tracking System—ATS—to produce better, more efficient management information. Since the OCFO has been designated as the central point to receive and track USDA audits these funds are needed to carry out that function.

WORKING CAPITAL FUND

Finally, Mr. Chairman, I will conclude my remarks by providing you with a brief update on our WCF. As you know, the WCF serves as the Department's primary financing mechanism for centrally managed financial, administrative, and information technology services. As such, it supports more than 20 distinct activity centers. Much of what I have already discussed, with respect to implementing FFIS and our new corporate systems, will be financed by our WCF and result in some short-term cost increases.

I cannot tell you, Mr. Chairman, how many USDA officials have come to me over the last twenty-three months and raised concerns on the WCF and the perceived lack of controls over its costs. I share these concerns and last fall initiated a study to evaluate those WCF costs at the National Finance Center. I recently expanded the study to look at all services performed at the Center, with the exception of those performed on behalf of the Thrift Investment Board. When the study is concluded, my goal will be to determine what it costs the Center to provide its accounting services.

USDA's leadership wants to control costs, not only for the WCF but for the individual agencies. The agencies' support for establishing a corporate strategy is indicative of this awareness. Furthermore, we are seeing a much greater collaboration between the activity centers that provide the WCF services and the agencies to ensure we are not duplicating each others work. For example, Mr. Chairman, last year the Department's Executive Information Technology Investment Review Board—EITRB—reviewed the major administrative, financial, and program systems. This Board is comprised of the Department's senior policy officials chaired by the Deputy Secretary. In this manner, we are better able to reduce the duplication of systems development and to coordinate the Secretary's administrative and financial priorities. In the long run, I also see this process as a means to maintain and improve the WCF's integrity.

As you know, the WCF is a revolving fund and totally dependent on transfers and income it receives from its customers for the services we provide. We are here today requesting no funding from the Committee, only to justify them. Much of the increase includes a number of items related to the modernization investments, re-engineering efforts, and enhanced accounting services I have spoken of already, along with associated increases related to the Thrift Savings Plan, or TSP. These increases are essential to modernize our operations, so we can maintain and improve upon the high quality of service delivery all of our customers demand. Only a small portion of the increases are related to inflation or other cost increases. With respect to TSP, we are requesting an increase in operating funds to provide for an expansion of services. The Thrift Investment Board has requested these increases so they can meet the expected legislative requirements allowing military personnel to participate in the TSP; make certain other changes relating to changes in employees' eligibility; and significantly expand the plans capabilities. These increased costs will be fully reimbursed by the Board as the customer. I am pleased to report that we, along with the Board and a private contractor, are in the final stages of implementing a new system in October 2000 that will provide two new investment options for TSP participants and allow them the capability to conduct on-line investing within their own accounts. These changes will bring TSP up to the standards on-line traders currently enjoy on the Web.

We have learned that modernizing our financial and administrative systems is an expensive and continuing process, and we are currently paying for years of inadequate investments that prevented NFC from keeping up with current technology standards. That's why we are having to bear high costs for modernizing NFC and for re-engineering a wide variety of administrative, information technology, and financial processes.

As I mentioned, we are evaluating innovative methods to provide financing for our major initiatives, including the performance-based contracting. With this in mind,

the President's Budget includes new language to be included in the Department's General Provisions that would grant authority to the Secretary to transfer certain funds to the WCF for plant and equipment investments in administrative, financial, and information technology services. In a rapidly changing technological environment, we are always going to be faced with the need to make improvements, redesign systems, re-engineer processes, and generally manage our operations in a virtual environment. Our customers will no longer accept less than what they can get in the market place or from our competitors. Therefore, we must have access to investment capital that is both sustainable and flexible. We need to be able to bring needed resources to bear quickly and efficiently. There is no clearer example of our emerging need than our efforts to re-engineer our corporate systems, as I noted before. When completed, we will be able to provide to all of our customers real-time information in an interactive environment. Again, our customers will accept no less.

Mr. Chairman, we have a shared responsibility to ensure that we can meet the needs of our agencies as they address the needs of the American farmer and agricultural community. I am eager to work with you and the members of this Committee to ensure that those needs are met. The resource estimates that I am presenting to you is our commitment to fulfilling our responsibilities. Thank you, Mr. Chairman. I welcome any questions the Committee might have.

OFFICE OF INSPECTOR GENERAL

PREPARED STATEMENT OF ROGER C. VIADERO, INSPECTOR GENERAL

INTRODUCTION AND OVERVIEW

Good morning, Mr. Chairman and members of the Committee. I am pleased to have this opportunity to visit with you today to discuss the activities of the Office of Inspector General (OIG) and to provide you with information on our audits and investigations of some of the major programs and operations of the U.S. Department of Agriculture (USDA).

Before I begin, I would like to introduce the members of my staff who are here with me today: Jim Ebbitt, Assistant Inspector General for Audit; Greg Seybold, Assistant Inspector General for Investigations; and Del Thornsby, Director of our Resources Management Division. I want to thank the Committee for its support during the 5½ years since my appointment as Inspector General. We have tried to work closely with you, and I hope we have been able to address some of your concerns. We have a diverse staff of auditors, criminal investigators, and other personnel in our offices throughout the Nation to carry out the agency's audit and investigative mission.

I am proud to say that in fiscal year 1999, we continued to more than pay our own way. In the audit arena, we issued 146 audit reports and obtained management's agreement on 348 recommendations. Our audits resulted in questioned costs of over \$262 million. Also, as a result of our audit work, management agreed to recover more than \$55 million and put another \$114 million to better use. Equally as important, implementation of our recommendations by USDA managers will result in more effective operations of USDA programs. In addition, our investigative staff completed 515 investigations and obtained 502 indictments, 559 convictions, and 2,780 arrests. OIG investigations also resulted in \$68 million in fines, restitutions, other recoveries, and penalties during the year.

We continued to work closely with USDA agency officials during fiscal year 1999 to address key issues and expand our cooperation with other Federal, State, and local law enforcement and audit agencies to broaden the impact of our work. Working together, our staffs identified program weaknesses and program violators. Capitalizing on the staffs' respective expertise, we created solutions for positive action.

In fiscal year 2000, our primary concerns continue to be in the areas of food safety, public health, and consumer protection. In the food safety arena, we continue to identify contaminated food, misbranded products, uninspected meat or other products, or items smuggled into the United States containing unwanted and unsafe pests. With the Nation's food supply being highly susceptible to tampering, diseases, or infestation with unwanted plant pests, OIG's resources, especially our investigative resources, continue to be drastically overextended in these highly critical areas.

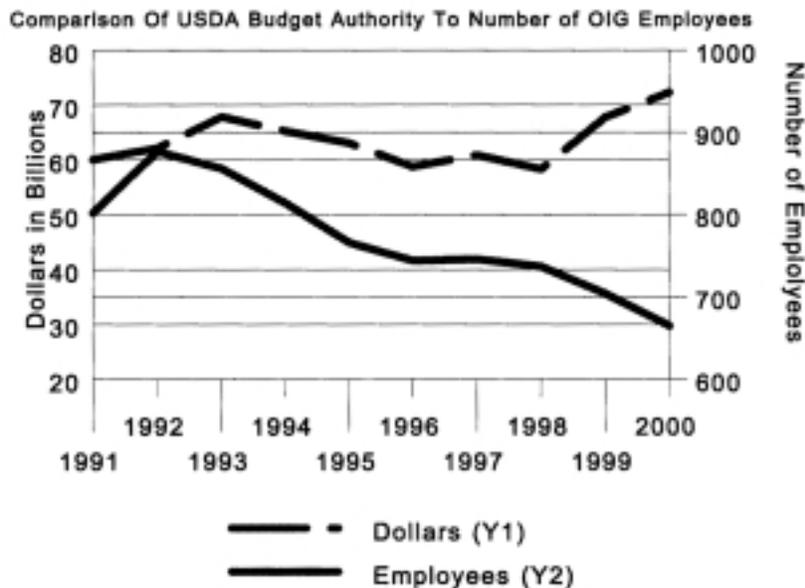

We are also focusing our audit efforts on the Department's financial information systems, which process billions of dollars in payments and an extraordinary amount of sensitive data. And, of course as conditions change, we adapt quickly to address critical, time-sensitive situations. For example, when Congress passed supplemental appropriations to help farmers suffering from natural disasters and low commodity

prices last year, our audit staff immediately teamed up with Department officials to make sure controls were in place to quickly get the right payments to farmers. Another area we are addressing is employee integrity. We are concerned by the occurrences of corruption within the Department's ranks. For instance, during fiscal year 1999, we issued 40 investigative reports and obtained 22 convictions of current or former USDA employees.

Before I continue with our accomplishments during the past year, I want to take a few minutes to address an issue that has me deeply troubled. I have been candid with the committee on whatever issues came before me and reported the facts as I have known them. This is as it should be. But now, I want to speak of the special agents and auditors of my own agency. These dedicated individuals have accomplished so very much, only a small portion of which I have ever had the time to share with you. Their work literally saved the lives of large numbers of our citizens, particularly children, and elderly. They have saved our precious tax dollars, worked with USDA agencies to restore integrity to our programs, and protected American agriculture. I am immensely proud of them and hope you are too.

While I have reported to you some of their accomplishments, I have not told how they have been stretched beyond the breaking point. The numbers of special agents and auditors, and the resources available to them, were severely limited when I arrived 5½ years ago, and while our responsibilities have increased since my arrival, our staff and resources have continually diminished. In January 1993, we had 875 employees on board. Now we have only 665 210 less, a 24 percent loss. Yet, the decrease to 665 people means little until one considers that the Department's budget, including loan authority, currently is \$177 billion; with a personnel staff of approximately 110,000 for fiscal year 2000. Not included in this dollar amount are the operations and actions of millions of companies, plants, and individuals regulated by USDA. As you know, investigating criminal activity by any of them is the responsibility of OIG agents. Ensuring the integrity of all of these programs is the responsibility of OIG auditors.

To put it in perspective, when we compare OIG staffing to the Department's programs and personnel, we find that each auditor must ensure the integrity of approximately \$635 million in program activity. Each special agent is responsible for investigating all crimes involving nearly \$840 million of USDA funds, and any crimes committed by the Department's approximately 110,000 employees, such as embezzlements, thefts, bribes, or extortions. This lone agent is also responsible for investigating criminal activity committed by immense numbers of companies, plants, and individuals whose actions are regulated by the Department through its animal and plant, meat, poultry, grain, fruit, and vegetable inspection and grading programs. Then, there are USDA's forests. It's like having one police officer and one auditor to handle all crime and corruption in New York City.

As our funding shortages have grown more severe, we have been forced to change our standards for determining which criminal activities we investigate. For years we have declined to investigate large numbers of prosecutable cases, focusing instead on those with higher dollar amounts or those that would have a significant impact on a USDA program. In recent years, as our resources have diminished, we have had to elevate the standard further, leaving thousands of prosecutable criminal cases in the files. The types of criminal activity which we do not have resources to investigate continue to vary widely, and range from corruption in USDA's grading programs, to smuggling of agricultural products, to large frauds in the Department's benefit programs. Proactive investigations have been, by necessity, severely curtailed.

Of course, our people continue to do their best, continue to lock up some of those who steal from the taxpayers, poison our citizens, and endanger American agriculture, but you must know that there are now huge gaps in that "thin blue line" that is OIG.

Our auditors and investigators can continue to recover and save money for the taxpayers only if they have the tools needed to perform their duties. The changing world of automation has added to the tools needed, and these tools come at a heavy price. For example, audits of computer security require specialized and costly training, hardware, and software. Without these tools, we stand little chance of staying abreast with the "hacker community," and the Department's exposure to system penetrations remains high, with potentially devastating effects. The highly publicized breakins over the past 2 weeks via the Internet of such major cyberspace vendors as Yahoo, Amazon.com, and eBay only highlight the urgency of protecting the Department's data bases and vulnerable computer systems.

Compounding our dilemma, for several years we have been required to absorb increases in personnel costs. This has forced us to limit our replacement hiring and has extensively curtailed the funding we have available for other necessary items, such as travel and specialized law enforcement equipment. At the same time, programs and activities administered by USDA to protect consumers have undergone substantial increases due to liberalized world trade and travel, and purchases of commodities for use in the National School Lunch and related programs. In addition to fewer staff, we received no additional resources for such mandated activities as auditing the Department's financial statements, yet this activity consumes about 20 percent of our audit resources. Under these conditions something has to give, and it is reduced coverage of the Department's increasing activities and expenditures. To illustrate this, in fiscal years 1997 through 2000, we determined that on average a little over 100,000 workdays were needed in each of those fiscal years to provide

audit coverage. Yet with available audit resources, we could staff only an average of 67,000 workdays, a shortage of 33,000 workdays. In fact, in fiscal year 2000 only 61,400 workdays are available. By way of example, because of these shortages, we have not been able to provide in-depth audit coverage to issues such as the Department's efforts to increase collection of debts owed to it, and the Department's new computer system for tracking the Rural Housing Loan Program. Overall, more needs to be done with information technology information since, with the advancing state of automation, more data involving payment systems, health and safety, economic matters, and research becomes at risk because of unauthorized access and possible irreparable damage.

At our current staffing level, we are simply not able to deal with crisis issues needing immediate audit and investigative attention without neglecting important work elsewhere. OIG is often required to pull its special agents from assigned investigations of large frauds in USDA's benefits and loan programs to investigate criminal activity that threatens the health and safety of the public. We currently have 34 open investigations on those who intentionally sold meat products that could have sickened or killed consumers, including school children and military personnel. While most cases involved those who processed the meat products, we also investigated those who endangered the public in other ways. For example, just this month we immediately responded to an incident where individuals had stolen tractor-trailer loads of meat and poultry from several locations in Georgia. Our immediate concern was that the thieves were repackaging and relabeling the stolen product and not properly maintaining it, making it hazardous to consumers. A portion of one tractor-trailer load transported to Texas had spoiled because the refrigeration unit on the trailer was not properly working. Other stolen meat product was found in Mississippi and in Tennessee, where it had been sold to prisons.

Another area that significantly affects our resources being available for criminal investigative operations is our need to provide protective security for the Secretary of Agriculture. OIG special agents continue to protect the Secretary during his official duties in Washington, D.C., and during his extensive official travel domestically and abroad. In the past 5 years, the number of threats to the Secretary has increased by 250 percent. In January 2000, the OIG security detail provided protection to the Secretary while he attended the World Trade Organization (WTO) meeting in Seattle, Washington. The WTO conference was ground to a halt by thousands of protestors who blocked entrances to meeting halls and hotels, virtually shutting down the city for 3 days. In 1999, 20 individuals either wrote threatening letters to the Secretary or protested the Secretary's agricultural policies and programs. One individual repeatedly wrote letters to the Secretary threatening deadly force against him or any other Government employee who attempted to foreclose on his farm. This individual was arrested by OIG special agents on January 28, 1999, and has been confined to a medical facility for psychiatric evaluation. At the time of his arrest, the individual was carrying a semiautomatic pistol and a shotgun in his vehicle. An OIG search of his home found five shotguns, three 22-caliber rifles, ammunition, and a gas mask. The weapons were placed at various doors and windows throughout the house, and ammunition was placed beside the weapons. The criminal complaint filed in Federal court against this individual is still proceeding.

Adequate funding and staffing for our office makes good sense because we help create a Government that works better and produces positive results. While I recognize that funding is limited, I believe OIG cannot continue to provide sufficient service and assistance to you, the Congress, and to USDA agencies without being provided adequate resources, and I request that our proposed funding level be approved. I believe that resources allocated to OIG are very cost-effective in view of the money we save the taxpayers.

Also, to keep the Committee informed, I have attached a summary to my testimony of the forfeiture funds we have received to date as a fully participating member of the Department of Justice's Asset Forfeiture Fund and how these have been used. These monies have been very helpful to the agency and have also enabled us to provide support to the State and local law enforcement agencies we work with in such joint efforts as Operation Talon. For example, we have been able to provide these law enforcement agencies nearly \$100,000 during the last year and a half to assist in this particular operation as a result of our forfeiture authority.

Mr. Chairman, at this time, I would like to highlight some of our audit and investigative activities.

AUDIT AND INVESTIGATIONS ACTIVITIES

FOOD SAFETY

Animal and Plant Health Inspection Service (APHIS)

Last year, OIG began an antismuggling campaign to interdict foreign agricultural products that are being illegally brought into the country. Such products can contain pests and diseases that could be catastrophic to U.S. plant and animal populations. Ongoing criminal investigations are targeting smuggled fruits, vegetables, plants, animals, and other commodities that bring high dollars in underground "black market" commerce. This initiative requires significant agent resources dedicated to intelligence collection, undercover operations, and foreign law enforcement liaison, as well as a need for high-tech surveillance equipment.

OIG is currently conducting 26 investigations into the smuggling of agricultural products that are entering the United States through Canada, Mexico, and U.S. ports in Florida and California. We are working closely with foreign customs and agricultural inspection officials, the U.S. Customs Service, the Animal and Plant Health Inspection Service, and State and local agricultural inspection personnel to locate the illegal products and identify the manner in which they are being brought into and moved around the country. These ongoing investigations have uncovered sophisticated smuggling conspiracies that are bringing in large quantities of agricultural products. These individuals fly products into areas of the country with little agricultural inspection, but then move them into other States where they pose a danger. They devise paper trails that hide the source of the products, and conceal the products when moving them. All of the products could harbor pests and diseases that could devastate the agricultural sector. Many of our investigations are being conducted on individuals who are bringing products into California, where outbreaks of plant pests have been common and costly. There is heightened concern in California because of the fruit fly quarantine imposed as a result of these pests being introduced. OIG must do proactive work to ensure these destructive pests are not being brought into the country on smuggled plants and commodities to infest our plants and crops. We must shift staff from current work to address these immediate issues to prevent loss of crops and dire economic consequences to the local economies.

Antismuggling operations also include our long-term joint Special Field Enforcement Program with APHIS, the U.S. Customs Service, and State and local law enforcement agencies in Florida. This Special Field Enforcement Program will target organized transportation and distribution networks responsible for the smuggling of foreign fruit contaminated with fruit flies and other pests into the United States via Florida. This program will eventually expand to other States with pest smuggling problems.

In another OIG criminal investigation that demonstrates our work in this area, we worked with APHIS to convict two owners and their company operating a horse export/import business in Virginia and Germany. The owners pled guilty to smuggling and providing falsified information concerning the age of horses being exported from Germany. The German veterinarians unknowingly issued inaccurate health certificates that allowed the horses to be exported to the United States. The certificates were presented to APHIS officials so that the horses could avoid the 50 days of quarantine in the United States paid for by the owner which is a requirement for all horses over the age of 731 days in order to prevent the spread of Contagious Equine Metritis, a sexually transmitted disease. Consequently, at least 10 mature horses were imported into the United States without being placed in quarantine. One owner was sentenced to 4 months in prison while the second owner and corporation were given probation. Collectively, the three were fined \$45,000. Because of OIG criminal enforcement actions, the Government seized the owners' horse farm in Virginia, valued at \$1.2 million, which the owners forfeited to pay damages in this case.

In another case, a husband and wife, both Canadian citizens, were indicted in Washington State for smuggling prohibited Asian fruit into the United States. The Asian fruit is prohibited entry into the United States because it is known to carry pests and diseases not found here that could devastate local crop economies. Four hundred pounds of fruit were discovered hidden in the cargo area of the subjects' station wagon as well as inside the walls of the cargo area. This was the third time these individuals had been caught smuggling fruit into the United States. The husband subsequently pled guilty while the charges against the wife were dropped. Both the Federal prosecutor and the defense counsel had initially recommended probation with no jail time. The judge, noting the potential harmful impact of the fruit, which tested positive for insect infestation, could have had on domestic crops and

local economies, declared her intent to "send a message" to the subject. She sentenced him to 2 days in jail and 3 years' supervised release.

Food Safety and Inspection Service (FSIS)

At last year's budget hearings, I reiterated our continuing commitment to placing a high priority on food safety and consumer protection issues. Threats to the health and safety of the public are the most important matters investigated by OIG. Recent criminal investigations addressed the processing and sale of adulterated meat and poultry and tampering with food products consumed by the public.

During the last few months, criminal investigations have necessitated the immediate deployment of special agents to several cities in the United States to protect the health and safety of consumers. These cases, some of which are still ongoing, have involved real or threatened adulteration of meat with E.coli and Listeria from unsanitary production methods intentionally neglected by the processor, sewing needles placed in commercial meat product packages at a supermarket to injure and possibly kill unsuspecting consumers, and substances added by the processor for economic gain.

To address these serious threats and illegal acts against the public's well being, we are pursuing joint activities with other Federal, State, and local agencies to share intelligence and conduct undercover operations. Doing so will help us better target criminal enterprise in general and the threat to the food supply in packing plants and other facilities in particular.

The increasing threat to the wholesomeness and safety of domestic and exported food requires not only vigilance but also advanced preparedness and preemptive undercover operations. Profit-motivated criminal activity that threatens the food industry can cause economic disruption while victimizing innocent members of the industry. Likewise, threats from outside the food industry of criminal adulteration and biological contamination of food products for extortion or ideological motives victimize and disrupt the food production or distribution systems until these threats are resolved through a law enforcement and health and safety response.

Immediate response to emergency situations impacting USDA programs and operations and regulated industries requires the specific, unique law enforcement expertise of USDA OIG. OIG's rapid response and deployment of considerable staff resources has helped to protect the health and safety of consumers this past year, and we will continue to do so in the future. However, the cost to respond rapidly is great and growing. To do so, we require specialized equipment and protective clothing and supplies to ensure the health and safety of our personnel responding to these crises. To date, we have very limited funding for these critical necessities.

A prime example of our work in this area was one of our high-profile cases, which was conducted with the technical assistance of the FSIS Compliance staff. Together, OIG and FSIS identified approximately 30 million pounds of potentially tainted hot dogs and sandwich meat deemed unfit for human consumption and ordered destroyed by FSIS. During December 1998, FSIS suspended the operations of the Arkansas meat processing plant responsible for the unsanitary production process that resulted in Listeria Monocytogenes bacteria infecting the hot dogs and sandwich meat. This processing plant produced approximately 600,000 pounds of hot dogs and cold cuts per week and sold these items to large food stores and the U.S. military. Our criminal investigation continues. An incident at an Iowa grocery store is another significant example of the multitude of food safety issues we deal with on a regular basis. In this case, 18 OIG criminal investigators, in cooperation with the local police department, worked round-the-clock for 4 weeks to identify the individual responsible for placing sewing needles in ground beef packages, fruit, and bakery items to be sold to the public. Due to the immediate response of OIG special agents and their subsequent investigative actions, one individual was indicted on a Federal criminal charge of tampering with food products. Fortunately, no injuries are known to have resulted from these criminal acts. An April 2000 trial date has been set.

As a result of another joint criminal investigation by OIG and the Internal Revenue Service, two owners, the vice president, plant manager, and four salesmen for a large meat company in Philadelphia, Pennsylvania, were indicted for skimming \$2.7 million from the company cash register and concealing this income on their tax returns. The owners and plant manager were also indicted for misbranding cheaper cuts of beef and pork and selling this meat as expensive cuts. The two owners pled guilty to all 52 counts brought against them. The plant manager pled guilty to selling misbranded meat and filing false income tax returns. At sentencing, the two owners were ordered to pay a total of \$1.5 million in restitution and fined \$724,000. In addition, one owner was sentenced to serve 60 days' imprisonment, the other was sentenced to 1 year of home confinement, and each received 5 years' probation.

Ongoing Food Safety Review

Another area that is critical to increasing food safety and ensuring that consumers receive safe and wholesome meat and poultry products is successful implementation of the Hazard Analysis and Critical Control Point (HACCP) and pathogen reduction programs. We developed a "Food Safety Initiative" to review FSIS' food safety mission across a broad spectrum of meat and poultry inspection operations. This initiative, which is now underway, includes a review of meat and poultry establishments' sanitation and HACCP implementation, including efforts to test for pathogens and reduce their presence. Because a key to pathogen reduction is FSIS' laboratory operations, our review is assessing FSIS' quality control system over those laboratory operations, product sample integrity, and laboratory testing operations.

Our review also focuses on the import of meat and poultry products into the United States from foreign countries. In order for a country to ship meat or poultry products into the United States, the country must demonstrate that its inspection system is equivalent to the U.S. system. When the review of the FSIS equivalency determination is completed, our efforts will focus on FSIS' responsibility to inspect the imported product on entry to the United States, and if need be, conduct visits to selected foreign countries to assess their inspection systems. Lastly, our initiative is focusing on FSIS' Compliance Program to determine its effectiveness in preventing and detecting violations of the meat and poultry inspection laws. This includes activities related to businesses engaged in transporting, storing, and distributing products after they leave federally inspected establishments. We are in the process of finalizing our work in this area.

FSIS Oversight of State-Operated Meat and Poultry Inspection Programs Need Further Improvements

Under the State-Federal Cooperative Inspection Program, individual States are authorized to inspect meat and poultry products sold solely within their boundaries, provided that their food safety requirements are at least equal to those of the Federal Government. FSIS retains an oversight role in this effort. Twenty-six States have FSIS-approved inspection programs, covering about 2,700 slaughtering and processing plants. About 7 percent of all meat and poultry production in the United States is inspected at these plants.

FSIS took significant steps to correct problems identified in a previous OIG audit, but additional improvements are still needed. Our most recent audit, released in May 1999, included reviews in two States that represented about 24 percent of the State-inspected establishments nationwide. This audit found that FSIS needs to ensure acceptable ratings are not given to State programs with identified sanitary deficiencies or to States that do not take adequate corrective actions to address serious sanitation problems. FSIS agreed to implement our recommendations.

EMPLOYEE INTEGRITY

The investigation of criminal acts associated with employee integrity violations by USDA employees is another high priority for OIG. During fiscal year 1999, we issued 40 reports of investigation concerning allegations of criminal conduct by USDA employees. Our investigations resulted in 22 convictions of current and former employees and resulted in 68 personnel actions, including removals, suspensions, resignations, reprimands, and alternative discipline.

Our current investigation in New York City epitomizes the agency's work in the employee integrity area. Thus far, in this ongoing investigation, 9 Agricultural Marketing Service (AMS) graders have pled guilty to charges of accepting bribes for downgrading the quality of fruit and vegetables at the Hunts Point Terminal Market in the Bronx. In addition, 3 owners or employees of produce wholesalers have pled guilty to charges of paying bribes to these graders. All 12 owners and employees of other produce wholesalers have also been indicted and are waiting trial. All had been arrested by OIG special agents. During the 2½ year investigation, we uncovered a scheme by which the AMS graders accepted bribes from produce wholesalers to downgrade lots of produce. The wholesalers then used the lower grades to negotiate the price they paid the grower for the produce downward, which resulted in the growers being cheated out of the true value of their produce.

In another investigation, in West Virginia, nine individuals, including two employees of the Farm Service Agency's (FSA) Agricultural Credit Team, were convicted for defrauding the Government of approximately \$2 million in FSA direct and guaranteed farm operating loan funds. The loans were obligated by FSA based on false information submitted by the applicants. The two employees of the Agricultural Credit Team assisted the loan applicants by forging signatures or manipulating fig-

ures on official FSA documents for the purpose of making the applicants qualify for loans. Eight of the nine individuals have been sentenced. All seven loan recipients were ordered to make full restitution. The two FSA employees resigned from Government service following their convictions.

In an investigation in Louisiana, five individuals pled guilty and were sentenced in Federal court for their involvement in a kickback scheme in which an FSA credit manager in Louisiana falsified loan documents, resulting in \$1.8 million in false FSA farm-operating loans. The credit manager, who resigned, and two other FSA borrowers were indicted and are fugitives. In addition, a local bank vice president was placed on pretrial diversion for conspiring with the former credit manager to provide false information to the Government, which resulted in the issuance of an FSA guaranteed loan that should not have been made. The bank vice president obtained the loan for the construction of an airplane hangar. To date, the sentences have ranged from probation to 2 years 3 months of incarceration. In addition, the court has, thus far, ordered a total of over \$670,000 in restitution be paid to USDA.

WORKPLACE VIOLENCE

Another extremely important area for OIG is the investigation of threats of violence against USDA employees. We have responded to numerous situations involving the use or threatened use of force against the Department's employees. For example, in Oklahoma, we investigated a shooting incident involving a farmer, a USDA Natural Resources Conservation Service employee, and a second farmer who was assisting the USDA employee. The USDA employee was present in an official capacity when the shooting occurred. The farmers involved in the situation began arguing about the destruction of several fences, and one farmer shot and killed the other. The USDA employee was held at gunpoint for 30 minutes until he was allowed to leave the scene to obtain help for the farmer who had been shot. The farmer who killed the individual was indicted by a Federal grand jury for murder. He recently appeared in District Court for a detention hearing. He was denied bond and ordered to remain in jail until his trial date which is scheduled for March 6, 2000.

In another investigation, in North Dakota, a dog kennel owner pled guilty to a felony count of threatening to assault an APHIS Animal Care inspector in an attempt to prevent the inspector from performing the required inspections at the kennel. During the OIG criminal investigation of this matter, the subject admitted that he had threatened to kill the inspector, and then proceeded to make a similar threat if the APHIS inspector attempted to perform his inspection duties in the future. The kennel owner was sentenced to 12 months' probation.

INFORMATION RESOURCES MANAGEMENT

Computer security

We have also conducted numerous reviews of the vulnerability of agencies' computer systems to unauthorized access. Using advanced techniques known to the hacker community our audits disclosed over 600 security vulnerabilities. For example, sensitive data such as passwords could be identified which would enable hackers to penetrate the Department's systems. With the continued expansion of Internet use and public access to departmental systems, security risks will continue to increase. The potential harm of improper entry to the Department's computer systems is extraordinary given the degree of sensitive data processed and the extent of program payments made through these systems. Alteration of data on quantity and price compiled by the National Agricultural Statistics Service could drastically impact world commodity markets. Penetration of Rural Development's \$56 billion loan portfolio could significantly reduce the safeguarding of those assets. Finally, data that FSIS depends upon to ensure a safe and healthy meat and poultry supply could be compromised. Although we have been successful in our audit efforts in this area, much work remains, and our ability to address it has been limited due to staffing and resource constraints.

The Department achieves "year 2000" compliance

Year 2000 testing was essential to provide reasonable assurance that new or modified systems processed dates correctly and would not jeopardize an agency's ability to perform core business operations after the millennium change. Throughout fiscal year 1999, we continued to review and report on the Department's Year 2000 compliance or necessary remedies. Our reviews were essential to provide the public with assurance that the Department would continue to operate and provide needed benefits to program participants.

The Department overcame the Y2K threat without significant interruption. OIG played a major role in this achievement.

FARM AND FOREIGN AGRICULTURAL SERVICES

*Farm Service Agency (FSA)**Monitoring the Implementation of the Crop Loss Disaster Assistance Program (CLDAP)*

In 1998, Congress appropriated \$2.4 billion for distribution to eligible farmers under the 1999 CLDAP. This program provided emergency assistance to over 270,000 farmers, many of whom suffered multiyear losses from drought or floods. The value of lost production totaled around \$2 billion. When the bill passed, we began working with FSA and the Risk Management Agency (RMA) as they began to implement this massive farm program, to ensure that all eligible farmers received this Federal farm assistance timely. We provided input on program controls to FSA and RMA as they drafted program regulations, and, in doing so, were able to proactively review and provide comments on the agencies' implementing regulations. This cooperative effort helped to preclude many of the problems we had noted in prior ad hoc disaster programs. We had staff at the FSA field offices shortly after CLDAP was implemented, checking on the effectiveness of FSA's and RMA's outreach program to ensure all eligible farmers were notified of this program and to determine if there were any backlogs or other problems in the timely processing of applications from all eligible farmers. We worked with the agencies to alert them to potential problems in getting this massive assistance to all farmers. We were also alert to potential abuses in the program through ineligible program overpayments submitted by individuals. As a result of our work with FSA and RMA, they were able to revise the program procedures and on a timely basis, which helped to preclude improper CLDAP payments.

On the investigative side, historically, one of our primary responsibilities has been the investigation of criminal violations of the various farm support programs administered by USDA. For example, as a result of a criminal investigation in Georgia, three Mitchell County farmers have each pled guilty to one count of conspiracy to launder money. These 3 individuals were believed to be the masterminds in a disaster fraud scheme that netted them and 12 of their relatives and friends approximately \$1.6 million in unentitled disaster payments. The defendants filed fraudulent claims to receive FSA disaster payments for themselves and the others and submitted fictitious seed invoices to support the fraudulent claims. Each farmer was sentenced to serve 1 year in Federal prison for involvement in this scheme.

In another investigative case in this area, two Idaho warehouse operators, a husband and wife, were ordered to pay restitution of \$166,000 to the Commodity Credit Corporation and local farmers after they pled guilty to Federal charges related to the theft of grain that was being stored at their State-licensed grain warehouse. Producers in Idaho and Oregon lost more than \$1.5 million as a result of the theft. The wife was sentenced to serve 6 months in Federal prison to be followed by 4 months of home detention and 3 years of supervised release. Her husband was placed on probation for 4 years. As part of their plea agreement, they also agreed not to contest debarment action by USDA. This investigation was a cooperative effort with the warehouse examiners from the FSA Kansas City Commodity Office; the Oregon State Police; the Canyon County, Idaho, Sheriff's Department; the FBI; and the IRS's Criminal Investigation Division.

*Risk Management Agency (RMA)**Reinsured companies were not properly servicing catastrophic (CAT) risk protection policies*

The CAT Program is part of the safety net for farmers. It provides basic coverage to all producers at a minimal cost and to limited-resource farmers at no cost. In 1996-1997, a decision was made to transfer the delivery of CAT policies from FSA to the reinsured companies. We evaluated the transfer and found a number of servicing problems, such as farmers not receiving adequate local agent servicing. Frequently, these producers were not contacted by insurance agents, and the needs of the limited-resource farmers were not being addressed.

In our recent followup review, we evaluated how effectively the delivery of this safety net program had been implemented by the reinsured companies. We found that the number of limited-resource farmers with CAT policies declined by about 78 percent between 1997 and 1998, during the time the reinsured companies assumed sole delivery of the program. RMA acknowledged there is a problem in the CAT Program as currently authorized. However, RMA believes that the significant decline in participation by limited-resource farmers stems from the elimination of the legal requirement that farmers purchase crop insurance in order to receive other Federal farm assistance and from the farmers' perception as documented in RMA's re-

views—that the CAT Program, as currently devised, does not provide an adequate safety net. Without improvements in the CAT Program, we believe that producer participation will likely continue to decline and that the effectiveness of the program as part of the safety net against catastrophic losses for farmers, especially small and socially disadvantaged farmers, will diminish further.

Foreign Agricultural Service (FAS)

Monitoring of FAS' Food Aid Assistance Agreements With the Russian Government

For the past several years, OIG has evaluated various aspects of the Department's food aid assistance to the Independent States of the Former Soviet Union. In response to our recommendations, the Department took actions to strengthen future programs' controls over accountability for the commodities and monetary proceeds and oversight of cooperating sponsors. We believe these actions have improved the Department's current food aid assistance.

In December 1998, the Governments of the United States and Russia signed two food aid agreements that would provide over 3 million metric tons of wheat and various other commodities to the Russian Government. Shortly thereafter, we began to monitor FAS' efforts to implement procedures to minimize potential misuse and improper losses of commodities. The estimated total costs for all the agreements, including transportation costs, are about \$1 billion. The commodities alone are estimated to have cost \$746 million, and their monetary proceeds in Russia are estimated at over \$403 million.

In February 1999, we recommended specific actions to strengthen FAS' monitoring plan, including the need to increase the size and effectiveness of its monitoring staff detailed to Russia, and to verify the financial integrity of any Russian financial institutions involved with monetary proceeds. In May 1999, we participated on a U.S. Government Interagency Team to Russia to observe the implementation of the agreements. We documented our observations in a memorandum to FAS in August 1999, suggesting that it needed to quickly finalize the financial guarantees for payment of the commodities and to increase coordination and communication among all parties. In that memorandum and in our testimony before the U.S. House of Representatives, Committee on Agriculture, in October 1999, we stated that even though we could not provide complete assurance that the controls are fully in place and working, we believed that FAS had made significant efforts to establish controls and strengthen monitoring efforts.

FOOD, NUTRITION, AND CONSUMER SERVICES

Food and Nutrition Service (FNS)

Operation Talon

Previously, I informed you we had initiated a new law enforcement initiative, code named "Operation Talon." This initiative provides for the exchange of information between law enforcement and State social services agencies. Specifically, law enforcement fugitive records are matched with social service agencies' food stamp recipient records, and the information is used by OIG and State and local law enforcement officers to locate and apprehend dangerous and violent fugitive felons who may also be illegally receiving food stamp benefits.

Overall, Operation Talon has been the most successful investigative initiative we have yet undertaken. To date, this initiative has resulted in the arrest of approximately 5,600 fugitive felons. This has included 33 wanted for murder or attempted murder; 24 for child molestation; 14 for rape or attempted rape; 9 for kidnapping; and 1,695 for assault, robbery, and drug offenses. Also, a number of States are removing arrested fugitives from their food stamp rolls, which will result in savings to the Food Stamp Program and allow food stamp benefits to continue to go to the needy who are the intended recipients and entitled to this benefit.

Operation Talon is an ongoing initiative, and we are planning future arrest operations in many parts of the country. During the next phase of Operation Talon, we will initiate data matches between State social service agencies' records and Federal fugitive information provided by the U.S. Marshals Service. Following these matches, our agents and the U.S. Marshals Service will conduct fugitive apprehension operations. These Federal arrest operations will take place concurrent with OIG, State, and local law enforcement agency operations targeting non-Federal fugitive felons.

Food Stamp Program (FSP)—Electronic Benefits Transfer (EBT)

In fiscal year 1999, just over \$19 billion in FSP benefits was issued with about 70 percent issued via EBT. This now involves 34 statewide systems and the District

of Columbia. It is critical that we provide audit coverage to ensure not only that the systems operate as designed, but also that only eligible persons receive benefits in the proper amounts. We will need to provide periodic assurances that EBT is working and that interState operability is functioning as it is expanded.

In fiscal year 1999, we completed EBT system work in seven States. The EBT systems were successfully implemented in all seven States; however, controls need to be strengthened in some areas. Six States need to improve controls over access to their EBT systems. Two States need to establish procedures to reconcile program authorizations to those received by the EBT processor and the system operated by the Federal Reserve. In another State, controls were not in place to correct an erroneous benefit file that had been transmitted to the contractor. This resulted in a system error, causing an estimated \$730,000 in erroneous FSP benefits to be issued to about 10,000 individuals. Even with these problems, however, we believe EBT has been successful it gets stamps off the street, thereby reducing the opportunities for food stamp trafficking. Our reviews of EBT systems will continue as States endeavor to implement EBT to meet the deadline of October 2002 mandated by the Welfare Reform Act.

We also continue to devote significant investigative resources to combating fraud in FSP. Ever since this important program began distributing food stamps to needy Americans, unscrupulous people have been willing to devise methods to unlawfully benefit from it. As the result of three OIG criminal investigations in Cleveland, Ohio, that initially seemed unrelated, a local grocer pled guilty to laundering \$8.6 million in connection with food stamp trafficking. The investigation showed that, from June 1993 through March 1998, the grocer organized the illegal redemption of food stamps for himself and other Cleveland area grocers. The grocer was sentenced in Federal court to 12 years' imprisonment. This individual also had two prior convictions for food stamp trafficking as a result of OIG investigations conducted in 1989 and 1994. The other two store owners involved in the conspiracy, who cooperated with the prosecution, were sentenced to 2½ years and 18 months, respectively. All involved grocers were permanently disqualified from FSP. This investigation was conducted by the Cleveland Food Stamp Task Force, which is composed of OIG, the Secret Service, the FBI, the IRS Criminal Investigation Division, the U.S. Customs Service, the Cleveland Police Department, and the Ohio Department of Public Safety.

In another 2-year criminal investigation by OIG, the Texas Department of Human Services' OIG, the IRS, and the Secret Service, six family members in Houston, Texas, were convicted for food stamp fraud, money laundering, and conspiracy, and criminal forfeiture actions were imposed. The subjects illegally accepted and redeemed in excess of \$2 million in food stamp benefits via the EBT system. The six subjects received sentences that ranged from 27 months' imprisonment to 97 months' imprisonment, and \$2 million was ordered in restitution.

Child and Adult Care Food Program (CACFP)

Last year I testified that we would continue with Operation "Kiddie Care" our Presidential Initiative reviewing CACFP as long as we find evidence of abuses in the program. In fiscal year 2000, estimated outlays for this program are \$1.8 billion; a program we judge to be at risk because its current control structure is flawed and places the primary controls in the hands of sponsors. Unless the program delivery system is overhauled, the kinds of abuses we have identified will continue, with the result being food literally being taken out of the mouths of hungry children to the benefit of greedy sponsoring organizations. We have continued our "sweeps" to identify, remove, and prosecute unscrupulous program sponsors and recover ineligible payments.

Since last year, the cases of serious deficiencies and criminal activities have continued to mount. Currently, we have 38 open CACFP investigations, which are part of our ongoing efforts to detect fraud committed by CACFP sponsors nationwide.

Our efforts have been very successful. For example, in Michigan, a former City of Detroit School Board member who owned and operated 16 day care centers, as well as an assistant, were indicted by a Federal grand jury for defrauding USDA of an estimated \$16 million. Our investigation showed that these individuals inflated the number of meals fed to children and falsified supporting documentation. A food vendor admitted supplying false invoices to inflate the food costs of the day care centers to substantiate the false meals reported to USDA. A Federal District Court jury found the owner of the day care centers guilty of conspiracy to commit mail fraud and Government program fraud, obtaining funds of the Department of Agriculture by fraud, mail fraud, embezzlement of public funds, conspiracy to launder money, and money laundering. This individual was sentenced to 108 months in prison, followed by 3 years' supervised release, and was ordered to pay over \$13 mil-

lion in restitution and a \$10 million fine. Her assistant recently pled guilty to conspiracy to commit mail fraud and Government program fraud. Sentencing is pending.

Our audit reviews of CACFP, as of December 1999, have identified 40 sponsors whose program deficiencies are so serious that they should be terminated from program participation unless the shortcomings are promptly addressed. These sponsors have been receiving about \$78.6 million in CACFP funds annually. Twenty-two sponsors terminated from the program were receiving \$45.4 million annually. Fifty-seven individuals have been charged with crimes, and 38 have pled guilty or been convicted thus far.

The focus of our Operation is now on improving program delivery and oversight. After an interim report on Operation "Kiddie Care" in April 1998, we issued our audit report in August 1999, urging needed regulatory and legislative changes to CACFP.

We believe our findings demonstrate a need for dramatic changes in CACFP. We made 23 recommendations to eliminate the structural program flaws, strengthen internal controls, and clarify CACFP requirements. We also recommended that FNS study alternative methods of delivering a meal program to children and adults in day care, specifically one that addresses the problems with private, nonprofit sponsoring organizations. FNS is in the process of preparing new regulations and requesting comments from stakeholders on basic structural changes in how payments are made to sponsors. Until changes are implemented, program abuses assuredly will continue. Returning integrity to this important feeding program and protecting the resources of the American taxpayer are high priorities for OIG, as well as FNS.

Special Supplemental Food Program for Women, Infants, and Children (WIC)

One of the primary purposes of WIC is to provide funds to families with small children to allow them to purchase certain nutritious food items. In an effort to curb fraud in WIC, we are continuing our investigative activities. For example, in a joint criminal investigation by OIG and the Georgia Department of Human Resources', Office of Fraud and Abuse, a Georgia Department of Health clerk responsible for administering WIC pled guilty to creating \$47,945 in fraudulent WIC vouchers and converting them for her own use. The investigation disclosed that the clerk created 77 fictitious infants, including 21 sets of twins, in a scheme to defraud WIC from October 1994 to August 1996. The clerk issued 1,073 fraudulent WIC vouchers and redeemed them for infant formula, which she resold to small retail grocery stores in the Atlanta area. While the investigation was in progress, the clerk resigned from her position. She pled guilty and was sentenced to 1 year of incarceration, followed by 3 years of supervised release, and ordered to pay \$47,945 in restitution.

RURAL DEVELOPMENT

Rural Housing Service (RHS)

Multifamily Housing Enforcement Program

RHS programs are intended to help finance new or improved housing for more than 70,000 moderate or low-income families. When program funds are diverted, tenants (including many elderly and disabled people) do not receive decent, safe, and sanitary housing as intended by the program. OIG and RHS recently combined forces to develop a team approach for review of borrowers and management agents at high risk of defrauding or abusing the multifamily rural housing program. Our report, issued in March 1999, described a high-risk profile which we used to identify over \$4.2 million in misused funds, as well as health and safety hazards posing an immediate danger to the tenants.

Historically, OIG has responded vigorously when indications of fraud and abuse are identified. However, as our resources are stretched, almost to the breaking point, we are frequently unable to respond to requests for audit assistance. As a result, some who abuse the RRH program can continue to do so with impunity at least until additional staffing and resources become available.

We have worked closely with RHS to develop proposed legislation to improve the integrity of the multifamily housing program. The draft bill would authorize a broad range of criminal and civil authorities which could be brought to bear against persons or entities who misuse RHS housing programs. Specifically, the proposed legislation would (1) establish civil sanctions for equity skimming, (2) establish civil monetary penalties for persons or entities who violate agreements and contracts, (3) authorize the Secretary to withhold the renewal or extension of loan or assistance agreements and request judicial intervention to enforce compliance with an administrative decision, (4) provide sanctions for money laundering and provide civil fines for obstruction of Federal audits and, (5) authorize the Secretary to impose civil pen-

alties when project accounting records are found to be in unsuitable condition for audit. These provisions will strengthen our ability to audit and prosecute cases of program fraud and abuse, significantly improve program controls, and facilitate the effective administration of rural housing programs.

Rural Utilities Service (RUS)

Telephone Loan Program Policies and Procedures

RUS continues to make and service loans to financially strong borrowers who likely could obtain financing from other sources. Of \$4.8 billion in loans to 815 direct and guaranteed RUS telephone borrowers, we determined that 434, or 53 percent of the borrowers, with loans totaling \$1.87 billion had sufficient financial strength to repay their loans or could obtain or be graduated to nongovernmental lending sources. This totaled 39 percent of the loans for the 17-year period, 1981 through 1997, which we reviewed.

By law, RUS is required to assist borrowers to achieve financial strength to enable them to satisfy their credit needs without its assistance. However, RUS' loan eligibility criteria are based on meeting minimum financial standards, with no consideration given to whether the borrower has a financial need. Also, RUS' annual budget is based on anticipated loan requests from all applicants regardless of financial condition. As a result, RUS makes loans to financially healthy telephone companies. Also, we reported that RUS has not established procedures and requirements for financially strong borrowers to seek credit from other sources, nor has it established a loan graduation program for borrowers who no longer need Government assistance.

We recommended that RUS work with the Congress to clarify its policy for the telephone loan program regarding loan graduation and require financially strong borrowers to obtain credit from nongovernmental sources. If Congress determines that RUS should require financially strong borrowers to use other sources of credit, we recommend that RUS establish a graduation program for assisting the 53 percent of its telephone borrowers who are financially strong. We point out, though, that RUS officials disagree that a graduation program is needed. Instead, RUS believes that it is carrying out its mission. We raise the question as to whether or not it makes sense to loan Government funds, limited in the first place, to borrowers who have the wherewithal to obtain credit in the private sector.

NATURAL RESOURCES AND ENVIRONMENT

Forest Service (FS)

While FS' operations are not funded through this Committee, they are a major program operation within USDA. As a result, OIG invests a significant amount of audit and investigative resources in the agency's activities.

We recently evaluated FS' administrative controls over the preparation of environmental documents and the implementation of environmental safeguards for timber sale activities. Our review disclosed that improvements were needed in all aspects of this program. We found that the lack of adequate administrative controls hurt not only the environment, but also the Timber Sale Program and timber purchasers. During our evaluation, FS took immediate action on several key recommendations that will improve the overall effectiveness of the Timber Sale Program. These actions included halting several timber sales in the Southern Region after we advised the region that surveys for threatened, endangered, and sensitive species had not been performed. Also, another region's FS personnel revised the boundaries of a timber harvest after we identified a heritage resource site that was not adequately protected.

We have also looked at a number of FS land exchanges. For example, in the Thunderbird Lodge land exchange, in Lake Tahoe, Nevada, FS obtained a \$50 million, 140-acre lakefront estate. During our review, we identified a number of issues that could have resulted in significant liabilities to FS if not resolved before completion of the transaction. For instance, we found that provisions for maintaining the historically significant structures were not adequate. As a result, FS could have been liable for up to \$3 million in maintenance costs for the estate over the duration of the agreement. Prompted by our discussion with FS officials, the terms and conditions of the transaction were changed to ensure FS would not be liable for future maintenance of the structure. While we were able to obtain prompt action in this instance, we are aware of other land exchanges where similar questions could be raised that go unaudited due to the lack of resources.

ACCOUNTING AND FINANCIAL MANAGEMENT

Financial Statement Audits

As required by law, we performed audits of the Department's fiscal year 1998 financial statements. These audits provide Congress and the public with information and insight regarding management's stewardship over Federal assets and its overall fiscal performance. We issued unqualified, or "clean," opinions on the financial statements of the Federal Crop Insurance Corporation and FNS. The Rural Development mission area, including the Rural Telephone Bank, received a qualified opinion because we were unable to assess the reasonableness of its credit program receivables or its estimated losses on loan guarantees.

We issued a disclaimer of opinion on FS and the USDA consolidated statements. A disclaimer of opinion means that the books and records of the entity were so poorly maintained we could not complete the required audit analyses. FS received a disclaimer due to significant financial system weaknesses, which include the lack of an integrated general ledger and supporting subsidiary records. Furthermore, FS could not account for its vast property, plant, and equipment holdings. The USDA consolidated statements received a disclaimer of opinion because the Department could not provide assurance that its financial systems provide information that is relevant, timely, consistently reported, and in conformance with accounting principles. In addition to financial system problems, numerous internal control weaknesses materially degrade the Department's ability to report accurate and reliable financial information.

Implementation of the Foundation Financial Information System (FFIS) Needs Improvement

Many of the Department's financial accounting problems stem from extraordinary weaknesses associated with the Central Accounting System (CAS) used by the National Finance Center (NFC). These weaknesses have significantly affected the ability of Department officials to prepare accurate financial statements and cost data necessary to manage departmental programs. To correct these problems, the Department is implementing FFIS to replace CAS at NFC. Our monitoring and review of these implementation efforts continue to find substantial weaknesses, however, and unless corrective actions are taken, the full and effective implementation of FFIS will not be achieved.

USDA Investments at Risk Due to Corporation's Mismanagement

The Alternative Agricultural Research and Commercialization Corporation (AARCC) was established to find innovative uses for agricultural products. We performed an audit to assess the agency's management of its mission program. The audit concluded that AARCC had only minimal assurance that taxpayers' monies had been properly expended and that its \$27 million investment portfolio had been adequately protected from loss.

The audit found that the process used by AARCC to select firms for investment was not adequate because the applicants had not displayed any reasonable basis for prospective success. AARCC's monitoring of the investees' operations to ensure compliance with its agreements was virtually nonexistent. Of particular concern were various transgressions by companies that AARCC took no action to preclude or rectify. In one case, AARCC invested \$450,000 in a firm for the development, manufacture, and marketing of headbands made from starch absorbents. In return, AARCC was to receive royalties on the sales of the product and an equity interest in the firm. After receiving the funding and procuring the specialized equipment to manufacture the headbands, the firm realized that no market existed for the product. However, the firm discovered there was substantial demand about \$80,000 a month for incontinence pads which could be made with the same equipment. The firm asserted AARCC had no claim to the revenues from the manufacture of the pads because the product had changed. The agreement, however, prohibited the use of the equipment for alternative production. AARCC subsequently became aware of the impropriety and unsuccessfully attempted to renegotiate the terms. Congress did not provide any funding for AARCC for fiscal year 2000. However, AARCC's Board of Directors needs to decide how it will manage and protect its existing \$27 million portfolio to ensure that the Government's interests are protected.

CONCLUSION

This concludes my statement, Mr. Chairman. As you can see, the work of OIG is far-reaching and expansive. I appreciate the opportunity to appear before you today and share with you some of the work we do. I hope my comments have been

helpful to you and the Committee. I will be pleased to respond to any questions you may have at this time.

DEPARTMENT OF JUSTICE PARTICIPATING AGENCY FORFEITURE FUNDING

Categories	Description	Fiscal year—		Total
		1998	1999	
Total expenditures:				
Third Party Interests	Payment of valid liens and secured mortgages	\$5,877		\$5,877
ADP Equipment	Automated data processing equipment	4,734	\$13,278	18,012
Case Related Expenses	Travel and subsistence expenses, translation services, storage.	40,635	92,078	132,714
Special Contract Services	Contract personnel (Data Analyst, Law Clerk)	646	131,555	132,200
Training and Printing	Training, travel, and printing expenses	37,726	224,111	261,838
Contracts to Identify Assets.	Information services for tracing forfeitable assets.		5,393	5,393
Joint Law Enforcement Task Forces.	Overtime and other operational costs for state and local agencies (including \$75,000 for Operation Talon).	7,367	239,692	247,059
Awards for Information	Payment for specific information on criminal activity.		19,802	19,802
Purchase of Evidence	Purchase of evidence for money laundering and other forfeiture related violations.		848	848
Equipping of Conveyances ...	Equipping agency owned or leased vehicles	185,380	3,586	188,966

Fiscal year 2000: OIG has received an allocation of \$940,000 for fiscal year 2000 current year use.

RURAL BUSINESS-COOPERATIVE SERVICE

PREPARED STATEMENT OF DAYTON J. WATKINS, ADMINISTRATOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you today to present the Administration's fiscal year 2001 Budget for the Rural Business-Cooperative Service (RBS).

Mr. Chairman, the key to improving the economic conditions of rural areas, and particularly those areas experiencing decades of poverty and stagnant economies, is the creation of more business opportunities and more jobs, and specifically jobs that pay wages that are sufficient to lift families out of poverty. Presently, service sector jobs are the leading employer in many rural areas, and as important as those jobs are to the local economy, they still do not pay a wage sufficient to support a family of four.

The creation of jobs is best accomplished by the private sector, but as we all know, there are a number of rural areas in which private sector capital is not readily available. The programs of the Rural Business-Cooperative Service help close the gap in opportunity for these areas, bringing them closer to sharing in the benefits of the Nation's economic growth. The \$1.5 billion requested for the programs in this budget will assist in creating or saving about 105,000 jobs and provide financial assistance to more than 4,200 businesses.

BUSINESS AND INDUSTRY GUARANTEED AND DIRECT LOAN PROGRAMS

For the Business and Industry Program (B&I), the fiscal year 2001 budget includes \$13 million in budget authority to support \$1.25 billion in Guaranteed Loans and \$50 million in Direct Loans. Since the streamlined Business and Industry Guaranteed Loan Program regulations were published in December 1996, demand for the program has increased 300 percent. With this level of funding, we estimate that these two programs will create or save about 40,000 jobs. But equally as important, under the guaranteed loan program, we are able to help the local lender provide financing and thus help build community stability.

Of the \$1.25 billion requested for the guaranteed program we are again proposing to make available \$250 million for financing for cooperative businesses with a particular emphasis on new value-added cooperatives as a policy objective. Priority will be given to projects involving farmer owned value-added cooperatives. In addition, this financing is available for guarantees of individual farmer's purchase of cooperatives stock in a start-up cooperative established for value-added processing of an ag-

ricultural commodity raised by the individual farmer stockholders. We expect this program to be a key tool in capital investment in rural areas and as a means of helping farmers keep more of the income generated by their product. In fiscal year 1999, \$44.4 million of B&I Guaranteed funding was obligated to support cooperative business. In fiscal year 2000, \$32 million of B&I Guaranteed funding has been obligated to date. In fiscal year 2001 priority will continue to be given to cooperatives businesses.

INTERMEDIARY RELENDING PROGRAM

The fiscal year 2001 budget also includes \$32.8 million in budget authority to support \$64.5 million in loans under the Intermediary Relending Program (IRP). The initial investment of this level of funding will create or save an estimated 14,500 jobs, but because these funds are re-loaned 3 or 4 times by the intermediary, we estimate that over 49,300 jobs will result eventually. In an effort to be of more assistance through this program, we revised the regulation in 1998 to expand the \$2 million cap on loans to intermediaries to a \$15 million cap to any one intermediary in annual increments of \$1 million. The President's budget also provides that \$4 million of the request for IRP shall be for Native Americans. The Administration is directing Federal lending entities to work more closely with Tribal governments and lenders to resolve some of the concerns private lenders have with trust lands and sovereignty issues.

The IRP regulation is now more user-friendly, and authorizes the Rural Development State Offices to process applications at the State level, rather than submitting applications to the National Office for processing. This change has speeded up the application process and allows State Offices to provide immediate feedback to borrowers concerning their applications. Pursuant to Rural Development's mission of prioritizing the most under served communities, we are prioritizing the neediest communities, such as those in low-income or under served areas, those with declining populations, or communities faced with economic restructuring or economic disasters. In addition, the eligible purposes for loans to businesses have been expanded. The demand for this program continues to be strong. To illustrate the benefits the IRP provides to rural America, the Southern Kentucky Economic Development Corporation (SKEDC) has loaned in excess of \$1.5 million to more than ten ultimate recipients, leveraging approximately \$11 million in new private investments. As a direct result of the IRP and leveraged funds, more than 200 new jobs have been created.

One ultimate recipient organization that directly benefited from the IRP funds was in Laurel, Kentucky. The Grocery Company needed to expand its transportation fleet and construct a modern new warehouse including the installation of a state-of-the-art computer tracking system for inventory control and uniform pricing. The warehouse was expanded by 37,000 square feet for a total of 237,000 square feet under one roof. Thirty new jobs were created, bringing the company's total employment to 290 persons. The total project value was \$1,361,000, which included a \$150,000 ultimate recipient loan from the SKEDC. The Grocery Company now serves 600 retail stores in Indiana, Ohio, West Virginia, Tennessee, and Kentucky.

RURAL BUSINESS ENTERPRISE GRANTS

For the Rural Business Enterprise Grants Program, the fiscal year 2001 budget includes almost \$40.7 million. We anticipate that this level of funding will create or save over 12,700 jobs. The purpose of this program is to assist small and emerging businesses and the small amount of funds we typically invest in a project, on a dollar-for-dollar basis generates another \$2.40 in private capital.

RURAL ECONOMIC DEVELOPMENT LOANS AND GRANTS

The fiscal year 2001 budget requests \$15 million in Economic Development Loans and \$4 million in grants. These programs represent a unique partnership since they directly involve the Rural Electric and Telecommunication borrowers in community and economic development projects. These borrowers are the intermediaries through which the funds are invested locally. Each dollar invested through these programs attracts an additional \$3 in other capital. The loan program provides a zero interest loan to the cooperative, which guarantees repayment of the loan to the government. Loans are used primarily for economic development activities, while the grant funds can be used for establishing revolving loan funds and for community development projects. To support the Vice President's Reinvention of Government Plain Language Initiative, we have recently published plain language regulations as a proposed rule. When implemented, these plain language regulations will provide a more efficient and customer friendly procedure for accessibility to the programs.

RURAL BUSINESS OPPORTUNITY GRANTS

The fiscal year 2001 budget includes \$8 million for Rural Business Opportunity Grants to provide much needed technical assistance and capacity building in rural areas. We have determined, through the Empowerment Zone/Enterprise Community Rural process, that the most significant non-capital need in most rural areas is the capacity to develop the economic and community development strategies necessary to attract private investment capital and Federal and state assistance. The vast majority of rural communities are served by part-time officials who do not have the time or the necessary training to compete with large communities for funding that may be available to them. The funds requested under this program will aid in providing that invaluable assistance that allows communities to take the first step in assisting themselves.

RURAL COOPERATIVE DEVELOPMENT GRANTS

For the Rural Cooperative Development Grants (RCDG), the fiscal year 2001 budget requests \$6 million. This program complements our internal National and State Office technical assistance efforts by encouraging the establishment of centers for cooperative development. Demand for technical assistance through RCDG has exceeded available funding by approximately five or six times over the past few years. Ten centers were funded in fiscal year 1999 and 13 in fiscal year 1998. They provide a focus of development expertise that devotes extensive time to conducting feasibility analysis and outreach for newly developing cooperatives. RBS has demonstrated how we are able to harness a variety of resources to enhance cooperative development efforts. In 1999, the National Pork Producers Council (NPPC) asked for technical assistance to explore cooperative solutions to the concentration issues facing the pork industry and its producers. RBS aggressively worked with a NPPC Task Force to explore formation of a nationwide cooperative business structure of independent pork producers. The result of these efforts has been the incorporation of the Pork America Cooperative in January 2000. RBS will continue its technical assistance in cooperative development as the newly formed organization develops its business plan, membership base and operations.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS

The Appropriate Technology Transfer for Rural Areas (ATTRA) program provides technical information to producers and their advisors on best sustainable production practices. A funding increase to \$2 million is requested to enhance delivery of this effective program. Direct responses to over 15,000 inquiries were made in 1999, in addition to information provided through the ATTRA web site. Requests from agricultural producers, extension personnel, and others focus primarily on sustainable practices that reduce dependence on chemicals and is more environmentally friendly.

COOPERATIVE RESEARCH AGREEMENTS

The fiscal year 2001 budget requests \$2 million in funding for cooperative research agreements. These agreements help assure our nation's farmers and their cooperatives have a sound basis on which to make critical economic decisions. In a time of considerable stress and structural change in U.S. Agriculture, it is essential that group action marketing endeavors be on the most solid ground possible.

BIO-BASED PRODUCTS

The President's fiscal year 2001 budget requests \$1.5 million to support cooperatives involved with processing and marketing bio-based products. Of that amount, \$1 million is for a pilot program for Rural Utilities Service electric borrowers to demonstrate the efficiency of bio-mass fuel generation.

NATIONAL SHEEP INDUSTRY IMPROVEMENT CENTER

The fiscal year 2001 budget requests \$5 million in funding for the National Sheep Industry Improvement Center. The Center, while having significant delays in implementing their program, has now made a major grant to an intermediary revolving fund that is loaning money to the sheep and goat industry. In addition, \$5 million of the National Sheep Industry Improvement Center's permanent funding has been used to assist the industry in market promotion in light of the unfair trade practices found in the International Trade Commission case against Australia and New Zealand.

COOPERATIVE CAPITALIZATION FUND

The President's fiscal year 2001 budget requests \$130 million to cooperative capitalization fund that would be used to provide equity capital for new livestock and other cooperatives and help finance construction of cooperative-owned processing facilities.

RURAL EMPOWERMENT ZONES AND ENTERPRISE COMMUNITIES GRANTS

For the Rural Empowerment Zones and Enterprise Communities, the President's fiscal year 2001 budget requests \$15 million to provide grants to designated rural areas including 5 Rural Empowerment Zones and 20 Rural Enterprise Communities. The purpose of this program is to target Federal, State, and local resources to low-income rural areas to demonstrate that innovative, comprehensive, and strategic alliances between private, public and nonprofit entities can work in concert to improve the economic strength of rural communities.

SALARIES AND EXPENSES

Before closing, I would like to urge the Committee to provide the requested funding for Rural Development Salaries and Expenses. We cannot manage the \$4.3 billion portfolio without qualified staff. We cannot maintain qualified staff without adequate funding. In addition, our computer systems cannot keep up with the growing portfolio.

CONCLUSION

Over the past several years, RBS has been provided with increased program resources to use in meeting rural business and economic development needs. We have streamlined our programs, improved consumer focus, and developed strategic relationships to benefit all of rural America. Each year we have used all of our resources in this new business environment, but still, the need exists for additional resources to accommodate the needs of those communities not yet experiencing the positive impact of America's economic prosperity. Mr. Chairman, this concludes my formal statement on the fiscal year 2001 Budget. I would be happy to respond to any questions the Subcommittee may have regarding the Rural Business-Cooperative Service programs of the Rural Development Mission Area.

RURAL DEVELOPMENT

PREPARED STATEMENT OF JILL LONG THOMPSON, UNDER SECRETARY FOR RURAL DEVELOPMENT

Mr. Chairman, Members of the Committee, it is a pleasure to present to you the President's fiscal year 2001 Budget Request for the Rural Development Mission Area of USDA. With your permission I will summarize my statement and request that the full text of the statement be presented in the hearing record.

Before discussing the budget request for 2001, I am pleased to share with you some of the results of the funding the Committee provided Rural Development for fiscal year 1999. I am very proud of the results, and I think the Committee will be as well. With the \$1.7 billion appropriated for Rural Development programs in fiscal year 1999, investments totaling \$9.9 billion were made in rural people, communities and businesses. A conservative estimate of the economic impact of that investment is \$18 billion. The following is a sample of the successes.

- The investment in rural businesses, housing and community infrastructure created or saved about 200,000 jobs.
- Almost 66,000 rural families that could not otherwise qualify for mortgage credit were able to buy or improve their homes; over 5,000 affordable rental units were added to the rural housing stock; and 42,357 low-income households were able to obtain decent housing at an affordable rent.
- Almost 500 community facilities projects, such as health clinics, child care facilities, schools, libraries, police stations and fire stations serving over 8 million residents were built.
- Almost 2 million rural residents were provided new or improved public water supply or waste disposal systems; 2.8 million rural residents received improved electrical service; 287 rural schools and 131 rural health care providers benefited from the distance learning/telemedicine facilities.
- Over 200 marketing networks and cooperative partnerships were established or increasing their business outlets.

While the aggregate statistics are impressive, they do not tell the human side of the story which is substantial, but is difficult to report statistically. Actual successes are described below.

- The local job market in a small, rural community in Kentucky was improved with the reopening of a local textile plant which had been closed by a large national company. With assistance from Rural Development, the plant was refurbished with modern equipment and now employs 125 residents.
- A single mother in rural Maine, suffering from memory impairment due to an automobile accident, now has a home for herself and her 6-year-old daughter. After the accident they had been required to move several times and for a while lived in a motel.
- The 1,200 residents of a small town in Georgia will, for the first time, have local health care and child care facilities. The clinic will provide health care 7 days a week and the child care facility will be open 24 hours a day to accommodate children whose parents work at night.
- A county-wide volunteer fire department in Texas replaced their 30-year-old radio equipment with new communications technology which will allow direct communications with the county police and emergency medical services.
- Approximately 9,100 residents in the very isolated Bering Straits region of Alaska will have improved health care. Diagnosis-quality images will be transmitted to medical specialists in Anchorage from 15 villages, a clinic in tribal headquarters and two health care providers in Nome. The residents are scattered over 25,000 square miles with some having no road access.

Mr. Chairman, as you and the Committee review the fiscal year 2001 Budget request for Rural Development, please keep in mind that the reason each of these programs was authorized, in some cases decades ago, was concern that rural America was being left behind economically. Although there has been significant progress during the past three decades in addressing these needs, the poverty rate in many rural communities is still unacceptable. After showing some improvement in the 1970's, many rural areas are once again significantly lagging behind the improvement in the national economy. And more recently there has been increased concern about the future economic opportunities of rural communities due to the concentration of agricultural production and processing.

We all know that, as farming operations increase in size and processing operations vertically integrate, ties to the rural community are weakened. Larger farms can purchase their inputs, including capital, from larger and more distant sources. Larger farms also find it easier to negotiate directly with processors rather than local buyers. This often results in less income being retained in local communities and less capital available for other business needs and for diversifying the local economy to counter the effects of concentration. This situation is exacerbated by consolidation in the banking, retailing, and in health care. Consequently, there are fewer rural economic hubs than once existed. And evidence shows that the greater the distance from an economic hub, the lower the economic growth rate.

Mr. Chairman, although there have been significant successes in rural areas generated by the programs we administer, the Federal government is not, nor should it be, a substitute for the wealth generating capacity of the private sector. That is why we, in Rural Development, continue to stress that cooperatives are a good solution to some of the development needs in rural areas. Agricultural producers have the opportunity to maximize their position in negotiating prices for their commodities through marketing cooperatives. They can also increase their profits by utilizing cooperatives to process and add value to their commodities. An example is a new cooperative soybean processing plant whose farmer-owners will realize an additional forty cents per bushel. Most of the additional earnings remain in the local community. We would like to see more cooperative business operations such as this one and others that we have financed in recent years. Through market forces, member-owned cooperatives help grow local economies and rural communities.

We believe it is our responsibility to assist the private sector make these opportunities a reality. This has been the focus and the message of the President's "New Markets" initiative to encourage the private sector to view poverty stricken rural and urban areas as potential market opportunities. Last fall I had the pleasure of accompanying the President to Hermitage, Arkansas, to demonstrate the success of a very small cooperative venture that includes 17 member producers. Three years ago before the cooperative was formed, these producers sold 3,400, 20 pounds cases of tomatoes worth \$60,000, and fifteen of the producers were on the verge of bankruptcy. Last year the sales had increased to 570,000 cases worth \$4 million. During peak season, the cooperative employs 120 people in a town with a population of less than 700.

Other examples include a very small cooperative in northern Florida that is selling its fresh vegetables and fruits to local school districts. Some of the producers have seen their incomes triple as they provide very competitively priced, nutritious and fresh produce to school children. Rural Development was a partner in this cooperative; much of the work was done by the Natural Resources Conservation Service, the Farm Service Agency, and, of course, the farmers. Another success story is a wheat farmer's cooperative in Colorado who purchased a bakery that was closing. They now process their own wheat into bakery products that are sold to a national sandwich chain and local supermarkets in the Denver area. They have already exceeded their capacity and are looking at options for expanding their operations.

In addition to the economic successes enjoyed by these operations, Mr. Chairman, is the satisfaction one sees on the faces of the producers when they realize they can be just as entrepreneurial as some of the "dot com" companies. Success breeds success. Seeing people realize they can be in charge of determining their future is one of the most rewarding parts of this job. A few years ago I told you of the joy I saw in people's faces after they had completed building their own homes through our mutual and self help housing programs—believe me, that joy is equaled when I see agricultural producers realize they can take greater control and generate greater profits in the food chain. They no longer feel captive of the markets.

I urge each Member of the Committee to visit some of these operations and enjoy that experience for themselves. You have appropriated the funds that made it possible.

BUDGET REQUEST

Mr. Chairman, the President's commitment to improving the economies of rural America continues and that is reflected in the budget request for fiscal year 2001. The Rural Development budget request for programs is \$12.4 billion, \$1.3 billion higher than the level enacted for fiscal year 2000. This level requires only about \$300 million in additional budget authority, not counting what is requested in the Farm Safety Net proposals, which I will discuss later. But, Mr. Chairman, if the Rural Development Mission is to deliver programs of this amount and carry out our fiduciary responsibilities of protecting the \$80 billion loan portfolio, we must have sufficient administrative expenses.

ADMINISTRATIVE EXPENSES

The request for administrative expenses for fiscal year 2001 is \$581 million, \$48 million higher than appropriated for fiscal year 2000 and includes \$20 million increase in administrative expenses to support a new guaranteed loan accounting system and other system improvements. I realize the burden this places on the Committee, but the potential risk that may occur without the appropriate level of oversight far overshadows this cost. For example, between housing loans of the Rural Housing Service and the farm credit operations of the Farm Service Administration, we are obligating about \$8 billion in guaranteed loans annually, and we do not have an automated accounting system that provides the capacity to manage these funds. This is irresponsible and is not a legacy that I want to leave.

Yet, because we cannot afford to reduce staffing any further than we have, I have made the decision to reduce other administrative expenses, including investments in accounting systems, to maintain the staffing level needed to deliver the programs and do the best we can in managing the assets with which we have been entrusted. These were not good decisions, and are decisions I would prefer not to make. For example, when I became Under Secretary, the training budget for Rural Development was about \$11 million. Over the past years we have reduced that budget to about \$2 million in training that we classify as mandatory, i.e., training that is the minimum needed for our staff to perform at acceptable levels. The loan programs we administer are much more complex than anything found in the private sector, and we have a significant number of new employees that are coming on board. We are not providing them adequate training. We have also reduced travel from over \$21 million to just over \$11 million at a time when we need to travel more to adequately supervise and monitor our loan portfolio. We have made these decisions because we had to, but I have concerns about our ability to maintain our fiduciary responsibilities. Mr. Chairman, the \$48 million increase requested for salaries and expenses is about 40 percent of the pay cost increases that we have had to absorb during the time that I have served in this job. Absorbing these costs is the same as a reduction as a reduction in funding.

An important part of the efforts to modernize field operations for the Natural Resources Conservation Service, the Farm Service Agency and the Rural Development agencies is the effective consolidation of three separate and largely redundant ad-

ministrative systems inot one under the proposed Support Services Bureau. This is a glaring inefficiency that needs to be eliminated. Consolidated support would be provided for information technology, financial management, travel, procurement, civil rights and human resource management. These services would be provided under the direction of an Executive Director who would report to a board of directors comprised of the heads of the agencies to be serviced. Unfortunately, language in the fiscal year 2000 Appropriations Act prevented us from implementing our plans for the Support Services Bureau. I would ask you to take a look at that language and work with us to move our operations into the modern world. By poling resources in the administrative arena, each agency will be in a better position to provide greater program support.

Mr. Chairman, before I leave the area of administrative expenses, I would also like to advise the Committee that the Office of General Counsel is critical to our success in protecting the interest of the taxpayers . We consider the Office of General Counsel to be an integral part of our team, and they are particularly helpful to us in resolving the problems we encounter in our more complex lending programs, such as like the multi-family housing and the electric loan programs. They have my support and I believe they deserve the support of the Committee.

Mr. Chairman, I would also like to take just a moment to discuss consolidation of some of the administrative systems that serve the Natural Resources Conservation Service, the Farm Service Agency, and Rural Development. We should not get bogged down in terms such as "Support Services Bureau" that, in my opinion, may have confused the objective. Mr. Chairman, Members of the Committee, the Natural Resources Conservation Service, Farm Service Agency and Rural Development are, for the most part, located in the same offices, and we are going to share one information system. Does it not, therefore, make good sense that we have one personnel system, one travel administration system, and. one procurement system that serves all three?

I would ask you to take another look at the language included in the fiscal year 2000 Appropriations Act that prevents us from implementing the plans for administrative consolidation; work with us to improve our administrative operations and place us in a better position to enhance delivery of the programs and services that each of us are entrusted, by Congress, to provide to the residents of rural areas.

PROGRAM BUDGET REQUEST

Mr. Chairman, I shall now discuss the requests for the various programs administered by Rural Development.

RURAL HOUSING SERVICE

I was honored to attend the 50th anniversary of the single family housing loan program in December of last year in Georgia at the home built with the first loan issued under this program. The wife of the family with the first loan and the widower of the Farmers Home Administration employee making the first loan were also in attendance. While the ownership has changed, the home is still in immaculate condition. The story of how much this home, and hundreds of thousands like it, have meant to rural families, and rural communities, is something that should be told again and again. This country can be very proud of this home ownership program.

The budget request for the programs administered by the Rural Housing Service totals \$6.7 billion, almost \$900 million more than the level appropriated for fiscal year 2000, requiring almost \$200 million more in budget authority. This increase reflects the Administration's commitment to improving housing conditions in rural areas and, in particular, improving homeownership opportunities, a key ingredient in building stable communities and economies. The request for single family housing, direct and guaranteed loans totals \$5.0 billion and will support about 64,000 housing units and, in the process, provide nearly 44,000 jobs, primarily in the construction trades.

We are proposing a modest increase in the multi-family housing program which provides housing for some of our most vulnerable citizens. A significant portion of these units are occupied by female heads of household, generally elderly females or single mothers, with annual incomes of about \$7,300. The budget request will provide for the construction of 1,400 units and the rehabilitation of over 4,000 existing units. Mr. Chairman, while there is a significant need for new multi-family housing throughout rural areas, we also have a significant problem in meeting the need for rehabilitation of an aging portfolio, and in maintaining the availability of these units for very low income tenants. The request for the multi-family housing guaranteed loan program will provide for the construction of about 6,400 units. The request for rental assistance is \$680 million, \$40 million higher than the level available for

2000. Most of the request is needed to renew contracts for 42,800 units. Without rental assistance, it would be impossible to provide affordable rental housing for very low income families, most of whom have no other housing alternative.

As I have told the Committee on many occasions, one of the great joys of this job is to see the satisfaction and absolute joy on the faces of families and their children when they have completed building their own homes with the help of new neighbors. The mutual and self help program is community building at the most basic level, neighbor helping neighbor in the construction of new homes. The Administration is requesting a significant increase in this grant program, \$12 million which is used to provide the technical expertise and supervision during construction. Families participating in the program receive loans through the single family direct loan program.

We are also requesting modest increases in the farm labor housing loans and grants and we are proposing \$5 million be appropriated for emergency assistance for migrant and seasonal farm workers. This program, although authorized in the 1990 Farm Bill, was not funded until last year's emergency supplemental appropriations act. The contribution of migrant and seasonal farmworkers to feeding our nation is often overlooked. The \$20 million made available for the first time last year is equally important and a very small cost to pay, compared to the value these families contribute to this economy. The assistance was used to pay back rent and utilities, school fees, and a number of other obligations that could not be met, due to natural disasters destroying the crops these individuals and families would have harvested.

Mr. Chairman, I would also like to thank the Committee for having the foresight to provide \$6 million in fiscal year 2000 for the Rural Community Development Initiative. These funds will be used by a wide variety of organizations to assist us in developing the capacity of rural communities to become more self-reliant. It is through these efforts that we endeavor to teach community leaders that dependence on the Federal government is not the answer to long-term economic problems. The communities, themselves, must develop the capacity to build local economies. It is also through efforts like this that we engage other organizations with resources to work with us in building homes for low income families. We are very proud of the number of funding partnerships we have established in the past couple of years. Through these efforts we are stretching the capacity of the tax dollars with which we are entrusted.

Mr. Chairman, we are also requesting a significant increase in the low income housing repair loan and grant program. This program provides the very basic improvements in owner occupied single family homes to make the house safe and livable. However, the most important contribution of the program may be that it allows elderly men and women to live the remainder of their lives in their own homes with a degree of dignity. It is also one of the most utilized programs we have in most disaster situations. It was used extensively in North Carolina following Hurricane Floyd.

The request for community facilities totals \$484 million, \$24 million of which is for grants, including \$6 million to continue the Rural Community Development Initiative which is being implemented this year, and \$5 million for the hazardous weather early warning alert system, the need for which has been recently demonstrated again in rural Georgia. Increasing the community facilities grant program is one of our highest needs. We can accomplish more with this program than almost any program in our portfolio. As Members of the Committee realize, this program finances rural health facilities, child care facilities, fire and safety facilities, jails, education facilities, and almost any other type of essential community needed in rural America. However, it is very difficult to reach many of the more impoverished communities that are unable to repay loans. Additional grant funds are needed to offset the cost of these loans.

RURAL BUSINESS-COOPERATIVE SERVICES

Mr. Chairman, the key to creating economic opportunity in rural areas is the development of new businesses and employment opportunities. This is primarily the role of the private sector. However, due to concentration and integration of the agriculture industry, and more recently the consolidation of the banking industry, local lending institutions frequently do not have the capacity or the capital needed to sustain local businesses and generate new growth. Further, something that should not be overlooked is that frequently, the Rural Business Service is only a partner, and sometimes a minor partner, in the loans made through these programs. We expend a lot of effort in every program, including housing and utilities, to leverage other monies into the projects we finance.

The programs, particularly the Business and Industry loan guarantee program, were enacted to supplement the efforts of local lending institutions in providing that capital. The program requested for the Rural Business-Cooperative Service is \$1.5 billion with the majority of the request for the Business and Industry Loan Guarantee program, \$1.2 billion, compared to \$869 million in fiscal year 2000. We will also again establish a policy objective of \$200 million of the total for the development or expansion of cooperative businesses. As you know, we have established similar priorities in other years, and while we have not yet achieved our objectives, the level used by cooperatives is increasing each year. For example, through the first quarter of fiscal year 2000, we almost matched the level used by cooperatives in fiscal year 1999.

I am particularly pleased that this budget request includes funding for a Cooperative Equity Capital Fund which will be used to assist producer's of livestock and other cooperatives to counter the effects of market concentration. This request is included in the Farm Safety Net proposal as a mandatory expenditure of the Commodity Credit Corporation. I have mentioned that the lack of capital is a major problem that rural areas face in economic growth. While not everyone agrees on the degree to which capital is lacking in rural areas, there is agreement on the lack of equity capital, and this need is greatest when crop and livestock prices are depressed. More and more producers are beginning to realize that the only means of gaining a greater share of the food dollar is to own the processing or manufacturing facilities. We intend to use this program to meet some of that demand and we will be submitting legislation for the consideration of Congress outlining how we intend to use the program.

Complementing this request is an increase in cooperative development grants which will be used to assist in the development of new cooperatives. These grants are made to cooperative development centers which augment our internal staff resources in providing technical, financial, and management assistance in the creation and maturation of new cooperative ventures. As provided in last year's Appropriations Act, a portion of these funds will be devoted to assistance to small and minority producers. It is these producers that more frequently, and more quickly, feel the effects of reductions in prices. The same producers can benefit more through the use of cooperatives to market or process their commodities. The Administration will also again be submitting legislation to authorize assistance to non-agriculturally related cooperatives. I believe such authority is important to the economic success of rural areas.

We are proposing that the Intermediary Relending Program be increased by almost 70 percent. The demand for this program is increasing significantly, and with part of the increase we wish to improve our ability to assist tribal governments establish revolving loan funds. We plan to do this in conjunction with the Small Business Administration and the Department of Treasury's Office of Community Development Financial Institutions. This would be a joint effort to aid tribal governments establish lending capacity, but also to aid private sector lenders in dealing with some of the obstacles they have encountered in lending to tribal organizations. The importance of these small revolving loan funds to rural communities is demonstrated not only in the successes of this program, but also in the fact that a significant portion of other grant programs are used to establish similar loan funds.

We are also proposing an \$8 million level for the Rural Business Opportunity Grant program, a 100 percent increase over the level provided for fiscal year 2000. This program was authorized in the 1996 Farm Bill and funded for the first time for the current fiscal year. These funds can be used by a variety of organizations, such as the Empowerment Zones/Enterprise Communities, Rural Conservation and Development districts and others to develop economic development strategies.

The budget request also includes \$3.5 million in budget authority for bio-mass demonstration projects. Specifically, \$2 million will be available for firms that will use the Business and Industry loan guarantee program to develop, process, or market bio-based products; \$1 million will be available for electric borrowers to demonstrate the value of generating electricity using bio-based products as the fuel, and \$500,000 will be available for cooperative development grants for cooperatives that process or market bio-based products.

The National Sheep Industry Improvement Center has recently entered into an agreement with the Livestock Production Association to establish a revolving loan fund which will be used to improve the infrastructure of the sheep and goat industry. We are requesting \$5 million of the remaining \$30 million authorized for this program to augment that effort.

We are also requesting \$15 million for the third year of the Empowerment Zones/Enterprise Communities designated in the 2nd round of this program.

RURAL UTILITIES SERVICE

The Rural Utilities Service provides financing for electric, telecommunications, and water and waste disposal services that are the backbone of economic development. Last fall we celebrated the 50th anniversary of the telecommunications program, and this year we will celebrate the 60th and 65th year of the water and waste disposal and electric programs, respectively. The successes of these programs and the benefits they have provided to rural America are unparalleled. Over \$70 billion has been invested in rural America through these programs, and the economic growth they have generated has repaid the cost 100 fold. And even more remarkable is that less than one percent of the amount loaned has been lost through defaults. The capital investment generated by the program levels requested in the budget will generate about 100,000 jobs, but more important is the opportunities generated, particularly through the telecommunications programs. It has long been the policy of RUS that fiber optic cable be used for telecommunication rather than the copper wire that is found in most urban areas. However, much of the rural traffic still must be routed through other exchanges with less capacity. The "digital divide" is composed of issues such as this.

Mr. Chairman, when President Clinton announced the Digital Initiative in early February, he was criticized for constructing a political deal, and he responded that, "this is not a political deal. If I had waited for the market to solve universal telephone access, there would still be places in Arkansas where people wouldn't have a phone." Paraphrasing another comment in that regard, the bottom line of the President's proposal is a better bottom line for firms in the technology industry. The President knows how important these programs have been to rural America over the decades and he sees the opportunities they can bring in the future.

The level requested for the programs administered by the Rural Utilities Service is \$4.3 billion, the same as is available for fiscal year 2000. For electric loans we are requesting \$1.5 billion, requiring \$26 million in budget authority. Again this year, we respectfully request that the budget authority be provided in a single amount, rather than by individual program. This additional flexibility permits us to more effectively manage demand for the four different programs.

Our request also includes \$670 million for telecommunication loans, including those made by the Rural Telephone Bank, and an additional \$325 million for the distance learning/telemedicine programs, which includes a significant increase for grant funds. One of the concerns that I have with the lack of opportunity in many rural areas is that unless we are able to reach the children in poverty stricken families and provide them the opportunity to expand their education, they will soon be left behind by the technology-driven economy and the rapidity with which knowledge is changing. Distance learning/telemedicine program is one of the best tools we have for ensuring that they are not left behind. We also request \$102 million to finance a broadband internet access loan and grant pilot program.

The request for water and waste disposal programs is \$1.6 billion which will require less budget authority than was available in fiscal year 1999, but a significant increase over fiscal year 2000. With this funding we estimate that we will build, improve, or expand 1,155 water and waste disposal systems serving 2.4 million people and create 42,000 jobs in the construction related fields. In addition, we will improve our leveraging of funds with State Revolving funds that are also used to finance water and waste disposal systems to ensure that each dollar provided by the taxpayers is used to its maximum. Our primary target is still those residents without safe, dependable water in their homes, especially those with the most serious quality or quantity problems—the systems classified as Water 2000 systems.

When we were challenged early in this Administration to provide every resident in rural America with safe, dependable water in their homes, we knew that we could not meet the ultimate objective. However, the challenge has led to the reduction in the number of rural residents without this basic necessity from 1.1 million in 1990 to under 700,000 now, and this is something we all should be proud of. We will continue to pursue that objective in fiscal year 2001, although we must be frank and tell you that the ultimate objective may not be reachable due to sparsity of population making affordable systems improbable or terrain that increases cost to the point that systems are not affordable.

Mr. Chairman, before I close, I must return to the issue of administrative expenses. These programs that all of us are so very proud of and that contribute so much to the economies and the quality of life in rural America cannot continue to be delivered without adequate support of the dedicated employees and the automated systems that are needed to ensure proper accounting of the taxpayers dollars. To continue down the path that we have been on in the past few years may be penny wise, but it is dollar foolish. I am very proud of our accomplishments in re-

ducing expenses. But, being economical and reducing expenses where one can is different than not providing the resources needed for our staff to operate successfully. Since I have held this position, the Rural Development Mission Area has met every streamlining target we have been given, but we have also been asked to absorb \$80 million in pay raises and other inflationary items that also should be considered as reductions, but never are. Rural Development and other USDA entities have reached the breaking point and without some relief, all of us may face the embarrassment of a major failure. I do not want this on my record, and I, as a former Member of Congress, am sure that none of you want to be responsible for such a failure either.

The Congress and the Administration, as well as the taxpayer, have every right to be proud of the fact that we have eliminated the word "deficit" from policy discussions. Let us acknowledge the fact and move on to ensuring that every individual in this country has the opportunity to participate in a dynamic, growing economy, but do so with the recognition that delivering these programs wisely costs money. The economic growth we create with these investments in rural America more than pay for the cost of the programs and the associated administrative cost. It is time we started counting both sides of the ledger.

Mr. Chairman, Members of the Committee, this concludes my formal statement. The Administrators and I would be glad to answer any questions you may have. Thank you for the opportunity to appear before you to discuss the Rural Development budget request with you.

ADDITIONAL SUBMITTED QUESTIONS

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

DEPARTMENT OF AGRICULTURE

AGRICULTURAL MARKETING SERVICE

FEDERAL-STATE MARKETING IMPROVEMENT PROGRAM

Question. Please provide the budget baseline for the Federal-State Marketing Improvement Program. Please include a listing of fiscal year 2000 and 2001 grants and an estimate of the backlog of applications for this program for fiscal year 2001.

Answer. The fiscal year 2000 appropriation for the Federal State Marketing Improvement Program, or FSMIP, is \$1.2 million. For fiscal year 2001, the Agricultural Marketing Service is requesting an additional \$300,000. FSMIP grants for fiscal year 2000 will be awarded on the basis of two rounds of competition among proposals submitted by eligible State Agencies. Fund allocations for the first round will be announced in late April, 2000, and those for the second round will be announced in August, 2000. Applications for grants typically exceed available funds by a ratio of approximately three to one. While AMS does not maintain a backlog list, proposals that are not funded during a particular round of competition may be reconsidered during subsequent rounds at the request of the applying State agency.

NATIONAL ORGANIC PROGRAM

Question. Please explain why the \$639,000 requested for consumer outreach in the National Organic Program cannot be offset from reduced costs in the program resulting in finalization of the rules to implement this program.

Answer. AMS is not proposing to finance the initial accreditation costs from current funding because there will be no reduction in organic program activities or expenditures after the rule is finalized. The program staff, whose efforts were previously focused on developing and issuing the final rule, must now change its focus to various related activities including:

- research on, and the possible development of, organic standards for aquatic animals, wildlife, honey production, hydroponic production and greenhouse production;
- conducting regulation review and amendment;
- reviewing substances petitioned to the National Organic Standards Board for addition to the National List;
- conducting day-to-day administration of the National Organic Standards Board;
- developing training materials and conducting training activities for producers, handlers and certifying agents on how to comply with the Act and regulations;
- reviewing documents and participating in the negotiation of organic program equivalency agreements between the United States and foreign governments;

- reviewing and recognizing foreign government organic accreditation programs for equivalency determinations;
- conducting program communication and education outreach to organic producers, organic handlers, and consumers of organic products;
- conducting program outreach to minority and limited resource farmers; and
- conducting continuing performance reviews of certifying agents and general enforcement of the Act and regulations after the initial accreditations (expected to begin 12 months after the final rule is published). Funding for these activities was not available during the development of the organic rule.

AMS is requesting \$639,000 to fund the cost of initially accrediting, without charge, as many as 59 certifying agents over an 18-month period. As recommended by Congress in fiscal year 2000 appropriations, AMS constructed a national organic program that takes into consideration the needs of small farmers, handlers, and certification agents. The proposed rule includes a provision that the initial costs of accreditation services will be provided without charge so that small farmers, handlers, and certification agents are not excessively burdened by additional costs. If this funding is not provided, the proposed rule will require substantial changes and consequently, further delays in implementation.

Specifically, AMS anticipates that accreditation costs for fiscal year 2001 will amount to \$450,680 and that accreditation costs for 6 months of fiscal year 2002 will amount to \$188,320. In addition to accreditation services, these funds will allow the program to develop and issue a program manual, and develop and distribute some of the educational materials needed for consumers, producers, handlers, certifying agents, and trading partners. AMS is requesting that \$639,000 be transferred to the Expenses and Refunds, Inspection and Grading of Farm Products fund account for the cost of the National Organic Program and that such funds remain available until expended. AMS does not anticipate requesting additional start-up funds beyond the existing request, which covers the anticipated 18-month implementation period.

Accreditation requires that AMS staff review certifier quality manuals for accuracy and completeness and perform at least one on-site audit evaluation. During an on-site audit, certifiers will be assessed for business capacity and competency in accordance with International Organization for Standardization Guide 65, as well as their ability to attest to the technical standards for organic production and handling.

ORGANIC SEAFOOD STANDARDS

Question. Please provide an update on activities regarding the organic seafood regulations.

Answer. The fiscal year 2000 appropriations Act included \$75,000 to begin development of organic standards with respect to seafood. To initiate this process, AMS will hold two public meetings to discuss issues related to the organic production and handling of aquatic animals to be labeled as organic: on April 10, 2000, in Mobile, Alabama; and on April 12, 2000, in Anchorage, Alaska. AMS will hold a third public meeting on May 3, 2000, in Providence, Rhode Island. We will also participate in the April 10, 2000, Workshop on Organic Certification of Wild Aquatic Animals in Seattle, Washington, sponsored by Senator Ted Stevens from Alaska and Governor Tony Knowles from Alaska. AMS will be participating in the June 23–24, 2000, aquaculture production standards workshop at the University of Minnesota, St. Paul, Minnesota.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

LINE ITEM FUNDING

Question. In your budget justification notes, there is no line item for the following items. Please provide the fiscal year 2001 budget request for the following: Foot-and-mouth-disease; Tropical bont tick; Golden nematode; and Witchweed.

Answer. These items were not included on the Summary of Increases and Decreases because no change in funding was requested. The funding levels are included on the table on page 14–18. The fiscal year 2001 funding levels are:

[In thousands of dollars]

<i>Line item</i>	<i>Fiscal year 2001 request</i>
Foot-and-mouth disease	\$3803
Tropical bont tick	407

<i>Line item</i>	<i>Fiscal year 2001 request</i>
Golden nematode	580
Witchweed	1,506

GRASSHOPPER/MORMON CRICKET

Question. Does the fiscal year 2001 budget request provide funding for the control of the grasshoppers/Mormon crickets?

Answer. The Animal and Plant Health Inspection Service (APHIS) is currently conducting spring predictive surveys to determine the needs for crop protection programs. Our effort is funded through contingency funds. In fiscal year 1999, we used \$850,000 and in fiscal year 2000 we plan to use \$404,000 for these activities. At this time, there is no clear indication of the funding level required for the crop protection programs in fiscal year 2000, but the need could be \$1.3 million or higher.

The fiscal year 2001 funding needs for grasshopper and Mormon cricket control will depend on this year's weather conditions—lack of a cool, damp spring will promote the development of high grasshopper/Mormon cricket populations in areas where they previously existed. Dry weather conditions in the spring exacerbate higher grasshopper/Mormon cricket populations because there will be increased numbers of grasshopper/Mormon cricket eggs laid and less forage, increasing the competition between livestock and the pests for survival. While we can not predict at this time what our funding needs will be and did not request funding for fiscal year 2001, we do know that we will need to continue survey work to determine where grasshopper/Mormon cricket problems will potentially exist and how to address them.

EMERGENCY MANAGEMENT SYSTEM

Question. Please provide the amount of funding for each activity that will be funded from the fiscal year 2001 budget request increase of \$5,241,000 for the emergency management systems program.

Answer. APHIS proposes to spend the \$5.2 million increase on the following activities: \$260,000 for an educational campaign aimed at providing information to Federal, State, and local governments, industry, stakeholders, and the public; \$657,000 for specialized training for State and Federal emergency managers and private practitioners; \$2 million for animal health emergency managers in the field to assist states with establishing animal health emergency management standards and to support the states during actual responses; \$230,000 for a genetic fingerprinting library; \$300,000 for the EpiInfo 2000 system, a geographical information system, and hand held units to record geographical data; \$300,000 for preparing and updating 6 disease plans and conducting 1 National and 2 regional test exercises; and \$1,494,000 for equipping the Emergency Management Operations Center.

KUDZU

Question. Does the fiscal year 2001 budget request for noxious weeds include funding for Kudzu projects?

Answer. In fiscal year 2000, APHIS will continue to fund approximately \$45,000 in a cooperative agreement with Mississippi State University for demonstration of Kudzu control techniques. Mississippi State University reported preliminary results from the Kudzu demonstration project at the 2000 Southern Weed Science Society meeting. Researchers are demonstrating and evaluating various control techniques. The project will continue in fiscal year 2000 at a new site. In fiscal year 2001, APHIS will reevaluate the Kudzu project to determine if the demonstration project control techniques can be effective in widespread eradication and if so, will continue to fund Kudzu activities in fiscal year 2001.

PINK BOLLWORM

Question. How much funding is needed to continue the pink bollworm eradication program in Arizona and to begin the program in New Mexico, Texas, and Mexico in fiscal year 2001? The fiscal year 2001 budget request proposes a decrease of \$242,000 for this program. Which activities are continued and which are discontinued for fiscal year 2001?

Answer. Before a pink bollworm eradication program can begin in New Mexico, Texas, and Mexico, funding for larval cut out racks (where pink bollworm eggs feed on an artificial diet until they hatch into larvae), pupal maturation racks (where the larvae spin into cocoons and begin maturing into moths), and upgrades to the exist-

ing electrical utilities is still necessary. Our current estimate for these costs is \$350,000.

With the fiscal year 2001 requested funds, we will continue to produce sterile insects for release in the San Joaquin Valley, California; however, we will not be in a position to move the eradication program to New Mexico, Texas and Mexico.

EMERGING PLANT PESTS

Question. The fiscal year 2001 budget request proposes an increase of \$25,079,000 for the emerging plant pests program. In the past, APHIS has been able to use emergency funds for citrus canker and the Asian longhorned beetle eradication. Why has the Administration chosen to request appropriations for this work instead of using emergency funds?

Answer. The Secretary's emergency transfer authority is a vital tool in enabling APHIS to respond quickly and effectively to incursions of exotic pests and diseases. The difficult issue is trying to determine the best funding mechanism when a given pest or disease incursion requires a multi-year eradication effort. Because it became apparent that the citrus canker, Asian longhorned beetle, and Mediterranean fruit fly programs would take more than 2 years to complete, we did not feel it was appropriate to continue to rely on CCC emergency funding, and instead decided to request funds for these programs through the regular budget process where it can receive the benefit of Congressional scrutiny.

SCRAPIE

Question. Why has the Administration decided to put an emphasis on eradicating scrapie from the U.S. in the fiscal year 2001 proposed budget?

Answer. Scrapie is a fatal disease of sheep and goats that is one of a group of diseases called transmissible spongiform encephalopathies (TSEs), which also includes bovine spongiform encephalopathy (BSE). This disease could impact the American food supply and the public health. The sheep industry has asked APHIS to accelerate efforts to eradicate scrapie because the disease costs the U.S. sheep industry an estimated \$20 million per year in direct losses and millions of dollars more in lost potential markets and flock productivity.

Currently, producers in scrapie-free countries have a significant competitive advantage over U.S. sheep producers for several reasons. First, as a result of scrapie, U.S. sheep producers are subject to higher production costs and lower revenues. Second, importing countries are demanding that imported sheep come from scrapie-free countries or regions, and U.S. producers are unable to make this certification. As a result, U.S. producers are locked out of the international market—a situation that is taking a financial toll on American sheep producers.

In addition, the presence of scrapie in the United States may jeopardize our ability to market a variety of ruminant products such as meat and bone meal internationally—due to elevated concerns about all TSEs resulting from the occurrence of BSE in Europe. APHIS has determined that it is necessary to accelerate efforts to eradicate scrapie from the United States to help the U.S. sheep industry become competitive again in the global market place and to protect existing U.S. markets for all ruminant products.

WILDLIFE SERVICES OPERATIONS

Question. The program fiscal year 2001 budget proposes a decrease of \$2,711,000 for Wildlife Services Operations program. Which ongoing activities will be affected by this proposed decrease?

Answer. APHIS proposes that cooperators of Wildlife Services programs assume a greater share of the operations costs in fiscal year 2001. Producers, States, and local governments are responsible for a large portion of the costs of running programs where they are the beneficiaries. We will work with program cooperators to determine how to best make the program reductions if the cooperators are unable to assume a larger share of the costs in light of the proposed reduction in fiscal year 2001.

We have not placed into priority order how we would implement program reductions if necessary.

Question. How does APHIS propose to enforce that cooperating agencies and individuals take on a larger share of the costs for projects currently underway? Does the fiscal year 2001 budget assume receipts from these agencies? If so, how much?

Answer. The fiscal year 2001 budget reduction for Wildlife Services Operations assumes that cooperating agencies and individuals will contribute a greater share of the costs for the projects underway. Cooperators are already contributing more than 50 percent of program costs. It is the cooperators' discretion to take on a greater

share of the costs for the programs, assuming that they will prioritize funding for those projects which benefit them directly. If they choose not to raise their level of contributions, APHIS will be forced to reduce program activities.

NATIONAL POULTRY IMPROVEMENT PLAN

Question. How much funding does the fiscal year 2001 budget request propose for the National Poultry Improvement Plan?

Answer. APHIS has included approximately \$616,000 in the fiscal year 2001 budget request to support the National Poultry Improvement Plan (NPIP). Of this amount, APHIS will use \$236,000 for program coordination; \$368,000 for diagnostic testing related to the NPIP; and \$12,000 for the Advisory Committee on the NPIP. The Advisory Committee serves as a liaison between the poultry industry and the U.S. Department of Agriculture on matters pertaining to U.S. poultry health.

SUMMARY OF INCREASES AND DECREASES

Question. On page 14–17 of the Explanatory Notes, what is contained in the line item for “All Other”? Does the Contingency Fund stay at the fiscal year 2000 level for fiscal year 2001?

Answer. The entry for “All Other” comprises all APHIS line items for which we are not proposing any program changes for fiscal year 2001. This encompasses the following line items: FMD/Emerging Foreign Animal Diseases; Tropical bont tick; Golden nematode, Witchweed, and the Contingency Fund.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

ADVANCED SPATIAL TECH, MISSISSIPPI (PRECISION AGRICULTURE)

Question. Please provide a description of the research that has been funded under the Advanced Spatial Technology, Mississippi grant.

Answer. This research will evaluate the use of site-specific technology and assess the economics of its application. Cultural practices will be studied and integrated into management system using-site specific technology to monitor yield and variable rate application. This project will expand on work conducted under the Special Technology Special Research Grant funded at \$350,000 in fiscal year 1997 and \$600,000 in 1998.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to provide farmers with unbiased information on the application and economics of site specific technologies for cotton production in the mid-south.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to evaluate site specific technologies and develop recommendations for management decisions related to fertilization, pest control, and other cultural practices.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$350,000, for fiscal year 1998 it was \$600,000, for 1999 it was \$1,000,000 and for fiscal year 2000 \$1,000,000 for a total of \$2,950,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant are \$620,300 in 1998, and \$942,000 in 1999. These funds are State appropriations that support the salaries of scientists and their support staff.

Question. Where is this work being carried out?

Answer. The research is being conducted on various Mississippi Agricultural Experiment Station branch locations around the State.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipated the completion date for the original objective to be in fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was subject to an initial evaluation at its start in fiscal year 1998. The last evaluation was in July of 1999. Progress so far has resulted in useful information already being applied at the farm level.

AFLATOXIN RESEARCH, ILLINOIS

Question. Please provide a description of the research that has been conducted under the Aflatoxin Research, Illinois grant.

Answer. This research is focused on development of strains of corn which will be highly resistant to infection with *Aspergillus flavus* and the production of aflatoxin under field conditions. Transfer of genetic material from resistant strains to other, usable, inbred strains of corn is underway and these new strains are being field tested to determine level of resistance to fungal infection.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. There is much national concern about the role of aflatoxins as carcinogens in the human population. The aflatoxin material is also toxic to animals and humans. The presence of the fungus in corn results in a lower value for the crop and the possible rejection of the corn by the grain elevator owners. Aflatoxin contamination continues to be a serious problem in the southern and southeastern United States, with additional outbreaks also occurring during severe drought conditions in the upper mid-west and other areas during the past few years.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was the reduction of infestation of corn with *Aspergillus flavus* and the consequent reduction of aflatoxin in the corn produced. The researchers have produced strains with resistance genes for both prevention of infection with *A. flavus* as well as the production of the aflatoxin itself. Field trials have been in progress to determine effectiveness of these resistance factors under normal growing conditions when exposed to the fungus. The work has now progressed to the stage where it seems likely that more than one gene will have to be transferred to produce strong resistance to the *Aspergillus* infection and production of aflatoxin.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$87,000; fiscal year 1991, \$131,000; fiscal years 1992–1993, \$134,000 per year; fiscal year 1994, \$126,000; fiscal years 1995 through 2000, \$113,000 per year. A total of \$1,290,000 has been appropriated.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. The non-Federal funds have been from State appropriated dollars in the form of principal investigator and technical salaries, equipment usage, and experimental plot expenses. These have been at the level of \$130,000 for fiscal years 1997 and 1998, and \$24,747 for fiscal year 1999.

Question. Where is this work being performed?

Answer. The research is being performed in the Department of Crop Sciences at the University of Illinois.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was 1995, but the project was revised last year to continue to fiscal year 2002. The primary reason for the extension of the work is that there appear to be multiple resistance genes which are necessary to prevent both the infection with the fungus and the synthesis of the aflatoxin compound. The investigators are very optimistic about the future success of this approach. This work was discussed at a meeting of Multi-State Research Project NC-129 on January 25-26, 1999 in New Orleans and the Principal Investigators are members of the Technical Committee of this project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was evaluated on March 10, 2000. The investigators have made good progress on this project. They presently have identified that the key issue is to insert genes coding for two enzymes, chitinase and B glucanase, which will attack the fungus cell wall. They have many options on how to enhance the resistance level in the corn and several genetic transformations that can be tested. The resistance of plants to *Aspergillus flavus* does not carry over to resistance to *Fusarium moniliforme*. A major impediment now is the ability to do field trials of sufficient scale to test the new varieties and the variation in environmental condi-

tions which often results in a growing season with a low incidence of aflatoxin production even in susceptible plants. The research team indicated that additional funds would be required in order to accelerate their current rate of progress.

AGRICULTURAL DIVERSIFICATION AND SPECIALTY CROPS GRANT

Question. Please provide a description of the research that has been funded under the Agricultural Diversification and Specialty Crops grant.

Answer. There are numerous outcomes from this grant over the past year:

- A book on plants for Hawaiian lei material is in the publications office for final work-up.
- Video conferences in June 1998 and September 1998 were held to discuss issues relating to food safety on the farm, and included USDA and FDA personnel in Washington and over 90 participants at each session. A food safety website was developed (<http://www.hawaiiag.org/foodsafefoodsaf.htm>) and an article was written for the Hawaii Farm Bureau Federation newsletter covering on-farm food safety issues.
- In 1999 the project co-chaired a Hawaii transportation industry education task force and developed and wrote with 18 co-authors the “Preflight Checklist for Shipping Your Quality Hawaii Agricultural Product.”
- The project worked with 32 co-authors to produce the handbook “Hawaiian Islands Air Cargo Resource Book 1999–2000,” which lists information on 130 service providers and valuable information on how to ship a product in the most efficient ways.
- A talk was given at the 2nd Annual Hawaii Air Cargo Symposium in September 1999 on the progress of the transportation education task force.
- The project developed a fact sheet called, “Estimating the per-pound cost of a dried or condensed food based on process yield and farm-gate price,” that helps entrepreneurs calculate processing loss and potential profits from food dehydration.
- Three tools for entrepreneurs will be completed in the first quarter of 2000: An extensive fact sheet on the “Costs and Considerations for Establishing an Entrepreneurial Community or Shared Use or Test Kitchen Incubator,” a poster to help food product entrepreneurs quickly calculate their cost of production; and a fact sheet on the cost of establishing incubator kitchens for food processing entrepreneurs, including an emphasis on safe food processing.
- The project is advising the Hawaiian Commercial and Sugar Company on the possibility of starting a large-scale white taro production and processing operation in high pressure minimal processing for pineapple and other tropical fruits, the cause of premature fading of pineapple slices has been determined and the temperature, pressure and time relationship has been identified to achieve sterility.
- The project is collecting data and information on cultural practices for kava, a nutraceutical. Projects with other funding sources have been facilitated on the major disease of kava in Hawaii (cucumber mosaic virus dieback) and on the biosynthesis of kava lactones in a bioreactor. Cooperation with the private sector is being facilitated on the production and processing of stevia, a natural sweetener.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Hawaii’s economy continues to lag behind national averages where growth is concerned. The various projects under the umbrella of the Diversified Agriculture and Specialty Crop grant rely on information research to build decision-making tools. These tools help entrepreneurs make more informed decisions. When entrepreneurs make better decisions they have a higher chance of making a profit in business. The decision-making tools are being used in the Hawaii, the Pacific, and on the mainland.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the original proposal was to screen potential food and non-food crops for commercial development in Hawaii and then make earnest attempts to work with willing and able entrepreneurs to move the results of research to the private sector. The lei manual, in final preparation, will provide entrepreneurs with information on how to grow plants that they never had information about, and they will also be armed with a cost of production framework that is specific to nursery production. While the University of Hawaii continues to screen crops to help entrepreneurs pick the best ones for production and the market place, there are few decision making tools that can help entrepreneurs take their products more successfully

to market. Thus, there is an emphasis on information tools such as a transportation handbook and a cost of production poster. To help farmers prepare for increased food safety scrutiny, the University of Hawaii is working with Hawaii State agencies and other non-profits to reach out to farmers with critical information.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows, fiscal years 1988–1989, \$156,000 per year; fiscal years 1990–1993, \$154,000 per year; fiscal year 1994, \$145,000; and fiscal years 1995–1999, \$131,000 per year; and fiscal year 2000, \$131,000. A total of \$1,859,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University of Hawaii provides in-kind support in the form of laboratory and office facilities, equipment and equipment maintenance, and administrative support services: \$68,503 in fiscal year 1992; \$75,165 in fiscal year 1993; and approximately \$75,000/year in fiscal years 1994–96, approximately \$20,000/year in fiscal years 1997–2000. Funds are also being leveraged from other private sector, State and Federal sources for the development of nutraceuticals.

Nearly \$50,000 of in-kind support has come from private sector and State partners, including \$8,000 from the Office of Hawaiian Affairs and \$30,000 from the private sector on the high pressure minimal processing project. The value of community time on all the publications written in the past year or so is also well over \$75,000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Hawaii's College of Tropical Agriculture and Human Resources on the island of Oahu, and other Hawaiian islands as necessary.

Question. What is the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date for additional or related objectives?

Answer. All taro work is completed. Lei plant manual will be out in the first quarter of 2000. Work is just starting on transportation and food safety issues and will continue through 2002. Work on business related information tools will continue through 2002. Work continues on high pressure processing of tropical fruits and will continue through 2002. Work on nutraceuticals, particularly cultural practices and disease management of kava and stevia, is continuing through 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Project PIs are in regular contact with project manager at USDA-CSREES. The USDA manager has seen outcomes on a regular basis and visits the project at least once per year to evaluate progress and help plan subsequent or related project objectives.

AGRICULTURAL DIVERSITY/RED RIVER, MN AND ND

Question. Please provide a description of the research that has been funded under the Agricultural Diversity Grant.

Answer. This multi-year, multi-phase project will have six specific components. They are: (1) vegetable growing research—especially field and glasshouse related research, (2) vegetable collection and storage research and/or related storage or distribution business development, (3) development of processing industries for the fresh market or research related to the fresh products for market, (4) development of marketing and/or supply associations among vegetable producers, (5) development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products, and (6) development of processing industries for the frozen vegetable products market or research related to frozen products. This first phase of this multi-phase project will concentrate its industry development and research activities in three areas: vegetable growing research—especially field and glasshouse related research, development of marketing and/or supply associations among vegetable producers, and development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products. The second phase of this multi-phase project will concentrate its activities in four areas: continued research on vegetable production, including commercial greenhouse production, field production using Missouri River water for irrigation; development of markets for fresh product; preparation of a business plan for a ready-to-eat delicatessen salad processing facility in the region; and analysis of the potential for adding higher value complementary crops to the rotation mix in vegetable producing areas.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Initially the growing of vegetables in the region was driven by an opportunity to meet increasing consumer demand for fresh vegetables and concerns over both the cost of water and the environmental impacts of the use of chemicals in the traditional vegetable producing regions of the southern United States. This industry currently raises three crops of vegetables a year. This requires extensive irrigation in the hot summer months. Population growth and increased domestic and industrial demands for water have created significant pressures to shift water usage away from agriculture and toward other domestic and industrial needs. Additionally, use of chemicals to fight soil bacteria has raised environmental concerns in these States. These issues created a need to identify other regions to produce vegetables, especially in the summer months. The northern plains States of Minnesota, North Dakota and South Dakota have been identified as one area that could meet this need. In addition, the opportunity to add a high-value crop to the rotation cycle for northern Great Plains farmers can help to decrease their dependence upon program crops. The shift in cropping patterns can have a positive effect on farm income and lessen the need for outside or Federal financial assistance. Interest in the potential for adding higher value crop to the rotation cycle, including vegetables, has increased significantly in the past year due to the poor farm economy. Research on the potential for adding new crops to the region's production base could help stabilize the farm economy in the region and lessen the need for outside financial assistance to farmers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project objectives include: (1) Conduct three replicated field trials on growing of carrots; (2) Continue study of vegetable growing techniques in Europe and continue negotiations with vegetable growing research facilities/laboratories in Europe to transfer growing knowledge to the region; (3) Review current and future market opportunities for further development of the industry and identify strategies and partners for pursuing these opportunities and take appropriate organizing steps; (4) Develop and maintain a web page for this vegetable industry project; (5) Conduct market research for establishment of a ready-to-eat delicatessen salad processing facility in the region; (6) Conduct market research for establishment of a ready-to-eat fresh-bagged salad processing facility in the region; (7) Continue business development planning for establishment of a ready-to-eat delicatessen salad processing facility in the region; and, (8) Continue business development planning for establishment of a ready-to-eat fresh-bagged salad processing facility in the region. Funding for this project was received July 1, 1998 at which time work on the project began. The Red River Trade Council Vegetable Industry Task Force has a number of specific activities currently underway to help develop regional vegetable processing markets for vegetable production.

In the area of Deli-salad production the Vegetable Task Force continues to work on transferring state-of-the-art deli-salad and upstream processing technology that produces long-shelf-life, preservative-free wet salads to the region. Over the past several years, researchers have conducted market opportunity studies, taste-test evaluation, and are in the process of business planning and coordinating additional partners to capitalize construction of a new processing facilities in the region. The work conducted in this process has identified specific technology that is used by upstream suppliers of a deli-salad company. This technology produces the highest quality pre-processed vegetables that can be stored at room temperature for up to 90 days. This technology allows several different vegetables to be processed using the same equipment and requires little time to switch to different vegetables. A facility like this in the region that is capable of processing several different vegetables is critical to allow production and market diversification.

Significant research has been conducted to understand the market opportunities available in premium dehydrated products, especially dehydrated vegetables. This research has identified several different vegetables that provide opportunities depending on the processing yield that our products would provide. Initial vegetable production trials were conducted in the summer of 1999. Results from these trials were positive and additional research will be conducted to evaluate additional varieties and production and storage practices in the summer of 2000.

Greenhouse Production issues are being examined by the Red River Trade Council which is developing a greenhouse task force to evaluate the potential for controlled environment production in the region. The Red River Trade Council has worked with extension and industry in the Netherlands to understand issues facing the development of this industry in the region. The Greenhouse Task Force is working to

identify markets and feasibility for controlled environment production to provide year-round supply of high-quality vegetables to supply processed and fresh markets.

Market research conducted on high value products from alfalfa indicated that there is a potential for development of an alfalfa processing facility in our region. Additional work to coordinate research, identify potential industrial partners, and further evaluate the market feasibility is continuing.

Significant effort is being conducted to develop cooperative marketing systems that allow production to be focused on specific-quality traits. The Red River Trade Council is working to facilitate development of farmer alliances or next generation cooperatives to supply specific-quality products to the marketplace.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 with appropriations for fiscal year 1998, 1999 and 2000 of \$250,000 each year for a total of \$750,000 appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Efforts have been made to secure non-Federal funding from individual States and commodity groups. To date the States of North Dakota and Minnesota have been a source of approximately \$65,000.

Question. Where is the work being carried out?

Answer. The work is being carried out in Minnesota, North Dakota and South Dakota.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Progress is being made on the original objectives. It is expected that this will be a multi-year, multi-phase project. Work is expected to continue until June 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was evaluated by review of the proposal and is subject to annual project reports. An on-site review is scheduled for June of 2000.

AG-BASED INDUSTRIAL LUBRICANTS RESEARCH PROGRAM, IOWA

Question. Please provide a description of the research that has been funded under the agricultural-based industrial lubricants research program grant.

Answer. This project is a continuation of nine years of activity conducted to target specific applications, establish baseline performance data, develop formulations of additives and chemical modifications, administer laboratory and field tests, characterize, and build relationships for commercialization of industrial lubricants derived from U.S. grown vegetable-based oils. Baseline performance data will be compiled to establish fatty acid compositions, will serve as guide to develop strategies for genetic modifications, additive development, establish standards relative to toxicity and biodegradability, and characterize compatibility with specific metallic and non-metallic components. The grant has been peer reviewed internally at the University of Northern Iowa.

Question. According to the research proposal, or the principal research, what is the national, regional, or local need for this research?

Answer. Primary local and regional need is related to expanding value-added applications of agricultural commodities in order to stimulate increased demand and raise crop prices paid to farmers. On a national level, the need is to provide renewable, safer, more environmentally sound alternatives to petroleum based industrial lubricants. The principal investigator believes this research to be of local, regional and national importance. Furthermore, there is a belief that there are international possibilities for the use of genetically modified soybean-based lubricants. Premium quality lubricants made of genetically modified domestic crops present a potential for use in a no-food area, i.e. industrial lubricants.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the program was sponsored by non-Federal funding to develop a soybean based hydraulic oil which was introduced to market in July of 1997, marketed by AGRI Industries of West Des Moines, Iowa as BioSOY hydraulic fluid. As of January 1999, and with the consensus of Agri Industries, the original license was transferred to West Central Cooperative of Ralston, Iowa, which is in a better position to market the product. Field testing of two grease formulations and a dielectric transformer coolant has begun, as well as development of a two-cycle

engine lubricant, and bar and chain oil. A large volume of technical data has been compiled specific to crop based oil and lubricants. This program has identified and has begun servicing a broad array of market development requirements, including demonstrating specific performance features, expanding awareness, and supporting government purchase initiatives. In September 1999, two new soybean-based lubricants were licensed to West Central Coop and are now commercial products. Those were a chain saw bar oil called SoyLINK and a fifth wheel grease call SoyTRUK.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Federal funding for this project began with a 1998 appropriation of \$200,000. Fiscal years 1999 and 2000 appropriations are \$250,000 each year for a total of \$700,000 appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since 1992, this research program has received cash grants from the Iowa Soybean Promotion Board, Carver Scientific Research Initiatives, in addition to several in-kind donations from industry to develop and coordinate commercialization of what has since become BioSOY hydraulic oil. Beginning in 1995, the State of Iowa began to support the program through its Wallace Technology Transfer Foundation. Beginning in 1996, State funding was provided by legislative appropriation through the Iowa Department of Economic Development. Additional funding has been provided by the Iowa Department of Agriculture and Land Stewardship. In fiscal year 1998 \$150,000 was appropriated through the Iowa Department of Economic Development, \$50,000 from the Iowa Soybean Promotion Board, \$25,000 from Iowa Department of Agriculture and Land Stewardship, \$32,500 from John Deere, and other awards and service revenues totaling approximately \$60,000. State funding for fiscal year 2000 in amount of \$400,000 has been requested through direct appropriation to the university.

Question. Where is the work being carried out?

Answer. Laboratory and literature studies are being carried out primarily at the Ag-based Industrial Lubricants Research Program facility in Waverly, Iowa, with minor portions of activity being conducted on the campus of the University of Northern Iowa in Cedar Falls, Iowa and the laboratories of various industrial affiliates located throughout the State and country. Field tests are being conducted at Sandia National Laboratories, U.S. Department of Army test sites, some municipalities, and in industrial equipment located throughout the nation. A short line Iowa-based railroad and a class I railroad have been testing soybean-based rail/flange grease with success and a new lubricant for railroad use is expected to be commercialized this year.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have been met, in part, with the optimization, demonstration, and commercialization of the soy-based hydraulic fluid. Data collection, additive and modification research, characterization, and supplier development objectives of the first year are ongoing. The development of the dielectric transformer coolant is an added objective and has been expedited through to field testing. Activities to expand public awareness and support government purchase initiatives have been added to the original objectives. Field testing of some products is expected to be completed within a year and additional lubricant applications are anticipated to be targeted for development and field testing within two years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist reviews quarterly reports and has determined that this research is technically sound and directly addresses the goal of the agency to expand markets for agricultural materials.

AGRICULTURE TELECOMMUNICATIONS, NY

Question. Please provide a description of the research that has been funded under this grant.

Answer. This program encourages the development and utilization of an agricultural communications network to facilitate and strengthen agricultural extension, resident education, and research, and domestic and international marketing of United States commodities and products through a partnership between eligible institutions and the Department of Agriculture.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. The following needs will be addressed by this program:

- Make optimal use of available resources for agricultural extension, resident education, and research by sharing resources between participating institutions;
- Improve the competitive position of United States agriculture in international markets by disseminating information to producers, processors, and researchers;
- Train students for careers in agriculture, natural resource management, environmental science, human sciences, and the food industries;
- Facilitate interaction among leading agricultural scientists;
- Enhance the ability of United States agriculture to respond to environmental and food safety concerns; and
- Identify new uses for farm commodities and increase the demand for United States agricultural products in both domestic and foreign markets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this program is to encourage the development and utilization of an agricultural communications network to facilitate and strengthen agricultural extension, resident education, and research, and domestic and international marketing of United States commodities and products through a partnership between eligible institutions and the Department of Agriculture. Various educational, extension, and technology transfer projects have been funded through the program in fulfillment of this goal.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2000?

Answer. The project began in fiscal year 2000, and is funded for \$425,000.

Question. What is the source and amount of non-Federal funds provided, by fiscal year?

Answer. Prior to fiscal year 2000 it was a one hundred percent match of funds from non-Federal sources. However, beginning in fiscal year 2000, it became a special research grant and does not require a match of funds from non-Federal sources.

Question. Where is this work being carried out?

Answer. Cornell University will award grants competitively throughout the United States.

Question. When do the principal researchers carrying out this work anticipate that the work will be completed?

Answer. Projects funded through this grant are two-year projects.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Due to the changing nature of technology and the continuing need for information in the agricultural community, the objectives of this project cannot be considered of a terminal nature. Individual projects being funded address ongoing needs for information dissemination and technology transfer. As each project is completed the results are evaluated to determine the success of meeting the program's objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The agency evaluates this project each year via a report from institutions funded. In summary, the following highlight the programs funded:

- Dollars provided by the Agricultural Telecommunications Program resulted in the Tri-State Agricultural Distance Delivery Alliance (TADDA), which includes Washington State University, Oregon State University, and the University of Idaho. Six courses reach learners at any location, and nearly fifty more are in the development stage.
- Texas A&M University collaborated with Utah State University and the University of Kentucky to develop a nationally recognized program in international agribusiness marketing. It reaches food marketing firms, food processors, and other extension audiences.
- New Mexico State University successfully implemented a multimedia program called "Marketing from a Rural Environment," which focuses on place-bound minority learners.
- The University of Arizona developed a comprehensive and dynamic Internet-based resource on rangeland management.
- Mississippi State University extended the reach of the Web to all State and county offices.
- Ohio State University developed an internationally recognized system for quickly targeting and accessing appropriate horticulture information.

AGRICULTURE WATER USAGE, GEORGIA

Question. Please provide a description of the research that has been funded under the Agriculture Water Usage, Georgia grant.

Answer. The project will determine agricultural water use in Georgia using a 2 percent statistical sample of water sources. Equipment has been purchased and personnel hired to conduct the project.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Water has become a major issue in the southeast. The tri-state water "issue" between Florida, Georgia, and Alabama is seeking to allocate interstate waters in the primary river basins which begin in the Atlanta area. These allocation formulas are completed and ready for use. The salt water intrusion problem associated with coastal Georgia and South Carolina is also a major issue. Both these problems suffer from the lack of data on agricultural water use across the State. This program seeks to develop a monitoring and modeling strategy to determine how much water is used by agricultural irrigation. The program is designed to begin with Georgia and then allow expansion into neighboring States for a better estimate of agricultural water use.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project has begun by hiring of strategic personnel for the monitoring program, and development of the equipment and the data base to be used for obtaining volunteers for the monitoring phase. This integrated project will involve the development of computer based models to take a monitoring sample and extrapolate that information for the entire State.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal year 1999 and 2000 is \$300,000 giving a total of \$600,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The State of Georgia through the Georgia Department of Natural Resources, Environmental Protection Division has appropriated \$289,000 for fiscal year 1998-1999 and is expected to appropriate \$250,000 per year for an additional 4 years to help support this project.

Question. Where is the work being carried out?

Answer. Research will be conducted from the University of Georgia, College of Agricultural and Environmental Sciences. The primary coordination of the program will be centered in the Biological and Agricultural Engineering Unit at Tifton, Georgia, but the program will involve input from personnel in Griffin and Athens, and researchers outside the University of Georgia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project, within the overall agricultural water use program, is anticipated to be completed within the original 5-year time frame. Since this project is new, objectives have not been completed to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is new and has not been through an agency evaluation; however, the investigators prepare quarterly reports for the State. The procedures used to conduct the project have been peer reviewed and all publications developed by the project will be peer reviewed. One product has been produced, "Irrigation Conservation Practices for the Southeast U.S.", a 60-page report.

ALLIANCE FOR FOOD PROTECTION, NE, GA

Question. Please provide a description of the research that has been funded under the Alliance for Food Protection grant.

Answer. The fiscal year 2000 appropriation supports the continuation of a collaborative alliance between the University of Georgia Center for Food Safety and Quality Enhancement and the University of Nebraska Department of Food Science and Technology. Fiscal year 1999 funds supported research at the University of Nebraska on the detection, identification and characterization of food allergens, the effects of processing on peanut allergens, and investigation of the efficacy of using various types of thermal processes to reduce or destroy the toxicity and mutagenicity of certain Fusarium metabolites in corn and corn products. Research at the University of Georgia is directed toward determining the foodborne significance of

Helicobacter pylori, developing a competitive exclusion bacterial culture to reduce carriage of *Campylobacter jejuni* in poultry, developing methods to differentiate Shiga toxin-producing *E. coli* that are pathogenic for humans from nonpathogenic strains, and developing methods to detect parasites in produce.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the proposed research addresses emerging issues in food safety which have national, regional and local significance. Specifically, research will address bacterial pathogens that can cause ulcers, cancer and diarrheal illness, toxic fungal metabolites in corn products, and allergens in foods that cause serious reactions, including death, in sensitive people. These emerging issues affect consumers, the food industry, and food producers at all levels, national, State, and local.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of this research was to: (1) facilitate the development and modification of food processing and preservation technologies to enhance the microbiological and chemical safety of products as they reach the consumer and (2) develop new rapid and sensitive techniques for detecting pathogens and their toxins as well as toxic chemicals and allergens in foods. The University of Nebraska developed assays for detection of peanut, milk, egg, and almond residues in processed foods, produced high-quality antibodies for these assays, identified a soybean allergen and two sunflower seed allergens, discovered clues as to the reason why Brazil nuts cause severe allergic reactions, discovered that certain types of *Fusarium* fungi do not produce mutagenic substances, developed a simple liquid chromatographic procedure for determination of moniliformin toxin, found that the corn flake manufacturing process can reduce levels of fungal toxins such as aflatoxin and fumonisins, and also found that low levels of carcinogenic aflatoxins in corn grits might be reduced to less than regulatory actions levels by the corn flake manufacturing process. The University of Georgia developed methods to culture *Helicobacter pylori* and to detect the pathogen in water by advanced genetic-based techniques. It was found that *Arcobacter* is easily killed by heat treatment, exposure of *E. coli* 0157:H7 to acid increases the bacterium's tolerance to heat and that the pathogen could survive for many weeks in refrigerated dry foods, and it was determined that extrusion cooking can greatly reduce allergens in peanuts.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1996, and \$300,000 was appropriated in each fiscal year 1996 through 2000, for a total appropriation of \$1,500,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. The non-Federal funds and sources provided for this grant were \$117,000 State funds and \$250,000 industry and miscellaneous in fiscal year 1996 and were estimated to be a minimum of \$111,000 State funds and \$305,000 industry and miscellaneous in fiscal year 1997. In fiscal year 1998, \$70,000 came from State funds and \$295,000 from the food processing industry and miscellaneous funds. The amount of State funds provided in fiscal year 1999 was \$30,000 and \$100,000 were provided by the industry. A minimum of \$25,000 State funds and \$25,000 industry funds will be provided in fiscal year 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Georgia Center for Food Safety and Quality Enhancement in Griffin, Georgia and at the University of Nebraska Department of Food Science and Technology in Lincoln, Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The original objectives have not yet been met. The researchers anticipate that work will be completed on the original objectives in 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposals submitted in support of the project on an annual basis. A review of the proposal from the University of Nebraska was conducted on March 29, 1999, and good progress was demonstrated on the objectives undertaken in 1998. For example, research performed at Nebraska has shown that extrusion cooking reduces allergenicity of peanut flour. At the University of Georgia a review was conducted on April 14, 1999, and good progress was demonstrated on the objectives under-

taken in 1998. Researchers there have developed a medium to enhance the growth of gastric ulcer-causing bacteria.

ALTERNATIVE CROPS, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Alternative Crops, North Dakota program.

Answer. The alternative crops project has two main thrusts, development and utilization of alternative or novel crops and utilization of traditional crops. The goals of the project are to diversify income at the farm gate, reduce reliance on monoculture to help alleviate pest problems, while providing new agricultural and industrial products to society. Some of the new areas under investigation include feeding of co-products to livestock; development of white wheat as an alternative crop, production of certified dried bean seed, and borage. Previous work continues with oilseed crops such as crambe, rapeseed and safflower as a renewable supply of industrial oil, products from food crops for novel new uses in paints, coatings, food ingredients, and the development of new biochemical and enzymatic processes to refine oils for industrial uses. The projects funded in this appropriation are evaluated by a peer-panel chosen by the Associate Dean of Research at North Dakota State University. The internal peer review was conducted on the following criteria: (1) probability and extent of generating value-added agricultural products, (2) technical and financial feasibility, (3) scientific merit, (4) innovation, (5) probability of rapid commercialization and (6) interdisciplinary research efforts.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Regionally, the temperate areas of the Midwest have the potential to grow a great number of different crops but are in need of publicly-sponsored research efforts to reveal the most practical, efficient, and economical crops and products to pursue. Growers in surrounding States are currently utilizing the information generated by research conducted through this grant. The principal researcher believes that nationally, developing new crops and new markets for agricultural products is critical for both environmental and economic reasons. Enhanced biodiversity that comes from the successful commercialization of new crops aids farmers in dealing with pests and reducing the dependency upon pesticides. New markets are needed to provide more economic stability for agricultural products, especially as Federal price supports are gradually withdrawn.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was and still is to introduce, evaluate and test new crops which will broaden the economic diversity of crops grown in North Dakota. The primary emphasis is to find new crops, new uses and create value added products, such as crambe, lupin, canola, safflower, cool-season grain legumes, buckwheat, amaranth, field pea production and utilization, transgenic sugar beets to produce levan, utilization and processing lupin flower, confectionery sunflower production, growing and marketing of carrots, crop-derived red food dye and high quality pectin as food ingredients, innovative biochemical means of splitting crop oils, and other new uses of oilseed crops, development of markets for new crops as livestock and fish feeds. These efforts have forged a strong link with the private sector, and successfully spawned several crops and products into profitable private sector businesses.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Appropriations by fiscal year are as follows: 1990, \$494,000; 1991, \$497,000; 1992 and 1993, \$700,000 per year; 1994, \$658,000; 1995, \$592,000; and in 1996 through 2000, \$550,000 per year. A total of \$6,391,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1991, \$10,170 was provided by State appropriations. In fiscal year 1992, \$29,158, was also provided by State appropriations and self-generated funds. In fiscal year 1993, \$30,084, was provided by State appropriations. In fiscal year 1994, \$161,628 was provided by State funds, \$3,189 provided by industry and \$9,020 provided by other sources, totaling \$173,837. In fiscal year 1995, \$370,618 was provided by State appropriations, \$1,496 provided by self-generated funds, \$1,581 provided by industry and \$5,970 was provided in other non-Federal funds, totaling \$379,665 for fiscal year 95. In fiscal year 1996 \$285,042 was provided by State appropriation, \$4742 provided by industry, \$14,247 provided from other non-Federal funds totaling \$304,031 for 1996. In fiscal year 1997, \$462,012 was provided

by State appropriations, \$8,080 was provided by self-generated funds, \$8,217 was provided by industry and \$103,063 was provided from other non-Federal funds totaling \$581,372 for fiscal year 1997. In fiscal year 1999, \$984,251 was provided through State appropriations, \$40,198 provided through self-generated funds, \$13,010 provided by industry and \$87,942 from other non-Federal sources.

Question. Where is this work being carried out?

Answer. The work is conducted on the campus of North Dakota State University and at six different research extension centers in North Dakota. Work is also done in eastern Montana.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Fiscal year 2000 is the eleventh year of activity under this grant. The primary emphasis has been to find new crops with non-food uses and create value added products. The original objectives have been met, and continue to expand.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist annually reviews the project and has determined that the research is conducted in accordance with the mission of this agency to expand agricultural markets.

ALTERNATIVE CROPS FOR ARID LANDS, TEXAS

Question. Please provide a description of the research that has been funded under the Alternative Crops for Arid Lands, Texas grant.

Answer. This grant is to develop the two most abundant plants in southwestern United States, i.e. mesquite and cactus, into commercial crops through a combination of applied research and market development. In Texas, New Mexico, Arizona and California these plants occupy 72 million acres. This grant is peer reviewed internally and external reviewers include a private sector cactus breeder, the Texas Agricultural Extension Service and a specialist in wood products marketing.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this goal?

Answer. The semi-arid regions of the United States that border with Mexico in Texas, New Mexico, Arizona, and California have some of the highest unemployment rates, lowest economic returns per acre, and lowest incomes in the United States. The two most abundant plant species in this region are prickly pear cactus and mesquite. By working with Mexican researchers, this grant will help to stabilize the economic situation of rural poor in Mexico and the United States. There are few crops capable of being grown sustainably in these regions. Due to the nitrogen fixing capability, and thus soil improving properties, of mesquite and high water use efficiency of cactus, these plants contribute to sustainable agriculture, and will diversify southwestern agriculture. This research group is the only center in the United States developing these plants as crops.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to dramatically improve the economic returns, and year-to-year economic stability in the southwestern United States from arid and semi-arid lands. For cactus, the goal has been to provide improved varieties that can be harvested and processed into food and forage. A collection of more than 130 varieties of cacti serves as a resource for full scale breeding program. Chromosome analysis began in fiscal year 1999 to improve breeding success. One hundred additional hybridizations are being tested. Especially significant is the start of a production trial for the top eight fruit and top two nopalito selections. The size of the production trial will be large enough to provide planting stock in quantities suitable to many growers. For mesquite, the goal is to increase its value as a result of better tree form. A genetic screening trial has been initiated to evaluate the growth and form of 20 native Texas mesquite seed sources. This research seeks to identify superior genetic material for further breeding and to maintain some of these trees as seed producers for further silvicultural research. Mesquite accomplishments include demonstrations of mesquite products at the World Trade Fair in Chicago, presentations to architects in all major cities in Texas, and providing research information that helped a new manufacturing plant license their mesquite products. Further economic development depends on good relations and cooperation of landowners willing to sell mesquite trees from their property. In return, landowners need relevant information to formulate plans for a sustainable harvest that can incorporate considerations for grazing, wildlife, and soil improvement.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994 and the appropriation for fiscal year 1994 was \$94,000. For fiscal years 1995 through 1997 the appropriation was \$85,000 per year and for fiscal years 1999 and 2000 is \$100,000 per year. A total of \$549,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1994, \$43,215 was provided by the Texas legislature.

Question. Where is the work being carried out?

Answer. The work is being conducted by Texas A&M University, Kingsville, Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. For cactus, the original objective of the project was to provide improved varieties of cactus for fruit and napolitos marketing. The fiscal year 1999 production trial represents a partial completion of the original objective by examining the yield and financial benefits of larger scale cactus cultivation. Researchers anticipate that improved varieties should be available in two to four years. Currently, a small Texas and California cactus industry exists and more economic growth can be achieved with the introduction of new varieties. For mesquite, the objective to improve the economic return largely has been met, since markets for mesquite lumber, flooring, furniture, and barbecue work products continue to improve. However, other related objectives such as growth and form, genetic screening and breeding will take longer to complete. Initial data collection for growth and form will begin in two years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

ALTERNATIVE SALMON PRODUCTS PROGRAM, ALASKA

Question. Please provide a description of the research that has been funded under the Alternative Salmon Products grant.

Answer. The initial project funded under this program is the Pinbone Removal Machine Project. This project was aimed at developing a high capacity commercial pin-bone removal machine to take pinbones out of salmon fillets. The machine promises to lower production costs for making boneless salmon fillets and provide new products like frozen skinless boneless salmon fillet portions that will open new markets for salmon fillet in shatter packs. Subsequent to initial funds provided in fiscal year 1998, additional appropriations to the Alternative Salmon Product Program have allowed other projects to be supported. These include the Marketing Competition Project and the Salmon Quality Project.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Alaska salmon industry has lost considerable market share worldwide to farmed salmon production. In 1994, the farmed salmon market share surpassed Alaska's market share of the world's salmon supply and has continued to climb every year since. In 1997, Norwegian farmed salmon production exceeded Alaska wild stock harvests. Also in 1997, Chilean coho salmon exports to Japan exceeded North American sockeye salmon exports to Japan. Japan has traditionally been Alaska's strongest and most lucrative export market. The current situation is an example of foreign competition undermining a traditional American industry. Though the product is harvested in Alaska, the benefits of this research are shared with fishermen residents in Washington State, Oregon, California and throughout the nation. There is still room for optimism in that worldwide salmon consumption is up and new markets for high quality affordable salmon exist.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The broad research goal of the Alternative Salmon Product Program is the development of market-desired salmon products using wild-caught salmon. In 1998 and continuing, researchers involved in the Pinbone Removal Machine Project are addressing the problem of deboning wild-caught fish in appropriate volumes, so that they can be marketed as frozen skinless boneless fillet portions rather than

simply as H&G frozen fish or canned salmon. New products such as this would allow Alaskan wild caught salmon to compete more effectively with pen-reared salmon. The researchers have designed, built and tested 4 prototype pinbone removal machines, making sequential improvements in design as new problems surfaced. Their latest iteration will be tested in processing plants during the 2000 salmon season.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The initial funding of the Alternative Salmon Product Program was \$400,000 in fiscal years 1998 and 1999, and in fiscal year 2000 it is \$552,500. A total of \$1,352,500 has been appropriated.

The fiscal year 1999 appropriations have gone to two other projects, both under the Alternative Salmon Product Program. These are the Marketing Competition Project and the Salmon Quality Project.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. Industry will contribute approximately \$50,000, based on an estimated cost of \$50,000 per plant, for commercial testing of the beta prototypes.

Question. Where is this work being carried out?

Answer. The work on the Pinbone removal Machine Project has been and will continue to be conducted at both the University of Alaska Fairbanks—Fishery Industrial Technology Center in Kodiak, Alaska and at the Geophysical Institute of the University of Alaska Fairbanks, in Fairbanks, Alaska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The Pinbone Machine Project under the Alternative Salmon Product Program, including original and related objectives, will be completed with fiscal year 2000 funding. Other projects, like the Alternative Salmon Management Program will take about five years to complete their goals.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal received in support of the fiscal year 1999 appropriation was reviewed for merit on August 18, 1999. At that time, the agency science specialist determined that the projects addressed needs and interests of the Alaskan salmon industry.

ANIMAL SCIENCE FOOD SAFETY CONSORTIUM

Question. Please provide a description of the research that has been funded under the animal science food safety consortium program.

Answer. The Food Safety Consortium is focused on accomplishing six objectives: (1) to develop techniques for rapid detection of infectious agents and toxins in meat and poultry; (2) to develop a statistical approach for evaluating potential health risks; (3) to identify effective intervention points to control microbiological or chemical hazards; (4) to develop monitoring methodologies to detect these hazards in the distribution chain; (5) to develop technologies to complement the development of Hazard Analysis and Critical Control Point programs by USDA; and (6) to estimate costs and benefits associated with intervention alternatives.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The Consortium's participation in technology transfer to health departments and trade associations are helping on a regional and local level to educate consumers and food handlers on safe handling procedures. Scientific-based testing that is being developed will help provide food that will be more readily accepted in international markets and increase exports and sustainable rural economies at home. On a regional and local level, each of the institutions are involved in Hazard Analysis Critical Control Point program training for industry and are holding seminars for industry to discuss food safety research findings. In addition, the University of Arkansas is teaching food safe programs to children in State elementary schools.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal was to bring together research and expertise of institutions in three States in order to best address the areas of poultry, beef, and pork meat production from the farm to the consumer's table. In coordination with each other, they seek to develop detection, monitoring, and prevention techniques to control or prevent the presence of infectious agents and chemical toxins in the food sup-

ply. Each year advisory and technical committees provide guidance and expertise in research planning.

In 1999, research at the University of Arkansas emphasized detection and control of pathogens from pre- through post-harvest raw and thermal processing, molecular surveillance of pathogens, predictive microbial modeling and risk assessment, a variety of rapid detection methods and education and outreach programs for children in grades K-12 and for food processors. At Iowa State University, research concentrated on swine production, irradiation, methodology and risk assessment. Work performed at Kansas State University emphasized intervention strategies, methods development, risk assessment and technology/information transfer.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,400,000; fiscal year 1990, \$1,678,000; fiscal year 1991, \$1,845,000; fiscal years 1992-1993, \$1,942,000; fiscal year 1994, \$1,825,000; fiscal years 1995-1996, \$1,743,000 each year; fiscal year 1997, \$1,690,000; fiscal years 1998-1999, \$1,521,000 each year; and fiscal year 2000, \$1,521,000. A total of \$20,371,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. The non-Federal funds are provided primarily by State and private organizations. These funds provided for this grant are as follows: \$1,611,947 in 1991; \$1,639,050 in 1992; \$1,726,153 in 1993; \$2,304,223 in 1994; \$2,075,145 in 1995; \$2,796,097 in 1996; \$2,600,545 in 1997; \$1,850,899 in 1998; \$3,421,866 in 1999. Thus, from 1991 through 1999 a total of \$20,025,934 in non-Federal funds was provided.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University, Kansas State University, and University of Arkansas at Fayetteville, University of Arkansas for Medical Sciences at Little Rock, and Arkansas Children's Hospital.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The research projects from the Consortium continue to evolve and build on the original objectives first set out in 1989. Additional objectives are revised on an annual basis to enhance the original six objectives. Recently, the Consortium has participated in research projects that have made significant contributions to the establishment of scientific parameters used in Hazard Analysis and Critical Control Point programs. The principal investigators have developed patented tests that have significantly reduced the time necessary to detect pathogens in the processing plants.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. There has never been a formal evaluation of the Food Safety Consortium but instead, an annual conference is organized at which a designated representative from CSREES attends. Along with other invited agency representatives such as FSIS, ARS, and ERS, CSREES participates in a steering committee meeting which critiques projects and discusses research priorities. CSREES representatives were considered part of the Technical Advisory Committee as well as members of the Food Safety Consortium Steering Committee and fully participated in meetings and conference calls. Peer reviews are conducted by expert scientists who are not members of the Consortium and determine those projects selected for funding.

APPLE FIRE BLIGHT, MICHIGAN AND NEW YORK

Question. Please provide a description of the research that has been funded under the Michigan and New York, Apple Fire Blight grant.

Answer. This project studies fire blight in apple trees, which is a bacterial disease that can kill spurs, branches, and whole trees. The management of this disease is difficult because only one antibiotic treatment is available. The objectives of this research are to develop fire blight resistance varieties, evaluate biological and chemical control methodologies for disease management, and develop an education and extension component for disease management.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Fire blight is a destructive disease of apple trees that can kill the trees. This disease is caused by bacteria and affects apple trees in all apple growing areas of the nation. In the northeast, the disease is more prevalent because of humid

weather conditions. Because there are significant needs for research in high priority national interest topics such as improved pest management systems, funds are not proposed in fiscal year 2001 to continue this Special Research Grant. At the discretion of the State, Hatch Act or other funding could be use to support this research.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to develop transgenic apple trees through various molecular technologies, to develop new approaches to antibiotic treatments of disease, to develop an early screening technique for tree sensitivity to the disease, to evaluate biological and cultural controls and to develop and improve education and extension components of disease management. The last objective involves using disease prediction models.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Fiscal year 1977 was the first year funds were appropriated for this grant at \$325,000. For fiscal year 1998–2000, \$500,000 was appropriated per year. A total of \$1,825,000 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for 1997 were \$40,127 for Michigan and \$104,166 for New York State. In 1998 the State of Michigan appropriated \$25,071 and the Michigan Apple Research Committee provided \$15,000 for a total of \$40,071 from Michigan. New York provided State appropriated funds of \$104,166 for 1998. The State appropriated funds provided for 1999 were \$49,771 for Michigan and \$106,689 for New York. The State appropriated funds provided for 2000 are \$46,178 for Michigan and \$43,200 for New York.

Question. Where is this work being carried out?

Answer. Research is being conducted at Michigan State University and Cornell University, New York Experiment Station.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated date of completion for the original objectives was 2000. The objectives have not been met. It is estimated by the researchers that three to five years is needed to complete this project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last merit review of this project was in January, 1999. A site visit was made to Michigan State University in March 1999 and to Cornell University, Geneva and Ithaca, New York in April 1999. Both principal investigators were visited as well as the field sites. In summary, in surveys of established apple orchard and new planting in New York there were losses of up to 255 of trees killed by fire blight infections of rootstocks. Several new materials for control of fire blight on susceptible varieties gave promising results in field trials. Improved techniques to transfer genes into apple and to obtain flowering on the transgenic trees have been developed so that transgenic fruits can be examined within two years. In research in Michigan a total of 50 phage isolated from fire blight were characterized with the potential of using these to control the disease. A new plant growth regulator that controls vegetative growth in apple appeared to make trees less susceptible to fire blight. A detailed study of the role of the hrpA gene in fire blight virulence has been completed with a better understanding of its involvement in virulence in the disease.

AQUACULTURE, LOUISIANA

Question. Please provide a description of the research that has been funded under the Aquaculture, Louisiana grant.

Answer. The agency requested that the university submit a grant proposal for fiscal year 2000 that has not been received to date. Research under this program has addressed critical problems in the commercial aquaculture industry including crawfish, catfish, and other emerging species. The university has completed studies in the area of fish nutrition, fish health, fish genetics, production management strategies, alternative species, seafood processing, product quality, and broodstock development.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal investigator indicates that information generated from the funded research will have broad application for local, regional, and national aqua-

culture industries. Specific projects have addressed priorities identified in the crawfish industry including water quality management, harvesting strategies, and nutrition for the production of large crawfish and development of value-added crawfish products. Problems addressed in the channel catfish industry include off-flavor, viral and bacterial diseases, gene mapping, nutrition, and an improved production system technology. Additionally, genetic studies on both hybrid-striped bass and tilapia are currently underway.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to provide science-based information through a basic and applied research base that specifically addressed the needs of the aquaculture industry in Louisiana and the southern region. The overall goals of the research are to improve production efficiency of important aquaculture species through enhancement of nutrient utilization, improvements in genetics, and development of new and alternative production management systems; to develop new technologies for preventing and treating prevalent diseases of important aquacultural species; and to develop new food products and new techniques and processes that improve aquacultural-food product quality. Research has led to improved channel catfish and hybrid striped bass feed formulations, production of new channel catfish vaccines, improved extraction and detection methods for off-flavor compounds, production of genetically-improved channel catfish, procedures for the production of gene maps for channel catfish, improved harvesting and production strategies for crawfish, and improved processing technologies for crawfish and other aquaculture products. Research continues to be directed at important opportunities to enhance production efficiency and commercial viability of sustainable aquaculture systems in Louisiana and the southern region.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Research to be conducted under this program continue as initiated under the Aquaculture General program in fiscal years 1988 through 1991. The work supported by this program began in fiscal year 1992 and the appropriation for fiscal years 1992–1993 was \$390,000 per year, \$367,000 in fiscal year 1994, and \$330,000 each year in fiscal years 1995–2000, for a total of \$3,127,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates that non-Federal funding for this program is as follows: in fiscal year 1991, \$310,051; in fiscal year 1992, \$266,857; in fiscal year 1993, \$249,320; in fiscal year 1994, \$188,816; in fiscal year 1995, \$159,810; in fiscal year 1996, \$150,104; in fiscal year 1997, \$158,808; and in fiscal years 1998 and 1999, \$110,101. The primary source of this funding was from State sources and self-generated funds with minor contributions from industry and other non-Federal sources.

Question. Where is this work being carried out?

Answer. Research is being conducted at Louisiana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific objectives were to be completed in 1990. These specific research objectives have been met, however, research required for long-term growth of the aquaculture industry in Louisiana and the southern region continues to be addressed. The specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Grants are awarded to scientists within the university on a competitive peer-review basis. The entire proposal is reviewed by agency Program Managers on an annual basis. The university is required to provide an accomplishment report each year when the new grant proposal is submitted to the agency for funding. In addition, the Program Manager conducted site visits in 1996 and 1997 to meet with the scientists involved in the project and review the progress of the research. The 1999 review concluded that the proposed research is addressing important research needs of the aquaculture industry throughout the southern region, that the facilities are excellent, that the principal investigators are well-qualified, that the experimental design is sound, that the proposed research builds upon research previously funded through this program, and that the progress on previous research funded under this program is well documented. Research results from this program have had a significant impact on the aquaculture industry in Louisiana and the region.

AQUACULTURE RESEARCH, STONEVILLE, MISSISSIPPI

Question. Please provide a description of the research funded under the Aquaculture Research Stoneville, Mississippi grant.

Answer. The agency has requested that the university submit a grant proposal that has yet to be received. Past projects funded by this grant have addressed critical problems in the farm-raised channel catfish industry including practical feeding and nutrition strategies and acoustical in-pond monitoring technologies.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator indicates that results from this project will continue to have a significant impact on the competitiveness of a significant segment of the domestic aquaculture industry, namely channel catfish. The farmed-raised channel catfish industry accounts for over 70 percent of total domestic aquaculture production. Research funded by this program is directed towards improving feeds and feeding strategies and acoustical monitoring and inventory of catfish in pond production systems. These findings will have long-term impacts on the competitiveness of the farm-raised channel catfish industries in several southern States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to address the research needs of the farm-raised channel catfish industry in the areas of water quality and nutrition. Results from this research has led to improved water quality management practices in commercial catfish ponds and improved diet formulation and feeding strategies that have been widely adopted by the industry. Research findings from this program have had a direct impact on reducing the cost of catfish feed without reducing performance and productivity. Additionally, sonar hardware and software technologies are being developed and evaluated for use in stock assessment of channel catfish ponds.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1980–81, \$150,000 per year; fiscal year 1982, \$240,000; fiscal year 1983–84, \$270,000 per year; fiscal year 1985, \$420,000; fiscal years 1986–87, \$400,000 per year; fiscal year 1988, \$500,000; fiscal year 1989, \$588,000; fiscal year 1990, \$581,000; fiscal year 1991, \$600,000; fiscal years 1992–1993, \$700,000 per year; fiscal year 1994, \$658,000; fiscal years 1995–1997, \$592,000 each year, \$642,000 in fiscal year 1998, and \$592,000 per year in fiscal years 1999 and 2000. A total of \$10,229,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a total of \$2,101,508 in non-Federal funding to support this research for fiscal years 1991–1994; \$1,128,451 in fiscal year 1995; \$601,473 in fiscal year 1996; \$463,990 in fiscal year 1997, \$464,266 in year 1998, and approximately \$740,000 in fiscal year 1999. Non-Federal funding is primarily provided by State funds. Additional funding is also provided from product sales, industry contributions, and other miscellaneous sources.

Question. Where is this work being carried out?

Answer. The grants have been awarded to the Mississippi State University Agricultural and Forestry Experiment Station. All nutrition research is conducted at the Delta Branch Experiment Station, Stoneville, Mississippi. The acoustical research is conducted in cooperation with the National Center for Physical Acoustics at the University of Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the specific original research objectives was 1984. The original objectives have been met, however, projects funded by subsequent grants continue to address the research needs of the domestic channel catfish industry as problems arise. The specific research outlined in the current proposal will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's Program Managers and Program Specialist evaluate the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new proposal is submitted to the agency for funding. Proposed new projects undergo internal review by the Mississippi State University Agricultural and Forestry Experiment Station and are reviewed exter-

nally by agency personnel consistent with United States Department of Agriculture guidelines. The Program Manager conducted a site visit in 1999. The 1998 review indicated that the research addresses key problems faced by the farm-raised channel catfish industry. Significant progress has been reported on past research and the experimental and scientific design of the new project are sound. Scientists involved in the project are leading authorities in this area of research and linkages between the researchers and the catfish industry has led to accelerated adoption of research findings. Adoption of improved feeds and feeding strategies developed through this program by the catfish industry has led to improved production efficiency in commercial catfish operations. The agency is planning a site visit in fiscal year 2000.

AQUACULTURE, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Aquaculture, North Carolina grant.

Answer. The agency has requested that the university submit a grant proposal that has yet to be received. The researchers indicate that the research will focus on improving husbandry methodologies for striped bass and rainbow trout.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal investigator indicates that the project will address specific research needs of the domestic trout and hybrid striped bass industries. Studies addressing vaccine administration and disease resistance, broodstock maintenance, and feeding strategies will result in improved culture technologies for these species in the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the project was targeted at resolving specific, industry-recognized impediments to aquaculture efficiency, profitability, and growth. The specific objectives include: improved vaccine administration methods for rainbow trout; improved broodstock maintenance methodologies for striped bass; and reduction of environmental impacts by improving system technologies and feeding strategies in hybrid striped bass production ponds.

Question. How long has the work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$150,000. The project was not funded in fiscal years 1998 and 1999. The current fiscal year 2000 appropriation is \$255,000. The total amount appropriated is \$405,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university reports a total of \$94,000 of non-Federal funding to support research carried under this program for fiscal year 1997. The primary source of the non-Federal funding was from State sources.

Question. Where is the work being carried out?

Answer. Research is being conducted at North Carolina State University and their aquaculture research field station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project was initiated in fiscal year 1997 and was funded for one year. Funding was not appropriated in fiscal years 1998 and 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will conduct the initial review of this proposal when it is submitted to the agency for funding. The proposal will be externally peer reviewed as part of the agency's evaluation.

AQUACULTURE, VIRGINIA

Question. Please provide a description of the research that has been funded under the Aquaculture, Virginia grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The proposed research will document and develop fish production culture methodologies and analyze economic management and marketing strategies for a recirculating aquaculture system-based industry.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The investigators indicate that there is a need to develop a highly competitive, sustainable aquaculture industry predicated upon land-based recirculating-water system technologies in order to meet consumer demand for cultivated aquatic foods that are of high quality, safe, competitively priced, nutritious, and are produced in an environmentally responsible manner. Research refining culture system technologies have the potential of significantly enhancing domestic aquaculture production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify commercially-viable aquaculture species utilizing recirculating aquaculture system technology, verifying production and culture management protocols utilizing this technology, analyze production budgets providing information upon which to build business plans, investigate marketing development strategies, and prepare scientific, technical, and popular publications to disseminate the results of this research. Research was initiated in fiscal year 1999. Initial production trials are underway, but have not yet been completed.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This was a new research initiative in fiscal year 1999. \$100,000 per year was appropriated for fiscal years 1999 and 2000. The total appropriation for this grant is \$200,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a minimum of \$90,000 of non-Federal funding in fiscal year 1999 and \$34,853 in fiscal year 2000 coming primarily from State sources.

Question. Where is this work being carried out?

Answer. The research will be conducted through the Virginia Agricultural Experiment Station, Virginia Polytechnic Institute and State University, Blacksburg, Virginia and in collaboration with private aquaculture firms in Virginia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This proposal seeks funding for year two of a proposed three year project. The anticipated completion date for the fiscal year 2000 component of the project is July 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report each year when the new proposal is submitted to the agency for funding. The objectives described in the proposal are relevant to State, regional, and national goals and address an important opportunity within the regional aquaculture industry. The specific objectives, methodology, and experimental design are clearly presented and experimentally sound. Personnel and facilities are appropriate for the stated objectives and objectives should be attained within budgetary and time constraints. Appropriate literature review and justifications for research were provided.

AQUACULTURE PRODUCT AND MARKETING DEVELOPMENT, W.V.

Question. Please provide a description of the research that has been funded under the Aquaculture Product and Marketing Development, West Virginia.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The research program is aimed at developing a viable and competitive aquaculture industry in West Virginia and the Appalachian region. The specific objectives of the project address State and regional needs by improving the short-term viability and long-term sustainability of aquaculture production and processing firms in West Virginia and similar areas of Appalachia. Specific research strategies include the development of marketing strategies for trout producers and processors, increasing the economic efficiency and profitability of trout-based enterprises, improving the consistency and quality of fresh trout fillets and value-added smoked trout products, and to implement a technology transfer component to disseminate information generated by this project to the aquaculture industry in Appalachia.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researchers indicate that there is a regional and national need to evaluate marketing and product development for small scale aquaculture systems in rural communities. In addition, there is a need to improve the efficiency and sustainability of these systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research proposes to develop sound marketing strategies for aquaculture products, improve the economic efficiency of aquaculture production systems, and improve the quality and variety of aquaculture products in West Virginia and the Appalachian region.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. A grant has been awarded from funds appropriated as follows: fiscal year 1998, \$600,000 and \$750,000 for each of fiscal years 1999 and 2000. A total of \$2,100,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university indicated that there were no non-Federal funds provided in fiscal years 1998 and 1999 for this project.

Question. Where is this work being carried out?

Answer. The research is being conducted at the University of West Virginia in Morgantown and at off campus sites with a variety of potential cooperators.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in fiscal year 1998. Research addressing the original objectives is currently underway and the anticipated completion date for these objectives is fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency conducted an external and internal peer review of the original proposal. The proposal was peer reviewed by 10 external reviewers and the agency's National Program Leaders for Aquaculture, and the Aquaculture Program Specialist. Although the proposal was aimed at important issues facing the aquaculture industry in the region, a number of significant concerns were expressed by both external and agency reviewers. These concerns with recommendations were presented to the university and a revised fiscal year 1998 proposal was submitted and approved. The Agricultural Experiment Station requested that a planning review be held to provide recommendations to the University to assist in developing and refining the direction and focus of the aquaculture program at West Virginia University. An external planning review was held in August, 1999, facilitated by the National Program Leaders and Program Specialist. The agency and West Virginia University agreed that additional time would be needed to develop a complete, detailed proposal for the fiscal year 1999 funding. West Virginia University requested, in their fiscal year 1999 proposal submission, that the funds be obligated but restricted until a detailed proposal was submitted and approved by the agency. The agency is currently awaiting receipt of the revised fiscal year 1999 proposal.

BABCOCK INSTITUTE FOR INTERNATIONAL DAIRY RESEARCH AND DEVELOPMENT

Question. Please provide a description of the research that has been funded under the Babcock Institute grant.

Answer. The Babcock Institute for International Dairy Research and Development was established with participation of the University of Wisconsin-Madison College of Agriculture and Life Sciences, School of Veterinary Medicine and the Cooperative Extension Division. The objective of the Babcock Institute is to link the U.S. dairy industry with the dairy industry in the rest of the world through degree training, continuing education, technology transfer, adaptive research, scientific collaboration and market analysis.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the need is to strengthen dairy industries around the world, to enhance international commercial and scientific collaborative opportunities for the U.S. dairy industry, and to draw upon global perspectives to build insight into the strategic planning of the U.S. dairy industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Institute remains the linkage of the U.S. dairy industry with the rest of the world through training, continuing education and outreach, technology transfer, adaptive research, scientific collaboration and market analysis. Initial efforts were focused on planning and staffing. An initial activity was, and continues to be, the development of multi language extension materials about basic management techniques essential to optimize performance of U.S. dairy cattle overseas. This activity has grown to include manuals on Breeding and Genetics, Lactation and Milking, and Basic Dairy Farm Financial Management published in English, Spanish, French, Russian, and Chinese. Research on potential implications of NAFTA and GATT on the U.S. dairy industry was completed. A technical workshop on dairy grazing in New Zealand and the Midwest was organized and held in Madison during the fall of 1993. A technical workshop on Nutrient Management, Manure and the Dairy Industry: European Perspectives and Wisconsin's Challenges was held in Madison, Wisconsin during September 1994. A round table was held in January 1995 addressing "World Dairy Markets in the Post-GATT Era." Sponsored the Great Lakes Dairy Sheep Symposium in 1995 and 1996. Created a World Wide Web site in 1996 for distribution of Babcock Institute technical dairy fact sheets in four languages. The first International Dairy Short Course for a group of producers and technicians from Argentina has been organized on the University of Wisconsin Campus. Scientists' are being supported in collaborative research with New Zealand primarily to gain a better understanding of grazing systems as related to dairy management. An analysis of the impact of changes in European dairy policies has been completed. The Institute sponsored a Minnesota-Wisconsin Dairy Policy Conference to provide insights into current agricultural programs and policy issues in the dairy sector of the U.S. economy.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years' 1992 and 1993, \$75,000 per year; fiscal year 1994, \$250,000; and fiscal years' 1995-1998, \$312,000 per year; fiscal year 1999, \$400,000; and fiscal year 2000, \$510,000. A total of \$2,648,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. During fiscal year 1992, \$13,145 of State funds were used to support this program and \$19,745 of State funds in fiscal year 1993 for a total of \$32,890 during the first two years of this research. Information is not available for fiscal years 1994-1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Wisconsin-Madison College of Agriculture and Life Sciences.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Babcock Institute's overarching mission has been to link the U.S. dairy industry and its trade potential with overseas dairy industries and markets. The original objectives of this project have remained consistent over the years. However, each year specific objectives were proposed to further the mission of the Institute and to build on previous accomplishments. The Institute has accomplished specific objectives each year in a timely manner. The Babcock Institute has remained true to its original objective of linking Wisconsin and the U.S. to dairy industries around the world. This objective remains increasingly important with continued development of international markets for dairy products and technologies. The University researchers anticipate that work currently in progress will be completed by September 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Babcock Institute undergoes two independent review processes each year. The first is done by a committee of university and industry representatives who review the annual research proposal and amend it prior to submission to the agency. The annual proposal is reviewed by agency technical staff prior to approval for fund release. In addition, the institute was included in a comprehensive review of the programs of the Department of Dairy Science at the University of Wisconsin in May 1995. The agency project officer has conducted two on site reviews of the institute since its formation in 1992. The most recent review has found that the approach proposed by the researchers is appropriate and that the researchers are well qualified to perform the objectives as stated. The objectives of the proposal are within the mission of the United States Department of Agriculture and the Cooperative State Research, Education, and Extension Service.

BIO DIESEL RESEARCH, MISSOURI

Question. Please provide a description of the research that has been funded under the biodiesel research grant.

Answer. Research on biodiesel involves examining the feasibility of producing biodiesel and other higher value products from oilseed crops including soybeans, canola, sunflower and industrial rapeseed. The project is also evaluating local processing plants whereby farmers could produce crops, process the crops locally and use the fuel and high protein feed coproducts on their farms or locally. This project undergoes merit review at the College of Agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The initial work is being conducted in Missouri. The results may provide the agricultural community with alternative crops and more diverse markets, additional marketable products and a locally grown source of fuel. This will result in increased investment in local communities, additional jobs, and increased value added in the farm and rural community sectors.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The ultimate goal of this project was to conduct research and development in an effort to help commercialize biodiesel as an important alternative fuel that could be used in fleets throughout the country. This would help to attain the objectives of the comprehensive Energy Policy Act of 1992, also known as EPACT. Success would increase the use of agricultural products as well as diversifying product markets, both of which would be beneficial to American farmers. This is especially important during periods of large commodity surpluses and extremely depressed prices such as we are currently experiencing. An important part of the ongoing research has been to identify potential markets where biodiesel can compete on an economic basis with other alternative fuels. An important part of the research this past year is to compare the cost of using a biodiesel blend, 20 percent biodiesel/80 percent petroleum diesel, as an alternative fuel in the St. Louis Metropolitan Fleet with other alternative fuels. Results indicate that the incremental cost of biodiesel over conventional diesel fuel is \$1,013 per EPACT credit. The incremental cost of the other options investigated was \$4,000 for compressed natural gas and \$3,281 for E-85 per credit. Thus, from an incremental cost perspective, biodiesel is the least cost option for helping the City of St. Louis meet the clean air requirements of Energy Policy Act.

Question. How long has this work been underway, and how much has been appropriated, by fiscal year, through fiscal year 2000?

Answer. The work for this program began in fiscal 1993, and the appropriation for that year was \$50,000. The appropriation for fiscal year 1994 was \$141,000; and for fiscal years 1995-2000, \$152,000 annually. A total of \$1,103,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The source of non-Federal funds is State appropriated funds. The level in 1994 was \$7,310. The funding level for 1995 was \$74,854. Cost sharing by the University of Missouri each year for fiscal year 96 and fiscal year 97 was \$80,000 and \$86,000 respectively. Total cost sharing for the project by the University of Missouri has been \$242,224. Matching funding for fiscal years 1998 and 1999 was \$77,431 and \$79,730. Total matching for the entire period has been \$399,385. Additionally, some work funded by this grant has been conducted in cooperation with the National Biodiesel Board, plus the Missouri Soybean Merchandising Council.

Question. Where is this work being carried out?

Answer. The work is being carried out at the University of Missouri-Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator believes that the work will be completed at the end of fiscal year 2000. Research and development completed by the end of that period will provide private industry with the information needed to successfully commercialize biodiesel.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The evaluation of using biodiesel as a complete fuel and in a blend has been met. This project is evaluated on an annual basis based on the annual progress report, discussions with the principal investigator as appropriate, and agency participation in collaborative activities related to this project. The review is conducted

by the cognizant staff scientist and it has been determined that the research is performed in accordance with the mission of this agency.

BLOCKING ANHYDROUS METHAMPHETAMINE PRODUCTION IOWA

Question. Please provide a description of the research that has been done under the Blocking Anhydrous Methamphetamine Production Grant, Iowa.

Answer. The Agency has requested Iowa State University to submit a grant proposal that has not yet been received. This is a new special grant for which there have been no previous awards.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher has indicated that anhydrous ammonia, a commonly used agricultural fertilizer, can be used as an ingredient for making methamphetamine, an illegal and highly addictive drug which has posed a drug enforcement problem for Iowa and other Midwestern States in recent years. At the discretion of the State, Hatch Act or other formula funding could be used to support this research. The National Research Initiative is another possible funding source for this project.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to discover a chemical procedure that will render anhydrous ammonia ineffective in producing methamphetamine while keeping the anhydrous ammonia cost-efficient and effective as a fertilizer. Preliminary results suggest that certain metal salts in catalytic amounts can be effective at inactivating the drug-producing reaction.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000 ?

Answer. Preliminary work funded by the State has been underway for approximately five months. This is a new special grant and \$212,500 has been appropriated for fiscal year 2000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. State funds in an amount less than \$5,000 were used to get the project started in fiscal year 1999. The State plans to cost-share the salaries of the principal investigator and a faculty collaborator in the amounts of \$20,000 and \$25,000 per year, respectively.

Question. Where is this work being carried out?

Answer. The research is being conducted in the Chemistry Department at Iowa State University, Ames, Iowa.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator anticipates completing the original objectives of the project in two or three years. Additional or related objectives have not been specifically identified at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As a new special grant for which a proposal has not yet been received, this project has not yet been evaluated. A merit review panel will be convened to evaluate the project upon receipt of a proposal for fiscal year 2000.

BOVINE TUBERCULOSIS, MICHIGAN

Question. Please provide a description of the research that has been conducted under the Bovine Tuberculosis, Michigan grant.

Answer. The agency has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The need for this research relates to the critical problem of bovine tuberculosis which has now been discovered to have spread into the white-tailed deer population in the State of Michigan. If information on the scope of this disease in deer and methodologies to monitor and reduce this problem is not available rather soon, this could cause significant problems for the plans to eradicate tuberculosis from cattle in the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research is to develop information about the spread of the bovine tuberculosis organism, *Mycobacterium bovis*, within the deer population of Michigan. Appropriate control programs can not be devised until the epidemiologic information is available.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$170,000.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. Because this project is just being initiated in this fiscal year, 2000, there is no information available about other funding for the project.

Question. Where is this work being performed?

Answer. The research is being performed in the College of Veterinary Medicine, Michigan State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Because this project is just being started in fiscal year 2000, no evaluation has been done at this time.

BRUCELOSIS VACCINE, MONTANA

Question. Please provide a description of the research that has been conducted under the Brucellosis Vaccine, Montana grant.

Answer. This project will study the immune response of bison to *Brucella abortus* antigen which has been incorporated into an organism that can be given orally to the animals. The objective is to produce an oral vaccine that can be easily administered to the bison without subjecting them to intensive handling procedures.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The research project is intended to develop a strategy for vaccinating or immunizing cattle against brucellosis by incorporation of *Brucella abortus* genes into an orally administered system.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the project was to accomplish incorporation of *Brucella* genes which code for specific antigens into *Salmonella* species of bacteria and test the efficacy of oral administration of this material in developing systemic immunity in bison.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work was started in fiscal year 1999. The appropriation for fiscal year 1999 was \$150,000, and for fiscal year 2000 was \$425,000 for a total of \$575,000.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. The source and amount of non-Federal funds for fiscal year 1999 was \$67,401 from State sources.

Question. Where is this work being performed?

Answer. The work is being performed at Montana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was May, 2002 or three years from the initiation of the project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As the project was started in the summer of 1999, there has not yet been an agency evaluation.

CENTER FOR ANIMAL HEALTH AND PRODUCTIVITY, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Center for Animal Health and Productivity grant.

Answer. This research is designed to reduce nutrient transfer to the environment surrounding dairy farms in the Chesapeake Bay watershed. Progress to date includes the development of an individual dairy cow model which will predict ab-

sorbed amino acids and the loss of nitrogen in manure. This model has been developed into a user friendly software so that trained farm advisors can evaluate herd nutrient management status while on a farm site. A whole farm model has been developed which integrates feeding and agronomic practices to predict utilization of nitrogen and farm surpluses. Using these tools, a survey of dairy farms in the region has been done to assess nitrogen status on dairy farms and potential management practices to reduce nitrogen excesses on dairy farms. Refinement of the model tools and research to refine estimates of the environmental fate of excess nitrogen from dairy farms is in progress. During the last year, researchers have discovered that significant nitrogen is lost from the animal housing facility in the form of ammonia volatilization to the atmosphere. Preliminary estimates indicate that as much as 50 percent of the nitrogen consumed by dairy cows is lost as ammonia to the atmosphere and never reaches the manure storage and management system. Two on-site reviews of the program have been conducted by the CSREES Project Officer and a third is planned during 2000. The animal and farm models have been published in a peer reviewed scientific journals.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that reducing non-point pollution of ground and surface water by nitrogen from intensive livestock production units are of concern nationally, and especially in sensitive ecosystems like the Chesapeake Bay. This research is designed to find alternative feeding, cropping and management systems which will reduce net nutrient flux on Pennsylvania dairy farms to near zero. The principal researcher believes this research to be of national, regional, and local need. Members of the research team have applied for funding through both the National Research Initiative and the Fund for Rural America. The Initiative for Future Agriculture and Food Systems should provide additional opportunity for funding of this research.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research remains the development of whole farm management systems which will reduce nutrient losses to the external environment to near zero. To date the researchers have developed their own models to more accurately formulate rations for individual dairy cows which permit the comparison of alternative feeding programs based upon both maximal animal performance and minimal nutrient losses in animal waste. This model is being tested on select commercial dairy farms to evaluate the extent to which total nitrogen losses in manure can be reduced without impacting economic performance of the farm. At the same time, whole farm nutrient models have been developed to evaluate alternative cropping systems which will make maximum use of nutrients from animal waste and minimize nutrient flux from the total farm system. These tools are currently being used to survey the current status of nutrient balance on farms in the area and efforts to fine tune the tools are in progress. The recent discovery of the quantitative significance of nitrogen loss as ammonia to the atmosphere and potential transport from the farm and redeposition to the earth's surface raises a whole new aspect of nutrient management.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. A grant has been awarded from funds appropriated in fiscal year 1993 for \$134,000 and in fiscal year 1994 for \$126,000. In fiscal years 1995-2000, \$113,000 has been appropriated each year. A total of \$938,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This information is not available at the present time.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Pennsylvania, College of Veterinary Medicine at New Bolton Center, Pennsylvania.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The University researchers anticipate that work currently underway will be completed by September 2000. This will complete the original objectives of the research. The principal researcher indicates that consideration has been given to the broadening of objectives to include additional nutrients in the model system, but this has been dropped because technical expertise required is currently not readily available.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Center for Animal Health and Productivity Project was last reviewed in June 1997. An on site review by agency technical staff was conducted in June 1995. It was concluded that project objectives are within the goals of the program, are within the mission of both the USDA and CSREES, and the institution is well equipped and qualified to carry out the research project. The institution has made excellent progress toward the completion of the original goals of the project, but still must evaluate the effectiveness of the use of the new tools developed in reducing nutrient runoff from commercial dairy farms in the watershed of the Chesapeake Bay.

CENTER FOR RURAL STUDIES, VERMONT

Question. Please provide a description of the program that has been funded under the Center for Rural Studies Project in Vermont.

Answer. The Center for Rural Studies Project involves applied research focused on developing and refining social and economic indicators used to evaluate the impact of economic development programming and activities. They are perfecting a delivery format for technical assistance for community and small business development. A major component of current research relates to utilization of the world wide web as a delivery vehicle. Project proposal undergoes a merit review within the agency.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural development. The grant has addressed methodology and strategies for assessing rural development program impacts.

Question. What was the original goal of this research and what has been accomplished?

Answer. The original goal was to create a database and analytical capability for rural development programming in Vermont. Examples of past accomplishments include maps presented to target child hunger programs, targeted areas for other types of rural development program intervention, analytical reports to guide the development of retail shopping areas, an "Economic Handbook for Vermont Counties", and strategies for using the world wide web to disseminate information.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The grant was initiated in fiscal year 1992. Appropriated amounts are: fiscal years 1992-93, \$37,000 per year; fiscal year 1994, \$35,000; fiscal years 1995-98, \$32,000 per year; fiscal year 1999-2000, \$200,000 for total appropriations of \$637,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Fiscal year 1991 included \$91,130 in State matching funds. Fiscal years 1993, \$143,124; 1994-96, \$3,547 State matching funds. Fiscal years 1997-98 State dollars were \$2,931 plus researcher's salary. No non-Federal dollars were provided for fiscal year 1999-2000.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through the University of Vermont.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1993. The original objectives of this research have been met. The additional objectives being presented for the current year will be completed by September 30, 2002. Proposal for current year has not been received to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

CHESAPEAKE BAY AGROECOLOGY, MD

Question. Please provide a description of the research that has been funded under the Chesapeake Bay Agroecology, MD special grant.

Answer. The Chesapeake Bay Agroecology grant focuses on increasing our understanding of nutrient cycling, retention and utilization by vital agricultural industries located within vulnerable Chesapeake Bay watershed ecosystems that have been impacted by outbreaks of the toxic microorganisms *Pfiesteria*. There is a specific focus on Maryland's Eastern Shore.

This research focus has been identified as a priority by the State of Maryland's Blue Ribbon *Pfiesteria* Action Commission Report (1997), and by a Research, Education, and Economics (REE) strategic plan emphasis, Greater Harmony Between Agriculture and the Environment, that calls for a better understanding of the linkages between agricultural production, water and soil quality, range and forest land health, and habitat protection.

Since the projects were initiated last year, investigators spent the first year designing and implementing their research. While some preliminary results are available, quantitative conclusions will require more time.

Requested funds in fiscal year 2000 will support interdisciplinary projects that bring together the expertise of numerous scientists located at institutions throughout the University System of Maryland. These scientists continue to generate technical and scientific advances that guide Federal, State and local policy responses to *Pfiesteria* outbreaks.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research.

Answer. The continued viability of Maryland's important coastal agricultural economy, and the protection of Chesapeake Bay and Atlantic Coastal aquatic and agricultural resources from future *Pfiesteria* outbreaks, depends upon our ability to prevent future toxic algal blooms by stemming the flow of nitrogen, phosphorus, and other agricultural nutrients into estuarine waterways.

Maryland is an acknowledged leader in implementing agricultural nutrient management, soil conservation, conservation reserve, Chesapeake Bay tributary team and other cooperative planning strategies. However, non-point sources of nutrients remain a major source of pollution into Atlantic Coastal waterways, and farmland remains the largest controllable source of non-point nutrient loading into Chesapeake Bay. Thus, it is essential that we continue to increase our efforts to stem nutrient losses into waterways while preserving and enhancing important agricultural industries.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to increase our understanding of nutrient (nitrogen and phosphorus) cycling, retention and utilization by vital agricultural industries located in coastal regions of Chesapeake Bay, and to develop new technologies and strategies that limit nutrient losses while enhancing vital agricultural industries. This project was initiated in fiscal year 1999.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This project was initiated in fiscal year 1999, and has received \$150,000 in fiscal years 1999 and 2000. A total of \$300,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The project is in its first year. The State of Maryland has pledged to match 100 percent of the Federal funds provided in fiscal year 2000 and in future years for the Chesapeake Bay Agroecology Project.

Question. Where is the work being carried out?

Answer. This research will be conducted at University System of Maryland institutions and field research stations located throughout the State, with an emphasis on the Eastern Shore of Maryland which experienced significant *Pfiesteria* outbreaks.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Major progress has been made towards meeting specific projects as well as regional objectives. However, the issues being addressed are complex and solutions will require a long-term approach.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project has not yet been reviewed by the agency. However, the projects supported by this special grant are peer reviewed by an independent, external scientific panel and before competitive awards are made to qualified scientists located throughout the University System of Maryland.

CHESAPEAKE BAY AQUACULTURE, MARYLAND

Question. Please provide a description of the research funded under the Chesapeake Bay Aquaculture grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The objective of the Chesapeake Bay Aquaculture project is to improve the culture of striped bass and its hybrids through genetic improvement, reproductive biology, nutrition, health management, waste management, and product quality. The research is aimed at enhancing production efficiency, product safety, and provides a good balance between basic and applied research.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal investigator indicates that the Mid-Atlantic region of the country continues to play a significant role in the overall expansion of the domestic aquaculture industry. Research supported through this program will assist in enhancing the culture of striped bass and its hybrids in the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original research goal was to generate new knowledge that can be utilized to address serious problems limiting the expansion of the aquaculture industry in Maryland and the Mid-Atlantic region. The program concentrates on closing the life cycle, enhancing production efficiency, decreasing effluents, and improving product quality under aquaculture conditions of striped bass and its hybrids. Research is conducted in the areas of growth, reproduction and development, nutrition, aquacultural systems, product quality, and aquatic animal health. Progress has been made in developing controlled artificial spawning techniques, cryopreservation of sperm, and refining the nutritional requirements.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported under this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$370,000. The fiscal years 1991–1993 was \$437,000 per year; fiscal year 1994, \$411,000; fiscal years 1995–1998, \$370,000 each year, and for each of fiscal years 1999 and 2000, \$385,000. A total of \$4,342,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university reports the amount of non-Federal funding for this program is as follows: in fiscal years 1991 and 1992, \$200,000; in fiscal years 1993 and 1994, \$175,000; in fiscal year 1995 \$400,000; in fiscal year 1996 \$536,000; in fiscal year 1997 approximately \$400,000; in fiscal year 1998, \$360,000; and in fiscal year 1999, approximately \$360,000. These funds are from direct State appropriations and other non-Federal funding sources.

Question. Where is the work being carried out?

Answer. Research is being conducted at the University of Maryland.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific research objectives were to be completed in 1993. The original specific research objectives have been met, however, research funded through this grant continues to address problems faced by the hybrid-striped bass industry in Maryland and throughout the country. The specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's Program Managers and Program Specialist evaluate the progress of this project on an annual basis. The researchers are asked to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development. The university awards grants consistent with United States Department of Agriculture guidelines based upon internal competitive peer review. The 1999 review concluded that the proposal was well written with objectives clearly stated; that excellent progress is reported on previous work; that scientific and technical expertise is excellent; and that the proposal addresses high-priority research needs. The proposal does address high pri-

ority research needs for the aquaculture industry at the State, regional, and national level and is consistent with the National Science and Technology Council's Joint Subcommittee on Aquaculture Strategic Plan for Aquaculture Research and Development.

CITRUS TRISTEZA

Question. Please provide a description of the research that has been funded under the citrus tristeza research program grant.

Answer. Nine projects were selected for funding through a CSREES competitive grants program. Some of the research included survey information on distribution of the brown citrus aphid and Citrus Tristeza Virus in Louisiana and Arizona, the develop of resistant citrus varieties to the virus, better understanding of virus strains and the disease complex and biological control efforts on the brown citrus aphid in Florida.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Citrus Tristeza virus is a problem in all citrus growing areas of the United States and Puerto Rico. The recent introduction of a new vector, the brown citrus aphid, into Florida has allowed for another pathotype of the virus to be introduced. This is a more destructive pathotype of the virus that causes more damage than those pathotypes already established in the citrus producing areas.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to reduce losses in citrus through research the characterization and detection of citrus tristeza virus strains, biology and control of the brown citrus aphid; host plant resistance; epidemiology and crop loss assessment; development of cross-protecting citrus tristeza virus strains, and research to enhance virus free budwood programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999 at the appropriation level of \$500,000 and for fiscal year 2000, the appropriation is \$595,000. A total of \$1,095,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. There are no non-Federal funds provided for this grant.

Question. Where is this work being carried out?

Answer. Research is being carried out at land grant universities and research centers in the Florida, Louisiana, California, and Arizona.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is the second year of this funding. An anticipated completion has not been determined as the original objectives have not been met at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. All projects underwent a peer review at the University level, a scientific peer review and an agency merit review in August, 1999.

COASTAL CULTIVARS, GA

Question. Please provide a description of the research that has been funded under the Coastal Cultivars grant.

Answer. The Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that has not yet been received. The research will address new plant crops and sustainable production systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research need to which this grant is directed is to potential new crop plants for the South Eastern United States Coastal zone and develop sustainable production systems. The results will have application throughout the region. Farmers currently have few options.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to improve rural income by identifying new crop cultivars for production in this area that now has few options.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriations for fiscal year 1997 was \$200,000, for fiscal year 1998, \$250,000 for fiscal year 1999 was—0. The appropriations for fiscal year 2000 is \$170,000. The total is \$411,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were estimated to be \$97,400 in 1997 and \$146,200 in 1998.

Question. Where is this work being carried out?

Answer. The work is being carried out at the University of Georgia Coastal Garden research facility.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Project proposals for this program were reviewed and evaluated in fiscal years 1997 and 1998.

COMPETITIVENESS OF AGRICULTURE PRODUCTS, WASHINGTON

Question. Please provide a description of the research that has been done under the Competitiveness of Agriculture Products research grant?

Answer. This research identifies international marketing opportunities for Northwest firms in the forest products and food products sectors.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. Most food processing firms are small. Their export sales are made in many widely scattered markets with different languages, customs, institutions, and market structures. These markets have also been subjected to wrenching changes. University researchers provide a central and stable core of knowledgeable experts who can guide small export businesses in navigating these markets successfully.

Forest products from the Pacific Northwest can be shipped to Asian markets for less than shipping them to the eastern population centers in the United States. Research has opened Asian markets to U.S. light frame construction building technology, providing good opportunities to export higher valued secondary manufactured products to Japan and China. Research has also been focused on forest management alternatives that can better satisfy environmental goals with less negative impacts on timber-dependent communities. The Northwest agricultural economy is highly dependent upon being able to export given that food production in the region greatly exceeds food consumption.

Northwest wood products companies that could export are generally small and are not able to provide their own research. Construction technologies used in Asian markets are inferior to U.S. technology, yet there is a long history of use and cultural appreciation of traditional methods. Deregulation and change in these markets has required extensive research on comparability of alternative product and building standards, quality and service needs, training in the U.S. technology, and customization to foreign consumer values. The Pacific Northwest can grow more wood with higher quality using more advanced technologies while reducing the impact on timber-dependent communities from harvest constraints to protect certain species.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to provide the information on markets and product technologies that can open higher-valued international markets to U.S. exporters. Foreign purchasers need information on the advantages of U.S. products, and U.S. exporters need information on the substantially different quality and service requirements for serving foreign markets. If the United States can remain competitive and retain its presence in these markets in the face of a stronger dollar, exports should return to a high growth path once Asian economies recover. Evidence to date suggests that this is indeed happening.

The food production research has focused on finding new market opportunities for Pacific Northwest producers, solving technical impediments to exports and developing new products and new processes that will enhance exports. It has pinpointed emerging market opportunities in Southeast Asia, China, Mexico, and Latin America. It has improved the export quality of diverse products, such as asparagus, ap-

ples, grass-seed, and wheat. It has helped commercialize high-value products, such as Wagyu beef, azuki beans, wasabi radish and burdock, and pioneered new food processing technologies that produce fresh-like, shelf-stable products and that save energy and reduce waste.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work began in fiscal year 1992. The appropriation for fiscal years 1992-1993 was \$800,000 each year; fiscal year 1994, \$752,000; fiscal years 1995-1998, \$677,000 each year; and \$680,000 in fiscal years 1999 and 2000. A total of \$4,420,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$716,986 State appropriations, \$209,622 product sales, \$114,000 industry, and \$661,119 miscellaneous, for a total of \$1,701,727 in 1991; \$727,345 State appropriations, \$114,81 product sales, \$299,000 industry, and \$347,425 miscellaneous for a total of \$1,488,351 in 1992; \$1,259,437 State appropriations, \$55,089 product sales, \$131,000 industry, and \$3,000 miscellaneous, for a total of \$1,448,526 in 1993; \$801,000 State appropriations, \$1,055,000 product sales, \$1,040,000 industry, and \$244,000 miscellaneous, for a total of \$3,140,000 in 1994; \$810,000 State appropriations, \$42,970 product sales, \$785,000 industry, and \$2,000,000 gift of a ranch due to the International Marketing Program for Agricultural commodities and Trade Center's research on Wagyu cattle, for a total of \$3,637,970 in 1995; \$844,000 State appropriations, \$45,000 product sales \$900,000 industry, and \$45,000 miscellaneous, for a total of \$1,834,000 in 1996; \$876,000 State appropriations, \$1,606,000 industry, for a total of \$2,482,000 in 1997, \$1,180,000 State appropriations, \$604,000 industry, for a total of \$1,784,000 in 1998, and \$1,551,000 State appropriations, \$1,006,400 industry, \$62,000 product sales, and \$30,096 miscellaneous, for a total of \$2,649,496 in 1999.

Question. Where is the work being carried out?

Answer. The food research is being carried out by the International Marketing Program for Agricultural Commodities and Trade (IMPACT) at Washington State University, Pullman, and the forest products research is carried out at the Center for International Trade in Forest Products (CINTRAFOR) at the University of Washington, Seattle.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was projected for 3 years duration to be completed following fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Two evaluations of the Washington State University component of the project were conducted in 1992 by the U.S. Department of Agriculture. The State of Washington Legislative Budget Committee gave the Washington State Center exemplary marks for meeting its objectives. On-site reviews are conducted annually of the University of Washington component of the project through annual meetings of the project's executive board attended by the agency's staff. Both components are reviewed annually by the agency. The project is meeting the key objective of trade expansion through innovative research. The University of Washington project was formally reviewed by the agency in 1991. State reviews were completed in 1992 and 1994. A formal review by the University was completed in 1997. A broad survey of constituents impacted by the research was completed, resulting in a very favorable review of the Center's activities and a recommendation to continue this research. In 1998, State of Washington legislation eliminated the requirement for State reviews of the center, including one scheduled for 1999, based on hearings that focused on the other favorable reviews and the continuous oversight by the Executive Board.

COOL SEASON LEGUME RESEARCH

Question. Please provide a description of the research that has been funded under the Cool Season Legume Research grant.

Answer. The Cool Season Legume Research Program involves projects to improve efficiency and sustainability of pea, lentil, chickpea, and fava bean cropping systems collaborative research. Scientists from seven States where these crops are grown have developed cooperative research projects directed toward crop improvement, crop protection, crop management, and human nutrition/product development.

Question. According to the research proposal, or principal researcher, what is the national, regional or local need for this research?

Answer. The multi-state region covered by this program represents most of the nation's production of cool season food legumes. These minor crops are very important economically to the region, are the primary source of these important food items, and contribute significantly to U.S. agricultural exports. The growers face a number of production problems that need research if this industry is to compete with international competition. In addition, use of these crops in rotation with wheat is critical to the production of wheat, the major cash crop for the region. National research in the area of crop genetics could potentially be supported by competitive grants awarded under the National Research Initiative and the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The principal researcher believes the original goal of this project was to improve efficiency and sustainability of cool season food legumes through an integrated collaborative research program and genetic resistance to important virus diseases in peas and lentils. Evaluation studies of biocontrol agents for root disease organisms on peas are underway. Other studies are evaluating integration of genetic resistance and chemical control. Considerable progress has been made using biotechnology to facilitate gene identification and transfer. Management system studies have addressed tillage and weed control issues.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 with appropriations for fiscal year 1991 of \$375,000; fiscal year 1992 and 1993 \$387,000 per year; fiscal year 1994, \$364,000; fiscal year 1995, \$103,000; fiscal years 1996 and 1999, \$329,000, fiscal year 2000 \$329,000. A total of \$3,261,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant were as follows: 1991, \$304,761 State appropriations, \$14,000 industry, and \$18,071 other non-Federal; 1992, \$364,851 State appropriations, \$15,000 industry, and \$14,000 other non-Federal; 1993, \$400,191 State appropriations, \$19,725 industry, and \$10,063, other non-Federal; and 1994, \$147,607 non-Federal support. Non-Federal support for 1995 was \$150,607; for 1996 it was \$386,887; for 1998, \$392,000 and for 1999 \$557,000.

Question. Where is this work being carried out?

Answer. Research has been conducted at agricultural experiment stations in Idaho, Oregon, Washington, Wisconsin, Minnesota, New York and New Hampshire. The funds have been awarded competitively among participating States and not all States receive funds each year.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The projected duration of the initial project was five years. Revised objectives are expected to be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation?

Answer. The project is evaluated annually by a university/industry advisory panel. Proposals are peer reviewed at the universities and by the agency National Program Leaders. This research has provided vital information which is already being used to improve production management. However, a number of critical issues related to insect and disease control as well as crop quality remain to be addressed. Breeding for insect and disease resistance is given the highest priority, while crop management alternatives to help reduce disease and insect pest problems will continue to be studied.

CRANBERRY AND BLUEBERRY, MASSACHUSETTS

Question. Please provide a description of the research that has been funded under the cranberry/blueberry research program grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. The research is a new approach to managing pests associated with cranberries and blueberries in Massachusetts. The program is focusing on the use of mo-

lecular genetics to reduce pesticide dependency in cranberry production. The research will be applicable to all cranberry research in States where cranberries are produced.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to determine whether early emerging and late emerging dodder populations can be differentiated using molecular markers; to determine the relationships among several isolates of a fungus which might be used in biological control; to screen various plant pathogen fungi isolates for infectivity and virulence and determine the presence of genes in these isolates; and develop an in vitro assay system for root rot and induce resistance in cranberry plants caused by different isotypes of the fungus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999 and the appropriation for fiscal year 1999 and 2000 was \$150,000. A total of \$300,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. There were no non-Federal funds provided for this grant in 1999 or 2000.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Massachusetts Cranberry Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this began in fiscal year 1999, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project underwent a merit review at the agency level in January, 1999. Due to delayed funding of this project until July of 1999, research is just now starting on these objectives.

CRANBERRY-BLUEBERRY DISEASE AND BREEDING, NEW JERSEY

Question. Please provide a description of the research that has been funded under the Cranberry-Blueberry Disease and Breeding, New Jersey grant.

Answer. The work has focused on identification and monitoring of insect pests on blueberries and cranberries, the identification, breeding, and incorporation of superior germplasm into horticulturally-desirable genotypes, identification and determination of several fungal fruit-rotting species, and identification of root-rot resistant cranberry genotypes. Overall, research has focused on the attainment of cultural management methods that are environmentally compatible, while reducing blueberry and cranberry crop losses.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. This project involves diseases having major impacts on New Jersey's cranberry and blueberry industries, but the findings here are being shared with experts in Wisconsin, Michigan, and New England.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was the development of cranberry and blueberry cultivars compatible with new disease and production management strategies. Over 75 blueberry selections with wild blueberry accessions resistant to secondary mummy berry infections have been moved into advanced testing identified. The biology and seasonal life history of spotted fireworm on cranberries has been determined. A pheromone trap-based monitoring system for cranberry fruitworm was developed and further refined for commercialization. Blueberry fruit volatiles attractive to blueberry maggots were identified and tested in the field. Researchers have planted over 4500 cranberry progeny for evaluation. Seven major fruit-rotting fungal species were identified, and their incidence in 10 major cultivars of blueberry and cranberry were determined. It is likely that resistance to fruit rot is specific to fungal species.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986–1987, \$95,000 per year; fiscal year 1988–1989,

\$260,000 per year; fiscal year 1990, \$275,000; fiscal years 1991–1993, \$260,000 per year; fiscal year 1994, \$244,000; and fiscal years 1995–1999, \$220,000 each year. A total of \$3,209,000 has been appropriated

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. State and non-Federal sources are providing funds in the amount of 250,000 each year.

Question. Where is this work being carried out?

Answer. This research is being conducted at the New Jersey Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original objectives was 1995. Those objectives have not been met. To complete the breeding, disease and insect management and provision of new management guidelines for extension and crop consultants, it estimated that an additional five to nine years will be required.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The last agency evaluation of this project occurred in January, 1999. In summary, the evaluation stated that the effort has continued to be highly productive, with various improved management strategies, plant materials and environmentally-balanced pesticides being areas of major impact. Some specific accomplishments included continued evaluation of blueberry and cranberry germplasm for yield, color, fruit rot, and flavor; and development of an efficient plant regeneration system for cranberry for genetic transformation. Other research includes trap and lure development for monitoring the cranberry fruitworm and evaluation of several aphicides in blueberries. The discovery of an antisporeulant in a registered fungicide provide for a novel use patent for blueberry anthracnose control.

CRITICAL ISSUES

Question. Please provide a description of the research that has been funded under the grant.

Answer. These funds support research on critical issues related to new or emerging pests and diseases of animals and plants. The program is expected to initiate research in a short time period until other resources can be secured to address the issue. The program began in fiscal year 1996 when potato late blight and vesicular stomatitis in animals were the two targeted emerging problems chosen for funding. Funding for these two projects was continued with fiscal year 1997 funds to permit orderly conclusion of work leading to integrated pest management efforts for the potato late blight and for further surveys on wildlife reservoirs of the vesicular stomatitis virus. During fiscal year 1998 these funds were used for support of a project on a newly emerging corona virus strain that is a probable cause of severe outbreaks of shipping fever or pneumonia in transported beef cattle. For plant diseases, fiscal year 1998 funds were used to support two major research projects on a new disease of sorghum, Sorghum Ergot. The two projects were Epidemiology and Life History of Ergot and Development of Integrated Control of Sorghum Ergot. In fiscal year 1999, Johne's Disease of cattle was identified by both veterinary researchers and APHIS animal disease control staff as a major issue. For plants in fiscal year 1999, research was supported on the insect vectored disease, Tomato Yellow Leaf Curl virus.

Question. What is the national, regional or local need for this research?

Answer. Vesicular stomatitis was of national impact due to its similarity to foot and mouth disease and the negative effect on movement of horses, cattle and swine during an outbreak. Since 1992 new, highly virulent strains of the potato late blight fungus *Phytophthora infestans* caused severe losses in potato and tomato production throughout the United States, resulting in what some experts term a national crisis. From 1993 to 1995, a series of meetings involving growers, consultants, industry, academia and government assessed the growing problem and participants concluded that extraordinary steps were needed to mobilize research efforts that would help address the problem in the near term. Bovine shipping fever causes heavy economic losses to the beef industry in cattle being shipped to feedlots and vaccines for currently recognized viruses seem to be ineffective in certain settings in preventing outbreaks. The isolation of a probable new virus, bovine respiratory corona virus represents an opportunity to contribute to the reduction of this disease complex in cattle. Sorghum Ergot is a serious disease of sorghum which was first detected in Texas in March, 1997. It rapidly spread to almost all sorghum growing regions of

the U.S. by September 1997. Johne's Disease has been identified by several commodity and animal health organizations as the leading problem for dairy cattle owners and also a serious issue for beef producers. Decisions on specific research needs and focus of research projects is decided after consultation with a variety of commodity stakeholders, other USDA agencies, especially the Animal and Plant Health Inspection Service, scientists in the land grant system, and other public input. Tomato Yellow Leaf Curl virus is a newly introduced disease into Florida that has caused considerable crop loss. The disease moved rapidly over the entire State and now has moved into Georgia. This disease is vectored by the silver leaf whitefly and affects tomatoes, beans, and other vegetables. The disease symptoms are severe stunting, distortion, and high rates of flower loss.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research supported by this program is to focus on specific questions or issues which are considered to be most important in developing control or prevention programs for the disease agent under investigation, whether in plants or animals. Thus, for the animal studies, the focus has been on identifying natural reservoirs of the vesicular stomatitis virus and insects which are capable of transmitting the disease among animals; determining the precise significance of the apparent new corona virus in shipping fever pneumonia of beef cattle; and developing a sub-unit vaccine for Johne's Disease in cattle and determining the significance of a linkage between Johne's Disease and Crohn's disease of humans. In spite of a very large research effort, the natural reservoir for vesicular stomatitis virus is still unknown. The bovine respiratory disease work on the apparently new respiratory corona virus is expected to validate the role of this virus in outbreaks of pneumonia in cattle vaccinated for other known causes of shipping fever. Confirmation of such a fact will provide a basis for development of control measures including vaccine development. Research was initiated to provide growers with the knowledge and technologies they need to reduce economic losses resulting from potato late blight with less reliance on pesticides. Research initiated with fiscal year 1996 funds is making progress in developing modeling tools and management approaches that are an important step towards reducing the devastating effects of late blight. The National Late Blight Fungicide Trial provided important information on the efficacy of an array of fungicide programs. A World Wide Web site was established to provide growers, researchers and industry with the latest information on management of potato late blight. The research projects on Sorghum Ergot were intended to develop information about the history and epidemiology of the disease which would lead to studies on development of integrated control programs for this fungus. Research on Tomato Yellow Leaf Curl Virus has aided in the understanding of which field crops other than tomato serve as a source of virus infection. Weed reservoirs were also studied as potential whitefly infection sites. These results will help in the development of field management strategies for this virus. Another research project tested transformed tomatoes that had been selected for resistance to Tomato Yellow Leaf Curl virus. This approach was successful in developing resistant tomatoes to another similar virus and is expected to produce highly resistant tomato varieties to Tomato Yellow Leaf Curl virus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. \$200,000 were appropriated in fiscal years 1996–2000 for a total appropriation of \$1,000,000 to date. The fiscal year 2001 budget proposes an increase of \$267,000 for a total of \$467,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This information should be available within 30 days.

Question. Where is this work being carried out?

Answer. From 1996 to 1997, the vesicular stomatitis work was conducted at the University of Arizona and Colorado State University. The potato late blight work has been conducted at Washington State University, Oregon State University, University of Idaho, University of Wisconsin, and Pennsylvania State University, and North Carolina State University. In 1998 the bovine respiratory disease work was performed at Louisiana State University. The Sorghum Ergot work is being done at the University of Nebraska and Texas A&M University. In 1999 the research on Johne's Disease has been performed at Iowa State University and the University of Iowa. The research on Tomato Yellow Leaf Curl Virus was carried out at the Gulf Coast Research and Education Center, University of Florida, Bradenton, FL and the Tropical Research and Education Center, University of Florida, Homestead, FL.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Critical Issues funds are intended to support the initiation of research on issues requiring immediate attention until other, longer-term resources are available. The objectives of the projects are short-term and are expected to be completed within a 1-2 year period. This has been true for the vesicular stomatitis and potato late blight work. These projects have been reviewed to ensure compliance with the original goals during fiscal year 1997.

The subsequent project grants for potato blight in 1997 and for Sorghum Ergot and bovine respiratory disease in 1998 had short term goals and are expected to be completed by the end of their project years which will occur in late spring 1999. Similarly, the objectives of the research funded with fiscal year 1999 funds are expected to be completed by the summer of 2000. For the Johne's Disease work, the emphasis is on determining the likelihood of a link between this disease of cattle and Crohn's Disease in the human and also developing a vaccine to prevent further spread within the cattle population. For Tomato Yellow Leaf Curl Virus, the emphasis is on field management of the disease and the development of virus resistant varieties of tomato.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. All projects were reviewed for scientific merit before funding decisions were made. Also, scientists being supported with these funds are in close contact with CSREES' National Program Leaders in these areas so that the agency is kept abreast of developments as they occur. Each investigator is required to submit a detailed report at the end of the funding period to document their accomplishments with these funds. In addition, site visits are arranged when convenient to include as part of other official travel to that State. The vesicular stomatitis research had a site visit review in early 1998 and was reviewed as a completed project in March, 1999 during a program review at the University of Arizona. The final results of the bovine respiratory work were submitted to CSREES for review in early fall, 1999. The plant related projects have received similar reviews as the projects have moved forward, and the results are being reported at regional and national meetings.

DAIRY AND MEAT GOAT RESEARCH, PRAIRIE VIEW A&M, TEXAS

Question. Please provide a description of the research that has been funded under the dairy goat research grant?

Answer. The program has addressed a range of issues associated with goat production. Research by scientists at the International Dairy Goat Center, Prairie View A&M University focuses on problems affecting goat production in the United States. Issues included are the study of nutritional requirements of goats, disease problems, methods to improve reproductive efficiency in the doe, the use of gene transfer to improve caprine genetics and the evaluation of breeding schemes to improve meat and milk production. Currently, research is in progress to assess the economics of alternative breeding and rearing systems for goats in the southeastern region of the U.S., to study the incidence and impact of intestinal parasites, and to develop least-cost health management strategies for parasite control.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that nationally, most of the farm enterprises that include goats are diverse and maintain a relatively small number of animals. Responding to disease, nutrition, breeding and management problems will improve efficiency of production and economic returns to the enterprise.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to conduct research that will lead to improvement in goat production among the many small producers in the United States. Research has been conducted to develop and improve nutritional standards, improve genetic lines for meat and milk production and to define mechanisms that impede reproductive efficiency in goats. Current efforts focus on the development of enterprise budget management tools for goat producers in the Texas gulf coast region.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded through appropriated funds as follows: \$100,000 per year for fiscal years 1983-85; \$95,000 per year for fiscal years 1986-88; no funds were appropriated in fiscal year 1989; \$74,000 for fiscal year 1990;

\$75,000 per year for fiscal years 1991–1993; \$70,000 for fiscal year 1994; and \$63,000 per year for fiscal years 1995–2000. A total of \$1,332,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University reports no non-Federal funds expended on this program.

Question. Where is this work being carried out?

Answer. Research is being conducted at Prairie View A&M University in Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The overall objective of this research is to support the needs of small farms engaged in the production of meat and milk from goats along the Texas Gulf Coast. The University researchers continue to address those needs on an annual basis and anticipate that work currently in progress will be completed by the end of fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Dairy/Meat Goat Research grant was reviewed last in June 1997. The project objectives are within the goals of the program, are within the mission of both USDA and CSREES, and the institution is well equipped and qualified to carry out the research project.

DELTA RURAL REVITALIZATION, MISSISSIPPI

Question. Please provide a description of the program that has been funded under the Delta Rural Revitalization, Mississippi Project?

Answer: The Delta Rural Revitalization, Mississippi Project involves applied research and outreach focused on creating new and expanded economic development opportunities for the Mississippi Delta region. The project has gone through several phases in the delineation of a strategy for long range development within the region. Phase I was completed with the delivery of a baseline assessment of the economic, social, and political factors that enhance or impede the advancement of the region. Phase II of the project evaluated the potential for entrepreneurship and small business creation as mechanisms to improve economic conditions. Phase III is now focusing on technical assistance to Delta region manufacturing firms to strengthen their ability to provide employment and incomes and includes the development and refinement of data bases and development statistics. The proposals are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas and provide greater impact on targeted region.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to job and business development as a development strategy. The principal researcher believes that the databases, technical assistance, and analytical capability will increase the effectiveness of economic development and entrepreneurial activity in the region.

Question. What was the original goal of this research and what has been accomplished?

Answer. The applied research and outreach project was designed to increase the ability to guide economic development strategically through target industry attraction. They developed an analytical baseline for the Delta region to benchmark economic development progress and to profile potential arenas of opportunity. An entrepreneurial forum was established to help new business ventures with start-up advice and assistance. A venture capital association was formed to help both inventors and businessmen find capital resources to carry out development initiatives. The emphasis of the project is now shifted to technical assistance for existing industries.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from appropriated funds in the following amounts per year: fiscal year 1989, \$175,000; fiscal year 1990, \$173,000; fiscal years 1991–93, \$175,000 per year; fiscal year 1994, \$164,000; fiscal years 1995–2000, \$148,000 per year. A total of \$1,925,000 has been appropriated and awarded.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Total non-Federal funds from the State of Mississippi directed to this project, as reported by Mississippi State University, are: fiscal year 1991, \$117,866; fiscal year 1992, \$84,402; fiscal year 1993, \$68,961; fiscal year 1998, \$57,404. Reports for other years indicate no non-Federal funds.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through Mississippi State University and sub-contractors.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1990. The original objectives of this research have been met. The additional objectives being presented for the current year should be completed by September 30, 2000. The current year proposal has not been submitted to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit periodic reports to the agency to document the impact of the project. Significant suggestions have been offered to improve the relevance and impact of this project. Time lines tend to lag on targeted accomplishments. An assessment of the project was conducted by the Social Science Research Center at Mississippi State University and a report compiled in November, 1996. A site review was conducted in April, 1999, to assess the merits of research efforts underway. A review and evaluation by an outside consultant is currently underway.

DESIGNING FOODS FOR HEALTH, TEXAS

Question. Please provide a description of the research that has been funded under the Designing Foods for Health, Texas grant.

Answer. Designing fruits and vegetables for improved health and nutrition is the overall goal. Health scientists have documented that naturally occurring compounds such as flavonoids, carotenoids, and antioxidants, have health benefits to prevent heart disease, stroke, and some forms of cancer. The research objective is to develop fruits and vegetables that have uniform, high levels of these compounds so all consumers can prevent chronic diseases through their diet. The fiscal year 1999 grant supports research through June 2000. CSREES requested the university submit a grant proposal for fiscal year 2000 that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to improve the quality and health-related benefits of fruits and vegetables. Health scientists have documented that fruits and vegetables have naturally occurring compounds that promote health and prevent disease. The medical community advocates that preventing disease is more advantageous than trying to cure it. For example, a large effort of Texas health science centers is to develop improved diets that can aid in prevention of colon, esophagus, and prostate cancers. Improved fruits and vegetables for health will provide an enormous benefit for consumers worldwide.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to design fruits and vegetables that assist in preventing diseases through diet. The most exciting accomplishment has been the development of the new carrot, BetaSweet. It was designed to be attractive, crisp in texture, have excellent sweet carrot flavor, and to contain a higher content of beta-carotene than most orange carrots in the marketplace. Beta-carotene is a major source of Vitamin A and is thought to play additional roles in preventing certain forms of cancer, especially oral cancer. This carrot also contains high levels of anthocyanins that are normally found in fruits. They are known to be excellent antioxidants that prevent blood clotting, aid in the prevention of some cancers, heart disease, and strokes. The researchers are also improving health promoting aspects of the BetaSweet carrot by adding lycopene, which is found in tomatoes. All these improvements are being done using conventional breeding.

Question. How long has this work been underway and how much has been appropriated by fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999, and the appropriation for fiscal year 1999 was \$250,000 and fiscal year 2000 was \$318,750. A total of \$568,750 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were \$206,500 from university funds and \$165,000 from an endowment fund in 1999.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Vegetable and Fruit Improvement Center and other locations within the Texas A&M University System.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective of developing fruits and vegetables that contain high levels of naturally occurring compounds that have health benefits continues to be addressed. The specific objective of improving the carrot by increasing the carotenoid and anthocyanin content while maintaining superior flavor and textural properties will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project director conducted a review by peer scientists at Texas A&M prior to submitting the proposal for fiscal year 1999. The Vegetable and Fruit Improvement Center has a very active advisory board which reviews the Center's research programs annually.

DIAPREPES/ROOTWEEVIL, FLORIDA

Question. Please provide a description of the research that has been funded under the Diaprepes/Rootweevil grant.

Answer. The funds are requested to address objectives established by an inter-agency/industry task force, as follows:

- Assessment of the plant injury and economic damage caused by the root weevil on horticultural, agronomic and ornamental plants in the affected area, and the potential for the pest to spread beyond its current range;
- Development and use of monitoring tools to evaluate population levels, regions infested, and to predict where economic damage is likely to occur. Since the pest's most damaging stages, the larvae, feed on roots, damage is not evident, and thus monitoring for the presence of the weevil and assessing population levels is most difficult;
- Development, field evaluation and implementation of management tools that individually will assist in reducing populations or the impact of their presence, and collectively, will serve as the basis for inclusion of weevil management into existing pest management programs in citrus and other affected crops. These tools also are being suggested as strategies important to management of containerized plant material, ornamentals and fruit trees, so that the weevil is not moved beyond its current area of infestation into other States and regions. Included in the tools to be developed are chemical, biological, cultural and mechanical methods.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Diaprepes abbreviatus is a pest introduced into Florida from its native Caribbean Islands in the late 1960's, but remained very localized in few citrus groves until the late 1980's when for unknown reasons, the pest began to spread, helped by movement of potted plant material and other mechanical spread methods. Known as a serious pest of a wide range of plants, from grasses, including Bermuda grass, to legumes, fruit trees and a large number of ornamental plants, this pest has the potential to not only affect traditional agricultural environments, but also native plants and can cause enormous economic losses in the home landscape, a multi-billion dollar industry in Florida and the Southeast. Further movement could expand the impact of this pest to other areas of the United States, and could invoke regulatory concerns between trading partners and commerce. Currently, there is no known tool or collection of tools that effectively limits population growth of the pest, and thus, there is no remedy for this pest at present. Development and evaluation of methods to locate and reduce larval populations must rely on a combination of treatments that are effective, safe, and economical. At present, those infested with the pest must stand by and watch the trees decline.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to develop and deliver strategies to eliminate further spread and maintain viable plant health in the presence of the

pest. Since it was first funded in 1999 progress towards attainment of the goal is still being assessed.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Fiscal year 2000 is the first year of the grant and \$297,500 has been appropriated for fiscal year 2000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Numerous investments will continue to be made in this research. University of Florida has several programs who have focused their efforts on Diaprepes research, including the entomologists, pathologists and plant improvement teams. Internal funds as well as effort have been redirected to address this problem. Likewise, United States Department of Agriculture, Agricultural Research Service scientists at several locations in the Southeast have been assigned to this research and internal funding is being utilized to address this problem. The citrus growers of Florida have dedicated considerable grant dollars from a self-tax for research, and more recently, other commodity groups are contributing to fund research. In-kind support through cooperation, shared equipment and other means are being offered to address the issue. However, the speed with which the pest has spread and the increasing economic impact has outpaced the current allocation of resources, and the economic losses are rising.

Question. Where is the work being carried out?

Answer. The work is being carried out at the University of Florida at Gainesville.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The plan for the work will be submitted with the research proposal.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project for which an evaluation has not been conducted

DROUGHT MITIGATION, NEBRASKA

Question. Please provide a description of the research that has been funded under the Drought Mitigation grant.

Answer. The National Drought Mitigation Center in the School of Natural Resource Sciences at the University of Nebraska has a comprehensive program aimed at lessening societal vulnerability to drought. Activities of the Center include promoting and conducting research on drought mitigation and preparedness technologies, improving coordination of drought-related activities and actions within and between levels of government, and assisting in the development, dissemination, and implementation of appropriate mitigation and preparedness technologies in the public and private sectors. Emphasis is directed toward research, outreach projects and mitigation/management strategies that stress risk minimization.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Federal Emergency Management Agency has recently estimated that annual losses attributable to drought in the United States are between \$6-8 billion. Drought impacts are escalating in response to increasing demands for water and other natural resources, increasing and shifting population, new technologies, and social behavior. These impacts are diverse and affect the economic, environmental, and social sectors of society. This fact was reinforced dramatically in 1996 in the Southwestern United States. Impacts in Texas alone were estimated to be more than \$5 billion.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to create a National Drought Mitigation Center and develop a comprehensive program aimed at lessening societal water shortages and vulnerability to drought. The Center has created an information clearinghouse and is delivering information to a diverse audience of users through its home page. Over 50,000 users now access the Center's home page each month. The Center's award winning home page was used extensively by State and Federal agencies during the 1999 drought to assist in the evaluation and response process. This home page networks users of drought-related information in the United States and elsewhere with information that would otherwise be unavailable or inaccessible to users.

The National Drought Mitigation Center played an important role in the response of Federal and State Government to the 1996 severe drought in the Southwest and

southern Great Plains States. In addition to providing timely and relevant information on drought severity and alternative response, mitigation, and planning measures, the Center participated in the Multi-state Drought Task Force workshop organized at the request of President Clinton and helped formulate long-term recommendations to improve the way this Nation prepares for and responds to drought. The Center is also a member of the Western Governors' Association

Drought Task Force. This Task Force made recommendations to Reduce the risks associated with drought in the western United States.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant received an appropriation of \$200,000 in fiscal years 1995 through 2000, for a total appropriation of \$1,200,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University of Nebraska contributed \$75,737 of non-Federal funds in support of this research in fiscal year 1995, \$58,977 in fiscal year 1996, and \$61,545 in fiscal year 1997. The University of Nebraska contributed \$67,819 in fiscal year 1998, and \$74,887 in fiscal year 1999.

Question. Where is this work being carried out?

Answer. The research is being conducted at the University of Nebraska-Lincoln.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research conducted under this project is being undertaken within a series of nine tasks. Significant progress on each of these tasks has been made, but these activities are ongoing. The information clearinghouse has been created, but new information and documents are continuously added to the home page in response to users' needs and requests. In addition, the drought watch section is updated monthly to assist users in evaluating current climate and water supply conditions. Research on new climatic indices to monitor drought and water supply conditions are being tested and mitigation technologies and existing State drought plans are continuously evaluated. New activities are also being initiated in response to the growing interest and awareness in drought mitigation in the United States and elsewhere. The activities of the Western Drought Coordination Council provides the Center with a broadening range of research needs on an annual basis.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer-reviewed at the time the proposal was prepared in 1998. Each year when the new proposal is prepared, the proposal is reviewed on the campus and again at CSREES. The project is evaluated for progress toward completion of objectives, new activities proposed and accomplishments.

ECOSYSTEMS, ALABAMA

Question. Please provide a description of the research that has been funded under the Ecosystems, Alabama, grant.

Answer. In 1998, CSREES approved a proposal from Auburn University to support projects at two Community Colleges in Alabama-Faulkner State Community College and Alabama Southern Community College. The Faulkner State Community College's project is intended to: (1) fund the development of distance education classrooms for estuarine- and marine-related education, and (2) to establish an aquaculture-related veterinary technician education program. The Alabama Southern Community College project will purchase and install laboratory equipment to further the education capacity of the Center for Excellence in Forestry, Paper, and Chemical technology.

Question. According to the research proposal, or the principal researcher, what is the local, regional, or national need for this project?

Answer. Faulkner State Community College asserts that their veterinary technician program will be the only such program in the country, providing the first two years of the degree program leading to an A.A. degree at Faulkner State, and the second two years leading to a bachelor's degree at Auburn University. The distance education capacity is intended to better integrate marine and estuary research into education activities.

The Center for Excellence in Forestry, Paper, and Chemical Technology at Alabama Southern Community College is believed to be a unique educational opportunity in the Southeastern United States due to the merging of four individual technology training programs. These programs are: (1) Industrial Maintenance, (2) Electronics and Instrumentation, (3) Paper Process, and (4) Chemical Process training.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals for these projects include the development of a veterinary technician training program and integration of marine and estuary research into classrooms at Faulkner State Community College; and to establish a state-of-the-art wood paper process and chemical process laboratory at Alabama Southern Community College.

The fiscal year 1998 objectives for Faulkner State College were to establish a distance education web to enhance integration of marine and estuarine environmental research and to establish a 2+2 veterinary technician program with an emphasis on marine/aquaculture. The distance education web is in place and has been tested. In addition, classrooms have been tested and some faculty have been trained in the use of the media/hardware. After further assessment, it was decided that the proposed Veterinary Technician Program would not be cost effective. With the fiscal year 1999 proposal, Faulkner proposed instead, to establish a 2+2 Environmental Science degree program.

The fiscal year 1998 objectives for Alabama Southern Community College was to have completed, tested, and placed into operation the chemical, pulp, and paper process laboratories in the areas of (1) Process Control, (2) Crystallization, (3) Batch Reactor, and (4) Digester by June, 2000. The Process Controls laboratory is nearly complete. The others are under design and the project is on-line for completion as originally proposed.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Funds were appropriated for this grant beginning in fiscal year 1998. In fiscal years 1998, 1999 and 2000, \$500,000 was appropriated each year. A total of \$1,500,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided to support this project?

Answer. No non-Federal funds have been identified to support this project.

Question. Where is this work to be carried out?

Answer. The project will be conducted at the Faulkner State Community College Aquaculture Center in Alabama and at the Alabama Southern Community College Center for Forestry, Paper, and Chemical Technology.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Alabama Southern Community College project proposal indicates a two year budget for project completion. The Faulkner State Community College proposal was for one year only. The objectives have not yet been met but are well underway.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project had a merit review before it began in fiscal year 1998. Subsequent projects were peer reviewed by the respective institutions for the fiscal year 1999 allocation.

ENVIRONMENTAL RESEARCH, NEW YORK

Question. Please provide a description of the research that has been funded under the environmental research grant.

Answer. The environmental research in New York has several major goals. These are: (1) to better understand the impacts of nutrient flows, principally nitrogen, from agriculture on non-agricultural ecosystems, forests, wetlands, and water resources in mixed ecosystem landscapes; (2) to improve knowledge of agricultural contributions to greenhouse gas emissions and effects of projected climate change on crop production; and (3) to develop innovative approaches and technologies for improving the efficiency of agricultural production. New thrusts include: (1) to improve understanding of the impacts of land application of biosolids on the sustainability of New York agriculture and on water quality, and to develop management practices and guidelines for sustainable use of biosolids in New York agriculture; and (2) to evaluate spatial and temporal variability of crop yields within fields and to develop management practices that increase productivity, increase the efficiency of use of inputs, and reduce environmental impacts of agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Programs supported by the special grant are multidisciplinary in nature, involving technical scientists from a range of disciplines, together with social sci-

entists and economists. Due to the complexity of agriculture and environmental interactions at all levels, the needed research is complex and requires much time. Additionally, translation of knowledge from plot or field studies to larger scales, such as landscape to regional and global, is needed to provide information that is useful to policy makers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. One goal of the program is to identify impacts of nitrogen flows from agricultural lands on adjacent natural ecosystems, forests and wetlands, and water resources, and to devise management strategies to minimize these impacts. Leaching of nitrogen from maize based cropping systems has been shown to be higher when organic sources of nitrogen, manures and plow-down alfalfa, are used as nitrogen sources for crop growth compared to use of inorganic fertilizers. A computer-based nitrogen decision support system to improve recommendations for on-farm nitrogen management is being used in New York.

A second goal of the program is to investigate several interactions between agriculture and climate change. Studies of methane fluxes to/from soils showed that northern hardwood forests are both a source and a sink for this powerful greenhouse gas and overall may be a net source of methane. In contrast, upland agricultural systems were consistently found to be a sink for methane. Use of legume green manures to supply nitrogen in an organic production system increased methane emissions two-fold, creating a conflict between a sustainable agriculture practice and the environment.

No-tillage agriculture was shown to increase preservation of existing soil organic carbon but accumulation of carbon derived from crop inputs was higher with conventional tillage. Inputs of carbon to soils from root exudates and residues were found to be more important to carbon sequestration in soils than were residues from the tops of plants.

Soil quality assessments at the Chesapeake farms sustainable agriculture project on Maryland's Eastern shore, where various cropping systems are being compared with the conventional corn-soybean rotation, have shown that soil quality improves as the cropping system becomes more complex, involves less tillage, and has more organic inputs.

Question. this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of \$297,000. The fiscal years 1992–1993 appropriation was \$575,000 per year; \$540,000 in fiscal year 1994; and fiscal years 1995 through 1999, \$486,000 each year. The appropriation for fiscal year 2000 is \$400,000. A total of \$4,817,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1991, Cornell University provided \$27,893 and the State of New York provided \$118,014. In fiscal year 1992, Cornell University provided \$37,476 and the State of New York \$188,915. In fiscal year 1993, Cornell University provided \$13,650 and the State of New York \$243,251. In fiscal year 1994, the State of New York provided \$214,989. In fiscal year 1995, the State of New York provided \$233,085. In fiscal year 1996, the State of New York provided \$388,301. In fiscal year 1999, the State of New York provided in excess of \$400,000 to support this research.

Question. Where is this work being carried out?

Answer. This research is being conducted at Cornell University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original estimate was for a 5-year program and many of the initial objectives in the nitrogen and climate change areas have been met. New objectives evolved from the original work and the program was also oriented to consider broader dimensions of environmental management, particularly strategies for community-based watershed management, involving linkage of technical knowledge with social and local governmental perspectives and needs. Estimated completion dates for current program elements are:

- Watershed science and management
- Effects of elevated carbon dioxide on crop yield potential
- Remington farms sustainable agriculture project—a 10-year project
- Carbon storage in soils

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed in 1997 and 1998. Overall, the project was rated very high. Specific ratings included the following:

- Outstanding scientific merit.
- Appropriate methodology.
- Excellent previous accomplishments.
- The project has potential for significant impact concerning the relationship of agriculture to global change.
- The proposal is well conceived and well written.

ENVIRONMENTAL RISK FACTORS/CANCER, NEW YORK

Question. Please provide a description of the work that has been funded under the Environmental Risk Factors/Cancer, New York, grant.

Answer. The agency has requested the University to submit a renewal grant proposal.

Question. According to the research proposal, or the principal researcher, what is the national, regional, and local need for this research?

Answer. The American Cancer Society estimated that approximately 175,000 women in the United States will be newly diagnosed with breast cancer during 1999 and that 43,000 will die from this disease. The role of environmental risk factors, such as pesticides, is of concern to women, the agricultural community, and policy-makers. This project, emphasizing risk reduction information, will work at filling that void.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original and continuing goals of this research are:

- To establish and expand the database of Critical Evaluations on the current scientific evidence of carcinogenicity for selected agricultural chemicals. This will include writing Critical Evaluations on the breast cancer risk of chemicals used in agricultural settings and the role of selected agrochemicals in childhood cancer.
- To communicate effectively information in the database to a variety of audiences, including the scientific community, Federal agencies, public health professionals, the agricultural community and the public, using printed materials and electronic formats on the internet.
- To ensure that the public will have access to science-based information written in non-technical language about environmental factors and the risk of breast cancer and childhood cancers.
- To increase the knowledge and use of practical strategies aimed at breast cancer risk reduction for residents in rural areas. Efforts to address this objective will include: (1) simple, attractive, printed educational materials tailored for families in rural areas; (2) videotape-based educational workshops for use with groups of rural women.
- To effectively incorporate breast cancer risk reduction messages into health care and health screening settings in rural areas. This will include enhancement and adaptation of the BCERF interactive computer display, developed in this current project year, for use in health care settings and at cancer screening events in rural areas.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1997, and in fiscal years 1997, 1998 and 1999 \$100,000 was appropriated per year, and in fiscal year 2000 \$170,000 was appropriated for a total of \$470,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows:

- \$150,000 New York State appropriations for fiscal year 1996.
- \$250,000 per year in New York State funds was provided for fiscal years 1977 and 1998.
- \$350,000 in New York State funds for 1999 and the same requested for fiscal year 2000.

Question. Where is the work being carried out?

Answer. This research and outreach is conducted at Cornell University. Ithaca, NY.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date or additional or related objectives?

Answer. This was a new project which began in April 1997. Because of the success of meeting the original objectives in NYS, BCERF efforts are being continued and directed toward regional efforts. The anticipated completion date is June 30, 2001.

Objectives met:

- The bibliographic database was established during year one and is updated and expanded each year. It currently has over 4,000 entries with over 250 added each quarter. Also, it includes full bibliographies of all pesticide and dietary/lifestyle scientific critical reviews.
- Critical Evaluations: the breast cancer risk of seven pesticides—four in fiscal year 1997, three in fiscal year 1998—have been completed. The completion of two additional Critical Evaluations is anticipated by the end of the current fiscal year.
- Science-based information material—fact sheets—have been developed for the seven pesticides and for four pesticide-related issues. Also, four fact sheets were developed on diet/lifestyle breast cancer risk factors, and three on general information on breast cancer. Eight additional fact sheets are to be developed in the current fiscal year.
- Two video teleconferences and an in-service have been held and evaluated. Follow-up telephone surveys of 1997 facilitators at BCERF satellite video conference downlink sites and participants at the June 1997 on-campus training program was completed, and an analysis of response data was initiated.
- The interactive computer Rural Exhibit was completed in 1999 and evaluated during Summer/Fall 1999.
- The BCERF website was revamped in 1997–1998 and relaunched in September 1998. The number of browsers accessing the BCERF home page rose from 380 to 450 hits per month during the summer of 1998 to 1,053 hits in November 1998 and 3,490 hits in December 1998. Hits remain high with an average of about 3,000 per month.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As a relatively new project, a complete evaluation has not been conducted, although the proposal is currently under review. Periodic progress reports have been made throughout the year. The project is moving towards achieving its desired goals. A final evaluation will be made after June 30, 2001. BCERF has evaluated most components of the program, with further evaluation planned. To date, BCERF has done an evaluation of the video teleconferences and in-service and has had the pesticide fact sheets reviewed by focus group—breast cancer survivors and women not having breast cancer. The participants brought a variety of perspectives to the discussion, providing BCERF with a wealth of important feedback on fact sheets and educational approach. Some of the conclusions drawn from this evaluation have already resulted in simple changes made in the preparation of current fact sheets. Other feedback from this evaluation will inform planning efforts for the education component in general.

Evaluation played a key role in the development of the interactive computer rural exhibit. To develop the exhibit, qualitative and quantitative information was gathered about the knowledge, attitudes and beliefs of rural women regarding environmental risk factors and breast cancer. In addition, BCERF conducted brief surveys of rural women attending several rural conferences and events. The complete exhibit was tested at two farm shows and the New York State Fair in Fall 1999, partnering with professionals and organizations, such as those providing mobile mammography.

To evaluate the value of Critical Evaluations to scientists and Federal agency personnel, a fax-back survey has been sent. The majority of respondents 88 percent so far have found the Critical Evaluations to be relevant to their work.

ENVIRONMENTALLY SAFE PRODUCTS, VERMONT

Question. Please provide a description of the research that has been funded under the grant.

Answer. Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that has not yet been received. The research will address the development of an environmentally friendly wood finish formulated with whey, a protein-based biopolymer that can replace standard polymer finishes that emit volatile organic compounds.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research addresses a national need to find alternative wood finishing products that are nontoxic and environmentally preferable.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This grant is new and the research will build upon existing expertise to offer new products with good performance for use in the furniture and toy manufacturing industries.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$170,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is a new grant and since the proposal has not yet been received, the source and amount of non-Federal funds for this research is not known.

Question. Where is this work being carried out?

Answer. This work will be carried at the University of Vermont.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Since this is a new grant, no evaluation has been conducted.

EXPANDED WHEAT PASTURE, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Expanded Wheat Pasture, Oklahoma grant.

Answer. This project was designed to develop improved supplementation programs and new systems for technology delivery to reduce production risk of raising cattle on wheat pasture. The work involves evaluation of grazing termination date on grain and beef production, assess the impact of wheat cultural practices, and develop an economic model to evaluate alternative decisions on grain/beef production. Additional effort is directed toward development of cool season perennial forage grasses to complement wheat pasture. The proposal for fiscal year 2000 has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that this work addresses the needs of wheat/cattle producers of Oklahoma as a primary focus. However, it would appear to have application regionally in adjacent wheat growing States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop economically-viable management systems for use of wheat for supplemental pasture for beef cattle before the crop starts making grain. This work has already shown how the use of feed supplements can increase net profit from cattle grazing on wheat pasture. The study has identified management practices, e.g. date of planting, cultivar selection, grazing intensity, and date of cattle removal that produce the optimum grain yield and cattle gain. A Wheat/Stocker Management Model has been developed as a decision aid to help producers assess income risk in the operation. Work is underway on a Wheat Grazing Systems simulation model.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1989 and appropriations were as follows: fiscal year 1989, \$400,000; fiscal year 1990, \$148,000; fiscal year 1991, \$275,000; fiscal years 1992–1993, \$337,000 per year; fiscal year 1994, \$317,000, and fiscal years 1995 to 2000, \$285,000 each year. A total of \$3,524,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$175,796 State appropriations in 1991; \$174,074 State appropriations in 1992; and \$236,584 State appropriations in 1993. The non-Federal support for 1994 was \$238,058 for State appropriations. Funds for 1995 were \$275,426, for 1996 were \$120,000, for 1997 were \$190,510, for 1998 were \$224,500, and for 1999, \$222,650.

Question. Where is this work being carried out?

Answer. The research is being done at Oklahoma State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project started in 1989 with a projection of 10 years to complete the research objectives. Some objectives are nearing completion while others will require further study. A number of wheat cultivars have been identified which will tolerate grazing and still produce economic grain yields. The grazing cut off date for grain production has been established. However year to year variation need additional study in order to develop a reliable decision support system. The revised projected completion date is 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This program is reviewed annually. Each year's funding cycle is peer reviewed internally and by the agency National Program Leaders for scientific merit and relevance. Results from this project are currently being used by ranchers to help with management decisions concerning stocker cattle grazed on wheat that will be harvested for grain. Current work is designed to refine the current information and identify wheat cultivars and grazing management for optimum economic return.

EXPERT IPM DECISION SUPPORT SYSTEM

Question. Please provide a description of the research that has been funded under the Expert Integrated Pest Management Decision Support System grant.

Answer. A prototype information and decision support system was developed in collaboration with Purdue University and the Department of Energy's Argonne National Laboratory that integrates and manages information from multiple data sources. Development of this system now continues with the National Science Foundation Center for Integrated Pest Management at North Carolina State University. Components of the Pest Management Information Decision Support System include information on the United States Environmental Protection Agency review status of pesticides, crop losses caused by pests, status of minor use registrations, current research in progress, and priorities of integrated pest management implementation teams.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Pest Management Information Decision Support System is fully operational and serves national, regional, and local needs for research and extension activities. The Food Quality Protection Act has been the driving force for the development and usage of this software program. At the national level, the system provides rapid access for the United States Department of Agriculture, and Environmental Protection Agency helping to address pest management concerns and information to support the regulatory decision making process. It provides a mechanism for decision transparency and for all stakeholders to interact with the priority setting process. The ultimate result will be to help insure that farmers have adequate alternatives for managing pests at the specific local level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Pest Management Information Decision Support System was to refine the process of identification for Integrated Pest Management needs of the United States Department of Agriculture, the Environmental Protection Agency, and States. This goal reinforces the State and Federal partnerships to disseminate important pest management information for improved decision making and environmental quality, and to address future needs. In 1996 and 1997, the program addressed and responded to the Memorandum of Understanding and supplemental Memorandum of Understanding between the United States Department of Agriculture and Environmental Protection Agency. The supplemental Memorandum of Understanding was signed in April, 1996, at which time there were 58 pesticides and 374 uses identified and prioritized. Twenty-five minor use crops were identified in the 1997 Pest Management Alternatives Request For Proposals as crops-at-risk due to regulatory actions. Results were also used to establish priority work identified for support by the regional Integrated Pest Management grants program Request For Proposal.

The Pest Management Alternatives Program Work-Bench of the Pest Management Information Decision Support System was beta tested in 1999 and has been delivered to the public domain and the present product (data base access) is available on the world wide web at <<http://dsslab.cs.gmu.edu/PMIDSS>>. Pest Management Information Decision Support System had undergone a complete rewrite during this last year. It has now been rewritten, using Java and Cold Fusion Struc-

tured Query Language queries, with all data now stored on a Structured Query Language Windows NT server. This means that no software other than the standard browser is required to access the information.

The Pest Management Information Decision Support System user interface has also been completely rewritten. It is a much friendlier interface, that allows users to search a multitude of specific pest management databases, either concurrently or separately, by crop, pest and/or tactic and retrieve data summaries or the entire record from all of the databases included. Each database now has a specific explanation of its source, the information contained within, and when last updated. Finally an automated update retrieval from many of the database sites such as the Inter-regional Project-4, Pipeline, Crop Profiles, and National Center for Food and Agricultural Policy Pesticide Use Database has been developed.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This work began in 1994 with development of the concept and design, and has proceeded through steps including database identification and specific development of a prototype and software. Current development have brought the product to the web and provides multiple database search capabilities for ease of data access. In fiscal year 1994, we expended \$40,000 of Cooperative State Research, Education and Extension Service administrative funds and \$90,000 from Science and Education Evaluation Funds to initiate collaborative work with the Argonne National Laboratory. In fiscal year 1995, we expended \$172,000 as a Cooperative Agreement with Purdue University and Argonne National Laboratory from the Pest Management Alternative Special Grant Funds and \$5,000 from Pesticide Impact Assessment Program funds. In fiscal year 1996, we expended \$177,000 in a cooperative agreement with Purdue University and Argonne National Laboratory from Pest Management Alternative Special Grant Funds, \$21,000 from Research, Education and Economics Mission area Evaluation Funds, and \$40,000 from Pesticide Impact Assessment Program. In fiscal year 1997–1998 we expended \$165,425 and \$177,000 to Purdue University and Argonne National Laboratory. In fiscal years 1999 and 2000, we are expending \$177,000 to North Carolina State University center for Integrated Pest Management to implement, enhance and maintain the web-based system and provide access to multiple databases.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. It is difficult for us to estimate the amount of non-Federal funds supporting the Pest Management Information Decision Support System. Purdue University, Cornell University and North Carolina State University have contributed non-Federal resources in the form of dollars and personnel time. The National Science Foundation Center for Integrated Pest Management at North Carolina State University is supported in large part by corporate funds, part of which have underwritten Center personnel salaries. The informational data bases, which are accessed by the Pest Management Information Decision Support System, have been developed and generated by States and universities and represent considerable investments in time and resources.

Question. Where is this work being carried out?

Answer. Presently, the bulk of the work is carried out in Washington, D.C. and in Raleigh, North Carolina. Cooperative State Research, Education and Extension Service has National Program Leaders in Integrated Pest Management, Pesticide Impact Assessment Program, and Inter-regional Project-4 program areas working on the Pest Management Information Decision Support System. The Center for Integrated Pest Management at North Carolina State University manages the web server where the pest management information system is located and is developing the multiple concurrent database search and decision support capability. Interaction and information is provided by every State in our system. We are in the process of strengthening the role of Land Grant partners in this program and additional database access is being developed through the Center for Integrated Pest Management, at North Carolina State University and through a sub-contract with George Mason University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Our original estimate in 1994 was two-to-three years with adequate resources to complete developmental work. However, the design considerations became more complex with the 1996 passage of the Food Quality Protection Act requiring an expansion and change in information data bases. In addition, advances in web technology has greatly expanded the potential and use of the system to all people wanting information on pesticide use and pest management alternatives. Additional

databases have been added to both the data access and decision support aspects of the project. The Pest Management Information Decision Support System team is now working directly with many data providers and users, including Inter-regional project 4, National Agriculture Statistics Service, the Cooperative State Research, Education and Extension Service, Office of Pest Management Policy, Environmental Protection Agency, commodity groups, and agribusiness to assure that needed data are available, consistent, current, and searchable. The Pest Management Information Decision Support System program is a key component in providing USDA, EPA, Congress, and the Office of Pest Management Policy with finger-tip access to new and rapidly changing data bases, making research information accessible to assist the regulatory decision making process.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. The Pest Management Information Decision Support System underwent two reviews in 1997. The first was a formal review of the entire program in June, 1997 which recommended: (1) focusing the system on the needs of the Pest Management Alternatives Program, (2) the timely delivery of a software product to USDA, and (3) the development of a plan to sustain the system in a user-friendly, widely available format. A second review which was conducted in November, 1997, focused strictly on the Pest Management Alternatives Program Work-Bench surfaced the following recommendations: (1) to expand the WorkBench linkages to additional relevant databases, (2) investigate the potential of placing the system on the World Wide Web for greater access and utility, (3) market the system to potential users, and (4) link to high quality databases to support and enhance data integrity of the WorkBench. In August, 1998 a progress review was conducted to evaluate the engineered software product and it was determined that a web accessible multiple database search capability was essential for the system. A concept review conducted in September, 1998, and at this review the functionality of a web-based decision support system was first demonstrated.

FARM AND RURAL FINANCE, ILLINOIS AND ARKANSAS

Question. Please provide a description of the research that has been funded under the farm and rural business finance program.

Answer. The Center for Farm and Rural Business Finance at the University of Illinois and the University of Arkansas is supported, in part, by the Federal funding for this project. The Center conducts a program of research and information on the financing of farms and rural businesses in the United States. The plan of work focuses on the financial management performance of farm and rural businesses, evaluation of financial markets and credit institutions serving rural America, and the impacts of public policies and regulations on the structure and performance of rural financial markets. During the past year, 17 projects have been conducted through the Center. They address financial issues facing farmers and rural businesses that range from financial risks faced by hog producers to farmland turnover rates to lending trends among large commercial banks. Professional staff at the two institutions are engaged in both joint and separate projects.

Question. What is the national, regional, or local need for this research?

Answer. The current financial stress in various regions and sectors of the farm economy, the changing structure within the agricultural sector, and financial implications of risk management strategies and technical change have created a national need for this research. The level of financial stress varies across commodities and with regional variation in yields and product mix. Analyses are needed to assess the financial impacts of agricultural policies and programs that provide various dimensions of the "safety net." Changes to the Federal income tax, capital gains tax and estate tax provisions can have significant impacts on owners of agricultural assets. Research is needed to identify impacts on individuals and those that may affect local institutions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal is to assist farmers, ranchers and rural businesses with research-based information on financial management as they deal with increasingly complex financial decisions. During this past year the program has conducted projects on the relationship between financial risk and farm size, financial aspects of various production technologies and management practices of small and medium-sized pork producers, the effect of technical change on rural commercial bank delivery systems, and regulatory costs in rural lending. Projects are being completed on the post-acquisition performance of banks resulting from recent mergers, levels and trends in small farm and small business lending across different types of commer-

cial banks, and the measurement and classification of the financial performance of agribusiness firms. Additional projects have developed a model of working capital management applicable to a wide variety of selected agribusiness firms and have identified primary risks associated with lending to integrated farm production units. Other projects are measuring the longer term impacts of changes in the Federal tax laws on the financial performance of Illinois farms, evaluating the financial characteristics of rural banks and assessing their competitiveness in rural financial markets, and identifying the financial characteristics of high performing agricultural banks. A project at the University of Arkansas has analyzed the effects of financing in accelerating the cattle cycle.

Question. How long has the work been underway, and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work has been underway since 1992. Appropriations were \$125,000 in fiscal year 1992, \$125,000 in fiscal year 1993, \$118,000 in fiscal year 1994, \$106,000 per year in fiscal year 1995 through fiscal year 1997, \$87,000 per year in fiscal year 1998, fiscal year 1999 and fiscal year 2000. Appropriations through fiscal year 2000 total \$947,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal sources and funds provided for this program in fiscal year 1992 totaled \$259,427 with \$58,427 in State appropriations, \$189,000 from industry and \$12,000 from miscellaneous sources. In fiscal year 1993, the total was \$287,890 with \$94,588 in State appropriations, \$133,000 from industry and \$25,000 from miscellaneous sources. In fiscal year 1994, the total was \$391,000 with \$221,000 coming from State appropriations, \$45,000 from industry and \$125,000 from the National Research Initiative competitive grants programs. In fiscal year 1995 the total was \$185,000 where \$46,000 came from State appropriations, \$62,500 from industry and \$76,500 from miscellaneous sources. In fiscal year 1996, the total was \$344,000 where \$294,000 was appropriated from State sources and \$50,000 from private sources. In fiscal year 1997, \$125,000 was appropriated from State sources, \$103,000 was received through a National Research Initiative grant, and \$130,876 was received from the Council on Food and Agricultural Research. In fiscal year 1998, \$176,250 was received from a Fund for Rural America grant, \$65,000 from a CSREES Special Research Grant, and \$20,000 from miscellaneous sources. In fiscal year 1999, \$133,500 was received from the Illinois Agricultural Experiment Station in the form of faculty-researcher salaries; the Arkansas Agricultural Experiment Station was providing \$49,500 in similar support; and the Illinois Farm Development Authority provided \$125,000. Non-Federal support for fiscal year 2000 has not been identified.

Question. Where is the work being carried out?

Answer. Researchers and professional staff conducting this program are located at the University of Illinois and the University of Arkansas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the program, as amended with additional funding and new termination dates now extend to fiscal year 2000. Initial objectives have been met; however changing financial conditions in the farm and rural business environment continue to add new dimensions to these original objectives. Anticipated completion dates of these amended objectives extend through fiscal year 2000.

Question. When was the last agency evaluation of this project. Provide a summary of the latest evaluation conducted.

Answer. In addition to the scientific and peer reviews conducted at the institutions, the program is evaluated periodically within the agency through direct contact with the Director of the Center and the project leaders, as reports are received, and annually when proposals are submitted. The latest evaluation occurred in March, 1999 when the most recent comprehensive report was received. Agency criteria are used to evaluate the program in terms of whether objectives are relevant and consistent, appropriate methods are being used, time lines are being met to a reasonable extent, and results are being disseminated through reports and scientific publications. The major objectives of the program are being met and results from specific projects are being shared through regional research committees and other outlets as they evolve. The latest evaluation shows 18 separate projects underway with many nearing completion. Results are applicable to issues within the rural finance community. A National Symposium for Agricultural Finance Executives provides a valuable service and visibility for the Center. The program has produced an impres-

sive number of publications. Articles have been published in leading U.S. agricultural and finance journals and in international outlets.

FEED BARLEY FOR RANGELAND CATTLE, MONTANA

Question. Please provide a description of the research that has been funded under the Feed Barley for Rangeland Cattle grant.

Answer. This project supports research on the nutritional value of barley cultivars as feed for beef cattle. This research will assist the breeding and selection of superior barley types that can be more competitive with other feed grains and improve farmer income from barley crops grown in rotational systems in the Northern Great Plains. The project was subjected to a merit review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Barley is grown extensively as a feed grain in the United States. Based both upon chemical analysis and the experience of some cattle feeders, the principal investigator believes barley should have a feed value on a par with corn or wheat. However, currently barley is listed as inferior to both corn and wheat in feed hand books and is, therefore, discounted in the feed market. Comprehensive feeding studies of various barley types will be conducted to document the value as a feed grain for beef cattle.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to determine the true relative feeding value of barley for feeder cattle, and thereby improve the economic return to barley producers.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1996 with an appropriation of \$250,000; for fiscal year 1997, \$500,000; for fiscal years 1998 and 1999, \$600,000 each year; and for fiscal year 2000, \$637,500. The total appropriation is \$2,587,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds for this project were \$160,000 in 1996, \$174,500 in 1997, and \$168,000 in 1998. No information is available for 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at Montana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion of the original objectives is anticipated in fiscal year 2001. Integrating of findings into management systems is expected by fiscal year 2005 with outreach and information dissemination completed by fiscal year 2010.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is evaluated annually. It undergoes a scientific merit review by two Department Heads and three peer faculty members. It is reviewed again by a CSREES National Program Leader upon submission to the agency.

FLORICULTURE, HAWAII

Question. Please provide a description of the research that has been funded under the floriculture program grant.

Answer. The research carried out with these funds involves wholesale and retail U.S. and Japan market research, development of new varieties for aesthetic values and pest resistance, and pest management strategies to meet quarantine needs and consumer expectations.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researcher believes the tropical cut flower and foliage industry in Hawaii, which includes anthurium, orchids, flowering gingers, bird of paradise, heliconia, protea, and cut foliage is worth over \$50 million primarily in out-of-state sales. Development of disease resistant cultivars and quarantine pest management strategies that reduce pesticide usage are high priority issues at the national level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to develop superior Hawaii anthuriums, orchids, protea, and exotic tropical flower varieties with disease resist-

ance, particularly to anthurium blight which devastated the Hawaii anthurium industry through the mid-1980's and reduced Hawaii's market share. Additionally, research focused on development of post-harvest handling practices and quarantine pest control. To date, a new anthurium cultivar has been patented and released. Additional blight resistant cultivars are being propagated and tested by the anthurium industry. Disease resistant protea germplasm has been obtained from South Africa and is being used in the protea breeding program. A post-harvest hot water dip treatment has been developed and is being used commercially on tolerant cut-flower species to meet quarantine requirements.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$300,000; fiscal years 1990–1993, \$296,000 per year; fiscal year 1994, \$278,000; and fiscal years 1995–2000 \$250,000 each year. A total of \$3,262,000 has been appropriated since 1989.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: State appropriations of \$87,937 in 1995, approximately \$77,000 in 1996, \$56,680 in 1997, and \$62,600 in 1998 for a total of \$207,217 since 1995.

Question. Where is this work being carried out?

Answer. Research is being conducted by the University of Hawaii at Manoa and Hilo.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives in the original project were to maintain Hawaii floricultural industry competitive. This objective continues to be the principal direction for the projects. Because the industry and the markets are changing pests are becoming either resistant or newer strains. And quarantines are changing with technology the objective remains valid.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The individual projects funded under this Special Research Grant are evaluated through merit review to ensure that good science is being used. This evaluation is the major tool used to award funds to the projects.

FOOD AND AGRICULTURE POLICY INSTITUTE, IOWA AND MISSOURI

Question. Please provide a description of the research that has been done at the food and agriculture policy institute program.

Answer. The Food and Agriculture Policy Research Institute—FAPRI—was established by Iowa State University and the University of Missouri, Columbia, in 1984. The purpose of the institute is to conduct comprehensive analysis and disseminate results about the economic impacts of U.S. food, farm, and trade policies to agricultural producers, agribusinesses, and public policymakers. Iowa State conducts research on the economic interrelationships within and between domestic and foreign food and agricultural markets from the farm gate to market destinations; develops and maintains databases and analytical support systems to facilitate the analysis of agricultural and trade policy issues; and evaluates the impacts of U.S. and foreign commodity supply, demand, and public policy programs on agricultural trade. The University of Missouri maintains models of the domestic agricultural economy and directs its efforts primarily to the analysis of domestic policy issues. The two universities maintain linkages with a number of other universities who provide data and analytical support to the system. The universities maintain a comprehensive analytical modeling system of the U.S. and international food and agricultural sectors to evaluate near- and long-term economic implications of alternative farm policies for the basic commodities. Each year, and more often if conditions require, the system is used to provide economic information on potential impacts out to 10 years in the future of farm policies on farm prices, income, output, government program costs and means to enhance the management of farm programs at the national level.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The Nation's agricultural sector and its components are subject to numerous Federal policies and programs. FAPRI is the only publicly supported, non-Federal organization with the analytical capability to assess and evaluate the numerous public policies and programs affecting the agricultural sector and report results to

a broad constituency including farmers, agribusinesses, and Federal and State policymakers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to develop the analytical capability to assess and evaluate U.S. farm policies on the U.S. agricultural sector and disseminate this information to farmers, farm and other agricultural organizations and public policymakers. The mission has been expanded to include assessment of trade and environmental policy impacts and their interaction with the agricultural sector at national, regional, and farm levels. The models in place are also used to assess fiscal and monetary policy implications and impacts of new technologies such as biotechnological innovations on the agricultural sector.

Both institutions maintain large econometric models and data sets which are regularly updated to analyze farm and trade policy alternatives and the impacts of various programs on the several sub sectors of the agricultural economy. This update was especially valuable for conducting analysis to assess policy options for the 1996 farm bill. During the past year, the FAPRI completed 35-40 studies addressing policy issues such as assessments of the 1996 Farm Bill, alternative ethanol programs, USDA's proposed milk market order reform, U.S.-Canada agricultural trade, the importance of fast track to U.S. agriculture economic recession in the Middle East and the economic meltdown in Russia. Numerous studies were completed addressing improvements made to the empirical modeling system to improve domestic and international policy capabilities. The FAPRI staff has made numerous public appearances throughout the U.S. to agricultural groups and Congressional committees and Executive branch groups addressing policy issues.

Question. How long has the work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1984-1985, \$450,000 per year; fiscal years 1986-1987, \$357,000 per year; fiscal year 1988, \$425,000; fiscal year 1989, \$463,000; fiscal year 1990, \$714,000; fiscal years 1991-1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal years 1995-1996, \$850,000 each year, and fiscal year 1997-2000, \$800,000. The total amount appropriated is \$11,171,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$260,355 State appropriations, \$113,565 industry, and \$37,913 miscellaneous for a total of \$411,833 in 1991; \$321,074 State appropriations, \$51,500 industry, and \$35,100 miscellaneous for a total of \$407,674 in 1992; \$234,796 State appropriations and \$70,378 industry for a total of \$305,174 in 1993; \$78,286 State appropriations, \$43,925 industry, and \$29,750 miscellaneous in 1994 for a total of \$151,961 in 1994; \$80,155 State appropriations, \$37,128 industry, and \$42,236 miscellaneous for a total of \$159,519 for 1995; \$124,123 in State appropriations with no other funding for 1996; \$79,000 in State appropriations, \$50,000 industry and \$25,000 miscellaneous for a total of \$154,000 in 1997; and \$88,800 State appropriations, \$75,200 industry, and \$34,687 miscellaneous for a total of \$198,687 in 1998.

Question. Where is this work being carried out?

Answer. The program is carried out at the Center for Agriculture and Rural Development, Iowa State University and the Center for National Food and Agricultural Policy, University of Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. While individual projects show progress towards achieving the goal, this is a continuing program of research and analysis for the purpose of assessing farm and related policy actions and proposed actions likely to affect the agricultural sector and its components.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The annual proposal is carefully reviewed for adherence to stated objectives and progress before the special research grant is awarded. It is also peer reviewed prior to its submission. No formal evaluation of this program has been conducted.

FOOD IRRADIATION, IOWA

Question. Please provide a description of the research that has been funded under the food irradiation grant.

Answer. Since the Linear Accelerator Facility was placed in operation in March 1993, studies on the effect of irradiation on shelf-life extension, safety and quality of ground beef, beef steaks, ham, pork chops from loins, chicken breasts, and turkey have been conducted. Studies combining irradiation with high hydrostatic pressure and cooking, using whole chicken breasts, turkey and ham, have been conducted to determine the combination of these treatments that will yield a shelf-stable product while maintaining high eating quality. Several studies were conducted to determine whether consumers can detect a difference between irradiated and non-irradiated ground beef patties. Experiments were also conducted to investigate consumer acceptance of pork products irradiated to prevent trichinosis. Test markets of irradiated chicken breasts were conducted to determine consumers' willingness to pay for irradiated products. Studies on the effect of packaging materials on quality of irradiated meat have been completed. Quality changes in ready-to-eat meat and poultry products irradiated to control *Listeria* are under investigation. The fiscal year 2000 funds are supporting research from May 1, 2000 through June 30, 2001.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes consumers' attention and concern about the safety of fresh meat and poultry has increased with recent outbreaks of foodborne illness from *E. coli* O157:H7 and *Listeria monocytogenes*. The meat industry has also expressed interest regarding the quality of irradiated products, and how this process can be used to yield high quality fresh meats and ready-to-eat products that are free of pathogens. The recent massive recall of over 50 million pounds of frankfurters and luncheon meats due to illness caused by *Listeria monocytogenes* contamination has resulted in huge economic losses. Additionally, researchers from eight other research institutes have used the irradiation facility for research projects. Thus, the principal researcher believes this research to be of national, regional and local need.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of the research was to generate knowledge necessary to develop a research and technology transfer program leading to commercial use of irradiation of foods, whereby consumers would be provided with food products with enhanced safety. The effectiveness of irradiation, using an electron beam accelerator, in destroying known pathogenic bacteria in pork and beef has been determined. Mathematical models have been developed to predict the growth of bacteria in low-dose irradiated ground pork. Demonstration of irradiation technology has been presented to some commercial firms, and plans are being developed for some large scale test markets.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 when \$100,000 was appropriated for this project. The appropriations for fiscal years 1992 and 1993 were \$237,000 per year; fiscal year 1994, \$223,000; fiscal years 1995–1997, \$201,000 each year; and fiscal years 1998–2000, \$200,000 per year. A total of \$2,000,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. The project received \$1,037,270 in State of Iowa funds—\$1 million of which was for capital construction—in fiscal year 1991; \$37,942 in State funds and \$67,800 in industry grants in fiscal year 1992; \$68,897 in State funds, \$78,300 in industry grants and \$9,666 in user fees in fiscal year 1993; \$70,652 in State funds, \$35,420 in industry grants and \$47,788 in user fees in fiscal year 1994; \$72,772 in State funds, \$100,000 in industry grants and \$55,211 in user fees in fiscal year 1995; \$81,540 in State funds, \$115,300 in industry grants and \$50,963 in user fees in fiscal year 1996; and \$77,963 in State funds, \$253,450 in industry grants and \$46,550 in user fees in fiscal year 1997; and \$100,200 in State funds, \$205,900 in industry grants and \$36,200 in user fees in fiscal year 1998; and \$125,000 in State funds, \$213,800 in industry grants and \$34,900 in user fees in fiscal year 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal investigator anticipates that the project's original objectives will be met within a few years after the USDA final rules are issued for ready-to-eat meat and poultry products.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A review of the proposal supporting the fiscal year 1999 appropriation was conducted on February 24, 1999. Previous studies funded under this project have provided useful information toward understanding how irradiation can be useful in eliminating or reducing foodborne pathogens in meat products. It is anticipated that the proposed research will continue to further the understanding of how irradiation can be used to improve shelf-life and enhance safety of meats and meat products.

FOOD MARKETING POLICY CENTER, CONNECTICUT

Question. Please provide a description of the research done under the Food Marketing Policy Center grant.

Answer. The Food Marketing Policy Center was established in 1988 at the University of Connecticut at Storrs. The Center seeks to improve the performance of the food production and marketing system by conducting research on food and agricultural marketing and related policy questions. The Center is primarily an economic research organization, but it conducts interdisciplinary research as appropriate and it communicates results to the public. Key users include farm and consumer organizations, agricultural business firms, public agencies, State legislatures, and the U.S. Congress. The research proposal was subject to an administrative review and a peer review by the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research addresses an ongoing national need to monitor the performance of the U.S. food system and to recommend policies that improve performance for the benefit farmers, merchants, processors, and consumers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The ongoing research goal is to identify marketing problems and assess alternatives that improve economic performance of the U.S. agricultural and food marketing sector. The Center serves as a core research group for Regional Research Project NE-165, Private Strategies, Public Policies, and Food System Performance. The research agenda includes industrial organization, strategic marketing, economics of food safety, cooperatives, and public policy including antitrust and regulation.

The Center is a prolific provider of high quality theoretical and empirical work, and makes significant scientific, management, and policy contributions. The Center has prepared about 50 working papers, 40 policy research reports, 20 policy issue papers, 8 books and numerous chapters, a number of MS and PhD theses, and has distributed scientifically important research articles to researchers, industry, Federal and State legislators, and decision makers.

This grant annually supports ten to fifteen research projects in two problem areas: impacts of changes in strategies, technologies, consumer behavior and policies on the economic performance of the food system, and impacts of private and public strategies on improvements in food safety and quality. Projects include competitive strategy analysis of cooperatives and investor-owned firms; firm dominance in food manufacturing; advertising; mergers, product relatedness and performance outcomes; effects of market structure and concentration on promotional activity; testing theories of oligopoly conduct; relationships between market structure, firm position and price levels; strategic responses to food safety and nutritional regulation; and trade agreement effects on food quality and trade.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1988, \$150,000; fiscal year 1989, \$285,000; fiscal year 1990, \$373,000; fiscal years 1991-1993, \$393,000 per year; fiscal year 1994, \$369,000; fiscal years 1995-1998, \$332,000 each year; and fiscal years 1999-2000, \$400,000 a year. A total of \$4,484,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are State appropriations as follows: \$234,259 in fiscal year 1991; \$231,741 in fiscal year 1992; \$201,288 in fiscal year 1993; \$234,557 in fiscal year 1994; \$219,380 in fiscal year 1995; \$134,399 in fiscal year 1996; \$135,490 in fiscal year 1997; \$164,772 in fiscal year 1998; and \$163,895 in fiscal year 1999.

Question. Where is the work being carried out?

Answer. The research is being carried out at the University of Connecticut and the University of Massachusetts.

Question. What was the anticipated completion date for the original objectives if the projects? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1987 was for 24 months. According to the principal researcher, the objective of conducting policy-oriented research on food manufacturing and distribution industries to assist State and Federal policy makers in improving the performance of the food system is still an ongoing public concern, given increasing levels of concentration in food processing. The current phase will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in April 1999, as it evaluated the 1999 project proposal, and determined that "the PI and associated researchers are nationally and internationally recognized and are clearly competent to execute this project. Funded research will take place at the Center . . . and in collaboration with researchers at the London Business School, University of Nebraska, Rutgers University, Montana State University, and USDA." The proposal also was subjected to peer review by experts with scientific knowledge and technical expertise.

FOOD PROCESSING CENTER, NEBRASKA

Question. Please provide a description of the research that has been funded under the food processing center grant.

Answer. The University of Nebraska Food Processing Center has been conducting short-term, highly applied research projects to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Projects were selected based on the estimated economic impact of the technical assistance or the criticality of the technical assistance to the future of the firm or venture. Priorities were placed on projects relating to the safety of the food product or process and to the fulfillment of regulatory mandates such as nutrition labeling, use of approved and effective ingredients, and adherence to regulations imposed by foreign governments. In addition, several research projects were conducted to improve or assess the quality, extend the shelf-life, or assess or improve the processing efficiency of specialty food products which impacted several processors or used alternative agricultural products.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the primary impact of this project will be statewide. Small and mid-sized food processing companies and entrepreneurs have limited technological capabilities for addressing issues related to product development, process development, product and process evaluation, food safety, quality assurance, and regulatory mandates. The short-term research and technology transfer projects conducted as part of this overall project will aid these companies in appropriately addressing these oftentimes complicated issues.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research, as stated previously, is to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Technological evaluations were conducted for 89 individuals or companies interested in developing new food processing businesses. These evaluations included formulations, processes, processing equipment, packaging, shelf-life, sensory, nutritional attributes, microbiological quality, regulatory considerations, and other factors. Additionally, microbiological analyses, shelf-life assessments, sanitation audits, and nutritional analyses were conducted for numerous Nebraska food companies.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1992. The appropriations were \$50,000 per year for fiscal years 1992–1993; \$47,000 for fiscal year 1994; and \$42,000 for fiscal years 1995–2000 each year. A total of \$399,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. The Food Processing Center received \$402,389 in State funds and \$1,993,914 in food industry grants and miscellaneous sources from 1992 through 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Because this project supports ongoing technical assistance to clients, the objectives are ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on March 31, 1999. Progress under previous grants for this project appears to be satisfactory, with numerous examples of assistance cited and summaries of short-term projects provided by the principal investigator.

FOOD QUALITY, ALASKA

Question. Please provide a description of the research that has been funded under the Food Quality, Alaska grant.

Answer. Research will be aimed at establishing the Salmon Quality Implementation Project. The project has two parts. The first part is the evaluation, design, and implementation of a voluntary quality seal that can be attached to salmon that meet the existing standards for premium and number one grade. The second part is a series of workshops and training sessions on salmon quality handling and maintenance for workers at all levels of the industry, from harvesting to retail.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The seafood industry is Alaska's largest employer and main source of revenue in many communities along its 38,000 miles of coastline. The salmon fishery is second only to groundfish in providing the most value in the industry. It is the mainstay of many traditional, family-owned businesses. The salmon industry is regional, involving thousands of fishermen and processing workers from Washington State, Oregon, California and throughout the nation that come to Alaska to participate in the fishery. In recent years, the Alaska salmon industry has suffered economically from increased competition from international salmon farmers, mainly in Norway and Chile. They have made great inroads in many traditional markets, surpassed Alaska in salmon production, and now set the product standard in the marketplace. One key for American businesses to recapture and strengthen their salmon markets is to guarantee and promote the quality of wild Alaska salmon. This project will provide the industry with the research and information needed to accomplish this.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of this research was to ensure a consistent and predictable level of handling and quality for Alaska seafood. In doing so, the project will help Alaska seafood processors strengthen or maintain their place in domestic and international markets. Because this is a new grant, no progress has yet been reported.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999 and the appropriation for fiscal years 1999 and 2000 \$350,000 each for a total of \$700,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. The State of Alaska, the Alaska Seafood Marketing Institute and the industry will contribute considerable personnel hours to perform the work described in the application. The State will contribute the time of several staff people to research and help establish the voluntary quality seal program. Nine hours a week of staff time through the end of the fiscal year (31 weeks) would account for approximately \$10,000. The Alaska Seafood Marketing Institute will have a staff person set up training workshops throughout Alaska.

Question. Where is this work being carried out?

Answer. The work will be administered at the University of Alaska Fairbanks. Field work will be carried out in numerous Alaska fishing communities.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The anticipated completion date for the quality and handling training portion of the project is July 1, 2000. The anticipated completion date for the voluntary quality seal portion of the project is December 31, 2000. The project managers will be able to report at that time on their success at meeting project objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal received in support of the fiscal year 1999 appropriation was reviewed for merit by a CSREES specialist on August 27, 1999.

FOOD SAFETY, ALABAMA

Question. Please provide a description of the research that has been funded under the Food Safety, Alabama grant.

Answer. Auburn Research Centers Food Safety Program is developing a method of food inspection that involves the placement of a sensor chip on food items. The goal is for these chips to automatically inventory and assess the safety at any point from source to consumption of appropriate fresh food products sold in the U.S.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Most food-borne illness can be attributed to bacteria. The sensor chips developed at Auburn University will target detection of the bacteria that causes most of these illnesses. This technology could result in financial savings nationally, regionally, and locally through the prevention of food-borne illness and its related costs. Up to 33 million Americans become ill each year from food borne disease. Estimates indicate that as many as 9,000 of these individuals will die with another one million suffering permanent disabilities. The USDA estimates that foodborne illness costs the U.S. economy \$14.2 billion in lost productivity annually. This project will improve the safety of our food supply chain leading to an improved quality of life for every citizen and resident of the United States. In addition to these costs to the public and the nation, the costs to industry of settling civil litigation due to foodborne disease can be immense. The 1993 Jack-in-the-Box hamburger incident, which infected 433 individuals, resulted in lawsuit settlements of \$126 million dollars. This research when implemented should greatly reduce the incidence of foodborne illness.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to reduce the incidence of food-borne illness through the use of a sensor chip that will assess the safety of food items as they move through the food chain. The research will be conducted through June 2000 so the results will be available after that time. Already to date, the researchers have demonstrated a new method for the detection of Salmonella bacteria that has the potential to greatly reduce detection times. Current industrial methods require that a sample of suspect food be taken to the lab where tests require a minimum of 6 to 48 hours to determine a food is safe to eat. The new technology can identify harmful levels of Salmonella bacteria in a few minutes and will be packaged as a portable hand-held unit that may be used on the food production line. Additionally, Auburn University has demonstrated a working stamp size radio frequency identification sensor tag that can be used to automatically inventory and trace food within seconds. This tag stores information from farm to its final destination and can be interrogated to rapidly provide information to identify the source of a contamination or food problem should it be detected at a latter date downstream.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in June, 1999. The appropriation for fiscal year 1999 was \$300,000 and for fiscal year 2000 is \$446,250. A total of \$746,250 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. Non-Federal State funds of \$577,350 have been allocated to additionally sponsor the research in fiscal year 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at Auburn University, through the Auburn Research Center for Detection and Food Safety.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The anticipated completion date for the original objectives will be one year following the date of the award. The award date was June 15, 1999. Already the project has achieved over 50 percent of the first year objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project has been underway for less than 6 months. Normally evaluations are conducted on an annual basis which would make the next evaluation due after June 2000.

FOOD SYSTEMS RESEARCH GROUP, WISCONSIN

Question. Please provide a description of the research that has been done under the Food Systems Research Group program.

Answer. The Group conducts research on contemporary issues affecting the organization and competitiveness of the U.S. food system in domestic and international markets. The issues include new technologies, market structure, firm behavior, and government policies and programs. Studies have been completed on pricing of cheddar cheese, fed cattle and hogs; changes in private label product markets; causes of structural change in the flour milling, soybean oil milling, wet corn milling, cottonseed milling, beef packing, and broiler processing industries; competition in U.S. food markets; and the relationship between U.S. food market structure and the industry's performance in global markets. The research proposal was subject to an administrative review and a peer review by the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the U.S. food system is changing rapidly in response to a large number of global economic, social, and technological changes. Research is needed to determine the effects of these changes on the system's organization and performance, and to ascertain needed adjustments in public policies based upon sound research. There is a national need to assess and evaluate the organization and performance of the Nation's food industry to ensure that it continues to satisfy performance expectations of farmers and consumers and adheres to acceptable standards of conduct. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations like the Food Systems Research Group are providing research needed for public and private decision making.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal was to assess and evaluate the organization and performance of the U.S. food industry and provide recommendations for improvements. Recent research developed models to estimate allocative efficiency in broiler, beef and pork subsectors; allocative inefficiency appears in all three because participants do not adequately anticipate dynamic market changes; vertical integration in broilers has greatly improved production efficiency but not allocative efficiency. The strategic behavior of Wisconsin agribusiness firms was documented in three case studies: one firm operates in the mature artificial breeding industry; the other two deal with relatively high input costs for cheese production. Other work continues to focus on the impact of "tough competition" on industry performance. In 1996, the project published its analysis showing manipulation of prices on the National Cheese Exchange by Kraft General Foods. Subsequently, USDA discontinued using Exchange prices in calculating basic formula milk prices, the Exchange closed, and the Chicago Mercantile Exchange opened a new cheese market. In December 1998, the University was able to publish additional materials previously held back by legal proceedings.

The project has completed numerous studies on economic structure and performance issues of the U.S. food manufacturing and distribution system. Basic research is conducted on market theories; effects of mergers, new technologies, and firm conduct on industry structure and organization; factors affecting industry prices, profits, efficiency and progressiveness; and impact of public policies and regulations on food system organization and performance.

Question. How long has this work been underway, and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1976-1981, \$150,000 per year; fiscal years 1982-1985, \$156,000 per year; fis-

cal years 1986–1989, \$148,000 per year; fiscal year 1990, \$219,000; fiscal years 1991–1993, \$261,000 per year; fiscal year 1994, \$245,000; fiscal years 1995–1998, \$221,000 per year; fiscal year 1999, \$225,000; and fiscal year 2000, \$425,000. A total of \$4,897,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: State appropriations of \$120,304 in 1991; \$119,448 in 1992; \$85,188 in 1993; \$96,838 in 1994; \$59,435 in 1995; \$50,636 in 1996; \$56,421 in 1997; \$64,004 in 1998; and \$75,115 in 1999.

Question. Where is the work being carried out?

Answer. The grant supports research at the University of Wisconsin, Madison.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1976 was for a period of 36 months. The current phase of the program will be completed in fiscal year 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in July 1999, as it evaluated the 1999 project proposal, and concluded: "The Food Systems Research Group at the University of Wisconsin does excellent research on structure, conduct and performance of selected segments of the food industry and publishes in respected journals. Researchers have won many professional awards. Much of the work provides empirical tests of competing theories. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations like the University of Wisconsin are providing research needed for public and private decision making."

FORAGES FOR ADVANCED LIVESTOCK PRODUCTION, KENTUCKY

Question. Please provide a description of the research that has been funded under the grant.

Answer. The Cooperative State Research, Education and Extension Service has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to provide improved forages/livestock management systems for Kentucky and adjacent areas.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to improve the economics of livestock production through the use of advanced production systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$212,500.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is a new project and no non-Federal funds have been provided to date.

Question. Where is this work being carried out?

Answer. Research will be conducted at the University of Kentucky Research Station.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency has not yet received the project proposal. It will be reviewed and evaluated prior to awarding fiscal year 2000 appropriations.

FORESTRY RESEARCH, ARKANSAS

Question. Please provide a description of the research that has been done under the Forestry Research grant.

Answer. The Arkansas Forest Resources Center offers programs of research, education, and outreach to the landowners of Arkansas and the surrounding region. This has been accomplished through continuing education events for landowners, the development of a series of distance-learning tutorials, and the funding of 20 assistantships for the first two classes of graduate students in the new forest resources master's program. A partial list of workshops includes: Uneven-aged Silviculture of Loblolly and Shortleaf Pine Forest Types, Environmental Law & Policy, Timber Income Tax Update, Thinning Methods and Operations, Introduction to Arc View 3.0, Estate Planning, Forest Finance Applications: Basic Tools for Daily Practice, and Opportunities in Forest Regeneration. The educational thrust has combined Center and private dollars to establish one of only three of the country's Arc View Learning Centers for natural resources. To better provide the highly educated professionals needed in the natural resources professions, educational tutorials are being developed in dendrology-tree ID, plant morphology, silvics—that aid in the (1) transfer of students in community colleges to institutions with forest resources offerings, and (2) forest resources education of non-majors at institutions without forest resources faculty. Furthermore, the University of Arkansas activated a new Master of Science program in the Fall 1998.

Research projects address issues of species diversity, richness, redundancy, and the resilience of disturbed and undisturbed hardwood stands of the Mississippi River floodplain. Furthermore, research has indicated that neotropical migratory birds are indicators of ecosystem health. Factors influencing their breeding range, include habitat destruction/alteration and forest fragmentation. Thus, issues of re-establishment and structure of hardwood stands are important for timber, non-timber values, and the quality of life enjoyed regionally, nationally, and internationally. Also, other projects are contributing to the development of (1) a biological control agent for the southern pine beetle, (2) alternative forest crops for the economically-depressed Delta region, and (3) technologies for enhanced fiber and wood production from nonindustrial and industrial lands. Newer projects include an important regional social science study of the resource ethical values held by people of the southern United States and a comprehensive study for forest growth and yield.

Question. According to the research proposal, or the principal researchers, what is the national, regional, and local need for this research?

Answer. With the reduced levels of production of wood products from the Northwest, southern forests are increasingly having to produce a major portion of wood products for the United States. This increased demand and production make it critical that the forestry community understand the possible environmental effects of forestry practice. Social implications of the conflicts between forest production and environmental quality will become more and more important. Collectively, the projects address the sustainable management of southern forests.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to develop alternative forest management strategies for achieving multi-resource objectives; i.e., production of timber, wildlife, recreation and other values of the forest on private industrial and nonindustrial forest lands and public lands. Significant progress has been made in several areas. Some examples include: developing intensive fiber farming systems as alternatives to soybeans for Mississippi Delta farmers, taking the first step toward biological control of the southern pine beetle by discovering the nutrient needs of predators of the beetle so predators can be grown and studied in artificial cultures. The first survey of nonindustrial landowners in Arkansas for 15 years has been conducted. The survey shows that because of the average age of landowners, 60+ years, there will be a massive change in ownership in the next 10–20 years. Landowners continue to not be aware of assistance programs. The survey also indicated a concern about government programs and possible intervention on private land. This information will be useful in understanding future timber supply trends from private holdings and in the design of assistance and educational programs.

Ongoing projects include a broad array of topics, competitively awarded within the Center. These include best management practices, ecological characteristics, effects of different forest management regimes, stream-sided buffer zone effectiveness, effects of winter logging, and secondary processing efficiency.

Question. How long has the work been under-way and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows:

<i>Grant Year</i>	<i>Grant Received</i>
1994	\$470,000
1995	523,000
1996	523,000
1997	523,000
1998	523,000
1999	523,000
2000	523,000
Total	3,608,000

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-fiscal funding and its source provided to this grant in 1994 was \$411,726 State appropriations and \$380,000 industry for a total of \$791,726; \$491,301 State appropriations and \$785,262 industry for a total of \$1,276,563 for 1995; a total of \$695,204 from State and industry sources for 1996; a total of \$1,115,341 from these sources in 1997; and an estimated total of \$1,000,000 for 1998. For 1999, the State legislature appropriated approximately \$850,000 above the 1998 level.

Question. Where is the work being carried out?

Answer. The Arkansas Forest Resources Center is administered from the School of Forest Resources on the campus of the University of Arkansas at Monticello. Individual studies are being conducted at the University of Arkansas at Fayetteville and several locations across the State.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Grants were received 1994–1999 with funds distributed for use over the 3 to 5 years following the activation year. Projects are on schedule; work from 1994 and 1995 funding are nearing completion. Forestry research is long term. Center objectives and selected projects will be continued beyond the life of individual grants using the infrastructure and capacity developed with these Special Research Grants.

Question. When was the last agency evaluation of the project? Provide a summary of the last evaluation conducted.

Answer. In 1991, an agency team visited the University and reviewed faculty qualifications, supporting sources, and the feasibility of the proposal. The team exit report indicated the faculty was highly capable, the infrastructure needed strengthening, and the proposal concepts were feasible. Since 1991, there has not been a formal program review. A review planned for the year 2000 has been rescheduled for 2001 because of a change in forest resources leadership at the University.

FRUIT AND VEGETABLE MARKET ANALYSIS, ARIZONA AND MISSOURI

Question. Please provide a description of the research that has been funded under the fruit and vegetable market analysis program.

Answer. The purpose is to provide timely knowledge and analysis of the impacts of trade, environmental, monetary, and other public policies and programs upon the Nation's fruit and vegetable industry to farmers, agribusinesses, and policymakers through a program of empirical assessment and evaluation.

Question. According to the research proposal, or the principal researchers, what is the national, regional or local need for this research?

Answer. The U.S. fruit and vegetable sector is experiencing increased growth from greater domestic and export demand. However, the growth of this sector depends upon its ability to compete domestically and internationally and to conform with the regulatory environment in which it operates. This program of research provides increasingly critical information to farmers and policymakers on the implications and impacts of various policies and programs such as environmental, trade, labor, and food safety. It is the only such program providing analysis of the total U.S. sector.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to develop the analytical capability to assess and evaluate public policies and programs impacting the U.S. fruit and vegetable industry and disseminate the results to policy makers, industry organizations, producers, and other users. Proposals have been submitted that outline long-range plans and specific projects for funding. Models have been developed for 18 major (as measured in production, consumption, and trade) U.S. fruits and vegetables representing 80 percent of the farm value of the U.S. fruit and vegetable industry. Trade models for those commodities with a significant import and/or export sector will also be devel-

oped. These models feed in to a larger food and agricultural sector model to support analysis of cross commodity and policy effects.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000; for fiscal years 1995–1998, \$296,000 each year; and for fiscal years 1999, \$320,000; and for fiscal year 2000, \$320,000. A total of \$2,153,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funding and its source provided to this grant in 1994 was \$50,073 State appropriations and \$11,000 industry for a total of \$61,073; \$21,876 State appropriations and \$36,624 industry for a total of \$58,500 for 1995; a total of \$62,400 from State and industry sources expected for 1996; and \$50,000 each year from these sources in 1997 and 1998.

Question. Where is the work being carried out?

Answer. The work is being carried out at Arizona State University and the University of Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The university researchers anticipate that work will support ongoing, changing projects to look at the impact of various public policy proposals on the U.S. fruit and vegetable industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation. However annual proposals are peer reviewed for scientific merit and relevance; also each annual budget proposal is carefully reviewed and work progress is compared with prior year's objectives. Informal discussions with congressional staff indicate that the analyses are extremely useful.

GENERIC COMMODITY PROMOTION, NEW YORK

Question. Please provide a description of the research that has been done under the generic commodity promotion program.

Answer. The grant supports, in part, the National Institute on Commodity Promotion Research and Evaluation which provides objective analyses of national and State commodity checkoff programs designed to enhance domestic and export demand for U.S. agricultural products. "Checkoff" programs provide funds from producers to pay for advertizing and promotional programs. The overall project proposal was peer reviewed at the university level; a competitive peer review process is used to select specific research projects.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher states that producers are contributing about \$1 billion annually to commodity research and promotion funds designed to expand the domestic and export markets for their products. The number of commodity groups participating and the size of the funds available could continue to grow. The 1996 FAIR Act requires all federally-constituted research and promotion boards to evaluate their programs at least every five years. Accurate evaluations require the development of sophisticated techniques that differentiate the impact of research and promotion expenditures from several other market influencing factors.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to determine the economic effectiveness of generic promotion programs designed to increase the sales of agricultural commodities in domestic and international markets. Accomplishments over the last five years include: Understanding key economic relationships in the advertising and promotion of milk and dairy products, beef, cotton, and eggs, and the exports of beef, pork, and wheat; developing new methods of estimating the relationships among advertising, promotion, government support programs, and government policy; developing new methods of measuring advertising "wearout;" determining the sensitivity of results using various methods; explaining the effect of socioeconomic and market factors on the impact of advertising; estimating optimal allocation of advertising expenditures by type of media; comparing the relative returns from generic and brand advertising. The Institute has sponsored educational workshops and conferences for promotion

board leaders, and for elected and appointed public officials responsible for developing public policy and administering checkoff programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by the grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000; for fiscal years 1995–1999, \$212,000 each year; and for fiscal year 2000, \$198,000. A total of \$1,493,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal matching funds and sources allocated to this grant by Cornell University are as follows: \$97,333 a year in State appropriations for 1994–96; \$125,650 for 1997; and \$130,430 each for 1998 and 1999. Collaborating institutions performing work under subcontracts also contribute non-Federal matching funds.

Question. Where is this work being carried out?

Answer. The work is being carried out at Cornell University in collaboration with eight other land-grant universities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 21 months, however, the need to evaluate the benefits of commodity promotion and research programs is a growing regional and national concern, as producers take on greater responsibility for marketing their products. An increasing number of promotion and research programs are being evaluated. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1999, as it evaluated the 1999 project proposal, and determined that “the project has sound objectives and procedures that are helping private and public decision makers effectively expand markets for U.S. agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans. The principal investigator is well recognized for his leadership in this area of research. Research results appear in several peer reviewed professional journals and popular press, and researchers have ongoing dialog with private and public decision makers.

GLOBAL CHANGE

Question. Please provide a description of the research that has been funded under the global change grant.

Answer. Radiation from the sun occurs in a spectrum of wavelengths with the majority of wavelengths being beneficial to humans and other living organisms. A small portion of the short wavelength radiation, what is known as the Ultraviolet or UV-B Region of the spectrum, is harmful to many biological organisms. Fortunately, most of the UV-B radiation from the sun is absorbed by ozone located primarily in the stratosphere and does not reach the surface of the earth. The discovery of destruction of the stratospheric ozone layer and development of the ozone hole over polar regions has raised concern about the real potential for increased UV-B irradiance reaching the surface of the earth and the significant negative impact this could have on all biological systems including man, animals, and plants of agricultural importance. There is an urgent need to determine the amount of UV-B radiation reaching the earth’s surface and to learn more about the effect of this changing environmental force. The Cooperative State Research, Education and Extension Service, CSREES, is in the process of establishing a network for monitoring surface UV-B radiation which will meet the needs of the science community of the United States, and which will be compatible with similar networks being developed throughout the world. The fiscal year 1999 grant supports work thru September 2000.

This grant is part of a government-wide initiative. The research is closely coordinated with the National Aeronautical and Space Administration, the National Oceanographic and Atmospheric Administration, the Environmental Protection Agency, the Smithsonian, the National Science Foundation, and the Department of the Interior. All these Federal agencies are involved in the U. S. Global Change Research Program Inter-agency UV-Monitoring Network Plan.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes destruction of the stratospheric ozone layer, our shield from the full intensity of solar radiation, continues to increase. This creates a high priority need for information to document not only the levels of UV-B radiation reaching the earth's surface, but the climatology of that radiation. The United States, and the rest of the world, needs to know the strength of the UV-B radiation reaching the earth and the potential impact on all forms of life, especially animal and plant life of agriculturally important species. The principal researcher believes this research to be of national as well as regional and local importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The purpose of the USDA UV-B Network is to provide accurate, geographically dispersed data on UV-B radiation reaching the surface of the earth and to detect trends over time in this type of radiation. A primary problem which had to be overcome in order to reach this goal was the development of instrumentation adequate to make the measurements required for the monitoring network. A major advance occurred during 1996 with the availability to the network of a new multi-band instrument which will provide the spectral information needed to support both biological and atmospheric science research and to serve as ground-truth for satellite measurements. These instruments have been deployed and are currently in operation at twenty-six monitoring sites across the United States, including Hawaii. The researchers plan to have additional sites in Alaska, Puerto Rico, Oregon, North Carolina, and Oklahoma, but these plans are on hold due to lack of funding to support their installation and operation.

Two grants to design and build six advanced spectro-radiometers have been awarded under the National Research Initiative Competitive Grants Program. These instruments are to be used in a research network to make precise measurements of the total UV-B spectra at selected research sites. The first of these instruments failed to meet spectral performance standards when tested and calibrated by the National Institute of Science and Technology. An alternative design which resulted in a much larger and more difficult instrument to deploy has been developed. The first of the advanced instruments was deployed at Department of Commerce research site at Table Mountain near Boulder, Colorado during the fall of 1998. The second and third were installed at a Department of Energy solar radiation research site in Oklahoma and at an Agricultural Research Service Plant Stress site in Beltsville, Maryland during 1999. Additional funding will be required to support the deployment of additional research instruments.

To gain experience in network operation, broadband instruments along with ancillary instruments were installed at ten sites and have been in operation for the last 64-72 months. These sites are now equipped with a full compliment of instruments including the new multi-band instrument. Sixteen additional sites developed since 1997 are similarly equipped with broadband and the new multi-band UV instrument. Data from each site is transmitted daily to Colorado State University for preliminary analysis, distribution and archiving. These data are available, within 24 hours of collection, on the Internet via a World Wide Web Site located in the Natural Resources Research Laboratory at Colorado State University. The Department of Agriculture is also a participant in the development of a central calibration facility at Department of Commerce facilities in Boulder, Colorado. The purpose of the central calibration facility is to ensure uniform and acceptable calibration and characterization of all instruments used in interagency UV-B monitoring programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1992, and the appropriation for fiscal years 1992-1993 was \$2,000,000 per year; fiscal year 1994 was \$1,175,000; fiscal year 1995 was \$1,625,000; fiscal year 1996 was \$1,615,000; fiscal year 1997 was \$1,657,000; and fiscal years 1998, 1999 and 2000 were \$1,000,000 per year. A total of \$12,982,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$162,000 State appropriations in 1993; \$183,106 State appropriations in 1994; and \$285,430 provided by Colorado State University in 1995.

Question. Where is this work being carried out?

Answer. Colorado State University is managing the operating network, which when completed will include all regions of the country. At least thirty sites are planned for the climatological network including sites in Hawaii, Alaska and Puerto

Rico in order to provide broad geographic coverage. Ten sites have been operational with broad band instruments for up to six years and twenty-six sites are now operational with new generation instruments. The research level network began with the first instrument installed at the Table Mountain, Colorado instrument inter-comparison site and the second and third have been installed at the Department of Agriculture Plant Stress Laboratory at Beltsville, Maryland and The Department of Energy Solar Radiation site near Ponca City, Oklahoma as part of the Atmospheric Radiation Measurements field network in 1999.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. As with other weather and climate observations, this network will be an ongoing need for the predictable future. These measurements will provide information on the nature and seriousness of UV-B radiation in the United States and will provide ground truth validation to other predictions of UV-B irradiance. The project has nearly met its first objective of the establishment of a climatological network to monitor UV-B radiation at the surface of the earth. Years of operation will be required to measure trends in UV-B radiation and to develop models to predict the climatology of UV-B radiation.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency has assigned two technical staff to continuously monitor activities in the global change research program. A team of three experts in UV-B radiation measurement technology reviewed specifications for the development of the advanced spectroradiometers in July, 1996 prior to the procurement of major components of the instrument. A panel of radiation spectra scientists were brought in to review data derived from the new multi-band instruments in December 1996 to advise on the interpretation and analysis of data derived from these instruments. Agency staff is in contact with program management on a weekly basis and has visited the program headquarters six times during the last year. The annual plan of work has been reviewed by three scientists prior to approval by the agency. A review of the UV-B Monitoring Program by a panel of technical experts from outside the Department is planned for 2000.

GLOBAL MARKETING SUPPORT SERVICES, ARKANSAS

Question. Please provide a description of the research that has been done under the global marketing support services program.

Answer. The Global Marketing Support Services project provides leadership for a comprehensive program to integrate Arkansas into the global economy. It provides market analyses and other research to identify marketing opportunities, and provides access to essential databases for people interested in conducting their own research. The research effort supports several educational activities, including workshops, educational materials, one-on-one technical assistance that help mostly small and moderate size businesses understand and enter the export market. The research proposal received a peer review at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the emerging importance of global trade to the nation's economy and the reduction of trade barriers world-wide present unprecedented opportunities for cooperative public-private-university research to develop expertise not only in Local markets, but in world markets as well.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to develop a university research and service organization to support international trade development activities by local area businesses. During the past year, two market analyses were done for Slovakia, and work was initiated for countries in Central and South America. As a result of previous work, a Panamanian business leader visited Arkansas firms in 1999. Two "Export Marketing—Getting Started" workshops were held; six firms received one-on-one assistance and have significantly increased their interest in international marketing. Six factsheets were completed and distributed. An Internet website was used to distribute information, and an Internet international market was developed. The project developed stronger ties with the Small Business Development Council, Arkansas Economic Development Commission and the U.S. and Foreign Commercial Service as partners in educational and technical assistance activities.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$47,000; for fiscal years 1995 through 1997, \$92,000 per year; and for fiscal years 1998 through 2000, \$127,000 per year. A total of \$704,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were \$90,000 per year in State appropriations for 1994 through 1996; \$51,700 for 1997; \$80,000 for 1998; and \$83,000 for 1999.

Question. Where is this work being carried out?

Answer. This research is being conducted at the University of Arkansas, Fayetteville.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 12 months, but the objective of expanding the export capacity of small to medium-sized agribusiness firms will not be met until 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1999, as it evaluated the 1999 proposal, and determined that "the project is helping agribusiness expand markets for U.S. Agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans. The principal investigator provides very good leadership for the project and integrates it into the overall research, education and extension functions of the university to provide relevant and useful assistance to Arkansas firms."

GRAIN SORGHUM, KANSAS

Question. Please provide a description of the research that has been funded under the Grain Sorghum grant.

Answer. This project was designed to improve the yield improvement of grain sorghum cultivars by developing early maturing hybrids with a longer grain filling period. The research focuses on identification of sorghum germplasm, which have a longer grain filling period or earlier maturation date. These traits may be used to shift more of the production to grain and less to vegetative growth, thus enabling more efficient use of the limited water supply. These funds are awarded to scientists working on sorghum at Kansas State University.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The focus of this research is toward the non-irrigated lands of Kansas where sorghum can produce a grain crop under conditions that would not be possible with corn and is, therefore, very important in the rotation with wheat. While the research is directed toward Kansas conditions, it would also apply to adjoining States. Germplasm research of national significance could potentially be supported by the competitive grants awarded under the National Research Initiative or the Initiative for Future Agriculture Food and Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify germplasm and use it to develop grain sorghum cultivars that mature earlier and produce more grain. Initial studies have identified genetic characteristics controlling grain yield under a range of climatic conditions. Researchers have identified several sorghum lines, which have a grain-filling period as much as one-third longer than U.S. adapted parent lines. Analyses show that variability exists, the trait is genetically controlled, and incorporation into adapted germplasm can be accomplished. Simulation of expected production gains has been initiated.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 1997 and the appropriation for fiscal years 1997 through 2000 was \$106,000, for a total of \$424,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In 1998, Kansas State provided support via salaries and associated fringe benefits of \$31,852, associated indirect costs of \$14,652, and in-kind costs of \$45,580, for a total of \$92,084 and \$95,700 for 1999.

Question. Where is this work being carried out?

Answer. These funds are awarded to Kansas State University, which allocates the money to Kansas State University scientists working on sorghum.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of this project, which began in 1997, are to develop sorghum parental lines with genetically longer grain fill duration and identify changes in management necessary to optimize grain production in these lines. Five years or more are required to accomplish the objectives. The first objective has been completed. The researchers expect to complete the next three original objectives by 2004 and subsequent objectives by 2006. Preliminary results have contributed toward the understanding of factors controlling grain yield and the development of higher yielding sorghum cultivars for Kansas.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is subjected to the institutional review and approval process, as well as review by an agency scientist. In addition, stakeholder input was obtained through formal and informal methods. The institutional review of the project confirmed that high priority issues of the sorghum industry in Kansas and other sorghum producing States were being addressed.

GRASS SEED CROPPING SYSTEMS FOR SUSTAINABLE AGRICULTURE

Question. Please provide a description of the research that has been funded under the Grass Seed Cropping Systems for Sustainable Agriculture grant.

Answer. This program was developed to provide management systems for sustainable grass seed production without field burning of the straw residue following harvest which results in adverse air quality problems. Grass seed yields are often significantly reduced the following season if the residue is not burned.

Funds from this grant are awarded competitively to scientists at Oregon State University, the University of Idaho, and Washington State University engaged in research on grass seed production. Each award has passed a merit review by peer scientist.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that according to information provided by technical committees representing researchers and the grass seed industry, the need for this research is to develop sustainable systems of seed production that do not depend on field burning of straw residue. Much of the grass seed for the United States, including lawn grasses, is produced in the area. Field burning of straw residue creates unacceptable levels of air pollution and yields of some cultivar decline without burning.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal for this project is to develop grass seed production systems that do not depend on field burning of straw residue. To date, joint planning by State experiment station administrators and researchers from the three States with industry input have developed an integrated regional research effort to solve the problem.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995–2000, \$423,000 each year. A total of \$3,008,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal support for this project in fiscal year 1994 was \$266,055, \$298,052 for fiscal year 1995, \$282,053 in 1996 \$301,650 in 1997, \$310,700 in 1998, and \$346,500 in 1999.

Question. Where is this work being carried out?

Answer. The research will be conducted by the three State agricultural experiment stations in Idaho, Oregon and Washington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion of the initial objectives was anticipated to take five years and, were partially completed in 1999. Revised goals leading to application of new management systems have been developed and should be completed in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The entire project is reviewed annually by a steering committee for focus and relevance. The combined proposal is reviewed by the agency before funds are awarded.

Considerable progress has been made toward identifying the consequences of phased out field burning of straw residue on grass seed production. Current and future effort are directed toward development of sustainable systems without field burning. This program is subject to annual comprehensive evaluation by a team of peer scientist, industry representatives, and farmers. The results are used to guide research for the next year. Each proposal is subjected to the institution project approval process and reviewed by the agency National Program Leader.

HUMAN NUTRITION, IOWA

Question. Please provide a description of the work that has been funded under the Human Nutrition, Iowa grant.

Answer. This research aims to develop animal and plant foods with nutritionally optimal fat content and to improve utilization of foods containing non-nutrient health protectants, components that may reduce health risks. The research includes food production and processing, human and animal nutrient utilization, consumer food choices, and economic impacts of designed food to support optimal nutrition. The fiscal year 1999 grant supports research efforts of 30 investigators from seven disciplines through June 2000. CSREES requested that the university submit a grant proposal for fiscal year 2000 which is now under CSREES merit review.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. The research addresses food quality, nutrition and optimal health. Much of the research focuses on improving the nutritional quality of foods important to the economy of the Midwest, while making those improvements economically feasible. Ongoing research focuses on increasing health protective lipids and plant chemicals in human foods. Such foods have recently been called functional foods and the development of functional foods is of high priority to the food industry. Recent strategies have included genetic modification of plant foods for animal and human diets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Center for Designing Foods to Improve Nutrition, the administrative unit for this grant, is to improve human nutrition and health maintenance by determining how to improve animal and plant food fat content and how to increase availability of health-protectant factors in the human food supply.

The Center's research group on soybean health effects has established an international reputation for the soybean isoflavone database. Studies of isoflavone absorption and bioavailability indicated different human phenotypes in the intestinal breakdown of isoflavones. Ongoing studies are determining genetic and environmental factors responsible for these differences. Results suggest that consumption of soybeans with isoflavones during menopause help to maintain bone density. One project focuses on the structural features of flavones and related compounds that are effective in preventing colon cancer. Results suggest that combining flavonoids at low doses may enhance the ability in prevention of colon cancer.

Additional projects are focusing on other phytochemicals that are widely distributed in plant foods and may account for many of the beneficial properties associated with eating fruits and vegetables. Another project has identified a bioactive compound from cinnamon that may potentiate the action of insulin to help overcome insulin resistance in type II diabetics. Recent research using the Center's unique analytical facilities determined that a normal dietary intake of the carotenoid, lutein, interferes with the generation of vitamin A from beta-carotene, a major carotenoid precursor for vitamin A.

Other accomplishments include development of strategies for enriching yogurt, milk, eggs and pork with conjugated linoleic acids commonly called CLA. These compounds have unique cancer preventive properties and are derived from animal fats. Eggs were shown to be a particularly good human food for increasing dietary CLA. Other ongoing research identified fractions of human milk that enhance iron absorption by human colon cells. Such a milk factor was long expected to be responsible for the unique high iron absorption by human infants fed mothers' milk. The identification of this factor will have important benefits for infant feeding and for improving iron fortification. In the area of behavior modification, Center scientists developed a two-credit college course for freshmen that successfully prevented weight

gain, whereas control students who did not participate gained 7.8 kilograms over the sixteen-month study period.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of \$300,000. The fiscal years 1992–1993 appropriation was \$500,000 per year; \$470,000 in fiscal year 1994; \$473,000 per year in fiscal years 1995 through fiscal year 2000. A total of \$4,608,000 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$293,000 university, \$312,869 industry, and \$14,000 miscellaneous in 1991; \$90,000 State appropriations, \$473,608 university, \$131,160 industry, and \$116,560 miscellaneous in 1992; \$307,500 State appropriations, \$472,081 university, and \$222,267 industry in 1993; \$486,000 university and \$254,000 private in 1994; \$210,000 university and \$200,000 private in 1995; \$613,770 university and \$207,811 private in 1996; \$690,736 university and \$458,000 private in 1997; \$502,124 university and \$700,000 private in 1998; and \$363,000 university, \$3,109,000 private and \$2,617,000 other Federal in 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at the Center for Designing Foods to Improve Nutrition, Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective to design foods to improve nutrition is continuing to be addressed. A new set of related objectives will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant proposals for fiscal years 1998 and 1999 have undergone extensive scientific peer review by the grantee. Progress and objectives were further reviewed in May 1999, by the Center's newly formed External Advisory Council and their recommendations are being implemented.

HUMAN NUTRITION, LOUISIANA

Question. Please provide a description of the work that has been funded under the Human Nutrition, Louisiana grant.

Answer. Obesity remains a worldwide epidemic. The grant entitled "Dietary Fat and Obesity" examines three aspects of this problem. Will the replacement of dietary fat reduce body weight in overweight men? Will fluctuations in daily fat intake influence the ability to use fat? How do good and bad fatty acids produce their differences?

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. If dietary fat plays a role in the epidemic of obesity, reducing fat intake might help alleviate its consequences. In collaboration with industry, the effects of a commodity-derived fat substitute made from sugar and soybean oil, which can lower the intake of available fat, is under investigation.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal of this grant is to identify the basis for the susceptibility to obesity of people who eat high-fat diets and to understand how they differ from those people who are resistant to becoming obese when eating a high-fat diet. In the first project, researchers have just completed a year-long feeding study in which one group received a standard diet that was compared with two low-fat diets. The data that are now being analyzed suggest that overweight men lose weight when eating the special commodity-derived fat replacement, but not when eating a standard diet. In the second project, studies on the effect of varying the intake of fat from day to day suggest that the adaptation is similar to a single change. This implies important sensing mechanisms respond rapidly but are not well understood. Data from the third project, dealing with dietary fatty acids and insulin sensitivity, clearly show that trans fatty acids acutely increase insulin secretion and/or reduce insulin clearance, and that this effect is more pronounced in people with certain genetic characteristics. Longer-term feeding studies with trans fatty acids in healthy young men and women showed that trans fatty acids do not have strong effects on insulin action if a low-fat diet is consumed.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991, and the appropriation for fiscal years 1991–1993 was \$800,000 per year and for fiscal years 1994–2000 was \$752,000 per year. A total of \$7,664,000 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$523,100 State appropriations in 1991; \$515,100 State appropriations and \$2,216,606 private in 1992; \$536,100 State appropriations and \$940,000 private in 1993; \$627,000 state appropriations and \$3,775,000 private in 1994; \$546,100 State appropriations and \$3,100,000 private in 1995; \$1,471,000 State appropriations and \$2,488,000 private in 1996; \$1,998,000 State appropriations and \$2,104,000 private in 1997; \$987,000 State appropriations and \$1,892,000 private in 1998; and \$1,004,000 State appropriations and \$3,136,000 private in 1999.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Pennington Biomedical Research Center, Louisiana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective was to understand the relationship of dietary fat to the development of obesity, and this objective hasn't changed. The anticipated completion date for the specific related objectives is 2001. The objectives to be completed over the remaining time of the grant will be reviewed by an external advisory team.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In March 1999 an on-site panel of researchers evaluated the proposed objectives and experimental protocols. The critiques from this site visit were used to revise the final proposal. Another site visit is planned in 2000 to assess the progress, and evaluate a new set of relative objectives, and future research protocols.

HUMAN NUTRITION, NEW YORK

Question. Please provide a description of the work that has been funded under the Human Nutrition, New York grant.

Answer. This grant continues to bring together investigators who focus on issues that range from improving our understanding of key roles of nutrients at the molecular level to the development of improved strategies to enable consumers to adopt newly created knowledge easily and effectively. At the molecular end of the spectrum, emphasis is given to nutrient-gene interactions and at the consumer end, emphasis is given to the role that a supportive environment plays in enabling consumers to make desired changes in their eating patterns. The fiscal year 1999 grant supports research through September 2000 and the focus shifted to address the individualization of nutrient requirements from a broad multidisciplinary perspective.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. In the past decade, and in particular the past five years, there has been an explosion of knowledge concerning individual differences in the genetic control of metabolism which underlay disease processes and health maintenance. Because metabolism cannot exist without the provision of nutrients, and because nutrients influence genetic control, an understanding of genomics is fundamental to the development of nutritional sciences, from the biological to the social. Further, knowledge of individuality will become critical for the development of appropriate nutrition programs and policies, ranging from food system concerns, to the philosophy and design of dietary guidelines and guidance, to the implementation and evaluation of food assistance programs. For all of these applications there is a need for an integrated consideration of individual differences, not just in biology, but also in personal and cultural experience with food and other lifestyle and environmental exposures.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Dietary Guidelines emphasize a reliance on plant-based foods. This emphasis is designed to control caloric consumption, reduce fat intake, modify the composition of ingested fats, enhance the consumption of foods associated with reduced cancer risk and simultaneously insure that nutrient needs are met in the proportion that is recommended. The researchers continue to address information gaps that re-

late to these health goals and to the policy aims for their implementation and that limit the more effective enhancement of consumer practices. This grant supported 25 research and outreach projects over the past year including 14 new awards in fiscal year 1999.

Selected highlights of the work in community outreach included the expansion of the Sisters in Health program to ten additional counties in New York State. This research-based nutrition education program encourages low income women to eat more fruits and vegetables through active experiences with foods in a positive social setting and has reported a 30 percent increase in fruit and vegetable consumption by participants. Another project supported the Community Food Security planning sessions that were held in six counties in New York State. Members of the groups have incorporated the insights and plans obtained from these sessions into their existing programs and activities.

The new initiative in genomics led to a study of the regulation of folate metabolism during neural development in a mouse model system. Disruption in folate metabolism due to nutritional deficiency and/or genetic predisposition is responsible for the occurrence of approximately 60 to 70 percent of neural tube birth defects including spina bifida. Using transgenic and gene knock-out approaches, researchers identified key genes that regulate folate metabolism exclusively during neural development. They are elucidating the molecular association between certain genes and nutrient status in the disease process, thereby defining the relative contribution of both nutrition and genetics in these folate-related birth defects. Other work in genomics include a study of the potential role of Receptor Associated Protein as a chaperone of lipoprotein lipase by employing mice with deletion of a critical gene. Lipoprotein lipase is a pivotal enzyme that regulates lipid metabolism. The enzyme is found mainly in adipose tissue and muscles but not in the liver. Recent work may have identified the molecular basis for the lack of expression of this enzyme in the liver.

Question. How long has this work been underway, and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal years 1990–1991, \$556,000 per year; fiscal years 1992–1993, \$735,000 per year; fiscal year 1994, \$691,000; fiscal years 1995–2000, \$622,000 each year. A total of \$7,455,000 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$154,056 State appropriations and \$2,456 private in 1991; \$238,430 State appropriations and \$60,746 private in 1992; \$19,401 State appropriations and \$22,083 private in 1993; \$202,441 State appropriations and \$1,175 private in 1994; \$296,794 State appropriations in 1995; \$348,127 in State appropriations and \$39,593 private in 1996; \$133,162 State appropriations in 1997; \$8,185 university appropriations, \$166,752 State appropriations, and \$7,905 private in 1998; and \$6,395 university appropriations, \$164,244 State appropriations, and \$7,414 private in 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at Cornell University, New York.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective to integrate nutrition goals and food systems is continuing to be addressed in fiscal year 1999. The university changed the focus to complement the university's initiative in genomics and to human and social science issues that relate to food and nutrition. Progress has been consistent with the proposed time lines. They anticipate completing the specific related objectives in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES made a site visit on May 27, 1999, to evaluate the change in focus. The grant proposal for fiscal year 1999 was also subjected to independent peer review coordinated through the Cornell Agricultural Experiment Station. Based on reviewer recommendations, two proposed objectives were not funded and modifications were made to experimental designs of other projects.

HYDROPONIC TOMATO PRODUCTION, OHIO

Question. Please provide a description of the research that has been funded under the Hydroponic Tomato Production, Ohio grant.

Answer. The Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that has not yet been received. Cultural practices, greenhouse design, and economics will be evaluated for Ohio and adjacent areas. Tomato production will be evaluated as an alternative enterprise to other crops.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research is needed to develop and evaluate management protocols for economical production of green houses tomatoes as an alternative crop for Ohio and adjacent areas.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of the research is to provide recommendations for management systems for successful operation of green house tomatoes as an alterative crop.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal year 1998 was \$140,000, and for fiscal years 1999 and 2000 is \$200,000 each year. A total of \$540,000, has been appropriated.

Question. What is the source and amount of non-Federal provided by fiscal year?

Answer. The non-Federal funds provided for support of the project are \$19,400 for fiscal year 1998 and \$24,500 for 1999.

Question. Where is this work being carried out?

Answer. The research will be conducted by the Ohio State Agricultural Experiment Station at selected locations in Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator for this project anticipates completion of the original objectives in fiscal year 2002. New objectives related to grass breeding are projected for completion in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was subjected to a peer review in the institution and again reviewed by the agency National Program Leader when initialed in 1998.

ILLINOIS-MISSOURI ALLIANCE FOR BIOTECHNOLOGY

Question. Please provide a description of the research that has been funded under the Illinois-Missouri Alliance grant.

Answer. The Illinois-Missouri Alliance has initiated a competitive grants program in agricultural biotechnology for research in targeted priority areas of need related to corn and soybeans. The scope of interest includes production, processing, marketing, utilization, inputs and support services, along with economic, social, environmental, and natural resource concerns. The Alliance has solicited research project proposals from scientists at Illinois and Missouri and other midwestern institutions, and has conducted peer reviews for science quality, commercial feasibility and potential economic impact to select the proposals that will be funded. In 1999 the Alliance awarded three new research grants at three institutions totaling \$590,000.

In 1998 the Alliance started an on-line magazine called AgBioForum devoted to the economics and management of agricultural biotechnology. The purpose of AgBioForum is to provide unbiased timely information and new ideas leading to socially responsible and economically efficient decisions in science, public policy, and private strategies pertaining to agricultural biotechnology. In its first year of operation, AgBioForum experienced over 145,000 hits from individuals in universities, industry, government, and international organizations.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal investigator has indicated that the goal of the Alliance is the pre-commercial development of emerging biotechnology discoveries for agriculture. The midwestern region produces more than half of the nation's output of corn and soybean crops, and is critical to domestic food security and United States competitiveness in global agricultural markets. Alliance grants are awarded on a regional basis to advance corn and soybean production in the Midwest. The Alliance is implementing a research strategy that it hopes will generate important biotechnological developments that are rapidly adaptable to unique local soil, climatic and so-

cioeconomic conditions of the region. Alliance grants are awarded to projects with a clearly defined marketable product or service derived from biotechnology research.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Fiscal year 1999 was the fifth year of funding for the Alliance. The research program focuses on the two major commodity crops, corn and soybeans, as produced, processed and marketed in the midwest. The goal of this biotechnology program is to fund integrated research and development projects that will lead to specifically defined practical technologies for commercialization. The projects funded in fiscal year 1999 include efforts to: (1) engineer maize to produce an isoflavone that is important in human health, (2) develop molecular markers for resistance of soybean to the sudden death syndrome fungus and then move resistance into commercial cultivars, and (3) to develop the genetic basis for asexual seed production in *tripsicum*, a close relative of maize.

Question. How long has this work been underway and how much has been appropriated by fiscal year through 2000?

Answer. The work supported by this grant began in fiscal year 1995. The appropriations for fiscal years 1995 and 1996 were \$1,357,000 each year, for fiscal year 1997, \$1,316,000, and for fiscal years 1998 through 2000, \$1,184,000 per year, bringing the total appropriations to date to \$7,582,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Alliance has not specified a required amount of matching funds, but it is expected that most projects will have commitments for significant direct and in-kind non-Federal support. Since Alliance projects are still underway, the exact amount of the non-Federal contribution is still unknown. The non-Federal contribution is expected to be substantial, and a system for accounting for future non-Federal contributions is in place.

Question. Where is this work being carried out?

Answer. The research projects identified for funding in fiscal years 1995 through 1999 are being conducted at the University of Illinois, the University of Missouri, Iowa State University, Northwestern University, Southern Illinois University, and the Agricultural Research Service.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Each project proposal for Alliance funding has a target date for completion. The four initial projects were three-year studies with anticipated completions at the end of fiscal year 1998. Most of the second and third rounds of projects are also three-year studies with anticipated completions at the end of fiscal years 1999 and 2000, respectively.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Illinois-Missouri Biotechnology Alliance was evaluated for scientific merit by an agency peer review panel on February 25, 1999. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received and we are satisfied that the program is being administered in compliance with the purpose of the grant. A peer review panel will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2000.

IMPROVED DAIRY MANAGEMENT PRACTICES, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Improved Dairy Management Practices grant.

Answer. The research focuses on developing methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. Individual research projects funded by the grant are determined by a competitive peer review process administered by the Institution using peers from Institutions located primarily in other States.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the local need is for the identification and implementation of profit enhancing management strategies for Pennsylvania dairy farms in response to changing market conditions and emerging technologies. The current focus is to develop economically-viable solutions to issues confronting Pennsylvania dairy farmers such as dealing with animal waste in an environmentally-friendly manner, reducing the cost of forage production systems, including

grazing systems, and to develop a better understanding of decision processes by dairy farmers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research remain the same, which is the development of methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. A farm management survey is complete and analysis of results is in progress. Farm financial models have been developed and are undergoing a field test on selected farms. Workshops to teach elements of business management to dairy farmers have been conducted, and survey instruments are in place to monitor effectiveness of workshops. Research is currently underway to develop improved models for nutrient management on northeastern dairy farms, to evaluate the potential role of intensive grazing systems to replace harvested forage, and to better understand how decisions are made by dairy farm families. Refinement of an expert computer-based system to assist dairy farmers in controlling the udder disease, mastitis, is underway. A study to evaluate the induction of lactation on dairy profitability is underway. An additional study to evaluate the impact of improved protein nutrition during late gestation on dairy cow performance has been initiated.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$335,000 per year. The fiscal year 1994 appropriation was \$329,000 and \$296,000 each year in fiscal years 1995–2000. A total of \$2,775,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. During fiscal year 1992, \$354,917 were from State funds, and \$16,000 from Industry, for a total of \$370,417. During fiscal year 1993, \$360,374 were from State funds and \$16,000 from Industry for a total of \$376,374. Information is not available for fiscal years 1994–1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at Pennsylvania State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal researcher anticipated completion of the original objectives by March 1994. The original objectives were met. Availability of continued funding has permitted the institution to develop a competitively awarded grant program within the institution to address priority issues related to management of dairy farms. Proposals are reviewed and ranked by peers from other institutions prior to award. It is anticipated that awards from the fiscal year 2000 appropriation will be complete in September 2002. Keeping with the Administration's policy of awarding research grants competitively, no further Federal funding for this grant is requested.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency accepts technical review of specific proposals funded by this grant on an annual basis. The overall proposal is review by the agency on an annual basis. In addition, technical staff has conducted on-site review of the program in 1993 and in 1995. The overall objective of the work funded by this grant has direct relationship to the development of Integrated Management System as well as to aspects of animal production systems on animal well-being and impact on the environment.

IMPROVED EARLY DETECTION OF CROP DISEASE, N.C.

Question. Please provide a description of the research that has been funded under the grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator is preparing to submit a proposal, but at this time no additional information is available.

Question. How long has this work been underway and how much has been appropriated by fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$170,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are not known at this time.

Question. Where is the work being carried out?

Answer. Research will be conducted at the University of North Carolina-Greensboro.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is a new grant.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project that will undergo merit review when received.

IMPROVED FRUIT PRACTICES, MICHIGAN

Question. Please provide a description of the work that has been done under the improved fruit practices grant.

Answer. Funds from this grant will be awarded competitively to scientist at Michigan State University working with these crops. This research will involve a multidisciplinary approach to reduce chemical use on apple, blueberry, and sour cherry, three important Michigan fruit crops, and improve the management of dry edible beans and sugar beets. Research will be conducted on crop management techniques and reduced chemical use.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes Michigan's need for this research is to develop and maintain/expand their tree fruit and small fruits industry. There is a need to improve the culture and management of dry edible beans and sugar beets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The planned objectives of the research are to reduce the chemical contamination of the environment from fruit production and improve production practices for beans and beets through multidisciplinary research, including pesticides, and the development of new nonchemical production methods.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$494,000, and for fiscal years 1995-2000, \$445,000 each year. A total of \$3,164,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant in fiscal year 1994 were \$437,338 from State appropriations and \$135,000 from industry, for fiscal year 1995 were \$574,494 from State appropriations and \$127,000 from industry and a total of \$908,969 for 1996. The non-Federal funds for 1997 totaled \$752,500. The non-Federal funds for 1998 total \$729,145, and for 1999 \$1,332,300.

Question. Where is this work being carried out?

Answer. Research will be conducted at Michigan State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Principal Investigators have reported significant progress toward improved cultural practices for these speciality crops which is expected to reduce the need for chemical pesticides, and expect to complete the original objective by the end of fiscal year 1999. Long-term goals are expected to take an additional five years with a projected completion date of 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has not been subjected to a comprehensive review. The annual proposals including all of its sub projects are subjected to peer review before submission to the Cooperative State Research, Education, and Extension Service before they are approved. The project has progress toward the objective of developing management practices and strategies for economical production of speciality crops in Michigan with reduced chemical pesticide use.

This program is evaluated at the end of each research cycle and priorities adjusted for the next years funding. The evaluation is performed by scientists at Michigan State University.

INFECTIOUS DISEASE RESEARCH, COLORADO

Question. Please provide a description of the research that has been conducted under the Infectious Disease Research, Colorado grant.

Answer. The purpose of this project is to establish a multidisciplinary research center to study infectious animal diseases which have a critical economic impact. The "Center for Economically Important Infectious Animal Diseases" will work collaboratively with universities and State and Federal agencies. The focus will be on the impact of such diseases on international trade.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The need for this research is to provide valid risk assessment models for diseases which affect international trade and animal and public health. Livestock producers and the industry need this type of information to enable them to make correct disease management decisions. The Center will utilize commodity advisory groups to prioritize specific disease problems and will focus on those diseases with the greatest potential for economic impact.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to establish a regional center that will foster interactive work on risk assessment, disease control, and minimize the economic impact of disease outbreaks in livestock. The Center has been successful in obtaining additional funding from a variety of sources to initiate studies on diseases such as vesicular stomatitis and tuberculosis. The coordinating structures have been established and the Center is poised to make excellent progress during the next year.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999 with appropriations in fiscal year 1999 of \$250,000 and in fiscal year 2000, \$255,000, for a total of \$505,000.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. In fiscal year 1999 the project also received the following funds: other Federal agency grants, \$85,750; private foundation grants, \$39,488; State, \$33,120.

Question. Where is this work being performed?

Answer. The research is being conducted at the College of Veterinary Medicine, Colorado State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date is 2003. The work is proceeding on the designated schedule and it is expected that the objectives will be met in a timely manner.

Question. When was the last agency evaluation of this project? Provide a summary of it.

Answer. Because the project was just initiated in fiscal year 1999, no evaluation has been done at this time. However, the first review will be conducted later in fiscal year 2000, on the first anniversary of the initiation of the project.

INSTITUTE FOR FOOD SCIENCE AND ENGINEERING, ARKANSAS

Question. Please provide a description of the research that has been funded under the Institute for Food Science and Engineering grant.

Answer. As the flagship center for the Institute of Food Science and Engineering, the Center for Food Processing and Engineering has as its objectives to facilitate and encourage value-added research and improve the processing of agricultural products.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the Institute will provide technical support and expertise to small and mid-sized food processors that usually do not possess adequate expertise in-house. The economy of the southern region will be improved through the creation of new jobs and a high multiplier effect from the research. The Institute will develop and disseminate scientific information and provide educational programs related to value-added further processing, storage and marketing of food products. These efforts will assure food safety, improve the sen-

sory and nutritional quality of food and meet the nutritional requirements and food preferences of a changing society.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to establish an Institute of Food Science and Engineering at the University of Arkansas-Fayetteville. The Institute for Food Science and Engineering and the Center for Food Processing and Engineering are operating. Research projects at the Center include: postharvest management practices for rice, such as studies of physicochemical properties, bacterial load of rice products, and milling systems, and development of methods to improve the texture and dill flavor of pickles, and the color of acidified pickled vegetables, with estimated impact to the pickle industry of \$500,000 annually. Researchers have developed 12 mechanized systems for total vineyard mechanization which maintain or improve juice and wine quality. Research on physicochemical properties of potatoes and bitterness in carrots and have had estimated economic impacts of several million dollars. Research on electrochemical flow-through systems for chicken processing water and near infrared/mid-infrared imaging for large scale fruit processing have important applications in industry. Institute staff, including the Descriptive Sensory Panel, have assisted both national food processing companies and small commercial kitchens in process development, with an impact of up to \$2,000,000 annually on the Arkansas vegetable processing industry. The Institute's Center of Excellence presents workshops in the United States as well as planning train the trainer courses in Mexico and Central America to improve the safety of imported fresh fruit and vegetables. To date, 70 publications, two IMPACT reports and a quarterly newsletter have served to keep the industry and fellow scientists informed of research and technology transfer activities.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$750,000 each year, \$950,000 for fiscal year 1998, and \$1,250,000 each for fiscal years 1999 and 2000. A total of \$4,950,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. The non-Federal funds and sources provided for this grant include \$184,700 in State funds and \$93,000 from industry in fiscal year 1996, and \$187,357 in State funds and \$320,403 industry funds in fiscal year 1997. Thus far in fiscal year 1998, industry has provided \$93,599, with firm commitments of an additional \$55,000. The State has also provided facilities and administrative and clerical support estimated at \$303,694 through June 30, 1998. The Institute has also received \$48,000 to establish the Food and Agriculture Organization Center of Excellence.

Question. Where is this work being carried out?

Answer. Research will be conducted at the University of Arkansas at Fayetteville.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal researcher anticipates that work will be completed on the original goals in fiscal year 2002. The goals of this project related to establishing the centers of the Institute have not been fully met. The Center for Food Processing and Engineering and the Center for Food Safety and Quality are in operation; activation of the Center for Human Nutrition is scheduled for 1999. The objectives related to research and service to industry, food entrepreneurs and the general public would continue to be ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. In a review of the proposal on April 14, 1999, the assessment was that satisfactory progress was demonstrated in meeting the goals of the Institute.

INTEGRATED PEST MANAGEMENT

Question. Please provide a description of the research that has been funded under the Integrated Pest Management research grant.

Answer. This research grant develops new pest management tools to address critical pest problems identified by farmers in an agricultural production region. Funds are distributed through the Regional Integrated Pest Management—IPM—Grants Program, which provides competitively-awarded grants to develop new pest manage-

ment tactics to replace management tools lost as a result of regulatory action, pest resistance, and other factors. The Regional IPM Grants program supports research and extension projects that identify new pest management tactics, validate the effectiveness of new tactics in a production setting, and help producers implement these tactics by providing education and training programs. Proposals submitted to the Regional IPM Grants Program undergo technical and merit review at the regional and national levels.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research.

Answer. The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber is dependant on access to safe, profitable, and reliable pest management systems. For a variety of reasons, including the Food Quality Protection Act of 1996—FQPA—and pest resistance, many of the chemical control options farmers and other pest managers have relied on for many years are no longer available. The loss of these important tools is likely to continue at an accelerated rate over the next several years, and will have significant impacts on pest management systems in the United States over the next decade. The “minor use” crops—high value crops grown on relatively few acres—will be particularly hard hit during this period. For these reasons and others, it is essential that farmers be provided with new pest management tools and better information so they can remain competitive in today's global marketplace. These research grant funds are an important part of the Department's plan to assist farmers in finding effective pest management alternatives so they can adjust to changes in pesticide availability resulting from implementation of FQPA.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to provide farmers with new pest management options that allow them to reduce dependance on pesticides, improve profitability, and protect vital natural resources. The research supported by this research grant has made important contributions to increasing knowledge about new approaches to pest management, but the need for continued investment in this area of research is greater than ever. The following are some accomplishment examples:

- In Massachusetts, an Integrated Pest Management approach for fresh sweet corn was developed using early season applications of *Bacillus thuringiensis* followed by an application of vegetable oil. This system is effective and economical and meets the requirements for organic production and allows small-acreage sweet corn growers to produce the crop without relying on insecticides.
- In Arkansas, a “friendly” fungus was discovered that attacks cotton aphids, a major pest of cotton. The aphid fungus saves Arkansas cotton growers millions of dollars each year by reducing the need to apply aphid insecticides.
- In Kentucky, researchers developed a simple management system for Japanese beetles that allows landscapers to determine the optimum timing for insect management. This management system has resulted in better use of resistant varieties and has reduced pesticide use.

Question. How long has this work been underway and how much as been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$1,500,000; fiscal years 1982 through 1985, \$3,091,000 per year; fiscal years 1986 through 1989, \$2,940,000; fiscal year 1990, \$2,903,000; fiscal year 1991, \$4,000,000; fiscal years 1992 and 1993, \$4,457,000 per year; fiscal year 1994, \$3,034,000; and fiscal years 1995–2000, \$2,731,000 each year. A total of \$60,861,000 has been appropriated since fiscal year 1981.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. A study of the sources of non-Federal funds that contribute to this research effort was conducted in 1993–94 with the following results. In fiscal year 1993, State appropriations, \$841,017, product sales, \$33,987, industry grants, \$17,081, and other, \$31,737; for fiscal year 1994, State appropriations, \$2,303,458, product sales, \$77,157, industry grants, \$210,110, and other, \$216,552. These studies, which have not been repeated since 1994, demonstrate a trend toward greater annual State investments in Integrated Pest Management programs.

Question. Where is the work being carried out?

Answer. Scientists in all States are eligible to compete for this funding on a competitive basis. This research is currently being carried out by Colleges of Agriculture in more than 30 States.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Due to the passage of FQPA in 1996, the economic and environmental pressures facing U.S. agriculture today are at least as great today as they were in 1981 when Federal funds were first appropriated for this research grant. It is important for government to address the needs of agricultural producers by supporting research and extension efforts to develop alternative pest management approaches. It is anticipated that the need for this work will only increase as new pests emerge, existing pests become resistant to current control methods, as new pesticide regulations are implemented, and as national and international markets shift.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is a continuous process. Projects funded by this research grant are awarded through a competitive process that includes relevance, technical, and merit review by multi-disciplinary panels. Progress reports are reviewed to evaluate accomplishments and special attention is given to studies involving new control strategies relating to at-risk sites with pest management usage patterns impacted by FQPA implementation.

INTEGRATED PRODUCTION SYSTEMS, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Integrated Production Systems, Oklahoma grant.

Answer. This grant focuses on the development of efficient management systems for production of watermelons and blackberries under intensively-managed conditions. The work will address biotic and abiotic production components under Southeastern Oklahoma conditions for use in production guidelines. This will include planting densities, fertilizer studies, weed management and insect and disease control.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for the research.

Answer. The principal researcher believes the need for this research is focused on the local area of Southeastern Oklahoma, an area that is economically-depressed and in need of alternative crops to diversify the dominant cow/calf livestock production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop new and alternative crops to supplement and diversify the cow/calf livestock agriculture of Southeastern Oklahoma with emphasis on horticultural crops. Work to date has shown promise for strawberries, blackberries, cabbage, melons and blueberries. CD-ROM technology transfer to research results to support an expert system will be developed for grower use.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Work supported by this grant started in fiscal year 1984 and the appropriations were: fiscal year 1984, \$200,000; fiscal year 1985, \$250,000; fiscal year 1986, \$238,000; fiscal years 1987-1989, \$188,000 per year; fiscal years 1990-1991, \$186,000 per year; fiscal year 1992, \$193,000; fiscal year 1993, \$190,000; fiscal year 1994, \$179,000; fiscal years 1995-1998, \$161,000 each year and fiscal years 1999-2000, \$180,000 per year. A total of \$3,190,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$165,989 State appropriations in 1991; \$160,421 State appropriations in 1992; and \$164,278 State appropriations in 1993. Non-Federal support for 1994 was \$141,850 for State appropriations. Funds for fiscal year 1995 were \$129,552, for 1996 \$146,000, for 1997 \$152,000, for 1998, \$148,000; and for 1999 \$151,000.

Question. Where is this work being carried out?

Answer. This research is being done at the West Watkins Agricultural Research and Extension Center at Lane, Oklahoma, a branch of the Oklahoma State Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of this project were to develop production systems for alternative crops with economic potential for southeastern Oklahoma. Each year's funding cycle has addressed specific crop and management objectives to be completed over two years time. These short term objectives have been met for each of the completed two year projects. However the original objective of developing al-

ternative cropping systems is very long term and have not been completed. The current project is projected for completion in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each of the annual project proposals has been put through the institutions' review and is reviewed by an agency scientist before approval. In addition to the annual review of individual proposals, a comprehensive review of the Lane Agricultural Center, where this research is conducted, was conducted in 1993. This review revealed that work supported by this grant is central to the mission of that station and represents an important contribution to the agriculture of the area.

This work has provided practical management information for farmers of southeastern Oklahoma that has improved their ability to economically-produce small fruit and vegetable crops. This project is evaluated internally at the end of each year in order to set priorities for the next year.

INTERNATIONAL AGRICULTURAL MARKET STRUCTURES & INSTITUTIONS, KY

Question. Please provide a description of the research that has been done under the International Agricultural Market Structures and Institutions program.

Answer. The International Agricultural Market Structures and Institutions project began late in fiscal year 1999 as a means of helping U.S. agriculture discover new ways to increase its global market share. The project analyzes food consumption trends and food distribution systems; evaluates the impact of actual and potential changes in local policies; identifies potential markets for food products produced in southern U.S. States.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. U.S. firms need to become more aggressive in international markets, but these markets are unfamiliar to many firms. The structure of international markets and the institutions that serve them are often different than in domestic markets, and the structures and institutions are continuously changing. Very few southeastern agribusinesses have the necessary research and intellectual resources to study international markets; they rely on their public institutions, such as the University of Kentucky, to assist them in discovering and exploiting export market windows.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to increase the international marketing success of American farmers and agribusinesses by increasing their understanding of international markets and the impact of policies that affect those markets.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal years 1999 and 2000 was \$250,000 a year. A total of \$500,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funding for this grant was \$135,000 from State appropriations in 1999.

Question. Where is this work being carried out?

Answer. The work is being conducted at University of Kentucky in Lexington.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1999 was for a three-year project ending in 2002. Work is ongoing for the original objectives. Additional funds in 2000 will extend the project to 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This was a new project in 1999 when CSREES performed a merit review of the original proposal and noted that: "The University of Kentucky has faculty with expertise to conduct such a study. The principal investigator has been engaged in such work for several years, has conducted projects in other countries, and has been the university's director of international programs."

INTERNATIONAL ARID LANDS CONSORTIUM

Question. Please provide a description of the research that has been funded under the International Arid Lands consortium.

Answer. Fiscal year 2000 is the seventh year that Cooperative State Research, Education, and Extension Service has funded the International Arid Lands Consortium. The Forest Service supported the program during fiscal year 1993 to develop an ecological approach to multiple-use management and sustainable use of arid and semiarid lands. Projects that began in 1996–1999 will continue to be funded to address issues of land reclamation, land use, water resources development and conservation, water quality, and inventory technology, and remote sensing. All proposals are peer reviewed and awarded competitively, whereby the principal investigator must be from a Consortium member institution.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the consortium is devoted to the development, management and reclamation of arid and semi-arid lands in the United States, Israel, and elsewhere in the world. The International Arid Lands Consortium will work to achieve research and development, educational and training initiatives, and demonstration projects. The current member institutions are the University of Arizona, The University of Illinois, Jewish National Fund, Jordan's Higher Council for Science and Technology, New Mexico State University, South Dakota State University, Texas A&M University, Kingsville and Nevada's Desert Research Institute. Affiliate membership includes Egypt's Ministry of Agriculture and Land Reclamation Undersecretary for Afforestation. The United States Department of Agriculture's Forest Service works very closely with The International Arid Lands Consortium through a service-wide memorandum of understanding.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Consortium was and continues to be acknowledged as the leading international organization supporting ecological sustainability of arid and semi-arid lands. To date, 63 projects have been funded, 43 of which are to conduct research and development, 11 for demonstration projects, and 9 for international workshops. Funds approximating \$4.04 million have been used to fund these projects.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The International Arid Lands Consortium was incorporated in 1991. Funds were appropriated to the Forest Service in 1993. Additional funds were received during each of the years that followed. \$329,000 has been appropriated from Cooperative State, Research, Education, Extension Service for fiscal years 1994 through 1998, and \$400,000 for fiscal years 1999 and 2000 each for total appropriations of \$2,445,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Members of the International Arid Lands Consortium have provided funds to support the Consortium office in Tucson, Arizona, and for printed materials as needed. Each member has provided travel and operations support for semi-annual meetings, teleconferences, and other related activities. In fiscal years 1993–1996, \$60,000 in State appropriations were provided. Industry provided \$84,083 and \$100,000 in fiscal years 1993 and 1995, respectively. Additional funds of \$34,000 were received during 1996 from the Egyptian affiliate member to enhance future collaboration. Funds of \$50,000 from industry were received during 1998–1999.

Question. Where is this work being carried out?

Answer. Research is currently being conducted at the University of Arizona, South Dakota State University, Texas A&M University, Kingsville, New Mexico State University, University of Illinois, Nevada's Desert Research Institute, and several research and higher education institutions in Israel, Jordan and Egypt.

Question. What was the anticipated completion date for the original objectives of the projects? Have those objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. All research and demonstration projects that started during 1993–1995 have been completed. The projects started in 1996–1997 are expected to be completed within 12 months depending upon the nature of the project. Projects started during 1998–1999 will be completed within 2 years. Several demonstration projects were completed and 6 international workshops were held during 1994 through 1999. The International Arid Lands Consortium is an organization with long-term goals.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist reviews the project semi-annually and has determined that the research is conducted in accordance with the mission of the agency.

IOWA BIOTECHNOLOGY CONSORTIUM

Question. Please provide a description of the work that has been funded under the Iowa Biotechnology Consortium grant.

Answer. This Consortium is the focal point for cooperative biotechnology research endeavors between Iowa State University, the University of Iowa and the City of Cedar Rapids to recover and utilize byproduct materials arising from new and emerging industries in biotechnology with an emphasis on fermentation wastes and agribusiness. Both fundamental and applied research studies are being conducted to reduce the burden of agricultural bioprocessing wastes on municipal waste management systems and to transform components of these agricultural wastes into commercially viable products. The overall project involves a coordinated approach by a diverse group of investigators, and funding decisions for individual studies within each participating institution are based on a competitive peer review process with letter and panel evaluations.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The environmental burden associated with agriculture and the agricultural processing industries is recognized as a growing problem in the United States. These researchers believe that technological breakthroughs are possible to recover and recycle energy, chemicals, and materials from agriculture-related wastes. Although these principal investigators are working with wastes that are generated in the State of Iowa, similar waste streams are generated by agricultural industries across the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this project were aimed at enhancing the recovery and utilization of by-product materials arising from new and emerging industries using biotechnology. Recycling agricultural wastes, isolating useful byproducts and developing value added processing remain the primary thrusts of the project. A cadre of scientists has been established by the Consortium to assist in finding uses for the by-product waste streams generated by agricultural processing. The Consortium is also making important progress in bioconversion, biocatalysis, membrane concentration, and bioseparation of by-products. Recently, new studies have been initiated on: value-added products related to culture of polysaccharide-producing bacteria; screening of agricultural seed processing fractions for biocatalysts; conversion of lignocellulose to lactic acid; the use of waste by-products as feeds for livestock and aquacultural species; composting strategies for waste streams; and exploitation of micro-organisms that colonize extreme environments found in food processing plants.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,225,000; fiscal year 1990, \$1,593,000; fiscal year 1991, \$1,756,000; fiscal year 1992, \$1,953,000; fiscal year 1993, \$2,000,000; fiscal year 1994, \$1,880,000; fiscal years 1995–1996 \$1,792,000 each year; fiscal year 1997, \$1,738,000; and in fiscal years 1998 through 2000, \$1,564,000 each year. A total of \$20,421,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds and sources provided for this grant were as follows: \$623,803 from the State of Iowa, \$42,813 from the city of Cedar Rapids in 1991; \$768,287 from the State of Iowa, and \$365,813 from the city of Cedar Rapids in 1992; \$858,113 from the State of Iowa, and \$170,000 from the city of Cedar Rapids in 1993; \$841,689 from the State of Iowa, and \$36,000 from the City of Cedar Rapids in 1994; \$1,016,505 from the State of Iowa, and \$36,000 from the city of Cedar Rapids in 1995; \$862,558 from the State of Iowa, and \$40,000 from the City of Cedar Rapids in 1996; \$1,044,864 from the State of Iowa, and \$50,000 from the City of Cedar Rapids in 1997; \$303,549 from the State of Iowa, and \$50,000 from the City of Cedar Rapids in 1998; and \$293,461 from the State of Iowa, and \$59,400 from the City of Cedar Rapids in 1999.

In addition, leveraging of Federal grant monies has been obtained in the form of industrial matching funds or contracts for related projects. Some of the more noteworthy awards are as follows: \$20,000 from Archer Daniels Midland; \$342,720 from Ajinomoto; \$40,000 from BASF; \$18,000 from Bluestem Solid Waste Agency; \$1,748,975 from Cargill; \$177,200 from Heartland Lysine, Inc.; \$48,000 from Horizon Technology, Inc.; \$75,274 from Iowa Corn Promotion Board; \$65,200 from Iowa

Energy Center; \$80,273 from National Corn Growers Association, \$25,000 from National Pork Producers Council; and \$11,500 from PathoGenesis Corporation.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University and the University of Iowa, in collaboration with the City of Cedar Rapids. In addition, field studies are being conducted at various sites through out Iowa, including the facilities of participating industries located in Cedar Rapids and other Iowa communities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Consortium was originally created as a partnership between the City of Cedar Rapids and the participating universities to assist the City in dealing with wastes associated with corn and oat processing and milling, biocatalysis to produce high-fructose syrups, and one of the largest fermentation facilities in the world. More recently, new biotechnology industries have been attracted to Cedar Rapids and have added greatly to the volume of industrial waste streams. No firm date was established to complete this research at the beginning of the project. The researchers have worked closely with the City and the industries generating these agricultural wastes since 1989, and the nature of the studies has evolved as significant progress has been made in analyzing waste streams and in devising laboratory procedures for extracting useful products. The City of Cedar Rapids is planning to invest funds from other sources in special waste treatment facilities to conduct large scale tests of new treatment methods. Several years will be required to complete these tests and to refine separation technologies.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Iowa Biotechnology Consortium proposal is composed of a selected group of studies that are individually peer reviewed within the universities. Once the complete proposal is submitted to CSREES, it is again evaluated for scientific merit by an agency biotechnology peer panel that makes recommendations regarding approval for the award. The Iowa Biotechnology Consortium proposal for fiscal year 2000 has not yet been received, and once available a CSREES review panel will be convened to review and evaluate the proposed studies in the grant application and to make recommendations regarding overall approval of the project. In addition, the panel will assess progress during the past year as a part of the approval process and post-award management. A site visit was made by a National Program Leader to the research facilities of the University of Iowa during the past year, and the Program Manager is planning to conduct an on-site assessment of research at Iowa State University during the coming year.

IR-4 MINOR CROP MANAGEMENT

Question. Please provide a description of the research that has been funded under the IR-4 Minor Crop Management grant.

Answer. The Pest Management for Minor Crops (IR-4) Program is a highly effective effort between the State Agricultural Experiment Stations, CSREES, and the Agricultural Research Service. IR-4 provides the national leadership, coordination and focal point for obtaining data to support the regulatory clearance through the U.S. Environmental Protection Agency (EPA) for pesticides and biological control agents for specialty food crops such as fruits and vegetables as well as non-food crops like turf and ornamentals. In many cases, the agricultural chemical industry can not economically justify the time and expense required to conduct the necessary research for products with limited market potential. With assistance from IR-4, registration-related costs are manageable, and producers of a large number of small acreage crops such as vegetables, fruits, nuts, herbs and other specialized crops have access to necessary pest control products. In order to accomplish the above, a four step process has been developed. Step one involves research prioritization. Because of limited resources, IR-4 requests and receives input from stakeholders on potential research projects. Yearly workshops are conducted that involve growers, commodity organizations, university research and extension specialists, EPA staff and industry representatives to determine which projects are the most critical to minor crop agriculture. Step two is research planning. Research protocols are written after careful review and comments from stakeholders. Step three is research implementation. A typical IR-4 program consists of both field and laboratory phases. For the field work, researchers apply the crop protection chemical to the target crop according to the experimental protocol. The crop is harvested and transferred to the laboratories where the chemical residues in the crop, if any, are determined. All field and laboratory research is conducted under EPA Good Laboratory Practices.

Step four is data submission and approval. The data are critically reviewed and formatted into a regulatory package and submitted to the EPA for their review. If appropriate, the EPA will approve the submission and grant a tolerance to use the chemical on the target minor crop.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is a national effort which identifies needs by a network of users, commodity groups, and State university and Federal researchers. This research is highly significant to national and regional as well as local needs. The basic mission of IR-4 is to aid producers of minor food crops and ornamentals in obtaining needed crop protection products. IR-4 is the principal public effort supporting the registration of crop protection products and biological pest control agents for approximately \$40 billion minor crop industry representing 40 percent of the total farm crop value in the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to obtain minor use pesticide registrations with a high priority placed on those pesticides classified as Reduced Risk, assist in the maintenance of current registrations and to assist with the development and registration of biopesticides. For 1999, IR-4 submitted data to EPA that supported 632 new minor food use clearances. During the past three years, over 960 new minor food use clearance requests were submitted to IR-4 from growers, State and Federal scientists and extension specialists. The Food Use part of the IR-4 Program continues to have a high productivity which, according to EPA, supports 40 percent of all EPA pesticide registrations. Since the program's inception in 1963, IR-4 has been granted over 5000 food use clearances.

For ornamental crops in 1999, IR-4 submitted 532 pesticide clearance requests to EPA. Since 1977, IR-4 has assisted with the registration of over 7000 crop protection chemicals and biological pest control agents on nursery stock, flowers and turf grass. The ornamental industry accounts for over 25 percent or \$11 billion of the total minor crop value in the U.S. Biopesticides have been an important IR-4 thrust since 1982. EPA granted 58 IR-4 supported biopesticide food use clearances in 1999 compared to 48 biopesticide clearances in 1998.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from appropriated funds as follows: Program redirection in fiscal year 1975, \$250,000; fiscal year 1979, \$500,000; fiscal years 1976-1980, \$1,000,000 per year; fiscal year 1981, \$1,250,000; fiscal years 1982-1985, \$1,400,000 per year; fiscal years 1986-1989, \$1,369,000 per year; fiscal year 1990, \$1,975,000; fiscal year 1991, \$3,000,000; fiscal years 1992-1993, \$3,500,000; fiscal year 1994, \$6,345,000; fiscal year 1995 through 1997, \$5,711,000 per year; and fiscal years 1998 through 2000, \$8,990,000 per year. A total of \$79,499,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$891,856 State appropriations and \$65,402 industry in 1991; \$1,002,834 State appropriations and \$104,292 industry in 1992; \$1,086,876 State appropriations and \$310,133 industry in 1993; \$550,160 State appropriations, \$408,600 industry, and \$924,169 miscellaneous in 1994; \$775,432 State appropriations, \$266,714 industry, and \$751,375 miscellaneous in 1995; and an estimated \$800,000 State appropriations, \$250,000 industry, and \$800,000 miscellaneous in each year of 1996 through 1999.

Question. Where is this work being carried out?

Answer. Field work is performed at the State and Territorial Experiment Stations. Laboratory analysis is conducted primarily at the California, New York, Florida and Michigan Agricultural Experiment Stations with assistance by the Puerto Rico, Hawaii, North Dakota, North Carolina, Washington, Virginia, and Idaho Agricultural Experiment Stations. Field Research Centers located in Hawaii, Oregon, Washington, California, Wisconsin, Michigan, North Dakota, South Dakota, North Carolina, Florida, Tennessee, Texas, New Jersey, New York, Maryland and New Hampshire conduct the field residue program. Protocol development, data assimilation, writing petitions and registration processing are coordinated through the New Jersey Agricultural Experiment Station. Agricultural Research Service is conducting minor use pesticide studies at field locations in California, Georgia, Ohio, South Carolina, Texas, and Washington. Agricultural Research Service laboratories in Georgia, Maryland, and Washington are cooperating with analyses.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Selected categories of the Special Research Grants Program address important national and regional research initiatives. IR-4 is involved in research on biological systems that by their nature are ever changing and presenting new challenges to agriculture. The IR-4 workload is anticipated to be long term because of the sensitivities about food safety and the environment, and the eventual loss of a large number of conventional pesticide registrations for minor crops because of the 1996 Food Quality Protection Act—FQPA. The FQPA presents a serious challenge to minor crop pest management. It is estimated that there will be significant loss of conventional pesticide registrations for minor crops. IR-4 has developed a strategy to minimize the impact of loss of the critical pest control tools needed by our domestic minor crop growers. The IR-4 strategy involves the following factors: first, facilitating regulatory clearance of Reduced Risk pesticides for minor crops; second, when appropriate, develop risk mitigation measures for existing minor use registrations; third, assist with the registration of biologically-based pest control products for minor crops; and fourth, register and maintain pesticides essential to integrated pest management systems—IPM.

With the implementation of the 1995 Strategy Plan, IR-4 has achieved significant accomplishments. Since FQPA requires that the EPA review all of the almost 10,000 tolerances by fiscal year 2006, it is anticipated that IR-4 program will have a significant challenge to help bring new crop protection solutions to minor crop growers well into the next century.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the grant applications are peer reviewed and reviewed by CSREES' senior scientific staff. A summary of those reviews indicate excellent progress in achieving the objective of providing safe pest controls for minor uses. In December 1997, CSREES sponsored a Peer Review of the Project by a panel chaired by a retired Administrator of USDA-ARS and representatives from the USDA, EPA, commodity groups, the food processing industry, the crop protection industry and the land grant university system; a report was issued January 1998. The report covered the areas of response to FQPA, Project operations, accomplishments, good laboratory practices, the ARS companion program and future outlook with specific recommendations for each area. The review panel was "in unanimous agreement that IR-4 is a very successful program which serves an important need to producers of agricultural products for ultimate consumption by the American public. The program is effectively and efficiently administered by a dedicated professional staff". The goal in 2000 and beyond will be to build on this basis and fully implement the recommendations of the panel. This review and previous reviews have resulted in significant improvement in the IR-4 program's productivity and quality of research. Additionally, the customers served by IR-4 have provided input to the program to enhance its effectiveness.

JOINTED GOATGRASS (AEGILOPS CYLINDRICUM)

Question. Please provide a description of the research that has been funded under the Jointed Goatgrass grant.

Answer. Research is conducted as sub-projects by more than 30 scientists in 10 western and mid-western States on systems for suppression of jointed goatgrass in winter wheat production systems. Research includes integrated cultural management, reduction of seed in the soil, identification of more competitive wheat varieties and crop rotations, and modeling to predict economic outcomes of changing management practices. The premier research projects continue to be four regional, long-term integrated management studies conducted across nine States. In these studies, various cultural control practices such as seeding rates, row spacing, planting dates, seed size, competitive varieties, fertilizer placement, crop rotations, and tillage practices are being evaluated as an integrated management system for the suppression of jointed goatgrass. Research is also being conducted on genetic diversity in the jointed goatgrass population, soil conditions responsible for persistence of jointed goatgrass seedbank, timing and intensity of tillage on seed persistence in the soil, gene flow between wheat and jointed goatgrass, identification of crop traits that make wheat more competitive against jointed goatgrass, and making the bioeconomic model more user friendly. All funded projects have a technology transfer component and a national extension coordinator insures that growers and extension personnel are fully informed about all options for the managing this devastating weed. The National Extension Coordinator is housed at Colorado State University.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Jointed goatgrass infests nearly five million acres of winter wheat lands in the west and mid-west. Through the efforts of the national program, the rate of spread of this weed has decreased significantly in the past 5 years. However, jointed goatgrass still costs U.S. wheat producers an estimated \$145 million annually in lost yield, reduced quality, production of less profitable crops, increased management costs, and reduced land values. Control of jointed goatgrass in a standing wheat crop is impossible with currently available technology because seed survives in the soil for five years or more, and because jointed goatgrass is genetically related to wheat. Jointed goatgrass has increased rapidly in the past 25 years in part because of the widespread adoption of conservation tillage systems. Jointed goatgrass proliferated in such systems, and it greatly impedes the universal adoption of such practices. The principal investigator and the National Association of Wheat Growers believe this research is of high national and regional importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to reduce the devastating effect of jointed goatgrass on winter wheat production and quality, and to prevent the spread of this weed into new, non-infested areas. Numerous individual cultural control practices have been evaluated in several States as to their effectiveness for the suppression of jointed goatgrass and on the growth and yield of wheat. Four regional, long-term integrated management projects have been established where three or more individual cultural control practices have been combined into an integrated management system for the suppression of jointed goatgrass in winter wheat. Results from these projects show that combining three or more individual cultural control practices into an integrated management system will suppress jointed goatgrass and improve the yield and quality of winter wheat. Significant progress has been made in understanding gene flow between wheat and jointed goatgrass. This information will be very valuable in managing the introduction of herbicide-resistant wheat for the control of jointed goatgrass. A bioeconomic model has been constructed that combines jointed goatgrass population biology information, weather data, and responses of jointed goatgrass and wheat to various cultural control practices, and predicts wheat yields, response of jointed goatgrass, and economic outcomes from changing production practices. In 1999, a symposium on jointed goatgrass was held as part of the Western Society of Weed Science meetings. At this symposium, ten papers were presented, outlining the latest research and technology transfer activities of this national program. Information presented at this symposium was used to establish new priorities for this program and to guide the program for the next five years. Since 1994, six regional symposia have been held to transfer to producers and extension personnel the latest information on the identification, biology and management of jointed goatgrass in winter wheat. A World Wide Web site (<http://www.ianr.unl.edu/jgg>) has been established and updated annually to further enhance information transfer. Also, a videotape, a poster and a slide set have been produced to assist extension personnel in transferring to producers information on jointed goatgrass biology and management.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000; for fiscal years 1995–1997, \$296,000, each year; \$346,000 for fiscal year 1998; and \$360,000 in fiscal years 1999 and 2000 bringing the total appropriations to \$2,283,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: for 1994, \$82,198 State appropriations, \$82,256 from industry, and \$14,871 miscellaneous; for fiscal year 1995, \$67,442 State appropriations, \$38,496 from industry, and \$13,304 miscellaneous; for each fiscal year 1996–1997, an estimated \$70,000 State appropriations, \$50,000 from industry, and \$14,000 miscellaneous; for 1998 \$231,335 State appropriations, \$42,570 from State wheat commissions, and \$15,000 miscellaneous; and for fiscal year 1999, \$258,122 State appropriations, \$87,750 State wheat commissions, and \$72,100 miscellaneous.

Question. Where is this work being carried out?

Answer. The research is being conducted by university scientists in 10 western States with serious infestations including Washington State University, who is the principal coordinating institution and receives the grant, Colorado, Kansas, Nebraska, Oklahoma, Utah, Oregon, Idaho, Montana, Wyoming, and South Dakota.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated to accomplish significant results in five years, and significant accomplishments have been made. However, the jointed goatgrass problem will require an additional five more years to accomplish all of the objectives and to have effective management practices available for producers to control jointed goatgrass in winter wheat.

Question. When was the agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the sub-grants are peer reviewed for scientific merit and adherence to the program objectives by a panel of scientists and producers. The overall grant is reviewed annually by CSREES's scientific staff. Sub-contract grants to the various universities are awarded using a peer review process coordinated by Washington State University.

LIVESTOCK AND DAIRY POLICY, NEW YORK AND TEXAS

Question. Please provide a description of the research that has been done under the livestock and dairy policy program grant?

Answer. The purpose of this grant is to assess the possible economic impacts on the U.S. livestock and dairy sectors from various macroeconomic, farm, environmental, and trade policies and new technologies. Both Cornell University and Texas A&M University conduct analysis of these policies and disseminate the information to policymakers, farmers, and agribusinesses. Cornell focuses on sector-level dairy policies, and Texas A&M focuses on policies affecting livestock and dairy at the farm level.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Information on the implications of new and alternative farm, trade, and macroeconomic policies affecting the livestock and dairy sectors is of special interest to policy-making officials, farmers, and others. Such information enables farmers and agribusinesses to make necessary adjustments to their operations to enhance profitability and for national public officials to consider alternatives to sustain adequate supplies and minimize costs. The principal researchers believe this research to be of national, regional and local significance.

Question. What was the original goal of this research and what has been done to date?

Answer. The original goal was to establish a specialized research program that could provide timely and comprehensive analysis of numerous policy and technological changes affecting livestock and dairy farmers and agribusinesses and advise them and policymakers promptly of possible outcomes. This goal has been achieved and the program continues to provide timely assessments and evaluations of provisions and proposed changes in agricultural policies, the General Agreement on Tariffs and Trade, and the North American Free Trade Agreement; various income and excise tax measures; and alternative pricing measures for milk. The institutions were integrally involved in several current studies relating to dairy provisions in the 1996 farm legislation. These studies contributed significantly to the development of proposed regulations called for in this legislation. Both institutions maintain extension outreach programs to disseminate results of their analysis throughout the United States. They have organized a national Dairy Markets and Policy Extension committee to advise and assist them in this effort. This latter committee was especially helpful to USDA in educating farmers about proposed milk marketing order changes last year.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$50,000; fiscal year 1990, \$518,000; fiscal years 1991–1993, \$525,000 per year; fiscal year 1994, \$494,000; fiscal years 1995–1997, \$445,000 each year and fiscal year 1999, \$475,000; fiscal year 2000, \$475,000. A total of \$5,767,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$37,420 State appropriations in 1991; \$162,086 State appropriations and \$133,278 product sales for a total of \$295,364 in 1992; and \$301,817 State appropriations, \$1,412 industry, and \$7,121 miscellaneous for a total of \$310,350 in 1993; \$24,702 State appropriations, and \$5,961 industry for a total of \$30,663 in 1994; \$235,526

State appropriations for 1995; \$250,000 in State appropriations for 1996; and approximately \$245,000 in State funding for 1997 and 1998.

Question. Where is this work being carried out?

Answer. The research is being conducted at Cornell University and Texas A&M University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program is of a continuing nature for the purpose of assessing existing issues and proposed policy changes affecting the livestock and dairy industries.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluations of this project. Annual proposals for funding, however, are peer reviewed for relevance and scientific merit. Our agency contact is also in regular contact with principal researchers at each institution to discuss progress toward project objectives.

LOWBUSH BLUEBERRY RESEARCH, MAINE

Question. Please provide a description of the research that has been funded under the lowbush blueberry research program grant.

Answer. Interdisciplinary research is being conducted on many aspects of lowbush blueberry culture and processing including investigations into factors affecting processing quality, biological control of insect pest, sustainable pollination, weed, disease, and fertility management, cold heartiness, and group water protection.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Maine produces 99 percent of all lowbush blueberries or 33 percent of all blueberries in the United States. This work is of major local interest, and helps maintain the continued availability and high quality of this native fruit commodity.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original research goal was to provide answers to unique lowbush blueberry production, pest, and processing problems. Research to date indicates that the field sanitizer was able to use heat to control insect pests without adversely affecting plant growth, while providing a non-chemical alternative for pest management. Biological control agents were used to control fireworms. Lowbush blueberry yields were increased by use of native and alfalfa leafcutter bees. Mechanical harvesting was found to be effective and had yields and fruit quality comparable to hand harvest, providing growers with a more efficient tool to harvest blueberries. Products for the use in food industry are being extracted from cull berries therefore improving utilization and reducing waste.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$170,000; fiscal year 1991, \$202,000; fiscal years 1992–1993, \$185,000 per year; fiscal year 1994, \$208,000; and fiscal years 1995–2000, \$220,000 per year. A total of \$2,270,000 has been appropriated to date.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Direct industry support was about \$65,000 from 1996–2000 per year.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Maine.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not yet been met. The University of Maine researchers estimate that the project will be concluded at the end of fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency merit review of this project was January, 1999. Research accomplishments included investigations of post emergence, grass specific herbicides to control weeds rather than the use of broad spectrum; timing of fertilization treatments and comparisons of various fertilizer combinations have indicated that fertilizers containing nitrogen increase yields. Other research accomplishments include the insect management of blueberry maggots through behavioral control and the use of less toxic chemicals from control of blueberry flea beetles.

MAPLE RESEARCH, VERMONT

Question. Please provide a description of the research that has been funded under the Maple Research Grant?

Answer. The research is designed to increase understanding of the sources of heavy metal contamination in maple sap and syrup and explore methods of reducing or eliminating lead and other heavy metal contaminant levels in the finished product through alteration of manufacturing equipment and production practices.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local focus for this research?

Answer. Maple products are an important cultural heritage, and a significant source of seasonal income in maple producing areas of rural America. Identifying sources of heavy metal contaminants during processing, and exploring methods to reduce or eliminate contaminants from maple products is important in assuring consumers that these food products are not harmful.

Question. What was the original goal of this research and what has been accomplished?

Answer. The goal of this research is to conduct investigations on maple tree physiology, the ecology and management of maple stands, and related aspects of the maple syrup industry in Vermont and the Northeast. The primary goal of this work has been to identify and eliminate sources of lead and other heavy metal contaminants in maple syrup.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Work under this project began in fiscal year 1985. Annual appropriations in support of this project are as follows: fiscal year 1985—\$100,000; fiscal years 1986 and 1987—\$95,000 per year; fiscal years 1988 and 1989—\$100,000 per year; fiscal years 1990 through 1993—\$99,000 per year; fiscal year 1994—\$93,000; fiscal years 1995 through 1997—\$84,000 each year; fiscal years 1998 through 2000—\$100,000 per year. A total of \$1,532,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal years?

Answer. Non-Federal fiscal support for this project is provided by two primary sources and one secondary source. The primary sources are State appropriations and product sales. The secondary source is local support, but that support is not available each year. The total non-Federal contribution from these sources provides an average 86 cents for every dollar of Federal funding. Early in the project the total non-Federal contribution was 60 cents for every dollar and most recently one dollar, ten cents for every dollar of Federal funding.

Question. Where is this work being carried out?

Answer. This research is being conducted at the Vermont Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The work from this project, relative to maple tree physiology and management of maple stands has been completed. The objective of identify sources of heavy metals in maple syrup products and subsequently reducing them is underway. The anticipated completion date is 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Project proposals and progress reports are reviewed and evaluated annually by the U.S. Department of Agriculture. Satisfactory progress has been made on tree physiology and maple tree (sugar bush) management. Progressive work on identifying sources and controlling maple syrup contaminants is in place and is being monitored by the department.

MEADOWFOAM, OREGON

Question. Please provide a description of the research that has been funded under the grant.

Answer. This funding will be used to: develop meadowfoam cultivars with increased seed yield, lodging resistance, oil concentration, and insect resistance; increase seed, field test and deploy several new experimental cultivars; enhance the genome map of meadowfoam; develop DNA markers for molecular breeding and genetic analysis in meadowfoam; and map genes affecting self-pollination, seed yield, oil content, and insect resistance. The proposal will be internally and externally reviewed for scientific merit. This research will be reviewed by State and Federal scientists and administrators for merit and progress.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research is needed to increase the productivity of meadowfoam as an edible and industrial oilseed crop. Meadowfoam oil is a basic feedstock for lubricants, cosmetics, and personal care products. Oregon State University has recently developed a food grade meadowfoam oil that should open edible oil markets for this crop. This research is needed to expand the range of production of meadowfoam and to supply United States farmers with competitive cultivars (varieties) for commercial production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to increase the productivity of meadowfoam as an oilseed crop for United States farmers. This research led to the development of a new variety of meadowfoam that outyielded existing cultivars by 800 kilograms per hectare in 1999. Seed increases and advanced field tests are underway for this cultivar. Significant progress was made on the development of high-throughput DNA markers for use in molecular breeding. These markers are being used to elucidate the genetics of several economically important traits in meadowfoam.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in 1999 and the appropriation for fiscal year 1999 was \$300,000, and for fiscal year 2000, \$300,000. A total of \$600,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds have not been provided.

Question. Where is this work being carried out?

Answer. The breeding research is being conducted at Corvallis, Oregon. Cultivars are being field tested at four sites in the western United States including Corvallis and Medford, Oregon, Mt. Vernon Washington, and Davis, California, and three sites in the eastern United States including Blacksburg, Virginia, and two as yet unspecified sites.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional and related objectives?

Answer. The anticipated completion date for the original objectives is June 2001. Progress has been made towards each of the stated objectives; however, we are still in the middle of the first year and thus cannot fully report on progress. To date, the first field experiments were planted in October 1999 and will be harvested in July 2000. Results will be assessed after harvest.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project will be conducted annually based on the annual progress report and discussions with the principal investigator as appropriate. The evaluation is conducted by the cognizant staff scientist who has determined that research to date is in accordance with the mission of the agency.

MICHIGAN BIOTECHNOLOGY CONSORTIUM

Question. Please provide a description of the work that has been funded under the Michigan Biotechnology Consortium grant.

Answer. The objective of the Consortium's research program is to develop bioprocessing technology to manufacture products from agricultural raw materials; to increase the utilization of agricultural raw materials; reduce agricultural surpluses; degrade agricultural and associated wastes, thereby decreasing environmental costs of agricultural products and processes; and to reduce the need to import foreign petroleum.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that the development of value-added products from agricultural raw materials will increase their utilization, reduce commodity surpluses and environmental costs and decrease the need for foreign petroleum thus contributing significantly to local, regional and national priorities. Biotechnology research of national significance could potentially be supported by competitive grants awarded under the National Research Initiative or the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to select and develop market-viable technologies for the production of industrial products from agricultural raw materials. The Consortium has used funding from the Special Grants program to develop technologies now in the marketplace. Examples include the production of lactic acid from corn which resulted in the building of a \$200 million plant in Nebraska. Agricultural resources were used as a feedstock for plant growth formulations that enhance productivity and reduce plant stress, biodegradable plastic resins for compostable films used in lawn/leaf litter bags, agricultural mulch films, etc., biodegradable plastic resins for injection molded products such as disposable cutlery, all-natural food flavors, calcium magnesium acetate deicer and biodegradable adhesives. The byproduct of cheese production (whey) was used to produce high quality, high value optically pure chiral intermediates for pharmaceuticals and agrochemicals.

A sand/manure separation system for dairy farms was developed to cost-effectively separate manure from sand and recycle both components. Numerous enzymes have been characterized and are now in use to provide value added modifications in the processing of agricultural products. Improved methods to clean up herbicides, pesticides and other agricultural materials have been developed. Many of the technologies developed have been commercialized through several licenses and eight new company startups.

Special Grant funding in fiscal year 1999 allowed the Consortium to develop high value animal feeds from agricultural residues, paint removers, biobased polymers for medical applications, liquid crystals and metals recovery, naturally occurring bioactive compounds and biocontrol agents, inks that are not hazardous aromatic products, fruit brandy, specialty mushrooms and methods to improve the economics of ethanol production. Funding also supported a technology transfer program that brought researchers from over 30 land grant universities, Federal laboratories and State Departments of Agriculture together with Consortium researchers to review numerous commercially promising biobased agricultural technologies.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,750,000; fiscal year 1990, \$2,160,000; fiscal year 1991, \$2,246,000; fiscal years 1992–1993, \$2,358,000 per year; fiscal year 1994, \$2,217,000; fiscal year 1995, \$1,995,000; fiscal years 1996 and 1997, \$750,000 per year; and fiscal years 1998 through 2000, \$675,000 per year. A total of \$18,609,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant were as follows: \$1,750,000—State of Michigan, \$160,000—industry and \$1,000,000 from miscellaneous in 1991; \$1,750,000—State of Michigan, \$175,000—industry and \$1,000,000 from miscellaneous in 1992; \$1,750,000—State of Michigan, \$100,000 from industry in 1993; \$1,750,000—State of Michigan, \$175,000—industry and \$100,000 from miscellaneous in 1994; \$200,000—State of Michigan, \$2,035,000 from industry in 1995; \$1,250,000—State of Michigan, \$350,000—industry and \$6,000,000 from miscellaneous in 1996; \$402,000—industry and \$10,000,000 from miscellaneous in 1997; \$500,000—State of Michigan and \$1,060,000 from industry in 1998; and \$1,400,000—State of Michigan and \$1,356,000 from industry in 1999. A total of \$34,263,500 has been provided to support this work by non-Federal sources.

Question. Where is this work being carried out?

Answer. The research is being conducted on the campus of Michigan State University and at the Michigan Biotechnology Institute International. Demonstrations of technology occur throughout the United States.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Consortium reports specific milestones for technology development over a five year period. Specific milestones for technologies which will be commercialized in fiscal year 1999 were established in fiscal year 1995 and updated annually. The Consortium has been successful in effectively closing the gap between research and commercialization in the five-year period.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Michigan Biotechnology Institute was evaluated for scientific merit by an agency peer review panel on February 25, 1999. The panel recommended approval of the project pending receipt of supplemental information on administrative

aspects of the project. A merit review panel will be convened to re-evaluate of the project upon receipt of a proposal for fiscal year 2000.

MIDWEST ADVANCED FOOD MANUFACTURING ALLIANCE, NEBRASKA

Question. Please provide a description of the research that has been funded under the Midwest Advanced Food Manufacturing Alliance grant.

Answer. The stated purpose of the Midwest Advanced Food Manufacturing Alliance is to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. The Alliance involves research scientists in food science and technology, food engineering, nutrition, microbiology, computer science, and other relevant areas from 12 leading Midwestern universities and private sector researchers from numerous U.S. food processing companies. Specific research projects are awarded on a competitive basis to university scientists with matching funds from non-Federal sources for research involving the processing, packaging, storage, and transportation of food products. Projects selected for funding are merit reviewed by non-participating university scientists, industry scientists and scientists from professional organizations. Close cooperation between corporate and university researchers assure that the latest scientific advances are applied to the most relevant problems and that solutions are efficiently transferred and used by the private sector.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this project?

Answer. The principal researcher believes the food manufacturing industry is the number one manufacturing industry in the Midwestern region and that opportunities for trade in high value processed food products will grow exponentially on a worldwide basis. The Alliance is positioned to fill the void in longer range research and development for the food industry. Though the focus is regional, it is anticipated that impacts may also be local and national.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal, as stated previously, was to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. This is accomplished by conducting a research proposal competition among faculty from the 12 participating universities to fund research projects where matching funds are available from industry. Fourteen projects were funded from fiscal year 1994 funds with completion and final reports due by May 1, 1996. Ten projects were funded from fiscal year 1995 funds with anticipated completion and final reports due by August 31, 1997. Ten projects were also funded from fiscal year 1996 funds with anticipated completion and final reports due by May 31, 1998. Eleven projects were funded from fiscal year 1997 funds with anticipated completion and final reports due by May 31, 1999. Nine projects were funded from fiscal year 1998 funds with anticipated completion and final reports due by May 31, 2000. Eleven projects were funded from fiscal year 1999 funds with anticipated completion and final reports due by May 31, 2001. Proposals are reviewed for scientific merit by independent scientists, and final selection of projects includes consideration of industrial interest and commitment on non-Federal matching funds.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000, and for fiscal years 1995-2000, \$423,000 each year. A total of \$3,008,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2000?

Answer. Industry matching funds were \$823,148 in fiscal year 1994, \$414,164 in fiscal year 1995, \$576,600 in fiscal year 1996, \$429,579 in fiscal year 1997, \$557,549 in fiscal year 1998, and \$490,496 in fiscal year 1999.

Question. Where is this work being carried out?

Answer. The work is being coordinated by the Nebraska Agricultural Experiment Station at Lincoln. Specific research projects are also being conducted at 8 other universities that are part of the Alliance.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The overall objectives of the Alliance are ongoing. Funding supports the continuing and evolving needs and opportunities for foods manufactured and processed from U.S. produced crops and livestock.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on February 24, 1999. The principal investigator has provided descriptions of projects funded by this grant. Scientifically sound, industry-relevant projects appear to be the basis of the project, with impact results expected.

MIDWEST AGRICULTURAL PRODUCTS, IOWA

Question. Please provide a description of the research that has been done under the Midwest Agricultural Products program.

Answer. The Midwest Agribusiness Trade Research and Information Center does applied research to improve the global competitiveness and marketability of agricultural products produced in the Midwest and disseminates the results to small and medium-sized agribusinesses. Projects include analyses of potential international markets for U.S. agricultural products and equipment/technology; attitudes of foreign consumers; development of new/improved U.S. products to meet foreign needs. The overall project proposal was peer reviewed at the university level, and individual research activities are reviewed by the principal investigator and other faculty.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that agribusiness firms in the United States, especially small to medium-sized firms, have a large unrealized potential to expand export sales and foreign business ventures. These untapped opportunities exist in the Pacific Rim and in emerging markets such as Mexico, China, and Eastern Europe. The reluctance of small to medium-sized firms to explore these market opportunities is, in part, due to the high cost of market information and analysis and the perceived high risk of doing business in new markets. This project meets the needs of these firms at the local, regional, and national level.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The goal is to enhance the exports of agricultural commodities, value-added products, and equipment produced by Midwestern agribusiness firms by providing research and educational programs as well as assistance to individual firms. Recent results include studies on improving the U.S. position in world soybean trade; global competitiveness of U.S. pork subsector; challenges and responses for marketing in large developing Asian countries such as China and India. The soybean study focused on the ability of U.S. firms to provide quality products designed for specific international market uses. Analyses of international markets include Hungary and the Baltic States. Several market development studies, conducted in cooperation with overseas firms, have resulted in ongoing relationships with U.S. firms; an Iowa firm is negotiating a sale of feed processing equipment; another Iowa firm has formed a joint venture in ovine genetics. The primary audience is small-to medium-sized agribusiness firms because they often lack the resources to conduct studies or acquire sufficient marketing information necessary for international trade.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992–1993 was \$700,000 per year; fiscal year 1994, \$658,000; and fiscal years 1995–2000, \$592,000 per year. A total of \$5,610,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$185,495 State appropriations and \$373,897 industry for a total of \$559,392 in 1992; \$183,192 State appropriations and \$318,966 industry for a total of \$502,158 in 1993; \$127,948 State appropriations and \$500,394 industry for a total of \$628,342 in 1994; \$258,053 State appropriations and \$389,834 industry for a total of \$647,887 for 1995; \$165,425 State appropriations for 1996; \$162,883 State appropriations for 1997; and \$143,850 State appropriations and \$51,384 industry for a total of \$195,234 in 1998. \$72,934 State appropriations and \$45,860 industry for a total of

\$118,794 in 1999. Industry contributions were not reported for fiscal years 1996 to 1997.

Question. Where is the work being carried out?

Answer. The program is carried out by Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 24 months, however, the objective of expanding the export capacity of small to medium-sized agribusiness firms is an ongoing regional and national concern. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in January 1998, as it evaluated the project proposal for 1999, and concluded that "the project has sound objectives and procedures that are helping agribusiness effectively expand markets for U.S. agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans." Research results appear in several peer-reviewed professional journals and the popular press.

MILK SAFETY, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the milk safety grant.

Answer. The overall goal of the milk safety program is to provide insight into factors that help ensure an adequate and safe milk supply. The research has focused on factors that affect milk production, processing, manufacturing, and consumption; including computer models for risk assessment. Special attention has been given to ways of preventing and/or treating pathogens that enter the milk supply.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that the question of microbial safety is of paramount interest to the milk/dairy industry at all levels—national, regional and local. Dairy products have been associated with several large outbreaks of staphylococcal food poisoning. Coagulase negative *Staphylococcus*, *Listeria monocytogenes* and pathogenic *E. coli* species, including *E. coli* O157:H7, are of public health concern. The population of infants, elderly, and immunosuppressed individuals at highest risk in the U.S. continues to grow rapidly. Understanding the growth of these microorganisms will provide pathways to minimize the occurrence of food poisoning related to milk and dairy products. For products which receive minimal thermal processing or which may be preserved primarily by acidification, development of additional means of controlling the growth of these foodborne pathogens is of critical importance in guaranteeing a safe milk supply. Ensuring the safety of dairy products impacts not only consumer health and confidence in the safety of the food supply, but economic viability as well.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research is aimed at minimizing or eliminating future foodborne disease outbreaks from milk and dairy products. Researchers demonstrated that when subjected to a sublethal heat shock prior to pasteurization, *Listeria monocytogenes* becomes much more heat-resistant than previously thought, likely requiring the design of new pasteurization guidelines to ensure the safety of dairy products. They also developed a simple, fast, sensitive, specific and inexpensive method for the detection of *Listeria monocytogenes* in dairy products that will allow dairy processors to rapidly and easily screen for the presence of this pathogen in their products and in the processing environment. A computer model of *Listeria monocytogenes* growth in dairy foods under dynamic refrigeration conditions and during extended storage has been developed and partially validated. This will equip producers and processors with a powerful tool for further enhancing the safety of fluid milk and dairy product. Discoveries of factors influencing growth of *Staphylococcus aureus* could be used to prevent or contain growth of this pathogen in foods. Researchers have identified and sequenced a gene from this bacterium that is essential for growth under stressful conditions. Consumer research has identified characteristics of consumers most likely to have a high general concern about milk and dairy product safety and nutrition. In addition, consumers indicate more trust in farmers' efforts to ensure food safety than in the efforts of other segments of the food system. Research has also indicated that consumers are concerned about food safety, but do not know a great deal about such important hazards as *Salmonella*, *E. coli*, and *Listeria*. Researchers

have examined the effects of water availability on the production of enterotoxins by *S. aureus* and found that the presence of certain nutrients within the environment, or food product, can greatly stimulate enterotoxin production when water availability is low. These results have important implications concerning the safety of certain food products, including those containing dairy ingredients.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded for milk consumption and milk safety from funds appropriated as follows: fiscal years 1986 through 1989, \$285,000 per year; fiscal year 1990, \$281,000; fiscal year 1991, \$283,000; fiscal year 1992, \$284,000; fiscal year 1993, \$184,000; fiscal years 1994–1998, \$268,000 per year; fiscal year 1999, \$250,000, and fiscal year 2000 \$297,500. A total of \$4,059,500 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University estimates that non-Federal funds contributed to this project include the following costs and salaries: \$265,000 for fiscal year 1991; \$224,700 for fiscal year 1992; \$142,600 for fiscal year 1993; \$252,168 for fiscal year 1995; and \$621,903 for fiscal year 1998; and \$460,423 for fiscal year 1999. No data available for fiscal years 1994, 1996, and 1997.

Question. Where is the work being carried out?

Answer. The research is being conducted at the Pennsylvania State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The researchers anticipate that research supported by this grant should be concluded in 2000. Continuing and evolving needs related to the safety of milk and dairy products are expected to reveal new related objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The proposal supporting the fiscal year 1999 appropriation was reviewed on August 12, 1999 and the agency science specialist concluded that the projects addressed important issues related to safety of milk and dairy products, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

MINOR USE ANIMAL DRUGS

Question. Please provide a description of the research that has been funded under the minor use animal drug program grant.

Answer. The National Agricultural Program to Approve Animal Drugs for Minor Species and Uses—NRSP-7—was established to obtain the Food and Drug Administration approval of animal drugs intended for use in minor species and for minor uses in major species. The objectives of the program are to identify the animal drug needs for minor species and minor uses in major species; generate and disseminate data for the safe, effective, and legal use of drugs used primarily in therapy or reproductive management of minor animal species; and facilitate the Food and Drug Administration in obtaining approvals for minor uses. Studies are conducted to determine efficacy, target animal safety, human food safety, and environmental safety. The shortage of drugs for minor food animal uses is a concern well recognized by animal producers, veterinarians, animal scientists, and regulators. The funds for the special research grant are divided between the four regional animal drug coordinators and the headquarters at Cornell University for support of the drug approval program. The NRSP-7 funds are being utilized by the State Agricultural Experiment Stations where the regional animal drug coordinators are located as well as by other stations to develop data required for meeting approval requirements. Participants in the research program consist of the regional coordinators, State Agricultural Experiment Stations, USDA's Agricultural Research Service, schools of veterinary medicine, and the pharmaceutical companies. Research priorities are continually updated through workshops and meetings with producer groups representing species categories such as small ruminants, game birds, fur-bearing animals, and aquaculture species. Each request for drug approval is evaluated by the technical committee according to established criteria which include significance to the animal industry, cost of developing the necessary data, availability of a pharmaceutical sponsor, and food safety implications. All grants are reviewed for relevance to industry needs and undergo scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Animal agriculture throughout the United States has relied on chemical and pharmaceutical companies to provide their industry safe and efficacious drugs to combat diseases and parasites. The high cost incurred to obtain data to approve these drugs, when coupled with limited economic returns, has limited the availability of approved drugs for minor uses and minor species. The economic losses due to the unavailability of drugs to producers for minor species and minor uses threatens the economic viability of some segments of the animal industry. The need for approved drugs to control diseases in minor species and for minor uses in major species has increased with intensified production units and consumer demand for residue-free meat and animal products. The program provides research needed to develop and ultimately culminate in drug approval by FDA for the above purposes. The goals are accomplished through the use of regional animal drug coordinators as well as a national coordinator to prioritize the need, secure investigators at Federal, State and private institutions, and oversee the research and data compilation necessary to meet Federal regulations for approval. All drug approvals are national, although industry use may be regional. For example, certain aquaculture and the game bird industries are concentrated in specific geographic sections of the country. The administration believes this research supports national, regional and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the NRSP-7 Minor Use Animal Drug Program was to obtain approval by the Food and Drug Administration for animal drugs intended for use in minor species and for minor uses in major species. This continues to remain the dominant goal of the program. In recent years, the research program has expanded or given additional emphasis to aquaculture species, veal calves and sheep. The importance of environmental assessment, residue withdrawals and occupational safety have increasingly been given more attention during the approval process to help assure consumer protection.

Since the beginning of the program, over 300 requests have been received from animal producers, universities and veterinarians for the development of data in support of the filing of a New Animal Drug Approval. Currently, data representing 28 Public Master Files have been published in the Federal. The Public Master File publication enables pharmaceutical companies to extend their label claims to minor species by referencing the published file in their New Animal Drug Approval filing. Furthermore, these data also enter the public domain as presentations to professional groups, publication of peer-reviewed articles and inclusion in the Food Animal Residue Avoidance Databank. Through these channels, NRSP-7 provides data supporting the safe and effective use of therapeutics in minor species by consumers. Moreover, the Minor Use Animal Drug Program has averaged an expenditure of only about \$200,000 for each drug approved for minor species.

In 1999, two Public Master Files, based on data submitted by NRSP-7, were published in the Federal Register indicating drug approval by the Food and Drug Administration. They were: Sulfadimethoxine/ormetoprim for control of coccidiosis in Chukar partridges and amoxicillin for treatment of bacterial pneumonia in sheep. In addition, three Public Master Files were submitted to the Food and Drug Administration by NRSP-7 for review. The three drugs and their use are: oxytetracycline for otolith marking of fish, ceftiofur for bacterial pneumonia in goats, and ivermectin pour-on for hypodermosis in American bison. In addition to the development of data for Food and Drug Administration review, the NRSP-7 program initiated a species grouping program. Designed to make the drug approval process more efficient for all minor species, research was begun that will enable game birds and fish to be evaluated on the basis of one or two marker species. With species grouping, safety and efficacy studies of a drug in one species could be extrapolated to other species within the same class. Considering that the aquatic and game bird classes contain at present 10 and 8 economically significant production species, respectively, rates of Public Master File publications could be increased many-fold. The Center for Veterinary Medicine of the Food and Drug Administration is cooperating and supporting this program to the fullest extent, thereby demonstrating a prime example of Federal interagency collaboration in coordination with academic institutions, pharmaceutical industries and commodity interests to effectively meet an urgent public health need.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from appropriated funds in the amount of \$240,000 per year for fiscal years 1982-85; \$229,000 per year for fiscal years 1986-

1989; \$226,000 for fiscal year 1990; \$450,000 for fiscal year 1991; \$464,000 per year for fiscal years 1992 and 1993; \$611,000 for fiscal year 1994; and \$550,000 per year for fiscal years 1995–2000. A total of \$7,391,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$156,099 State appropriations, \$29,409 industry contributions and \$11,365 miscellaneous in 1991; \$265,523 State appropriations, \$1,182 product sales, \$10,805 industry contributions and \$59 miscellaneous in 1992; \$212,004 State appropriations, \$315 industry contributions and \$103 miscellaneous in 1993; \$157,690 State appropriations and \$7,103 miscellaneous in 1994; \$84,359 State appropriations in 1995; \$191,835 non-Federal support in 1996; \$357,099 non-Federal support in 1997; \$104,596 State appropriations and \$97,375 industry contributions in 1998; and \$317,225 State appropriations and \$9,678 industry contributions, and \$7,000 miscellaneous in 1999.

Question. Where is this work being carried out?

Answer. The grants have been awarded to the four regional animal drug coordinators located at Cornell University, the University of Florida, Michigan State University and the University of California-Davis, and to program Headquarters at Cornell University. Research is conducted at these universities and through allocation of these funds for specific experiments at the State Agricultural Experiment Stations, the Agricultural Research Service, the U.S. Department of Interior, and in conjunction with several pharmaceutical companies.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Selected categories of the Special Research Grants program address important national/regional research initiatives. The overall objectives established cooperatively with FDA and industry remain valid. However, specific objectives continually are met and revised to reflect the changing priorities for FDA, industry, and consumers. Research projects for this program have involved 20 different animal and aquaculture species with emphasis given in recent years to research on drugs for the expanding aquaculture industry and increasing number of requests from the sheep, veal calf, and game bird industries. The program involves research on biological systems that by their nature are ever changing and presenting new challenges and/or threats to agriculture.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency conducted a formal review of the Minor Use Animal Drug Program in 1997. An external review team of experts representing animal drug research and development, the veterinary profession, the pharmaceutical industry, and academia, found the program to be very productive. Recommendations from the review included (1) improve the visibility of the Minor Use Animal Drug Program, (2) improve working relationships with the veterinary and pharmaceutical communities, (3) and acquire additional support for the program by pharmaceutical companies, universities, and the Federal Government to meet the identified national needs with emphasis on responsiveness to industry needs and food and environmental safety. In 1999, stakeholders representing the sheep, aquaculture, goat, and game bird industries met with CSREES administration and NRSP-7 representatives to define research priorities for the Minor Use Animal Drug Program. Annually, grant proposals are scientifically peer reviewed and twice a year the agency and program representatives meet with the Food and Drug Administration representatives to evaluate progress and to prioritize research requests. Workshops are held periodically to identify priorities for the program whereby producers, pharmaceutical companies, FDA, and researchers participate.

MOLLUSCAN SHELLFISH, OREGON

Question. Please provide a description of the research that has been funded under the Molluscan Shellfish grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. A molluscan shellfish germplasm repository was established with funds from this grant and has played a key role in the genetic improvement of cultured shellfish stocks on the west coast. With specific shellfish stocks that are being made available to commercial growers, a broodstock selection program is currently underway to determine stocks with traits desirable for commercial culture. Additionally, the repository is used to establish a population of tetraploid pacific

oysters for use in the production in triploid oysters and has established a population of Kumamoto oysters.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researchers indicate that there is a national need for a molluscan broodstock development program. This line of research will benefit the commercial shellfish industries on the west coast and nationally through the conservation of shellfish lines with desirable traits, studies involving genetic manipulation to increase disease resistance and enhance growth, and judicious husbandry practices utilizing molluscan shellfish resources.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research program are to establish a repository for molluscan shellfish germplasm, to establish breeding programs for commercial production of molluscan shellfish, and to establish a resource center for the industry researchers, and other interested parties in the United States and abroad. The oyster broodstock selection program was implemented in partnership with industry and performance trials of selected stocks continue at commercial sites. Tetraploid oysters are being produced for use in the production of triploid seedstock to be used in commercial production trials. A temperature-controlled algae culture facility has been constructed to provide adequate nutrition to the oysters used in the studies. Oyster broodstock conditioning systems have been developed and in 1999, over 120 families were evaluated at commercial sites

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1995 with an appropriation of \$250,000; fiscal year 1996 was \$300,000; and \$400,000 in each of fiscal years 1997 through 2000. A total of \$2,150,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a total of \$135,454 of non-Federal funding in fiscal year 1995 primarily from State sources; in fiscal years 1996, 1997, 1998, and 1999, no cost sharing was provided.

Question. Where is this work being carried out?

Answer. Research will be conducted at Oregon State University.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Specific research objectives outlined in the original proposal were completed in 1996. Researchers have broadened the scope of the project from the original objectives and it is anticipated that these objectives will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal is put through the university's peer review process and is reviewed on an annual basis by the Program Managers, the Program Specialist, and is consistent with United States Department of Agriculture guidelines. The researchers are asked to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development. The university is required to submit an accomplishment report when the new proposal is submitted to the agency for funding. The 1999 review concluded that the researchers were well qualified and work in close cooperation with the private sector. Progress on previous work is well documented and the work complements other research being funded through the United States Department of Agriculture on molluscan shellfish.

MULTI-CROPPING STRATEGIES FOR AQUACULTURE, HAWAII

Question. Please provide a description of the research funded under the Multi-Cropping Strategies for aquaculture research grant in Hawaii.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The original goal of this program was to identify and develop sustainable and commercial opportunities inherent in the Molokai aquaculture community while maintaining the cultural and physical environment unique to Molokai. In fiscal year 1993, the university redirected this research program to address the opportunities of alternative aquaculture production systems, including the ancient Hawaiian fish ponds on the island of Molokai. A community-based research identification process has been used to identify and develop specific research projects and prioritize objectives in this program. Current research includes work in the area of

water quality characterization to accelerate permitting of aquaculture systems. Field testing of alternative species in the ancient Hawaiian fish ponds also continues.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers indicate that the primary need for this research is to assist the native Hawaiians in improving the profitability and sustainability of the ancient Hawaiian fish ponds and other appropriate aquaculture systems as part of a total community development program on the Island of Molokai.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this program was to develop technology for the co-production of shrimp and oysters in aquacultural production systems. Research led to the development of oyster production systems that have been field tested under commercial conditions. The objective of the program is to implement sustainable subsistence and commercial development of Molokai fish ponds while maintaining the culture and physical environment unique to Molokai. Production methods have been developed for native species including Pacific threadfin, Moi, and seaweed and studies involving shrimp and ornamental fish production are underway. Additionally, studies addressing water quality issues necessary for permitting of the ancient Hawaiian fish ponds for aquaculture are being conducted.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. This research was initiated in fiscal year 1987 and \$152,000 per year was appropriated in fiscal years 1987 through 1989. The fiscal year 1990–1993 appropriations were \$150,000 per year; \$141,000 in fiscal year 1994; and \$127,000 in fiscal years 1995–2000, each year. A total of \$1,959,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university reports a total of \$137,286 of non-Federal funding for this program in fiscal years 1991–1994, \$318,468 in fiscal years 1995–1996, \$116,730 in fiscal year 1997, \$197,000 in fiscal year 1998, and no non-Federal funds are available for this project for fiscal years 1999 and 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted through the University of Hawaii on the island of Molokai.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original project was 1993. The original objectives were met. The specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal is placed through the university's peer-review process, is reviewed by the Program Managers and Program Specialist on an annual basis, and is consistent with United States Department of Agriculture guidelines. The researchers are asked to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development. The university is required to provide an accomplishment report when the new grant proposal is submitted to the agency for funding. Adequate progress has been reported on specific tasks by agency-funded personnel and activities. The research is relevant and addresses an important opportunity for the aquaculture industry on Molokai.

MULTI-COMMODITY RESEARCH, OREGON

Question. Please provide a description of the research done under the Multi-Commodity Research program?

Answer. This research provides agricultural market research and analysis to support Pacific Northwest producers and agribusiness in penetrating new and expanding Pacific Rim markets for value-added products. It examines the potential for increasing the competitiveness of Pacific Northwest agriculture through improvements in food production, processing, and trade by assisting decision makers in developing economic and business strategies. The research proposal was peer reviewed at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Oregon and other Pacific Northwest States produce a wide variety of agricultural commodities and products with export potential to Pacific Rim countries. Research and analysis are necessary to guide agricultural producers and processors in assessing markets, developing market strategies, and creating appropriate value-added products.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research project is to gain better specific understanding of the technical, economic, and social relationships that define Oregon's value-added agricultural sector, and examine how these factors affect the economic performance of the sector. This project investigates and develops innovations in value-added agriculture to improve the economic performance of the agricultural and food manufacturing sectors in the Pacific Northwest.

Work in progress has resulted in research output in four topic areas: market research, packaging research, sensory research, and food processing industry strategic planning. Output includes development of a World Wide Web site for PNW exports, data bases, survey work, and collaborative research activity with industry and with institute and university researchers in selected Asian countries. Many high quality manuscripts, working papers, journal articles, and graduate theses have been produced.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The research began in fiscal year 1993. The appropriation for fiscal year 1993 was \$300,000; fiscal year 1994, \$282,000; and fiscal years 1995 through 2000, \$364,000 for each year. The total amount appropriated is \$2,766,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funding for this grant \$177,574 in State appropriations in 1993, and \$162,394 in 1994. The project involves the use of Oregon State University administrative personnel, equipment, utilities and facilities that are indirect costs to the project. These costs constitute an Oregon State University contribution to the project that is not allowable as a reimbursable expense. Because the Oregon State appropriations process penalizes the University for reporting nonreimbursed indirect costs, the university has not reported the amount of non-Federal funds appropriated for fiscal years 1995–2000.

Question. Where is the work being carried out?

Answer. The research is carried out at Oregon State University in Corvallis, and at the Northwest Food Innovation Center in Portland, Oregon.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1993 was for a period of 12 months, however, the goal of enhancing Oregon's value-added agricultural sector in an ongoing regional and national concern. Progress on the original objectives is as follows: baseline data have been accumulated; an economic growth assessment model is being refined; global competitiveness is being assessed for value-added Pacific Northwest agricultural products; targets for performance are being worked out with agricultural industries; and trade teams have been involved in assessing the ability of U.S. based industries to meet the demands for noodle production for Asian markets. The current phase of the program will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in January 1999, as it evaluated the 1999 project proposal, and determined that: "This institution has a highly productive history regarding this research. Outputs and accomplishments in 1998 include 4 scientific journal articles and 1 scientific paper presentation; participation in 8 domestic and 2 international professional, scientific and industry meetings; participation on 2 multistate research committees; completion of 2 MS theses and 1 Ph.D. dissertation; and 1 patent application."

NATIONAL BIOLOGICAL IMPACT ASSESSMENT PROGRAM

Question. Please provide a description of the work that has been funded under the National Biological Impact Assessment Program grant.

Answer. The National Biological Impact Assessment Program supports the environmentally responsible use of biotechnology products to benefit agriculture and the environment. This grant provides funding for the Information Systems for Biotechnology which is a national resource in agricultural biotechnology information.

The Information Systems for Biotechnology provides information to the research community regarding biotechnology regulations and the environmental issues associated with small and large scale releases of genetically modified organisms. It provides searchable databases, documents and resource lists on the internet, a monthly News Report with over 2,200 subscribers, custom software to assist in risk assessment and management, and printed reference materials.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The National Biological Impact Assessment Program provides information on biotechnology not found anywhere else. This program fulfills an important national need to provide scientists easy access to relevant information that will facilitate conducting research that complies with the oversight and regulatory requirements for testing biotechnology products, and foster the safe application of biotechnology to benefit agriculture and the environment. The Information System for Biotechnology was the first on-line system to address the rapidly expanding information needs of the agricultural biotechnology research community and institutional biosafety committees. It continues to be one of the most comprehensive sources of information on this topic.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to facilitate and assess the safe application of new techniques for the genetic modification of plants, animals and microorganisms to benefit agriculture and the environment. Since its inception in 1989, the Program has developed tools and resources to provide scientists, regulators, teachers, administrators, and the interested public with value-added information in a readily accessible form. It has developed into a sophisticated computer-based information system and internet site that responds to more than 4200 requests per month from over 40 countries. The site carries documents pertaining to regulatory oversight of biotechnology products, policy statements, and risk assessment and risk management information. Searchable databases include records of all environmental releases of genetically engineered organisms conducted under authority of the Department of Agriculture, institutional biosafety committees, State regulatory contacts, biotechnology research centers and companies. A monthly News Report, covering research, regulatory, legal and international issues, is distributed to 1700 e-mail and 500 print subscribers. Biosafety training workshops have been conducted for public and private sector scientists and State regulatory officials. A major recent activity was publication of the proceedings of a risk assessment workshop on Ecological Effects of Pest Resistance Genes in Managed Ecosystems, that was held January 31-February 3, 1999. Over 800 copies have been distributed by request. Also, a guidebook for safely conducting transgenic research in greenhouses titled "Greenhouse Research with Transgenic Plants and Microbes: A Common Sense Guide to Containment" has been published.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$125,000; fiscal year 1990, \$123,000; fiscal years 1991-1993, \$300,000 per year; fiscal year 1994, \$282,000; and fiscal years 1995-2000, \$254,000 per year. A total of \$2,954,000 has been appropriated. There are no other potential sources of funding from other Cooperative State Research, Education, and Extension Service programs.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Virginia Tech contributes administrative and clerical support which amounts to approximately \$5000 per year.

Question. Where is this work being carried out?

Answer. The grant award is with Virginia Tech. Current partners in the program include the University of Minnesota and the Institute for Biotechnology Information.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Ensuring the environmentally responsible use of agricultural biotechnology products is an ongoing and important task. Opportunities for plant and animal improvement through biotechnology are expanding as more genes are identified and new methods are developed for introducing specific, beneficial genes into plant and animal populations. As these genetically enhanced crops and livestock are adopted commercially, assuring long term safety and efficacy will be a high national priority.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external panel of scientists reviewed this program in 1994. The review report was highly complimentary of this project and recommended continuation of the program. Another external review is being planned for the year 2000. The current proposal was peer-reviewed at Virginia Tech prior to submission and was also peer-reviewed by the agency.

NEMATODE RESISTANCE GENETIC ENGINEERING, NEW MEXICO

Question. Please provide a description of the work that has been funded under the Nematode Resistance Genetic Engineering Project grant.

Answer. This research is designed to investigate naturally occurring compounds from diverse sources that may confer pesticidal resistance if introduced into agronomic plants. The main target pests are no longer plant parasitic nematodes but include insects as well. The work is using molecular biological techniques to incorporate genes into agronomic plants which will shorten the time frame to produce transgenic plants. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the successful development of these techniques and subsequent transfer of genes with insecticidal and/or pesticidal activity into agronomic plants will provide an environmentally sound system for all plants susceptible to pests. The principal researcher believes that project has the potential for both regional and national application.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to provide an alternative approach for the control of plant parasitic nematodes through the use of molecular biological technologies to transfer pesticide resistance to plants. More recently, an insecticidal protease inhibitor gene has been used in transformed plants. A unique technique utilizing insect intestinal membrane vesicles were used as tools for detection of specific protein binding domains. The synthetic gene, CRY3A Bt has been successful for four years in field trails with transformed potato in managing Colorado potato beetles.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 and the appropriations for fiscal years 1990–1993 were \$150,000 per year; \$141,000 was appropriated in 1994; and \$127,000 in fiscal years 1995–2000, each year. A total of \$1,353,000 has been appropriated thus far.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$65,000 State appropriations in 1991; \$62,000 in State appropriations in 1992; \$75,000 in State appropriations in 1994; and \$75,000 State appropriations in 1995. For 1996, the University and the Plant Genetic Engineering Laboratory are providing matching contributions in faculty and staff salaries, facilities, equipment maintenance and replacement, and administrative support. In 1997, there were no matching non-Federal funds. In 1998 and 1999, State appropriated funds were \$48,000 and \$71,000, respectively. In 2000, the non-Federal funds are \$70,000.

Question. Where is the work being carried out?

Answer. Research is being conducted at the New Mexico State University, and at collaborating universities in the region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not as yet been met. The estimated completion date for this project is in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation of this project was a merit review conducted in January, 1999. In summary, the overall goal of this project is to use molecular technology to develop pesticide capability in plants of agronomic importance. A plant transformation system was developed to improve the historically difficult transformation efficiently of monocots. In field trails of transformed eggplants and potatoes, high

levels of effectiveness against insects have been found. Other constructs are being used in many crops to determine resistance to nematodes and other crop pests.

NEVADA ARID RANGELANDS INITIATIVE, NEVADA

Question. Please provide a description of the research that has been funded under the grant.

Answer. The Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to develop management systems to protect Nevada's arid range land from invasive weeds and wildfires.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to develop research management and educational programs to promote healthy productive and sustainable use of Nevada rangeland.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$255,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is a new project. No non-Federal funds have been provided at this time.

Question. Where is the work being carried out?

Answer. Research will be conducted at the University of Nevada Research Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project is under development, however anticipated completion for the original objectives should be 5 years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is under development and will be evaluated prior to funding.

NEW CROP OPPORTUNITIES, ALASKA

Question. Please provide a description of the research that has been funded under the grant.

Answer. Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that has not yet been received. The research will address the feasibility of growing wild rice as an alternative crop in Alaska.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research addresses a local need to find an alternative crop for the State of Alaska.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This grant is new and the research will build upon existing expertise to offer new opportunities for crop diversification.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$425,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since this is a new grant, and a proposal has not yet been received, the source and amount of non-Federal funds for this research is unknown.

Question. Where is this work being carried out?

Answer. This work will be carried at the School of Agriculture and Land Resources management at the University of Alaska, Fairbanks.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Since this is a new grant, no evaluation has been conducted.

NEW CROP OPPORTUNITIES, KENTUCKY

Question. Please provide a description of the research that has been funded under the grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. The research will promote economically sustainable crop production, new crops, and expanded crop uses in Kentucky. Improved plant and innovative production systems through integrated research in plant ecology, biochemistry, physiology and genetics, will be developed. Technology and information support for Kentucky farmers and for the economic base of the State will be provided.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research addresses a regional need to find alternative crops to replace tobacco.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This grant is new and the research will build upon existing expertise to offer new opportunities for crop diversification, technology transfer and demonstrations.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$595,000.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is a new grant and no non-Federal funds have been provided.

Question. Where is this work being carried out?

Answer. This work will be carried at the University of Kentucky and at various locations across the State.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. This is a new grant and no evaluation has been conducted yet.

NONFOOD AGRICULTURAL PRODUCTS PROGRAM, NEBRASKA

Question. Please provide a description of the research that has been funded under the Nonfood Agricultural Products Program grant.

Answer. This work focuses on the identification of specific market niches that can be filled by products produced from agricultural materials, developing the needed technology to produce the product, and working with the private sector to transfer the technology into commercial practice. Major areas of application include starch-based polymers, use of tallow as diesel fuel, improvements in ethanol production, use of vegetable oil as drip oil for irrigation wells, as a two cycle engine oil, and as a chain saw bar oil, production of levulinic acid, the extraction of wax from grain sorghum and production of microcrystalline cellulose from crop biomass. The Dean and Director of Agricultural Research has initiated a review process that parallels the process used for Experiment Station projects. Two to three faculty member are asked to critically review the proposal using criteria as described by Cooperative State Research, Education and Extension Service in the letter soliciting proposals for 1999.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes our ability to produce agricultural commodities exceeds our needs for food and feed. These commodities are environmentally friendly feedstocks which can be used in the production of many biochemicals and biomaterials that have traditionally been produced from petroleum. The production of the commodities and the value-added processing of these commodities is regional in scope.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The objectives are to identify niche markets for industrial utilization of agricultural products, improve and develop conversion processes as needed for specific product isolation and utilization, provide technical, marketing and business assistance to industries, and coordinate agricultural industrial materials research at the University of Nebraska, Lincoln. Accomplishments include commercialization of soybean based drip oil for irrigation wells. Bruning Grain Co. Marketing "Soy Bio Drip." MCC Technologies, Inc. continues to refine the processing requirement and develop a business plan for production of microcrystalline cellulose from crop residues such as corn cobs, wheat straw and cellulose via a reactive extrusion process developed by the university's Industrial Agricultural Products Center. Various hardness grades of plastic particle media blast using a combination of commercially available biodegradable polymers have been produced. A water resistant starch-based foam has been developed and a patent disclosure has been submitted. A commercialization strategy is being developed. Also, an alternative process for producing biodiesel has been developed and will be disclosed soon. All of these commercialization projects are the result of research efforts, most of which have been supported by the Nonfood Agricultural Products Program. Two Small Business Innovation Research, Phase I, proposals have been funded for technologies developed at the Center. A Phase II proposal is currently being written on loose fill packaging. A Phase II proposal on levulinic acid is anticipated.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The funding levels for this project are \$109,000 in 1990; \$110,000 per year in fiscal years 1991-1993; \$103,000 in fiscal year 1994; \$93,000 in fiscal year 1995; and \$64,000 in fiscal years 1996-2000 per year. A total of \$955,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funding for this project is: in fiscal year 1992, \$315,000; fiscal year 1993, \$330,000; fiscal year 1994, \$330,000; fiscal year 1995, \$309,000; fiscal year 1996, \$251,000; fiscal year 1997 \$250,000; fiscal year 1998, \$340,000; and fiscal year 1999, \$260,000. These funds were from Nebraska Corn, Soybean, Wheat, Sorghum and Beef Boards, World Wildlife Fund, Nebraska Bankers Association, United Soybean Board and National Corn Growers Association, Bioplastics, Inc., Biofoam, Inc. and M.C.C. Technologies, Inc.

Question. Where is this work being carried out?

Answer. This work is being conducted at the Industrial Agricultural Products Center, L.W. Chase Hall, University of Nebraska, East Campus, Lincoln, Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of the original projects were completed. Specific objectives have been identified in each renewal request.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is evaluated based on the annual progress report. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of this agency.

OIL RESOURCES FROM DESERT PLANTS, NEW MEXICO

Question. Please provide a description of the research that has been done under the Oil Resources from Desert Plants, New Mexico.

Answer. The Plant Genetic Engineering Laboratory has been exploring the potential for the production of high value industrial oils from agricultural products. The effort has been focused on transferring the unique oil producing capability of jojoba into oilseed rape and soybean. With the development of technology to both isolate the enzyme components of oil biosynthesis and successfully transform the target plants, significant advances have been made with jojoba. In addition, oil enzymes have been studied in castor, oilseed rape, desert primrose, cyanobacteria, and meadowfoam.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes desert plant sources of valuable oils for industrial applications are typically low yielding and limited in climatic areas for farm production. Genetic engineering offers an opportunity to move genetic capability to high yielding major crops. Many of the oils and their derivative acids,

waxes, and others can directly substitute for imports of similar polymer materials, especially petroleum.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to transfer the unique oil producing capability of jojoba and other native shrubs into higher yielding crops such as oilseed rape and soybean. This is a form of metabolic engineering and it requires the transfer of coordinated groups of genes and enzymes into the host plant to catalyze the necessary biochemical reactions. Recent progress includes successful transformation of tobacco and alfalfa plants with oil metabolism genes from the meadowfoam plant and a cyanobacterium.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. This research began in fiscal year 1989 with a \$100,000 grant under the Supplemental and Alternative Crops program. Grants have been awarded under the Special Research Grants program as follows: fiscal year 1990, \$148,000; fiscal years 1991–1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995–1996, \$169,000 each year; and fiscal years 1997 through 2000, \$175,000 per year. A total of \$2,074,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Matching funds from State and private sources used to help fund this project were \$27,747 in fiscal year 1998 and \$71,000 in fiscal year 1999. New Mexico State University and the Plant Genetic Engineering Laboratory also provide \$90,000 for in-kind support per year including faculty salaries, graduate student stipends, facilities, equipment maintenance, and administrative support services.

Question. Where is this work being carried out?

Answer. The research is being conducted by the Plant Genetic Engineering Laboratory at New Mexico State University, Las Cruces, New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. An estimate of the total time required to complete all phases of the project is 3–4 years. The application of this research for improved management of natural resources will evolve and expand as technology in the area advances.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Oil Resources from Desert Plants, New Mexico project was evaluated for scientific merit by an agency peer review panel on February 25, 1999. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The Institution conducts an internal peer review of this project by scientists with expertise in this area of research. A panel of scientists will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2000.

ORGANIC WASTE UTILIZATION, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Organic Waste Utilization, New Mexico grant.

Answer. Composted dairy waste is utilized as a pretreatment to land application. Composting dairy waste before land application may alleviate many of the potential problems associated with dairy waste use in agronomic production systems. Composting may also add value to the dairy waste as a potential landscape or potting medium. High temperatures maintained in the composting process may be sufficient for killing enteric pathogens and weed seeds in dairy waste. Noxious odors and water content may be reduced via composting. Composted dairy waste may be easier to apply, produce better seed beds, and not increase soil salinity as much as uncomposted dairy waste. Changes in the physical structure of the soil are being monitored for the effects of composted vs uncomposted amendments. This project undergoes annual peer review from academic institutions and experts from government and state agencies, and industrial partners.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the research will address the utilization of dairy waste combined with other high-carbon waste from agriculture and industry, including potash and paper waste, for composting. This approach to waste management will have high impact for states where dairy and agriculture are important industry sectors. This is especially true for New Mexico and the southwest United

States where the dairy business is growing rapidly. This research will also provide an additional pollution prevention tool for the industrial sectors dealing with potash and paper waste. The principal investigator believes this research to be of local, regional and national importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was and continues to determine the feasibility of simultaneously composting dairy waste from agriculture and industry. The research will determine effects of utilizing composted waste, as opposed to raw waste, as a soil amendment on plant growth, irrigation requirements, and nutrient and heavy metal uptake. Phase I, to determine the feasibility of simultaneous composting dairy waste with available high carbon wastes from agriculture and industry, has been completed. Phase II, to determine the appropriate ratios of waste to carbon substrate for successful composting is completed. Phase III, to determine the kinetics of nutrient release and effects of composted material on heavy metal uptake will be completed next year. The study of the second and third year application of the compost will be undertaken this year. This will identify the long term soil impact resulting from compost application.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal year 1996 was \$150,000, and for fiscal years 1997 through 2000, \$100,000 per year. A total of \$550,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds for the duration of this grant from the state appropriation is \$75,000. There is another \$50,000 in-kind support from the industrial partners. Additionally, a sum of \$15,000 from the New Mexico State Highway Department has been leveraged by this project.

Question. Where is this work being carried out?

Answer. This work is being carried out in New Mexico under the direction of the Waste-Management Education and Research Consortium in collaboration with The Composting Council and industrial partners, such as Envio in Ohio, Plains Electric, and McKinley Paper in New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion date of the initial phases I and II was March 2000 and the project has progressed according to the specified targets. Phase III is ongoing and will be completed by early 2001. Phase IV was added last year to evaluate the multi-year compost application on parameters such as plant growth, soil water retention and soil salinity.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has been evaluated based on the semi-annual progress report and research findings presented at conferences. The cognizant staff scientist has reviewed the project and determined that this research is conducted in accordance with the mission of this agency.

PASTURE & FORAGE RESEARCH, UTAH

Question. Please provide a description of the research that has been funded under the Pasture and Forage Research, Utah grant.

Answer. This is a multidisciplinary effort to develop profitable and sustainable pasture and forage management systems. The Cooperative State Research, Education, and Extension Service requested Utah State University to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The proposed research under this Special Research Grant will address issues related to forage production and utilization in Utah.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to develop a comprehensive guide for the management of irrigated pastures to assist livestock producers reduce cost and increase net returns.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$200,000, and for fiscal years 1998 through 2000 was \$225,000 per year. A total of \$875,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds in support of this project and related activities were \$360,200 for 1997, \$356,000 for 1998 and \$364,000 for 1999.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Utah Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate the completion date for these objectives to be in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant is peer reviewed annually through the institutions project approval process as well as by the agency National Program Leader and the last on-site review took place in November 1999. The evaluation summary noted that the program, as implemented at the farm level, has already produced significant results in addressing problems of 4-H in Utah and the surrounding area.

PEACH TREE SHORT LIFE IN SOUTH CAROLINA

Question. Please provide a description of the research that has been funded under the Peach Tree Short Life in South Carolina grant.

Answer. Progress continued in 1999 with focus on the evaluation and longevity and productivity of Guardian rootstocks on peach tree short life sites in the southeast and replant sites throughout North America. More fundamental work has involved the biochemical characterization of the egg-kill factor produced by a bacteria on nematode eggs. Other basic studies involved the cloning of genes associated with production and expression of toxins from bacteria. New studies were initiated on the use of solarization to reduce nematode populations for peach tree replant. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the principal researcher the problem of disease on peach, nectarine, and plum trees in the southeastern United States effects is very great. More than 70 percent of peach acreage in the southeast is affected. Research continued on the improvement of rootstocks and the use of the cultivar Guardian BY520-9 which has now been released in 22 states including California, New Jersey and Michigan where bacterial canker is a problem.

Question. What was the original goal of this research and what has been accomplished to date.

Answer. The goal of this research was the continued evaluation of productivity of peach Guardian BY520-9 rootstocks on peach tree short life and investigations into novel management for ring nematodes by bacteria. Recent accomplishments include the increase in bulk commercial production of Guardian seed while two new Guardian selections have had very good nursery trails. Guardian rootstock continues to be tested in 22 states and is performing well. A marker for a gene for rootstock resistance to two root-knot nematode species was sequenced and successfully used to correctly sort current commercial rootstocks according to their known nematode resistance or susceptibility. A major find is that the egg-kill factor produced by the bacteria kills root-knot nematode eggs as well as ring nematode eggs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$100,000; fiscal years 1982-1985, \$192,000 per year; fiscal years 1986-1988, \$183,000 per year; fiscal year 1989, \$192,000; fiscal year 1990, \$190,000; fiscal years 1991-1993, \$192,000 per year; fiscal year 1994, \$180,000; fiscal years 1995-2000, \$162,000 per year. A total of \$3,527,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources for this grant were as follows: \$149,281 state appropriations in 1991; \$153,276 state appropriations in 1992; \$149,918 state appropriations in 1993; \$211,090 state appropriations in 1994; \$193,976 in state appropriations in 1995; \$169,806 in state appropriations in 1996

and 1997; \$150,693 in state appropriations in 1998; \$92,099 in 1999; and \$92,099 in state appropriations in 2000.

Question. Where is this work being carried out?

Answer. This research is being conducted at South Carolina Agricultural Experiment Station.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The researchers anticipate that the work may be completed in fiscal year 2001. Adequate progress has been made to assure that the objectives will be met before the completion date.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation of this project was a merit review completed in January, 1999. In summary, the evaluation of peach rootstocks with resistance to peach tree short life is of continued importance in managing this disease. The use of biological control strategies in suppression of plant parasitic nematodes are a complementary area of research in that it can enhance disease management by protecting the peach rootstocks. Solarization of orchard sites prior to peach tree replanting significantly altered the microbial community and suppressed nematode multiplication in the rhizosphere. Some accomplishments were the increased production and release of commercial Guardian seed and continued evaluation of rootstock in 22 states and provinces. A molecular technique that separates resistant and susceptible peach rootstocks was validated.

PEANUT ALLERGY REDUCTION, ALABAMA

Question. Please provide a description of the research that has been funded under the Peanut Allergy Reduction grant.

Answer. The industry, in conjunction with Alabama A&M University, Auburn University and the University of Georgia are trying to develop a response to the problem of peanut allergy being experienced by greater numbers of people and have determined that research is needed in the following areas:

- the possibility of reducing the allergenic potential of peanuts through bioengineering and traditional breeding targeted at modifying the peanut proteins responsible for causing allergic reactions;
- development of vaccines and other means to desensitize people with peanut allergies; and
- development of better marketing, handling and processing methods to reduce allergy risks.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Peanut allergies present a major problem for the growth of the peanut industry nationally, regionally and locally.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research are to (1) reduce the allergenic potential of peanuts through bioengineering and traditional breeding targeted at modifying the peanut proteins responsible for causing allergic reactions; (2) develop vaccines and other means to desensitize people with peanut allergies; and (3) develop better marketing, handling and processing methods to reduce allergy risks.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant begins during this fiscal year 2000. The appropriation for fiscal year 2000 is \$425,000.

Question. What is the source and amount of non-federal funds provided by fiscal year 2000?

Answer. A grant proposal is expected from a consortium of universities, among them are Alabama A&M University, Auburn University, and the University of Georgia. Since grant proposals have not yet been received, the source and amount of non-federal funds for this research is not known.

Question. Where is this work being carried out?

Answer. The research is expected to be carried out in Alabama.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Since grant proposals from the cooperating universities of the consortium have not yet been received, the anticipated completion date and completion of objectives is not yet known.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since grant proposals from the cooperating universities of the consortium have not yet been received, the date of the last agency evaluation is not yet known.

PEST CONTROL ALTERNATIVES, SOUTH CAROLINA

Question. Please provide a description of the research that has been funded under the Pest Control Alternatives grant.

Answer. This grant supports research and technology transfer to provide growers with alternatives for managing pests and to implement the use of new alternatives reducing the sole reliance on chemical pesticides.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The investigators contributing to the research and technology transfer at South Carolina believe that need for the development of alternatives for managing pests on vegetables is a regional and national problem. Contributions from the South Carolina work are projected by South Carolina to impact vegetable production in the Southern region and consumers of vegetable production from the Southern region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Studies conducted during 1999 demonstrated that *Bacillus thuringiensis* formulations and combinations with botanicals such as neem controlled a number of insect pests important on collards. Comparisons were conducted with commonly used conventional pesticides. Clearly, microbial products or microbial materials in combination with botanicals such as neem, can control caterpillars on leafy greens without the use of broad spectrum chemical insecticides. Fresh cowpea pods were treated with different concentrations of neem to determine the effects on the southern green stinkbug. Numbers of feeding punctures were significantly reduced when pods were treated with neem. Also, treatment caused deformed adults that could not feed or reproduce. Because neem is "soft" on beneficial insects and spiders, it may be considered as a part of an ecologically-compatible program of insect control in several vegetable crops.

Field studies conducted during 1999 have shown that applications of the entomopathogenic nematode, *Steinernema fletiae*, are as effective in reducing damage from the squash vine borer as standard insecticide sprays. Foliage sprays of a *Bacillus thuringiensis* formulation were also effective in reducing damage by this pest.

Plant-feeding insects and predators were monitored by two different methods in 5 species of medicinal plants during the spring and summer of 1999. Except for one small, localized outbreak of whiteflies, the natural enemies kept potential pests in check. Major predators included ladybeetles, *Nabis* sp., *Geocoris* spp., and spiders in the genus *Pardosa*. These preliminary results show that any insect management program on medicinal herbs should avoid altogether the use of chemical insecticides. Seedless watermelon were more resistant to powdery mildew than seeded ones. Losses to powdery mildew should be less with seedless than with seeded varieties. '19Munchkin' and '19Baby Boo' mini-pumpkins were the most productive varieties among 11 mini-pumpkins tested. Collards produced by crossing collard and cabbage germplasm had increased vigor and favorable color, size and shape for the fresh market. South Carolina county extension agents were provided technology transfer information by Clemson University research scientists participating in this research. Topics included, (1) conservation of indigenous natural enemies, (2) augmentation of predators and parasitoids, (3) age of microbial agents in cultivated systems and (4) nematodes as biocontrol agents. County agents should be more informed about the practical use of biological control agents as alternatives to chemical insecticides.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$125,000 per year. In fiscal year 1994 the appropriation was \$118,000 and in fiscal years 1995 through 2000, \$106,000. A total of \$1,004,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. South Carolina has provided approximately \$200,000 in personnel support and operating dollars per year from State appropriations based on the PI's estimate.

Question. Where is the work being carried out?

Answer. This research and technology transfer program is being conducted at the South Carolina Agricultural Experiment Station, Clemson University at Clemson, Florence, and Charleston, South Carolina.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the project were for five years. The project was revised in 1998. Research on objective A: to develop and evaluate microbial pest control agents for control of plant pathogens and insect pests of vegetables, is diffuse and non-conclusive. It would be far superior for continued work in this area to be submitted to competitive peer review programs where the investigators would need to clearly focus specific activities and receive the benefit of the comments of peer scientists. Objective B: to determine the efficacy of innovative cultural practices for vegetable production systems in South Carolina and Objective C: to assess the role of indigenous predators, parasites, and pathogens in controlling insect pests; determine environmental and biological factors that influence the abundance and distribution of these indigenous beneficials; and consider the presence of natural enemies, as well as pests, in management decisions. These are areas where the most progress appears evident and has been cited in the accomplishments. The base of information and orientation of the research in these areas is adequate and of such quality that the investigators could compete well in competitive grant programs such as sustainable agriculture or regional Integrated Pest Management grant programs, and would benefit from the peer review process. Progress in these areas is an ongoing process as explanations are sought for the results being obtained. Objective D: to evaluate and develop germplasm, breeding lines and cultivars for resistance to major pathogens of commercially important vegetables and Objective E: to transfer new technology to user groups, have not at this time, demonstrated progress which could be anticipated from ongoing conventional sources of funds.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is evaluated annually when the grant is processed. An agency evaluation of this project is to be scheduled for the last part of fiscal year 2000.

PEST MANAGEMENT ALTERNATIVES

Question. Please provide a description of the research that has been funded under the Pest Management Alternatives special grant.

Answer. This special research grant supports projects that help farmers respond to the environmental and regulatory issues confronting agriculture. These special grant funds support research that provides farmers with replacement technologies for pesticides that are under consideration for regulatory action by EPA and for which producers do not have effective alternatives. The passage of the Food Quality Protection Act of 1996 (FQPA) makes this special research grant of critical importance to the Nation's farmers.

New pest management tools are being developed to address critical pest problems identified by farmers and others in a crop production region, and to identify new approaches to managing pests without some of the most widely used pesticides. Farmers have identified the lack of effective alternative pest management tactics as a primary reason for not implementing IPM on their farms. Where effective alternative tactics have been developed, they are widely and rapidly implemented by farmers. These special research grant funds are distributed on a competitive basis to all eligible research institutions through the Pest Management Alternatives Program or PMAP. Research priorities for PMAP are established with the help of a database analysis system, which draws upon the expertise of the land-grant university system, commodity groups, and others.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research.

Answer. The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber is dependant on access to safe, profitable and reliable pest management systems. For a variety of factors, farmers and other pest managers have fewer chemical control options available to them than they did at the beginning of the decade, and this trend is likely to continue at an accelerated rate. The Food Quality Protection Act of 1996 (FQPA) will have significant impacts on pest management systems in the United States over the next dec-

ade, and the "minor use" (high value crops grown on relatively few acres) will be particularly hard hit. For these reasons and others, it is essential that farmers be provided with new pest management tools and better information so they can remain competitive in today's global marketplace.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This research is conducted to help farmers respond to the environmental and regulatory issues confronting agriculture by providing them with new options for managing pests. The research supported by this special grant is identifying new ways to manage pests without key pesticides that may no longer be available as FQPA is implemented. Some highlights of the research funded through PMAP include technology that reduces organophosphates in apples, modified cropping systems that replace herbicide use in pumpkins and squash, surface amendments that reduce aerial pesticide pollutants, development of pest and natural enemy thresholds to improve pest scouting on wheat, models to improve pesticide use efficiencies in minor fruit crops, improved insecticide and herbicide spray technology, new selective insecticides to control broccoli insects, and use of non-traditional oil sprays to control mites on apples.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1996 through 2000, \$1,623,000 each year. A total of \$8,115,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds are not required by this grants program.

Question. Where is the work being carried out?

Answer. All State agricultural experiment stations, all colleges and universities, other research institutions and organizations, Federal agencies, private organizations or corporations, and individuals are eligible to compete for this funding. This research is currently being carried out by State Agricultural Experiment Stations and other research organizations located in 20 States.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The economic and environmental pressures facing U.S. agriculture today are greater today than in 1996 when federal funds were first appropriated for this special research grant. There will be a need for continued investment in research to develop new approaches to managing pests for the foreseeable future as the Food Quality Protection Act of 1996 is implemented.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each new draft RFP and all project proposals are evaluated annually by multi-disciplinary relevancy and merit review panels. A joint USDA/EPA workshop to evaluate the progress and scope of the program was held in Arlington, VA on May 11th, 1999. The conclusions were that the program was on course and making good progress, and could do more with additional funding. The projects supported by this special research grant have consistently provided key knowledge needed in developing new approaches to pest management. The focus on pesticides targeted by FQPA assures that critical pest management alternatives are being addressed. PMAP has supported 82 projects in 29 States since it started five years ago.

PHYTOPHTHORA ROOT ROT, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Phytophthora Root Rot grant.

Answer. Work has continued to focus in general on the development of strategies for sustainable vegetable production in irrigated lands. This research includes continued work on the search for Phytophthora root rot resistance in chilies, identification of molecular markers for rot tolerant genes, investigation on irrigation modification as a means to manage root rot, and soil bed temperature control as a means to manage disease.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that since Phytophthora disease threatens chili production in west Texas, New Mexico, and Eastern Arizona, this problem is of state and regional significance.

Question. What is the original goal of this research and what has been accomplished to date?

Answer. The original goal was to improve chile production through genetically superior cultivars, combined with new improved cultural practices. Researchers have developed a highly effective disease screen that selects resistant seedlings, found that genes for resistance to root rot do not provide protection against *Phytophthora* foliar blight, that a wild species of *Capsicum* is immune to the fungus, and that molecular markers are useful to introgress genes for tolerance.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of \$125,000 for that year. The fiscal years 1992–1993 appropriation was \$150,000 per year; \$141,000 in fiscal year 1994; and \$127,000 in fiscal years 1995–2000, each year. A total of \$1,328,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds from state appropriations and the California Pepper Commission were \$255,614, in 1997; \$253,614 in 1998; and state appropriations in 2000 are \$250,000.

Question. Where is this work being carried out?

Answer. Research is being conducted at New Mexico State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was 1995. These objectives have not been met. Related programs deal with research and development efforts designed to prevent or manage diseases impacting vegetable production in irrigated areas, and cooperators estimate that the objectives of these programs should be met by 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last merit review was made in January, 1999. In summary, the development of resistant cultivars and research on interactions of *Capsicum* and *Phytophthora* for developing strategies for irrigated crop growers to be competitive in the international economic arena continued. More than 40,000 seedlings were screened for resistance to root rot and/or foliar blight in the greenhouse. Several individual plants from cayenne, jalapeno, and new Mexican pod types were found to possess both root-rot and foliar blight resistance. Unfortunately due to an introduction of curly top virus the field evaluation were lost this year. However, other research continues to identify molecular makers linked to foliar blight.

PLANT, DROUGHT, AND DISEASE RESISTANCE GENE CATALOGING

Question. Please provide a description of the research that has been funded under the Plant, Drought, and Disease Resistance Gene Cataloging grant.

Answer. This research grant identifies, characterizes, and catalogs genes that enhance the ability of agricultural crops to resist stress caused by drought and disease organisms. The project constructs, carts, and distributes Cana libraries for genes that are differentially expressed in response to drought or disease pressure. Work is also being done to sequence DNA of these genes, to characterize their patterns of expression, and to develop databases to share information with other scientists.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research will improve the drought and disease resistance of agricultural crops in New Mexico and throughout the United States. This work has applications throughout the Nation, especially in the arid and semi-arid production regions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This research project was supported so that better adapted agricultural crops could be developed for difficult environments in New Mexico and throughout the United States. New Mexico State University established the facility, developed a database to catalogue Cana, and began the initial work of sequencing and cataloging genes into biologically informative groups. To date, scientists have isolated the appropriate DNA to construct libraries of drought-stress induced transcripts from three different chile genotypes, one grass, and one clover. Additionally, they have selected the germplasm to characterize for other species.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 and has been with appropriations of the following amounts: fiscal years 1998 and 1999, \$150,000 per year; fiscal year 2000, \$212,500. A total of \$512,500 has been appropriated since fiscal year 1998.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In fiscal year 1998, New Mexico Agricultural Experiment Station provided \$8,444 in non-federal funds. The funds covered a portion of the salary for the two principal investigators.

Question. Where is this work being carried out?

Answer. The research is primarily conducted at New Mexico State University. Collaborations with Los Alamos National Lab and the National Center for Genome Resources have been established.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. When it was initiated in fiscal year 1998, this project was designed to demonstrate significant accomplishments within a five-year time frame. The principal investigators report significant progress has been made in achieving project objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation of this project was an agency merit review which took place last March, 2000. This evaluation noted that the faculty at New Mexico State University have been conducting research on genes involved in disease and drought resistance on a wide range of crops and have recently developed expertise and collaborative efforts in bio-informatics. Work has begun on two new databases in the areas of plant metabolism and cell biology. When the cDNA libraries are constructed, curated and distributed, scientists from around the world will have access to this database information. It was noted that this project addresses high priority objectives in plant genetics which are directed to economically important crops and approval of funding was highly recommended.

POTATO RESEARCH

Question. Please provide a description of the research that has been funded under the grant.

Answer. Scientists at several of the State Agricultural Experiment Stations are breeding new potato varieties, high yielding, disease and insect resistant potato cultivars, adapted to the growing conditions in their particular areas, both for the fresh market and processing. Research is being conducted in such areas as protoplast regeneration, somoclonal variation, storage, propagation, germplasm preservation, and cultural practices. Congressional language for fiscal years 1997, 1998, 1999, and 2000 has directed CSREES to award these funds on a competitive basis. In each of the years, CSREES published a request for proposals in the Federal Register and awarded grants competitively based on a scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research effort addresses needs of the potato producers and processors throughout the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to improve potato production through genetics and cultural practices as well as improve storage for quality potatoes for processing and fresh market. This research has resulted in a number of new high yielding, good quality, disease and insect resistant cultivars, which are now being used in the processing industry and in the fresh market. Regional comprehensive breeding programs have been developed to produce cultivars targeted to the specific growing conditions of that region. A number of the new cultivars have also been adaptable to other regions. These programs have also had success in identifying resistance to pests and pathogens in wild germplasm and are developing expertise to incorporate genetic engineering approaches as traditional components of the program.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1983, \$200,000; fiscal year 1984, \$400,000; fiscal year 1985, \$600,000; fiscal years

1986–1987, \$761,000 per year; fiscal year 1988, \$997,000; fiscal year 1989, \$1,177,000; fiscal year 1990, \$1,310,000; fiscal year 1991, \$1,371,000; fiscal years 1992 and 1993, \$1,435,000 per year; fiscal year 1994, \$1,349,000; fiscal years 1995 through 1998, \$1,214,000; and for fiscal years 1999 and 2000, \$1,300,000 per year. A total of \$19,252,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$401,424 state appropriations, \$4,897 product sales, \$249,830 industry, and \$30,092 miscellaneous in 1991; \$567,626 state appropriations, \$6,182 product sales, \$334,478 industry, and \$44,323 miscellaneous in 1992; \$556,291 state appropriations, \$9,341 product sales, \$409,541 industry, and \$44,859 miscellaneous in 1993; \$696,079 state appropriations, \$21,467 product sales, \$321,214 industry, and \$226,363 miscellaneous in 1994; \$935,702 state appropriations, \$35,376 product sales, \$494,891 industry, and \$230,080 miscellaneous in 1995; and an estimated \$900,000 state appropriations, \$10,000 product sales, \$400,000 industry, and \$200,000 miscellaneous in each of 1996, 1997, 1998, and 1999.

Question. Where is this work being carried out?

Answer. The research work is being carried out at the Cornell, Idaho, Maine, Michigan, North Dakota, Oregon, Pennsylvania, Washington, North Carolina, New Jersey, and Colorado State Agricultural Experiment Stations. The grant to Colorado is divided by Colorado with the California and Texas Agricultural Experiment Stations.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated to accomplish significant results in about five years. Because the research is based on genetic varietal development, progress is developing new potato varieties takes from 5 to 10 years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Beginning in fiscal year 1997, these funds have been awarded on a competitive basis using a scientific peer review. In addition, CSREES conducts a formal meeting with representatives from the potato industry to review research needs and provide input to the agency on the merits of the proposals.

PRECISION AGRICULTURE, KENTUCKY

Question. Please provide a description of the research that has been funded under the Precision Agriculture, Kentucky grant.

Answer. The Cooperative State Research, Education and Extension has requested the university to submit a grant proposal that has not yet been received. Research will evaluate site-specific practices for production of corn and soy beans under field conditions. The work will compare various combinations of management practices using site-specific technology and evaluate economics of its application.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to provide objective information about precision agriculture technologies to assist farmers in the development of management systems that are productive, economical, and environmentally benign.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to evaluate site specified technologies and develop recommendations for their use in crop management systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999 and the appropriation for fiscal year 1999 was \$500,000 and 2000 is \$850,000, total of \$1,350,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This is a new project which has not yet began and, therefore, no non-federal funds have been used.

Question. Where is this work being carried out?

Answer. The research will be conducted at the Kentucky Agriculture Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for this project is 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will be evaluated upon receipt of the required grant proposal.

PRE-HARVEST FOOD SAFETY, KANSAS

Question. Please provide a description of the research that has been conducted under the Pre-Harvest Food Safety, Kansas grant.

Answer. Longitudinal studies on the fecal shedding of *Escherichia coli* 0157:H7 (*E. coli* 0157:H7) by cattle on beef cow-calf ranches are being done to determine the impact of various routine management practices on the shedding rate. The purpose of the research is to develop an understanding of the management factors that contribute to the incidence of *E. coli* 0157:H7 in beef cattle. During the past year, the project has been enlarged to include more monitoring of environmental and wildlife samples to determine reservoirs for *E. coli* 0157:H7.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The presence of *E. coli* in beef animals sent to slaughter can contribute to the contamination of meat products produced from such animals. This has increased the need for control measures that could reduce the incidence of such food-borne human pathogens in food animals during the production cycle. With the implementation of mandatory Hazard Analysis Critical Control Point programs for *E. coli* 0157:H7 in slaughter plants, there is increased pressure for the livestock producer to deliver animals to slaughter with reduced prevalence of *E. coli* 0157:H7. This type of research has been identified as critical by all food animal commodity groups as well as public health officials and consumers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to determine the incidence of *E. coli* 0157:H7 in large versus small beef cow-calf operations and describe the management factors that contribute to or affect the rate of shedding of organisms in the feces of such animals. *E. coli* 0157:H7 has been detected in 3.11 percent of monthly fecal samples (n=3152), with 4.57 percent of the 2058 animals having at least one positive sample. Fecal shedding was normally transient; only one animal was positive on more than one sampling date. In addition, there was a difference in prevalence between farms. Sources of drinking water were also examined and 3.5 percent of 199 water samples were positive. Of particular interest was that 8.3 percent of 24 creek/stream samples and 2.9 percent of 103 pond samples were positive. In addition, isolates of *E. coli* 0157:H7 have been obtained from wildlife, especially deer. Management practices on the ten farms are being examined to determine if there are specific risk factors that can be identified.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1996. The appropriations for fiscal years 1996 through 2000 was \$212,000 per year. A total of \$1,060,000 has been appropriated.

Question. What is the source and amount of non-federal funds by fiscal year?

Answer. Non-Federal funds have been contributed to this project as follows: In fiscal year 1996 non-federal funds were \$150,000 in state appropriations and \$91,450 in contributed indirect costs; 1997 non-federal funds were \$165,000 in state appropriated funds and \$90,300 in contributed indirect costs; 1998 non-federal funds were \$175,000 in state funds and \$91,500 in contributed indirect costs; 1999 non-federal funds were \$109,957 in state funds and \$90,800 in contributed indirect costs.

Question. Where is this work being performed?

Answer. This research is being conducted at Kansas State University, University of Nebraska-Lincoln, and at ranches in Kansas, Nebraska, and Colorado.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date was October 1, 1998 for the original objectives. However, the project was not initiated until several months after the expected start date of October 1, 1995 and the original objectives were completed in late spring of 1999. As the project has progressed, the Principal Investigator has added other important questions to the original research plan and has planned to

look more closely at management interventions that could help reduce the incidence of *E. coli* shedding in beef cattle. During the past year, the project has added objectives which are focused on environmental issues such as prevalence of *E. coli* 0157:H7 in wildlife as well as in various water supplies used by the cattle. Thus the project is expected to continue for some time after the original expected period of time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was evaluated by an on-site visit on October 28–29, 1997. The evaluation noted that the project team was doing an excellent job and the interactive collaboration was outstanding. The research team has been successful in bringing other participants into the program. The project leader provided a very comprehensive written report on November 3, 1998, including manuscripts currently under review for publication, which has permitted a further assessment of the continued progress on this important project. Several scientific papers have been given at scientific meetings and manuscripts are being published as rapidly as data are assembled, analyzed, and prepared for publication.

PRESERVATION AND PROCESSING RESEARCH, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Preservation and Processing Research grant.

Answer. Research has focused on the effects of preharvest and postharvest factors on the market quality of fresh and minimally processed horticultural products, including marigolds, pecans, watermelons, peaches, and sage. Researchers are developing harvester prototypes for marigold flowers and drying and threshing systems for marigold petal drying and separation. A fruit orienting mechanism is being developed for incorporation into an on-line grading system. An integrated harvesting and postharvest handling system is being developed for fresh market and processing market horticultural products. Research continues on methods to determine textural properties of pecans, determine optimum operating parameters for supercritical carbon dioxide and other alternative extraction technologies, and develop and optimize modified atmosphere packaging techniques and partial oil extraction for pecan shelf life extension.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that technological improvements in fruit, nut and vegetable handling systems are needed to supply domestic markets and support continued participation in international commerce, which is a national need. New environmentally friendly processing systems have been developed and are being commercialized in Oklahoma, with broad application to numerous crops with international marketing potential. Processing systems under development for commercial adaptation will support market expansion of pecans and sage, affecting product market potential and value regionally. Improvements in postharvest handling and processing are necessary to support growth of the state and national horticulture and related agricultural industries and ensure competitive involvement in national and international commerce of commodities uniquely suited for production in Oklahoma. New extraction facilities will continue to have a positive impact on local economies, incorporating a new value added processing industry, providing local employment opportunities and providing a new local market for Oklahoma produced commodities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research has been to define the major limitations for maintaining quality of harvested fruits, vegetables and tree nuts and prescribe appropriate harvesting, handling and processing protocols to extend shelf life and marketability of harvested horticultural commodities, thus maintaining profitability of production systems and assuring an economic market niche for Oklahoma producers and food processors. A systems approach to develop complementary cropping, harvesting, handling and processing operations has resulted in development of improved handling systems for cucurbit, tree fruit and herb crops. Nondestructive processing systems for partial oil reduction of tree nuts have been developed to extend shelf life and lower the calorie content for the raw or processed product. A new food extraction facility has started operations in Oklahoma.

Question. How long has the work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986, \$142,000; fiscal year 1987, \$242,000; fiscal years

1988 and 1989, \$267,000 per year; fiscal year 1990, \$264,000; fiscal year 1991, \$265,000; fiscal year 1992, \$282,000; fiscal year 1993, \$267,000; fiscal year 1994, \$251,000; and fiscal years 1995–2000 \$226,000 each year. A total of \$3,703,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year 2000?

Answer. State funds have been provided as follows: fiscal year 1991, \$126,900; fiscal year 1992, \$209,783; fiscal year 1993, \$219,243; fiscal year 1994, \$308,421; fiscal year 1995, \$229,489; year 1996, \$366,570; fiscal year 1997, \$397,881; fiscal year 1998, \$205,662; and fiscal year 1999, \$206,334. The State also invested \$16,100,000 for development of an Agricultural Products and Food Processing Center and approximately \$2 million dollars annually to staff and operate the facility.

Question. Where is the work being carried out?

Answer. This work is being conducted at the Oklahoma State Agricultural Experiment Station, in conjunction with ongoing production research at the Wes Watkins Agricultural Research and Extension Center and the South Central Agricultural Research Laboratories.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. It is expected that ongoing research will be completed in 2002. Additional related objectives beyond this date would address further opportunities for horticulture industry growth, innovative food processing technologies and associated economic development.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A review of the proposal supporting the fiscal year 1999 appropriation was conducted on March 31, 1999. The project was evaluated as part of a comprehensive site review in the fall of 1995, with a recommendation by the review team to continue and expand the value-added product development.

RANGELAND ECOSYSTEMS, NM

Question. Please provide a description of the research that has been funded under the Rangeland Ecosystems, NM grant?

Answer. Current research is focused on the ecology of noxious and invasive weeds that are endemic to New Mexico's rangelands. Competitive research grants have been awarded that deal with studying the physiological and toxicological effects of these weeds on livestock.

Question. According to the research proposal, or the principal researchers, what is the national regional, or local focus for this research?

Answer. Noxious weeds are a serious problem in the southwestern United States. About one-fifth of the rangeland in Texas and more than one-half in the New Mexico is infested to some degree. Under this program, researchers are working to develop an integrated weed management approach in rangeland ecosystems for that region.

Question. What has the original goal of this research and what has been accomplished?

Answer. Accomplished research led to understanding of broom snakeweed and other noxious weeds including a better understanding of plant's strategy for invasion and persistence. The primary focus of research at this time is addressing the need for an integrated weed management approach for noxious weeds, especially broom snakeweed.

Research is addressing three general areas which are ecology and management, biological control and toxicology and animal health. One specific accomplishment is the biological control arena; several plant pathogens and insects are proving to be effective in broom snakeweed's control.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$100,000; fiscal year 1990, \$148,000; fiscal year 1991, \$150,000; fiscal years 1992 and 1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995 and 1996, \$169,000 each year; fiscal year 1997, \$175,000; fiscal year 1998, \$185,000; and for fiscal years 1999 and 2000, \$200,000 per year. A total of \$2,084,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$249,251 state appropriations in 1991; \$200,110 state appropriations in 1992; \$334,779 state appropriations in 1993; \$302,793 state appropriations in 1994; \$294,451 state appropriations in 1995; and an estimated \$300,000 in state appropriations in each fiscal year of 1996, 1997, 1998 and 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at New Mexico State University and throughout the State of new Mexico in actual field conditions.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in 1991. Considerable progress has been made on many of the original objectives. Currently, additional and related objectives have evolved and anticipated completion date for these is 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the grant is peer reviewed with oversight by an administrative executive committee within the College of Agriculture and Home Economics at New Mexico State University. Additionally, CSREES' senior scientific staff review the progress of the grant. Those reviews indicated progress in achieving the objectives.

RED SNAPPER RESEARCH/ALABAMA

Question. Please provide a description of the research that will be funded under the Red Snapper Research grant, Alabama.

Answer. The agency is in the process of requesting the university to submit a grant proposal for this new research activity.

Question. According to the research proposal, or the principal research, what is the national, regional or local need for this research?

Answer. The researchers indicate that there is a regional need for red snapper research because of its importance to the Gulf states and the fact that it is presently considered to be an over-fished species by commercial and recreational interests. Current harvest limitations mandated by Federal actions have resulted in economic losses to coastal communities. Research will provide critical knowledge in efforts to restore native populations and stimulate the development of aquaculture enterprises in the Gulf region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new research grant to be funded in fiscal year 2000.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$510,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates that significant non-federal funding will be provided in fiscal year 2000 primarily from state sources to cover salaries of the principal investigators. As the program develops, additional non-federal funding is expected.

Question. Where is this work being carried out?

Answer. The research will be conducted through the Alabama Agricultural Experiment Station at the Claude Peteet Mariculture Center located in Gulf Shores in collaboration with the Alabama Marine Resources Division.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2001. The project will be initiated in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this new project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to the agency for funding. Since this is the first year of the program, the agency will conduct an external peer review of the proposal. The fiscal year 2000 review will be completed within three weeks of submission of the proposal. The researchers will be requested to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development.

REGIONAL BARLEY GENE MAPPING PROJECT

Question. Please provide a description of the work that has been funded under the Regional Barley Gene Mapping Project grant.

Answer. The Regional Barley Genome Mapping Project is a multi-disciplinary, multi-institutional project to develop a genome map of barley. Specific objectives are to: construct a publicly-available medium resolution barley genome map; use the map to identify and locate loci, especially quantitative trait loci controlling economically-important traits such as yield, maturity, adaptation, resistance to biotic and abiotic stresses, malting quality, and feed value; provide the framework for efficient molecular marker-assisted selection strategies in barley varietal development; identify chromosome regions for further, higher resolution mapping with the objective of characterizing and utilizing genes of interest; and establish a cooperative mapping project ranging from molecular genetics to breeding that will be an organizational model for cereals and other crop plants. All funds are awarded on a competitive basis.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes barley breeders nationwide need information about the location of agriculturally-important genes controlling resistance to biotic and abiotic stresses, yield, and quality factors in order to rapidly develop new, improved cultivars and respond to disease and pest threats. This project provides that information along with appropriate molecular markers to track these traits through the breeding and selection process.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project has been to develop a restriction fragment length polymorphism map for barley and associated important genetic traits to provide closely linked molecular markers for barley breeders. The project has developed comprehensive linkage maps defining the entire barley genome in three experimental populations and determined the location, number, effect, and interaction of genes determining a range of economically-important traits. Additionally, the project has supported the development and use of an array of genomics tools that are publicly available. Technical papers have been published to report research results to the scientific community.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$153,000; fiscal year 1991, \$262,000; fiscal years 1992–1993, \$412,000 per year; fiscal year 1994, \$387,000; fiscal years 1995–1998, \$348,000 each year; fiscal year 1999, \$400,000; and fiscal year 2000, \$425,000. A total of \$3,843,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$203,760 from industry in 1991; \$212,750 from industry in 1992; \$115,000 from industry in 1993; and \$89,000 from industry in 1994; and \$35,000 from the State of Washington and \$108,000 in other non-federal funding, for a total of \$143,000 in 1995. Non-federal funds were \$163,000 for 1996 and \$178,240 in 1997. In 1998, the project received \$35,000 from industry. Non federal for 1999 were estimated at \$156,000.

Question. Where is this work being carried out?

Answer. Research is being conducted in the following state agricultural experiment stations; Oregon, Colorado, Washington, Montana, Idaho, North Dakota, Minnesota, New York, Virginia and California.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to produce a genetic map of agronomically-important traits of the barley genome. The anticipated time to complete this task was estimated at ten years with completion in 1999. The initial goals have been exceeded; however, maps are never “done”. The next step will be physical mapping of gene rich regions in order to study the genes and understand pathways. Researchers will focus on quality and disease resistance. This phase is projected for completion in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In 1998, the special grant proposal was subjected to the project approval process at Oregon State University, which is the lead university, and reviewed by an agency scientist. This project is made up of many competitively-awarded mini grants. A subgroup of the National Barley Improvement Committee, which is composed of elected representatives of research, growers, and industry, serves as the peer panel to review and select proposals based on relevance to the original objectives and scientific merit. Multi-disciplinary, multi-institutional, and continuing projects are given the highest priority. The overall project and its mini-grants have been judged to be scientifically sound and appropriate for the stated objectives, based on comments and rating from peer scientists which is done on each support prior to selection.

REGIONALIZED IMPLICATIONS OF FARM PROGRAMS

Question. Please provide a description of the research that has been done under the program on Regionalized Implications of Farm Programs grant.

Answer. The University of Missouri continuously provides regionalized analysis of alternative farm program designs. This includes providing farm level analysis of national changes in agriculture policy.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to give farm-level or micro view of macro-level changes; and to provide as accurate and robust an analysis as possible in order to point out regional differences in policy alternatives.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original, as well as current, goal was and continues to be to provide the farm community, agribusiness groups, and public officials information about farm, trade, and fiscal policy implications by developing regionalized models that reflect farming characteristics for major production regions of the United States. The researchers have developed a farm level policy analysis system encompassing major U.S. farm production regions. This system interfaces with existing agricultural sector models used for farm, macroeconomic, and trade policy analysis. The universities have expanded the number and types of representative farms to 80. Typical farm models also are being developed for Mexico and Canada under a collaborative agreement for use in analyzing impacts of the North American Free Trade Agreement.

Policy studies completed this past year at the request of policymakers and farm groups included analysis of the impacts of marketing loan provisions on farmers' economic viability; drought on farm income and farm viability; early provision of Agricultural Marketing Transaction Act (AMTA) payments, risk management accounts; and other crop insurance and disaster assistance alternatives.

Results of these analysis were presented to more than 60 different groups across the U.S., including, of course, both congressional agriculture committees. The Agricultural Food Policy Center (AFPC) web site, which contains copies of all Working and Briefing Papers, was visited more than 345,000 times during May-November, 1998.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$346,000. The fiscal years 1991–1993 appropriations were \$348,000 per year; \$327,000 in fiscal year 1994; and \$294,000 in each of the fiscal years 1995 through 1999. The fiscal year 2000 is \$294,000. A total of \$3,481,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$288,843 State appropriations and \$46,773 industry for a total of \$335,616 in 1991; \$45,661 State appropriations in 1992; \$33,979 State appropriations in 1993; \$40,967 State appropriations in 1994; \$161,876 State appropriations in 1995; \$187,717 State appropriations for 1996; and \$137,100 for 1997; and \$161,400 for 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted by the Texas A&M University and University of Missouri at Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program is of a continuing nature for the purpose of assessing the impacts of existing policies and issues and proposed policy and program changes at the individual firm level for feed grain, wheat, cotton, rice, oilseed and livestock producers. In addition, the representative farms are constantly being updated as farming practices change. Currently the researchers are making adjustments for the increasing use of Bt and Round-Up Ready seeds.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. No formal evaluation of this project has been carried out; however, the CSREES representative is in frequent communication with the principal investigator concerning policy analysis procedures and studies.

RICE MODELING, AR

Question. Please provide a description of the research that has been funded under the Rice Modeling grant.

Answer. The purpose of this research project is to develop a regional, national and global rice industry model for use in analyzing the impact of changes in domestic and foreign public policies on production, trade, stocks, substitute crops, farm prices and domestic as well as global consumption.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Research is needed to assist both the U.S. rice industry and national policymakers in assessing the impact of existing and proposed changes in public policies for rice. This research enables improved analysis of both international and domestic policy changes on rice production, stocks, prices of substitute crops and consumption. It has been, and is being used to analyze the impacts of farm policy proposals on the U.S. rice industry, to analyze the impact of WTO and the Uruguay Round agreements on U.S. trade, to analyze the impact of emerging rice importing and exporting countries on U.S. rice exports, and to analyze the market for different rice types (qualities) and seasonal demand and supply factors that affect the global rice market. The principal researcher believes this research addresses national, regional and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop international, national and regional models to analyze the impact of foreign and domestic policy changes, and forecast changes in production, trade, stocks, prices of substitute crops, farm prices, and consumption.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work actually began about four years ago and federal research grants from various sources have totaled roughly \$2 million prior to this year. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$395,000; for fiscal years 1998, 1999, and 2000, \$296,000, for a total appropriation of \$1,678,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds over the 4 years prior to this year totaled approximately \$500,000. For the 1996 fiscal year, state appropriations were \$178,000; and for 1977 and 1998, \$150,000.

Question. Where is the work being carried out?

Answer. The research is being carried out at the University of Arkansas-Fayetteville and the University of Missouri-Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The domestic portion of the rice model has been completed. The international modeling research is a little over half completed and the researchers estimate another 5 years is required. The purpose of constructing the models, however, is to provide on-going analysis of the impact of various policy proposals on the U.S. rice industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation of this project. However, annual proposals are peer reviewed for relevance and scientific merit. Also, each annual budget proposal is carefully reviewed for adherence to stated objectives and annual progress is discussed with the principal investigators.

RURAL DEVELOPMENT CENTERS

Question. Please provide a description of the research that has been funded under the Rural Development Centers Program grant.

Answer. The overall objectives of the research agenda of the five rural development centers are to: Improve economic competitiveness and diversification in rural areas; support management and strategic planning for economic development; create community capacity through leadership; assist in family and community adjustments to stress and change; and promote constructive use of the environment. The function of the Centers is to increase the productivity of regional faculty both in doing research on rural issues and in using that research to do effective outreach with rural communities. These projects have undergone a merit review.

Question. According to the research proposal, or one of the principal investigators, what is the national, regional or local need for this research?

Answer. In the context of a global society, rural communities and rural economies are increasingly complex and multi-dimensional. People living in rural America face an ever increasing number of public issues and problems needing resolution. Yet the number of research faculty addressing broader rural issues is declining in many places. The multi-disciplinary, multi-state work supported by the Centers is even more crucial in this context. The four Centers initiate, facilitate, and evaluate research that has direct, positive impacts on the social and economic well-being of individuals, families, communities, small towns and rural places. Center-supported research addresses such rural development issues as rural economic diversification, workforce preparation, the changing demography of rural places, transitions in agriculture, small business and retail trade opportunities, the impacts of welfare reform, the capacity of state and local governments to meet changing public assistance needs, management of natural and environmental resources, public lands policy, water quality, physical infrastructure, food assistance issues among vulnerable populations, education and strengthened human capital, forest stewardship, and access to vital community services. Specific research priorities emerge from on-going dialog with stakeholders and clients in each region and are reviewed annually by the Centers and their Boards of Directors. In addition, in 1999 the Center Directors began a collaborative process to identify critical rural development issues shared across regions and to establish a collaborative national rural research agenda. Together the Centers enhance the capacity of people and communities to carry out expanding responsibilities in the design, management, and financing of government programs and in building healthy, viable communities and families across rural America.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The Rural Development Center mission is to strengthen rural families, communities, and businesses by facilitating collaborative research and extension education through land-grant institutions and their partners in the various regions. Research programs are undertaken after evaluating broader regional and national priorities. Following are some accomplishments of selected research activities conducted under the auspices of various centers.

The Southern Regional Development Center (SRDC) is nationally recognized for its Information Briefs, prepared to shed light on the host of challenges and opportunities facing governments, communities and people in the South. In a special 1998–71999 series, for example, SRDC sponsored research by land-grant faculty on the South's experience of major welfare reform in the United States. The "Welfare Reform Briefs" now help national, state, and local leaders and officials understand and respond to the devolution of government services, rural transportation issues and welfare reform, family economics and individual development accounts, the cost of living, rural earnings capacity, job opportunities for low-income people, and child care issues. Most recently, SRDC launched its "Millennium Series," research on persistent problems in the rural South as well as optimistic trends. Research underway addresses wage levels, strategies to strengthen the economic health of agricultural and non-agricultural firms, rural racial and ethnic diversity, rapid urbanization and its effects on natural and environmental resources, the demand for better educated workers, progress advancing labor force skill levels, entrepreneurial opportunities and strategies to diversify the rural economy, the changing structure of families and related family services needs, and barriers to health care quality and access. The planned series of 35 policy briefs will stimulate public dialogue needed to create vibrant, healthy rural communities in the rural South.

Like the other Centers, the SRDC links the research sponsors with extension education in several ways. For example, with land-grant faculty in the southeast, the SRDC developed and sponsors the Southern Regional Community Development Institute. Diverse extension educators (agriculture, natural resources, family and

youth development, community development, and middle management) spend five days attending sessions on understanding community, strategic planning, asset-mapping, social infrastructure, local government, problem-solving, economic and sustainable development, and leadership skills. Started in 1998, demand for the training is strong, and SRDC has scheduled its third Institute for summer 2000. Another initiative begun in 1999, the Mid-South Delta Institute, is an on-going participatory research and training program designed to help community leaders of northwest Mississippi expand their understanding of themselves and their communities through asset-mapping, strategic planning, building partnerships, and consensus-building.

The North Central Regional Center for Rural Development (NCRCRD) has an extensive repertoire of research informing policy and community development programs. Its contributions have won national recognition in the areas of workforce preparation, state of the art community visioning and strategic planning, social indicators for community and economic planning, and federal program assessment including the Empowerment Zone/Enterprise Community initiative and national workforce preparation programs. NCRCRD supported research also enhances the scientific methods land-grant faculty use in applied research on rural development. For example, land-grant faculty supported by NCRCRD demonstrates the power and utility of clustering geographic and demographic data and linking geodemographic clusters to Agriculture Census and Decennial data. Other research analyzes the future of small rural trade centers as providers of public services, the dynamics of rural retail trade, and the most critical needs of rural business communities. Through its workshops, conferences, training programs, and newsletter, Rural Development News, NCRCRD provides research results and related educational materials to rural development professionals in land-grant and partner institutions and organizations across the country.

Industrial recruitment has been one of the most popular methods of economic development in the U.S. But increasingly, the cost effectiveness of this strategy is being questioned by researchers and practitioners. With the help of research and related training programs, communities are capitalizing on an alternative strategy called Business Retention and Expansion (BR&E). This builds on local economic development efforts by creating teams of local leaders to help communities improve their business climate and identify and address impediments to growth and retention of existing businesses. The Northeast Regional Center for Rural Development (NERCRD) supported the development of BR&E materials that are now used in training workshops across the country, sponsored by Business Retention and Expansion International. Economic development professionals across the U.S. and in Canada have purchased these materials and use them locally to retain and expand existing businesses and reduce the high costs associated with industrial recruitment strategies. Shared internationally, the materials also have been translated into French and Polish.

NERCRD also funded research to assess the consumer credit knowledge of rural poor and ethnic minorities and determine their use of credit and management practices. Based on the research, an educational program that focuses on the wise use of consumer credit has been developed and offered to a diverse extension audience. This program also contributed to a video that promotes the MONEY 2000 program, encouraging participants to save and/or reduce debt by \$2,000 by the end of the year 2000. The video is distributed widely by extension personnel within the region and nation and is used by financial counselors at several military bases. It helps families living paycheck-to-paycheck and struggling with low savings or high household debt. Since it was launched in 1996, MONEY 2000 has helped over 7,000 people in more than 30 states increase their net worth by more than \$3 million.

New programs underway at the Western Rural Development Center (WRDC) include research to enhance home-based and micro business opportunities and a "rapid growth toolkit" to help communities address land and natural resource use issues in the midst of economic growth. This builds on the Center's long-standing support for research on the impacts of tourism and its economic impact and promise in the west. In addition, WRDC has been active in BR&E related research. Using a WRDC supported BR&E expansion program, New Mexico State University Extension has helped communities expand their economic base by saving and creating local jobs, and BC Hydro in Burnaby, British Columbia recently requested and received permission to adapt the Business R&E program materials for use in rural Canada.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1971, \$75,000; fiscal year 1972, \$225,000; fiscal year 1973, \$317,000; fiscal years

1974–1981, \$300,000 per year; fiscal years 1982–1985, \$311,000 per year; fiscal years 1986–1987, \$363,000 per year; fiscal year 1988, \$475,000; fiscal year 1989, \$500,000; fiscal year 1990, \$494,000; fiscal years 1991–1993, \$500,000 per year; fiscal year 1994, \$470,000; fiscal years 1995–1998, \$423,000 per year; fiscal year 1999, \$523,000; and fiscal year 2000, \$523,000. A total of \$11,164,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds available to the four Regional Centers for Rural Development were: fiscal year 1991, \$1,117,000; fiscal year 1992, \$790,000; fiscal year 1993, \$900,000; fiscal year 1994, \$776,591; and fiscal year 1995, \$710,005; for a total of \$4,293,641 across the five years for which there are complete data. Non-federal partners sponsoring research and related extension programs through the Centers since 1995 include the Farm Foundation, the University of Kentucky's Tennessee Valley Authority Rural Studies Program, the W. K Kellogg Foundation, the Upjohn Institute, the Kerr Center for Sustainable Agriculture, the National 4-H Council, and the Heartland Center. Other federal partners include the EPA, Small Business Administration, and in USDA—Rural Development, Economic Research Service; Agricultural Research Service; Forest Service; SARE; and National Resource and Conservation Service. In short, in recent years the Centers have established an impressive record of brokering partnerships with private foundations and non-governmental organizations, as well as other federal partners, to meet their goals and extend the impact of their allocated federal dollars.

Question. Where is this work being carried out?

Answer. The regional rural development centers include the following: Northeast Regional Center for Rural Development; Pennsylvania State University; North Central Regional Center for Rural Development at Iowa State University; Southern Rural Development Center at Mississippi State University; and Western Rural Development Center at Oregon State University. There is also a rural development project at North Dakota State University which receives funding from the annual Rural Development Centers appropriation. Most of the research sponsored by the four regional centers is actually performed by resident faculty at land-grant universities in the respective region through subcontracts from that center's grant.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. The regional rural development centers were established to provide an on-going "value added" component to link research and extension and by doing so to increase rural development under the special conditions in each region. The work of the Centers is being carried out in all 50 states and in some territories. The Centers compile a report of annual accomplishments and share those with the states in the region. Accomplishments are now shared through sophisticated, interactive web sites. The list of needs is constantly evolving and is being addressed through projects that are matched to the constantly shifting local agenda. The current phase of the program will be completed in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Centers enlist the help of academic and private/public foundations personnel on advisory committees and boards of directors to help establish operating rules and provide professional, technical counsel and peer evaluation of Center projects and the investigators. The projects are evaluated annually by the advisory committees and the boards of directors against the five key issue areas and the objectives of each project for relevance, achievement, and initial impacts. Follow-up evaluation is carried out by the Center staffs in order to assess long-term impacts of these projects on local communities.

RURAL POLICIES INSTITUTE

Question. Please provide a description of the research that has been funded under the Rural Policies Institute grant.

Answer. The Rural Policy Research Institute is a consortium of three universities designed to create a comprehensive approach to rural policy analysis. The Institute conducts research and facilitates public dialogue to increase public understanding of the rural impacts of national, regional, state, and local policies on rural areas of the United States.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. There is a need to estimate the impacts of changing state and national programs and policies on rural people and places. Objective public policy analysis can provide timely and accurate estimates of the impacts of proposed policy changes to allow more reasoned policy discussions and decisions. The principal researcher believes this research meets national, regional and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Rural Policy Research Institute (RUPRI) was to create a new model to provide timely, accurate, and unbiased estimates of the impacts of policies and new policy initiatives on rural people and places. During the past four years, RUPRI has analyzed the impact of market-driven health reform and impacts of specific health policy alternatives on rural people; the impact of implementing the Telecommunications Act of 1996, including use of the Universal Service Funds; the impact of welfare reform on rural communities. RUPRI has developed complex models to provide quantitative estimates of economic, demographic, and fiscal effects of policy alternatives on local communities of different types and in different regions. During those same four years, RUPRI has provided 30 analyses for congressional hearings and briefings on critical issues affecting rural America, 100 policy research papers, and developed a popular website. RUPRI's work is published and cited in numerous academic journals, discussed in the media, and widely used by policy decision makers at all levels of government.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by these grants began in fiscal year 1991 and the appropriation for fiscal year 1991 was \$375,000. The fiscal year 1992 appropriation was \$525,000; for fiscal year 1993, \$692,000; for fiscal year 1994, \$494,000; and fiscal years 1995–2000, \$644,000 each year. A total of \$5,950,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Aggregated non-federal funds to support the Rural Policy Research Institute across the three universities involved include unrecovered indirect costs, salary support from university and other non-federal sources, and various other grants, contracts, and reimbursable agreements. They amounted to \$316,458 for fiscal year 1991; \$417,456 in fiscal year 1992; \$605,302 in fiscal year 1993; \$537,834 in fiscal year 1994; \$584,516 in fiscal year 1995, for fiscal year 1996, \$576,782; \$186,859 in 1997; \$153,614 for 1998; and an estimated \$168,450 for 1999. Total to date including the 1999 estimate, is \$3,547,271.

Question. Where is this work being carried out?

Answer. The Institute's member universities are: the University of Missouri-Columbia; the University of Nebraska-Lincoln; and Iowa State University, Ames.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1991 was for a period of 24 months, however, rural communities continue to be impacted by major socio-economic changes as well as state and federal policy changes. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1999, as it evaluated the 1999 project proposal, and determined that: "RUPRI is an effective interdisciplinary, multistate effort that supports the mandates for collaboration in the Agricultural Research, Extension and Education Reform Act of 1998. Its work supports CSREES strategic goals of enhancing economic opportunity and quality of life. The principal investigator and participants are well qualified to conduct the project."

RUSSIAN WHEAT APHID, COLORADO

Question. Please provide a description of the research that has been funded under the Russian Wheat Aphid grant.

Answer. Funding will support two key areas of research that are needed to assure long-term and sustainable Russian wheat aphid management. These are:

- Discovering new crop genes which provide resistance to the Russian wheat aphid and incorporating them into commercially acceptable wheat varieties, and
- Integrating the available control tactics into the most effective, efficient, and environmentally sound production systems for the Great Plains.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Russian wheat aphid is an exotic pest that entered the western United States without its normal complement of biological control agents. This insect has rapidly become the most important insect pest of wheat in the western United States. From 1986–1991, the total economic impact was estimated to be in excess of \$657 million. In the same period, some 17.5 million pounds of insecticides were used nationally for Russian wheat aphid control. The cost to American farmers of insecticide treatments was over \$70 million. In addition, the intense use of insecticides on a crop that previously received little insecticide treatment raised concerns about the impact on water quality, human health, food safety, non-target organisms, and general environmental quality. Direct losses in Colorado have been as high as \$27 million in a single year with an average direct loss of above \$11 million per year, since 1987.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of the research are to:

- Discover new crop genes which provide resistance to the Russian wheat aphid and incorporate them into commercially acceptable wheat varieties, and

- Integrate the available control tactics into the most effective, efficient, and environmentally sound production systems for the Great Plains. The techniques of molecular genetics are being employed to reach the goal of identifying new genes for resistance to Russian wheat aphid and incorporating them into commercially acceptable wheat varieties. Several DNA marker technologies used in other plant species have been successfully adapted for mapping Russian wheat aphid resistance genes in wheat. These include restriction fragment length polymorphism and amplified fragment length polymorphism techniques as well as microsatellite markers. Restriction fragment length polymorphism markers were initially used to map two Russian wheat aphid resistance genes—Dn4, the one used in 19Halt' and Dn2, an additional resistance gene that might be suitable for inclusion in a cultivar containing two resistance genes.

A new Russian wheat aphid resistance gene (Dn7), identified by other researchers in South Africa, 94M370, has been crossed with susceptible wheat to generate materials for use in molecular genetic analysis of Dn7 and to incorporate the gene into wheat. Dn7 is one of the resistance genes that is being targeted for molecular cloning in the Colorado State program.

Two kinds of DNA libraries were developed from 94M370 as additional sources of clones for RFLP mapping: a Pst-I genomic library and a cDNA library. These libraries are very useful because they allow screening for clones in such a way that the DNA from rye can be distinguished from wheat DNA.

In another set of experiments, a cDNA library was made from mRNA extracted from leaf tissues of 94M370. One thousand randomly picked clones from this library are being sequenced. The sequenced clones from the 94M370 library also will be used in the mapping effort.

In addition, the mapping effort of this project will be strengthened by access to cDNA libraries that will be produced under a National Science Foundation grant awarded to a team of U.S. wheat researchers for the purpose of developing tools for wheat genomics.

Once a genetic map is developed, the next step in positional cloning is to determine the physical location of the markers on the chromosomes and the physical distance between the markers. This step is being accomplished by the use of fluorescence in situ hybridization (FISH) techniques.

In order to routinely detect DNA markers on chromosomes by fluorescence in situ hybridization, clones containing large DNA inserts are required. Bacterial artificial chromosomes will be used to meet this requirement. Two Bacterial artificial chromosome libraries are available from other research teams as sources of probes for the FISH experiments. These were screened with five markers linked to either Dn2 or Dn4 and positive Bacterial artificial chromosomes were identified for all five markers. Fluorescence in situ hybridization using these Bacterial artificial chromosome clones to wheat metaphase chromosomes are underway.

A critical factor in the success of fluorescence in situ hybridization is the routine availability of complete chromosome spreads that are flat and free of cytoplasmic material. Procedures have been developed for preparing wheat chromosome spreads that are flat and intact.

Another critical factor in the fluorescence in situ hybridization experiments is the ability to distinguish the target chromosome from the rest of the wheat chromosomes. Target chromosomes include 1RS/1BL, which contains Dn7; 1D, which

contains Dn4; and 7D, which contains Dn2. Several techniques are being used to distinguish the desired chromosomes.

Progress has been made in Integrating Tactics for Management of the Russian wheat aphid. In 1998, experimental dryland cropping systems were established in eastern Colorado. To be as realistic as possible, two of these are located in growers fields and have been designed with grower input and are managed jointly with the grower-cooperator. Long-term studies were initiated to compare the experimental systems with typical wheat production systems in the area. The experimental systems were designed to optimize the effects of environmentally sound pest management tactics (particularly resistant cultivars, the effects of cultural practices, such as planting date, harvesting date, grazing, et cetera., and biological control, such as reducing Russian wheat aphid numbers through the actions of predators and parasites. In addition, the experimental systems were designed to optimize water use efficiency and other agronomic and profitability factors.

At each location, wheat and other adapted dryland crops are grown in proximity to each other so that interactions among various crops and various production practices can be studied. Rotations over time of wheat with other crops also are being investigated. These large-scale experimental systems will be ideal arenas in which to determine the best way to apply the knowledge already gained about specific aspects of Russian wheat aphid biology and ecology, production practices, and the effectiveness of naturally occurring Russian wheat aphid parasites and predators. These large-scale experimental cropping systems also will provide valuable information on Russian wheat aphid management to wheat growers who are considering adding additional crops to their dryland cropping systems.

In 1999 data were collected on a wide variety of agronomic and pest variables. Initial observations on Russian wheat aphid indicated enhanced biological control in the more diverse, experimental cropping systems. The enhancement occurred just prior to planting the fall wheat crop which is one of the most critical points in Russian wheat aphid seasonal dynamics.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal years 1998, 1999 and 2000 is \$200,000 for a total of \$600,000.

Question. What is the source and amount of non-federal funds provided by fiscal year.

Answer. State appropriations and the Colorado Wheat Administrative Committee have demonstrated strong support for this effort. The total per year is approximately \$775,000 in new funding from the state of Colorado and redirected funds from within the university.

Question. Where is the work being carried out?

Answer. Research will be conducted on the campus of Colorado State University, at Colorado State University research stations, and on the farms of cooperators throughout Colorado. Outreach and extension activities will be focused on wheat growers in Colorado, Nebraska, Wyoming, Kansas, New Mexico, Texas, and Oklahoma.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project is anticipated to continue for a total of five years with a completion date of July 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was evaluated by a Cooperative State Research, Education and Extension Service site visit on February 4 and 5, 1999. Laboratory, greenhouse and field research facilities available for the research program are considered to be excellent. Greenhouse space appears adequate for the work and the units are well adapted for the wheat breeding program. Rearing facilities and the support personnel for maintaining a source of aphids used for bioassays are excellent. Research laboratories are very well equipped for the studies, either proposed or underway and there is strong technical support for the research which involves application of techniques of molecular genetics to wheat breeding. The research scientists represent strengths in both classical or traditional wheat breeding and new molecular genetics-based wheat breeding. The group also has strong, well recognized expertise in Russian wheat aphid biology, ecology and management as well as in dryland wheat production systems used in the Great Plains states. The project is a multifaceted, multi-disciplinary program which is directed toward long-term solutions for Russian wheat aphid management utilizing a viable combination of approaches which requires the type of facilities and equipment available at this location.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, ALASKA

Question. Please provide a description of the research that has been funded under the Seafood Harvesting, Processing, and Marketing grant.

Answer. This is a new project to be started in fiscal year 2000. Research related to seafood safety, quality and by-product utilization will be supported by this grant. CSREES has requested the University to submit a proposal, which has not yet been received, in support of fiscal year 2000 funds.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This will be determined after the proposal is received from the principal investigator.

Question. What is the original goal of the research and what has been accomplished to date?

Answer. This will be determined after the proposal is received from the principal investigator.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This is a new project for fiscal year 2000. For fiscal year 2000 \$552,500 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year 2000?

Answer. This will be determined as the project progresses.

Question. Where is this work being carried out?

Answer. Research will be conducted by scientists at the University of Alaska, Fairbanks.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. This will be proposed by the principal investigator(s) soon.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As this is a new project, no evaluation has been conducted at this time.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, MISSISSIPPI

Question. Please provide a description of the research that has been funded under the Seafood Harvesting, Processing, and Marketing grant.

Answer. Research related to seafood safety, quality and by-product utilization has been supported by this grant. Research conducted included: (1) microbial population changes during retail display of shrimp,

(2) development of an impedance-based method to rapidly detect microorganisms on shrimp, (3) determine physical, chemical, microbiological, and sensory differences between pond and tank aquaculture tilapia, and (4) evaluate processes for utilization of uncooked shrimp processing by-products for production of flavor extracts. Funds from the fiscal year 1999 grant are supporting research through September 30, 2000. A proposal in support of fiscal year 2000 funds will be requested to (1) evaluate the potential of the xanthene colorant phloxine B to control *Listeria monocytogenes* on ready-to-eat shrimp and (2) determine the survival of organic acid exposed *Listeria monocytogenes* in a simulated gastrointestinal model.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that national needs reflected in the project include providing consumers with affordable alternative seafood products. Alternative sources of seafood protein are needed because of a drastic decline in natural harvests due to overexploitation. Other national needs addressed in this project include reducing pollution during seafood and aquaculture food processing by converting byproducts into value-added food ingredients or materials. Regionally, much is unknown about the short and long-term effects of the new seafood HACCP regulations on the livelihood of Mississippi seafood and aquaculture food producers and processors who are typically small and lack sufficient resources to remain competitive. Continuation of this project will provide continued assistance to Gulf-Coast seafood processors in meeting new U.S. regulations as well as new international regulations that are important for Mississippi export products. Locally, catfish processors are a major employer of the severely economically depressed Delta region of Mississippi. By further enhancing the value of catfish products, this project seeks to improve the livelihood of individuals both on the Gulf coast and in the aquaculture region of the state.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goals of the research were to improve the quality and safety of catfish and improve the utilization of catfish byproducts and underutilized marine species. Due to successes of the original project, subsequent efforts are focusing on additional uses of seafood and aquaculture foods by improving processing strategies and providing alternative products from waste materials. The project has thus expanded to include crab, shrimp, oysters, freshwater prawns, hybrid striped bass, tilapia, and crawfish.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1990 when \$368,000 was appropriated for this project. The appropriations for fiscal years 1991–1993 were \$361,000 per year; fiscal year 1994, \$339,000; and fiscal years 1995–1999, \$305,000 each year. For fiscal year 2000 \$305,000 has been appropriated. A total of \$3,867,500 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year 2000?

Answer. The State of Mississippi contributed \$1,949 to this project in fiscal year 1991; \$41,286 in fiscal year 1992; \$67,072 in fiscal year 1993; \$91,215 in fiscal year 1994; \$147,911 in fiscal year 1995; and \$61,848 in fiscal year 1996. Product sales contributed \$7,044 in 1991, \$13,481 in 1992, \$13,704 in 1993, and \$5,901 in 1994. Industry grants contributed \$14 in 1992 and \$31,796 in 1993. Other non-federal funds contributed \$80 in fiscal year 1991, \$838 in 1992, and \$17,823 in 1993. The total non-federal funds contributed to this project from 1991 through 1996 was \$501,962. In fiscal year 1998, \$151,286 in state funds, \$8,790 in self-generated funds, and \$23,877 in other non-federal funds were obtained. Information on funding in 1999 and 2000 is not currently available.

Question. Where is this work being carried out?

Answer. Research is being conducted by scientists in the Departments of Food Science and Technology and Agricultural Economics of the Mississippi Agricultural and Forestry Experiment Station at Mississippi State University and at the Coastal Research and Extension Center, Seafood Processing Laboratory, in Pascagoula, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The original, scheduled date of completion of the objectives will be September 30, 2000. The work for fiscal year 1999 is still in progress. A progress report on the achievement of the objectives was due by March 15, 2000. It should be noted that the work on this project over the last fiscal year was severely curtailed due to extensive damage to the seafood processing pilot plant and destruction of the office facility, both located in Pascagoula, due to a hurricane.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The last review of the proposal was conducted on June 28, 1999. At that time, the agency science specialist believed that the projects addressed needs and interests of the regional seafood and aquaculture industries.

SEAFOOD SAFETY/MASSACHUSETTS

Question. Please provide a description of the research that has been funded under the grant.

Answer. The agency is in the process of requesting the university to submit a grant proposal for this new research activity.

Question. According to the research proposal, or the principal research, what is the national, regional or local need for this research?

Answer. The researchers indicate the need to strengthen the local and Northeast region fisheries industry by addressing and solving priority seafood safety issues critical to assuring public health and maintaining consumer confidence in a variety of economically important fisheries products.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new research grant to be funded in fiscal year 2000.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$255,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates that significant non-federal funding will be provided in fiscal year 2000 primarily from state sources to cover salaries of the principal investigators. As the program develops, additional non-federal funding is expected.

Question. Where is this work being carried out?

Answer. Research will be conducted at the University of Massachusetts—Amherst, Chenoweth Laboratory of the Department of Food Science through the Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2002. The project will be initiated in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this new project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to the agency for funding. Since this is the first year of the program, the agency will conduct an external peer review of the proposal. The fiscal year 2000 review will be completed within three weeks of submission of the proposal.

SMALL FRUIT RESEARCH, OREGON

Question. Please provide a description of the research that has been funded under the Small Fruit Research grant.

Answer. Funding for this special grant has been used to enhance the production and quality of small fruits—blackberry, blueberry, caneberry, cranberry, marionberry, raspberry, strawberry and grape in the Pacific Northwestern states of Idaho, Oregon, and Washington. Research has been focused on crop genetics, production/physiology, pest management, berry/grape processing, marketing, and wine production. Proposals are selected after examination of their relevance to priorities identified within the region.

Question. According to the research proposal, or the principal researcher, what is the national, regional and local need for this research?

Answer. There is a considerable demand for fresh and processed berry products in the United States. The demand is also high in urban Asian markets where consumer interest for berry products is strong. Currently, international marketing of Northwest small fruit commodities involves the sale of traditional products. Research on international consumer preferences, packaging, and products continues to be essential. The importance of berry and grape crops to the region has long been recognized by the three Northwest states: Washington, Idaho and Oregon. These crops are mainstays of high-value, specialty horticulture. The universities and small fruits industry have made a strong commitment to the improvement of these crops as evidenced by the high level of internally developed resources for research and marketing. Thus, the Northwest Center for Small Fruit Research has developed effectively over the last 8-10 years into its present fully established form.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. Genetic improvement of small fruit cultivars continues to be a powerful tool using germplasm collection and identification, field evaluation of new germplasm and advanced selections from breeding programs, virus identification and elimination, and approaches that utilize genetic engineering. Research is identifying cultivars and developing cultural practices that growers can utilize to reduce crop losses. Research is evaluating and investigating nutritional factors, cultural management, temperature stress, effects of pruning, micro propagation, cold hardiness/low temperature injury and effects of viticulture practices on wine quality of winery processing on wine quality. Small fruit research continues to reap acclaim for its components involving industry-driven cooperation between industry, state and federal research. Its genesis as a small-fruits program reflects the contributions of plant biology, the commitment to facilitating the efficiency of research and the coordination of marketing throughout a multi-state region. The Center represents an innovative organization which has created a cooperative strategy for university, USDA's—Agricultural Research Service, and industry small fruit programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000.

Answer. The initial support for this grant was an appropriation in fiscal year 1991 for \$125,000. The fiscal appropriation for 1992 and 1993 was \$187,000 per year; fiscal year 1994 was \$235,000; fiscal years 1995–1998 were \$212,000 each year; fiscal year 1999 was \$300,000; and was \$300,000 for fiscal year 2000. A total of \$2,182,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This project involves the use of OSU administrative personnel, equipment, utilities and facilities that are indirect costs to the project. These costs constitute an OSU contribution to this research project, which is not allowable as a reimbursable expense under this project. The recent passage of Oregon's tax limitation laws reduce revenues that restrict our ability to cost share. Thus, our policy is that we do not provide any cost sharing or matching funds for this or other agreements in which we receive no indirect costs. We are committed to providing the required collaborative efforts by Oregon State University scientists and administrators to complete the work described in this proposal.

Question. Where is the work being carried out?

Answer. The research is being conducted at Oregon State University, Washington State University and the University of Idaho. Oregon State University is the lead institution for this project.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of small fruit research are still valid researchable issues because they encompass research focused on such diverse topics as: crop genetics, production/physiology, pest management, berry/grape processing, marketing, wine production, international consumer preferences, and specialty horticulture. Much progress has taken place in meeting the research objectives in these topics but this is a continuing process with priorities annually re-evaluated to appropriately adjust research direction within the project objectives as well as their relevance to priorities identified within the region.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. There has not been an overall agency evaluation of this project. However, the project evaluation process is accomplished annually by peer reviewers whom are chosen and organized by expertise according to the five technical working groups with input from the designated Agricultural Experiment Station Representatives in Washington, Oregon and Idaho. In fiscal year 1999, for example, there were 19 project reports which were evaluated for each of the recipients of grants. Each submitted proposal is peer-reviewed by a panel of five individuals (three scientists and two industry representatives) and is grouped into one of the Center Technical Working Groups, namely genetics, pest management, production/physiology, processing/packaging, and marketing. Each proposal is evaluated on the following criteria: (1) The nature of the proposed research and its relevance to the needs of the small fruit industries; (2) The relevance of the proposal to current small fruit research designated priorities; (3) The scientific expertise of the scientists involved—training, experience, and accomplishments relative to specific areas of small fruit research; (4) The appropriateness of the level of funding requested, vis-a-vis, availability of funds; and (5) The likelihood of success. Reviewers complete an evaluation sheet for each proposal, rating the five criteria on a scale of one to ten, with ten being the best. Previously awarded projects are given special consideration in order to allow for funding for up to three years (when appropriate progress is demonstrated). Compilation of evaluations are distributed to the three Agricultural Experiment Station Directors and the USDA-ARS Horticultural Crops Research Laboratory Research Leader, who make the final determination of funding for each proposed project. Notification of awards are made in December. The peer review of all proposals is coordinated and processed through the Northwest Center for Small Fruit. An agency-level site review of the Small Fruit Research project will be performed in the coming year.

SOUTHWEST CONSORTIUM FOR PLANT GENETICS AND WATER RESOURCES

Question. Please provide a description of the work that has been funded under the Southwest Consortium for Plant Genetics and Water Resources Program grant.

Answer. New Mexico State University, Los Alamos National Laboratory, Texas Tech University, the University of Arizona, and the University of California at Riv-

erside entered into a cooperative interdisciplinary research agreement constituted as the Southwest Consortium for Plant Genetics and Water Resources to facilitate research relevant to crop adaptation to and semi-arid regions. The overall goal of the Consortium is to bring together multi-disciplinary scientific teams to develop innovative advances in plant biotechnology and related areas to bear on agriculture and water use in and semi-arid regions. All grants made to the participating Institutions are awarded competitively by a scientific peer review process.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research is highly significant to national, regional, and local needs. The Consortium is conducting an integrated program that identifies specific problems of southwest agriculture, coordinates water and biotechnology research aimed at solving these problems, and facilitates the transfer of this information for commercialization. The specific research objectives of the Consortium include the development of crops with resistance to drought and temperature extremes, adverse soil conditions, and pests and parasites.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to enhance the adaptation of agricultural crops to and semi-arid crop environments. Five participating institutions have developed research plans consistent with the Consortium's goals. Mini-grants to support research that would solve problems unique to southwest agriculture are awarded competitively following peer review. Specific attention is given to interdisciplinary agricultural research. Since its inception in 1985, the Consortium has provided essential support for the establishment of baseline data on new, forward thinking research relevant to the improvement of and lands agriculture. Accomplishments include the identification of chromosome regions conferring water use and transpiration efficiency in wheat, an analysis of the impacts of water stress on host plant resistance to aphids and whiteflies on melon, and an evaluation of genetic variation of water-soluble carbohydrates in spring wheat and salt-tolerance mechanisms.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1986 and has been provided with appropriations of the following amounts: fiscal year 1986, \$285,000; fiscal years 1987 through 1989, \$385,000 per year; fiscal year 1990, \$380,000; fiscal years 1991 through 1993, \$400,000 per year; fiscal year 1994, \$376,000; and fiscal years 1995 through 2000, \$338,000 per year. A total of \$5,424,000 has been appropriated since fiscal year 1986.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The Consortium's lead institution, New Mexico State University, reports matching non-federal funds of \$80,000 in state appropriations in 1992 and \$100,000 in 1993 through 1998. Non-federal funds spent on this project originate from the five institutions that participate in the Consortium and support researchers' salaries, facilities, equipment maintenance, and administrative assistance.

Question. Where is this work being carried out?

Answer. Research is being conducted by the member institutions of the consortium, which includes New Mexico State University; Los Alamos National Laboratory, Texas Tech University; the University of Arizona, and the University of California at Riverside.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in 1986 and accomplished significant results in the first five years. Additional and related objectives have been developed and anticipated completion date for these is 2001. The Consortium is successfully achieving its objectives through the funding of new interdisciplinary projects each year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Mini-grants are awarded competitively to support research that will solve problems unique to agricultural production in the Southwest. The mini-grant selection process is competitive. Proposals are evaluated by external peer reviewers, the Consortium Steering Committee, and the Consortium Scientific Committee. The review process includes pre-proposal screening by the Consortium Steering and Scientific committees, and review of all new proposals by external and internal panels. An internal review of a progress report on each project is completed before the second year of funding is released.

SOYBEAN CYST NEMATODE

Question. Please provide a description of the research that has been funded under the Soybean Cyst Nematode grant.

Answer. The research being funded by this grant is crucial to the development of effective management strategies to understand host parasite relationships of the pathosystems and each of its components. Work has dealt mainly with identifying *Heterodera glycines*-resistant genes and incorporating them into agronomically superior cultivars. Basic studies elucidate the fundamental biology of the cyst nematode in regard to new management strategies. Applied work dealt with evaluating production systems and to new management strategies. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for the research?

Answer. The principal researcher believes that although this research is focused on the soybean cyst nematodes in Missouri, the problems are of regional and national significance. The soybean cyst nematode, *Heterodera glycines* is the most serious pest of soybean in the United States. The problems continue to increase in the Midwest where 12 states have yield reductions in soybean because of this nematode. Due to the nematodes ability to adapt to resistant varieties over time, new varieties are continually needed.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is managing soybean cyst nematode through the various management strategies including the development of new resistant soybean varieties. To date, several nematode resistant soybean lines have been or will be released. The need for breeding soybean lines to develop resistant varieties with a broad spectrum of resistance continues. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. DNA fingerprinting of 118 soybean lines have identified several different genes for soybean cyst nematode resistance. Other aspects of the work relates to field management strategies for these nematodes. Studies on nitrogen fertilizers and tillage have indicated that these may not be important in management of soybean cyst nematode.

Question. How long has work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1979, \$150,000; fiscal years 1980–1981, \$250,000 per year; fiscal year 1982, \$240,000; fiscal years 1983–1985, \$300,000 per year; fiscal years 1986–1989, \$285,000 per year; fiscal year 1990, \$281,000, fiscal year 1991, \$330,000; fiscal years 1992–1993, \$359,000, fiscal year 1994, \$337,000; fiscal years 1995–1997, \$303,000 per year; fiscal year 1998, \$450,000; fiscal year 1999, \$475,000 and fiscal year 2000, \$475,000. A total of \$6,880,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$105,012 state appropriations in 1991; \$84,368 state appropriations in 1992; \$168,017 state appropriations in 1993; \$118,725 state appropriations in 1994; \$33,498 in 1995 and 1996; \$33,723 in state appropriations in 1997; \$37,445 in state appropriations in 1998; \$201,994 in 1999; and an estimated \$200,000 in 2000.

Question. Where is this work carried out?

Answer. This research is being conducted at the Missouri Agriculture Experiment Station and the University of Missouri.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Many objectives are being met but genetic interaction of the soybean cyst nematode/soybean is extremely complex. The anticipated completion date of the continuing research is 2004–2006.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation of this project was a merit review in January, 1999 and the renewal project will be evaluated in 2000. In summary, continued development of new management strategies for the soybean cyst nematode is extremely important. Progress continues with new varieties with nematode resistance being released yearly as well as excellent progress in other management strategies. Certified seed of MPV437–NRR was made available to farmers in 1999. A new soybean vari-

ety, 19Anand' was released this year. Another high yielding soybean strain, S96-1908 was developed that is resistant to all races of soybean cyst nematodes and is being evaluated in the uniform tests. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Seven genetic markers associated with loci controlling resistance to soybean cyst nematode were found in Peking which may be useful in marker assisted selection for resistant lines. Other aspects of the works relates to field management strategies for these nematodes including effects of nutrient uptake on nematode development. A seven year study of the effects of soybean cyst nematode on soybean growth and development was recently completed. It showed among other things, that a grower's choice of tillage methods and date of planting are relatively unimportant in their strategy to control soybean cyst nematodes. Another study indicated that nitrogen accumulation and fixation are limited under high soybean cyst nematode infections.

STEEP—WATER QUALITY IN PACIFIC NORTHWEST

Question. Please provide a description of the research that has been funded under the STEEP—Water Quality in the Pacific Northwest grant.

Answer. The STEEP III study was established in 1996 as the third phase of the tri-state STEEP Program entitled "Solutions to Environmental and Economic Problems," to meet the needs of farmers and ranchers in the Pacific Northwest in solving severe problems with soil erosion and water quality, while maintaining economically and environmentally sustainable agricultural production. An open call for research proposals is held by three cooperating states, Idaho, Oregon, and Washington. Awards are made competitively after both internal and external peer reviews within the states, and merit review by the agency. The project is in a new phase, and is just known as STEEP, as the STEEP III objectives have been completed.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. According to the research proposal, the soils of the Pacific Northwest wheat region are subject to severe wind and water erosion, which has taken a heavy toll of the topsoil in a little more than 100 years of farming. Due to the hilly terrain, water erosion has reduced potential soil productivity in the high rainfall areas of the region by about 50 percent. Wind erosion has reduced productivity on the sandy soils in the lower rainfall areas. Also, off-site environmental costs of water erosion are large. Although many of these are difficult to measure, they include damage from sediment to recreational areas, roadways, and other areas which costs taxpayers millions of dollars annually. Wind erosion, which occurs mostly in the spring and fall, also can be costly and environmentally damaging to air quality, and causes increasing concerns for human health and safety from blowing dusts. Water quality degradation is of increasing concern in the agricultural areas of this region, since sediment is a major pollutant of surface water runoff which may also carry potential chemical contaminants. The complex hydrology of the region's landscape has made it difficult to identify the sources of these chemicals in surface and ground waters. A new major emphasis has been the funding of direct seed research in combination with a reduction in summer fallow and more complex crop rotations. Direct seed is synonymous with no till where tillage is eliminated or reduced to a very minimum. Consequently soil and wind erosion are reduced significantly, improving soil and water quality and contributing to salmon recovery.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The primary goals are: to obtain and integrate new technical/scientific information on soils, crop plants, pests, energy, and farm profitability into sustainable, management systems; to develop tools for assessing the impacts of farming practices on soil erosion and water quality; and to disseminate conservation technology to the farm.

The original STEEP and following STEEP II and STEEP III projects for erosion and water quality control, have provided growers a steady flow of information and technologies that have helped them meet economic, environmental, and resource conservation goals. Through the adoption of these technologies, the researchers believe that growers of wheat, barley, and other alternative crops have been able to reduce soil erosion by water and wind, improve water quality, and maintain or increase farm profitability. This has been accomplished through a tri-state, multi-disciplinary, multi-agency approach of basic and applied research, along with technology transfer and on-farm testing to assist growers with applying these research findings on their farms. The on-farm testing program has directly involved growers and stakeholders in the planning and conduct of the research and educational ef-

forts—and has helped growers evaluate conservation options, such as residue management, to meet conservation compliance requirements.

STEEP programs have helped position farmers with new conservation technologies, such as direct seeding management systems, well in advance of deadlines to meet current and anticipated policy requirements. This preparation protects farmers against potential penalties and loss of government program benefits. The new emphasis on direct seeding has significantly reduced summer fallow through more annual cropping, and through more emphasis on alternative crops.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991, and the appropriations for fiscal years 1991–1993 were \$980,000 per year; in fiscal year 1994, \$921,000; in fiscal year 1995, \$829,000; and in fiscal years 1996–2000, \$500,000 per year. A total of \$7,190,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$938,812 state appropriations, \$63,954 product sales, \$156,656 industry, and \$16,994 miscellaneous in 1991; \$1,025,534 state appropriations, \$75,795 product sales, \$124,919 industry, and \$88,696 miscellaneous in 1992; \$962,921 state appropriations, \$62,776 product sales, \$177,109 industry and \$11,028 miscellaneous in 1993; \$1,069,396 state appropriations, \$46,582 product sales, \$169,628 industry, and \$22,697 miscellaneous in 1994; and \$1,013,562 state appropriations, \$31,314 industry, and \$107,151 miscellaneous in 1995. In 1996, Washington received \$231,724 state appropriations; Oregon passed Measure 5 which reduced revenues and imposed funding restrictions so they were unable to provide any non-federal cost-sharing or matching funds; and Idaho contributed \$81,525 state support, and \$86,242 in estimated non-federal grant support, for a total non-federal contribution of \$167,767. In 1997, Washington received \$197,234 state appropriations; Oregon continues to have Measure 5 as law and continues to be unable to provide any non-federal cost-sharing or matching funds; and Idaho contributed \$27,235 state support and \$24,525 in estimated non-federal grant support for a total non-federal contribution of \$51,760. In 1998 and 1999, these same general levels of support have been continued.

Question. Where is this work being carried out?

Answer. The work under STEEP will be done at laboratories and field research sites at the University of Idaho, Oregon State University, and Washington State University. Cooperative on-farm testing will be conducted in cooperation with growers on their fields in Idaho, Oregon and Washington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The STEEP II project was completed in 1995, and the results were compiled in a final, 5-year report in January 1997, showing that the original objectives have largely been met. The STEEP III project started in 1996 and will continue through the year 2000 as a 5-year project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's program manager annually reviews progress reports, proposes new research on the STEEP Program, and attends the annual meetings to assess progress. The program is evaluated within the states each year by three committees: grower, technical, and administrative. Annual progress is reported at an annual meeting and compiled into written reports. These reports and the meeting are reviewed annually. Grower and industry input is solicited at the annual meeting on research objectives and accomplishments. The most recent evaluation was made at the January 2000 annual meeting which highlighted direct-seeding technology. This successful meeting attracted many growers, scientists, and agricultural experts from the tri-state region. Farmer surveys are also distributed at each annual meeting, and results compiled to assess whether objectives are being successfully achieved.

SUSTAINABLE AGRICULTURE, CALIFORNIA

Question. Please provide a description of the research that has been funded under the grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Since this is the first year of funding for this project, and the research proposal has not yet been received, that question cannot be Answered at this time.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Since the research proposal has not yet been received, and the project has not yet been funded, there are no stated goals nor accomplishments to report at this time.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$255,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Since the project has not yet been funded, there are no non-federal funds to report at this time.

Question. Where is this work being carried out?

Answer. The specific locations for this work in California are not yet available.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives and completion date have not yet been determined.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. No evaluation has yet taken place since the project has not yet begun.

SUSTAINABLE AGRICULTURE, MICHIGAN

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture, Michigan program grant.

Answer. This project is intended to develop agricultural production systems that are highly productive and profitable and which provide high quality ecosystem services to local communities and to the environment. It examines how to achieve a high nutrient flow from soil to crops and animals, and back to soil, with low loss to ground and surface waters. The grant is allocated, by the Michigan Agricultural Experiment Station, to priority areas within the general area of sustainable agriculture. Grants are awarded based on research merit and proposal submission.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research.

Answer. The principal researcher believes there is a need to better understand the biological processes occurring Michigan's high-nutrient-flow crop and animal systems. With high water tables, networks of lakes and slow-moving streams, and concern about environmental standards, field contamination by agricultural production materials is a high priority.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The objective of this research is the identification, quantification and description of production ecology information to permit its use in a significant way in farm management decision making. Key areas addressed include soil carbon and nitrogen flows, soil nematode population management and weed seed predation and seedbank management.

Accomplishments to date include the development of on-farm compost demonstration sites, collection of research data and computer software models on water table management, completion of initial research trials on rotational grazing at three sites in Michigan, widespread testing of cover crops in several crop rotation systems, and tests of the use of nematology community structure as a method of detecting difference among farming systems. Findings from this project have demonstrated that rotational grazing reduces production costs, and increases net profits, compared to traditional cow management. This project has also shown that composting is an effective way of stabilizing livestock waste, controlling odor, and improving nutrient composition for later land application. Cover crop development as an integrated tool is becoming quite advanced. Frost seeding of wheat with clover is increasingly used; approximately one-third of Michigan's wheat acreage, by some estimates, is overseeded. Results are being integrated into a series of practical publications partially supported by this grant. The first in the series, "Michigan Field Crop Ecology," received an American Society of Agronomy award in 1998 for excellence as an Exten-

sion publication. A second volume, on field crop pest ecology, and similar volumes for fruit and vegetable ecology are under development.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1994 with an appropriation of \$494,000; \$445,000 were appropriated in fiscal years 1995 through 2000, bringing total appropriations to \$3,164,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Matching funds were provided at the state level for \$511,900 in fiscal year 1994, \$372,319 for fiscal year 1995, and \$359,679 in fiscal year 1996. Matching support was not reported in fiscal years 1997 through 1999.

Question. Where is this work being carried out?

Answer. This work is being carried out in Michigan at several locations by Michigan State University. Locations include the Kellogg Biological Station, the Upper Peninsula Experiment Station, and farms around the state.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project, begun in 1994, was proposed through April of 1997. Its specific objectives were met, with additional objectives addressed in subsequent related proposals. The current project is currently scheduled to go through June 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. A formal evaluation of the Principal Investigator's program was concluded in 1997, commissioned by the C.S. Mott Foundation through an independent consultant. The project continues to have annual peer review. According to the Principal Investigator, the proposal has gone through the normal Michigan State University review process. First, all teams and collaborators of the project have met and reviewed the entire proposal with several suggestions and changes being incorporated. Secondly, research administrators in the fields of agronomy/soil science and entomology/pest management covering the major dimensions of the proposal have reviewed it for scientific appropriateness and accuracy as well as for overall balance and likelihood of achieving objectives. Their comments have been included as revisions to the proposal.

SUSTAINABLE AND NATURAL RESOURCES, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture and Natural Resources, Pennsylvania project.

Answer. This project studies the cycling of nutrients in soil and crops with special emphasis on the development of indices for measurement of soil health. Specific goals are to identify indicators of a soil ecosystem that maintains a high level of active soil organic matter, and to develop nutrient and carbon budgets for managing on-farm cropping systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Degradation of soil health/quality is a most serious problem for agriculture both in the mid-Atlantic region and throughout the nation. State governments both regionally and nationally are attempting to address the issue of soil and water degradation in cropping systems and in intensive animal agriculture. Traditional soil test results are not providing the needed answers for effective nutrient management.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to understand the cycling of nutrients and to use that knowledge to develop practical indicators of soil quality and health. If farmers are to manage their farm lands properly, indicators of soil quality and health must be developed that can be used by agricultural producers and consultants. Efforts under this project have been devoted to this goal with significant accomplishments to date. Management practices have been found to affect soil microbiology, and the fate of nutrients from crop residues and legume cover crops is being elucidated. A significant indicator of soil quality has been identified: measurement of the decomposition of filter paper has been shown to be an effective indicator of plant residue decomposition, which in turn has been shown to be highly correlated to nitrogen mineralization and also shows promise as an indicator of soil biological activity. Experiments are underway to refine this approach.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported under this grant began in fiscal year 1993. The appropriation for fiscal year 1993 was \$100,000; \$94,000 in fiscal years 1994 through 1998; \$95,000 in fiscal years 1999 and 2000, for a total of \$760,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. According to the principal investigator, non-federal funds from university, state, and private industry sources were as follows: \$195,901 in 1996, \$369,574 in 1997, \$324,724 in 1998, and \$36,469 in 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted by the Pennsylvania State University with cooperators throughout the state, at the Hunter Rotation Experiment at Penn State's R.E. Larson Research Center near Rock Springs, Pennsylvania, at the Rodale Institute Research Center near Kutztown, Pennsylvania, and on farms around the state.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project has met the specific objectives set forth in the original project which began in 1993 with an ending date in 1995. The continuing project addresses additional objectives related to the overall goal. The ending date for the current project objectives is June 30, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff. The project undergoes regular internal evaluation and assessment as part of Penn State's major effort in soil quality and nutrient management research.

SUSTAINABLE AGRICULTURE SYSTEMS, NEBRASKA

Question. Please provide a description of the research that has been funded under the integrated crop and livestock research program for Nebraska.

Answer. This project is aimed at integration of field crops, animal production, agroforestry, livestock waste management, and diversified enterprises to meet production, economic, and environmental quality goals.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Farmers and ranchers in Nebraska and throughout the Midwest face increasing difficulties in maintaining profitable operations that are sustainable under increased production costs and more stringent environmental regulations. They continue to seek alternative production systems, integration of crop and animal enterprises, value-added products, including those from woody perennials, and new marketing approaches to secure more of the food dollar. Work on crop residue utilization is highly important to assess the loss of erosion mitigation when grazing occurs as well as the benefits of winter forage to production of lean beef. Erosion is still a major problem with monoculture cropping, and work with contour strips, residue management, and animal grazing is essential to provide good recommendations to farmers for how to manage fragile lands.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This project has addressed a number of questions related to the management of integrated crop and livestock enterprises. The work on composting has answered questions about the costs of composting, improved the nutrient content of compost, and evaluated different spreading technologies. The work on contour strip cropping, residue management, no-till planting, and cover crops has demonstrated ways to reduce erosion on highly erodible land. Studies of grazing on corn residues under different tillage and management systems are determining the forage value of residue and the impact of grazing on subsequent crop production.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. This project began in fiscal year 1992, with an appropriation of \$70,000; subsequent appropriations are as follows: \$70,000 in fiscal year 1993; \$66,000 in fiscal year 1994; and \$59,000 in fiscal years 1995 through 2000. Total appropriations to date are \$560,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Matching funds provided for this research include state funds in the amount of \$25,313 for fiscal year 1992; \$26,384 for fiscal year 1993; \$27,306 for fiscal year 1994; \$36,091 in fiscal year 1995; and \$24,267 in fiscal year 1996. No matching funds were reported in fiscal years 1997 through 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted by the University of Nebraska at several locations in Nebraska, with the major part of the project at the Agricultural Research and Development Center near Mead, Nebraska.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project proposed work through March of 1994. The current project proposes work addressing additional related objectives through March 31, 2002. It is expected that current objectives of the project will be met by this time period.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff. The grant was awarded competitively within the University of Nebraska, and the integrated farm project has been reviewed annually for technical merit and progress toward goals by the internal review process of the university.

SUSTAINABLE BEEF SUPPLY, MONTANA

Question. Please provide a description of the research that has been funded under the Sustainable Beef Supply, Montana grant.

Answer. The Sustainable Beef Supply, Montana project is a cooperative effort between Montana State University and the Montana Stockgrowers Association to develop a system to provide information feedback among various segments of the beef industry. This may be one of only a very few joint efforts between a university and a commodity group currently in progress in the United States. A systems approach is being utilized to monitor and track calves from ranches in Montana to feedlots in other states and eventually to the packing plant. Information collected throughout the production cycle is shared among all owners of the cattle.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to develop a reliable and predictable supply of safe, consumer-friendly beef of high quality. The beef industry is becoming more consumer focused, and specific quality and consistency targets are being established in all segments of the industry. To meet consumer needs and return additional revenue to cattle producers, a systems network must be in place to ensure that a high quality and consistent product is being produced. Central to this networking approach is the exchange of information among all segments of the industry from producer to consumer.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this project are: Develop and conduct educational programs on how to attain beef quality assurance standards, provide certification of feeder calves that have met defined management protocols, and provide information feedback from the feedlot and packing plant to the cow-calf producer to determine if the feeder calves met requirements for quality, consistency, safety, and red meat yield. A training manual was developed and 1,000 copies were distributed. Thirty-five quality assurance educational programs were conducted in Montana and county extension agents were trained to deliver this program to producers. Approximately 25,000 calves were certified. A statewide audit of ranchers has been initiated to determine what value-added practices are being utilized related to breeding, health management, nutrition and marketing. A research project involving 2,000 calves at 12 ranches has been initiated to determine if a standardized weaning protocol of vaccinations and nutrition can reduce the morbidity of calves after they enter the feedlot.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal year 1999 was \$500,000 and for fiscal year 2000 was \$637,500 for a total appropriation of \$1,137,500. There are no other sources of funding available from other CSREES programs.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The Montana Department of Agriculture has contributed \$15,000 and the Montana Stockgrowers Association has contributed \$5,000 in fiscal year 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at Montana State University and on cooperating Montana ranches.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that it will take three to four years of funding to fully achieve the objectives of this project. Progress to date has been very encouraging. Approximately 1,000 producers have received quality assurance training and 25,000 calves were certified as being managed under specified best management practices. The goal is to certify 75,000 calves annually in this program.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project and is not far enough along to be effectively evaluated. The project was peer-reviewed at the University before submission. The proposal was also merit reviewed by the agency prior to funding.

SUSTAINABLE PEST MANAGEMENT FOR DRYLAND WHEAT, MONTANA

Question. Please provide a description of the research that has been funded under the Sustainable Pest Management for Dryland Wheat, Montana grant.

Answer. Montana State University researchers are studying the influence of four cropping sequences and two tillage systems on insects, weeds, plant pathogens, nutrient management, physical and biological properties of soil, economic profitability, and environmental benefits. The research is being conducted on large experimental blocks in the three different dryland farming regions of northern, central, and eastern Montana. Each site differs climatologically and agronomically from one another yet represents a significant production area within the state.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project addresses pest management issues under different cropping sequences and tillage practices utilized in the Northern Great Plains for dryland wheat production. The wheat-fallow-wheat system used by many farmers in the region favors the build up of many pests. Dollar losses due to insects, competitive weeds, and plant pathogens in dryland wheat production in Montana alone are staggering. For example, annual losses attributed to wheat stem sawfly exceeds \$25 million; wild oat infestations causes an estimated \$50 million in harvest losses and management costs; and wheat streak mosaic has a monetary loss of \$37.5 million. These and other pests also increase reliance on pesticides for crop protection which impacts environmental quality, increases production costs, and causes secondary pest outbreaks and resistance. The agronomic, environmental, and economical benefits of diversified crop rotations are numerous, but these benefits are largely unknown or not documented in dryland wheat production. As a result of this multidisciplinary project, we can significantly reduce the economic impact of agriculturally important pests, improve soil health, reduce production costs, and improve production efficiency.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The second cropping season was completed at the northcentral site in 1999. Data were collected from 26 different cropping sequences grown under two tillage systems. Crops grown included spring wheat, pea, chickpea, and lentil, cool oilseed, for example, mustard, warm oilseed, or safflower, and sunflower. Numerous physical and chemical attributes of the soil were measured again in 1999 including available nutrients, soil aggregate characteristics, pH, forms of nitrogen, bulk density, salinity, water flow rates and water holding capacity. There was no detectable wheat streak mosaic virus and there was no evidence of foliar fungal diseases in any of the wheat plots. Crop data taken included dates of plant emergence, vegetative dry matter, yield components, and straw residue. Above ground insects in different crop rotations were estimated by sweep samples, sticky traps and pheromone traps. Soil-inhabiting arthropods were sampled by removing soil cores from selected cropping sequences.

The first cropping season was completed at the central location in 1999. The crop rotations include 5 sequences of cereals, oilseeds, legumes and forages grown under high and low input systems. High input treatments included seeding at the rec-

ommended times for maximizing yields, seeding at recommended rates, band applying nitrogen fertilizer, and implementing a standard herbicide program. Low inputs were characterized by delaying seeding of cereal until annual weeds have emerged, seeding small grains at 90 lb/ac, and applying herbicides only as needed. Data were recorded throughout the growing season at this site in 1999 on physical and chemical attributes of soils, plant pathogens, insects, weeds, and crop emergence, vegetative dry matter, yield components, and residue cover.

The main treatment effects and cropping sequences at the third research site in northeast Montana are currently being established. Ground preparation through mechanical tillage and herbicide applications at this site began in fall 1998. The entire 25 acre site was cropped to spring wheat in 1999.

Related investigations currently supported by this project include a weed science study delineating the spatial distribution of wild oats and wheat stem sawfly in dryland spring wheat. A second project focuses on the chemical ecology of wheat stem sawflies. We now have convincing evidence that male and female sawflies produce different compounds that are vital in locating mates. Experiments have been designed to collect, isolate and identify chemical volatiles released by sawflies. A dozen compounds have been identified as components of pheromones released by sawflies. An experimental trap design with a synthetic pheromone lure was field tested in 1999 and proven to be effective in attracting sawflies. Thus, the feasibility of using sawfly pheromones to manage this ubiquitous pest appears achievable.

Question. this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$200,000, for fiscal years 1998 and 1999, \$400,000 per year and for fiscal year 2000, \$425,000. A total of \$1,425,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds of \$42,000, \$80,000 and \$80,000 from the Montana Wheat and Barley Committee were provided for project support during 1997, 1998 and 1999, respectively. The Montana Agricultural Experiment Station provided \$25,000 in state support. Private industries provided \$5,000 during 1999.

Question. Where is the work being carried out?

Answer. Research is being conducted in three distinct dryland areas of Montana in the north, central and northeast, located on producer owned land. Each field site is within 45 miles of a Montana State University Agriculture Experiment Station research center.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initially proposed for a duration of 3 years. However, this project is envisioned as a long term project and will require a total of 12 years to see it to completion.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Yearly progress reports will be used to track the effectiveness of the program of research with the first agency evaluation scheduled for October 2000. Assessment of the precision of biological control organisms and estimates of profitability, marketability, and risk will be used to assess progress.

SWINE WASTE MANAGEMENT, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Swine Waste Management, North Carolina, grant.

Answer. During the past year, this multi-disciplinary project has expanded existing university efforts that have included plans to develop a prototype system for the treatment of animal waste which will be used to study and optimize new and innovative swine waste treatment processes. Specifically, the current project is focusing on the following topics: biological safety and nutrient quality of phosphoric acid-preserved animal mortality products processed by rendering, extrusion, and fluidized-bed cooking/dehydration; beneficial effects of swine manure biosolids on plant disease suppression; evaluation of alternative compost products; use of processed animal waste as a nitrogen and phosphorus source for Fraser Fir Christmas trees; production of a commercially viable feed ingredient from animal wastes, cull sweet potatoes and soybean hulls; routine techniques for monitoring the nutritional value of processed animal waste; residual dietary phytase activity; and phosphorus, calcium and nitrogen content in fresh and composted manure.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The urgency for addressing environmental concerns relative to the intensive production of livestock and poultry continues to intensify in the United States. This is reflected by strategies currently proposed jointly by the U. S. Environmental Protection Agency and U. S. Department of Agriculture. In North Carolina, where livestock and poultry production account for approximately \$5 billion in farm gate income annually, issues of adequate land area for recycling animal manures for crop uptake of nitrogen and phosphorus in some counties of intensive animal agriculture is especially sensitive. North Carolina is also currently in the process of implementing odor rules that will impact animal agriculture. Several other states and local regions are facing the same concerns. It is anticipated that deliverables from this research project will have a local, state and national impact.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The specific goals for this project include the following. Utilize the North Carolina State University Animal Poultry Waste Management Center waste processing facility to develop optimum methods processing animal waste-based nutrients for use as value-added products. Installation of solid separation system at the Animal Poultry Waste Management Center waste processing facility. Collect samples and establish supply sources of various types of animal waste by-products for conducting commercial scale processing and end-product evaluations. Evaluate materials processed for plant nutrients or feedstuffs. Set up and conduct field demonstration involving potential market use for value-added products produced. Complete summary of data for publication and presentation at workshops, conferences and professional meetings

These goals required assimilation of a multidisciplinary research team, and completion of facilities that are able to heat treat, dehydrate, blend, extrude, compost and pelletize the by-products to produce potentially valuable organic fertilizers or feed supplements. These tasks have been completed, and the individual projects described previously are underway.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$215,000; fiscal year 1998 was \$300,00; fiscal year 1999 was \$500,000; and fiscal year 2000 is \$500,000. A total of \$1,515,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This federally funded project has helped leverage funds procured from the state as well as private sector. For example, during the past fiscal year approximately \$735,000 in state funds have been provided—for the development and demonstration of alternative swine waste treatment technologies—plus approximately \$150,000 from industry and commodity groups in support of objectives related to this project.

Question. Where is this work being carried out?

Answer. This work is being conducted at North Carolina State University in Raleigh, North Carolina.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original anticipated completion date was February 1999. Project objectives were not completed by this date. The time to complete processes associated with equipment, facilities and safety plans required for this project, coupled with unavoidable administrative delays in the secondary award process from federal and university level for this project, required a request for extension of the completion date to February 2000. It is anticipated that most project objectives will be completed by February 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The CSREES conducted an evaluation of the progress of this work during January, 2000. The project has made significant progress towards meeting the original goals.

TILLAGE, SILVICULTURE, AND WASTE MANAGEMENT, LOUISIANA

Question. Please provide a description of the research that has been funded under the Tillage, Silviculture, and Waste Management Research Grant?

Answer. This research has six components: Rice and Cotton Tillage, Bald Cypress and Water Tupelo Silviculture, and Dairy and Poultry Waste Management. More specifically, the Rice Scientists are looking for ways to improve stand establishment; the Cotton Scientists are focusing on the use of tillage systems to combat harmful insect populations; the Waste Management Scientists are quantifying the environmental and economic effectiveness of approved dairy and poultry waste disposal systems; and the Silviculturists are conducting a problem analysis on factors affecting Bald Cypress and Water Tupelo regeneration. The project is annually subjected to the university's merit review process.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers hypothesize that the crops, forests, and waste issues addressed by this project extend beyond the state borders, thus this research has, at a minimum, multi-state to regional application.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals were to: improve conservation tillage in rice and cotton farming; determine the effectiveness of no-discharge dairy waste treatment facilities; determine acceptable land treatment levels for poultry waste disposal; and to evaluate wetland forest regeneration processes. All components of the project have established research studies and are monitoring progress. For fiscal year 1998 the silviculture component was placed on hold and a sweet potato project was added. This decision was prompted by a staffing change in the Department of Forestry and Wildlife. Prior to this decision, an annotated bibliography of Bald Cypress Silviculture was completed and the responsible scientists had begun work on Water Tupelo regeneration.

Question. How long has the project been underway, and how much has been appropriated, by fiscal year, through fiscal year 2000?

Answer. The work began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000. For fiscal years 1995–2000 the appropriation was \$212,000. This sums \$1,507,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. State funding in support of these areas of research exceeds \$750,000 annually.

Question. Where is the work being carried out?

Answer. Investigations are being conducted on the main campus at Louisiana State University—LSU—as well as the LSU's Experiment Stations at Calhoun, Crowley, Chase, Winnsboro, St. Joseph, and Washington Parish, Louisiana.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related projects?

Answer. The original work was scheduled for completion in 1999. Early term objectives have been met. The added experiments have closing dates ranging from fiscal years 1999 to 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The last field evaluation was completed on December 12, 1995. The evaluation summary complimented the scientists on the interdisciplinary components associated with this project, along with their investigative procedures, report writing, and external networking.

TOMATO WILT VIRUS, GEORGIA

Question. Please provide a description of the research that has been funded under the tomato wilt virus research program grant.

Answer. This project supports research to help in the reduction of major crop losses in the southeastern United States due to Tomato Spotted Wilt Disease. Research focuses on vector biology and the virus transmitted by the vector. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Tomato Wilt Virus has become a major yield-limiting constraint on a number of very important food crops. This is a problem world-wide, but in the last ten year spread throughout the Southeastern states. Since this virus was first observed in Georgia in 1986, it has caused an estimated \$100 million crop loss to the state. The wide host range of the virus and its vector make this a disease that is

difficult to manage. The new strategies to manage this virus in Georgia will be applicable to all states where it occurs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to reduce losses in the major crops grown in the Southwest due to spotted wilt. This requires identifying the sources of virus and vectors, determining the dynamics of the thrips species that transmit the virus, elucidating how the virus is acquired by thrips to identify possible genes to enhance virus resistance in plants, and adapting to crops in the Southeast the Risk Assessment Index for spotted wilt that is currently in implementation and refinement at the University of Georgia for peanut.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This grant began in 1999 and has been supported at the level of \$200,000 in fiscal years 1999 and 2000. A total of \$400,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds provided for this grant are \$84,736 for 1999.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Georgia and The Coastal Plain Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not been met since this is a complex research area. The anticipated completion date for the continuing research is 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project has undergone peer review at the University level and an agency merit review in January, 1999. In summary, some progress has been made on all objectives of this research. Some progress has been made in understanding the relationship of cellular receptor proteins in the guts of the vector. This will aid in the identification, characterization and eventually cloning of these genes that then could be modified against the virus. Progress was also made in investigating the source of inoculum and seasonal dynamics of the vector. This included identification of several weed species that are alternative virus hosts. The Risk Assessment Index for management of spotted wilt disease was used to evaluate peanut cultivars and determine how they fit better into management of the virus on peanut.

TROPICAL AQUACULTURE/FLORIDA

Question. Please provide a description of the research that has been funded under the grant.

Answer. The agency is in the process of requesting the university to submit a grant proposal for this new research activity.

Question. According to the research proposal, or the principal research, what is the national, regional or local need for this research?

Answer. The researchers indicate that the ornamental fish industry is unique and important to the local economy where 69 percent of the total domestic production of ornamental fish occurs in Hillsborough County and 95 percent of the total production of ornamental fish is in southern Florida. At a national level, the United States imports 60-70 percent of the ornamental fish sold. This results in a significant trade deficit that can be reduced by increased domestic production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new research grant to be funded in fiscal year 2000.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$170,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates that significant non-federal funding will be provided in fiscal year 2000 primarily from state sources to cover salaries of the principal investigators and operating expenses for the laboratory. As the program develops, additional non-federal funding is expected.

Question. Where is this work being carried out?

Answer. Research will be primarily conducted at the University of Florida's Tropical Aquaculture Laboratory located in Ruskin with some work to be done also at the main campus.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2001. The project will be initiated in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this new project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted for funding. Since this is the first year of the program, the agency will conduct an external peer review of the proposal. The fiscal year 2000 review will be completed within three weeks of submission of the proposal. The researchers will be requested to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development.

TROPICAL AND SUBTROPICAL RESEARCH

Question. Please provide a description of the research that has been funded under the tropical and subtropical research program grant.

Answer. Tropical and Subtropical Research—T STAR—Program is operating in coordination with the T STAR Caribbean and the T STAR Pacific Administrative Groups. State Agricultural Experiment Stations that are members of the Caribbean group are Florida, Puerto Rico, and the Virgin Islands; members of the Pacific group are Hawaii and Guam. The proposals are peer reviewed and are then selected for funding by the administrative groups.

Non-member institutional interests are represented by the Executive Director of the Southern Region Agricultural Experiment Station Directors, who is a member of the Caribbean group, and the Executive Director of the Western Region Agricultural Experiment Station Directors, who is a member of the Pacific group. The Agricultural Research Service also has representation on the two groups, as does the CSREES scientist who manages the T STAR grant program.

Funds for the program are divided equally between the two Basin Administrative Groups. The research objective of the program developed by the principal is to improve the agricultural productivity of many of the subtropical and tropical parts of the United States. Special research grants have been awarded for research on controlling insect, disease, and weed pests of crops; increasing the production and quality of tropical fruits, vegetables, and agronomic crops; promoting increased beef production through development of superior pastures; detection of heartwater disease of cattle and the influence of heat stress on dairy cattle reproduction; better use of land and water resources; developing computer models for efficient crop production systems and animal feeding systems; developing computer models for land-use decisions; using biotechnology methodologies for improving plant resistance to viral and bacterial diseases; using biotechnology to develop non-chemical, or biological, strategies for controlling insect pests; and potential for growing new speciality crops.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes this program provides research-generated knowledge that enables informed choices in the responsible use of natural resources, facilitates the health and well being of American citizens through improved food safety and nutrition, provides frontline protection for the rest of the nation's farms and ranches from serious plant and animal diseases and pests, and enhances the ability of U.S. farmers to produce crops efficiently and economically and/or to introduce new crops and agricultural products with export potential to gain market share abroad. On a regional basis, the T STAR program addresses the unique challenges of practicing tropical agriculture, that is, presence of pests year-round, heat stress, post-harvest processing to meet regulatory requirements for export, etc. The local need of Americans living in tropical regions of the nation for T STAR knowledge-based products is to design and implement sustainable agricultural development within fragile tropical agroecosystems—particularly on tropical islands—and to develop new crops and niche markets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to increase the production and quality of tropical crops; control pests and diseases of plants and animals; promote

increased beef production; and conserve land and water resources. Grants have supported research on control strategies for Melon thrips; the biochemical nature of resistance to rust in nutsedge; development of bioherbicides for nutsedges; development of tomato cultivars with resistance to the spotted wilt virus; development of pheromones for monitoring and controlling the citrus root weevil; reducing the effects of heat stress in dairy cattle; development of a decision support system for vegetable production; finding cucurbits with resistance to silverleaf, developing a computer program for optimal supplementation strategies for beef and dairy cattle on tropical pastures; characterizing new strains of citrus tristeza virus in the Caribbean basin; determining the economic threshold for the citrus leaf miner on limes; using viral replicase genes to engineer rapid detection methods for geminiviruses; developing makers of bacterial spot resistance genes in tomato; breeding snap and kidney beans for resistance to golden mosaic virus and for heat tolerance; searching for resistance to papaya bunchy top disease; developing weed control for yam production; and bioengineering ringspot virus resistance in papaya.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The operation of the tropical and subtropical research program was transferred from the Agricultural Research Service to the CSREES, with funding being first provided in fiscal year 1983. Funds in the amount of \$2,980,000 per year were appropriated in fiscal years 1983 and 1984. In fiscal year 1985, \$3,250,000 was appropriated. In fiscal years 1986, 1987, and 1988, \$3,091,000 was appropriated each year. \$3,341,000 was appropriated in fiscal year 1989. The fiscal year 1990 appropriation was \$3,299,000. The fiscal years 1991–1993 appropriations were \$3,320,000 per year; \$3,121,000 in fiscal year 1994; \$2,809,000 in fiscal years 1995–1996 per year; and \$2,724,000 per year in fiscal years 1997 through 2000. A total of \$54,718,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. For fiscal year 1997, more than \$1 million of non-federal funds were provided to the T STAR program from state appropriations; for 1998 \$856,000; and for 1999 \$158,500. These state funds were in the form of faculty salary time commitments and indirect costs covered by the institutions.

Question. Where is this work being carried out?

Answer. This research is being conducted in Florida, Puerto Rico, Virgin Islands, Hawaii, and Guam. Work is also being done in other Pacific and Caribbean countries through agreements between institutions but not using Federal funds.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Research on tropical crop and animal agriculture to increase productivity net profits, decrease harmful environmental impacts, conserve water, and natural resources. Objectives for some projects have been completed and new objectives addressing new issues are being developed in this ongoing project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The projects that are funded by the T STAR Special Research Grant have been peer reviewed by panels of scientists in the United States to assure that good science is undertaken. Also, as part of the grant renewal process, progress reports are reviewed by the two Administrative Groups and by the grant manager at the national level. Workshops in which research results and their application for agricultural production are developed are conducted every two years. Research papers are published in the appropriate regional, national, and international forums available.

The development in 1995 of the Strategic Plan for T STAR provided a mechanism to define priorities, examine program direction, and recommend operational changes. One of the principal points considered was to bring the Caribbean and Pacific Basin components closer and better coordinated. T STAR and the coordination which it implies was an outcome that will make this program better. Each sub project is peer reviewed annually at the initiating institution by the T STAR panel and by the agency National Program Leaders.

TURKEY CORONAVIRUS, INDIANA

Question. Please provide a description of the research that has been funded under the Turkey Coronavirus, IN grant.

Answer. The objectives of the research will be to:

- develop enzyme-linked immunosorbent assays for detecting antibody to turkey coronavirus and turkey coronavirus antigen in turkey flocks,
- elucidate immune responses in turkey poults infected with turkey coronavirus, and
- determine which immunity, humoral and /or cellular, will provide the most effective protection for turkey poults against turkey coronavirus infection.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is that the turkey industry plays a major role in animal agriculture in the U.S. This enteric disease of young turkey poults, called turkey poult enteritis or poult enteritis mortality syndrome, has contributed to significant economic losses by producers in Indiana, North Carolina, South Carolina, Virginia and other states. The cost to the industry is in the millions. Currently, no effective medication or vaccination is available for control and prevention of the disease. Although turkey poults that recover from the coronaviral enteritis may develop long-term immunity, little is known about the specific immunity. The proposed research will lead to further study on the understanding of immunological interaction between turkey poults and individual turkey coronaviral proteins and subsequent development of recombinant or a deoxyribonucleic acid vaccine for effective prevention of the disease. The enzyme-linked immunosorbent assays that will be developed in this research will provide an efficient tool for diagnosis and control of turkey poult enteritis.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research was to develop enzyme-linked immunosorbent assays for monitoring antibody to turkey coronavirus and turkey coronavirus antigen in turkey flocks during acute outbreaks or recovery and in routine health monitoring and to develop effective vaccines to protect turkey poults against turkey coronavirus infection.

The investigators' laboratories have successfully propagated turkey coronavirus from intestines of infected turkey poults in 22-day-old turkey embryos, purified turkey coronavirus from the embryo intestines and have demonstrated an acute enteritis with decreased body weight gain in 7 or 10-day-old turkey poults by oral inoculation of the purified turkey coronavirus. This establishes an infection model to study immunology, pathogenicity, and pathogenesis of turkey coronavirus.

Turkey coronavirus has failed to adapt to grow in cell cultures after numerous attempts, hindering the development of antibody-capture enzyme-linked immunosorbent assay—ELISA—for antibody to turkey coronavirus that requires a large amount of highly purified turkey coronavirus antigens. Nevertheless, another alternative antigen source for ELISA has been investigated. Antibody to turkey coronavirus was found to be cross-reactive with infectious bronchitis virus antigen. An antibody-capture ELISA for detection of antibody to turkey coronavirus utilizing commercially-available ELISA plates coated with infectious bronchitis virus antigens is being developed. Since large numbers of clinical samples can be handled by ELISA rapidly and accurately, successful development of ELISA for antibody to turkey coronavirus will provide the turkey industry with a sensitive and specific tool for the diagnosis and control of turkey coronavirus infection.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal year 1999 was \$200,000 and for fiscal year 2000 was \$200,000, for a total of \$400,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds expended on this project in fiscal year 1999 were \$72,311.06. These funds included \$25,200 from state funds and \$47,111.06 from a private commodity group.

Question. Where is this work being carried out?

Answer. Research is being conducted at Purdue University in the Department of Veterinary Pathobiology and the Animal Disease Diagnostic Laboratory.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is December 31, 2001. At present the project is on target to meet its stated objectives in the designated time period.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was initially funded on July 19, 1999 and no evaluation has been performed since that time.

URBAN PESTS, GEORGIA

Question. Please provide a description of the research that has been funded under the Urban Pests, Georgia grant.

Answer. This research is focused on urban pests with specific emphasis on termites and ants. This project has been evaluated annually by CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes subterranean termites and ants are significant economic pests in the Southeastern United States. Damage and control costs for termites in Georgia were estimated at \$44.5 million in 1993. It is estimated that professional pest control operators apply over 23 million pounds of active ingredients in and around homes each year. Chemicals currently registered for controlling these pests are less efficacious than desired and applied at an intensity that exceeds most agricultural settings.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the termite research is to better understand the biology of subterranean termites and their responses to selected environmental cues in order to design monitoring, risk assessment, and precision-targeting control strategies using conventional and alternative methods. Additionally, an objective is to improve the identification of subterranean termites to the species level through studies of the termite genome, cuticular chemistry, morphometric characteristics and termite behavior. Specific accomplishments in the termite research are as follows: Multi-disciplinary research using morphometric comparisons, agonism bioassays, chemotaxonomic phenotypes, mark-release-recapture and genetic analysis shows that subterranean termite populations display a multiple-queen colony organization. This field research also proved that termite movement between established feeding sites is not random. It demonstrates that current understanding of termite population structure must be reconsidered. It is clear from this work that termite population structure cannot be determined using only a single technique, like the current industry standard of mark-release-recapture, and that the organization of termite populations is dynamic. This work raises questions concerning the implementation of termite baiting control tactics and claims of structural protection using the current termite baiting technology which in the past four years has become a multi-million dollar industry in the United States. This same multi-disciplinary research approach has demonstrated that the Formosan termites from 7 separate sites in the Atlanta, Georgia, Metro Area were from a single maternal line and that this maternal line originated from New Orleans, Louisiana not, Charleston, South Carolina as originally suggested. The research also provided strong evidence that the subterranean termite species that is infesting areas in and around Paris and Southwestern France is from the United States, not southern Europe. Research on new chemistries demonstrated that the currently registered non-repellent termiticides require longer than 10 minute exposure times at concentrations at least twice the current registered application rates to effect greater than 90 percent mortality in the termites tested in bioassay. This work cannot explain the purported field efficacy of the new termite control concept of the "treatment zone" which allows termites to penetrate the soil but kills them before they breach the barrier and infest a structure. Field and laboratory research with insect pathogenic fungi used as a biological control agent indicate that multiple soil applications are required and that population impacts are likely limited to the area of application not disparate feeding sites. Laboratory research on wood treatments using borate materials indicates that these materials discourage termite feeding but not exploration for additional, untreated wood. Tests designed to treat infested structural wood using a new insecticide chemistry provided evidence of killing termites at sites untreated by the insecticide but known to be visited by the population of termites in the treated area.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 was \$76,000 per year. In fiscal year 1994 the appropriation was \$71,000 and in fiscal years 1995 through 2000 the appropriation was \$64,000 each year. A total of \$683,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant by fiscal year were as follows: 1991—none, 1992—\$26,000, 1993—\$18,000, 1994—\$59,530, 1995—\$59,539, 1996—\$30,000, 1997—\$80,000, 1998—\$50,000, and 1999—\$100,000.

Question. Where is the work being carried out?

Answer. This research and technology transfer program is being conducted at the University of Georgia, Department of Entomology, Athens, Georgia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The grants have been processed on a year to year basis pending the availability of funds, however, the original objectives were essentially a five-to eight-year plan of work. CSREES entomologists judge that excellent progress has been made in meeting the objectives, especially on foraging behavior and the identification and development of termite baits.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has been evaluated on an annual basis by CSREES through progress reports and by evaluation of contributions presented through the Entomological Society of America meetings in December of 1999.

VIDALIA ONIONS, GEORGIA

Question. Please provide a description of the research that has been funded under the Vidalia Onions, Georgia grant.

Answer. The research has concentrated on developing pungency testing procedures to improve quality and sensory consistency of Vidalia onions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for the research?

Answer. Vidalia onions are a specialty crop of extreme importance to the economy of certain areas of Georgia. The project is directed toward improving product quality and the nationally and internationally economic competitiveness of this production system.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research has demonstrated that chemical tests can be used to accurately predict the pungency of onions prior to harvest, and perhaps flavor categorization, to consumers. The results have also indicated that several diseases affecting onions are the most serious problem in regard to quality and production.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The project was funded for \$84,000 for 1998; for \$100,000 in fiscal year 1999; and for \$100,000 in fiscal year 2000. A total of \$284,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year.

Answer. The non-federal funding for this project for the last two years was \$193,137 from the state of Georgia and \$251,427 in private funding.

Question. Where is the work being carried out?

Answer. The work is being conducted at the Coastal Plain Experiment Station in Tifton, Georgia and in test plots in several commercial field sites.

Question. What was the anticipated completion date for the original objections of the project? Have those objectives been met? What is the anticipated completion date of additional objectives?

Answer. The anticipated duration for the original project was five years. The initial objective of establishing procedures for pungency testing has proceeded ahead of schedule. The plant disease problems that have emerged will likely require several additional years, although the incidence and severity of these diseases are highly variable from year to year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is in its second year and a CSREES review has not yet been done.

VITICULTURE CONSORTIUM, NEW YORK AND CALIFORNIA

Question. Please provide a description of the research that has been funded under the Viticulture Consortium grant.

Answer. The University of California and Cornell University in New York conducted research on varietal responses of grapes, modeling of water requirements,

management of diseases including Phyloxera and other cultural aspects of grape production. Funds were used by the lead institutions to fund projects in the various grape producing states within their region. Grants were made based on peer reviewed proposals and selected competitively by regional groups based on priorities developed by researchers, extension, and industry personnel.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research being carried out is designed to help the viticulture and wine industries remain competitive in the U.S. and in the global market. Further, disease and insect problems are a concern of the industry, especially in new strains of phyloxera while overall improvement in all cultural management approaches to grape production need to continue.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to maintain or enhance the competitiveness of the U.S. Viticulture and wine industry in the global market.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1996-1997, \$500,000 per year; fiscal year 1998, \$800,000; fiscal year 1999, \$1,000,000 and \$1,000,000; in 2000. A total of \$3,800,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Each year the viticulture industry provides matching contributions in excess of the appropriated federal funds.

Question. Where is the work being carried out?

Answer. Research is being carried out in 8 eastern states and California through 18 grants.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research priorities set by the guidance group have not been met. The research is varied and complex and will take many years to complete.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project underwent merit review in January, 1999. The research proposals are peer-reviewed in both regions before selection. The review group is composed on industry, research, and extension personnel that are experts in viticulture.

WATER CONSERVATION, KANSAS

Question. Please provide a description of the research that has been funded under the water conservation program grant.

Answer. This research program is designed to develop and disseminate technical and economic information on the efficient use of water for irrigated crop production in western Kansas. The program has the following objectives: 1. Develop regression models to estimate the longevity of subsurface drip irrigation systems using calculations of annual system performance deterioration based on 13 years of operating pressures and flow rates; 2. Evaluate utilization of livestock effluent with subsurface drip irrigation and its effect on water redistribution and corn water use patterns; 3. Develop best management practices for nitrogen fertigation using subsurface drip irrigation systems for corn; 4. Estimate the long run economic impacts of irrigation efficiency improvements for irrigated corn, wheat, and grain sorghum in the farm sector and affiliated sectors of the High Plains economy; 5. Disseminate irrigation research information and best management practice recommendations to Kansas irrigators through a series of extension bulletins and updates based on research-based information.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need to conserve water has focused attention on more efficient alternatives such as subsurface drip irrigation. This research will be of particular significance within the state and region. However, it also has national and international applications as advanced irrigation systems, such as subsurface drip irrigation, will be needed to improve irrigation water use efficiency in the next century. Economic research initiated in 1998 is examining the impact of adoption of improved water conservation techniques on the entire regional economy rather than just on the short term economics faced by the individual irrigator. This research will help soci-

ety determine whether society should have a role in providing incentives to increase adoption rates of water conservation technology.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research goal is to determine the feasibility of subsurface drip irrigation and other alternative irrigation systems in western Kansas to sustain irrigated corn production to support the beef feedlot industry. The project also supports an educational effort through collection and dissemination of information on efficient irrigation methods. Subsurface drip irrigation acreage is increasing in Kansas and farmers are obtaining results on their own farms.

The computer program Irrigation Economics Evaluation System—IEES—was distributed by the Kansas State University Cooperative Extension Service and is being used by Kansas irrigators. A report has been published which documents the data requirements and algorithms used in the model. A users guide is also available.

A report entitled "Economic Analysis of Alternative Irrigation Systems for Continuous Corn and Grain Sorghum in Western Kansas," has been completed. The results of this study indicate that a low drift nozzle, center pivot system is the most profitable center pivot system to use for irrigation of corn and grain sorghum. Overall, a surge flood system was the most profitable because of its relatively low ownership costs. Although the subsurface drip system shows some potential, it is only economically feasible when above-average crop yield and price conditions exist.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1993 with an appropriation of \$94,000; \$88,000 in fiscal year 1994; and \$79,000 in fiscal years 1995–2000 each year. The total funds appropriated are \$656,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal state of Kansas funds provided to this project were as follows: 1997, \$119,659 state funds; 1998, \$135,993 state funds; and 1999, \$129,850 state funds.

Question. Where is this work being carried out?

Answer. The research is being conducted at Kansas State University. The field portion of the research is being conducted on Research Centers at Colby and Garden City, Kansas. Additional work is being carried out on campus at the Departments of Agronomy and Agricultural Economics in Manhattan, Kansas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original anticipated completion date for the project was 1998. One of the most important objectives of the study is to evaluate longevity of the subsurface drip irrigation systems. These sites are unique to the region and very little information is available on system longevity. Pressing water quality problems of a regional and national scope has necessitated a change in the objectives to developing nutrient management practices under subsurface drip irrigation and utilization of livestock wastewater with subsurface drip irrigation. Additionally, changes in the federal farm program which allow greater planting flexibility has an effect on how irrigators make water/land allocation decisions. Field and economic studies related to allocation strategies, nutrient management, and wastewater utilization should be completed in three years. The projected completion date is 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project has been peer reviewed in January 2000. The reviewers felt the project concept to be valid and the timetable for accomplishments to be on target.

WEED CONTROL, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Weed Control, North Dakota grant.

Answer. A major focus has been developing and evaluating systems to reduce herbicide use in crop production. The experiments of longest duration are field evaluations of sustainable, reduced tillage and conventional crop rotation systems to ascertain changes in weed species and densities and in economic returns over time when weed management is reduced. Another emphasis has been weed biology, particularly understanding the unique physiological and genetic traits of herbicide-resistant kochia and wild oat in an effort to recommend the most cost-effective management alternatives. Another goal has been to improve the efficiency of postemergent herbi-

cide use by utilizing additives that maximize weed control with reduced amounts of herbicide and by reducing spray volume and adapting new nozzle designs that improve application techniques.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research address new methods to control weeds using systems control. The principles concerning effective use of additives with postemergent herbicides are being applied to improving the efficiency of postemergent herbicide use across the nation. Similarly, adaptation of herbicide application technology that allows reduced spray volumes while sustaining herbicide effectiveness is of nationwide benefit. The increased understanding of the inheritance and management of herbicide resistance in kochia and wild oat will be beneficial to management of these weeds in the central and northern regions of the United States where these weeds are abundant and cause major losses annually. The long-term field experiments should provide useful information on the positive and negative impacts of reduced weed management systems wherever spring-sown small grains are the primary crop.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The initial major activity was a long-term series of experiments to evaluate changes in weed species and populations and the economic returns in conventional, sustainable and reduced tillage systems with rotations that are up to four years long. The research was initiated in 1993, but atypical wet conditions occurred for the first three years. It is felt that at least two complete cycles of crop rotations (eight years) will be necessary to accurately assess what farmers can expect from adopting new management systems.

The research to improve the efficiency of herbicides lead to development of the principle that effectiveness of many postemergent herbicides can be improved by using additives that dissolve the herbicide. This principle was utilized to develop a basic pH adjuvant that improves the effectiveness of several postemergent herbicides.

The research with genetics of herbicide-resistant kochia has determined that inbreeding depression occurs when this naturally cross-pollinated plant is self-pollinated to develop genetically uniform plants, which are desirable for many research objectives related to inheritance of genetic traits. However, this discovery also demonstrates that cross-pollination must be maintained in kochia for research intended to accurately simulate genetic changes and competition with crops that may occur in a field.

Resistance of wild oat to many of the major herbicides used for its control in the United States has been documented, including resistance to imazamethabenz which has not been reported previously. Molecular biology and physiological studies have been initiated to better understand the cause of imazamethabenz resistance in wild oat, so management strategies can be recommended. Initial research has demonstrated that weed control by herbicides applied to weeds of recommended size has been equally effective when spray-drift-reducing or conventional nozzles are used. Because drift-reducing nozzles produce large droplets, the next step of evaluation is being initiated to determine whether small weeds are treated and controlled effectively when drift-reducing nozzles are used.

Question. How long has this work been underway and how much has been appropriated by fiscal year through year 2000?

Answer. The support by this grant began in fiscal year 1992 and appropriation for fiscal years 1992 and 1993 was \$500,000 per year; \$470,000 in fiscal year 1994; and \$423,000 per year in fiscal years 1995 through 2000. A total of 4,008,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$27,030 state appropriations in 1992; \$48,472 state appropriations in 1993; \$41,969 state appropriations in 1994; \$71,847 state appropriations in 1995; \$62,134 state appropriations in 1996; \$78,579 state appropriations in 1997; and an estimated \$70,000 state appropriations in 1998 and 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at the North Dakota State University.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date for the long-term rotation experiment, utilizing the conventional, reduced tillage and sustainable management systems, was

anticipated to be a minimum of five years, but the experience with atypically environmental conditions suggest that 8 to 10 years will be necessary to attain a relatively steady state or logical end of the research. The current intent is to continue the research until at least 2002. The problems encountered due to the inbreeding depression in kochia suggests that it will be difficult to determine the true genetic nature of inheritance of herbicide resistance in this weed as quickly as projected. Due to the discovery of herbicide resistance of wild oat to imazamethabenz, the genetic and molecular biology research to characterize the nature of this resistance is just getting a good start. It is anticipated that the genetic and biology research with kochia and wild oat will need to continue until at least fiscal year 2002.

Question. When was the last Agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A scientific peer review of the written proposal was conducted in fiscal years 1998 and 1999 by CSREES prior to awarding the grant. Based on comments from the reviewers, CSREES is planning to conduct an onsite scientific peer review of this grant.

WETLAND PLANTS, LOUISIANA

Question. Please provide a description of the research that has been funded under the Wetland Plants, Louisiana, grant.

Answer. CSREES has requested the university to submit a grant proposal that is currently in preparation.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. There is local, regional, and national need for this research. Coastal wetlands erosion is a serious environmental problem in many coastal locations around the United States. The problem is particularly severe in Louisiana where an acre of coastal wetlands is lost to erosion every 20 minutes. Current technologies, even at great expense, can only slightly reduce these losses. The research this grant is funding has the potential to provide a significant improvement with respect to both the magnitude and expense of future coastal erosion control efforts.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop an economically-feasible approach to controlling coastal wetlands erosion that would utilize vegetation to retain areas threatened by erosion and to rebuild lost land. To accomplish this, a system that incorporates agricultural principles involved in crop production is required. Specifically, a seed-based system utilizing appropriate planting material is required. While last year was the first year of funding for this project from CSREES, progress has been rapid in developing this seed-based system, and field trials in the marsh were initiated in 1999.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999, and the appropriation for fiscal years 1999 and 2000 was \$600,000 per year for a total of \$1,200,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: \$18,391 state appropriations, \$5,319 industry grants, and \$8,691 miscellaneous in 1999. In addition, the university had \$110,081 in unrecovered indirect costs.

Question. Where is the work being carried out?

Answer. Research is being conducted at the Louisiana Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new program, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project, and there has been no prior agency evaluation. An agency evaluation is planned for fiscal year 2000 following one year of project operation.

WHEAT GENETICS, KANSAS

Question. Please provide a description of the research that has been funded under the Wheat Genetics, Kansas grant.

Answer. This project provides partial support for the Wheat Genetics Resource Center at the University of Kansas. The Center focuses on collection, evaluation, maintenance, and distribution of exotic wheat-related germplasm needed to develop new wheat cultivar resistant to disease, insects and environmental stress.

Question. According to the research proposal or the principal research, what is the national, regional or local need for this research?

Answer. The principal researcher believes most cultivated varieties of wheat are derived from common sources. They lack the rich genetic diversity needed to develop resistance to diseases, insects, and environmental stress. The replacement of genetically-rich primitive cultivar and land races by modern, more uniform cultivars all over the world is causing erosion of wheat germplasm resources. New pests or those that have overcome varietal resistance pose a constant threat to the Nation's wheat production. Genetic resistance often resides in wild relatives of wheat. The researchers believe this program, which was established in Kansas, is providing service to wheat breeders nationally and internationally.

Question. What was the original goal of this research and what has been accomplished?

Answer. The original goal of this research was to enhance the genetic diversity available to wheat breeders nationally and internationally by collecting, evaluating, maintaining, and distributing germplasm derived from wild relatives of wheat. To date, 39 germplasm releases have been made containing new genes for resistance to such pests as Hessian fly, greenbug, leaf rust, soil-borne mosaic virus and Russian wheat aphid. Germplasm stocks with resistance to leaf rust and powdery mildew are under development. Evaluation of germplasm for important resistance genes was carried out by Center scientists and cooperating institutions. Center scientists have introduced antifungal protein genes into the wheat plant to enhance its survival against pathogen attacks. One transgenic wheat line gave enhanced resistance to wheat scab, a devastating disease of wheat. In 1998, the Center filled 20 requests from U.S. wheat breeders for seed from the germplasm collection and 10 requests for seed of germplasm releases, as well as 34 requests from international breeders.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Work supported by this grant began in fiscal year 1989. Appropriations were for fiscal year 1989, \$100,000; fiscal year 1990, \$99,000; fiscal year 1991, \$149,000; fiscal years 1992-1993, \$159,000 per year; fiscal year 1994, \$196,000; fiscal years 1995-1997, \$176,000 each year, and \$261,000 for fiscal years 1998, 1999, and 2000. A total of \$2,173,000 has been appropriated.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The nonfederal funds provided for this grant were as follows: \$609,309 in 1991; \$531,167 in 1992; and \$730,082 in 1993, \$468,960 in 1994; \$563,671 in 1995; \$457,840 in 1996; \$495,820 in 1997; \$155,279 in 1998 and \$452,600 in 1999. Sources include state appropriations, product sales, and other organizations, such as state commodity associations.

Question. Where is this work being carried out?

Answer. This research is being conducted at Kansas State University at the Wheat Genetics Resource Center. The principle investigator also reports collaborative projects with other departments at Kansas State University, as well as other institutions in the U.S.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The collection, evaluation, and enhancement of wheat germplasm is a continual process. Therefore, this project does not have a defined completion date. Some objectives related to germplasm evaluation have been completed in fiscal year 1999 and other objectives which are related to other genetic sources are still in the developmental stage.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was peer reviewed by the institution, Kansas Agricultural Experiment Station, and was found to address important issues in the winter wheat industry in Kansas and other states. The research has been productive based on

germplasm releases and peer-reviewed journal articles and other publications. Additionally, each annual proposal is reviewed by an agency scientist.

WOOD UTILIZATION RESEARCH

Question. Please provide a description of the research that has been done under the wood utilization grant.

Answer. The research includes: developing processes to upgrade wood products made from small-diameter or low quality trees to higher value structural applications; catalyzing the formation of new business enterprises; reducing environmental impact while improving systems for timber harvesting and forest products manufacturing; increasing the life of wood in use through preservation and good design; and assisting industry to be more innovative.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The forest products industry is very fragmented with many small firms which benefit from publicly-sponsored research. Research provides the woodworking machinery and tooling industry with the technology needed to be more competitive in the global economy. Most of the companies helped by this research are too small to afford in-house research groups. Shifts in resource availability and increased costs of the timber that is still available demand more complete utilization in order for wood to remain competitive.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to generate new knowledge that will benefit the wood industry and the environment. New scientists are trained. Consumers benefit from better and more environmentally-sound products. Among the major accomplishments of the eight centers are (1) design of glue-laminated beams that are reinforced with plastics to save 25–40 percent of the wood fiber that would otherwise be needed, (2) technology to apply wood preservatives using super fluids to reduce environmental problems associated with present commercial treatments, (3) better harvesting systems that are efficient and environmentally acceptable, (4) increase of wood machining speeds and reduction of saw blade width to increase productivity and save raw material, (5) a patented system to apply pressure and vibration to prevent enzymatic sapstain which degrades hardwood lumber by \$70 to \$200 million per year, (6) reduction of quantity of wood bleaching chemicals needed by wood pulp producers, (7) design and strength of wood furniture frames to minimize wood requirements, (8) adoption of European frame saw technology to composite lumber to provide a new raw material source for industry, (9) improved technology to non-destructively scan standing trees for mechanical properties of the wood, (10) reduced warp in structural lumber produced from small-diameter trees, (11) characterization of the wood products industry, (12) heartwood formation, (13) recovery of preservatives from treated wood, (14) installation of a statistical process control system has been installed in one sawmill with impressive cost savings, and (15) development of cost effective and environmentally-friendly processes for removing high value chemicals from bark.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$3,000,000; fiscal years 1986 through 1989, \$2,852,000 per year; fiscal year 1990, \$2,816,000; fiscal years 1991 and 1992, \$2,852,000 per year; fiscal year 1993, \$4,153,000; fiscal year 1994, \$4,176,000; fiscal years 1995 and 1996, \$3,758,000 per year; fiscal years 1997 and 1998, \$3,536,000 per year; fiscal year 1999, \$5,136,000, which provided a half million increase for the six existing centers, and \$1,000,000 for the two new centers; and \$5,136,000 in fiscal year 2000, which provided \$577,000 to establish a new center in Alaska. Total appropriations are \$56,117,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The following are non-federal funds provided by state:

—Mississippi State University non-federal funds were: State appropriations, \$2,498,800, \$2,178,725, \$2,353,225, \$2,331,691, \$2,778,535, \$2,582,617, \$2,543,017, and \$2,717,448 for 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, and 1999, respectively. In addition, industrial funds averaged \$876,057 for the 5 years from 1995 to 1999 in support of the Mississippi Forest Products Laboratory.

—Oregon State University state appropriations were: \$1,337,962, \$1,394,304, \$1,256,750, \$1,252,750, \$1,417,755, \$1,117,000, \$1,100,000, \$1,352,000, and

\$1,337,000 for 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, and 1999, respectively. Estimated non-public support was \$731,000 this year.

—Michigan State University non-federal contributions were \$605,000, \$590,000, and \$700,000 for 1997, 1998, and 1999, respectively.

—Three new locations were added in 1994: University of Minnesota-Duluth non-federal match was \$590,000, \$550,000, \$560,000, \$371,930, \$307,532, and \$510,939 for 1994, 1995, 1996, 1997, 1998, and 1999, respectively.

—North Carolina State University was \$126,000, \$165,000, \$135,000, \$163,216, \$323,134, and \$518,258 for 1994, 1995, 1996, 1997, 1998, and 1999, respectively.

—University of Maine was \$600,000, \$445,723, \$459,100, \$477,464, \$526,210, and \$148,032 for 1994, 1995, 1996, 1997, 1998, and 1999, respectively.

—Two new centers were added in 1999: The University of Tennessee non-federal funds for 1999 were \$150,987. The consortium of the Universities of Idaho and Montana and Washington State University non-federal funds for 1999 were \$305,000.

Question. Where is the work being carried out?

Answer. There are nine locations. The initial three—Oregon State University, Mississippi State University, and Michigan State University—were joined by the University of Minnesota-Duluth, North Carolina State University, and the University of Maine in fiscal year 1994. In 1999, they were joined by a center at the University of Tennessee, and a second center at the University of Idaho, which includes a consortium of Idaho, Montana, and Washington State. In 2000, funds for a wood utilization center in Alaska were appropriated. This center is just getting organized now.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to build and maintain three strong regional centers of wood utilization research. These centers have been established, and six more centers have been added. Projects begun in 1999 will be completed by 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. On site reviews of centers are conducted on a rotating basis. Each center's plans are reviewed yearly or more frequently. Progress reports are reviewed yearly. Center directors met together for joint planning in June 1996 and in February 1999. Centers all have advisory committees or research committees which meet periodically. CSREES conducts informal on-site reviews periodically. The Minnesota and Oregon sites were visited in 1996, and the North Carolina site was visited in 1997. Oregon State was visited in 1998. A Departmental panel reviewed the original three centers in 1992 and 1993. At that time, the original objectives were broadened to address environmental concerns. The centers are helping industry meet environmental objectives by conducting research leading to sustained timber production; extending the timber supply through improved processing; developing new structural applications for wood; and developing wood extractives to substitute for pesticides, preservatives, and adhesives.

WOOL RESEARCH

Question. Please provide a description of the research that has been funded under the wool research grant.

Answer. The overall goals for this research are to develop objective measures of wool, mohair, cashmere and other animal fibers to improve the quality of wool products while enhancing the profitability of the U.S. sheep and Angora goat industries. Specific objectives include: develop and evaluate measurement techniques for rapid objective evaluation of wool, mohair, cashmere and other animal fibers; increase the use of objective measurements to increase fiber production, quality and income to producers, and increase consumer acceptance of fabrics made from these fibers. The fiscal year 1999 grants terminate between August 2000 and June 2001. The 2000 grant proposals will soon be requested by the agency. All grants are reviewed for relevance to industry needs and undergo scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Collaboration exists among researchers in Texas, Wyoming and Montana associated with this grant and other federal, university and industry scientists to assure responsiveness to the needs of those involved in wool and mohair production, marketing and processing. The sheep and goat industries and the principal researchers believe that this research to be of national, regional and local need. The

research on wool, conducted by means of this grant, represents the only research efforts in the U.S. focused on improving the efficiency of measuring and assuring wool, mohair and cashmere quality for garments made from these fibers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal for this research is to develop objective measures of wool, mohair, cashmere and other animal fibers with a focus on improving the efficiency of determining the quality of products made from these fibers while enhancing the profitability of the sheep and Angora goat industries. Research accomplishments included the development of rapid and inexpensive measurements of fiber diameter, distribution of animal fibers, and other fiber properties such as fiber length and color. Each of these properties are very important for grading and processing to determine ultimate softness, durability, dye characteristics, comfort, and garment price. Within the past year, evaluation of laser and near-infrared spectroscopy techniques have been completed by the three cooperators in this project in collaboration with Yocom-McColl Testing Labs, the main animal fiber testing lab in the United States. Two of the principal investigators authored an article in the American Society for Testing and Materials on standard methods of test for these instruments that are now in the final stages of acceptance by the Society, and therefore, the U.S. textile industry. In part, due to our efforts of this grant, all animal fibers tested for fiber diameter distribution by this commercial laboratory are now tested using one or the other of these new instruments. This has resulted in labor savings, thereby a reduction in the price for some associated fiber tests. Producers, traders, and processors now receive more accurate fiber data at reduced cost and with shorter turnaround times. Because this form of testing is also recognized by the international textile community, U.S. animal fibers are now more readily accepted and accessible as international commodities. Additional instruments, primarily for measuring length and strength, have also been evaluated with the ultimate objective of better describing domestic wool that will eventually permit electronic trading of animal fibers. These measurements impact the efficiency of the sheep and Angora goat industries, the effectiveness of monitoring the quality and consistency of imported products, and the satisfaction of buyers of wool, mohair and cashmere textiles. Other experiments aimed at enhancing our ability to establish the value of specialty animal fibers were successfully completed and reported for mohair, cashmere and other fibers. Experiments were also conducted to identify more productive rams and billie goats; to select for finer and more valuable mohair in Angora goats; to establish the genetic, nutrition, and management requirements for the concurrent production of lean lamb meat and high quality wool; and to demonstrate the economic advantages to producers of skirting and classing their raw wool prior to marketing. Research and education efforts have kept U.S. processors and producers current on the status of the wool markets world wide. It is important that the U.S. producers of wool, mohair, and cashmere are competitive in the world market and that consumers are assured high quality textiles.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Grants have been awarded from appropriated funds in the amount of \$150,000 per year for fiscal years 1984–1985; \$142,000 per year for fiscal years 1986–1989; \$144,000 for fiscal year 1990; \$198,000 for fiscal year 1991; and \$250,000 per year for fiscal years 1992–1993; \$235,000 for fiscal year 1994; \$212,000 per year for fiscal years 1995–1997; and \$300,000 per year for fiscal years 1998–2000. A total of \$3,481,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$150,913 state appropriations, \$11,800 product sales, \$5,817 industry, and \$3,556 miscellaneous in 1991; \$111,394 state appropriations, \$25,451 product sales, \$41,442 industry contributions and \$3,068 miscellaneous in 1992; \$152,699 state appropriations, \$39,443 product sales, \$40,804 industry contributions and \$3,556 miscellaneous in 1993; \$150,094 state appropriations, \$35,284 product sales, \$36,484 industry contributions and \$3,556 miscellaneous in 1994; \$67,345 state appropriations, \$10,000 product sales, and \$34,325 industry contributions in 1995; \$39,033 non-federal support in 1996; \$174,486 non-federal support in 1997; \$200,307 state appropriations and \$13,000 industry contributions in 1998; and \$202,854 state appropriations, \$14,385 industry contributions, and \$34,000 miscellaneous in 1999.

Question. Where is this work being carried out?

Answer. The research is in progress at the Texas A&M University, Texas Agricultural Experiment Station at San Angelo, the University of Wyoming at Laramie, and Montana State University at Bozeman.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The original objectives to improve the efficiency and profitability of wool, mohair and cashmere production and marketing are still valid and subject to further research. Specific objectives for individual laboratories and experiments are continually revised to reflect the changing research priorities for the wool, mohair, and cashmere industries and to satisfy consumer demands for products from these fibers. It is anticipated that current research will be completed by fiscal year 2005.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external review of the overall wool research program was conducted in 1998 in Las Cruces, New Mexico by a team consisting of industry experts and peers from the scientific community. The review team concluded that the program was very productive and beneficial to the United States wool, mohair, and cashmere producers as well as the allied fiber industries. Research achievements, noted by the review team, included program input for testing methods and standards used to buy and sell wool for international trade.

In addition to the program review, grant proposals are annually reviewed and the research facilities are periodically visited. The principal investigators meet annually to evaluate progress and re-evaluate research priorities according to industry needs. Because the research encompassed in this grant is a component of a regional research project, accomplishments are reported annually to scientific peers and representatives from the sheep, goat, wool, mohair, and cashmere industries. In addition, the overall regional research project is peer reviewed every third year.

RESEARCH FEDERAL ADMINISTRATION PROJECTS

AGRICULTURAL DEVELOPMENT IN THE AMERICAN PACIFIC

Question. Please provide a description of the research that has been funded under the Agricultural Development in the American Pacific program.

Answer. The Agricultural Development in the American Pacific (ADAP) is a primary means for land-grant research, extension, and instruction programs of the five participating institutions of American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and University of Hawaii, to collaborate and cooperate to enhance their impact on Pacific tropical agriculture and communities. ADAP is a mechanism to address common regional client-based issues while maintaining cultural, rural, economic, and environmental integrity. This research grant is awarded noncompetitively to a program planned and approved by the five involved land-grant institutions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the five participating institutions are geographically dispersed yet facing many similar issues which can best be served through extensive networking and communication. ADAP facilitates communications and seeks to raise levels of academic achievement and improve the quality of education. ADAP's most unique feature is that twice each year it brings together the five Deans/Directors to discuss agriculture and human resources issues facing isolated, tropical ecosystems in the Pacific, and to plan and implement activities to address those issues. Priorities are categorized in three areas: sustainable systems, collaborations/partnerships, and communication systems. Activities range from joint and collaborative efforts to overcome taro leaf blight in the Pacific, to seeking recognition of Pacific tropical agriculture by the National Association of State Universities and Land-Grant Colleges.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. ADAP's goals are to develop human resources within the institutions, to manage more effectively agricultural programs within and among the institutions, and to focus available resources on critical agricultural issues of the Pacific. Ongoing projects include animal health surveys, livestock waste management, dietary guidelines for Pacific foods, youth-at-risk assessment, artificial insemination demonstration/education, and market information collaboration with "state" Departments of Agriculture. ADAP is now working jointly with the 22-nation Secretariat of the Pacific Community in developing a paraveterinary program. This program will use distance learning and site visits to train students from the cooperating nations and territories in animal health. This is a critical need for the Pacific region. Both ADAP and the Secretariat of the Pacific Community will contribute money as well as skilled personnel to assist in this project. In another regional cooperative

effort, ADAP led a retreat for strategic planning among the "state" and national Departments of Agriculture in the Pacific region in July 1999. That retreat identified food insecurity as a major issue for Pacific island nations, and ADAP is formulating a forum in collaboration with the Secretariat of the Pacific Community to address the issue.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2000?

Answer. This work was funded for seven years with an annual appropriation of \$650,000 to the former Extension Service. In fiscal year 1994, an appropriation of \$608,000 was made to CSREES to continue the ADAP program. In fiscal year 1995 the appropriation was \$527,000. The fiscal years 1996 and through 2000 appropriations were \$564,000 each year. The appropriation total to CSREES is \$3,955,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds are not provided. Unspecified in-kind support, such as facilities, equipment, and administrative support, are provided by each institution and, in some specific projects, by non-ADAP collaborating institutions.

Question. Where is this work being carried out?

Answer. This work is being carried out by American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and the University of Hawaii.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The ADAP program has been achieving original program objectives, particularly in the areas of improvement in institutional capacity and communications. It is anticipated that an additional 5 to 10 years will be needed to fully achieve collaborative integration of the American Pacific land-grant programs.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A formal review of the ADAP program was conducted July 1–10, 1997, and included visits by review team members to American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and University of Hawaii. ADAP incorporated review recommendations in preparing and adopting a new five-year 1997 strategic plan. An agency specialist conducts a merit review of the proposals submitted in support of the appropriation annually. In a review of the April 1999 proposal, progress was judged satisfactory.

AGRICULTURAL WASTE UTILIZATION, WEST VIRGINIA

Question. Please provide a description of the research that has been funded under the Agricultural Waste Management, West Virginia grant.

Answer. The West Virginia Department of Agriculture is conducting a project to validate the applicability and effectiveness of anaerobic filtration for treating municipal and agricultural wastes. POWER anaerobic filtration is a leading-edge technology specifically developed to biologically recover nutrients and energy from organic waste streams and produce an effluent which meets discharge permit requirements.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The current need for this technology is local, national, and international. The beneficiaries of this technology will be both the people and the environment anywhere in the world where problems of food, fertilizer, and energy shortages are currently in conflict with the preservation of environmental quality. The direct benefits include enhanced and expanded waste water capacity, creation of new jobs, and revenue from by-products and water quality improvement.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to determine the applicability of anaerobic digestion to convert organic waste materials to energy in the form of biogas, thereby reducing the amount of organic matter for disposal. The goal will go beyond the testing of waste materials in the digester and proceed with a program to compare the microbiological loading of rivers, where known environmental pollution is measurable, and where the total bacterial concentration in the rivers could be determined in real-time with a bioprobe. Several demonstration tests have been conducted on municipal solid waste, municipal sludge, poultry mortality and poultry litter. These demonstrations have validated the applicability of this technology to a waste stream formulated to reduce measurable river and stream pollution.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal year 1998 was \$360,000; fiscal year 1999 was \$250,000; and fiscal year 2000 was \$425,000. A total of \$1,035,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-Federal funds are not being expended.

Question. Where is this work being carried out?

Answer. Research is conducted at Moorefield, West Virginia and West Virginia State College, Charleston, West Virginia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives is June 30, 2000. These objectives are within the original schedule. The additional objectives should be completed by June 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An on-site evaluation of the project was conducted in January 2000. The pilot scale digester has been operating continuously since 1995, treating a variety of municipal and agricultural wastes. In 1999 it has primarily been used to treat poultry litter and poultry mortalities. The components of the primary digester are: mix tank, holding tank, grit removal trap, feed tank, insulated digester with mixing capability, screen separator for the effluent, biogas treatment to remove impurities, engine unit that runs on biogas, and a computer that controls the mixing and feeding of the digester. In June 1999 an anaerobic filtration unit was added to further treat the effluent of the primary digester. The anaerobic filtration unit operates at approximately 100 degrees Fahrenheit, while the primary digester operates at 130 degrees Fahrenheit. The anaerobic filtration unit is filled with pieces of plastic pipe to provide additional surface area for the bacteria to grow upon and thereby converting more of the organics into biogas. Data on treatment efficiencies for both digesters have been collected. The samples collected are analyzed at the laboratories of the West Virginia Department of Agriculture in Moorefield, WV. The typical analyses consists of: total solids, volatile solids, volatile fatty acids, total kjeldahl nitrogen, phosphorus, pH, and fecal coliform. The treated effluent is applied daily to nearby pasture land. The separated solids are collected and sent to West Virginia State College for use in field studies to determine plant growth response to the nutrients.

NATIONAL ALTERNATIVE FUELS LABORATORY

Question. Please provide a description of the research that has been funded under the National Alternative Fuels Laboratory (NAFL) grant.

Answer. Through a nationally-marketed collaboration program in which the NAFL matches about half of its USDA funding with nonfederal money to work on industry-relevant research, NAFL staff have (1) developed a U.S. Federal Aviation Administration-certified lead-free ethanol- and biodiesel-containing alternative to leaded aviation gasoline that should be commercially available at Midwest airports by March 2000, (2) resolved ethanol-in-gasoline performance and environmental issues to accelerate the use of ethanol, (3) initiated new biomass fuel developments including a process to produce butanol—a high octane gasoline additive that helps reduce automobile evaporative and tailpipe emissions—from agricultural resources, (4) initiated and coordinated the 27-member Red River Valley Clean Cities Coalition to increase the number of alternative fuel vehicles in regional public and private fleets, and (5) built E85 refueling sites in North Dakota.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. As stated by former CIA director R. James Woolsey, our nation needs to develop commercially viable alternatives to fossil fuels to ensure energy security, improve air quality, and provide employment. It is crucial to national security and economic development that these new fuels are accurately represented in the marketplace and given an opportunity to compete fairly with traditional fossil fuels. The NAFL provides unbiased scientific data on fuel performance and environmental effects. Regional need for the research derives from the need to support regional agriculture and associated industries through (1) development of new biomass fuel industries based on new crops and conventional crop residues and (2) development of economic uses for agricultural co-products.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The primary original goal was to develop a database of at-the-pump-sampled conventional, reformulated, and alternative transportation fuels sold in the upper Midwest and throughout the U.S. to enable comparison of current and historical fuels on the basis of chemical and physical properties. This fuels database is being expanded to include how gasoline chemistry affects air quality and fuel performance. Another original goal was to provide information on conversion of crop residues, agriculture processing wastes, high-cellulose-content municipal wastes, and other biomass materials to alternative fuels. The NAFL program supported North Dakota's first two public E85 refueling sites, initiated an ongoing industry-supported effort to develop and build a new ag co-product-to-lactic acid plant in the Grand Forks region—lactic acid is a building block for new bio-based polymers—helped resolve ethanol blend evaporative emissions issues and E85 engine cold-start problems, and initiated an ongoing industry collaboration to demonstrate the viability of producing and utilizing biomass-based butanol, a clean-burning gasoline and diesel fuel additive.

Question. How long has this work been underway, and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The NAFL work began in fiscal year 1991 and was, in part, sponsored by this grant. USDA appropriations in fiscal year 1991 through fiscal year 1993 were \$250,000 per year. Later awards were \$235,000 in fiscal year 1994, \$204,000 in fiscal year 1995, and \$218,000 per year in fiscal years 1996 through 2000. A total of \$2,279,000 has been appropriated over 10 years.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. To date in fiscal year 1999, \$85,000 in nonfederal collaborative funding has been secured from the American Coalition for Ethanol, the South Dakota Corn Utilization Council, and the American Lung Association of Minnesota. A total of \$1,160,000 in nonfederal funds has been secured for performance of NAFL program objectives over the duration of this grant. During fiscal year 1991 through fiscal year 1993, nonfederal funding from the State of Illinois totaled \$630,000. For fiscal year 1994, nonfederal funding of \$105,000 was secured from the American Corn Growers' Association, the Renewable Fuels Association, and others. For fiscal years 1995, 1996, 1997, and 1998, nonfederal funding totals of \$50,000, \$60,000, \$140,000, and \$90,000, respectively, were secured from corn grower organizations, state agriculture departments, alternative fuels technology companies, and regional economic development agencies.

Question. Where is this work being carried out?

Answer. The work is performed at the University of North Dakota Energy & Environmental Research Center—EERC—in Grand Forks. The EERC is a research, development, demonstration, and commercialization facility that employs about 200 scientists, engineers, and support personnel.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original objectives was April 30, 1992. The objectives were met. The work was then expanded to include partnerships with industry and agriculture. The NAFL has been established as a center of expertise for development and demonstration of bio-based fuels, investigating fuel chemistry effects on engine performance and air quality, dissemination of accurate and objective information regarding ethanol in gasoline, and ethanol feedstock assessment and process development. Additional tasks include commercializing an ethanol-based aviation gasoline, implementing industry collaborations to produce lactic acid and butanol from regional agricultural resources, and administering the Red River Valley Clean Cities Coalition. These tasks should be completed by 2002.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. In June 1998, the USDA conducted an on-site evaluation, and the NAFL program was given a very favorable review. The program continues to be a model for federal-private sector collaborations. Personnel have continued to meet or exceed program objectives detailed at the initiation of each annual performance period.

ANIMAL WASTE MANAGEMENT, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Animal Waste Management, Oklahoma grant.

Answer. This research project is designed to develop sustainable, environmentally safe, and ecologically-sound best management principles and practices for beneficial animal waste applications for "High Plains Agriculture" in support of rural economic development through a Federal-state-local partnership. Emphasis will be placed on the rapidly expanding hog industry in the semiarid region, but information gained will also be applicable to the beef and dairy industries which play major roles in agriculture production in the region. .

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Oklahoma Panhandle region and contiguous counties in the states of Colorado, Kansas, New Mexico and Texas generated \$2.9 billion in sales of agricultural products in 1997. The Oklahoma Panhandle is the most productive agricultural region in the state with agricultural receipts in excess of \$937 million, which represents 31 percent of the receipts in the region. The majority of sales are related to livestock production and the rapid expansion of the hog industry in this semiarid region has only strengthened that position. Oklahoma has moved to 9th in position in the U.S. for swine sales and Texas County, has risen to 3rd nationally with nearly \$200 million in swine sales from a position of 645th in 1992. The rapidly expanding swine industry was projected to add \$650 million in pork and value added products in Oklahoma in 1997 with the slaughter and processing of over 4 million hogs per year. The semiarid agro-ecosystem is unique with climatic conditions consisting of low rainfall that promotes both dryland and irrigated agricultural practices; extremes in high and low temperatures; soils characterized with alkaline pH, low in organic matter, and high in calcium carbonate. This unique agro-ecosystem makes information gained from more humid environments inapplicable.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop best management practices that will protect ground water supplies from pollution of nutrients, salts, and pathogens; maintain air quality; and minimize odors derived from the entire hog-house, lagoon, land-application, soil-cropping and or rangeland production system, thus maintaining the quality of life in the rural sector. Field work has been initiated and initial work shows a positive response to animal waste applications. Initial studies of ammonia loss from applications indicate there can be significant losses following land applications.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal years 1998, 1999 and 2000 is \$250,000 per year. A total of \$750,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year 2000?

Answer. Non-federal funding from state and industry totals \$659,000.

Question. Where is this work being carried out?

Answer. This work has been initiated at The Oklahoma Panhandle Research and Extension Center located in Goodwell, Oklahoma. Further work will continue to be done at this site. The Center will provide the land area and a portion of the facilities and equipment necessary to conduct the major portion of the study. Other study sites have developed on private land in cooperation with swine operations in the panhandle region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was February 29, 2000. To document the results for these objectives more than one growing season will be needed. Completion of these objectives and additional objectives related to these will be February 28, 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was evaluated at the end of December 1999 when the summary report of the 1998-99 accomplishments was submitted. To date seven proceedings or abstracts have been published in national or regional forums. Results to date indicate: (1) Significant amounts of ammonia will be volatilized, lost as a gas, almost immediately following effluent application to bare soils, (2) Swine effluent applications to corn, sorghum and forages demonstrate that it is an acceptable method to supply nutrients for crop production, and (3) There is a significant increase in soil phosphorus levels from application of swine lagoon sludge to soil. This and other important technology was transferred at the High Plains Animal Water

Management Conference, hosted in conjunction with the Oklahoma Panhandle Research and Extension Center, at Goodwell, Oklahoma. Those in attendance included the general public, producers, governmental officials, extension personnel and researchers from Arkansas, Colorado, Kansas, New Mexico, Oklahoma and Texas.

BIOTECHNOLOGY RESEARCH, MISSISSIPPI

Question. Please provide a description of the research that has been done under the Biotechnology Research Grant, Mississippi.

Answer. The Agency has requested Alcorn State University to submit a grant proposal that has not yet been received. This is a new special grant for which there have been no previous awards.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The overall purpose of this project is to establish a Biotechnology Center at Alcorn State University that will focus on plant biotechnology research geared toward small farmers in Mississippi. Emphasis will be placed on improving the productivity and efficiency of crops and plants grown by small farmers in order to improve profitability and ensure long-term viability.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to enhance Alcorn State University's research efforts in biotechnology through genetic improvement research utilizing biotechnology techniques and to improve the livelihood and viability of limited-resource producers in Mississippi and the Southeast.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Preliminary work funded by the State has been underway for approximately six years. This is a new special grant and \$425,000 has been appropriated for fiscal year 2000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. State funds and a \$150,000 grant from the World Bank in fiscal year 1996 have supported this work in previous years.

Question. Where is this work being carried out?

Answer. The research is being conducted at Alcorn State University, Lorman, Mississippi, and at field locations in Preston and Mound Bayou, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator anticipates completing the original objectives of the project in two years. Additional or related objectives have not been specifically identified at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As a new special grant for which a proposal has not yet been received, this project has not yet been evaluated. A merit review panel will be convened to evaluate the project upon receipt of a proposal for fiscal year 2000.

CENTER FOR AGRICULTURE AND RURAL DEVELOPMENT, IOWA

Question. Please provide a description of the research that has been done under the Center for Agriculture and Rural Development program.

Answer. The research monitors the final form and implementation of the Uruguay Round Agreement and evaluates its impacts on global trade and implications for U.S. agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. As the Uruguay Round—UR—Agreement implementation proceeds, researchers will monitor the development of these policy changes and analyze the likely impacts of these decisions with emphasis on obtaining differential impacts for developing economies, developed economies and those in transition. Researchers will also explore possible directions for the next Round or Mini-round of the World Trade Organization.

The original goal is to assess and evaluate various proposals affecting agricultural trade, to provide analytical support to the Office of the U.S. Trade Representative, and to provide information to farmers and agribusiness firms on the competitive implications of trade agreements. Theoretical studies and empirical and descriptive analyses of policy issues and technical problems pertaining to the Uruguay round

of negotiations were completed and provided to negotiators and the agribusiness community. Knowledge developed in this phase is now being used to monitor the effects of the Uruguay Round Agricultural Agreement—URA.

This grant supports six projects focusing on URA and the World Trade Organization—WTO—monitoring and implementation problems; implications of the URA and WTO for Eastern Europe, Baltic, and the Newly Independent States; development of a model to assess the North American Free Trade Agreement and its linkages with the General Agreement on Tariffs and Trade; trade implications of U.S. food and development aid in developing countries; integration of China into world agricultural markets; and special projects as requested for the U.S. Trade Representative's office. Major emphasis is placed on developing and improving international livestock and grain sector models.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2000?

Answer. This research program was initiated in fiscal year 1989. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$750,000; fiscal years 1990 and 1991, \$741,000 per year; fiscal years 1992–1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal year 1995, \$612,000; fiscal year 1996, \$655,000; and fiscal years 1997 through 1999, \$355,000; fiscal year 2000, \$355,000. A total of \$7,124,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: \$111,210 State appropriations and \$175,616 miscellaneous for a total of \$286,826 in 1991; \$113,779 State appropriations and \$173,117 miscellaneous for a total of \$286,896 in 1992; \$120,138 State appropriations and \$164,707 miscellaneous for a total of \$284,845 in 1993; \$161,000 State and \$30,000 miscellaneous for a total of \$191,000 in 1995; \$70,000 State appropriations and \$44,000 miscellaneous for a total of \$114,000 in 1996; \$60,325 in State appropriations and \$61,500 in miscellaneous funds for a total of \$121,825 in 1997; and \$72,000 in State appropriations and \$75,000 in miscellaneous funds for a total of \$147,000 in 1999.

Question. Where is the work being carried out?

Answer. The research program is carried out by the Center for Agriculture and Rural Development at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the project envisioned the development of models capable of providing guidance to policymakers, researchers, and farmers and others of the impact of agricultural trade proposals on the U.S. agricultural sector. As such the objectives are on-going.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluations; however, each annual proposal is peer reviewed for relevance and scientific merit. Also, an informal evaluation of this project takes place as a part of each annual project review and approval process.

CENTER FOR INNOVATIVE FOOD TECHNOLOGY, OHIO

Question. Please provide a description of the research that has been funded under the Center for Innovative Food Technology Grant.

Answer. Funds from the fiscal year 1999 grant are supporting research projects to (1) develop techniques for applying powdered material onto snack foods and shredded cheeses, (2) assess the usefulness of artificial intelligence to predict finished product quality from incoming ingredient attributes in vegetable and meat processing applications, (3) develop methods to convert the waste product whey from dairy operations into a saleable product, (4) refine the techniques for producing extended shelf life milk products in PET containers, and (5) evaluate applications for real time process control in the milling industry using Near Infrared reflectance systems. Fiscal year 1999 funds are supporting research from March 1999 through February 29, 2000. A proposal in support of the fiscal year 2000 appropriation will be requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the value-added food processing industry is the largest industry in Midwestern states, including Ohio where the industry contributes over \$17 billion to the annual economy. From an economic development

point of view, processing and adding value to crops grown within a region is the largest possible stimulus to that region's total economic product. This program aims to partner with and encourage small and medium sized companies to undertake innovative research that might otherwise not be undertaken due to risk aversion and limited financial resources for research and development in these companies. The principal researcher believes that, although the initial impact of this research will be regional, the recipient organization of this grant is part of a technology transfer network and proactively seeks opportunities to deploy technologies developed through this research to the food industry on a national basis.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of the research was to develop innovative processing techniques to increase food safety and quality or reduce processing costs. The coatings project has developed methods to extend product shelf life while reducing costs, and the neural network project has developed a model for predicting the harvesting time that will optimize product quality and economic return to the grower, processor, and consumer. The dairy project has developed a method that allows fluid milk processors to lower their costs. The milling project has developed methods for improving quality of milled flours by developing improved process control systems.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1995. The project received appropriations of \$181,000 in fiscal years 1995 through 1997, \$281,000 in fiscal year 1998, and \$381,000 each in fiscal years 1999 and 2000. A total of \$1,586,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year 2000?

Answer. In fiscal year 1995, non-federal funds included \$26,000 from state funds and \$70,000 from industry memberships. In fiscal year 1996, non-federal funds included \$26,000 in state funds and \$80,000 in industry funds. In fiscal year 1997, non-federal funds included \$35,000 in state funds and \$95,000 in industry memberships. In 1998, \$35,000 in state funds and \$105,000 in private industry memberships contributed to the support of the project. In 1999, \$62,000 in State of Ohio funds, and \$115,000 from private industry were used to support the project.

Question. Where is this work being carried out?

Answer. Research is being conducted in the laboratories of the Ohio State University and at various participating companies in Ohio, Illinois, and Pennsylvania.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal investigator anticipates that some projects supported by the fiscal year 2000 grant will be completed by February 28, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The last review of the proposal was conducted on April 15, 1999. At that time, the agency science specialist believed that the projects addressed issues relevant to food manufacturing, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

CENTER FOR NORTH AMERICAN STUDIES, TEXAS

Question. Please provide a description of the research that has been done under the Center for North American Studies program.

Answer. The purpose of this grant is to develop linkages with educational and other institutions in Mexico and Canada in order to share data and faculty, conduct research identifying trade opportunities and marketing problems, conduct policy analyses, and develop a broad range of training programs preparing agricultural firms for international marketing opportunities. The research proposal was peer reviewed at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The program director believes that citizens of the United States, Mexico and Canada have some similar concerns about the impact of the North American Free Trade Agreement, and that new, innovative approaches involving international cooperation are needed to assess and evaluate these issues. Research and training

are needed to provide information to evaluate alternatives for expanding U.S. exports and to resolve potential social, economic, and environmental conflicts.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The goal is to promote strong agricultural ties among the three North American countries, foster greater cooperation in resolving critical agricultural issues of common interest, and ensure the continued competitiveness of U.S. agriculture. Recent research results include an investigation of technical trade barriers; a study of the impact of El Niño and La Niña on fruit and vegetable production; impacts of the North American Free Trade Agreement on livestock, meat, feed, fruit and vegetable trade; a range management watershed study along both sides of the Rio Grande River; and competitive response of Texas food marketers to the Agreement. A new publication series was started in June 1998, and four research papers were published. Recent training and education programs include a televideo conference on International Marketing Opportunities for the 21st Century with participants in five states; and 37 seminars/workshops for producers and agribusinesses to increase the international capacity of U.S. firms was attended by over 2,600 people in 1998. Collaborative work included a workshop on International Strategic Alliances workshop developed jointly with a Mexican and a Canadian university; an expanded database on Mexican agriculture; and a video conference for a Mexican agribusiness audience.

Question. How long has this work been underway, and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Work supported by this grant began with an appropriation of \$94,000 in fiscal year 1994; \$81,000 in 1995; and \$87,000 for 1996 through 2000. A total of \$610,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds are derived from the State of Texas for salaries and benefits. Amounts provided for this grant are as follows: \$39,000 State appropriations in fiscal year 1994; \$54,000 in 1995; \$60,000 per year in 1996 and 1997; \$84,500 in 1998; and \$80,000 in 1999.

Question. Where is the work being carried out?

Answer. The program is being carried out at Texas A&M University through the Texas Agricultural Experiment Station in collaboration with other segments of the Texas A&M University System and Louisiana State University Agricultural Center.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 12 months. The current phase of the program will be completed in the year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. CSREES performed a merit review of the project in January 1999 and concluded that "the project has sound objectives and procedures for helping U.S. firms to be successful in North American markets for agricultural products, thereby achieving CSREES goals of a highly competitive agricultural production system and enhanced economic opportunity for Americans." The principal investigator is well recognized for his leadership in the area of international trade.

CLIMATE CHANGE RESEARCH, FLORIDA

Question. Please provide a description of the research that has been funded under the Climate Change Research grant.

Answer. CSREES requested the University to submit a grant proposal which has not yet been received. Funds have not previously been appropriated for this research.

Question. According to the research proposal, or the principal investigator, what is the national, regional or local need for this research?

Answer. The need for this research will be described upon receipt of a formal project proposal.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research is not yet underway.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 with an appropriation of \$170,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Information on non-federal funds and sources is not available.

Question. Where is this work being carried out?

Answer. In the absence of a research proposal, location of the research can not be determined.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This will be determined upon receipt of an acceptable research proposal.

COTTON RESEARCH, TEXAS

Question. Please provide a description of the research that has been funded under the Cotton Research, Texas, grant.

Answer. CSREES has requested the university to submit a grant proposal for fiscal year 2000, that has not yet been received. Texas A&M and Texas Tech Universities have developed an integrated research effort to address cotton production issues using a comprehensive approach in order to strengthen the cotton industry in the high plains. Priority productions and marketing issues will be studied.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The proposed project is expected to help support a broad based program to address priority research needs of cotton grown on the Texas high plain. The specific issues will include production, processing, marketing, and utilization.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to improve cotton production in West Texas and expand the demand for cotton grown in the area.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal years 1998–1999 is \$200,000 per year, and \$170,000 for fiscal year 2000. A total of \$570,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds are from the State of Texas and provide salaries and benefits for experiment station employees. Funds supporting the project were \$156,000 in fiscal year 1998 and \$149,000 in 1999.

Question. Where is this work being carried out?

Answer. The work will be conducted at the Texas A&M University Research and Extension Center, Lubbock and Texas Technical University Campus.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate the developmental phase of this project, which will establish priorities and provide planning for a long-term comprehensive program, should be completed in fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project received a comprehensive review and evaluation at its inspection by Texas A&M and Texas Tech Universities and the agency National Program Leader. It will be evaluated annually throughout its lifetime.

CURRICULUM DEVELOPMENT/MISSISSIPPI VALLEY STATE UNIVERSITY

Question. Please provide a description of the research that has been funded under the Curriculum Development and Strengthening-Mississippi Valley State University grant.

Answer. Funds were used to strengthen academic programs, including accreditation and re-accreditation. Of the ten programs eligible for accreditation, nine have been accredited. Assessment of the criteria has begun for the remaining eligible program. Academic programs have been broadened to include more agriculture-related courses consistent with the needs of students from the Mississippi Delta, students from other parts of the State, as well as out-of-state students. Curriculum additions have had a positive impact on student enrollment. Courses continue to be modified to reflect the needs of graduates as well as employers in the Mississippi Delta, with particular emphasis on those areas that employers have the greatest need. The funds continue to provide enhancements related to other program and administra-

tive support areas that positively impact program delivery and administration at Mississippi Valley State University.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this proposal?

Answer. The primary need for this project is to satisfy a local need. The need is for strengthening university capacity and curriculum development at Mississippi Valley State University. Degree programs in Accounting, Mass Communications and Public Administration have been added since the 1988 plan was developed. The Criminal Justice program has been developed into a departmental unit with social work in order to provide for improved administration and academic counseling. A master's program in Criminal Justice is now offered. The baccalaureate major in chemistry and the master's program in Elementary Education have been reinstated.

Question. What was the original goal of this project and what has been accomplished to date?

Answer. The original goal was to provide funding to strengthen the academic programs of the university. This funding has strengthened the fiscal and academic areas of the university. The University's cash flow and cash availability have remained steady and sufficient all year long. Student recruitment has improved to show a positive ratio between applications received and students admitted. Approximately one half of the applicants are enrolled. Increased quality of instruction and programs have benefitted students. This is reflected in the higher graduation rate, increased student enrollment, enriched faculty and improved community relationship.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. This program was initiated in fiscal year 1987. Grants have been awarded from funds appropriated as follows: fiscal year 1987, \$750,000; fiscal years 1988 and 1989, \$625,000 per year; fiscal year 1990, \$617,000; fiscal year 1991, \$642,000; fiscal years 1992 and 1993, \$668,000 per year; fiscal year 1994, \$593,000; fiscal year 1995, \$544,000; fiscal years 1996–2000, \$583,000 per year. A total of \$8,647,000 was appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Mississippi Valley State University received State and private funding during the period of this grant. The State figures provided here are for enhancement funds gained above the University's standard formula generated funds. The sources and amounts are as listed:

SOURCE

Fiscal year	State	Private	Total
1997		\$168,640	\$168,640
1988		186,036	186,036
1989	\$68,658	190,258	258,916
1990	207,879	369,358	577,237
1991	333,263	337,700	670,963
1992	349,427	470,220	819,647
1993	35,750	358,680	394,430
1994	590,890	568,970	1,159,860
1995	841,654	530,300	1,371,954
1996	1,197,917	590,824	1,788,741
1997	309,717	755,629	1,065,346
1998	313,738	538,423	852,161
1999	909,419	389,812	1,299,231

Question. Where is this work being carried out?

Answer. These funds are intended to strengthen programs at Mississippi Valley State University. The program has been carried out on the campus at Itta Bena and at off-campus sites in Anguilla and Greenville and the Greenwood Center since the Spring Semester of 1996.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives completion date was June 1992, and the primary objective of erasing the financial deficit was accomplished at that time. The univer-

sity has been operating on a sound financial basis as of July 1993. Academic program strengthening has progressed very well. The objectives of the current grant will be completed by September 30, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The program staff in the agency conducts an annual evaluation of reports submitted by the principal investigator. The evaluation reflects steady enhancement in curriculum development and improved support for strengthening administrative units. The Department of Education doubled efforts to seek two new programs at the undergraduate level in the areas of Special Education and Early Childhood. The department enhanced the faculty through two fronts—technology upgrade and scholarship. A number of technology workshops were provided for faculty in collaboration with the Institute for Effective Teaching Practice. These workshops were aimed at helping faculty to incorporate technology into their teaching. In pursuance of the National Council of Accreditation of Teacher Education—NCATE—accreditation visit in year 2000, the department undertook a series of activities aimed at enhancing the teacher education programs as well as ensuring reaccreditation. These activities included: attending American Accreditation of Colleges for Teacher Education—AACTE—and NCATE national meetings, revisiting and reassessing curricular and programmatic requirements. Core Curriculum has received special attention during the year. Annual revisions were completed for all core courses in each discipline. Strong emphasis was placed on Writing Across the Curriculum. The University Testing Center has undergone significant growth. Staff development has continued in technology utilization skills. Since more standardized tests are becoming computer-based, the Center has developed a plan for increased computer testing.

DATA INFORMATION SYSTEM

Question. Please provide a description of system development activities that have been funded.

Answer. CSREES continues to fund activities under contract with a major information technology firm for the design and development of the Research, Education, and Economics Information System—REEIS. Previously funded tasks that have been completed include the conduct of an inventory of databases targeted for inclusion in REEIS; a comprehensive assessment of information needs and practices within the Research, Education, and Economics mission agencies and State partner institutions; design and development of a Web accessible catalog of databases identified in the inventory; a comprehensive review of state-of-the-art information technology systems available for use in developing the system; and design and development of a REEIS proof-of-concept prototype that is currently undergoing critical review and evaluation. An additional task was completed under a separate contract that provided for an outside expert to conduct a review and evaluation of Web interfaces to the REEIS Database Catalog. Also, a cooperative agreement with the University of Arkansas was also established to provide national leadership in coordinating the efforts a National Steering Committee charged with guiding the continuing development of the system. The Committee has met on a regular basis with the next meeting planned for August, 2000. Currently underway, and critical to the development of REEIS, is a comprehensive interagency data modeling effort designed to identify and describe data, data relationships, and sources of data from across the research, extension, education, and statistics domains of the Research, Education, and Economics mission agencies and State partner institutions. This will serve as the basis for the development of alternative system architectures and the population of the REEIS prototype with actual data from selected core databases that are to be included in REEIS. Funding has also been provided under the REEIS initiative for the design and development of an Evaluation and Accountability System for Extension—EASE—which has been targeted for linkage in REEIS.

Question. What is the national, regional or local need for this activity?

Answer. At present, USDA's Research, Education, and Economics—REE—mission agencies and their university partners lack a central, integrated, user-friendly electronic information system capable of providing access to thousands of programs and projects for which they are responsible that focus on food, agriculture, natural resources, and rural development. Such an information system is increasingly needed to enable the Department and its partners to readily conduct baseline and ongoing assessments and evaluations of research, education, extension, and economic programs and projects. In recent years, this need has become more urgent for several reasons. First, the United States needs a visionary publicly funded research and development program to produce essential knowledge and innovations for meeting growing competition in a global market—which is largely attributable to the ex-

panding research and development efforts of foreign nations. Second, a comprehensive information system is needed to serve as a primary reference source for development of new research and education programs on such diverse issues as increasing productivity in agriculture and processing, improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Third, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds to provide a basis for redirecting funds to higher priority issues. Fourth, the Government Performance and Results Act—GPRA—has imposed reporting demands which current databases and decentralized information systems are not prepared to adequately satisfy. It is also envisioned that REEIS will play a key role in implementation of the Agricultural Research, Extension, and Education Reform Act—AREERA—of 1998. In this regard, REEIS would be well-positioned to:

- Provide linkages for decision making among REE agencies,
- Enable consistent reporting on identical or similar issues,
- Provide the public with understanding of the role and mission of REE agencies,
- Expand REE's outreach to a broader base of constituencies,
- Provide a better vehicle to facilitate interaction among REE agencies and their university partners,
- Link commonalities of research, extension, and teaching projects and programs through a single interface, and
- Foster global interactions.

Additionally, REEIS will serve to expand the Federal partnership by facilitating coalition-building with other Federal agencies.

Question. What was the original goal of this initiative and what has been accomplished to date?

Answer. The original goal of this initiative was to develop an information system that provides real-time tracking of research, extension and education projects and programs; has the capability to communicate vertically between field, State and Federal locations; enables the REE agencies and their partners to conduct rapid and comprehensive policy assessments and program evaluation analysis; facilitates assessment of technologies and practices employed in extension, education, economics, and research activities at the field and/or regional levels; provides clear and transparent public access to relevant parts of the information; and provides information management tools to enhance the timeliness and accuracy of REE-wide responses to inquiries about program objectives and expenditures.

Since launching of the REEIS initiative, substantial system planning and development work has been completed. Work accomplished under a series of multi-task contracts with a private sector information technology firm was instrumental in meeting major milestones considered to be critical components and a prerequisite to the design, development, and implementation of REEIS. Major tasks included the conduct of a comprehensive strategic information audit of information practices and needs within the REE agencies and partner institutions; the identification and inventory of major research, extension, education, and economics/statistics databases maintained or supported by the REE mission agencies; the design, development, and preparation of the REEIS Database Catalog Prototype that affords Web access to the inventory of 38 databases initially identified as candidates for inclusion in REEIS; the design and evaluation of the Web interface to the REEIS Database Catalog; a comprehensive review of state-of-the-art information technology systems available for use in developing REEIS; and the design and development of a Web accessible REEIS proof-of-concept prototype.

Plans in fiscal year 2000 include the development and assessment of alternative system architectures, development and testing of a REEIS prototype populated with actual data from selected core databases, updating and maintenance of the Information Systems Technology database and the REEIS Database Catalog, and initial implementation and operation of the REEIS system, including training of REEIS users and technical system operators.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Congress first appropriated \$0.4 million for REEIS in fiscal year 1997 to begin planning its design and development. The fiscal year 1998 appropriation was \$800,000. This was followed by appropriations of \$1.0 million in fiscal year 1999 and \$2.0 million in fiscal year 2000. A total of \$2.25 million is requested in fiscal year 2001.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funding does not apply at this time.

Question. Where is this work being carried out?

Answer. Leadership responsibility for REEIS resides within the CSREES Science and Education Resources Development unit. This provides for effective linkage within the REEIS platform of the Current Research Information System, the Food and Agricultural Education Information System, and other appropriate research, extension, education, and statistics databases. The REEIS leadership works closely with the four Research, Education, and Economics mission agencies and the university system to ensure that primary users as well as key stakeholders are involved in the REEIS development process. A sizeable effort continues under contract with a major private sector information technology firm for the design, development, testing, and implementation of REEIS. One staff person assigned full time to manage and coordinate agency contracting activities currently serves as the REEIS technical information program manager. Plans are to recruit for the positions of a REEIS Director and a support staff person in fiscal year 2000, followed by computer and technical information specialists in future years to operate and maintain the system.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that REEIS will become operational during fiscal year 2000. The requested increase for fiscal year 2001 is required to achieve broad implementation. Included is the need to conduct ongoing, iterative needs assessments within the mission area and with its partners to align information system products and services with strategic information requirements necessary for meeting agency mission and goals and satisfying GPRA reporting requirements. Updating and maintenance of technical system assessments, conducting ongoing information technology evaluations, and enhancements of REEIS user interfaces will be essential to ensure currency and responsiveness over the life of the system. The additional funding will allow also for the enlistment, training, and retention of essential personnel and staff and provide for the enhancement of several legacy systems and databases to permit effective inclusion in REEIS.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Progress and accomplishments stemming from the REEIS initiative have undergone and continue to undergo review and evaluation by the REE mission agencies, the REEIS National Steering Committee, our State partner institutions, and outside sources. The most recent evaluation of the project was conducted in December, 1999 by a Department-wide information technology review board which approved the project for continued support as a mission-critical system. Factors considered in the evaluation included REEIS system objectives, its support of mission area strategic goals, strategies for managing risk, the degree of return on investment, and the level of support for the Secretary's priorities. An earlier evaluation of this project was conducted at the June, 1999 meeting of the REEIS National Steering Committee, comprised of representatives of the REE mission agencies, university partners, and key stakeholders. Committee members were presented the opportunity to critique the REEIS proof-of-concept prototype in terms of its potential for responding to primary users, satisfying primary uses, and meeting priority system requirements. An interagency REEIS team is in the process of performing technical evaluations of a series of successive iterations of the prototype. In May, 1999 a two-day REEIS retreat was held to review project status and make recommendations as to future tasks for the development and implementation of the system. Based on participant recommendations, a comprehensive interagency data modeling effort is underway to identify and describe in detail data and sources of data that are to be included in REEIS and which reside within the research, extension, education, and statistics domains of the Research, Education, and Economics mission agencies and their State partner institutions. A review by REE agency policy officials, budget and GPRA staff, national program leaders, and senior managers of the final set of system requirements resulting from the needs assessment was completed in February, 1999.

GEOGRAPHIC INFORMATION SYSTEMS

Question. Please provide a description of the research that has been funded under the geographic information system program.

Answer. The purpose of this program is to promote collaborative and innovative transfer of systems technologies to state and local governments and others in the public and private sectors. The current program is being carried out by the non-profit National Consortium for Rural Geospatial Innovations in America—NCRGI. The directors and participants of the Consortium are the sub-contractors who are carrying out the program by working on agro-environmental problems at the national,

regional, state and neighborhood levels. They represent a wide spectrum of site-based expertise including six academic institutions, one regional development authority, and the Southwest Indian Polytechnic Institute site added by Congress in 1997. This institutional arrangement has helped fill a role in linking some of the otherwise disparate efforts of agencies and academic institutions to apply them in the now seven regions of the country.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that local officials are facing increasingly complex land management issues that require rapid access to resource knowledge and databases for decision making. This project is needed to transfer relevant technology to state and local governments, including Native American communities whose limited training budgets and sometimes-isolated location, make it difficult to use the latest technology. The technology developed by the Consortium is useful in improving the management of natural resources. While concentrating on issues related to agriculture, the independent, non-profit nature of the National Consortium for Rural Geospatial Innovations in America facilitates linkages across disciplinary and institutional barriers, and makes it possible to use analyses at the state and local levels which were initiated at the federal level. While the early phases of the geographic information system concentrated on building information systems related to rural, physical, and natural resources, the current challenge is to integrate human economic, social and demographic information in order to better understand the relationship of human communities to the landscape. At the other end of the spatial scale, the role of the public sector in geographic information system-based precision farming technologies, data capture, and information synthesis is the subject of a current study group.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this work was to serve as a pilot project for the transfer of geographic information systems technology related to natural resources to local governments.

The Consortium has carried out this function. Economic and biological data are being presented in various formats to state and local governments and individuals. Through its 7 regionally distributed sites, including the new Southwest Indian Polytechnic Institute site in New Mexico, the Consortium has implemented a variety of geographic systems technologies to local governments—both rural and urban. These include the recent expansion of transfer of geographic information technology through various distance education and Internet technologies. It is anticipated that the fiscal year 2000 grant will support work under this program through March 2001. The proposal for this work in 1999 has been received and reviewed.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$747,000; fiscal years 1992 and 1993, \$1,000,000 per year; fiscal year 1994, \$1,011,000; fiscal year 1995, \$877,000; fiscal year 1996, \$939,000; fiscal years 1997 through 1999, \$844,000 per year; and fiscal year 2000, \$850,000. A total of \$9,450,000 has been appropriated since the beginning of the program.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. For fiscal year 1990 through fiscal year 1997, to date, the work in this program had \$5,009,834 in non-federal support. In fiscal year 1990, non-federal support was \$714,940 consisting of equipment, databases, and other miscellaneous contributions from foundations, city, and state governments. In fiscal year 1991, non-federal support was \$25,000 from county government. In fiscal year 1992, non-federal support was \$366,016 from county government, computer companies, and state governments consisting of equipment, software, facilities, and miscellaneous support. In fiscal year 1993, non-Federal support was \$713,900 consisting of financial and miscellaneous support from foundations, county and state governments. In fiscal year 1994, the non-federal support was \$713,643. In fiscal year 1995, the non-federal support was \$987,000. In fiscal year 1996, it was \$567,173. It was \$456,582 in fiscal year 1997. In 1998 and 1999, non-federal dollars exceeded \$1,000,000, and it is anticipated that they will again in 2000.

Question. Where is this work being carried out?

Answer. The National Consortium for Rural Geospatial Innovations in America is administratively centered at the University of Wisconsin-Madison. The University of Wisconsin-Madison, functioning as the Great Lakes center, continues a long history of involvement in the application of this technology at the local level with

strong focus on soils/land-use and the institutional aspects of the integration of a new technology. The southeastern center in Valdosta, Georgia, in affiliation with the South Georgia Regional Development Center, has developed a comprehensive plan of the City of Adel as a model for other urban centers in the ten-county region. The southwestern center, in Fayetteville, Arkansas serves several local governments through its training facilities at the University of Arkansas, basing its technical approach on expertise and past experiences with the Federally developed system known as GRASS. They have developed pilot projects for some local jurisdictions and state level databases, which they have provided online. Central Washington University focuses on training for state planning and on three local governments and the Yakima Nation in the Yakima watershed. The north central center in Grand Forks, North Dakota, in affiliation with the University of North Dakota, focuses on relating real time weather data to other spatial attributes. The University of Wisconsin-Madison, functioning as the Great Lakes and Administrative center, continues a long history of involvement in the application of this technology at the local level with strong focus on soils/land-use and the institutional aspects of the integration of a new technology. Native American communities are being reached through the newly-developed Southwestern Indian Polytechnic Institute facilities in Albuquerque, New Mexico. Two new sites were added in fiscal year 99. They are Pennsylvania State University and the GIS Consortium at Wilkes University and Kings College in Pennsylvania. These two sites have replaced the NCRI-Chesapeake site and will be involved in providing GIS solutions to environmental problems that local government and regional planning commissions are dealing with in the Upper Susquehanna/Lackawanna Watershed.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives to build institutional frameworks for developing and disseminating geographic and related information to local decisionmakers is constantly evolving. Each site has developed approaches to addressing regional needs for modern technologies, and many innovative applications have been implemented. Technologies, including Internet-based educational and information exchange, have been developed to respond to the Consortium's customers. The Consortium has been asked to include these new technologies in order to bring its primarily rural users into new eras of public education and information management.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Proposals have been internally reviewed by Departmental personnel in different agencies. Beginning in 1995, the program has also been externally reviewed by local advisory committees and qualified professionals inside and outside of government. Their various comments and suggestions are sent to the agency and have helped with the favorable merit reviews.

GULF COAST SHRIMP AQUACULTURE

Question. Please provide a description of the research that has been funded under the Gulf Coast Shrimp Aquaculture grant.

Answer. The agency requested that the Oceanic Institute, and the Gulf Coast Research Laboratory submit a grant proposal that is currently under review. Recent research has addressed three major areas of research including: stock improvement; disease control; and sustainable culture technology. A number of important viral pathogens of marine shrimp have been identified and protocols have been established for the detection of viral pathogens that have decimated the shrimp industry world-wide. Improved viral detection techniques have led to the development of specific pathogen-free stocks of commercial importance. Researchers have responded rapidly to the multiple viral diseases that have significantly impacted the United States shrimp farming industry. Researchers will intensify efforts aimed at preventing new introductions of exotic viral pathogens both in commercial and wild shrimp stocks.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher indicates that there is potential to enhance domestic production of marine shrimp through aquaculture in order to reduce the approximately \$3 billion annual trade deficit in marine shrimp. Research continues to improve the supply of high quality seed, improve shrimp health management, improve biosecurity and environmental protection, and enhance production efficiency in shrimp culture systems. The United States has the opportunity to become a

major exporter of shrimp seed and broodstock, disease control and biosecurity technologies, products, and services.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to increase domestic production of marine shrimp through aquaculture. Researchers have responded to severe disease outbreaks caused by the introduction of exotic viral pathogens into United States shrimp farms and recent studies have focused on the prevention and detection of shrimp viral diseases which have decimated domestic commercial production. Production of specific-pathogen free and specific-pathogen resistant seed and broodstock, biosecure and environmentally compatible production systems, and improved feeds and feeding strategies for broodstock maturation and larval production will all enhance United States production technology while preventing the introduction of exotic pathogens into commercial and wild shrimp stocks. Diagnostic and disinfection techniques for a number of important viral pathogens have been developed. In addition, scientists are developing high-health genetically improved stocks and evaluating these animals under commercial production conditions.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$1,050,000; fiscal year 1986, \$1,236,000; fiscal year 1987, \$2,026,000; fiscal year 1988, \$2,236,000; fiscal year 1989, \$2,736,000; fiscal year 1990, \$3,195,000; fiscal year 1991, \$3,365,000; and fiscal years 1992–1993, \$3,500,000 per year; fiscal year 1994, \$3,290,000; and fiscal year 1995, \$2,852,000; fiscal year 1996, \$3,054,000; and fiscal years 1997 through 2000, \$3,354,000. A total of \$45,456,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The United States Marine Shrimp Farming Consortium estimates that non-federal funding for this program approaches 50 percent of the Federal funding for fiscal years 1991–2000. The source of non-federal funding is primarily from state and miscellaneous sources.

Question. Where is this work being carried out?

Answer. The work is being carried out through grants awarded to the Oceanic Institute in Hawaii and the Gulf Coast Research Laboratory in Mississippi. Research is also conducted through subcontracts with Tufts University, the Waddell Mariculture Center in South Carolina, the Texas Agricultural Experiment Station, and the University of Arizona.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original specific research objectives was 1987. The original specific objectives have been met, however new challenges to the United States farm-raised shrimp industry continue the need for shrimp culture research. Researchers anticipate that the specific research outlined in the current proposal will be completed in fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project proposal is reviewed annually by the agency's Program Managers and the Program Specialist and is consistent with United States Department of Agriculture guidelines. Participating institutions are required to submit a detailed accomplishment report with the submission of each new grant proposal. The 1999 review of the program found that the progress during the last twelve months has been well documented and the proposal is well written. Research objectives are being met and the proposed research is consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development. Facilities and expertise are very good and the close linkages between the researchers involved and the United States shrimp farming industry has greatly enhanced the commercialization of the research findings from this project. The United States Marine Shrimp Farming Project continues to address important research needs of the industry and has played a critical role in developing management strategies for protecting both wild and cultured stocks from the introduction of viral pathogens. The agency conducted an on-site review of this program in October, 1999. The agency is awaiting the final report of the review team.

LIVESTOCK MARKETING INFORMATION CENTER, COLORADO

Question. Please provide a description of the research that has been done under the Livestock Marketing Information Center program.

Answer. This is a new project and Colorado State University is submitting its first grant proposal in fiscal year 2000. The project will enhance the ability of the Center to provide objective analyses of livestock markets and make recommendations to livestock producers.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Recent changes in the structure of the livestock industry and in farm legislation have forced producers to pay more attention to market signals. Market prices have become more volatile because of changing domestic and international markets, thereby increasing producers' need for high quality market information and interpretation.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to increase the ability of livestock producers to make good business decisions in a changing global economy.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by the grant begins in fiscal year 2000 with an appropriation of \$170,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The Center includes a consortium of faculty from 22 universities; participating universities contribute about \$170,000 of non-federal funds a year.

Question. Where is this work being carried out?

Answer. The work will be carried at the Livestock Marketing Information Center, Denver, Colorado in cooperation with Colorado State University and 21 other universities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives and duration of the project will be specified in the grant proposal to be submitted in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a brand new project. CSREES will carefully review the proposal when it is received.

MARICULTURE, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Mariculture, North Carolina grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The long-term goal of the project is to develop methods for mass propagation of marine finfish for commercial cultivation and possible stock enhancement. Specific objectives include development of growout technologies from juvenile to marketable stages and broodstock husbandry practices of selected marine species including the southern flounder and the black sea bass.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Principal Investigators forecast an increasing need for the development of aquacultural production systems and methodologies for a variety of marine finfish. Results from this research will have broad application in the identification and development of marine species with commercial potential in the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research program is to develop sustainable aquaculture production systems for marine finfish. Captive mutton snapper were successfully matured and spawned and the resulting larvae reared through the juvenile stages. Juveniles were supplied to commercial and governmental organizations for commercial grow-out trials. Initial results appear promising with good survival rates and excellent feed conversion ratios. Captive-spawned mutton snapper are currently being raised to maturity and methods are being evaluated to control gonadal maturation through temperature and light manipulation and hormone treatment.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal year 1998 was \$150,000, and for fiscal years 1999 and 2000, \$250,000 was made available. A total of \$650,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates that approximately \$115,000 of non-federal funds were provided for this project in fiscal year 1998 and \$61,941 were provided for fiscal year 1999. These funds came primarily from state and private sources.

Question. Where is this work being carried out?

Answer. The research will be conducted at the Center for Marine Science Research at the University of North Carolina at Wilmington.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in fiscal year 1998. The original goals continue to be addressed. The anticipated completion date for the current proposal is fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Program Managers and Program Specialist evaluate the progress of this project on an annual basis and is consistent with United States Department of Agriculture guidelines. The proposal is well-written and the objectives are clearly stated. The methodology and experimental design are sound. The research is relevant and addresses a potential opportunity for the aquaculture industry. Facilities are excellent and have been enhanced through this program. The research team is well-qualified and has the appropriate background. Literature and justifications for research are provided.

NATIONAL CENTER FOR PEANUT COMPETITIVENESS

Question. Please provide a description of the research that has been done under the National Center for Peanut Competitiveness grant.

Answer. The grant supports an interdisciplinary research and education program to enhance the competitiveness of the U.S. peanut industry by examining alternative production systems, developing new products and new markets, and improving product safety.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Peanuts are a very important crop in several southern states. In many counties, peanuts provide more than 50 percent of all crop income. Peanut producers have been major beneficiaries of government income protection programs, but Federal farm and trade policies are changing and producers must become more competitive and market oriented.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project helps peanut producers be more competitive in the global market. Recent results include: economic feasibility analyses of alternative production and risk management practices; a computerized expert system adapted for hand-held computers to help farmers reduce pest control costs; the addition of economic factors to a computerized disease risk management system. The Center attracted some additional funding from other sources to purchase hand-held computers to run the pest management program for a number of producers.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998. Appropriations have been as follows: \$150,000 in 1998; \$300,000 in 1999; and \$300,000 in 2000. Total appropriations to date total \$750,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: in fiscal year 1998, the state of Georgia contributed \$141,181 and the state of Alabama, \$15,000; in 1999, the state of Georgia contributed \$504,354 and the state of Alabama, \$67,553.

Question. Where is this work being carried out?

Answer. The Center is located at the University of Georgia at Griffen and involves cooperators from nearby peanut producing states, such as Auburn University in Alabama.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1998 was for a period of 36 months, however, the need to improve the competitiveness of U.S. peanut growers continues to grow. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in August 1999, when it evaluated the current year's project proposal, and concluded that "the project has sound objectives and procedures for helping the U.S. peanut industry become competitive, thereby contributing to the CSREES goals of a highly competitive agricultural production system and enhanced economic opportunity for Americans." The principal investigator and other faculty named in the proposal are recognized for their leadership in the industry.

PM-10 STUDY, CALIFORNIA AND WASHINGTON

Question. Please provide a description of the research that has been funded under the PM-10 study, California and Washington research grant.

Answer. The PM-10 study in California and Washington addresses the effects of emissions of PM-10 and PM-2.5 sized particulates, or dust, from agricultural land on air quality and development of control strategies. These studies are being conducted by scientists at the University of California-Davis and the Washington State University, in cooperation with Federal, state, and local agricultural, environmental, and health agencies, and farmers and growers in both states. The California program has focused on developing and refining methods to accurately measure and detect the sources of PM-10 and PM-2.5 emissions from various agricultural susceptible California crops and soils. In addition, the California research has been expanded to include dust and gaseous emissions from cattle feedlots, dairies, and poultry industry. This is related to livestock operations. The Washington State University scientists are using refined instruments on field sites to measure and predict the effects of wind erosion and agricultural practices in the Columbia River Basin region on PM-10 and PM-2.5 emissions, under both natural wind erosion and with portable wind tunnel studies. Alternative cropping and tillage practices, residue management, and weed control practices are being developed and compared for control of PM-10 and PM-2.5 emission pollution under Columbia River Basin conditions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. There has been growing national concern over the potential health and safety aspects of air pollution from dusts and suspended particulate matter resulting in passage of the 1990 Clean Air Act, as well as state air quality laws in both California and Washington. Because of particular problems from PM-10 and PM-2.5 emission in the arid regions of the Western United States, research on the role of agricultural operations in intensively cultivated soils in California and the Columbia River Basin, as sources of PM-10 and PM-2.5 emissions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research were to measure the PM-10 emission rates from significant crop and tillage practices, to determine the source of PM-10 emissions on soils in agricultural regions of central and southern California and the Columbia River Basin in the Pacific Northwest, and to explore cost-effective alternative agricultural practices to control these emissions. More recently, studies of finer PM-2.5 particulates have been included because of their recognized potential health risks. In California, field measurements are being continued on both PM-2.5 and PM-10 emissions on production practices on almonds, figs, walnuts, cotton, wheat, and on ammonia emissions from dairy farms and feedlots. Similar studies in the Columbia River Basin are being conducted in Washington on a number of agricultural practices in the rain-fed and dryland croplands. Susceptible climatic and soil conditions and tillage and cropping practices have been identified and are being used to develop prediction tools to assist growers to adopt alternative practices to reduce potential air pollution by PM-10 and PM-2.5 particulate emissions. During 1998 an intensive study was undertaken to evaluate emission differences in almond harvesters. Data has been taken in California to assess land preparation techniques.

A Light Detection and Ranging system has been developed at the University of California at Davis that makes it possible to take a snapshot of the shape of an

emission plume from a source such as a harvester, and to make estimates on the amount of particulate material emitted into the atmosphere and its subsequent transport. Efforts continue to calibrate the Light Detection and Ranging System.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in March 1994. The appropriation for fiscal year 1994 was \$940,000; fiscal year 1995, \$815,000; and for fiscal years 1996 through 2000, \$873,000 per year. A total of \$6,120,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In California, the program is matched by State funds in the form of salaries, benefits, and operating costs. In Washington, there were no state or non-federal funds in support of the PM-10 project in 1994 and 1995. In 1996, state support was \$22,566, and in 1997, state support was \$102,364. Similar funding was continued in 1998 and 1999.

Question. Where is this work being carried out?

Answer. This work is being directed by participating scientists at the University of California-Davis and at the Washington State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives of this project is 2000. The first four objectives of the project on soil particle characterization are anticipated to be completed in 1999. The objectives on field control will continue. In 1998, a manual for practices was developed and circulated for use by growers in Washington State to reduce wind erosion on agricultural land. Implementation and development of these management practices will be a major role of this project in the future. Quarterly and annual reports on the Washington State project to date are available.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's Program Manager annually reviews the research progress reports and proposed new research and attends the annual meetings of the program to assess progress. The program is also evaluated each year by technical, administrative, and agency personnel. Progress is reported at research review meetings three times a year, with the November 1998 advisory committee members. A formal on-site review by a panel of experts was conducted of the Washington program in November 1997, and a similar review of the California program is planned in the near future.

PRECISION AGRICULTURE, ALABAMA AND TENNESSEE

Question. Please provide a description of the research that has been funded under the Precision Agriculture, Alabama and Tennessee grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. This grant will develop needed training for farmers in the use Global Positioning Systems, Geographical Information Systems, Remote Sensing and Variable Rate Technology for precision farming application.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This project will focus on the Southeastern area of the U.S. However results will apply to anywhere precision farming is applied.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to provide training for farmers in the use of precision farming technology.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and is funded at \$425,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This is a new project and therefore no non-federal funds have been provided.

Question. Where is this work being carried out?

Answer. The project will be conducted at the United States Space and Rocket Center Huntsville, Alabama and the Tennessee Valley Research and Extension Center at Belle Minci, Alabama.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is under development and has not yet been evaluated.

WATER QUALITY—ILLINOIS

Question. Please provide a description of the research that has been funded under the water quality program grant.

Answer. The Illinois Groundwater Consortium grew out of a fiscal year 1990 appropriation of \$500,000 to Southern Illinois University at Carbondale to focus on the short- and long-term effects of agricultural chemical contamination on the environment, the groundwater, and ultimately, human health and welfare. As a result of this appropriation, the University joined forces with the Illinois State Geological Survey, Illinois State Water Survey, the University of Illinois Cooperative Extension Service, and the University of Illinois Agricultural Experiment Station to create the Illinois Groundwater Consortium. The Consortium's primary mission, then and now, is to work effectively toward providing a scientifically-valid basis upon which meaningful agricultural chemical management and regulatory decisions can be based. The Consortium has worked to address the concerns of the agricultural and agricultural industries as well as the valid concerns of the agencies charged with protection of environmental quality. Projects supported with Consortium funding are peer reviewed by researchers at 35 different universities and agencies from across the Nation, and results are presented and critiqued annually at the Consortium's Research Planning Conference.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The fiscal year 1998 appropriation was targeted to research pertaining to the impacts, recovery, and remediation of the Midwestern region after flooding. The 1993 and 1995 flooding of the Mississippi, Missouri, and Illinois Rivers, and their tributaries, created devastating effects on the farm lands, communities, and natural resources of the area. These effects have major implications for agricultural practices, water quality, and public policy decisions. This natural catastrophe has resulted in a need for further studies examining the impact of the flooding on surface/groundwater, soils and their rehabilitation, biodiversity, and on economic and public policy in the region. In addition, there is the need to disseminate results to the public to enable the Consortium findings to be beneficial in the near term to those needing the information. To facilitate this work, the Consortium expanded its participant institutions to include Southern Illinois University at Edwardsville. Southern Illinois University at Edwardsville's strategic location in the heart of the flood damage area, as well as its qualified research scientists who work in the Consortium's high priority research areas, strengthen the capabilities of the Consortium. The highest priorities of the Consortium are: (1) the funding of research upon which public policymakers working on land use or groundwater protection issues in flood plain areas can base decisions and (2) the broad dissemination of this information. The projects funded by the Consortium are providing researchers opportunities to obtain data upon which larger projects can be built. Without this initial data, funding from other competitive sources would be difficult to obtain. The Consortium has tried to expand its efforts through a proposal for funds from the Fund for Rural America. This application received good feedback but was not funded. A revised proposal to similar funding sources is planned in the continuing efforts to expand the basic and applied impacts of the Consortium's research.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The Illinois Groundwater Consortium was established to coordinate and support research on agricultural chemicals in Illinois groundwater. The recent Midwest flood of the Mississippi, Missouri, and Illinois Rivers, and their tributaries, created devastating effects on farm lands that have major implications for agricultural practices and water quality in the region as well as effects in other states in the Midwest. The Consortium would like to be a leader in providing information to facilitate short-term and long-term systems studies of the effects of flooding on groundwater and surface water upon which to base policy management decisions.

Research areas characterizing short-term and long-term projects completed, underway, or proposed for each research area include:

Short-term

Effect of extended inundation on soil productivity.
 Movement of chemicals—pesticides, herbicides, heavy metal, other chemicals—from flooded soils into surface and groundwater.
 Impacts on soil fertility and nutrient balance caused by flooding.
 Changes in nitrogen-fixing bacteria or pesticide microbic activity due to flooding.
 Impacts of flooding on plant and aquatic life, including endangered and dangerous species, and microbial communities.
 Effectiveness of riparian buffer strips under flooded conditions.
 Groundwater quality changes resulting from flood related land-use developments in both the bottomlands where farming practices change and in the uplands where new communities are being developed.

Long-term

Effectiveness of methods of remediation for flooded soils.
 Changes in surface and groundwater quality over time with changes in flooding conditions.
 Changes in soil chemistry and productivity over time.
 Long-term effects and recovery of microbic activity.
 Effects of time on recovery and eradication of plant and aquatic life.
 Recommendations for long-term, systems-based planning and management for watershed and bottomland management.
 Examination of public policy decisions with implications for agriculture and water quality in light of flooding effects and recovery.
 Long-term implication for public policy decisions and management of the river systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Research grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$600,000; and fiscal years 1992–1993, \$750,000 per year; fiscal year 1994, \$666,000; fiscal year 1995, \$460,000; fiscal year 1996, \$468,000; fiscal years 1997 and 1998, \$465,000 per year; and fiscal year 2000, \$297,500. A total of \$5,415,500 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: \$255,891 state appropriations in 1991; \$447,237 state appropriations in 1992; \$644,054 state appropriations in 1993; and \$623,124 state appropriations in 1994. Non-federal and state funds for 1995–1997 have exceeded the federal funds.

Question. Where is this work being carried out?

Answer. The work is being carried out by the Illinois Groundwater Consortium and coordinated by the Carbondale campus of Southern Illinois University. The research is being conducted by staff at the University of Illinois, Southern Illinois University-Carbondale, the Southern Illinois University-Edwardsville, the Illinois State Geological Society and the Illinois State Water Survey at locations across the State of Illinois and in Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project was planned as a 5-year study of the impacts and recovery of flooding in the Midwest. In the original proposal and subsequent proposals, we identified both short-term objectives which are project goals that could be accomplished within 1–2 years and long-term objectives which are project goals that could be accomplished within 2–5 years. In calendar year 1997, we completed 3 years of studies involving 26 projects, and in calendar year 1998, we began 4 new projects and continued 12 projects. These projects were spread across areas identified as high priority, including studies of flood impacts on soil productivity and remediation, movement of chemicals in water and soils, bacteria and microbial life, plants and aquatic life, and on public policy impact. Results of projects completed in previous years and progress reports on projects underway are published each year as part of the Proceedings of the annual conference of the Illinois Groundwater Consortium and in the Illinois Groundwater Consortium's Groundwater Bulletin. Dissemination of both of these publications is broad-based, utilizing mailing lists to public and private institutions and individuals kept by the University of Illinois Cooperative Extension Service, the Illinois Groundwater Consortium, as well as dissemina-

tion through related conferences and workshops. Progress in meeting short-term and long-term objectives has been excellent. The most complex task is coordinating research projects on flood issues involving multiple issues, such as biological, social, economic and political issues, where effective solutions await the expansion of research databases. Due to waterborne contaminant problems within the Mississippi River Basin and sub-basins, it is anticipated that the projects will continue beyond the year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. From its beginning, the projects funded through the Illinois Groundwater Consortium involve reviews by at least three faculty/researchers drawn from 35 different universities, state, and federal labs and surveys, USDA's research laboratories, and other research centers. The reviewers rate proposals on criteria pertaining to scientific merit, quality of the research team, likelihood of the work resulting in publications and grant support from other sources, and relatedness of the project to the key objectives of the Illinois Groundwater Consortium. This peer review system enables the Consortium's Advisory Committee to select projects with high scientific merit from the group of proposals submitted for funding consideration. The titles, principal investigators' names and affiliations, and budgets are submitted to the USDA for review along with the Consortium's proposal for funding.

WATER QUALITY—NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the water quality, North Dakota program grant.

Answer. The original goal of this research was to develop an understanding of the occurrence, transport, and fate of agricultural chemicals found in representative field settings in the Northern Great Plains region of the United States. In 1996, the scope of the program was expanded to include additional water management issues in the Red River of the North drainage basin. The Red River Water Management Consortium, a partnership between public and private sectors, was established to address critical water quality and quantity issues in an area where agriculture is the predominant industry. A major objective of the Red River Water Management Consortium is to use results from the initial phases of this research program to find economical, practical, and timely technological solutions to water problems of the region. By providing cofunding for the program, Red River Water Management Consortium members become active stakeholders in the research and ensure the practicality of the work performed.

The focus of current work is on:

- the assessment, development, and implementation of new technologies for addressing water quality and quantity concerns within the basin;
- water resource assessment and analysis, including the development of mechanisms for providing easy access to water-related information so proper water management decisions can be made;
- the determination of agricultural, industrial, municipal, and recreational impacts on water resources, both current and potential, and the identification of potential solutions to water quality and quantity problems and needs;
- water quality monitoring and coordination of monitoring activities;
- education and information dissemination on water issues facing this region of the United States; and
- the development of a watershed management strategy for the Red River of the North Basin focusing on water quality and quantity to ensure continued economic development of the area.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The original focus of the work was on agricultural chemicals in groundwater which potentially presents both a public health and an environmental quality problem of significant short- and long-term importance. The goal of this work was to provide a scientifically valid basis upon which meaningful agricultural chemical management and regulatory decisions could be made. The establishment of the Red River Water Management Consortium provided a mechanism for transferring results of the initial research to vested stakeholders of the region and for addressing water quality and quantity issues resulting from agricultural practices and development. The overall goal of the Red River Water Management Consortium is the development of a long-term watershed management strategy focusing on water quality and quantity which can be used as a model for watershed management in other agricultural regions in the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research program was to understand the occurrence, transport, and fate of agricultural chemicals in representative field settings in the northern Great Plains region so scientifically-valid decisions could be made for their management and regulation. Work on five of the seven sites originally instrumented under this program has been completed. Research at the two remaining sites is directed toward answering questions that have arisen during the course of this research program, specifically to determine the long-term trends in nitrate concentrations in surficial aquifers under irrigated agriculture and to determine the source and trends for sulfate.

Results from this program have been reported in journals, conference proceedings, and through presentations at national, state, and local meetings. To date, more than 40 presentations or publications have resulted. In addition, two doctoral dissertations and one master's thesis have resulted from this program.

Finally, the researchers have established the Red River Water Management Consortium as a mechanism for transferring the results of the initial research to vested stakeholders in the region and to the general public in order to address water quality and quantity problems resulting from agricultural practices and agricultural development.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. In 1989, \$1.0 million was appropriated under the groundwater research program. Beginning in 1990, funds have been earmarked under the Direct Federal Administration program. Work supported by this grant was initiated in fiscal year 1990 with an appropriation of \$987,000. Subsequent appropriations have been \$750,000 in fiscal year 1991, \$500,000 per year in fiscal years 1992–1993; \$470,000 in 1994; \$407,000 in fiscal year 1995; \$436,000 in fiscal years 1996–1998; and \$340,000 in fiscal year 2000. A total of \$6,602,000 has been appropriated for this water quality research program.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Red River Water Management Consortium members provide co-funding to support their participation in the program. Co-funding provided by Red River Water Management Consortium members for fiscal year 1996 totaled \$59,700 and for fiscal year 1997 totaled \$80,000. Interest in this program continues to grow, and it was expected that at least \$100,000 in cost-share would be obtained during fiscal year 1998 through membership fees. These funds are provided directly to the program and do not include in-kind costs incurred by the participants which are estimated to be several hundred thousand dollars.

Field activities to determine the long-term trends of nitrate and sulfate and to determine the source of sulfate are being conducted in cooperation with the North Dakota State Water Commission, which is providing an estimated cash equivalent funding in the amount of \$33,660 for sample analysis and approximately \$12,000 for field instrumentation. Instrumentation of sites occurred in fiscal year 1997, and sampling and analysis continued through fiscal year 1999.

Consortium members' dues are also used to provide in-kind services for match in other projects being performed by the Red River Water Management Consortium. A major project sponsored by the U.S. Environmental Protection Agency and local contributors to restore riparian areas in the Red River of the North Basin has been funded and will provide \$175,000 for consortium activities over the next 4 years. The amount of in-kind services provided from Consortium member fees is \$9,000 per year.

The U.S. Corps of Engineers has contracted through the Red River Water Management Consortium a \$100,000 6-month effort to improve the decision making capability regarding ongoing flooding within the Devils Lake Basin, a sub-basin of the Red River of the North Basin. This work is intended to produce decision support tools, forecasts, data, and forums that can be continued to be used by the Corps St. Paul district, the states of North Dakota and Minnesota, the International Joint Commission, and the people of the Devils Lake region after the project has been completed.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of North Dakota through its Energy and Environmental Research Center and at field sites and agricultural product-processing facilities in North Dakota, Minnesota, and Montana. In addition, a portion of the pesticide research was conducted at North Dakota State University. Cooperative efforts have resulted in work also being performed at cooperative institution locations such as the University of Waterloo, Victoria University, University

of Montana, the Red River Resource Conservation and Development Council offices, and the North Dakota State Water Commission.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives of the project, specifically the field-related research, was fall 1995. This research has been completed; and the sites have been decommissioned, with the exception of those relating to long-term nitrate and sulfate monitoring and analysis. Work on nitrate and sulfate trends and occurrence was scheduled for completion in 1999. The Red River Water Management Consortium was established in 1996 as a mechanism for transferring the information derived from this research program to the technical community and to the public for use in addressing water quality and quantity issues relating to agriculture and agricultural development. It is anticipated that Red River Water Management Consortium activities will continue for several years in order to meet the objectives as defined by the non-federal sponsors and the agency.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation of this project was conducted in September 1996. CSREES' Technical Project Officer attended a meeting of the Red River Water Management Consortium to evaluate and determine the status of this effort, which is currently the focus of research program activities. Progress was made by the Consortium during its first year, and the program is an excellent example of how federal and state agencies, research and academic institutions, private industry, and the general public can work together to solve problems in an economical manner to benefit people, communities, and the Nation. All project objectives were met for the first-year Consortium activities.

EXTENSION FEDERAL ADMINISTRATION PROJECTS

AGRICULTURE IN THE CLASSROOM

Question. Please provide a description of the research that has been funded under the Ag in the Classroom grant.

Answer. Agriculture in the Classroom is an academic program designed to promote agricultural literacy among kindergarten through 12th grade—K-12—students. Funds appropriated for this program are used to leverage agricultural literacy activities in all fifty States, the District of Columbia, and U.S. territories by providing national leadership and guidance to State Agriculture in the Classroom Coordinators. This serves the educational needs of more than five million students through a network of more than 120,000 teachers annually. Activities during the past year include implementation of cooperative agreements to identify sound instructional materials that focus on the contribution of minorities to the food and agricultural system, establishment of a web site to provide faster and more cost-effective dissemination of information and materials, and planning and conducting an annual national conference.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This outreach program is directed toward the youth of America. In the Federal Agriculture Improvement and Reform Act of 1996 Congress noted the importance of increasing the number of young Americans pursuing baccalaureate or higher degrees in the food and agricultural sciences. Agricultural literacy is a first step in creating interest and awareness of career opportunities in the food and agricultural sciences. Education studies cite that students learn best by example. Agriculture provides an excellent vehicle for providing hands-on learning experiences in a variety of academic disciplines including biological science, social science, language arts, and mathematics.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original purpose of this outreach program was to promote agricultural literacy through the education system. The Secretary of Agriculture established the Agriculture in the Classroom Program in 1981 to help future generations become more agriculturally literate. Agriculture in the Classroom helps students understand the complexity of the total food and fiber system, appreciate its impact on the economy and society, and become citizens who support wise agricultural policies. The program encourages educators to integrate the critical role of agriculture in our economy and society into their teaching. The program provides leadership, counsel and education materials, and maintains a nationwide network of teachers, farmers, agribusinesses, and government officials who actively support the Agriculture in the

Classroom mission. Cooperation between the Federal government and the agricultural community is strengthened through a Memorandum of Understanding between the National Agriculture in the Classroom Consortium and USDA.

Question. How long has this work been underway and how much has been appropriated by fiscal years to date.

Answer. A total of \$2,461,880 has been appropriated for this program as follows: fiscal year 1986, \$76,000; fiscal years 1987 and 1988, \$74,000 per year; fiscal year 1989 \$87,000; fiscal year 1990, \$135,000; fiscal year 1991, \$170,000; fiscal years 1992 and 1993, \$208,000 per year; fiscal year 1994, \$185,000; fiscal year 1995, \$208,000; fiscal year 1996, \$204,880; and fiscal years 1997 through 2000, \$208,000 per year.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is not a grants program and does not require matching funds. Agriculture in the Classroom is highly leveraged through a variety of public and private funding that supports the State programs. The cooperative agreements that are in place have matching funds.

Question. Where is the work being carried out?

Answer. National leadership for the Agriculture in the Classroom is provided by the Higher Education Programs unit within the CSREES. Each State actually manages its own program. Overall, the national program impacts an estimated 120,000 teachers and over 5 million students annually in grades K–12.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related activities?

Answer. Beginning in 1981, under the direction of the Secretary of Agriculture, an Agriculture in the Classroom program was initiated in every State, the District of Columbia, and in the U.S. territories. Each State has a viable program. The goal of promoting agricultural literacy among America's youth is a continuing effort to serve each new generation of students.

In the past year, cooperative agreements have been implemented for the development of a high quality web site to coordinate and exchange ideas among each of the Agriculture in the Classroom State Coordinators, to sponsor national teaching awards, and further disseminate superior agricultural educational materials.

Agriculture in the Classroom annually sponsors a National Agriculture in the Classroom Conference to bring the Agriculture in the Classroom community together to expand experiences, ideas, materials, information, and techniques among State programs, educators, governmental agencies, agribusinesses and agricultural organizations. A quarterly newsletter communicates agricultural educational topics. A Resource Guide and outreach to educational associations are planned to enhance the Agriculture in the Classroom efforts.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The State Agriculture in the Classroom program coordinators have formed a National Agriculture in the Classroom Consortium. This provides USDA with another source of stakeholder input for identifying and setting priorities. Evaluations have been conducted in several States. Findings are provided to the Executive Committee of the National Agriculture in the Classroom Consortium and to the National Program Leader.

During each national conference formal evaluations are conducted. These are considered in defining future goals for the program. Participants find the conferences valuable for sharing ideas on projects and for obtaining resource materials. In response to evaluations a "teacher friendly" web site has been developed and efforts are underway to find, develop and disseminate new educational materials.

BEEF IMPROVEMENT—ARKANSAS

Question. Please provide a description of the program that has been funded as the Arkansas Beef Improvement Program.

Answer. The Arkansas Beef Improvement Program uses result demonstrations to demonstrate cost effective beef management practices. These demonstrations are conducted on family owned beef cattle operations. The type of demonstrations implemented on the farms is determined by the specific problems and needs of the rancher. Education gained is then transferred to other producers through beef cattle field days and presentations, 6-hour county workshops, factsheets and popular press articles.

Question. What is the national, regional or local need for this program?

Answer. When planning, implementing and monitoring demonstrations, a business plan is used with specific goals and objectives. Therefore, the overall educational goal is to teach that decision making process rather than the specific management practices. Management problems differ from farm to farm, region to region and from year to year. Therefore, emphasizing problem identification and evaluation, exploring management options and monitoring progress are procedures that can be used throughout the ranching industry.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The overall goal of the Arkansas Beef Improvement Program was to enhance the efficiency and profitability of the Arkansas beef cattle producer. This program uses demonstration farms to implement and evaluate management practices. There are four farms enrolled in whole farm demonstrations. These demonstrations are five-year commitments. Three farms are in year three of the program and one farm is in year one. There are eight special projects that address specific management problems. Depending upon the special project, they can last two to five years. Twenty farms either have been or are currently enrolled in special projects. A six-hour workshop was developed to teach other producers the decision making process used and practices implemented on demonstration farms. Twenty-six workshops in 21 counties have been conducted. A quarterly Arkansas Beef Improvement Newsletter, two Extension publications and monthly articles in the Arkansas Cattle Business publication are methods used to transfer information to the public.

Question. How long has the program been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. \$200,000 has been devoted to this project from fiscal years 1993 through 1995 and in fiscal years 1996 through 2000, \$197,000 was appropriated for a total of \$1,585,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Arkansas provided \$118,154 for this past year.

Question. Where is the work being carried out?

Answer. The four current whole farm demonstrations and eight special projects are located on beef producing farms located throughout the state of Arkansas. These farms are family owned and operated and vary in size and stocking rates.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Arkansas Beef Improvement Program currently has four whole farm demonstrations and twenty special projects. Three of the whole farm projects will finish in 2001, and the fourth whole farm project will finish in 2003. The special projects include cowherd performance, pasture renovation, establishing a breeding and calving season, stocker cattle, hay quality and supplemental feeding, replacement heifer management, cull cow management, and stockpiled forages. These projects range from two to five years in length. As farms complete special projects; additional farms are selected for special projects. The management problems addressed in special projects changes depending upon the need at the time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES review of this project is conducted annually. The 1999 review was positive, with mention made of the efforts to develop decision making skills among beef producers. A suggestion was made to expand the environmental protection aspects of the project.

BOTANIC GARDEN INITIATIVE, ILLINOIS

Question. Please provide a description of the research that has been funded under the Botanic Garden Initiative, Illinois.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. The program is expected to increase student interest and understanding of science and other related subjects using gardening as the focus.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. We have contacted the Chicago Botanic Garden regarding this special grant. Their anticipated research is expected to result in educational curricula, lesson plans, garden design and construction recommendations, and garden activities that will serve as a model for other cities throughout the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The anticipated goal of this research is to develop an innovative program that increases green spaces at Chicago's public schools and teaches elementary school students the value of plant science, math, nutrition, business, and literature. Students and teachers, in collaboration with the Garden, build and maintain gardens by using the Life Lab curriculum, a nationally acclaimed and widely used science curriculum.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant begins in fiscal year 2000 and the appropriation for fiscal year 2000 is \$106,263.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds sources provided for this grant have not been determined at this time, since the grant has not yet been received.

Question. Where is this work being carried out?

Answer. This work will be conducted at the Chicago Botanical Garden.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Current progress indicates the anticipated completion date for the original objectives is five years.

Question. When was the last agency evaluation of this project? Provided summary of the last evaluation conducted.

Answer. This is a new project which will begin in 2000; therefore no evaluation has occurred.

CONSERVATION TECHNOLOGY TRANSFER, WISCONSIN

Question. Please provide a description of the extension project that has been funded under the Conservation Technology Transfer, Wisconsin grant.

Answer. This is a new project that will leverage funding at the University of Wisconsin with other federal, state and local sources to provide education and technical support to livestock producers regarding animal waste.

Question. According to the proposal, what is the national, regional or local need for this project?

Answer. The need for this project is to meet new federal regulations on animal waste to protect public waters and air quality. It can also serve as a regional model for the dairy industry.

Question. What was the original goal of this project and what has been accomplished to date?

Answer. The original goal of this project is to coordinate nutrient management assistance for livestock producers among multiple agencies and the private sector. It is a new project that has not yet received funding.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant will begin in fiscal year 2000, and the appropriation for fiscal year 2000 is \$170,022.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are expected to be \$600,000 from state and local funds for fiscal year 2000. As a new grant, commitments are still being secured.

Question. Where is this work being carried out?

Answer. This project will be conducted with individual producers throughout Wisconsin, in coordination with the USDA Agricultural Research Station in Madison.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is one year from the date of fund transfer. As a new project, no funds have been received to date.

Question. When was the last agency evaluation of this project?

Answer. This new project will have an evaluation process included in the proposal.

DELTA TEACHERS ACADEMY

Question. Please provide a description of the program that has been funded under the Delta Teachers Academy project.

Answer. The National Academy proposes to continue its Delta Teachers Academy in the Lower Mississippi Delta Region—219 counties and parishes near the Mississippi River including portions of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, Missouri and Tennessee—focusing on educational improvement in core subject areas. The program was launched in 1992 with a pilot grant of \$500,000 from the U.S. Department of Education. U.S. Department of Agriculture funding began in 1994. The program provides long-term academic enrichment to approximately 525 elementary and secondary school teachers at 35 sites by teaming them with university scholars for in-service training during the school year and with summer institutes. Through its Fellows Program, the Delta Teachers Academy sustains the professional development of more than 650 Academy graduates throughout the region. This grant is not awarded competitively; however, we require annual applications reporting the previous year's accomplishments and describing planned activities and expenditures for the coming year. These applications undergo merit review before the awards are made.

Question. What is the national, regional, or local need for this project?

Answer. The 219-county Lower Mississippi Delta region has been cited by the Educational Testing Service and the National Center for Education Statistics as notably lagging in student performance in core academic areas. According to the grant recipient, 33 percent of the children in the region live below the poverty line compared to 20.5 percent nationally. In 1996, 60 percent of Louisiana's public school sample ranked "below basic" on the National Assessment of Education Progress test for eighth-graders. The USDA's Economic Research Service correlated poor educational performance, rural poverty, and limited economic development. The Delta Development Commission cited serious educational problems including poor student performance in core content areas, demoralized teachers with little opportunity for academic development, and region-wide difficulty in recruiting and retaining qualified teachers. The Commission noted that 75 percent of the region's workforce lacks the basic reading skills necessary for technical training, and specifically cited improved teacher training as one means for breaking the cycle of poverty and economic noncompetitiveness.

Question. What was the original goal of the program and what has been accomplished to date?

Answer. The original and continuing goal of the project is to address the problem of insufficient professional development opportunities for the elementary and secondary teachers of the seven-state region. The Delta Teachers Academy focuses on core subjects of English, geography, history, mathematics and science. Some sites also focus on humanities, language arts, social studies, reading, civics and interdisciplinary subjects. The Delta Teachers Academy began by offering educational development activities for 100 teachers from 50 rural districts at 10 sites. Training has expanded to 600 teachers at 35 sites across the entire seven-state region. More than 750 graduates whose professional development is sustained through the Academy's Fellows Program lead teacher in-service training at their home schools. The project has improved student performance and teacher training, morale, recruitment and retention in the region.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. A total of \$24.161 million has been appropriated to the Department of Agriculture for this project, including \$2 million in fiscal year 1994; \$3.935 million in fiscal year 1995; \$3.876 million in fiscal year 1996; \$3.850 million in fiscal year 1997; and \$3.500 million each year in fiscal years 1998 through 2000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. There are no non-federal funds identified for this project.

Question. Where is the work being carried out?

Answer. The Delta Teachers Academy project is coordinated out of The National Faculty's Southern Region office in New Orleans, Louisiana. The project is conducted at 33 sites in the seven-state Lower Mississippi Delta region including Arkansas, Kentucky, Illinois, Louisiana, Mississippi, Missouri, and Tennessee.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to provide three full years of training to each faculty team established by the Delta Teachers Academy. Training consists of four two-day academic sessions and one two-week summer institute for each team. This objective was met for the 24 faculty teams funded under a fiscal year 1994 Department of Agriculture grant; for 15 additional teams funded in 1995; and for one team funded in fiscal year 1996. The 20 teams funded in fiscal year 1997 have received

two years of training and the 14 teams funded in fiscal year 1998 have received one year of training.

Objectives for fiscal year 1999 included providing ongoing professional development of 33 teams consisting of 600 participants; adding two additional teams to maintain the level of service to 35 teams throughout the region; instituting new procedures to better meet clientele needs based on an independent review completed by Westat; intensifying its individual and field-based approach; and drafting individual work plans for each site. The anticipated completion date is September 30, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An assessment of the short-term impact of the Delta Teachers Academy by Westat, Inc. of Rockville, Maryland was completed in August 1997. Westat found the majority of participants reported that the Academy met their personal and professional needs by renewing their enthusiasm for teaching, improving self-confidence, increasing their sense of professionalism, improving their knowledge of specific content areas, enhancing teaching methods and interacting with peers. Teachers are applying what they have learned from the Academy in their classrooms. For example:

- 88 percent said the Academy prepared them to assume leadership roles in their schools;
- 89 percent noted changes in student work habits, attitudes, aspirations and achievements;
- 90 percent applied academic content from the program in their classrooms;
- 78 percent used skills and strategies learned at the Academy in their classroom teaching;
- 83 percent said their teaching approaches became more effective in improving student learning.

A U.S. General Accounting Office review of the Academy's programs was conducted in 1995. Report GAO/RCED-95-208 included summary statistics on more than 1,000 teacher evaluations of Academy sessions as well as the General Accounting Office's survey of participants. On average, participants reported that the Academy was more effective than any other teacher development program they had participated in, was very effective in renewing or enhancing knowledge in one or more academic subjects, and was generally effective in enhancing the teaching skills and strategies required for teaching challenging academic content.

A site visit of the Delta Teachers Academy in New Orleans, Louisiana and the National Faculty's Summer Institute at Tulane University was conducted by the CSREES's National Program Leader for Higher Education and Evaluation in 1996. The visit confirmed that Delta Teachers Academy strengthened participating teachers' abilities by improving their knowledge base, helped them become leaders of other teachers by requiring them to conduct staff development at their home schools, and had a positive impact on student learning. School superintendents reported greater student enthusiasm, more homework, and higher test scores for students whose teachers were participants in the Delta Teachers Academy program.

DIABETES DETECTION AND PREVENTION, WASHINGTON AND HAWAII

Question. Please provide a description of the extension activity that has been funded under the Diabetes Detection and Prevention, Washington and Hawaii, grant.

Answer. The grant supports research/demonstration and outreach activities designed to (1) detect undiagnosed diabetes through use of a non-invasive ocular fluorescence technique, and (2) promote collaborative efforts by CSREES and The Joslin Diabetes Center to develop and pilot test a model to provide diabetes screening, prevention education, and case management services for selected rural and urban populations in Hawaii and Washington.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research/demonstration program.

Answer. This program grows out of a need to reach more of the millions of Americans who have undiagnosed diabetes. Diabetes is currently one of the leading causes of death and disability in the U.S. adult population, and is highest among certain racial and ethnic populations, especially Native Americans, African Americans, Hispanic Americans, and Asians and Pacific Islanders.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research/demonstration and outreach project is to (1) provide screening for diabetes among selected rural minority patient populations in

Washington and Hawaii using innovative detection technology and blood glucose measures; (2) diabetes education prevention and care materials; and (3) case management support and follow-up services for patient referrals.

Among the accomplishments to date are the following:

- CSREES has met with representatives of the Joslin Diabetes Centers, and convened regular telephone conferences with representatives of State Cooperative Extension Partners in Washington and Hawaii, and all partners.
- A Memorandum of Understanding has been prepared and approved by USDA and Joslin Diabetes Center.
- A revised proposal has been submitted by the Joslin Diabetes Center, and the Hawaii and Washington Extension Programs which clarifies the Project's objectives, and establishes roles and expectations of each of the partners.
- Prevention and care materials are in draft form and are being reviewed by Cooperative Extension staff.
- Cooperative Extension staff are being trained in delivery techniques for diabetes care and risk reductions strategies.
- Cooperative Extension staff are establishing local collaborations with health agencies, and developing recruitment and maintenance strategies.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1999 with an appropriation of \$550,000; the fiscal year 2000 appropriation is \$550,000. The total appropriation is \$1,100,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. There were no non-federal funds and sources provided for this grant.

Question. Where is this work being carried out?

Answer. The research and demonstration will be conducted at Joslin Diabetes Centers at Swedish Hospital in Seattle, Washington, and Straub Hospital in Hawaii. In addition, the Cooperative Extension offices in selected counties in Hawaii and Washington will be involved in program implementation.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completed date for the original objectives is 2002. The anticipated completion date of the revised objectives is 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project did not get underway until late in fiscal year 1999 because of the need to prepare and seek approval of the Memorandum of Understanding. Thus, an Agency evaluation has not yet occurred. A mid-year evaluation of program outputs and the delivery process to date will occur in July 2000.

EXTENSION SPECIALIST, MISSISSIPPI

Question. Please provide a description of the program that has been funded as the Basic Weather Service for Research and Extension Project.

Answer. The Basic Weather Service and Extension project is designed to fill a void in weather data due to closure of the Ag Weather Service facility in Stoneville, Mississippi. The funding will be used to gather and disseminate critical agricultural weather data for producers and researchers in Mississippi and surrounding states.

Question. What is the national, regional or local need for this program?

Answer. The grant proposal states that the Ag Weather Service facility was closed at Stoneville, Mississippi. This action has created a void in the availability of and access to critical weather data that producers and researchers use to make management decisions and to formulate work plans within the state and region. The weather data collected by this project serves a national need to provide a national database.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of the project is to collect, maintain, and disseminate weather information for producers and researchers in Mississippi and surrounding states. Electronic weather stations and links with other web sites to deliver weather data have been installed and developed. The project is providing timely data to producers in the Delta.

Question. How long has the program been underway and how much has been appropriated by fiscal year through 2000?

Answer. The funding for fiscal years 1997 and 1998 was \$50,000 each year and for fiscal years 1999 and 2000, \$100,000 each year. A total of \$300,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Mississippi through the Mississippi Cooperative Extension Service and Delta Research and Extension Center provided \$41,350 in state appropriated funds to support this project in 1997, 1998, and 1999.

Question. Where is the work being carried out?

Answer. The project will be conducted at the Delta Research and Extension Center in Stoneville, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of the additional or related objectives?

Answer. One of the original objectives, installation of equipment to collect weather data and establishment of a website, has been completed. The agriculture community—producers, markets, suppliers of goods and services, and financial institutions—depend upon weather information as a guide for business planning and decision making. The National Weather Service has eliminated certain critical services to rural areas and to agriculture clientele. As agriculture implements new programs in pest management, crop production, and site-specific farming, near real-time weather data is needed for the success of these programs. Weather services provided by the Stoneville project will be in cooperation with and complementary to services provided by the National Weather Service. Additional objectives relating to the collection, process, and disseminate of timely weather data are needed in the Delta Region. Current funding supports the objectives to ensure these weather services are available to the region.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of the project and Internet website is being conducted with an on-line survey instrument and through e-mail responses about the site. An advisory group has been identified and is functioning to provide feedback on the weather center's current status as well as assessing needs for future plans for the project's continued mission.

INCOME ENHANCEMENT DEMONSTRATION, OHIO

Question. Please provide a description of the program that has been funded under the Income Enhancement Demonstration Project for Northwest Ohio.

Answer. The Federal funds support the Agricultural Business Enhancement Center which plays a major role in the development of the agricultural sector of Northwest Ohio. The Center provides a variety of management training programs, helps farmers and other agribusinesses develop comprehensive business plans, and facilitates business networking. CSREES performs an annual merit review of this project.

Question. According to the research proposal, or principal researcher, what is the national, regional, or local need for this program?

Answer. The Center seeks to enhance the competitiveness of agricultural firms in Northwest Ohio and create greater economic opportunity for local residents. To be successful in business, farmers and other agribusiness firms must be able to adapt to a large number of major changes affecting the entire food system from the farmer to the consumer. These include changes in farm programs, globalization of markets, new technologies, information systems, consumers' concerns for food safety and nutrition, and society's concern for protecting the environment. Individuals, families, firms and communities in Northwest Ohio need to understand the changes, develop and implement effective strategies for dealing with change.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal of the project was to help people develop new businesses and restructure and expand existing businesses in order to enhance incomes in Northwest Ohio. The Agricultural Business Enhancement Center conducts economic research on market opportunities, provides a variety of management training programs, helps individual farms and other agribusinesses develop comprehensive business plans, and facilitates networking with businesses in other regions of the United States and around the world. Recent accomplishments include the following: A group of growers formed a cooperative and contracted with the Ohio Turnpike Commission to operate farmers markets at rest stops; farmers expanded their use of the national Internet Hay Exchange; sugar beet grower associations are exploring

the feasibility of reopening a closed processing plant; Christmas tree growers worked together to expand their market and increase sales; at an annual Women in Agriculture forum, 61 percent said workshop participation would improve management of the family farm, 78 percent would improve family relations, and 28 percent would improve farm income; Master Gardener volunteers were trained and provided over 6,000 hours to advise local home gardeners.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The project began in 1991. Appropriations have been as follows: \$145,000 in fiscal year 1991; \$250,000 per year in fiscal years 1992 through 1995; and \$246,000 per year in fiscal years 1996 through 2000. Appropriations to date total \$2,375,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Ohio has appropriated the following funds: \$35,100 in fiscal year 1991; \$72,368 in 1992; \$56,930 in 1993; \$30,547 in 1994; \$49,935 in 1995; \$51,432 in 1996; \$48,664 in 1997; \$53,736 in 1998; and \$56,186 in 1999.

Question. Where is the work being carried out?

Answer. The Agricultural Business Enhancement Center is located in Bowling Green, Ohio and serves eight counties in the Toledo Metropolitan Area. Project leadership is being provided by the Department of Agricultural Economics, Ohio State University, Columbus, Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1991 was for a period of 12 months, however, the ongoing needs of producers and agribusinesses to adjust to major changes in the agricultural sector continues to provide the Center with many challenges. The current phase of the program will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1999. In that review it was noted that: "The fiscal year 1999 proposal is especially well done—for each of its 3 objectives, there are one or more goals, and each goal has procedures and evaluation plans." Throughout the year, the project director completed evaluations which clearly demonstrated the value of the project to citizens of Ohio.

INTEGRATED COW-CALF MANAGEMENT—IOWA

Question. Please provide a description of the program that has been funded as CHIPS: Cow-Calf Integrated Resource Management Program.

Answer. CHIPS is an integrated cow-calf resource management program that originally targeted an eleven county area in southeast Iowa. The intent of the program is to impact the area's economy by maximizing the profit potential of individual livestock operations. Program technicians work one-on-one with participating beef operations, utilizing a variety of management services designed to assist these producers as enterprise decisions are made. The program has grown to extend services to over 200 beef producers in over 60 Iowa counties.

Question. What is the national, regional or local need for this program?

Answer. The agricultural economy of Iowa and surrounding states has suffered over the past several years due primarily to low commodity prices, especially corn, soybean, and hog enterprises. Selected areas of Iowa have also been challenged with extreme weather conditions that have impacted many beef operation current and long-term financial and managerial decisions.

To address this rapidly changing agricultural infrastructure, the program has adjusted its direction and focus to meet the management and technical needs of Iowa beef producers. Program technicians and staff work closely with participants to collect and analyze individual operation data. This information is necessary as management recommendations are developed to enhance the performance and economic stability of the operation. This approach supports individual economic survival as well as strengthening the local and regional economic community.

The Iowa cattle industry is exploring strengthening its position by building a new beef harvesting facility. This involves cooperation of many industry representatives. If this effort becomes a reality, the importance and need for such programs will continue to grow and expand. Producers will need continued technical assistance and expanded services as long-term decisions are made to supply a high quality, source verified, environmentally sound product to consumers.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The overall goal of the program is to have a positive effect on the area's economy by improving the long-term profit potential of the local cattle industry. Objectives include improving the understanding of producers about cow-calf production on highly erosive land, providing intensive technical assistance to develop goals and individualized farm recommendations and helping producers develop management skills to improve efficiency and lower costs of production. Over 220 cow-calf operations are to be involved in 2000.

Over the past several years, the program has expanded in geographical area, clientele and technicians. The program has grown from one technician and 11 counties in 1992 to seven technicians providing services to over 60 counties in Iowa. These technicians serve over 220 cooperators that manage over 18,000 beef cows.

During the 1998-99 fiscal years, technicians conducted over 1,330 farm and office visits. Numerous management areas were addressed during these one-on-one contacts. Over 27,000 head of calves and beef cows were weighed and over 4,000 breeding animals were permanently identified. A total of 33 performance analysis records incorporating financial and performance information were individually analyzed. More than 560 forage and soil samples were collected and approximately 300 ration projections were developed for cooperators.

Networking projects are emphasized by the program. Examples include the heifer development program, regional steer tests, educational efforts in conjunction with the Iowa Beef Center, Iowa State University Extension and the Iowa Quality Beef Program.

Question. How long has the program been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. \$138,000 was approved for fiscal year 1992; \$138,000 for fiscal year 1993; \$276,000 for fiscal year 1994; \$350,000 for fiscal year 1995; \$345,000 for fiscal year 1996; \$345,000 for fiscal year 1997; \$300,000 per year in fiscal years 1998 and 1999; and \$250,000 in fiscal year 2000. Federal funding through fiscal year 2000 totals \$2,442,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Cooperators pay fees of approximately \$3.00 per beef cow on a sliding scale that adjusts for herd size. In fiscal year 1999, approximately \$47,000 in fees were collected.

Question. Where is the work being carried out?

Answer. The program is operated in six designated technician areas in Iowa. Services and technical support are offered to producers in approximately 60 Iowa counties.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives and goals of the program have been modified to meet the needs of cooperators and adjust to the rapidly changing cattle industry. The program initially projected to address the objectives in a three-year time frame. However, due to the expansion of the program in both geographical area and cooperator numbers, services and technical assistance have been modified to accommodate the numerous changes experienced by the industry.

Over the past several years, the program has made considerable progress in achieving its goals. Cooperators are utilizing more of the data collection and record keeping programs that are offered. This data collection process has been important as producers make long-term decisions. The Iowa beef industry faces a challenging and exciting time. With the beef harvest facility initiative underway, the support and assistance offered to producers needs to be modified and adapted. A three-year time frame for the development and initiation of the Iowa Beef Network is expected.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last annual review of this project was conducted by the agency in May, 1999. This review was positive, with special note taken of the expansion of the project to include a greater number of beef producers, promotion of a sound business approach to on-farm record keeping and management practices, and the efforts to extend this knowledge to other beef producers of the State.

NATIONAL EDUCATION CENTER FOR AGRICULTURAL SAFETY, IOWA

Question. Please provide a description of the extension project that has been funded under the National Education Center for Agricultural Safety grant.

Answer. The mission of the National Education Center for Agricultural Safety is to reduce the level of preventable illnesses, injuries and fatalities among agricultural populations. The National Education Center for Agricultural Safety serves farmers, ranchers, their families and employees by providing hands-on training and education programs at the Center. The center works in conjunction with the "Farmedic" program and teaches agricultural families how to handle farm emergencies by providing First on the Scene and First Responder courses. It also provides training for rural firefighters and paramedics who respond to rural emergencies.

The National Education Center for Agricultural Safety is located in Peosta, Iowa on the Northeast Iowa Community College Campus. Phase Two of the center's construction program has just been completed, allowing the center to provide training in "real life situations". Experience in handling grain bin entrapments, farm equipment entanglements, manure pit rescues, tractor over-turns, livestock, and utility emergencies are provided. Regularly scheduled training includes general First Aid and Cardiopulmonary Resuscitation courses.

The center has assisted local farmers and small corporations to screen workers for employment health risks and conducts health education programs on hearing conservation, skin cancer prevention and prevention of swine confinement worker and animal health problems.

The center operates an 11,000 square foot facility that was funded by the state of Iowa with matching private donations. The USDA grant provides salaries and operating funds, corporate and private donations provide needed programs and equipment. The National Safety Council and Northeast Iowa Community College underwrite additional operational costs not covered in the USDA grant or donations.

Question. According to the extension proposal, or the project director, what is the national, regional and local need?

Answer. The project director believes this training to be of national, regional, and local need. According to information compiled by the National Safety Council, 800 farmers and ranchers died in farm work incidents in 1998. Nearly 50 percent of these fatalities were related to work with farm tractors and equipment. Many of the training programs conducted at this new training center are focused on issues related to safe machinery operations. Included are safe tractor operation programs for youth and young adults and safety equipment retrofitting of farm equipment in cooperation with farm machinery manufacturers.

One common thread for most fatal injury incidents in U.S. agriculture is that they are preventable. To prevent these serious injuries and deaths, the National Education Center for Agricultural Safety develops interactive training for the many at-risk audiences, including senior farmers, children and youth, and farmers who work part-time off the farm. These programs are offered in many local, regional, and national settings and are aimed at increasing awareness and knowledge about the hazards that impact farmers, ranchers, their families, and their employees.

Question. What was the original goal of this training center and what has been accomplished to date?

Answer. The original and continuing goal of this project is to develop, implement and evaluate diverse training methods for meeting the desired training objectives of at-risk agricultural audiences. For example, the training center has developed and is currently testing the feasibility of delivering agricultural safety and health information over fiber optic systems in the Midwest. This training is designed for firefighters and emergency medical service providers who respond to farm chemical emergencies. By using a fiber optics delivery technology, the training center is able to reach over 20,000 volunteer firefighters and rescue personnel with the latest methods for mitigating farm chemical and fertilizer fire, explosion and spill and leak emergencies.

The training center's 12 acre site is also now equipped with confined spaces facility for delivering important hands-on training on manure storage hazards and silo gas risks for U.S. dairy farmers. This \$60,000 private donation enables the center's staff to present real-life scenarios about the risks associated with naturally-occurring gases in production agriculture.

It should also be noted that many of the center's programs are developed for safety professionals who work with farmers and ranchers across the nation. These programs are designed for train the trainer initiatives that greatly expand the education and training opportunities for farm populations that would otherwise be at risk due to the unavailability of effective training.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 1998 with an allocation of \$195,000, and has remained at this level through fiscal year 2000. The total appropriation to date has been \$585,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds and sources of donations were as follows: In 1998, non-federal funds included \$450,000 state appropriation dedicated to the construction of Phase II; and \$75,000 of miscellaneous donations and in-kind contributions received from Deere & Company, Dupont Corporation, Double L Group, Ltd, Melroe Company, Dubuque Racing Association and Theisen's Farm, Home and Auto, Inc. In 1999, non-federal funds totaled \$135,200 from the same sources as 1998 and additional state, non-profit organizations and private sources.

Question. Where is this work being carried out?

Answer. Training and educational initiatives under this grant are being conducted at the National Education Center for Agricultural Safety, located on the campus of Northeast Iowa Community College in Peosta, Iowa.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives is approximately March 31, 2000. Many of these objectives have already been met. Anticipated completion date of additional objectives is March 31, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES merit review of the project application and site review were conducted in the spring of 1999. Another site visit is scheduled for June 2000. The project will be completing its second fiscal year on March 31, 2000. The National Education Center for Agricultural Safety utilizes external farm safety and health evaluators and two advisory committees to maintain its focus on the most pressing issues affecting the safety and health of our nation's agricultural populations.

Wisconsin-Stout's Northwest Wisconsin Manufacturing Outreach Center with direct consultation and long-term in-plant assistance delivered primarily through the efforts of university Project Managers. Direct assistance may be delivered through Co-op students, staff of the University of Wisconsin System, both two-and-four year institutions, and Extension services; the Wisconsin Technical College System; secondary schools; the private sector, professional societies, and private consultants, or attendance at state or national seminars. The project also draws on many other state resources to add expertise and capacity to network facilitation and in-plant extension activities. The project has undergone a merit review.

Question. What is the national, regional, or local need for this program?

Answer. America's manufacturers continue to face tremendous global competition. There are enormous pressures to improve the quality of products; reduce the time consumed to bring new products to market; and there remains an ever increasing demand to reduce the costs of products. Currently there is a strong movement in manufacturing to use speed-to-market combined with new product introduction as a tool to obtain a competitive advantage. While high quality and cost efficiencies continue to be mandatory commitments for today's manufacturers, great value is now being placed on speed-to-market. Large companies are not the only ones influenced by these trends. Small and medium size manufacturers often supply directly to the market or are vital elements of a supply chain. Hence, they must be able to respond quickly to changing market conditions while continuously improving productivity and product quality.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The Manufacturing Technology Transfer program's principal objective is the development of a competitive, secure manufacturing base through the mechanism of industrial extension. The program principally targets small and medium size manufacturers in rural Wisconsin. This funding will: continue to provide valuable industrial extension service to the target audience; support the continued empirical development of an industrial extension model; and investigate the use of new manufacturing technologies to support global competitiveness of manufacturers. Productivity improvements were reported by the companies showing impressive economic impact to the region through client operations assessments and plant evaluations, strategy development for continuous improvement, implementation of new organizational and operational methods, implementation of new manufacturing technologies, establishment of quality assurance/total quality systems, establishment of ongoing training programs, on-site instruction in new technologies, improved methods, and processes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This project has been underway since fiscal year 1992 and was funded for \$165,000 per year in fiscal years 1992 through 1995, and for \$163,000 in fiscal years 1996 through 2000 for a total of \$1,475,000.

Question. What is the source of and amount of non-federal funds provided by fiscal year?

Answer. University of Wisconsin-Stout provides \$24,367 as in kind match. Funds from other state, University, and partner resources are pooled with USDA funds to carry out the described efforts.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 12 months. However, the Manufacturing Technology Transfer Program was developed as a continuously evolving industrial extension strategy for serving the needs of the manufacturing community. The Manufacturing Technology Transfer program is measured by success in meeting the objectives of the past five years' proposals, including the delivery of modernization assistance and development of an industrial extension model. The current phase of the program will be completed in 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. To measure the success of the project, a client evaluation process has been developed which includes an evaluation questionnaire. Evaluations are performed both by program staff, and by an objective, third-party survey house. Evaluations indicate significant forward strides in job creation, new businesses, expanded productivity, and enhanced international competitiveness. An agency evaluation of this project was last performed by the Department of Commerce in 1999.

PILOT TECHNOLOGY TRANSFER PROJECTS, OKLAHOMA AND MISSISSIPPI

Question. Please provide a description of the program that has been funded under the Oklahoma and Mississippi Technology Transfer Projects.

Answer. The original work involved the transfer of uncommercialized technologies from Federal laboratories and universities to rural businesses and communities. The objectives have evolved to providing more one-on-one assistance to small manufacturers. This type of assistance responds to the stated needs of the small manufacturing community and fills a recognized gap in the existing service provider community. This innovative and unique program has opened an entirely new clientele base for Cooperative Extension, small rural manufacturers in Oklahoma. This project has undergone a merit review.

The original project in Mississippi focused upon the exploration, evaluation, development, and education/transfer of innovative technologies throughout the state such as agribusinesses, rural businesses and industries, communities, and local governments. In Mississippi, these original goals are still the guiding principle of the project. Specific objectives and activities of the project have been modified as the project and new technologies have been invented and introduced.

Question. What is the national, regional, or local need for this program?

Answer. Manufacturing extension programs throughout the country have identified one-on-one engineering technology assistance as a need for small manufacturers as they attempt to become more competitive and profitable. The Oklahoma Manufacturing Extension Partnership has received national acclaim for its noteworthy and highly effective partnership with the Land Grant University. This partnership was forged in 1995 by the Technology Transfer Program and continues today as the model Applications Engineering Program. As the Applications Engineering Program has begun to address more of the manufacturing engineering issues on a state-wide basis, the Technology Transfer Program has been exploring new ways of providing technology assistance to the small manufacturers. The Technology Transfer Program will begin augmenting its manufacturing engineering and technology service with Advanced Manufacturing Management Systems assistance to include: Resource Planning and Control, Manufacturing Operations Costs Analysis and Control, Manufacturing Process Simulation, and Electronic Commerce.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The primary goal of these programs is to contribute to an increase in business productivity, employment opportunities, and per capita income by utilizing technology and information from Federal laboratories, Rural Enterprises of Oklahoma, Inc. of Durant, Oklahoma; Mississippi State Food and Fiber Center; Voca-

tional-Technical Education System; Center for Local Government Technology; Cooperative Extension Service; and other university departments and non-campus agencies.

The original project in Mississippi focused upon the exploration, evaluation, development, and education/transfer of innovative technologies to various throughout the state such as agribusinesses, rural businesses and industries, communities, and local governments. In Mississippi, these original goals are still the guiding principle of the project. Specific objectives and activities of the project have been modified as the project and new technologies have been invented and introduced.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Funding appropriated to date is as follows: \$350,000 per year in fiscal years 1984 and 1985; \$335,000 in fiscal year 1986; \$333,000 per year in fiscal years 1987 through 1990; \$331,000 per year in fiscal years 1991 through 1995; and \$326,000 per year in fiscal years 1996 through 2000. Total appropriations is \$5,652,000.

Question. What is the source and amount of non-federal funds?

Answer. Oklahoma State University and Mississippi State University have provided considerable amounts of matching support from state funds over the life of the project. Over the past four years, support has included a significant portion of engineering faculty salaries as well as the administrative support of county and district extension staff.

Mississippi State University has provided a considerable amount of matching support from state funds each year of the project. Matching funds have been at least equal to the amount of the Federal funds provided for the project in the past 10 years. Matching funds have included faculty salaries, technology equipment, travel, commodities, and administrative support. Additional non-federal funds have been provided.

Question. Where is this work being carried out?

Answer. The work is being carried out at Mississippi State University and Oklahoma State University and, more importantly, on the shop floors of the small rural manufacturers. Work related to this project is being carried out at the University, in some of Mississippi's Community Colleges, on the Internet, and in every county in Mississippi. Demonstrations, educational workshops, Internet access, video-conferencing sessions, satellite conferences, and one-on-one sessions have been conducted in businesses, local government offices, Extension offices, schools, farms, and even homes where appropriate.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1984 was for 12 months. The original objectives have been, and continue to be met. Although individual client projects have a beginning and end, the technology transfer process is continuous. Over the past years, specific and measurable annual objectives and the achievement of objectives have been documented in annual reports. The objectives of both programs have been to continue the delivery of high-quality engineering assistance and technology transfer services to small manufacturers, conduct joint workshops, client referral, and joint research and application projects, and demonstrate a value of service to clients many times project operating costs.

In Mississippi the original project contained objectives designed to be completed in 12 months. However, the first year clearly demonstrated that fully reaching objectives related to the transfer of new technology not only takes longer to achieve, but becomes a never ending process as the challenge is constantly changing as new technologies are developed. The technology transfer process is an extended and a continuous process. Over the past years, specific annual objectives and activities have been set and achieved and have been documented in annual reports. The objectives and activities of the current project are designed to be completed in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Site visits and merit reviews have been conducted annually on these projects as well as client surveys by project staff themselves. Survey results have documented job creation, productivity enhancement, and local community economic activity. The Technology Transfer Program has impacted the integration of emerging technologies that are benefitting the citizens, ranging from assisting small businesses and industries in integrating new computer hardware and software for conducting electronic commerce, to providing extensive on-line information resources. The Technology Transfer Funds have served as a catalyst for the development of

a long range telecommunications network plan for the total extension service to link all county extension offices and research centers directly to the Mississippi data/video backbone and provide access to the Internet.

Evaluation for the Technology Transfer Project in Mississippi has been both formative and summative. The effectiveness of all project activities is carefully reviewed and input is gathered from the individuals who participate in the training sessions to determine if the objectives of the project are being achieved. Evaluations of every educational workshop and activity are conducted on a regular basis and have consistently yielded outstanding marks. At the end of each year, a careful review of project demonstrations/exhibits/presentations, as well as the number of individual served, are reviewed. Perhaps the best indicator of success has been the continued increase in the demand for these technology-related activities. Also, Mississippi State University Extension Service annually reviews its implementation of new technologies to insure that these technologies are being utilized in the most effective manner possible. This project has allowed the Mississippi State University Extension Service to make significant progress in educating the clientele it serves. No State Extension Service provides more technology transfer education than Mississippi for its personnel. This training equips our county personnel to be more effective technology transfer educators and advisors to outside clientele to the point where county personnel are now conducting their own technology transfer training sessions. For example, Newton County personnel have provided at least 10 workshops in the past year for county clientele.

PILOT TECHNOLOGY PROJECT WISCONSIN

Question. Please provide a description of the program that has been funded under the Wisconsin Pilot Technology Project.

Answer. Primary industrial extension activity of the Manufacturing Technology Transfer program is the delivery of technical assistance to manufacturing companies. Executive direction in determining the assistance required will be provided by the University of Wisconsin-Stout's Northwest Wisconsin Manufacturing Outreach Center with direct consultation and long-term in-plant assistance delivered primarily through the efforts of university Project Managers. Direct assistance may be delivered through Co-op students, staff of the University of Wisconsin System, both two-and-four year institutions, and Cooperative Extension services; the Wisconsin Technical College System; secondary schools; the private sector, professional societies, and private consultants, or attendance at state or national seminars. The project also draws on many other state resources to add expertise and capacity to network facilitation and in-plant extension activities. The project has undergone a merit review.

Question. What is the national, regional, or local need for this program?

Answer. America's manufacturers continue to face tremendous global competition. There are enormous pressures to improve the quality of products; reduce the time consumed to bring new products to market; and there remains an ever increasing demand to reduce the costs of products. Currently there is a strong movement in manufacturing to use speed-to-market combined with new product introduction as a tool to obtain a competitive advantage. While high quality and cost efficiencies continue to be mandatory commitments for today's manufacturers, great value is now being placed on speed-to-market. Large companies are not the only ones influenced by these trends. Small and medium size manufacturers often supply directly to the market or are vital elements of a supply chain. Hence, they must be able to respond quickly to changing market conditions while continuously improving productivity and product quality.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The Manufacturing Technology Transfer program's principal objective is the development of a competitive, secure manufacturing base through the mechanism of industrial extension. The program principally targets small and medium size manufacturers in rural Wisconsin. This funding will: continue to provide valuable industrial extension service to the target audience; support the continued empirical development of an industrial extension model; and investigate the use of new manufacturing technologies to support global competitiveness of manufacturers. Productivity improvements were reported by the companies showing impressive economic impact to the region through client operations assessments and plant evaluations, strategy development for continuous improvement, implementation of new organizational and operational methods, implementation of new manufacturing technologies, establishment of quality assurance/total quality systems, establishment of

ongoing training programs, on-site instruction in new technologies, improved methods, and processes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This project has been underway since fiscal year 1992 and was funded for \$165,000 per year in fiscal years 1992 through 1995, and for \$163,000 per year in fiscal years 1996 through 2000 for a total of \$1,475,000.

Question. What is the source of and amount of non-federal funds provided by fiscal year?

Answer. University of Wisconsin-Stout provides \$24,367 as in kind match. Funds from other state, University, and partner resources are pooled with USDA funds to carry out the described efforts.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 12 months. However, the Manufacturing Technology Transfer Program was developed as a continuously evolving industrial extension strategy for serving the needs of the manufacturing community. The Manufacturing Technology Transfer program is measured by success in meeting the objectives of the past five years' proposals, including the delivery of modernization assistance and development of an industrial extension model. The current phase of the program will be completed in 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. To measure the success of the project, a client evaluation process has been developed which includes an evaluation questionnaire. Evaluations are performed both by program staff, and by an objective, third-party survey house. Evaluations indicate significant forward strides in job creation, new businesses, expanded productivity, and enhanced international competitiveness. An agency evaluation of this project was last performed by the Department of Commerce in 1999.

RANGE POLICY DEVELOPMENT, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Range Policy Development grant.

Answer. The Range Policy Development project has collected local economic data throughout the State. Local data have been used to develop an economic model to help explain the relationships among local economies and primary industries. The model enables policymakers to better understand how local and State economies are tied to primary industries, especially those industries that use public lands. The initial focus of the project has been on the livestock grazing industry.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. In New Mexico and throughout the western states, many local economies are dependent on the use and management of public range and forest lands. However, there exists a great deal of disagreement about the true level of dependence of individual communities on these public land-based industries and, consequently, disagreement about the local, statewide, and regional impacts of public policies that alter the use and management of these lands. Through better understanding of how public lands impact local and regional economies, we now can predict the outcomes of potential legislation or amended land use policies, resulting in policies that enhance, rather than detract from, local economies. The model was used to analyze the economic impacts of rangeland reform. The Bureau of Land Management—BLM—and Governor's State team chose to use the tool—Input/Output Model—and the method to analyze the Resource Advisory Council—RAC, fall back, and county alternatives for the State Environmental Impact Statement—EIS.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The model has been requested by the U.S. Forest Service to help improve Region 3 Land Use Plan amendments in response to newly listed Threatened and Endangered Species. New Mexico is in the process of developing detailed input-output models for each county, from local and state tax revenue data. Economists are following up with workshops across the state to present information from economic forecasts to local decision makers. Further, the project calls for increasing the utility of the models by expanding the scope of the database to include oil, gas, cheese processing, dairy and food livestock industries in addition to the grazing enterprises.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2000?

Answer. This project was initiated in December 1994. The total appropriation for the project has been \$1,162,240. The award of \$197,000 for 2000 has been made to allow completion of the analysis of Draft EIS and Final EIS for BLM-U.S. Department of the Interior in conjunction with the State of New Mexico. The document is a proposed Statewide Resource Management Plan Amendment/Final EIS and is entitled "New Mexico Standards for Public Land Health and Guidelines for Livestock Grazing Management."

Question. What is the source and amount of non-federal funds to support this project?

Answer. The project budget does not indicate any non-federal support. However, Agricultural Research Stations in five other States have economists currently working to expand upon the New Mexico project, ultimately to build a regional model.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. According to the project director, most of the original objectives of the first phase have been accomplished. The second phase of the project was initiated September 15, 1999. This phase will investigate the hypothesis that recreation—in particular, Federal land based dispersed recreation—generates sufficient revenue to offset the significant and now documented economic contributions of the consumptive industries, such as range, forestry and mining, and crop and livestock agriculture. Recreation expenditure patterns and economic cycles will be investigated. Production agriculture and range livestock are vital segments of rural economies. These sectors produce sustainable long-term income and wealth and are the basis of the customs and culture of rural economies. The anticipated completion date is September 30, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal for continued funding underwent merit review by an agency team of National Program Staff in May 1997, and a review of progress to date was conducted by the project liaison in September 1997. The reviews focused on criteria including the relevance of the project goals, the suitability of the proposed research methods, and the extent of progress made toward addressing the goals of the project. Both reviews found that phase one objectives had been met, and adequate progress had been made toward the objectives of the second phase of the project.

RURAL DEVELOPMENT, ALASKA

Question. Please provide a description of the program that has been funded under the Rural Development, Alaska Project.

Answer. This program is being designed to assist technical assistance delivery to distressed communities in Alaska. The grant has not been distributed to date and no programmatic actions have occurred to date.

Question. What is the national, regional, or local need for this research?

Answer. Changes occurring in the management and utilization of public lands and changes occurring in rural economies as a result of global competition and changing market conditions need to be assessed in terms of impacts on small and rural communities in distress.

Question. What was the original goal of this program and what has been accomplished?

Answer. The original goal of this program was to improve technical assistance to distressed Alaskan rural communities.

Question. How long has this work been underway and how much has been appropriated by fiscal year 2000?

Answer. The work supported by this program began in fiscal year 2000 with an appropriation of \$276,285.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. No non-federal funds have been provided for this project.

Question. Where is the work being carried out?

Answer. The work is to be carried out in rural communities in Alaska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original grant proposal has not been submitted to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. No program activities and no evaluation have been carried out to date.

RURAL DEVELOPMENT THROUGH TOURISM, NEW MEXICO

Question. Please provide a description of the program that has been funded under the Rural Economic Development Through Tourism—REDTT—Project in New Mexico.

Answer. The Rural Economic Development Through Tourism Project involves applied research and outreach focused on locally-based tourism development strategies to enhance economic opportunity in small and rural communities in New Mexico. Components of the agenda support training of local leadership and tourism professionals, strategic planning and market development, and technical assistance to communities. Proposals submitted are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas.

Question. What is the national, regional or local need for this program?

Answer. This is an on-going pilot project to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural tourism as a development strategy. The grant has demonstrated that a long-term commitment of resources and activity can lead to effective development of tourism resources and build new market opportunities and tourism products for small communities. This project would provide an excellent proposal for the Fund for Rural America.

Question. What was the original goal of this program and what has been accomplished?

Answer. The applied research and outreach project was designed by the State Cooperative Extension Organization to increase the ability of the public sector to enhance economic opportunity for rural communities through tourism development. A regional task force composed of Extension professionals and community leaders from business, industry, education, and government—local, state, and Federal—was developed to guide and advise the development and implementation of locally-based programming and research. The results include video training materials, a public relations package, image studies and profiles, regional tourism guides, development of tourism bus packages, festival planning workshops, development of regional tours, and a mini-grants program for tourism development.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2000?

Response. In fiscal years 1992 through 1995 the amount of \$230,000 per year was appropriated. The appropriation for fiscal years 1996–1997 was \$227,000 per year; for fiscal year 1998 was \$247,000; for fiscal years 1999 and 2000, \$280,000 per year. Total appropriated funds to date is \$2,181,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Fiscal year 1992 included \$38,764 in state matching funds. Fiscal years 1993, 1994, 1995 and 1996 included \$39,360 per year of state matching funds. Fiscal years 1997 and 1998 include \$39,040 per year state matching funds.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through New Mexico State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1993. The original objectives of this research have been met. The additional objectives being presented for the 1999 year will be completed by September 30, 2000. Year 2000 proposal has not been submitted to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Each year, the project has demonstrated significant accomplishment in the reports submitted. Impacts include significant increases in attendance of local festivals, increase in number of tour bus visits to New Mexico, training to over 700 tourism employees in the region, and establishment of a number of new businesses. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

RURAL DEVELOPMENT, OKLAHOMA

Question. Please provide a description of the program that has been funded under the Rural Development, Oklahoma Project.

Answer. This program provides financial and technical assistance to small business to create and retain jobs in rural Oklahoma and to stimulate the local economies. The program is carried out through financial services, business incubators, problem-solving assistance to small and medium-sized manufacturers and technical assistance to rural small businesses. The program is expanding to include assistance to rural small businesses to enter international trade. The program continues to evaluate new products and processes that may result in new industries or be applied to improve existing manufacturing processes. The project has undergone a merit review.

Question. What is the national, regional, or local need for this research?

Answer. The increased demand for small business financing and technical assistance verifies the need for the program. Each year financing secured for small businesses has significantly increased. The demand for business incubators is also on the rise. Last year, Rural Enterprises, REI agreed to manage two more business incubators bringing the total REI-managed facilities to thirteen. Also, small businesses continue to need access to technical and business management assistance, worker training, and international trade assistance in order to stay competitive in domestic and world markets.

Question. What was the original goal of this program and what has been accomplished?

Answer. The original goal of the program was to create jobs in rural Oklahoma by providing systematic access to improved technology, training, financial and business management assistance. REI is a Certified Development Corporation for the Small Business Administration as well as a designated Certified Development Financial Institution. As a result, REI has been successful in obtaining financing for entrepreneurs and rural small businesses totaling \$119,060,129. Special technical assistance efforts have included problem-solving assistance to small manufacturers; training and dissemination of information on ISO9000 to assist rural businesses compete with a global market; providing manufacturers with a "Quick View Assessment" program which enables manufacturers to compare their facilities and operations with other companies across the United States; and working one-on-one with small businesses providing on-site assistance with inventory control, cash flow management, and marketing.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Appropriations to date are as follows: \$433,000 per year in fiscal years 1988-89; \$430,000 in fiscal year 1990; \$431,000 in fiscal year 1991, \$300,000 per year in fiscal years 1992-95; \$296,000 per year in fiscal years 1996-97; \$150,000 per year in fiscal years 1998-2000. Appropriations total \$3,969,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. No non-federal funds have been provided for this project.

Question. Where is this work being carried out?

Answer. The work is being carried out at Rural Enterprises, Inc., REI in Durant, Oklahoma.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1988 was for a period of 12 months. However, the objectives of Rural Enterprises, Inc. are on-going because of the nature of the activity. The clientele is diverse and decentralized. The engineering and management consultation model being pursued with individual clients results in a situation where hundreds of problems are being pursued simultaneously and when solved are replaced by new issues resulting from international competition, regulations, training needs, and changeover costs. The next phase of the program will be completed in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. REI itself conducts an on-going evaluation process to measure the organization's effectiveness and efficiency in accomplishing its objectives and this is documented on a quarterly basis through our reporting system. Over 6,000 jobs have been created and retained for new and expanding businesses as a result of this program. While the program has met its key objective of job creation in rural Oklahoma, the nature of its outreach effort continues to evolve and change as business

sustainability and profitably confront new challenges within small and rural communities.

RURAL REHABILITATION, GEORGIA

Question. Please provide a description of the program that has been funded under the Rural Rehabilitation project in Georgia.

Answer. The program has tested the feasibility of providing satellite-based adult literacy education, in association with vocational rehabilitation services, to handicapped adults in rural Georgia. The program has developed curriculum, tested and adapted technology, established student recruitment and retention strategies, expanded to Statewide coverage, and provided successful adult literacy education.

Question. What is the national, regional, or local need for this program?

Answer. A state task force has estimated that 25 percent of Georgia's adult population is functionally illiterate. Functional illiteracy is regarded in Georgia as a form of disability. The extent of adult functional illiteracy is similar throughout much of rural America.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal of this program was to prove that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. This program has demonstrated that satellite-based literacy training, in cooperation with vocational rehabilitation services, can successfully provide adult literacy education designed to improve critical reading, writing, and thinking skills, for handicapped rural adults. Over the past 9 years, test scores and attendance and completion rates of students in the satellite-based program have shown that distance learning is an effective delivery system for instructing low-level readers and non-readers. Test scores and attendance rates of students in this program have been comparable to those of students in traditional, urban classes. The project is currently working to perfect a process for internet based instruction and student assessment.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. Funding for this program was initially appropriated in fiscal year 1989, and the program has been in operation since March 1989. Through fiscal year 2000, appropriations for this program have been as follows: \$129,000 in fiscal year 1989; \$256,000 in fiscal years 1990, 1991, and 1992; \$250,000 in fiscal years 1993, 1994, and 1995; and \$246,000 in fiscal years 1996, 1997, 1998, 1999 and 2000 for a total of \$2,877,000.

Question. What is the source of and amount of non-federal funds provided by fiscal year?

Answer. The fiscal year 1998 source of non-federal funds provided for this program are state appropriated funds from the Georgia Department of Adult Education. Prior years sources also included private contributions from the Woodruff Foundation and other local foundations. Through fiscal year 1998, the total amount of non-federal funds provided the project has been \$8,006,901. The breakdown by fiscal year is: \$164,000 in fiscal year 1988; \$270,500 in fiscal year 1989; \$809,675 in fiscal year 1990; \$656,765 in fiscal year 1991; \$65,000 in fiscal year 1992; \$1,019,821 in fiscal year 1993; \$20,000 in fiscal year 1994; \$872,500 in fiscal year 1995; \$1,500,000 in fiscal year 1996; \$1,319,320 in fiscal year 1997; and \$1,309,320 in fiscal year 1998.

Question. Where is this work being carried out?

Answer. The Georgia Tech Satellite Literacy Project is sponsored and operated by four organizations: Georgia Institute of Technology's Center for Rehabilitation Technology, the Center for Rehabilitation Technology, Inc., Literacy Action, Inc., and the Georgia Department of Technical and Adult Education. The program grantee is CRT, Inc., a private, not-for-profit business advisory board to the Center for Rehabilitation Technology, College of Architecture, Georgia Institute of Technology, from which the literacy instruction has been provided.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It was anticipated that it would take 3 years to demonstrate that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. That original objective was met in Fiscal 1991. Additional objectives since fiscal year 1991 have been to expand the outreach of the satellite based adult literacy program to enough additional sites throughout the State of Georgia so that all potential participants have reasonable access to the program,

and to continually upgrade the quality of class programming and the technical capacities of the system. The fiscal year 1997 technological upgrades expanded the capacity of the program more than 25-fold, from 77 to over 2,000 downlink sites, and a six-fold increase in broadcast hours, and made materials available as supplemental tools to all Georgia literacy classes. As of December 1997, the Georgia Tech Satellite Literacy Program is in a period of transition from that of providing literacy instruction via direct television broadcasts to classrooms to that of development and dissemination of technology-based instructional aids. The project has been renamed the Lifelong Learning Network, or LNN. This change is being made based upon the request of the major sponsor, the Georgia Department of Technical and Adult Education, Office of Adult Literacy. The LNN will develop and produce video-based instructional supplements, technology-based curriculum and training for adult literacy practitioners, and multi-media projects for literacy students.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency receives annual reports on the project that are used, together with agency merit review, to assess its progress. Based on these reports, the agency has found that the project has made steady progress in demonstrating the feasibility of utilizing distance learning technology and teaching methods to provide adult literacy education programs to handicapped adults throughout the State of Georgia. The project has been successful in applying the latest distance education technology to both control the program cost per participant and, most recently, to expand the availability of the program.

WOOD BIOMASS, NEW YORK

Question. Please provide a description of the research that has been funded under the Wood Biomass Grant?

Answer. The objective of this project is to expand, implement, and gain acceptance of short rotation woody crop biomass as a sustainable, renewable and environmentally friendly fuel source and as a feedstock for conversion into biobased industrial products. In addition, the project is supporting the promotion of low value fiber from the Nation's Central and Northern Hardwood forests regions.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The principal researchers hypothesize that the project is of national interest. Biomass research studies through the U.S. Departments of Agriculture and Energy span 20 or more years. This work clearly demonstrates that the nation is in a position to scientifically produce environmentally affable fuels for power generation systems and other biobased industrial products. Except for co-generation plants, the current cost of conventional power supply fuels currently precludes the wholesale adoption of this technology. Complementing the planned fuel supply are many sidebar benefits including carbon offsets and sequestration, rural economic development, wildlife habitat, and reduction in soil erosion sedimentation and non-point source pollution associated with conventional agriculture. Valuing these and other products will make the economics of the system much more attractive. The applied research on the production system will be applicable across the Northeastern and Midwestern United States. Knowledge gained and lessons learned during the project will be applicable to similar projects across the country. The project is awarded non-competitively, but it is annually subjected to a CSREES Merit Review.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to promote, through applied research and technology transfer, wood biomass as a sustainable wood supply for (1) power generation and other biobased industrial products, (2) alternative farm products, (3) wise stewardship of land resources, and (4) enhanced farm profitability.

To accommodate these goals, scientists at the State University of New York College of Environmental Science and Forestry—SUNY-ESF—are planting willow trials and demonstration areas on several sites. Site preparation trials—including the use of cover crops, reduced tillage practices, and different herbicide regimes—and planting has occurred on several locations. Cornell University, a partner institution in the project, has hired a technology transfer specialist to coordinate educational activities resulting from this work. Common events include field days, news articles, presentations, tours of the demonstration farms, and exhibits.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. This aspect of the program began with an appropriation of \$200,000 in fiscal year 1995. An additional \$197,000 was appropriated by the Congress for fiscal years 1996 through 2000. This sums \$1,185,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Four state partners and approximately 18 private partners contribute resources at a ratio of nearly 1.5 to 1 for this project.

Question. Where is the work being carried out?

Answer. The fieldwork is being conducted on private and state land near Syracuse, New York. Electronic and print media allows Cornell's and SUNY-ESF's technology transfer activities to extend far beyond that point. Presentations have been made at international, national, and regional conferences and workshops. Numerous presentations have been made to local groups across the northeastern United States. The demonstration farms established under this project have been toured regularly by visitors from across the country and around the world.

Question. What was the anticipated completion date for the original objectives of the project. Have those objectives been met? What is the completion date of additional or related objectives?

Answer. The completion date for the original objectives of the project, willow cultivar planting was September 30, 1996. With the addition of some new dimensions to the project and the need to monitor the plots through the first growing cycle of 4 years, the completion date is now 2003. Because of the timing of one of the fiscal awards, some weather related problems and some land contract problems, all of the original objectives have not been met. Most of the unmet objectives should be completed in 2000.

Question. When was the last agency evaluation of the project? Provide a summary of the last evaluation conducted.

Answer. A field review of the project was conducted on August 20–21, 1997. Excerpts from the review report include (1) positive accolades for their quarterly progress reports, (2) positive accolades for the outreach program being conducted by Cornell University, (3) praise for the scientific outreach by the principal investigators, (4) praise for connecting the willow biomass program to the poultry waste and riparian issues in New York state, and (5) praise for gaining the acceptance of willow biomass as an agricultural crop for state property tax purposes. On the concern side CSREES' project administrator flagged the delay in establishing the demonstration farm and requested diligence in bringing this aspect of the project to fruition. Subsequent reports from the project reveal that this aspect has been satisfactorily addressed. In addition to the above, the project is annually reviewed by the Salix (willow) Consortium.

FOOD SAFETY INITIATIVE—NATIONAL RESEARCH INITIATIVE

Question. The Administration identifies a portion of the National Research Initiative (NRI) as part of the President's Food Safety Initiative. Please provide the total amount of funding made available through the NRI for Food Safety Initiative research in each of the past three fiscal years. Provide a brief description of the research work/project funded in each of these years and how it is contributing to meeting the goals of the President's food safety initiative, the amount of funding provided for the project, who is carrying out the work, and when the research work will be completed.

Answer. The NRI awarded funds for Food Safety Initiative research in fiscal years 1997, 1998, and 1999 via the Ensuring Food Safety Program. The primary objective of this program is to increase our understanding of disease-causing microorganisms, their products, and naturally occurring toxicants in meats, poultry, seafood, and fresh fruits and vegetables. In fiscal year 1999, in response to increased funding, the NRI added the Epidemiological Approaches for Food Safety Program to provide the opportunity and the large grant amounts needed for epidemiologic/population studies on the farm or anywhere along the food production continuum. The NRI awarded a total of \$2.5 million in 1997, \$2.9 million in 1998, and \$11.1 million in 1999 for food safety research. Of the \$11.1 million awarded in fiscal year 1999, \$4.1 million were awarded in the Ensuring Food Safety Program, \$5.3 million were awarded in the Epidemiological Approaches for Food Safety Program, and the remaining \$1.7 million were awarded for food safety research under other NRI programs. A brief description of each project funded by the NRI food safety programs in the past 3 fiscal years, including amount awarded, principal investigator—PI—and institution receiving the award, duration of the award, and a short project description, follows.

1999 Awards, epidemiological approaches for food safety:

Microbial Contamination of Produce: A Field Study in the Lower Rio Grande Valley, Texas, \$416,572, 3 years, University of North Carolina, Chapel Hill, C. Moe (PI). This study will look at farming and shipping practices on approximately 12 farms in the lower Rio Grande Valley of Texas with 3 vulnerable produce groups that are minimally processed and eaten raw—leaf lettuce/spinach, parsley/basil, green onions. Key agricultural practices where contamination may occur will be identified by measuring the microbial quality of produce at each step. Sources of fecal contamination will be determined.

Risk factors for Salmonella and Campylobacter infections and drug resistance in dairy cattle, \$765,447, 3 years, Michigan State University, J. Kaneene (PI). This is a 3 year longitudinal study of 130 dairy herds to (1) identify the patterns of occurrence and shedding of Salmonella species and Campylobacter jejuni and associated risk factors on dairy farms in midwest and northeast. This study will also evaluate the relative sensitivity and specificity of different sampling frequencies; determine susceptibility profiles to a number of antimicrobial agents; compare conventional and organic dairy farms; and determine molecular mechanisms involved in reduced susceptibility and the development of resistance.

Ecologic Assessment of Salmonella Enteritidis *va typhimurium* in a dairy milk shed, \$600,000, 3 years, University of California, Davis, W. Sisco (PI). This study will monitor changes in *S. typhimurium* isolated from two county dairy milk sheds—400,000 dairy cattle—in central California and identify the genetic variants of these isolates. It will also determine spatial pattern of variants and assess the pathogen, environment, and management factors associated with persistent dairy herd infection. Included in this study is the determination of genetic and phenotypic diversity of human and bovine sources and the spatial and temporal dynamics of human and bovine sources.

Ecology of antimicrobial resistance of enteric Salmonella and *E. coli* in cattle operations, \$771,868, 3 years, The Ohio State University, T. Wittum (PI). This study will describe the on-farm ecology of Salmonella species and *E. coli* antimicrobial resistance patterns in intensively managed cattle operations. It will monitor dairy and feedlot cattle operations and identify patterns of antimicrobial use and other factors.

Effect of water chlorination on prevalence of *E. coli* O157:H7 and Campylobacter in feedlot cattle, \$325,528, 2 years, Washington State University, T. Besser (PI). This study will chlorinate the water supplies of 32 pens of feedlot cattle in two feedlots through the feeding period and compare the infection rate in these cattle to that of 32 pens of cattle consuming non-chlorinated water. It will also evaluate the effect of chlorination on water consumption and weigh gains.

New methods for risk analysis of infectious animal diseases affecting food safety, \$359,515, 2 years, Colorado State University, M. Salman (PI). This study's goal is to refine existing and developing new methodologies to allow for better risk analyses of foodborne diseases. It will compare different current approaches, develop new models and will validate these methods using two diseases as modules.

Molecular epidemiology of Salmonella transmission in swine production systems, \$885,294, 3 years, University of Illinois, R. Weigel (PI). The goal of this research is to identify critical control points for interventions to reduce Salmonella infection in modern swine production facilities. Specifically, it will identify reservoirs for Salmonella in ecosystems; characterize these isolates genetically; identify the degree of genetic diversity in different reservoirs; identify changes in genetic diversity over time; and use ecological and genetic information to infer probable modes of transmission. Eight large, multi-site modern swine production systems will be studied over 15 months.

Following Resistant Salmonella through the food chain: a molecular ecology approach, \$814,564, 3 years, University of Georgia, J. Maurer (PI). This study will identify the diverse integron classes and their drug resistance genes in the chicken microflora and characterize their respective bacterial hosts. This study will follow transmission of the genes and integrons throughout the food chain. Samples will be taken from poultry at the hatchery, flock house, and the processing plant.

Dynamics of Campylobacter transmission on poultry farms, \$384,284 3 years, The Ohio State University, Q. Zhang (PI). This study will attempt to elucidate the sources of Campylobacter infection in broiler chickens and examine the host and environmental factors that affect the transmission of the organism on broiler farms. It will identify potential sources and routes of transmission, the affect of immune status and the environment, and assess the effect of both vertical and horizontal transmission.

1999 Awards, ensuring food safety:

Irradiation in a Combination Approach to Enhance Vegetable Safety, \$128,000, 2 Years, Chapman University, A. Prakash (PI). This study will determine the optimum levels of irradiation, modified atmosphere packaging—MAP, and chlorination that will enhance safety while preserving sensory attributes such as texture, color, and flavor in selected vegetables, including shredded iceberg lettuce and shredded cabbage. The project is expected to reveal the efficacy of combination processing to address the emerging safety issues associated with minimally processed vegetables.

Recalcitrance of *Clostridium perfringens* to High Hydrostatic Pressure Processing, \$95,000, 2 Years, University of Delaware, D.G. Hoover (PI). The goal of this study is to obtain an accurate assessment of the response of the foodborne pathogen, *Clostridium perfringens*, to high hydrostatic pressure in order to better understand the mechanism of inactivation and identify those controllable factors most important in protection of this pathogen from the effects of high pressure processing in foods. A novel technology, high pressure processing of foods offers U.S. agriculture a commercially-viable non-thermal means, i.e., “cold pasteurization”, for the processing of foods and beverages resulting in longer shelf-life and improved safety while maintaining sensory characteristics and nutrient content nearly identical to fresh or raw products.

Are Virulent Strain-Specific DNA Sequences of *Vibrio vulnificus* Essential For Virulence? \$150,000, 2 Years, University of Florida, P.A. Gulig (PI). *Vibrio vulnificus* is the leading cause of death in the U.S. associated with consumption of shellfish. This study will examine the relationship of virulent strain-specific DNA sequences to the disease process by determining if genes encoded on virulent strain-specific genomic sequences are essential for virulence, or if they are only markers for virulence by coincidence. By identifying virulence genes, we will contribute to understanding how this devastating food-borne pathogen can kill humans so rapidly after consumption of contaminated sea food. This information could be integrated into CDC, FDA, and State efforts to determine the epidemiology of infections and to develop interventions to reduce risk of *V. vulnificus* disease.

Inactivation of Pathogens on Alfalfa Seeds, \$114,319, 2 Years, University of Georgia, L.R. Beuchat (PI). The overall goal of this research is to develop a procedure to kill *E. coli* O157:H7 and *Salmonella* on alfalfa seeds without reducing the ability of the seeds to germinate and produce sprouts. Information gained from this research will be valuable in developing strategies to eliminate *E. coli* O157:H7 and *Salmonella* from alfalfa seeds as well as other seeds intended for sprout production, thus greatly minimizing the risk of illness associated with eating of raw seed sprouts.

Improving Pathogen Decontamination Treatments for Fresh Produce, \$185,000, 2 Years, University of Georgia, J.F. Frank (PI). This project will determine strategies for removing or inactivating pathogenic bacteria at protected locations on the surfaces of fresh produce. Such strategies will involve application of sanitizing agents containing food grade solvents or surfactants that may penetrate to protected sites and provide an effective decontamination treatment. Results of this research will provide basic information necessary for the commercial development of fresh produce decontamination treatments.

Genetic Markers and Pathogenesis Features of *Listeria monocytogenes* serotype 4b, \$220,000, 3 Years, University of Hawaii, S. Kathariou (PI). *Listeria monocytogenes* is a troublesome food-borne bacterial pathogen because of its ubiquitous distribution, its ability to grow in refrigerated foods, and its involvement in severe and often fatal illness—listeriosis. Serotype 4b is of special interest, being involved in almost all common-source outbreaks of listeriosis and in numerous sporadic cases. This study will complete the molecular characterization of two gene clusters unique to serotype 4b strains in order to identify DNA-based diagnostic reagents for this serotype. This research may yield novel molecular reagents that will facilitate monitoring and detection of clinically important strains of *Listeria monocytogenes*.

Identifying Factors that Promote Clearance of *E. coli* O157:H7 From Cattle, \$265,000, 2 Years, University of Idaho, C.H. Bohach (PI). This research will test the hypothesis that cattle diet and colonic cell proliferation may be used in pre-harvest interventions to promote the clearance of *E. coli* O157:H7 from the gastrointestinal tract of cattle. This research directly contributes to the USDA NRI Food Safety program goals of decreasing the incidence of food-borne illness by increasing our understanding of the ecology of *E. coli* O157:H7.

Molecular Mechanisms of Psychrotrophy in *Listeria monocytogenes*, \$253,000, 3 Years, Illinois State University, B.J. Wilkinson (PI). The proposed research aims to: (1) increase our understanding of an important foodborne psychrotrophic—cold-growing—pathogen and how it resists the food preservation strategy of chilling; and

(2) provide the scientific basis for improved control strategies for *Listeria monocytogenes*. The investigators are studying the membrane fluidity of the organism and the genes and proteins involved in its growth of at low temperatures.

Molecular Biology of Fumonisin Biosynthesis in *Gibberella fujikuroi*, \$100,000, 2 Years, Purdue University, C.P. Woloshuk (PI). Fumonisin are toxins produced in corn by the fungus *Gibberella fujikuroi*. Evidence has linked fumonisin with cancer in humans. With the likelihood of fumonisin concentrations being regulated world wide, the impact on the U.S. food industry will be substantial. The long-range goals of this research are to understand fumonisin biosynthesis and to develop novel approaches for eliminating fumonisin contamination of food sources.

Ecological Distribution of *E. coli* O157:H7 Strains in Agricultural Environments, \$210,000, 2 Years, Kansas State University, J.M. Sargeant (PI). The goal of this project is to determine the distribution of genetically-identified *E. coli* O157:H7 isolates in agricultural environments, as a means to identifying the sources of infection for cattle. This information will allow for the development of land management and water-use practices and policies for the control and/or reduction in the overall prevalence of *E. coli* O157:H7 in agricultural food products.

Characterization of Multiple Fluoroquinolone Resistance Among Bacterial Pathogens, \$157,000.00, 2 Years, U.S. Food and Drug Administration, D.G. White (PI). The objectives of this project are to: (1) Characterize the genetic resistant determinants responsible for fluoroquinolone resistance among veterinary isolates of *E. coli* and *Salmonella* spp.; (2) Determine if veterinary fluoroquinolone use selects for bacterial isolates that are cross resistant to human therapeutic fluoroquinolones; and (3) Determine if the emergence of fluoroquinolone resistance among veterinary and foodborne bacterial pathogens is genetically related. The data will determine if there are potential public health implications regarding the use of fluoroquinolones in animals in the U.S.

Detection of Viable Enterohemorrhagic *Escherichia coli* using Polymerase Chain Reaction and RNA-based Polymerase Chain Reaction, \$111,000, 2 Years, Mississippi State University, M.A. Drake (PI). This project will develop methodologies to rapidly detect viable enterohemorrhagic *Escherichia coli*—EHEC. The methods will be applied to artificially-contaminated ground beef samples. The development of nucleic acid based methodologies to detect viable EHEC will be applicable to other foodborne pathogens and will provide a more rapid option for monitoring food safety.

Extrusion Processing as a Means of Reducing *Fusarium* Mycotoxins in Cereal Foods, \$128,000, 2 Years, University of Nebraska, L.B. Bullerman (PI). Toxin producing *Fusarium* molds pose major food safety hazards by invading corn and wheat in the field and producing their toxins in the grain. The goal of this research is to find the optimum conditions of extrusion processing which will destroy and reduce the amounts of deoxynivalenol, zearalenone, and fumonisins in contaminated corn and wheat under simulated industrial conditions to render the processed grain-based foods free of these toxins. This project will contribute to the safety of the food supply by improving the safety of cereal-based foods.

A Membrane Fluidity Model for Sensitivity of Foodborne Pathogens to Preservatives, \$230,405, 3 Years, Rutgers, the State University of New Jersey, T.J. Montville (PI). There is poor understanding of how *Listeria monocytogenes*, a food poisoning bacteria, survives in cold hostile environments once thought to kill bacteria or at least prevent them from growing. The cell membrane is the barrier that protects food poisoning bacteria from preservatives and the environment. This research determines how membrane properties regulate the sensitivity of the bacteria to preservatives, acidity, and cold. A better understanding of how the bacteria survive our attempts to kill them will provide new concepts that can be used to increase the effectiveness of current preservatives and processes, and thus, improve food safety.

Specific Detection and Typing of *Vibrio parahaemolyticus* serotype O3:K6, \$110,065, 2 Years, Cornell University, K.J. Boor (P.I.). The goal of this research is to enhance the safety of seafood consumed in the U.S. by developing a rapid strategy for detecting pathogenic *V. parahaemolyticus* in foods, specifically focusing on serotype O3:K6 strains. The ability to distinguish between potentially dangerous isolates and the more prevalent nonvirulent vibrios will provide critically important tools that will allow public health workers to develop scientifically based guidelines for identifying water sources more likely to cause infection.

Novel Strategies for Determining Thermal Destruction of *Mycobacterium paratuberculosis*, \$87,784, 2 Years, Cornell University, K.C. Sasahara (PI). The American dairy industry annually loses \$120 million to Johne's disease, an incurable bacterial infection in cattle. Infected cattle shed *Mycobacterium paratuberculosis* into milk and feces, posing a possible health risk to humans. Although pasteurization of raw milk kills most spoilage and pathogenic microorganisms, isolation of *M. paratuberculosis* from humans suffering from Crohn's disease,

an incurable inflammatory bowel disease with clinical symptoms similar to Johne's disease, suggests a possible causal relationship. To better establish whether *M. paratuberculosis* cells are killed by pasteurization, the investigator will develop a strategy for screening for the presence of *M. paratuberculosis* in raw and processed milk. This project will establish specific heat treatment parameters for the destruction of *M. paratuberculosis* and develop a rapid detection method to improve dairy herd health management.

Transmission of *Listeria monocytogenes* in Food Systems, \$192,000, 3 Years, Cornell University, M. Wiedmann (PI). This project is designed to better understand the characteristics of different *Listeria monocytogenes* subtypes and to gain a better understanding of which specific *L. monocytogenes* subtypes cause human disease and how these types differ from those that cannot cause human disease. The investigators will comprehensively characterize *L. monocytogenes* isolates from humans, animals, and foods using both DNA fingerprinting methods and methods for evaluating a strain's ability to cause disease. This work will ultimately contribute to the development of science-based food safety regulations that economically meet public health needs.

Modeling Bacterial Pathogen/Biocontrol Competition With Changing Temperature, \$117,369, 2 Years, USDA-Agricultural Research Service; North Carolina State University, F. Breidt (PI). This project will develop models for the growth and death of two or more competing microorganisms during changing environmental conditions. The computer simulations and mathematical models being developed will be used primarily as tools to investigate the mechanisms of microbial competition. It is hoped that the principles learned in these studies can be applied to the prediction and prevention of the growth of disease causing bacteria in a variety of foods.

A Salmonella-based Vaccine to Prevent *E. coli* O157:H7 Infection in Cattle, \$200,000, 2 Years, North Carolina State University, S.J. Libby (PI). In this study, investigators will use several live, attenuated vaccine strains of *Salmonella* expressing important surface proteins of *E. coli* O157:H7 to vaccinated calves. Vaccination of calves with *Salmonella* strains expressing surface proteins of *E. coli* O157:H7 will engender a mucosal immune response. By stimulating mucosal immunity, it is hoped that the *E. coli* O157:H7 will not have an opportunity to colonize the lower bowel of the calves. The reduction or elimination of *E. coli* O157:H7 from these vaccinated animals will be determined. Means to significantly reduce or eliminate *E. coli* O157:H7 from cattle will ensure a safer food supply.

Characterization of Genes Regulating Aflatoxin Biosynthesis, \$220,000, 3 Years, North Carolina State University, G.A. Payne (PI). Aflatoxins are toxic and carcinogenic compounds produced in food by the fungus *Aspergillus flavus*. Contamination often occurs before harvest and no effective control procedures are available. The goal of this research is to understand the factors that regulate aflatoxin biosynthesis such that plant gene products or synthesized compounds can be employed to inhibit aflatoxin formation.

Development and Validation of Instruments to Evaluate Food Safety Education, \$200,000, 2 Years, The Ohio State University, L. Medeiros (PI). Consumer education about the basic principles of food safety is an important component of preventing foodborne illnesses. Impact is difficult to document because of a lack of valid and reliable evaluation instruments. The goal of this project is to develop and validate an instrument that is suitable for evaluation of food safety educational programs for low-income, low-literacy audiences.

Optical Biosensor Detection of Food Pathogens Based On Direct Measurement of Antibody/Antigen Binding, \$180,000, 2 Years, University of Rhode Island, A.G. Rand (PI). The demands from consumers for fresh, less processed food has increased the need to ensure microbial safety of these products. This project provides the opportunity for a multidisciplinary effort to create specific biosensors for rapid and early detection of pathogen contamination. These devices have the potential for specifically selecting food pathogens from among the total microbial load within minutes and measuring the concentration as real-time analysis on site.

Evaluation of Jensenin G as a Potential Food Preservative, \$90,000, 2 Years, Clemson University, S. Baker (PI). Bacteriocins, proteins produced by some bacteria which kill other bacteria, offer a defense against some foodborne pathogens. Currently, nisin is the only approved bacteriocin for use in foods in the United States. The development of additional bacteriocins for use as food preservatives is needed in the event organisms develop resistance to nisin or for use in foods in which nisin is ineffective. Jensenin G, a bacteriocin produced by *Propionibacterium jensenii*, inhibits the outgrowth of the causative agent of botulism and is heat and pH stable. The objectives of this study are to increase the number of organisms which are sensitive to jensenin G, characterize the mode of action of jensenin G, and produce large amounts of jensenin G.

Mechanism of Pathogen Survival During Microwave Thermalization, \$123,000, 2 Years, Virginia Polytechnic Institute & State University, J. Eifert (PI). It has been reported that microorganisms are more likely to survive in foods cooked using microwaves than foods cooked using conventional methods. This project will determine the mechanism of microorganism survival during microwave heating; determine the role of fat in the food product on inactivation of the microorganisms; study the effect of the presence or absence of steam on inactivation of the microorganisms; and develop mathematical models to describe the cooking process in the microwave oven in the presence or absence of steam. This research will result in procedures that can be used to develop microwave-heating procedures that will increase food safety.

Molecular Characterization of the *Campylobacter jejuni* Adhesin to Fibronectin, \$195,000, 3 Years, Washington State University, M.E. Konkel (PI). The ultimate goal of this study is to develop intervention and control methods to reduce the number of cases of human campylobacteriosis caused by *Campylobacter jejuni* and *Campylobacter coli*. Most cases of campylobacteriosis are sporadic in nature, resulting from the consumption of *Campylobacter*-contaminated chicken, unpasteurized milk, and unchlorinated water. The proteins that mediate the binding of *C. jejuni* to host cells are termed adhesins. The goal of this project is to further characterize one *C. jejuni* adhesin termed CadF, for *Campylobacter* adhesin to fibronectin. CadF may be useful as a vaccine candidate.

1998 Awards, ensuring food safety:

Rapid Detection of Brevetoxin and Ciguatoxin Using Recombinant Na⁺ Channels, \$90,000, 2 Years, University of South Alabama College of Medicine, S.D. Critz (PI). Contamination of shellfish by a marine toxin known as brevetoxin periodically threatens the health and safety of seafood consumers. This proposal will develop rapid and sensitive methods to test for brevetoxin and ensure seafood product safety.

Role of Putative Pathogenicity Island in *Campylobacter jejuni* Virulence, \$190,000, 3 Years, University of Arizona, L.A. Joens (PI). The goal of this study is to evaluate genes contained within a putative pathogenicity island in *C. jejuni* for their role in virulence. Genes within this island may be influential in defining the pathogenicity of the agent that will lead to control measures for decreasing the incidence of campylobacteriosis.

Strategies to Eliminate and Prevent Microbial Contamination of Food Products, \$70,000, 1 Year, University of Arkansas for Medical Science, C.M. Compadre (PI). The ultimate goal of this research is to develop effective methods to control, eliminate, and prevent microbial contamination of food products. The specific aims of this project are: to determine the effectiveness of the chemical cetylpyridinium chloride for decontamination of fresh fruits and vegetables.

Bacteria for Competitive Exclusion of *Salmonella enterica* Species in Chickens, \$185,000, 3 Years, University of Delaware, R.D. Joerger. The community of bacteria inhabiting the intestinal tract can prevent or impede the establishment of undesirable bacteria such as *Salmonella enterica* subspecies. The goal of the proposed research is to identify and isolate bacteria from the intestinal tract of chickens and to eventually test their effectiveness in reducing colonization of young chicks with *Salmonella*.

Fluorescence-Based Chemical Sensor for Saxitoxin, \$95,000, 2 Years, University of Miami, R.W. Gawley (PI). Saxitoxin is the primary constituent of the paralytic shellfish poisons. The investigators have discovered a molecular receptor that "signals" the presence of saxitoxin in solution by emitting light. The goal of this study is to begin the development of a photochemical sensor for the presence of saxitoxin which could be used to detect contamination of shellfish beds.

Defining Genomic Sequences Specific to Virulent *Vibrio vulnificus* Strains to Assess Risk, \$90,000, 1 Year, University of Florida, P.A. Gulig (PI). Currently, there is no practical test to determine if seafood products contain hazardous strains of *Vibrio vulnificus*. The goal of this study is to define DNA sequences specific to virulent strains and to develop simple DNA probe test(s) that can be used by industry and public health organizations to assess risk.

Regulation of Lipopolysaccharide Micro Heterogeneity, \$125,000, 2 Years, USDA Agricultural Research Service, J. Guard-Petter (PI). This study is directed towards understanding the genetic changes that result in strain variation in the *Salmonella enterica* serovar Enteritidis—SE. Strain variation will be measured by the ability of strains to generate particular lipopolysaccharide structures while maintaining accelerated growth. This work will lead to a better understanding of environmental conditions that favor outgrowth of new strains of SE.

Mechanism for Inactivation of Microorganisms by High Oxidation Potential Water, \$120,000, 2 Years, University of Georgia, U.C. Hung (PI). High oxidation potential—HOP—water has been reported to have strong bactericidal effect on most pathogenic bacteria. The overall objective of this project is to study the fundamental principles involved in the inactivation of food microorganisms with HOP water. The application of this technology will ensure food safety at reduced cost, high food quality, and reduced danger from foodborne illness.

Screening Corn for Resistance to *Aspergillus flavus* and Aflatoxin Accumulation, \$100,000, 2 Years, Southern Illinois University, J.S. Russin (PI). Two traits in corn genotypes will be used to identify potential sources of resistance to *Aspergillus flavus*. Genotypes that exhibit these traits will be evaluated for resistance in field trials. Those that show resistance will be examined for the mechanism of resistance.

Listeria monocytogenes: Ozone Inactivation, \$95,000, 2 Years, University of Illinois, S.E. Martin (PI). The objectives of this study are to examine the effects of ozone on the pathogen *Listeria monocytogenes*. Ozone has recently been recommended for approval as Generally Recognized As Safe in food production. This study will determine important parameters of ozone-induced injury and death of *L. monocytogenes* in a food product—cabbage.

Persistence of *Salmonella typhimurium* in Swine, \$240,000, 3 Years, University of Illinois, R.E. Isaacson (PI). *Salmonella typhimurium* is one of the major causes of salmonellosis in humans. Pigs persistently infected with *S. typhimurium* are one of the major reservoirs of this pathogen. One means to reduce the risk of foodborne infections caused by *S. typhimurium* is to prevent pigs from becoming persistently infected. This project is designed to understand the mechanisms promoting persistent infections.

Analysis of the Osmotic Regulation of Thermotolerance in *Salmonella* and *E. coli* O157:H7, \$185,000, 3 Years, Purdue University, L. Csonka (PI). The investigators have found that betaine, which is found at high levels in edible plants such as spinach and cereal grains, blocks the ability of salt additives to increase the heat tolerance of bacteria. This project will carry out a comprehensive characterization of all available structural relatives of betaine for their ability to counteract the induction of increased thermotolerance by salt additives in food pathogenic bacteria. This procedure may uncover new food additives that might be used to increase the efficacy of thermal inactivation in food contaminating bacteria.

Molecular Biology of Aflatoxin Biosynthesis in *Aspergillus flavus*, \$160,000, 2 Years, Purdue University, C.P. Woloshuk (PI). Aflatoxins, produced by the fungus *Aspergillus flavus*, are toxic and carcinogenic compounds contaminating a variety of food products. This research project will investigate an unusual mutation in *A. flavus* to determine the mechanism responsible for the suppression of aflatoxin biosynthesis. This research will impact agriculture by furthering our understanding about the regulation of aflatoxin biosynthesis and contribute information leading to development of new strategies for eliminating aflatoxin contamination.

Modeling Food Fluctuating Microbial Populations and Their Aperiodic Outbursts, \$90,000, 2 Years, University of Massachusetts, M. Peleg (PI). This project will analyze the pattern of fluctuation of the number of microorganisms in food products and will use mathematical models and statistical methods to estimate the probability of occurrence of an outburst of unusually high numbers which could be considered a safety problem. These calculated probabilities can then be used as an indication of an impending microbial outbreak, and as a tool to assess the efficacy of preventive methods in reducing the risk of foodborne illness.

Genomic Analysis of *Escherichia coli* O157:H7 Populations from Cattle and Humans, \$150,000, 2 Years, University of Nebraska, A.K. Benson (PI). The investigators have developed a powerful technique, termed high-resolution genotyping, that permits identification of even minor genetic differences between different *E. coli* O157:H7 strains. In the study, they will develop a database for rigorous assessment of isolates to identify genetic differences that may be related to persistence—strains that can be repeatedly isolated from a given herd of cattle over time. Ultimately, the results may provide a basis for understanding the impact of herd management practices on the population structure of *E. coli* O157:H7.

Antimicrobial Use and Emerging Resistance of *Salmonella typhimurium* in Dairy Cattle, \$120,000, 2 Years, Cornell University, L.D. Warnick (PI). This project investigates the effect of antibiotic treatment of clinical salmonellosis in dairy cattle on the occurrence of antibiotic-resistant *Salmonella typhimurium*, a major animal and human pathogen. This will be done by identifying dairy herds with *S. typhimurium*-infected cattle based on diagnostic laboratory culture results, obtaining antibiotic treatment information from farm records, and collecting fecal samples from cattle on the farm for *Salmonella* isolation and determination of resistance patterns. The study results will provide valuable information on the emergence of antibiotic-resist-

ant *Salmonella typhimurium* and specific drug-use practices which are associated with resistance.

Identification of Human Enteric Viruses in Foods and Foodborne Disease Outbreaks, \$140,000, 2 Years, North Carolina State University, L. Jaykus (PI). The purpose of this research is to refine molecular methods to detect human enteric viruses from foods and to further develop approaches for the investigation of outbreaks of foodborne viral disease. The successful completion of this project will provide rapid and economical methods for the detection of viral contamination of foods and the investigation of foodborne viral disease outbreaks. These benefits will ultimately improve the safety of food products, protect public health, and minimize financial losses due to viral contamination of foods.

Stress-Induced Resistance to High Pressure in *Listeria monocytogenes* and *Escherichia coli* O157:H7, \$90,000, 2 Years, The Ohio State University, A.E. Yousef (PI). High pressure processing is a novel, non-thermal technique for inactivating pathogens in food by the application of extremely high pressures. Since heat is not used in the process, negligible flavor and nutrient changes occur as a result of the high pressure treatment. Pathogenic bacteria are more likely to survive during food processing if they were exposed to conditions that make them resistant to preservation methods. This project will identify the potential causes for increased resistance of pathogens to pressure. The outcome of this project will help food manufacturers develop strategies to overcome and eliminate stress-adaptation in foodborne pathogens.

The Molecular Epidemiology of *Clostridium perfringens* Type A Food Poisoning, \$160,000, 2 Years, University of Pittsburgh, B.A. McClane (PI). *Clostridium perfringens* type A food poisoning is a common foodborne disease in the U.S. The diarrhetic and cramping symptoms of this illness are caused by *C. perfringens* enterotoxin—CPE. This project will evaluate four possible explanations for the strong association between chromosomal CPE isolates and food poisoning. These studies will improve the safety of the American food supply by distinguishing whether only chromosomal CPE isolates are able to cause food poisoning, or if isolates carrying an extrachromosomal CPE can be converted, by food-related stress, into chromosomal CPE isolates.

Inactivation of Foodborne Pathogens Exposed to a Uniform Flow Discharge Plasma, \$71,442, 1 Year, University of Tennessee, D.A. Golden (PI). The overall objective of this research is to evaluate the efficacy of a One Atmosphere Uniform Glow Discharge Plasma—OAUGDP—for its ability to destroy foodborne pathogens. The OAUGDP is a newly-invented form of electron discharge which generates a uniform glow discharge plasma in atmospheres of various gases such as helium, carbon dioxide, and most importantly, air. The OAUGDP unit has the potential to be adapted as an in-line process suitable for application as a mechanism of pasteurizing foods and controlling foodborne pathogens.

Sporulation Control of Enterotoxin Synthesis in *Clostridium perfringens*, \$130,000, 2 Years, University of Tennessee, S.B. Melville (PI). *Clostridium perfringens* is a common source of food poisoning in humans. The ability of *C. perfringens* to produce a heat resistant spore not only leads directly to the production of enterotoxin, but also leads to increased outbreaks of the disease. Often, foods are prepared at high enough temperatures to kill vegetative cells, but not spores. The purpose of this study is to determine how the sporulation process regulated enterotoxin protein gene expression. Information about how heat-resistant spores and enterotoxin are produced by the cell can be used to develop better food handling procedures to reduce the incidence of this very common disease.

Novel Antimicrobial Systems for Control of Foodborne Pathogens, \$90,000, 2 Years, University of Wisconsin, E.A. Johnson (PI). In the presence of low concentrations of the food-approved flavorants nerolidol and farnesol, microorganisms are inhibited by markedly lower doses of certain antimicrobial agents and antibiotics. These compounds are derived from natural plant sources. In this study sensitization by flavorants and inactivation of foodborne pathogens will be investigated. The successful completion of this project will provide novel elimination and sanitation technologies to reduce the risk of foodborne disease from foods and food contact surfaces.

DNA-Binding Proteins CspE and Dps Protect DNA at Low pH in *Escherichia coli* O157:H7, \$115,000, 2 Years, University of Wisconsin, C.W. Kaspar (PI). It is hypothesized that acid tolerance of *Escherichia coli* O157:H7 is a contributing factor to the low-infectious dose noted for this human pathogen. Because DNA is sensitive to acidic—low pH—environments and survival is dependent upon its protection, the goal of this project is to define the contributions of specific regulated proteins, known as CspE and Dps, to DNA protection in low pH environments such as foods and gastric fluid. Results from this study will provide industry and public health

agencies with the much needed data to further refine strategies for control, identify areas of risk, and add to the scientific knowledge on the survival of *E. coli* O157:H7.

1997 Awards, ensuring food safety:

The Role of Acid Resistance in *Escherichia coli* O157:H7 Colonization and Disease, \$227,000, 3 Years, University of South Alabama, J.W. Foster (PI). A crucial feature of *Escherichia coli* O157:H7 pathogenesis is its ability to withstand stomach acidity. The long term goal of this study is to develop new strategies that will diminish the infectious character of this pathogen through an understanding of the molecular basis of acid resistance in *E. coli* with emphasis on the superior acid resistance of O157:H7.

Quantitative Viability Assays for *Cryptosporidium parvum* and *Giardia lamblia*, \$44,000, 1 Year, University of California, Davis D.O. Cliver (PI). *Cryptosporidium parvum* and *Giardia lamblia* are common waterborne agents whose potential for transmission via foods is increasingly being recognized. The objectives of this study are to develop quantitative viability assays for *C. parvum* and *G. lamblia* and to evaluate the methods in trials of killing the protozoan oocysts or cysts by various means pertinent to food safety. The tests will be applied in inactivation trials with viable oocysts or cysts in foods of interest—e.g., apple juice, shellfish—or in water that might be used in food processing.

Molecular Stress Physiology of *Listeria monocytogenes*, \$113,000, 2 Years, Illinois State University, B.J. Wilkinson (PI). This study will look at the underlying mechanisms involved that permit *Listeria monocytogenes* to grow at low temperatures. The investigators will attempt to identify novel genes and proteins involved in growth at low temperatures. It is hoped that these studies will provide the scientific basis that will lead to novel methods of control of *Listeria* and improved methods of detection of the organism.

Detoxification of Fumonisin by a Simple Fructose Reaction in Corn for Food, \$110,000, 2 Years, Iowa State University, S. Hendrich (PI). A suspected cancer-causing agent in humans, fumonisin B1—FB1—requires its amine group, a simple nitrogen-containing portion of the molecule, for its toxic action. Reacting this amine with simple sugars, such as fructose, is likely to block fB1 toxicity. The objectives of this study are to determine the toxicity of fructose-fB1 products in feeding studies in pigs and rats and to determine the processing conditions for the reactions of fructose and glucose with fumonisin to occur in corn-based foods. These studies may provide a practical approach to the problem of natural toxins, increasing the safety of the food supply by detoxifying a natural toxin that occurs in corn everywhere.

Salmonella enteritidis Heterophil Resistance, \$164,000, 3 Years, Iowa State University, T.T. Kramer (PI). The investigators have isolated two less virulent *Salmonella enteritidis*—SE—mutants which are only briefly shed by infected chickens, are effective in protecting birds against virulent challenge, and prevent egg transmission of virulent SE. In this study, they will use these mutants to study the molecular basis of SE virulence and to identify genes involved in immune cell resistance so that safer vaccines can be developed.

Extracellular Sporulation Signals of *Clostridium perfringens*, \$148,000, 3 Years, University of Massachusetts, R. Labbe (PI). *Clostridium perfringens* is a leading cause of human foodborne illness in the U.S. This organism produces heat resistant spores. An enterotoxin is produced by some strains during sporulation and therefore the sequence of events leading to spore formation are especially important. The investigators have identified a sporulation factor produced by both enterotoxin-positive and negative strains which stimulate the onset of sporulation and enterotoxin formation by this organism. In this study they will develop conditions to optimize the levels of this factor and then attempt to isolate and characterize it.

Enhanced Green Fluorescent Protein Expression in *Escherichia coli* to Study Adherence to Meat, \$92,000, 2 Years, University of Massachusetts, L.S. McLandsborough (PI). This study will develop a microscopic experimental system that will investigate bacterial adhesion to meat surfaces at the cellular level. Knowledge of the interaction between bacterial and meat surfaces will lead to improved methods of detection and meat decontamination.

Detection and Analysis of *Staphylococcus aureus* Enterotoxin A in Food, \$133,000, 2 Years, Johns Hopkins University, L. Rasooly (PI). The goal of this project is to increase food safety by developing the next generation of detection and analysis methodology for bacterial toxins in food, using *Staphylococcus aureus* enterotoxin A—SEA—as a model. The project aims to develop two technologies: a cell culture based assay of SEA activity and biosensor methodology for immediate automated detection of SEA in food. Biosensor technology represents a new approach to food safety analysis: real-time analysis.

Intimin: Candidate for an *Escherichia coli* O157:H7 Anti-Transmission Vaccine, \$232,456, 3 Years, Uniformed Services University of the Health Sciences, A.D. O'Brien (PI). Most cases of enterohemorrhagic *Escherichia coli* O157:H7—EHEC—disease have occurred after ingestion of undercooked, contaminated ground beef. Cattle are reported to be asymptotically infected with the organisms. EHEC have been shown to adhere to the intestinal epithelium of neonatal calves via a bacterial surface protein called intimin. The long-term goal of this project is to develop an inexpensive vaccine to prevent cattle from becoming infected with EHEC, and thus prevent transmission from cattle to humans.

Survival and Virulence of Enterohemorrhagic *Escherichia coli* as Affected by pH and Water Activity, \$87,000, 2 Years, University of Maryland, J. Meng (PI). A variety of foods have been implicated in *Escherichia coli* O157:H7 outbreaks, particularly foods of bovine origin. Certain foods such as apple cider and dry-cured salami that were considered safe and are generally not heated before consumption have been identified as transmitting vehicles in *E. coli* O157:H7 outbreaks. Unlike O157:H7, most of the non-O157 EHEC serotypes have been isolated from sporadic cases, hence, the significance of food as a vehicle for transmitting non-O157 EHEC is not clear. This project will study survival of EHEC strains—mainly non-O157:H7—as affected by pH and water activity and virulence of EHEC strains as affected by pH and water activity.

Symposia on Microbial Foodborne Hazards—Basic Research/Industry/Regulatory Concerns, \$6,000, 1 Year, U.S. Food and Drug Administration, V.K. Bunning (PI). The Food Microbiology Research Conference—FMRC—focuses on the presentation of basic/applied research by scientists within academia, government, and industry. The FMRC meets every two years to advance knowledge and understanding in the area of food microbiology.

Recombinant Antibodies to Natural Toxicants, \$116,000, 2 Years, Michigan State University, J.J. Pestka (PI). This project seeks to genetically engineer novel antibodies to an important group of natural toxins known as the *Fusarium* mycotoxins which commonly contaminate wheat, corn, rice, and barley. From the perspective of food safety, the general approaches developed in this research will be amenable to improved detection of natural toxicants, chemical contaminants as well as bacterial pathogens and their toxins.

Adhesins for Colonization of Chickens & Their Use in Preventive of Salmonellosis, \$156,000, 3 Years, Washington University, R. Curtiss III (PI). The long-term objective of this study is to reduce or eliminate *Salmonella* colonization of poultry, which would in turn result in a reduction in the shedding of *Salmonella* in feces, its transmission to eggs, and the cross-contamination which occurs during processing. An understanding of the mechanism of *Salmonella* adherence to chicken cells could be particularly valuable when developing strategies to eliminate *Salmonella* contamination of poultry.

Incidence and Fate of Moniliformin in Corn and Heat Processed Corn Products, \$97,000, 2 Years, University of Nebraska, L.B. Bullerman (PI). Moniliformin is a highly toxic substance produced by *Fusarium proliferatum* and *Fusarium subglutinans*, molds commonly found on corn. The overall objective of this study is to determine the incidence and levels of moniliformin in U.S. corn and corn-based foods and the effects of heat, as applied in basic thermal processing of corn, on the stability of moniliformin.

Modeling the Interactions of Pathogenic and Biocontrol Bacteria for Applications in Foods, \$86,000, 2 Years, USDA-Agricultural Research Service, F. Breidt (PI). The objective of this research is to develop a safe method for preventing the growth of pathogenic bacteria in minimally processed, refrigerated foods. A biocontrol strategy will be used which involves bacterial competition to accomplish this task. Lactic acid bacteria which are commonly used in various food fermentations—dairy, meat, vegetables—will be added as biocontrol agents to prevent the growth of pathogenic bacteria in minimally processed foods.

Salmonella in Modern Swine Production Systems. Risk Factors for Fecal Shedding by Finished Pigs, \$241,000, 3 Years, North Carolina State University, P.R. Davies (PI). Specific objectives of this project are to determine risk factors for *Salmonella* prevalence in finishing pigs raised on slotted concrete floors in barns managed all-in/all-out, within multiple-site production systems and the relative importance of *Salmonella* infection in nurseries or the finishing environment as determinants of *Salmonella* infection in finishing hogs. The information obtained will be relevant to a large and increasing segment of the national swine industry and will aid in defining the most efficient options for reducing *Salmonella* in the pork supply.

Experimental *Campylobacter* Vaccine, \$138,000, 2 Years, University of Pennsylvania, I. Nachamkin (PI). *Campylobacter jejuni* is a major cause of gastrointestinal infection in humans. The goal of this study is to assess the ability of previously de-

veloped *Campylobacter* vaccines to confer cross protection with different flagella types of *C. jejuni*, determine the minimal amount of time needed post-immunization to confer protective immunity, determine the minimal *C. jejuni* challenge dose in which complete protection occurs, determine whether the bivalent vaccine confers protection against *Salmonella* infection, and determine the smallest flagellin fragment that can elicit protective immunity.

Food Pathogen Biosensors for Rapid Safety Measurements of Meat, \$96,205, 2 Years, University of Rhode Island, A.G. Rand (PI). Classical procedures for the detection of microbial pathogens in meats are slow and labor intensive. Rapid methods currently available are either complex, require potentially hazardous and expensive materials, or utilize a pre-enrichment step of 18–24 hours to grow enough cells for detection. This project will establish that biosensors employing immobilized antibodies specific for meat pathogens can be successfully utilized for biomonitoring of contamination in food products.

Salmonella typhimurium Genes Required for Systemic Infection of Cattle, \$90,000, 2 Years, Texas A & M University, R.M. Tsois (PI). Little is known about genes allowing *Salmonella typhimurium* to cause systemic infection in cattle, an important meat source in the U.S. Since systemic infection can lead to a chronic carrier state, information about the mechanisms used by *S. typhimurium* to establish systemic infection is relevant to development of strategies to eliminate this pathogen from cattle. The goals of this project are the identification and characterization of bacterial genes which enable *S. typhimurium* to cause systemic infection in cattle.

Fumonisin: Immunology, Genetics and Enzymology, \$129,897, 2 Years, University of Wisconsin, F.S. Chu (PI). Using mutant cultures and a combination of immunochemical and chemical methods, the investigators will identify the major steps, intermediates, and enzymes involved in the biosynthesis of fumonisins. The methodology developed in the proposed work could be used for further studies of the conditions conducive to the formation of fumonisins in the field and during storage.

REGIONAL CROP INFORMATION AND POLICY CENTERS

Question. The President proposes first-time funding of \$1,500,000 for Regional Crop Information and Policy Centers program. Please explain why this new program is needed and why the goals of this program can't be fulfilled by other existing programs, and identify where each of the proposed Centers will be located.

Answer. USDA has placed a high priority on the establishment of regionally-based Pest Management Center(s) as a means of strengthening its connection with production agriculture, research and extension programs, and agricultural stakeholders throughout the United States. Since passage of the Food Quality Protection Act—FQPA—in 1996, USDA and the Environmental Protection Agency—EPA—have recognized the need for a pest management information network that can quickly respond to information needs of the public and private sectors. When fully functional, Pest Management Centers will help agricultural producers, USDA, and its partner institutions identify, prioritize, and coordinate a national pest management research, extension, and education program implemented on a regional basis. The intent of the Center concept is to bring to the region a new level of coordination and stakeholder input to Federal and state pest management programs and activities. This effort will be directed toward coordinating expertise and resources located at colleges and universities throughout a multi-state region. The exact location of each of the centers will be determined by a competitive grants process. Criteria for selection includes: (1) the expertise present at site; (2) documentation of the ability to accomplish the Center objectives; (3) the ability to provide leadership to form a broad-based regional information network; (4) the ability to foster research, extension and education collaborations, interdisciplinary teams, and inter-institutional partnerships; (5) the adequacy, professional training and experience of Center staff; (6) evidence that stakeholders were consulted during proposal preparation and will participate in the operation of the Center; (7) the ability to establish partnerships with stakeholders to accomplish Center objectives; and (8) institutional support for the Center and a budget reflective of the Center objectives.

1994 INSTITUTIONS

Question. Why does this budget propose to support infrastructure enhancement at the 1994 Institutions through an increase in the annual contribution into the endowment rather than through a separate line-item in the budget?

Answer. The critical need for infrastructure support at the 1994 Institutions is well documented. While the purpose of the endowment fund is to support educationally related activities, often the classrooms and laboratories at the 1994 Institutions are in poor and unsafe condition. By providing the 1994 Institutions with a stable

funding source for improving their educational facilities, college administrators will be more effective in planning institutional needs. This will create a better educational environment for both students and faculty and allow the 1994 Institutions to be more effective partners in the Land Grant community. Each 1994 Institution will be able to determine if its priority needs are educational activities or in infrastructure to support those educational activities, and be able to plan accordingly.

NATIONAL RESEARCH INITIATIVE

Question. Is there a need in your view to establish better accountability measures of agricultural research outcomes for the National Research Initiative projects and other federally-funded agricultural research? I understand that NRI, for example, has no systematic documentation of accomplishments from past funded research. It has been suggested that competitively awarded "evaluation grants" might be one way to address this. Do you agree?

Answer. While accountability for programs such as the National Research Initiative—NRI always could be improved, the NRI does systematically document accomplishments from funded research. Each awardee is required to produce annual and final technical reports. In addition, one of the most rigorous accountability measures for NRI supported projects is the renewal of the project. For a project to renew, it must go through a peer review and be analyzed by a panel of experts as to its accomplishments, its progress towards meeting its original stated goals, and its proposed work for the next funding increment. To renew, the project must also compete against other renewals and new projects. This systematic analysis of the supported research provides one of the most rigorous accountability measures possible.

The NRI could better its accountability, not on a project by project basis, but on a program basis. This year as a pilot project, the NRI is using experts to assess the value of previously supported projects, what has resulted from these projects, and the state of the science in the Markets and Trade program area. While this is a pilot program, CSREES expects that valuable information will be produced and such an analysis could serve as a foundation for further programmatic evaluations. However, such an evaluation is costly and with the many programs within the NRI and elsewhere, it would be cost-prohibited to plan such an exercise for each and every program. Evaluation grants might offer an opportunity for this, however, additional funds should be provided for such purposes since the existing funding level for the NRI only allows support of about 20 percent of all submitted projects.

SMITH-LEVER 3(D) FARM SAFETY AND AGRABILITY

Question. The Administration again proposes to eliminate Smith-Lever 3(d) farm safety funds and funding for the AgrAbility program after the Administration rescinded nearly \$600,000 in fiscal year 2000 appropriations provided for these programs. Why does the Administration propose to eliminate funding for these programs?

Answer. This action is consistent with the Administration's belief that the most effective use of taxpayer dollars is through competitively-awarded, peer reviewed grants. Alternate funding from formula programs, State and local governments, and private sources could be used to support aspects of this program deemed to be of high priority at State and/or local levels. However, a new Youth Farm Safety Education and Certification program is proposed for \$5.0 million in fiscal year 2001.

YOUTH FARM SAFETY EDUCATION AND CERTIFICATION

Question. A new program named Youth Farm Safety Education and Certification is proposed to be established with a funding level of \$5 million. Please describe this new program in detail (who would be eligible for the program, how funds will be awarded, and what activities will be funded, etc.). Also, how is this proposed new program different from the Smith-Lever 3(d) farm safety and AgrAbility programs the Administration proposes to eliminate?

Answer. The Fair Labor Standards Act and selected state laws allow child agriculture workers to work at younger ages, for longer hours, and in more hazardous occupations than in other industries. Minors 16 and 17 years of age are exempt from prohibitions on work in hazardous occupations identified by the Secretary of Labor, and 14 and 15 year old children are exempt from the hazardous occupation restriction if they possess a valid certificate documenting completion of safety training for tractor operation or other machine operation. This new Youth Farm Safety Education and Certification Initiative would establish a USDA-administered competitive grants program to states to provide formal safety training and certification targeted to youth age 16–17 years. These grants would also be used for related purposes such as curriculum improvement for current safety programs and development of new

safety education curricula for other agricultural occupations as needed. The initiative would provide funds to land-grant institutions in order to contract with qualified private businesses and community and youth organizations to deliver education and training, such as 4-H, Future Farmers of America, and other similar organizations that would provide safety education that prepares youth for safety certification.

This initiative is intended to augment state and local vocational agriculture school funds for safety training by agricultural employers and other private businesses, and is intended to enhance the safety of young farm workers, while maintaining their employability in agriculture and minimizing disruptions to farm employers' access to youth workers.

The Youth Farm Safety Education and Certification program supports specific formal training that is required by the Fair Labor Standards Act while the current Farm Safety program provides limited support for an Extension program developed by State or Territory Extension specialists that addresses a wide range of farm safety program needs identified by these specialists. The AgrAbility program is designed to assist farmers with disabilities to stay in farming.

No Federal funds have been appropriated to support the current certification training required by the Fair Labor Standards Act for 14-15 year olds. Thus, State Extension programs have struggled to find the resources to provide the training, keep training materials current, and conduct evaluations of the training.

1890 INSTITUTIONS

Question. Provide a list, by 1890 institution, of the renovation and construction projects funded in fiscal year 1998 and fiscal year 1999, the funds provided for each, and the amount required in future years to complete the project.

Answer. Awards are made for the acquisition and improvement of agricultural and food sciences facilities and equipment, including libraries, so that the 1890 Land-Grant Institutions and Tuskegee University may participate fully in the production of human capital in the food and agricultural sciences. These activities are ongoing and are proposed in a five-year plan of work. The first table indicates the past, current, and proposed appropriations to complete activities under the current five-year plan of work starting in fiscal year 1998. The second table is a chart which provides the progress to date on each of these projects, as well as the plans for each facility in fiscal year 2000.

1890 FACILITIES

	Fiscal Year					Total
	1998	1999	2000	2001	2002	
Alabama	\$403,755	\$449,013	\$666,710	\$666,710	\$666,710	\$2,852,898
Tuskegee	403,755	449,013	666,710	666,710	666,710	2,852,898
Arkansas	387,818	430,036	658,969	658,969	658,969	2,794,761
Delaware	310,482	337,479	621,209	621,209	621,209	2,511,588

Virginia State	430,885	481,317	679,888	679,888	679,888	2,951,866
Subtotal	7,247,040	8,088,960	11,520,000	11,520,000	11,520,000	49,896,000
Federal Admin	301,960	337,040	480,000	480,000	480,000	2,079,000
Total	7,549,000	8,426,000	12,000,000	12,000,000	12,000,000	51,975,000

1890 FACILITIES PROGRAM SUMMARY OF PROGRESS

[Fiscal years 1999 and 2000]

Institution	1999	2000
Alabama A&M University Normal, Alabama.	<p>Develop specifications and bid requests for connectivity of Interactive Video Center and Mobile Video Conference Laboratory.</p> <p>Select architect for renovation of teaching and research laboratories.</p> <p>Select architect for replacement of heating and cooling system for Hobson Bonner Halls.</p> <p>Purchase research equipment.</p> <p>Enhance Extension facilities/equipment.</p>	<p>Enhance teaching facilities for academic units in family, consumer and food sciences.</p> <p>Establish a multi-media laboratory to enhance instruction and research lecture, workshops and seminars.</p> <p>Initiate the bid process to replace the laboratory and field research equipment.</p> <p>Convert extension laboratories in accommodations for new program efforts.</p>
Tuskegee University Tuskegee, Alabama.	<p>Renovate and upgrade Milbank Hall.</p> <p>Renovate and upgrade the Vocational Building as an Extension Activity Center.</p> <p>Upgrade gutters and repair Morrison-Mayberry Hall.</p> <p>Planning for improving and constructing teaching facilities.</p> <p>Renovate the Vocational Education Building.</p> <p>Construct Safety and Food Processing Center.</p> <p>Purchase equipment for the Extension Building.</p> <p>Complete the renovation of Milbank Hall.</p> <p>Renovate and convert the Vocation Building as an Extension Activity Center.</p> <p>Plan for teaching facilities.</p> <p>Install and seal flooring in Milbank Hall.</p> <p>Install draining system in Milbank Hall.</p> <p>Replace roof of the new wing of the Carver Research Foundation Laboratory.</p> <p>Acquire land and plan for rural tourism and business development laboratory.</p> <p>Construct Safety and Food Processing Center.</p>	
University of Arkansas Pine Bluff, Arkansas.	<p>Site improvements at the University of Arkansas at Pine Bluff (UAPB) farm.</p> <p>Support renovation of Woodard Hall.</p> <p>Renovation of Child Development Laboratory.</p> <p>Renovate Agronomy storage building.</p> <p>Acquire replacement farm vehicles.</p> <p>Purchase GIS survey system equipment.</p> <p>Purchase instructional and audio-visual equipment.</p> <p>Design of the Sheep Facility.</p> <p>Construction of Fish Processing and Marketing Facility.</p>	<p>Design for renovation of Woodard Hall.</p> <p>Upgrade playground at the Child Development Center.</p> <p>Design of the Child Development Center.</p> <p>Renovation of Agronomy Storage Building.</p> <p>Construct an outdoor pavilion at the Lonoke farm site.</p> <p>Purchase instructional, farm and research equipment.</p>
Delaware State University Dover, Delaware.	<p>Plan and construct a facility for office, laboratory and classroom space.</p> <p>Construction of the herbarium.</p>	<p>Construct an office, laboratory and classroom building to support the research, extension and academic programs and centralize the location of two academic departments of the School of Agriculture, Natural Resources, Family and Consumer Sciences.</p> <p>Complete construction of the herbarium.</p>

1890 FACILITIES PROGRAM SUMMARY OF PROGRESS—Continued

[Fiscal years 1999 and 2000]

Institution	1999	2000
Florida A&M University Tallahassee Florida.	Acquire land to construct a facility for research, teaching and extension aquaculture. Develop plans and specifications for Aquaculture facility.	Determine equipment and supplies needed for the Aquaculture facility and laboratories. Develop plans and specifications for multi-purpose research, teaching and extension facility. Purchase computer and office equipment for extension offices. Acquire materials and supplies to develop outreach Environment Science programs. Acquire equipment and furniture for distance learning classrooms. Develop plans and specifications for enclosure at teleconference center.
Fort Valley State University Fort Valley, Georgia.	Plan for the construction of the Family Development Center. Acquire and improve laboratory and demonstration equipment.	Construction of the Family Development Center. Acquisition and installation of laboratory and demonstration equipment.
Kentucky State University Frankfort, Kentucky.	Development of a Research, Extension and Teaching Aquaculture Field Station. Establishment of Resource Technology Center.	Establishment of a Resource Technology Center.
Southern University and A&M College Baton Rouge, Louisiana.	Purchase and install equipment including animal pens, electronic timers, portable bleachers, portable panels, poultry coops. Purchase a small vehicle. Purchase fire and sound evacuation, security and monitoring systems for the Multi-purpose Livestock Show Arena. Renovate the facility (Pinkie Thrift Hall) for the Division of Family and Consumer Sciences. Bring the Meat Processing Laboratory to meet health department standards. Plan to construct a facility to store agricultural chemicals. Construct the Cooperative Extension Administrative Complex and Center for Small Farms Research and the Arena Complex.	Renovate meat laboratory. Install video equipment for conference center. Renovate the facility (Pinkie Thrift Hall) for the Division of Family and Consumer Sciences. Renovate the Meat Processing Laboratory to meet health department standards. Complete purchases and installation of signage, equipment and furnishings for the Cooperative Extension Administrative Complex and Center for Small Farms Research and the Arena Complex. Complete landscape design, and design and construction of parking lot for the Cooperative Extension Complex.
University of Maryland Eastern Shore Princess Anne, Maryland.	Design of the Plant Science and Teaching Research Facility. Design of the Food Science and Technology Center.	Construction of the Plant Science and Teaching Research Facility. Construction of the Food Science and Technology Center. Purchase equipment for the Cooperative Extension facility.
Alcorn State University Lorman, MS.	Planning of Center for Biotechnology. Planning of Center for Environmental Ecology and Natural Resources.	Construction of Center for Biotechnology. Planning of Center for Environmental Ecology and Natural Resources. Computer Networking.
Lincoln University Jefferson City, MO.	Renovation of Bennett Hall.	Continue renovation of Bennett Hall.

1890 FACILITIES PROGRAM SUMMARY OF PROGRESS—Continued

[Fiscal years 1999 and 2000]

Institution	1999	2000
North Carolina A&T State University Greensboro, NC.	<p>Wire and connect offices and classrooms in Carver Hall to University Fiber Optic Network.</p> <p>Install new lighting, ceiling, heating/air conditioning and window treatments to offices, classrooms, and auditorium in Carver Hall.</p> <p>Renovate labs offices, and lounge area in Ward Hall and construct new labs and research areas to support program activities in food safety, nutrition and health.</p> <p>Purchase scientific equipment.</p> <p>Wire and connect offices and labs in Ward Hall.</p> <p>Establish teleconferencing and distance education capabilities in Coltrane Hall.</p>	<p>Construct new greenhouse and small horse barn/corral in support of teaching programs in horticulture and animal sciences.</p> <p>Enhance research capabilities of Ward Hall in support of multi-disciplinary research and graduate education in food safety, nutrition and health.</p> <p>Enhance telecommunications infrastructure and capabilities of research facilities; Ward Hall and C. H. Moore Ag Research Facility and School of Ag-TV studio.</p> <p>Enhance infrastructure of research facilities, both physical and equipment needs, used in support of research and graduate education.</p> <p>Renovate and expand extension equipment/storage building to create bathrooms and new offices, conference room and meeting rooms.</p>
Langston University Langston, OK	Construct/renovate Complex.	Extension/Research Building.
South Carolina State University Orangeburg, SC.	Construct/renovate Foodservice Management Laboratory.	Commercial Research/Extension Building.
Tennessee State University Nashville, TN.	Renovation and installation of equipment for a distance learning center.	Construct/renovate greenhouse.
Prairie View A&M University Prairie View, TX.	Purchase equipment.	Construct new facility to house teaching, research and extension programs.
	Purchase office and audio-visual equipment for the Cooperative Agricultural Research Center (CARC).	Construct commercial dining/hospitality facility.
	Construct/renovate H.S. Estelle 4-H and Youth Camp.	Continue renovation at Staley Hall auditorium.
	Renovate dairy goat center, creamery laboratory, meat laboratory, greenhouse, swine center, feed mill, poultry center, and human nutrition/food science laboratories..	Continue renovation at R.L. Hurst Building.
Virginia State University Petersburg, VA.	Further develop the greenhouse facility.	Continue development of demonstration areas of distance learning center.
	Construct the greenhouse.	Renovate and upgrade the child development laboratory.
	Purchase bus.	Continue to purchase office and audio-visual equipment for the CARC.
	Procure equipment for the Plant Science and Animal Science Labs.	Purchase vehicles for the CARC.
		Continue to construct H.S. Estelle 4-H and Youth Camp.
		Purchase equipment for communications network.
		Upgrade communications network with new equipment and connectivity for satellite video production.
		Continue renovation of dairy goat center, creamery laboratory, meat laboratory, greenhouse, swine center, feed mill, poultry center, and human nutrition/food science laboratories.
		Demolish current storage facility and construct a new facility.
		Construct a New Farm Service Center.
		Develop an electronic Classroom.

EXTENSION INDIAN RESERVATION PROGRAM

Question. The administration asks for an increase of over \$3 million for Extension Indian Reservation Agents for fiscal year 2001. Are all reservations eligible for this program? How many extension agents are currently funded for fiscal year 2000 and

at which reservations are they located? How many requests for extension agents are outstanding? How many agents can be added with this increase?

Answer. The Extension Indian Reservation Program—EIRP—provides Extension agents and links the Land Grant University. The EIRP is designed for large reservations—100,000 acres or larger—that preclude adequate programming from existing county staffs. Reservations are isolated, seldom have industrial development or job opportunities, and often have high rates of unemployment, alcoholism, school-dropouts, and nutrition-related health problems. Gainful employment opportunities are tied to the limited natural resource base—mostly land and water. Agriculture is often the only feasible route to gainful employment. This program helps reservation residents to make the most of their cultural and natural resources in the production of crops and livestock; in the development of youth skills, self esteem, and educational achievement; in the maintenance of family health and well-being; and in the achievement of an improved quality of life.

The Reservation Extension agents help Native Americans to produce and market crops, livestock, and timber; to develop quality products to overcome isolated sales locations and quality or shipping discounts; to develop and exploit niche markets; to develop healthier life styles; to develop more nutritious diets; to forestall diabetes—a ubiquitous malady in Indians; to develop marketable life-skills; to stay in school until graduation; to pursue higher education; and to help themselves. There is widespread need for more of these programs that assist new and experienced farmers and ranchers; that provide linkages for “Remote Area”—veterinary—Medicine programs on the reservations; and that encourage youth to achieve, develop leadership skills, stay in school, develop healthy life styles, and to pursue college educations that will be helpful to their families and others.

Developing these skills will enable reservation residents to make direct use of their natural and cultural resources, rather than leasing them to outsiders and depending upon the Bureau of India Affairs—BIA—to collect, mishandle, and distribute the receipts; or to depend upon welfare programs for sustenance.

There is a need for about 85 such projects, based on reservation numbers and size. To date, only 25 are in operation because there has been no funding increase for this program since 1990. There is a backlog of 17 applications for this program. Other reservations have expressed interest, but have been discouraged from submitting applications until additional funding is available. The proposed increase to \$5 million would allow the program to increase the level of support for many of the existing projects, and to add an additional 23 Reservation agents.

The present level of funding—\$1.71 million, supports EIRP agents—employees of the State Land-Grant University—on 25 reservations, distributed as follows:

Alaska—1—(Tanana Chiefs Conf)
 Arizona—4—(Navajo [Window Rock], Hopi, San Carlos Apache, Colorado River Tribes.)
 Florida—1—(Seminole)
 Idaho—1—(Fort Hall)
 Mississippi—1—(Choctaw)
 Montana—4—(Flathead, Northern Cheyenne, Blackfeet, Ft. Belknap)
 N. Carolina—1—(Cherokee)
 N. Dakota—1—(Fort Berthold)
 New Mexico—3—(Jicarilla Apache, Zuni, Navajo [Shiprock]¹)
 Nevada—1—(Nevada tribes)
 Oklahoma—1—(Muscogee)
 Oregon—1—(Warm Springs)
 S. Dakota—2—(Pine Ridge, Rosebud)
 Washington—2—(Chehalis, Colville)
 Wyoming—1—(Wind River)

Under the fiscal year 2001 proposal, the program would actively solicit applications for new projects from those reservations that have previously applied, and from all other qualified reservations. The Inter Tribal Agriculture Council estimates that a total of 86 agents are needed to adequately serve such reservations. The proposed increase would allow the EIRP to expand to a total of 48 reservation agents.

AGRICULTURE IN THE CLASSROOM

Question. There is an increase in the President’s budget that would double the funding for Ag in the Classroom. Please provide a brief explanation of this program

¹ Administered by the University of Arizona, in cooperation with New Mexico State University and the Utah State University.

(who qualifies for the funds; what activities are funded, etc.) How will the increased funding requested for the program be utilized?

Answer. The Agriculture in the Classroom program is an effective vehicle to provide students and educators with accurate information about food and agriculture. The program integrates scientifically-valid agricultural information into a variety of academic disciplines including science, the social sciences, language arts, and mathematics. The program reaches over 120,000 teachers annually, impacting over 5 million students.

We reach teachers through a variety of activities such as a national web site linking State programs and other related agricultural projects, national teacher awards honoring outstanding teachers incorporating agricultural concepts into their curriculum, annual conferences attended by over 300 teachers and educators, and a network of State programs coordinated by the National Agriculture in the Classroom Consortium. In addition, we seek to make agricultural concepts a part of national initiatives such as the Millennium Green.

In 1999, eight graduate-credit courses were offered throughout Missouri to better acquaint 200 teachers with agriculture and demonstrate how to integrate some facet of agriculture into the regular classroom curriculum. On average, each participating teacher will teach 10 years, reaching over 50,000 children. Efforts of this nature are being replicated across the Nation. For the 1999-2000 school year, the Missouri Farm Bureau Foundation for Agriculture is providing \$7,500 in mini-grants to K-12 teachers who demonstrate ability to enhance student knowledge of agriculture. Thirty-nine classrooms will directly benefit from this endeavor. Mini-grant programs in each State and territory are supporting projects that promote agricultural literacy efforts.

Ohio's Agriculture in the Classroom program has been successful in developing a comprehensive educational kit in conjunction with Ohio State University. This kit meets the Ohio's Kindergarten through third grade competencies and helps prepare students for their State proficiency tests.

Maryland's Agriculture in the Classroom program has been successful in educating teachers, students, and the public about agriculture with three Mobile Agriculture in the Classroom Laboratories. The themes for the mobile units are "Aquatic Science," "Agricultural Products," and the "Biotechnology and Food Safety."

Additional funding would allow the Department and the Agriculture in the Classroom community to expand education outreach activities to under-represented groups, support regional demonstration projects, continue the integration of information technology to lower program delivery costs, and increase outstanding teacher recognition initiatives.

Other planned initiatives include the development of materials which portray scientifically-accurate and technologically-advanced agriculture, dissemination of materials about career opportunities in the food and agriculture arena, research and evaluation of program components, an expanded network of educators involved in promoting agricultural literacy, and strengthened relationships between the Agriculture in the Classroom community and our partnering college and university systems.

LOUISIANA AND MISSISSIPPI RURAL HEALTH PROJECTS

Question. Please give the Committee an update on the Louisiana and Mississippi rural health projects funded for the last several years.

Answer. The Nurse Managed Family Health Care Center project conducted by Southern University and A&M College is a health promotion and disease prevention program for at-risk populations residing in rural and inner city neighborhoods in south Louisiana. Quality, cost-effective, community-based health care services are offered through a collaborative practice model where graduate-prepared nurse faculty, nursing students, and physicians located in the community health outreach centers assist women, children and the elderly in promoting self-care health behaviors.

Since the inception of the program in 1995, 400 nursing students have participated in this program. During 1999, in a partnership with Head Start, 500 children enrolled in Head Start were able to receive all their health screenings through the mobile health unit made available in this program. The mobile clinic also visited a rural clinic and homeless shelters in inner-city neighborhoods.

This program continues to expand outreach to underserved populations and has been recognized in a number of publications.

The Mississippi Rural Health Corps is a joint endeavor of the state's 15 community and junior colleges and the Mississippi State University Cooperative Extension Service. The purpose of the project is to improve rural health through the education

of Mississippi residents and the training of health care professionals in rural practice. Loans have been made to 608 students enrolled in nursing and allied health professional courses. Of the 608 loans, 246 were awarded to students in an associate degree nursing program, 140 went to those in licensed practical nursing programs, with the remainder awarded to students in allied health professional programs. Four loans assisted nursing faculty to pursue advanced degrees.

During 1999, 362 Corps students graduated. Since the inception of the program, 1,827 loan recipients have graduated. Each makes a commitment to practice for up to a maximum of three years in a rural setting.

Other examples of the breadth of the outreach include the following: two nursing courses, one nutrition course, and three health seminars which were delivered to 17 locations throughout the state in 1999. Extension agents reached over 60,000 clients with health related training and events. Mississippi Extension staff trained 2,461 lay health volunteers in early breast cancer detection who reached 16,400 women with prevention information. Self-care education reached 1,732 rural families with information on the safe use of medications.

This program continues to expand outreach and graduate new health professionals.

INTEGRATED RESEARCH, EDUCATION, AND EXTENSION ACTIVITIES

Question. In the fiscal year 2000 budget the Administration requested that Smith-Lever 3(d) programs Water Quality, Food Safety, and Pesticide Impact Assessment be funded through the integrated research, education, and extension competitive grants program. How do you foresee the ability of the integrated authorities account to manage these programs?

Answer. CSREES was created by merging the Cooperative State Research Service and the Extension Service in 1995. Since that time, CSREES has integrated the staff, functions, and goals of the two former agencies into a new agency to serve the American public with the highest quality agriculture and food system research, education, and extension programs. However, this integration could never be complete while no funding mechanism existed to link the functions of research, education, and extension together under a single program. The Agricultural Research, Education, and Extension Reform Act of 1998 includes Section 406, Integrated Activities, giving CSREES the authority to develop programs which integrate these three functional areas. In fiscal year 2000, Congress appropriated \$39.541 million under this funding authority.

Funding research, education, and extension under the Integrated Activities authority holds several advantages. The integrated program is open to a broader array of colleges and universities. All colleges and universities, including the 1890 Institutions, Hispanic Serving Institutions, and non-land grant colleges of agriculture are eligible to compete for funds under these programs, thereby broadening the range of topics proposed and building research, extension, and education capacity of the non-1862 Land Grant community. Grants from the integrated authority programs are competitively awarded, as required by law; therefore, all proposals will be judged on technical merit, with only the best programs funded. Most importantly, the integrated program more closely links research programs with extension and education activities and transfers the results of the research to producers more quickly. For instance, in the pest management area, several programs are funded under integrated authorities: Pesticide Impact Assessment, Crops at Risk from FQPA Implementation, FQPA Risk Mitigation and Methyl Bromide Transitions. These programs address critical issues faced by producers who stand to lose important pest control tools to the implementation of FQPA. The research to develop new pest management systems must be immediately transferred to producers. The most effective way to promote this linkage is through a single integrated competitive program which evaluates each project on the basis of scientific merit and the linkage of research, extension, and education components.

INTEGRATED ACTIVITIES

Question. There is a concern that there will be a funding gap when the funding runs out for water quality programs in June 2000 and when the funds will be awarded through the competitive basis that will result in the termination of staff members and a disruption of coordination activities between federal agencies and private sector groups. What is the Administration doing to avoid this situation?

Answer. The integrated research, education, and extension Water Quality Program is designed to protect water from contamination by agricultural chemicals—including agricultural plant nutrients and pesticides—and has also included efforts to reduce the overall impact of agricultural practices in degrading the physical

structure and biological support capacities of water bodies. The program is structured to allow the stakeholder community to be the group responsible for the identification of most critical problems, and for the development of approaches to resolve those problems. This approach has historically resulted in the CSREES' support of a broad array of projects and state programs designed to reduce nutrient loading to targeted water bodies.

In fiscal year 2000, CSREES restructured its Water Quality Program, placing all of the available funding under the Integrated Authority outlined in Sec. 406 of the Agricultural Research, Extension, and Education Reform Act of 1998. This authority will be used to further integrate the activities of research, education, and extension on a common basis. Grants will be awarded on a competitive basis. Recipients who have received grants in previous years have the ability to request no cost extensions without additional funds, if appropriate, to existing grants which may ease the funding gap. Watersheds will serve as the common activity and reporting unit to be used within a regional coordination structure that will facilitate inter-state collaboration as well as collaboration with other Federal water quality programs. The objectives of these watershed-based activities would be to identify the causes of water quality degradation; conduct research filling the gaps that are critical to the development of water improvement practices and programs; implement watershed-scale improvement programs; monitor the efficacy of the improvement programs implemented; assess the costs and benefits of water quality management; and conduct evaluations closing the loop and improving our understanding of the drivers of water quality degradation.

For fiscal year 2001, CSREES has requested an additional \$3.204 million to enhance current efforts by conducting integrated farm- and watershed-scale research, education, and extension on ways to reduce nutrient and pesticide delivery to streams and rivers draining into coastal ecosystems—including the Great Lakes. If funded, the CSREES Integrated Water Quality Program will promote a stronger linkage between research, education, and extension to ensure that education and outreach programs reflect the most current scientific knowledge resulting from the Research, Education, and Economics water quality research and development efforts.

These additional funds will also be used to support interagency programs designed to assess and reduce nutrient delivery to impacted coastal areas.

SMALL FARMS INITIATIVE

Question. The Administration proposes again the Small Farms Initiative in the fiscal year 2001 budget at a funding level of \$4 million. In what ways does this program propose to stop the decrease of the small farm? Can this program be carried out in conjunction with other programs that already exist?

Answer. CSREES' Small Farms Program proposes to address the economic, social, and environmental problems that contribute to the decrease in small farms nationally. The Initiative will support Land Grant institutions and other partners who work with small farmers to develop effective research, education, and extension programs on:

- Small farm specific research, rather than size neutral research;
- Marketing strategies such as direct marketing, cooperative marketing, and community-supported agriculture;
- Helping beginning farmers establish viable farm operations;
- Entrepreneurial and business skills that will help small farms deal with their social and environmental issues; and
- Facilitating the development of networks between farmers and experts, in both the public and private sectors, that can help small farmers gain better access to information and technology.

The Small Farm Program will collaborate with other research, education, and extension programs. In fiscal year 1999, CSREES' Small Farm Program awarded four small grants to land-grant universities in four regions to conduct feasibility studies assessing the resources available for research and extension activities favoring small farmers and ranchers. The information in the reports from the land-grant universities will be useful to managers of the Small Farm Initiative because the report will identify integral institutions such as community-based organizations, non-profits, other government programs, and individuals that have interest in the small farm effort and will complement the work for effective research and extension to stop the decrease of small farms and ranches.

BIOBASED PRODUCTS

Question. A new program named the Biobased Products Program has been proposed in the President's budget that proposes to increase economic opportunities for farmers by developing and expanding markets through research, development, and commercialization of products from bio-based resources. Does this program need to be authorized? Can you explain in detail the effort in this program to promote commercialization for ongoing projects within CSREES?

Answer. Section 406 of the Agricultural Research, Education, and Extension Reform Act enables an integrated approach to research, education, and extension activities. The Biobased Products Program has been proposed under this authority.

This proposed program targets the expansion of the domestic industrial base through research and development of agricultural raw materials as feedstocks for industrial products. Thus far, advances in agriculture have stressed crop production technologies without a comparable interest in new crops or conversion technologies to produce industrial products. Currently, projects within CSREES that address biobased product research and development are, for the most part, single issue projects and do not take into account barriers to commercialization that can occur at various points along the research and development continuum. The proposed program is based on a systems approach that will build upon currently funded projects and will encompass all phases of product development, from growing industrial crops, adding value to conventional crops, to demonstration of the end-items. Integration of research, education, and extension activities is considered an efficient mechanism to accomplish the goals of this program.

METHYL BROMIDE TRANSITION PROGRAM

Question. Can you give an initial status report on the Methyl Bromide Transition Program that has recently been funded? Do you feel that the program thus far has been successful enough in its initial stages to warrant such a large increase in funds? How many more competitive grants can you award with this increase?

Answer. The Methyl Bromide Transition Program is being administered in fiscal year 2000 as a competitive grants program, and it is expected that 10 to 12 projects will be funded during the review process to be conducted in early July with the awards announced at that time. The proposed increase in funding for fiscal year 2001 would allow for about 20 more grants to be funded during the next year. The use of methyl bromide is scheduled to be reduced from a 1991 baseline by 50 percent in 2001, by 70 percent in 2003, and by 100 percent in 2005. This will impact the U.S. tomato and strawberry industry, fruit and nut tree production, nursery stock production, the cut-flower industry, forest nursery production, ornamental crops, post-harvest treatments, and other uses. Due to the large number of U.S. production systems that use methyl bromide, the increase in funding is necessary to assure that alternatives can be developed rapidly for all needs.

METHYL BROMIDE TRANSITION PROGRAM

Question. The Department stated that research, education, and extension would proportionately receive the funds for the Methyl Bromide Transition Program. Have you seen a need for one category to receive more of the funds than another category?

Answer. The Methyl Bromide Transition Program was funded under Section 406, Integrated Research, Education, and Extension Competitive Grants Program—Pest Management. These funds support integrated, multi-functional agricultural research, extension, and education activities. Depending upon the commodity, the degree to which an alternative to methyl bromide use on that commodity has been developed varies greatly, with some commodities having no proposed alternatives at this time. Therefore, it is expected that proposals will equally consider the research approach and the delivery of that research to the grower through extension and education programs. Due to the competitive nature of the program, we are not able to predetermine the ultimate combination of research, education, or extension that will be supported by these projects.

ANTI-HUNGER AND FOOD SECURITY GRANTS PROGRAM

Question. How does the proposed Anti-Hunger and Food Security Grants Program in the fiscal year 2001 budget differ from the program that the Administration proposed in last year's fiscal year 2000 budget and why is there a significant decrease in funds from last year's proposal? Does this program need to be authorized?

Answer. The Food Recovery and Gleaning grants proposed in fiscal year 1999 and fiscal year 2000 would have funded only food recovery, gleaning, rescue, and donation programs, but the Anti-Hunger and Food Security Grants proposed for fiscal

year 2001 would fund, in addition to food recovery and gleaning projects, a far broader array of projects to reduce hunger, improve nutrition, strengthen local food systems, and help low-income families move towards self-sufficiency. USDA broadened the proposal in direct response to input from community-based groups throughout the country who communicated their belief that food recovery, gleaning, and donations programs would be most effective as part of more comprehensive efforts to deal with local food insecurity.

The grants would be made available to any nonprofit group in the United States, including faith-based organizations. Such groups could include:

- food banks;
- church, synagogue, mosque, or temple-based soup kitchens or food pantries;
- community food security groups;
- nonprofit small farmer or sustainable agriculture groups;
- food recovery, food rescue, or gleaning organizations;
- community gardening groups;
- job training, assets development, and micro enterprise organizations;
- community action agencies;
- youth service organizations;
- nutrition education groups;
- nonprofit farmers' markets and direct marketing organizations.

The intent of the program will be to give out as many small and medium-sized grants as possible to provide seed money so that the grant recipients will be able to leverage other resources. Priority would be given to innovative public/private partnerships that comprehensively tackle local problems, as well as for the replication of successful model programs. Nonprofit groups have consistently commented that government and foundation funding that often focuses only on new—and unproven projects—is not always wise public policy, particularly when the funding streams will not fund the replication of programs that have proven their effectiveness. Thus, these grants will place a significant focus on helping nonprofit groups replicate projects that have already proven their effectiveness.

The following are some examples of the types of projects that could be funded by the grants:

- Enabling local emergency feeding organizations, which currently focuses on the short-term goal of providing food to clients, to increase their focus on longer-term and broader community food security activities that both help their client move to self-sufficiency and strengthen local food systems.
- Assisting small- and medium-sized farmers to sell their agricultural products directly to school districts, government hospitals, public universities, and other public institutions. These projects have the potential to boost the income of struggling family farmers and at the same time provide students and others with improved nutrition by being able to eat fresher products.
- Starting or expanding community or school gardens that enable low-income residents to produce their own food; such projects can help increase community self-reliance, increase the availability of fresh produce in low-income areas, preserve open space, teach young people about science, and even create “safe spaces” that reduce crime.
- Strengthening the infrastructure of food banks, food recovery organizations, food rescue groups, and field gleaning organizations necessary to increase the quantity and/or quality of the excess food that is recovered and gleaned; funds could be used for: (1) vehicles and fuel for transportation of recovered food; (2) Volunteer coordinators as well as training programs for volunteers; (3) preparing, printing, and distributing handbooks, and instructional materials; (4) heating and refrigeration equipment to ensure the safety of the recovered food; (5) equipment to collect, sort, process, dehydrate, transport, and distribute food.
- Supporting peer-to-peer efforts in which senior citizens provide nutrition, food, and other assistance to fellow senior citizens.
- Helping youth service or other community organizations increase the involvement of community volunteers in anti-hunger and community food security activities. This would advance the volunteerism goals set jointly by President Clinton, former President Bush, and former General Colin Powell. Funds could be used for hiring staff to recruit and supervise volunteers, as well as for training programs for volunteers.
- Increasing connections between farmers' markets and other local food security and anti-hunger activities.
- Supporting the creation of new or expansion of existing community kitchens, such as DC Central Kitchen, that combine rescuing excess food with training low-income individuals for jobs in the food service industry. Such programs have

- been extremely successful in helping individuals move from poverty and homelessness to self-sufficiency and independent living.
- Enabling community groups to team up with local universities to comprehensively map all food security-resources in their community and then conduct outreach to ensure that more community residents utilize those resources.
 - Expanding programs that engage chefs as volunteer nutrition education instructors and tying nutrition education and financial management training classes into broader community food security efforts that comprehensively help low-income families.
 - Supporting the development of small, food-related businesses and micro enterprises in low-income communities, such as youth farm-stand programs or efforts in which products grown in local gardens are turned into salad dressing or baked goods.
 - Providing increased food and assets development assistance to help working poor families to stay off welfare, increase their ability to feed and support their families, and eventually move into the middle class.

In fiscal year 1999 and fiscal year 2000, USDA proposed in the Food and Nutrition Service's budget \$20 million and \$15 million in CSREES' budget for grants for food recovery and gleaning. The need for food banks, food pantries, soup kitchens, religious-based anti-hunger groups, community food security organizations, etc. to receive Federal assistance has increased in the past years with many organizations reporting a rise in the number of families needing assistance, particularly working families.

The proposed grants do not require separate authorization.

DEPARTMENTAL ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR CHRISTOPHER S. BOND

CONTRACTS TO PRIVATE SOURCES FOR SERVICES

Question. Please provide a description of estimates on the degree to which the Department contracts to private sources outside USDA for various services. Include in this description, estimated expenditures, mission areas, and FTE equivalents for the current fiscal year. Additionally, for the purposes of comparison, please include the same estimates for fiscal year 1995. Finally, please describe what process whereby decisions to contract out are analyzed and evaluated to insure that the service level is not compromised and cost-savings are accrued.

Answer. USDA contracts out with private sources for a wide array of services. The information provided below generally represents contracts awarded for such services, with the exception of construction services. We do not collect data on FTE equivalents of contracting activity. Decisions to contract for services are made on a case-by-case basis by the requiring office. The decision process is governed by the instructions of the Office of Management and Budget in Circular A-76 in those situations where it applies. The procurement process is governed by A-76 and the instructions applicable in the Federal Acquisition Regulation. USDA has installed an internal oversight process for approval of advisory and assistance services in excess of \$25,000. Services in this category are elevated to the Under and Assistant Secretaries for approval prior to contract award.

[The information follows:]

CONTRACTS TO PRIVATE SOURCE FOR SERVICES

[In millions of dollars]

Mission Area and Agency	Fiscal year		
	1995	1999	2000
Farm and Foreign Agricultural Services:			
Farm Service Agency	44.1	70.9	16.9
Foreign Agricultural Service	0.3
Food, Nutrition, and Consumer Services: Food and Nutrition Service	24.2	23.8	0.4
Food Safety: Food Safety and Inspection Service	3.4	15.6	10.6
Marketing and Regulatory Programs:			
Agricultural Marketing Service	0.7
Animal and Plant Health Inspection Service	17.1	11.6	1.5

CONTRACTS TO PRIVATE SOURCE FOR SERVICES—Continued

[In millions of dollars]

Mission Area and Agency	Fiscal year		
	1995	1999	2000
Natural Resources and Environment:			
Forest Service	254.5	361.7	77.5
Natural Resources Conservation Service	48.9	33.7	8.0
Rural Development Mission Area	55.3	34.7	15.9
Research, Education, and Economics: Agricultural Research Service	85.7	93.0	32.4
Departmental Administration	35.2	50.5	24.8

ECONOMIC RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

STRUCTURAL CHANGES AND CONCENTRATION

Question. Can you give more information on an increase of over \$1 million dollars in the President's budget for an initiative on Structural Changes and Concentration in Food and Agriculture to improve the efficiency of the Agricultural Sector?

Answer. ERS aims to significantly enhance its ability to address the growing issues of concentration and structural change in the food system. Broad areas of interest include: structural change in food and agricultural industries; expanded reliance on formal contracting as a means of organizing the production and exchange of agricultural commodities; and the role of new developments in biotechnology as they affect structural change and agricultural markets. The increased budget resources would be used to improve the agency's stock of relevant data; to perform policy relevant economic research on structure and concentration issues through internal agency research and through cooperative research projects with universities and other agencies; and to encourage interaction among researchers and dissemination of new knowledge through a series of conferences and workshops on specific topics. Actions would emphasize: (1) determining where and why concentration is occurring in the agricultural marketing chain; (2) examining opportunities and risks for farmers within this kind of market environment; and (3) providing analysis for the USDA and other parts of government regarding structural changes in agriculture.

ERS efforts regarding market concentration are distinct from those of other USDA agencies because the focus of research and analysis is addressed broadly to all agricultural markets from producers to consumers. Concentration is occurring throughout the marketing chain, among input suppliers, production agriculture, commodity marketing, food processing, and wholesale and retail markets. At the same time, marketing arrangements like contracting, vertical integration, and various types of strategic alliances have emerged throughout the supply chain from producers to processors to retailers. In some instances, developments in biotechnology and intellectual property rights influence trends in industry concentration and the choice of marketing arrangements. Because concentration and changing marketing arrangements and scientific developments are interrelated, analyses of concentration and marketing arrangements must be largely integrated.

This initiative will aid expansion and targeting of data collection related to changes in market structure and the identification of small and mid-size farms that are affected by these developments. Current data collection and research will indicate what portion of total agricultural production is grown under contract, the distribution of the mix of business strategies used by farmers, and will begin to determine the extent to which economic returns from contract growers differs from participants in cash market. This research will enhance ERS's ability to measure and analyze changes in concentration and provide assistance to USDA and the Department of Justice regarding potential impacts of concentration and merger activity. Finally, ERS will develop a forward-looking capacity to anticipate significant changes in markets and their potential economic impacts on farmers and consumers.

CARBON SEQUESTRATION

Question. What are the details on the initiative on the Economic Incentives for Carbon Sequestration and Trace Gas Emissions Control in Agriculture to mitigate the dangerous effects of greenhouse gases that is proposed in the President's budget?

Answer. This initiative will focus on the economic potential for domestic carbon sequestration and control of greenhouse gases (GHG) in agriculture, the use of economic incentives to encourage carbon sequestration on agricultural lands, and the potential to target USDA conservation programs to promote GHG mitigation activities in the farm sector.

ERS would initiate three kinds of activities:

Economic potential for domestic carbon sequestration and trace gas control in agriculture.—This component of the work would seek to establish the “supply curve” of trace gas control in agriculture. ERS has begun a three-year cooperative research agreement with the Natural Resource Ecology Laboratory in Colorado to investigate this topic. Funding for the first two years has been provided by the Fund for Rural America. Funding under this initiative would allow completion of the third year.

Economic Incentives for Carbon Sequestration.—There are many ways to create economic incentives for sequestering carbon in agriculture. For farmers, however, the economic implications of even relatively specific proposals, such as a system of tradable carbon permits, can be very different depending on how such a program is implemented. Additionally, the nonpoint nature of soil carbon sequestration means that monitoring and enforcement could be a costly component of a tradable permit system. For this reason, other policy mechanisms that have been successfully used in agricultural conservation programs may have merit or there may be ways to target programs such as Conservation Reserve Program or Environmental Quality Improvement Program to meet trace gas control goals. Research to use economic valuation techniques to weight multiple objectives to better target these programs is underway at ERS. Initiative funds would allow this work to incorporate carbon sequestration and other trace gas control programs in such targeting schemes.

The Global Potential for Agricultural Trace Gas Mitigation and Sequestration.—This component of the initiative would allow ERS to collaborate with researchers around the world to incorporate estimates of carbon sequestration in agricultural soils into global economic models such as ERS's FARM model as well as to consider the potential for other GHG mitigation efforts on agriculture. This would build on modeling work to estimate the impacts of climate change on agriculture and link this to the broader issue of threats to global agricultural sustainability such as water quantity and quality and land constraints and soil degradation.

RESEARCH PRIORITIES

Question. What are the research priorities for fiscal year 2000?

Answer. ERS research priorities for 2000 are as follows for each of the three program divisions:

Priorities for the food and rural economics division

Restructuring of the Food System.—Processing, wholesaling, and retailing industries have been consolidating rapidly, following many mergers, acquisitions, and plant closures. These transformations are leading to larger and more specialized firms and plants with fewer buyers and sellers. A series of ERS studies is designed to examine the impact of these changes on businesses and consumers.

Food Stamp Caseloads.—ERS research will identify the forces that explain the declining Food Stamp Caseloads including the impacts of the economy, welfare reform, and State administrative practices. The study will address the economic status of households and individuals leaving the program.

Benefits of Safer Food.—In collaboration with the Centers for Disease Control and the Food Safety and Inspection Service, ERS will use data from the FoodNet active surveillance system to develop new estimates of the costs associated with foodborne pathogens. These findings will be used to rank pathogen-related diseases on the basis of their economic impact. This will help establish priorities for investments in food safety improvements, and to evaluate efforts to strengthen the food regulatory system.

Low-Wage Low-Skill Workers in Rural Labor Markets.—ERS will study the characteristics of low-skill, low-wage workers in rural America. Focus will also be given to the availability of jobs, the geographic distribution of rural workers, and the long-run market prospects for low-income, low-skill workers.

Economic Change in Rural Areas.—ERS will study the determinants and consequences of rural economic change in the 21st century. Analyses will focus on de-

mographic diversity and the changing face of rural America; the socioeconomic well-being of rural residents; growth, decline and stability of the rural economy; implications of industrial restructuring on rural areas and challenges and policy implications for the future.

Behavioral Nutrition.—ERS research will study children's food consumption and compare it to the Food Guide Pyramid. Food intakes will also be studied by source, at home and away, and eating occasion. The factors causing the displacement of milk by soft drinks will be addressed.

Priorities for the market and trade economics division

Risk and Uncertainty in U.S. Agriculture.—ERS research is focused on factors influencing the degree of price and market risk, and economic implications of various risk management strategies. In early 2001, a synthesis report will assess the current state of knowledge regarding price variability in U.S. and global markets.

Unfinished Business and New Issues for Agriculture in the WTO.—ERS research is now focused on finalizing conceptual and empirical economic frameworks to analyze the unfinished business and new issues arising out of implementation of the Uruguay Round Agreement on Agriculture. Planned for early 2001, Options for Agricultural Trade Liberalization will provide a synthesis of quantitative analyses of the costs to the global and U.S. economies stemming from protectionist agricultural policies.

Biotechnology and Agricultural Markets.—In 2000, ERS studies will examine the adjustment of marketing systems to the introduction of biotech crops, the pricing of biotech crops, and the implications of new genetically enhanced seeds on comparative advantage both in the U.S. and globally.

Improved Capacity for Analysis and Forecasts of Demand and Supply Conditions in Commodity Markets and Major Regions.—ERS' commodity and regional market analyses provide timely economic outlook information on U.S. and global agricultural markets. In 2000, ERS will study the dynamics and changing structure of global food demand and its implications for U.S. agricultural producers and exporters. ERS will continue to develop new and innovative ways for users to access commodity market information.

Structural Change in U.S. and Global Agriculture.—ERS will undertake a series of studies on how structural changes in U.S. and global commodity markets, such as the use of contracting, will affect U.S. producers and consumers. A forthcoming report, Understanding the U.S. Wheat Industry's Transition into the 21st Century, looks at challenges and opportunities confronting wheat producers due to U.S. farm policy changes, the pace of yield-enhancing research and new product development, and a more liberalized and competitive global marketplace.

Priorities for the resource economics division

Analysis of Farm Sector Performance.—As part of USDA's interdepartmental responsibility to support estimation of the National Income and Product Accounts, ERS will measure, forecast, and explain indicators of economic performance for the U.S. farm sector and major crop and livestock groups. Particular attention is directed to the impact on farm income of adoption and use of technology, managerial decisions and practices, and government programs.

Domestic Conservation Policy.—ERS will review the accomplishments under the conservation titles of the past 3 Farm Bills and evaluate options for a new generation of agri-environmental policies, to provide insights regarding program size, design, and implementation.

Greenhouse Gas Emission Reduction, Carbon Sinks, and U.S. Agriculture.—ERS will examine the economic potential for domestic carbon sequestration and control of greenhouse gases (GHG) in agriculture, the use of economic incentives to encourage carbon sequestration on agricultural lands, and the potential to target USDA conservation programs to promote GHG mitigation activities in the farm sector.

Adoption of Bio-engineered Crops.—ERS will assess the farm-level effects of the adoption of bio-engineered crops and identify the factors that have affected adoption. Manure Management for Water Quality Improvement. ERS will assess some of the issues in designing nutrient-based nonpoint source pollution control policies and to evaluate the economic and environmental characteristics of animal waste regulations on confined livestock and poultry farms.

Small Farm Success.—ERS will examine the determinants of small farm success, with particular attention to farm type (stated occupation of the operator, financial resources, sales level), resource endowment, and choice of integrated management systems. Agricultural Trade and the Environment. ERS will analyze how trade liberalization agreements affect the environment, how domestic environmental policies

affect trade flows, and how international environmental agreements can improve global environmental quality.

GEOGRAPHIC BREAKDOWN OF OBLIGATIONS

Question. What is the geographic breakdown of obligations for fiscal year 1999?

Answer. Below is a table that shows the geographic breakdown of obligations for fiscal year 1999.

Alabama	\$27,000
Arizona	176,800
Arkansas	26,000
California	764,428
District of Columbia	53,077,897
Florida	90,000
Georgia	99,828
Illinois	309,090
Indiana	169,500
Iowa	180,000
Kentucky	44,500
Louisiana	7,100
Maryland	406,429
Massachusetts	3,601,543
Michigan	220,354
Minnesota	197,500
Mississippi	182,900
Nebraska	755,556
New Jersey	18,500
New York	813,212
North Carolina	212,812
Ohio	360,000
Oklahoma	20,000
Oregon	59,100
Pennsylvania	15,000
Tennessee	15,000
Texas	38,700
Virginia	271,550
Washington	155,000
Wisconsin	173,150
Total	62,488,449

FOOD AND NUTRITION SERVICE

INCENTIVE PAYMENTS

Question. How much in incentive payments will be made to States lowering their error rates in fiscal year 2000?

Answer. It is estimated that in fiscal year 2000 States will earn \$39 million for incentive payments by lowering their food stamp issuance error rates in fiscal year 1999.

CHILD NUTRITION STATE ADMINISTRATIVE EXPENSES

Question. What is the breakdown in increases requested by the fiscal year 2001 budget proposal for State Administrative Expenses for the Child Nutrition Programs? Why is an increase of \$9,482,000 needed for fiscal year 2001?

Answer. The level of funding required for Child Nutrition, State Administrative Expenses is dictated by section 7 of The Child Nutrition Act, as amended. This law requires that 1.5 percent of the amount of funds a State used in the second prior year for School Lunch and Breakfast, Special Milk and the Child and Adult Food Care Programs be made available to States for their administrative expenses for those same programs. Thus, the funding requested for fiscal year 2001 is determined by the actual expenditures in fiscal year 1999. All of the funds requested would be granted to States, usually the State education agency for school programs with some funding going to the State Agriculture agency to pay for their expenses incurred in handling commodities for schools and some to the State welfare agency if they administer the Child and Adult Care Food Program. I will provide additional data on how much funding is generated from each of the programs listed above.

STATE ADMINISTRATIVE EXPENSES—EARNINGS: FISCAL YEAR 2001

[In thousands of dollars]

	Fiscal year 1999 cash payments to States	Percent- age	Fiscal year 2001 State Administrative expenses
School Lunch Program	\$5,516,552	1.5	\$82,748
School Breakfast Program	1,354,843	1.5	20,323
Child and Adult Care Food Program	1,598,580	1.5	23,979
Special Milk Program	18,075	1.5	271
Total	8,488,050	1.5	127,321

SCHOOL BREAKFAST DEMOS

Question. Please give the subcommittee an update on the School Breakfast demos. Answer. USDA is continuing preparations to commence the demonstration of universal free school breakfast in school year 2000–2001. A rigorous study design has been developed with the assistance of a contractor and a panel of National experts. The design document, along with a literature review that summarizes the current knowledge about the relationship between breakfast and learning, was completed in December 1999; these documents are now available on the Food and Nutrition Service website.

A Federal Register notice announcing the application process for school food authorities (SFAs) who wish to participate was published in early December 1999. School districts throughout the country have expressed interest in participating in the pilot project demonstration. A total of 386 school districts from 43 States submitted applications. Selection of the six school districts to participate in the pilot projects will occur in early Spring 2000. These districts will be selected to be geographically dispersed, with a blend of urban and rural areas, and consideration given to socioeconomic conditions.

In addition, the process of selecting an evaluation contractor to collect and analyze data and produce a final report is underway. The request for proposals (RFP) for the evaluation of the pilot projects was mailed to over 60 potential offerors in February 2000. Proposals were submitted to FNS at the end of March; we expect to make a final selection of the evaluation contractor by early July 2000.

NUTRITION EDUCATION AND TRAINING

Question. The fiscal year 2001 proposed budget has an increase of \$2 million for Nutrition Education and Training. Was the study that was directed by the Committee used in forming this request?

Answer. The request in the President's fiscal year 2001 budget of \$2 million in funding for the Nutrition Education and Training (NET) Program is designed to help States maintain the nutrition education infrastructures they have built up through NET over the past 20 years. While the Administration is exploring budget options for the future that would implement the broader nutrition education coordination strategies outlined in the report directed by Congress, it has requested NET funding for a number of years as a critical tool to support nutrition education efforts at the State level.

"The Promoting Healthy Eating: An Investment in the Future" report on nutrition education in Federal nutrition assistance programs, prepared by FNS pursuant to the Agriculture Appropriations Act for fiscal year 2000, identifies a number of important actions that would strengthen nutrition education within and across FNS programs. One of the actions identified was to restore the appropriation for NET. The report notes that "Over the last 10 years, the inconsistency of NET funding levels has complicated the coordination and long-term planning of nutrition education services. While Team Nutrition has made available many creative nutrition education resources and strategies for State and local government, implementation is limited. Without the infrastructure supported by NET, States face diminished capacities to conduct programs and to perform the vital leadership functions of assessment, policy development and quality assurance needed to promote implementation." (p. 17)

Nutrition education in the Child Nutrition Programs is designed to be supported through two complementary, integrated mechanisms—NET and Team Nutrition.

NET has provided the infrastructure required by State and local agencies to deliver the Team Nutrition materials at schools and child care settings participating in the Child Nutrition Programs. Without NET, delivery mechanism for either National Child Nutrition Initiatives like Team Nutrition or more localized approaches and projects.

ALTERNATIVE PROTEIN PRODUCTS

Question. On March 9, 2000, the Food and Nutrition Service issued a final rule that allows full replacement of meat, poultry, and seafood with Alternative Protein Products (APPs) such as soy and whey protein in the child nutrition programs.

Why did the agency change the name of Vegetable Protein Products (VPPs) to Alternate Protein Products? Does not this name change infer a substitution rather than an alternate choice of one protein for another? Is it the agency's intent that Alternate Protein Products replace rather than substitute meat, poultry, and seafood available in the child nutrition programs?

Answer. We changed the name of Vegetable Protein Products (VPPs) to Alternate Protein Products (APPs) to permit the use of protein products that are vegetable-based as well as products derived from animal sources such as whey-based protein products. In addition, we did not want to restrict the use of any alternate protein products that might be developed in the future that were not vegetable-based. We believe the term APPs, as opposed to the term VPP, most accurately reflects the fact that protein is available from a variety of sources, including vegetable-based sources. This name change was not intended to imply a replacement or a substitution, rather it was intended to provide schools with the flexibility of expanding their menus to offer children a meat alternative in addition to those currently available such as cheese, peanut butter and dry beans. It was our intention that Alternate Protein Products would expand the number of protein food items to satisfy the cultural, ethnic and special dietary needs of a diverse student body.

Question. Why does the agency not require blended meat products with more than 30 percent (VPPs) be clearly identified and labeled in a non-misleading way?

Answer. Food product labeling is regulated by both the Food Safety Inspection Service (FSIS) in USDA and by the Food and Drug Administration (FDA) in the Department of Health and Human Services. FSIS labeling regulations cover meat, poultry and egg products. FDA labeling requirements cover all other non-meat foods such as shellfish, fruit, milk and grain products. Current FSIS and FDA rules require food manufacturers to list, by common name, the ingredients used in the formulation of processed food products on the label for that product. Information about the source or type of protein will be clearly indicated in the ingredient listing, such as whey protein concentrate or hydrolyzed soy protein. However, according to FSIS and FDA regulations, percent labeling is voluntary.

With regard to the point of service menu labeling, we encourage program administrators to provide menus that accurately describe menu items served to students and their parents to assist them in making choices that meet their dietary demands. Clear point of service menu labeling can assist students and their parents in making menu selections consistent with their dietary needs.

We plan to work with representatives of the food industry, school food service directors, FSIS, FDA and other interested parties to develop voluntary labeling for both products and menus.

Question. On days when products composed entirely of VPPs are served to fit the needs of religious and ethnically diverse populations, is a meat entree required to be served also? If not, why?

Answer. On days when products composed entirely of APPs are served to meet the needs of religious and ethnically diverse populations, a meat entree is not required. However, we do believe that menu planners are likely to use APPs as a choice, not as the only entree available. This is consistent with the use of other meat alternates such as cheese, peanut butter and dry beans. Many factors go into menu planning for our programs—preferences of those consuming the meals, economics, availability of foods, and the need to meet program meal patterns as well as the nutrition standards, including the Dietary Guidelines for Americans' recommendation that people consume a variety of foods. We stress the importance of schools and institutions offering choices and believe this practice to be the general rule.

Given these factors, we believe that menu planners will provide choices and variety to the greatest extent possible and that they will use APPs appropriately and will take into account the varied dietary demands of all program participants.

Question. How is the agency ensuring that schools who use VPP/meat blended products are in a readily fortified form so that all products meet the same quality and consistency?

Answer. Manufacturers are required to document that the amount and quality of protein meets the levels specified in the final rule. Further, schools may specify that products are fortified. Finally, manufacturers may participate in the Child Nutrition (CN) labeling program. The CN labeling program has reviewed labels of products containing VPP since 1984 and will continue to do so for APP labels. The CN labeling program, which is widely used by the food manufacturers who market their products to the Child Nutrition Programs, provides information on how products are to be credited under the meal patterns established for each program.

Question. Why did the agency choose to not require fortification of these APPs when research shows that increased consumption of soy has been found to cause deficiency systems of calcium, magnesium, manganese, iron and zinc?

Answer. The Food and Nutrition Service is not aware of any scientific research showing that increased consumption of soy has led to the deficiencies enumerated. However, we are aware of current research indicating that eating a variety of foods will generally ensure adequate mineral intake. This research further suggests that unrestricted use of highly fortified APPs could actually result in excessive intakes of iron and zinc.

When the VPP regulations were first developed in 1983, we required that VPPs used in the school meals programs be fortified according to our specifications. When we recently revised the requirements on VPPs, we eliminated our special fortification requirement. The requirement had previously been eliminated for schools using the Nutrient Standard Menu Planning System. The new rule extends to all schools the option to purchase the same products available to commercial markets, as well as allowing the food industry to directly market their products to schools.

USDA's nutrition standards for school meals require that meals, averaged over a week, meet one-third of the Recommended Daily Allowance (RDA) for key nutrients, including iron. Schools may continue to purchase fortified products if they are needed to ensure menus meet the nutrition standards. We believe the decision to purchase fortified products should rest with the local school, based on the nutrient content of other menu items. We believe that the food industry is in the best position to determine if and to what extent APPs should be fortified based on available research and the needs and preferences of consumers.

STUDIES AND REPORTS

Question. FNS was directed to provide information to the committee relating to the effectiveness of adolescents and older children participating in the after-school program and provide views on the advisability of expanding the availability of free or reduced price meals under this authority to children under the age of 12. What is the status of this request?

Answer. The enactment of the William F. Goodling Child Nutrition Reauthorization Act of 1998 (Public Law 105-336), on October 31, 1998, expanded the availability of afterschool snack programs in a significant manner. In essence, it made them available to every child through age 18 in every public and nonprofit private primary and secondary school in the Nation. It also made them available to children through age 18 that attend afterschool programs operated by public and nonprofit private organizations in areas in which at least half of the children are eligible for free and reduced price meals. The Department initially proposed expansion of the afterschool snack program in its 1998 reauthorization proposals and fully supported the version of the provision enacted into law.

FNS shares the belief reflected in the Committee's directive that afterschool programs are an effective way of providing supervision to a vulnerable population and that the availability of nutrition benefits can be helpful in drawing children to these programs. As we gain more experience under the existing provisions of the law, we may be in a better position to consider whether further expansion of benefits and/or eligibility is warranted. We would certainly support an evaluation of the effectiveness of these programs after they have become more widely utilized.

FOOD SAFETY AND INSPECTION SERVICE

Question. What is the status of the agency's efforts to streamline regulations and eliminate carcass by carcass requirements in the HACCP Inspection environment?

Answer. FSIS has undertaken a comprehensive review of its regulations, policy notices, and policy memoranda for consistency with the HACCP-based inspection system. The review was announced in the December 29, 1995, Federal Register as an advance notice of proposed rulemaking (ANPR) entitled "FSIS Agenda for Change: Regulatory Review." In it, the Agency said that it would determine which regulatory procedures and requirements were still needed and which needed to be

modified, streamlined, or eliminated. The ANPR identified several categories of meat and poultry products inspection regulations that would be reviewed.

Published on the same day as the ANPR—December 29, 1995—were some of the rulemakings needed to streamline existing requirements and carry out the FSIS food safety strategy. These included a proposed rule to eliminate the FSIS prior-approval system for substances added to meat and poultry products (FDA issued a companion rule) and a final rule eliminating unnecessary duplication in the approval system for meat and poultry labels. Since the “Regulatory Review” ANPR was published, several “HACCP-consistent” rulemakings occurring over the past three years have streamlined requirements or replaced prescriptive requirements with performance standards. These include: issuing a final rule eliminating prior approval requirements for facilities and equipment, eliminating prior approval requirements for proprietary substances and non-food compounds used in meat and poultry establishments, issuing a final rule on performance standards for the production of certain meat and poultry products, issuing a final rule on revised sanitation requirements for meat and poultry establishments, and issuing a final rule revising regulations governing the refusal, suspension, or withdrawal of inspection services (including determinations of HACCP system inadequacies).

A number of dockets remain under development within the Agency with final publication expected during fiscal year 2000. These include regulations governing water retention in meat and poultry (proposed rule published September 11, 1998), chilling requirements for slaughtered poultry, processing and handling temperature requirements for meat and poultry, and the elimination of requirements for partial quality control programs (proposed rule published May 18, 1999).

FSIS has also completed action on a list of priority regulatory changes provided to the Agency by the industry following a May 20, 1998 hearing before the House Agriculture Subcommittee on Livestock, Dairy, and Poultry. The top five rulemakings requested by industry were those dealing with:

- Procedures for industry appeals of FSIS decisions and rules of practice for proceedings under the Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA). A final rule was published on November 29, 1999.
- Sanitation at official establishments. A final rule was published on October 20, 1999.
- Substances approved for use in the preparation of livestock and poultry products. FSIS simultaneously published the substances final rule and the final rule on red meat irradiation on December 23, 1999 so that future activity by FDA on irradiation—as well as other additive approvals—can be handled by FDA rulemaking without separate rulemaking by FSIS.
- The elimination of prior approval of proprietary substances and non-food compounds was accomplished in the Agency’s final rule on revised sanitation requirements, which was published on October 20, 1999.
- Performance standards for certain cooked meat and poultry products were published in a final rule on January 6, 1999.

Lower-priority actions specified by industry include rulemakings on: (1) performance standards for perishable and shelf-stable ready-to-eat products (a proposed rule to be completed during fiscal year 2001); performance standards for perishable, non-ready-to-eat products (a proposed rule to be completed during fiscal year 2001); and, (3) the elimination of requirements for partial quality control programs (a final rule to be completed during fiscal year 2000).

The Federal Meat Inspection Act and the Poultry Products Inspection Act require post-mortem inspection of all carcasses by Federal inspectors. Absent any amendment of these Acts, carcass-by-carcass inspection remains a requirement of the Federal meat and poultry inspection program. However, in a case recently brought before a District Court, it was ruled that the Secretary of Agriculture has the discretion to decide that the inspection of each carcass need not be “organoleptic.” The implications of this decision may lead to further regulatory streamlining.

Question. The budget request includes new language which authorizes the Secretary to transfer funds to FSIS to cover unbudgeted expenses in the event of a food safety emergency. Why is the Department’s existing reprogramming authority not adequate in this case? Please provide a history of all occurrences of food safety emergencies in which the funds available to FSIS were insufficient to meet needs arising from the emergency.

Answer. New appropriations language authorizing funding transfers is included in the budget request since the Secretary’s previous authority to transfer funds between Agencies has expired. Two types of significant events would warrant use of the transfer authority: (1) a costly nationwide recall involving large amounts of product that would constrain the Agency’s ability to fund its other food safety efforts; and (2) massive outbreaks of foodborne illness, such as that which might be

the result of a bioterrorist action, which overwhelm the Agency's ability, given existing resources, to protect public health. Funds transferred in these situations would cover the cost of emergency personnel deployments, laboratory analysis, and inspector recruitment and hiring.

During a bioterrorist event, FSIS would assume the lead in coordinating the local, State, and federal authorities that comprise the Foodborne Outbreak Response Coordination Group (FORCG). Proper execution of this role would require dedicated manpower and a state-of-the-art communications capability. Additional personnel, travel, and equipment would also be needed to conduct on-site investigations in the "zone of contamination," as well as trace backs of many more implicated lots of product than in a usual investigation when only 1 or 2 products are implicated. Emergency deployment of personnel and supporting resources would require emergency funding so as not to divert resources from core food safety activities.

FSIS has in the past responded to food safety emergencies as they arise, however, the pace of the Agency's response is hampered by the need to first assess where within the Agency funds might be available to cover emergency personnel redeployments or increased laboratory costs as these emergencies arise. A large scale, nationwide, recall of product can result in direct costs to FSIS of over \$300,000 in a brief period of time. It is estimated that FSIS could expend close to \$200,000 for travel by public health and investigative staff and laboratory costs in the event of an act of bioterrorism in a major metropolitan area. Food safety emergencies late in a fiscal year are especially difficult since flexibility is limited when most funds are already obligated. In 1997, the costs related to a massive recall of ground beef produced in Nebraska caused the Agency to impose restrictions on travel by both support staff and processing inspectors, many of whom have patrol assignments visiting several establishments on a daily basis. The cost of this recall of ground beef was among a number of factors contributing to the Agency's fiscal year 1997 Anti-Deficiency Act violations. Other high-priority activities of the Agency must be postponed or cancelled as funds originally budgeted to support them are redirected to deal with emergency situations. For example, as a result of the 1999 outbreak of listeriosis in ready-to-eat hot dogs and lunchmeat products, FSIS was unable to provide training for new Epidemiology Officers to coordinate emergency response activities at the State and local level. Other examples of postponed, high priority activities include inspector recruitment efforts and HACCP implementation programs, such as the HIMP Models project.

The following is a listing of all product recalls and examples of food safety emergencies handled by FSIS over the previous five years:

EXAMPLES OF FOOD SAFETY EMERGENCIES

YEAR	PRODUCT	PROBLEM TYPE	LOCATION
2000	BONELESS BEEF	POSSIBLE PRODUCT TAMPERING (SYRINGE)	GENESSEO, IL
1999	BEEF CARCASSES	ALLEGED PRODUCT TAMPERING (INVOLVING CONTAMINATION WITH HIV TAINTED BLOOD).	MILWAUKEE, WI
1999	PORK DUMPLINGS	ILLEGALLY IMPORTED PORK DUMPLINGS FROM KOREA	COLUMBIA, MD
1999	BEEF CARCASSES	PRODUCT ADULTERATED WITH E. COLI O157:H57	COLUMBUS, NE
1999	BEEF CARCASSES	INVESTIGATION OF ALLEGED UNSANITARY PRACTICES AND ADULTERATED PRODUCT.	WALLULA, WA
1999	BEEF CARCASSES	CUSTOM VIOLATION, PRODUCT ADULTERATED WITH E-COLI O157:H7.	HARRSON, AR
1999	BEEF CARCASSES	ALLEGED DES FINDINGS IN SWITZERLAND	CHICAGO, IL
1999	CHICKEN BREASTS	METAL CONTAMINATION IN CHICKEN BREASTS	ROME, GA
1999	HOT DOGS	HOT DOGS ADULTERATED WITH LISTERIA	MADISON, FL
1999	BEEF CARCASSES	E-COLI O157:H57 OUTBREAK ON BEEF CARCASSES	VARIOUS STATES
1998	HOT DOGS	LISTERIA INVESTIGATION	ZEELAND, MI
1998	HOT DOGS	HOT DOGS ADULTERATED WITH LISTERIA	FOREST CITY, AR
1998	BEEF	SPOILAGE IN BEEF PRODUCTS	OCALA, FL
1997	POULTRY	SPOILAGE IN POULTRY PRODUCTS	ROGERS, AR
1997	MEAT AND POULTRY	DIOXIN CONTAMINATION	NATIONWIDE
1997	GROUND BEEF	E-COLI O157:H57 OUTBREAK IN GROUND BEEF PATTIES/BURGERS.	NATIONWIDE
1996	MEAT AND POULTRY	RODENT DEFILED PRODUCTS RECEIVED FROM OTHER COUNTRIES.	TAMUNING, GUAM
1996	MEAT AND POULTRY	SPOILAGE IN MEAT AND POULTRY PRODUCTS	TROY, FL

Question. Please describe the arrangement under which the Agricultural Marketing Service performs egg safety activities through contract or cooperative agreement for FSIS, including the dollar amount of such agreements.

Answer. FSIS has a cooperative agreement with the Agricultural Marketing Service (AMS) to cross-utilize AMS graders to perform routine egg product inspection and other related services. Included in the agreement is a provision that FSIS will provide egg products inspectors to perform routine egg grading and other service to AMS. The estimated amount of reimbursements provided to each agency is \$130,000 for fiscal year 2000. These agreements will be proposed for modification under the new Egg Safety Action Plan.

Question. Please provide an update on the FAIM program, including funds obligated to date and projected needs in future years.

Answer. Nationwide FAIM implementation for Federal inspectors is scheduled to be completed over a five-year period. Implementation started in fiscal year 1996 and is on schedule to be completed at the end of fiscal year 2000. Although FAIM implementation will be completed on schedule by the end of fiscal year 2000, in fiscal year 2001 and future years, funding will be required to (a) replenish obsolete and depreciated equipment/software; (b) support a user population of 5,500 inspectors with telecommunications, maintenance, technical support, and supplies; and (c) develop and deploy new software applications as the system evolves to meet new inspection requirements. A table of actual and estimated obligations is provided.

[The information follows:]

Field Automation and Information Management

[In thousands of dollars]

<i>Fiscal year</i>	<i>Expenditures</i>
1996	7,230
1997	9,485
1998	8,023
1999	7,524
2000	8,893
2001	8,023

FSIS began an initiative to extend the FAIM project to the State inspection programs in fiscal year 1999 as a multi-year capital investment to assist States in meeting mandatory HACCP requirements. Under this initiative State inspectors receive identical equipment, software, training and technical support as FSIS inspectors. Completion of State FAIM implementation is dependent upon individual States obtaining the necessary matching funds. Fifteen States will have secured sufficient funding to complete FAIM implementation by the end of fiscal year 2000, and FSIS plans to work with the remaining 10 States in fiscal year 2001 and future years. The State FAIM project's costs are segregated from Federal FAIM as a separate budget activity with laboratory upgrades and HACCP training under Special Assistance for State Programs. In fiscal year 1999 \$2.2 million was spent for State FAIM and it is estimated that \$3.9 million and funds carried over will be spent in fiscal year 2000 and fiscal year 2001.

Question. The Senate report accompanying the fiscal year 2000 appropriations act urges the Secretary to provide at least \$3,200,000 for Codex alimentarius activities for fiscal year 2000. Please provide the estimated level of Codex support provided for fiscal year 2000. Is the fiscal year 2001 request adequate to support the United States' participation in this organization?

Answer. The direct funding of the activities of the U.S. Codex Office is provided for in the budget of the Food Safety and Inspection Service under the Codex budget activity. Estimated direct Codex funding is \$707,000 in fiscal year 2000 and funding of \$2,039,000 is proposed in fiscal year 2001. FSIS also funds travel for the chairman of the Codex Alimentarius in the amount of \$30,000 for fiscal years 2000 and 2001. Two former Foreign Agricultural Service (FAS) employees have been added to the Codex staff to work with the chairman. These amounts exclude spending by either other USDA agencies or other Departments in support of Codex activities such as the travel and personnel costs of the Agricultural Marketing Service (AMS), Foreign Agriculture Service (FAS), and U.S. Trade Representative, Commerce and State Department staff that are sent as delegates to meetings of Codex Committees. FAS also expends funds for programs of support to developing countries which indirectly advance U.S. Codex interests. Codex interests are served by Agricultural Attaches around the world in the handling of demarches to foreign capitals on specific Codex issues. Affixing firm dollar levels to these activities with respect to Codex is not practicable.

FSIS' fiscal year 2001 budget request is adequate to fund the Agency's activities supporting the United States' participation in the Codex Alimentarius Commission.

Question. Does the budget request assume enactment of legislation allowing interstate shipment of state inspected meat? If so, please provide a budget cross-walk that reflects fiscal year 2001 needs if this legislation is not enacted.

Answer. The fiscal year 2001 budget includes an initiative for comprehensive reviews of all State Inspection Programs, which is justified in part to prepare for enactment of legislation to permit interstate shipment of State inspected meat and poultry. Whether or not this legislation is enacted, FSIS will increase the frequency and intensity of its State reviews to ensure HACCP compliance. Currently, State reviews are staggered over a three-year period. State programs inspect many of the very small plants, which recently implemented HACCP in January 2000. FSIS worked closely with the very small plants to provide needed technical assistance, and comprehensive reviews in fiscal year 2001 will provide follow-up assistance to address and resolve any compliance issues that may arise in the first year of HACCP-based State inspection. Reviewing all State programs in the same year will enable FSIS to assist the States in preventing problems that may develop if reviews are delayed for two or three years.

Question. The budget request reflects \$943,094 in fiscal year 1999 funds which lapse. Please explain why it was therefore necessary for this subcommittee to provide \$8,000,000 above the fiscal year 2000 budget request for filling of inspector vacancies and recruitment of new inspectors.

Answer. The \$943,094 in unobligated fiscal year 1999 funds which lapsed was intentionally held in reserve to cover unforeseen upward adjustments in obligations. This reserve is intended to guard against unintentional violation of the Anti-Deficiency Act, which occurred in fiscal year 1997 and fiscal year 1998, and to ensure sound fiscal management of the food safety program. This amount is far less than the standard recommended reserve of two percent of the Agency's budget.

Fiscal year 1999 unobligated funds which lapsed are only 11.8 percent of the amount provided in fiscal year 2000 for filling inspector vacancies and for the recruitment of new inspectors to meet estimated increases in industry demand for new services. Had FSIS obligated all \$943,094 for hiring additional inspectors in fiscal year 1999, a significant increase in fiscal year 2000 inspection resources would still be needed.

NATURAL RESOURCES CONSERVATION SERVICE

FARM SAFETY NET INITIATIVE

Question. Assuming that the President's Farm Safety Initiative is not enacted into law, what increases in conservation technical assistance would be needed for fiscal year 2001?

Answer. Assuming that the President's Farm Safety Net Initiative is not enacted into law, an increase in Conservation Technical Assistance of \$86 million over the fiscal year 2000 appropriated level is needed.

Question. What would the adjusted ceiling for staff be should the Farm Safety Initiative not be enacted into law in fiscal year 2001?

Answer. Should the Farm Safety Net Initiative not be enacted into law in fiscal year 2001, the adjusted staff year ceiling would be 11,344 based on the assumption of a technical assistance reimbursement level of \$75 million for the Wetlands Reserve and the Conservation Reserve Programs.

WATERSHED LOAN PROGRAM SUBSIDY

Question. For fiscal year 2001 the President's budget request proposes \$4.17 million in subsidy budget authority for a new \$60 million loan program. How many projects would be funded by this amount of loan authority?

Answer. It is estimated that \$60 million would address between 10 and 20 rehabilitation projects. This is difficult to answer definitively, since the scope and complexity of needed work varies significantly with each project.

Question. How will projects be chosen to receive loans for this work?

Answer. NRCS will develop a risk-based ranking system to score loan applicants which would take in to account the greatest human health and safety, as well as environmental concerns. The applicants' qualifications for a loan would also need to be factored into the priority process.

The rehabilitation program will be modeled after the Rural Utilities Service (RUS) Municipal Electric Loan Program, in terms of borrowers, defaults, interest, pre-payments, and loan characteristics.

FUNDS AVAILABLE FOR CRP AND WRP

Question. How much funding is available for technical assistance for CRP and WRP due to the limitation on the use of CCC funds? Does the President's proposed budget request require the passage of legislation to provide technical assistance for CRP and WRP at \$75 million from CCC?

Answer. Fund transfers through the Commodity Credit Corporation (CCC) are limited by statute through the Section 11 cap. In fiscal year 2000, NRCS's portion of these funds was \$10.74 million.

The President's budget proposes to increase the Conservation Reserve Program (CRP) acreage cap to 40 million acres and that the annual enrollment in the Wetlands Reserve Program (WRP) be set at 250,000 acres.

The Farm Service Agency (FSA) has estimated that the technical assistance needs in fiscal year 2001 would be \$81,866,909 for NRCS and \$4,593,883 for the Forest Service to implement the 40 million-acre CRP program. It would take \$22.5 million to implement the WRP program as contained in the President's budget. Technical assistance funding for the two programs combined would equal \$109.01 million.

If NRCS receives the same level of funding from CCC that it did in fiscal year 2000 (\$10.74 million) we would experience a \$93.62 million shortfall. Without removal of the CCC Section 11 cap, or some designated additional discretionary appropriations, NRCS would not be able to implement these programs in fiscal year 2001.

ADDITIONAL ASSISTANCE TO AMERICAN INDIANS AND ALASKA NATIVES

Question. How does the department plan to focus additional resources to assist American Indians and Alaska Natives regarding their conservation needs other than through the designation of \$16 million of EQIP funds in fiscal year 2001?

Answer. If additional resources are allocated USDA will use them to do the following types of activities: Accelerated technical assistance through additional staff to support conservation planning and applications. Accelerated outreach with tribes regarding USDA programs and activities including field trials, field days, etc. Accelerated soil survey's of Native American lands.

Question. If there is no increase in EQIP funds will the Department still earmark these funds for assistance to American Indians and Alaska Natives?

Answer. The Department has earmarked \$5 million (2.5 percent) in fiscal year 1997, \$8.1 million (4.0 percent) in fiscal year 1998, and \$8.7 million (5 percent) in fiscal year 1999 and fiscal year 2000 for EQIP activities on Native American and Alaskan Native lands. If there is no increase in the fiscal year 2001 EQIP budget, the Department will continue to earmark 5 percent of the EQIP allocation for Native American and Alaskan Native concerns.

OPERATION OF PLANT MATERIALS CENTERS

Question. The fiscal year 2001 proposed budget would continue the operation of the plant materials centers at the fiscal year 2000 level of \$9.1 million. The explanatory notes state that the ongoing plant materials development would continue at a somewhat reduced rate. What materials development is ongoing and what would be at a "somewhat" reduced rate?

Answer. Level funding over the past several years has reduced our ability to perform studies on plant materials by approximately 12 percent. In fiscal year 1999, over 14,000 plant collections were being evaluated on 73,000 plots by the Centers and 22 new plants were released for commercial production. If funding continues at a level rate as it has for the last 4 years, outputs from the Centers will be reduced. There are 26 plant materials centers around the country that maintain an ongoing program to develop plant technology for such critical issues as buffer strips, invasive species problems, and habitat restoration with native species. Products from this work have made significant contributions to conservation programs like, WRP, WHIP, CRP and others. Plant centers will become more limited in their ability to undertake new studies and to develop new technology and/or plant releases.

RESCISSION OF FINANCIAL ASSISTANCE

Question. Why did a rescission of \$7.8 million in financial assistance for Public Law 534 and Public Law 566 occur?

Answer. The Department opted to utilize its authority to rescind 15 percent of the financial assistance for Watershed and Flood Protection Operations as a means of complying with the omnibus budget bill while minimizing impact on technical assistance.

IMPACT OF GENERAL PROVISION SECTION 717

Question. How has the General Provision Section 717 of Public Law 106-78 affected this agency?

Answer. General Provision Section 717, Public Law 106-78 has had a positive impact on the agency by allowing NRCS to non-competitively enter into cooperative agreements with conservation partners under the Wetlands Reserve Program (WRP) to restore and protect America's wetlands.

EQIP NATIONAL PRIORITY AREAS

Question. In the fiscal year 1999 Senate Report 105-212 and in fiscal year 2000 Senate Report 106-80, the Committee directed the agency to provide adequate funding for two designated National priority area pilot projects. It is the Committee's understanding that no funds have been obligated for the Mississippi Delta National Priority Area Pilot Project. However, in fiscal year 2000 the Colorado Salinity Basin National Priority Area Pilot Project received "special emphasis" dollars amounting to \$1.3 million. How has this discrepancy occurred?

Answer. In accordance with fiscal year 1999 Senate Report 105-212, the Department established two EQIP National Priority Areas; the Colorado River Basin Salinity Control Area and the Mississippi Delta Area. The Mississippi Delta National Priority Area received \$1.3 million in both fiscal years 1999 and 2000.

STUDIES AND REPORTS

Question. The Committee directed the NRCS to provide the committee with a detailed analysis of the aging water systems for flood control structures and the hardship placed on the local conservation and flood control districts and to provide a comprehensive strategy for rehabilitation of these structures. The Committee has not received this analysis. What is the status of this analysis and strategy plan?

Answer. The report is in draft form. The final report will be available on or before May 1, 2000.

OFFICE OF THE CHIEF INFORMATION OFFICER

Question. What is USDA's fiscal year 2001 Information Technology (IT) budget?

Answer. According to the OMB Exhibit A-11 submitted in January 2000, the Department plans to spend approximately \$1,316,100,000 on its fiscal year 2001 IT budget.

Question. What part of USDA's fiscal year 2001 budget is for new IT investments, such as acquisition of new technology?

Answer. Consistent with revised reporting guidance of the Office of Management and Budget, USDA includes funding for new IT investments in the category of Development/Modernization/Enhancement. The latest report submitted to OMB estimates that approximately 50 percent of USDA's information technology budget is dedicated to this category.

Question. How much of USDA's fiscal year 2001 IT budget represents costs for personnel, and what is the total number of FTE's that the fiscal year 2001 budget supports?

Answer. Approximately 23 percent of the budget is for salaries and benefits for government personnel who perform information technology related functions 51 percent or more of their time. This supported an estimated 4,964 FTE's as of August, 1999.

Question. How much of USDA's fiscal year 2001 IT budget is for contractor support services, and what did USDA spend for such services in fiscal year 1999/2000?

Answer. According to our August 1999 OMB report, USDA contractor support services will be approximately 19 percent of the budget for fiscal year 2001. This includes maintenance used in support of equipment, software or other services. Contract support services for fiscal year 1999 and fiscal year 2000 are as follows:

- Fiscal year 1999—\$277,434,826
- Fiscal year 2000—\$293,831,647

CAPITAL PLANNING AND INVESTMENT CONTROL (CPIC) PROCESS

Question. USDA's OCIO budget says that the CPIC program has established a process for the Department to select, manage, and evaluate the results for all major investments in information technology.

What were the major investments reviewed and approved for fiscal year 2001 by USDA's Executive Information Technology Investment Review Board as part of the CPIC process?

Answer. The major investments reviewed, and decisions, for those investments in the "Select" and "Control" phases are included in the following charts. [The information follows:]

RECOMMENDATIONS TO THE EITIRB REGARDING USDA MAJOR INFORMATION TECHNOLOGY
INVESTMENTS FOR BUDGET YEAR 2001

	Rank (H,M,L)	Investment Decision
Select Phase:		
Employment Complaints Tracking System	High	Approve
Integrated Acquisition System (IAS)	Defer
Programs Funding Control System (PFCS)	High	Defer
REE Information System (REIS)	Medium/High	Approve
Integrated Personnel System for the 21st Century (IPS 21)	High	Approve
Guaranteed Loan System (GLS)	High	Approve
Multi-Family Integrated System (MFIS)	High	Approve
Community and Utility Business System (CUBS)	High	Approve
USDA Telecommunications Enterprise Network	High	Defer
International Trade Data System (ITDS)	High	Approve
Entry, Processing, and Inquiry System (EPIC)/Personnel Office Desktop Solution/PODS	Low	Disapprove
Combined Administrative Management System (CAMS)	High	Approve
Control Phase CORE Accounting System (CORE)	High	Continue
Project 615	High	Continue
Foundation Financial Information System (FFIS)	High	Continue
Shared Information Systems	High	Continue
Evaluate Phase:		
Processed Commodities Inventory Management System (PCIMS)	High	Continue
Integrated System Acquisition Project (ISAP)	High	Continue
Agency Financial Management System (AFMS)	High	Continue
Food Stamp Program Integrated Information System (FSPHIS)	High	Maintain
Integrated Personnel System (IPS)	Medium	Maintain
Field Automation and Information Management (FAIM)	High	Continue
Management Services Information System (MSIS)	Low	Terminate
Dedicated Loan Origination System (DLOS)	High	Continue

Question. Has the USDA established performance measures for each and every one of these IT investments? If so, what are they for each project. If not, why?

Answer. In accordance with the Department's CPIC process, each agency is required to establish performance measures for their respective information technology investments during the "select" phase of capital planning and investment control for fiscal year 2002. Agencies with projects in the "evaluate" phase will conduct post-implementation reviews to ensure that program missions are being met, and the performance measure accurately reflects contribution of the IT investment to the mission. As the CPIC process is now in its early stages within the Department, much of this is already being done. While USDA does not yet have performance measures for all of the IT systems listed above, the OCIO is working with each agency to develop mission and program related performance measures so that the CPIC process can be in full effect for the fiscal year 2002 budget process. Following are the performance measures for some of our major IT systems.

Research education and economics information system

Performance measures are to be developed through modeling user behavior, through an ongoing Quality Assurance program to assess system performance, and through establishing user feedback mechanisms as part of system usage. Performance Indicators include:

- Number of accesses per user profile
- Number of reports requested per user access
- Number of returns to access system

- Number of changed user profiles
- Quantifiable responses on Quality Assurance questionnaire
- Character of responses on non-system surveys

Food safety and inspection service—field automation and information management (FAIM) project

- Performance Goals for system implementation include:
- Number of FSIS inspectors trained in FAIM each year through fiscal year 2005
 - Number of FSIS computers deployed to the field each year though fiscal year 2005

Forest service project 615—IT infrastructure

The Forest Service (FS) is using the “Hardware Management System—HMS—to track Project 615 IBM acquisitions, including financial and inventory information and to develop replacement plans. The HMS tool provides guidance on replacement planning using market analysis and utilizing the output from Information Technology Investment Portfolio System—I-TIPs. The Agency’s Project 615 implementation team is responsible for monitoring the achievement of Project 615 goals and outcomes. These goals and outcomes are defined in the FS GPRA Performance Plan. Performance Measures include:

- Cost per seat. Anticipated computer system capital investment level for hardware and software as currently planned is \$1,600 per seat per year.
 - To ensure that the IT infrastructure meets minimum performance characteristics, yet stays within investment guidelines, additional measures include disk space per seat, seat/server capacity utilization, expected versus actual seats, useful life remaining per unit equipment, and others.
- Some example target measures would be:
- One gigabyte server-disk capacity per seat
 - 75–85 percent seat/server capacity utilization
 - Actual versus expected seats of under 110 percent

Field units report on their measures on a regular basis, documenting reasons for any deviations from performance targets. Quarterly summaries are prepared with aggregated results that are used in future planning.

Implementation of the IBM System is critical to the successful accomplishment of the Forest Service mission. Listed below are key milestones and measures of success for this project.

Date	Milestone	Measure of Success	Status
October 1998	Office automation on 615	95 percent of Data General office automation closed and transferred to 615.	Completed
February 1999	Full 615 implementation	All offices equipped and operating with initial 615 systems for all employees.	Completed
March 1999	All offices functional on 615	All mission work accomplished on 615 with initial system.	Completed
May 1999	Data General phased out	Existing systems transferred from Data General computers and made Y2K compliant on 615.	Completed
October 1999	New accounting system	FFIS implemented service wide	Completed
September 1999	New Office Automation (O/A) System ...	Microsoft Office 2000 installed on desktops.	Completed
January 2000	GIS project work standardized	Existing GIS project work converted to core data standards.	Completed
June 2000	Mainstream E-mail messaging system (Lotus Notes) implemented.	All employees using the new messaging system integrated with the Office Automation system.	On Schedule
March 2001	GIS project work standardized	90 percent of major information systems operating with corporate standards and support.	Plans in Progress
June 2001	Enterprise Management standardized ..	All server and desktops installed with and managed by enterprise systems management software.	Plans in Progress

Rural development—guaranteed loan system (GLS)

Description of performance-based system:

Rural Development and FSA are shifting from primarily making direct loans to making a significant number of guaranteed loans as part of their overall role in providing agricultural credit and rural development assistance. To achieve this objec-

tive, the automated system needs to support the full range of guaranteed loan business activities in order to:

- Improve availability, accuracy, and timeliness of management information;
- Provide servicing offices with capability to maintain and manage their guaranteed loan portfolio;
- Improve the guaranteed program to be more attractive to lenders;
- Provide the capability to effectively monitor lender performance;
- Provide information required by congress, OMB, General Accounting Office, Office of Inspector General, and United States Department of Agriculture.
- Fully comply with the Government-wide guidelines documented in the Joint Financial Management Improvement Program (JFMIP) Guaranteed Loan System Requirements.

Performance Goals:

- Achieve annual savings of \$250,000 through reduced postage and mailing costs, and a significant reduction in paper costs facilitated by the use of electronic commerce.
- Achieve reduction in non-performing loans through more timely and accurate status information. The new system will allow the Agency to monitor the status of guaranteed loans more closely. This will allow the Agency to determine which loans are experiencing problems and implement corrective action sooner. This will result in a 5 percent reduction in non-performing loans.

Rural development—dedicated loan origination and servicing system (DLOS)

DLOS is considered an earned value system in that it identifies baseline costs, schedules, and performance goals. The DLOS system was installed in the Production environment and the Centralized Servicing Center was established in fiscal year 1997 to provide the loan origination and servicing functions for RHS Single Family Housing borrowers. Performance indicators used to gauge the success of DLOS are monitored on an ongoing basis through management reviews and tracking of key factors including:

- Borrower Delinquency Rates
- Delinquent Loan Accelerations
- Average Response Time in Call Center
- Average Response Time in Field Support
- Customer Service Call Abandon Rates in Call Center
- Collections Call Abandon Rate
- Accuracy of New Loan Set-ups
- Collections Through Treasury Offset Program
- Escrowing of Portfolio

Rural development—multi-family integrated system (MFIS)

MFIS is considered an earned value system in that it identifies baseline costs, schedules, and performance goals. The MFIS system will be installed in the Production environment in fiscal year 2000. Performance indicators that will be used to gauge the success of MFIS and will be monitored on an ongoing basis through management reviews and tracking of key factors include:

- Increase the Number of Supervisory Activities Performed
- Reduce Classification “D” Projects (Not in Compliance) to Below Current Levels
- Reduce Delinquency Rates to Below Current Levels
- Reduce the Average Time to Correct Project Findings
- Decrease the Average Time Required to Review and Approve Project Budgets
- Decrease the Average Time Required to Perform Quarterly and Year-end Analysis.

Question. How is USDA tracking the performance of all of its IT investments—in terms of improvements to the business it is supporting?

Answer. The Department has taken great strides to fully institute its Capital Planning and Investment Control (CPIC) Process. Per the Office of Management and Budget passback language, the Department has forwarded the CPIC guide to OMB in March 2000. Integral to the CPIC is the evaluation of the contribution of an IT investment to the agency’s mission as part of the selection process, monitoring of achievement of the investment’s performance goals as part of the control process; and performance evaluation of each information technology system. OCIO is working with Departmental executives to increase the attention to the “control” aspect of capital planning during the fiscal year 2002 budget development process. OCIO, in conjunction with agency executives, will review performance of major investments against established goals, and is working on an individual basis with each agency to ensure that CPIC is applied effectively. Eight information technology systems are currently undergoing a post-implementation review based on the USDA CPIC guid-

ance, to determine how well those systems met performance goals and contributed to agency mission.

The Department has a senior level advisory group that reviews the major information technology—IT—investments in an effort to make recommendations aligned with the Department's missions and to maximize efficient and effective utilization of USDA's IT resources.

For fiscal year 2001, the senior level advisory group's review encompassed IT investments designated major because of their size, scope, or strategic impact to the Department. The review criteria included impact on mission, risk, return on investment for new investments, along with performance criteria—cost, schedule, and performance goals—for systems that are underway. Additionally, IT investments in the Evaluate phase were evaluated against Post-Implementation-Review criteria to determine how the systems were performing against the original design criteria. The senior level advisors reviewed and scored the investments based on supporting documentation prepared by the agencies and met early in December to develop a consensus on investment scores and priorities. The review process took approximately two weeks. Their report was reviewed and voted upon by the Executive Technology Investment Review Board—EITIRB—prior to being forwarded to the Office of Management and Budget.

Question. How does the CPIC process address managing and evaluating the investment for IT personnel, which are IT-related investments, to ensure that investments in personnel are still cost-effective as opposed to other options (i.e., outsourcing)?

Answer. All costs for IT investments are evaluated through USDA's CPIC process. Prior to proposing investments to the Department, agencies evaluate alternatives for accomplishing IT investments, which may include using government personnel versus outsourcing. Investment proposals specifically identify the FTE's associated with initiatives and as directed by OMB Circular A-11 include the personnel costs for project management and direct support. In addition, the CPIC investment proposal process allows the EITIRB to evaluate the business case presented to justify new investments and their reliance on Federal support versus outsourcing as a delivery method.

Question. How are investments for contractor support addressed in the CPIC process to ensure that the investment in contractor support is cost-effective?

Answer. As stated above, all costs for IT investments are evaluated through USDA's CPIC process. Prior to proposing investments to the Department, agencies evaluate alternatives for accomplishing IT investments, which may include using government personnel versus outsourcing. Investment proposals specifically identify the FTE's associated with initiatives and as directed by OMB Circular A-11 include the personnel costs for project management and direct support. In addition, the CPIC investment proposal process allows the EITIRB to evaluate the business case presented to justify new investments and their reliance on Federal support versus outsourcing as a delivery method. Reliance on contractor support to implement IT initiatives is often a result of a need for specific skills that cannot be obtained through the permanent workforce or is the result of a need for temporary support that is most efficiently provided through contractors.

IT MORATORIUM

Question. The budget mentions that a supplemental activity to the CPIC is the IT acquisition moratorium. It says that under the moratorium, significant investments (over \$25,000) are reviewed. It also says that during 1999, 249 IT acquisition moratorium waivers were approved. What was the total number of waivers requested in 1999?

Answer. During fiscal year 1999 the OCIO processed 249 waiver requests for approximately \$414.5 million.

Question. What was the total value of the 249 waivers approved?

Answer. During fiscal year 1999, 241 waivers were fully approved and two were partially approved to expend \$386.6 million in fiscal year 1999, 2000, and 2001 funds. Also, two waivers were fully denied and the requesting agency or OCIO canceled four.

Question. If the OCIO approves such a large number of waivers, then does the Department really have an IT acquisition moratorium in place? In that regard, what was the total number and value of waivers denied in 1999?

Answer. USDA's goal in instituting the IT acquisition moratorium was not to stop agencies from purchasing IT, but to ensure that they followed Departmental guidance on the Year 2000 problem and as much as possible, an IT architectural blueprint. Many approved waivers contained conditions or stipulations that the agencies

must share IT or coordinate the purchases with other agencies. USDA's use of frequent, good communications with the Under and Assistant Secretaries, Agency Heads, and Agency Chief Information Officers has resulted in agencies understanding and complying with the changing direction of the moratorium. This was especially evident when Secretary Glickman's mandate that USDA direct more attention and funds to the Year 2000 conversion effort was so successful. We have also used the moratorium to move USDA towards a comprehensive capital planning process that is recognized by OMB as being among the leaders of the Federal Government. During fiscal year 1999, two waivers were fully denied and the requesting agency or OCIO canceled four. Denied amounts totaled \$27.9 million in fiscal year 1999 and 2000 funds.

INFORMATION SYSTEMS ARCHITECTURE

Question. USDA's OCIO budget states that the Department's February 1997 version of its information systems technical architecture is being expanded and updated. If USDA does not continuously update its architecture, how can the Department then be positioned to use it as an effective tool to ensure it is cost-effectively meeting business needs as opposed to just putting a document on a shelf.

Question. What processes are USDA's OCIO establishing to ensure that the architecture is continuously updated?

Answer. The updated and expanded version of the architecture outlines USDA's architecture program, its future architecture direction, and its current baseline. The major components of the architecture program are principles and standards, current architecture, the architecture repository/database, future architecture, and the associated governance and transformation processes required to achieve the future architecture direction. We view the architecture on a continuum. The architecture is never completed but instead is managed using processes that respond to continuously changing programmatic requirements and technology advancements. USDA's approach to architecture aligns with the Federal Architecture Framework model as endorsed by the Federal CIO Council.

Question. What steps will USDA take to incorporate the new business models and associated processes and technologies evolving from the e-commerce revolution?

Answer. USDA agencies are beginning to develop electronic-based services and program delivery mechanisms and USDA has already recognized the need to incorporate E-models into its architecture efforts. USDA's future architecture direction has an "E" focus. For both this year's and last year's IT planning cycles, USDA IT investments were evaluated based on whether or not electronic program delivery had been considered. Several agencies have already implemented systems or are in the process of designing them. While agencies recognize the need to change their business models to an electronic government model, much work remains to be done.

E-COMMERCE

Question. USDA's OCIO budget includes about \$1.3 million for contractor support and operating expenses to support E-government/commerce at the Department. What are the overall planned expenditures in fiscal year 2001 across all USDA's agencies and offices on E-government/commerce initiatives (broken out by agency)?

Answer. The Department does not currently track expenditures for E-government/commerce initiatives apart from overall IT or other related spending, such as training. Our fiscal year 2002 budget requests funding to develop a corporate strategy and approach to E-government/commerce. Among other things, this would provide the Department the capability to develop common definitions and metrics to assess and measure E-government/commerce activities; and would include an inventory of existing and planned initiatives, including expenditures, across USDA.

Question. What steps has the Department taken to ensure that there is a common, consistent USDA approach to E-government/commerce initiatives across the Department so that there is not duplication of effort?

Answer. We fully recognize and appreciate the need to ensure that there is a common, consistent approach to E-government/commerce at the Department. The host of web sites run by USDA agencies are supported by scores of servers, and other technology, which is decentralized and often redundant across agencies and even at the state and regional level.

The Department must act quickly and decisively to develop a corporate strategy for E-government to ensure that we maximize the resources that are being devoted to this effort with an emphasis on sharing lessons and leveraging solutions across USDA. To that end, the Department is in the process of establishing an E-government working group, under the direction of the Deputy CIO, with representation from all agencies and mission areas with E-government initiatives. The working

group represents an important step towards establishing the common look to E-government that we desire.

Most importantly, the funding we have requested in our fiscal year 2001 budget will enable the Department to develop a coordinated strategy and ensure that cross-cutting issues which affect all USDA customers and employees are identified, prioritized and addressed as agencies pursue E-government initiatives. Our goals include developing a Department-wide strategy improving coordination, and developing standardized approaches to cross-cutting issues. These include data warehousing, data mining, electronic mail and other electronic directories, online forms, and privacy protection. Training our IT staff to integrate web-based applications into the Department's technical infrastructure is another integral component.

Question. What specific programs and benefits (1) are already being delivered via the Internet, or (2) are expected to be delivered via the Internet in fiscal year 2001. (List programs/benefits for each agency/office).

Answer. USDA agencies have a number of E-government related initiatives in progress, with more applications being developed regularly. The Department has not yet ascertained which specific applications are being planned for fiscal year 2001. However, with a few exceptions, most USDA agencies are at the initial stage of E-government where agencies are using the Internet to provide the public electronic access to information about the Department's programs and services, market information, as well as breaking news. For example:

Today, via the Internet, farmers and agricultural producers can electronically view public information on USDA programs such as crop and production reports. They can download and fill-in application forms for temporary programs such as the Small Hog Operation Program, the Dairy Market Loss Assistance Program, Crop Disaster Program, the Livestock Assistance Program, and several forms for the Farm Service Agency's farm loan programs.

The Natural Resources Conservation Service's—NRCS—PLANTS website provides a single source of standardized information about plants in the US and its territories. The database includes all sorts of information about plants, and is accessed by over 57,000 users per month.

The Economics Research Service publishes online research reports, periodicals, new releases, issue papers, and other information on all aspects of the domestic and international farm and agricultural economy. Agricultural Outlook reports, state fact sheets, and Agricultural Trade data bases are all available to anyone with access to the Internet.

The Rural Development agencies provide data over their web sites about all of their housing, infrastructure and job creating programs, as well as links to other sites of interest to the rural development community. Almost a million citizens viewed these web sites in 1999.

Visitors to the web site of the Risk Management Agency—RMA, which manages Federal crop insurance, can access and search county actuarial tables online, by State or crop. There is also an education site to assist producers and agribusiness in understanding their risk exposure and responsibility.

Another example is USDA's Forest Service—FS, which is participating in a one-stop recreation site with seven other Federal agencies. The site—www.recreation.gov—is part of the Vice-President's Access America initiative that was established to provide a single source of information about recreation on federal lands. Citizens can now reserve campground sites via the Internet. FS is also piloting a clearinghouse on the Internet for distributing information related to Forest Plan updates. The clearinghouse application allows the public to view information generated from the FS' Geographical Information System (GIS) and relate their comments on the plan to specific locations on a GIS map.

The Agricultural Research Service—ARS—web sites provide Internet access to extensive resources for scientists, regulators, farmers and many other customers. ARS laboratories use the Internet to provide information about their missions, research programs, results, and analyses. Technical and semi-technical publications produced in-house are published electronically; and customers may now subscribe to the Agricultural Research magazine online. Some 1,500 stakeholders, including media outlets, commodity groups, educators, and others, have also signed up for a daily E-mail feed. An interactive web site for middle school students, "Science for Kids," showcases ARS research results in ways that demonstrate the importance of agriculture in people's everyday lives and help students understand and appreciate the benefits of agricultural research.

The National Agricultural Library—NAL—is also providing increased electronic access to its unparalleled storehouse of agriculture related information and to improve the services it provides. NAL maintains the Agriculture Online Access bibliographic database of more than 3 million citations to the literature of agriculture and

related physical and social science subjects. NAL is also working in partnership with land-grant universities and other institutions through the establishment of the Agriculture Network Information Center—AGNIC—that serves as a major focal point on the Internet for access to quality information, subject area experts, and other resources. Funding is needed for new technology to improve search systems that operate across multiple institutions and to expand the scope of these initiatives.

The Department's main "home page"—www.usda.gov—has also recently been redesigned to provide visitors with information about critical Departmental issues and Secretarial initiatives, regardless of which agency or mission area they relate to. The homepage provides links to pages developed and maintained by USDA's agencies. Our E-government vision includes eventually providing customers a "portal" or main web site, similar to major private sector sites such as Yahoo.com, that will be organized by subjects, so that visitors can find the information they want regardless of which agencies might possess it.

The Internet now makes it possible for the Department to provide real time information to the public about issues critical to their health and welfare. USDA's broadcast facilities, managed by the Office of Communications, provide a wealth of information to farmers daily through radio and satellite transmissions. Daily and weekly radio and news reports supply information about sign ups for farm programs; announce results of agricultural research; broadcast major policy changes; provide consumer news on food prices, nutrition, conservation, and the environment; and report vital economic news about crop prices and supplies, as well as crop weather conditions. However, the broadcast industry is moving quickly to digital standards that our existing equipment cannot meet. Our goal is to use the Internet to allow farmers, constituency groups, and the public to take full advantage of the programs, services, and data at USDA. This means that we must invest in the kinds of high-speed computers and telecommunications equipment necessary to handle the voluminous files required to electronically disseminate video, photographs, radio, and television messages in digital formats.

Increasingly, USDA agencies are working with State and local partners, and other agencies, to develop applications that utilize the Internet to actually conduct E-business. Agencies are trying to meet the demands of their customers by moving beyond simply providing the public access to information via the Internet to implementing more advanced applications to conduct secure transactions online. Processes, from applying for grants to procuring products and services, are being web-enabled. For example:

The Food and Nutrition Service—FNS—which is in the forefront of E-government through its highly successful Electronic Benefits Transfer—EBT—initiative, has plans to use the Internet to share information with its state partners; provide authorized users online access to information to help reduce fraud; and collect information directly from retailers who support the WIC program. FNS has also begun planning for an extranet environment that will allow entry to only users who have direct business with FNS. FNS currently uses an Electronic Data Interchange—EDI—system in its food distribution division that enables customers to process some 80 percent of the orders for the school lunch program. Of course, all of these applications are being developed with security and privacy as key components. FNS has also recently developed and deployed an online Healthy Eating Index (HEI), which allows citizens to input their diets and receive instant analysis of their nutritional strengths and weaknesses.

Cooperative States Research and Extension Service—CSREES is a participant in the Inter-Agency Electronic Grants Committee in the development of standard processes, standard Federal data sets, and the design of a "portal" to Federal grants activities known as the Federal Commons. The portal will allow citizens and institutions to track the status of federal grant proposals online throughout the entire grants life cycle. When it is completed, constituents will be able to apply for grants electronically as well as receive award notices online. This kind of interagency initiative is key to government's ability to provide citizens with the kind of common interfaces to government they are demanding; however these projects are expensive and they depend upon means being found to support interagency funding that have yet to be developed. CSREES has actually been using electronic mail to send acknowledgement of proposal receipts for the past year, reducing turn around time by weeks from the normal paper intensive process. However, much more work must be done before citizens can actually submit their proposals online.

The Farm Services Agency has already implemented an award winning E-business application—the Electronic Bid Entry System—that automates the bid entry portion of USDA's procurement of commodities that are exported under foreign food aid programs. With this system, bids for some \$1.2 billion in food for farm aid can be opened and contracts awarded in two hours. Plus, up to the minute market prices

improve competition, so that more people can be fed for each dollar in aid. More recently, FSA has developed a system which allows steamship lines to use the Internet to input bid data. Yet another E-business application allows FSA to issue payment statements to vendors via E-mail, with estimated savings to vendors of almost \$200,000 per year as a result.

In 1997, USDA's Agricultural Marketing Service—AMS—became the first Federal agency to actually use the Internet in the rule-making process by posting proposed rules for the National Organic Program, which sets standards for organic produce, for comment on its web site. As a result, the agency reported receiving over five times the usual number of comments on the proposed rule. AMS is now focused on educating employees and managers about potential E-business opportunities; establishing a viable Internet infrastructure which is 80 percent complete; providing adequate security for that infrastructure; training staff; and providing training to secure expert web building support to all AMS users.

Rural Development—RD—agencies are developing web-based applications to allow more efficient operation of multi-family housing programs. Over 10,000 changes to tenant certifications, such as changes in income, etc, are received each month from borrowers. RD plans to enable those borrowers to transmit this information electronically or to enter data directly via a web page. Borrower and lender changes for RD and FSA guaranteed programs are now accepted via Intranet, and all RD community program reporting is now available through the web.

The Animal and Plant Health Inspection Service—APHIS—just recently launched a new website that will allow customers to submit online applications to import fruits, vegetables, and animal products into the United States. APHIS' new website is designed to make the permit application process easier for our customers, and if it is as popular as can be expected, it will be expanded to include additional permit applications. Importers can access the site by going to APHIS' Home Page at www.aphis.usda.gov and clicking on Import Authorization System under hot issues.

Question. USDA's OCIO budget also states that web-enabling service deliver will demand a high-performance and reliable enterprise telecommunications network. It says that to meet these expectations in fiscal year 2001, the Department will expand its network to all major state offices and that significant contract support will be required to securely expand the enterprise telecommunications network. What will the cost be in fiscal year 2001 to expand the network and how many states are being considered when you say all major state offices?

Answer. Fiscal year 2001 reflects the Phase I implementation of our Universal Telecommunications Network that will be delivered to sixteen states where our major offices are located. Phase II will extend the Network to all fifty states. Phase I cost is projected at \$4.5 million.

Question. What will be the recurring annual operational and support annual costs for the network to the states, and what are estimated annual benefits?

Answer. Our annual operational and support costs are projected to grow from a current \$1.6 million to \$6.1 million based on program delivery requirements and Electronic Government initiatives. The recurring annual costs are expected to increase as the program areas increase their dependence on information technology to support their missions. However the unit cost will decrease. For example, in the last two years USDA has increased its Internet capacity by seven-fold and increased network reliability while the costs to support these activities increased 3 fold. Each dollar bought more than 2.3 times than it previously bought.

Question. What alternatives' analysis has USDA completed to show that it will be more cost-effective to expand its network to states to deliver web-enabling service delivery from such a large number of sites as opposed to delivery of web-based service from just one or two sites?

Answer. USDA's initial architectural design is based on analysis done as part of the Service Center Initiative's LAN/WAN/Voice project. The understanding of program direction and future requirements is essential to effective network design. Network requirements are being collected from the program community so that the initial architecture can be independently verified and validated.

COMMON COMPUTING ENVIRONMENT/SERVICE CENTER MODERNIZATION

Question. Describe in detail how USDA will provide one-stop service to its customers in all 3,000 of its service center sites, especially since only about 700 sites will house all three service center agencies. Also describe the mission critical processes for implementing such a concept and the estimated milestones, time frames and resources required.

Answer. About 700 of our 2,600 Service Centers will have all three agencies present. About 1,700 of the remaining 1,900 will have at least two agencies present,

primarily the Natural Resources Conservation Service (NRCS) and the Farm Service Agency (FSA). Around 200 will be occupied by only one agency on a full-time basis.

Our one-stop vision essentially means that service will be available anywhere, anytime and in a seamless manner. For customers with Internet access, this may mean that they may rarely or even never go to a physical office location at all. They will be able to electronically “shop” at the Service Center via the Internet to obtain information, set up appointments at their farm site, file program applications, and change or update information in the files.

Customers who do not have access to the Internet or need “hands on” assistance, will be able to go to any one of the 2,600 Service Centers and obtain some level of service for all of the programs offered by the county-based agencies. That level of service will be different depending on which agencies have staff at that particular center and the progress in deploying a fully functional CCE. The following describes one-stop service for each of these office scenarios assuming that the CCE technology infrastructure is in place.

All three agencies present

This would represent the optimum level of service. Each agency representative would be able to describe, in general, the program services available from the other two agencies, provide written material and introduce the customer to other agency counterparts if the customer was interested in other services. They would also be able to check the status of a pending item, such as a loan application, and provide that information to the customers. If needed, they could set up appointments with the counterparts or take information, such as a new telephone number, and put that information into a shared database.

One or two agencies present

Same type of service described above except that for services for an agency not on site, the Service Center employees will depend upon technology to bridge from providing general information, such as application forms, to personal service on a particular program. For example, if the customer is interested in a service offered by Rural Development—RD, but there is no RD employee on site, an NRCS employee can provide general information and assistance. But, since their expertise is conservation and not lending, they would not be able to pre-qualify or process a loan application. With the CCE technology in place, however, they would be able to assist the customer in connecting to the nearest RD office through a user friendly KIOSK or computer terminal. Through an automated question/answer process, the customer could pre-qualify for a loan, submit a loan application, and schedule an appointment with the RD loan officer either at his or her base Service Center or at the NRCS only office. Another option would be to go on line directly using the KIOSK or computer terminal and a two-way video connection to discuss the loan application and needs with a remote RD loan officer.

In the above instance, the full one-stop service would be provided via the technological connection with some assistance from the NRCS employee to help the customer get started and be comfortable with the process.

In addition to the above examples, the one-stop concept also encompasses situations where a farmer may have parts of his or her farming operation in several counties or even crossing state lines. Currently, that individual has to visit each Service Center that services his or her dispersed operation. With CCE technology in place and the Geographic Information Systems that are a key part of that technology, the producer will be able to stop in only one of the Service Centers and sign up for programs or conduct other business covering the entire operation.

The CCE is the essential linchpin for achieving the one-stop vision outlined above. This common information system will allow information to be shared both within a Service Center and between Service Centers. The current stove pipe and out-of-date technology supporting the Service Center operations today do not allow for this mobility of data and customer service. This infrastructure barrier must be removed in order to provide the “anytime, anywhere” one-stop shopping service that is needed. Without the open state-of-the-art enabling technology provided by the CCE, one-stop service cannot be achieved.

With respect to major milestones, the CCE will be fully implemented at the end of fiscal year 2002, provided that adequate funding is provided for the capital investments necessary to acquire the key components at the specified times to meet that schedule. The implementation strategy identifies the key components of the CCE infrastructure and lays out their execution in a staged approach, providing immediate benefits and building capability to support reengineered business processes as they are implemented. These critical milestones for the implementation of the CCE are

described in the following project plan Implementation Schedule for CCE components:
[The information follows:]

Question. Because most business planning for the common computing environment was completed prior to advent of Internet growth, (1) to what extent and specifically how does the Department intend to use the Internet to compliment current service delivery, and (2) what changes if any will integrating the Internet into service delivery have on CCE IT acquisition and maintenance costs in fiscal years 2000, 2001, and 2002.

Answer. Today, via the Internet, farmers and agricultural producers can electronically view public information on USDA programs, such as crop and production reports. They can download and fill-in application forms for temporary programs such as the Small Hog Operation Program, the Dairy Market Loss Assistance Program, Crop Loss Disaster Assistance Program, the Livestock Assistance Program, and several forms for FSA's farm loan programs. USDA is making additional forms available in electronic form, including applications for loan deficiency payments. However, these forms must still be faxed or mailed back to the Department for processing. This kind of electronic access is a good first step, as it saves having to visit a Service Center to obtain a form, and requires a minimal infrastructure investment (a web server accessible from the Internet). USDA is also currently providing a large variety of program information on its Web sites, including news releases, program fact sheets, program activity information, and office locators.

As part of our Electronic Access Initiative—EAI—within the SCMI, the next level of electronic access planned is to enable farmers to complete and submit USDA forms over the Internet. Current paper forms often assume the customer is sitting with and being assisted by a Service Center employee. Many of the forms being converted to electronic format for access over the Internet must be enhanced with easy to understand instructions and when fully interactive prompt customers in a way that prevents submission without the customer having provided all the required information. The current technology infrastructure does not adequately support access to the Internet for USDA staff or full access via the Internet for customers. Achieving this level of access requires a fully implemented CCE under the SCMI of the county-based agencies. The EAI is developing electronic authentication (electronic signature) methods to verify the identity of the sender and the integrity of the content of the electronic document.

Achieving the vision of electronic access to USDA programs offered through Service Centers so America's farmers and other rural residents can conduct their business with the Department online is an enormous undertaking. Additionally, submission of a document to the Department electronically does not mean that processing of the document is automated. Electronic access will require reengineering numerous existing programs and systems, as well as training employees in new roles, responsibilities, and technologies. From a technical perspective, Web-enabling USDA's business means investing in hardware, software, and telecommunications to securely connect the existing county-based USDA Service Centers to the Department's national network and the Internet. The level and timing of these investments play an important role in determining which electronic services the Department can provide to farmers and when it can provide them. CCE IT acquisition and maintenance estimated costs for fiscal years 2000, 2001, and 2002 include support for these Internet based processes.

USDA recently contracted for a major study to address the security issues associated with this initiative. The Department plans to use \$1 million of the fiscal year 2000 CCE appropriation to provide the initial web servers and security tools needed to start the process. Additional investments required for full electronic access are planned for fiscal year 2001 and 2002, as outlined in the CCE Implementation Plan.

In April 1999, the Service Center Agencies began working on the EAI with the objective of establishing an infrastructure that enables them to make the web a mainstream way of doing business. Although the primary purpose of the project is to build the IT infrastructure necessary to support e-business, the program owners in the agencies are actively participating in pilots, process reengineering, staff assignments and other innovative activities.

One of the major requirements for USDA to move forward with technology acquisitions was for it to have reengineered business processes for the service centers.

Question. Has USDA completed reengineering business processes for the service centers?

Answer. Business Process Reengineering—BPR—is at the heart of the Service Center Modernization Initiative—SCMI. BPR analyzes the service center agencies' current program and administrative processes to see how they can be streamlined and integrated to improve the effectiveness and efficiency of USDA's service to customers. Our BPR efforts to date have given us the understanding of our basic business processes needed to move forward with the CCE and have served as the basis for defining the CCE technology architecture. We recognize that the CCE will need

to support business as we know it today, as well as any changes in business over the next decade. That is why our CCE architecture is designed around open, interoperable and scalable systems. We look at the CCE as the basic technology infrastructure to support county-based program delivery through the first decade of the 21st century. Failure to move forward will hamper our ability to service our customers and respond to the needs of the future.

Question. If not, what is left to reengineer and when will this be completed?

Answer. There are 20 active BPR projects focusing on core business areas such as lending, managing risk, conservation and environment, community development and outreach, and administration. Each of these projects is tested in a laboratory environment before being piloted in the field and deployed nationally.

SCMI has initiated the reengineering design of approximately 60 percent of the Service Center business processes and will reengineer the remaining 40 percent of the business processes as resources permit. The BPR project designed to streamline human resources administration has completed all testing and piloting and is being deployed nationally. BPR projects involving lending, community development, managing risk, conservation, and administrative areas are scheduled to complete testing and piloting in fiscal year 2000 and be deployed nationally in fiscal year 2001.

Question. What are the estimated savings that USDA will achieve from processes already reengineered?

Answer. CEE is also designed as a fully scalable infrastructure that can quickly respond to and support future business needs as dictated by new legislative or policy changes.

The SCI Business Case developed in fiscal year 1998 provides an economic analysis and cost benefits for the implementation of the CCE and reengineered business processes. It shows a return on investment of 40 percent over the full 10-year life span of the project. The calculated dollar value of benefits from staff time savings and improved efficiencies of operations total \$5.486 billion over this period. This analysis has been validated by actual measurement of increased process efficiencies at two of the field pilot sites. In fact, staff reductions have already been made (over 10,000 from fiscal year 1993) and the technology tools and streamlined processes will be the only way this reduced staff can continue to deliver quantity service and meet the demands of cyclical workload such as that associated with natural and economic disasters.

Question. USDA's budget for fiscal year 2001 shows that the department plans to spend \$86 million for equipment for the CCE/Service Center Modernization. What will this investment acquire?

Answer. The following table shows the planned investment for CCE components in fiscal year 2001.

[The information follows:]

<i>CCE Fiscal Year 2001 Investments</i>	<i>Estimated Costs</i>
Network/Communications Servers	\$32,240,000
Application Servers (includes GIS and public access servers)	15,000,000
Workstation/Server Software	7,000,000
Enterprise GIS Software	5,000,000
Relational Database	2,640,000
Peripheral Equipment (includes digital cameras and portable data accessories)	8,095,000
Printers	6,150,000
Workstations	10,000,000
 Total	 86,125,000

Question. With the Internet, many companies can now deliver services to anywhere by having computer equipment at a central location. How is USDA's planned investment of \$86 million going to move the Department to this capability and new business model that other companies are moving to?

Answer. At this point we are very limited in our ability to do business with our producers electronically. Currently they can get on our Web pages and download information and application forms, but cannot submit them to us electronically. They are able to fill out the forms and then bring them to us or mail or fax them to our office.

Moving forward to provide full electronic access to our programs and services is one of our top priorities. Our primary obstacles are that (1) many of our forms need to be redesigned to a user friendly format with clear instructions so that our customers can use them and (2) our current technology infrastructure is outdated and cannot support full electronic access. We now have an Electronic Access Initiative

underway that will provide for staged roll-outs of infrastructure improvements, security and privacy protocol to support this effort. Also, agencies are working to redesign forms and instructions so that some interim improvements in this area can be made. We plan to use part of the \$12.6 million appropriated by the Congress in fiscal year 2000 for CCE to acquire the infrastructure needed to support electronic access. We also expect to pilot several electronic access applications by mid 2001 and to provide full electronic access when the basic CCE infrastructure is installed at the county office level by the end of fiscal year 2002.

Question. USDA's budget for the CCE shows \$44.5 million was spent in fiscal year 2000 for other services and that another \$50 million will be spent in fiscal year 2001 for other Services. What do these other services comprise?

Answer.

[In thousands of dollars]

Activity	Fiscal year		
	1999	2000	2001
Program Management	1,770	600	600
BPR	8,192	12,314	18,850
LAN/WAN/Voice	10,432	3,500
Base Data Acquisition	15,050	23,550	23,550
Common Computing Environment (CCE)	1,707	4,500	7,000
Total Other Services	37,151	44,464	50,000

The program management funding represents support contracts for the change management training, improvement of customer service, and overall program management. The BPR amount represents support contracts for the development and pilot testing of reengineered processes. The LAN/WAN/Voice represents the contractor costs for installation and maintenance of equipment in LAN/WAN/Voice sites. The base data acquisition constitutes the digitizing of all soil, common land unit, and other data; and the purchase of ortho-imagery data from the Geological Survey Service. Finally, the CCE amount is for architecture, systems, and data integration studies.

USDA is requesting \$75 million under a special account for the CCE/Service Center Modernization. The budget indicates that fund requested under this account would provide the essential capital investments that are needed to achieve the goal of a fully operational CCE in 2002.

Question. Does this mean that USDA will only need the additional \$75 million to complete the CCE implementation? What assurance can USDA give us that if the \$75 million is funded, that USDA will not come back to request additional funds in fiscal year 2002 and thereafter?

Question. Once USDA does fully implement the CCE, what does the Department estimate its annual costs will be to maintain, update, provide, provide communications, and manage the CCE?

Answer. The estimated CCE total cost for fiscal year 2001 is \$91.2 million. The additional \$16.2 million would come from the Service Center agencies' budgets. An additional \$91.2 million would be needed in fiscal year 2002 to complete CCE implementation. After the fiscal year 2002 investment, the CCE installation would be largely complete. The maintenance and operations costs would be included in the Service Center agencies' budgets.

When fully implemented, annual estimated costs for CCE vary between \$146 million to \$178 million, depending upon whether or not a major technology upgrade to CCE components is anticipated during that year. These costs are for the acquisition, maintenance, operation, telecommunications, and other related costs to support the CCE after its initial implementation. These include staff salaries and administrative costs that would also be incurred for the maintenance of the CCE. These are not, however, new costs that would need to be borne by the department, but a re-direction (with a significant reduction) of current spending to support and operate the legacy systems of the three Service Center agencies.

SERVICE CENTER IMPLEMENTATION OVERSIGHT

USDA's OCIO fiscal year 2001 budget narrative says that for service center implementation oversight the department, among other things, conducts independent verification and validations (IV&V's).

Question. How much does OCIO plan to spend on IV&Vs in fiscal year 2001 for the service center implementation, and what specific areas will the IV&Vs be focused?

Answer. OCIO has projected a need to spend about \$100,000 in fiscal year 2001 on IV&Vs related to Service Center implementation. IV&Vs are generally done on a specific technical or management issues that need outside, objective review and will be determined based on the progress of the overall project.

Question. How many IV&Vs were completed in fiscal year 1999, and will be completed in fiscal year 2000, for the service center implementation?

Answer. Two IV&Vs were completed in fiscal year 1999 and three are estimated to be completed in fiscal year 2000.

Question. For those IV&Vs completed for the service center implementation, how many recommendations were made and how many of these recommendations have been implemented to date? Please discuss each recommendation and the actions taken by the Department to address each one.

Answer. The two 1999 IV&Vs involved (1) a task to observe and evaluate work being done by FSA and the Service Center Implementation Team (SCIT) on a technical solution to connect FSA legacy systems to the network and (2) a task to review the process by which the SCIT identified and selected an Enterprise Geographic Information System—GIS—software. The recommendations and follow-up actions for each of these IV&Vs follow:

FSA system 36 legacy system IV&V

The IV&V evaluation made seven key recommendations. The recommendation and status of each follows:

Recommendation.—Drop the IDEA gateway from the completion for architectural reasons because it is an interim solution that does not offer any long term migration path or hardware recovery.

USDA Action/Status.—The IDEA gateway was dropped from consideration.

Recommendation.—Prior to final selection, perform a load test in the lab and field-test a performance-based pilot to verify that the performance of the Microsoft SNA Server solution is adequate to support the largest service center on busy days.

USDA Action/Status.—The additional testing was completed.

Recommendation.—If the performance tests indicate that the Microsoft SNA Server cannot support the required performance metrics of the Service Center, then select the A/36 upgrade.

USDA Action/Status.—The conclusion from this testing was that the Microsoft SNA solution performance metrics were not satisfactory. The FSA has selected and proposed the AS400 upgrade for the connectivity solution.

Recommendation.—If the Microsoft SNA Server passes the performance test, then select it for the A/36 connectivity solution. By selecting the Microsoft SNA Server as the solution, USDA will gain other uses for the server. In order to take advantage of COTS applications and associated plans for future business requirements, the Service Centers will require a file server. The Microsoft SNA solution, while providing connectivity to the A/36 and associated legacy equipment, can be utilized to perform everyday LAN/WAN related support (file and print sharing, electronic mail, etc.). Further, since the IBM Mainframes in NITC are IP-enabled, once applications and data are either transferred or rewritten for use on another platform (Operating System and DBMS), the SNA connection (Dial Up XOT modem line) can be dropped.

USDA Action/Status.—Because of the performance testing results, the Microsoft SNA solution was not selected.

Recommendation.—Obtain a best and final cost from the selected vendor.

USDA Action/Status.—We will obtain a best and final cost as part of the procurement process that will occur after a solution is decided upon.

Recommendation.—In order to expedite deployment of the Microsoft SNA Server solution, should it be selected, consider reconfiguring 2,600 of the 16,000 existing workstations already purchased or part of the 6,000 workstations to be purchased for use as the NT Server to host the SNA server. This will reduce start-up and deployment time. More robust NT Servers can later be procured to replace these converted workstations when their usage increases and funding allowed.

USDA Action/Status.—As noted above, this solution was not selected and this recommendation has not been implemented.

Recommendation.—Investigate the use of A/36 migration or porting software companies to help rehost FSA applications from the A/36 to the new target platform. This will help USDA save on the A/36 maintenance costs and potentially also save on the field software deployment costs. Furthermore, it could help ease the complexity of migration since FSA will only have to be concerned with one hardware platform.

USDA Action/Status.—Some work in this regard was done by FSA, but an OCIO sponsored evaluation is currently underway to respond to this issue. This evaluation of connectivity alternatives sponsored by OCIO will be completed in May with a decision by the CIO expected by June 1, 2000.

Evaluation of SCIT enterprise GIS software selection process

The IV&V study made six key recommendations. The recommendations and status of each follows:

Recommendation.—Due to the pace and structure of the overall Service Center Program, there are a number of system architecture issues that cannot be thoroughly investigated prior to GIS solution selection and therefore pose a significant risk. These issues include performance, maintenance, administration, and incomplete business case development. The USDA should undertake a study to understand the nature and potential magnitude of the risks posed by the current level of uncertainty and to develop migration plans to address these risks prior to deployment.

USDA Action/Status.—The USDA GIS Team evaluated the IV&V recommendations and developed a risk mitigation strategy which was incorporated into their final recommendation document.

Recommendation.—The USDA should perform both stress testing and performance testing before making the final selection of GIS products. This includes defining realistic environments (infrastructure and loads) and testing perspective vendor products in these environments. The results of performance testing should be used to assess implications on hardware suite acquisition and maintenance costs to achieve desired response times.

USDA Action/Status.—The USDA GIS Team developed a series of discrete event simulation performance models to test candidate GIS architectures. These models were used to test the top software candidates. Additional models will be developed in the future to test other components.

Recommendation.—The USDA should define system support requirements including software and hardware maintenance requirements, and data distribution and administration requirements. Assess vendor products implications on support costs to adequately install and maintain the system.

USDA Action/Status.—The USDA Team incorporated consideration of support requirements and availability as part of their analysis and final recommendation for a GIS product.

Recommendation.—Identify key GIS interfaces with other CCE components and assure that there are no incompatibilities. Ensure that, if there are requirements not derivable from the business case, they can be justified by some other means—reasonable performance, interfaces with existing/future products, product, and data support. Consider adding these requirements to the business case.

USDA Action/Status.—The USDA GIS Team documented the interfaces and compatibility issues and developed an “Enterprise GIS Business Requirements” document that specifically addressed the business case issue pointed out in the IV&V.

Recommendation.—The USDA should provide clear rationale for prioritizing the numerous functional capabilities demonstrated through the LTD. This prioritization should reflect a clear concept of how these capabilities will be transitioned to the field to achieve projected benefits.

USDA Action/Status.—The USDA GIS Team provided documentation regarding the rationale and prioritization in the final recommendation document and the business requirements analysis.

Recommendation.—The scope of the Draft CCE GIS Results Report produced by the AMS subcontractor should be modified to just present the results of the LTD. A separate report produced by the USDA GIS Team should develop recommendations as to how the USDA should proceed, taking into account the USDA prioritized functions.

USDA Action/Status.—The USDA GIS Team chose not to limit the contractor to a presentation of the test results, but allowed the vendor to include a recommendation based on those results. The recommendation was non-binding on the government, but provided a third party, objective perspective. The team did prepare its own report and recommendations as suggested by the IV&V.

CONSOLIDATING/OUTSOURCING USDA HEADQUARTERS INFORMATION TECHNOLOGY
FUNCTIONS

Question. What analyses has USDA completed to determine where there would be opportunities to consolidate internal IT activities across agencies throughout the department?

Answer. The Department is increasingly exploring opportunities where the USDA agencies might benefit from consolidated IT activities. An interagency team is currently working on several issues in the area of asset management. For example, the team is currently analyzing the potential benefits of USDA standardizing on one tool set for querying large data sets, a need which has been identified by several agencies.

In November 1999, the Secretary directed the Chief Financial officer, working with the Chief Information Officer and the Assistant Secretary for Administration, to lead a group of senior executives in developing a corporate strategy for administrative/financial systems that affect the entire Department. The group will look at a range of systems, including accounting/budget execution and formulation functions, procurement, property, human resources, travel, and the associated telecommunications and security.

The Department is working to establish a corporate or enterprise telecommunications network to support interoperability for interagency communications and data exchange among agencies and programs and enhance program delivery and eliminate redundant services, facilities, resources, and operations. An enterprise network is also an integral component of our efforts to strengthen cyber-security. With mergers occurring throughout the telecommunications industry, often resulting in reduced unit costs for telecommunications services, an enterprise network will enable USDA to leverage the apparent successes documented by our industry partners and take advantage of these reductions. The aggregation of telecommunications services and equipment from a corporate perspective can also significantly reduce the unit costs that are incurred by individual agencies by allowing the Department to take advantage of the economies-of-scale that exist. The bottom line is improved USDA program delivery.

Another area where we are making progress with consolidating IT activities across agencies is at our National Information Technology Center (NITC), located in Kansas City and Ft. Collins. NITC already consolidates and centralizes some of the client server platforms across agencies; with several agencies running applications on NITC servers and reaping the benefits of a shared environment. FSA and RD have also consolidated some data warehouse operations on a single server procured by NITC. In addition, the data warehouse for our Foundation Financial Information System (FFIS), serving multiple USDA customers, is hosted on its own mainframe at NITC.

This centralized approach to hosting agency IT applications at NITC benefits USDA agencies by offering: a 24 hour/day, 7 days/week, 365/366 days a year operating environment; an Uninterruptible Power Supply (UPS), including a dual power feed UPS, and diesel generators; a secure infrastructure (including physical access to facility, security clearances, biometric entry controls, cameras, dry sprinklers, and halon fire suppressants); system administration/management (including Commercial-off-the-shelf (COTS) software support, storage management, operating system management, change and problem management, capacity and performance management, and help desk facility; disaster recovery(including backup recovery, off-site storage, and hotsite recovery program); and centralized hardware maintenance. Most importantly, it allows costs to be spread across all clients, while freeing up agency FTE to work on applications.

The Service Center Modernization Initiative's Support Services Bureau is designed to consolidate internal IT activities across our county based agencies. In our view, the only way to successfully maintain and operate the shared CCE that we plan to put in place is by consolidating the three separate IT organizations of the Service Center agencies into one integrated staff. Otherwise, it is just a matter of time before the stovepipes begin to form and we no longer have a "common" environment. That is why the Secretary is asking Congress to remove the restrictive fiscal year 2000 appropriations language that prevents us from moving forward with the Support Service Bureau.

Question. What analyses has USDA completed to determine whether outsourcing for some of its IT functions would be cost-effective?

Answer. In accordance with the Federal Activities Inventory Reform (FAIR) Act, the Department has developed a list of all functions that are not considered "inherently governmental" and thus could potentially be outsourced. However, we have not yet conducted any systematic analysis to determine whether or not outsourcing for specific IT functions would be cost-effective. I do plan to look at outsourcing in the area of software services—that is, determining where it might be cost effective for the Department to use application services providers (ASPs) to lease software, rather than buy and maintain it using our in-house technical staff.

SECURITY

Question. USDA's CIO budget includes an increase of \$6.6M for expanding its USDA Cyber Security Program and identifies numerous activities related to security that it will be undertaking.

Answer. The \$6.6 million includes funding for the following activities:

- \$1,392,000 for salaries, benefits, travel, and contract support for the Cyber Security Program Office;
- \$1,280,000 to conduct risk assessments;
- \$2,325,000 for contract support to create a USDA Information and Telecommunications Security Architecture, which will provide the corporate products and services necessary to securely use USDA's information assets (commensurate with the sensitivity and value of those assets);
- \$1,200,000 for contract support to design and implement a USDA Information Security Awareness and Training Program; and
- \$437,000 to develop a USDA Software Import Control and Licensing Program;

Question. What are the current general areas of security weaknesses at USDA that this program will address?

Answer. The general areas of security weaknesses to be addressed by the cyber security Office are: Risk Management—vulnerability assessments, risk mitigation programs, monitoring of safeguards, building of risk management models, Telecommunications weakness, Internet access—firewall, intrusion detection, reporting—Logical access in tiers I Mainframe, II Minicomputers and servers, and III Workstations, configuration management, Operations, Critical Infrastructure, Disaster recovery, Security Awareness, Personnel security, insufficient and ineffective tools, Skills and Security and System Administration training.

Question. What are the milestones and time frames and estimated total costs to fully address these weaknesses?

Answer. The Department's Associate Chief Information Officer for Cyber Security began work in February, 2000. His early estimates are that, if funding is available, it will take at a minimum 3 years and could be dependent upon the magnitude of spending to adequately mitigate these weaknesses and to have the processes to adequately manage the risks. Specific milestones and time lines will be developed based upon the funding that is made available.

Question. How much will be spent in fiscal year 2001 across USDA on information security management for staff, software and other related expenses? (Please break out the number of information security management staff in and total security dollars spent at each agency and office.)

Answer. The following two tables provide that information. USDA does not collect data on security in the aforementioned categories. However, based on the most recent data, security expenditures are estimated to be devoted to the following categories: Personnel—64 percent, System Protection—10 percent, Threat and Risk Assessment—7 percent, Intrusion Monitoring and Response—7 percent, and Education and training—5 percent.

[The information follows:]

TABLE 1. USDA INFORMATION TECHNOLOGY SECURITY BUDGET (BASED ON INFORMATION COLLECTED IN JULY 1999)

[Dollars in thousands]

Agency	Security Budget (fiscal years)			Total IT Budget (fiscal years)			Percent for Security		
	1999	2000	2001	1999	2000	2001	1999	2000	2001

Total	71	179	13	9	7

The Forest Service was only agency to report field staff, who spend 0–10 percent of their time on security related administrative tasks. FTEs provide both operational and policy support.

Question. What performance measures has USDA established to measure the effectiveness, progress, and benefit of all the information security management activities? And where and how are they being tracked within USDA?

Answer. The Department has recently established metrics to measure the effectiveness and progress for information security management activities in new systems under development—for example adherence to the five core information security requirements in the Department's Security Architecture—and is working on establishing the metrics for all information security management activities. The Office of the Associate Chief Information Officer for Cyber Security will track security management activities. They will be tracked through activity reports and on-site visits.

Question. How much does USDA plan to spend in fiscal year 2001 to further implement its FFIS and related improvements?

Answer. The implementation budget for fiscal year 2001 is \$25.2 million.

Question. How much will have been spent through fiscal year 2000 to implement FFIS?

Answer. To ensure a better understanding of the FFIS project budget and costs, in fiscal year 1999, the new project management team was asked to develop a budget that segregated implementation costs from the ongoing operational costs of implemented USDA agencies. Through fiscal year 1998, \$57.4 million had been spent for development and implementation activities. This amount includes USDA personnel

costs and contractor costs in support of the overall project and individual agency implementation efforts. It does not include any internal agency costs for business process re-engineering or similar activities. In fiscal year 1999, implementation costs were \$16.9 million. For fiscal year 2000, one of the two most intensive years for implementation of USDA agencies, the implementation budget is \$25.5 million. The total amount spent through fiscal year 2000 will be approximately \$100 million.

Question. What are the milestones for completing the implementation of FFIS, and what will be the final costs?

Answer.

Fiscal Year	FFIS Production Operation Date	Agency Name
1998	October 1, 1997	Office of the Chief Financial Officer, Forest Service (approximately 1/3 of Forest Service)
1999	October 1, 1998	Risk Management Agency
2000	October 1, 1999	Remaining 2/3 of Forest Service and Food Safety and Inspection Service
2001	October 1, 2000	Animal and Plant Health Inspection Service, Farm Service Agency, Natural Resources Conservation Service, and Rural Development
2002	October 1, 2001	Agricultural Marketing Service, Departmental Administration/Staff Food and Nutrition Service, and Research, Education and Economics Mission area
2003	October 1, 2002	Foreign Agricultural Service, Grain Inspection, Packers and Stockyards Administration, and Six Non-USDA Cross-Serviced Agencies

Question. How many agencies are currently using FFIS to input their financial information, and when does the Department expect all agencies/offices to be using FFIS?

Answer. The Forest Service, Food Safety and Inspection Service, the Risk Management Agency, and the Office of the Chief Financial Officer, about 44 percent of the USDA workforce, all rely on FFIS for their administrative accounting services. By October 1, 2000, four additional agencies, Rural Development, Animal and Plant Health Inspection Service, the Farm Service Agency, and the Natural Resource Conservation Service will utilize FFIS for these same services. The following table shows the number of USDA employees served by fiscal year.

[The information follows:]

USDA FFIS IMPLEMENTATIONS

Fiscal Year	Total USDA Employment ¹	Number of USDA Employees Served	Percentage of Total USDA Workforce
1999	104,661	528	.005
2000	101,772	44,544	43.76
2001 ²	104,220	75,257	72.2

¹ Based on fiscal year 1999 Actual Staff Years.

² Projected fiscal year 2001 Implementation.

Question. To its credit, USDA recently made a successful transition into the year 2000. In preparing for Y2K, the Department spent more than \$50 million to get its information systems ready. What were the positive lessons learned and how are they being applied today at USDA? Aside from making the actual transition itself, to what extent has the Department been able to capitalize on its Year 2000 investment and make added improvements in the Department-wide use of information technology?

Answer. The Y2K experience enhanced the capability of USDA managers to use proven project management techniques to ensure completion of complex tasks on time and within cost:

—Process owners and business resumption team leaders have an increased understanding of and skills in strategic planning and risk management, such as the use of assessment tools, mitigation and contingency planning, and management track-

ing, as well as greater appreciation for the value of exercises to test their plans and train critical staff members.

—The Office of the Chief Information Officer (OCIO) developed capabilities and processes to centrally coordinate a set of major IT initiatives to leverage investments and promote Department-wide efficiencies that will be applicable to future IT investments and system rollouts, especially as investments are considered as part of the Department’s Capital Planning and Investment Control (CPIC) process.

This successful experience is the impetus for initial plans to establish an enterprise program management unit within OCIO. The purpose will be to plan, manage and evaluate proposed major IT investments to identify and take advantage of economies of scale, coordinate with the enterprise architecture development to establish consistency in IT investments, manage risk from a corporate perspective, and to track actual return on investment.

Question. For the record, what was the total dollar amount spent by the Department on Year 2000 fixes and what does this include?

Answer. Total overall Y2K spending obligations, including agency appropriations, is reflected in the following chart.

<i>Fiscal Year</i>	<i>Cost in Millions</i>
1996	\$1.4
1997	14.1
1998	64.1
1999	95.4
Est. 2000	13.5
 Total	 188.5

These funds were spent for: hardware upgrades and replacements; embedded chip and scientific equipment remediation; Independent Validation and Verification; telecommunications systems remediation; remediation of other systems; software upgrades and replacements; business continuity and contingency planning; program management; technical assistance to states; and outreach.

OTHER AREAS

USDA INFORMATION TECHNICAL INFRASTRUCTURE

Question. A primary goal for USDA’s CIO has been the development of a Department-wide information and technical infrastructure to improve service delivery through more effective information systems and data management. What efforts are now underway in connection with this overall goal? Where does the Department stand on carrying out these initiatives and what are the time frames for their completion?

Answer. USDA began its enterprise architecture initiative in September 1996. The USDA Information Systems Technology Architecture was published in February 1997. The architecture was developed as part of USDA’s IT Modernization Plan. Since that time, the architecture has been used in the development of core business processes for each mission area for their Y2K business continuity plans, establishment of the applications baseline for the Y2K initiative, development of the proposed enterprise telecommunications network, and creation of the baseline architecture for use by the Service Center Initiative and the Common Computing Environment. In addition, the architecture processes have been integrated with the CPIC process to ensure architectural compliance.

The February 1997 version is now being expanded and updated to address recommendations of the independent verification and validation, align USDA’s architecture approach and model with the Federal architecture model, and broaden the architecture to include current industry best practices. We have also developed a direction for our future architecture that focuses on an enterprise-centric approach for shared information and applications. It recognizes the movement toward electronic government. The future architecture is also being developed based on the concept of technology domains, which represent common areas that USDA can approach from an enterprise perspective such as electronic signature and collaboration tools.

We have also developed a draft ISTA Management Framework which includes ongoing processes that, when finalized, will guide agencies regarding selecting business processes for improvement projects, working together to define specific technologies, standards, products and configurations that will be common across USDA, and standardizing USDA information systems across USDA, where there are common requirements

Our fiscal year 2000 Architecture initiatives include: publishing the USDA ISTA in both paper and electronic forms; continuing outreach to agencies regarding edu-

cation and awareness of architecture principles, standards, and processes; and implementing the ISTA Management Framework. This includes establishing the groups who will oversee and operate specific architecture processes.

PRESIDENT'S DECISION DIRECTIVE (PDD) 63

Question. Under the President's 1998 Decision Directive (PDD) 63, departments and agencies are required to develop infrastructure protection plans and strategies for achieving them by May 2000. What efforts are underway in connection with the implementing PDD63 at USDA? What is the status of the work and when will each effort be completed?

Answer. USDA and its agencies has developed a strategy for protecting its critical infrastructures. Most Business Resumption and Disaster recovery plans are in the development stage except for our major computing facilities—NFC & NITC—which have executable Disaster Recovery plans. Efforts are underway to define the security risks and establish risk management processes. Funding of the \$6.6 million is critical in establishment of the risk management process, performing vulnerability assessments, building a security architecture all of which are necessary for the successful implementation of PDD63.

IT ACQUISITION MORATORIUM

Question. USDA has had an IT Acquisition Moratorium in place for several years that requires waivers for IT investments exceeding \$25,000. In fiscal year 1999, many of the waivers granted by USDA involved acquisitions supporting Y2K-related improvements. What was the total number and dollar amount of waivers granted for non-Y2K-related acquisitions during the fiscal year 1999? With the Y2k crisis now over, does USDA plan to continue its IT moratorium and if so, what will be the basis for granting waivers?

Answer. The total number and dollar amount of waivers granted for non-Y2K-related acquisitions during the fiscal year 1999 is 203 waivers at a total of \$281 million.

With the successful Y2K transition behind us, USDA recently restored the threshold back to the original level of \$250,000 for information technology acquisitions needing Chief Information Officer approval. The \$250,000 threshold was established when the IT acquisition moratorium originated in November 1996. In July 1997, Secretary Glickman directed USDA agencies to concentrate as many resources as possible on correcting the Year 2000 problem so the moratorium threshold was lowered to \$25,000. Since the USDA transition was successful, the moratorium threshold was raised back to its original level except for administrative and financial systems. Again, Secretary Glickman wants USDA to focus on strengthening the corporate management of the Department's administrative and financial systems; the Chief Information Officer must approve all money expended on any administrative and financial systems. As stated in the answer to question 11, we are also using the moratorium to continue USDA's move towards a comprehensive capital planning process.

Question. As part of the USDA's effort to develop Business Continuity and Contingency Plans for Y2K, agencies conducted business analysis assessments to identify their core business processes and mission-critical IT systems. How has USDA integrated the results of these agency assessments into its overall IT planning?

Answer. As a direct consequence of its investment in Y2K preparations, USDA has many new or improved capabilities. The main collateral benefits of Y2K preparation include enhanced IT systems management capabilities and an improved focus on core business process support.

Enhanced systems management

Business Continuity and Contingency Planning (BCCP) preparation included a thorough inventory of current IT assets. Assessment and preparation of IT systems for remediation necessitated updating IT architecture diagrams. Older systems, particularly desktop hardware and applications, have been updated or replaced to ensure Y2K compliance. The enhanced IT architecture and information will enable improved capital investment management decisions in the future.

The experience of designing and implementing comprehensive hardware and software tests has improved USDA's capability to test new applications and components and will reduce the time and cost to deploy new applications.

Improved Focus on Core Business Process Support

The tension of preparation for Y2K led to the identification and prioritization of core business processes and critical IT systems. The business focus on core processes had the benefit of increasing management awareness of the critical role of IT in

daily business. This increased management awareness of dependence on IT for day-to-day business has led to improved coordination between program and IT personnel. Identification and prioritization of core business processes also revealed which IT systems are most critical and when, whether on a daily basis or periodically. Sustaining this awareness will aid in allocating scarce IT resources and will help continue improving the Department's Capital Planning and Investment Control process.

TELECOMMUNICATIONS ENTERPRISE NETWORK

Question. Several years ago, in connection with USDA's work to develop an integrated overall IT architecture, the Department also embarked on an effort to establish an enterprise network to better integrate the Department's many disparate telecommunications systems. What is the status of that work and what has been accomplished thus far?

Answer. Our previous attempts to establish a Telecommunications Enterprise Network—TEN was ultimately put on hold. However, we believe that a USDA enterprise network is now even more imperative. Consequently, armed with lessons from previous efforts, we are now in the process of identifying agency business requirements and redefining the architecture of a USDA telecommunications enterprise network to ensure that it meets the Department's and individual USDA agencies' requirements. Working jointly with the agencies, we are developing a framework that consists of technology standards, policies, change control mechanisms, and common processes. Consolidation and optimization opportunities are also being address using a collaborative approach. The Department will manage USDA's wide area network and perimeter security. USDA agencies will continue to administer security, metropolitan and local area networking and security.

The Department's telecommunications network is analogous to the nation's highway system, with many local and state roads and highways feeding into the Interstate system—allowing traffic to flow across the country. Similarly, our telecommunications backbone consists of a corporate network with feeder networks managed at the agency level. Our vision is to develop a modern and efficient corporate network, which is the backbone of the Department's telecommunications operation.

As you know, the operation of agency-specific stovepipe networks has historically resulted in reduced inefficiencies to program delivery and has hampered USDA's interoperability efforts. A corporate or enterprise network is necessary to support consolidated telecommunications operations; provide interoperability for interagency communications and data exchange among agencies and programs; enhance program delivery and eliminate redundant services, facilities, resources, and operations. Most importantly, an enterprise network is also an integral component of our efforts to strengthen cyber security.

The formulation of the enterprise network infrastructure will provide us with the opportunity to implement a "centralized management" concept which will allow the department to monitor and measure network performance and result in improved planning and security functionality.

Question. As part of its enterprise network, USDA also began reengineering telecommunications management processes throughout the department to address long-standing problems and achieve savings. What are the results and what savings have been achieved?

Answer. We are taking steps to improve telecommunications management and more efficiently utilize our resources even as we work to transition to an enterprise network. For example, we have made progress in correcting deficiencies raised in previous GAO audit reports. To ensure that telecommunications services and leased telecommunications equipment are terminated upon office closures, a checklist to be used when closing offices was provided to the agencies. Steps have also been taken to eliminate redundant, uneconomical or unused services and equipment. In response to another GAO recommendation, we have developed a plan to establish a telephone fraud incident reporting mechanism between the long distance exchange carriers and USDA's System Network Control Center—SNCC—in Kansas City, MO. We are also taking advantage of every opportunity during the current FTS2001 transition to improve our performance in this area.

We are confident that the USDA enterprise network solution makes good business sense and that the Department will benefit from significant unit cost reductions, (not necessarily savings), once it is implemented. Achieving "savings" will be difficult given the growing need for increased bandwidth and other services as more and more programs and services are made available over the Internet. Still, with mergers occurring throughout the telecommunications industry, often resulting in

reduced unit costs for telecommunications services, an enterprise network will enable USDA to leverage the apparent successes documented by our industry partners and take advantage of these reductions. The aggregation of telecommunications services and equipment from a corporate perspective can also significantly reduce the unit costs that are incurred by individual agencies by allowing the Department to take advantage of the economies-of-scale that exist. The bottom line is improved USDA program delivery. Our phased approach to the implementation of an enterprise network is evolving. We anticipate that the enterprise network strategic plan will be fully documented this fiscal year. We will also begin the process of obtaining funding in fiscal year 2000 and look to complete that effort during fiscal year 2001.

E-GOVERNMENT

Question. USDA's OCIO has requested funding for E-Government related activities aimed at promoting the use of Internet-based technologies to make agency programs and services more accessible to customers. What plans have been developed for executing such initiatives and what programs do they involve?

Answer. As noted earlier, USDA agencies have several initiatives already underway. Most encompass providing customers information on USDA programs and services, as well as market information, over the Internet. Other applications are being developed which would allow customers to actually transact business with the Department online. These include the Electronic Access Initiative in the Farm Services agencies that will allow farmers to download the forms they need, fill them out online, and electronically submit them back to the Department.

The funds we have requested will enable the Department to develop a corporate strategy to implement E-government and are critical for implementing the recently passed Freedom to E-file legislation. At present, agencies are planning numerous initiatives without the necessary level of coordination at the Departmental level. A Department-wide E-government working group is being established to address this issue. Our plans include conducting an education and outreach campaign to ensure that all senior USDA program managers are aware of and understand the potential impact of E-government and their role in ensuring that USDA provides the kinds of services that our customers are increasingly expecting. Most importantly, our plan includes developing a corporate wide strategy to ensure the necessary level of coordination and to develop standard approaches to cross-cutting issues. Once the strategy is in place, agencies can develop and implement specific plans in an environment which ensures that USDA will leverage resources across the Department.

INFOSHARE BALANCES

Question. The Committee recommended that unobligated funds made available to the Office of the Secretary in fiscal year 1996 for "InfoShare" be used to fund various activities related to information technology for which increased funding was requested in the President's fiscal year 2000 budget. Have "InfoShare" funds been proposed to meet any of these requirements? If so, what investments are proposed from unobligated "InfoShare" funds?

Answer. Because of funding needs to support implementation of the Service Center Modernization—SCM—and Common Computing Environment—CCE—all of the funds are being used for that purpose. Where possible, the Department is leveraging work done in support of SCM activities such as computer assistance and other work on computer and privacy issues, for the benefit of all of USDA. For example, in the process of analyzing requirements and solutions for intrusion detection for the SCM Electronic Access Project, the Department will utilize that process and information for the broader USDA environment.

SUBMITTED QUESTIONS ON GOVERNMENT PERFORMANCE AND RESULTS ACT

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. CSREES has developed an annual Performance Plan that links to that of the Research, Education, and Economics—REE—Mission Area. The Plan relates program activities to the mission and goals of the agency—as described in the Agency strategic plan—to the budget request submitted in support of research, extension

and education activities. More importantly, it reflects the role of CSREES in enabling land-grant universities and other partners who carry out the research and extension activities authorized in the CSREES budget, and frames our ability to use reports and databases to document accomplishments against expectations.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. We use a process of continuous dialogue with our land-grant partners to identify emerging issues that are of the highest priority to include in our budget. This takes place in quarterly meetings with system administrators, while program reviews are conducted by National Program Leaders, and during annual reviews of research and education programs. In all instances, these relate to issues of importance included in the Administrator's budget request. The difficulty we experienced is one of not being able to describe in sufficient detail the specific impacts of the Federal investment in research and education in advance of the completion of research and education activities by those institutions that receive funding. Using existing databases and the Research, Education, and Economics Information System—REEIS—which has not yet been completely developed, and our past experience with the land-grant system, we feel confident that projects are focused on issues important to the taxpayers and producers. This is reflected in the "Impact" statements that are being developed to share the results of research and education with the public. These impact statements relate to our agency performance goals and our budget activities.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The agency performance plan is linked to performance measures that relate to the President's budget. Because of the complexity of the agency budget and the large number of components in its accounts, individual components were aggregated around five broad agency goals for more efficient planning and reporting. Using the five goals gives a national, issue-based focus to programming planned and conducted in a dynamic process in the states by eligible partner institutions. All program and budget activities relate to one or more of the following CSREES Strategic Goals: (1) An Agricultural Production System that is Highly Competitive in the Global Economy; (2) A Safe and Secure Food and Fiber System; (3) A Healthier, More Well-Nourished Population; (4) Greater Harmony between Agriculture and the Environment; and (5) Enhanced Economic Opportunities and the Quality of Life among Families and Communities.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Again, because of the complexity of the agency budget and the large number of components in its accounts, activities were aggregated in the performance plan around the five agency goals for more efficient planning and reporting. This means that the individual components in the account and activity structure do not have performance measures that are specifically linked to those accounts. We do however believe that we have enough flexibility to effectively link planning with the budget.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. CSREES does not plan to propose any changes to its account structure for fiscal year 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. At this time, CSREES does not plan to propose any changes to the program activities described under that account structure.

Question. How were performance measures chosen?

Answer. Performance measures were chosen to reflect critical actions necessary to achieve shared and national priorities in agriculture and which describe the purposes and impact of the Federal investment in research, extension, and education.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Our agency did not employ additional staff to collect and verify data, but utilized existing staff and data sources, such as the Current Research Information System—CRIS—Food and Agricultural Education Information System—FAEIS—and the Impact Data Base. We believe that these provide reliable sources of data in identifying performance measures. The 1998 Farm Bill also developed a Plan of Work requirement for institutions receiving formula funds in which institutions must list output and outcome measures that will be addressed in perspective plan-

ning—five years. This will become another data source when annual Plan of Work reports are submitted in March 2001.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No. The agency plan includes performance measures for which reliable data will be available for the first performance report.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The key performance goals that we recommend the subcommittee use to track program results by goals are: Goal 1—Develop new and value-added products and improved production systems; Goal 2—Develop and improve detection and prevention methods to reduce pathogens in foods, and decreased contaminants in the food supply; Goal 3—To improve the health of consumers through changes in diet, quality of food, and food choices; Goal 4—To understand the compatibility of agricultural practices on the natural resource base and environment; and Goal 5—To improve economic and social indicators of community well being.

Question. For each key annual goal, indicate whether you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

Answer. CSREES has performance plans for each of our strategic goals. An example of an output measure under Strategic Goal 1 would be to develop new and value added products. An outcome measure example would be improved risk management skills and practices of agricultural producers, and processors, and marketers.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked?

Answer. Our Strategic Plan is linked to five general goals: 1) Agricultural Production System that is Highly Competitive in the Global Economy; 2) A Safe and Secure Food and Fiber System; 3) A Healthier, More Well-Nourished Population; 4) Achieve Greater Harmony between Agriculture and the Environment; and 5) Enhanced Economic Opportunity and Quality of Life for Communities; and one agency specific goal—Responsive and Effective Management Systems. Our annual performance goals are linked to the objectives and general goals contained in both the Annual Performance Plan and Strategic Plan. An example of an Annual Performance Goal is to develop and improve detection and prevention methods which links to the Objective to improve food safety by controlling or eliminating food-borne risks, and links to Strategic Goal 2 to provide a safe and secure food and fiber system.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The agency plan reflects substantial internal and external partnership discussions to identify outcome/output measures which demonstrate that the goals in the plan have been met, including those noted in the previous answer.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, the plan specifies agency and collective program activities as outputs and university partnership and grantees’ work as the outcomes which address objectives. We support an annual process that ensures our success in using output and outcome measures. We are continuing to work with our partners to insure performance measures contained in our Annual Performance Report are updated and refined.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Customer satisfaction measures for the agency will include, but will not be limited to expert assessments—such as would be needed to assess impacts of genome research and discovery—customer surveys—such as would be needed to measure scope and effectiveness of selected extension programs—economic data or social survey data, and physical monitoring—such as would be valuable to determine effects of research-based changes in best management practices affecting environmental quality of public health indicators. Examples of customers would include Federal agencies—e.g., the Agricultural Research Service, the Department of Energy, the National Science Foundation, the Environmental Protection Agency, colleges and universities, and producers and consumers of information related to the food and agricultural sciences.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The agency identified approaches to addressing relevant national issues such as food safety, water quality, waste management, youth and families at risk, food genome initiative, pest management strategic, biobased products, and small farms in the formation of the budget. The measurable goals—and budget necessary to achieve the goals—contribute to achieving the strategic plan of CSREES.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. In collaboration with university partners, we will be able to describe the likely impact on programs and achievement of goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. We do not currently have the capacity; however, we are working to develop the technological capability to measure and report performance throughout the year. We have completed modernization of CRIS, are developing REEIS, and are in the final phases of a three-year project to establish integrated grants tracking and financial management. With university partners, we have developed a National Impact Data base and are updating the form and format of state plans and reports so that they can be submitted and updated through a World Wide Web-based system.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. The technology capable of measuring and reporting program performance is accessible to senior and mid-level managers. We have program analysts who assist in these efforts.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Program related data bases are available for use by program and mid-level managers.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Because of the complexity of the agency budget and its many lines, individual programs were aggregated around five general agency goals for more efficient planning and reporting. While the current account structure has offered a challenge in the way we respond to the requirements of GPRA, we feel we have been successful in using the five goals to give a national focus to programming that is planned and conducted in a dynamic process in the states by partner institutions and grantees.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Although changes in the budget account structure might clarify linkage of dollars to results in a meaningful way, that is not the solution to the challenges CSREES faces in responding to GPRA. This becomes problematic because the CSREES budget structure is based on congressional authorities. Through a partnership with the system of State Agricultural Experiment Stations, land-grant and other colleges and universities, and other public and private research and education organizations, CSREES is USDA's principal link to the university systems for the initiation and development of agricultural research and education programs. Additionally, CSREES is the Federal partner in the Cooperative Extension system, a nationwide non-formal educational network. The challenge CSREES faces is capturing and reporting research and education results of our partners who conduct and deliver activities supported in the CSREES Budget. We are currently engaging our Partners in dialogue to help them understand. This will allow CSREES to be more responsive to the GPRA mandate. In concert with our Partners, we have prepared impact statements highlighting research, education, and extension accomplishments supported by the Federal investment.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. CSREES does not propose to modify its budget account structure at this time.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. CSREES does not propose to modify its budget account structure.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise. \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to the goals?

Answer. The dollars associated with the performance goals represent the total amount appropriated for CSREES programs including Federal administration funds retained by the agency to administer the programs. In addition, estimated reimbursable funds and mandatory funds for programs administered by CSREES are included.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. We have no specific regulatory reform measures associated with the development of the agency's performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The strategic plan does mention external factors that could influence goal achievement. While we cannot predict how the factors will influence goal achievement, we attempt to engage customers and stakeholders in a way that would minimize the impact of external factors on programs.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. To anticipate and plan for the influence of external factors, we look to other Federal agencies for mechanisms to coordinate research and education programs. This permits joint identification of issues and the appropriate role of all participants. These steps help us to understand, predict, and respond to the external factors that influence goal achievement.

Question. What impact might external factors have on your resource estimates?

Answer. While we cannot predict how the factors will influence goal achievement, we attempt to engage customers and stakeholders in a way that would help our agency respond to their concerns through the research and education programs that we manage.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. CSREES manages formula funds, special grants, and competitive grants in a way to minimize unnecessary program duplication. All programs/projects are subject to merit and peer review and internal reviews to address this concern.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. The agency performance plan is written to eliminate the overlap and duplication of funding in support of programs.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Agencies should address management challenges and potential duplication. Our agency has included a specific agency goal "Responsive and Effective Management Systems." This includes strategies that improve information management systems and financial management.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. GPRA has challenged our agency to focus on those issues and program areas that are important rather than solely focusing on the funding mechanisms to support programs. With a diverse funding portfolio consisting of formula funds, competitive grants, multi-state, and integrated projects, we should be in a position to respond to issues that are of the greatest national importance.

Question. Will this use increase in the future and if so in what ways?

Answer. We will continue to use GPRA, as well as other accountability strategies, that demonstrate a willingness to respond to national programs of importance.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. We believe that we can with some degree of confidence establish milestones that demonstrate movement towards targets—outputs and outcomes.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The questions raised under GPRA relate to accountability expectations associated with the budget. While we have always responded to questions of accountability, there appears to be a difference in expectations between the agencies and those who review the results of our expectations. As we submit future reports and receive feedback, these differences will be minimized, and we will be on target in reporting outputs and outcomes. For example, in the Performance Plan, we recognize that in our research and education activities, results and performance measures occur over time, and in many instances, over several years. However, when the performance plan is read, the reader expects all performance measures to be reported within one year.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. CSREES is not requesting any waivers of non-statutory administrative requirements.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. CSREES is requesting no relaxation of transfer or programming controls in return for specific accountability commitments.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. We are supporting the revision of the REE mission area strategic plan. However, the agency does not expect to make substantive revisions to our strategic plan.

OFFICE OF BUDGET AND PROGRAM ANALYSIS

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. They link to OBPA's mission and sole program activity by assessing the quality, value, and usefulness of information provided to the Office of the Secretary and policy officials; they link to the strategic goals by measuring specific activities and products that support the provision of useful information.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. OBPA examined activities supported by its single budget account and established goals to evaluate the products and services it provides to its stakeholders while ensuring that they are consistent with Departmental policy and valuable to the decision making process. Quantifying the value of these products was the greatest challenge. This value is dependent, to a large degree, on subjective judgement of those parties OBPA supports. OBPA learned that it could capitalize on existing consultation processes to seek feedback on the utility of its products and services. Additionally, OBPA has learned to use some quantifiable measures under its management initiatives to gauge progress in staff development and training that is integral to successful performance.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Performance measures are associated with OBPA's single account.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification? Do you plan to propose any changes to your account structure for fiscal year 2001? Will you propose any changes to the program activities described under that account structure?

Answer. The performance planning structure can be easily related to OBPA's single account. We are not planning changes to the account structure.

Question. How were performance measures chosen? How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data? Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Measures were chosen based on an analysis of OBPA's mission and role, the products and services it provides, and the resources necessary to maintain high performance. Cost considerations, balanced with OBPA's role, led to a determination that quantifying the utility of its products and services would add little to no value at a high cost. Data will be available in time for the first report.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure or an outcome measure. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. All of OBPA's performance goals under its three strategic goals are of equal value in tracking program results. They represent outcomes that validate and confirm the outputs OBPA produces are useful, valuable, and consistent with Departmental policy—these outcome goals are further supported by performance indicators which predominantly represent outputs. OBPA's quantified performance goal under its management initiative to "maintain or increase the percent of all employees who receive training or other professional development" is worthy of tracking. While the actual percentage is an output, it contributes to the outcome that OBPA maintains a highly-skilled staff. This relates to OBPA's general long-term Management Initiative to "Build a more productive and diverse workforce."

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Realizing that it is difficult to measure the performance of a staff agency such as OBPA, performance goals were developed that would capture the utility of products and services through informal feedback and consultation with key stakeholders.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, OBPA has a staff of highly-skilled managers and support analysts with backgrounds and on-the-job experiences that equip them with the necessary

skills and knowledge to assess the efficiency and effectiveness of the agencies and programs they oversee.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. While OBPA does not directly measure customer satisfaction, the performance goals do seek feedback from its internal customers—the Office of the Secretary and other senior level policy officials—and external customers—OMB and Congress—as to the utility of its products.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 Budget? If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. To ensure that OBPA's goals would be met, OBPA assessed its resource and staffing needs. It determined that the desired level of program performance is becoming increasingly difficult to maintain as staff resources have decreased and program and budget complexity has increased. To meet these needs, OBPA requests an increase for pay costs to maintain staff levels and be in a position to use base funding to provide staff training and professional development. Without this increase, staff resources will be strained and the absorption of pay costs will make it difficult to maintain a high level of performance or to provide for employee development. If a proposed number is changed up or down, OBPA would be able to indicate the likely impact on performance.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results? If so, who has access to the information—senior management only, or mid- and lower-level program managers, too? Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes, senior as well as program managers have easy access to the performance data OBPA maintains on its information systems.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty? Would the linkages be clearer if your budget account structure were modified? If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure? How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. As a staff office, OBPA only has one program activity and does not believe its budget structure represents a significant challenge or that it should be modified.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Because OBPA is a small staff office, it relies on the Office of the Chief Financial Officer (OCFO) for budget and accounting services and expertise. Based on OCFO guidance and additional direction provided by OMB, OBPA links GPRA to the budget process.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting Requirement, and are you using Activity-Based Costing? Will you be able in the future to show this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation? By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities? Will you be able to show us the per-unit cost of each activity and result? To what extent do the dollars associated with any

particular performance goal reflect the full cost of all activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. This issue will be further dealt with as USDA moves to a Department-level approach. At the present time, OBPA does allocate the full cost of activities to its goals.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. OBPA does not issue program regulations and therefore has not put in place any such measures.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate and plan for such influences? What impact might external factors have on your resource estimates?

Answer. External factors OBPA attempts to prepare for include changing policy priorities and funding levels. While the 2000 performance plan does not specifically mention these as external factors with identified response strategies, OBPA does have the processes in place to respond to such challenges. By monitoring policy trends and critical issues in the agricultural sector, OBPA tries to anticipate changing priorities and shift staff resources as appropriate.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify overlap or duplication?

Answer. No, OBPA has clear lines of responsibilities divided among its budget, program analysis, and legislative, regulatory, and automated systems divisions.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Certainly, in a decentralized agency such as USDA, this is a key issue. GPRA planning efforts should address these challenges in the means and strategies sections of agency performance plans as well as through management initiatives.

Question. To what extent has GPRA been used by agency leadership to guide decision making? Will this use increase in the future and if so in what ways?

Answer. As mentioned previously, it has been difficult for staff offices like OBPA to use GPRA as an effective guide. Many of the activities OBPA has described in its plans have always been critical components of its performance. The office has long valued good management practices and effective coordination. As USDA moves to a new strategic planning approach, staff offices will then be able to focus more on how they contribute to overall departmental success.

Question. Future funding decisions will take into consideration actual performance compared to expected or targeted performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Keeping in mind the difficulties associated with measuring the performance of a staff office such as OBPA, the performance measures are adequate.

Question. Are you requesting any waivers on non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or re-programming controls in return for specific accountability commitments?

Answer. No.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. OBPA's 2000 Performance Plan contained changes from previous plans by eliminating indicators that did not contribute to the measurement of program performance, but there is no need for substantive change.

OFFICE OF THE GENERAL COUNSEL

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. OGC's annual performance plan defines our performance goals and measures that are used to assess progress over the coming years. OGC's mission and strategic goal is centered around providing effective legal services in a responsive manner that is consistent with the priorities of the Secretary. In order to respond effectively to those priorities, we have established in our budget activity a request to increase legal services provided to the Department, as well as a goal to improve computer technology and communication tools in order to improve the productivity of employees of the agency

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. OGC only has one strategic goal and one budget activity. As previously stated, the goal centers around making OGC more responsive by ensuring that demands for legal services are prioritized in a manner consistent with the priorities of the Secretary. Our budget is consistent with that goal and those priorities.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Because the budget activity for OGC is requested via a single line item in the budget, we did not encounter any difficulties.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. The performance plan for OGC does link performance measures to its budget.

Question. Does each account have performance measures?

Answer. Performance measures exist for OGC's account for legal services

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. OGC's performance planning structure does not differ from the account and activity structure in the budget justification.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. OGC does not plan to propose any changes to the account structure for fiscal year 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. We do not anticipate any need to change or modify the program activities under the account structure.

Question. How were performance measures chosen?

Answer. The performance measures were based on the fact that OGC is a staff agency which responds primarily to the needs of the USDA agency clients. Thus, interviews of Under and Assistant Secretaries, as well as other officials, were conducted to determine what aspects of OGC's performance were of most importance.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Interviews and surveys of agency heads were chosen as the most effective and cost-efficient way to measure performance.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Data from the performance surveys are not likely to be available for the first performance report in March 2000.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well"). State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The mission of OGC is to provide legal services necessary to support activities of the USDA. OGC provides legal services primarily to the Secretary of Agriculture and officials at all levels of USDA as well as members of Congress concerning the programs and activities carried out by USDA. All legal services are centralized within OGC and the General Counsel reports directly to the Secretary. The Office of the General Counsel will provide legal services in a responsive manner to USDA officials, executive branch officials and members of Congress. OGC has 6 objectives that support its mission and strategic goal. They are: (1) OGC will provide effective legal services in a responsive manner to support USDA activities, consistent with the priorities established by the Secretary of Agriculture, (2) OGC will review for legal sufficiency, draft regulations submitted by USDA agencies and advise the appropriate USDA officials of the results of the review, (3) OGC will draft and conduct a legal review of documents as requested by USDA and Executive Branch officials, (4) OGC will conduct litigation on behalf of USDA officials and will provide litigation support services to the Department of Justice in cases arising out of USDA programs and activities, (5) OGC will draft legislation and review for legal sufficiency legislative reports and testimony as requested by USDA officials, (6) OGC will provide counseling to USDA officials concerning issues arising out of USDA programs and activities. Each of these objectives is measured by a combina-

tion of customer satisfaction measures (outcome) and output measures of OGC's workload.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The efforts to ensure that the goals in the plan included a significant number of outcome measures were both external and internal. Externally, OGC's interviews of Under and Assistant Secretaries focused on the responsiveness of OGC both quantitatively and qualitatively. The surveys of agencies will also include both measures. Internally, OGC is requiring quarterly workload assessments from its managers. These workload assessments measure both the objective quantifiable number of OGC cases and the complexity and difficulty of the cases. Managers are asked to critically report, in various forums, on the outcome of significant legal efforts throughout OGC.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The managers clearly understand the difference between workload and effectiveness. The range of OGC legal work, from routine and quantity-driven paper filings to complex class actions, requires that the managers assess both output and effectiveness.

Question. What are some examples of customer satisfaction measures that you intend to use? Please indicate examples of both internal and external customers.

Answer. OGC will be using surveys of agency clients and management reports which reflect anecdotal evidence regarding customer satisfaction.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. In order to develop the fiscal year 2001 budget, OGC conducted reviews of our fiscal year 2000 Annual Performance Plan. That review included surveys of agency officials concerning OGC's performance—effective, responsive legal services especially with respect to priority matters—as it relates to the performance indicators in the plan. Throughout these surveys, it became clear that agency officials wanted legal reviews to be provided in a more responsive and effective manner, taking into account established priorities. Therefore, OGC's fiscal year 2001 budget focused on ensuring that resources would be made available to meet the foremost legal service needs of the Department.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Should funding be provided at a level that is greater or less than requested, OGC would be able to indicate the impact the change would have on the level of program performance and the achievement of various goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. The Office of the General Counsel has a Work Tracking System, (WTS) which utilizes Paradox software and which has the capability to track OGC performance indicators on a regular basis.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. The information provided by the WTS is available and easily accessible to all of managers.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Performance-related data is easily accessible.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. OGC's present budget structure does not make it difficult to link dollars to results in a clear and meaningful way.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. N/A.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. N/A.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standard Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation.

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the programs, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. None.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate and plan for such influences? What impact might external factors have on your resource estimates?

Answer. External factors that could influence goal achievement are increased litigation at all levels, but particularly in the civil rights and environmental sectors. Substantial increases in litigation have a substantial impact on OGC's resources, particularly staffing requirements.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. There are no overlapping functions or program duplication within OGC.
Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. N/A.

Question. To what extent has GPRA been used by agency leadership to guide decision making? Will this use increase in the future and if so in what ways?

Answer. GPRA has been used to assist both managers in OGC and throughout USDA in planning for how legal resources will be used and prioritized. If the leadership shares a common set of priorities, OGC resources can be used more effectively to meet program goals. Also, a management seminar for OGC managers is planned for late spring which will incorporate the GPRA.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Since the implementation of the WTS we have continued to refine the system to assure its accuracy in meeting management's desires objectives.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. OGC is not requesting any waivers of non-statutory administrative requirements.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. More emphasis should be placed on the substantial rise of litigation throughout OGC, particularly in the civil rights and forest service sectors, and the resources needed to adequately address the increased workload.

OFFICE OF THE CHIEF FINANCIAL OFFICER

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The mission of the Office of the Chief Financial Officer—OCFO—is to shape an environment in which USDA officials have and use high quality financial and performance information to make and implement effective policy, management, stewardship, and program decisions. The OCFO has established three strategic goals to support this mission, identified strategic objectives under each goal, and developed key performance goals to accomplish the objectives.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The performance goals in the Annual Performance Plan are clearly linked to OCFO's strategic goals. These goals link to OCFO's single appropriation account—program activity—and to the Working Capital Fund. The major share of appropriated funds, approximately 85 percent of the total in fiscal year 2000 and fiscal year 2001, support Strategic Goal 1: Promote sound financial management through leadership, policy, and oversight. The remainder supports Strategic Goal 2: Create an infrastructure to carry out financial management policies. In addition, OCFO has reimbursable funds, which support Goal 1 only. Working Capital Funds, provided through client payments for goods and services, support Goal 2 and Goal 3: Operate a financial center that produces timely and reliable information and services. The allocation of funds and FTEs for fiscal year 2000 and fiscal year 2001 are shown in the following table.

[The information follows:]

OCFO RESOURCES BY GOAL AND SOURCE OF FUNDS

[Funds in thousands of dollars]

Funding	Fiscal Year 2000				Fiscal Year 2001			
	Goal 1	Goal 2	Goal 3	All goals	Goal 1	Goal 2	Goal 3	All goals
Appropriated	\$4,191	\$769	\$4,960	\$5,462	\$1,003	\$6,465
FTEs	58	11	69	58	11	69
Reimbursable	\$2,130	\$2,130	\$2,252	\$2,252
FTEs	19	19	19	19
Working Capital Fund	\$19,531	\$172,773	\$192,304	\$25,160	\$176,016	\$201,176

OCFO RESOURCES BY GOAL AND SOURCE OF FUNDS—Continued

[Funds in thousands of dollars]

Funding	Fiscal Year 2000				Fiscal Year 2001			
	Goal 1	Goal 2	Goal 3	All goals	Goal 1	Goal 2	Goal 3	All goals
FTEs		44	1,626	1,670		44	1,626	1,670
Total	\$6,321	\$20,300	\$172,773	\$199,394	\$7,714	\$26,163	\$176,016	\$209,893
FTEs	77	55	1,626	1,758	77	55	1,626	1,758

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Our organizational structure did not reflect the strategic plan. We have taken the necessary steps to restructure the organization so the staff resources will be better positioned to meet the strategic plan's goals.

Question. Does the Agency's Performance Plan link performance measures to its budget?

Answer. Yes, it does. Resource increases to accomplish the budget year performance targets are discussed in the Annual Performance Plan with respect to means and strategies for accomplishing the performance goals. Total resource requirements in the plan tie directly to the budget request.

Question. Does each account have performance measures?

Answer. Our Plan has performance measures for both our single appropriation account and the Departmental Working Capital Fund. The performance measures for the direct appropriation are primarily linked to Goal 1. Those for the Departmental Working Capital Fund are primarily linked to Goals 2 and 3.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Currently, performance planning occurs along organization lines, mainly within each Division, and resources are allocated along organizational lines. Because the budget also is developed along organizational lines, plans and resources feed directly into the budget activity structure.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. At this time, we do not anticipate any.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No, not at this time.

Question. How were performance measures chosen?

Answer. After careful review of the OCFO's primary business lines, we identified those business outcomes that would best illustrate USDA's progress in financial management.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Our performance goals are based primarily on information we already have available or expect to have available for performance reports. As we improve our plan and report, we must achieve greater specificity in our plan, emphasize quality in financial management data, and move toward outcome-oriented performance measures. We expect these changes to be reflected in our revised Strategic Plan and subsequent Annual Performance Plans.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No, it does not. Our current measures can be quantified.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. We recommend that you track performance goals related to achieving an unqualified audit opinion on the USDA consolidated financial statements, thus improving the quality of USDA financial information; reducing the ratio of collectable delinquencies; implementing the Foundation Financial Information System; and increasing the number of clients currently using the NFC payroll facilities.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. All four annual goals include elements of both measures. For example, if OCFO issues a policy, that policy reflects and output. The Department achieves

an outcome if this policy results in better decision-making that reduces costs or improves services.

Question. State the long-term—fiscal year 2003—general goal and objective from the agency Strategic Plan to which the annual goal is linked?

Answer. This information has been incorporated into the following table.
[The information follows:]

Strategic goal	Strategic objective	Key performance goal
1. Promote sound financial management through leadership, policy, and oversight.	1.1. Achieve an unqualified audit opinion on USDA's consolidated financial statements..	Unqualified audit opinion on the USDA consolidated financial statements for the prior fiscal year.
	1.3. Reduce outstanding delinquent debts to USDA and limit the increase in number of new delinquencies, and increase use of Electronic Funds Transfer (EFT) for payment.	Improve the ratio of collectable delinquencies to total receivables.
2. Create an infrastructure to carry out financial management policies.	2.1. Implement an integrated financial management information system for USDA.	Implement the Foundation Financial Information System (FFIS)
3. Operate a financial center that produces timely and reliable information, and services..	3.2. Expand the NFC customer base to increase volume and reduce unit cost..	Increase in number of newly implemented payroll accounts (number of new employees)

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The OCFO Annual Performance Plan is realistic and reflects current priorities, given the financial management challenges facing the Department. As OCFO gains experience with GPRA and strategic planning, and, as an integrated financial management system is established throughout USDA, we expect we will shift to even more outcome oriented measures, so we can better establish how well we are performing. A better financial infrastructure, complete with compliant systems and sound business practices, will lead to more outcome-oriented measures.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Our managers do understand differences between outputs and outcomes. OCFO managers have had GPRA training and we have facilitated discussions on strategic planning and GPRA.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Measures of customer satisfaction have not yet been established for OCFO, but we are developing several measurements, particularly with respect to the National Finance Center and the multiple administrative services we provide there.

Question. How were the measured goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The fiscal year 2000 Plan describes what can be accomplished with current resources. Using that information, we established our priorities, the desired goals and requisite performance level needed for fiscal year 2001, and identified the additional resources required to achieve desired performance. Many of the initiatives were proposed in response to deficiencies brought to our attention by the General Accounting Office, the Inspector General, and central guidance agencies. The need for an additional \$1.5 million is justified in the Explanatory Notes for fiscal year 2001.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and achievement of various goals?

Answer. Yes, we will. The performance improvements identified for fiscal year 2001 above the fiscal year 2000 level shown in Goal 1 are clearly quantified, and we would be able to explain the impact of any significant change to the request.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Based on our current measures, we have the technological capability; however, we are discovering that there is a need to make refinements in the level of detail reported and how it is reported.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Currently, information is available to management at varying levels of the organization depending on the measure. We are reviewing our internal planning and reporting processes with a view toward making them more inclusive, available to all management levels, and used in the every-day planning and decision making process.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Based on our current measures, we are able to compile the necessary data from several systems. This does, however, require cooperation from our client organizations, particularly with respect to our debt performance measures.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. No, we have not. Our budget structure is relatively straight forward, which makes the necessary linkages easy to accomplish.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No, our budget structure is adequate.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. We do not believe that a modification is necessary.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We believe that the current structure provides sufficient accountability for program performance.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. The number of personnel currently assigned to cost accounting and their respective levels of expertise vary widely from one agency to another. However, we are making progress. Several agencies have implemented cost accounting techniques, including Activity-Based Costing—ABC, in their financial management activities. The Animal and Plant Health Inspection Service, the Food Safety Inspection Service, Agricultural Research Service, Office of Inspector General, and the Farm Service Agency each have implemented ABC in their operations and currently use it for performance measurement and reporting, as appropriate. In addition, the Office of Chief Financial Officer has begun implementing ABC at the National Finance Center and plans to use it for performance measurements in selected situations.

OCFO recognizes the need to lead a Department-wide effort to enhance its cost accounting expertise and has included \$240,000 in its fiscal year 2001 President's Budget request to provide such leadership. In addition, the OCFO's on-going Professional Development Program requires its candidates to complete two courses on cost accounting, along with several other financial management courses. This professional development program and the specific cost accounting training will contribute considerably to enhancing USDA's reporting capabilities under GPRA. Currently, all USDA agencies have linked budget program activities to strategic goals, with some linked down to performance goals. Ultimately, with the additional fiscal year 2001 resources and a better trained workforce, USDA will continue to implement improvements in cost accounting.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standard Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each one of the activities of an agency. What is the status of your

agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing.

Answer. USDA still needs to make progress to fully implement FASAB's cost accounting standards. To advance this initiative we identified responsibility segments, for which we provide financial statement reporting, employing full cost techniques that include allocation of unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate to allocate. Currently USDA uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation.

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all of our agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. We are moving with a very aggressive schedule to implement the remaining agencies by fiscal year 2003. As we improve our basic accounting and reporting processes, we will be able to better identify activities and outputs for unit costing. At that time, we will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the programs, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As we implement activity based costing, we will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Our approach will be to capture the full cost of doing business, capturing overhead and all other applicable costs associate with performance measures and goals.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. There are no regulatory reform measures involved in OCFO's Annual Performance Plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievements?

Answer. With respect to the direct appropriations, we believe that the performance targets set in our Plan are realistic and achievable as long as OCFO receives the resources requested for fiscal year 2001. With respect to the Departmental Working Capital Fund, our Revised fiscal year 2000 and fiscal year 2001 Annual Performance Plan contains a brief discussion of the need for continued customer support of the systems and services provided by the National Finance Center—NFC. NFC provides a variety of services to USDA and non-USDA customers. To remain competitive, NFC must continually improve the quality and the cost-effectiveness of services to those customers. NFC's success depends on its ability to retain current customers and the need to attract new ones. Consequently, NFC is currently re-engineering its business processes to improve its operations and is aggressively pursuing new customers. Because customer satisfaction and an increased customer base are so critical to the continued viability of NFC, OCFO has developed performance goals addressing these two areas.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. OCFO has identified the following actions to mitigate the impact of external factors: (1) The Secretary directed the Chief Financial Officer, in conjunction with the Chief Information Officer and the Assistant Secretary for Administration, to upgrade and modernize USDA's administrative systems in a corporate environment to meet the customers' needs. This process will assure the quality and integrity of information in USDA's Foundation Financial Information System, as well as mixed systems in USDA, provide the corporate reporting required to better manage

USDA, and improve corporate decision making. (2) The National Finance Center—NFC—is conducting a survey to assess the level of customer satisfaction with the services it provides to its USDA and non-USDA customers. This survey will provide important information on customer perceptions about the quality of NFC's existing services, desired services not currently performed, and current services that might potentially be discontinued. This information will improve our ability to assign priorities and target resources to meet customer needs. (3) NFC plans to improve its operations through implementation of the Capability Maturity Model—CMM—Level II throughout NFC by fiscal year 2003. CMM is part of a discipline for increasing product quality and team productivity, or reducing development time that helps an organization improve its software development and management activities. CMM serves as a standard for software engineering and management practices and is essential to support the increasing maturity of NFC's software engineering capabilities. (4) NFC will apply the principles of "Activity Based Costing" to its operations to improve its cost estimating techniques and to identify operating efficiencies.

Question. What impact might external factors have on your resource estimates?

Answer. Improved business processes can make NFC operations more efficient, which will reduce the unit cost of providing services. Although savings to customers may be difficult to quantify, low costs makes these services more attractive to current and potential customers.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. Our mission is well-defined, and we do not believe there is duplication or overlapping functions. Interestingly enough, we did find structural problems in our performance objectives that gave the appearance of overlap and duplication. We have modified and streamlined the strategic objectives that appear in the Revised fiscal year 2000 Annual Performance Plan to eliminate possible confusion.

Question. If so, does the Performance Plan identify the overlap or duplication.

Answer. Our Plan contains no overlapping functions or program duplication.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. As the lead for implementation of GPRA in USDA, we believe that it is essential that these issues are addressed in agency Annual Performance Plans. Whether these issues are addressed in the general discussion of annual performance goals, in the means and strategies for accomplishing performance goals, or as external factors will depend on the agency and its circumstances. We are in the process of developing a Department-wide Strategic Planning process for USDA, and this is one of the issues that will be addressed as part of that process.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. GPRA has made us aware that we need to utilize the principles of strategic planning more effectively in our daily operations and our decision making processes. As we begin development of the new strategic plan and the fiscal year 2002 Annual Performance Plan, we will take steps to integrate GPRA more fully into our program management. We intend to establish a working group to institutionalize strategic planning within OCFO. This group will concentrate on ensuring the proper linkages are made between resources, performance, and outcomes. They will ensure that lessons learned in working with our customers and stakeholders are incorporated into our management processes.

Question. Will this use increase in the future and if so in what ways?

Answer. We expect that GPRA will become standard practice within OCFO in the future. We will be reviewing our planning processes in the very near future and will be better able to describe how we will apply GPRA at the conclusion of that review.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The performance measures in the fiscal year 2000 Annual Performance Plan include elements of output and outcome measures.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. There is a learning curve associated with GPRA implementation, but we are making progress. We are trying to ensure that staff at all levels are properly trained and that the proper tools are available to our managers to link costs to performance. We also are attempting to ensure that GPRA principles are applied in our daily operations.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No, we are not requesting waivers of non-statutory administrative requirements.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. We are not requesting relaxation of transfer or reprogramming controls.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997.

Answer. We have gained substantial insight into GPRA implementation since the initial strategic plan was issued and expect that there will be substantive revisions in our strategic plan and qualitative improvements in our Annual Performance Plans and Reports.

FARM SERVICE AGENCY

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The annual performance goals measure incremental achievement of the agency's strategic goals and, ultimately, the agency's mission. Annual performance goals were developed for, and are directly linked to, the objectives for each strategic goal. Furthermore, the Annual Performance Plan reflects the program activities in the agency's budget request, summarized on a GPRA basis, including FTEs and funding, associated with achievement of annual performance goals.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. As part of the budget process, an fiscal year 2001 Annual Performance Plan was developed and submitted which contained performance goals relating to the agency's strategic plan. The Annual Performance Plan includes all program activities in the agency's budget, and reflects the program activities associated with identified performance goals. Both the Annual Performance Plan and the fiscal year 2001 budget relate the need for resources to achievement of program performance goals. This linkage also enables decision-makers to assess the FTEs and funding requirements of the strategic plan goal encompassing the program activities to the achievement of annual performance goals.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Difficulties associated with establishing this linkage included developing outcome measures for each of the major program activities included in the budget, while maintaining an Annual Performance Plan that is informative and concise; and, establishing quantitative performance goals for program activities to show a definite cause and effect relationship between the funding requested for program activities and the expected outcome.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes. Performance measures were incorporated in budget material to indicate the performance level needed to achieve the goals outlined in the 5-year strategic plan and annualized in the performance plan.

Question. Does each account have performance measures?

Answer. Performance measures were developed for each major FSA budget account. Performance measures were developed for the strategic goals and annual performance goals and then linked to budget accounts. Budget accounts were aggregated to tie in with strategic goals.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The performance planning structure was aligned with the structure reflected in the Strategic Plan. As such, annual performance goals, measures, indicators, and baselines were developed for each of the agency's strategic goals and management initiatives. The budget account structure, however, differs from the performance planning structure. The performance planning structure encompasses both program and salaries and expenses funding requirements, whereas the budget account structure is based on individual program funds, broken out by major activity, with a separate administrative expense account that consolidates all administrative resources needed to carry out every agency program and activity.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. Presently, there are no plans to change the FSA account structure for fiscal year 2001, since there is linkage between the account and activity structure in the budget and GPRA program activities.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. We do not plan to propose any changes to the program activities under the account structure.

Question. How were performance measures chosen?

Answer. Agency representatives within their respective areas of responsibilities developed performance measures. The FSA Strategic Management and Corporate Operations Staff worked closely with agency representatives to ensure performance measures captured significant, vital operations. This ongoing interaction continues as the agency strives to develop a greater number of outcome measures reflecting results, or impact, of agency programs.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance?

Answer. In many instances, data collection systems and verification methods were already established prior to the development of performance measures. As such, managers were able to utilize existing technology, processes, and resources to collect and evaluate data. Instances in which data collection systems and/or verification methods were not available required consideration of several factors to evaluate the cost versus benefit of data collection and verification methods. Factors considered included actual/anticipated changes within program and administrative operations, available technology and funding, internal and external risk factors, and the degree to which FSA operations are capable of influencing performance results.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. As reflected in the Annual Performance Plan, there are a limited number of performance measures for which data are not available for inclusion in the fiscal year 1999 Annual Performance Report, which is due in March 2000. Instances in which data are not available are identified in the Annual Performance Report, accompanied by an explanation supporting the reason data is unavailable and anticipated timeframes to obtain the data. In lieu of final numbers, the report contains preliminary data.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

—For each key annual goal, indicate whether or not you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

—State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The agency was diligent in ensuring that the most critical performance goals were included in the annual performance plan. We recommend that the subcommittee track all of the annual performance goals in the fiscal year 2000 Annual Performance Plan. We feel that the set of performance goals/measures established for Farm Loan programs are particularly helpful for tracking program performance (see the following table).

Strategic foal	Objectives	Performance goals	Type
Assist eligible individuals and families in becoming successful farmers and ranchers.	Improve the economic viability of farmers and ranchers.	5. Reduce direct loan delinquencies 6. Reduce first year delinquency rate on new loans and restructured loans. 7. Increase the percentage of guaranteed loans made to direct borrowers.	Intermediateoutcomes.
	Reduce losses in loan programs	8. Reduce losses on direct loans 9. Maintain the guaranteed loan loss rate at or below 2 percent.	Intermediateoutcomes.
	Respond to loan making and servicing requests in a timely manner.	10. Reduce direct and guaranteed loan processing times. 11. Process primary loan servicing requests within 60 days.	Intermediateoutcomes.
	Maximize financial and technical assistance to under served groups to aid them in establishing and maintaining profitable farming operations.	12. Increase the number of loans to socially disadvantaged farmers/ranchers.	Intermediateoutcome.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. During the development of the fiscal year 2000 Annual Performance Plan, agency managers were reminded of the distinction between output and outcome measures and were encouraged, to the extent possible, to develop outcome measures in their area of responsibility. Currently, the majority of the performance measures in the Annual Performance Plan are outputs rather than outcomes. Furthermore, output measures are often most appropriate for evaluating achievement of annual performance goals, because it often takes multiple years for outcomes to be achieved and evaluated. The Strategic Management and Corporate Operations Staff, however, will continue working with program managers to develop outcome measures, where applicable.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Agency program managers well understand the distinction between output and outcome measures. However, developing outcome measures is often not feasible for interim timeframes, such as the short-term timeframes encompassed in Annual Performance Plans. In fiscal year 2000, FSA will be revising its strategic plan, emphasizing the identification and development of outcome (including intermediate outcome) measures for objectives and strategic goals.

Question. What are some examples of customer satisfaction measures that you intend to use? Please use examples of both internal and external customers.

Answer. As indicated above, one of the agency priorities in fiscal year 2000 is the development of improved performance measures, particularly the use of intermediate outcomes to show how our programs are impacting our customers. FSA conducted an extensive customer satisfaction survey, in conjunction with our USDA service center partner agencies, in fiscal year 1999. The revised strategic plan and subsequent annual performance plans will contain measures of overall customer satisfaction, satisfaction with program delivery timeliness, and effectiveness of program delivery efforts. The fiscal year 1999 survey results will be used to develop our performance baselines. Additionally, each of these measures can be disaggregated by major program as well as by minority and non-minority customers.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The measurable goals in the fiscal year 2000 Annual Performance Plan served as a basis for establishing performance goals for fiscal year 2001. However, the achievement or non-achievement of specific performance goals during fiscal year 2000 was not the primary factor in determining the level of funding requested in the fiscal year 2001 budget. Funding proposals relative to the fiscal year 2001 budget were primarily based on agency funding priorities associated with carrying out the agency's mission, and were greatly influenced by the current economic crisis in production agriculture.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. The ability to assess the impact of proposed budget changes on targeted performance will vary among program areas depending on the extent and nature of proposed funding changes. For instance, the ability to effectively administer farm loan programs is dependent on adequate administrative funding levels, and the ability to improve the economic viability of farmers is dependent on appropriated loan levels. Farm loan program personnel can immediately assess the impact on performance and the achievement of various goals if proposed budget numbers are changed, up or down.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. In most instances, FSA will be able to measure and evaluate program performance throughout the year. However, data will not be available for all measures included in the fiscal year 2000 Annual Performance Plan until new software and/or systems are in place.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Performance data is available to all levels of management in the agency.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes, we are able to gain access easily to various performance-related data.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. No, we have not experienced that difficulty. The program activities in the Annual Performance Plan are linked to the budget. As a result, performance goals have been developed for each program activity in the Annual Performance Plan that define the level of expected performance.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Since there is linkage between the budget and the activities in the Annual Performance Plan, we believe, at this time, there is no need to modify the agency's budget account structure.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. We do not propose to modify the budget structure because linkage exists between the Annual Performance Plan and the budget.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. At the present time, we do not think the modification of this agency's budget account structure would necessarily strengthen accountability for program performance.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. The FSA implemented an activity-based costing pilot project in 1997 to capture the full cost of administrative services by using the "Activity-Based Costing" process. During the pilot stage of the project, FSA used the support of a private contractor. Presently, the agency has three people with one year's experience in cost accounting. This year FSA will add two additional staff who have limited experience.

With respect to linkage, the program activities in the agency's fiscal year 2001 budget request are summarized on a GPRA basis, including FTE staffing and funding associated with achievement of annual performance goals. FSA funding and staff year estimates for the Salaries and Expenses Account support the four GPRA program goals in the FSA Annual Performance Plan. The funding and staff year estimates reflect a cost allocation of agency resources based on reviews of county office workday estimates and functional responsibilities identified to FSA organizations which are then prorated by Program Goal to derive Federal funding and FTE's. However, the Farm Loan program goal estimates are taken directly from the Agricultural Credit Insurance Fund budget estimates. Within each Program Goal, funding for implementing Management Initiatives is included, except for State Mediation Grants, which is separately appropriated.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all Federal agencies are required to have a system of Managerial Cost Accounting.

The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

Question. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. The FSA has been using the "Activity-Based Costing" (ABC) process to capture the full cost of administrative services since 1997. FSA has continued this process each year since the inception of the pilot. FSA has successfully used the ABC methodology to substantiate reimbursable agreements with its customers and to determine the administrative costs to support the Farm Service Agency (FSA) and Commodity Credit Corporation (CCC). FSA/CCC's future plans include an activity-based costing pilot project within a major program area and to expand the project to other FSA/CCC programs in upcoming years. FSA/CCC has identified responsibility segments for financial statement reporting.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. We are presently determining the full cost of our responsible segments which includes multiple programs. In the future we plan on capturing the full cost of each program and for certain programs the full cost of each activity. The level to which we will drill down into the activities will be determined by the measurements required to evaluate the performance against the annual performance plan and management's need for information to control cost, allocate resources and measure performance against goals.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. If the full cost of each activity for a program is captured, you will know the cost of administering the program by activity plus the program expenses paid to the farmers. It will also provide information on activities which consume the most cost, resources and unit cost and volume.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. Based on ABC results for administrative services, per unit costs and results were reflected for critical activities. Although the ABC process has not yet been implemented agency-wide, we anticipate that this type data will be available for other areas of agency operations.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Performance goals in the agency's budgets are not reflective of the full costs of all associated activities performed in support of that goal. However, performance goals and program activities in the budget are linked to the four agency goals in the annual performance plan, which are presented on a full cost basis. For example, Goal 1, Farm Programs, includes the salaries and expenses needed to support that goal. Agency performance goals for specific program activities in the annual performance plan are not reflective of the full costs. A basis for determining full cost at this level has not been developed.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. We have not put any significant regulatory reform measures in place in conjunction with the development of the agency's performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate, and plan for such influences?

Answer. The discussion of external factors is primarily reflected in FSA's Strategic Plan. The measures in the Annual Performance Plan are linked to the goals, objectives, and measures in the Strategic Plan. Therefore, the same external factors identified in the Strategic Plan will influence achievement of annual performance goals. However, there are instances where the performance plan does specifically address external factors and FSA's efforts to mitigate their impact.

Question. What impact might external factors have on your resource estimates?

Answer. External factors, such as unexpected changes in the agricultural economy, make it difficult to use past performance goals as reliable indicators of the level of resources needed in future years to achieve the agency's mission. External factors, such as policy debates, also make it extremely difficult to adequately request the level of resources needed to address critical agency priorities.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. The agency did not identify overlapping functions or program duplication, within the agency, as a result of the performance planning process. However, the discussion of partnerships and coordination in the FSA Strategic Plan reflects government and private entities with which FSA administers complementary program functions. The same partnerships and coordination also apply to the program activities included in the Annual Performance Plan.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Agencies should address the most significant management challenges in GPRA plans. However, where possible, the challenges should be included within the context of improving program performance. Differing viewpoints among reviewers

and users of GPRA plans as to which “management challenges” should be included in plans make it difficult to address these issues in the plans.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. To date, strategic plan usage by agency senior management has been limited.

Question. Will this use increase in the future and if so in what ways?

Answer. We believe that as the planning process becomes more ingrained in the agency culture, and as the quality of the planning documents improve, their usefulness for high level decision making will increase.

Question. Future funding decisions will take into consideration actual performance compared to expected or targeted performance. Given that, to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The agency has established measures enabling FSA to compare targeted to actual performance. However, the planning process is constantly evolving. The agency is continuing efforts to develop better measures of program performance. As newer, improved performance measures are developed and implemented, sufficient time will be required to facilitate a comparison between targeted and actual performance, and for establishment of trend data.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. The primary reason for requesting funding is to achieve expected or targeted performance, given certain assumptions. However, the uncertainty relative to expected changes in the agricultural economy, which can not be easily quantified, has an impact on what can be achieved with available as well as requested resources. Given this reality, future funding requests will continue to reflect agency funding priorities with consideration given to performance in the prior year relative to expected or targeted performance. Although data available from actual performance will be a factor in deciding on resources estimates in future years, it is and will continue to be only one of many factors considered in determining appropriate funding levels, because much of the agency’s workload is imposed by external sources; i.e., the volatile farm economy and resulting mandatory producer assistance legislation enacted in response to downturns.

Question. Are you requesting any waivers on non-statutory administrative requirements: Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. We are not requesting any waivers on non-statutory administrative requirements.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. FSA’s strategic plan will be revised in fiscal year 2000 to reflect additional programs implemented, revisions to existing programs, and to improve on the overall content of the fiscal year 1997 plan. One of the ways FSA intends to improve the plan is by reducing the overall number of strategic goals, objectives, and the volume of performance measures so that only the most important items are represented in the agency-wide strategic plan. Secondly, we plan to incorporate, where feasible, the existing “Management Initiatives” into the major program goals. Currently, major activities, such as outreach, are shown separately from the program goals to which they are intricately linked. Another area we intend to incorporate into the program goals is information technology initiatives, better explaining the relationship between IT investments, program results, and improved customer satisfaction. Finally, we believe that a more concise plan will be a more useful tool for managers to guide the agency.

RISK MANAGEMENT AGENCY

Question. How are the agency’s annual performance goals linked to the agency’s mission, strategic goals, and program activities in its budget request?

Answer. RMA’s performance goals were derived directly from the Agency’s objectives contained in its strategic plan. RMA documented its business processes (life cycles) in line with its strategic planning efforts. These business processes contain the activities that support the achievement of RMA’s performance goals. RMA is currently working to establish the capability to more directly link program activities, performance goals, and resource requirements with the strategic plan components.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The activities described in the budget justification support the one general goal "To strengthen the safety net for agricultural producers through sound risk management programs and education. The budget justification links the program activities with funding for the desired results for program delivery. Performance goals and indicators in the Agency's Annual Performance plan gauge progress toward achieving the long-term general goal and objectives found in its strategic plan.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. RMA's major difficulty at the moment is instituting better cost accounting.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes, and we are improving in this regard. The performance measures specifically link resources to goals, as many of the goals are financial. The Agency also uses the approach of establishing annual performance goals and indicators that gauge progress toward achieving the long-term general goal and objectives found in its strategic plan. As a result, all resources directly support the general goal of the Agency, "To strengthen the safety net for agricultural producers through sound risk management programs and education."

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. RMA's performance planning structure and the account and activity structure in its budget do differ significantly in format and structure. However, RMA's budget estimates and justifications do include linkage to the performance goals and indicators found in the Annual Performance Plan as well as goals and objectives found in the agency strategic plan. This linkage can be found throughout the agency's fiscal year 2001 Explanatory Notes package and 2000 and 2001 Annual Performance Plan. In addition, it is important to note that RMA's performance plan is consistent with the Agency strategic plan and fiscal year 2001 budget request, as required. The following is a description of both the performance planning structure and program activities found in RMA's budget request:

- The performance planning structure in the annual plan outlines the performance goals and indicators that RMA would like to accomplish in the given fiscal year. This structure is very similar to that found in RMA's 5-year strategic plan which focuses on the mission, goal and objective of the agency.
- RMA's budget account and activity structure currently includes two accounts, the mandatory Federal Crop Insurance Corporation Fund (FCIC) and the discretionary Administrative and Operating Expense Account. The FCIC Fund is further broken out by the following program activities: premium subsidy; delivery expenses; research and development reform costs; and apportionment for excess losses. For fiscal year 2001, the A&O account includes only one program activity, salaries and expenses.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. At the present time, RMA does not propose any changes to the budget account structure for fiscal year 2001. However, changes may be necessary if legislation is enacted to reform the Crop Insurance Program.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. Not at this time.

Question. How were performance measures chosen?

Answer. RMA documented the life cycles for its core business processes. These life cycles contained the activities as well as specific inputs and outputs to our process steps. Out of this process, RMA selected measures that we felt would best allow RMA management to determine agency results in line with the components defined in the strategic plan.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. RMA's current measures are primarily based on activity, not on results. RMA continues to have an interest in collecting performance measures that are based on results (outcomes). But, to do so would require considerable resources and additional funding.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Yes. We had difficulty in gauging farmers' use and knowledge of risk management tools. The collection procedures need to be improved to assess information regarding the number of producers attending risk management education

courses (RME) and the number of RME sessions being coordinated or facilitated. We are reviewing steps necessary to improve the collection process for reporting.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. RMA recommends that its performance measures that are outcome based be used to determine applicable program results. RMA's output based measures are intended to help support or determine additional specifics regarding the outcome measures. RMA intends to conduct quarterly reviews of its available measures and determine their appropriateness as management tools. RMA fully expects adjustments to be made to its performance measures as experience is gained in being a results-based Agency, and new measures are developed.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. RMA's strategic plan includes outcome measures for each objective and management initiative in support of our strategic goal. The intent was to include at least one outcome measure for each objective and management initiative. RMA recognizes that work needs to be done to establish or refine these measures. RMA experience with these measures should increase the maturity and potential benefits that can be derived for the Agency.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. These measures (i.e., output and outcomes) were explained and briefed to the Agency's senior management. Discussions and comments were used to clarify and/or adjust both kinds of measures. RMA intends to ensure program manager understanding of all GPRA concepts as implementation progresses.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. RMA has created two projects that will institutionalize the development and administration of surveys to internal and external customers. RMA is currently in the definition stage working to determine: what data elements are needed; what specific questions should be asked; who should be asked; where are they; what vehicle/instrument should be used; what should be the frequency of data collection; and, at what cost. Examples of internal customers include: employees, unions and other agencies. Examples of external customers include: private reinsured companies and agricultural producers.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. Actually, the fiscal year 2001 budget process began prior to the developmental stage of RMA's Annual Performance Plan. However, throughout the budget preparation process, RMA was able to incorporate portions of its annual plan throughout the fiscal year 2001 Explanatory Notes. For example, justifications in the budget request link to the annual and strategic plans and support the goals within those plans. The Purpose Statement and Status of Programs sections of the justification outline the contents of the annual plan and reflect the resources required to accomplish those goals and measures. RMA feels that together, these two tools will provide clear direction to manage RMA's activities for fiscal year 2001. In addition, the annual plan and budget documents clearly define the Agency's commitment to meet its goals.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. If a budget number is changed RMA can determine the likely impact the change would have on program performance and goals. For example, in fiscal year 2000, the FCIC Insurance Fund was apportioned approximately \$953.8 million less than was needed to cover estimated program expenses because FCIC's unexpended appropriations carried forward from prior fiscal years had increased. This increase was due to excellent insurance experience during those prior fiscal years. This did substantially decrease the FCIC Insurance Fund reserve that would have been available to cover losses when FCIC experiences loss ratios which are higher than budgeted loss ratios.

In the future if FCIC's Insurance Fund is apportioned insufficient funds to cover estimated expenses and the FCIC experienced severe losses, the FCIC would have to rely on Treasury to immediately provide funds which the FCIC can use to cover these losses or the FCIC would not have the funds to reimburse the reinsured companies (ultimately producers) for losses. The FCIC Act does provide for FCIC to re-

ceive such sums as necessary to cover the mandatory expenses of the FCIC. In addition, shortages in funding would impact the FCIC's ability to timely reimburse the reinsured companies for administrative and operating subsidy per the Standard Reinsurance Agreement.

If appropriations to the Administrative and Operating Fund (A&O Fund) were cut, RMA would not have sufficient funding to meet all of the program goals. For example, program expansion and pilot programs may not be initiated and producers may not be made aware of various risk management alternatives through educational seminars. In addition, program oversight would be reduced. One of the more difficult items to budget for in the A&O Fund is the computer costs which cover costs to edit data which is transmitted by the reinsured companies and additional computer costs due to program changes made during the current fiscal year. Also, the volume of data could increase substantially and one cannot budget two years in advance to cover these type of costs. It would be very advantageous if computer costs could be paid for with mandatory rather than discretionary funding. If RMA's computer funding is cut, RMA would not be able to edit and validate data being submitted in order to reimburse companies for losses and expenses.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes, but it is limited. Budget limitations have hindered efforts to make access to data more readily available. Budget constraints have also impacted RMA's ability to move forward on Pattern Recognition efforts. Pattern recognition systems will be initiated (fiscal year 2001) to facilitate trend analysis studies, enabling the Agency to timely identify performance strengths and deficiencies and seize opportunities for improvement. RMA is working to identify the technological elements necessary to review, analyze, and make adjustments in priorities or process steps to ensure achievement of our performance goals.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Information generated from systems are available to lower-level program managers as well as senior management. For example, the Summary of Business Report which contains detailed crop insurance data is available to all RMA personnel and is maintained on RMA's web-site.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes, for some aspects. For example, our Research and Development Office utilizes two integrated data processing systems to receive and validate data transmitted by reinsured companies. Data validated by RMA's Data Acceptance System (DAS) and Reinsurance Accounting System (RAS) are used to generate all accounting reports. Together they provide RMA with a mechanism to ensure that data received is accurate and reliable to make management decisions.

The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Question. Have you faced such difficulty?

Answer. Yes. RMA has faced difficulties in linking dollars to results under the current budget structure, especially in the mandatory FCIC Fund. For example, it was very difficult to produce quantifiable and measurable performance goals for program activities such as delivery expenses paid to reinsured companies. RMA will continue to make improvements in establishing performance measures to capture the performance of services provided.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. RMA, to date, has not thoroughly analyzed the impacts or potential results of changing the budget account structure for either the discretionary A&O account or the mandatory FCIC Fund.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. To effectively link dollars to results, RMA will need to modify its present budget account structure. RMA will continue to work with the Office of Management and Budget to improve its cost accounting system.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. RMA has not yet conducted any analyses to determine an appropriate account structure. Therefore, it is unclear how any modifications would strengthen accountability.

Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions.

Question. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting.

The clearly preferred methodology for a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

Question. What is the status of your agency's implementation of the Management Cost Accounting requirements, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permits us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Not yet, our overhead is funded from discretionary dollars, not the mandatory account as is the FCIC fund. Thus, we tend to view them separately. We maintain program cost data by cost centers and object class, not by crops or counties. The costs are then allocated to the performance goals.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. There have not been any regulatory reform measures put into place specifically for RMA Compliance during the past year.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. In our strategic plan, RMA identified several key external factors that could significantly affect progress in our efforts to achieve our goal.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. RMA conducted Business Process Reengineering (BPR) that allowed for the opportunity to address some of these factors. The reengineering plan focused on targeted oversight reviews, shared program integrity roles, and better communications.

Question. What impact might external factors have on your resources estimates?

Answer. External factors can have a significant impact on RMA resource estimates. For example, the level and degree of private sector involvement in risk management activities will require RMA to adjust its current expenditures to meet variations in costs.

More importantly, Senate and House conferees are now considering major crop insurance reform legislation. RMA management has requested that Congress provide full funding for the implementation of this law, if it is passed. Substantial changes are planned for the development of crop insurance policies for specialty crops and under served products, geographic areas, and producers. Other extensive changes would include the training of FSA “fact finding” case workers, the creation of a new project to reconcile FSA and RMA data, and the expansion of IT capabilities to support the new structure.

In the event the proposed legislation is not enacted, current RMA funds will be insufficient to support its current and approved programs. RMA recently imposed a moratorium on product expansion and development because of a shortage of funds: In the past 3 years, its programs have tripled, while its funding has not appreciably changed. RMA needs to finance new crop program development, maintain the current program, expand IT capabilities that will make it possible for farmers to interact electronically with the agency and insurance companies, and expand the agency’s compliance division for the improved maintenance of program integrity.

For overall Agency function, the enhancement of RMA’s ability to enter into contract agreements for the development of new insurance products to accommodate specialty crops, and for the expansion of the Compliance Division’s error rate and data mining capabilities, is an absolute necessity. If not done, the payment of fees to other agencies that act on RMA’s behalf in contracting matters will require the use of extensive capital originally intended for more useful purposes.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. The performance planning process did not identify any significant duplicative functional or process steps.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. The Annual Performance Plans should include appropriate discussion of management challenges. Agencies should coordinate crosscutting programs so that duplication does not occur in the plans.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. In January of last year, the Risk Management Agency initiated a series of quarterly executive meetings for the purpose of discussing and improving Agency performance. At the first meeting, six macro performance measures were identified: (1) loss ratio, (2) market information, (3) financial audit, (4) public awareness, (5) program integrity, and (6) administrative costs. These measures were developed in consultation with the private insurance sector. At the second meeting, these macro-level indicators were merged into our operational strategy to ensure effective and efficient progress in achieving performance targets.

Question. Will this increase in the future and if so in what ways?

Answer. Yes, RMA will continue to integrate GPRA in the managerial decision making process. We will continue to examine our strengths and weaknesses through program evaluations, audits, and conducting quarterly executive meetings. Congress can encourage this by holding hearings and providing oversight not on plans, but on the actual management of the agencies and Departments.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. RMA’s measures are still being tested to ensure they are the right measures allowing for proper results and management of the Agency. Through time and

empirical evidence, RMA will refine its measures and become more confident in its ability to manage actual performance with targeted performance.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Many of RMA's traditional measures are activity based. While we are still in the process of accessing our outcome measures, we expect time and experience will improve the degree to which our resource estimates are accurate.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. RMA's fiscal year 2000 performance plan was directly derived from our strategic plan. RMA expects that changes to the 1977 issued strategic plan will result in adjustments due to program changes and the legislation on crop insurance reform.

OFFICE OF COMMUNICATIONS

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. As a support entity, the Office of Communications—OC—has only one program activity, public affairs. OC's budget structure is a single line item that fully supports its one performance goal.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. Since OC has only one goal, which is supported by its entire budget, the link between the budget activities and the goal is established by this relationship.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. In assessing its performance goal, OC was confronted with the problem that it is a support agency, and as such, an evaluation of its performance does not rely on the quantifying of communications products, but rather, on how well the communication products created/coordinated by OC support the Secretary and agencies, who are the prime initiators of communications products. It is not logical for a support entity such as OC to propose that it will produce more press releases each year or more video products because the needs to the Department and its agencies to disseminate information to the public are ever changing and dependent on such unpredictable variables as weather, plant and animal disease, and health and safety issues. Regardless of the circumstances, it is OC's responsibility to be able to provide the maximum support possible to the Department whether that means being able to produce 100 press releases or 1,000 press releases. This means that an evaluation of a support agency such as OC cannot be focused on a quantitative analysis of what has been produced, but must concentrate on an assessment of their capacity to provide the services required by those entities it serves.

Question. Does the Agency's Performance Plan link performance measures to its budget?

Answer. OC's budget structure is a single line item that fully supports its one performance goal and the measures used to meet that goal.

Question. Does each account have performance measures?

Answer. There is essentially only one "account" and as noted above, it is related to the performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. OC's budget structure is a single line item that fully supports its one performance goal.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No changes will be proposed because no change is necessary to improve the linkage between the performance planning structure and the account structure.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. Again, no changes will be proposed because no change is necessary.

Question. How were performance measures chosen?

Answer. Through a series of meetings and the process of developing the OC Strategic Plan, OC's key managers chose the "outcome" measures that most accurately describe how well OC provides support to the Department and its agencies.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Discussions were held with the National Agricultural Statistics Service to determine the general costs associated with developing and administering surveys. This data, along with data derived from OC's past use of surveys, was used to determine a general cost for surveys. Because OC's budget has limited operational funds, it was obvious that OC's efforts to conduct surveys could not be expanded without additional funds being provided.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. OC's fiscal year 2000 budget included a request for additional funding to expand or enhance the evaluation mechanisms used for GPRA purposes. Since funding was not provided, OC revised its plan and will rely on existing feedback and evaluation techniques which provide measures in time for the first report.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. There is one key performance goal for OC. We will ensure the use of all available communications products, technology and techniques to reach employees and all segments of the American public to strengthen public knowledge and understanding of USDA's effective customer services and efficient program delivery to all citizens.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. Our measure is an outcome measure.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked?

Answer. To support the Department in creating a greater awareness among the American Public about USDA's major initiatives and services.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. OC managers and the key personnel involved in identifying the agency's measures engaged in extensive consultations with the staff of the Chief Financial Officer to ensure that the plan contained the appropriate outcome measures.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, because our work requires that we be responsive to our customers' communication needs, we are sensitive to the differences between a workload measure, such as how many copies of a particular brochure they may need, versus an effectiveness measure, such as whether that brochure is distributed or designed properly to achieve a desired outcome of awareness, action, or education.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. There are two primary means that OC will use to measure customer satisfaction. First, comments received by our staff from USDA agencies (our internal customers) or the public (our external customers) are conveyed to management during the daily and weekly OC planning and coordination meetings. Second, results of random and periodic surveys that will be conducted of our internal and external customers, as funds permit, will be used. Such measures will help gauge whether the intended populations are receiving the information and whether the information was useful.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The Office of Communications' determined that it needed to develop a budget request to obtain the resources critical to accomplishing the goal in its GPRA plan. The increases proposed in the fiscal year 2001 budget will be used to add technological enhancements that allow measurement of communications performance—e.g., Internet counters or feedback on use of radio and TV products; train OC staff in the use of the latest technologies; effectively and efficiently provide information to under served client populations; and to obtain a limited amount of consulting assistance to gain specialized skills not currently available on OC staff. Our requested funding for fiscal year 2001 is directly related to our annual performance plan.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and achievement of various goals?

Answer. The impact of such a change would be difficult to quantify, although it would be possible, in general, to identify the expansion or limitation in OC's capacity to provide support to the Department and its agencies communications efforts that would result from an up or down decision.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Automated systems are not essential to the measuring of OC's performance. OC uses a constant stream of feedback from the media and the public to evaluate our performance. Positive or negative performance indicators are used in evaluating individual performance. Work accountability is measured by weekly activity and management reports. Remedies and additional actions are established if performance falls below the plan.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. All levels of managers participate in the weekly meetings and have access to the necessary information.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. We utilize a system that allows work tracking and cost measurement for many of our work processes. We also rely on National Finance Center—NFC—systems to provide financial and administrative data in support of our performance measures.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure make it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. OC's budget structure is a single line item that fully supports one performance goal, therefore we have not faced this problem.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No modification is necessary.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. No modification is necessary.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. No modification is necessary.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standard Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based

Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the programs, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. Since OC has only one performance goal, all of its funding resources are devoted to this one goal.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Since OC has only one performance goal, all of its funding resources, including overhead costs are devoted to this one goal.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. OC does not require the implementation of any significant regulatory reform measures.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievements?

Answer. The plan identifies a change in the public need for information and funding as the two most significant external factors that could influence goal achievements.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. There are weekly and often daily consultations with the Department's agencies to anticipate the public's information needs. Based on these consultations, OC's efforts are continually refined to meet the needs of the public. The fiscal year 2001 budget request includes a request for additional funding to expand or enhance the evaluation mechanisms used by the Office of Communications. If the requested funding is not provided, OC will rely on existing feedback and evaluation techniques, and modify them to the degree practical, if it is apparent that a problem exists in monitoring a specific aspect of OC's performance.

Question. What impact might external factors have on your resource estimates?

Answer. Significant changes in either the public's requirements or the technology required to meet those requirements may require additional funds to meet those needs.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No duplications were identified during development of the Performance Plan.

Question. If so, does the Performance Plan identify the overlap or duplication.

Answer. Not applicable.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Agencies should address the challenges by linking the management challenges to their impact on the agency's ability to meet its performance goals, as well as, their impact on the resources needed to meet those goals. Obviously, duplication should be eliminated where feasible. These can be addressed through management initiatives.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. Successful accomplishment of OC's mission has always been the basis for executive decision making in OC. GPRA has been useful in emphasizing the focus on performance, but OC's role as a support entity combined with a lack of funding to refine the tools necessary to measure performance place some limits on the extent to which GPRA directly influences executive decision making.

Question. Will this use increase in the future and if so in what ways?

Answer. It is likely that GPRA and the development of performance reports and plans will be much more integrated in the OC budget development process as time passes and OC's GPRA efforts build a baseline of information for use by managers.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Much of the work OC does in support of the Secretary's or Department's primary goals is very visible and is an integral part of program and mission successes, and in one sense, OC is very mature in evaluating its performance on actual achievements. We can count number of products produced and cost to produce them. However, as a support entity it is very difficult to establish measures that assess OC's efforts as stand-alone entities rather than as part of the agencies' programs. OC can be left powerless to provide support if funding is not appropriated directly or provided from other program sources.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. OC faces three significant challenges: first, the lack of funds necessary to acquire better and more extensive data related to internal and external customer satisfaction; second, lack of funds to upgrade and add new communication technologies offering greater public access electronically; and third, the difficulty associated with attempting to independently measure the performance of a support entity. The lack of funds for survey instruments makes it difficult to build and maintain a repository of information on OC's performance. The lack of funding for capital investment for new communications technologies will soon take its toll in a decreased productivity and response by OC in supporting Departmental goals. OC's dramatic staffing reduction over the past 5 years and the aging of computer and broadcasting technologies will continue to reduce actual performance unless technology additions bolster or replace staff reductions. Also, changes in communication technology are so dramatic that communications products will become less marketable or acceptable causing a decline in actual performance.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. OC is not requesting any relaxation of transfer or reprogramming controls.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997.

Answer. As operations continued during the past year, it became apparent that the original objectives identified in the 1997 strategic plan were not representative of the full scope of OC's support of USDA's goals. After reviewing the plans of other departments and guidance from OMB, it was determined that a more refined objective and set of means and strategies would be required. As a result, the original objectives and means and strategies were replaced by those given in the fiscal year 1999 performance plan.

OFFICE OF THE INSPECTOR GENERAL

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. OIG's annual performance goals are linked to the agency's mission, strategic goals, and program activities by providing an implementation methodology that in each year moves the agency closer to achieving the strategic goals. The performance indicators used in the Annual Performance Plan provide a target and basis for measurement that provide an assessment of how well OIG has progressed toward achieving the performance goals.

OIG has three strategic goals that support its mission to conduct and supervise audits and investigations to prevent or detect fraud and to improve the effectiveness of USDA programs by recommending changes that will increase efficiency and reduce wasteful and fraudulent activities.

The first is to "Promote economy, efficiency, and effectiveness in the administration of USDA programs and operations." Two performance goals are directly linked

to this strategic goal: (1) audit and investigate the most significant programs or areas identified in OIG's planning process and (2) promote economy, efficiency, and effectiveness of USDA programs by recovering inappropriately spent costs, putting funds to better use, and avoiding costs.

The second strategic goal is to "Promote USDA's conformity with the applicable principles, standards, and related requirements by fostering improvements in financial systems and financial reporting, which will enhance the Department's fulfillment of its fiduciary responsibilities." Two performance goals are also directly linked to this strategic goal: (1) foster improvements in financial systems and financial reporting by timely issuing financial statement audits and (2) reduce noncompliance with the applicable principles, standards, and related requirements in the Department's financial systems and financial reporting.

The third strategic goal is to "Promote program integrity by detecting criminal activity involving USDA programs and personnel." Two performance goals are directly linked to this strategic goal: (1) investigation of fraud within USDA programs and (2) investigation of allegations involving the integrity of USDA employees.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. OIG has only one budget activity, "OIG salaries and expenses." All performance goals are directly related to this budget activity.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. OIG has not encountered any difficulties in linking its performance goals to its budget activity. With only one budget activity, all performance goals directly support this activity.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes. Each strategic goal includes a planned proportion of the budget for each fiscal year. Within that structure, the performance measures provide a means of assessing how well OIG has succeeded in achieving its annual performance goals under each strategic goal.

Question. Does each account have performance measures?

Answer. There is only one account: "OIG salaries and expenses."

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. There is no difference between the performance planning structure and the account and activity structure in the budget justification.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No changes are planned.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No changes in program activities are planned. OIG is unlike a typical programmatic agency in that our activities, audits, and investigations, while subject to improvements in methodology and application of improved technology, are required to meet prescribed standards and, therefore, are not subject to changes in the same manner as other programmatic agencies.

Question. How were performance measures chosen?

Answer. The performance measures employed by OIG were carefully chosen to provide a clear means of assessing our annual progress toward achieving our performance goals. In selecting our performance measures, we reviewed the measures used by other benchmarking agencies, attended training seminars provided by outside vendors, consulted with the Congress, and held focus group sessions with a diversity of members of other USDA agencies and our own OIG employees. Based on these activities, we made a determination as to the strategic and performance goals, objectives, and performance measures that we would apply.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The cost of data collection was considered in the process of developing performance measures. We considered several measures and determined which measures were most appropriate to provide clear and supportable evidence of our success in achieving our performance goals. We then assessed the cost of collecting the supporting data for the measures and selected those that provided reliable information at the most efficient cost. We already had a data collection system in place termed "Consolidated Assignments, Personnel Tracking, and Administrative Information Network" (CAPTAIN). We were able to utilize existing OIG expertise to make modifications to the CAPTAIN reports that provided the data we required for most of our measures. Nevertheless, the data for some measures, such as the num-

ber of recommendations made to strengthen financial controls and foster compliance with laws and regulations, were most efficiently collected by manual means.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No. All the performance measurement data in the OIG performance report is in final form.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

—For each key annual goal, indicate whether you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

—State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. General Goal—“Promote economy, efficiency, and effectiveness in the administration of USDA programs and operations.” Objectives: (1) identify the most significant programs or areas for audit and investigation and allocate resources accordingly and (2) devote audit and investigative resources in the areas identified.

Annual performance goals linked to the general goal.

“Audit and investigate the most significant programs or areas identified in OIG’s planning process.” This goal is assessed by an output measure that shows how well OIG was able to anticipate those audits and investigations of most importance to the Department, the Congress, and the public and how much of the planned work was carried out.

“Promote economy, efficiency, and effectiveness of USDA programs by recovering costs, putting funds to better use, and avoiding costs.” This goal is assessed by an outcome measure in that it reflects the financial recovery that results from OIG’s activities.

General Goal—“Promote USDA’s conformity with the applicable principles, standards, and related requirements in financial systems and financial reporting, which will enhance the Department’s fulfillment of its fiduciary responsibilities.” Objectives: (1) identify the system, control, or compliance weaknesses, which preclude the safeguarding and accountability over funds, property, and assets.

Performance goals linked to the general goal.

“Foster improvements in financial systems and financial reporting by timely issuing financial statements audits.” This goal is assessed by an output measure as it relates to the completion of an activity by a set date.

“Reduce the noncompliance with the applicable principles, standards, and related requirements in the Department’s financial systems and financial reporting.” This goal is assessed by an outcome measure as it reflects improvements in the Department’s financial systems and reporting as a result of OIG’s audit activity.

General Goal—“Promote program integrity by detecting criminal activity involving USDA programs and personnel.” Objectives: (1) identify potential criminal violations impacting the Department, (2) identify potential misuse of USDA funds, and (3) identify instances of serious USDA employee misconduct.

Performance goals linked to the general goal.

“Investigation of fraud within USDA programs.” This goal is assessed by an output measure as it relates to the number of fraud investigation reports completed. The percentages of fraud investigations resulting in (1) criminal prosecutions and (2) fines, penalties, recoveries, restitutions, cost avoidances, and other payments are outcome measures that reflect and assess how well we have performed investigative work.

“Investigation of allegations involving the integrity of USDA employees.” This goal is assessed by an output measure as it measures the number of employee misconduct investigation reports issued. The percentage of total reported employee misconduct investigations resulting in corrective or disciplinary actions is an outcome measure that reflects and assesses performance of investigative work.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. In selecting the goals in the Annual Performance Plan, we made sure that, among the potential measures that could be used to assess progress in achieving the goals, at least one outcome measure was included for each goal. While we consider output measures to be significant, outcome measures provide a means of assessing how well OIG is performing its mission and, thus, carry a greater significance.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes. Our program managers were involved in the process of developing the goals and measures and, therefore, are aware of the difference between output and outcome measures.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. We assess external customer satisfaction by providing a survey request to our auditees upon completion of each audit and compiling the results. This measure is not included in the Annual Performance Plan because we use it as an analytical tool in our detailed audit planning to identify specific areas where our attention can be applied to improve customer service. We have found that the overall measure of success remains high and is relatively consistent from year to year, and, in our case, we do not believe the general overall result of this survey would be a particularly useful measure. In addition, as we develop our OIG Annual Plan each year, we request input from USDA agency managers, State-level agencies, and members of congressional committees as to the areas in which they believe OIG should perform work. We also solicit information from our internal staff on ways in which our work can be improved.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The results of our fiscal year 1999 measurable goals were used to revise targets for fiscal year 2001, as the fiscal year 2000 results will not be known until after September 30, 2000. The targets were revised proportionately with the level of increase in the projected budget activity and in consideration of the results achieved in fiscal year 1999.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes. Projected outputs would be adjusted in conformity with the level of percentage of change in the final appropriated budget.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. We have such capability with some of the performance measures through our CAPTAIN system, which provides current data on audit activity; however, certain of the performance measures are dependent on the completion of activities and cannot be assessed until that time. For example, the timely issuance of financial statement audit reports and related results cannot be assessed until the audit reports are issued but can be monitored through the use of the audit plan.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. The information can be obtained from the CAPTAIN system by mid-level and above personnel based on password-protected access.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes. We have an extensive tracking system that is used to manage resources, as well as the progress, status, and results of our audit and investigative efforts.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget.

Answer. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Question. Have you faced such difficulty?

Answer. We did not encounter such difficulty since our only budget account is "OIG Salaries and Expenses."

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. There is no need to modify our budget account structure.

Question. If so, would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. Modification is not necessary.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Modification is not necessary as we have full accountability for program performance in the use of budgeted dollars with the current structure.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions.

Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Our agency has a professional level of cost accounting expertise, and GPRA performance goals are already linked to our budget process—from the initial strategic planning stage through execution of operations.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting.

Answer. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

Question. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. OIG is using activity-based costing to manage its resources.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. Yes. OIG can provide full activity costs for internal appropriated funds and, in coordination with Department efforts, can identify overall costs, including indirect costs.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Providing the full direct and indirect costs associated with each program should provide a more complete picture of the benefits of the program versus its overall costs.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. OIG can provide costs of each activity, which can then be related to specific program performance goals and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Dollars allocated to the agency's performance goals are direct appropriated funds only and include all internal OIG overhead costs. However, they do not include indirect related costs such as retirement paid by the Office of Personnel Management or depreciation.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. No regulatory reform measures have been put into place in conjunction with the development of OIG's performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. No. External factors were not identified in the performance plan. However, external factors were identified in the strategic plan. OIG, as a part of its mission, must be prepared to respond rapidly to unforeseen events that could have a significant impact on OIG resources, which could affect workload and goal achievement.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. We prepare our OIG Annual Plan to ensure that all assignments are prioritized and that all OIG resources are fully and efficiently utilized during the following fiscal year. We also anticipate that there will be unforeseen external demands on OIG's resources, and, by prioritizing our workload, we ensure that the most significant and important work is addressed first.

Question. What impact might external factors have on your resource estimates?

Answer. Unforeseeable external demands, such as responding to emergency requests for OIG assistance, can deplete a portion of resources necessary to complete our workload. Therefore, unforeseen external factors that consume these resources

reduce the amount of planned assignments that OIG can complete in each fiscal year.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

If so, does the Performance Plan identify the overlap or duplication?

Answer. No overlapping functions or program duplication have been identified.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Yes. This issue should be addressed within individual agency plans, as well as between plans of other agencies, to ensure that Federal funds are used in the most efficient and effective manner to accomplish programmatic goals. By structuring strategic goals and objectives and performance goals and measures to focus on the key elements of an agency's mission, it should be possible to identify instances where differing elements of an agency or Department are performing similar functions and to note which element can perform that function most effectively. This is not an easy task, but as performance plans and reports are developed over a number of years, it should be possible to determine which changes can be made to various processes to improve efficiency and effectiveness and which have peaked. Based on this accumulated data, it should be possible to address management challenges and selectively eliminate duplication and overlapping functions.

Question. To what extent has GPRA been used by agency leadership to guide decision-making?

Will this use increase in the future and if so in what ways?

Answer. GPRA has been used to guide decision-making. GPRA is used in planning ensuing years' assignments and in assessing satisfaction of those programs impacted by current activity. In the future, as performance plans and reports continue to be developed and a foundation of data and experience is developed, the impact of GPRA on decision-making will likely increase.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Our performance measures are sufficiently developed to allow for these kinds of uses.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data that might affect the accuracy of resource estimates?

Answer. Such factors definitely have an impact, but the extent of the impact is dependent on the types of performance measures applied. For OIG, the resources consumed to conduct individual audits and investigations, for example, may vary and exceed estimates; but over the course of a year and the conduct of many audits and investigations, the variations should cancel out, and, therefore, allow for reasonably accurate estimates. We believe that we have sufficient experience to capably estimate our resource needs for the activities depicted in our performance plan.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No, OIG is not requesting any waivers or relaxation of administrative requirements.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. We do not see any need for substantive revisions to the strategic plan at this time. We routinely review the plan to determine if revisions need to be made.

FOOD AND NUTRITION SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. All fiscal year 2001 performance goals are linked to the mission and the strategic goals and objectives in the FNS Strategic Plan 2000–2005 to which they contribute, as well to the Department-wide goals, objectives, and management initiatives listed in the USDA Strategic Plan Overview.

FNS resources (financial and staff-year) are linked to the performance goals in two ways:

—First, total resources required to accomplish the performance goals under each strategic objective are listed under that objective in the performance plan. Over

99 percent of fiscal year 2001 resources requested for FNS are linked to the performance goals in this way.

—Second, portions of requested fiscal year 2001 resources in each FNS program account that contribute to each strategic goal are identified in the plan. This latter division by strategic goal includes the activities in support of each performance goal under those strategic goals, as well the small remainder of additional resources that contribute more generally to each strategic goal.

Question. Could you describe the process used to link performance measures to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. FNS developed direct measures for the majority of its goals and objectives. These performance measures were constructed in collaboration with FNS staff and were shared with our stakeholders and cooperators. Because performance goals are linked directly to the agency's budget activities, their measures are, by definition, linked to the budget activities as well. Among the most difficult problems the agency encountered were developing valid measures for which data could be obtained with reasonable cost and effort. FNS learned that, in developing performance measures, it is necessary to specify measures that both assess goal achievement and communicate results clearly.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. FNS's performance plan links its performance measures and goals directly to its budget. Each account has performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. FNS's performance planning structure is different from our budget structure. This is because our appropriation request focuses on programs, while our performance planning is structured around outcomes.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. We do not plan to propose any changes at this time.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. We will not propose any changes at this time.

Question. How were performance measures chosen?

Answer. FNS developed direct measures of programs' performance. A work group, composed of staff representing all FNS divisions was responsible for developing, revising, and finalizing the performance measures. The measures were reviewed by cognizant program staff to ascertain their appropriateness to performance goals.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Where possible, FNS used extant data sources to minimize data collection and verification costs.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. FNS's 1999 performance plan contains a significant number of performance measures for which data will not be available for the March 2000 Annual Report. Most of these data will be available later in 2000. This is because FNS relies substantially on the agency's existing data collection schedules, which have due dates after March 2000.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well"); state the long-term (fiscal year 2003) goal or objective from the Strategic Plan to which the annual goal is linked.

Answer. FNS recommends that, for tracking program results over time, the subcommittee focus on the performance goals in the fiscal year 2001 Annual Performance Plan, which is based on the FNS Strategic Plan 2000–2005, a major revision of the agency's 1997–2002 strategic plan. The new plan is designed to be simpler and more comprehensive, consolidating the old plan's six program-focused goals and 20 objectives into two cross-cutting goals with five related objectives. It better reflects the ways that Federal nutrition assistance programs work together to achieve the agency's mission, and permits a more complete allocation of the budget across the plan.

While some of the measures in this plan are clearly more important than others, we do not consider the plan to be at a sufficient level of refinement to make selec-

tion of a subset of these measures an appropriate or useful overall performance assessment tool. FNS intends to continue refining and improving these measures over time, in order to achieve the “critical few” performance plan measures that focus clearly on key program performance outputs and outcomes.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. To the extent possible, FNS attempted to develop outcome measures for the performance goals in its Annual Performance Plan. For other goals, we developed output measures, to enable the agency to track its progress in achieving its targets. These output measures allow us to provide annual data on the program performance metrics used by managers in making administrative decisions.

OMB guidance with regard to annual performance planning states that, while “[a]n annual plan should include outcome goals when their achievement is scheduled for the fiscal year covered by the plan...[m]easures of output can be the predominant goals and indicators in an annual plan for several reasons:

- Outcome goals, other than those being accomplished at a continuing, sustained level, may not be scheduled for achievement in the fiscal year covered by the annual plan;
- An agency is likely to have more output goals than outcome goals; and
- As the frequency and nature of performance data for outputs allows for periodic assessment and intervention, managers often manage to outputs.” (OMB Circular A–11 (1999), Section 220.9, p. 493.)

To this list of reasons we would add a fourth: critical outcome measures, including many of those in the new FNS strategic plan, are meaningful only when assessed over a multi-year period, so that even when annual data is available, it frequently does not provide a useful explanation of program performance.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. FNS believes that our program managers understand the difference between output and outcome measures. FNS conducted briefings of all agency staff on GPRA requirements, including the difference between output and outcome measures.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Customer satisfaction measures have not been incorporated as key performance indicators in the Annual Performance Plan. However, FNS has participated in the American Customer Satisfaction Index (ACSI) survey being conducted under the auspices of NPR. Data was collected and the index calculated for the WIC Program in 1999 (the program scored 83 out of 100 overall). FNS plans to expand its involvement to include the Food Stamp Program and the National School Lunch Program in 2000.

Examples of external questions used in the Government-wide Customer Satisfaction Survey for the WIC Program are given below:

Q. Before you entered the WIC Program, you probably knew something about it. Now think back and remember your expectations for the overall quality of the WIC Program. Please give me a rating on a 10-point scale on which “1” means your expectations were “not very high” and “10” means they were “very high.” (The program scored 8.8 on this question.)

Q. Was it difficult or easy to get into the WIC Program to get its food benefit and support? Using a 10-point scale on which “1” means “very difficult” and “10” means “very easy” how difficult was it for you to get into the WIC Program? (The program scored 8.7 on this question.)

Question. How were the measurable goals of your 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The vast majority of the resources included in FNS’s budget request are allocated for benefit dollars and State administrative expenses and are driven by statutory requirements. The measures of program participation used to develop those requests were not included in the fiscal year 2000 Annual Performance Plan. For this and other reasons, the fiscal year 2001 Performance Plan was extensively revised from the fiscal year 2000 Performance Plan. The new plan, based on FNS’s revised strategic plan, does include these measures.

Measures of other activities, such as delivery of nutrition education, link to specific allocations of resources in the fiscal year 2000 Performance Plan; FNS assessed the measures of performance included in that plan in developing its fiscal year 2001 Performance Plan, as well as the budget request to support it.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. In general, FNS would be able to estimate the impacts of changes in the budget, but the precision of these estimates would depend on the nature of the changes. In addition, some of the performance measures in the plan (those related to benefit accuracy, for example) are influenced significantly by the efforts of our program partners and other external factors. Nonetheless, FNS intends the Plan to serve as a useful framework to identify the impact of different funding levels on key program performance issues.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Program data related to participation, benefit levels, and certain aspects of benefit delivery are collected and reported on a monthly basis. These data are collected primarily in support of FNS's responsibility to disburse, and oversee the use of, program funding, rather than performance measurement. Therefore, not all areas of performance are covered in this collection; for some measures, information is developed on an annual or ad hoc basis.

FNS is constrained in its capability to collect the data required for measuring and reporting program performance throughout the year by two major factors. First, the Agency no longer has the ability to set an operational and performance-focused studies and evaluation agenda; funds for this purpose were transferred to another USDA agency, which has to date focused on other areas of inquiry. Second, because the programs operate primarily through partnerships with State and local agencies, FNS depends on those agencies to collect and deliver performance data in many areas. The agency is heavily constrained in adding to State and local reporting burdens, beyond basic requirements needed to ensure effective controls over Federal funding.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Our program data are available to all program managers and staff.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Program data is generally consolidated and reported, verified, and consolidated in the National Data Bank, which is used to prepare a single monthly report that is widely distributed in the agency, and which is also available for individual queries by program analysts and managers.

Question. Agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. In our fiscal year 2001 Annual Performance Plan (APP), each individual objective under the respective strategic plan goal is associated with estimated dollar resources and associated staff years. Although the FNS budget structure remains unchanged, the FNS Strategic Plan was significantly changed (from six goals to two goals) to better align with our current budget structure. The improved alignment significantly improved our abilities to match budgeted resources with the strategic plan objectives identified in the APP.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Since FNS only recently modified the FNS Strategic Plan to better align with our budget structure, we would like the opportunity to assess the results of the change relative to our current structure before addressing the issue of a budget structure change.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. We do not see a need to modify the present structure at this time.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We do not see a need to modify the present structure at this time.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. FNS demonstrated our cost accounting expertise through the planning and development of a Managerial Cost Accounting model which was implemented

and subsequently approved by the USDA Office of Inspector General. Our model was designed to provide reliable and timely information relative to the full cost of our programs.

With regard to linking GPRA to the budget process, the FNS annual performance plans (for fiscal years 1999, 2000, and 2001) are linked to the FNS President's Budget for each respective fiscal year by means of a crosswalk which aligns program and sub-program dollars and staff years to the respective strategic plan goals. The crosswalk linking the budget with the strategic plan goals is developed off-line—that is, the crosswalk is not generated using the agency's official budget and accounting systems.

Question. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. FNS implemented a cost accounting design in fiscal year 1998 using a model which follows the five standards as described in the Managerial Cost Accounting Concepts and Standards for the Federal Government, Statement of Federal Financial Accounting Standards, Number 4: (1) accumulating and reporting costs, (2) establishing responsibility segments, (3) determining full costs, (4) recognizing the costs of goods and services received from other entities, and (5) using appropriate costing methodologies. FNS is not currently using activity-based costing and has no plans to do so.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. FNS has the capability to show full cost (including administration, employee benefits, and depreciation) at the sub-program activity level, which we define in our model as "level 1" under each responsibility segment. This means that within our accounting code structure, FNS can report full cost at the "school breakfast" level under Child Nutrition.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. The FNS Managerial Cost Accounting model shows a clear relationship between the dollars spent and the activities accomplished, as summarized at the "level 1" sub-program level. Alternatively, the level at which we have implemented Managerial Cost Accounting would not provide a meaningful relationship to the costs or results of activities accomplished at any level below "level 1".

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. For each GPRA activity and related results, the associated per unit cost will have to be developed off-line; that is, outside of the formal budget and accounting systems. This is principally because the FNS annual performance plan goals generally would not have a one-for-one relationship with any defined "level 1" sub-program.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Because we have implemented a Managerial Cost Accounting model which is supported by our current accounting code structure and since our goals are not directly aligned with our accounting code structure, dollar costs associated with any particular performance goal will be generated off-line (outside the formal budget and accounting systems).

Overhead costs would not be assigned or allocated to a particular annual performance plan goal. As indicated above, in our model, indirect cost allocations are made at a level which is no lower than the sub-program level (i.e., school breakfast program under Child Nutrition). Since any annual performance plan goal would be a level below sub-program (level 1), the "full cost" of that plan goal would, if necessary, have to be done off-line and would be done on an estimated basis.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. There are no such regulatory reform measures.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Yes, some external factors are identified. The fiscal year 2000 Performance Plan refers to the FNS Strategic Plan 1997–2002, which identifies a wide range of external factors that could influence goal achievement.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. The most significant external factors on the performance of the nutrition assistance programs administered by FNS include the overall status of the economy and the efforts of our State partners. With regard to the former, the programs are structured to respond to economic changes; our budget request projects program participation and expenditures based on economic forecasts used by the government at large. For the Food Stamp Program, benefit reserves are included in the request to ensure that the program can respond rapidly to unanticipated changes.

With regard to the efforts of State partners in, for example, improving benefit accuracy, the Performance Plan and budget request include earmarking of resources to support and provide incentives to States to improve performance.

Question. What impact might external factors have on your resource estimates?

Answer. FNS will require additional resources to cope with external factors, such as those identified above, that are likely to impede the agency' achievement of its goals.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. FNS has identified no significant overlapping functions and duplication. While FNS programs are designed to work together to provide both a basic level of nutrition assistance, and targeted supplemental benefits for those with special needs, these are not duplicative functions.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. The Performance Plan does not identify any significant overlap or duplication. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Agencies should address potential duplications and overlapping functions in their GPRA plans. The overlapping and duplication must be carefully analyzed to determine the reasons for their existence and whether elimination would result in savings and improved program efficiency and effectiveness.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. FNS is using its Strategic and Annual Performance Plans as an integral part of its Leadership 2000 Initiative, which is designed to improve agency management, operations, and effectiveness.

Question. Will this use increase in the future and if so in what ways?

Answer. Yes. As agency management and staff get more experience with GPRA, they will be able to integrate it even more into the agency's day-to-day operations.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. FNS believes that additional time may be needed for some of the performance measures to mature. For those measures for which data are available, we believe that they are sufficiently mature to influence budget decisions.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might effect the accuracy of resource estimates?

Answer. In a number of areas, FNS hopes to extensively refine its performance measures, particularly with regard to measures of performance regarding benefit accuracy, fraud reduction, and administrative efficiency. More extensive analysis of the factors that contribute to good performance in these areas could allow the agency to develop better measures and more reliable estimates of resources needed for specific performance levels. Notably, FNS is hampered in this area by a lack of study and evaluation funding that could permit the agency to conduct such analyses.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. At this time we are not requesting any waivers.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued September 30, 1997?

Answer. In 1999, FNS identified the need for a major revision of the agency's 1997-2002 strategic plan. A revised plan, FNS Strategic Plan 2000-2005, was released in January, 2000. The new plan is designed to be simpler and more comprehensive, consolidating the old plan's six program-focused goals and 20 objectives into two cross-cutting goals with five related objectives. It better reflects the ways that Federal nutrition assistance programs work together to achieve the agency's mission, and permits a more complete allocation of the budget across the plan.

FNS engaged in an extensive stakeholder input process in revising the plan, including regional and National stakeholder meetings, discussions with FNS employees, and a website offering information on the proposed revision and soliciting com-

ments. FNS received a large volume of input; most was supportive of the revised plan structure, though some changes were suggested and made. The agency intends to use the revised plan, and related performance plans, to work with our program partners toward shared goals.

RURAL DEVELOPMENT SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals and program activities in its budget request?

Answer. Rural Development established one strategic plan which supports the three agencies constituting the mission area. The Rural Development Strategic Plan contains a mission statement which encompasses the role of the entire mission area. This statement is cited in the Purpose Statement of the budget request. The strategic plan also contains three Goals, one for each agency, and four broad Management Initiatives which support the entire mission area. By having a Goal for each agency, alignment with the existing budget structure, which is agency and program based, is achieved.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. For loan and grant programs the performance goals and indicators in the Annual Performance Plan are tied directly to the level of funding requested for each program.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The primary problem we have encountered is establishing performance measures for new programs when we have no historical data on which to base future performance. Also, new programs may require several years to become fully functional, which results in unused funding. Since the performance target was based upon full usage of funding, the target performance cannot be met regardless of our best efforts.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. The performance goals in the mission area Annual Performance Plan, which align with the objectives in the strategic plan, are supported by one or more quantified performance indicators to be achieved during the fiscal year. The performance goals are linked to the President's budget request at the agency level and for each major category of programs. For example, funding requested for the Rural Business-Cooperative Service is linked at the total agency level and then linked again for business and industry programs and cooperative development programs. The business and industry programs consist of several accounts and the plan does not provide separate performance measures for each account. However the contribution of the account to the larger goal is often indicated.

Question. Does each account have performance measures?

Answer. We do not have performance measures for each account. With over 50 accounts in the Rural Development budget, a plan with performance measures for each account would cause the plan to be too large and too segmented to be useful.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The performance planning structure is based upon the eight basic programs of the mission area. These are business and industry programs; cooperative programs; single family housing; rural rental housing; community development programs; water and waste programs; telecommunication programs; and electric program, rather than the account and activity structure of the budget.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No, we do not plan to propose changes for fiscal year 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No, we will not propose changes to the program activities described under that account structure.

Question. How were performance measures chosen?

Answer. The performance goals and indicators were selected by the agency administrators in consultation with their program managers.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Since we have limited funds for systems development, the decision was made to rely on existing data sources, or those under development for other pur-

poses, when developing performance goals. The data comes from a variety of sources. Much of it comes from the various loan accounting systems which contain edit checks and are audited annually. The data from these systems are considered reliable and valid. Other data is provided by the field staff and, while its validity cannot be verified, it is considered adequate for the purposes it is being used.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. All of the data included in the performance report is considered final. The performance plan does include a few performance indicators, primarily in support of the rural rental housing program, which are under development and were not available for the first report. The indicators under development primarily relate to rent overburden of the tenants living in the rural rental housing projects.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well"). State the long-term (fiscal year 2003), general goal and objective from the agency strategic Plan to which the annual goal is linked.

Answer. We recommend the subcommittee track all of the key performance goals from the Annual Performance Plan. These are:

Key performance goal	Output or Outcome	Long-term general goal in the strategic plan supporting the key performance goal
Rural Business-Cooperative Service:		
Create or save jobs in rural areas	Outcome ...	The following general goal supports all of the key performance goals: Rural Development will improve the quality of life in rural America by encouraging the establishment and growth of rural businesses and cooperatives.
Assist marketing networks and cooperative partnerships in the expansion of business outlets.	Outcome ...	
Direct program resources to those rural communities and customers with the greatest need.	Outcome ...	
Manage the B&I portfolio effectively to minimize the delinquency rate.	Outcome ...	
Rural Housing Service:		
Improve the quality of life of residents of rural communities by providing access to credit for decent, safe, and sanitary housing.	Outcome ...	The following general goal supports all of the key performance goals: Rural Development will improve the quality of life of rural residents by providing access to technical assistance, capital, and credit for quality housing and modern, essential community facilities.
Improve the quality of life for the residents of rural communities by providing access to decent, safe, sanitary, and affordable rental housing.	Outcome ...	
Improve the quality of life for rural residents by providing new or improved essential community facilities.	Outcome ...	
Maximize the leveraging of loan funds to increase the number of rural residents assisted by Rural Development programs.	Outcome ...	
Direct resources to those communities and customers with the greatest need.	Outcome ...	
Provide effective supervision to minimize delinquencies and future losses.	Outcome ...	
Rural Utilities Service:		
Provide rural residents with modern, affordable water and waste services.	Outcome ...	The following general goal supports all of the key performance goals: Rural Development will improve the quality of life of rural residents by promoting and providing access to capital and credit for the development and delivery of modern affordable utility services.
Provide modern, affordable telecommunications services to rural communities.	Outcome ...	
Provide distance learning and telemedicine services, utilizing telecommunications technologies, to rural communities.	Outcome ...	
Provide modern, affordable electric service to rural residents and communities.	Outcome ...	
Direct program resources to those communities with the greatest need.	Outcome ...	

Key performance goal	Output or Outcome	Long-term general goal in the strategic plan supporting the key performance goal
Maximize the leveraging of loan funds to increase the number of rural residents assisted.	Outcome ...	

While all of the goals are considered to be outcomes, most of them are measured with a variety of performance indicators, many of which are outputs.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Throughout the process of implementing GPRA, we have encourage staff to think about the impact of the programs and how that impact, or outcome, could be quantified. Information on the impact of our loan and grant programs on the families, communities and businesses recipients is not available and would be costly to obtain. As an alternative we have elected to establish unquantified performance goals, which are written from an outcome perspective, and measured with several quantified performance indicators, most of which are output oriented.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, program managers understand the difference.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Our customer service activities in the Performance Plan are focused on conducting customer satisfaction surveys for most of the major program areas. We have no indicators related to internal customers. Limited staff and financial resources have impaired our ability to meet our targets in these areas. The Cooperative Development program has conducted annual surveys of its customers for a number of years and it has a target for the customer's rating of the quality of the technical assistance provided. The Service Center Modernization Initiative (SCMI) includes RHS' single family housing borrowers in its surveying activities. The SCMI annual performance plan includes targets related to customer satisfaction by those customers using the field service centers. In addition, RHS is interested in determining if its customers were attaining favorable outcomes through their participation in the agency's programs. RHS contracted with USDA's Economic Research Service (ERS) to survey the Section 502 direct loan borrowers and the Section 515 multi-family housing tenants to determine whether their participation in these programs had improved their quality of life. ERS released its report on Section 502 borrowers last December under the title "Meeting the Housing Needs of Rural Residents: Results of the 1998 Survey of USDA's Single Family Direct Loan Housing Program." This report is available electronically at <http://www.econ.ag.gov/Prodsrvs/rept-rur.htm>.

The report shows that 90 percent of the borrowers surveyed said the quality of their current home was better than that of their previous home; 77 percent rate their new neighborhood as 8, 9, or 10 on a scale of 1 to 10, with 10 being the best; and 75 percent rate the schools in their neighborhood as good or very good. These results indicate that participation in the Section 502 direct loan program has helped borrowers change their lives for the better.

Once we obtain the results of the Multi-Family Housing survey, we will share them with you. As you know, reports such as these take years to develop and are expensive. However, as resources are available, we will continue to pursue research on how well RHS programs accomplish our central mission of improving the quality of life of rural Americans.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. Funding requests for Rural Development programs are based on many factors, especially our customer's needs. The fiscal year 2000 Annual Performance Plan did not have a major impact on the development of the fiscal year 2001 budget request.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Since most of the performance measures are directly related to the amount of funds available, the impact on a performance measure can be determined if the committee is considering a change in a budget number.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Data utilized by Rural Development comes from a variety of sources. Much of it comes from the program loan accounting systems and this information is basically available on a regular basis with routine reports printed on a monthly or quarterly basis. Some of the data comes from the Rural Communities Facilities Tracking System (RCFTS). This system is updated by the field offices and, while it is always available, it is not always current. Some of the data comes from surveys of field offices and this information is only available once a year.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. This information is available is available to all levels of program managers.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Trained program staff is able to query most of the systems to develop ad-hoc reports. In order to make access easier, and to make more information available, Rural Development is developing a data warehouse which will include not only program data but also data from outside sources, such as the Bureau of Census.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. By linking performance goals and indicators at the agency and broadest program level only, we have avoided this difficulty. If we attempted to develop performance measures for each of our over 50 program accounts, the task would be monumental and the plan too large to be useful.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No. We believe the linkage, as we presently present it, is appropriate and easy for someone unfamiliar with Rural Development's programs to understand.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. We propose no modification. .

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We do not believe any modification would strengthen accountability.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions, and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Rural Development's accounting systems do not currently support cost accounting. Enhancing the systems to support cost accounting will require the investment of substantial resources.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies, are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. Rural Development will not implement a cost accounting system in the near future. Resources available to enhance the accounting systems are either being directed to improving their ability to account for program funds or to the implementation of the Department's Foundation Financial Information System (FFIS). Rural Development is scheduled to implement FFIS effective October 1, 2000. After FFIS is implemented, Rural Development will work with Department representatives in the development of a plan for obtaining and integrating the data needed for an activity-based cost accounting system.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. It is unclear at this time what costs will be included in the cost accounting system.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. The dollars spent on a program and the cost of activities related to a program would be apparent with a cost accounting system. The results of those activities would then be related to this data.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. It is unclear at this time how the cost of activities could be displayed and how those costs would be tied to results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The Annual Performance Plan contains salary and expense costs at the mission area level. Costs are not allocated to the individual goals. The costs in the Plan do include all overhead costs.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. Several regulatory changes have occurred to make the programs easier for our customers to use, to encourage leveraging, to make it easier for the neediest customers and communities to access our programs, and to strengthen oversight of the programs with the goal of diminishing future delinquencies and losses. Over the past several years, we sought to reduce the regulatory burden while also implementing handbooks that enable us to more rapidly react to changes, make it easier for staff to deliver the programs to the customers, and provide the guidance needed to operate and manage the programs. In conjunction with this process, we have implemented a number of improved automated systems to help staff accomplish their work more effectively and efficiently. Work on these improvements continues.

The Intermediary Relending Program regulation were revised in August 1998. Some of the significant changes to these regulations included:

- State Offices are authorized to accept and process applications without the application having to go through the National Office.
- The contents of a complete application and work plan are revised to eliminate some unnecessary items; provide more detail on what should be covered regarding re-lending plans; add certifications regarding debarment, Federal debt collection policies, and lobbying; provide goals, strategies, and anticipated outcomes; provide information on technical assistance available to ultimate recipients; and provide for streamlined applications for subsequent loans.
- The priority scoring system is revised by reducing the number of points for other funds, adjusting the threshold for points based on service area income compared to the poverty line, adding a category of points based on service area income compared to statewide income levels, adding a category of points for service to under-represented groups, and providing additional guidance regarding justification for Administrative points.

The loan origination and servicing systems, which support the Single Family Housing direct programs, have been automated which increases the agency's ability to process and service loans. Through changes in the manner in which payment assistance is provided, the cost of providing families with opportunities for homeownership provided a 40 percent savings to the taxpayer and reduced paper work by over 75 percent.

We have implemented a series of Congressionally mandated reforms to the Section 515 program. We continued the task of reinventing the Section 515 and the Section 514/516 Farm Labor Housing programs. Through these changes, we eliminated the occupancy surcharge and are making equity loans available for all pre-1989 housing complexes. New processes have been developed for prioritizing funding assistance to the neediest communities, as defined by ruralness, incidence of substandard housing, and incidence of rent overburden. We implemented provisions to ensure that developers receive no more than a reasonable profit and that transfers of property are in the best interest of the government. In addition, we provided for penalizing property managers for equity skimming. Our streamlining efforts have reduced regulatory burden, simplified agency management and servicing responsibilities, and streamlined procedures for origination and prepayment of loans.

Oversight and management of the Multi Family Housing program has been an on-going concern. We have reinvented the approach to overseeing management and compliance for the Multi Family Housing programs. To address management inefficiencies and to combat fraud, waste, and abuse, we have undertaken a continuing

process of regulatory reforms. As a result of these reforms, debarment activity in the Section 515 program has significantly increased as we replace borrowers and management companies unable to meet their responsibilities. We have developed a loan classification system to quickly identify problem loans at a very early stage before there are serious loan losses or health and safety concerns for the tenants. The classification system identifies maintenance deficiencies, financial deficiencies, high operating costs and deficient reserve accounts, as well as other management indicators.

During fiscal year 1999, the regulations governing the Distance Learning and Telemedicine loan and grant programs were completely rewritten. These revisions are now in effect and more clearly delineate the application requirements for the loan, grant, and combination loan and grant programs. A new combination loan and grant program was introduced which pairs up loans with grants on a 10 to 1 ration. That is, for every \$10 in loan applications, the applicant would receive an additional \$1 in grant funds. The purposes for which loan funds can be utilized was also broadened and a new expedited application review process was implemented.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. The Annual Performance Plan identifies two key external factors that can influence goal achievement—macroeconomic influences and reductions in funding.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. Should the economy start to weaken, we will need to increase loan servicing activities to help those borrowers who are impacted and to limit future losses to the Government. The availability of adequately trained staff to provide the servicing will be critical to our success.

Question. What impact might external factors have on your resource estimates?

Answer. Higher interest rates and higher unemployment will limit our ability to assist the weakest applicants and is likely to increase delinquencies within our portfolio. Higher interest rates will also reduce our ability to leverage loans, putting greater pressure on program funds. The impact will be a higher subsidy cost for the direct programs.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. We have not identified significant overlapping functions or program duplication through the strategic planning process. Most programs which may appear to be duplicates of another program are actually designed for a different clientele. There is always the need for agencies to coordinate on related activities.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. The Plan identifies those Federal agencies which mission area staff work closely with in the delivery of our programs.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Agencies should address management challenges and potential duplication and overlapping functions, to the extent they are within the agency's control, if they impact achievement of the performance goal. These items can be addressed in the means and strategies portion of the annual plan.

Question. To what extent, has GPRA been used by agency leadership to guide decision making?

Answer. During the strategic planning phase of the implementation of GPRA, senior management determined, with support from our stakeholders, that targeting of financial resources to the neediest individuals and communities and leveraging of our resources with other sources of technical assistance or credit would be priorities. These priorities are reflected in the objectives in the strategic plan and in the performance goals and indicators in the Annual Performance Plan for all of the programs. To ensure achievement of these priorities the Agency Administrators have established performance goals for each Rural Development State Office which are tied to the State Director's performance standards.

Question. Will this use increase in the future and if so in what ways?

Answer. As long as the strategic plan reflects the priorities of senior management, GPRA will help agency leadership make the decisions needed to guide the agency. The extent to which a manager uses the strategic planning in their management process varies widely depending upon the style of the manager.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Most of the performance measures are sufficiently mature for use in determining program performance. However, there are difficulties with some databases and systems that impact the quality of the data. For example:

—We are having problems with the reconciliation of data in the Rural Communities Facilities Tracking System (RCFTS) with the same data in the Guaranteed Loan Accounting System (GLAS) and the Program Loan Accounting System (PLAS). There is no automated single point-of-entry of duplicate data into GLAS/PLAS and RCFTS. Duplicate data has to be manually input into each system by the field staff. This does not always happen and the result is inaccurate data. We are, through a GSA FEDSIM contract, attempting to develop a reconciliation process that identifies discrepancies in like-data between the systems.

For some of our direct loan programs we recently replaced our old servicing system with a new modern system. However, some of the historical information typically needed to track loan history was never centralized in the old system. We are presently building histories in the new system that will serve as useful comparison measures for trends in the future but accumulating the historical data needed will take several years.

In addition, there are other factors to consider in using these measures to compare actual performance with targeted performance. For example, the number of housing units we can finance is based on the average cost of each unit. Factors such as whether the unit is newly constructed or whether the house is in a remote or difficult-to-build area could influence the average loan amount since both of these situations generally increase the cost of construction. Additionally, the cyclical nature of the housing market can influence performance. An example is that rising interest rates or rising home prices may have a negative influence on the ability of low- and moderate-income families achieving homeownership.

For our Community Facilities programs, it is difficult to accurately predict the number and type of projects financed because of the vast number of different uses for this program. Projects can range from building a multi-million dollar hospital to purchasing a \$30,000 fire truck.

Another factor that has a great deal of influence on our performance level is leveraging. As we work with more and more lenders, we are gaining experience with leveraging so that hopefully we can make better estimates of leveraging activity expected in the future, however this activity may also be sensitive to interest rates.

Question. Are there any factors such as inexperience in making estimates for certain activities or lack of data that might affect the accuracy of resource estimates?

Answer. Data used in the performance measures come from a variety of sources. The number of jobs created or saved is based upon information from the borrower for the business programs and through the use of job multipliers for many of the other programs. Estimating the number of jobs created through the Intermediate Relending Program (IRP) has been especially difficult. Impacts of IRP over the life of the loan (30 years) with regard to job retention/creation has been an estimate based on a study conducted several years ago by a private consultant. Currently, Agency accounting and management systems do not track actual job retention/creation as a result of re-lending to ultimate recipients under the program. The Agency has entered into a Cooperative Agreement with the Virginia Institute of Technology to develop a pilot database that tracks actual performance of ultimate recipient loans including job retention/creation.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No, we are not requesting any waivers.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No, we are not.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The strategic plan currently reflects the priority of senior management and substantive revisions are not needed. The strategic plan could be updated to be more reflective of current initiatives within the Department.

NATURAL RESOURCES CONSERVATION SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. Our strategic plan provides a statement of the fundamental mission of the agency and lays out long-term goals for achieving that mission, including strate-

gies to reach identified multi-year performance targets. It serves as a blueprint for agency budget formulation, and serves as a foundation for resource allocation, performance planning, business planning, and performance measurement.

Performance planning provides the link between the agency mission and strategic plan goals and the tasks performed by agency personnel on a day-to-day basis. The process converts the multiyear strategic plan goals into measurable annual goals and priorities. The annual Performance Plan contains specific performance measures to be monitored through the year that either directly, or as surrogates, represent each of the strategic objectives. The specific linkages between the annual goals and the Strategic Plan targets are explained in the Annual Performance Plan.

The performance plan also guides the allocation of staff time and resources. The agency budget request is based on measurable output and outcome goals defined in the agency performance plan. The establishment of measurable performance goals is the first step in the annual budget formulation process. The performance plan directly links the goals to the programs through which the agency receives funds. This information is contained in tables in the Performance Plan. The annual performance plan also describes how the funds the agency receives are used to achieve the strategic goals.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The process drew on the technical and program experience of a team of headquarters and regional staff. This team drew on a wider circle of state and field level employees and national program managers. The team studied each of the performance goals for 2002 that are established in the strategic plan and identified program activities that contribute to meeting the long-term goal. The team determined which activities were most clearly outcome-related and recommended those to be used as performance measures. The main problem that we encountered was data availability to establish baselines for some natural resources conditions. For some natural resource objectives, such as water quality, there are not currently reliable annual data sources to support an annual performance goal stated in terms of resource condition, that is, it is not possible to set an annual goal for number of stream miles improved and then reliably report annual performance.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. The agency's Performance Plan includes several tables that map the linkage between the performance measures and the budget. Tables 2 through 5 of the document show the relationships between the objectives in the strategic plan and the long-term and annual performance measures. Tables 6a and 7 then show the relationship between programs and strategic objectives. Tables 9 and 10 present information, for fiscal year 2000 and fiscal year 2001, on the amount of funds from each budget activity that support each objective.

The performance plan includes measures that can be used as measures for each program. The measures, however, are designed to fit our larger programs. Some, but not all activities of smaller programs are covered by the current set of measures. For example, activities of the RC&D program that directly relate to resource conservation are covered by performance measures in the plan. RC&D activities that relates to community development are not.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Our budget provides funds through a structure of 12 accounts and activities. The authorizing legislation of each account defines the resource concerns that the program is intended to address. Some programs have a very narrow focus and address a limited range of resource concerns. Others are broader. The programs are delivered through a single workforce to customers who may participate in several programs. We are using the performance planning process as a means to integrate management of our program activities. Our performance planning structure, therefore, is natural-resource driven and very closely follows the structure of the outcome-related objectives in our strategic plan. All of the objectives in the strategic plan are supported by multiple programs. We have very few single-program performance measures in our performance plan.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No, we do not anticipate proposing changes to our account structure for fiscal year 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. At present, we are not proposing changes to the program activities. We are evaluating a possible redefinition of the Conservation Technical Assistance account to focus on reporting the outcomes of program actions. This redefinition should enable us to improve the linkage to program results as well as improve allocation of costs to the outcomes. It will not involve any fundamental change in the nature of the program.

Question. How were performance measures chosen?

Answer. A team that included representation of all regions identified possible measures and recommended those that most closely related to the long-term goals established in the strategic plan. We selected predominantly measures for which we are able to collect data or for which data was already being collected through existing efforts.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. In fiscal year 1999, we implemented a new performance reporting system designed to minimize field staff time required for reporting and to provide the essential data needed by agency leadership to make management decisions and respond to questions from the Administration and Congress in a timely fashion. The Performance and Results Measurement System provides a method for every office to report progress on mission-critical goals using a nationally consistent set of defined measures. The system is Web-based and user-friendly; it reduces the time staff must spend entering data and includes automated quality checks to improve the accuracy and consistency of the data. Tests conducted in the early stages of implementation indicated that the system will reduce the staff time required to enter data into the system by 195 staff years annually. These reductions result from the use of improved information technology and from focusing performance reporting on a set of clearly defined measures linked to agency outcomes and will allow our staff to use this time providing additional services instead of reporting past activities.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Our performance report for fiscal year 1999 includes data for all measures. For most measures, the reported performance will be based on expansion of data from a sample of offices. The sample was selected to provide a reliable picture of agency performance at the national level. We do, however, intend to continue refining measures over the next several years. We are currently looking very closely at our annual performance measures as we update our strategic plan. As we revise the strategic plan to address the changing needs of our customers and new guidance from the Administration, changes will also be needed in the annual performance measures that track progress toward strategic goals. This means that there likely will be one or more measures in the plan for any given year for which we may not have reliable baseline data or consistent current-year data.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The annual performance indicators that support our strategic goal for a healthy land are key measures that the committee can use to track the effectiveness of our combined programs. These indicators include acres of cropland and grazing land managed sustainably ("resource management systems"), acres of cropland protected against excessive erosion, acres of land managed to minimize offsite delivery of nutrients and pesticides, number of waste management systems installed to minimize risk of problems associated with animal wastes; acres of wetlands restored or enhanced, and acres on land where practices have been applied to enhance habitat for wildlife. In addition, the indicator for number of minority customers served is a useful indicator of the agency's commitment to providing services on a non-discriminatory basis to all customers.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. Measures supporting the goal of a healthy land are all outcome-related measures. They measure "conservation on the land" as a result of action and investment of time and money by the target audience—private land managers—rather than internal processes and tasks completed by agency personnel. These intermediate outcome measures provide a more reliable picture of annual performance than would end outcome measures based on the impacts that the systems and practices have on the land. In many cases, the benefits of applying conservation cannot be documented in the environment until several years after the action is completed. In other cases, changes related to weather or market conditions can mask or intensify the impacts of conservation progress. The indicator for number of minority cus-

tomers served is an output measure of a key dimension of the quality of services provided. The measures for information products, such as number of surveys digitized, are outputs.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. All outcome-related goals for resource condition and health support our Goal 1: A healthy and productive land that sustains food and fiber production, sustains functioning watersheds and natural systems, enhances the environment, and improves urban and rural landscapes. The objectives for this general goal are:

- Healthy and productive cropland sustaining U.S. agriculture and the environment.
- Healthy and productive grazing land sustaining U.S. agriculture and the environment.
- Healthy watersheds providing clean and abundant water supplies for people and the environment.
- Healthy and productive wetlands sustaining watersheds and wildlife.
- High quality habitat on private land supporting the Nation's wildlife heritage.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. We identified outcome goals and objectives in our strategic plan and supported them with quantified outcome-related targets. The criterion for establishment of a performance goal was that the goal must be stated in terms of an outcome-related measure. The annual performance measures for resource condition, therefore, are all at least intermediate outcomes that measure improvements in natural resource management implemented by resources managers with NRCS assistance. We included few measures of internal processes in our performance plan, and those few apply to civil rights in program delivery or to support functions, such as resources inventory, for which output measures are more meaningful than end outcomes.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcomes)?

Answer. Yes, most NRCS managers at all levels have a general understanding of the difference between outputs and outcomes. We are a field agency in which most of our employees are front line staff providing services directly to the public. Most managers have first-hand knowledge of the results our customers want and can distinguish between the activities that employees perform and the changes on the land that result from that assistance to land users.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. The Natural Resources Conservation Service is conducting several activities in customer satisfaction measurement for fiscal year 2000 and fiscal year 2001. In 1998 and 1999, NRCS participated in the development of the USDA Service Center Customer Card. This card was piloted in six states and the results of the pilot are presently being evaluated.

In September of 1999, NRCS established a Chief's Feedback System to receive feedback from both internal and external customers. The system is user-friendly and Web-based. Incoming messages and responses are posted in question and answer format. Other customer feedback activities include the Conservation Summit and various Conservation forums that have taken place in 1999 and 2000 to solicit feedback from our external customers throughout the country.

NRCS is designing a plan to establish a national customer satisfaction measurement system. Due to funding shortages, the design and implementation of this system will not be fully accomplished in fiscal year 2000. The goal of the system is to establish a series of on-going customer satisfaction measures that, through internal and external customer feedback, will be used to guide NRCS programs and activities.

Question. How were the measurable goals of your fiscal year 2000 annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. In 1998, state conservationists provided estimates of the level of performance that could be expected for a set of performance measures, assuming level buying power over the following years. In early calendar 1999, state conservationists developed revised projections of performance for these outcome-related measures for several budget scenarios. They also conducted a field-level workload analysis to better define the level of outputs that could be produced by the current workforce. Agency leadership identified actions, including program strategies, and the funding

required to support the strategies, to achieve alternative goals developed in response to input from stakeholders.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. If the committee changes a proposed number, we will be able to tell you the eventual impact on the level of program performance in terms of program-specific outputs and the outcome goal most closely related to the program purpose. We could, for example, estimate with considerable accuracy the change in extent of acreage that could be placed under easement in the Wetlands Reserve Program (WRP) corresponding to a change in the WRP budget. Acreage enrolled in the program, however, is not the annual performance measure in our performance plan; acreage on which practices have actually been applied is the measure. The change in funding would likely have a lesser effect on the acres of wetlands created or restored in fiscal year 2001 than on the acreage in the following 2 or 3 years. This is because securing easements and applying restoration practices is generally a multi-year process. We do not yet have all of the information needed to precisely project the change that a funding change would have on such a outcome-related measure in the initial year. Nor are we yet able to trace all of the effects that a change in funding aimed at one goal would have on related goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. The new Performance and Results Measurement System that we implemented in fiscal year 1999 gives us the capability to monitor progress on a daily basis. Performance information from the field is entered in the Performance and Results Measurement System when the system or measure is completed. The standard reports available on the system website are updated daily at 2:00 am EST. Therefore, raw data is available on a real-time basis.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. A number of standard reports are available on the PRMS homepage, which is <http://www.nrcs.usda.gov/prms>. These reports currently provide data at the national, state, or county level. The standard reports are accessible to all NRCS employees and to the general public. They include both measures in the agency performance plan and additional reporting items needed by agency managers. A standard report now under development will provide a snapshot of current status of activities on all measures in the agency performance plan.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. We are developing an integrated accountability system that will provide a single point of access to performance-related information. The home page, which will be unveiled in the next few weeks, will allow access to the performance information in PRMS, estimates of the resource needs and associated workload in each county as projected by the National Partnership Workload Analysis, and information on the resource concerns and conservation partnership available to address those concerns. In addition, selected program management data will be automatically loaded into the integrated site on a quarterly basis. A security system has been designed to enable managers at all levels to have access to the data they need to manage their responsibilities, permit the general public access to appropriate levels of information, protect the integrity of the database, and ensure restricted access to confidential data.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. The difficulty we face in linking dollars to results in a meaningful way stems more from the nature of the results we seek to achieve than from our budget structure. Because natural resources are parts of an interrelated system, program activities that are undertaken primarily to achieve a specific goal will have effects on other components of the system. In our performance plan, we have attempted to show the linkage between programs and the primary performance goal(s) the funds support. However, the goal for any resource objective is based on the assumption that the funds requested to meet other objectives will also be available.

Question. Would the linkages be clearer if your budget account structure were modified? If so, how would you propose to modify it and why do you believe such

modification would be more useful both to your agency and to this committee than the present structure?

Answer. We have not identified changes in our budget structure that would make the linkages clearer. In the Performance and Results Measurement System, accomplishments on the performance measures is linked to the program or programs involved. In the time and attendance reporting system, time is reported by program and major activity. We are analyzing the initial year data from these systems to identify modifications in the reporting systems that would enable us to tie activities to dollars more precisely. As part of the strategic planning process, we are considering alternatives for stating strategic goals and objectives in an effort to design a framework that permits closer linkages between costs, outputs, and outcomes.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Our new time and attendance reporting system makes available improved data on how employees spend their time. We believe that this data will provide the basis for accountability for program performance without requiring modification of the budget structure.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Cost accounting within NRCS is not a new concept. As early as the 1970s the agency had a manual process in place that required employees to record time by program supported. Due to the staff time required for manual recording, however, the agency went to the cost offset type of process currently in use. The TCAS system of time and attendance reporting, implemented in 1998, will provide the information to ensure that the offset process supports fund accountability. Although NRCS accounting resources are very limited, there is an overall understanding of FASAB standard 4, Managerial Cost Accounting and its mandate to determine the full cost of programs and activities.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. Since 1998, NRCS has been implementing cost accounting in the agency. The process requires a cultural change in recording time and allocating costs to activities and programs. The process began with the implementation of the Total Cost Accounting System (TCAS). TCAS replaced the old methodology by which employees recorded only the time worked with a system that permits reporting amount of time by activity and by the program the activity supports. The second part of the process is to allocate the remaining costs of the agency to programs and activities using reasonable allocable bases. This process requires links to the future USDA financial information system called Foundation Financial Information System (FFIS) and to the NRCS Integrated Accountability System (IAS) to relate costs to performance data.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. Eventually, this will be possible. Once the TCAS system is linked to the FFIS and the IAS, NRCS will be able to determine the full costs of activities and programs and calculate administrative costs, employee benefits and depreciation.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, the agency would be able to document more precisely the dollars spent on programs, the costs of activities within the programs.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. The ultimate achievement of the per-unit cost will be possible once the previously mentioned systems are linked.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The agency performance plan includes tables that estimate the amount of funds of each program that support each strategic objective. These tables show

estimates based on available information. In the current plan for fiscal year 2000 and fiscal year 2001, the estimates for an objective include overhead; all funds of all programs are distributed among the objectives. There are, however, significant limitations in the data on which the estimates are based. Efforts to improve the data are ongoing. We have concentrated first on developing a system to account for field-level activities in terms of outputs. We developed a national workload analysis that defines the great variety of field office activities as a set of well-defined, mutually-exclusive work processes and identifies the steps that compose each process. Local teams estimated the time required to complete these activities on a typical operation in each of the more than 200 time team areas that make up the nation. We are using this data to project the field time needed to achieve certain types of goals and the possible shifting of personnel that might be involved. We intend to expand the workload system to include other agency activities above the field level. In many cases, the linkages of the outputs in the workload analysis to the program accounts and to resource outcomes are weak at present.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. This agency does not have any regulatory authority or role.

Question. Does your fiscal year 2001 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Our strategic plan briefly describes key external factors that might influence the ability of the agency to achieve the goals in the plan. Our current performance plan also includes brief descriptions of key external factors that might affect certain groups of performance goals.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. We are strengthening our capability to analyze resource and other data to identify emerging trends in production patterns and resource use to help anticipate changes that might intensify pressures on the resource base. We are also moving to a system of more annual resource inventories for key indicators so that we can identify where change is occurring and revise strategies before severe problems can develop. In addition we are strengthening our working relationships with other natural resources agencies in order to draw on their data and expertise.

Question. What impact might external forces have on your resource estimates?

Answer. The transition to market-driven agriculture could result in changes in land use and cropping patterns that affect the conservation needs on agricultural land, impacting the level of assistance producers need from USDA. Enactment of new requirements for resource protection, at either the national level or by a significant number of states, could greatly affect the level and kind of resources NRCS would need to help landusers meet their responsibilities. Changes in domestic or international economic conditions could substantially alter agricultural commodity prices, farm incomes, and the ability of private individuals to maintain or enhance their investments in conservation of natural resources. Such changes could also affect the ability of state and local members of the conservation partnership to increase their contributions to joint conservation initiatives. Also, dramatic changes in weather patterns, such as those experienced with El Niño, could have significant impacts on resources needed for protecting natural resources and the environment.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. There is some overlap in the sense that several of our programs are authorized to address a wide range of resource goals. Rather than causing duplication, this overlap creates flexibility that permits us to tailor assistance to meet the wide range of conditions and needs in local areas across the country. In the performance plan, the programs that can be used to address goals are shown in the tables that map programs to resource objectives. In addition, there are areas of cooperation on outcomes for which other USDA agencies and agencies of other departments have a role. In these situations, our role as provider of technical assistance supports the efforts of other federal entities whose authorities and role are different from ours.

Question. Should agencies address management challenges and potential duplication and overlapping functions in the GPRA plans, and if so, how?

Answer. Agencies that have been identified as high risk may find it appropriate to include in their performance plans measures to track progress toward eliminating the risk. We do not, however, think that management challenges should become a primary focus of the GPRA process or that routine operational concerns should be reflected in most agencies' plans. GPRA focuses on the outcomes of agency activities.

There is a danger that requiring a major emphasis on internal management issues in GPRA plans will seriously dilute the focus on outcomes.

Because GPRA plans focus on outcomes, and most true outcomes are achieved as a result of actions by multiple agencies, GPRA plans are an appropriate avenue for analyzing the interaction of agencies' programs to ensure coordinated action rather than duplication of effort.

Question. To what extent has GPRA been used by agency leadership to guide decision making? Will this use increase in the future and, if so, in what ways?

Answer. Agency leadership has used performance information and workload information to formulate and evaluate alternative goals and strategies and to consult with partners on mutual activities. Use of GPRA information will increase in the future as the components of the system are fully implemented and as managers become more familiar with the data and its uses.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Some additional development and evaluation of our new accountability system must be conducted before we consider the system fully mature. For many measures, we do not yet have reliable baselines against which to measure future performance. Fiscal year 2000 is the first year of full implementation for the new performance reporting system. Not all quality control processes for the performance reporting system were in place at the beginning of the year. Also, managers need some time to become familiar with the new system and ensure that performance information is being entered accurately and consistently in all offices. At present, there is inexperience with making estimates for some activities. The workload analysis has been conducted three times, resulting in a good quality product that field-level employees understand. However, more experience is needed to develop the linkages between outputs and outcomes so that reliable projections of performance can be made. Additional training to increase the understanding of the several components of the system will be provided to field-level employees later this year.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No, we are not requesting any waivers.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. As NRCS revises its strategic plan for the next GPRA cycle, we anticipate changes in strategic goals and objectives as a result of new data and information available from the accountability system. We expect that accountability data will allow the agency to better evaluate alternative ways of framing goals and performance targets that take advantage of the ability to better evaluate the costs of achieving targets. We also expect to consider including sub-goals for regional concerns of national significance that can now be tracked through both performance and time expenditure systems, in addition to generalized national goals. The data available from the new system will enable us to make needed adjustments to previously established goals, objectives, and performance targets where analyses indicate they are needed. It will also enable us to refine performance measures to align them more directly with performance monitoring systems. Conversely, the flexibility of the integrated accountability system will now allow rapid changes in data collection to accommodate changes in performance measures on both a strategic and annual basis. We are also now able to establish more discrete performance targets for specific strategic objectives and use performance-related data to make adjustments to future year performance estimates from emerging initiatives and events based on real-time data linking performance, time expenditures, resource concerns, and workload.

In addition, during this GPRA cycle we have new data and analyses from the National Resource Inventory (NRI) that will help in evaluating progress. The combination of these data and information may lead to the development of strategic goals, objectives, or performance targets that are considerably more useful for measuring agency success than those of the first plan.

NATIONAL AGRICULTURAL STATISTICS SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The Annual Performance Plan covering fiscal years 2000 and 2001 is a blueprint of the program objectives and performance goals for NASS. The performance plan is closely linked to not only the Agency's mission statement, but to the NASS and the Research, Education, and Economics (REE) Strategic Plans as well, and is framed by the REE general outcomes outlined in those strategic plans. The NASS Annual Performance Plan links the budget and performance goals by showing the Agency's funding and Full Time Equivalent (FTE's) allocated by the REE mission area general goals. The last page of the NASS Annual Performance Plan includes Resource Tables showing the three NASS program activities divided according to the REE goals.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. Budget activities and initiatives, since they are mission and strategic goal oriented, align well with overall NASS performance goals.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The only difficulty arises when budget activities relate to multiple goals and must be allocated across them.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes. The NASS Revised fiscal year 2000 and fiscal year 2001 Performance Plan links funding and FTE's with performance goals and associated measures; funding and FTE levels are shown by goal as well as by individual budget activity.

Question. Does each account have performance measures?

Answer. Each appropriations account by program activity has associated performance measures for each goal. NASS program activities are agricultural estimates, statistical research and service, and the census of agriculture.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. Accounts by activity structure are cross-walked against strategic and performance goals. Program activities are designed to contribute to goals from performance planning.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No changes are planned at this time.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No, program activities will remain unchanged.

Question. How were performance measures chosen?

Answer. NASS's senior executive decision making body, the Program Planning Committee, reviews the specific performance measures in semiannual meetings and requests more information from individual units, as needed. The responsibility for reporting the needed data for the performance measures resides within the individual NASS work units. In addition to the Agency GPRA Strategic Plan, NASS developed an internal NASS Action Plan, a major tool which provides employees with a more detailed blueprint for achievement of the NASS goals and objectives. This document contains internal performance targets, strategies, and measures which were developed at the grassroots level by NASS employees. The NASS Action Plan also includes the specific performance measures reported in the Agency's Annual Performance Plan.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. Most of the tabulated data and information was part of evaluation monitoring readily available within the NASS work units. NASS absorbed the resources and costs associated with these activities.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Yes. The NASS plan includes performance measures for which reliable data were not available for the fiscal year 1999 Annual Program Performance Report. However, they are footnoted or fully explained in the plan.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. NASS recommends tracking the performance goal listed under general goal 1, since this represents the largest part of NASS's agricultural statistics program. The other key performance goal for NASS is listed under goal 5, which contains the measures for the census of agriculture.

NASS Performance Goal 1: Provide timely and impartial agricultural statistics for use by all market participants which promote an economically viable and competitive agricultural production system. Performance measures listed under Goal 1 include: Percent of NASS reports that are complete, meet scheduled release dates, and contain no data errors; percent of total national agricultural production included in the NASS annual statistics program; percent of data users who rate NASS data as important or essential to the orderly marketing of agricultural products; and the NASS annual report release calendar is published and distributed prior to the start of each year.

NASS Performance Goal 5: Provide detailed data from the census of agriculture at specified intervals to facilitate locality based policy and business decisions benefiting farmers, ranchers, and rural residents, and provide necessary and sufficient economic data on prices, labor, cost of production, farm numbers, and farm income to enable informed policy decisions to benefit farmers, ranchers, and rural residents. Performance measures listed under Goal 5 include: Number of months earlier than previous agricultural censuses for release of U.S. census data, and percent completeness improvement for coverage of minority operated farms compared to the previous agricultural census.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. Performance measures for the NASS Goal 1 are outcome measures on how well the Agency performed against standards, including data user ratings of NASS data as important or essential to the orderly marketing of agricultural products. Performance measures for the NASS Goal 5 are measures of how well the census of agriculture was conducted relative to previous censuses.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The five General Goals in the NASS Strategic Plan can be viewed in both the long-term or short-term. The fiscal year 2000–2001 Annual Performance Plans contain the same organizing matrix (General Goals, Objectives, Strategies, and Performance Goals) as does the NASS Strategic Plan. The fiscal year 2001 budget request is linked by the crosswalks to the General Goals of the Strategic Plan. The Annual Performance Plans transmitted to Congress contain indicators for the fiscal year 2000–2001 that can be achieved with base funding. The fiscal year 2001 plan also identifies activities that will be initiated or expanded with the new funds requested in the President's budget.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Material was gathered from the internal and external interviews, as well as results from a NASS organizational climate survey, middle manager committee meetings, data users meetings and other NASS employee and customer feedback efforts, which contributed to the deliberations of the Agency's Program Planning Committee. Understanding the needs, goals, and concerns of both data suppliers and customers concerning NASS products and services is crucial to continued success. Similar attention is necessary for the internal constituency, the staff and management of NASS. NASS has taken the approach of formulating meaningful outcome measures which assess NASS's ability to provide accurate, unbiased, meaningful, useful data on time with no errors.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes. Program managers understand these differences. NASS program managers have participated in the Agency's strategic planning efforts including the development of measures for the annual performance plans and the annual program performance report.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. NASS is working in partnership with the Federal Consulting Group, Department of Treasury, to conduct a survey of a sample of external customers representing all data users at the national level. Internal customers are measured with NASS's Biannual Organizational Climate Survey. The instrument to be used is the American Customer Satisfaction Index which delivers customer satisfaction information that is actionable, linked to outcomes, and is comparable across other agencies

governmentwide. The resulting measures will also establish a baseline and provide needed trend data.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. NASS evaluated the level of support for each of the REE general goals and corresponding Agency performance goals and measures in making the decisions related to the development of the fiscal year 2001 budget, particularly with regard to the new program initiatives.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes. NASS is a service agency whose customers are affected by the extent and frequency with which NASS can provide needed agricultural statistics. Significant budget changes have a direct bearing on the level of program performance such as statistical coverage, accuracy, and timeliness.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes. NASS has the ability to communicate electronically to every employee in NASS and is able to distribute program performance information throughout the year on a regular basis. Work units can disseminate information on the electronic NASS Bulletin Boards as well as the internal NASSNet Intranet system, both of which are easily accessed by all employees.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Program performance information is accessible to all employees when it is posted on the information systems in NASS.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Yes. While there are no reporting systems that have been specifically designed and developed for the GPRA performance measures, the NASS GPRA performance reports are readily accessible to all employees from the NASS Bulletin Boards as well as the NASSNet Intranet system. Performance-related data reported in the fiscal year 1999 Annual Program Performance Report and annual performance plans were developed by the individual work units.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. *Answer.* Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. No. NASS's present budget accounting structure aligns with core program activities to allow for the development of meaningful performance indicators and resource allocations. The only weakness in this design may be that the REE general goals which each agency in the REE mission area adhere to are quite general, sometimes making it difficult to directly link the impact of specific budget decisions on performance goals and measures.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No. Changing the NASS budget accounting structure is unlikely to help the current planning process.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. Not applicable.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Not applicable.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual perform-

ance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all Federal agencies are required to have a system of Managerial Cost Accounting.

The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. Yes, as the Department implements activity-based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Baseline budgets cross-cut through all of the goals with supporting cost data provided for the programs by goal. Overhead costs are fully allocated.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. Since NASS is not a regulatory agency, no regulatory reform measures are included in the performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. No. The NASS performance plan only provides a framework to evaluate NASS's key external factors which have important implications for the NASS program. The factors most important for the next decade are explicitly listed in the Agency's strategic plan. For example, one key external factor influencing NASS is the increasing demand among data users for new kinds of information provided in alternative forms. These pressing data user needs and requests always require an assessment of NASS resources and priorities. Rapid changes, continued concentration and more vertical integration in the agricultural industry has required NASS to modify procedures for collecting and publishing information for certain sectors of the industry. The need to sustain, and even increase, NASS's high standards for accuracy, timeliness, and relevancy in order to meet rising public expectations requires constant technological upgrades, training, and improved survey methodology. Changes in customer priorities and the addition of new program initiatives can result in shifts in resource allocations, all of which must be balanced against the reporting burden on individual producers.

Question. If so, what steps have you identified to prepare, anticipate, and plan for such influences?

Answer. NASS developed a 1998 Action Plan which is an internal document for use by employees that updates and complements the NASS Strategic Plan. The action plan presents immediate, tactical goals that must be met for NASS to realize its vision and accomplish its mission in a manner consistent with the objectives of the official strategic plan. For each tactical goal the plan lists concrete objectives and the actions to be taken to attain them. The action plan serves as a "road map" to guide NASS employees to the goals and objectives of the strategic plan.

Question. What impact might external factors have on your resource estimates?

Answer. The impact of these factors and the continued increase in information demands will most likely create a growing need for more appropriated resources for the collection of agricultural information, analysis, and publishing of NASS reports in a timely manner.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No. NASS is the primary USDA agricultural statistical agency whose agricultural statistics mission does not overlap or duplicate that of any other agency within or outside of USDA.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. Not applicable.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Yes. Each Agency has unique challenges for management depending on the culture of the organization, function, and mission. Each agency should address these organizational management challenges internally and externally with their customers, and work with the appropriate agencies regarding the specific areas of concern. Duplicative and overlapping functions should be justified and handled in the budget and appropriations processes. In addition, the annual performance plans should include a full discussion of goals and indications for these areas.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. The original strategic planning activity was initiated in NASS in 1993 and a final plan was accepted by the Administrator in 1994. The 1998 Action Plan builds upon the work embodied in earlier plans. The current GPRA strategic plan for NASS emulates the Agency's continued strategic planning efforts. For example, the NASS strategic plan and strong NASS leadership provided a solid foundation for the successful transfer of the Census of Agriculture from the Department of Commerce in fiscal year 1997. The ongoing expansion of the environmental statistics program is another growing area that is reflected in the GPRA plans.

Question. Will this use increase in the future and if so in what ways?

Answer. Senior management will continue to use strategic planning as a tool for program planning which has been very successfully integrated into the Agency's leadership and management process. The high level of NASS strategic planning efforts will continue into the future.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Established performance goals for NASS are in response to customer requests, most often expressed through the budgetary process. Most performance measures associated with each of the goals are relatively immature and would not provide a complete "picture" by themselves for make funding decisions. Responding to the data needs of those dependent upon and concerned with the Nation's agriculture is the most meaningful performance measurement.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Yes, the most significant difficulty is measuring Agency performance against the rapidly increasing demand for more and better agricultural statistics with which to make increasingly complex and critical decisions.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. No waivers have been requested.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No requests have been made.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. No. No major revisions were reflected in the fiscal year 2000 performance plan that required NASS to substantially revise the 1997 GPRA strategic plan.

ECONOMIC RESEARCH SERVICE (ERS)

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. ERS's annual performance goals all aim to increase understanding of a variety of economic issues. They flow directly from ERS's mission, which is to provide economic analysis on efficiency, efficacy, and equity issues related to agriculture, food, natural resources, and rural development to improve public and private decision making. The annual performance goals parallel ERS's strategic goals. ERS program activities—research planning and conduct, and dissemination of research results and economic information—directly support the strategic and annual performance plan goals.

Question. Could you describe the process used to link your performance goals to your budget activities?

What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. Increasingly, since the strategic plan was developed, the strategic and performance goals have become organizing principles for the ERS program and planning for future activities. This is a fairly straightforward process since ERS has five strategic goals and five performance goals. ERS has determined the number of staff years allocated to each goal and uses that as a basis for linking the performance goals to the budget. There were no significant difficulties.

Question. Does the agency Performance Plan link performance measures to its budget?

Does each account have performance measures?

Answer. ERS's budget has one appropriation item, economic analysis and research. The Performance Plan's five goals are linked and dependent on funding levels allocated within the agency.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Do you plan to propose any changes to your account structure for fiscal year 2001?

Will you propose any changes to the program activities described under that account structure?

Answer. ERS's performance planning structure does not differ from its account and activity structure. ERS does not propose any changes to its account structure for fiscal year 2001.

Question. How were performance measures chosen?

How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. ERS has always been concerned with its performance and has maintained information on its analytical outputs, their use, and their impacts on decisions about U.S. agriculture, food, natural resources, and rural development. ERS began a review of its planning and performance measurement systems in fiscal year 1995 when it provided all managers training on the Government Performance and Results Act (GPRA) and results-oriented management approaches. At that time, a group of middle managers reviewed and redrafted ERS performance measures. Subsequent mission area-wide activities in 1996–97 provided senior and middle ERS managers additional opportunities to test and refine ERS's performance measures including exchanges with staff at other government research agencies that were engaged in pilot GPRA projects and staff at private research companies. The performance plans' external reviews included meetings convened by the National Agricultural Research, Extension, Education, and Economics Advisory Board and included individuals from agri-business, public interest groups, and universities. The measures have also been critiqued extensively within USDA. Lessons reinforced were: do not make performance measurement so difficult that no one has time to work on achieving goals; good planning is an ongoing process and assessments will lead to further refinements; staff will perform to indicators—make sure measures lead to correct outcomes; and research agencies face special difficulties in tying research results to broader outcomes. Good measures for a research program are difficult to develop, and ERS is process of re-thinking the measures currently in place.

ERS will be able to produce and verify the data needed to underpin measures specified in its performance plan with very little additional cost. ERS would like to get more feedback from users outside the Federal Government, but is carefully con-

sidering the costs of doing so. The agency is in the process of developing a customer management program for its research monographs and periodicals that is expected to provide for a feedback loop.

ERS had reliable data for completing its fiscal year 1999 Performance Report.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

For each key annual goal, indicate whether you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The ERS Annual Performance Plan has one performance goal for each strategic goal. Each goal has two measures—one a quality measure and the other a timeliness measure. Each measure provides useful information on ERS’s success in enhancing understanding by policy makers of key economic issues. The measures, though useful, do not fully describe ERS’s success in meeting its goals. It is extremely difficult to measure the effectiveness and impact of research. Quantitatively and definitively establishing a link between economic analysis provided to decision makers and the outcome of the decision making process is rarely, if ever, possible. As a result, ERS used narratives in its fiscal year 1999 Performance Report to demonstrate that the agency ensured that high quality, objective, relevant, timely, and accessible analyses were made available to policy makers regulators, program managers, and organizations shaping public debate.

All of ERS’s performance goals and objectives are outcome oriented. The measures are closer to being output oriented, which is why the agency felt it necessary to supplement the performance report with narratives in its fiscal year 1999 Performance Report. Future plans and reports are expected to be in an alternative format.

The long-term goals and objectives from the strategic plan are linked to the annual performance goals as follows (taken directly from the fiscal year 2000–01 Annual Performance Plan):

Goal 1: The agricultural production system is highly competitive in the global economy.

Objective 1.1: Enhanced understanding by policy makers, regulators, program managers, and those shaping public debate of economic issues involved in ensuring that the U.S. food and agriculture sector effectively adapts to changing market structure, domestic policy reforms, and post-GATT and post-NAFTA trade conditions.

Performance Goal 1: Provide policy makers, regulators, program managers, and organizations shaping public debate with timely and high quality analyses of the economic issues affecting the U.S. food and agriculture sector’s competitiveness including factors related to performance, structure, risk and uncertainty, marketing, and market and non-market trade barriers.

Goal 2: The food production system is safe and secure.

Objective 2.1: Enhanced understanding by policy makers, regulators, program managers, and those shaping public debate of economic issues involved in improving the efficiency, efficacy, and equity of public policies and programs designed to protect consumers from unsafe food.

Performance Goal: Provide policy makers, regulators, program managers, and organizations shaping public debate with timely and high quality analyses of economic issues affecting the safety of the U.S. food supply including the efficacy, efficiency, and equity of alternative policies and programs designed to protect consumers from unsafe food.

Goal 3: The nation’s population is healthy and well-nourished.

Objective: Enhanced understanding by policy makers, regulators, program managers, and organizations shaping public debate of the factors affecting food prices and of the efficiency and effectiveness of alternative public policies and programs aimed at ensuring consumers equitable access to wide varieties of high quality food at affordable prices.

Performance Goal: Provide policy makers, regulators, program managers, and organizations shaping public debate with timely and high quality analyses of economic issues affecting the nutrition and health of the U.S. population including factors related to food choices, consumption patterns at and away from home, food prices, food assistance programs, nutrition education, and food industry structure.

Goal 4: Agriculture and the environment are in harmony.

Objective: Enhanced understanding by policy makers, regulators, program managers, and those shaping public debate of the economic issues involved in balancing long term sustainability goals with improved agricultural competitiveness and eco-

conomic growth and of the effects of Federal farm, natural resource, and rural policies and programs on that balance.

Performance Goal: Provide policy makers, regulators, program managers, and organizations shaping public debate with analyses of economic issues affecting agriculture's interface with the environment including those related to integrated pest management, sustainability, biodiversity, global change, and environmental accounting.

Goal 5: Enhanced economic opportunity and quality of life for rural Americans.

Objective: Enhanced understanding by policy makers, regulators, program managers, and organizations shaping public debate of economic issues affecting rural development and performance of all sizes of American farms.

Performance Goal: Provide policy makers, regulators, program managers, and those shaping public debate with timely and high quality economic analyses that identify (1) how investments in rural people, businesses, and communities affect rural economies' capacity to survive and prosper in the global marketplace and (2) what policies and programs keep American farms of all sizes viable.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. Interpreting outcome measurements is not a straightforward process for research organizations. The cause and effect relationship between research outputs and eventual outcomes is complex. The challenges facing those interpreting performance measures for a public information and analytical organization such as ERS are even greater. Public information can be freely used without attribution. Its widespread use and effects may be difficult to fully measure. Delays between when research results are presented and when their effects are fully assimilated are variable and can be long. Specific outcomes are influenced by factors besides quality research results. If ERS analysis is objective, analysis on the efficacy, efficiency, and equity impacts of specific policies, programs, and regulations will at any one time support some customers' proposals but not others. Rigorous adherence to standards of disciplinary excellence contributes greatly to the quality and objectivity of ERS analyses and their defensibility. The narratives included in ERS performance reports are key to showing how ERS analysis enhanced understanding of key economic issues by policy makers, regulators, program managers, and others.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, and they are particularly aware of the difficulty in measuring outcomes of research and analysis. ERS has a head start in making sure that program managers understand the difference between workload and effectiveness measures. Most ERS employees are economists with substantial interest, training, and experience in understanding efficacy, efficiency, and equity concepts. In addition, ERS augmented program managers' training specific to GPRA requirements beginning in fiscal year 1995, providing managers with training on GPRA and results oriented management approaches.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. ERS is looking at a variety of qualitative indicators to help measure customer satisfaction and to understand how ERS research results are used by decision makers and thus affect outcomes. Some of these indicators are likely to become part of ERS's alternative measurements. ERS internal customers include the Office of the Secretary, the Chief Economist and other USDA agencies. External customers include Congress, other Federal agencies, industry groups, and other researchers, both in universities and in private organizations. Possible indicators are: (1) call backs for follow up information/analysis from policy makers; (2) requests for ERS staff as primary speakers at important meetings/conferences; (3) articles in major public media that correctly and effectively use ERS analysis and data; and (4) relevance of ERS output to stated Administration or congressional priorities. To ensure that the outputs present data and analyses that are high quality, comprehensive, objective, relevant and accessible, ERS routinely provides its customers many opportunities for feedback, conducts rigorous peer reviews before analysis is released, and uses a wide variety of proven and innovative dissemination systems.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. The fiscal year 2001 budget reflects the ERS fiscal year 2000 Performance Plan and performance goals. Changes in the level of funding affect ERS ability to produce and disseminate its research and analysis. ERS would be able to provide information on the impact of funding changes on performance goals.

Question. Do you have technological capability of measuring and reporting program performance throughout the year on a regular basis, so the agency can be properly managed to achieve the desired results?

If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. ERS could prepare program performance reports at any time during the year. However, the nature of research outcomes including the often long evolution between provision of economic analysis and any particular public and private decisions, means that frequent detailed measurement and reporting may not be cost effective or meaningful for understanding overall progress on meeting goals and objectives. ERS is in the process of developing a system that brings together performance information from a variety of current tracking systems. That will make it simpler for managers and supervisors at all levels to track progress on certain specific activities over the course of the year.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear meaningful way.

Have you faced that difficulty? Would the linkages be clearer if your budget account structure were modified?

If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Because ERS's budget has one appropriation item—economic analysis and research—ERS does not face difficulties in linking performance across various accounting and reporting structures and presenting its budget by performance goals.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions.

Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plans. With additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issue by OMB, this year for the first time, all Federal agencies are required to have a system of Managerial Cost Accounting.

The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

Question. What is the status of your agency's implementation of the managerial cost accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals, and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, the Department strongly believes that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity-based costing, it will be able to provide unit costs for activities and results.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. None. ERS does not perform regulatory functions.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement? If so, what steps have you identified to prepare, anticipate and plan for such influences? What impacts might external factors have on resource estimates?

Answer. Implicit in ERS's fiscal year 2000 performance plan and explicit in the strategic plan are external factors that could affect achievement of ERS goals. Changes in the larger policy context in which ERS operates will influence the content and orientation of ERS research and analysis. These changes can be in Government policy, changes in markets, or new technology; all influence the direction of the ERS program. In addition, the changing needs of users of ERS information influence ERS's program.

Steps taken to prepare for changing demands include continuous communication with major customers and constant monitoring of trends in markets and policy development. Anticipation of changes is a critical part of ERS's research planning. Readiness to respond to unforeseen changes is also built into the ERS decision making and budgeting process. One means of providing flexibility is the quarterly allocation of funds by the Administrator. Another is the agency's commitment to seek reimbursements for research or analysis requested by customers.

ERS is committed to anticipating changes in external demands because such demands can make it difficult to sustain core research, which is the essential base on which the agency operates. Also, over the longer run, those changes may need to become part of the core research.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so does the Performance Plan identify the overlap or duplication?

Answer. Development of the performance plan did not reveal significant overlaps or duplication within the agency. Externally, because ERS's economic analyses cover all aspects of USDA's mission, the crosscuts between ERS research and the missions and goals of other USDA agencies are extensive and complicated. However, even before GPRA was implemented, ERS was cognizant that its unique contribution is provision of external economic analysis and ensured that it did not duplicate or overlap with program functions in other agencies.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Significant management challenges, including efforts to deal with overlapping functions can and should be addressed through management initiatives.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Will this use increase in the future and, if so, in what ways?

Answer. GPRA is and will continue to be a significant factor in agency decision making. The five strategic goals and the five performance goals are central to research planning in ERS. Division and branch annual plans are organized around the goals. A major overhaul of the ERS website is underway, also organized around the goals. A new agency information system currently under development will assist in tracking activities, accomplishments, and, if possible, outcomes for the purposes of GPRA and for other management needs.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. ERS performance measures, supplemented by narrative information provided in the Annual Performance Report are sufficiently mature to allow funding decisions to consider actual performance compared to targets. However, the caveats raised in earlier responses about the complexity of measuring performance for a public research organization remain. ERS is in the process of seeking an alternative approach that better serves to measure performance. Quantitative measures alone are not likely to completely fulfill this purpose. Increasingly, agency management sees evaluation of agency programs and program impacts as a central function.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. ERS will review and consider revisions to its strategic plan during fiscal year 2000. Major revisions are not expected.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. There is a direct correlation between the Agency's mission, strategic goals, performance goals, and budget activities. Each of the Agency's budget activities—the Packers and Stockyards Program and the Grain Inspection Program—is directly linked to a strategic goal and supporting performance measures. The Packers and Stockyards Program is represented in Goal 1 of the Agency's strategic plan, and the Grain Inspection Program is represented in Goal 2. Both goals support the Agency's mission and have supporting performance measures.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. In the drafting process, we ultimately designed the Agency's strategic plan with the Agency's budget activities in mind. The end result is that there is a one-to-one correlation between budget activities and strategic goals and supporting performance goals.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, each budget account is aligned with a strategic goal and supporting performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. There are no differences.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. The Agency does not plan to propose any changes at this time.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. The Agency does not currently plan to propose any changes to the program activities described under our account structure.

Question. How were performance measures chosen?

Answer. GIPSA focuses on what customers have indicated they want measured—cost efficiency, timeliness of service, and accuracy of results. To date, the Agency has developed measures of timeliness (e.g., percentage of violations corrected within 1 year of investigation's starting date) and cost efficiency (e.g., cost of the official grain inspection and weighing service per metric ton using constant 1992 dollars indexed on the Gross Domestic Product). The Agency will be developing measurements of accuracy during fiscal year 2000.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. For some of the Agency's performance measures, such as cost per metric ton, the data was already available and resulted in no extra cost to the Agency. In other instances, the Agency is still struggling with developing meaningful outcome measures and identifying the necessary data sources.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. The Agency has performance measures for which reliable data was available in time for the first performance report.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. GIPSA's performance goals align with the Agency's budget line items and, as a result, it would be difficult to assign greater importance to any one goal. As given in the revised fiscal year 2000 and fiscal year 2001 Annual Performance Plans, the Agency's performance goals and affiliated budget line items are: (1) Ensure a fair, open, and competitive marketing environment for livestock, meat, and poultry; (2) Increase the efficiency of grain inspection and weighing processes; (3) Provide a standardized framework for the U.S. grain trade; (4) Provide cost effective and responsive official grain inspection and weighing services; (5) Protect the integrity of U.S. grain marketing for the U.S. grain trade; (6) Implementation of workforce plan action items (percent); and (7) Number of deficiencies and/or nonconformance.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. Of these performance goals, numbers 6 and 7 are output measures. Numbers 1 through 5 are outcome measures.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The current Agency Strategic Plan extends to fiscal year 2002. To date, long-term fiscal year 2003 general goals and objectives, have not been developed to which the annual goal can be linked. Of the Agency's present performance goals listed above, the first one is linked to our Strategic Goal 1. Performance Goals 2 through 5 support Strategic Goal 2; and Performance Goals 6 and 7 support both Strategic Goals 1 and 2.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The Agency is well aware of the importance and the difficulty in developing meaningful outcome measures. GIPSA anticipates refining some of its current performance goals and measures and intends to develop new measures, accordingly.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Although managers understand the difference, GIPSA continues to have some difficulty in identifying meaningful outcome goals. For example, standardization of grain quality and quantity measurement improves market efficiency. Likewise, the use of grades and standards improves market efficiency if the grades and standards communicate the quality characteristics relevant to the market. GIPSA directly controls the standardization of the official inspection system and influences the standardization of the commercial market. Measuring the use of grades and standards by the commercial market is impractical, since nearly all those buying or selling grain use the grades and standards to one degree or another. As a result, GIPSA is attempting to develop surrogate measures that track the efficiency of the official inspection system and the adequacy of grades and standards.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. GIPSA has conducted a survey of external customers of the official inspection and weighing system. Results from the survey have allowed the official system to quantitatively assess customer satisfaction in terms of the factors that have been identified by customers as being critical to the official system's success: timeliness, accuracy and consistency, cost-effectiveness, responsiveness, and professionalism. Results from the survey will also serve as benchmarks against which further progress will be measured. GIPSA has conducted surveys of employees of the grain program. The Agency's managers and employees use survey results to identify the Agency's strengths and weakness and to take actions to improve upon both. The Agency plans to conduct another customer survey in fiscal year 2000.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. We aligned the Agency's strategic goals and supporting performance goals and measures with the Agency's two budget accounts, the Packers and Stockyards Program and the Grain Program.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. If appropriated funding is increased or decreased, it would have an impact on the Agency's target levels of performance and the fiscal year 2001 Performance Plan would be revised accordingly.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Yes. With the exception of one measure, GIPSA will rely on internal agency procedures to track performance. In the future, this will allow GIPSA to have the capability of regularly assessing program progress. At the national level, the average cost of the inspection and weighing program per metric ton (unadjusted) is included in the monthly financial reports prepared by the Animal and Plant Health Inspection Service's Washington Financial Service Branch. GIPSA's success in tracking the cost of the program is directly dependent on the timeliness and quality of service it receives.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. Currently, access to the information is available mainly to senior and mid-level management. We are, however, planning to extend future access to lower-level managers.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. While we would not consider it an easy process to gain access to various performance-related data located throughout the Agency's various information systems, we do expect access to become easier as we continue to develop our various information systems.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Since GIPSA's program activities set forth in the budget and the Agency's strategic and performance goals are aligned, the Agency has not encountered such difficulty.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No, the linkages are currently clear.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. Modification is not necessary at this time.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. Modification is not necessary at this time.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions: Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. GIPSA understands the importance of identifying real costs to perform various government functions, as well as the importance of allocating valuable, and sometimes limited, resources to perform these functions. Although the Agency has limited cost accounting expertise, it plans to use all available accounting resources at its disposal to link GPRA to the budget process, and to identify real costs and allocate Agency resources.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting.

The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities in the agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. We are just in the early stages of the Activity-Based Costing process. The Agency has had meetings on the subject of "Activity-Based Costing" and is exploring possible training opportunities to develop the necessary skills to carry out this process.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. It is the Agency's intent to be able to show the Committee the full and accurate cost of each activity for each program, including costs for such items as administration, employee benefits, and depreciation.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. The Committee will be able to receive a much more accurate accounting of the dollars spent on a program, the true costs of the activities conducted by the program, and the subsequent results of these activities.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. It is our intent to identify and track costs down to the lowest practical levels within each activity, and thus be able to report per-unit costs and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. As near as possible, we hope to be able to identify the full cost of all associated activities performed in support of a particular performance goal, including associated overhead costs.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. The Agency has not identified, nor put in place, any significant regulatory reform measures in conjunction with the development of the Agency's performance plan.

Question. Does your fiscal year 2000 Performance Plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Yes, the fiscal year 2000 Performance Plan does identify external factors.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. GIPSA must effectively respond to the fluid and dynamic business environments in which the grain and livestock industries operate. Like many segments of American agriculture, these industries are experiencing rapid changes such as mergers, acquisitions, vertical integration, and increasingly automated operations. The changes are shaping how GIPSA operates. For example, GIPSA has developed a field office consolidation plan, which will allow more resources to be located in regions where beef, pork, and poultry production and processing are concentrated. Furthermore, the field offices will be strengthened with additional expertise in economic, statistical, and legal issues to more effectively conduct investigations of alleged anticompetitive practices and financial and trade practice violations. In the grain program, GIPSA has been working closely with official agencies to enhance customer service. The end result has been ground breaking. With the guidance of GIPSA, three official agencies have formed a limited liability partnership that will enable them to better serve a common customer, a large Midwestern grain cooperative. Even more important, the cooperative will now be able to load unit trains more quickly, with fewer problems, and for much less cost.

Question. What impact might external factors have on your resource estimates?

Answer. Changing external factors may require the Agency's Packers and Stockyards program to shift from one area of focus to another. In the grain arena, increases or decreases in U.S. grain exports will affect the cost per metric ton of the grain inspection and weighing service provided.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. GIPSA has not identified any overlapping functions or program duplication. GIPSA does, however, coordinate its program activities with a number of gov-

ernment entities. Within USDA, GIPSA works with the Animal and Plant Health Inspection Service and the Agricultural Marketing Service on marketing issues; the Foreign Agricultural Service on international trade issues and programs; the Agricultural Research Service and the Economic Research Service for research support; and the Office of the Inspector General on investigative matters. Further, GIPSA cooperates with various non-USDA entities, including the Food and Drug Administration on food safety issues; the Environmental Protection Agency on pesticide residue programs; and the Department of Justice and the Commodity Futures Trading Commission on investigative matters. GIPSA's strategic plan, rather than its performance plan, addresses the coordination of efforts.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. GIPSA sees no need for agencies to address management challenges and potential duplication and overlapping functions in their GPRA plans. Hopefully, in developing their plans, agencies have already identified and eliminated overlapping functions or program duplication.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. GIPSA has developed an investigation and case tracking system, which will allow the Agency to track regional and industry-wide investigations, thus increasing efficiencies for the Agency and customers alike.

GIPSA has implemented an enhanced quality assurance and quality control program to ensure the quality and accuracy of inspection results nationwide. The new program includes a balance of national and localized monitoring. A greater emphasis is being placed on proactive actions to prevent problems from occurring rather than reacting to problems once they have occurred.

Question. Will this use increase in the future and if so, in what ways.

Answer. Yes, GPRA will increasingly be used to make decisions, particularly with efforts to decrease costs and increase productivity. Managers will continue to be reminded of the importance of GPRA and its increasing impact on budgetary decisions.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses? Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. Given that the Agency's current performance goals and measures are relatively immature, the Agency is in the process of reviewing and refining its current goals and measures and developing some new measures in time for the beginning of the fiscal year 2002 budgeting cycle.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. GIPSA is not currently requesting any waivers of non-statutory administrative requirements, nor is the Agency requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issues on September 30, 1997?

Answer. GIPSA does not foresee any need for any substantive revisions in the Agency's strategic plan at this time.

NATIONAL APPEALS DIVISION

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. NAD has a single performance goal to conduct hearings and issue determinations within applicable time frames and the entire appropriation is used to support the achievement of that goal.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. NAD has a single performance goal that is linked to its single budget activity.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. No difficulties were encountered.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes, NAD's performance plan links its performance measures to its budget.

Question. Does each account have performance measures?

Answer. NAD has one account and four corresponding performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. NAD's performance planning structure does not differ from the activity structure.

Question. Do you plan to propose any changes to your account structure for 2001?

Answer. NAD does not plan to propose any changes to the account structure for 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No changes to the program activity described under that account structure are proposed for 2001.

Question. How were performance measures chosen?

Answer. NAD based its performance measures on statutory and regulatory requirements.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. NAD considered the cost of data collection and verification with respect to its existing information systems and additional programs, and examined its quality and sufficiency with respect to the need for reliable and valid performance data.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No, our plan does not include performance measures for which reliable data are not likely to be available in time for our first performance report in March 2000.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. NAD has one performance goal to conduct hearings and issue determinations within applicable time frames.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. NAD has four indicators for its one performance goal. The indicators are based on outcome measures.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. NAD's long-term general goal and objective is to conduct hearings and issue determinations within applicable time frames.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. NAD undertook efforts to ensure that not only would compiled data indicate compliance within time frames, but that both the quality of customer service and the quality of the determinations would be measured.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, we are confident that our program managers understand the difference between goals that measure workload—output—and goals that measure effectiveness—outcome.

Question. What are some examples of customer satisfaction measures that you intend to use? Please use examples of both internal and external customers.

Answer. NAD uses the same customer satisfaction measures for internal and external customers. These measures include identifying levels of satisfaction with: treatment—courtesy and respect; The customers' rights to present their case and tell their side of the story; the level of fairness and impartiality; the degree of responsiveness in answering questions; and the level of comprehension in reading and understanding NAD information.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. The fiscal year 2001 budget was based upon a review of the performance goal and measures.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, we would be able to indicate the likely impact.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. NAD maintains a management information system (NADTrack) that tracks cases and provides data which enables NAD to properly manage program performance.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. NADTrack information is provided and maintained by mid- and lower-level program managers. The information is used by senior management to consider in making decisions and to compile statistical reports. Both managers and program managers, at all levels, have access to the information.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. The information system was designed for easy accessibility.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget? Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. NAD has not faced any difficulties in linking dollars in a clear and meaningful way to results.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. Modification to NAD's budget account structure is not necessary.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. NAD does not propose to modify the budget account structure.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. No such modification is necessary.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as Activity-Based Costing, whereby the full cost is calculated for each of the set activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. All costs, direct and indirect, are allocated to support the achievement of NAD's single performance goal.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. NAD has not put any regulatory reform measures in place.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. NAD's fiscal year 2000 performance plan does not identify any external factors that could influence goal achievement.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. NAD's fiscal year 2000 performance plan does not identify any significant external factors that could influence goal achievement, therefore, no steps have been identified to prepare, anticipate and plan for such influences.

Question. What impact might external factors have on your resource estimates?

Answer. NAD does not have any significant external factors.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. NAD has not identified any overlapping functions or program duplication.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. NAD has not identified any overlapping functions or program duplication.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. NAD has not identified any overlapping functions or program duplication.

Question. To what extent has GPRA been used by agency leadership to guide decision making?

Answer. GPRA requirements have had a growing impact on agency leaders' decision making. Customer service consideration and budget/goal correlation are two areas considered in NAD's decision making.

Question. Will this use increase in the future and if so in what ways?

Answer. NAD is moving from attribute data to continuous data in measuring customer service. NAD is also finding better methods of tailoring training programs based on quantitative data gathered at all levels of the organization.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. Our performance measures are sufficiently mature.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data, that might affect the accuracy of resource estimates?

Answer. No, there are no such factors.

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. NAD is not requesting any waivers of non-statutory administrative requirements at this time.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. NAD is not requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. When the strategic plan was prepared, NAD had been in existence less than four years and did not have the breadth of experience needed to establish mature management-related goals and indicators. NAD now has sufficient experience with which to establish more realistic and meaningful management goals. NAD's 2000 Strategic Plan will be modified to reflect more realistic and meaningful goals. NAD's mission-related performance goal is expected to continue without revision.

AGRICULTURAL MARKETING SERVICE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. AMS' annual performance goals are directly linked to its mission and strategic goals. The agency's program activities are grouped according to the agency's two strategic goals; the performance goals are listed by program activity. The table below shows the linkage between each activity and strategic goal.
[The information follows:]

SUMMARY OF AMS STRATEGIC GOAL LINKAGES—FISCAL YEAR 2000

[Dollars in thousands]

	Goal 1	Goal 2
Marketing Services, Appropriated:		
Market News	X	
Standardization	X	
Shell Egg Surveillance		X
Federal Seed Act Program		X
Pesticide Recordkeeping Program		X
Pesticide Data Program	X	
Wholesale Market Development	X	
Transportation Services	X	
Section 32, Appropriated:		
Commodity Purchase Services	X	
Marketing Agreements and Orders		X
User Funded:		
Grading & Certification	X	
Plant Variety Protection Act Program		X
Commodity Research and Promotion Acts	X	
Perishable Agricultural Commodities Act Program		X

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. We used the budget activities as the framework for our performance goals and did not encounter any difficulties.

Question. Does the agency's Performance Plan link performance measures to its budget? Does each account have performance measures?

Answer. Yes, the agency's performance plan links performance measures to budget activities. AMS budget accounts include multiple activities; each ongoing AMS activity has a performance measure.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification? Do you plan to propose any changes to your account structure for fiscal year 2001? Will you propose any changes to the program activities described under that account structure?

Answer. AMS' performance planning structure does not differ from the budget structure. The activities in the annual performance plan are the same as the activities in the budget justification. The budget justification lists AMS activities by account, whereas the performance planning structure lists the activities by goal. We do not plan to propose any change to our account structure or program activities in fiscal year 2001.

Question. How were performance measures chosen? How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data? Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. Performance measures were developed through a consensus of program personnel and agency managers. As part of its strategic plan development, AMS established committees of agency program personnel for each activity. These committees were responsible for developing performance measures for their activities based on the strategic plan. AMS also formed a Strategic Planning Action Team at the Associate Deputy Administrator level. This team monitors the performance goals in the annual plan, gathers actual performance data semiannually, and prepares a report to the Administrator. Data collection and verification is an integral part of the programs that we carry out and the collection of data was not a material obstacle. In the few cases where performance data was found to be unavailable, AMS has revised the performance goal.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results? For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well"). State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. Since the AMS performance goals track the budget activities, we believe that the Subcommittee would be interested in all of them. Most of AMS' performance goals are outcome measures; wherever data is available. Output measures closely aligned with the goals were used where outcome measures were not available.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. We attempted, where possible, to provide outcome measures for each program area. AMS formed a committee of program managers who worked together to determine what measures best met the requirements of GPRA and the needs of the managers for program operation.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes, we believe AMS program managers understand the differences. The problem, in some instances, was that measuring outcome was not possible and we had to use output measures instead. For example, our transportation services program helps to ensure that the transportation system serves the needs of U.S. agriculture by providing technical assistance to shippers and carriers, providing economic analyses and recommending improvements to domestic and international agricultural transportation. The best measure of program performance currently available is the number of projects completed—an output measure.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Some examples of customer satisfaction measures for external customers include the performance goal for market news services that is based on timeliness and the percentage of formal and informal rulemaking completed within time frame goals.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget? If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. We developed the budget based on the agency's mission and strategic plan then adjusted the performance goals as needed. We changed the goal estimates based on the budget proposals. If the proposed budget number is changed, AMS program personnel can estimate the likely impact of the change on program performance. The performance goals and indicators reflect the requested budget levels.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results? If so, who has access to the information—senior management only, or mid- and lower-level program managers, too? Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. AMS has systems in place to measure and report program performance throughout the year on a regular basis for management use. Senior management has access to performance-related data on a semiannual basis.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way.

Have you faced such difficulty?

Would the linkages be clearer if your budget account structure were modified?

If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. We have not faced any difficulty in linking dollars and results since we are using the samples under both the annual performance plan and the budget structure. Therefore, there is no need to change the budget account structure for AMS to improve the linkages.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. The AMS operated its own GAO approved cost accounting system prior to merging the accounting function with NFC's accounting system. This experience plus the voluntary user fee nature of nearly three-quarters of the agency's funding provides us with a good understanding of the costs to carry out our programs. Currently, we are linking budget program activities to the goals in our annual performance plan.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency.

What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Will you be able to show us the per-unit cost of each activity and result?

To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The NFC's central accounting system does not currently have a full cost accounting option, however, when AMS begins utilizing the new Financial Foundation Information System in fiscal year 2002, this function will be available. Despite the current data limitation, AMS has structured its central accounting system general ledger so that we can obtain account information by individual programs. Due to the voluntary user fee nature of AMS' programs, we have allocated the administrative and supervisory costs enabling us to determine the true cost of activities carried out by the agency. All administrative and overhead costs are fully allocated to the various budget activities.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. No regulatory reform measures have been put in place in AMS in conjunction with the development of our performance plan.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

If so, what steps have you identified to prepare, anticipate, and plan for such influences?

What impact might external factors have on your resource estimates?

Answer. We included a discussion of external factors in the strategic plan. The discussion of performance goals in the performance plan briefly mentions external factors that could influence goal achievement for some of the agency's activities. AMS programs try to anticipate and prepare for uncontrollable external factors such as weather, economics, production levels, and consumer preference by closely monitoring the agricultural industry and its environment.

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication? If so, does the Performance Plan identify the overlap or duplication?

Answer. No, rather the plan process has helped us to understand the complementary nature of our activities with others within and outside the Department.

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. These issues are addressed in the "Means and Strategies" and "Management Initiative" sections of the performance plan.

Question. To what extent has GPRA been used by agency leadership to guide decision making? Will this use increase in the future and if so, in what ways?

Answer. Since most of AMS' programs are user fee based, management has traditionally used the "bottom line" to determine if fees covered costs and if customer requirements are being met. The performance measure data has helped to increase the managers' understanding of performance issues and the impact of agency activities on our customers.

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that:

To what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Are there any factors, such as inexperience in making estimates for certain activities or lack of data that might affect the accuracy of resource estimates?

Answer. As in the past, future funding decisions will be based on both program performance and changing marketing structure. We believe our performance measures are the best that are currently available to reflect the accomplishment of our mission. We plan to periodically reassess our performance measures to assure that they effectively measure AMS performance and revise them when necessary.

Question. Are you requesting any waivers of non-statutory administrative requirements? Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No we are not requesting any waivers of non-statutory administrative requirements.

Question. Based on your fiscal year 2000 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. The agency's strategic plan is currently being reviewed for possible revision.

OFFICE OF THE CHIEF ECONOMIST

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The annual performance goals of the Office of the Chief Economist (OCE) are directly linked to the agency's mission, strategic goals, and program activities. OCE goals are compatible with the program activity structure contained in the President's Budget. These three strategic goals correspond to the three components of OCE's mission which is to advise the Secretary of Agriculture on the economic prospects in agricultural markets and the economic implications of policies, programs and economic events affecting U.S. agriculture and rural communities; to ensure the public has consistent, objective and reliable agricultural forecasts; and to promote effective and efficient rules governing Departmental programs. These goals are funded through a single budget account.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. The process of linking OCE performance goals to its budget activities was accomplished by establishing performance goals that were developed to ensure

OCE's ability to accomplish its delegated responsibilities under the authority of the Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994, Public Law 103-354. Funding levels were established to achieve these performance goals, considering existing, as well as, new responsibilities assigned to OCE by the Secretary, such as assuming management and operation of the Office of Energy Policy and New Uses—OEPNU—in fiscal year 1999.

Question. What difficulties, if any did you encounter, and what lessons did you learn?

Answer. OCE is largely affected by events and external factors beyond its control, such as the degree of analytical support provided by other agencies and special, unforeseen projects as requested by the Secretary and other policy officials within the Department and the Executive Branch. The primary lesson learned is that OCE must develop performance goals and targets that reflect these external factors and develop strategies to ensure that OCE achieves its goals despite this uncertainty.

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes, OCE's Performance Plan links performance measures to its budget. OCE's Performance Plan estimates funding and FTE levels for each goal.

Question. Does each account have performance measures?

Answer. Yes, OCE has a single budget account that funds all of its goals and performance measures.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. OCE's performance planning structure does not differ from the account and activity structure in its budget justification.

Question. Do you plan to propose any changes to your account structure for fiscal year 2001?

Answer. No, OCE does not plan to propose any changes to the account structure for fiscal year 2001.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. Yes, the program activities described under the current account structure are increased in three general areas: biomass and bioenergy research, risk analysis, and data management.

Question. How were performance measures chosen?

Answer. Performance measures were chosen to enable OCE managers and outside observers to track progress in accomplishing OCE's mission and strategic goals, including new goals associated with expanded biomass and bioenergy activities.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. OCE balanced the cost of data collections and verification with the need for reliable and valid performance data by using low cost data collection methods. Recorded performance data largely reflects feedback from the Secretary, Deputy Secretary, and other OCE clients and customers, including surveys taken at the annual USDA Agricultural Outlook Forum and public feedback at data users' meetings operated jointly with the National Agricultural Statistics Service and the Economic Research Service—ERS.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. No, our plan does not include performance measures for which reliable data are not likely to be available in time for our first performance report in March 2000.

Question. What are the key performance goals from your fiscal year 2000 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. We have three key strategic goals that the subcommittee should use to track results through the annual performance goals and measures provided for each.

Question. For each key annual goal, indicate whether you consider it to be an output measure ("how much") or an outcome measure ("how well").

Answer. All three of OCE's strategic goals are supported by outcome measures. However, goals 2 and 3, which relate to products of the World Agricultural Outlook Board—WAOB—and Office of Risk Assessment and Cost Benefit Analysis—ORACBA—respectively, are measured by a mix of output measures and outcome measures.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. The long-term general goals that appear in the Strategic Plan are identical to the goals that appear in the annual performance plans.

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. OCE undertook efforts to develop outcome measures that provided a description of the intended result, effect, or consequence that would occur from accomplishing the activity. Indicators were developed to measure output and outcome in order to provide a comprehensive view to managers and outside observers.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. The Chief Economist has addressed the distinction between the concept of workload—output—from that of goals which measure effectiveness—outcome—when providing direction to managers during the development of the annual performance plans. Managers were aware of this distinction when goals and indicators were developed for each element of OCE. Even so, because OCE delivers information to decision makers, it is very difficult and often impossible to link the outcome of a policy or program decision or a private sector decision back to information delivered to OCE.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. Among the measures developed for determining satisfaction, OCE developed measures of the Secretary's satisfaction with economic information produced by OCE for incorporation into the Secretary's decisions, communications, and interactions with other government officials and the public because of its relevance, accuracy, objectivity, and timeliness. OCE measures external customer satisfaction by surveying attendees at USDA's outlook forum.

Question. How were the measurable goals of your fiscal year 2000 Annual Performance Plan used to develop your fiscal year 2001 budget?

Answer. Planned activities, funding requests, and performance goals for the fiscal year 2001 budget were based on OCE's best estimate of progress in the remainder of fiscal year 1999 and the goals for fiscal year 2000.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes, OCE would be able to estimate the impact of changes in levels of funding for its performance goals. Because OCE's budget was frozen in fiscal year 2000, little flexibility remains in resource reallocation. Further freezes or cuts will directly affect OCE's ability to attain its goals.

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. Feedback regarding OCE performance is a continuous activity. OCE has the capability of measuring and reporting performance throughout the year on a regular basis so that the agency can be properly managed to achieve desired results. The Chief Economist meets weekly with key managers and quarterly with the Senior Executive Service staff to review program operation and performance.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers, too?

Answer. OCE managers share their observations regarding OCE performance among themselves and with staff on a continuous basis.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. In most cases, OCE managers can gain access easily to various performance-related data. Feedback comes from frequent contact with its principal customers: the Secretary, Deputy Secretary, and other senior officials, and from public users of OCE information.

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Budget structure has not caused OCE difficulty in linking dollars in a clear and meaningful way.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. No, we think linkages are clear enough to assess funding changes and results.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. OCE does not propose to modify the budget account structure.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. OCE does not propose any modification at this time.

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. Although the Department has some personnel with cost accounting expertise, the Department's Chief Financial Officer has recognized the need for a Department-wide effort to enhance cost accounting expertise and \$240,000 is included in the fiscal year 2001 President's Budget request to provide such leadership. Currently, we are linking budget program activities to the goals in our annual performance plan. Ultimately, with additional fiscal year 2001 resources and a better trained workforce, the Department will continue to implement improvements in this area.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as Activity-Based Costing, whereby the full cost is calculated for each of the set activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. USDA is in compliance with FASAB's cost accounting standards. The Department has identified responsibility segments, for which financial statement reporting is provided, employing full cost techniques that include unfunded pension and accrued annual leave, Federal Employment Compensation Act accrued expenses, GSA rent, depreciation, and other expense items that are appropriate. Currently, the Department uses several costing techniques, including Activity-Based Costing, that permit us to determine the cost of our strategic goals and selected output activities.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. The Department's current goal is to implement the Foundation Financial Information System throughout all USDA agencies in order to provide standardized accounting methodologies and improve data integrity for management and reporting purposes for salaries and expenses and administrative operations. As the Department improves its basic accounting and reporting processes, it will be able to better identify activities and outputs for unit costing and will evaluate the various accounting methodologies available and incorporate the appropriate methodology for the activity being costed.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes, we strongly believe that effective implementation of costing systems will vastly improve Federal planning, evaluation, and reporting at all levels of the organization.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. As the Department implements activity based costing, it will be able to provide unit costs for activities and results.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. All OCE costs, including overhead, are associated with the performance goals.

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. OCE has not put any regulatory reform measures in place.

Question. Does your fiscal year 2000 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?
